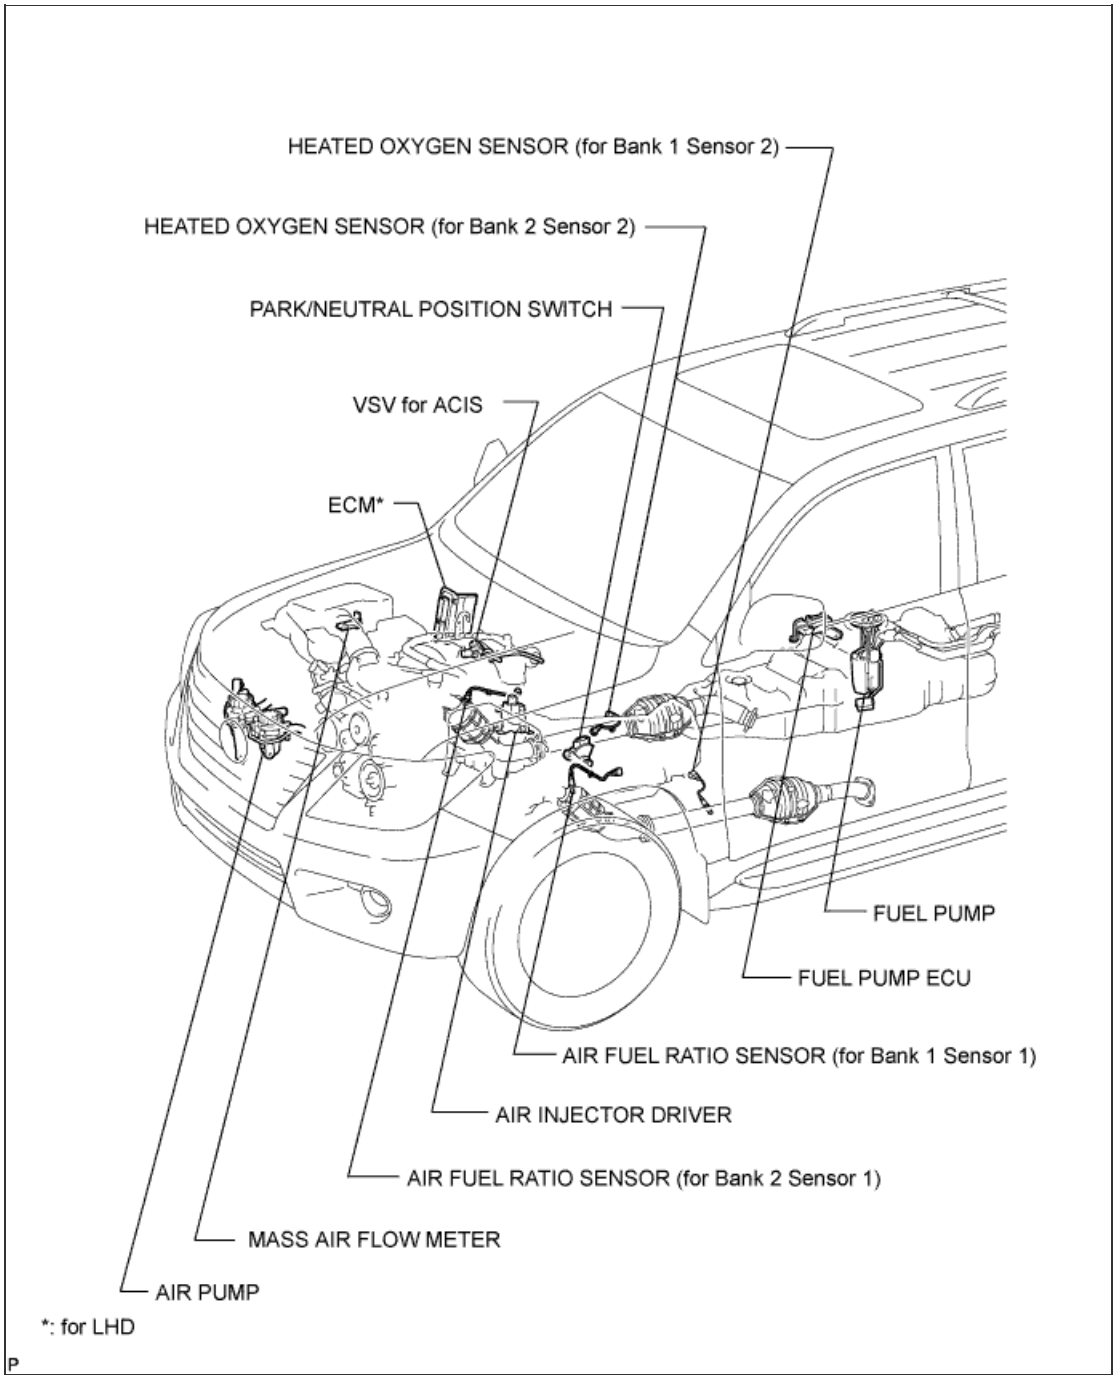
for Preparation Click here

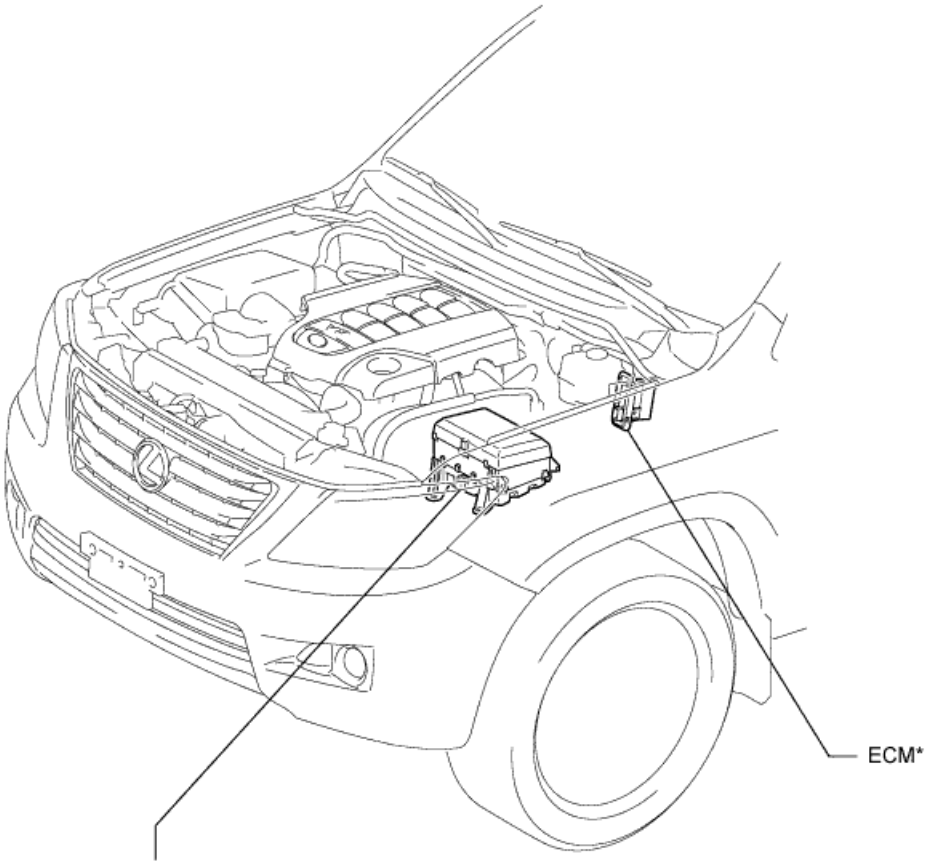
CAUTION:

When using the intelligent tester, observe the following items for safety reasons:

- **Read its instruction books before using the tester.**
- **Prevent the tester cable from being caught on the pedals, shift lever and steering wheel when driving with the tester connected to the vehicle.**
- **When driving the vehicle for testing purposes using the tester, 2 persons are required. One person drives the vehicle, and the other operates the tester.**



NOTICE:



Perform Reset Memory (AT initialization) for 4WD when replacing the automatic transmission assembly, engine assembly or ECM (Click here).

HINT:

Reset Memory cannot be completed by only removing the battery.

for Preparation Click here

HINT:

Inspect the vehicle ECM using check mode. Intermittent problems are easier to detect with the intelligent tester when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. **Clear the DTCs (Click here).**
2. **Switch the ECM from normal mode to check mode using the tester (Click here).**
3. **Perform a simulation test.**
4. **Check and wiggle the harness(es), connector(s) and terminal(s).**

3. **Perform a simulation test.**
4. **Check and wiggle the harness(es), connector(s) and terminal(s).**

for Preparation Click here

When a malfunction is not confirmed by the DTC check, troubleshooting should be carried out in all circuits considered to be possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential when performing engine troubleshooting.

1.CHECK BATTERY VOLTAGE

NOTICE:

Conduct this check with the engine stopped and engine switch off.

Result

Result	Proceed to
11 V or higher	OK
Below 11 V	NG

NG. → CHARGE OR REPLACE BATTERY

OK ↓

2.CHECK WHETHER ENGINE WILL CRANK

NG. → PROCEED TO PROBLEM SYMPTOMS TABLE

OK ↓

3.CHECK WHETHER ENGINE STARTS

NG. → Go to step 6

OK ↓

4.CHECK AIR FILTER

a. Visually check that the air filter is not excessively contaminated with dirt or oil.

NG. → REPLACE AIR FILTER

OK ↓

5.CHECK IDLING SPEED

NG. → TROUBLESHOOT IDLING SPEED AND PROCEED TO NEXT STEP

OK ↓

6.CHECK FUEL PRESSURE

NG. → TROUBLESHOOT FUEL PRESSURE AND PROCEED TO NEXT STEP

OK

7.CHECK FOR SPARK

NG. → TROUBLESHOOT SPARK AND PROCEED TO NEXT STEP

OK

PROCEED TO PROBLEM SYMPTOMS TABLE

HINT:

Use the table below to help determine the cause of problem symptoms. If multiple suspected areas are listed, the potential causes of the symptoms are listed in order of probability in the "Suspected Area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.

CHECK ECM

a. Measure the voltage according to the value(s) in the table below.

HINT:

The standard normal voltage between each pair of ECM terminals is shown in the table below. The appropriate conditions for checking each pair of terminals are also indicated. The result of checks should be compared with the standard normal voltage for that pair of terminals, displayed in the Specified Condition column. The illustration above can be used as a reference to identify the ECM terminal locations.

Terminal No. (Symbols)	Wiring Color	Terminal Description	Condition	Specified Condition
A38-1 (BATT) - C53-81 (E1)*1 A53-1 (BATT) - C54-81 (E1)*2	L - W-B	Battery (for measuring battery voltage and for ECM memory)	Always	11 to 14 V
C53-41 (+BM) - C53-81 (E1)*1 C54-41 (+BM) - C54-81 (E1)*2	P - W-B	Power source of throttle actuator	Always	11 to 14 V
A38-28 (IGSW) - C53-81 (E1)*1 A53-28 (IGSW) - C54-81 (E1)*2	B - W-B	Engine switch	Engine switch on (IG)	11 to 14 V
A38-3 (+B) - C53-81 (E1)*1 A53-3 (+B) - C54-81 (E1)*2	B - W-B	Power source of ECM	Engine switch on (IG)	11 to 14 V
A38-2 (+B2) - C53-81 (E1)*1 A53-2 (+B2) - C54-81 (E1)*2	B - W-B	Power source of ECM	Engine switch on (IG)	11 to 14 V
C53-58 (OC1+) - C53-57 (OC1-)*1 C54-58 (OC1+) - C54-57 (OC1-)*2	B - B-L	Camshaft oil control valve (OCV) (for Intake Side of Bank 1)	Idling	Pulse generation (See waveform 1)
C53-52 (OC2+) - C53-51 (OC2-)*1 C54-52 (OC2+) - C54-51 (OC2-)*2	L-B - R-B	Camshaft oil control valve (OCV) (for Intake Side of Bank 2)	Idling	Pulse generation (See waveform 1)
C53-56 (OE1+) - C53-55 (OE1-)*1		Camshaft oil control valve (OCV) (for		Pulse generation

C54-56 (OE1+) - C54-55 (OE1-)*2	L-W - L-B	Exhaust Side of Bank 1)	Idling	(See waveform 1)
C53-50 (OE2+) - C53-49 (OE2-)*1 C54-50 (OE2+) - C54-49 (OE2-)*2	L-R - L-B	Camshaft oil control valve (OCV) (for Exhaust Side of Bank 2)	Idling	Pulse generation (See waveform 1)
A38-34 (MREL) - C53-81 (E1)*1 A53-34 (MREL) - C54-81 (E1)*2	W-R - W-B	EFI relay	Engine switch on (IG)	11 to 14 V
C53-74 (VG) - C53-75 (E2G)*1 C54-74 (VG) - C54-75 (E2G)*2	L-Y - G-W	Mass air flow meter	Idling, Shift lever in P or N, A/C switch off	0.5 to 3.0 V
C53-73 (THA) - C53-97 (ETHW)*1 C54-73 (THA) - C54-97 (ETHW)*2	Y-B - BR	Intake air temperature sensor	Idling, Intake air temperature 20°C (68°F)	0.5 to 3.4 V
C53-76 (THW) - C53-98 (ETHA)*1 C54-76 (THW) - C54-98 (ETHA)*2	G-B - BR	Engine coolant temperature sensor	Idling, Engine coolant temperature 80°C (176°F)	0.2 to 1.0 V
C53-80 (VCTA) - C53-79 (ETA)*1 C54-80 (VCTA) - C54-79 (ETA)*2	Y - L	Power source of throttle position sensor (specific voltage)	Engine switch on (IG)	4.5 to 5.5 V
C53-78 (VTA1) - C53-79 (ETA)*1 C54-78 (VTA1) - C54-79 (ETA)*2	R-Y - L	Throttle position sensor (for engine control)	Engine switch on (IG), Throttle valve fully closed	0.5 to 1.2 V
			Engine switch on (IG), Throttle valve fully open	3.2 to 4.8 V
C53-77 (VTA2) - C53-79 (ETA)*1 C54-77 (VTA2) - C54-79 (ETA)*2	Y-B - L	Throttle position sensor (for sensor malfunction detection)	Engine switch on (IG), Throttle valve fully closed	2.1 to 3.1 V
			Engine switch on (IG), Throttle valve fully open	4.5 to 5.5 V
A38-55 (VPA) - A38-58 (EPA)*1 A53-55 (VPA) - A53-58 (EPA)*2	R - W-L	Accelerator pedal position sensor (for engine control)	Engine switch on (IG), Accelerator pedal released	0.5 to 1.1 V
			Engine switch on (IG), Accelerator pedal fully depressed	2.6 to 4.5 V
A38-56 (VPA2) - A38-60 (EPA2)*1 A53-56 (VPA2) - A53-60 (EPA2)*2	GR-G - BR	Accelerator pedal position sensor (for sensor malfunctioning detection)	Engine switch on (IG), Accelerator pedal released	1.2 to 2.0 V
			Engine switch on (IG), Accelerator pedal fully depressed	3.4 to 5.3 V
A38-57 (VCPA) - A38-58 (EPA)*1 A53-57 (VCPA) - A53-58 (EPA)*2	L-W - W-L	Power source of accelerator pedal position sensor (for VPA)	Engine switch on (IG)	4.5 to 5.5 V
A38-59 (VCP2) - A38-60 (EPA2)*1 A53-59 (VCP2) - A53-60 (EPA2)*2	V - BR	Power source of accelerator pedal position sensor (for VPA2)	Engine switch on (IG)	4.5 to 5.5 V
C53-22 (HA1A) - C53-23 (E04)*1 C54-22 (HA1A) - C54-23 (E04)*2	L - W-B	Air Fuel ratio (A/F) sensor heater	Idling	Below 3.0 V
			Engine switch on (IG)	11 to 14 V
C53-20 (HA2A) - C53-21 (E05)*1 C54-20 (HA2A) - C54-21 (E05)*2	G - W-B	A/F sensor heater	Idling	Below 3.0 V
			Engine switch on (IG)	11 to 14 V
C53-126 (A1A+) - C53-81 (E1)*1 C54-126 (A1A+) - C54-81 (E1)*2	G - W-B	A/F sensor	Engine switch on (IG)	3.3 V*3
C53-125 (A1A-) - C53-81 (E1)*1 C54-125 (A1A-) - C54-81 (E1)*2	R - W-B	A/F sensor	Engine switch on (IG)	2.9 V*3
C53-103 (A2A+) - C53-81				

(E1)*1 C54-103 (A2A+) - C54-81 (E1)*2	P - W-B	A/F sensor	Engine switch on (IG)	3.3 V*3
C53-102 (A2A-) - C53-81 (E1)*1 C54-102 (A2A-) - C54-81 (E1)*2	L - W-B	A/F sensor	Engine switch on (IG)	2.9 V*3

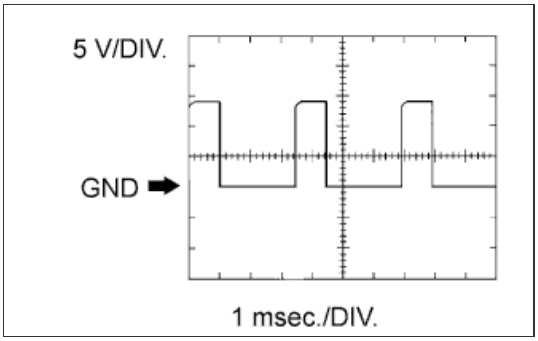
118 (EKN4)*2				
C53-92 (VV1+) - C53-91 (VV1-)*1 C54-92 (VV1+) - C54-91 (VV1-)*2	R - Y	Variable valve timing (VVT) sensor (for Intake Side of Bank 1)	Idling	Pulse generation (See waveform 5)
C53-87 (VV2+) - C53-88 (VV2-)*1 C54-87 (VV2+) - C54-88 (VV2-)*2	R - Y	Variable valve timing (VVT) sensor (for Intake Side for Bank 2)	Idling	Pulse generation (See waveform 5)
C53-69 (EV1+) - C53-68 (EV1-)*1 C54-69 (EV1+) - C54-68 (EV1-)*2	R-L - Y	Variable valve timing (VVT) sensor (for Exhaust Side of Bank 1)	Idling	Pulse generation (See waveform 16)
C53-64 (EV2+) - C53-65 (EV2-)*1 C54-64 (EV2+) - C54-65 (EV2-)*2	R-L - Y	Variable valve timing (VVT) sensor (for Exhaust Side of Bank 2)	Idling	Pulse generation (See waveform 16)
C53-110 (NE+) - C53-111 (NE-)*1 C54-110 (NE+) - C54-111 (NE-)*2	W - G-W	Crankshaft position sensor	Idling	Pulse generation (See waveform 5)
C53-40 (IGT1) - C53-81 (E1)*1 C54-40 (IGT1) - C54-81 (E1)*2	B-Y - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-33 (IGT2) - C53-81 (E1)*1 C54-33 (IGT2) - C54-81 (E1)*2	L-B - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-37 (IGT3) - C53-81 (E1)*1 C54-37 (IGT3) - C54-81 (E1)*2	B - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-34 (IGT4) - C53-81 (E1)*1 C54-34 (IGT4) - C54-81 (E1)*2	L-B - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-35 (IGT5) - C53-81 (E1)*1 C54-35 (IGT5) - C54-81 (E1)*2	G-R - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-36 (IGT6) - C53-81 (E1)*1 C54-36 (IGT6) - C54-81 (E1)*2	G - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-38 (IGT7) - C53-81 (E1)*1 C54-38 (IGT7) - C54-81 (E1)*2	G-W - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-39 (IGT8) - C53-81 (E1)*1 C54-39 (IGT8) - C54-81 (E1)*2	G-B - W-B	Ignition coil (ignition signal)	Idling	Pulse generation (See waveform 6)
C53-104 (IGF1) - C53-81 (E1)*1 C54-104 (IGF1) - C54-81 (E1)*2	G-B - W-B	Ignition coil (ignition confirmation signal)	Engine switch on (IG)	4.5 to 5.5 V
			Idling	Pulse generation (See waveform 6)
C53-105 (IGF2) - C53-81 (E1)*1 C54-105 (IGF2) - C54-81 (E1)*2	R - W-B	Ignition coil (ignition confirmation signal)	Engine switch on (IG)	4.5 to 5.5 V
			Idling	Pulse generation (See waveform 6)
C53-63 (PRG) - C53-81 (E1)*1 C54-63 (PRG) - C54-81 (E1)*2	L-B - W-B	Purge VSV	Engine switch on (IG)	11 to 14 V
			Idling	Pulse generation (See waveform 7)
A38-13 (SPD) - C53-81 (E1)*1 A53-13 (SPD) - C54-81 (E1)*2	V-R - W-B	Speed signal from combination meter	Driving at 20 km/h (12 mph)	Pulse generation (See waveform 8)
A38-46 (STA) - C53-81 (E1)*1				

A53-46 (STA) - C54-81 (E1)*2	R-B - W-B	Starter signal	Cranking	5.5 V or more
C53-120 (NSW) - C53-81 (E1)*1 C54-120 (NSW) - C54-81 (E1)*2	L - W-B	Park/neutral position switch	Engine switch on (IG), Shift lever in other than P and N	11 to 14 V
			Engine switch on (IG), Shift lever in P or N	Below 3.0 V
A38-36 (STP) - C53-81 (E1)*1 A53-36 (STP) - C54-81 (E1)*2	R - W-B	Stop light switch	Brake pedal depressed	7.5 to 14 V
			Brake pedal released	Below 1.5 V
A38-35 (ST1-) - C53-81 (E1)*1 A53-35 (ST1-) - C54-81 (E1)*2	R-W - W-B	Stop light switch (opposite to STP terminal)	Engine switch on (IG), Brake pedal depressed	Below 1.5 V
			Engine switch on (IG), Brake pedal released	7.5 to 14 V
C53-19 (M+) - C53-82 (ME01)*1 C54-19 (M+) - C54-82 (ME01)*2	R - W-B	Throttle actuator	Idling with warm engine	Pulse generation (See waveform 9)
C53-18 (M-) - C53-82 (ME01)*1 C54-18 (M-) - C54-82 (ME01)*2	G - W-B	Throttle actuator	Idling with warm engine	Pulse generation (See waveform 10)
A38-48 (FC) - C53-81 (E1)*1 A53-48 (FC) - C54-81 (E1)*2	L-R - W-B	Fuel pump control	Engine switch on (IG)	11 to 14 V
A38-52 (FPC) - C53-81 (E1)*1 A53-52 (FPC) - C54-81 (E1)*2	W - W-B	Fuel pump control	Engine switch on (IG)	Below 1.5 V
A38-24 (W) - C53-81 (E1)*1 A53-24 (W) - C54-81 (E1)*2	R-Y - W-B	MIL	Engine switch on (IG)	Below 3.0 V
			Idling	11 to 14 V
A38-16 (TC) - C53-81 (E1)*1 A53-16 (TC) - C54-81 (E1)*2	V-W - W-B	Terminal TC of DLC3	Engine switch on (IG)	11 to 14 V
A38-15 (TACH) - C53-81 (E1)*1 A53-15 (TACH) - C54-81 (E1)*2	W-G - W-B	Engine speed	Idling	Pulse generation (See waveform 11)
C53-67 (VCV1) - C53-97 (ETHW)*1 C54-67 (VCV1) - C54-97 (ETHW)*2	L - BR	Power source for sensor (specific voltage)	Engine switch on (IG)	4.5 to 5.5 V
C53-66 (VCV2) - C53-97 (ETHW)*1 C54-66 (VCV2) - C54-97 (ETHW)*2	L - BR	Power source for sensor (specific voltage)	Engine switch on (IG)	4.5 to 5.5 V
C53-32 (ALT) - C53-81 (E1)*1 C54-32 (ALT) - C54-81 (E1)*2	R - W-B	Generator	Engine switch on (IG)	11 to 14 V
A38-10 (CANH) - C53-81 (E1)*1 A53-10 (CANH) - C54-81 (E1)*2	P - W-B	CAN communication line	Engine switch on (IG)	Pulse generation (See waveform 12)
A38-11 (CANL) - C53-81 (E1)*1 A53-11 (CANL) - C54-81 (E1)*2	B - W-B	CAN communication line	Engine switch on (IG)	Pulse generation (See waveform 13)
C53-62 (ACIS) - C53-81 (E1)*1 C54-62 (ACIS) - C54-81 (E1)*2	L-Y - W-B	VSV for ACIS (Acoustic Control Induction System) operation signal	Engine switch on (IG)	11 to 14 V
C53-28 (AIRV) - C53-81 (E1)*1 C54-28 (AIRV) - C54-81 (E1)*2	BR - W-B	Air switching valve for secondary air injection system	Engine switch on (IG)	11 to 14 V



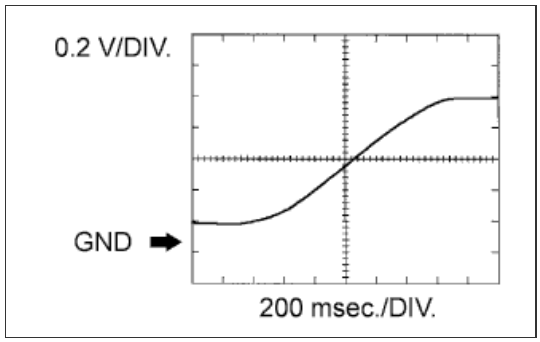
C53-54 (AIRP) - C53-81 (E1)*1 C54-54 (AIRP) - C54-81 (E1)*2	P - W-B	Air pump control	Engine switch on (IG)	11 to 14 V
C53-30 (AIDI) - C53-81 (E1)*1 C54-30 (AIDI) - C54-81 (E1)*2	G - W-B	Diagnostic information signal for secondary air injection system	Secondary air injection system operates	Pulse generation (See waveform 15)
A38-54 (AIP) - C53-98 (ETHA)*1 A53-54 (AIP) - C54-98 (ETHA)*2	P-L - BR	Secondary air injection system pressure signal	Engine switch on (IG)	3.0 to 3.6 V
A38-43 (ARV2) - C53-81 (E1)*1 A53-43 (ARV2) - C54-81 (E1)*2	R-L - W-B	Air switching valve for secondary air injection system	Engine switch on (IG)	11 to 14 V
C53-53 (ARP2) - C53-81 (E1)*1 C54-53 (ARP2) - C54-81 (E1)*2	P-L - W-B	Air pump control	Engine switch on (IG)	11 to 14 V
C53-29 (AID2) - C53-81 (E1)*1 C54-29 (AID2) - C54-81 (E1)*2	G-Y - W-B	Diagnostic information signal for secondary air injection system	Secondary air injection system operates	Pulse generation (See waveform 15)
A38-53 (AIP2) - C53-97 (ETHW)*1 A53-53 (AIP2) - C54-97 (ETHW)*2	LG-B - BR	Secondary air injection system pressure signal	Engine switch on (IG)	3.0 to 3.6 V
C53-90 (G2) - C53- 89 (G2-)*1 C54-90 (G2) - C54- 89 (G2-)*2	G - Y	Camshaft position sensor	Idling	Pulse generation (See waveform 14)
A38-18 (DI) - C53-81 (E1)*1 A53-18 (DI) - C54-81 (E1)*2	G-Y - W-B	Fuel pump control	Engine switch on (IG)	0 to 3.0 V
A38-14 (STSW) - C53-81 (E1)*1 A53-14 (STSW) - C54-81 (E1)*2	R - W-B	Starter switch	Shift lever in P or N, Cranking	6.0 V or more
A38-41 (ACCR) - C53-81 (E1)*1 A53-41 (ACCR) - C54-81 (E1)*2	L-Y - W-B	ACC relay control signal	Engine switch on (IG) → Cranking	11 to 14 V → Below 1 V
C53-16 (STAR) - C53-81 (E1)*1 C54-16 (STAR) - C54-81 (E1)*2	L - W-B	Starter relay control	Engine switch on (IG)	Below 1.5 V
			Cranking	5.5 V or higher
C53-72 (PSP) - C53-81 (E1)*1 C54-72 (PSP) - C54-81 (E1)*2	G - W-B	Power steering oil pressure sensor	Engine switch on (IG)	0.5 to 4.5 V

- *1: for LHD
- *2: for RHD
- *3: The ECM terminal voltage is constant regardless of the output voltage from the sensor.

b. WAVEFORM 1:

Camshaft Oil Control Valve (OCV) (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
C53-58 (OC1+) - C53-57 (OC1-)	5 V/DIV., 1 msec./DIV.	Idling
C53-52 (OC2+) - C53-51 (OC2-)	5 V/DIV., 1 msec./DIV.	Idling
C53-56 (OE1+) - C53-55 (OE1-)	5 V/DIV., 1 msec./DIV.	Idling
C53-50 (OE2+) - C53-49	5 V/DIV., 1	Idling



(OE2-)	msec./DIV.	

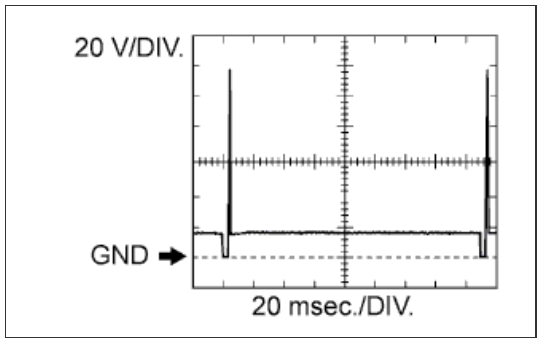
Camshaft Oil Control Valve (OCV) (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
C54-58 (OC1+) - C54-57 (OC1-)	5 V/DIV., 1 msec./DIV.	Idling
C54-52 (OC2+) - C54-51 (OC2-)	5 V/DIV., 1 msec./DIV.	Idling
C54-56 (OE1+) - C54-55 (OE1-)	5 V/DIV., 1 msec./DIV.	Idling
C54-50 (OE2+) - C54-49 (OE2-)	5 V/DIV., 1 msec./DIV.	Idling

c. WAVEFORM 2:

Heated Oxygen Sensor (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
C53-114 (OX1B) - C53-115 (EX1B)	0.2 V/DIV., 200 msec./DIV.	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor
C53-112 (OX2B) - C53-113 (EX2B)	0.2 V/DIV., 200 msec./DIV.	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor



Heated Oxygen Sensor (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
C54-114 (OX1B) - C54-115 (EX1B)	0.2 V/DIV., 200 msec./DIV.	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor
C54-112 (OX2B) - C54-113 (EX2B)	0.2 V/DIV., 200 msec./DIV.	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor

HINT:

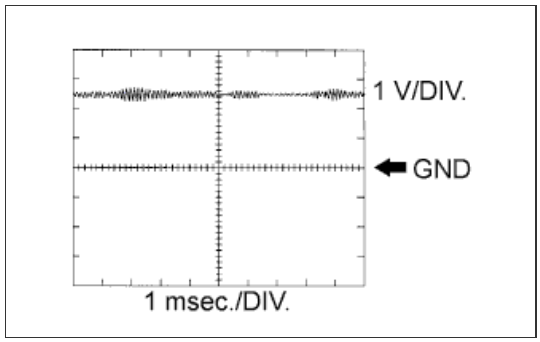
In the Data List, item O2S B1 S2 or O2S B2 S2 shows the ECM input values from the heated oxygen sensor.

d. WAVEFORM 3:

Injector No. 1 (to No. 8) Injection Signal (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
C53-86 (#10) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C53-109 (#20) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C53-85 (#30) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C53-108 (#40) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C53-84 (#50) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C53-107 (#60) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C53-83 (#70) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C53-106 (#80) - C53-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling

Injector No. 1 (to No. 8) Injection Signal (for RHD)



Terminal No. (Symbols)	Tool Setting	Condition
C54-86 (#10) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C54-109 (#20) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling

C54-85 (#30) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C54-108 (#40) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C54-84 (#50) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C54-107 (#60) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C54-83 (#70) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C54-106 (#80) - C54-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling

HINT:

The wavelength becomes shorter as the engine speed increases.

e. WAVEFORM 4:

Knock Sensor (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
C53-94 (KNK1) - C53-93 (EKNK)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
C53-117 (KNK2) - C53-116 (EKN2)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
C53-96 (KNK3) - C53-95 (EKN3)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
C53-119 (KNK4) - C53-118 (EKN4)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine

Knock Sensor (for RHD)

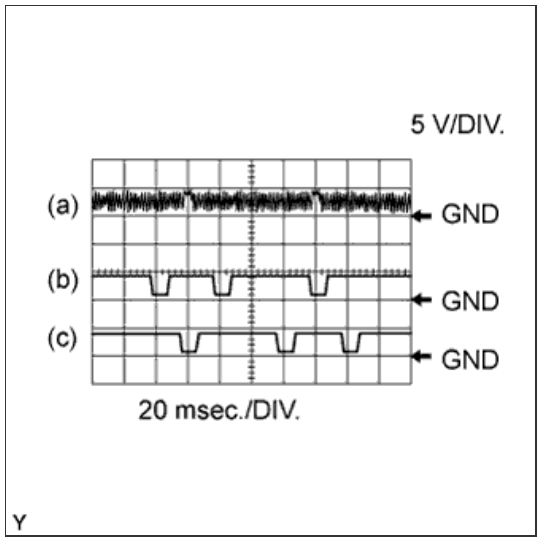
Terminal No. (Symbols)	Tool Setting	Condition
C54-94 (KNK1) - C54-93 (EKNK)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
C54-117 (KNK2) - C54-116 (EKN2)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
C54-96 (KNK3) - C54-95 (EKN3)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
C54-119 (KNK4) - C54-118 (EKN4)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine

HINT:

- **The wavelength becomes shorter as the engine speed increases.**
- **The waveforms and amplitudes displayed differ slightly depending on the vehicle.**

f. WAVEFORM 5:

Crankshaft Position Sensor and VVT Sensor for Intake Side (for LHD)

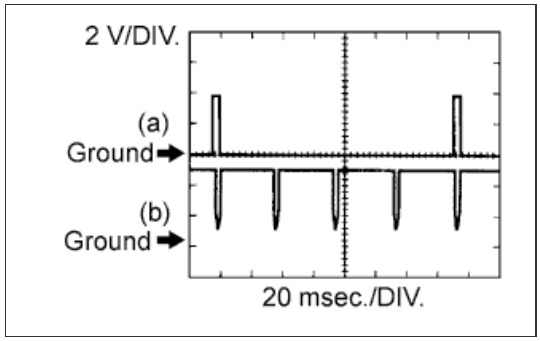


Terminal No. (Symbols)	Tool Setting	Condition
(a) C53-110 (NE+) - C53-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(b) C53-92 (VV1+) - C53-91 (VV1-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(c) C53-87 (VV2+) - C53-88 (VV2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up

Crankshaft Position Sensor and VVT Sensor for Intake Side (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
(a) C54-110 (NE+) - C54-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(b) C54-92 (VV1+) - C54-91 (VV1-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(c) C54-87 (VV2+) - C54-88 (VV2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up

HINT:



The wavelength becomes shorter as engine speed increases.

g. WAVEFORM 6:

Igniter IGT Signal (from ECM to Igniter) and Igniter IGF Signal (from Igniter to ECM) (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
(a) C53-40 (IGT1) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C53-33 (IGT2) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C53-37 (IGT3) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C53-34 (IGT4) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C53-35 (IGT5) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C53-36 (IGT6) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C53-38 (IGT7) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling

Igniter IGT Signal (from ECM to Igniter) and Igniter IGF Signal (from Igniter to ECM) (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
(a) C54-40 (IGT1) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C54-33 (IGT2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C54-37 (IGT3) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C54-34 (IGT4) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C54-35 (IGT5) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C54-36 (IGT6) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C54-38 (IGT7) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C54-39 (IGT8) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(b) C54-104 (IGF1) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(b) C54-105 (IGF2) - C54-81	2 V/DIV., 20	

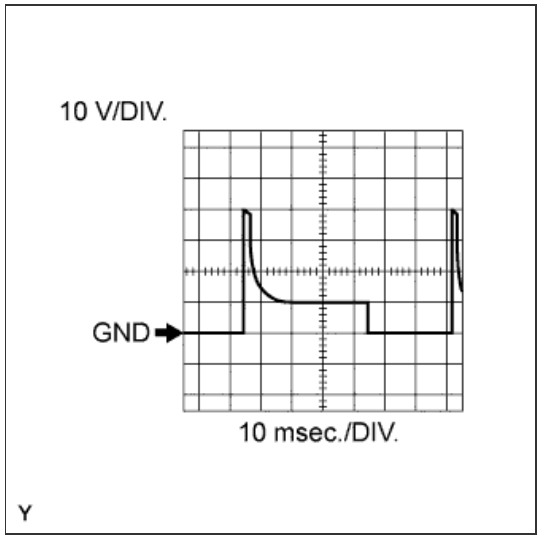
(E1)	msec./DIV.	Idling

HINT:

The wavelength becomes shorter as engine speed increases.

h. WAVEFORM 7:

Purge VSV (for LHD)



Terminal No. (Symbols)	Tool Setting	Condition
C53-63 (PRG) - C53-81 (E1)	10 V/DIV., 10 to 100 msec./DIV.	Idling

Purge VSV (for RHD)

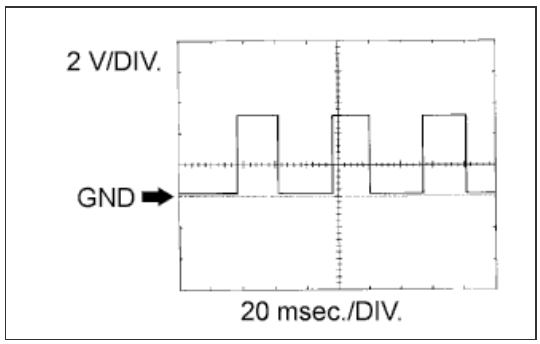
Terminal No. (Symbols)	Tool Setting	Condition
C54-63 (PRG) - C54-81 (E1)	10 V/DIV., 10 to 100 msec./DIV.	Idling

HINT:

If the waveform is not similar to the illustration, check the waveform again after idling for 10 minutes or more.

i. WAVEFORM 8:

Vehicle Speed Signal (for LHD)



Terminal No. (Symbols)	Tool Setting	Condition
A38-13 (SPD) - C53-81 (E1)	2 V/DIV., 20 msec./DIV.	Driving at 20 km/h (12 mph)

Vehicle Speed Signal (for RHD)

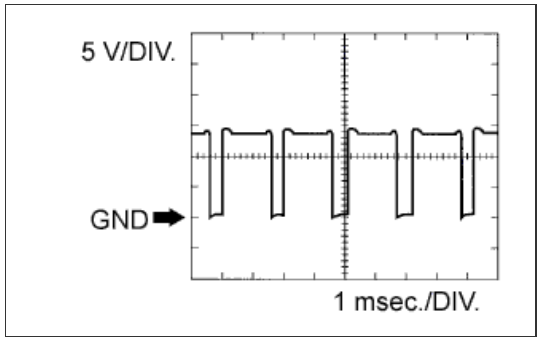
Terminal No. (Symbols)	Tool Setting	Condition
A53-13 (SPD) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Driving at 20 km/h (12 mph)

HINT:

The wavelength becomes shorter as the vehicle speed increases.

j. WAVEFORM 9:

Throttle Actuator Positive Terminal (for LHD)



Terminal No. (Symbols)	Tool Setting	Condition
C53-19 (M+) - C53-82 (ME01)	5 V/DIV., 1 msec./DIV.	Idling with warm engine

Throttle Actuator Positive Terminal (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
C54-19 (M+) - C54-82 (ME01)	5 V/DIV., 1 msec./DIV.	Idling with warm engine

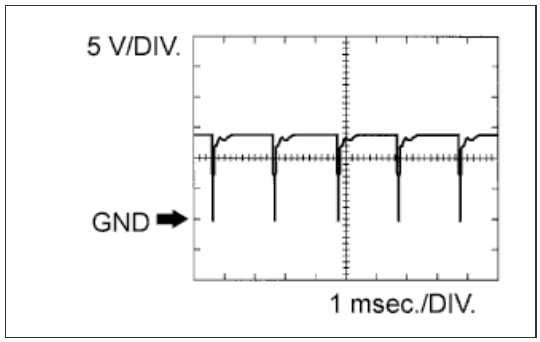
HINT:

The duty ratio varies depending on the throttle actuator operation.

k. WAVEFORM 10:

Throttle Actuator Negative Terminal (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition



C53-18 (M-) - C53-82 (ME01)	5 V/DIV., 1 msec./DIV.	Idling with warm engine

Throttle Actuator Negative Terminal (for RHD)

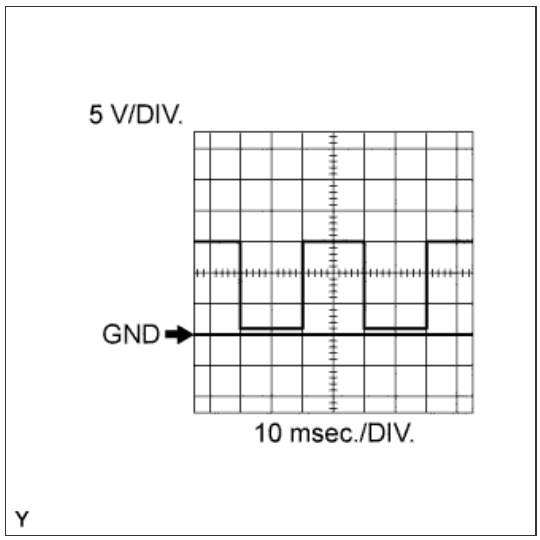
Terminal No. (Symbols)	Tool Setting	Condition
C54-18 (M-) - C54-82 (ME01)	5 V/DIV., 1 msec./DIV.	Idling with warm engine

HINT:

The duty ratio varies depending on the throttle actuator operation.

l. WAVEFORM 11:

Engine Speed Signal (for LHD)



Terminal No. (Symbols)	Tool Setting	Condition
A38-15 (TACH) - C53-81 (E1)	5 V/DIV., 10 msec./DIV.	Idling

Engine Speed Signal (for RHD)

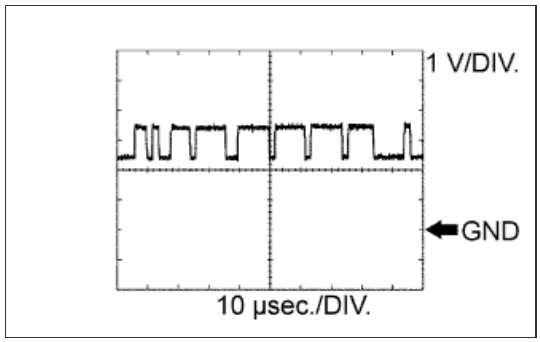
Terminal No. (Symbols)	Tool Setting	Condition
A53-15 (TACH) - C54-81 (E1)	5 V/DIV., 10 msec./DIV.	Idling

HINT:

The wavelength becomes shorter as the engine speed increases.

m. WAVEFORM 12:

CAN Communication Signal (for LHD)



Terminal No. (Symbols)	Tool Setting	Condition
A38-10 (CANH) - C53-81 (E1)	1 V/DIV., 10 µsec./DIV.	Engine stops and engine switch on (IG)

CAN Communication Signal (for RHD)

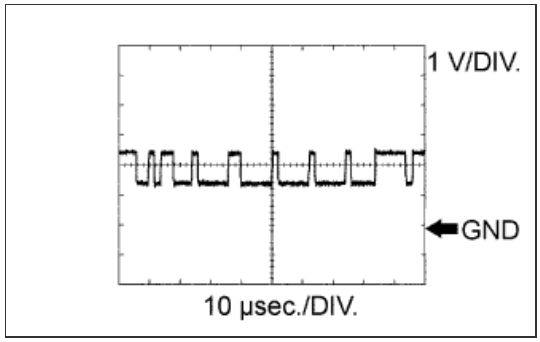
Terminal No. (Symbols)	Tool Setting	Condition
A53-10 (CANH) - C54-81 (E1)	1 V/DIV., 10 µsec./DIV.	Engine stops and engine switch on (IG)

HINT:

The waveform varies depending on the CAN communication signal.

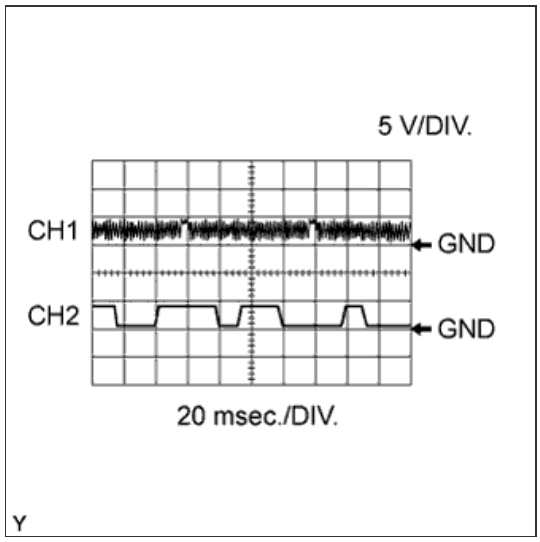
n. WAVEFORM 13:

CAN Communication Signal (for LHD)



Terminal No. (Symbols)	Tool Setting	Condition
A38-11 (CANL) - C53-81 (E1)	1 V/DIV., 10 µsec./DIV.	Engine stops and engine switch on (IG)

CAN Communication Signal (for RHD)



Terminal No. (Symbols)	Tool Setting	Condition
A53-11 (CANL) - C54-81 (E1)	1 V/DIV., 10 µsec./DIV.	Engine stops and engine switch on (IG)

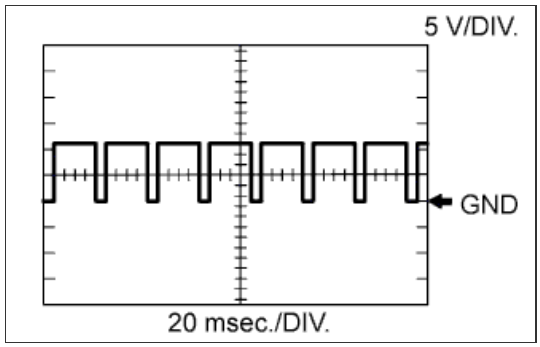
HINT:

The waveform varies depending on the CAN communication signal.

o. WAVEFORM 14:

Crankshaft Position Sensor and Camshaft Position Sensor (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
CH1: C53-110 (NE+) - C53-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
CH2: C53-90 (G2) - C53-89 (G2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up



Crankshaft Position Sensor and Camshaft Position Sensor (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
CH1: C54-110 (NE+) - C54-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
CH2: C54-90 (G2) - C54-89 (G2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up

HINT:

The wavelength becomes shorter as the engine speed increases.

p. WAVEFORM 15:

Terminal DI of Air Injection Control Driver (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
C53-30 (AIDI) - C53-81 (E1)	5 V/DIV., 20 to 40 msec./DIV.	Performing utility using intelligent tester (secondary air injection check)
C53-29 (AID2) - C53-81 (E1)	5 V/DIV., 20 to 40 msec./DIV.	Performing utility using intelligent tester (secondary air injection check)

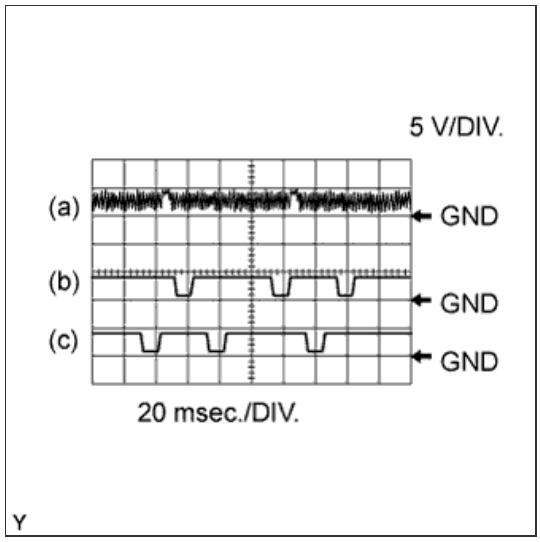
Terminal DI of Air Injection Control Driver (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
C54-30 (AIDI) - C54-81 (E1)	5 V/DIV., 20 to 40 msec./DIV.	Performing utility using intelligent tester (secondary air injection check)
C54-29 (AID2) - C54-81 (E1)	5 V/DIV., 20 to 40 msec./DIV.	Performing utility using intelligent tester (secondary air injection check)

HINT:

The wavelength changes when the air injection control driver detects malfunctions in the secondary air injection system (Click here).

q. WAVEFORM 16:



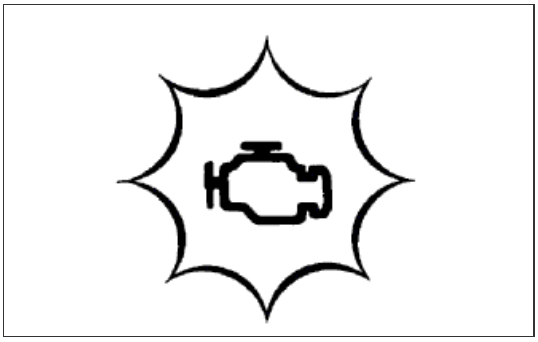
Crankshaft Position Sensor and VVT Sensor for Exhaust Side (for LHD)

Terminal No. (Symbols)	Tool Setting	Condition
(a) C53-110 (NE+) - C53-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(b) C53-69 (EV1+) - C53-68 (EV1-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(c) C53-64 (EV2+) - C53-65 (EV2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up

Crankshaft Position Sensor and VVT Sensor for Exhaust Side (for RHD)

Terminal No. (Symbols)	Tool Setting	Condition
(a) C54-110 (NE+) - C54-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up

(b) C54-69 (EV1+) - C54-68 (EV1-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(c) C54-64 (EV2+) - C54-65 (EV2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up



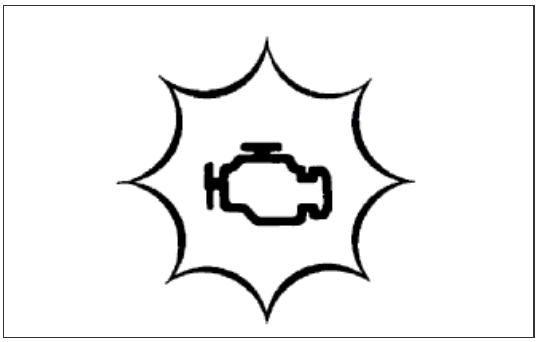
HINT:

The wavelength becomes shorter as engine speed increases.

for Preparation Click here

EURO-OBD (EUROPE)

When troubleshooting Europe On-Board Diagnostic (Euro-OBD) vehicles, the vehicle must be connected to an OBD scan tool (complying with ISO 15765-4). Various data output from the vehicle ECM can then be read.



Euro-OBD regulations require that the on-board computer of the vehicle illuminate the Malfunction Indicator Lamp (MIL) on the instrument panel when the computer detects a malfunction in:

1. The emission control system components
2. The powertrain control components (which affect vehicle emissions)
3. The computer itself

In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by ISO 15765-4 are stored in the ECM memory. If the malfunction does not reoccur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain stored in the ECM memory.

To check the DTCs, connect the intelligent tester to the Data Link Connector 3 (DLC3) of the vehicle. The scan tool displays DTCs, the freeze frame data and a variety of the engine data. The DTCs and freeze frame data can be cleared with the scan tool.

M-OBD (EXCEPT EUROPEAN SPEC.)

When troubleshooting Multiplex On-Board Diagnostic (M-OBD) vehicle, the vehicle must be connected to the intelligent tester. Various data output from the ECM can then be read.
OBD regulations require that the on-board computer of the vehicle illuminate the MIL on the instrument panel when the computer detects a malfunction in:

1. The emission control system components
2. The powertrain control components (which affect vehicle emissions)
3. The computer

In addition, the applicable DTCs are stored in the ECM memory. If the malfunction does not recur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain stored in the ECM memory.

NORMAL MODE AND CHECK MODE

The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic is used to ensure accurate detection of malfunctions. Check mode is also available as an option for technicians. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the ability of the system to detect malfunctions, including intermittent problems (intelligent tester only).

2 TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the next subsequent driving cycle, the MIL is illuminated (2nd trip).

FREEZE FRAME DATA

The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air-fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

BATTERY VOLTAGE

Standard voltage:
11 to 14 V

If voltage is below 11 V, replace or recharge the battery before proceeding.

MIL (Malfunction Indicator Lamp)

a. The MIL is illuminated when the engine switch is first turned on (IG) (the engine is not running).

b. The MIL should turn off when the engine is started. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.

HINT:

If the MIL is not illuminated when the engine switch is first turned on (IG), check the MIL circuit (Click here).

ALL READINESS

HINT:

- **With "All Readiness" it is possible to check whether or not the DTC judgment has been completed by using the intelligent tester.**
- **Check "All Readiness" after simulating malfunction symptoms or for validation after finishing repairs.**

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

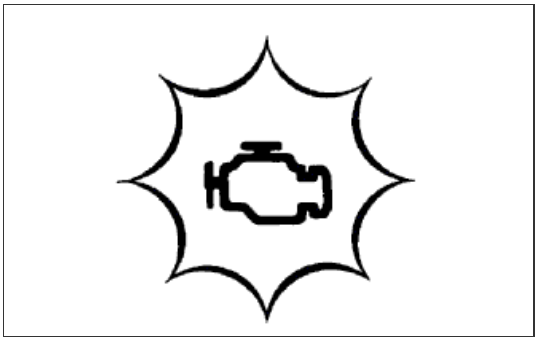
d. Clear the DTCs (Click here).

e. Perform the DTC judgment driving pattern to run the DTC judgment.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

g. Input the DTCs to be confirmed.

h. Check the DTC judgment result.



Result

Tester Display	Description
NORMAL	• DTC judgment completed • System normal
ABNORMAL	• DTC judgment completed • System abnormal
INCOMPLETE	• DTC judgment not completed • Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	• Unable to perform DTC judgment • Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

for Preparation Click here

EURO-OBD (EUROPE)

Result

Tester Display	Description
NORMAL	• DTC judgment completed • System normal
ABNORMAL	• DTC judgment completed • System abnormal
INCOMPLETE	• DTC judgment not completed • Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	• Unable to perform DTC judgment • Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

for Preparation Click here

NOTICE:

When the diagnosis system is changed from the normal mode to check mode or vice versa, all DTCs and freeze frame data recorded in normal mode are cleared. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

- **DTCs which are stored in the ECM can be output to the intelligent tester. The tester can display the current and pending output DTCs.**
- **Same DTCs are not set if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.**

CHECK DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Check the DTC(s) and freeze frame data, and then write them down.

f. Check the details of the DTC(s) (Click here).

CLEAR DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Clear the DTCs.

CLEAR DTC (Without using the intelligent tester)

a. Perform either of the following operations:

i. Disconnect the cable from the negative (-) battery terminal for more than 1 minute.

ii. Remove the EFI MAIN fuse from the engine room relay block located inside the engine compartment for more than 1 minute.

for Preparation Click here

NOTICE:

When the diagnosis system is changed from the normal mode to check mode or vice versa, all DTCs and freeze frame data recorded in normal mode are cleared. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

- **DTCs which are stored in the ECM can be output to the intelligent tester. The tester can display the current and pending output DTCs.**
- **Same DTCs are not set if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.**

CHECK DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Check the DTC(s) and freeze frame data, and then write them down.

f. Check the details of the DTC(s) (Click here).

CLEAR DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Clear the DTCs.

CLEAR DTC (Without using the intelligent tester)

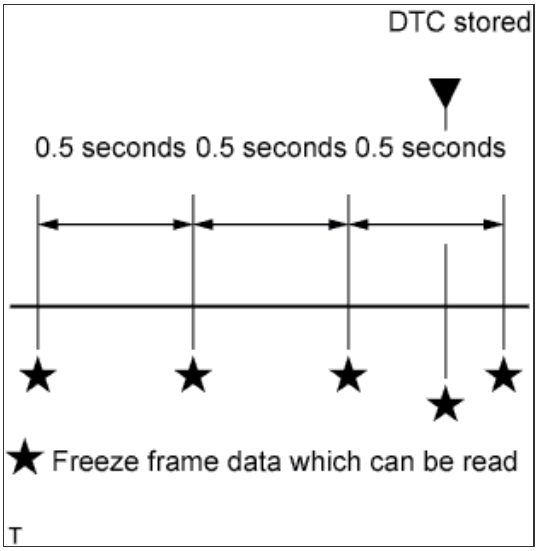
a. Perform either of the following operations:

i. Disconnect the cable from the negative (-) battery terminal for more than 1 minute.

ii. Remove the EFI MAIN fuse from the engine room relay block located inside the engine compartment for more than 1 minute.

for Preparation Click here

DESCRIPTION



Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, it can help determine if the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was Lean or Rich, and other data from the time the malfunction occurred.

HINT:

If it is impossible to duplicate the problem even though a DTC is output, confirm the freeze frame data.

The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the intelligent tester, 5 separate sets of freeze frame data can be checked.

- 3 data sets before the DTC was stored.
- 1 data set when the DTC was stored.
- 1 data set after the DTC was stored.
  These data sets can be used to simulate the condition of the vehicle around the time of the occurrence of the malfunction. The data may assist in identifying the cause of the malfunction, and in judging whether it was temporary or not.

LIST OF FREEZE FRAME DATA

Display Item	Measurement Item	Diagnostic Note
Injector (Port)	Injection period of No. 1 cylinder	-
IGN Advance	Ignition advance	-
Calculate Load	Calculated load	Calculated load by the ECM.
Vehicle Load	Vehicle load	-
MAF	Mass air flow volume	If the mass air flow volume is approximately 0.0 g/sec.: • The mass air flow meter power source circuit is open or shorted. • The VG circuit is open or shorted. If the mass air flow volume is 160.0 g/sec. or more: • The E2G circuit is open.
Engine Speed	Engine speed	-
Vehicle Speed	Vehicle speed	Speed indicated on the speedometer.
Coolant Temp	Engine coolant temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
Intake Air	Intake air temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
2nd Air System Status	Second air system status	-
Air-Fuel Ratio	Ratio compared to stoichiometric level	-
Purge Density Learn Value	Learning value of purge density	-

Evap Purge Flow	Ratio of evaporative purge flow to intake air volume	-
EVAP (Purge) VSV	Purge VSV duty ratio	-
Knock Correct Learn Value	Correction learning value of knocking	-
Knock Feedback Value	Feedback value of knocking	-
Accelerator Position No. 1	Absolute Accelerator Pedal Position (APP) No. 1	-
Accelerator Position No. 2	Absolute APP No. 2	-
Throttle Pos. Sensor Output	Throttle Position Sensor Output	-
Throttle Sensor Position	Throttle sensor positioning	-
Throttle Sensor Position #2	Throttle sensor positioning #2	-
Throttle Motor DUTY	Throttle actuator duty	-
O2S B1 S2 O2S B2 S2	Heated oxygen sensor output	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS B1 S1 AFS B2 S1	A/F sensor output	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS B2 S1	A/F sensor current	-
Total FT #1 Total FT #2	Total fuel trim	-
Short FT #1	Short-term fuel trim	Short-term fuel compensation is used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #1	Long-term fuel trim	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central valve.
Short FT #2	Short-term fuel trim	Short-term fuel compensation is used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #2	Long-term fuel trim	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central valve.
Fuel System Status (Bank 1)	Fuel system status (for Bank 1)	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the air fuel ratio sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the air fuel ratio sensor, which is used for fuel control, is malfunctioning.
Fuel System Status (Bank 2)	Fuel system status (for Bank 2)	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the air fuel ratio sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the air fuel ratio sensor, which is used for fuel control, is malfunctioning.
AF FT B1 S1	Fuel trim at A/F sensor	-
AFS B1 S1	A/F sensor current	-

AF FT B2 S1	Fuel trim at A/F sensor	-
Catalyst Temp (B1 S1) Catalyst Temp (B2 S1)	Estimated catalyst temperature (for Sensor 1)	-
Catalyst Temp (B1 S2) Catalyst Temp (B2 S2)	Estimated catalyst temperature (for Sensor 2)	-
Initial Engine Coolant Temp	Engine coolant temperature at engine start	-
Initial Intake Air Temp	Intake air temperature at engine start	-
Injection Volum (Cylinder 1)	Injection volume	-
Air pump pressure (absolute)	Air pump pressure	-
Air Pump Pulsation Pressure	Air pump pulsation pressure	-
Air Pump2 Pressure (Absolute)	Air pump pressure	-
Air Pump2 Pulsation Pressure	Air pump pulsation pressure	-
Power Steering Pressure	Power steering pressure sensor	-
ACC Relay	ACC relay status	-
Starter Relay	Starter relay status	-
Starter Signal	Starter switch (STSW) signal	-
Starter Control	Starter switch status	-
Power Steering Switch	Power steering switch status	-
Power Steering Signal	Power steering signal (history)	This signal status is usually ON until the cables are disconnected from the battery terminals.
Closed Throttle Position SW	Closed throttle position switch	-
A/C Signal	A/C signal	-
Neutral Position SW Signal	Park/Neutral position (PNP) switch signal	-
Electrical Load Signal	Electrical load signal	-
Stop Light Switch	Stop light switch	-
Immobiliser Communication	Immobiliser communication	-
Fuel Cut Condition	Fuel cut condition	-
Battery Voltage	Battery voltage	-
Atmosphere Pressure	Atmosphere pressure	-
Secondary Air Control VSV	Secondary air injection system status	-
ACIS VSV	VSV for Acoustic Control Induction System (ACIS)	-
ACT VSV	A/C cut status for Active Test	-
VVT Control Status (Bank 2)	VVT control status	-
EVAP Purge VSV	Purge VSV	-
Fuel Pump/Speed Status	Fuel pump/speed status	-
VVT Control Status (Bank 1)	VVT control status	-
TC and TE1	TC and CG (TE1) terminals of DLC3	-
AI Test	Secondary air injection system operation prohibit	-
Engine Speed of Cyl #1	Engine speed for cylinder 1	-
Engine Speed of Cyl #2	Engine speed for cylinder 2	-
Engine Speed of Cyl #3	Engine speed for cylinder 3	-
Engine Speed of Cyl #4	Engine speed for cylinder 4	-
Engine Speed of Cyl #5	Engine speed for cylinder 5	-
Engine Speed of Cyl #6	Engine speed for cylinder 6	-
Engine Speed of Cyl #7	Engine speed for cylinder 7	-
Engine Speed of Cyl #8	Engine speed for cylinder 8	-
Av Engine Speed of All Cyl	Engine speed for all cylinders	-
VVT Aim Angle (Bank 1)	VVT aim angle	-
VVT Change Angle (Bank 1)	VVT change angle	-
VVT OCV Duty (Bank 1)	VVT OCV operation duty	-
VVT Ex Hold Lrn Val (Bank 1)	VVT exhaust hold duty ratio learning value (Bank 1)	-
VVT Ex Chg Angle (Bank 1)	VVT exhaust change angle (Bank 1)	-
VVT Ex OCV Duty (Bank 1)	VVT exhaust OCV duty (Bank 1)	-
VVT Aim Angle (Bank 2)	VVT aim angle	-
VVT Change Angle (Bank 2)	VVT change angle	-

VVT OCV Duty (Bank 2)	VVT OCV operation duty	-
VVT Ex Hold Lrn Val (Bank 2)	VVT exhaust hold duty ratio learning value (Bank 2)	-
VVT Ex Chg Angle (Bank 2)	VVT exhaust change angle (Bank 2)	-
VVT Ex OCV Duty (Bank 2)	VVT exhaust OCV duty (Bank 2)	-
Idle Fuel Cut	Fuel cut idle	ON: when the throttle valve is fully closed and the engine speed is more than 3500 rpm.
FC TAU	Fuel cut during very light load	Fuel cut being performed under a very light load to prevent the engine combustion from becoming incomplete.
Ignition	Ignition counter	-
Cylinder #1 Misfire Count	Cylinder #1 misfire	Only displayed during idling.
Cylinder #2 Misfire Count	Cylinder #2 misfire	Only displayed during idling.
Cylinder #3 Misfire Count	Cylinder #3 misfire	Only displayed during idling.
Cylinder #4 Misfire Count	Cylinder #4 misfire	Only displayed during idling.
Cylinder #5 Misfire Count	Cylinder #5 misfire	Only displayed during idling.
Cylinder #6 Misfire Count	Cylinder #6 misfire	Only displayed during idling.
Cylinder #7 Misfire Count	Cylinder #7 misfire	Only displayed during idling.
Cylinder #8 Misfire Count	Cylinder #8 misfire	Only displayed during idling.
All Cylinders Misfire Count	All cylinders misfire	Only displayed during idling.
Multi Cylinders Misfire Count	Multiple cylinder misfire	-
Misfire RPM	Engine speed when misfire occurred	-
Misfire Load	Engine load when misfire occurred	-
Misfire Margin	Margin to detect engine misfire	-
Catalyst OT MF F/C	Catalyst over temperature misfire prevention F/C	-
Cat OT MF F/C History	Catalyst over temperature misfire prevention F/C history	-

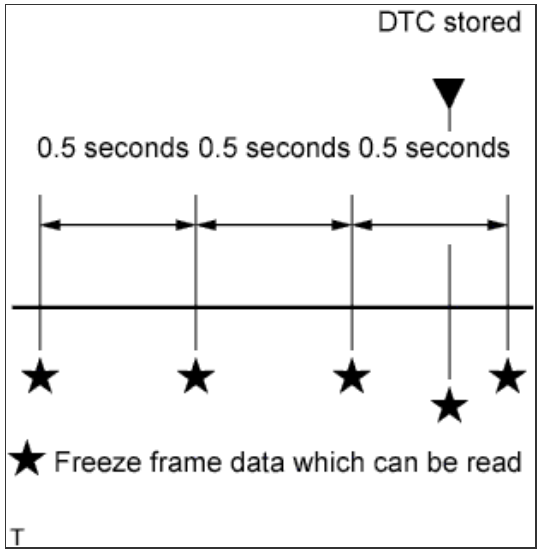
DESCRIPTION



Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, it can help determine if the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

HINT:

If it is impossible to duplicate the problem even though a DTC is stored, confirm the freeze frame data.

The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the intelligent tester, 5 separate sets of freeze frame data can be checked.

- 3 data sets before the DTC was stored.
- 1 data set when the DTC was stored.
- 1 data set after the DTC was stored.
  These data sets can be used to simulate the condition of the vehicle around the time of the occurrence of the malfunction. The data may assist in identifying the cause of the malfunction, and in judging whether it was temporary or not.

LIST OF FREEZE FRAME DATA

LABEL (Tester Display)	Measurement Item	Diagnostic Note
Trouble Code	Trouble code	-
Injector (port)	Injection period of No. 1 cylinder	-
IGN Advance	Ignition advance	-
Calculate Load	Calculated load	The load calculated by the ECM.
Vehicle Load	Vehicle load	-
MAF	Mass air flow volume	If the value is approximately 0.0 g/sec.: • The mass air flow meter power source circuit is open or shorted. • The VG circuit is open or shorted. If the value is 160.0 g/sec. or more: • The E2G circuit is open.
Engine Speed	Engine speed	-
Vehicle Speed	Vehicle speed	The speed indicated on the speedometer.
Coolant Temp	Engine coolant temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
Intake Air	Intake air temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
2nd Air System Status	Second air system status	-
Air-Fuel Ratio	Ratio compared to stoichiometric level	-
Purge Density Learn Value	Learning value of purge density	-

Evap Purge Flow	Ratio of evaporative purge flow to intake air volume	-
EVAP (Purge) VSV	EVAP purge VSV duty ratio	-
Knock Correct Learn Value	Correction learning value of knocking	-
Knock Feedback Value	Feedback value of knocking	-
Accelerator Position No.1	Absolute Accelerator Pedal Position (APP) No. 1	-
Accelerator Position No.2	Absolute APP No. 2	-
Throttle Position	Throttle position	-
Throttle Sensor Position	Throttle sensor positioning	-
Throttle Sensor Position #2	Throttle sensor positioning #2	-
Throttle Motor	Throttle motor	-
O2S B1 S2 O2S B2 S2	Heated oxygen sensor output	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS B1 S1 AFS B2 S1	A/F sensor output	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS B2 S1	A/F sensor current	-
Total FT #1 Total FT #2	Total fuel trim	-
Short FT #1	Short-term fuel trim	Short-term fuel compensation is used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #1	Long-term fuel trim	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Short FT #2	Short-term fuel trim	Short-term fuel compensation is used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #2	Long-term fuel trim	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Fuel System Status (Bank1)	Fuel system status (for Bank 1)	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
Fuel System Status (Bank2)	Fuel system status (for Bank 2)	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
O2FT B1 S2 O2FT B2 S2	Fuel trim at heated oxygen sensor	-
AF FT B1 S1	Fuel trim at A/F sensor	-

AFS B1 S1	A/F sensor current	-
AF FT B2 S1	Fuel trim at A/F sensor	-
Catalyst Temp (B1 S1) Catalyst Temp (B2 S1)	Estimated catalyst temperature (for Sensor 1)	-
Catalyst Temp (B1 S2) Catalyst Temp (B2 S2)	Estimated catalyst temperature (for Sensor 2)	-
Initial Engine Coolant Temp	Engine coolant temperature at engine start	-
Initial Intake Air Temp	Intake air temperature at engine start	-
Injection Volum (Cylinder1)	Injection volume	-
Air pump pressure (absolute)	Air pump pressure	-
Air Pump Pulsation Pressure	Air pump pulsation pressure	-
Power Steering Pressure	Power steering pressure sensor	-
ACC Relay	ACC relay status	-
Starter Relay	Starter relay status	-
Starter Signal	Starter switch (STSW) signal	-
Starter Control	Starter switch status	-
Power Steering Switch	Power steering switch status	-
Power Steering Signal	Power steering signal status	-
Closed Throttle Position SW	Closed throttle position switch	-
A/C Signal	A/C signal	-
Neutral Position SW Signal	Park/Neutral Position (PNP) switch signal	-
Electrical Load Signal	Electrical load signal	-
Stop Light Switch	Stop light switch	-
Immobiliser Communication	Immobiliser communication	-
Fuel Cut Condition	Fuel cut condition	-
Battery Voltage	Battery voltage	-
Atmosphere Pressure	Atmospheric pressure	-
Secondary Air Control VSV	Secondary air injection system status	-
ACIS VSV	VSV for Acoustic Control Induction System (ACIS)	-
ACT VSV	A/C cut status for Active Test	-
VVT Control Status (Bank2)	VVT control status	-
EVAP Purge VSV	EVAP purge VSV	-
Fuel Pump/Speed Status	Fuel pump/speed status	-
VVT Control Status (Bank1)	VVT control status	-
TC and TE1	TC and CG (TE1) terminals of DLC3	-
AI Test	AI test status	-
Engine Speed of Cyl #1	Engine speed during No. 1 cylinder fuel cut	-
Engine Speed of Cyl #2	Engine speed during No. 2 cylinder fuel cut	-
Engine Speed of Cyl #3	Engine speed during No. 3 cylinder fuel cut	-
Engine Speed of Cyl #4	Engine speed during No. 4 cylinder fuel cut	-
Engine Speed of Cyl #5	Engine speed during No. 5 cylinder fuel cut	-
Engine Speed of Cyl #6	Engine speed during No. 6 cylinder fuel cut	-
Engine Speed of Cyl #7	Engine speed during No. 7 cylinder fuel cut	-
Engine Speed of Cyl #8	Engine speed during No. 8 cylinder fuel cut	-
VVT Aim Angle (Bank1)	VVT aim angle	-
VVT Change Angle (Bank1)	VVT change angle	-
VVT OCV Duty (Bank1)	VVT OCV operation duty	-
VVT Aim Angle (Bank2)	VVT aim angle	-
VVT Change Angle (Bank2)	VVT change angle	-
VVT OCV Duty (Bank2)	VVT OCV operation duty	-
Idle Fuel Cut	Fuel cut idle	ON: when the throttle valve is fully closed and the engine speed is more than 3500 rpm.
FC TAU	Fuel cut during very light load	Fuel cut is being performed under a very light load to prevent the engine combustion from becoming incomplete.
Ignition	Ignition counter	-
Cylinder #1 Misfire Count	Cylinder #1 misfire	Only displayed during idling.

Cylinder #2 Misfire Count	Cylinder #2 misfire	Only displayed during idling.
Cylinder #3 Misfire Count	Cylinder #3 misfire	Only displayed during idling.
Cylinder #4 Misfire Count	Cylinder #4 misfire	Only displayed during idling.
Cylinder #5 Misfire Count	Cylinder #5 misfire	Only displayed during idling.
Cylinder #6 Misfire Count	Cylinder #6 misfire	Only displayed during idling.
Cylinder #7 Misfire Count	Cylinder #7 misfire	Only displayed during idling.
Cylinder #8 Misfire Count	Cylinder #8 misfire	Only displayed during idling.
All Cylinders Misfire Count	All cylinders misfire	Only displayed during idling.
Multi Cylinders Misfire Count	Multiple cylinder misfire	-
Misfire RPM	Engine speed when misfire occurred	-
Misfire Load	Engine load when misfire occurred	-
Misfire Margin	Margin to detect engine misfire	-
Engine Run Time	Accumulated engine running time	-
Time after DTC Cleared	Cumulative time after DTC cleared	-
Distance from DTC Cleared	Accumulated distance from DTC cleared	-
Warmup Cycle Cleared DTC	Warm-up cycle after DTC cleared	-

HINT:

Intelligent tester:

Compared to the normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect the malfunctions that cannot be detected in normal mode.

NOTICE:

All the stored DTCs and freeze frame data are cleared if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the engine switch is turned from on (IG) to on (ACC) or off while in check mode. Before changing modes, always check and note any DTCs and freeze frame data.

CHECK MODE PROCEDURE

a. Check and ensure the following conditions:

   i. Battery positive voltage 11 V or higher.

   ii. Throttle valve fully closed.

   iii. Transmission in the P or N position.

   iv. A/C switch off.

b. Turn the engine switch off.

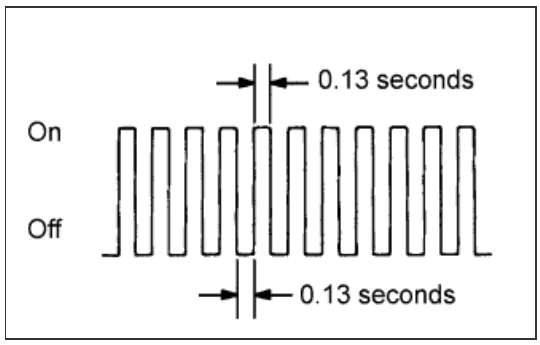
c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / Check Mode.

g. Switch the ECM from normal mode to check mode.



h. Make sure the MIL flashes as shown in the illustration.

i. Start the engine.

j. Make sure the MIL turns off.

k. Simulate the conditions of the malfunction described by the customer.

l. Check the DTCs and freeze frame data using the tester.

for Preparation Click here

If any of the following DTCs are stored, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily.

DTC	Component	Fail-Safe Operation	Fail-Safe Deactivation Condition
P0011, P0021, P0015 and P0025*3	Camshaft oil control valve (OCV)	When a misfire occurs, fuel cut is performed for catalyst overheat malfunction prevention. • With a normal load and normal engine speed (MIL is blinking): - Fuel cut is performed on the malfunctioning cylinder. • With a high load and high engine speed driving (MIL is blinking): - Throttle valve opening angle control is performed. - Fuel cut is performed on all cylinders or the malfunction cylinder.	Pass condition detected and then engine switch turned off
P0031, P0032, P0051 and P0052	Air Fuel ratio (A/F) Sensor Heater	The ECM turns off the A/F sensor heater.	Engine switch off
P0037, P0038, P0057 and P0058	Heated Oxygen (HO2) Sensor Heater	The ECM turns off the HO2 sensor heater.	Engine switch off
P0102 and P0103	Mass Air Flow (MAF) Meter	The ECM calculates ignition timing according to the engine speed and throttle valve position.	Pass condition detected
P0110, P0112 and P0113	Intake Air Temperature (IAT) Sensor	The ECM estimates the IAT to be 20°C (68°F).	Pass condition detected
P0115, P0117 and P0118	Engine Coolant Temperature (ECT) Sensor	The ECM estimates the ECT to be 80°C (176°F).	Pass condition detected
P0120, P0121, P0122, P0123, P0220, P0222, P0223, P0604, P0606, P060A, P060B, P060D, P060E, P0657, P2102, P2103, P2111, P2112, P2118, P2119 and P2135	Electronic Throttle Control System (ETCS)	The ECM cuts off throttle actuator current and the throttle valve is returned to a 7° throttle position by the return spring. The ECM then adjusts the engine output by controlling fuel injection (intermittent fuel cut) and ignition timing in accordance with the accelerator pedal opening angle to allow the vehicle to continue at minimal speed*1.	Pass condition detected and then engine switch turned off
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308*2	• Fuel injector • Electronic Throttle Control System (ETCS)	When a misfire occurs, fuel cut is performed for catalyst overheat malfunction prevention. • With a normal load and normal engine speed (MIL is blinking): - Fuel cut is performed on the malfunctioning cylinder. • With a high load and high engine speed driving (MIL is blinking): - Throttle valve opening angle control is performed. - Fuel cut is performed on all cylinders or the malfunction cylinder.	Pass condition detected and then engine switch turned off
P0327, P0328, P032C, P032D, P0332, P0333, P033C and P033D	Knock Sensor	The ECM sets the ignition timing to maximum retard.	Engine switch off

P0351 to P0358	Ignition Coil	The ECM cuts fuel.	Pass condition detected
P0504	Stop Light Switch	The accelerator pedal angle is fixed.	Accelerator pedal angle is fixed
P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138	Accelerator Pedal Position (APP) Sensor	The APP sensor has 2 sensor circuits: Main and Sub. If either circuit malfunctions, the ECM controls the engine using the other circuit. If both circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.	Pass condition detected and then engine switch turned off
P2432, P2433, P2437 and P2438	Secondary Air Injection System	Throttle valve opening angle control is performed.	Pass condition detected
P2440 and P2442	Secondary Air Injection System	Throttle valve opening angle control is performed.	Pass condition detected
P2445 and P2447	Secondary Air Injection System	Throttle valve opening angle control is performed.	Pass condition detected

HINT:

- ***1: The vehicle can be driven slowly when the accelerator pedal is depressed firmly and slowly. If the accelerator pedal is depressed quickly, the vehicle may speed up and slow down erratically.**
- ***2: Misfire related fail-safe operations occur when catalyst overheat malfunctions occur.**
- ***3: Only for M-OBD.**

DATA LIST

HINT:

Using the intelligent tester to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. This non-intrusive inspection can be very useful because intermittent conditions or signals may be discovered before parts or wiring is disturbed. Reading the Data List information early in troubleshooting is one way to save diagnostic time.

NOTICE:

In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

a. Warm up the engine.

b. Turn the engine switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data.

g. According to the display on the tester, read the Data List.

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
Injector (Port)	Injection period of the No. 1 cylinder/ Min.: 0 ms, Max.: 32.64 ms	2.0 to 4.0 ms: idling	-
IGN Advance	Ignition timing advance for No. 1 cylinder/ Min.: -64 deg., Max.: 63.5 deg.	BTDC 5 to 15°: Idling	-
Calculate Load	Calculated load by ECM/ Min.: 0%, Max.: 100%	• 11 to 25%: Idling • 12 to 26%: Running without load (2500 rpm)	-
Vehicle Load	Vehicle load/ Min.: 0%, Max.: 25700%	Actual vehicle load	-
MAF	Air flow rate from Mass Air Flow (MAF) meter/ Min.: 0 g/sec., Max.: 655 g/sec.	4.0 to 8.0 g/sec.: Idling	If the mass air flow volume is approximately 0.0 g/sec.: • The mass air flow meter power source circuit is open or shorted. • The VG circuit is open or shorted. If the mass air flow volume is 160.0 g/sec. or more: • The E2G circuit is open.
Engine Speed	Engine speed/ Min.: 0 rpm, Max.: 16383 rpm	650 to 750 rpm: Idling	-
Vehicle Speed	Vehicle speed/ Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	The speed is indicated on the speedometer.
Coolant Temp	Engine coolant temperature/ Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	If the value is -40°C (-40°F): the sensor circuit is open. If the value is 140°C (284°F): the sensor circuit is shorted.
Intake Air	Intake air temperature/ Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	If the value is -40°C (-40°F): the sensor circuit is open. If the value is 140°C (284°F): the sensor circuit is shorted.
2nd Air System Status	Secondary air system status/ ON or OFF	ON: Secondary air system operation	-

Air-Fuel Ratio	Air-fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: During idling	-
Purge Density Learn Value	Learning value of purge density/ Min.: -50, Max.: 350	Idling: -40 to 0%	The service data.
Evap Purge Flow	Purge flow/ Min.: 0%, Max.: 102.4%	0 to 100%: Idling	-
EVAP (Purge) VSV	Purge VSV control duty/ Min.: 0%, Max.: 100%	0 to 100%: During idling	The order signal from the ECM.
Knock Correct Learn Value	Correction learning value of knocking/ Min.: -64 CA, Max.: 1984 CA	0 to 22° CA: Driving, 70 km/h (44 mph)	The service data.
Knock Feedback Value	Feedback value of knocking/ Min.: -64 CA, Max.: 1984 CA	-22 to 0° CA: Driving, 70 km/h (44 mph)	The service data.
Clutch Current	Clutch current/ Min.: 0 A, Max.: 2.49 A	-	-
Accelerator Position No. 1	Absolute Accelerator Pedal Position (APP) No. 1/ Min.: 0%, Max.: 100%	10 to 22%: accelerator pedal released 54 to 86%: accelerator pedal fully depressed	-
Accelerator Position No. 2	Absolute APP No. 2/ Min.: 0%, Max.: 100%	12 to 42%: accelerator pedal released 66 to 98%: accelerator pedal fully depressed	-
Accelerator Position No. 1	APP sensor No. 1 voltage/ Min.: 0 V, Max.: 4.98 V	-	The ETCS freeze data.
Accelerator Position No. 2	APP sensor No. 2 voltage/ Min.: 0 V, Max.: 4.98 V	-	The ETCS freeze data.
Accelerator Position No. 1	APP sensor No. 1 voltage/ Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: accelerator pedal released 2.6 to 4.5 V: accelerator pedal fully depressed	-
Accelerator Position No. 2	APP sensor No. 2 voltage/ Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: accelerator pedal released 3.4 to 5.3 V: accelerator pedal fully depressed	-
Accelerator Idle Position	Whether or not accelerator pedal position sensor detecting idle/ ON or OFF	ON: Idling	-
Throttle Fully Close Learn	Throttle valve fully closed (learned value) Min.: 0 V, Max.: 5 V	0.4 to 0.8 V	-
Accel Fully Close #1 (AD)	Accelerator fully closed value No. 1 (AD)/ Min.: 0, Max.: 4.98 V	-	The ETCS service data.
Accel Fully Close Learn #1	Accelerator fully closed learning value No. 1/ Min.: 0, Max.: 124.512	-	The ETCS service data.
Accel Fully Close Learn #2	Accelerator fully closed learning value No. 2/ Min.: 0, Max.: 124.512	-	The ETCS service data.
Fail Safe Drive	Whether or not fail-safe function executed/ ON or OFF	ON: ETCS has failed	-
Fail Safe Drive (Main CPU)	Whether or not fail-safe function executed/ ON or OFF	ON: ETCS has failed	-
ST1	Brake pedal signal/ ON or OFF	ON: Brake pedal depressed	-
System Guard	System guard/ ON or OFF	-	The ETCS service data.
Open Side Malfunction	Open side malfunction/ ON or OFF	-	The ETCS service data.
Throttle Pos. Sensor Output	Absolute throttle position sensor/ Min.: 0%, Max.: 100%	• 10 to 24%: Throttle fully closed • 64 to 96%: Throttle fully open	Read the value with intrusive operation (Active Test).
Throttle Idle Position	Whether or not throttle position sensor detecting idle/	ON: Idling	-

	ON or OFF		
Throttle Require Position	Throttle requirement position/ Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	-
Throttle Sensor Position	Throttle sensor positioning/ Min.: 0%, Max.: 100%	10 to 18%: Idling	The calculated value based on VTA1.
Throttle Sensor Position #2	Throttle sensor positioning #2/ Min.: 0%, Max.: 100%	-	The calculated value based on VTA2.
Throttle Position No. 1	Throttle position sensor No. 1 output voltage/ Min.: 0 V, Max.: 4.9 V	-	The ETCS freeze data.
Throttle Position No. 2	Throttle position sensor No. 2 output voltage/ Min.: 0 V, Max.: 4.9 V	-	The ETCS freeze data.
Throttle Position No. 1	Throttle position No. 1/ Min.: 0 V, Max.: 5 V	• 0.5 to 1.2 V: Throttle fully closed • 3.2 to 4.8 V: Throttle fully open	-
Throttle Position No. 2	Throttle position No. 2/ Min.: 0 V, Max.: 5 V	• 2.0 to 2.9 V: Throttle fully closed • 4.6 to 5.5 V: Throttle fully open	Read the value with intrusive operation (Active Test).
Throttle Position Command	Throttle position command value/ Min.: 0 V, Max.: 4.98 V	0.5 to 4.8 V	The ETCS service data.
Throttle Sens Open Pos #1	Throttle sensor opener position No. 1/ Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	The ETCS service data.
Throttle Sens Open Pos #2	Throttle sensor opener position No. 2/ Min.: 0 V, Max.: 4.98 V	2.2 to 2.6 V	The ETCS service data.
Throttle Sens Open #1(AD)	Throttle sensor opener position No. 1 (AD)/ Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	The ETCS service data.
Throttle Motor	Whether or not throttle actuator control permitted/ ON or OFF	ON: Idling	Read the value with the engine switch on (IG) (do not start the engine).
Throttle Motor Current	Throttle actuator current/ Min.: 0 A, Max.: 20 A	0 to 3.0 A: Idling	-
Throttle Motor DUTY	Throttle actuator duty/ Min.: 0%, Max.: 100%	0.5 to 40%: Idling	-
Throttle Motor Current	Throttle actuator current/ Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-
Throttle Motor Open Duty	Throttle actuator opening duty ratio/ Min.: 0%, Max.: 100%	0 to 40%: During idling	When the accelerator pedal is depressed, the duty ratio increased.
Throttle Motor Close Duty	Throttle actuator closed duty ratio/ Min.: 0%, Max.: 100%	0 to 40%: During idling	When the accelerator pedal is released quickly, the duty ratio increased.
Throttle Motor Duty (Open)	Throttle actuator duty ratio (open)/ Min.: 0%, Max.: 100%	-	The ETCS service data.
Throttle Motor Duty (Close)	Throttle actuator duty ratio (close)/ Min.: 0%, Max.: 100%	-	The ETCS service data.
O2S B1 S2	Heated oxygen sensor output voltage (for Bank 1 Sensor 2)/ Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
O2S B2 S2	Heated oxygen sensor output voltage (for Bank 2 Sensor 2)/ Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
AFS B1 S1	Air fuel ratio sensor output voltage (for Bank 1 Sensor 1)/ Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.

AFS B2 S1	Air fuel ratio sensor output voltage (for Bank 2 Sensor 1)/ Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
AFS B2 S1	Air fuel ratio sensor current (for Bank 2 Sensor 1)/ Min.: -128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output current of the sensor.
Total FT #1	Total fuel trim of bank 1 Average value for fuel trim system of Bank 1/ Min.: -0.5, Max.: 0.496	-0.2 to 0.2: Idling	-
Total FT #2	Total fuel trim of bank 2 Average value for fuel trim system of Bank 2/ Min.: -0.5, Max.: 0.496	-0.2 to 0.2: Idling	-
Short FT #1	Short-term fuel trim of Bank 1/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the short-term fuel compensation used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #1	Long-term fuel trim of Bank 1/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the overall fuel compensation carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Short FT #2	Short-term fuel trim of Bank 2/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the short-term fuel compensation used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #2	Long-term fuel trim of Bank 2/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the overall fuel compensation carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Fuel System Status (Bank 1)	Fuel system status (Bank 1)/ OL, CL, OLDrive, OLFault or CLFault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
Fuel System Status (Bank 2)	Fuel system status (Bank 2)/ OL, CL, OLDrive, OLFault or CLFault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel

			enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
AF FT B1 S1	Short-term fuel trim associated with the Bank 1 Sensor 1/ Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) = Rich • Stoichiometric air-fuel ratio = 1 • Value more than 1 (1.001 to 1.999) = Lean	-
AFS B1 S1	Air fuel ratio sensor current Bank 1 Sensor 1/ Min.: -128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output current of the sensor.
AF FT B2 S1	Short-term fuel trim associated with the Bank 2 Sensor 1/ Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) = Rich • Stoichiometric air-fuel ratio = 1 • Value more than 1 (1.001 to 1.999) = Lean	-
Catalyst Temp (B1 S1)	Catalyst temperature (Bank 1, Sensor 1)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp (B2 S1)	Catalyst temperature (Bank 2, Sensor 1)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp (B1 S2)	Catalyst temperature (Bank 1, Sensor 2)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp (B2 S2)	Catalyst temperature (Bank 2, Sensor 2)/ Min.: -40°C, Max.: 6513.5°C	-	-
Initial Engine Coolant Temp	Initial engine coolant temperature/ Min.: -40°C, Max.: 120°C	Close to ambient air temperature	The service data.
Initial Intake Air Temp	Initial intake air temperature/ Min.: -40°C, Max.: 120°C	Close to ambient air temperature	The service data.
Injection Volum (Cylinder 1)	Injection volume (cylinder 1)/ Min.: 0 ml, Max.: 2.048 ml	0 to 0.5 ml	The quantity of fuel injection volume for 10 times.
Air pump pressure (absolute)	Air pump pressure (absolute)/ Min.: 0 kPa, Max.: 320 kPa	Atmospheric pressure +1 kPa or more: Air pump ON, Air switching valve open Close to atmospheric pressure: Air pump OFF, Air switching valve closed	Refer to DTC P2431 (Click here).
Air Pump Pulsation Pressure	Air pump pulsation pressure/ Min.: 0 kPa, Max.: 639.9 kPa	-	The cumulative pulsation pressure calculated by the ECM. (Click here).
Air Pump2 Pressure (Absolute)	Air pump pressure (absolute)/ Min.: 0 kPa, Max.: 320 kPa	Atmospheric pressure +1 kPa or more: Air pump ON, Air switching valve open Close to atmospheric pressure: Air pump OFF, Air switching valve closed	Refer to DTC P2431 (Click here).
Air Pump2 Pulsation Pressure	Air pump pulsation pressure/ Min.: 0 kPa, Max.: 639.9 kPa	-	The cumulative pulsation pressure calculated by the ECM. (Click here).
Power Steering Pressure	Power steering oil pressure/ Min.: -1.897 MPa, Max.: 12.799 MPa	-	-
	Acc relay status/		

ACC Relay	ON or OFF	ON: Cranking	-
Starter Relay	Starter relay status/ ON or OFF	ON: Cranking	-
Starter Signal	Starter signal/ ON or OFF	ON: Cranking	-
Starter Control	Starter switch status/ ON or OFF	ON: Cranking	-
Power Steering Switch	Power steering switch signal/ ON or OFF	ON: Power steering operation	-
Power Steering Signal	Power steering signal (history)/ ON or OFF	ON: When steering wheel first turned after battery terminals connected	This signal status is usually ON until the cables are disconnected from the battery terminals.
Closed Throttle Position SW	Closed throttle position switch/ ON or OFF	• ON: Throttle fully closed • OFF: Throttle open	-
A/C Signal	A/C switch status/ ON or OFF	ON: A/C ON	-
Neutral Position SW Signal	PNP switch status/ ON or OFF	ON: Shift lever in P or N	-
Electrical Load Signal	Electrical load signal/ ON or OFF	ON: Headlights or defogger turned on	-
Stop Light Switch	Stop light switch/ ON or OFF	ON: Brake pedal depressed	-
Immobiliser Communication	Immobiliser communication/ ON or OFF	ON: Normal	-
Fuel Cut Condition	Fuel cut condition/ ON or OFF	ON: Fuel cut operating	-
ETCS Actuator Power	Whether or not electric throttle control system power inputted/ ON or OFF	ON: Idling	-
+BM Voltage	+BM voltage/ Min.: 0, Max.: 19.92	10 to 15 V: Idling	The ETCS service data.
Battery Voltage	Battery voltage/ Min.: 0 V, Max.: 65.535 V	11 to 14 V: Idling	-
Actuator Power Supply	Actuator power supply/ ON or OFF	ON: Idling	The ETCS service data.
Atmosphere Pressure	Atmospheric pressure/ Min.: 0 kPa, Max.: 150 kPa	Equivalent to atmospheric pressure (absolute pressure)	-
Secondary Air Control VSV	Secondary air injection system status	ON: Secondary air injection system operation	-
ACIS VSV	VSV status for ACIS control/ ON or OFF	-	The Active Test support data.
ACT VSV	A/C cut status for Active Test/ ON or OFF	-	The Active Test support data.
VVT Control Status (Bank 2)	VVT control status (Bank 2)/ ON or OFF	-	The Active Test support data.
EVAP Purge VSV	VSV status for EVAP control/ ON or OFF	-	The Active Test support data.
Fuel Pump/Speed Status	Fuel pump/speed status/ ON or OFF	-	The Active Test support data.
VVT Control Status (Bank 1)	Variable valve timing (VVT) control status (Bank 1)/ ON or OFF	-	The Active Test support data.
TC and TE1	TC and TE1 terminal of DLC3/ ON or OFF	-	-
AI Test	AI operation prohibition/ OK or NG	OK	-
Engine Speed of Cyl #1	Engine speed for cylinder 1/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #2	Engine speed for cylinder 2/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #3	Engine speed for cylinder 3/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.

Engine Speed of Cyl #4	Engine speed for cylinder 4/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #5	Engine speed for cylinder 5/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #6	Engine speed for cylinder 6/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #7	Engine speed for cylinder 7/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #8	Engine speed for cylinder 8/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Av Engine Speed of All Cyl	Engine speed for all cylinders/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
VVT Aim Angle (Bank 1)*	VVT aim angle (Bank 1)/ Min.: 0%, Max.: 100%	0%: Idling	The VVT duty signal value during intrusive operation.
VVT Change Angle (Bank 1)*	VVT change angle (Bank 1)/ Min.: 0° FR, Max.: 60° FR	0 to 5° FR: Idling	The displacement angle during intrusive operation.
VVT OCV Duty (Bank 1)*	VVT OCV operation duty (Bank 1)/ Min.: 0%, Max.: 100%	0%: Idling	The requested duty value for intrusive operation.
VVT EX Hold Lrn Val (Bank 1)*	VVT exhaust hold duty ratio learning value (Bank 1)/ Min.: 0%, Max.: 100%	0 to 80%: Idling	-
VVT EX Chg Angle (Bank 1)*	VVT exhaust change angle (Bank 1)/ Min.: 0°FR, Max.: 60°FR	0 to 40°FR: Idling	The displacement angle during intrusive operation.
VVT EX OCV Duty (Bank 1)*	VVT exhaust OCV duty (Bank 1)/ Min.: 0%, Max.: 100%	0 to 100%: Idling	The requested duty value for intrusive operation.
VVT Aim Angle (Bank 2)*	VVT aim angle (Bank 2)/ Min.: 0%, Max.: 100%	0%: Idling	The VVT duty signal value during intrusive operation.
VVT Change Angle (Bank 2)*	VVT change angle (Bank 2)/ Min.: 0° FR, Max.: 60° FR	0 to 5° FR: Idling	The displacement angle during intrusive operation.
VVT OCV Duty (Bank 2)*	VVT OCV operation duty (Bank 2)/ Min.: 0%, Max.: 100%	0%: Idling	The requested duty value for intrusive operation.
VVT EX Hold Lrn Val (Bank 2)*	VVT exhaust hold duty ratio learning value (Bank 2)/ Min.: 0%, Max.: 100%	0 to 80%: Idling	-
VVT EX Chg Angle (Bank 2)*	VVT exhaust change angle (Bank 2)/ Min.: 0°FR, Max.: 60°FR	0 to 40°FR: Idling	The displacement angle during intrusive operation.
VVT EX OCV Duty (Bank 2)*	VVT exhaust OCV duty (Bank 2)/ Min.: 0%, Max.: 100%	0 to 100%: Idling	The requested duty value for intrusive operation.
Idle Fuel Cut	Fuel cut idle/ ON or OFF	ON: Fuel cut operation	Idle Fuel Cut is "ON" when the throttle valve is fully closed and the engine speed is more than 2800 rpm.
FC TAU	Fuel cut TAU: Fuel cut during very light load/ ON or OFF	ON: Fuel cut operation	The fuel cut being performed under a very light load to prevent the engine combustion from becoming incomplete.
Ignition	Ignition counter/ Min.: 0, Max.: 800	0 to 800	-
Cylinder #1 Misfire Count to Cylinder #8 Misfire Count	Misfire count of the cylinder 1 to 8/ Min.: 0, Max.: 255	0%	This item is displayed only when idling the engine.
All Cylinders Misfire Count	All cylinders misfire count/ Min.: 0, Max.: 255	0 to 35	-
Multi Cylinders Misfire Count	Multiple cylinder misfire count/ Min.: 0 Max.:65535	0 to 65,535	-

Misfire RPM	Engine speed for first misfire range/ Min.: 0 rpm, Max.: 6375 rpm	0 rpm: Misfire 0	-
Misfire Load	Engine load for first misfire range/ Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	-
Misfire Margin	Misfire monitoring/ Min.: -100%, Max.: 99.22%	-100 to 99.2%	The misfire detecting margin.
Catalyst OT MF F/C	Catalyst over temperature misfire prevention F/C/ Not Avl or Avail	Avail: Cat OT MF F/C available Not Avl: Cat OT MF F/C not available	-
Cat OT MF F/C History	Catalyst over temperature misfire prevention F/C history/ OFF or ON	ON: Fuel cut operation history exists	-
Cat OT MF F/C Cylinder #1	Display of fuel cut operation in No. 1 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #2	Display of fuel cut operation in No. 2 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #3	Display of fuel cut operation in No. 3 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #4	Display of fuel cut operation in No. 4 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #5	Display of fuel cut operation in No. 5 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #6	Display of fuel cut operation in No. 6 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #7	Display of fuel cut operation in No. 7 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #8	Display of fuel cut operation in No. 8 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
# Codes	#Codes/ Min.: 0, Max.: 255	-	The number of stored DTCs.
Check Mode	Check mode/ ON or OFF	ON: Check mode ON	Refer to the Check Mode Procedure (Click here).
SPD Test	Check mode result for vehicle speed sensor/ Compl or Incmpl	-	-
AS Test	Check mode result for secondary air injection system/ Compl or Incmpl	-	-
Misfire Test	Check mode result for misfire monitor/ Compl or Incmpl	-	-
OXS2 Test	Check mode result for heated oxygen sensor (Bank 2)/ Compl or Incmpl	-	-
OXS1 Test	Check mode result for heated oxygen sensor (Bank 1)/ Compl or Incmpl	-	-
A/F Test Results (Bank 2)	Check mode result for air fuel ratio sensor (Bank 2)/ Compl or Incmpl	-	-
	Check mode result for air fuel ratio		

A/F Test Results (Bank 1)	sensor (Bank 1)/ Compl or Incmpl	-	-
MIL	MIL status/ ON or OFF	ON: MIL ON	-
MIL ON Run Distance	MIL ON run distance/ Min.: 0 km, Max.: 65535 km	Distance after DTC stored	-
Running Time from MIL ON	Running time from MIL ON/ Min.: 0 minute, Max.: 65535 minutes	Equivalent to running time after MIL ON	-
Engine Run Time	Engine run time/ Min.: 0 seconds, Max.: 65535 seconds	Time after engine start	The service data.
Time after DTC Cleared	Time after DTC cleared/ Min.: 0 minutes, Max.: 65535 minutes	Equivalent to time after DTCs cleared	-
Distance from DTC Cleared	Distance after DTC cleared/ Min.: 0 km, Max.: 65535 km	Equivalent to drive distance after DTCs cleared	-
Warmup Cycle Cleared DTC	Warm-up cycle after DTC cleared/ Min.: 0, Max.: 255	-	The number of warm-up cycles after the DTC is cleared.
OBD Requirements	OBD requirement	E-OBD	-
Number of Emission DTC	Emission related DTCs	-	The number of emission related DTCs.
Complete Parts Monitor	Comprehensive component monitor/ Not Avl or Avail	-	-
Fuel System Monitor	Fuel system monitor/ Not Avl or Avail	-	-

Catalyst Monitor	Catalyst monitor/ Not Avl or Avail	-	-
Catalyst Monitor	Catalyst monitor/ Compl or Incmpl	-	-
Model Code	Model code	-	Identifying the model code: URJ2###.
Engine Type	Engine type	-	Identifying the engine type: 3URFE.
			Identifying the number of

Cylinder Number	Number of cylinders/ Min.: 0, Max.: 255	-	cylinders: 8.
Transmission Type	Transmission type	-	Identifying the transmission type: ECT 6th.
Destination	Destination	-	Identifying the destination: W.
Model Year	Model year/ Min.: 0, Max.: 255	-	Identifying the model year: 200#.
System Identification	System identification	-	Identifying the engine system: Gasoline (gasoline engine).

HINT:

- **Normal Condition: If no conditions are specifically stated for "idling", the shift lever is in N or P, the A/C switch is off and all accessory switches are off.**
- ***: Data List values are only displayed when performing the following Active Tests: Control the VVT Linear (Bank 1), Control the VVT Linear (Bank 2), Control the VVT Exhaust Linear (Bank 1) and Control the VVT Exhaust Linear (Bank 2). For other Active Tests, the Data List value will be 0.**

ACTIVE TEST

HINT:

Using the intelligent tester to perform Active Tests allows relays, VSVs, actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing Active Tests early in troubleshooting is one way to save diagnostic time. Data List information can be displayed while performing Active Tests.

a. Warm up the engine.

b. Turn the engine switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test.

g. According to the display on the tester, perform the Active Test.

Tester Display	Test Part	Control Range	Diagnostic Note
Control the Injection Volume	Change injection volume	Between -12.5% and 24.8%	• All the injectors are tested at the same time. • Perform the test at less than 3000 rpm. • The injection volume can be changed in 1% graduations within the control range.
Control the Injection Volume for A/F Sensor	Change injection volume	Lower by 12.5% or increase 24.8%	• Perform the test at less than 3000 rpm. • Control the Injection Volume for A/F Sensor enables the checking and graphing of the A/F (Air Fuel Ratio) sensor voltage outputs. • To conduct the test, enter the following menus: Active Test / Control the Injection Volume for A/F Sensor / Data List / A/F Control System / AFS B1 S1 and

			O2S B1 S2 or AFS B2 S1 and O2S B2 S2.
Activate the VSV for Secondary Air Control	Activate the Secondary Air System	ON/OFF	• Do not perform the test for 5 seconds or more. • After the test, do not perform the test again for 30 seconds.
Activate the VSV for Intake Control	Activate VSV for intake control	ON/OFF	-
Activate the VSV for Evap Control	Activate purge VSV control	ON/OFF	-
Control the A/C Cut Signal	Control A/C cut signal	ON/OFF	-
Control the Fuel Pump / Speed	Activate fuel pump	ON/OFF	-
Connect the TC and TE1	Turn on and off TC and TE1 connection	ON/OFF	• ON: TC and TE1 are connected. • OFF: TC and TE1 are disconnected.
Control the Idle Fuel Cut Prohibit	Prohibit idling fuel cut control	ON/OFF	-
Prohibit the Catalyst OT Misfire prevent F/C	Prohibit catalyst overheat malfunction prevention fuel cut operation during misfire	ON: Fuel cut is prohibited	Confirm that the vehicle is stopped and the engine speed is 3000 rpm or less.
Activate the Starter Relay	Activate the starter relay	ON/OFF	The engine is stopped.
Activate the ACC Cut Relay	Activate the ACC CUT relay	ON/OFF	The engine is stopped.
Control the ETCS Open/Close Slow Speed	Throttle actuator	ON: throttle valve opens slowly	This test is possible when the following conditions are met: • The engine switch is on (IG). • The engine does not starts. • Fully depressing the accelerator pedal (APP: 58 degrees or more).
Control the ETCS Open/Close Fast Speed	Throttle actuator	ON: throttle valve opens fast	Same as above.
Control the VVT Linear (Bank 1)	Control Variable Valve Timing (VVT) [Bank 1]	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• The engine stalls or idles roughly when the VVT actuator is operated by 100%. • The test is possible during idle.
Control the VVT System (Bank 1)	Turn on and off Oil Control Valve (OCV)	ON/OFF	• The engine stalls or idles roughly when the OCV is turned on. • The engine runs or idles normally when the OCV is OFF.
Control the VVT Linear (Bank 2)	Control Variable Valve Timing (VVT) [Bank 2]	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• The engine stalls or idles roughly when the VVT actuator is operated by 100%. • The test is possible during idle.
Control the VVT System (Bank 2)	Turn on and off Oil Control Valve (OCV)	ON/OFF	• The engine stalls or idles roughly when the OCV is turned on. • The engine runs or idles normally when the OCV is OFF.
			• The engine stalls

Control the VVT Exhaust Linear (Bank 1)	Control VVT (Bank 1)	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	or idles roughly when the VVT actuator is operated by 100%. • The test is possible while the engine is idling.
Control the VVT Exhaust Linear (Bank 2)	Control VVT (Bank 2)	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• The engine stalls or idles roughly when the VVT actuator is operated by 100%. • The test is possible while the engine is idling.
Control the Cylinder #1 Fuel Cut	Cylinder #1 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the Cylinder #2 Fuel Cut	Cylinder #2 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the Cylinder #3 Fuel Cut	Cylinder #3 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the Cylinder #4 Fuel Cut	Cylinder #4 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the Cylinder #5 Fuel Cut	Cylinder #5 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the Cylinder #6 Fuel Cut	Cylinder #6 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the Cylinder #7 Fuel Cut	Cylinder #7 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the Cylinder #8 Fuel Cut	Cylinder #8 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Control the All Cylinders Fuel Cut	All cylinder fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*1
Check the Cylinder Compression*2	Check the cylinder compression pressure	ON/OFF	Fuel injection and ignition stop in all cylinders.

NOTICE:

- ***1: If the display of the Data List Prohibit the Catalyst OT Misfire prevent F/C item is Not Avl, perform this Active Test with the vehicle stopped and the engine idling.**
- ***1: If the display of the Data List Prohibit the Catalyst OT Misfire prevent F/C item is Avail, perform this Active Test as described below.**
    1. **Stop the engine and turn the engine switch on (IG) to turn Control the Cylinder#1 Fuel Cut (to Control the Cylinder#8 Fuel Cut) on.**
    2. **Start the engine.**

HINT:

*2: When cranking the engine, each cylinder measures the engine speed.

In this Active Test, the fuel and ignition of all cylinders is cut, and cranking occurs for approximately 10 seconds. Then, each cylinder measures the engine speed. If a cylinder engine speed is higher than the other, that cylinder compression pressure is compared to the other, and whether or not the compression pressure is low can be determined.

1. Warm up the engine.
2. Turn the engine switch off.
3. Connect the intelligent tester to the DLC3.
4. Turn the engine switch on (IG) and turn the tester on.
5. Enter the following menus: Powertrain / Engine and ECT / Active Test / Check the Cylinder Compression.

   HINT:

   To display the entire Data List, press the pull down menu button next to Primary. Then select Compression.

6. While the engine is not running, press the RIGHT or LEFT button to change the Check the Cylinder Compression to ON.

   HINT:

After performing the above procedure, the Active Test Check the Cylinder Compression will start. Fuel injection for all cylinders is prohibited, and each cylinder engine speed measurement will enter standby.

7. Fully open the throttle.
8. Crank the engine for about 10 seconds.
9. Monitor the engine speed (Engine Speed of Cyl #1 to #8) displayed on the intelligent tester.

HINT:

At first, the intelligent tester display will show each cylinder engine speed measurement to be extremely high. After approximately 10 seconds of engine cranking, each cylinder engine speed measurement will change to the actual engine speed.

NOTICE:

- **When the Check the Cylinder Compression test is OFF and the engine is cranked, the engine will start.**
- **If the Check the Cylinder Compression test needs to be performed after it is turned on and performed once, press Exit to return to the Active Test menu screen. Then perform the Check the Cylinder Compression test again.**
- **Use a fully-charged battery.**

SYSTEM CHECK

HINT:

Performing a System Check enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are stored, and can detect potential malfunctions in the system. The System Check can be performed with the intelligent tester.

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Utility.

e. Perform the System Check by referring to the table below.

Tester Display	Test Part	Control Range	Diagnostic Notes
Secondary air Injection Check (Automatic Mode)	Perform secondary air injection system operation automatically	With warm engine, engine switch turned off once	• If no DTCs are in Pending after performing this test, the system is functioning normally. • Refer to the inspection procedure for secondary air injection system DTCs. • When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with engine switch turned on (IG) or the engine running. • Turn the engine switch off when the Secondary Air Injection Check is finished.
			• This is used to detect malfunctioning parts. • Refer to the inspection procedure for secondary air injection system

Secondary air Injection Check (Manual Mode)	Perform 8 operations in order to operate air injection system monitor manually	With warm engine, engine switch turned off once	DTCs. • When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with engine switch turned on (IG) or the engine running. • Turn engine switch off when the Secondary Air Injection Check finishes.

for Preparation Click here

HINT:

Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.

For details of each DTC, refer to the "See page" below.

*: The MIL flashes when a catalyst damaged misfire is detected.

SFI System

DTC Code	Detection Item	Trouble Areas	MIL	Memory	See page
P0010	Camshaft Position "A" Actuator Circuit (Bank 1)	- Open or short in OCV for intake camshaft (for Bank 1) circuit - OCV for intake camshaft (for Bank 1) - ECM	Comes on	DTC stored	Click here

P0017	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor B)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0018	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0019	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor B)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0020	Camshaft Position "A" Actuator Circuit (Bank 2)	- Open or short in OCV for intake camshaft (for Bank 2) circuit - OCV for intake camshaft (for Bank 2) - ECM	Comes on	DTC stored	Click here
P0021	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here

P0022	Camshaft Position "A" - Timing Over-Retarded (Bank 2)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0023	Camshaft Position "B" Actuator Circuit / Open (Bank 2)	- Open or short in OCV for exhaust camshaft (for Bank 2) circuit - OCV for exhaust camshaft (for Bank 2) - ECM	Comes on	DTC stored	Click here
P0024	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 2)	- Valve timing - Oil control valve (OCV) for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0025	Camshaft Position "B" - Timing Over-Retarded (Bank 2)	- Valve timing - OCV for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)	- Open in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0051	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)	- Open in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0052	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0102	Mass or Volume Air Flow Circuit Low Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0103	Mass or Volume Air Flow Circuit High Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0110	Intake Air Temperature Circuit Malfunction	- Open or short in Intake Air Temperature (IAT) sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0112	Intake Air Temperature Circuit Low Input	- Short in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0113	Intake Air Temperature Circuit High Input	- Open in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0115	Engine Coolant Temperature Circuit Malfunction	- Open or short in Engine Coolant Temperature (ECT) sensor circuit - ECT sensor	Comes on	DTC stored	Click here

P0116	Engine Coolant Temperature Circuit Range / Performance Problem	- ECM - Thermostat - ECT sensor	Comes on	DTC stored	Click here
P0117	Engine Coolant Temperature Circuit Low Input	- Short in ECT sensor - ECT sensor - ECM	Comes on	DTC stored	Click here
P0118	Engine Coolant Temperature Circuit High Input	- Open in ECT sensor circuit - ECT sensor - ECM	Comes on	DTC stored	Click here
P0120	Throttle / Pedal Position Sensor / Switch "A" Circuit Malfunction	- Throttle Position (TP) sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem	TP sensor (built into throttle body)	Comes on	DTC stored	Click here
P0122	Throttle / Pedal Position Sensor / Switch "A" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA1 circuit - Open in VC circuit - ECM	Comes on	DTC stored	Click here
P0123	Throttle / Pedal Position Sensor / Switch "A" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA1 circuit - Open in E2 circuit - Short between VC and VTA1 circuits - ECM	Comes on	DTC stored	Click here
P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)	- Open or short in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - HO2 sensor heater (for Bank 1) - Air Fuel ratio (A/F) sensor (for Bank 1) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)	- Open in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - HO2 sensor heater (for Bank 1) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)	- Short in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - ECM internal circuit malfunction - Air Fuel ratio (A/F) sensor (for Bank 1)	Comes on	DTC stored	Click here
P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)	- Open or short in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - HO2 sensor heater (for Bank 2) - Air Fuel ratio (A/F) sensor (for Bank 2) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)	- Open in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - HO2 sensor heater (for Bank 2) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)	- Short in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - ECM internal circuit malfunction - Air Fuel ratio (A/F) sensor (for Bank 2)	Comes on	DTC stored	Click here
P0171	System Too Lean (Bank 1)	- Air induction system - Injector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
		- Injector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure			

P0172	System Too Rich (Bank 1)	- Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM	Comes on	DTC stored	Click here
P0174	System Too Lean (Bank 2)	- Air induction system - Injector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
P0175	System Too Rich (Bank 2)	- Injector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM	Comes on	DTC stored	Click here
P0220	Throttle / Pedal Position Sensor / Switch "B" Circuit	- TP sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA2 circuit - Open in VC circuit - ECM	Comes on	DTC stored	Click here
P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA2 circuit - Open in E2 circuit - Short between VC and VTA2 circuits - ECM	Comes on	DTC stored	Click here
P0230	Fuel Pump Primary Circuit	- Open or short in fuel pump circuit - Fuel pump - Fuel pump ECU - ECM	-	DTC stored	Click here
P0300	Random / Multiple Cylinder Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0301	Cylinder 1 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections	Comes on/Blinks*	DTC stored	Click here

		- Air induction system - ECM			
P0302	Cylinder 2 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0303	Cylinder 3 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0304	Cylinder 4 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0305	Cylinder 5 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0306	Cylinder 6 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
		- Open or short in Engine wire harness - Connector connection			

P0307	Cylinder 7 Misfire Detected	- Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0308	Cylinder 8 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)	- Short in knock sensor (for Bank 1 Sensor 1) circuit - Knock sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)	- Open in knock sensor (for Bank 1 Sensor 1) circuit - Knock sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P032C	Knock Sensor 3 Circuit Low	- Short in knock sensor (for Bank 1 Sensor 2) circuit - Knock sensor (for Bank 1 Sensor 2) - ECM	Comes on	DTC stored	Click here
P032D	Knock Sensor 3 Circuit High	- Open in knock sensor (for Bank 1 Sensor 2) circuit - Knock sensor (for Bank 1 Sensor 2) - ECM	Comes on	DTC stored	Click here
P0332	Knock Sensor 2 Circuit Low Input (Bank 2)	- Short in knock sensor (for Bank 2 Sensor1) circuit - Knock sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P0333	Knock Sensor 2 Circuit High Input (Bank 2)	- Open in knock sensor (for Bank 2 Sensor1) circuit - Knock sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P0335	Crankshaft Position Sensor "A" Circuit	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	Comes on	DTC stored	Click here
P0337	Crankshaft Position Sensor "A" Circuit Low Input	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	Comes on	DTC stored	Click here
P0338	Crankshaft Position Sensor "A" Circuit High Input	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	Comes on	DTC stored	Click here
P0339	Crankshaft Position Sensor "A" Circuit Intermittent	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	-	DTC stored	Click here
P033C	Knock Sensor 4 Circuit Low Input	- Short in knock sensor (for Bank 2 Sensor 2) circuit - Knock sensor (for Bank 2 Sensor 2) - ECM	Comes on	DTC stored	Click here
		- Open in knock sensor (for Bank 2 Sensor 2)			

P033D	Knock Sensor 4 Circuit High Input	circuit - Knock sensor (for Bank 2 Sensor 2) - ECM	Comes on	DTC stored	Click here
P0340	Camshaft Position Sensor Circuit Malfunction	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0342	Camshaft Position Sensor "A" Circuit Low Input (Bank 1 or Single Sensor)	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0343	Camshaft Position Sensor "A" Circuit High Input (Bank 1 or Single Sensor)	- Open or short in VVT sensor for intake camshaft circuit - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0345	Camshaft Position Sensor "A" Circuit (Bank 2)	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0347	Camshaft Position Sensor "A" Circuit Low Input (Bank 2)	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0348	Camshaft Position Sensor "A" Circuit High Input (Bank 2)	- Open or short in VVT sensor for intake camshaft circuit - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0351	Ignition Coil "A" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT1 circuit between ignition coil and ECM - No. 1 ignition coil - ECM	Comes on	DTC stored	Click here
P0352	Ignition Coil "B" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT2 circuit between ignition coil and ECM - No. 2 ignition coil - ECM	Comes on	DTC stored	Click here
P0353	Ignition Coil "C" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT3 circuit between ignition coil and ECM - No. 3 ignition coil - ECM	Comes on	DTC stored	Click here
P0354	Ignition Coil "D" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT4 circuit between ignition coil and ECM - No. 4 ignition coil - ECM	Comes on	DTC stored	Click here
P0355	Ignition Coil "E" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT5 circuit between ignition coil and ECM - No. 5 ignition coil - ECM	Comes on	DTC stored	Click here
P0356	Ignition Coil "F" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT6 circuit between ignition coil and ECM - No. 6 ignition coil - ECM	Comes on	DTC stored	Click here
P0357	Ignition Coil "G" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT7 circuit between ignition coil and ECM	Comes on	DTC	Click

		- No. 7 ignition coil - ECM		stored	here
P0358	Ignition Coil "H" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT8 circuit between ignition coil and ECM - No. 8 ignition coil - ECM	Comes on	DTC stored	Click here
P0365	Camshaft Position Sensor "B" Circuit (Bank 1)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0367	Camshaft Position Sensor "B" Circuit Low Input (Bank 1)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0368	Camshaft Position Sensor "B" Circuit High Input (Bank 1)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0390	Camshaft Position Sensor "B" Circuit (Bank 2)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0392	Camshaft Position Sensor "B" Circuit Low Input (Bank 2)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0393	Camshaft Position Sensor "B" Circuit High Input (Bank 2)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0412	Secondary Air Injection System Switching Valve "A" Circuit	- Open in ASV drive circuit - Short between ASV drive circuit and body ground - AID - ASV - ECM	Comes on	DTC stored	Click here
P0415	Secondary Air Injection System Switching Valve "B" Circuit	- Open in ASV drive circuit - Short between ASV drive circuit and body ground - AID - ASV - ECM	Comes on	DTC stored	Click here
P0418	Secondary Air Injection System Control "A" Circuit	- Open in air pump drive circuit - Short between air pump drive circuit and body ground - Air pump - AID - ECM	Comes on	DTC stored	Click here
P0419	Secondary Air Injection System Control "B" Circuit	- Open in air pump drive circuit - Short between air pump drive circuit and body ground - Air pump - AID - ECM	Comes on	DTC stored	Click here
P0420	Catalyst System Efficiency Below Threshold (Bank 1)	- Gas leakage from exhaust system - Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) - Heated Oxygen (HO2) sensor (for Bank 1 Sensor 2) - Front No. 2 exhaust pipe (TWC)	Comes on	DTC stored	Click here

P0430	Catalyst System Efficiency Below Threshold (Bank 2)	- Gas leakage from exhaust system - Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) - Heated Oxygen (HO2) sensor (for Bank 2 Sensor 2) - Front exhaust pipe (TWC)	Comes on	DTC stored	Click here
P0443	Evaporative Emission Control System Purge Control Valve Circuit	- Open or short in purge VSV circuit - Purge VSV - ECM	Comes on	DTC stored	Click here
P0500	Vehicle Speed Sensor "A"	- Open or short in speed signal circuit - Combination meter - ECM	Comes on	DTC stored	Click here
P0504	Brake Switch "A" / "B" Correlation	- Short in stop light switch signal circuit - STOP fuse - IGN fuse - Stop light switch - ECM	-	DTC stored	Click here
P0505	Idle Control System Malfunction	- ETCS - Air induction system - PCV hose connections - ECM	Comes on	DTC stored	Click here
P0550	Power Steering Pressure Sensor Circuit Malfunction	- Open or short in power steering oil pressure sensor circuit - Power steering oil pressure sensor - ECM	Comes on	DTC stored	Click here
P0552	Power Steering Pressure Sensor Circuit Low Input	- Open or short in power steering oil pressure sensor circuit - Power steering oil pressure sensor - ECM	Comes on	DTC stored	Click here
P0553	Power Steering Pressure Sensor Circuit High Input	- Open or short in power steering oil pressure sensor circuit - Power steering oil pressure sensor - ECM	Comes on	DTC stored	Click here
P0560	System Voltage	- Open in back up power source circuit - Battery - Battery terminals - EFI NO. 1 fuse - ECM	Comes on	DTC stored	Click here
P0604	Random Access Memory (RAM)	ECM	Comes on	DTC stored	Click here
P0606	ECM / PCM Processor	ECM	Comes on	DTC stored	Click here
P060A	Internal Control Module Monitoring Processor Performance	ECM	Comes on	DTC stored	Click here
P060B	Internal Control Module A/D Processing Performance	ECM	Comes on	DTC stored	Click here
P060D	Internal Control Module Accelerator Pedal Position Performance	ECM	Comes on	DTC stored	Click here
P060E	Internal Control Module Throttle Position Performance	ECM	Comes on	DTC stored	Click here
P0617	Starter Relay Circuit High	- Park/Neutral Position (PNP) switch - Starter relay circuit - Engine switch - ECM	Comes on	DTC stored	Click here
P0657	Actuator Supply Voltage Circuit / Open	ECM	Comes on	DTC stored	Click here
P0660	Intake Manifold Tuning Valve Control Circuit / Open (Bank 1)	- Open or short in VSV for ACIS circuit - VSV for ACIS - ECM	Comes on	DTC stored	Click here
P1340	Camshaft Position Sensor "A" (Bank 1 Sensor 2)	- Open or short in camshaft position sensor circuit - Camshaft position sensor - Camshaft timing plate LH - ECM	Comes on	DTC stored	Click here
P1342	Camshaft Position Sensor "A" Low Input (MRE)	- Open or short in camshaft position sensor circuit - Camshaft position sensor - Camshaft timing plate LH - ECM	Comes on	DTC stored	Click here
P1343	Camshaft Position Sensor "A" High Input (MRE)	- Open or short in camshaft position sensor circuit - Camshaft position sensor	Comes on	DTC	Click

		- Camshaft timing plate LH		stored	here
P1607	Cruise Control Input Processor	- ECM ECM	Comes on	DTC stored	Click here
P1613	Secondary Air Injection Driver Malfunction	- Short in diagnostic information signal circuit (AID - ECM) - Open in diagnostic information signal circuit (AID - ECM) - Open or short in air pump and air switching valve command signal circuit (AID - ECM) - Open or short in AID power source circuit - Open in AID ground circuit - AID - ECM	Comes on	DTC stored	Click here
P1614	Secondary Air Injection System Driver Bank 2	- Short in diagnostic information signal circuit (AID - ECM) - Open in diagnostic information signal circuit (AID - ECM) - Open or short in air pump and air switching valve command signal circuit (AID - ECM) - Open or short in AID power source circuit - Open in AID ground circuit - AID - ECM	Comes on	DTC stored	Click here
P2102	Throttle Actuator Control Motor Circuit Low	- Open in throttle actuator circuit - Throttle actuator - ECM	Comes on	DTC stored	Click here
P2103	Throttle Actuator Control Motor Circuit High	- Short in throttle actuator circuit - Throttle actuator - Throttle valve - Throttle body assembly - ECM	Comes on	DTC stored	Click here
P2111	Throttle Actuator Control System - Stuck Open	- Throttle actuator - Throttle body assembly - Throttle valve	Comes on	DTC stored	Click here
P2112	Throttle Actuator Control System - Stuck Closed	- Throttle actuator - Throttle body assembly - Throttle valve	Comes on	DTC stored	Click here
P2118	Throttle Actuator Control Motor Current Range / Performance	- Open in ETCS power source circuit - Battery - Battery terminals - ETCS fuse - ECM	Comes on	DTC stored	Click here
P2119	Throttle Actuator Control Throttle Body Range / Performance	- ETCS - ECM	Comes on	DTC stored	Click here
P2120	Throttle / Pedal Position Sensor / Switch "D" Circuit	- APP sensor - ECM	Comes on	DTC stored	Click here
P2121	Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance	- Accelerator Pedal Position (APP) sensor - ECM	Comes on	DTC stored	Click here
P2122	Throttle / Pedal Position Sensor / Switch "D" Circuit Low Input	- APP sensor - Open in VCPA circuit - Open or ground short in VPA circuit - ECM	Comes on	DTC stored	Click here
P2123	Throttle / Pedal Position Sensor / Switch "D" Circuit High Input	- APP sensor - Open in EPA circuit - ECM	Comes on	DTC stored	Click here
P2125	Throttle / Pedal Position Sensor / Switch "E" Circuit	- APP sensor - ECM	Comes on	DTC stored	Click here
P2127	Throttle / Pedal Position Sensor / Switch "E" Circuit Low Input	- APP sensor - Open in VCP2 circuit - Open or ground short in VPA2 circuit - ECM	Comes on	DTC stored	Click here
P2128	Throttle / Pedal Position Sensor / Switch "E" Circuit High Input	- APP sensor - Open in EPA2 circuit - ECM	Comes on	DTC stored	Click here
P2135	Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation	- Short between VTA1 and VTA2 circuits - TP sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P2138	Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation	- Short between VPA and VPA2 circuits - APP sensor	Comes on	DTC stored	Click here

		- ECM			
P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2197	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2198	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2237	Oxygen (A/F) Sensor Pumping Current Circuit / Open (Bank 1 Sensor 1)	- Open in Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) circuit - Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2238	Oxygen (A/F) Sensor Pumping Current Circuit Low (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2239	Oxygen (A/F) Sensor Pumping Current Circuit High (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2240	Oxygen (A/F) Sensor Pumping Current Circuit / Open (Bank 2 Sensor 1)	- Open in Air Fuel Ratio (A/F) sensor (for Bank 2 Sensor 1) circuit - Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2241	Oxygen (A/F) Sensor Pumping Current Circuit Low (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2242	Oxygen (A/F) Sensor Pumping Current Circuit High (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2252	Oxygen (A/F) Sensor Reference Ground Circuit Low (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2253	Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2255	Oxygen (A/F) Sensor Reference Ground Circuit Low (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1)	Comes on	DTC stored	Click here

		- ECM			
P2256	Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2431	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Range / Performance Bank1	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2432	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Low Bank1	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2433	Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank1	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2436	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Range / Performance Bank 2	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2437	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Low Bank 2	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2438	Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank 2	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2440	Secondary Air Injection System Switching Valve Stuck Open Bank1	- ASV - Open or short in ASV circuit - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2441	Secondary Air Injection System Switching Valve Stuck Close Bank1	- ASV - Open or short in ASV circuit - Vacuum hose (ASV - pressure sensor) - Air injection hose - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2442	Secondary Air Injection System Switching Valve Stuck Open Bank 2	- ASV - Open or short in ASV circuit - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2443	Secondary Air Injection System Switching Valve Stuck Closed Bank 2	- ASV - Open or short in ASV circuit - Vacuum hose (ASV - pressure sensor) - Air injection hose - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2444	Secondary Air Injection System Pump Stuck On Bank1	- Short in air pump circuit - Open or short in pressure sensor circuit - Pressure sensor - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2445	Secondary Air Injection System Pump Stuck Off Bank1	- Air pump - Open in air pump circuit - Air injection system piping - Vacuum hose (pressure sensor - air switching valve) - Pressure sensor - Open or short in pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2446	Secondary Air Injection System Pump Stuck On Bank 2	- Short in air pump circuit - Open or short in pressure sensor circuit - Pressure sensor - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
		- Air pump			

P2447	Secondary Air Injection System Pump Stuck Off Bank 2	- Open in air pump circuit - Air injection system piping - Vacuum hose (pressure sensor - air switching valve) - Pressure sensor - Open or short in pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)	- Open or short in A/F sensor circuit (for Bank 1) - A/F sensor (for Bank 1) - ECM	Comes on	DTC stored	Click here
P2A03	A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)	- Open or short in A/F sensor circuit (for Bank 2) - A/F sensor (for Bank 2) - ECM	Comes on	DTC stored	Click here

for Preparation Click here

HINT:

Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.

For details of each DTC, refer to the "See page" below.

*: The MIL flashes when a catalyst damaged misfire is detected.

SFI System

DTC Code	Detection Item	Trouble Areas	MIL	Memory	See page
P0010	Camshaft Position "A" Actuator Circuit (Bank 1)	- Open or short in OCV for intake camshaft (for Bank 1) circuit - OCV for intake camshaft (for Bank 1) - ECM	Comes on	DTC stored	Click here
P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0013	Camshaft Position "B" Actuator Circuit / Open (Bank 1)	- Open or short in OCV for exhaust camshaft (for Bank 1) circuit - OCV for exhaust camshaft (for Bank 1) - ECM	Comes on	DTC stored	Click here
P0014	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 1)	- Valve timing - Oil control valve (OCV) for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0015	Camshaft Position "B" - Timing Over-Retarded (Bank 1)	- Valve timing - OCV for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0017	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor B)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0018	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0019	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor B)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0020	Camshaft Position "A" Actuator Circuit (Bank 2)	- Open or short in OCV for intake camshaft (for Bank 2) circuit - OCV for intake camshaft (for Bank 2) - ECM	Comes on	DTC stored	Click here
P0021	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here

P0022	Camshaft Position "A" - Timing Over-Retarded (Bank 2)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0023	Camshaft Position "B" Actuator Circuit / Open (Bank 2)	- Open or short in OCV for exhaust camshaft (for Bank 2) circuit - OCV for exhaust camshaft (for Bank 2) - ECM	Comes on	DTC stored	Click here
P0024	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 2)	- Valve timing - Oil control valve (OCV) for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0025	Camshaft Position "B" - Timing Over-Retarded (Bank 2)	- Valve timing - OCV for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)	- Open in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0051	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)	- Open in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0052	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0102	Mass or Volume Air Flow Circuit Low Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0103	Mass or Volume Air Flow Circuit High Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0110	Intake Air Temperature Circuit Malfunction	- Open or short in Intake Air Temperature (IAT) sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0112	Intake Air Temperature Circuit Low Input	- Short in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0113	Intake Air Temperature Circuit High Input	- Open in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0115	Engine Coolant Temperature Circuit Malfunction	- Open or short in Engine Coolant Temperature (ECT) sensor circuit - ECT sensor	Comes on	DTC stored	Click here

P0116	Engine Coolant Temperature Circuit Range / Performance Problem	- ECM - Thermostat - ECT sensor	Comes on	DTC stored	Click here
P0117	Engine Coolant Temperature Circuit Low Input	- Short in ECT sensor - ECT sensor - ECM	Comes on	DTC stored	Click here
P0118	Engine Coolant Temperature Circuit High Input	- Open in ECT sensor circuit - ECT sensor - ECM	Comes on	DTC stored	Click here
P0120	Throttle / Pedal Position Sensor / Switch "A" Circuit Malfunction	- Throttle Position (TP) sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem	TP sensor (built into throttle body)	Comes on	DTC stored	Click here
P0122	Throttle / Pedal Position Sensor / Switch "A" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA1 circuit - Open in VC circuit - ECM	Comes on	DTC stored	Click here
P0123	Throttle / Pedal Position Sensor / Switch "A" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA1 circuit - Open in E2 circuit - Short between VC and VTA1 circuits - ECM	Comes on	DTC stored	Click here
P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)	- Open or short in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - HO2 sensor heater (for Bank 1) - Air Fuel ratio (A/F) sensor (for Bank 1) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)	- Open in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - HO2 sensor heater (for Bank 1) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)	- Short in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - ECM internal circuit malfunction - Air Fuel ratio (A/F) sensor (for Bank 1)	Comes on	DTC stored	Click here
P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)	- Open or short in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - HO2 sensor heater (for Bank 2) - Air Fuel ratio (A/F) sensor (for Bank 2) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)	- Open in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - HO2 sensor heater (for Bank 2) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)	- Short in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - ECM internal circuit malfunction - Air Fuel ratio (A/F) sensor (for Bank 2)	Comes on	DTC stored	Click here
P0171	System Too Lean (Bank 1)	- Air induction system - Injector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
		- Injector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure			

P0172	System Too Rich (Bank 1)	- Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM	Comes on	DTC stored	Click here
P0174	System Too Lean (Bank 2)	- Air induction system - Injector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
P0175	System Too Rich (Bank 2)	- Injector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM	Comes on	DTC stored	Click here
P0220	Throttle / Pedal Position Sensor / Switch "B" Circuit	- TP sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA2 circuit - Open in VC circuit - ECM	Comes on	DTC stored	Click here
P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA2 circuit - Open in E2 circuit - Short between VC and VTA2 circuits - ECM	Comes on	DTC stored	Click here
P0230	Fuel Pump Primary Circuit	- Open or short in fuel pump circuit - Fuel pump - Fuel pump ECU - ECM	-	DTC stored	Click here
P0300	Random / Multiple Cylinder Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0301	Cylinder 1 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections	Comes on/Blinks*	DTC stored	Click here

		- Air induction system - ECM			
P0302	Cylinder 2 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0303	Cylinder 3 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0304	Cylinder 4 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0305	Cylinder 5 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0306	Cylinder 6 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
		- Open or short in Engine wire harness - Connector connection			

P0307	Cylinder 7 Misfire Detected	- Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0308	Cylinder 8 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)	- Short in knock sensor (for Bank 1 Sensor 1) circuit - Knock sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)	- Open in knock sensor (for Bank 1 Sensor 1) circuit - Knock sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P032C	Knock Sensor 3 Circuit Low	- Short in knock sensor (for Bank 1 Sensor 2) circuit - Knock sensor (for Bank 1 Sensor 2) - ECM	Comes on	DTC stored	Click here
P032D	Knock Sensor 3 Circuit High	- Open in knock sensor (for Bank 1 Sensor 2) circuit - Knock sensor (for Bank 1 Sensor 2) - ECM	Comes on	DTC stored	Click here
P0332	Knock Sensor 2 Circuit Low Input (Bank 2)	- Short in knock sensor (for Bank 2 Sensor1) circuit - Knock sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P0333	Knock Sensor 2 Circuit High Input (Bank 2)	- Open in knock sensor (for Bank 2 Sensor1) circuit - Knock sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P0335	Crankshaft Position Sensor "A" Circuit	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	Comes on	DTC stored	Click here
P0337	Crankshaft Position Sensor "A" Circuit Low Input	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	Comes on	DTC stored	Click here
P0338	Crankshaft Position Sensor "A" Circuit High Input	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	Comes on	DTC stored	Click here
P0339	Crankshaft Position Sensor "A" Circuit Intermittent	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	-	DTC stored	Click here
P033C	Knock Sensor 4 Circuit Low Input	- Short in knock sensor (for Bank 2 Sensor 2) circuit - Knock sensor (for Bank 2 Sensor 2) - ECM	Comes on	DTC stored	Click here
		- Open in knock sensor (for Bank 2 Sensor 2)			

P033D	Knock Sensor 4 Circuit High Input	circuit - Knock sensor (for Bank 2 Sensor 2) - ECM	Comes on	DTC stored	Click here
P0340	Camshaft Position Sensor Circuit Malfunction	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0342	Camshaft Position Sensor "A" Circuit Low Input (Bank 1 or Single Sensor)	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0343	Camshaft Position Sensor "A" Circuit High Input (Bank 1 or Single Sensor)	- Open or short in VVT sensor for intake camshaft circuit - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0345	Camshaft Position Sensor "A" Circuit (Bank 2)	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0347	Camshaft Position Sensor "A" Circuit Low Input (Bank 2)	- Open or short in VVT sensor circuit for intake camshaft - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0348	Camshaft Position Sensor "A" Circuit High Input (Bank 2)	- Open or short in VVT sensor for intake camshaft circuit - VVT sensor for intake camshaft - Camshaft timing gear for intake camshaft - Jumped tooth of timing chain for intake camshaft - ECM	Comes on	DTC stored	Click here
P0351	Ignition Coil "A" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT1 circuit between ignition coil and ECM - No. 1 ignition coil - ECM	Comes on	DTC stored	Click here
P0352	Ignition Coil "B" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT2 circuit between ignition coil and ECM - No. 2 ignition coil - ECM	Comes on	DTC stored	Click here
P0353	Ignition Coil "C" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT3 circuit between ignition coil and ECM - No. 3 ignition coil - ECM	Comes on	DTC stored	Click here
P0354	Ignition Coil "D" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT4 circuit between ignition coil and ECM - No. 4 ignition coil - ECM	Comes on	DTC stored	Click here
P0355	Ignition Coil "E" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT5 circuit between ignition coil and ECM - No. 5 ignition coil - ECM	Comes on	DTC stored	Click here
P0356	Ignition Coil "F" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT6 circuit between ignition coil and ECM - No. 6 ignition coil - ECM	Comes on	DTC stored	Click here
P0357	Ignition Coil "G" Primary / Secondary Circuit	- Ignition system - Open or short in IGF1 or IGT7 circuit between ignition coil and ECM	Comes on	DTC	Click

		- No. 7 ignition coil - ECM		stored	here
P0358	Ignition Coil "H" Primary / Secondary Circuit	- Ignition system - Open or short in IGF2 or IGT8 circuit between ignition coil and ECM - No. 8 ignition coil - ECM	Comes on	DTC stored	Click here
P0365	Camshaft Position Sensor "B" Circuit (Bank 1)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0367	Camshaft Position Sensor "B" Circuit Low Input (Bank 1)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0368	Camshaft Position Sensor "B" Circuit High Input (Bank 1)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0390	Camshaft Position Sensor "B" Circuit (Bank 2)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0392	Camshaft Position Sensor "B" Circuit Low Input (Bank 2)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0393	Camshaft Position Sensor "B" Circuit High Input (Bank 2)	- Open or short in VVT sensor for exhaust camshaft circuit - VVT sensor for exhaust camshaft - Exhaust camshaft - Jumped tooth of timing chain - ECM	Comes on	DTC stored	Click here
P0412	Secondary Air Injection System Switching Valve "A" Circuit	- Open in ASV drive circuit - Short between ASV drive circuit and body ground - AID - ASV - ECM	Comes on	DTC stored	Click here
P0415	Secondary Air Injection System Switching Valve "B" Circuit	- Open in ASV drive circuit - Short between ASV drive circuit and body ground - AID - ASV - ECM	Comes on	DTC stored	Click here
P0418	Secondary Air Injection System Control "A" Circuit	- Open in air pump drive circuit - Short between air pump drive circuit and body ground - Air pump - AID - ECM	Comes on	DTC stored	Click here
P0419	Secondary Air Injection System Control "B" Circuit	- Open in air pump drive circuit - Short between air pump drive circuit and body ground - Air pump - AID - ECM	Comes on	DTC stored	Click here
P0420	Catalyst System Efficiency Below Threshold (Bank 1)	- Gas leakage from exhaust system - Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) - Heated Oxygen (HO2) sensor (for Bank 1 Sensor 2) - Front No. 2 exhaust pipe (TWC)	Comes on	DTC stored	Click here

P0430	Catalyst System Efficiency Below Threshold (Bank 2)	- Gas leakage from exhaust system - Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) - Heated Oxygen (HO2) sensor (for Bank 2 Sensor 2) - Front exhaust pipe (TWC)	Comes on	DTC stored	Click here
P0443	Evaporative Emission Control System Purge Control Valve Circuit	- Open or short in purge VSV circuit - Purge VSV - ECM	Comes on	DTC stored	Click here
P0500	Vehicle Speed Sensor "A"	- Open or short in speed signal circuit - Combination meter - ECM	Comes on	DTC stored	Click here
P0504	Brake Switch "A" / "B" Correlation	- Short in stop light switch signal circuit - STOP fuse - IGN fuse - Stop light switch - ECM	-	DTC stored	Click here
P0505	Idle Control System Malfunction	- ETCS - Air induction system - PCV hose connections - ECM	Comes on	DTC stored	Click here
P0550	Power Steering Pressure Sensor Circuit Malfunction	- Open or short in power steering oil pressure sensor circuit - Power steering oil pressure sensor - ECM	Comes on	DTC stored	Click here
P0552	Power Steering Pressure Sensor Circuit Low Input	- Open or short in power steering oil pressure sensor circuit - Power steering oil pressure sensor - ECM	Comes on	DTC stored	Click here
P0553	Power Steering Pressure Sensor Circuit High Input	- Open or short in power steering oil pressure sensor circuit - Power steering oil pressure sensor - ECM	Comes on	DTC stored	Click here
P0560	System Voltage	- Open in back up power source circuit - Battery - Battery terminals - EFI NO. 1 fuse - ECM	Comes on	DTC stored	Click here
P0604	Random Access Memory (RAM)	ECM	Comes on	DTC stored	Click here
P0606	ECM / PCM Processor	ECM	Comes on	DTC stored	Click here
P060A	Internal Control Module Monitoring Processor Performance	ECM	Comes on	DTC stored	Click here
P060B	Internal Control Module A/D Processing Performance	ECM	Comes on	DTC stored	Click here
P060D	Internal Control Module Accelerator Pedal Position Performance	ECM	Comes on	DTC stored	Click here
P060E	Internal Control Module Throttle Position Performance	ECM	Comes on	DTC stored	Click here
P0617	Starter Relay Circuit High	- Park/Neutral Position (PNP) switch - Starter relay circuit - Engine switch - ECM	Comes on	DTC stored	Click here
P0657	Actuator Supply Voltage Circuit / Open	ECM	Comes on	DTC stored	Click here
P0660	Intake Manifold Tuning Valve Control Circuit / Open (Bank 1)	- Open or short in VSV for ACIS circuit - VSV for ACIS - ECM	Comes on	DTC stored	Click here
P1340	Camshaft Position Sensor "A" (Bank 1 Sensor 2)	- Open or short in camshaft position sensor circuit - Camshaft position sensor - Camshaft timing plate LH - ECM	Comes on	DTC stored	Click here
P1342	Camshaft Position Sensor "A" Low Input (MRE)	- Open or short in camshaft position sensor circuit - Camshaft position sensor - Camshaft timing plate LH - ECM	Comes on	DTC stored	Click here
P1343	Camshaft Position Sensor "A" High Input (MRE)	- Open or short in camshaft position sensor circuit - Camshaft position sensor	Comes on	DTC	Click

		- Camshaft timing plate LH		stored	here
P1607	Cruise Control Input Processor	- ECM ECM	Comes on	DTC stored	Click here
P1613	Secondary Air Injection Driver Malfunction	- Short in diagnostic information signal circuit (AID - ECM) - Open in diagnostic information signal circuit (AID - ECM) - Open or short in air pump and air switching valve command signal circuit (AID - ECM) - Open or short in AID power source circuit - Open in AID ground circuit - AID - ECM	Comes on	DTC stored	Click here
P1614	Secondary Air Injection System Driver Bank 2	- Short in diagnostic information signal circuit (AID - ECM) - Open in diagnostic information signal circuit (AID - ECM) - Open or short in air pump and air switching valve command signal circuit (AID - ECM) - Open or short in AID power source circuit - Open in AID ground circuit - AID - ECM	Comes on	DTC stored	Click here
P2102	Throttle Actuator Control Motor Circuit Low	- Open in throttle actuator circuit - Throttle actuator - ECM	Comes on	DTC stored	Click here
P2103	Throttle Actuator Control Motor Circuit High	- Short in throttle actuator circuit - Throttle actuator - Throttle valve - Throttle body assembly - ECM	Comes on	DTC stored	Click here
P2111	Throttle Actuator Control System - Stuck Open	- Throttle actuator - Throttle body assembly - Throttle valve	Comes on	DTC stored	Click here
P2112	Throttle Actuator Control System - Stuck Closed	- Throttle actuator - Throttle body assembly - Throttle valve	Comes on	DTC stored	Click here
P2118	Throttle Actuator Control Motor Current Range / Performance	- Open in ETCS power source circuit - Battery - Battery terminals - ETCS fuse - ECM	Comes on	DTC stored	Click here
P2119	Throttle Actuator Control Throttle Body Range / Performance	- ETCS - ECM	Comes on	DTC stored	Click here
P2120	Throttle / Pedal Position Sensor / Switch "D" Circuit	- APP sensor - ECM	Comes on	DTC stored	Click here
P2121	Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance	- Accelerator Pedal Position (APP) sensor - ECM	Comes on	DTC stored	Click here
P2122	Throttle / Pedal Position Sensor / Switch "D" Circuit Low Input	- APP sensor - Open in VCPA circuit - Open or ground short in VPA circuit - ECM	Comes on	DTC stored	Click here
P2123	Throttle / Pedal Position Sensor / Switch "D" Circuit High Input	- APP sensor - Open in EPA circuit - ECM	Comes on	DTC stored	Click here
P2125	Throttle / Pedal Position Sensor / Switch "E" Circuit	- APP sensor - ECM	Comes on	DTC stored	Click here
P2127	Throttle / Pedal Position Sensor / Switch "E" Circuit Low Input	- APP sensor - Open in VCP2 circuit - Open or ground short in VPA2 circuit - ECM	Comes on	DTC stored	Click here
P2128	Throttle / Pedal Position Sensor / Switch "E" Circuit High Input	- APP sensor - Open in EPA2 circuit - ECM	Comes on	DTC stored	Click here
P2135	Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation	- Short between VTA1 and VTA2 circuits - TP sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P2138	Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation	- Short between VPA and VPA2 circuits - APP sensor	Comes on	DTC stored	Click here

		- ECM			
P2195	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2196	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2197	Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2198	Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - Air induction system - Fuel pressure - Fuel injector - ECM	Comes on	DTC stored	Click here
P2237	Oxygen (A/F) Sensor Pumping Current Circuit / Open (Bank 1 Sensor 1)	- Open in Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) circuit - Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2238	Oxygen (A/F) Sensor Pumping Current Circuit Low (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2239	Oxygen (A/F) Sensor Pumping Current Circuit High (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2240	Oxygen (A/F) Sensor Pumping Current Circuit / Open (Bank 2 Sensor 1)	- Open in Air Fuel Ratio (A/F) sensor (for Bank 2 Sensor 1) circuit - Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2241	Oxygen (A/F) Sensor Pumping Current Circuit Low (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2242	Oxygen (A/F) Sensor Pumping Current Circuit High (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2252	Oxygen (A/F) Sensor Reference Ground Circuit Low (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2253	Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 1 Sensor 1)	- Open or short in A/F sensor (for Bank 1 Sensor 1) circuit - A/F sensor (for Bank 1 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2255	Oxygen (A/F) Sensor Reference Ground Circuit Low (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1)	Comes on	DTC stored	Click here

		- ECM			
P2256	Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 2 Sensor 1)	- Open or short in A/F sensor (for Bank 2 Sensor 1) circuit - A/F sensor (for Bank 2 Sensor 1) - ECM	Comes on	DTC stored	Click here
P2431	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Range / Performance Bank1	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2432	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Low Bank1	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2433	Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank1	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2436	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Range / Performance Bank 2	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2437	Secondary Air Injection System Air Flow / Pressure Sensor Circuit Low Bank 2	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2438	Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank 2	- Pressure sensor - Open or short in pressure sensor circuit - ECM	Comes on	DTC stored	Click here
P2440	Secondary Air Injection System Switching Valve Stuck Open Bank1	- ASV - Open or short in ASV circuit - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2441	Secondary Air Injection System Switching Valve Stuck Close Bank1	- ASV - Open or short in ASV circuit - Vacuum hose (ASV - pressure sensor) - Air injection hose - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2442	Secondary Air Injection System Switching Valve Stuck Open Bank 2	- ASV - Open or short in ASV circuit - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2443	Secondary Air Injection System Switching Valve Stuck Closed Bank 2	- ASV - Open or short in ASV circuit - Vacuum hose (ASV - pressure sensor) - Air injection hose - Pressure sensor - Pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2444	Secondary Air Injection System Pump Stuck On Bank1	- Short in air pump circuit - Open or short in pressure sensor circuit - Pressure sensor - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2445	Secondary Air Injection System Pump Stuck Off Bank1	- Air pump - Open in air pump circuit - Air injection system piping - Vacuum hose (pressure sensor - air switching valve) - Pressure sensor - Open or short in pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2446	Secondary Air Injection System Pump Stuck On Bank 2	- Short in air pump circuit - Open or short in pressure sensor circuit - Pressure sensor - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
		- Air pump			

P2447	Secondary Air Injection System Pump Stuck Off Bank 2	- Open in air pump circuit - Air injection system piping - Vacuum hose (pressure sensor - air switching valve) - Pressure sensor - Open or short in pressure sensor circuit - Air Injection Control Driver (AID) - ECM	Comes on	DTC stored	Click here
P2A00	A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)	- Open or short in A/F sensor circuit (for Bank 1) - A/F sensor (for Bank 1) - ECM	Comes on	DTC stored	Click here
P2A03	A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)	- Open or short in A/F sensor circuit (for Bank 2) - A/F sensor (for Bank 2) - ECM	Comes on	DTC stored	Click here

for Preparation Click here

HINT:

Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.

For details of each DTC, refer to the "See page" below.

*: The MIL flashes when a catalyst damaged misfire is detected.

SFI System

DTC Code	Detection Item	Trouble Areas	MIL	Memory	See page
P0010	Camshaft Position "A" Actuator Circuit (Bank 1)	- Open or short in OCV for intake camshaft (for Bank 1) circuit - OCV for intake camshaft (for Bank 1) - ECM	Comes on	DTC stored	Click here
P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0013	Camshaft Position "B" Actuator Circuit / Open (Bank 1)	- Open or short in OCV for exhaust camshaft (for Bank 1) circuit - OCV for exhaust camshaft (for Bank 1) - ECM	Comes on	DTC stored	Click here
P0014	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 1)	- Valve timing - Oil control valve (OCV) for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0015	Camshaft Position "B" - Timing Over-Retarded (Bank 1)	- Valve timing - OCV for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0017	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor B)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0018	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0019	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor B)	- Mechanical system (Timing chain has jumped tooth or chain stretched) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0020	Camshaft Position "A" Actuator Circuit (Bank 2)	- Open or short in OCV for intake camshaft (for Bank 2) circuit - OCV for intake camshaft (for Bank 2) - ECM	Comes on	DTC stored	Click here
P0021	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here

P0022	Camshaft Position "A" - Timing Over-Retarded (Bank 2)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0023	Camshaft Position "B" Actuator Circuit / Open (Bank 2)	- Open or short in OCV for exhaust camshaft (for Bank 2) circuit - OCV for exhaust camshaft (for Bank 2) - ECM	Comes on	DTC stored	Click here
P0024	Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 2)	- Valve timing - Oil control valve (OCV) for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0025	Camshaft Position "B" - Timing Over-Retarded (Bank 2)	- Valve timing - OCV for exhaust camshaft - OCV filter - Camshaft timing exhaust gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)	- Open in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0051	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)	- Open in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0052	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for Sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for Sensor 2) - Integration relay - ECM	Comes on	DTC stored	Click here
P0102	Mass or Volume Air Flow Circuit Low Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0103	Mass or Volume Air Flow Circuit High Input	- Open or short in MAF meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0110	Intake Air Temperature Circuit Malfunction	- Open or short in Intake Air Temperature (IAT) sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0112	Intake Air Temperature Circuit Low Input	- Short in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0113	Intake Air Temperature Circuit High Input	- Open in IAT sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0115	Engine Coolant Temperature Circuit Malfunction	- Open or short in Engine Coolant Temperature (ECT) sensor circuit - ECT sensor	Comes on	DTC stored	Click here

P0116	Engine Coolant Temperature Circuit Range / Performance Problem	- ECM - Thermostat - ECT sensor	Comes on	DTC stored	Click here
P0117	Engine Coolant Temperature Circuit Low Input	- Short in ECT sensor - ECT sensor - ECM	Comes on	DTC stored	Click here
P0118	Engine Coolant Temperature Circuit High Input	- Open in ECT sensor circuit - ECT sensor - ECM	Comes on	DTC stored	Click here
P0120	Throttle / Pedal Position Sensor / Switch "A" Circuit Malfunction	- Throttle Position (TP) sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem	TP sensor (built into throttle body)	Comes on	DTC stored	Click here
P0122	Throttle / Pedal Position Sensor / Switch "A" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA1 circuit - Open in VC circuit - ECM	Comes on	DTC stored	Click here
P0123	Throttle / Pedal Position Sensor / Switch "A" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA1 circuit - Open in E2 circuit - Short between VC and VTA1 circuits - ECM	Comes on	DTC stored	Click here
P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)	- Open or short in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - HO2 sensor heater (for Bank 1) - Air Fuel ratio (A/F) sensor (for Bank 1) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)	- Open in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - HO2 sensor heater (for Bank 1) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)	- Short in HO2 sensor (for Bank 1) circuit - HO2 sensor (for Bank 1) - ECM internal circuit malfunction - Air Fuel ratio (A/F) sensor (for Bank 1)	Comes on	DTC stored	Click here
P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)	- Open or short in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - HO2 sensor heater (for Bank 2) - Air Fuel ratio (A/F) sensor (for Bank 2) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)	- Open in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - HO2 sensor heater (for Bank 2) - Integration relay - Gas leakage from exhaust system	Comes on	DTC stored	Click here
P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)	- Short in HO2 sensor (for Bank 2) circuit - HO2 sensor (for Bank 2) - ECM internal circuit malfunction - Air Fuel ratio (A/F) sensor (for Bank 2)	Comes on	DTC stored	Click here
P0171	System Too Lean (Bank 1)	- Air induction system - Injector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
		- Injector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure			

P0172	System Too Rich (Bank 1)	- Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM	Comes on	DTC stored	Click here
P0174	System Too Lean (Bank 2)	- Air induction system - Injector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
P0175	System Too Rich (Bank 2)	- Injector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure - Gas leakage from exhaust system - Open or short in A/F sensor (for Sensor 1) circuit - A/F sensor (for Sensor 1) - A/F sensor heater (for Sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM	Comes on	DTC stored	Click here
P0220	Throttle / Pedal Position Sensor / Switch "B" Circuit	- TP sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA2 circuit - Open in VC circuit - ECM	Comes on	DTC stored	Click here
P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA2 circuit - Open in E2 circuit - Short between VC and VTA2 circuits - ECM	Comes on	DTC stored	Click here
P0230	Fuel Pump Primary Circuit	- Open or short in fuel pump circuit - Fuel pump - Fuel pump ECU - ECM	-	DTC stored	Click here
P0300	Random / Multiple Cylinder Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0301	Cylinder 1 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections	Comes on/Blinks*	DTC stored	Click here

		- Air induction system - ECM			
P0302	Cylinder 2 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0303	Cylinder 3 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0304	Cylinder 4 Misfire Detected	- Open or short in Engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel injector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve timing - PCV Valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here

DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

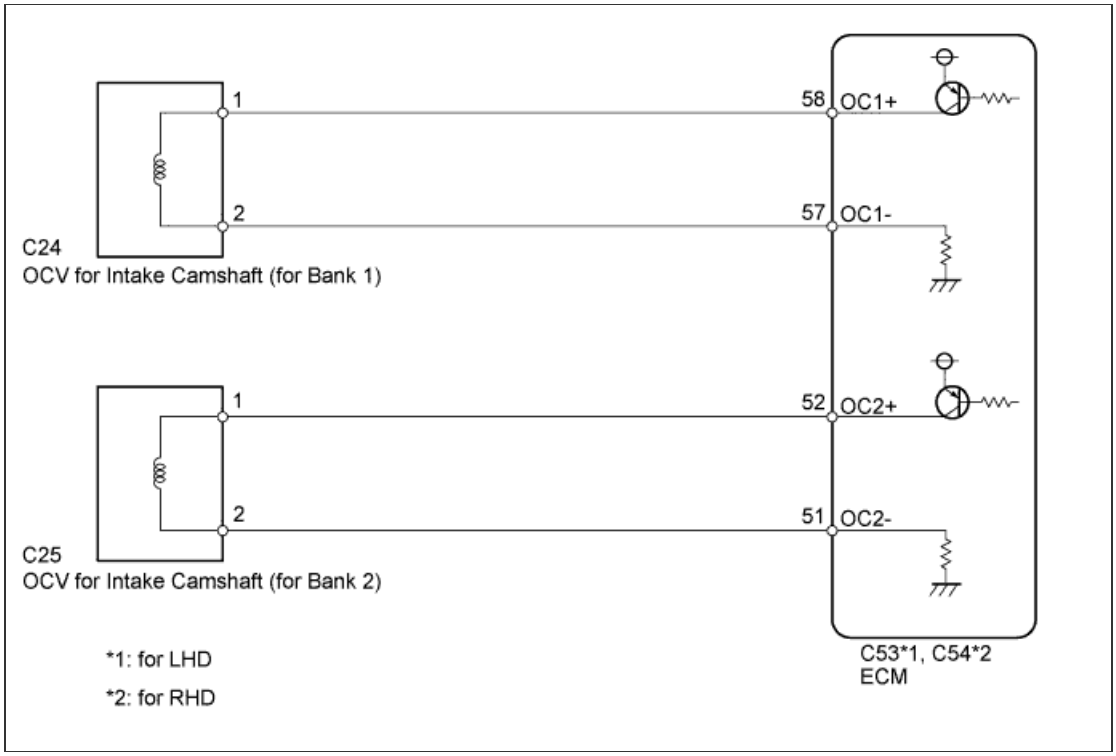
DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the Camshaft Oil Control Valve (OCV) for intake side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for intake side of Bank 1) circuit • OCV (for intake side of Bank 1) • ECM
P0020	An open or short in the OCV for intake side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for intake side of Bank 2) circuit • OCV (for intake side of Bank 2) • ECM



HINT:

This DTC relates to the Camshaft Oil Control Valve (OCV).

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear DTC after recording the freeze frame data and DTC (Click here).

b. Turn the engine switch off.

c. Allow the engine to idle and check DTC.

d. Check that P0010 or P0020 is not output.

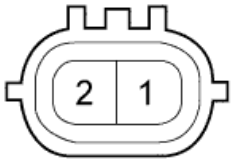
OK:
P0010 or P0020 is not output.

NG → Go to step 2

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY



a. Disconnect the C24 or C25 camshaft oil control valve (OCV) connector.

b. Measure the resistance according to the value(s) in the table below.

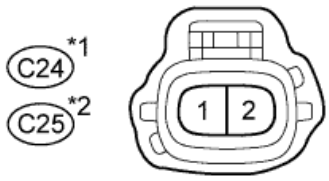
Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

Component without harness connected:
(Oil Control Valve)

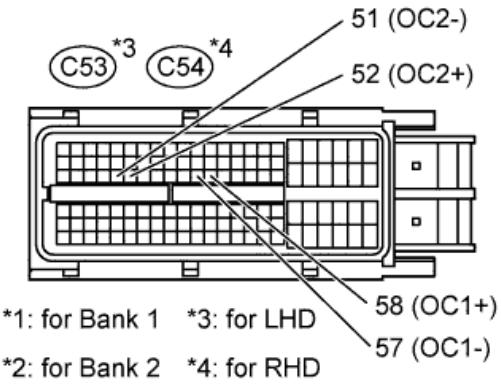
NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK



3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C24 or C25 OCV connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Oil Control Valve)

Front view of wire harness connector:
(to ECM)

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C24-1 - C53-58 (OC1+)	Always	Below 1 Ω
C25-1 - C53-52 (OC2+)	Always	Below 1 Ω
C24-2 - C53-57 (OC1-)	Always	Below 1 Ω
C25-2 - C53-51 (OC2-)	Always	Below 1 Ω

C24-1 or C53-58 (OC1+) - Body ground	Always	10 kΩ or higher
C25-1 or C53-52 (OC2+) - Body ground	Always	10 kΩ or higher
C24-2 or C53-57 (OC1-) - Body ground	Always	10 kΩ or higher
C25-2 or C53-51 (OC2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C24-1 - C54-58 (OC1+)	Always	Below 1 Ω
C25-1 - C54-52 (OC2+)	Always	Below 1 Ω
C24-2 - C54-57 (OC1-)	Always	Below 1 Ω
C25-2 - C54-51 (OC2-)	Always	Below 1 Ω
C24-1 or C54-58 (OC1+) - Body ground	Always	10 kΩ or higher
C25-1 or C54-52 (OC2+) - Body ground	Always	10 kΩ or higher
C24-2 or C54-57 (OC1-) - Body ground	Always	10 kΩ or higher
C25-2 or C54-51 (OC2-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

DESCRIPTION

The intake camshaft Variable Valve Timing (VVT) sensor (VV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The intake camshaft has 3 teeth on its outer circumference. When the intake camshaft rotates, changes occur in the air gaps between the teeth and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the intake camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft position sensor plate has 34 teeth. The crankshaft position sensor generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor (for intake side of Bank 1, 2) signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0343 P0348	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope

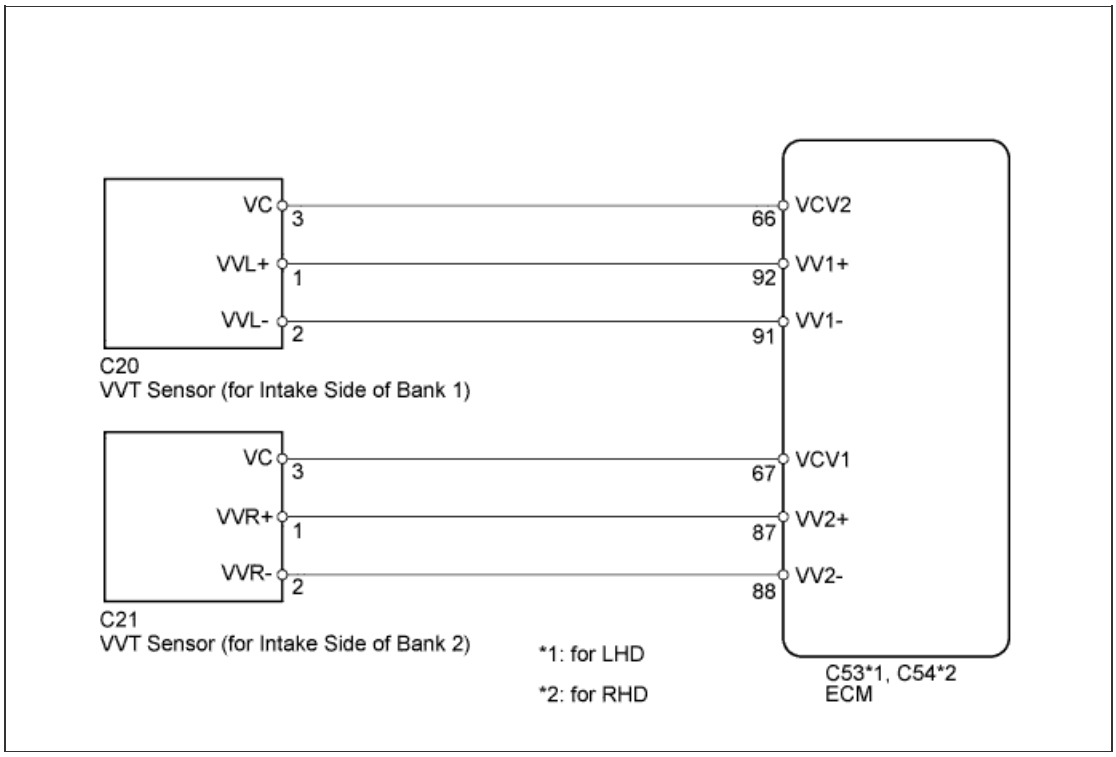
Standard:

for LHD

Tester Connection	Tool Setting	Condition	Specified Condition
C53-110 (NE+) - C53-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-92 (VV1+) - C53-91 (VV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-87 (VV2+) - C53-88 (VV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

for RHD

Tester Connection	Tool Setting	Condition	Specified Condition
C54-110 (NE+) - C54-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-92 (VV1+) - C54-91 (VV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-87 (VV2+) - C54-88 (VV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown



HINT:

VV1+ and VV2+ stand for the VVT sensor (for intake side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

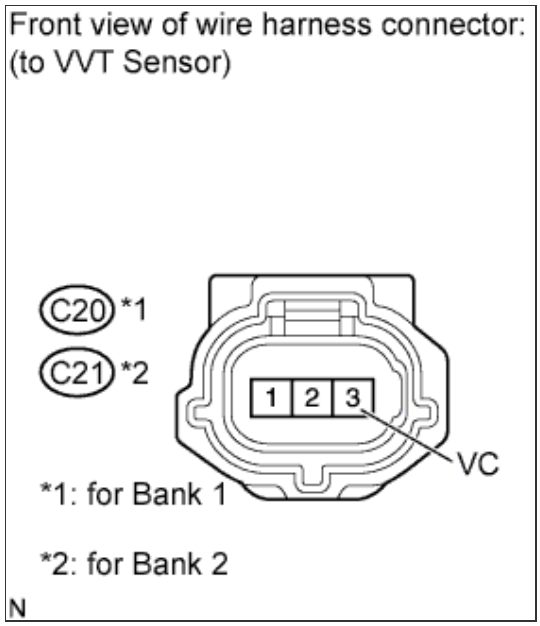
If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

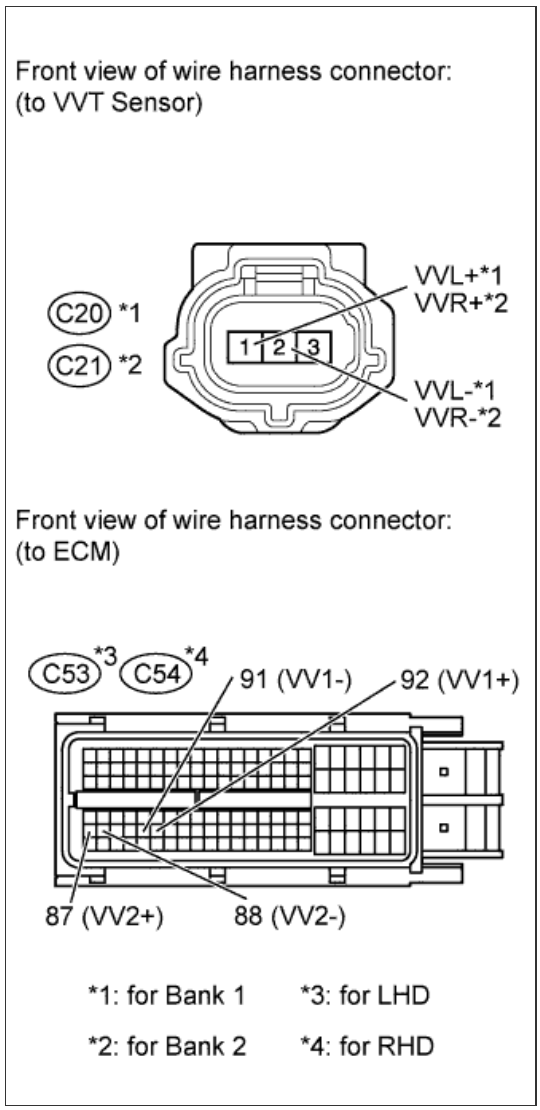
a. Disconnect the C20 or C21 VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C20-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C21-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR FOR INTAKE SIDE - ECM)

a. Disconnect the C20 or C21 VVT sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

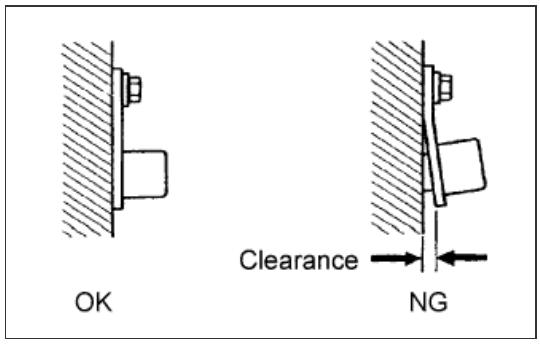
Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (VVL+) - C53-92 (VV1+)	Always	Below 1 Ω
C20-2 (VVL-) - C53-91 (VV1-)	Always	Below 1 Ω
C21-1 (VVR+) - C53-87 (VV2+)	Always	Below 1 Ω
C21-2 (VVR-) - C53-88 (VV2-)	Always	Below 1 Ω
C20-1 (VVL+) or C53-92 (VV1+) - Body ground	Always	10 kΩ or higher
C20-2 (VVL-) or C53-91 (VV1-) - Body ground	Always	10 kΩ or higher
C21-1 (VVR+) or C53-87 (VV2+) - Body ground	Always	10 kΩ or higher
C21-2 (VVR-) or C53-88 (VV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (VVL+) - C54-92 (VV1+)	Always	Below 1 Ω
C20-2 (VVL-) - C54-91 (VV1-)	Always	Below 1 Ω
C21-1 (VVR+) - C54-87 (VV2+)	Always	Below 1 Ω
C21-2 (VVR-) - C54-88 (VV2-)	Always	Below 1 Ω
C20-1 (VVL+) or C54-92 (VV1+) - Body ground	Always	10 kΩ or higher
C20-2 (VVL-) or C54-91 (VV1-) - Body ground	Always	10 kΩ or higher
C21-1 (VVR+) or C54-87 (VV2+) - Body ground	Always	10 kΩ or higher
C21-2 (VVR-) or C54-88 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor (for intake side) installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK INTAKE CAMSHAFT (TEETH)

a. Check the teeth of the camshaft.

OK:
Teeth do not have any cracks or deformation.

NG → REPLACE INTAKE CAMSHAFT (Click here)

OK

5.REPLACE VVT SENSOR (for Intake Side)

a. Replace the VVT sensor (for Intake Side) (Click here).

NEXT

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs.

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No output	A
P0340, P0342, P0343, P0345, P0347 or P0348	B

HINT:

If the engine does not start, replace the ECM.

B → REPLACE ECM (Click here)

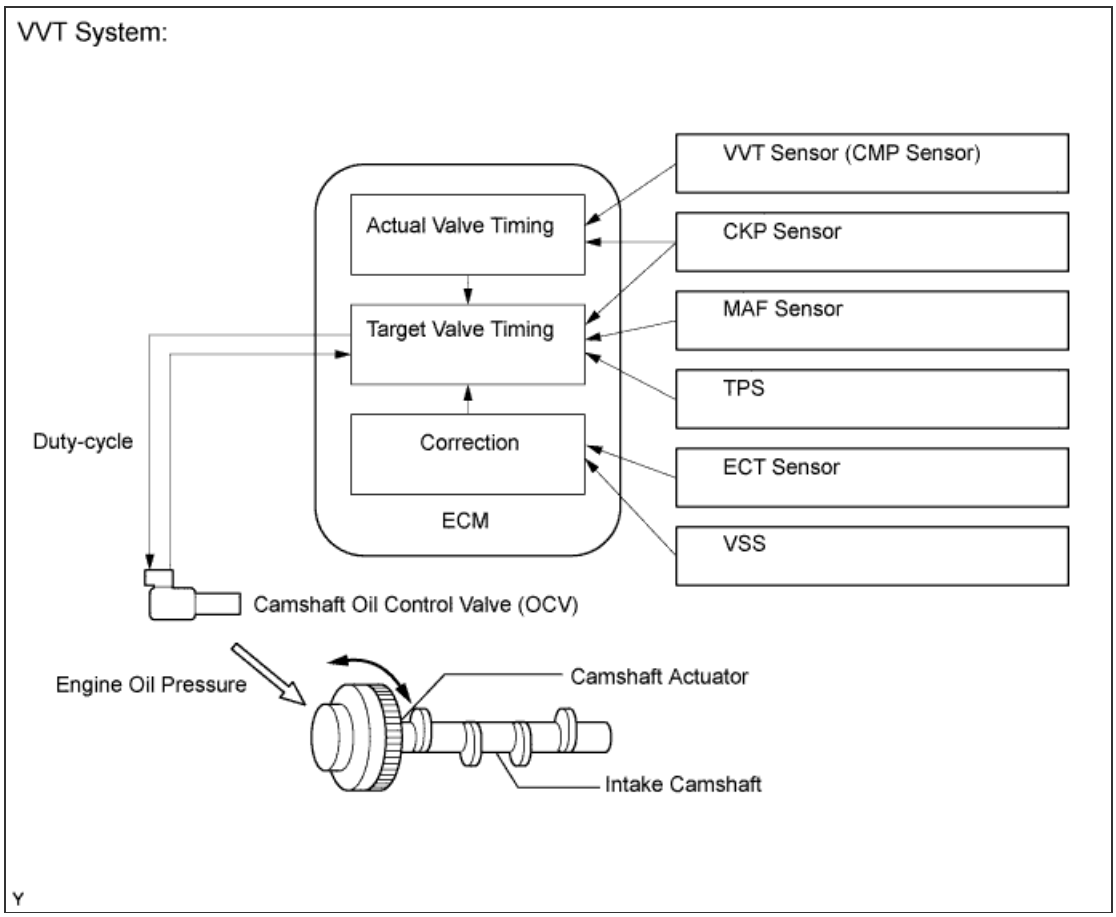
END



DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

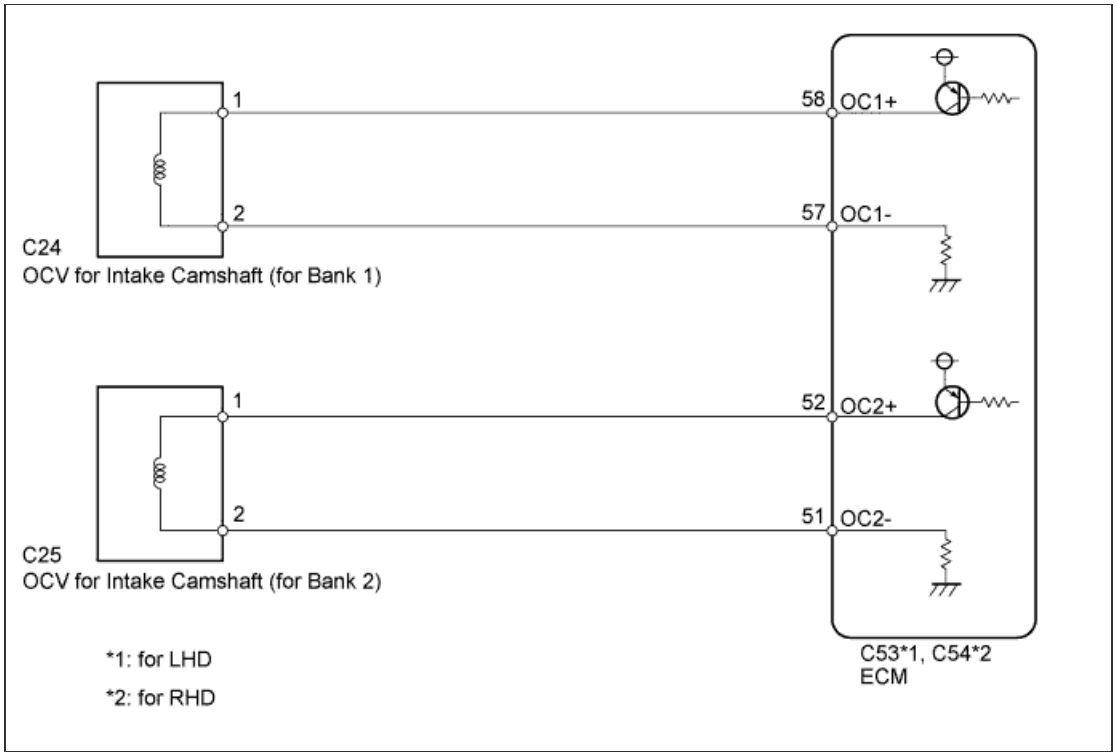
DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the Camshaft Oil Control Valve (OCV) for intake side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for intake side of Bank 1) circuit • OCV (for intake side of Bank 1) • ECM
P0020	An open or short in the OCV for intake side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for intake side of Bank 2) circuit • OCV (for intake side of Bank 2) • ECM



HINT:

This DTC relates to the Camshaft Oil Control Valve (OCV).

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear DTC after recording the freeze frame data and DTC (Click here).

b. Turn the engine switch off.

c. Allow the engine to idle and check DTC.

d. Check that P0010 or P0020 is not output.

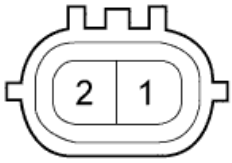
OK:
P0010 or P0020 is not output.

NG → Go to step 2

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY



a. Disconnect the C24 or C25 camshaft oil control valve (OCV) connector.

b. Measure the resistance according to the value(s) in the table below.

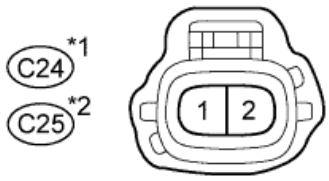
Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

Component without harness connected:
(Oil Control Valve)

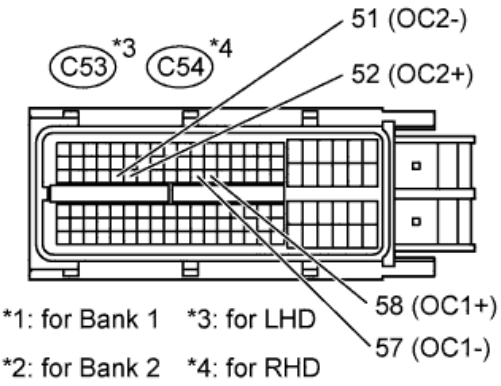
NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK



3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C24 or C25 OCV connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

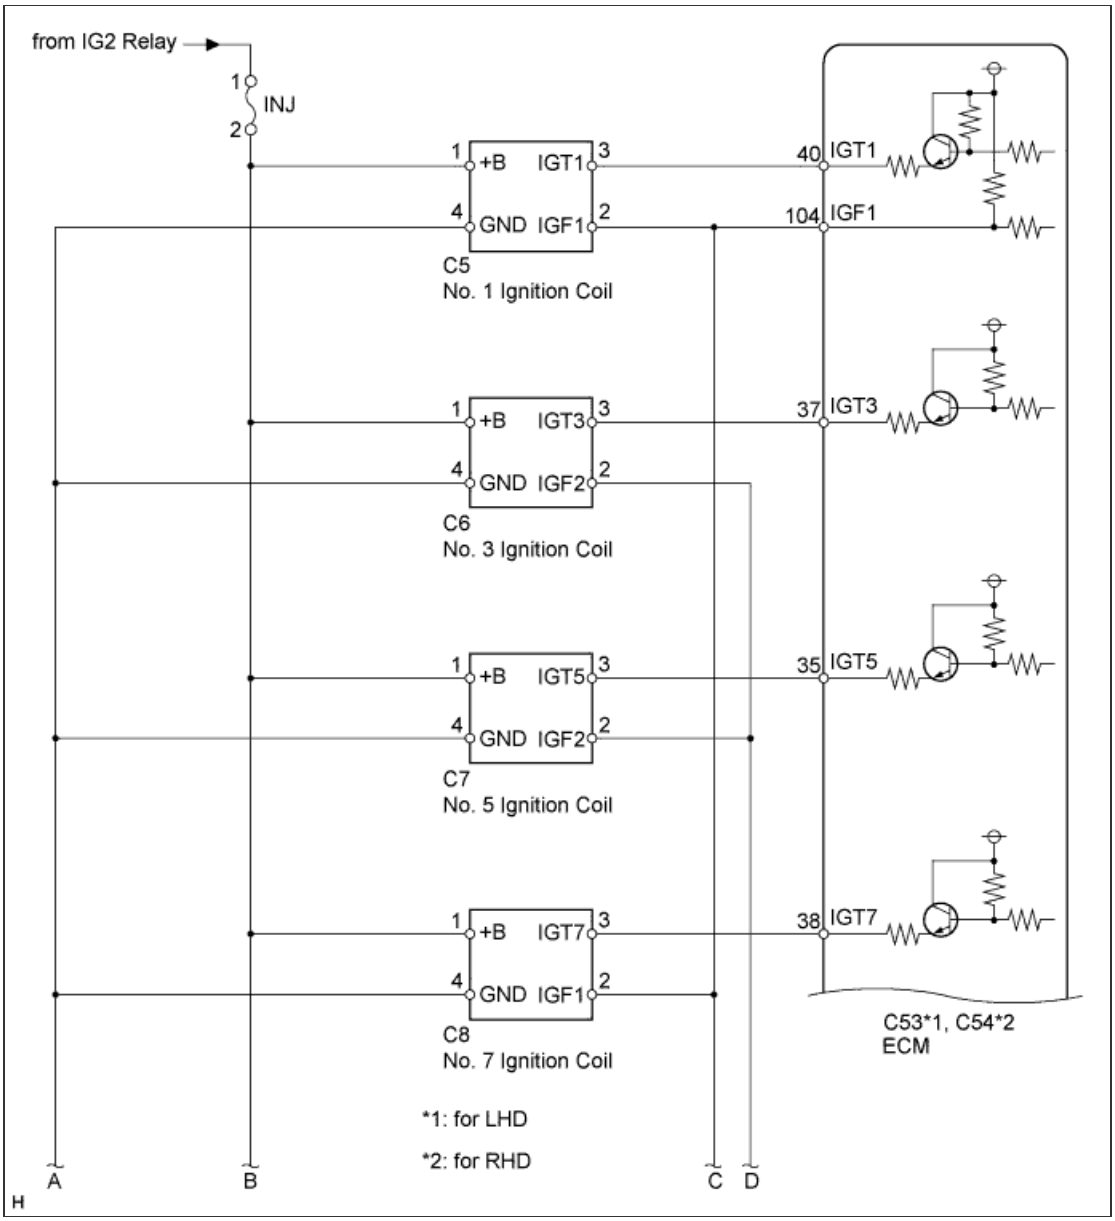
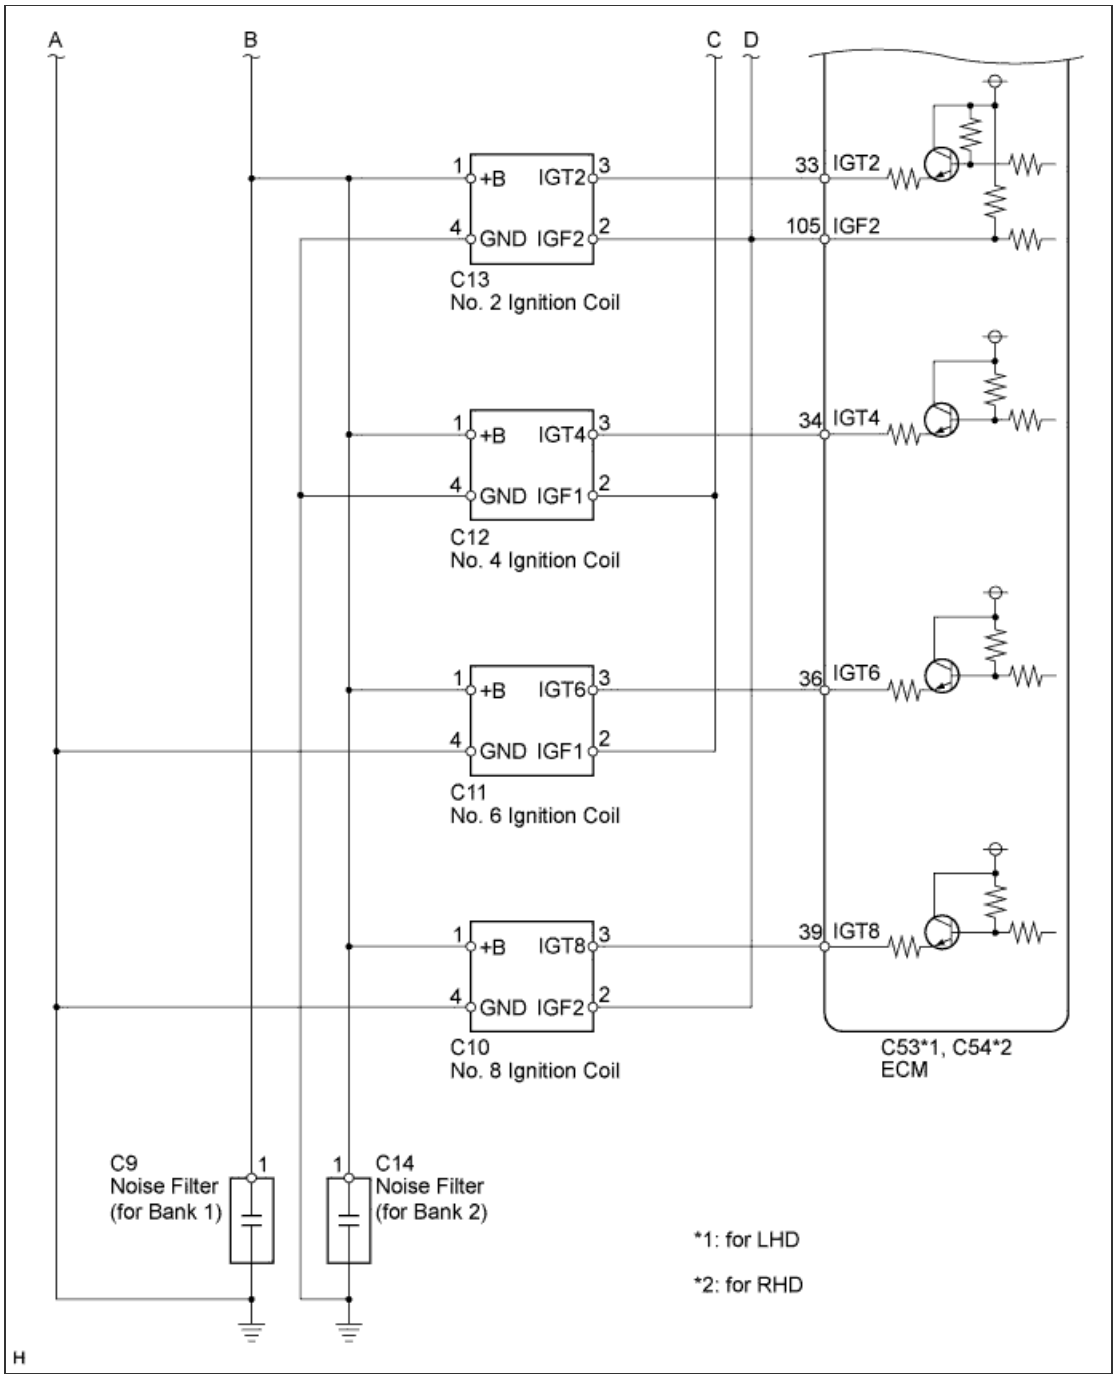
C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:



While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

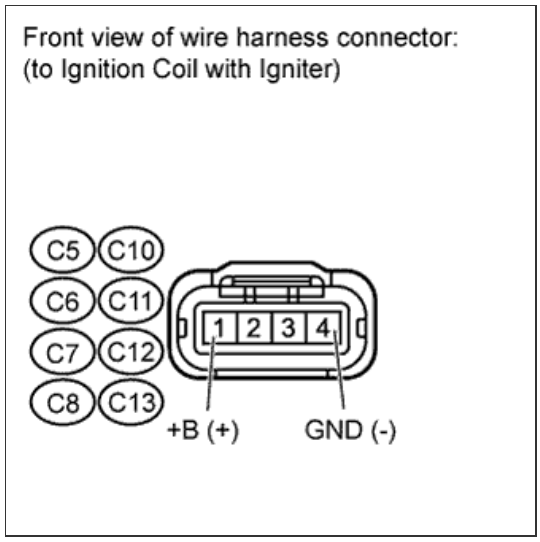
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

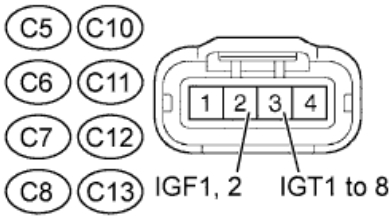
c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

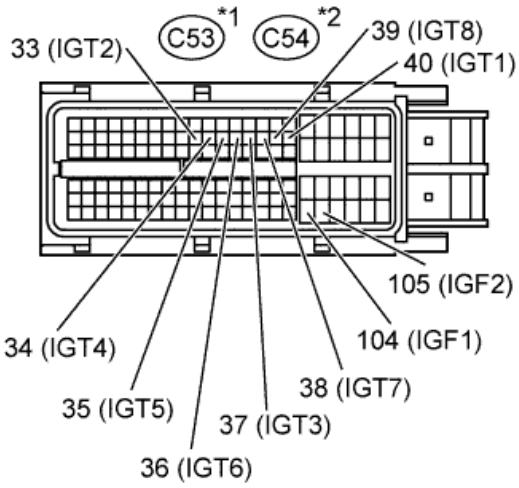
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353, P0354, P0355, P0356, P0357 OR P0358)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Shuffle the arrangement of the ignition coils (among No. 1 to No. 8 cylinders).

NOTICE:

Do not shuffle the connectors.

e. Perform a simulation test.

f. Check DTCs displayed on the tester.

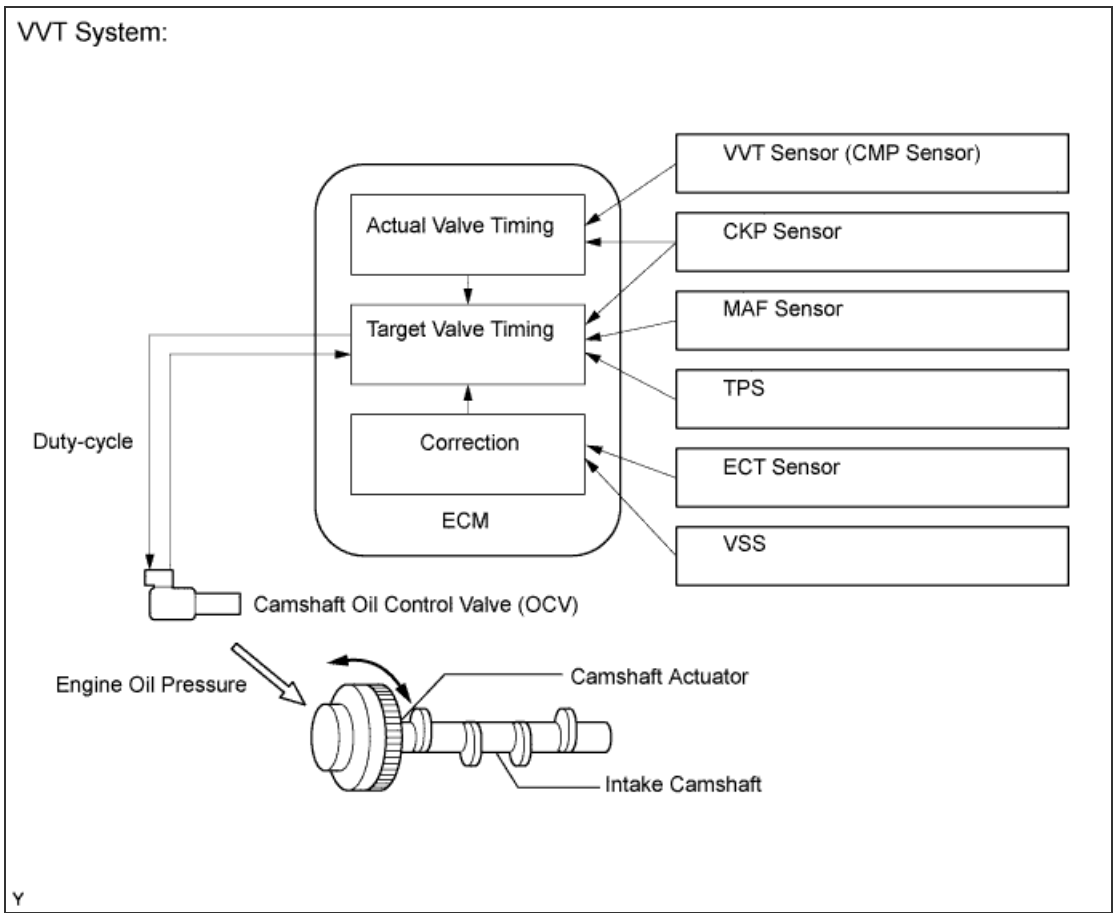
A

REPLACE ECM (Click here)



DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

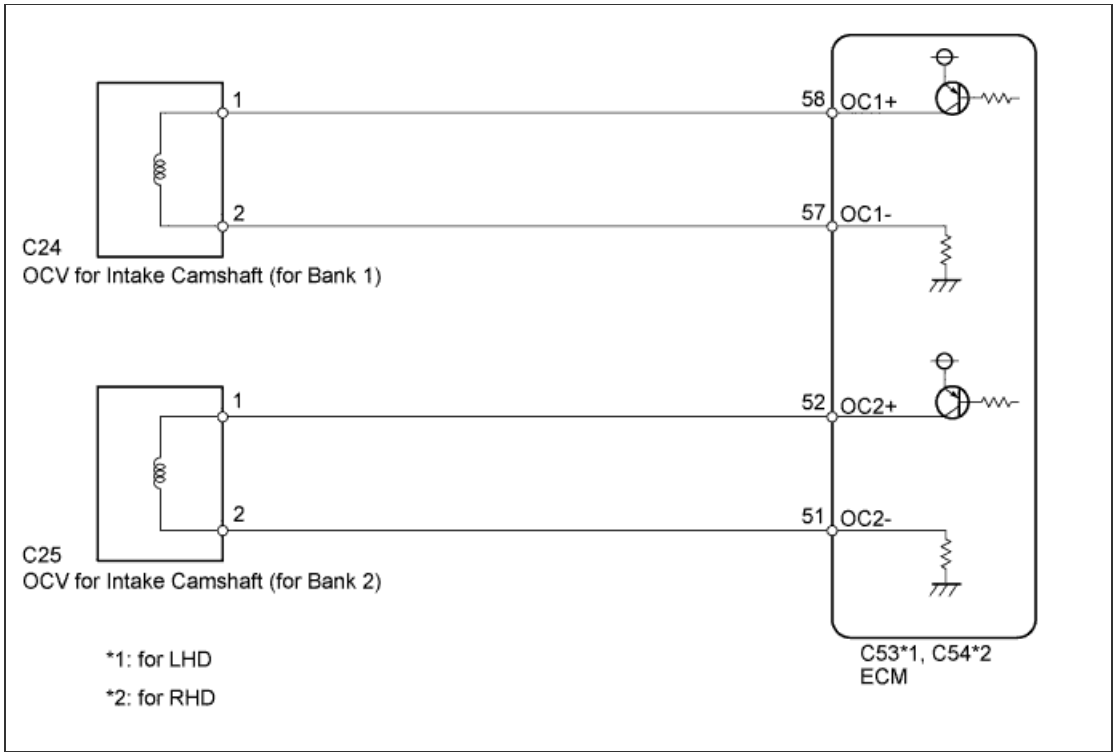
DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the Camshaft Oil Control Valve (OCV) for intake side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for intake side of Bank 1) circuit • OCV (for intake side of Bank 1) • ECM
P0020	An open or short in the OCV for intake side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for intake side of Bank 2) circuit • OCV (for intake side of Bank 2) • ECM



HINT:

This DTC relates to the Camshaft Oil Control Valve (OCV).

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear DTC after recording the freeze frame data and DTC (Click here).

b. Turn the engine switch off.

c. Allow the engine to idle and check DTC.

d. Check that P0010 or P0020 is not output.

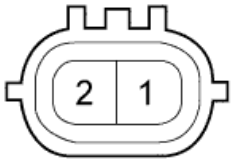
OK:
P0010 or P0020 is not output.

NG → Go to step 2

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY



a. Disconnect the C24 or C25 camshaft oil control valve (OCV) connector.

b. Measure the resistance according to the value(s) in the table below.

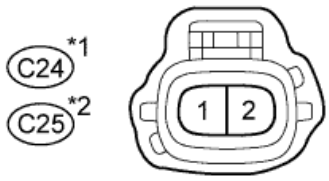
Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

Component without harness connected:
(Oil Control Valve)

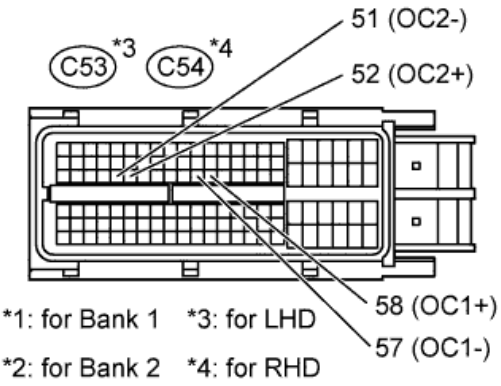
NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK



3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C24 or C25 OCV connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

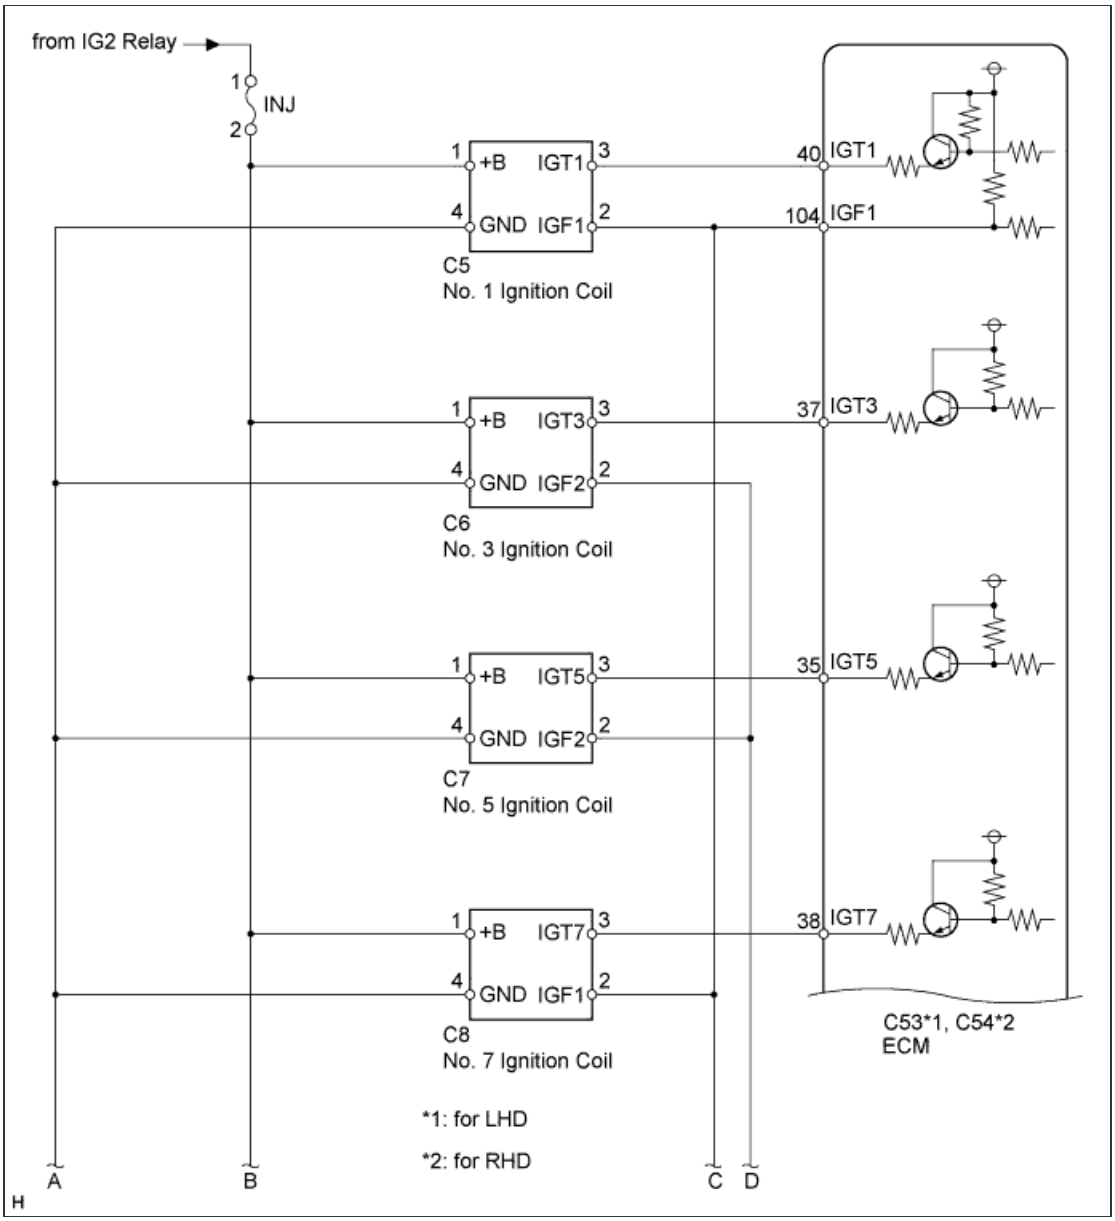
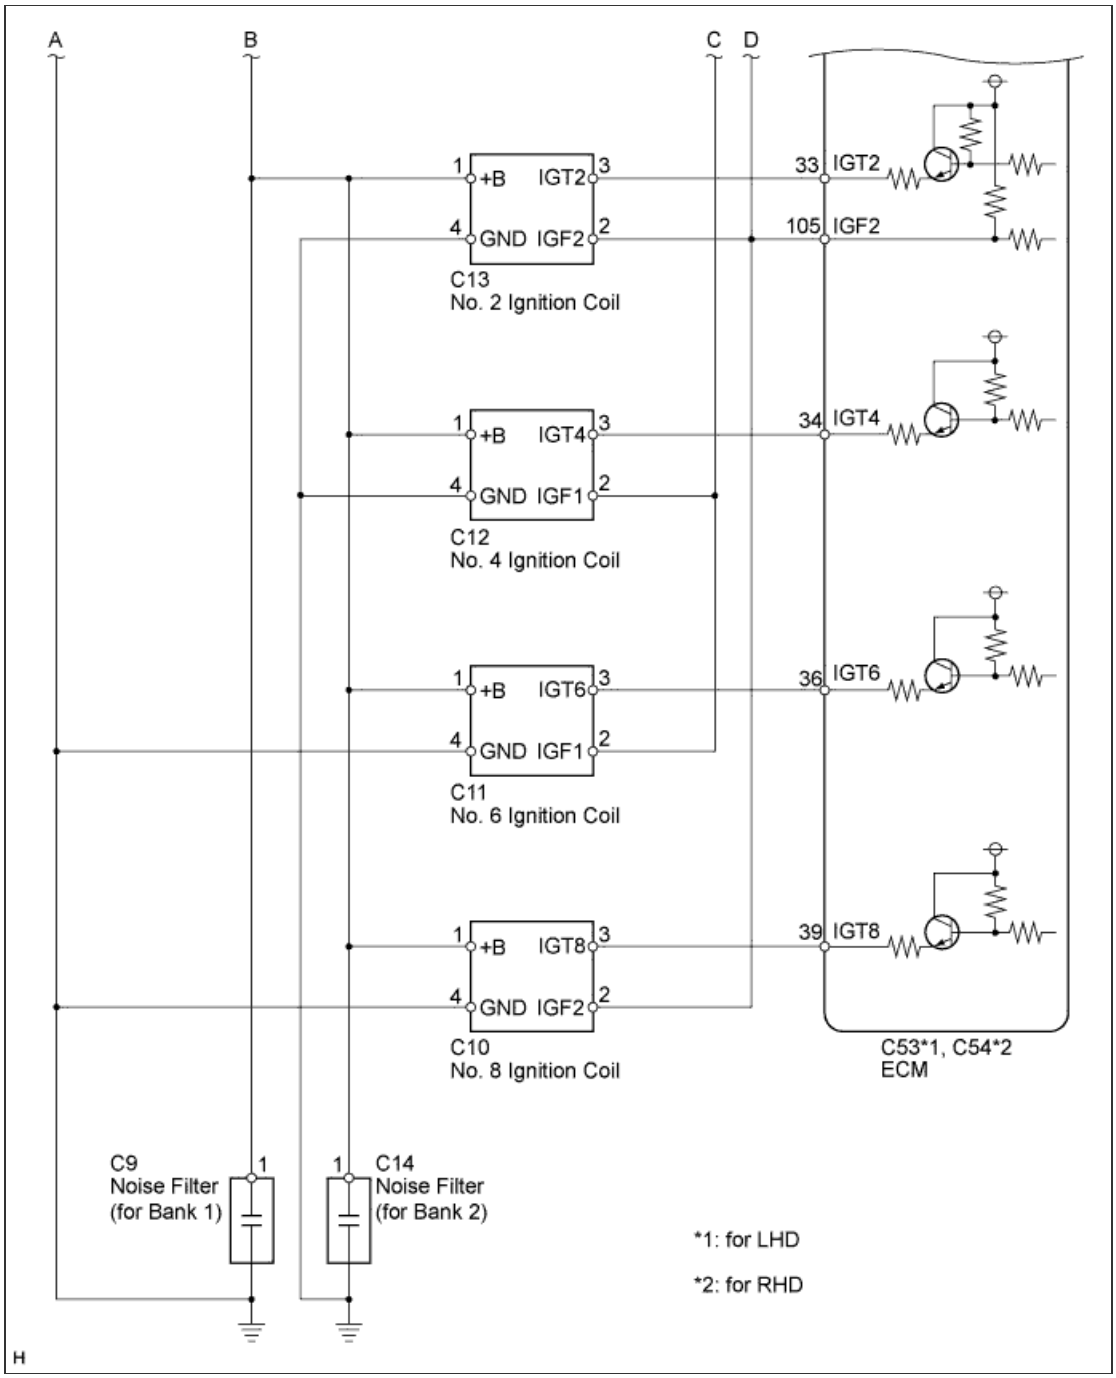
HINT:



While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

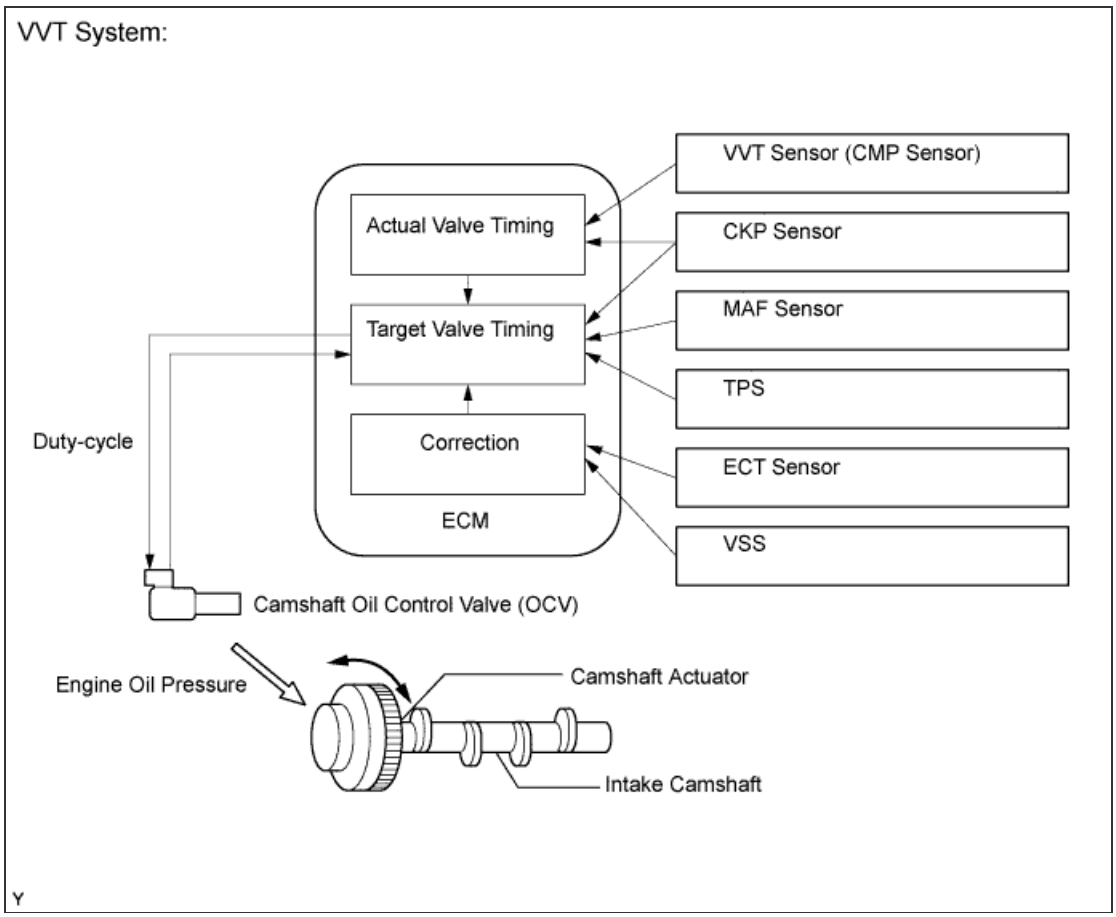
REPLACE ECM (Click here)



DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

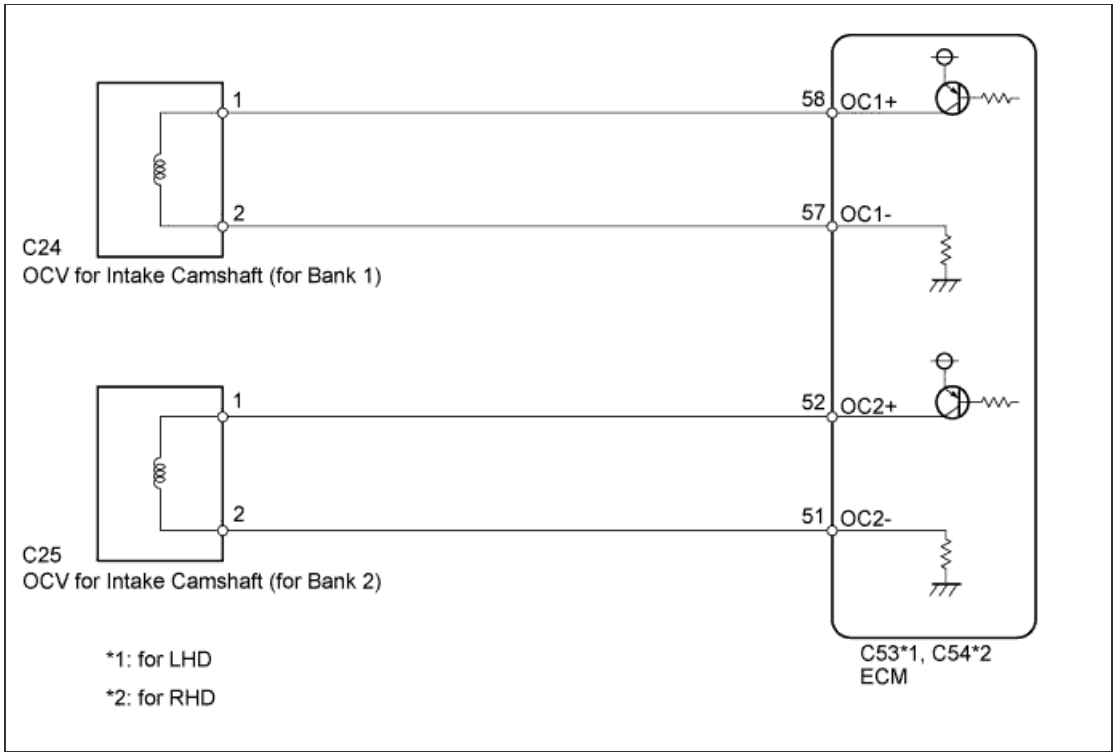
DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the Camshaft Oil Control Valve (OCV) for intake side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for intake side of Bank 1) circuit • OCV (for intake side of Bank 1) • ECM
P0020	An open or short in the OCV for intake side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for intake side of Bank 2) circuit • OCV (for intake side of Bank 2) • ECM



HINT:

This DTC relates to the Camshaft Oil Control Valve (OCV).

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear DTC after recording the freeze frame data and DTC (Click here).

b. Turn the engine switch off.

c. Allow the engine to idle and check DTC.

d. Check that P0010 or P0020 is not output.

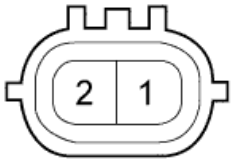
OK:
P0010 or P0020 is not output.

NG → Go to step 2

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY



a. Disconnect the C24 or C25 camshaft oil control valve (OCV) connector.

b. Measure the resistance according to the value(s) in the table below.

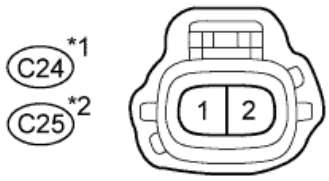
Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

Component without harness connected:
(Oil Control Valve)

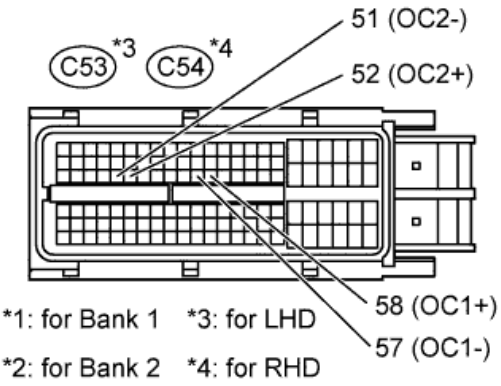
NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK



3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C24 or C25 OCV connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

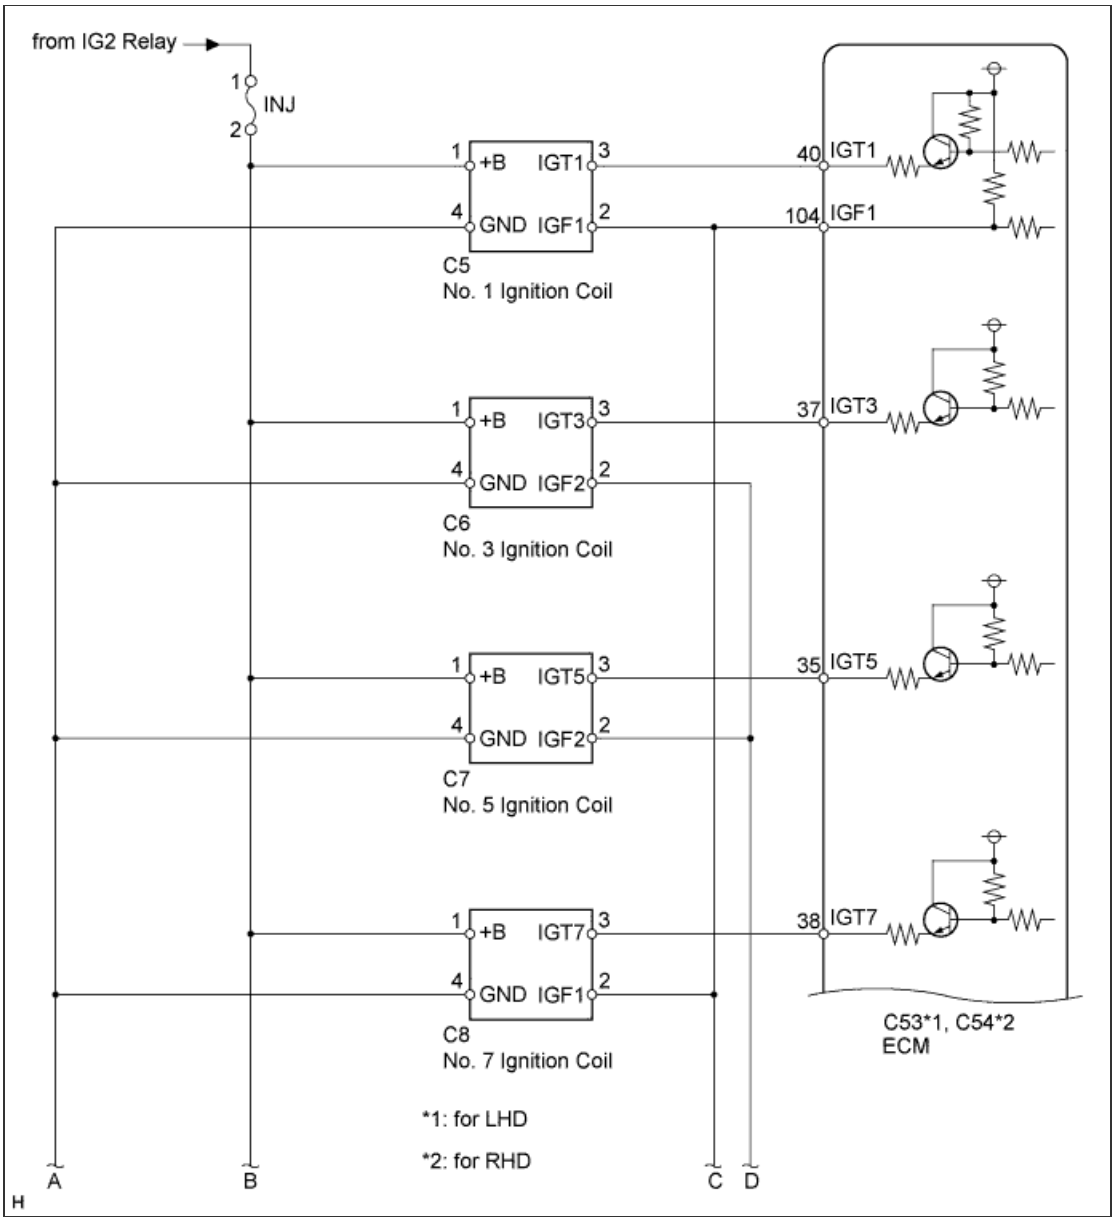
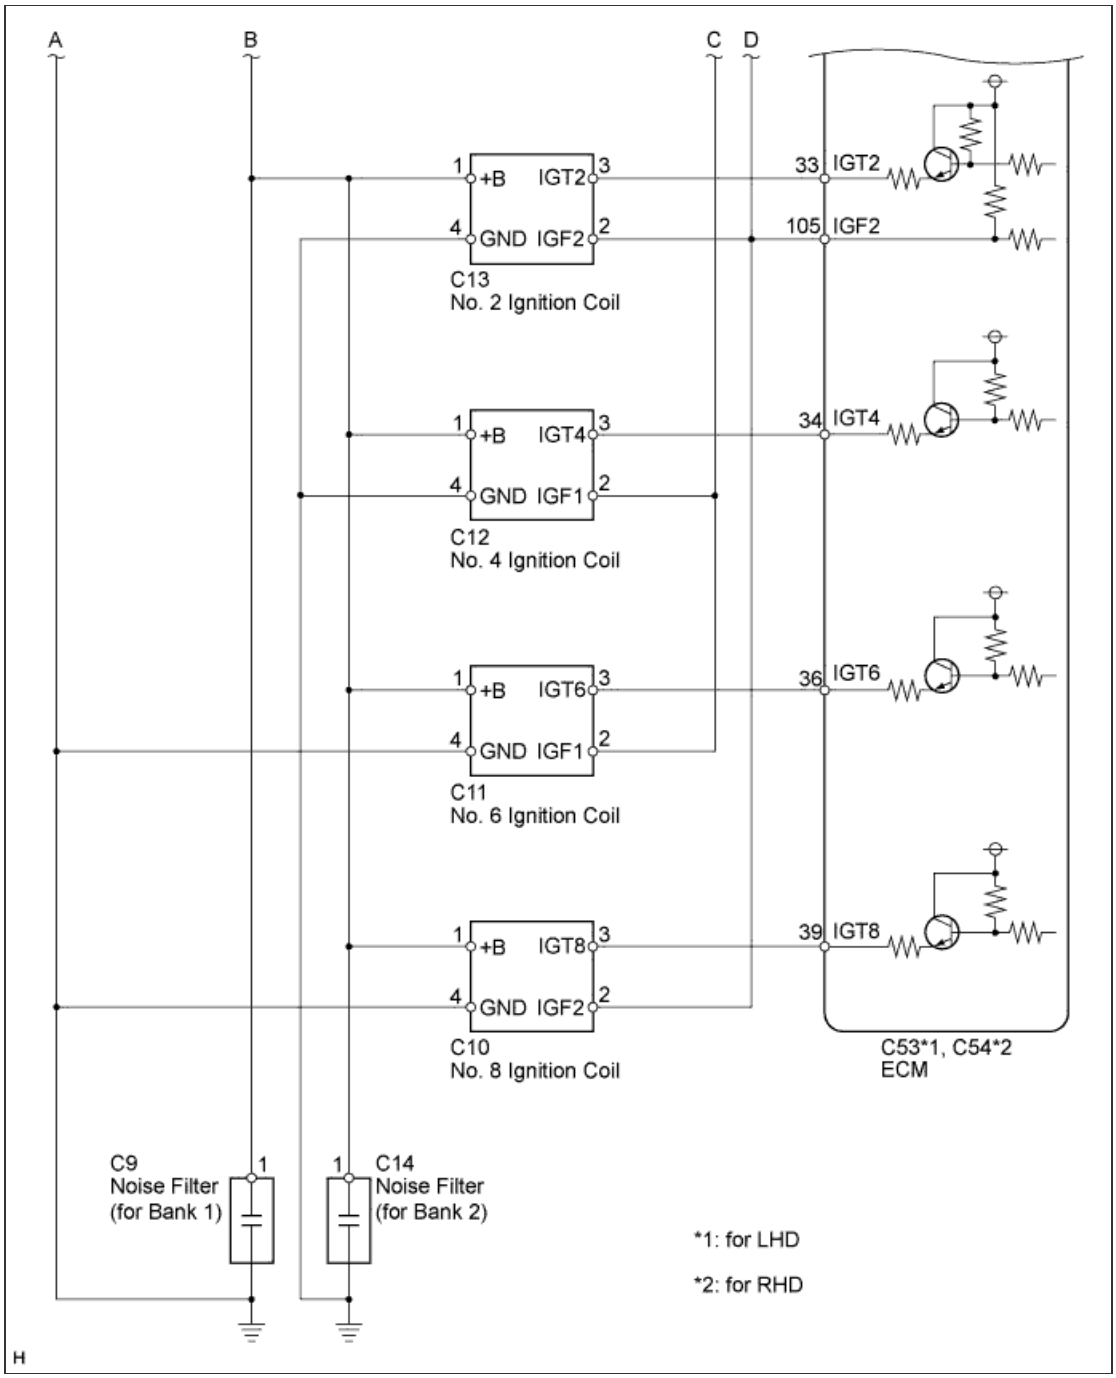
HINT:



While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

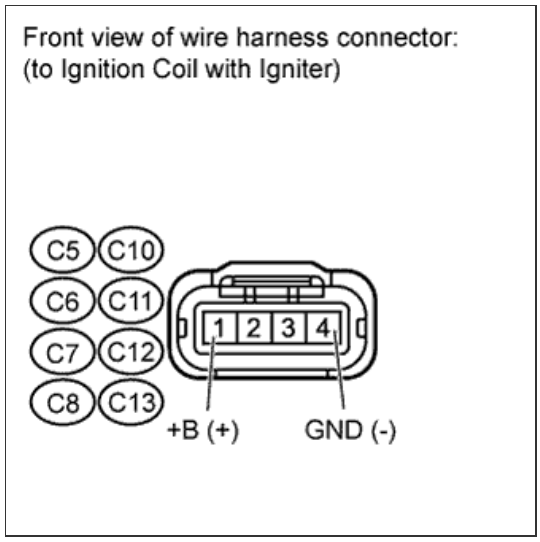
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

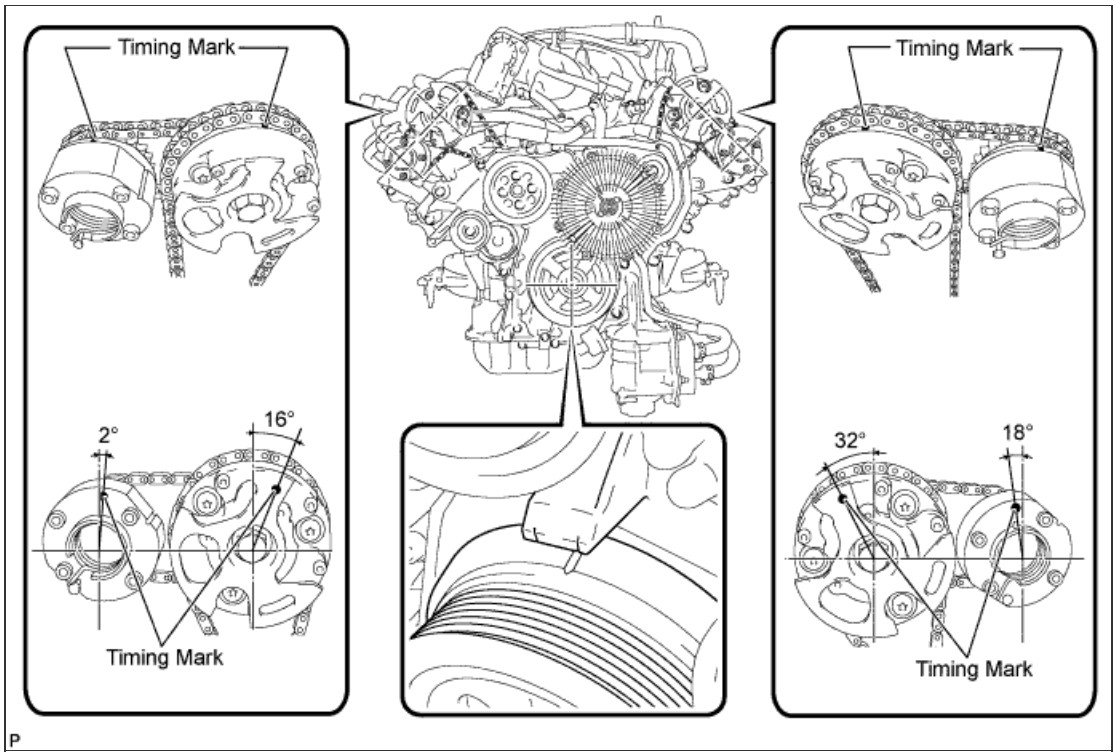
c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.



OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

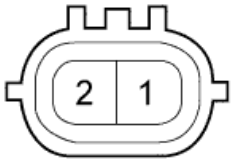
OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

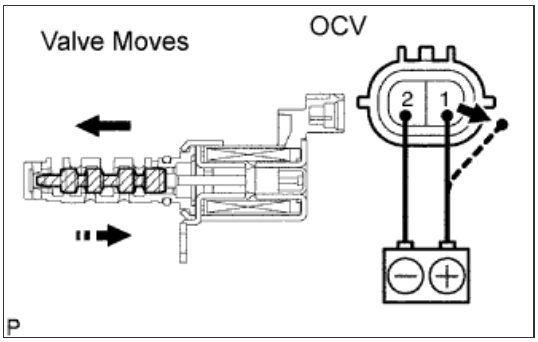
a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

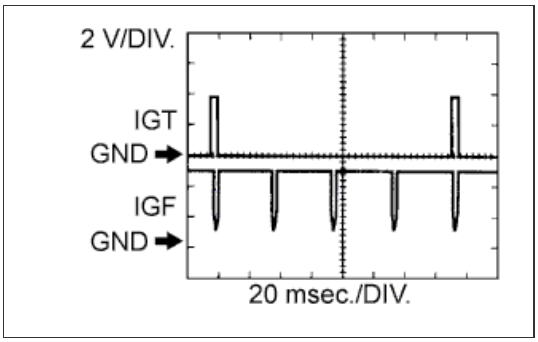
DESCRIPTION

HINT:



- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

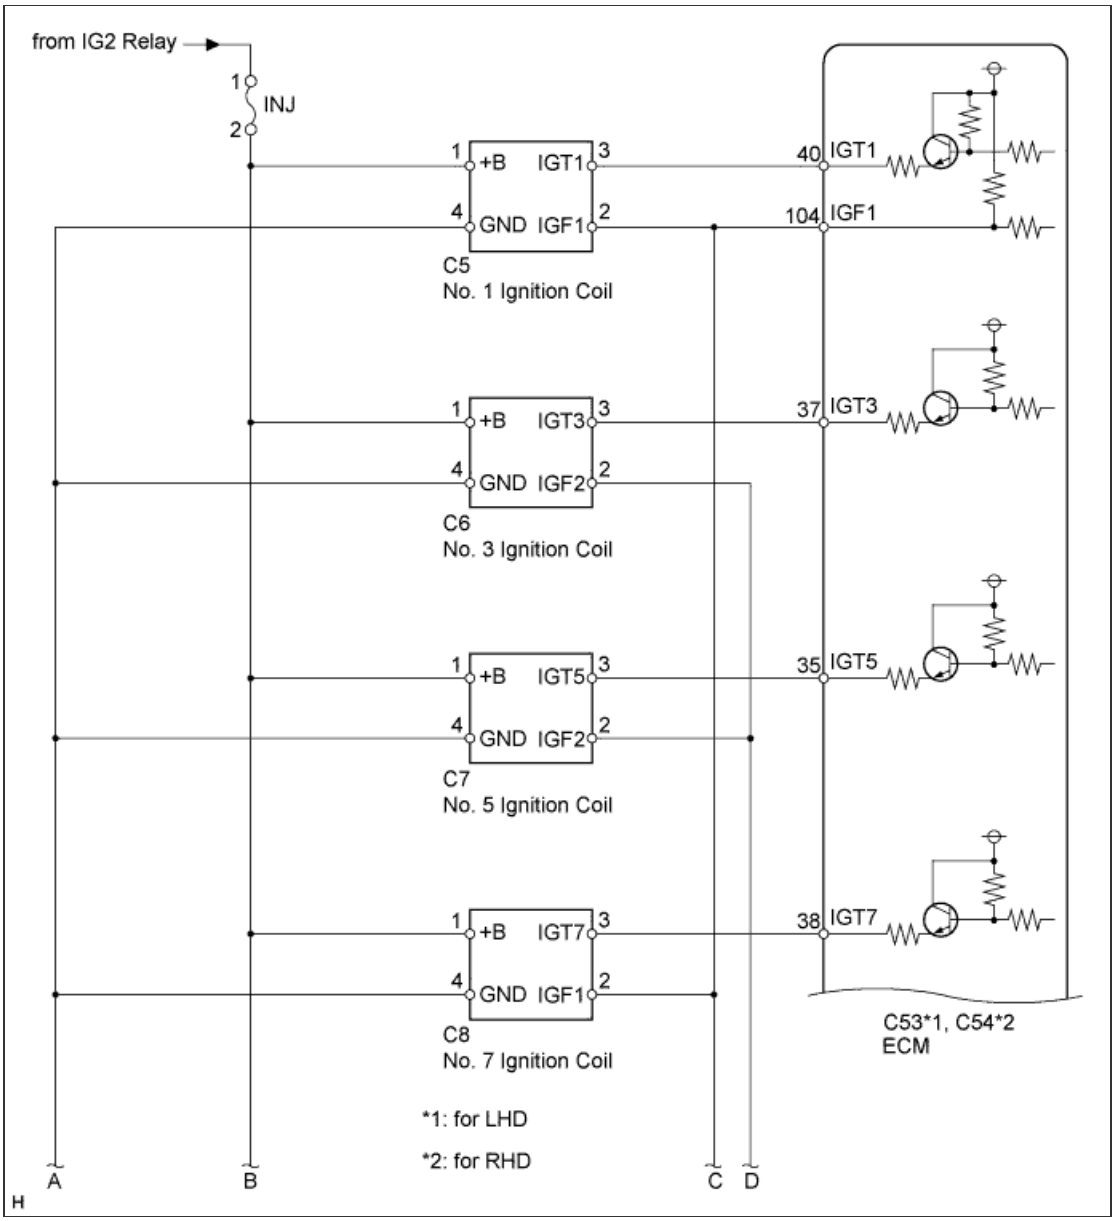
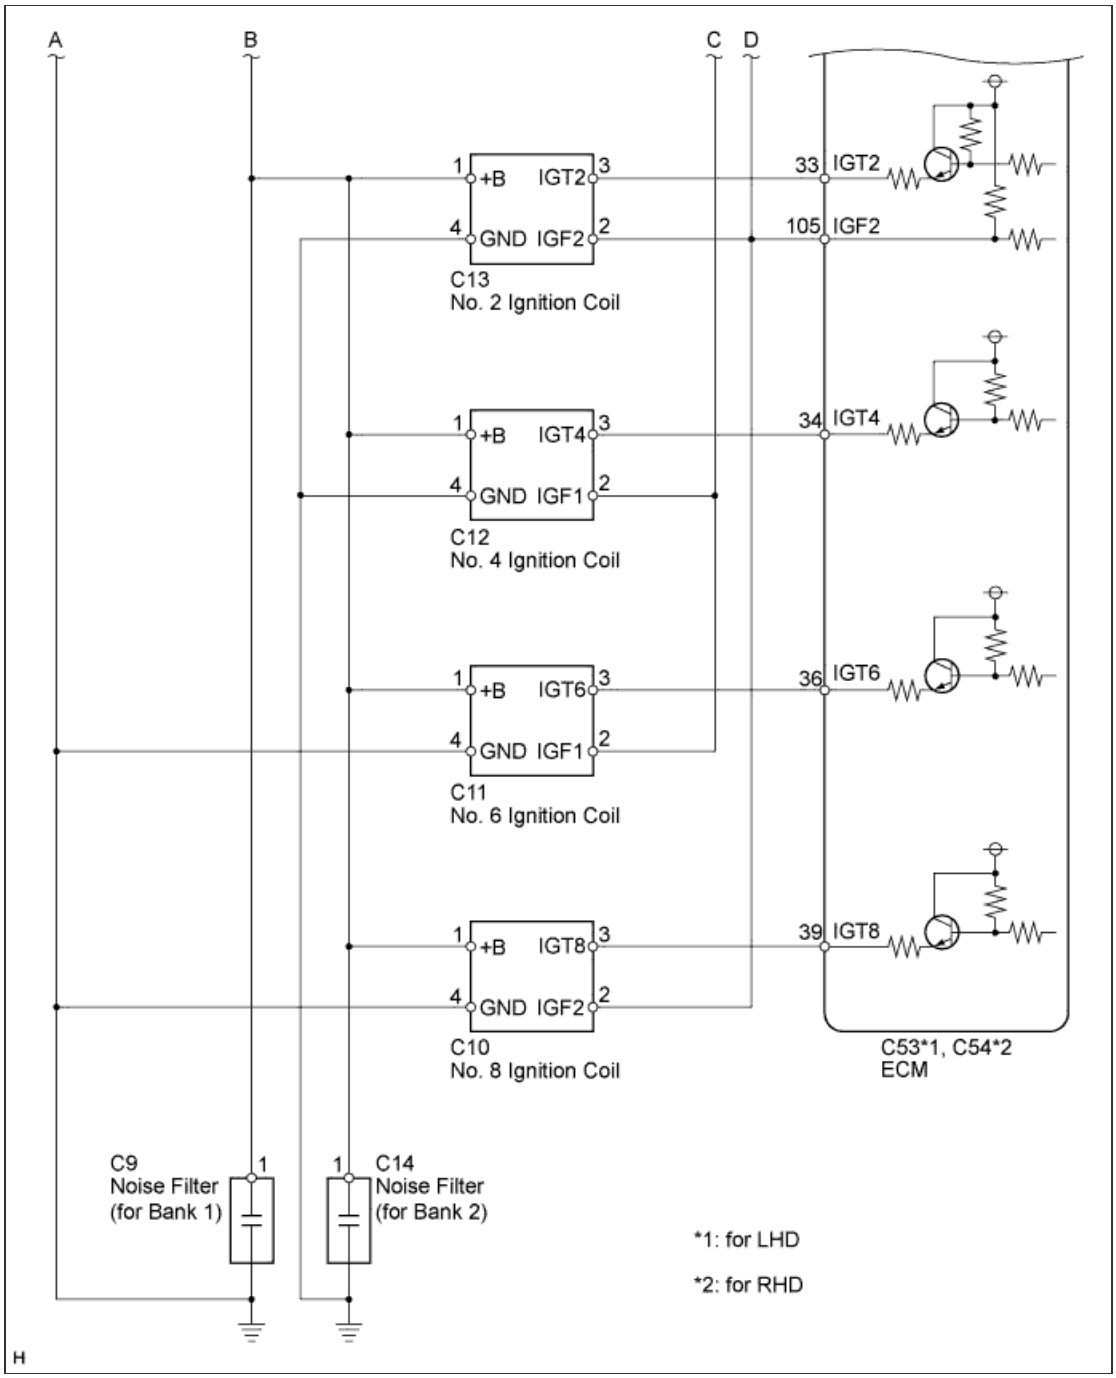
C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:



While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

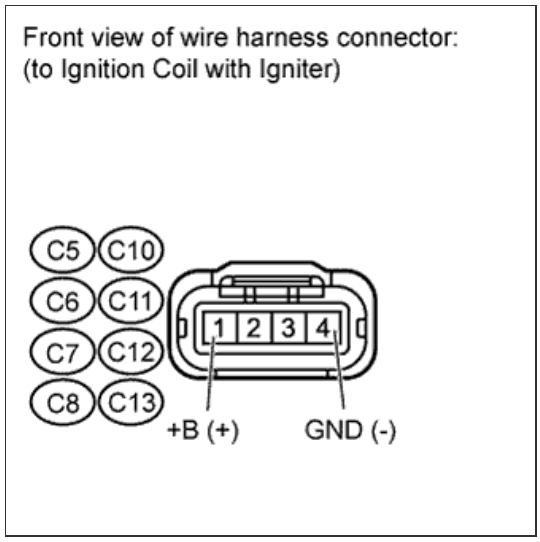
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

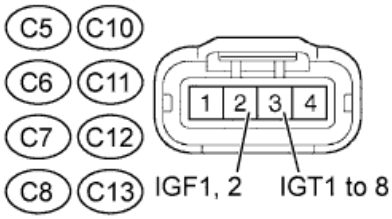
c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

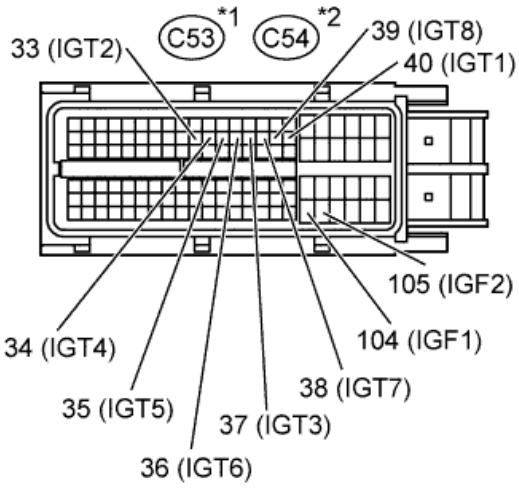
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

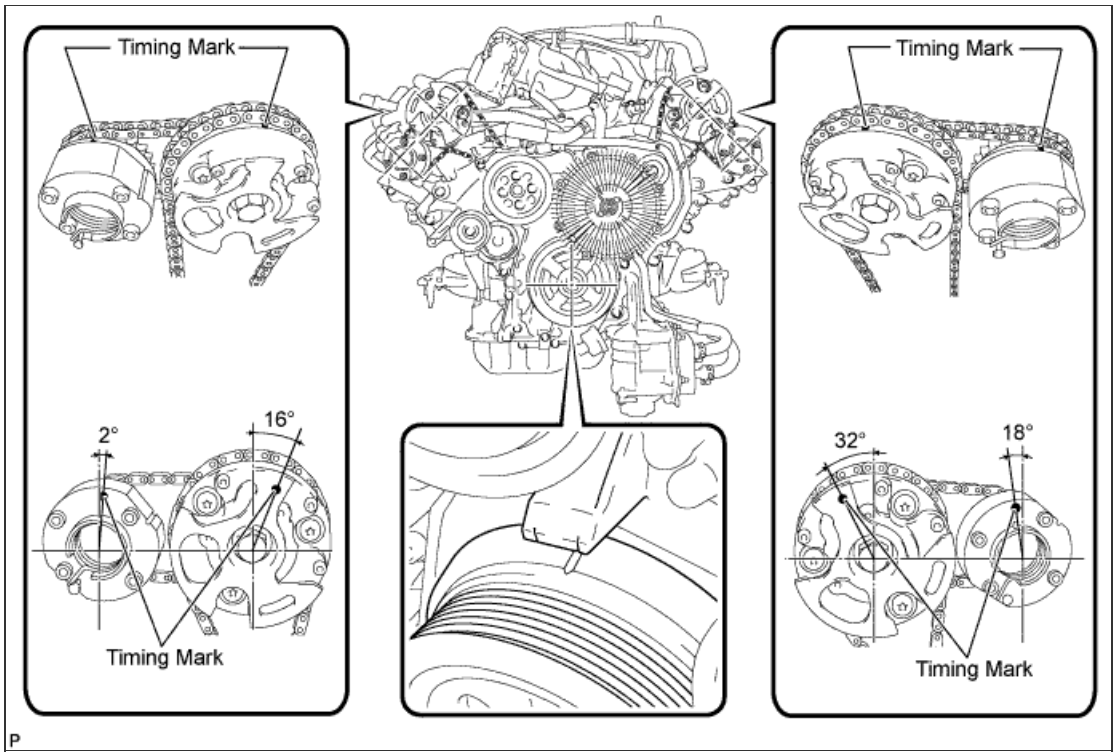
c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.



OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

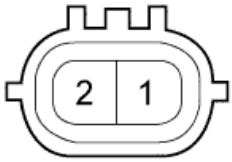
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

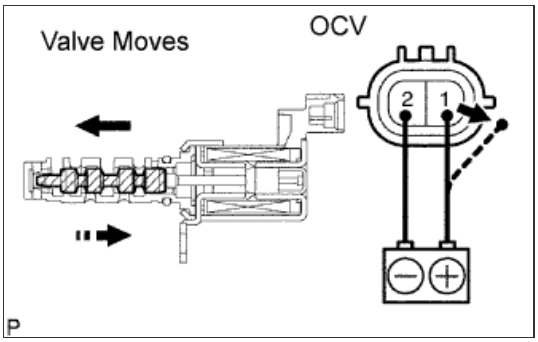
a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

HINT:

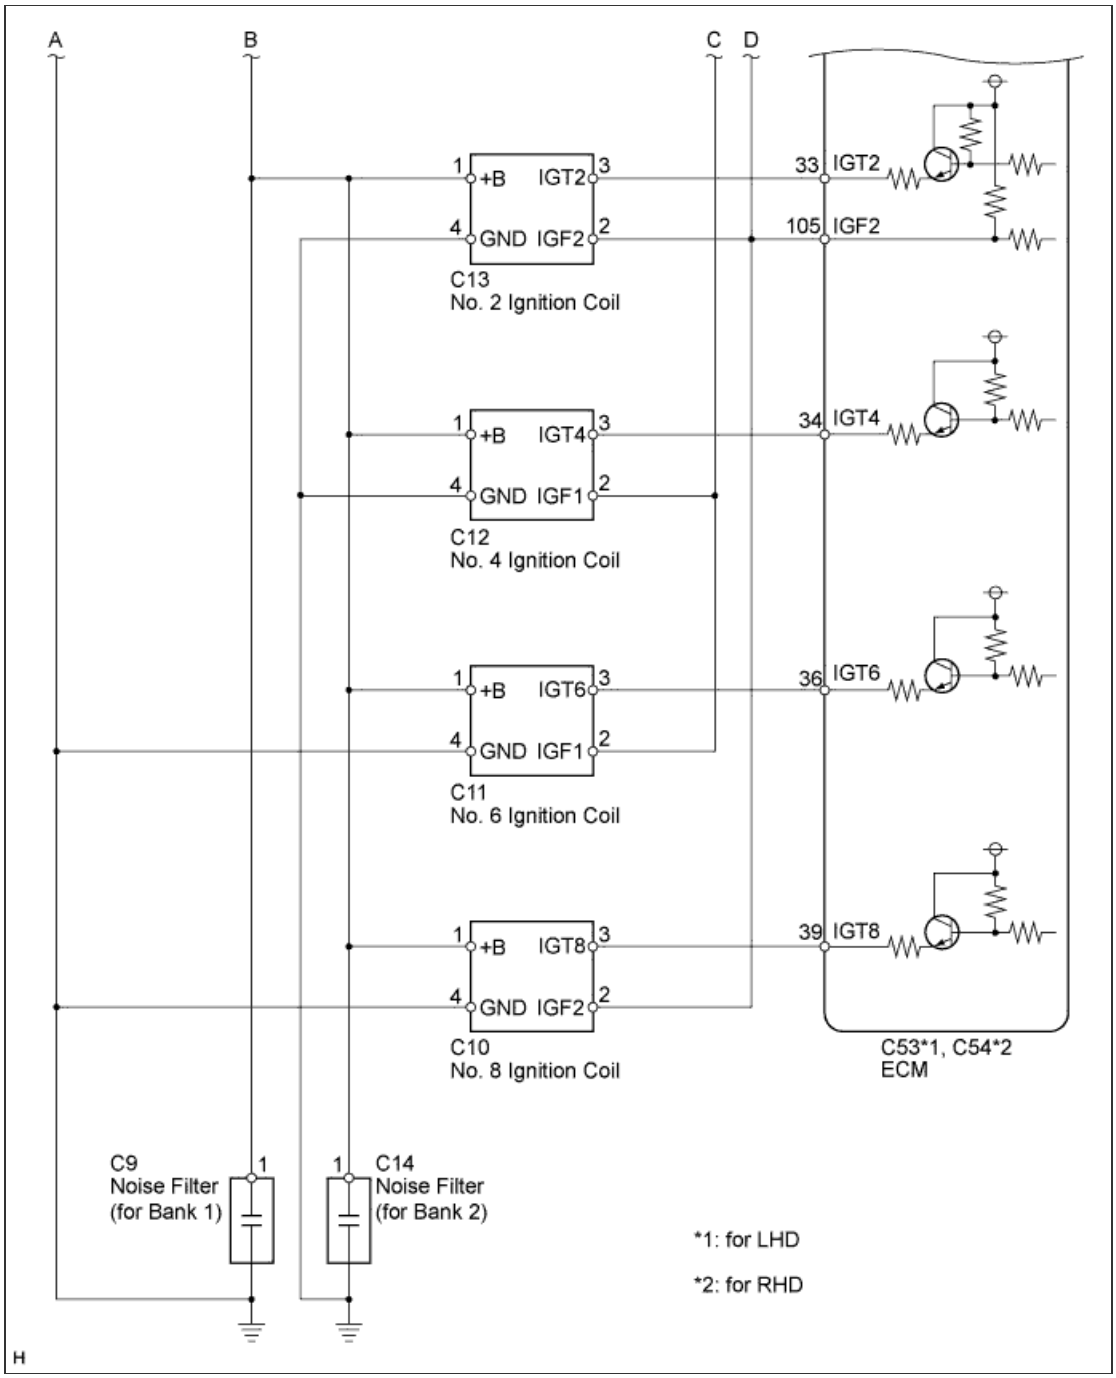
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

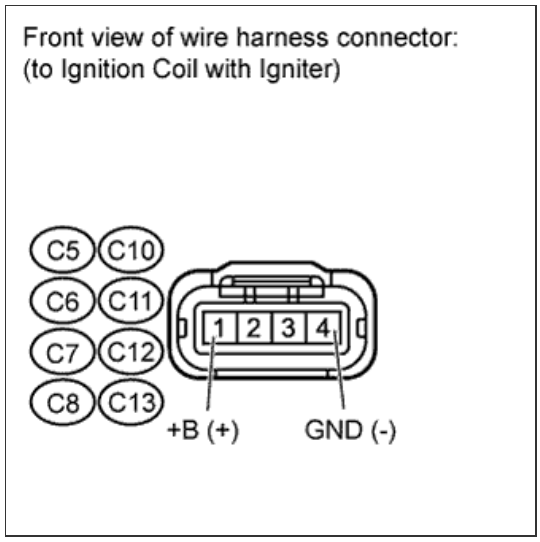
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

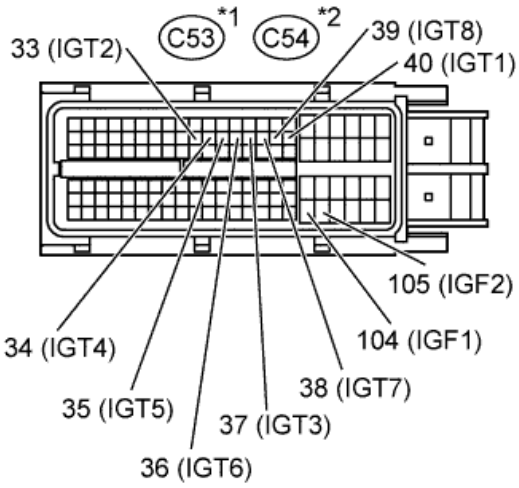
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Ignition Coil with Igniter)

Front view of wire harness connector:

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

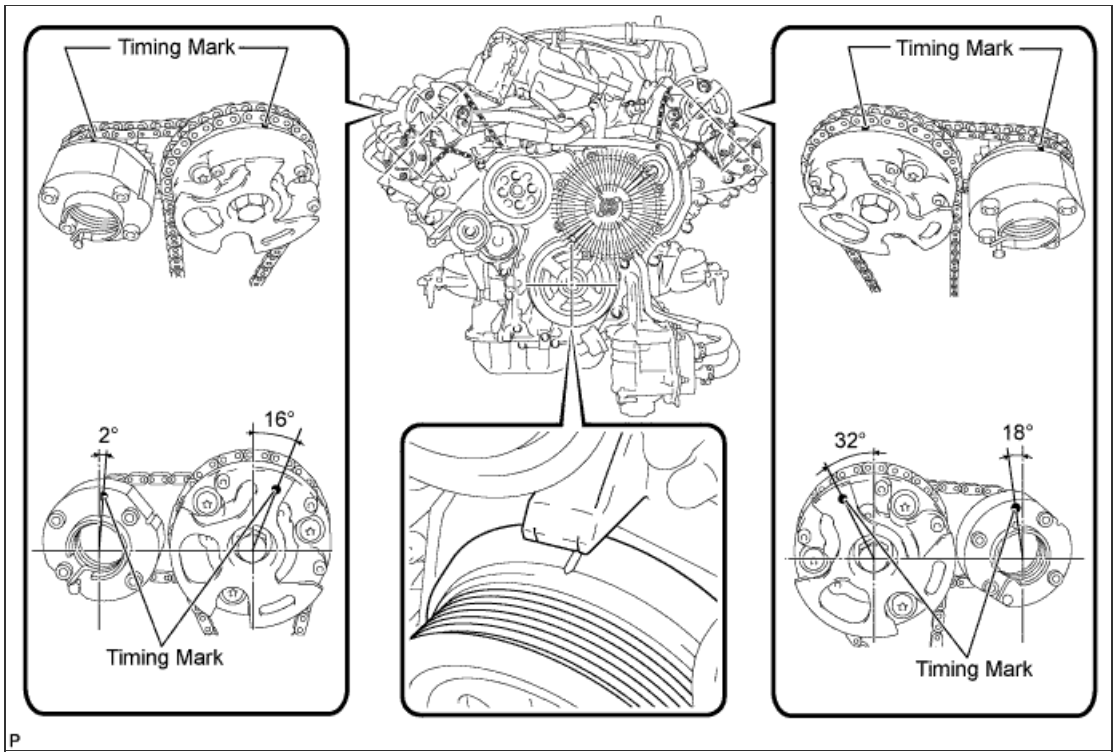
c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.



OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
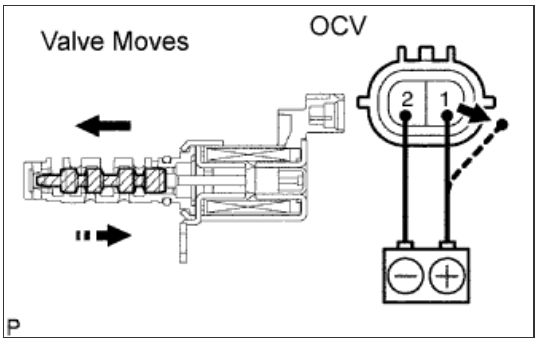
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

HINT:

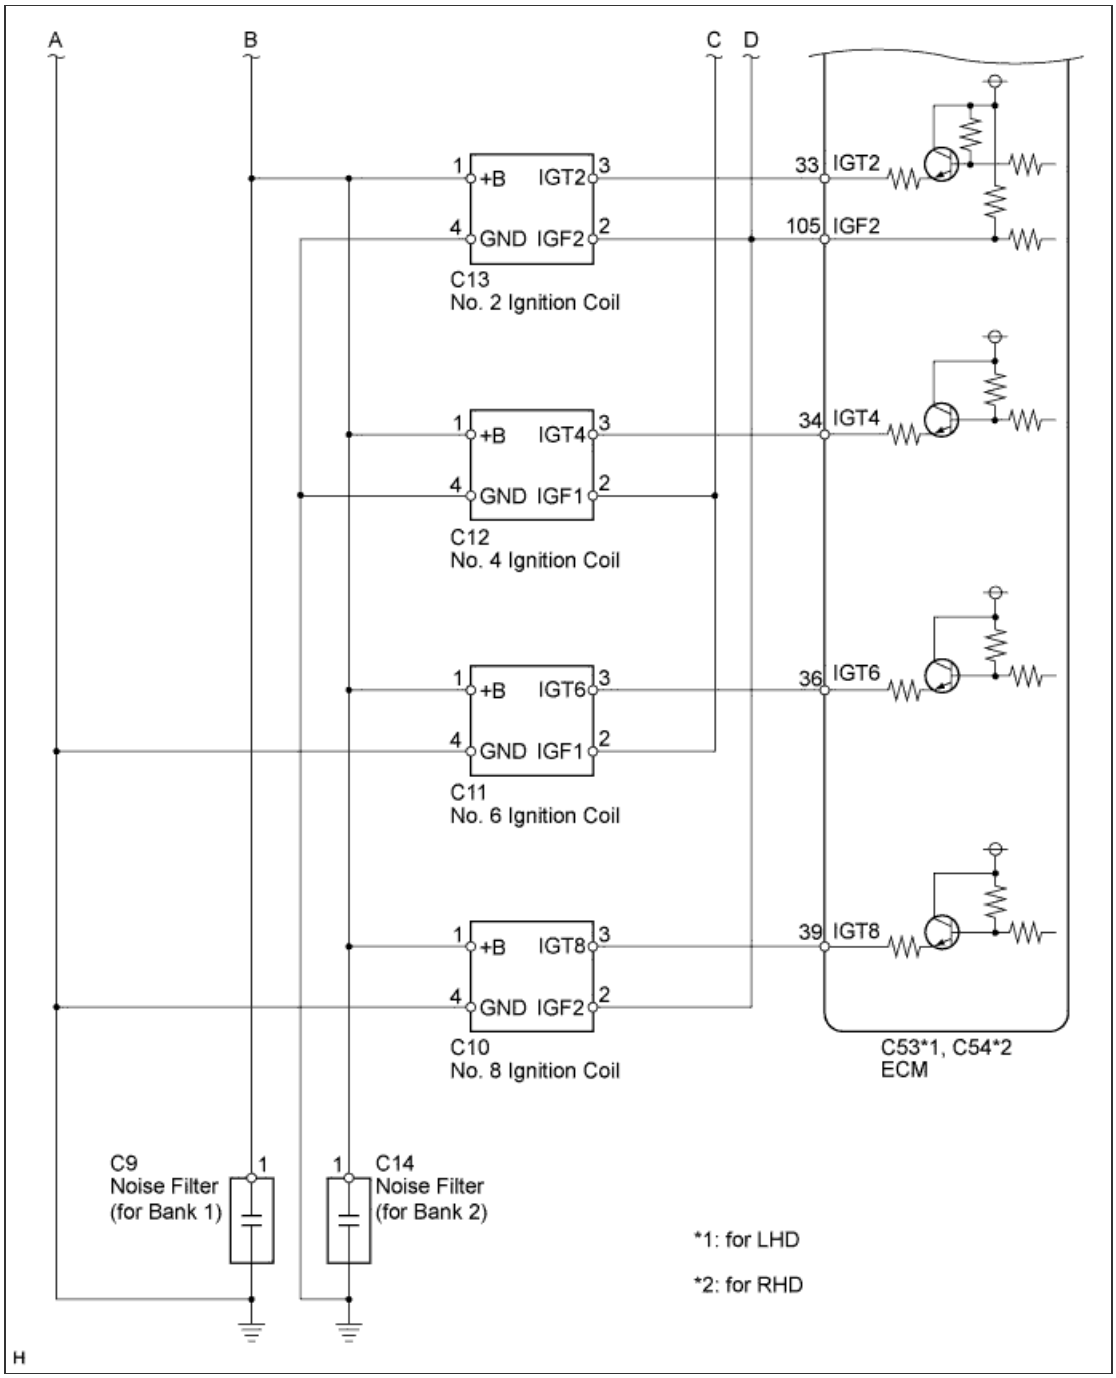
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

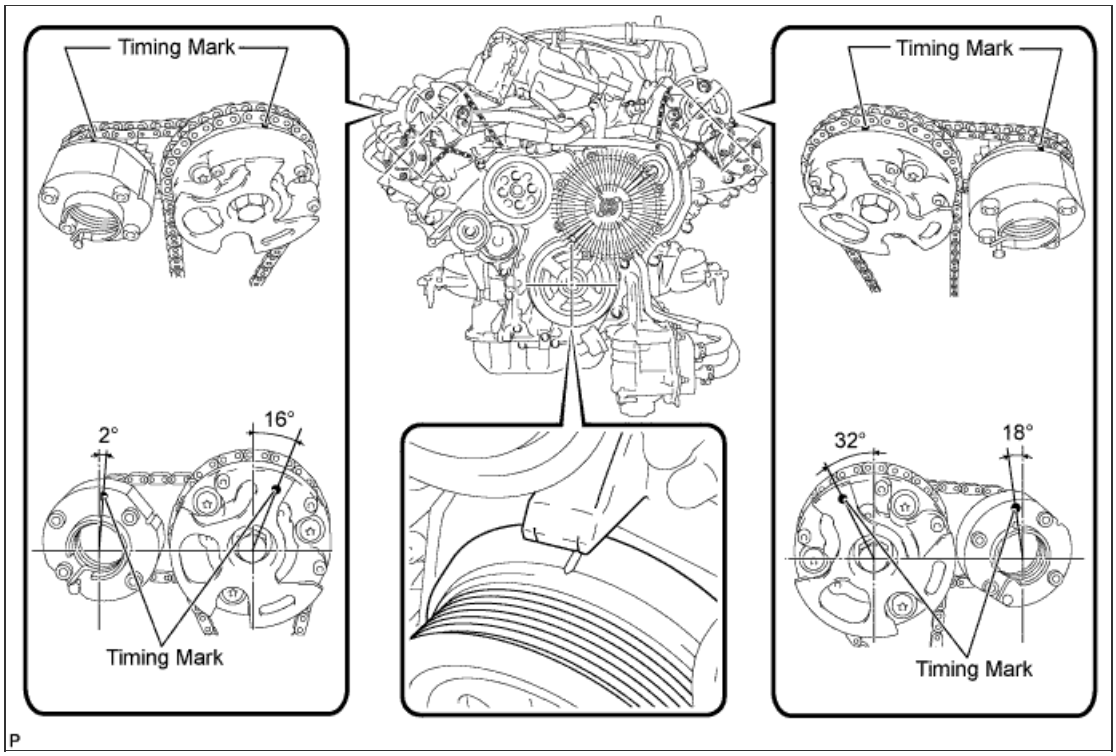
c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.



OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
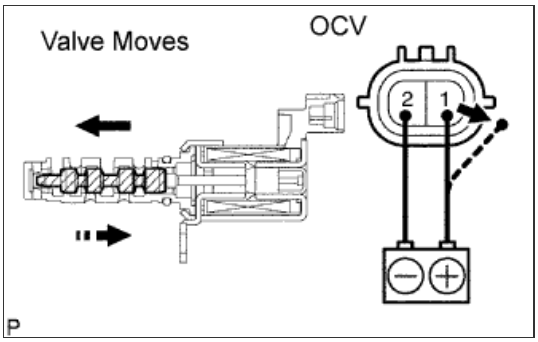
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM OK

- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

C54-38 (IGT7) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C54-39 (IGT8) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C54-104 (IGF1) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

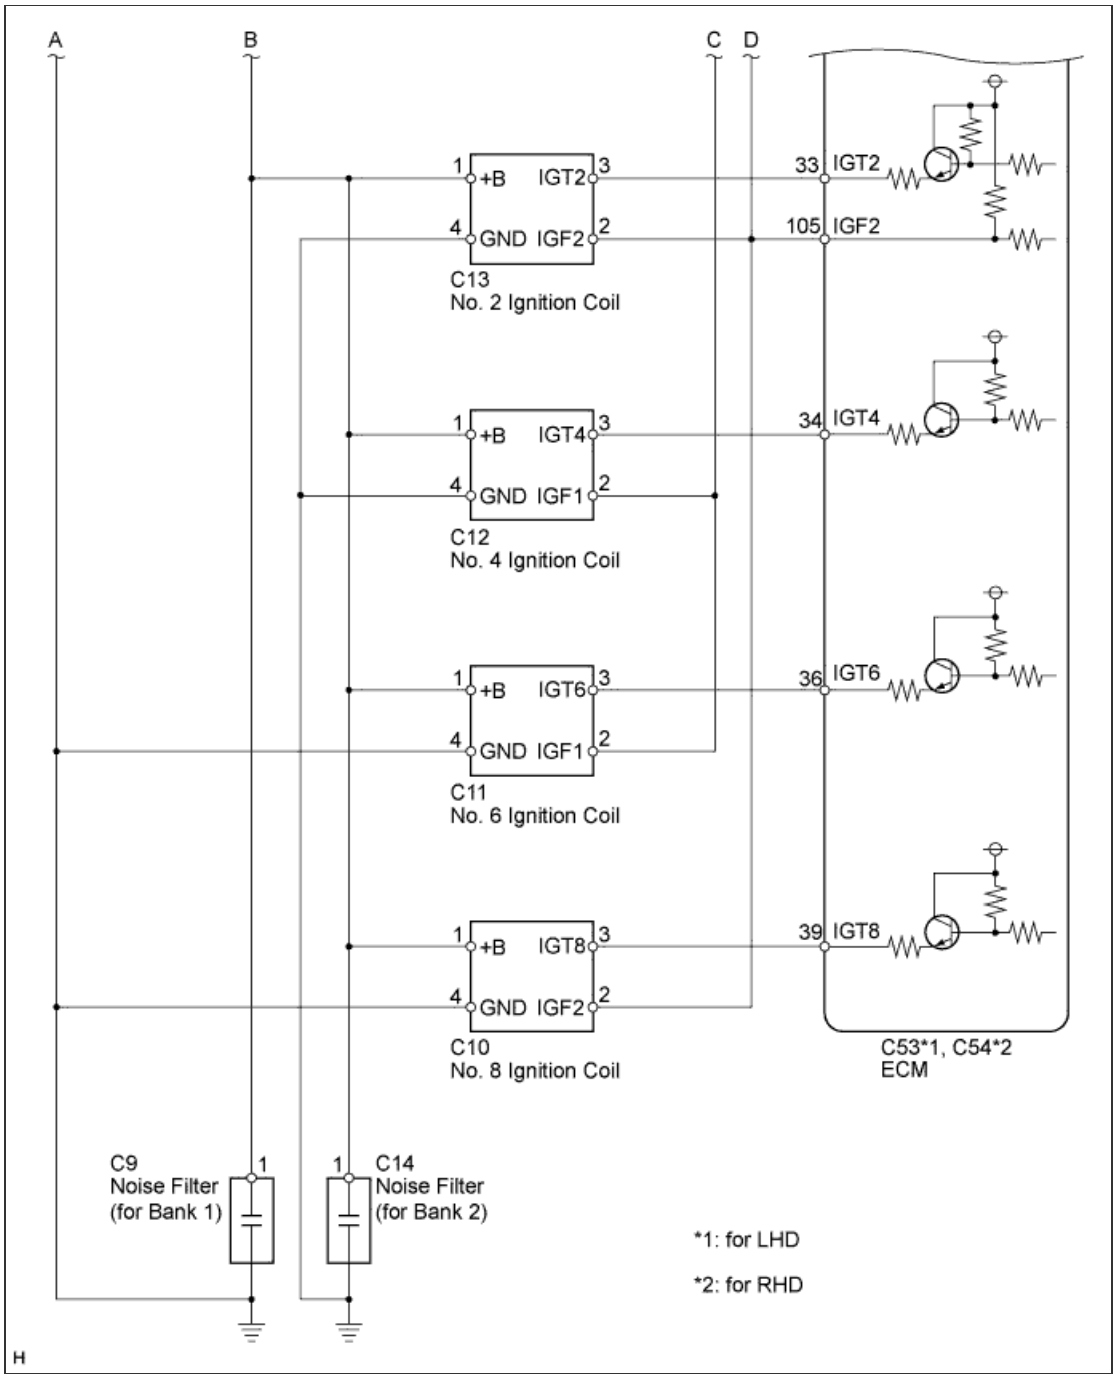
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

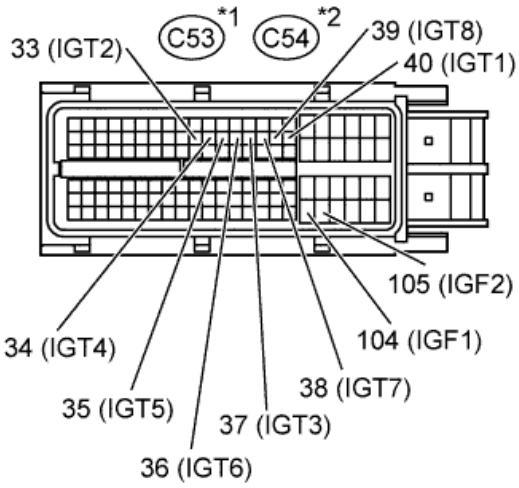
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Ignition Coil with Igniter)

Front view of wire harness connector:

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
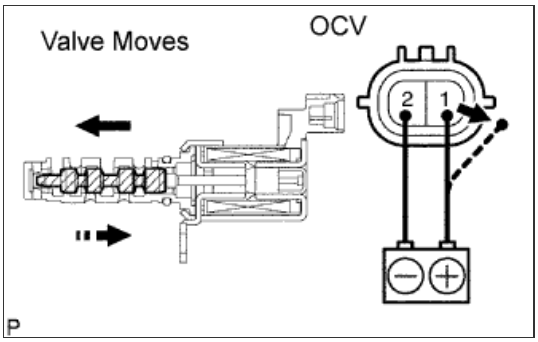
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM OK

- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

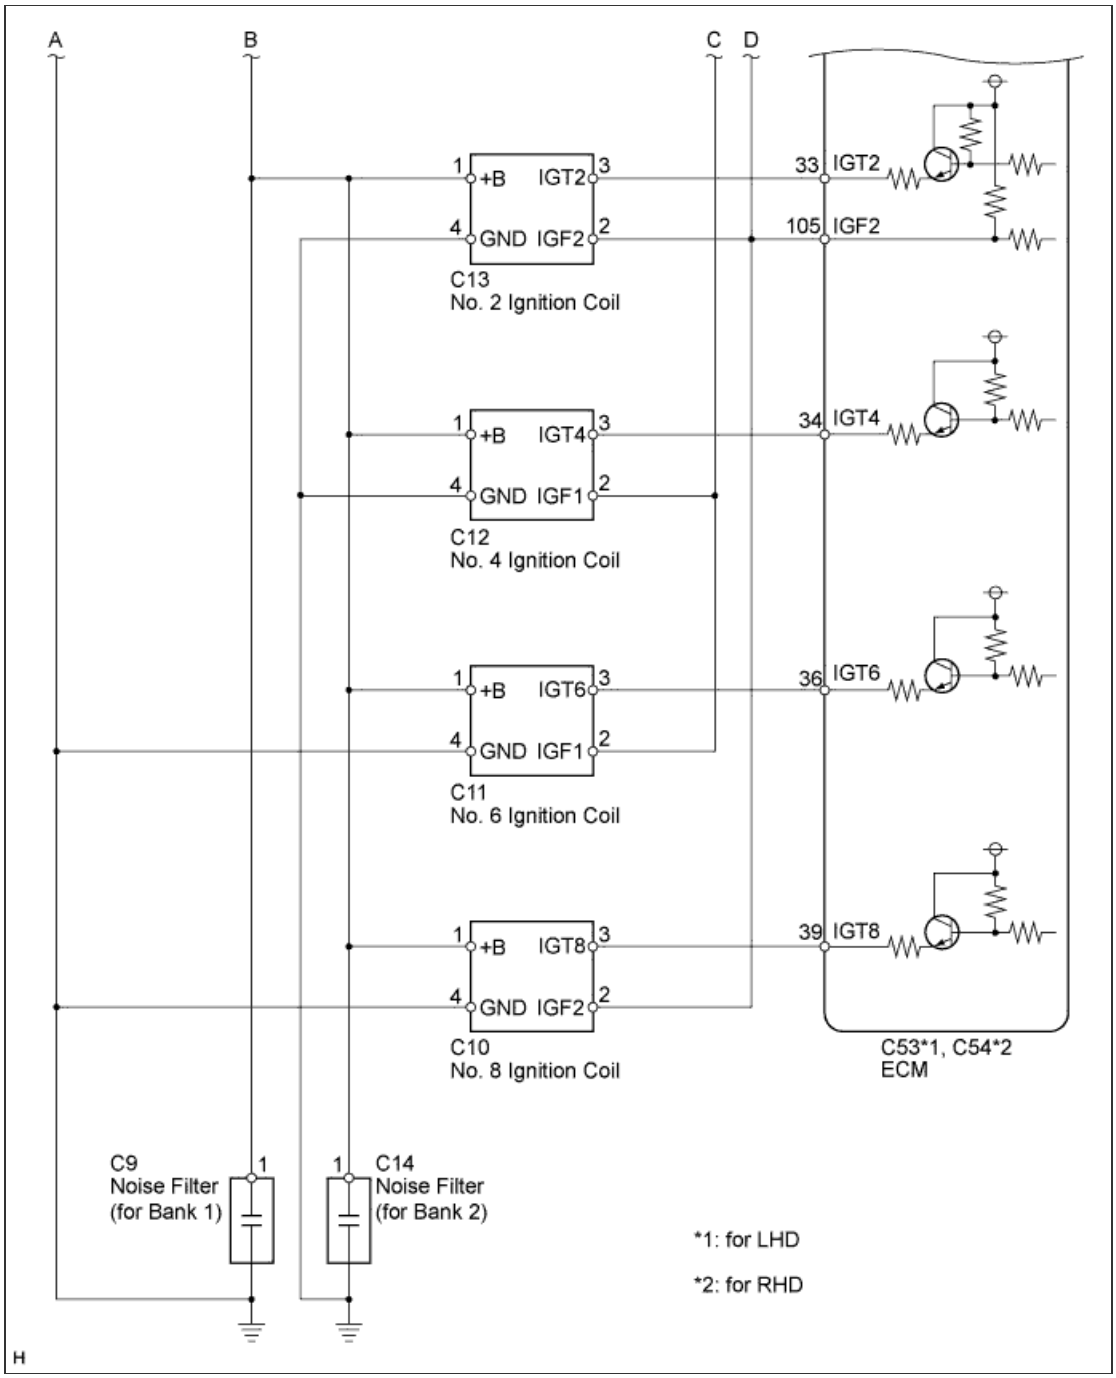
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

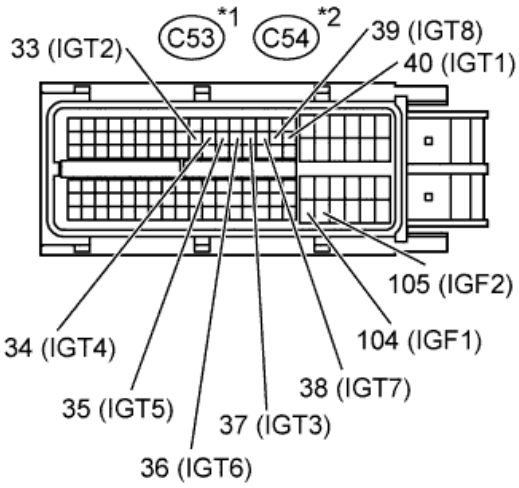
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Ignition Coil with Igniter)

Front view of wire harness connector:
(to ECM)

for Preparation Click here

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
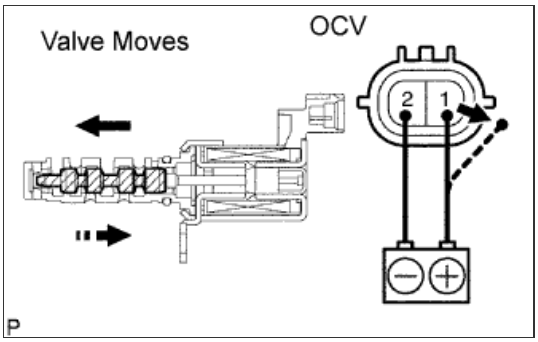
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM OK

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

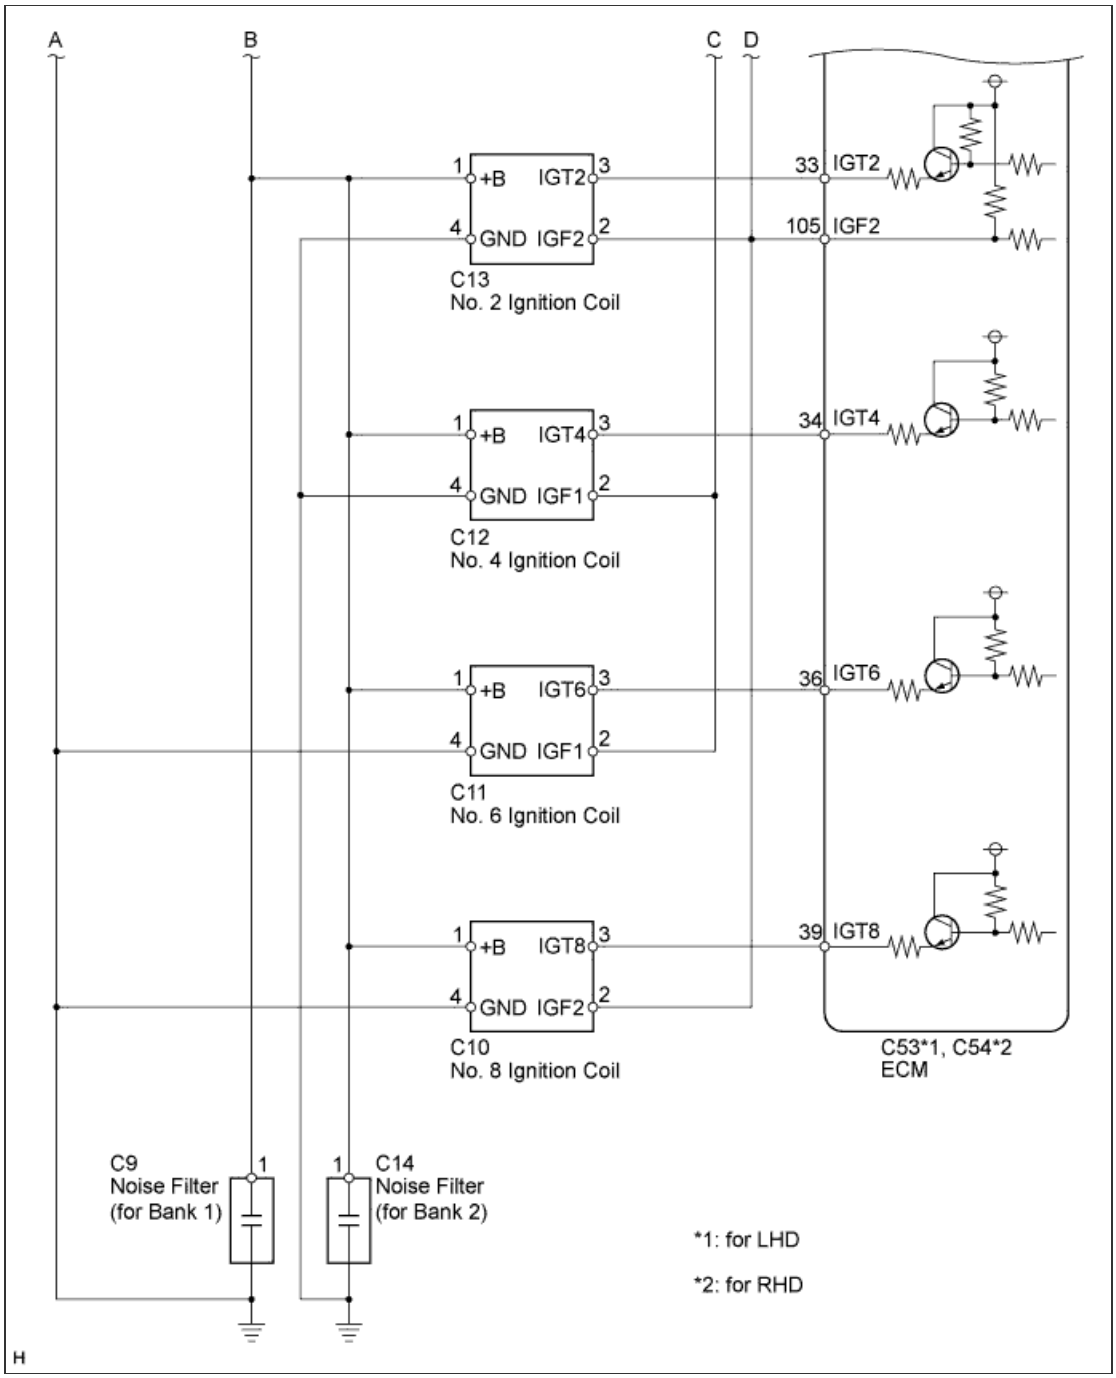
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
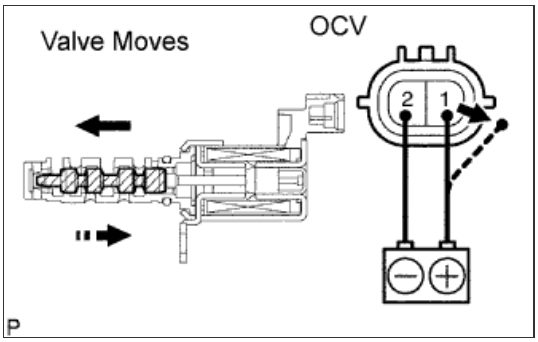
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM OK

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

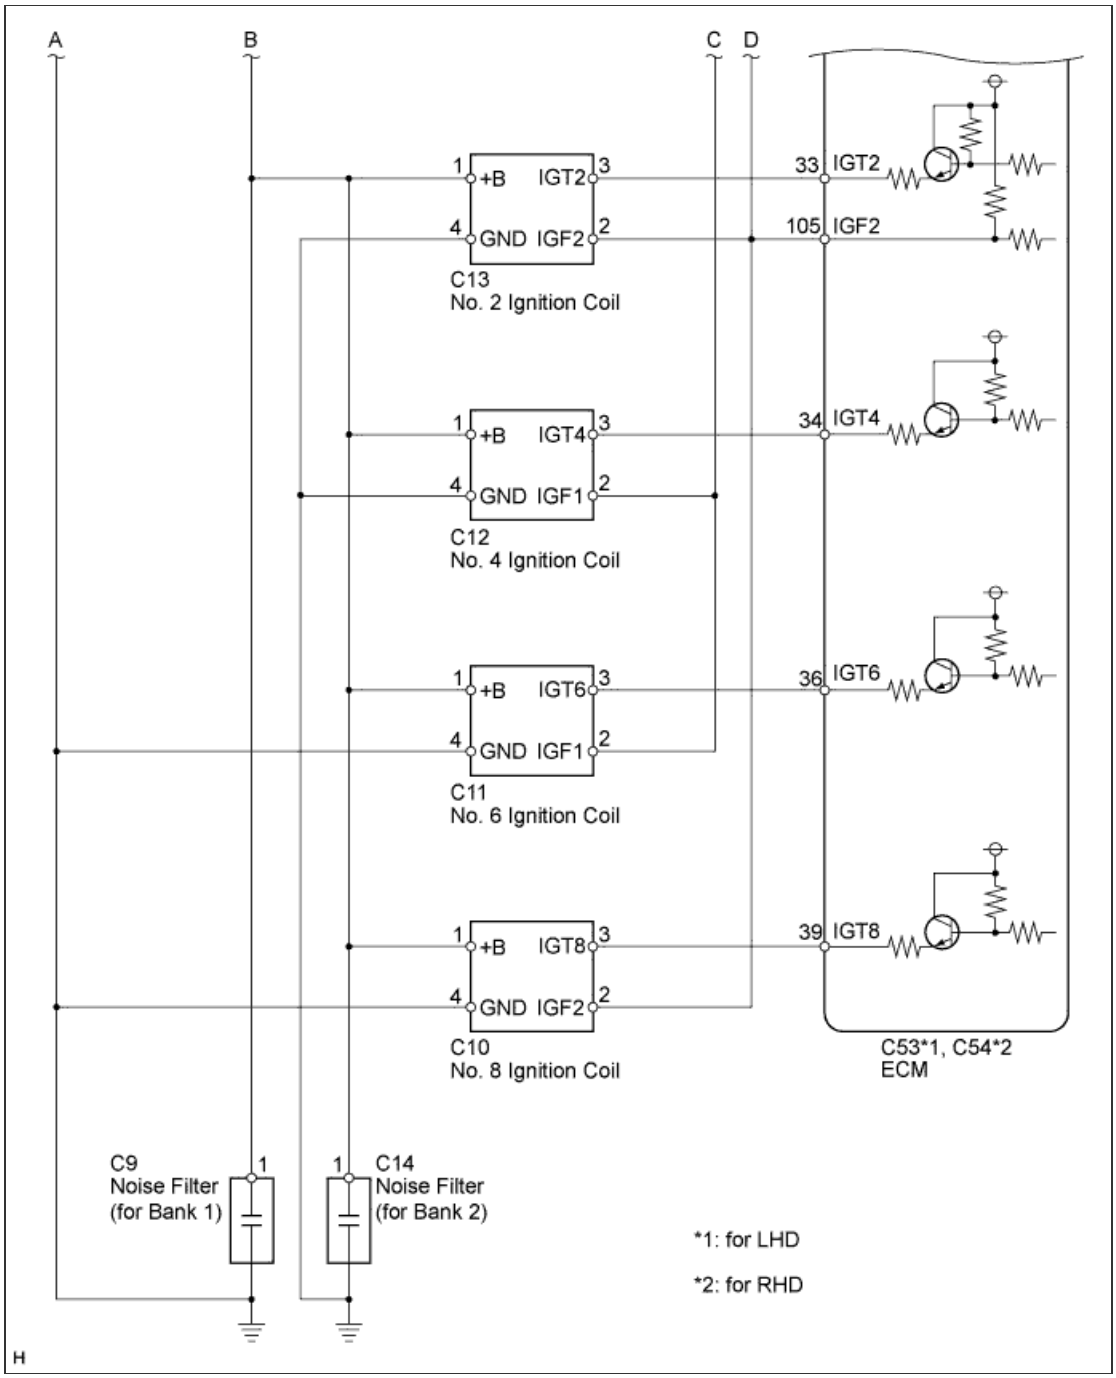
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → **Go to step 4**

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
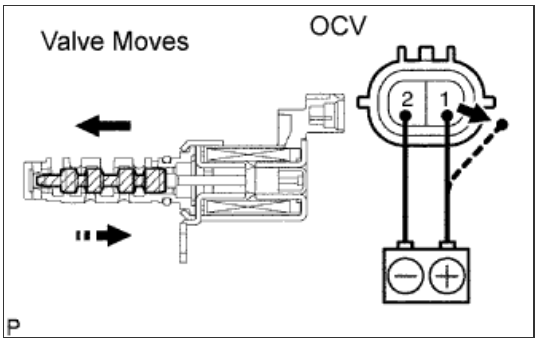
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM OK

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

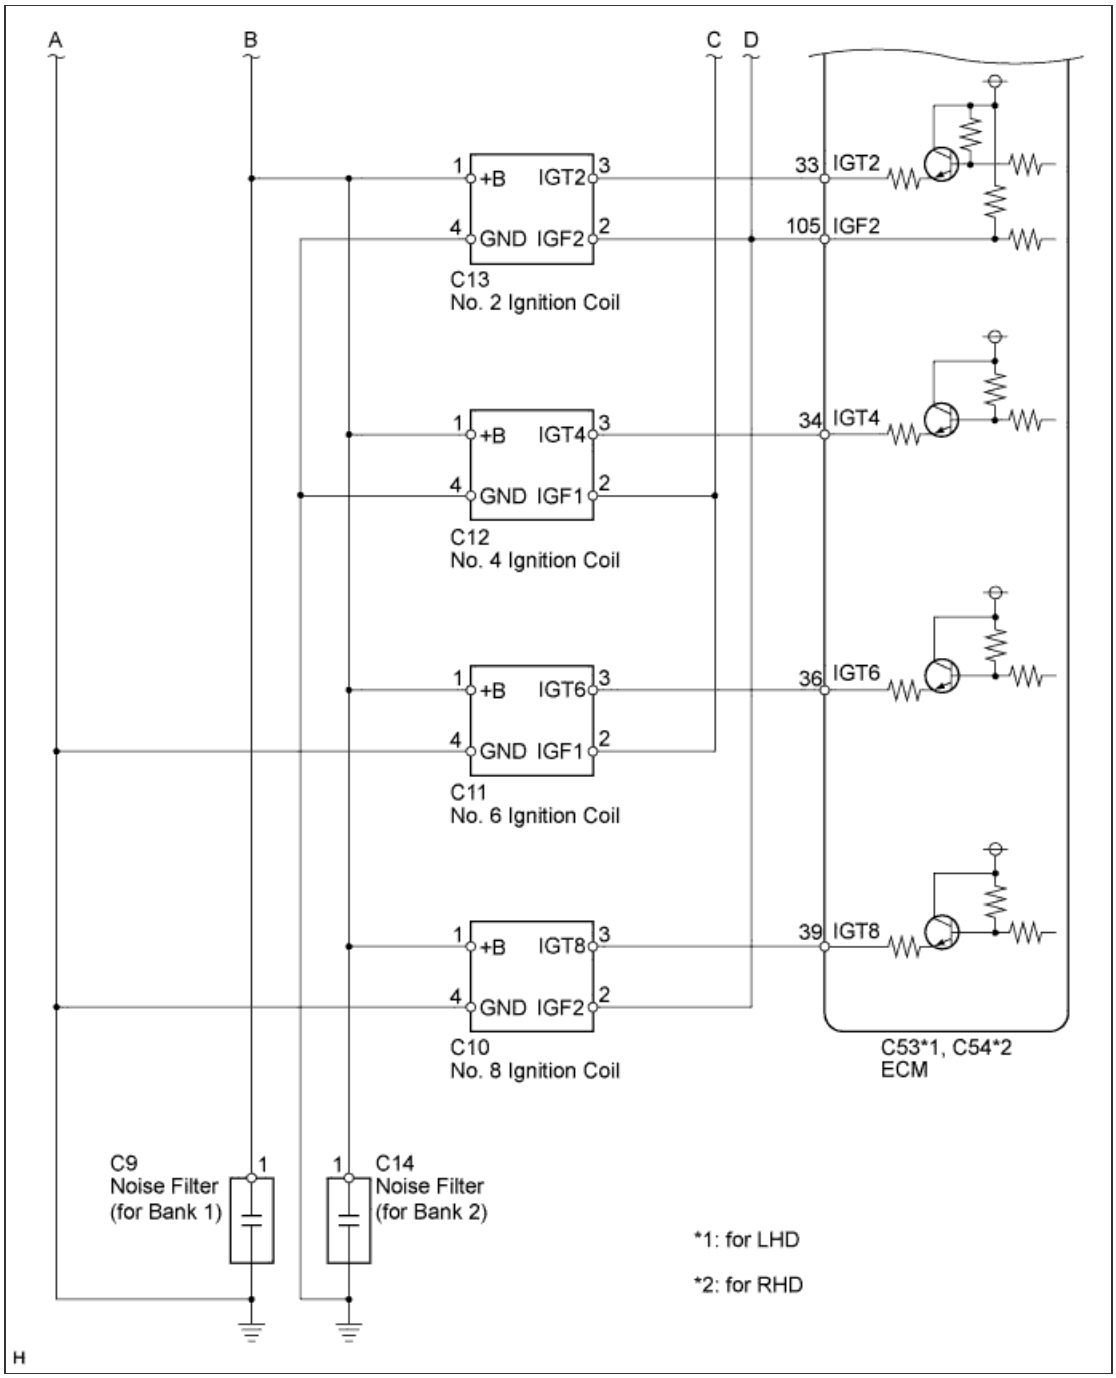
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353, P0354, P0355, P0356, P0357 OR P0358)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Shuffle the arrangement of the ignition coils (among No. 1 to No. 8 cylinders).

NOTICE:

Do not shuffle the connectors.

e. Perform a simulation test.

f. Check DTCs displayed on the tester.

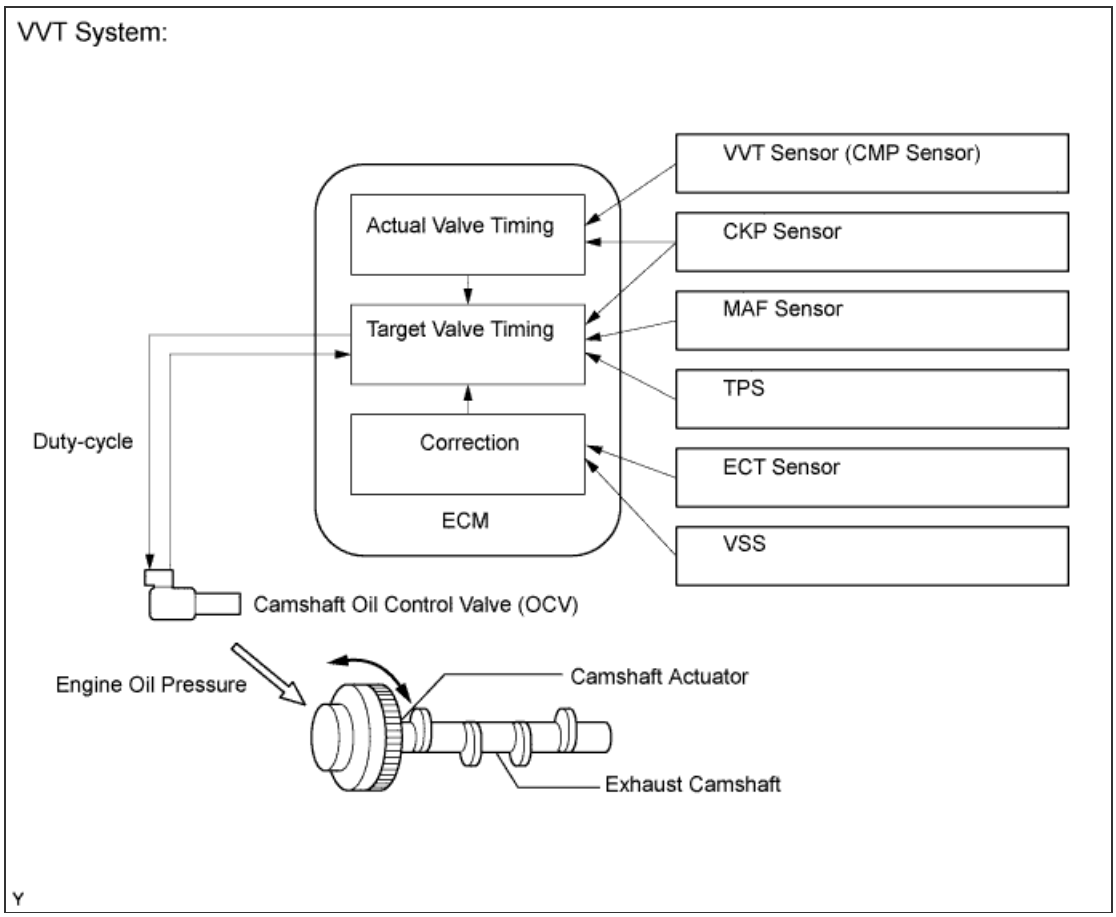
REPLACE ECM (Click here)



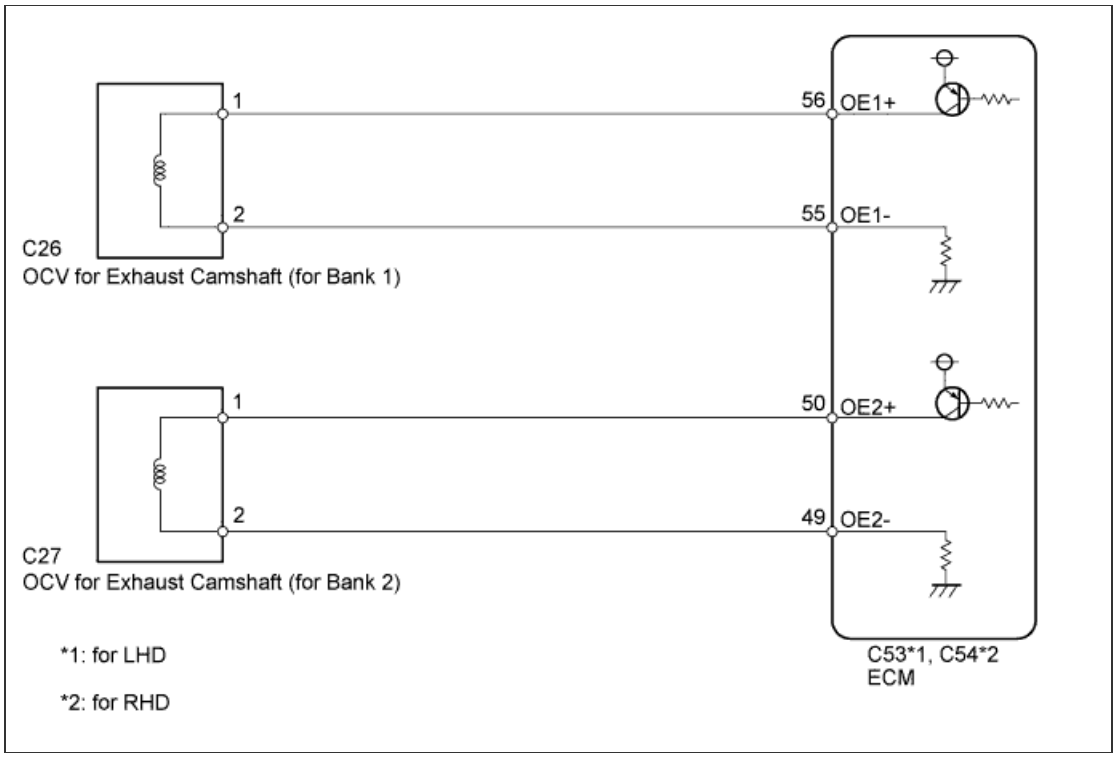
DTC P0013 Camshaft Position "B" Actuator Circuit / Open (Bank 1)

DTC P0023 Camshaft Position "B" Actuator Circuit / Open (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the Camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.



DTC Code	DTC Detection Condition	Trouble Area
P0013	An open or short in the Camshaft Oil Control Valve (OCV) for exhaust side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1) circuit • OCV (for exhaust side of Bank 1) • ECM
P0023	An open or short in the OCV for exhaust side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for exhaust side of Bank 2) circuit • OCV (for exhaust side of Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If DTC P0013 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0023 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK DTC (DTC P0013 OR P0023)

a. Connect the intelligent tester to the DLC3.

b. Clear DTC after recording the freeze frame data and DTC.

c. Turn the engine switch off.

d. Allow the engine to idle and check DTC.

e. Check that P0013 or P0023 is not output.

OK:
P0013 or P0023 is not output.

NG → **Go to step 2**

OK

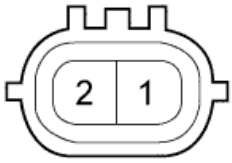
CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Disconnect the C26 or C27 OCV connector.

b. Remove the camshaft oil control valve (OCV) (Click here).



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified

		Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

Component without harness connected:
(Oil Control Valve)

NG

REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

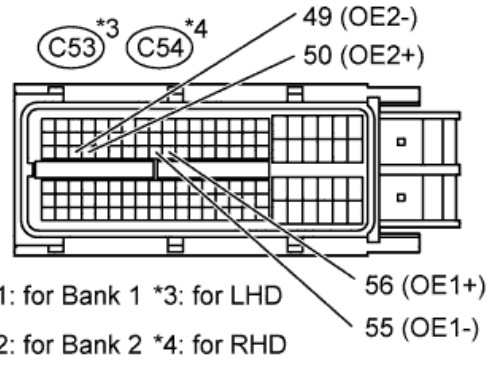
3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C26 or C27 OCV connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Oil Control Valve)

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

HINT:

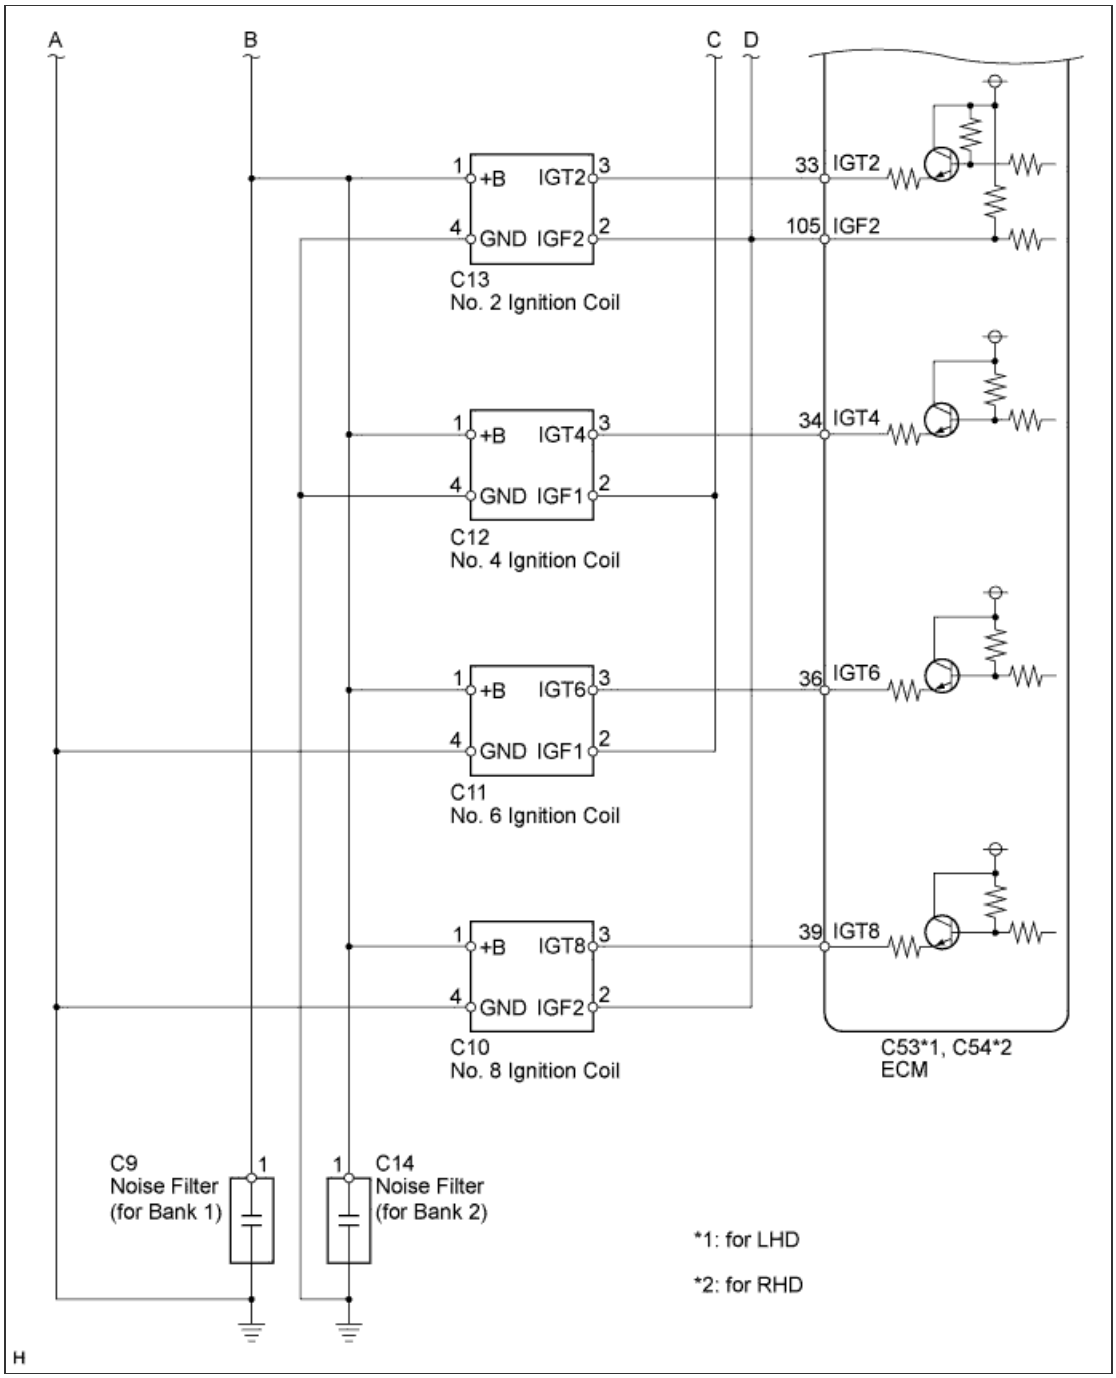
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353, P0354, P0355, P0356, P0357 OR P0358)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Shuffle the arrangement of the ignition coils (among No. 1 to No. 8 cylinders).

NOTICE:

Do not shuffle the connectors.

e. Perform a simulation test.

f. Check DTCs displayed on the tester.

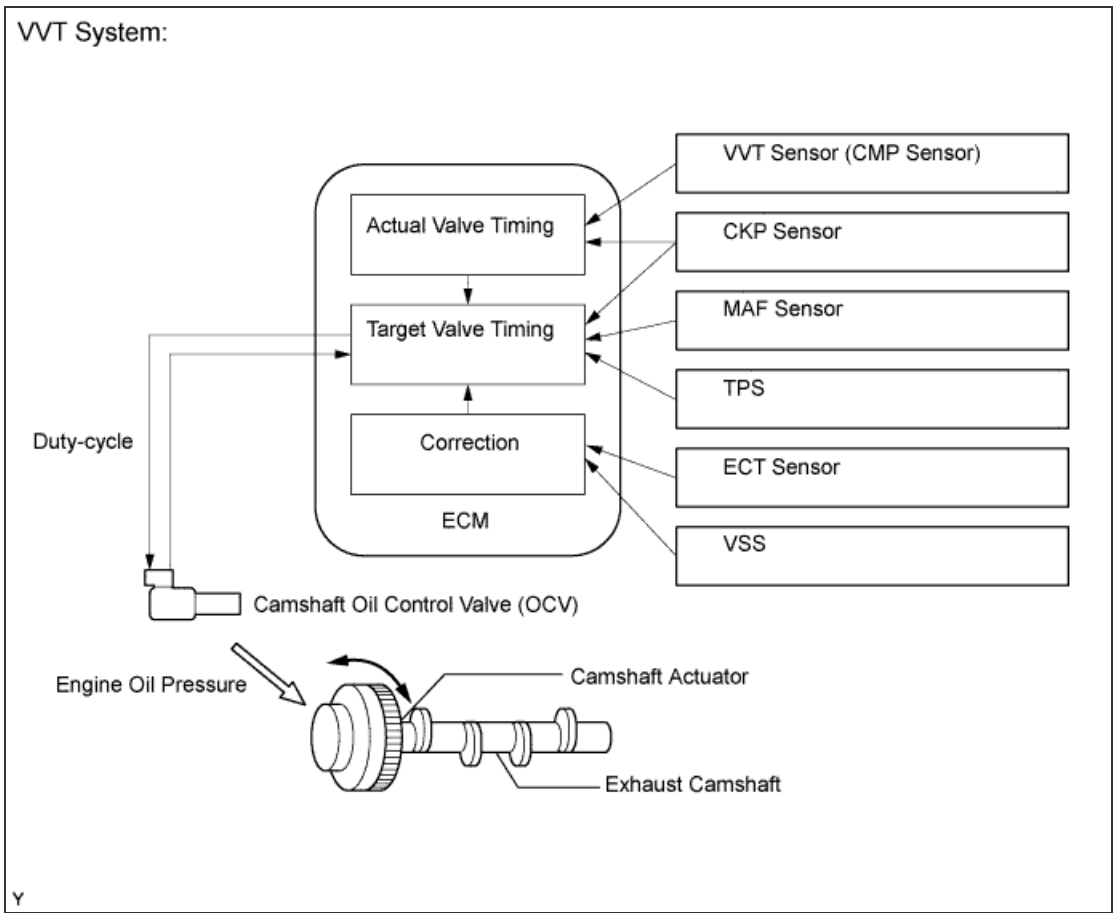
REPLACE ECM (Click here)



DTC P0013 Camshaft Position "B" Actuator Circuit / Open (Bank 1)

DTC P0023 Camshaft Position "B" Actuator Circuit / Open (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the Camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0013	An open or short in the Camshaft Oil Control Valve (OCV) for exhaust side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1) circuit • OCV (for exhaust side of Bank 1) • ECM
P0023	An open or short in the OCV for exhaust side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for exhaust side of Bank 2) circuit • OCV (for exhaust side of Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If DTC P0013 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0023 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK DTC (DTC P0013 OR P0023)

a. Connect the intelligent tester to the DLC3.

b. Clear DTC after recording the freeze frame data and DTC.

c. Turn the engine switch off.

d. Allow the engine to idle and check DTC.

e. Check that P0013 or P0023 is not output.

OK:
P0013 or P0023 is not output.

NG → **Go to step 2**

OK

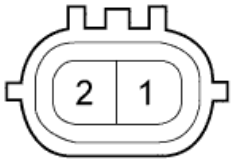
CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Disconnect the C26 or C27 OCV connector.

b. Remove the camshaft oil control valve (OCV) (Click here).



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified

		Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

Component without harness connected:
(Oil Control Valve)

NG

REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

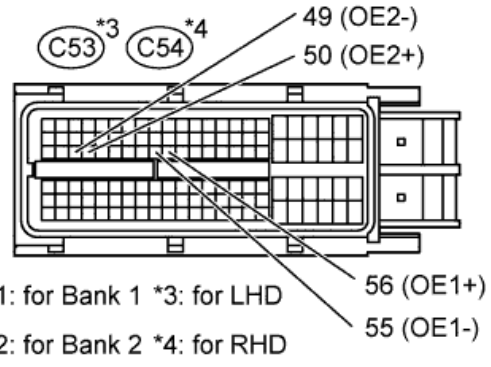
3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C26 or C27 OCV connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Oil Control Valve)

- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

HINT:

While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

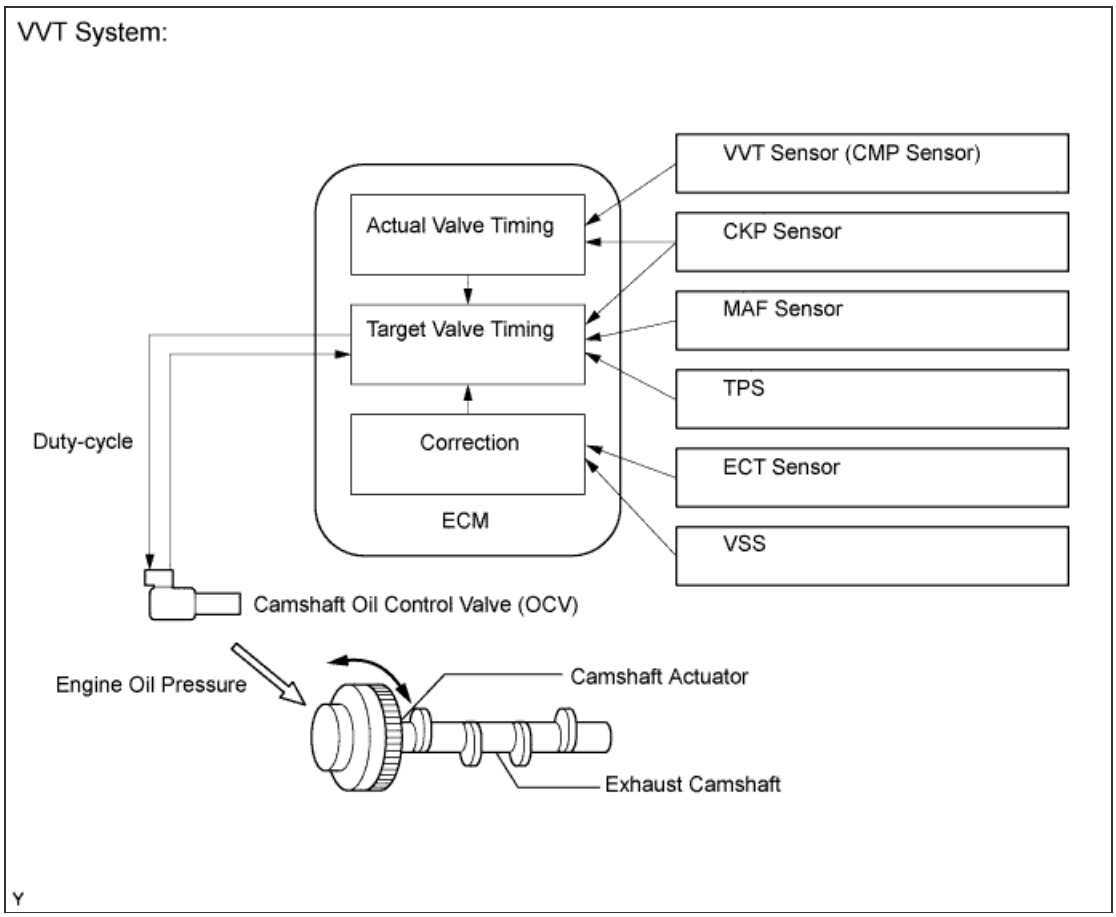
REPLACE ECM (Click here)



DTC P0013 Camshaft Position "B" Actuator Circuit / Open (Bank 1)

DTC P0023 Camshaft Position "B" Actuator Circuit / Open (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the Camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0013	An open or short in the Camshaft Oil Control Valve (OCV) for exhaust side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1) circuit • OCV (for exhaust side of Bank 1) • ECM
P0023	An open or short in the OCV for exhaust side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for exhaust side of Bank 2) circuit • OCV (for exhaust side of Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If DTC P0013 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0023 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK DTC (DTC P0013 OR P0023)

a. Connect the intelligent tester to the DLC3.

b. Clear DTC after recording the freeze frame data and DTC.

c. Turn the engine switch off.

d. Allow the engine to idle and check DTC.

e. Check that P0013 or P0023 is not output.

OK:
P0013 or P0023 is not output.

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

HINT:

While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:

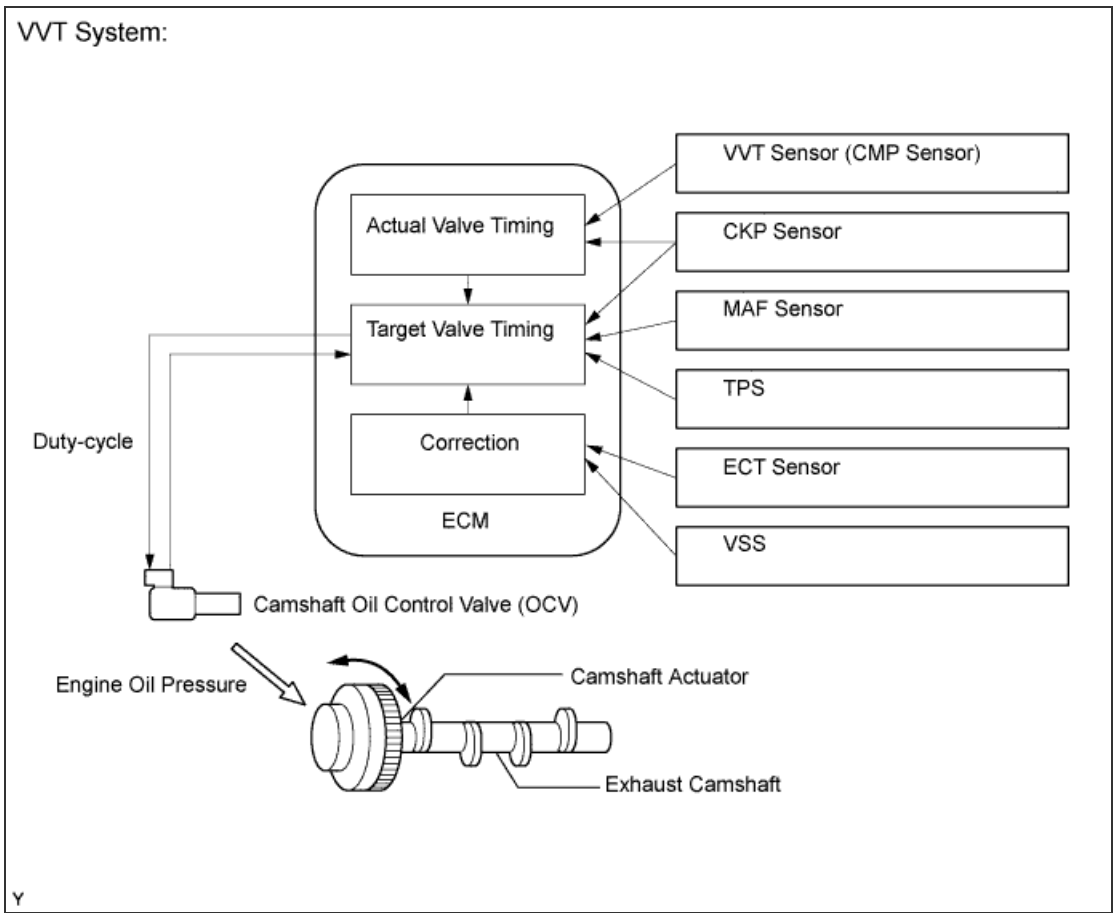
REPLACE ECM (Click here)



DTC P0013 Camshaft Position "B" Actuator Circuit / Open (Bank 1)

DTC P0023 Camshaft Position "B" Actuator Circuit / Open (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the Camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0013	An open or short in the Camshaft Oil Control Valve (OCV) for exhaust side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1) circuit • OCV (for exhaust side of Bank 1) • ECM
P0023	An open or short in the OCV for exhaust side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for exhaust side of Bank 2) circuit • OCV (for exhaust side of Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If DTC P0013 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0023 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK DTC (DTC P0013 OR P0023)

a. Connect the intelligent tester to the DLC3.

b. Clear DTC after recording the freeze frame data and DTC.

c. Turn the engine switch off.

d. Allow the engine to idle and check DTC.

e. Check that P0013 or P0023 is not output.

OK:
P0013 or P0023 is not output.

NG → **Go to step 2**

OK

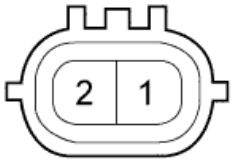
CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Disconnect the C26 or C27 OCV connector.

b. Remove the camshaft oil control valve (OCV) (Click here).



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified

		Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

HINT:

While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Ignition Coil with Igniter)

Front view of wire harness connector:
(to ECM)

DTC P0025 Camshaft Position "B" - Timing Over-Retarded (Bank 2)

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

Refer to DTC P0013 (Click here).

INSPECTION PROCEDURE

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- **If DTC P0014 or P0015 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0024 or P0025 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

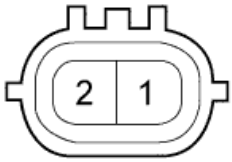
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
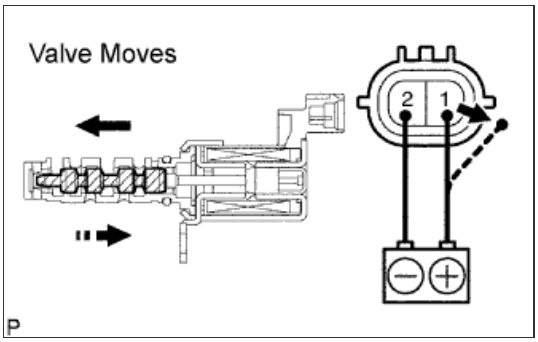
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM IS OK

for Preparation Click here

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

C54-104 (IGF1) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C54-105 (IGF2) - C54-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C5-4 (GND) - Body ground	Always	Below 1 Ω
C13-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C12-4 (GND) - Body ground	Always	Below 1 Ω
C7-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C10-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C5-1 (+B) - C5-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C12-1 (+B) - C12-4 (GND)	Engine switch on (IG)	11 to 14 V
C7-1 (+B) - C7-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C10-1 (+B) - C10-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C5, C6, C7, C8, C10, C11, C12 or C13 ignition coil connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Ignition Coil with Igniter)

Front view of wire harness connector:
(to ECM)

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0013 (Click here).

INSPECTION PROCEDURE

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- **If DTC P0014 or P0015 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0024 or P0025 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

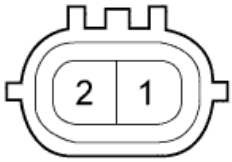
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
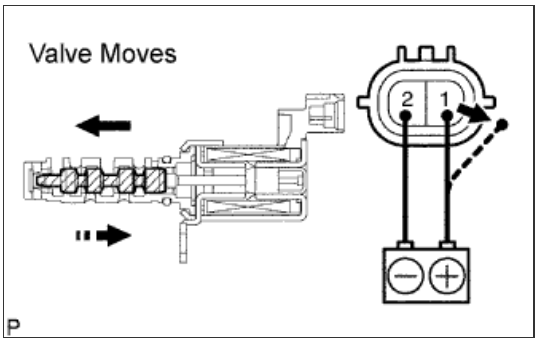
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM IS OK

for Preparation Click here

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

for LHD

Tester Connection	Tool Setting	Condition	Specified Condition
C53-110 (NE+) - C53-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-69 (EV1+) - C53-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-64 (EV2+) - C53-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

for RHD

Tester Connection	Tool Setting	Condition	Specified Condition
C54-110 (NE+) - C54-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-69 (EV1+) - C54-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-64 (EV2+) - C54-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

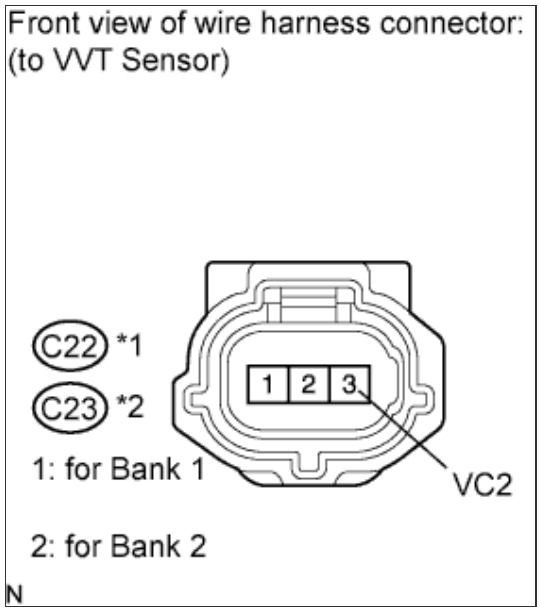
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C22 or C23 VVT sensor (for exhaust side) connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C22-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C23-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR (for Exhaust Side) - ECM)

a. Disconnect the C22 or C23 VVT (for exhaust side) sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C53-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C53-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C53-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C53-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C53-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C53-68 (EV1-) - Body ground	Always	10 kΩ or higher
C23-1 (EX+) or C53-64 (EV2+) - Body ground	Always	10 kΩ or higher
C23-2 (EX-) or C53-65 (EV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C54-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C54-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C54-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C54-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C54-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C54-68 (EV1-) - Body ground	Always	10 kΩ or higher

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

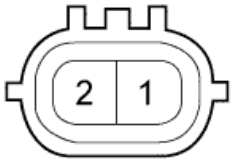
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
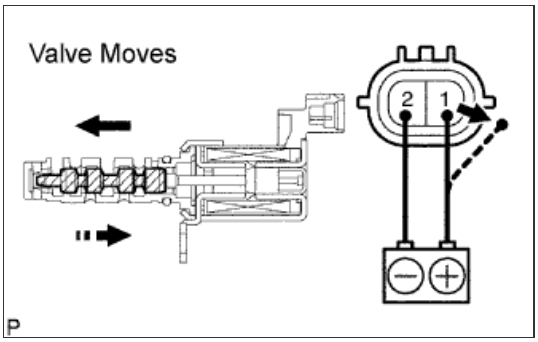
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

for LHD

Tester Connection	Tool Setting	Condition	Specified Condition
C53-110 (NE+) - C53-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-69 (EV1+) - C53-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-64 (EV2+) - C53-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

for RHD

Tester Connection	Tool Setting	Condition	Specified Condition
C54-110 (NE+) - C54-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-69 (EV1+) - C54-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-64 (EV2+) - C54-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

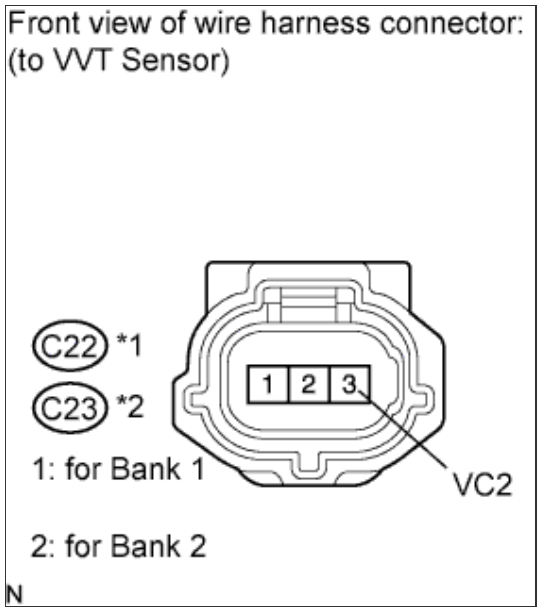
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C22 or C23 VVT sensor (for exhaust side) connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C22-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C23-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR (for Exhaust Side) - ECM)

a. Disconnect the C22 or C23 VVT (for exhaust side) sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C53-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C53-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C53-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C53-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C53-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C53-68 (EV1-) - Body ground	Always	10 kΩ or higher
C23-1 (EX+) or C53-64 (EV2+) - Body ground	Always	10 kΩ or higher
C23-2 (EX-) or C53-65 (EV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C54-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C54-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C54-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C54-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C54-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C54-68 (EV1-) - Body ground	Always	10 kΩ or higher
C23-1 (EX+) or C54-64 (EV2+) - Body ground	Always	10 kΩ or higher
C23-2 (EX-) or C54-65 (EV2-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor (for exhaust side) installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK EXHAUST CAMSHAFT

a. Check the teeth of the camshaft.

OK:
Teeth do not have any cracks or deformation.

DTC P0024 Camshaft Position "B" - Timing Over-Advanced or System Performance (Bank 2)

DTC P0025 Camshaft Position "B" - Timing Over-Retarded (Bank 2)

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

for LHD

Tester Connection	Tool Setting	Condition	Specified Condition
C53-110 (NE+) - C53-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-69 (EV1+) - C53-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-64 (EV2+) - C53-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

for RHD

Tester Connection	Tool Setting	Condition	Specified Condition
C54-110 (NE+) - C54-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-69 (EV1+) - C54-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-64 (EV2+) - C54-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

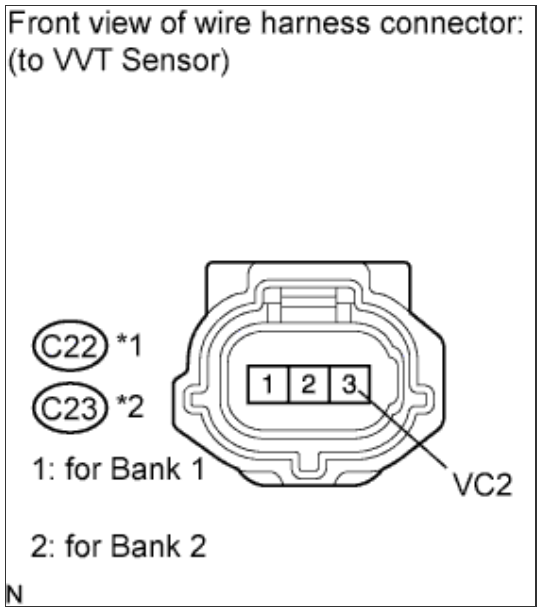
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C22 or C23 VVT sensor (for exhaust side) connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C22-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C23-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR (for Exhaust Side) - ECM)

a. Disconnect the C22 or C23 VVT (for exhaust side) sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C53-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C53-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C53-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C53-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C53-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C53-68 (EV1-) - Body ground	Always	10 kΩ or higher
C23-1 (EX+) or C53-64 (EV2+) - Body ground	Always	10 kΩ or higher
C23-2 (EX-) or C53-65 (EV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C54-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C54-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C54-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C54-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C54-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C54-68 (EV1-) - Body ground	Always	10 kΩ or higher
C23-1 (EX+) or C54-64 (EV2+) - Body ground	Always	10 kΩ or higher
C23-2 (EX-) or C54-65 (EV2-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor (for exhaust side) installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK EXHAUST CAMSHAFT

a. Check the teeth of the camshaft.

OK:
Teeth do not have any cracks or deformation.

NG → REPLACE EXHAUST CAMSHAFT (Click here)

OK

5.REPLACE VVT SENSOR (for Exhaust Side)

a. Replace the VVT sensor (for exhaust side) (Click here).

NEXT

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

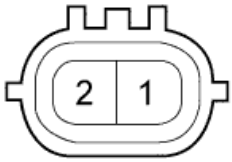
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
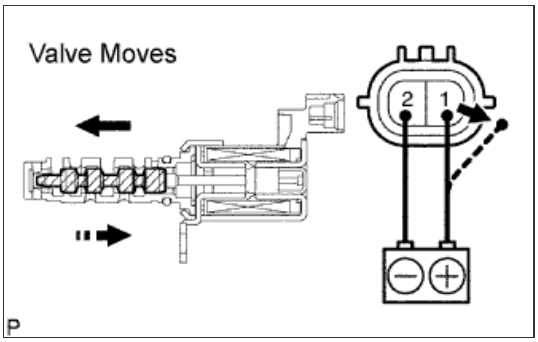
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

C54-69 (EV1+) - C54-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-64 (EV2+) - C54-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

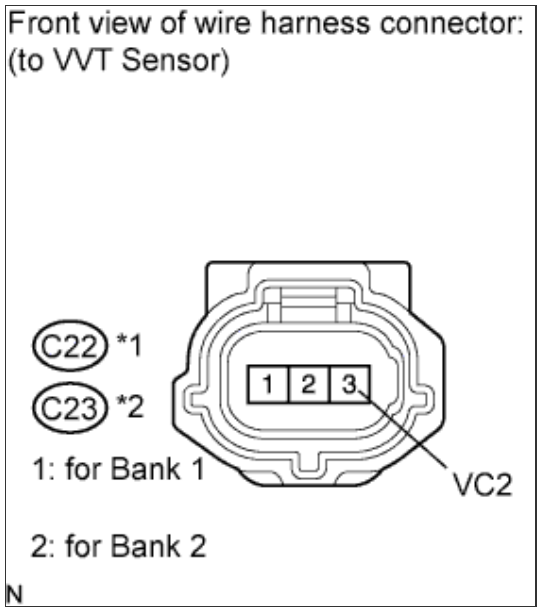
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C22 or C23 VVT sensor (for exhaust side) connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C22-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C23-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR (for Exhaust Side) - ECM)

a. Disconnect the C22 or C23 VVT (for exhaust side) sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C53-69 (EV1+)	Always	Below 1 Ω

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

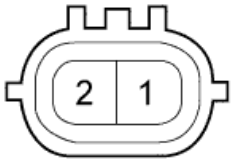
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
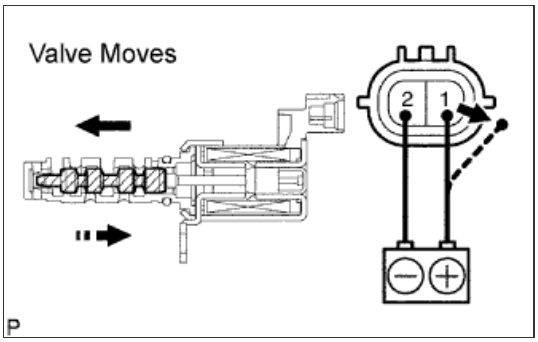
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM IS OK

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

for LHD

Tester Connection	Tool Setting	Condition	Specified Condition
C53-110 (NE+) - C53-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-69 (EV1+) - C53-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-64 (EV2+) - C53-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

Tester Connection	Tool Setting	Condition	Specified Condition
C54-110 (NE+) - C54-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-69 (EV1+) - C54-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-64 (EV2+) - C54-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

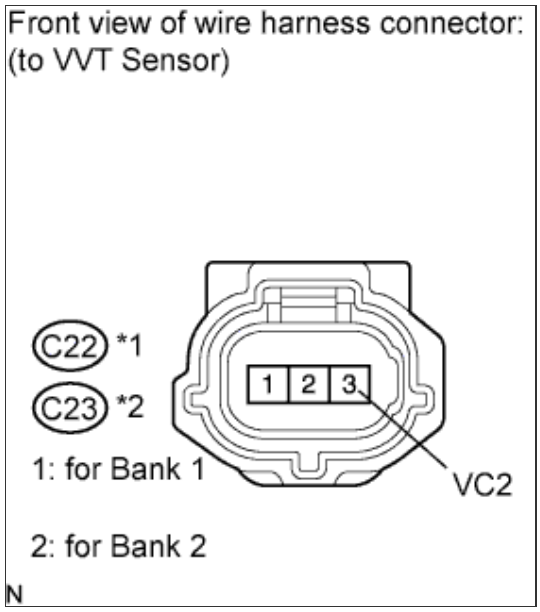
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C22 or C23 VVT sensor (for exhaust side) connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C22-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C23-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR (for Exhaust Side) - ECM)

a. Disconnect the C22 or C23 VVT (for exhaust side) sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C53-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C53-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C53-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C53-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C53-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C53-68 (EV1-) - Body ground	Always	10 kΩ or higher
C23-1 (EX+) or C53-64 (EV2+) - Body ground	Always	10 kΩ or higher
C23-2 (EX-) or C53-65 (EV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C54-69 (EV1+)	Always	Below 1 Ω
C22-2 (EX-) - C54-68 (EV1-)	Always	Below 1 Ω
C23-1 (EX+) - C54-64 (EV2+)	Always	Below 1 Ω
C23-2 (EX-) - C54-65 (EV2-)	Always	Below 1 Ω
C22-1 (EX+) or C54-69 (EV1+) - Body ground	Always	10 kΩ or higher
C22-2 (EX-) or C54-68 (EV1-) - Body ground	Always	10 kΩ or higher
C23-1 (EX+) or C54-64 (EV2+) - Body ground	Always	10 kΩ or higher
C23-2 (EX-) or C54-65 (EV2-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor (for exhaust side) installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK EXHAUST CAMSHAFT

a. Check the teeth of the camshaft.

OK:
Teeth do not have any cracks or deformation.

NG → REPLACE EXHAUST CAMSHAFT (Click here)

OK

5.REPLACE VVT SENSOR (for Exhaust Side)

a. Replace the VVT sensor (for exhaust side) (Click here).

NEXT

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

DTC P0025 Camshaft Position "B" - Timing Over-Retarded (Bank 2)

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

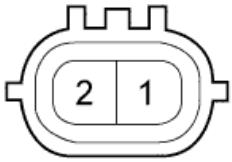
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
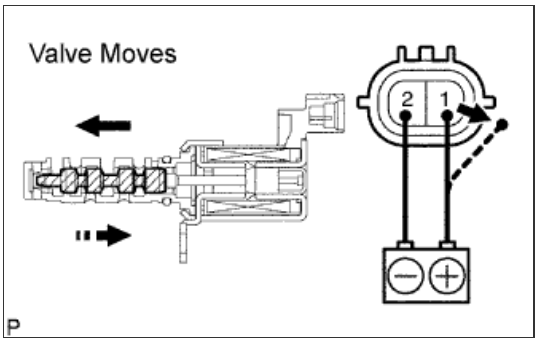
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1, 2 and 3 are met:
   1. The difference between the target and actual exhaust valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds (Procedure "A").
   2. It takes 5 seconds or more to change the valve timing by 5° CA (Procedure "B").
   3. After above procedures "A" and "B" are met, the OCV is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- **If DTC P0014 or P0015 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0024 or P0025 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

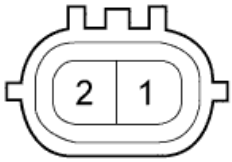
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
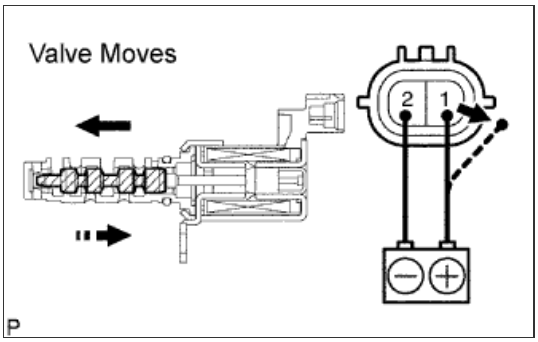
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM IS OK

for Preparation Click here

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

for LHD

Tester Connection	Tool Setting	Condition	Specified Condition
C53-110 (NE+) - C53-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-69 (EV1+) - C53-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C53-64 (EV2+) - C53-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake and exhaust valve open and close timing is controlled by the ECM. The ECM performs intake and exhaust valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft oil control valve (OCV) (for intake side of bank 1) • Camshaft timing gear assembly • ECM
P0017	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 1) • Camshaft timing exhaust gear assembly • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for intake side of bank 2) • Camshaft timing gear assembly • ECM
P0019	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 2) • Camshaft timing exhaust gear assembly • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (Bank 1) or P0018 (Bank 2).
To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0017 (Bank 1) or P0019 (Bank 2).

P0019	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 2) • Camshaft timing exhaust gear assembly • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (Bank 1) or P0018 (Bank 2).
To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0017 (Bank 1) or P0019 (Bank 2).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0016, P0017, P0018 OR P0019)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0016, P0017, P0018 or P0019 is output	A
P0016, P0017, P0018 or P0019 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

NG → Go to step 4

OK

3.ADJUST VALVE TIMING

a. Adjust the valve timing (Click here).

NEXT → Go to step 6

4.INSPECT CAMSHAFT OIL CONTROL VALVE (FOR INTAKE SIDE OR EXHAUST SIDE)

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
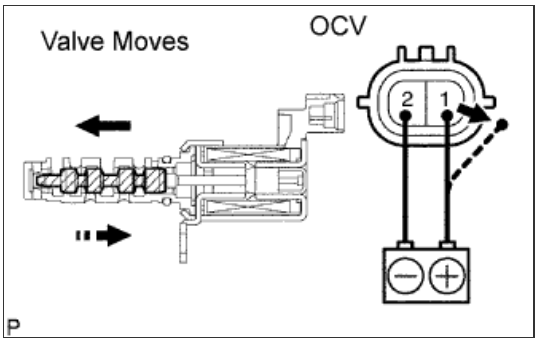
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE (Click here)

OK

5.REPLACE CAMSHAFT TIMING GEAR OR CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing gear (Click here).

b. Replace the camshaft timing exhaust gear (Click here).

NEXT

6.CONFIRM WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTC (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle in an urban area for approximately 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC is output.

NG → GO TO DTC CHART (Click here)

OK

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

C54-69 (EV1+) - C54-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C54-64 (EV2+) - C54-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C22 or C23 VVT sensor (for exhaust side) connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C22-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C23-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR (for Exhaust Side) - ECM)

a. Disconnect the C22 or C23 VVT (for exhaust side) sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (EX+) - C53-69 (EV1+)	Always	Below 1 Ω

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake and exhaust valve open and close timing is controlled by the ECM. The ECM performs intake and exhaust valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft oil control valve (OCV) (for intake side of bank 1) • Camshaft timing gear assembly • ECM
P0017	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 1) • Camshaft timing exhaust gear assembly • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for intake side of bank 2) • Camshaft timing gear assembly • ECM
P0019	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 2) • Camshaft timing exhaust gear assembly • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (Bank 1) or P0018 (Bank 2).
To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0017 (Bank 1) or P0019 (Bank 2).

DTC P0412 Secondary Air Injection System Switching Valve "A" Circuit

DTC P0415 Secondary Air Injection System Switching Valve "B" Circuit

for Preparation Click here

DESCRIPTION

The Secondary Air Injection (AIR) system consists of an air pump, the Air Switching Valve (ASV), a pressure sensor, the Air Injection Control Driver (AID) and the ECM. For a short time after a cold engine start, the AIR system pumps secondary air to the exhaust port of the cylinder head to purify the exhaust emissions. The secondary air is supplied by the air pump and is pumped to the exhaust port through the ASV.
The AID drives the ASV and the air pump according to command signals transmitted by the ECM. The pressure sensor detects the pressure in the secondary air passage when the AIR system is ON and OFF, and transmits a pressure signal to the ECM.
The AID is not only equipped to drive the pump and valve, but also with a diagnosis function to detect malfunctions in the AIR system circuit.

HINT:

As a large current is required to drive the air pump and ASV, an AID is installed to this system.

DTC Code	DTC Detection Condition	Trouble Area
P0412 P0415	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. The Secondary Air Injection (AIR) system is not operating (air pump OFF, Air Switching Valve [ASV] OFF). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 40%. 3. The battery voltage is 8 V or higher.	• Open in Air Switching Valve (ASV) drive circuit • Air Injection Control Driver (AID) • Air Switching Valve (ASV) • ECM
P0412 P0415	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. The Secondary Air Injection (AIR) system is operating (air pump ON, Air Switching Valve [ASV] ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 40%. 3. The battery voltage is 8 V or higher.	• Short between ASV drive circuit and body ground • AID • ASV • ECM

MONITOR DESCRIPTION

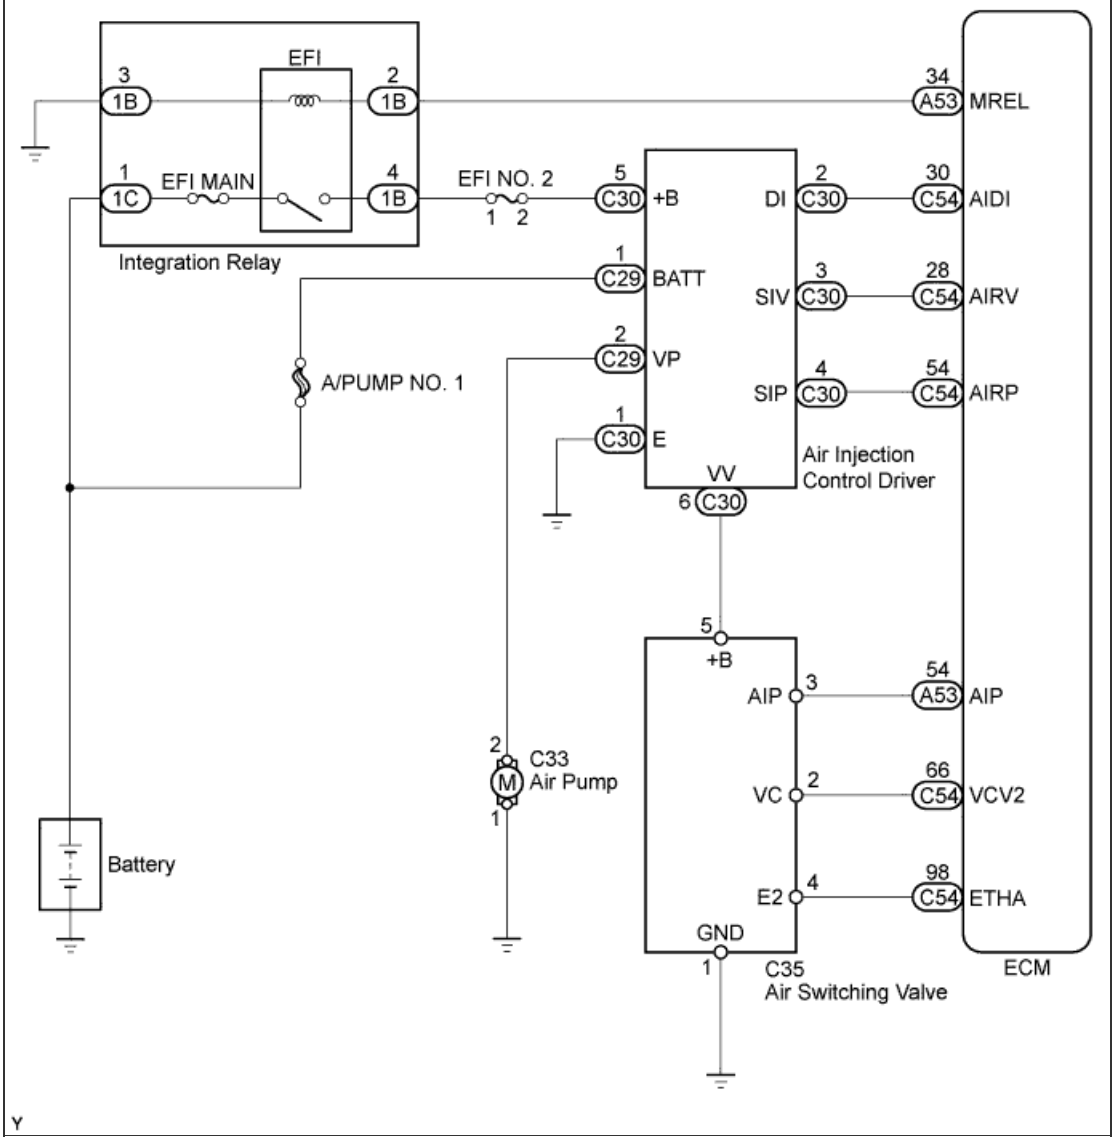
The Air Injection Control Driver (AID) detects open and short circuits according to the voltages of the air pump terminal (VP) and the Air Switching Valve (ASV) terminal (VV), and transmits diagnostic information as a signal to the ECM.
For a short time after a cold engine start, the ECM transmits command signals to the AID to drive the air pump and ASV.
The AID transmits an ASV malfunction signal to the ECM if either of the following conditions is met:



- The voltage at the AID terminal relating to the ASV is low despite the AID receiving command signals from the ECM to drive the ASV.
- The voltage at the AID terminal relating to the ASV is high despite the AID receiving no command signals from the ECM to drive the ASV.

The ECM stores the DTC based on diagnostic signals from the AID.

INSPECTION PROCEDURE

HINT:

The diagnostic information output from Air Injection Control Driver (AID) can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the Utility function allows the possible trouble areas to be narrowed down.

NOTICE:

- **This Secondary Air Injection Check only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).**
  If an ERROR is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the Secondary Air Injection Check repeatedly may cause damage to the AIR system. If necessary, leave an interval of several minutes between system check operations to prevent the system from overheating.**
- **When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.**
- **Turn the engine switch off when the Secondary Air Injection Check operation finishes.**

HINT:

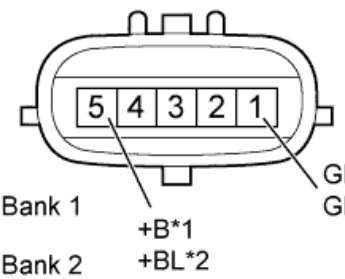
- **By using the intelligent tester to perform the Secondary Air Injection Check operation in the Utility, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT AIR SWITCHING VALVE ASSEMBLY



a. Disconnect the C35 or C36 air switching valve (ASV) connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C35-5 (+B) - C35-1 (GND)	20°C (68°F)	4.5 to 5.5 Ω
C36-5 (+BL) - C36-1 (GNDL)	20°C (68°F)	4.5 to 5.5 Ω

Component without harness connected:
(Air Switching Valve)

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake and exhaust valve open and close timing is controlled by the ECM. The ECM performs intake and exhaust valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft oil control valve (OCV) (for intake side of bank 1) • Camshaft timing gear assembly • ECM
P0017	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 1) • Camshaft timing exhaust gear assembly • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for intake side of bank 2) • Camshaft timing gear assembly • ECM
P0019	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 2) • Camshaft timing exhaust gear assembly • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (Bank 1) or P0018 (Bank 2).
To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0017 (Bank 1) or P0019 (Bank 2).

DTC P0412 Secondary Air Injection System Switching Valve "A" Circuit

DTC P0415 Secondary Air Injection System Switching Valve "B" Circuit

for Preparation Click here

DESCRIPTION

The Secondary Air Injection (AIR) system consists of an air pump, the Air Switching Valve (ASV), a pressure sensor, the Air Injection Control Driver (AID) and the ECM. For a short time after a cold engine start, the AIR system pumps secondary air to the exhaust port of the cylinder head to purify the exhaust emissions. The secondary air is supplied by the air pump and is pumped to the exhaust port through the ASV.
The AID drives the ASV and the air pump according to command signals transmitted by the ECM. The pressure sensor detects the pressure in the secondary air passage when the AIR system is ON and OFF, and transmits a pressure signal to the ECM.
The AID is not only equipped to drive the pump and valve, but also with a diagnosis function to detect malfunctions in the AIR system circuit.

HINT:

As a large current is required to drive the air pump and ASV, an AID is installed to this system.

DTC Code	DTC Detection Condition	Trouble Area
P0412 P0415	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. The Secondary Air Injection (AIR) system is not operating (air pump OFF, Air Switching Valve [ASV] OFF). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 40%. 3. The battery voltage is 8 V or higher.	• Open in Air Switching Valve (ASV) drive circuit • Air Injection Control Driver (AID) • Air Switching Valve (ASV) • ECM
P0412 P0415	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. The Secondary Air Injection (AIR) system is operating (air pump ON, Air Switching Valve [ASV] ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 40%. 3. The battery voltage is 8 V or higher.	• Short between ASV drive circuit and body ground • AID • ASV • ECM

MONITOR DESCRIPTION

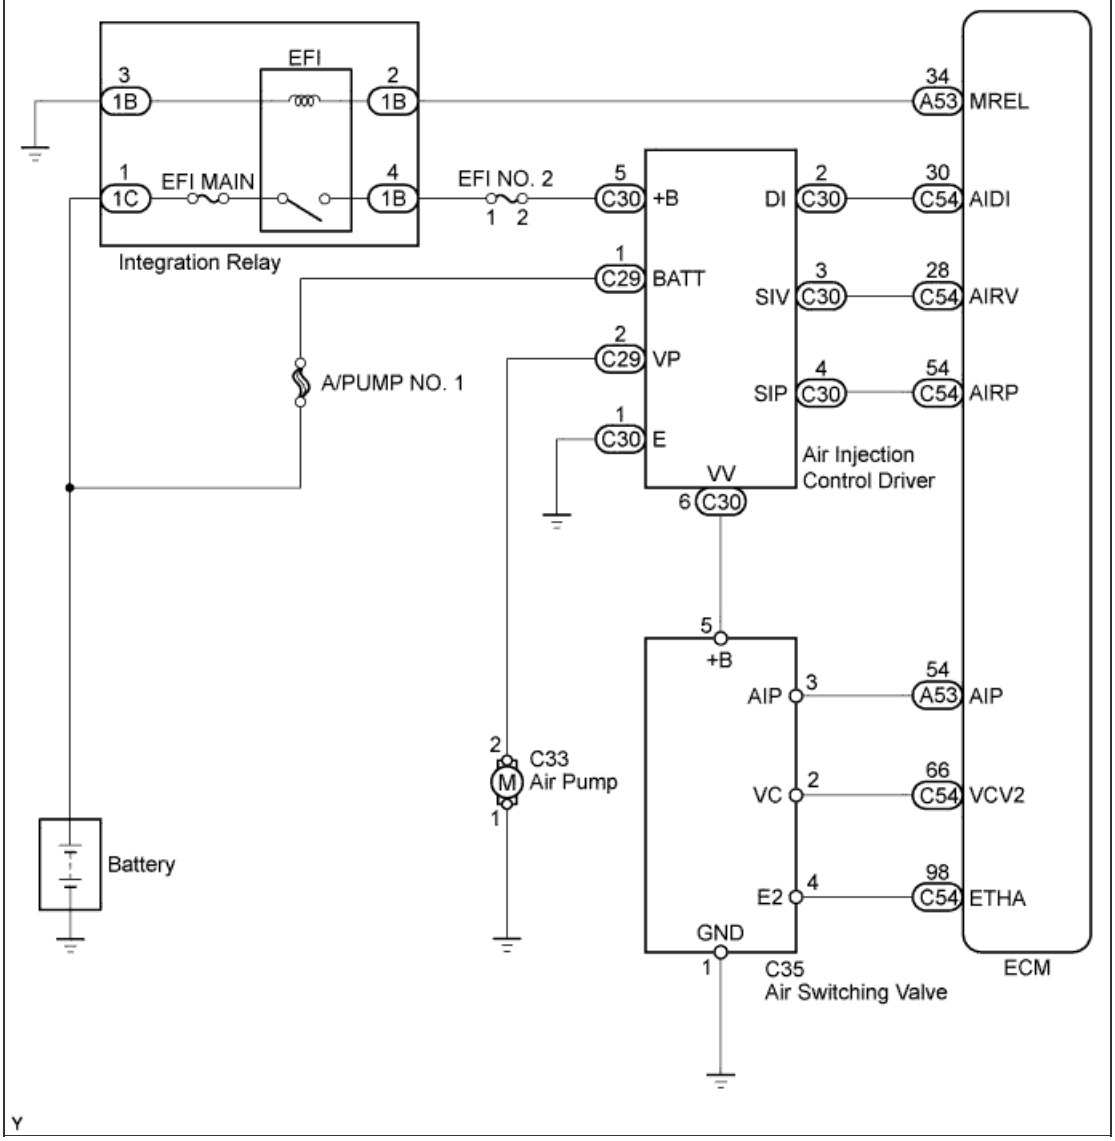
The Air Injection Control Driver (AID) detects open and short circuits according to the voltages of the air pump terminal (VP) and the Air Switching Valve (ASV) terminal (VV), and transmits diagnostic information as a signal to the ECM.
For a short time after a cold engine start, the ECM transmits command signals to the AID to drive the air pump and ASV.
The AID transmits an ASV malfunction signal to the ECM if either of the following conditions is met:



- The voltage at the AID terminal relating to the ASV is low despite the AID receiving command signals from the ECM to drive the ASV.
- The voltage at the AID terminal relating to the ASV is high despite the AID receiving no command signals from the ECM to drive the ASV.

The ECM stores the DTC based on diagnostic signals from the AID.

DTC P0418 Secondary Air Injection System Control "A" Circuit

DTC P0419 Secondary Air Injection System Control "B" Circuit

for Preparation Click here

DESCRIPTION

Refer to DTC P0412 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0418 P0419	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. Secondary Air Injection (AIR) system not operating (air pump OFF, Air Switching Valve [ASV] OFF) 2. The diagnostic signal from the Air Injection Control Driver (AID) is 20%. 3. The battery voltage is 8 V or higher.	• Open in air pump drive circuit • Air pump • Air injection control driver (AID) • ECM
P0418 P0419	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. The Secondary Air Injection (AIR) system is operating (air pump ON, Air Switching Valve [ASV] ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 20%. 3. The battery voltage is 8 V or higher.	• Short between air pump drive circuit and body ground • Air pump • Air injection control driver (AID) • ECM

MONITOR DESCRIPTION

The Air Injection Control Driver (AID) detects open and short circuits according to the voltages of the air pump terminal (VP) and the Air Switching Valve (ASV) terminal (VV), and transmits diagnostic information as a signal to the ECM.
For a short time after a cold engine start, the ECM transmits command signals to the AID to drive the air pump and ASV.
The AID transmits an air pump malfunction signal to the ECM if either of the following conditions is met:

- The voltage at the AID terminal relating to the air pump is low despite the AID receiving command signals from the ECM to drive the air pump.
- The voltage at the AID terminal relating to the air pump is high despite the AID receiving no command signals from the ECM to drive the air pump.

The ECM stores the DTC based on diagnostic signals from the AID.

WIRING DIAGRAM

Refer to DTC P0412 (Click here).

INSPECTION PROCEDURE

HINT:

Diagnostic information output by the AID can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the Utility function allows the possible trouble areas to be narrowed down.

NOTICE:

- **This Secondary Air Injection Check only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore, the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).**
  If an ERROR is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.
- **Performing the Secondary Air Injection Check repeatedly may cause damage to the AIR system. If necessary, leave an interval of several minutes between system check operations to prevent the system from overheating.**
- **When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.**
- **Turn the engine switch off when the Secondary Air Injection Check operation finishes.**

HINT:

- **By using the intelligent tester to perform the Secondary Air Injection Check operation in the Utility, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT AIR PUMP ASSEMBLY

a. Disconnect the C33 or C34 air pump connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	0.44 to 1 Ω

Component without harness connected:
(Air Pump)

NG → REPLACE AIR PUMP ASSEMBLY (Click here)

OK

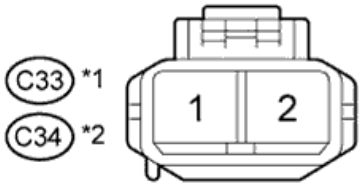
2.CHECK HARNESS AND CONNECTOR (AIR PUMP - BODY GROUND)



a. Disconnect the C33 or C34 air pump connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C33-1 - Body ground	Always	Below 1 Ω
C34-1 - Body ground	Always	Below 1 Ω

Front view of wire harness connector:
(to Air Pump)

DTC P0031 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC P0032 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

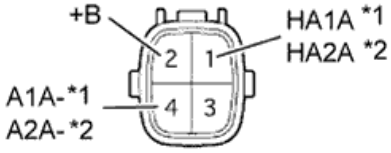
1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the C47 or C48 Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

A

3.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
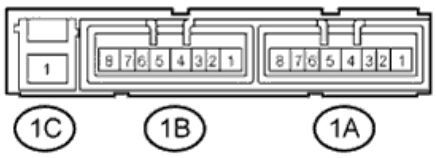
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

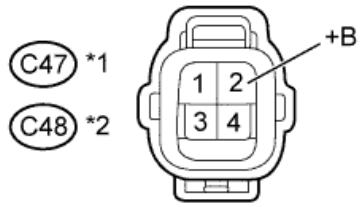
4.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - A/F SENSOR AND BODY GROUND)

a. Disconnect the C47 or C48 A/F sensor connector.



b. Remove the integration relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C47-2 (+B) - 1A-4	Always	Below 1 Ω
C48-2 (+B) - 1A-4	Always	Below 1 Ω
1A-2 - 1B-4	Always	Below 1 Ω
1A-3 - Body ground	Always	Below 1 Ω
C47-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C48-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
1A-2 or 1B-4 - Body ground	Always	10 kΩ or higher

DTC P0418 Secondary Air Injection System Control "A" Circuit

DTC P0419 Secondary Air Injection System Control "B" Circuit

for Preparation Click here

DESCRIPTION

Refer to DTC P0412 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0418 P0419	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. Secondary Air Injection (AIR) system not operating (air pump OFF, Air Switching Valve [ASV] OFF) 2. The diagnostic signal from the Air Injection Control Driver (AID) is 20%. 3. The battery voltage is 8 V or higher.	• Open in air pump drive circuit • Air pump • Air injection control driver (AID) • ECM
P0418 P0419	After a cold engine start, all of the following conditions are met (1 trip detection logic): 1. The Secondary Air Injection (AIR) system is operating (air pump ON, Air Switching Valve [ASV] ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 20%. 3. The battery voltage is 8 V or higher.	• Short between air pump drive circuit and body ground • Air pump • Air injection control driver (AID) • ECM

MONITOR DESCRIPTION

The Air Injection Control Driver (AID) detects open and short circuits according to the voltages of the air pump terminal (VP) and the Air Switching Valve (ASV) terminal (VV), and transmits diagnostic information as a signal to the ECM.
For a short time after a cold engine start, the ECM transmits command signals to the AID to drive the air pump and ASV.
The AID transmits an air pump malfunction signal to the ECM if either of the following conditions is met:

- The voltage at the AID terminal relating to the air pump is low despite the AID receiving command signals from the ECM to drive the air pump.
- The voltage at the AID terminal relating to the air pump is high despite the AID receiving no command signals from the ECM to drive the air pump.

The ECM stores the DTC based on diagnostic signals from the AID.

WIRING DIAGRAM

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

DTC P0420 Catalyst System Efficiency Below Threshold (Bank 1)

DTC P0430 Catalyst System Efficiency Below Threshold (Bank 2)

for Preparation Click here

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air Fuel ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM. In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and stores the DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 1 Sensor 2) • Front No. 2 exhaust pipe assembly (TWC)
P0430	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 2 Sensor 2) • Front exhaust pipe assembly (TWC)

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (if output) (Click here).
(e) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Catalyst Monitor.
(f) Check that Catalyst Monitor is incomplete.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to Complete as Catalyst Monitor monitor operates.
(j) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are output.

HINT:

If Catalyst Monitor does not change to Complete, and any pending DTCs fail to be stored, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched off until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While running the engine at 3000 rpm and 2000 rpm at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.

HINT:

- **If either voltage output of the Air Fuel ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is a noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following Control the Injection Volume for A/F Sensor using the intelligent tester.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0420 or P0430 is output	A
P0420 or P0430 and other DTCs are output	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (Control the Injection Volume for A/F Sensor)

a. Connect the intelligent tester to the DLC3.

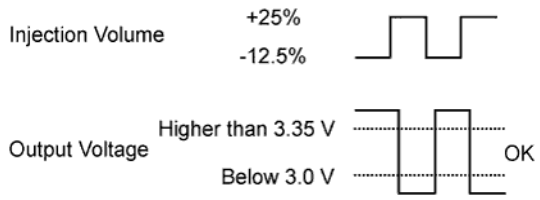
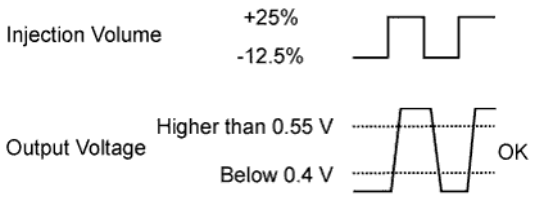
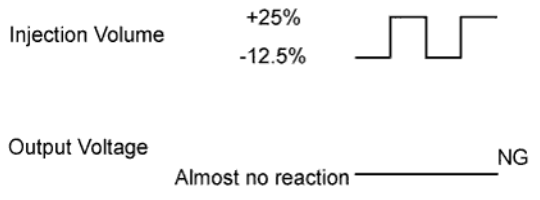
b. Start the engine and turn the tester on.

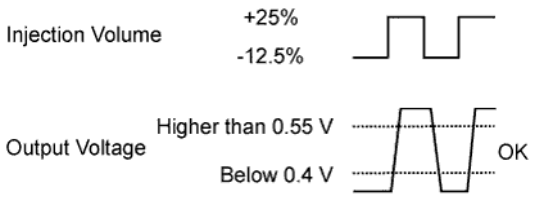
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

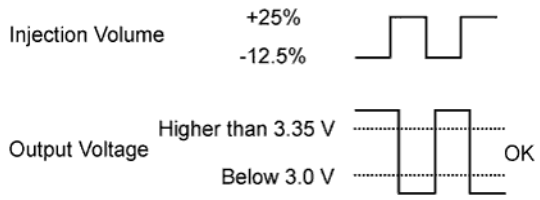
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

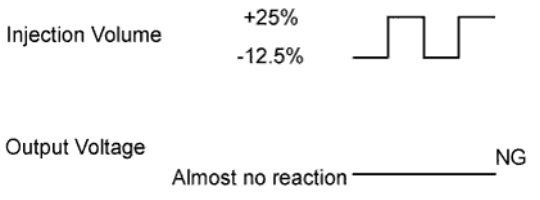


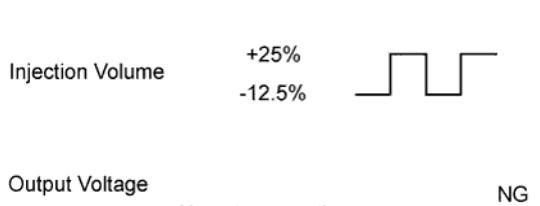












e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

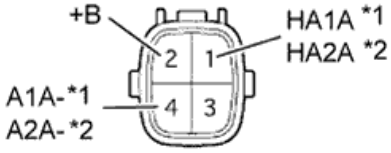
1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the C47 or C48 Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

3.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
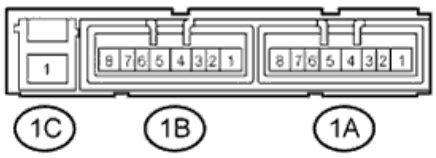
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

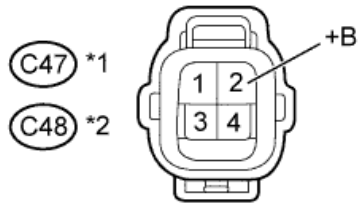
4.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - A/F SENSOR AND BODY GROUND)

a. Disconnect the C47 or C48 A/F sensor connector.



b. Remove the integration relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C47-2 (+B) - 1A-4	Always	Below 1 Ω
C48-2 (+B) - 1A-4	Always	Below 1 Ω
1A-2 - 1B-4	Always	Below 1 Ω
1A-3 - Body ground	Always	Below 1 Ω
C47-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C48-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
1A-2 or 1B-4 - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to A/F Sensor)

Front view of wire harness connector:

DTC P0420 Catalyst System Efficiency Below Threshold (Bank 1)

DTC P0430 Catalyst System Efficiency Below Threshold (Bank 2)

for Preparation Click here

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air Fuel ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM. In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and stores the DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 1 Sensor 2) • Front No. 2 exhaust pipe assembly (TWC)
P0430	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 2 Sensor 2) • Front exhaust pipe assembly (TWC)

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (if output) (Click here).
(e) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Catalyst Monitor.
(f) Check that Catalyst Monitor is incomplete.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to Complete as Catalyst Monitor monitor operates.
(j) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are output.

HINT:

If Catalyst Monitor does not change to Complete, and any pending DTCs fail to be stored, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched off until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While running the engine at 3000 rpm and 2000 rpm at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.

HINT:

- **If either voltage output of the Air Fuel ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is a noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following Control the Injection Volume for A/F Sensor using the intelligent tester.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0420 or P0430 is output	A
P0420 or P0430 and other DTCs are output	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (Control the Injection Volume for A/F Sensor)

a. Connect the intelligent tester to the DLC3.

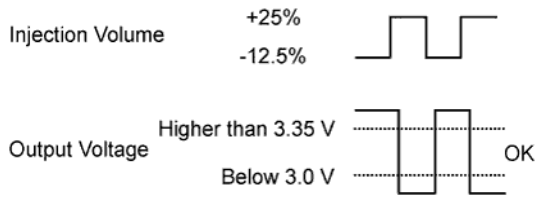
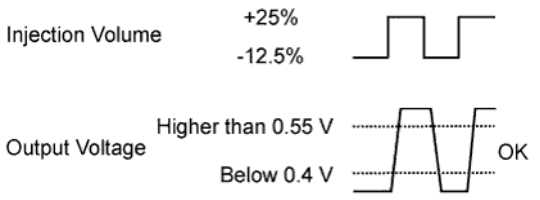
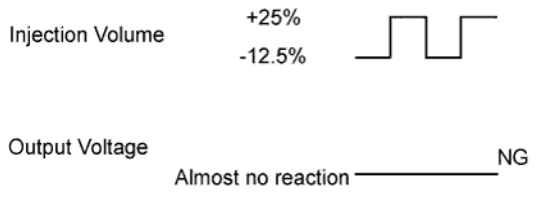
b. Start the engine and turn the tester on.

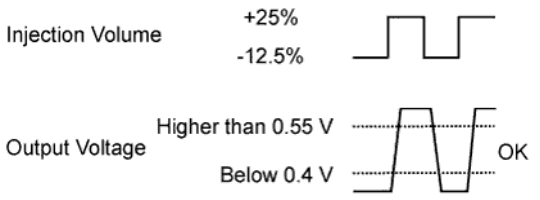
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

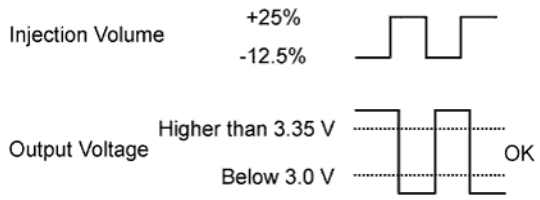
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

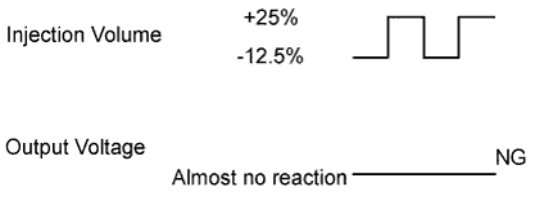


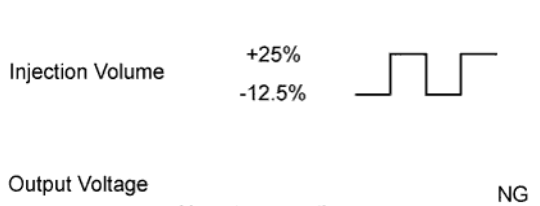












e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

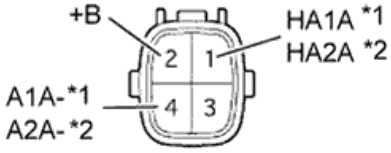
1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the C47 or C48 Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF A/F SENSOR)

a. Disconnect the C47 or C48 A/F sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C47-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C48-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

Result

Result	Proceed to
NG	A
OK	B

Front view of wire harness connector:
(to A/F Sensor)

*2: for Bank 2

B → Go to step 5

A

3.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
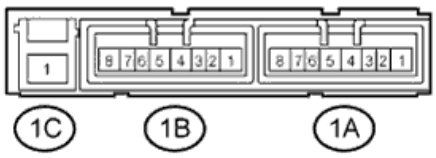
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

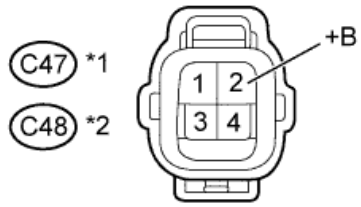
4.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - A/F SENSOR AND BODY GROUND)

a. Disconnect the C47 or C48 A/F sensor connector.



b. Remove the integration relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C47-2 (+B) - 1A-4	Always	Below 1 Ω
C48-2 (+B) - 1A-4	Always	Below 1 Ω
1A-2 - 1B-4	Always	Below 1 Ω
1A-3 - Body ground	Always	Below 1 Ω
C47-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C48-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
1A-2 or 1B-4 - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to A/F Sensor)

Front view of wire harness connector:
(to Integration Relay)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

CHECK ECM POWER SOURCE CIRCUIT (Click here)

5.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C47 or C48 A/F sensor connector.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C47-1 (HA1A) - C53-22 (HA1A)	Always	Below 1 Ω
C48-1 (HA2A) - C53-20 (HA2A)	Always	Below 1 Ω
C47-1 (HA1A) or C53-22 (HA1A) - Body ground	Always	10 kΩ or higher
C48-1 (HA2A) or C53-20 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C47-1 (HA1A) - C54-22 (HA1A)	Always	Below 1 Ω
C48-1 (HA2A) - C54-20 (HA2A)	Always	Below 1 Ω
C47-1 (HA1A) or C54-22 (HA1A) - Body ground	Always	10 kΩ or higher
C48-1 (HA2A) or C54-20 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Allow the engine to idle for 1 minute or more.

g. Enter the following menus: Powertrain / Engine and ECT / DTC.

h. Read DTCs.

DTC P0420 Catalyst System Efficiency Below Threshold (Bank 1)

DTC P0430 Catalyst System Efficiency Below Threshold (Bank 2)

for Preparation Click here

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air Fuel ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM. In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and stores the DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 1 Sensor 2) • Front No. 2 exhaust pipe assembly (TWC)
P0430	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 2 Sensor 2) • Front exhaust pipe assembly (TWC)

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (if output) (Click here).
(e) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Catalyst Monitor.
(f) Check that Catalyst Monitor is incomplete.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to Complete as Catalyst Monitor monitor operates.
(j) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are output.

HINT:

If Catalyst Monitor does not change to Complete, and any pending DTCs fail to be stored, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched off until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While running the engine at 3000 rpm and 2000 rpm at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.

HINT:

- **If either voltage output of the Air Fuel ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is a noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following Control the Injection Volume for A/F Sensor using the intelligent tester.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0420 or P0430 is output	A
P0420 or P0430 and other DTCs are output	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (Control the Injection Volume for A/F Sensor)

a. Connect the intelligent tester to the DLC3.

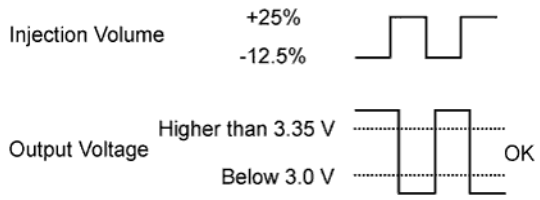
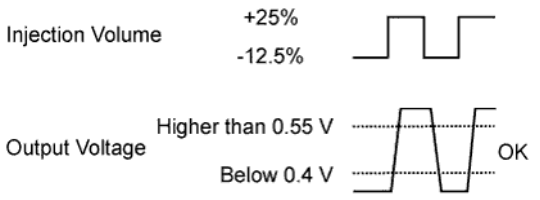
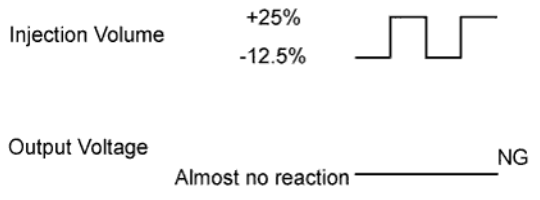
b. Start the engine and turn the tester on.

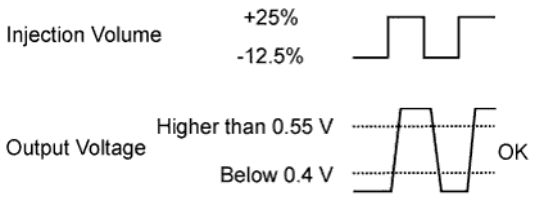
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

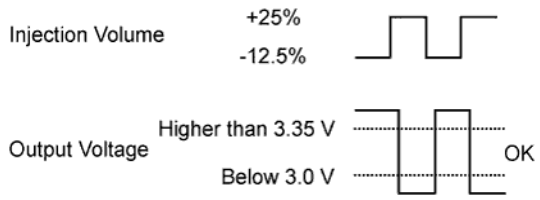
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

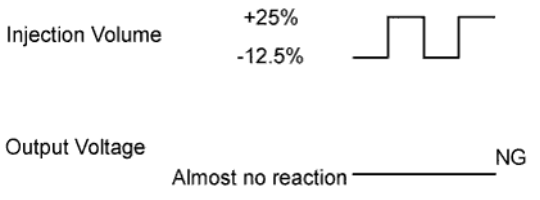


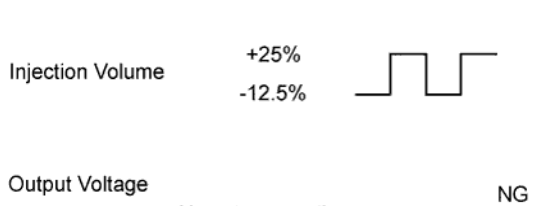












e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

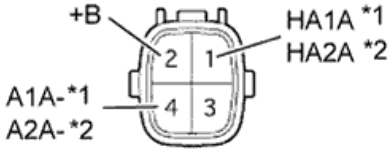
1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the C47 or C48 Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

3.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
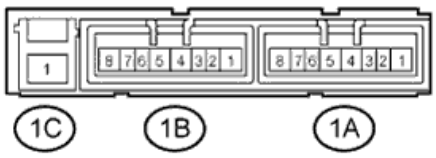
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

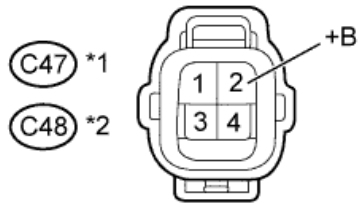
4.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - A/F SENSOR AND BODY GROUND)

a. Disconnect the C47 or C48 A/F sensor connector.



b. Remove the integration relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C47-2 (+B) - 1A-4	Always	Below 1 Ω
C48-2 (+B) - 1A-4	Always	Below 1 Ω
1A-2 - 1B-4	Always	Below 1 Ω
1A-3 - Body ground	Always	Below 1 Ω
C47-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C48-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
1A-2 or 1B-4 - Body ground	Always	10 kΩ or higher

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air Fuel ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM. In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and stores the DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 1 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 1 Sensor 2) • Front No. 2 exhaust pipe assembly (TWC)
P0430	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • Air Fuel ratio (A/F) sensor (for Bank 2 Sensor 1) • Heated Oxygen (HO2) sensor (for Bank 2 Sensor 2) • Front exhaust pipe assembly (TWC)

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (if output) (Click here).
(e) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Catalyst Monitor.
(f) Check that Catalyst Monitor is incomplete.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and 70 mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to Complete as Catalyst Monitor monitor operates.
(j) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are output.

HINT:

If Catalyst Monitor does not change to Complete, and any pending DTCs fail to be stored, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched off until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While running the engine at 3000 rpm and 2000 rpm at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.

HINT:

- **If either voltage output of the Air Fuel ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is a noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following Control the Injection Volume for A/F Sensor using the intelligent tester.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

- **DTC P0420 and P0430 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0420 or P0430 is output	A
P0420 or P0430 and other DTCs are output	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (Control the Injection Volume for A/F Sensor)

a. Connect the intelligent tester to the DLC3.

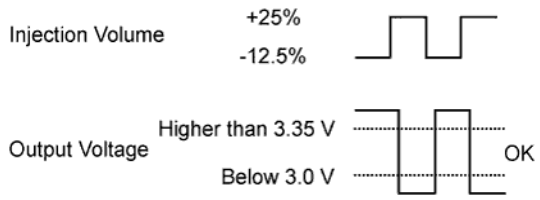
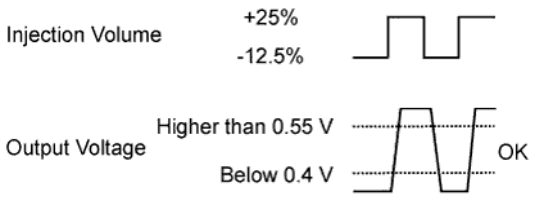
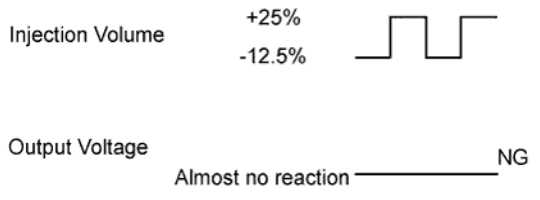
b. Start the engine and turn the tester on.

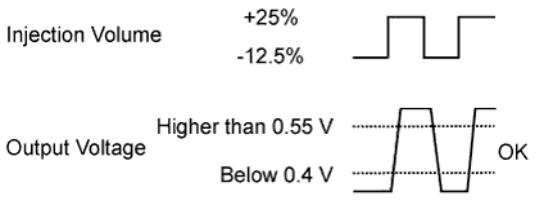
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

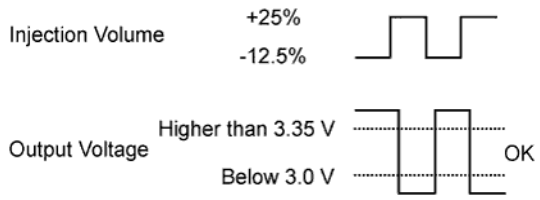
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

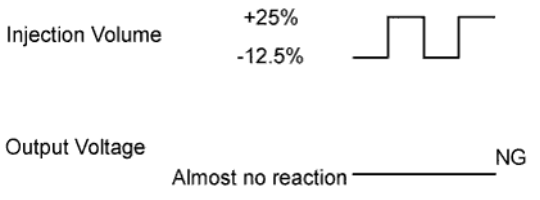


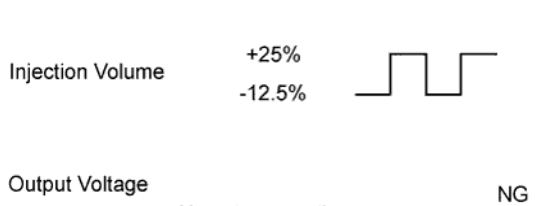












e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

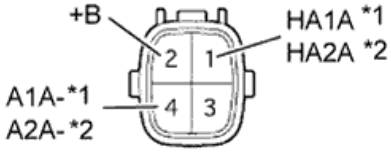
1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the C47 or C48 Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

DTC P0032 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

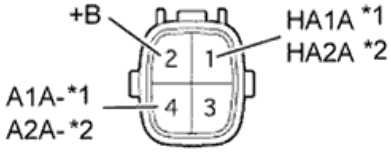
1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the C47 or C48 Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:

3.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
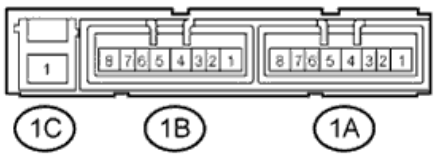
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

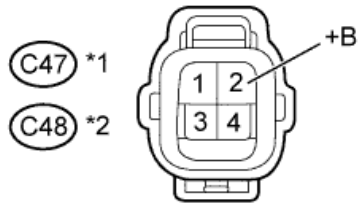
4.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - A/F SENSOR AND BODY GROUND)

a. Disconnect the C47 or C48 A/F sensor connector.



b. Remove the integration relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C47-2 (+B) - 1A-4	Always	Below 1 Ω
C48-2 (+B) - 1A-4	Always	Below 1 Ω
1A-2 - 1B-4	Always	Below 1 Ω
1A-3 - Body ground	Always	Below 1 Ω
C47-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C48-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
1A-2 or 1B-4 - Body ground	Always	10 kΩ or higher

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC Code	DTC Detection Condition	Trouble Area
P0500	While the vehicle is being driven, no vehicle speed sensor signal is transmitted to the ECM (2 trip detection logic).	• Open or short in speed signal circuit • Combination meter • ECM

MONITOR DESCRIPTION

The ECM assumes that the vehicle is being driven when the indicated vehicle speed is more than 9 km/h (5.6 mph). If there is no speed signal from the combination meter despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and stores the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When

troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK OPERATION OF SPEEDOMETER

a. Drive the vehicle and check whether the operation of the speedometer in the combination meter is normal.

HINT:

- **The vehicle speed sensor is operating normally if the speedometer reading is normal.**
- **If the speedometer does not operate, check it by following the procedure described in Speedometer Malfunction (Click here).**

NG → **GO TO MALFUNCTION IN SPEEDOMETER (Click here)**

OK

2.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPD)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Vehicle Speed.

e. Drive the vehicle.

f. Read the value displayed on the tester.

OK:

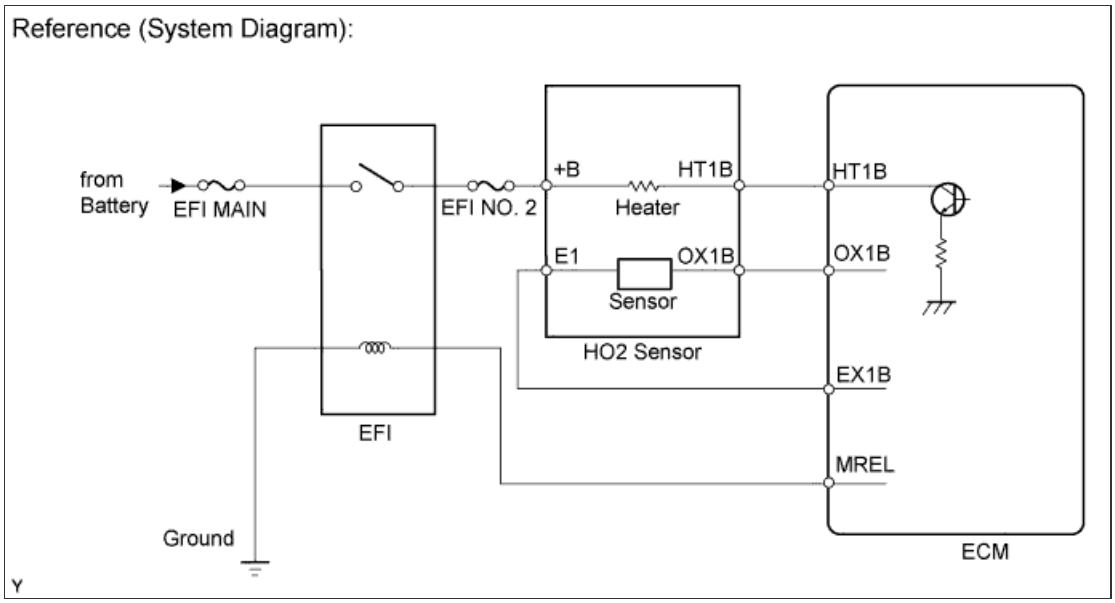
DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in Heated Oxygen (HO2) sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):
The ECM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM determines that there is an open circuit in the heater. If the current is higher than the threshold value, the ECM determines that there is a short circuit in the heater.
The ECM constantly monitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and stores a DTC.
If a malfunction is detected, the ECM cuts off the current applied to the heater.
Example:
The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

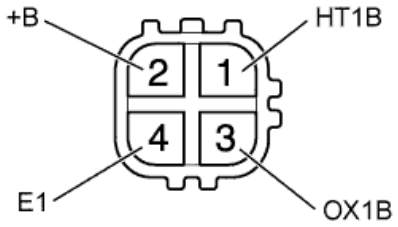
These DTCs are stored when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:

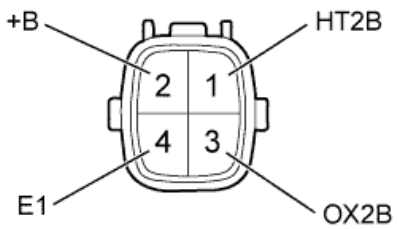
- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher

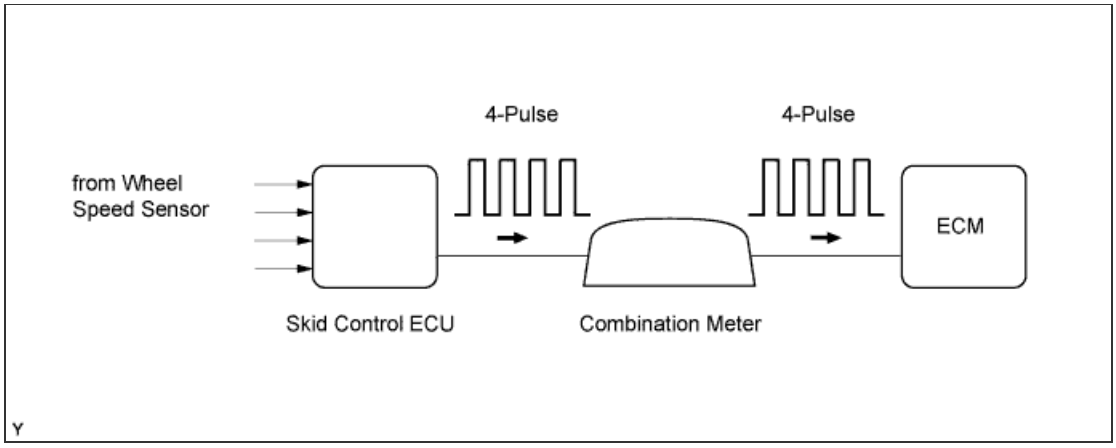
DTC P0500 Vehicle Speed Sensor "A"



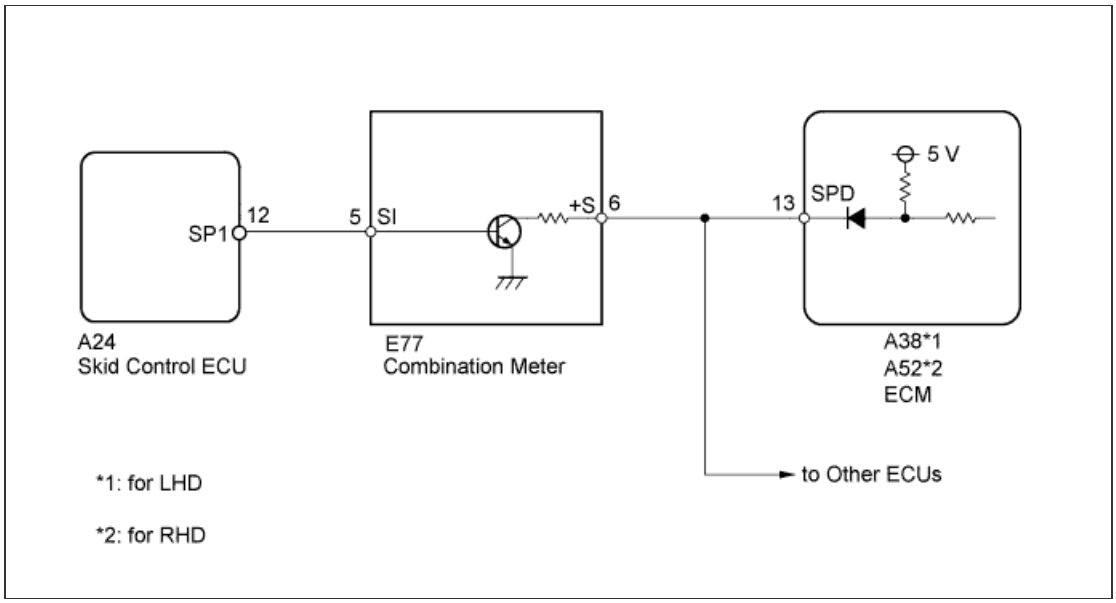
for Preparation Click here

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.

HINT:

- **A voltage of 12 V or 5 V is output from each ECU and then input to the combination meter. The signal is changed to a pulse signal at the transistor in the combination meter. Each ECU controls the respective system based on the pulse signal.**
- **If a short occurs in any of the ECUs or in the wire harness connected to an ECU, all systems in the diagram below will not operate normally.**



DTC Code	DTC Detection Condition	Trouble Area
P0500	While the vehicle is being driven, no vehicle speed sensor signal is transmitted to the ECM (2 trip detection logic).	• Open or short in speed signal circuit • Combination meter • ECM • Skid control ECU

MONITOR DESCRIPTION

The ECM assumes that the vehicle is being driven when the indicated vehicle speed is more than 9 km/h (5.6 mph). If there is no speed signal from the combination meter despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and stores the DTC.

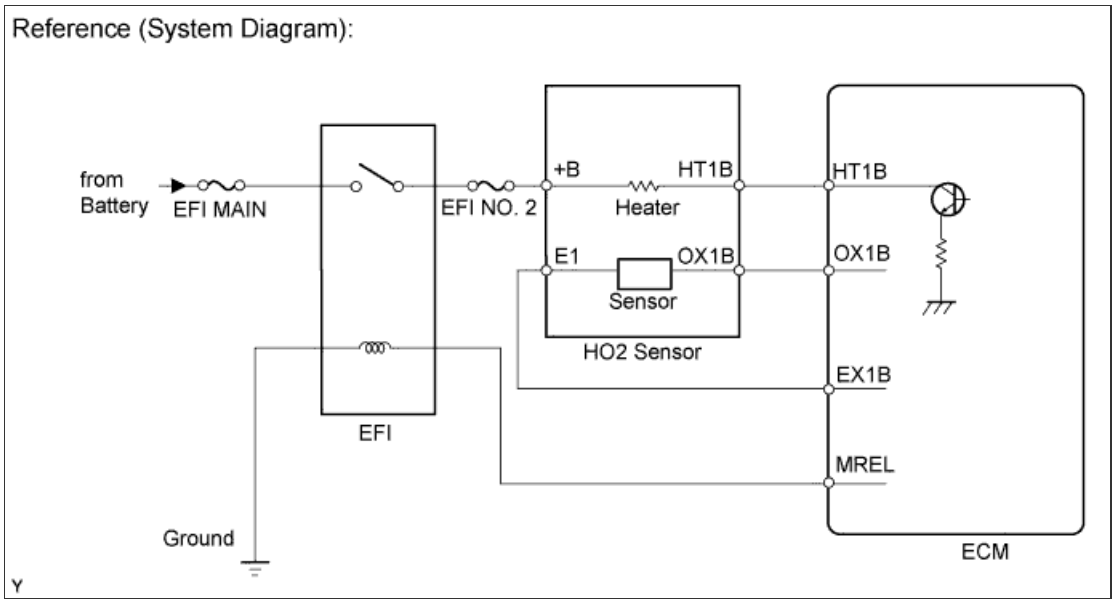
DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in Heated Oxygen (HO2) sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):
The ECM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM determines that there is an open circuit in the heater. If the current is higher than the threshold value, the ECM determines that there is a short circuit in the heater.
The ECM constantly monitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and stores a DTC.
If a malfunction is detected, the ECM cuts off the current applied to the heater.
Example:
The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

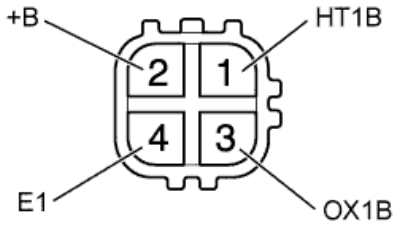
These DTCs are stored when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:

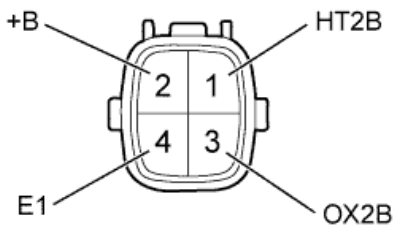
- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C17-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C18-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

3.INSPECT INTEGRATION NO.1 RELAY (EFI)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

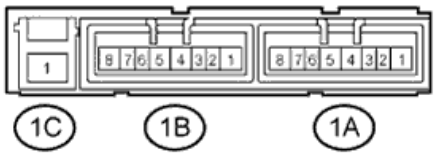
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (EFI)

OK

4.CHECK HARNESS AND CONNECTOR (HO2 SENSOR - INTEGRATION RELAY)

a. Check the EFI NO. 2 fuse.

i. Remove the EFI NO. 2 fuse from the engine room relay block.

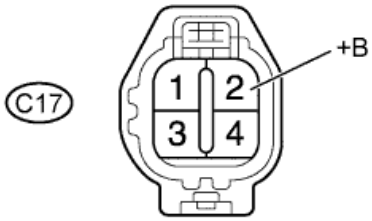
ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

iii. Reinstall the EFI NO. 2 fuse.

b. Disconnect the C17 or C18 HO2 sensor connector.



c. Remove the integration relay from the engine room relay block.

d. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C17-2 (+B) - 1B-4	Always	Below 1 Ω
C18-2 (+B) - 1B-4	Always	Below 1 Ω
C17-2 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher
C18-2 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher

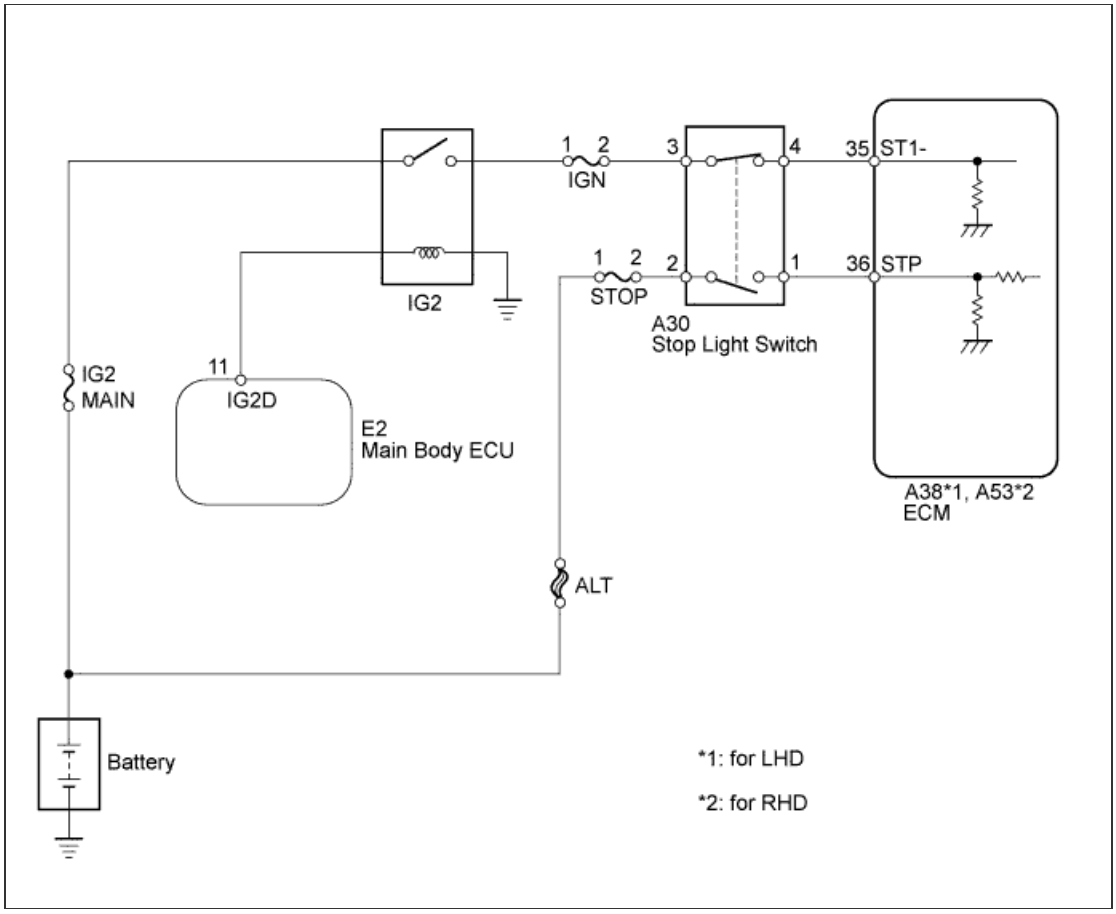
CHECK FOR INTERMITTENT PROBLEMS (**Click here**)

DTC P0504 Brake Switch "A" / "B" Correlation

for Preparation Click here

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and stores the DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic): (a) The engine switch is on (IG). (b) The brake pedal is released. (c) The STP signal is OFF when the ST1- signal is OFF.	• Short in stop light switch signal circuit • STOP fuse • IGN fuse • Stop light switch • ECM

HINT:

The normal conditions are as shown in the table below. The signals can be read using the intelligent tester.

Signal	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

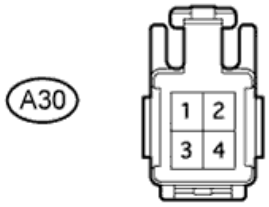
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was**

warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

- STP signal conditions can be checked using the intelligent tester.
  1. Connect the tester to the DLC3.
  2. Turn the engine switch on (IG).
  3. Turn the tester on.
  4. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Stop Light Switch.
  5. Check the STP signal when the brake pedal is depressed and released.

Brake Pedal Operation	Specified Condition
Depressed	STP signal ON
Released	STP signal OFF

1.CHECK STOP LIGHT SWITCH ASSEMBLY (B+ VOLTAGE)



a. Disconnect the A30 stop light switch connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

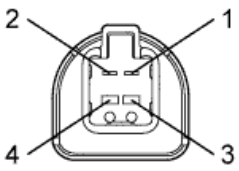
Tester Connection	Switch Condition	Specified Condition
A30-2 - Body ground	Always	11 to 14 V
A30-3 - Body ground	Engine switch on (IG)	11 to 14 V

Front view of wire Harness connector:
(to Stop Light Switch)

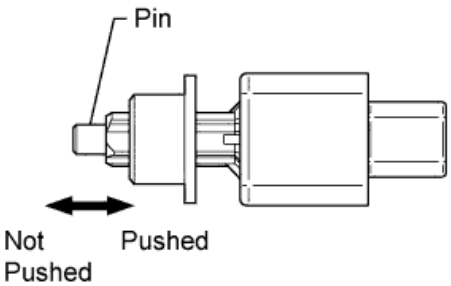
NG → Go to step 4

OK ↓

2.INSPECT STOP LIGHT SWITCH ASSEMBLY



a. Remove the stop light switch.

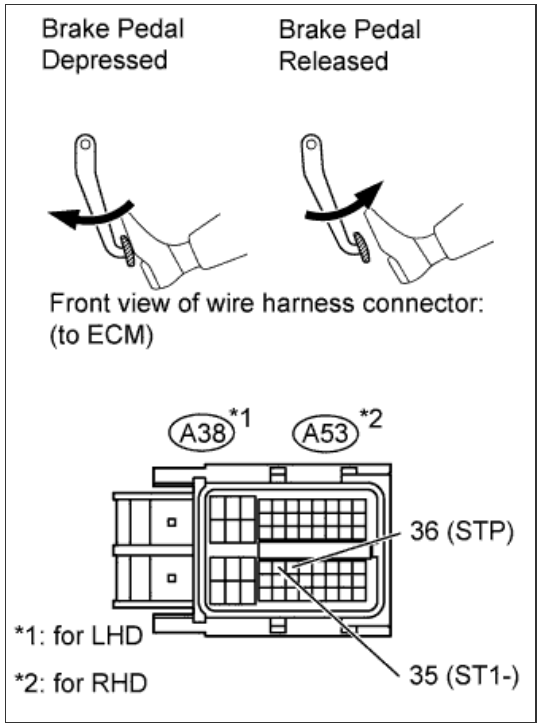


b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Pin not pushed	Below 1 Ω
	Pin pushed	10 kΩ or higher
3 - 4	Pin not pushed	10 kΩ or higher
	Pin pushed	Below 1 Ω

Component without harness connected:
(Stop Light Switch)



NG → REPLACE STOP LIGHT SWITCH ASSEMBLY (Click here)

OK ↓

3.CHECK ECM (STP AND ST1 - VOLTAGE)

a. Disconnect the A38 or A53 ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Condition	Specified Condition
A38-35 (ST1-) - Body ground	Brake pedal released	11 to 14 V
	Brake pedal depressed	0 to 3 V
A38-36 (STP) - Body ground	Brake pedal released	0 to 3 V
	Brake pedal depressed	11 to 14 V

for RHD

Tester Connection	Condition	Specified Condition
A53-35 (ST1-) - Body ground	Brake pedal released	11 to 14 V
	Brake pedal depressed	0 to 3 V
A53-36 (STP) - Body ground	Brake pedal released	0 to 3 V
	Brake pedal depressed	11 to 14 V

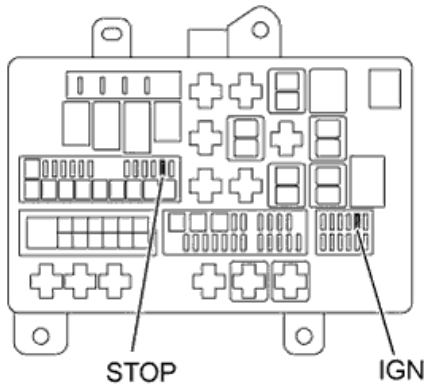
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

4.INSPECT FUSE (STOP AND IGN)

a. Remove the STOP and IGN fuses from the engine room relay block.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
STOP fuse	Always	Below 1 Ω

IGN fuse	Always	Below 1 Ω

Engine Room Relay Block:

NG

CHECK FOR INTERMITTENT PROBLEMS (**Click here**)

DTC P0505 Idle Control System Malfunction

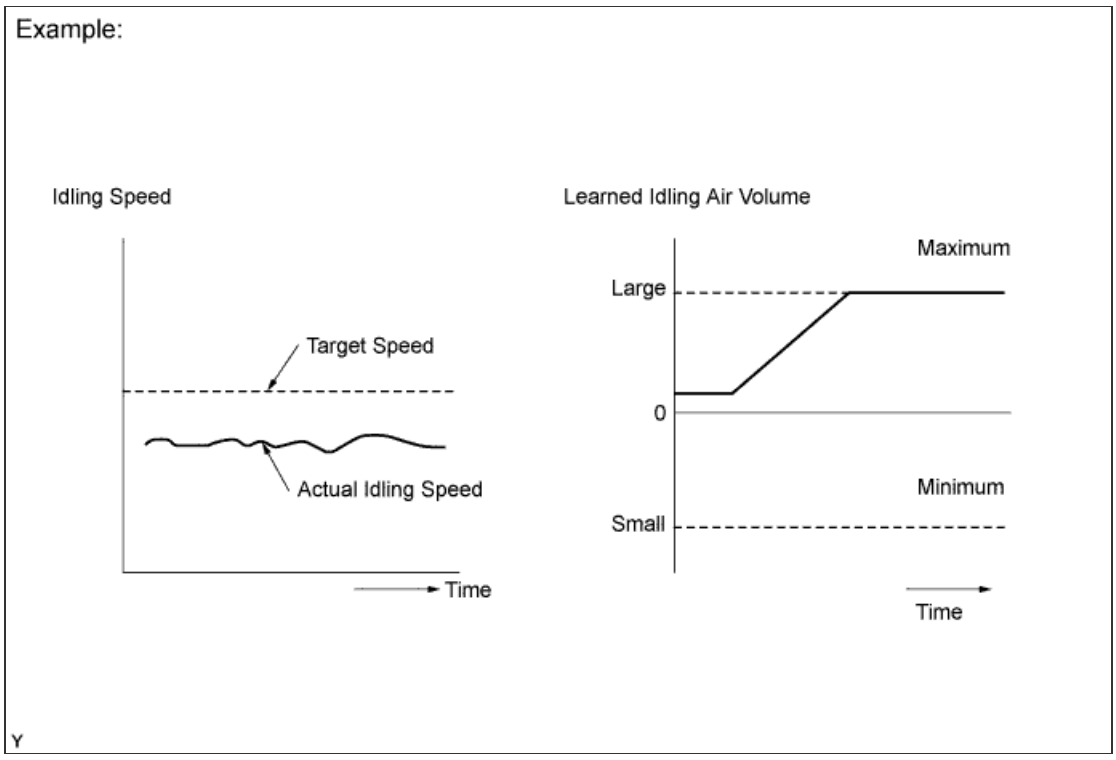
for Preparation Click here

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) the one valve type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

DTC Code	DTC Detection Condition	Trouble Area
P0505	The idling speed continues to vary greatly from the target idling speed (2 trip detection logic).	• ETCS • Air induction system • PCV hose connections • ECM

MONITOR DESCRIPTION



The ECM monitors the idling speed and idling air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the ISC system is malfunctioning if the following conditions apply:

- The learned idling air flow volume remains at the maximum or minimum volume for 5 seconds during a drive cycle.
- After driving at 10 km/h (6.25 mph) or more, the actual engine idling speed varies from the target idling speed by between 100 rpm and 150 rpm, 5 times or more during a drive cycle.

Example:
If the actual idling speed varies from the target idling speed by more than 150 rpm* 5 times during a drive cycle, the ECM illuminates the MIL and stores the DTC.

HINT:

*: Threshold idling speed varies with engine load.

INSPECTION PROCEDURE

HINT:

- **DTC P0505 is for Euro-OBD only.**
- **The following conditions may also cause DTC P0505 to be stored:**
  1. **The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.**
  2. **The accelerator pedal being not fully released.**

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0505 is output	A
P0505 and other DTCs are output	B

HINT:

If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

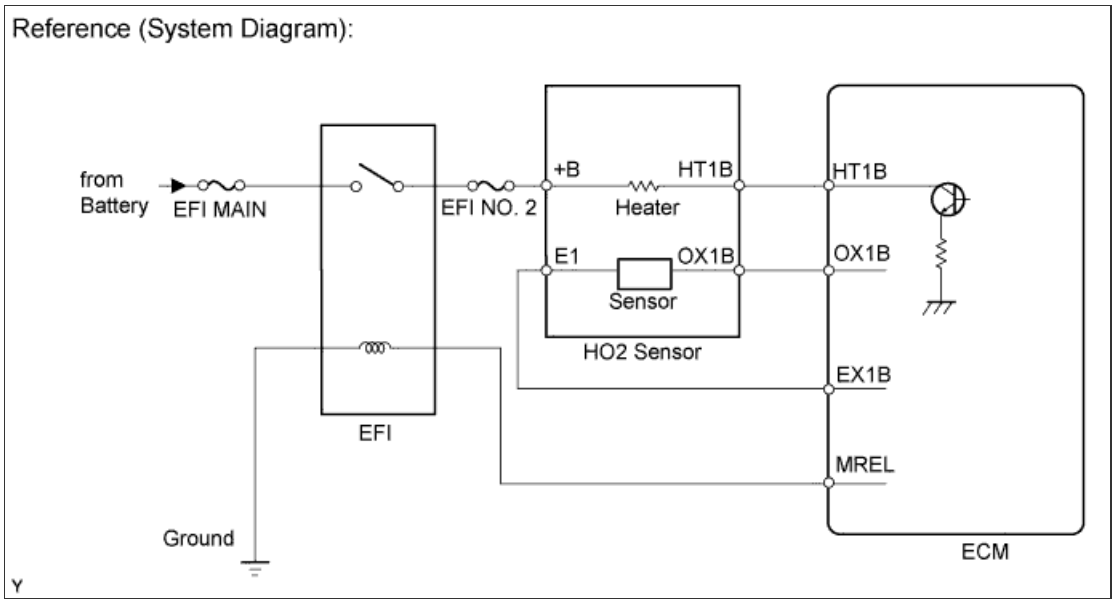
DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in Heated Oxygen (HO2) sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):
The ECM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM determines that there is an open circuit in the heater. If the current is higher than the threshold value, the ECM determines that there is a short circuit in the heater.
The ECM constantly monitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and stores a DTC.
If a malfunction is detected, the ECM cuts off the current applied to the heater.
Example:
The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

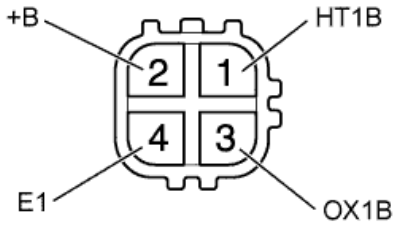
These DTCs are stored when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:

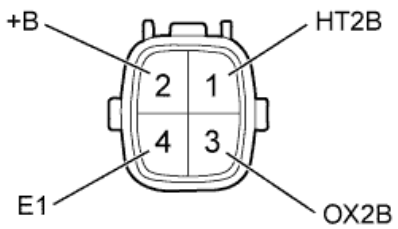
- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C17-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C18-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

Result

Result	Proceed to
NG	A
OK	B

B → Go to step 5

A

3.INSPECT INTEGRATION NO.1 RELAY (EFI)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

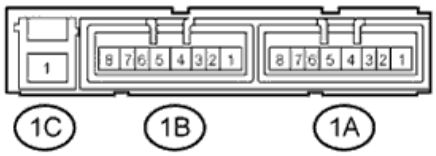
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (EFI)

OK

4.CHECK HARNESS AND CONNECTOR (HO2 SENSOR - INTEGRATION RELAY)

a. Check the EFI NO. 2 fuse.

i. Remove the EFI NO. 2 fuse from the engine room relay block.

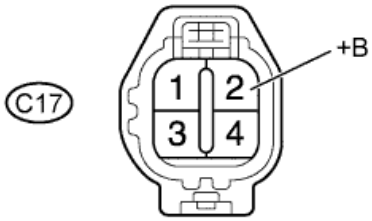
ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

iii. Reinstall the EFI NO. 2 fuse.

b. Disconnect the C17 or C18 HO2 sensor connector.

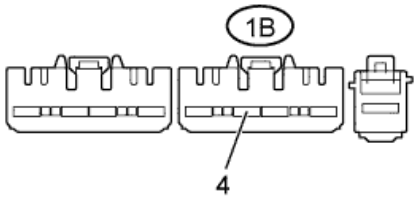


c. Remove the integration relay from the engine room relay block.

d. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C17-2 (+B) - 1B-4	Always	Below 1 Ω
C18-2 (+B) - 1B-4	Always	Below 1 Ω
C17-2 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher
C18-2 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

CHECK FOR INTERMITTENT PROBLEMS (**Click here**)

DTC P0505 Idle Control System Malfunction

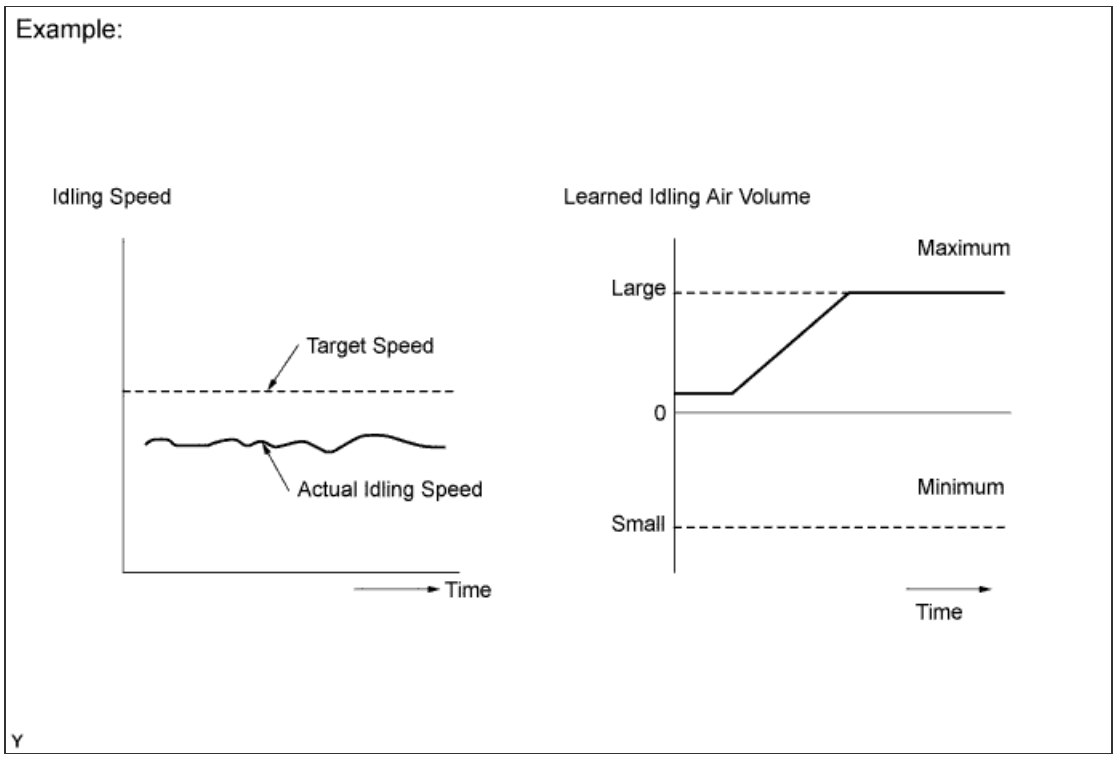
for Preparation Click here

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) the one valve type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

DTC Code	DTC Detection Condition	Trouble Area
P0505	The idling speed continues to vary greatly from the target idling speed (2 trip detection logic).	• ETCS • Air induction system • PCV hose connections • ECM

MONITOR DESCRIPTION



The ECM monitors the idling speed and idling air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the ISC system is malfunctioning if the following conditions apply:

- The learned idling air flow volume remains at the maximum or minimum volume for 5 seconds during a drive cycle.
- After driving at 10 km/h (6.25 mph) or more, the actual engine idling speed varies from the target idling speed by between 100 rpm and 150 rpm, 5 times or more during a drive cycle.

Example:
If the actual idling speed varies from the target idling speed by more than 150 rpm* 5 times during a drive cycle, the ECM illuminates the MIL and stores the DTC.

HINT:

*: Threshold idling speed varies with engine load.

INSPECTION PROCEDURE

HINT:

- **DTC P0505 is for Euro-OBD only.**
- **The following conditions may also cause DTC P0505 to be stored:**
  1. **The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.**
  2. **The accelerator pedal being not fully released.**

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0505 is output	A
P0505 and other DTCs are output	B

HINT:

If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)**

OK

4.CHECK THROTTLE VALVE

a. Check the throttle valve condition.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → **REPLACE THROTTLE BODY ASSEMBLY (Click here)**

OK

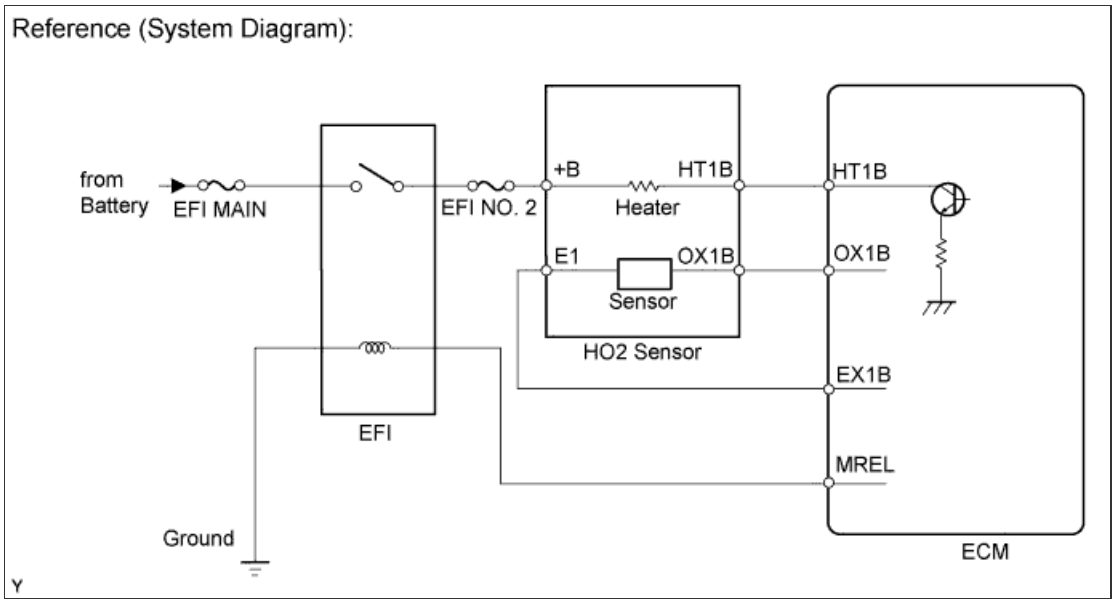
REPLACE ECM (Click here)

DTC P0037 Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)

DTC P0038 Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in Heated Oxygen (HO2) sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):
The ECM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM determines that there is an open circuit in the heater. If the current is higher than the threshold value, the ECM determines that there is a short circuit in the heater.
The ECM constantly monitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and stores a DTC.
If a malfunction is detected, the ECM cuts off the current applied to the heater.
Example:
The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

These DTCs are stored when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:

- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. A

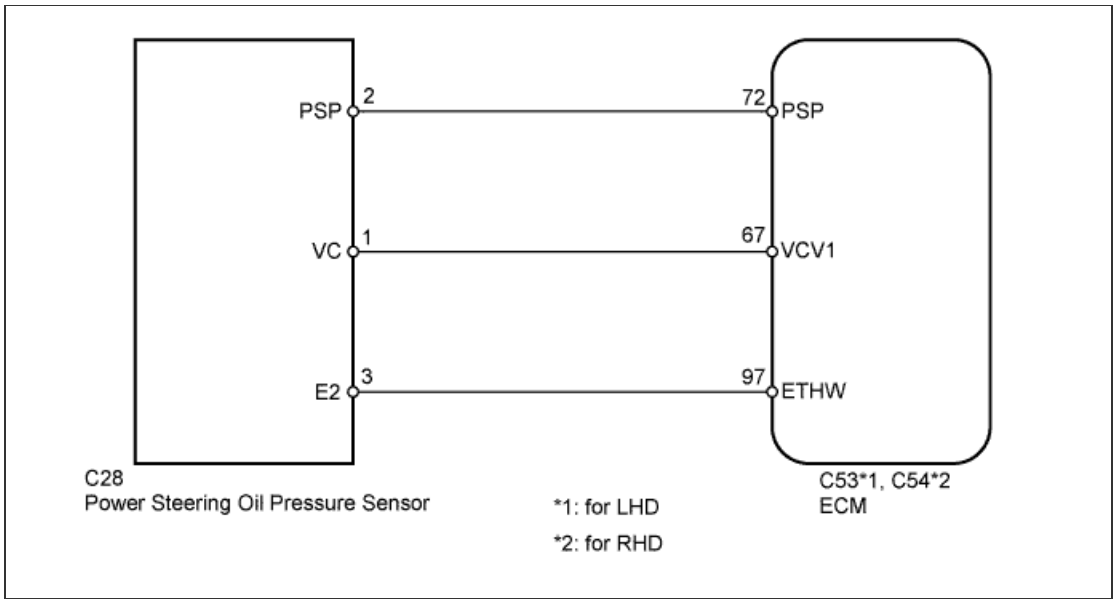
CHECK FOR INTERMITTENT PROBLEMS (**Click here**)

DTC P0550 Power Steering Pressure Sensor Circuit Malfunction

DTC P0552 Power Steering Pressure Sensor Circuit Low Input

DTC P0553 Power Steering Pressure Sensor Circuit High Input



for Preparation Click here

DESCRIPTION

The power steering oil pressure sensor is turned on when a power steering wheel load occurs by turning the steering wheel. The ECM regulates the engine idling RPM according to the voltage output of the sensor.

DTC Code	DTC Detection Condition	Trouble Area
P0550	Power steering oil pressure sensor voltage less than 0.28 V, or more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0552	Power steering oil pressure sensor voltage less than 0.28 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0553	Power steering oil pressure sensor voltage more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM

WIRING DIAGRAM

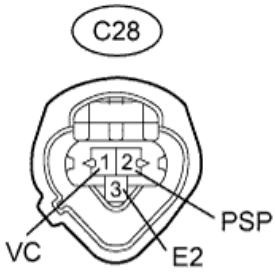
MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to regulate the engine idling speed. When the sensor output voltage deviates from the normal operating range, the ECM determines that there is a malfunction in the power steering oil pressure sensor and stores DTC(s).

INSPECTION PROCEDURE

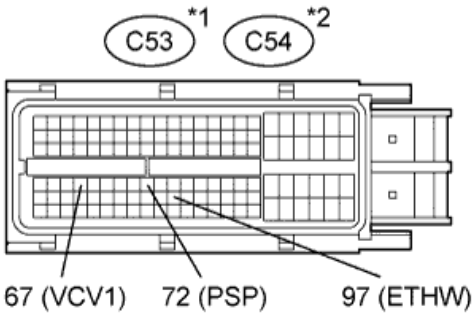
HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.CHECK HARNESS AND CONNECTOR (ECM - POWER STEERING OIL PRESSURE SENSOR)

a. Disconnect the C53 or C54 ECM connector.



b. Disconnect the C28 power steering oil pressure sensor connector.

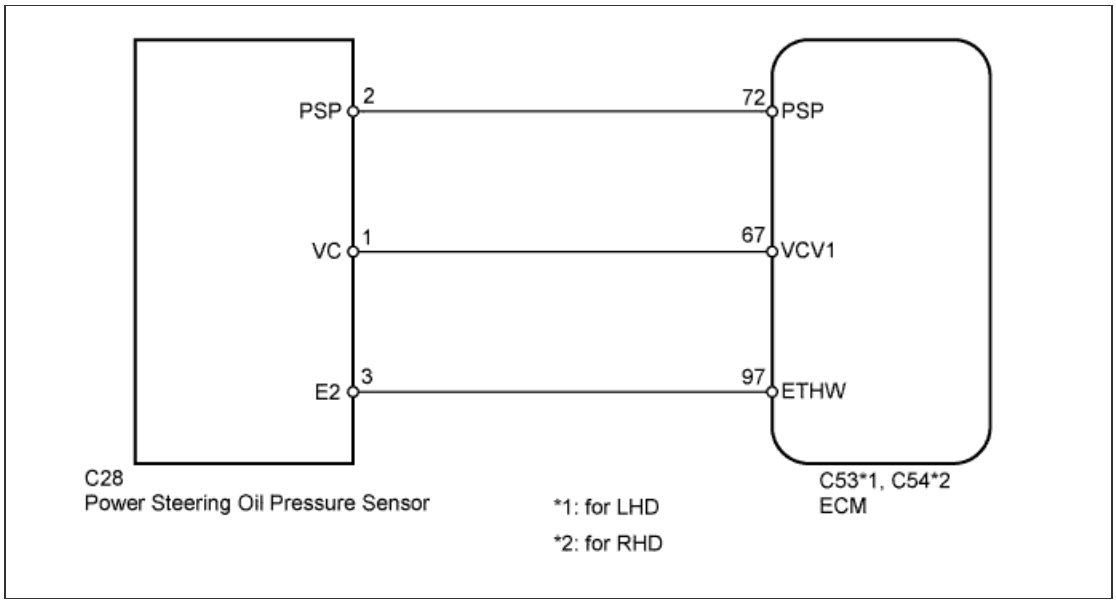
CHECK FOR INTERMITTENT PROBLEMS (**Click here**)

DTC P0550 Power Steering Pressure Sensor Circuit Malfunction

DTC P0552 Power Steering Pressure Sensor Circuit Low Input

DTC P0553 Power Steering Pressure Sensor Circuit High Input



for Preparation Click here

DESCRIPTION

The power steering oil pressure sensor is turned on when a power steering wheel load occurs by turning the steering wheel. The ECM regulates the engine idling RPM according to the voltage output of the sensor.

DTC Code	DTC Detection Condition	Trouble Area
P0550	Power steering oil pressure sensor voltage less than 0.28 V, or more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0552	Power steering oil pressure sensor voltage less than 0.28 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0553	Power steering oil pressure sensor voltage more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM

WIRING DIAGRAM

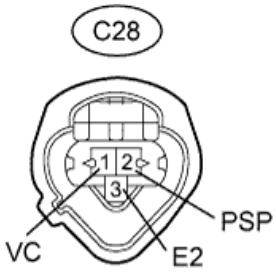
MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to regulate the engine idling speed. When the sensor output voltage deviates from the normal operating range, the ECM determines that there is a malfunction in the power steering oil pressure sensor and stores DTC(s).

INSPECTION PROCEDURE

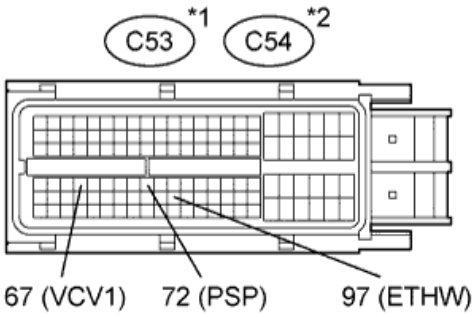
HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.CHECK HARNESS AND CONNECTOR (ECM - POWER STEERING OIL PRESSURE SENSOR)

a. Disconnect the C53 or C54 ECM connector.



b. Disconnect the C28 power steering oil pressure sensor connector.

c. Measure the resistance according to the value(s) in the table below.

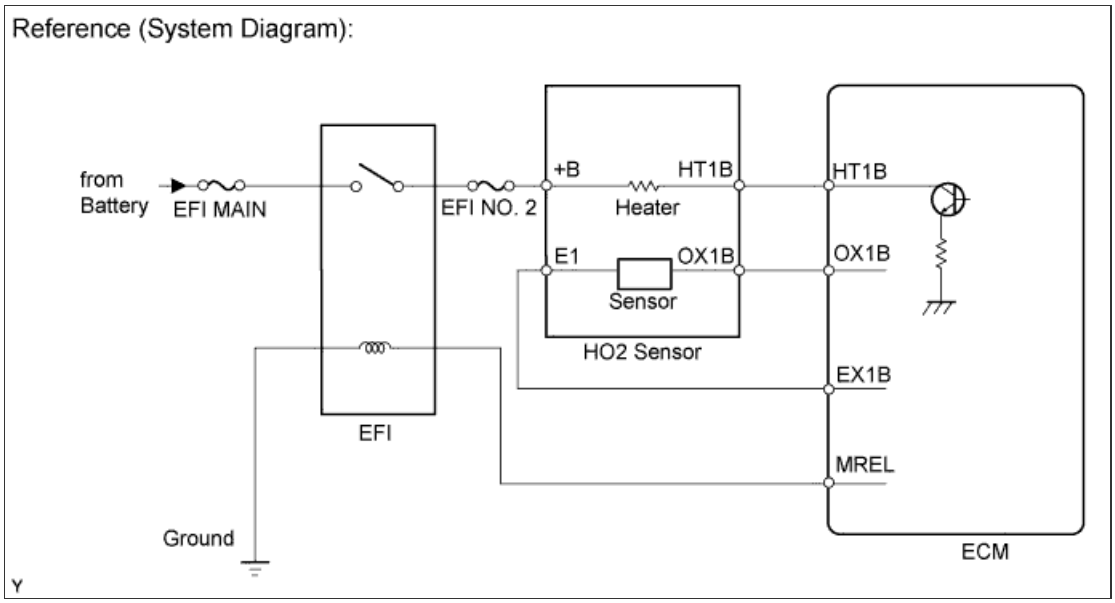
DTC P0038 Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in Heated Oxygen (HO2) sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for Sensor 2) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):
The ECM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM determines that there is an open circuit in the heater. If the current is higher than the threshold value, the ECM determines that there is a short circuit in the heater.
The ECM constantly monitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and stores a DTC.
If a malfunction is detected, the ECM cuts off the current applied to the heater.
Example:
The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

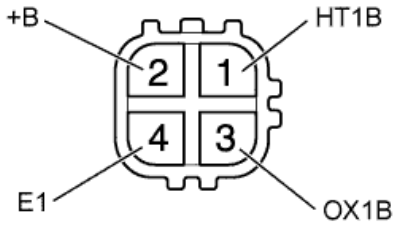
These DTCs are stored when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:

- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher

for Preparation Click here

DESCRIPTION

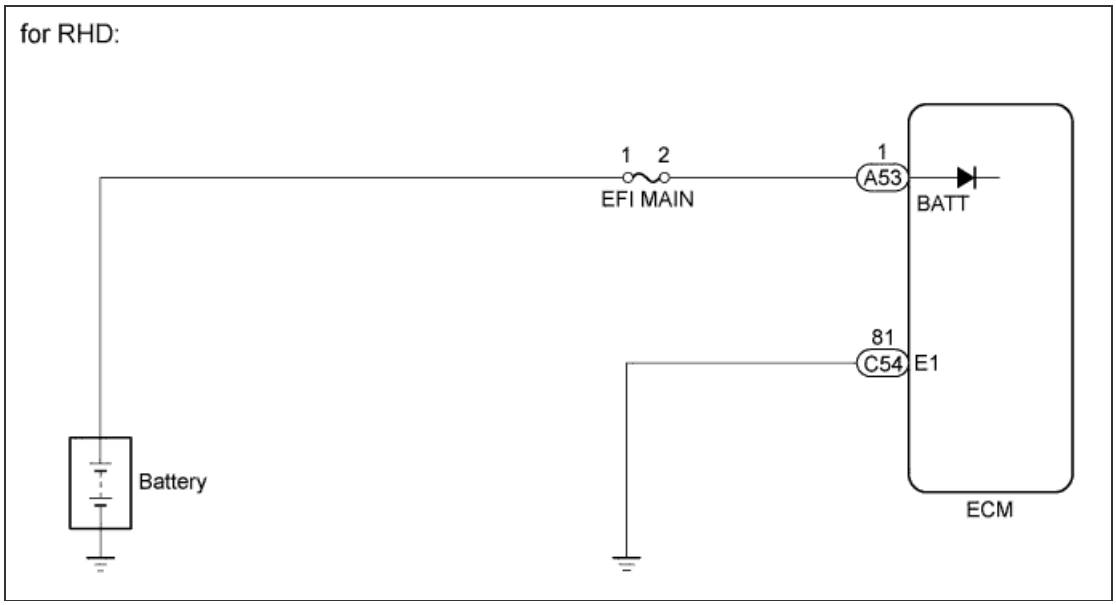
The battery supplies electricity to the ECM even when the engine switch is off. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and stores the DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0560	An open in the ECM back up power source circuit (1 trip detection logic).	• Open in back up power source circuit • Battery • Battery terminals • EFI MAIN fuse • ECM

HINT:

If DTC P0560 is stored, the ECM does not store other DTCs or the data stored in the ECM is partly cleared.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

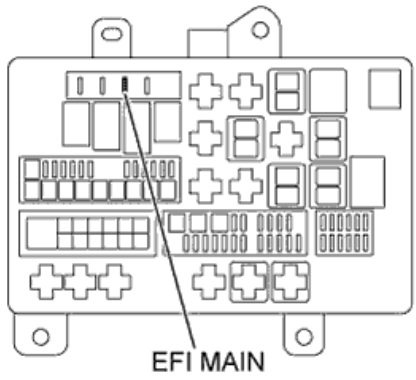
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT FUSE (EFI MAIN)



a. Remove the EFI MAIN fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

Engine Room Relay Block:

NG → CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

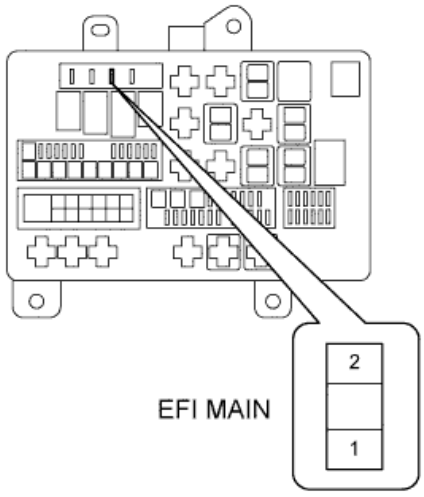
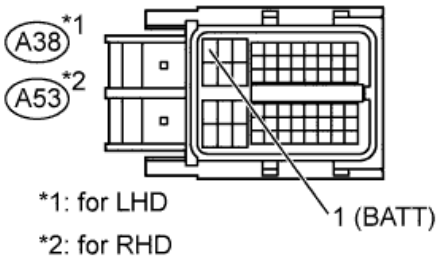
2.CHECK HARNESS AND CONNECTOR (EFI NO. 1 FUSE - ECM, BATTERY)



a. Check the harness and the connector between the EFI MAIN fuse and ECM.

i. Remove the EFI MAIN fuse from the engine room relay block.



ii. Disconnect the A38 or A53 ECM connector.

iii. Measure the resistance according to the value(s) in the table below.

Engine Room Relay Block:

Front view of wire harness connector:
(to ECM)

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
EFI MAIN fuse terminal 2 - A38-1 (BATT)	Always	Below 1 Ω
EFI MAIN fuse terminal 2 or A38-1 (BATT) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
EFI MAIN fuse terminal 2 - A53-1 (BATT)	Always	Below 1 Ω
EFI MAIN fuse terminal 2 or A53-1 (BATT) - Body ground	Always	10 kΩ or higher

b. Check the harness and the connector between the EFI MAIN fuse and battery.

i. Remove the EFI MAIN fuse from the engine room relay block.

ii. Disconnect the positive battery terminal.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Battery positive (+) terminal - EFI MAIN fuse terminal 1	Always	Below 1 Ω
Battery positive		

(+) terminal or EFI MAIN fuse terminal 1- Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.INSPECT BATTERY

a. Check that the battery is not depleted (Click here).

OK:
Battery is not depleted.

NG → REPLACE BATTERY

OK

4.CHECK BATTERY TERMINAL

a. Check that the battery terminals are not loose or corroded.

OK:
Battery terminals are not loose or corroded.

NG → REPAIR BATTERY TERMINAL

OK

5.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Turn the engine switch off and turn the tester off.

e. Start the engine and turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

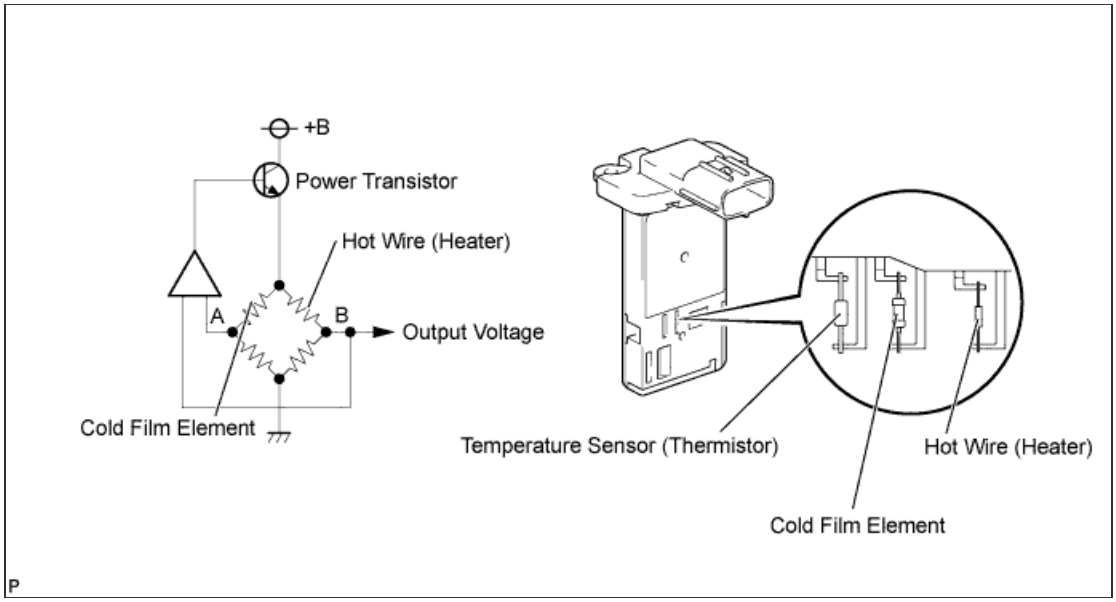
DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.
The ECM uses this information to determine the fuel injection time and to provide the appropriate air-fuel ratio.
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.
By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter.
The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The circuit is constructed so that the platinum hot wire and the cold film element create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

HINT:

When any of these DTCs are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine speed and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0102	The Mass Air Flow (MAF) meter voltage is below 0.2 V for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • MAF meter • ECM
P0103	The MAF meter voltage is higher than 4.9 V for 3 seconds (1 trip detection logic).	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:

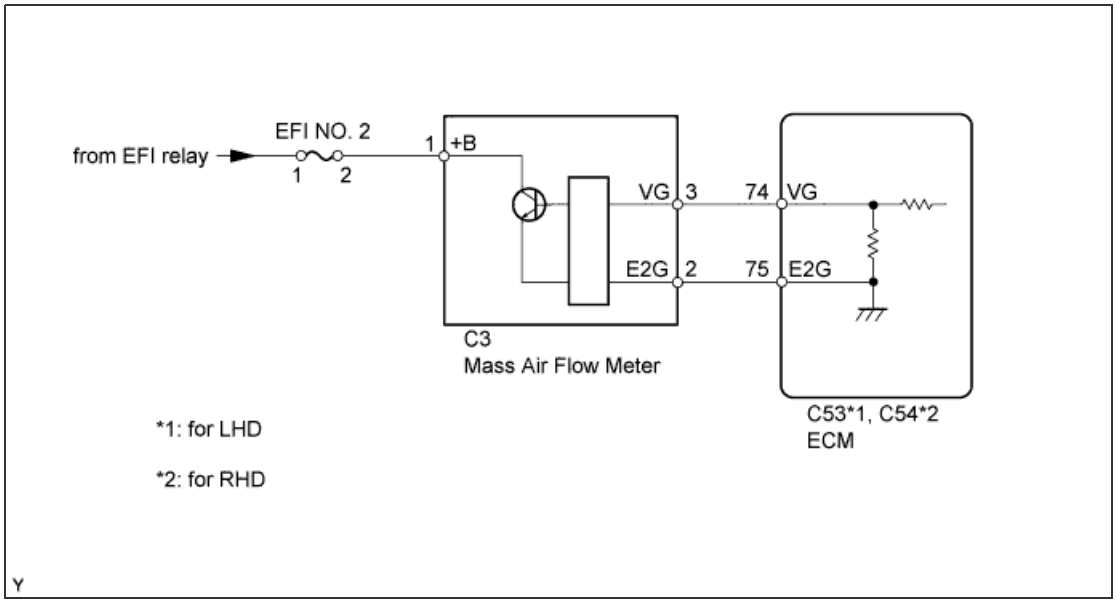
When any of these DTCs is output, check the air-flow rate by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.



Mass Air Flow Rate (g/sec.)	Malfunction
Approximately 0.0	• **Open in Mass Air Flow (MAF) meter power source circuit** • **Open or short in VG circuit**
271.0 or more	Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this

deviation as a malfunction in the MAF meter and stores DTC(s).
Example:
When the sensor output voltage remains at below 0.2 V, or higher than 4.9 V for more than 3 seconds, the ECM stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 3 seconds after the engine is next started.

DTC P0604 Random Access Memory (RAM)

for Preparation Click here

DESCRIPTION

The ECM continuously monitors its internal memory status. This self-check ensures that the ECM is functioning properly. This is diagnosed by internal "mirroring" of the main CPU and sub CPU to detect Random Access Memory (RAM) errors. If outputs from these CPUs are different and deviate from the standard, the ECM will illuminate the MIL and store DTC(s) immediately.

DTC Code	DTC Detection Condition	Trouble Area

DTC P0604 Random Access Memory (RAM)

for Preparation Click here

DESCRIPTION

The ECM continuously monitors its internal memory status. This self-check ensures that the ECM is functioning properly. This is diagnosed by internal "mirroring" of the main CPU and sub CPU to detect Random Access Memory (RAM) errors. If outputs from these CPUs are different and deviate from the standard, the ECM will illuminate the MIL and store DTC(s) immediately.

DTC Code	DTC Detection Condition	Trouble Area
P0604	ECM RAM errors.	ECM

INSPECTION PROCEDURE

1.CHECK DTC

a. Clear DTC (Click here).

b. Turn the engine switch off.

c. Disconnect the cable from the negative (-) battery terminal and wait for 1 minute.

d. Connect the cable to the negative (-) battery terminal.

e. Turn the engine switch on (IG).

f. Check DTC.

OK:
P0604 is not output.

NG → **REPLACE ECM (Click here)**

OK

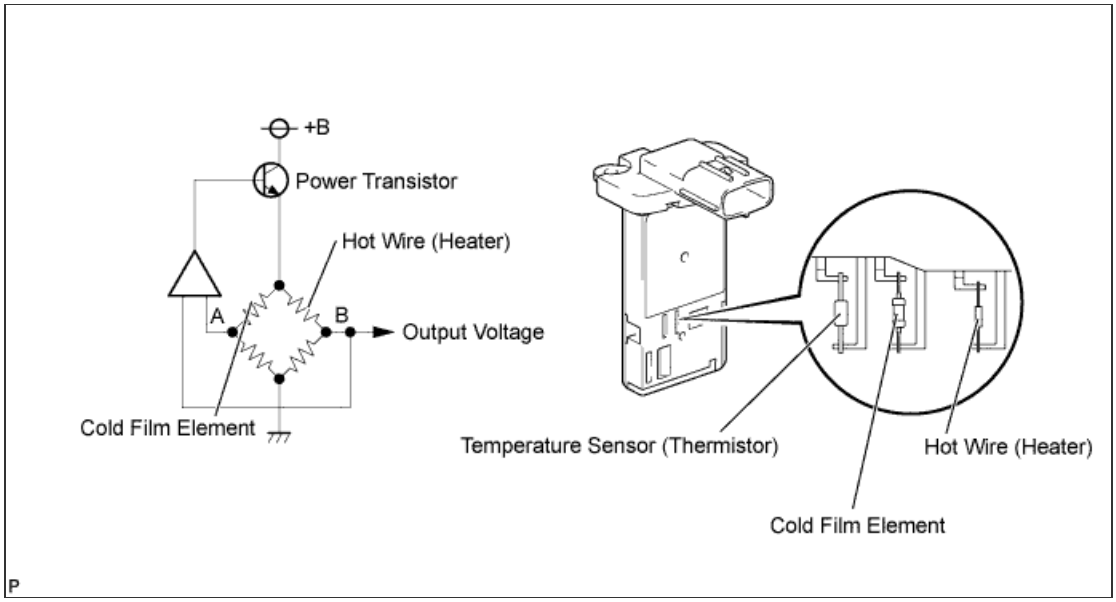
CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.
The ECM uses this information to determine the fuel injection time and to provide the appropriate air-fuel ratio.
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.
By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter.
The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The circuit is constructed so that the platinum hot wire and the cold film element create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

HINT:

When any of these DTCs are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine speed and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0102	The Mass Air Flow (MAF) meter voltage is below 0.2 V for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • MAF meter • ECM
P0103	The MAF meter voltage is higher than 4.9 V for 3 seconds (1 trip detection logic).	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:

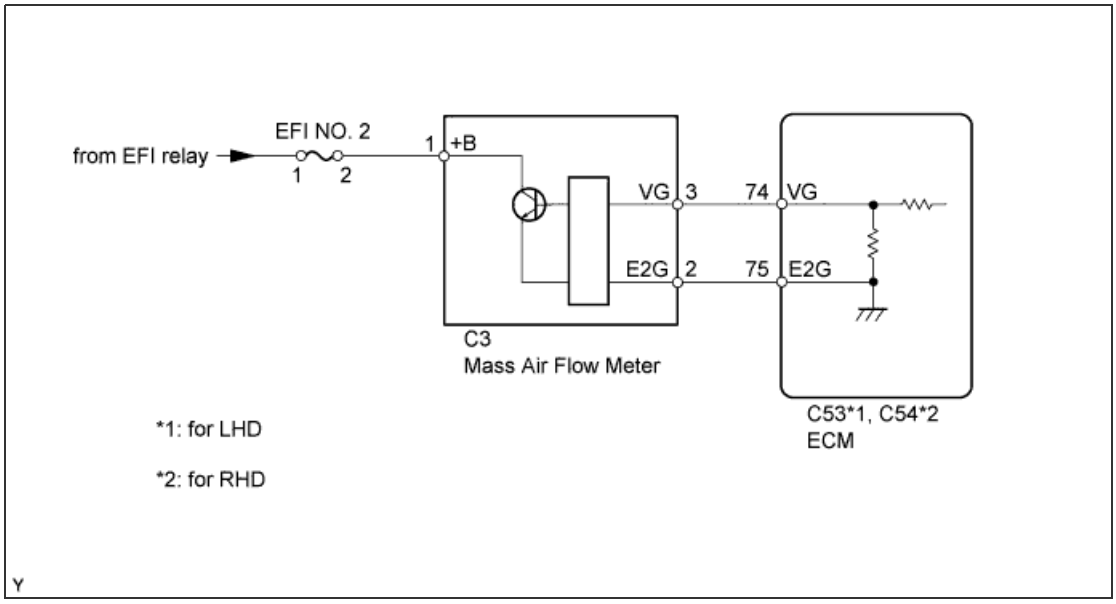
When any of these DTCs is output, check the air-flow rate by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.



Mass Air Flow Rate (g/sec.)	Malfunction
Approximately 0.0	• **Open in Mass Air Flow (MAF) meter power source circuit** • **Open or short in VG circuit**
271.0 or more	Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this

deviation as a malfunction in the MAF meter and stores DTC(s).
Example:
When the sensor output voltage remains at below 0.2 V, or higher than 4.9 V for more than 3 seconds, the ECM stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 3 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MASS AIR FLOW RATE)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.

e. Read the values displayed on the tester.

Result

Mass Air Flow Rate (g/sec.)	Proceed to
0.0	A
271.0 or more	B
Between 1.0 and 270.0*	C

HINT:

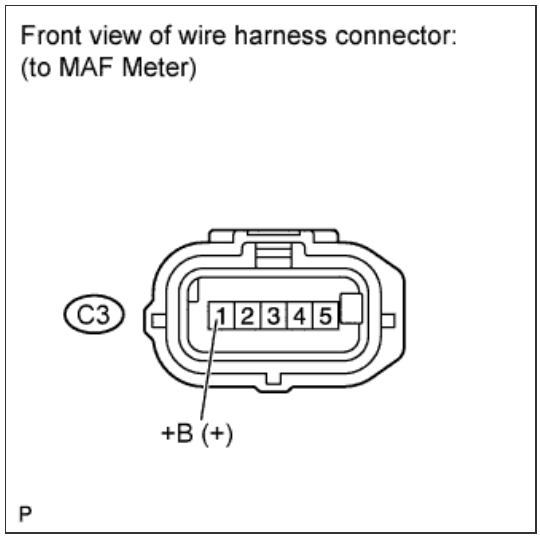
*: The value must change when the throttle valve is open or closed with the engine running.

B → Go to step 6

C → CHECK FOR INTERMITTENT PROBLEMS (Click here)

A



2.INSPECT MASS AIR FLOW METER (POWER SOURCE VOLTAGE)

a. Disconnect the C3 Mass Air Flow (MAF) meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C3-1 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

NG → Go to step 5

OK

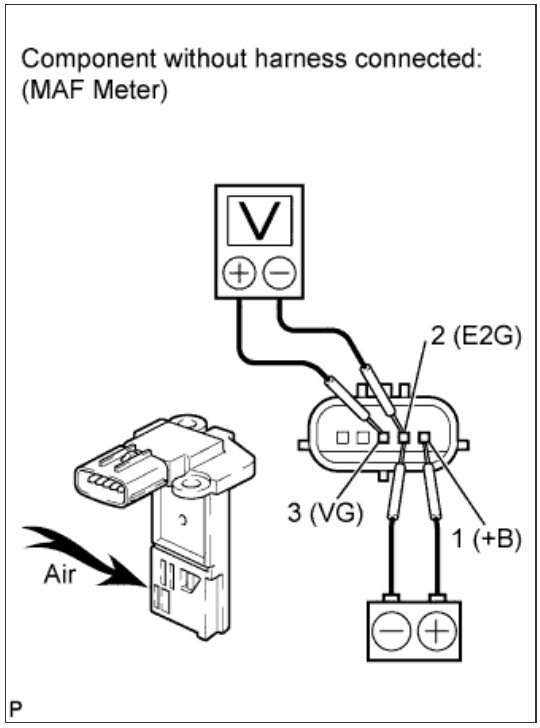
3.INSPECT MASS AIR FLOW METER

a. Remove the Mass Air Flow (MAF) meter (Click here).

b. Inspect the MAF meter.



i. Measure the voltage according to the value(s) in the table below.

OK:

Tester Connection	Condition	Specified Condition
2 (E2G) - 3 (VG)	• Battery voltage applied to terminals 1 (+B) - 2 (E2G) • Air blown into the MAF meter	Voltage fluctuates

NOTICE:

While using the battery during inspection, do not bring the positive and negative tester probes too close to each other as a short circuit may occur.

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

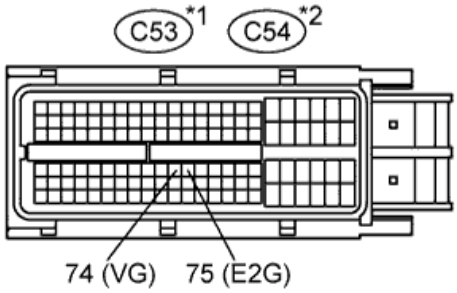
4.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the C3 MAF meter connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

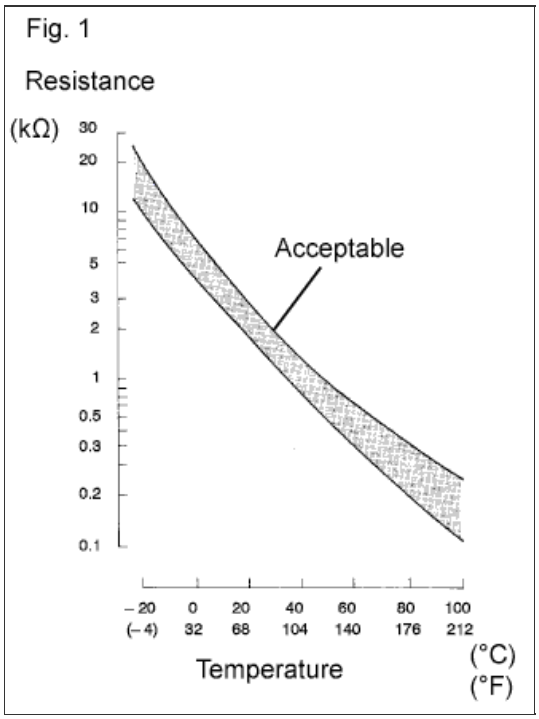
CHECK FOR INTERMITTENT PROBLEMS (Click here)



DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 is stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow [MAF] meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:

When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 is stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow [MAF] meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:

When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

DTC P060A Internal Control Module Monitoring Processor Performance

for Preparation Click here

DESCRIPTION

The main CPU and sub CPU of the ECM perform data communication between each other. The main CPU monitors the communications and WDC pulses from the sub CPU. When the signal malfunctions below are detected, a DTC is stored.

DTC Code	DTC Detection Condition	Trouble Area
P060A	When either condition below is met: • An ECM main CPU error. • An ECM sub CPU error. • An electronic throttle monitoring CPU error.	ECM

INSPECTION PROCEDURE

1.CHECK DTC

a. Clear DTC (Click here).

b. Turn the engine switch off.

c. Disconnect the cable from the negative (-) battery terminal and wait for 1 minute.

d. Connect the cable to the negative (-) battery terminal.

e. Turn the engine switch on (IG).

f. Check DTC.

OK:
P060A is not output.

NG → **REPLACE ECM (Click here)**

OK

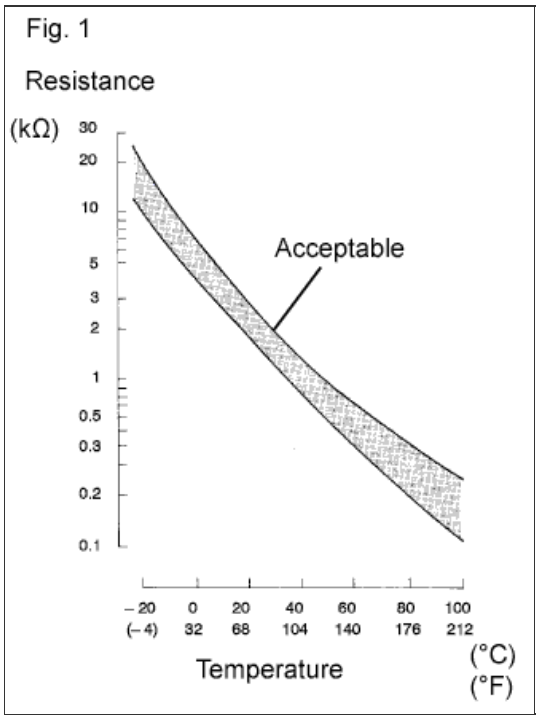
CHECK FOR INTERMITTENT PROBLEMS (Click here)



DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 is stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow [MAF] meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:

When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (INTAKE AIR TEMPERATURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

e. Read the value displayed on the tester.

Standard:
Same as actual Intake Air Temperature (IAT).

Result

Temperature Displayed	Proceed to
-40°C (-40°F)	A
140°C (284°F) or higher	B
Same as actual IAT	C

HINT:

- **If there is an open circuit, the tester indicates -40°C (-40°F).**
- **If there is a short circuit, the tester indicates 140°C (284°F) or higher.**

B	Go to step 4
C	CHECK FOR INTERMITTENT PROBLEMS (Click here)

A

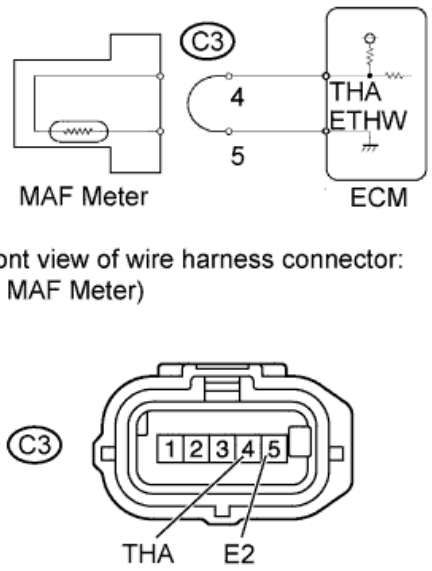
2.READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)

a. Disconnect the C3 Mass Air Flow (MAF) meter connector.

b. Connect terminals 4 (THA) and 5 (E2) of the MAF meter wire harness side connector.

c. Connect the intelligent tester to the DLC3.



d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

g. Read the value displayed on the tester.

Standard value:
140°C (284°F) or higher

NG → Go to step 3

OK

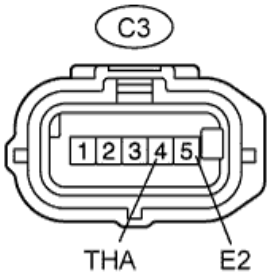
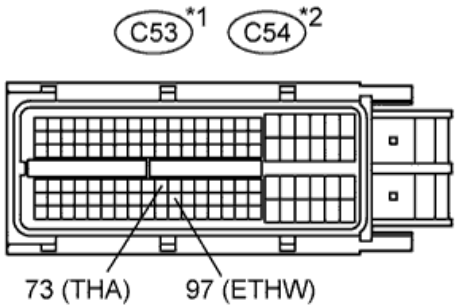
CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE MASS AIR FLOW METER (Click here)



3.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the C3 MAF meter connector.



b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 is stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow [MAF] meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:

When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

DTC P0115 Engine Coolant Temperature Circuit Malfunction

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

A thermistor, whose resistance value varies according to the ECT, is built into the Engine Coolant Temperature (ECT) sensor.
The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0115	An open or short in the Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Engine Coolant Temperature (ECT) sensor circuit • ECT sensor • ECM
P0117	A short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor • ECT sensor • ECM
P0118	An open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:

When any of these DTCs is output, check the ECT by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and stores DTC(s).
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and stores DTC P0118. Conversely, if the voltage output is below 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0117.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

REPLACE ECM (Click here)

DTC P0617 Starter Relay Circuit High

for Preparation Click here

DESCRIPTION

While the engine is being cranked, the positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the Starter Control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and stores the DTC.
This monitor runs when the vehicle is driven at 20 km/h (12.4 mph) for over 20 seconds.

DTC Code	DTC Detection Condition	Trouble Area
P0617	When conditions (a), (b) and (c) are met, and a positive (+B) battery voltage of 10.5 V or higher is applied to the ECM for 20 seconds (1 trip detection logic). (a) The vehicle speed is 20 km/h (12.4 mph) or more. (b) The engine speed is 1000 rpm or more. (c) The STA signal is ON.	• Park/Neutral Position (PNP) switch • Starter relay circuit • Engine switch • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **The following troubleshooting flowchart is based on the premise that the engine is cranked normally.**
  If the engine will not crank, proceed to the Problem Symptoms Table (Click here).
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Starter Signal.

d. Check the value displayed on the tester when the engine switch is turned to the START positions.

OK:

DTC P0115 Engine Coolant Temperature Circuit Malfunction

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

A thermistor, whose resistance value varies according to the ECT, is built into the Engine Coolant Temperature (ECT) sensor.
The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0115	An open or short in the Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Engine Coolant Temperature (ECT) sensor circuit • ECT sensor • ECM
P0117	A short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor • ECT sensor • ECM
P0118	An open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:

When any of these DTCs is output, check the ECT by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and stores DTC(s).
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and stores DTC P0118. Conversely, if the voltage output is below 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0117.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0116 Engine Coolant Temperature Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0115 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0116	The Engine Coolant Temperature (ECT) is between 35°C and 60°C (95°F and 140°F) when the engine is started, and conditions (a) and (b) are met (2 trip detection logic): (a) The vehicle is driven at varying speeds (accelerated and decelerated). (b) The ECT remains within 3°C (5.4°F) of the initial ECT.	• Water inlet sub-assembly with thermostat • ECT sensor

MONITOR DESCRIPTION

The ECT sensor is used to monitor the ECT. The ECT sensor has a built-in thermistor with a resistance that varies according to the temperature of the engine coolant. When the ECT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in the resistance are reflected in the output voltage from the ECT sensor.
The ECM monitors the sensor voltage and uses this value to calculate the ECT. If the sensor output voltage deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the ECT sensor and stores the DTC.
Example:
Upon starting the engine, the ECT is between 35°C and 60°C (95°F and 140°F). If after driving for 250 seconds, the ECT remains within 3°C (5.4°F) of the starting temperature, the DTC is stored (2 trip detection logic).

INSPECTION PROCEDURE

HINT:

- **If any of DTCs P0115, P0117, P0118 or P0125 is output simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTC.

Result

Result	Proceed to
P0116 is output	A
P0116 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.INSPECT WATER INLET SUB-ASSEMBLY WITH THERMOSTAT

a. Remove the water inlet sub-assembly with thermostat (Click here).

b. Measure the valve opening temperature of the water inlet sub-assembly with thermostat.

Standard opening temperature:
80 to 84°C (176 to 183°F)

HINT:

In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

c. Reinstall the water inlet sub-assembly with thermostat (Click here).

NG → REPLACE WATER INLET SUB-ASSEMBLY WITH THERMOSTAT (**Click here**)

OK → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (**Click here**)

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0116 Engine Coolant Temperature Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0115 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0116	The Engine Coolant Temperature (ECT) is between 35°C and 60°C (95°F and 140°F) when the engine is started, and conditions (a) and (b) are met (2 trip detection logic): (a) The vehicle is driven at varying speeds (accelerated and decelerated). (b) The ECT remains within 3°C (5.4°F) of the initial ECT.	• Water inlet sub-assembly with thermostat • ECT sensor

MONITOR DESCRIPTION

The ECT sensor is used to monitor the ECT. The ECT sensor has a built-in thermistor with a resistance that varies according to the temperature of the engine coolant. When the ECT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in the resistance are reflected in the output voltage from the ECT sensor.
The ECM monitors the sensor voltage and uses this value to calculate the ECT. If the sensor output voltage deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the ECT sensor and stores the DTC.
Example:
Upon starting the engine, the ECT is between 35°C and 60°C (95°F and 140°F). If after driving for 250 seconds, the ECT remains within 3°C (5.4°F) of the starting temperature, the DTC is stored (2 trip detection logic).

INSPECTION PROCEDURE

HINT:

- **If any of DTCs P0115, P0117, P0118 or P0125 is output simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTC.

Result

Result	Proceed to
P0116 is output	A
P0116 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.INSPECT WATER INLET SUB-ASSEMBLY WITH THERMOSTAT

a. Remove the water inlet sub-assembly with thermostat (Click here).

b. Measure the valve opening temperature of the water inlet sub-assembly with thermostat.

Standard opening temperature:
80 to 84°C (176 to 183°F)

HINT:

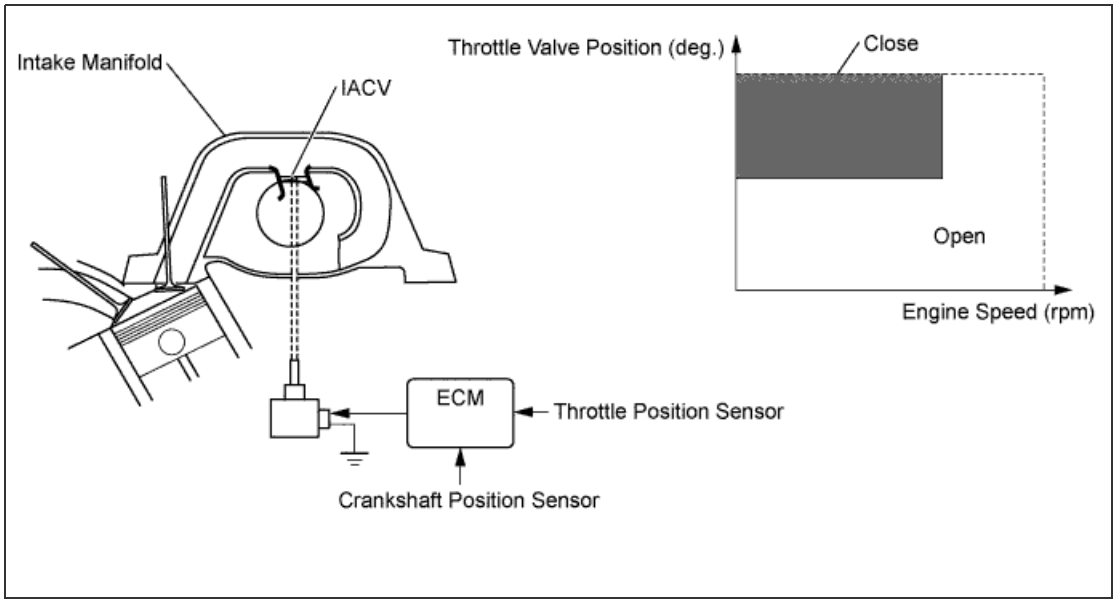
In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

c. Reinstall the water inlet sub-assembly with thermostat (Click here).



NG → REPLACE WATER INLET SUB-ASSEMBLY WITH THERMOSTAT (**Click here**)

OK → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (**Click here**)

for Preparation Click here

DESCRIPTION

This circuit opens and closes the Intake Air Control Valve (IACV) in response to the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).

DTC Code	DTC Detection Condition	Trouble Area
P0660	Conditions (a) and (b) are met for 0.5 sec. or more (2 trip detection logic): (a) The voltage of terminal ACIS of the ECM is low when the VSV is OFF. (b) The engine has started.	• Open or short in VSV for ACIS circuit • VSV for ACIS • ECM

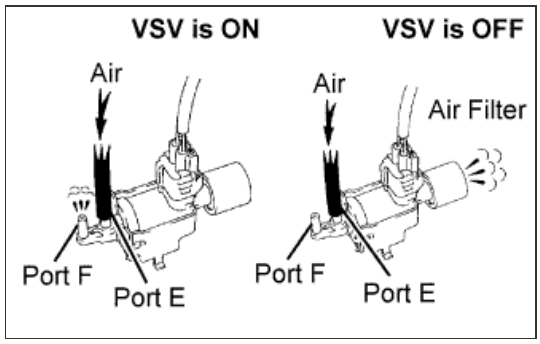
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE VSV FOR ACIS)



a. Disconnect the vacuum hose.

b. Connect the intelligent tester to the DLC3.

c. Turn the engine switch on (IG) and turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Active the VSV for Intake Control. Operate the VSV for ACIS.

e. Check the VSV operation when it is operated using the tester.

Standard:

Tester Operation	Specified Condition
VSV ON	Air from port E flows out through port F
VSV OFF	Air from port E flows out through air filter

NG → Go to step 4

OK ↓

2.CHECK VACUUM HOSE

a. Check that the vacuum hose is connected correctly, and that there are no cracks, holes, damage, or looseness.

OK:
Vacuum hose is normal.

NG → REPAIR OR REPLACE VACUUM HOSE

OK ↓

3.INSPECT INTAKE MANIFOLD (INTAKE AIR CONTROL VALVE)

a. Inspect the intake air control valve (Click here).

NG → REPLACE INTAKE MANIFOLD (INTAKE AIR CONTROL VALVE) (Click here)

OK ↓

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (Click here)

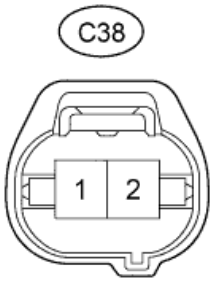
4.INSPECT VSV FOR ACIS (OPERATION)

a. Inspect the VSV for ACIS (Click here).

NG → REPLACE VSV FOR ACIS (Click here)

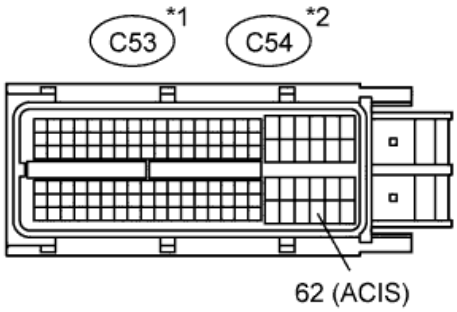
OK ↓

5.CHECK HARNESS AND CONNECTOR (VSV FOR ACIS - ECM, VSV FOR ACIS - EFI NO. 2 FUSE)



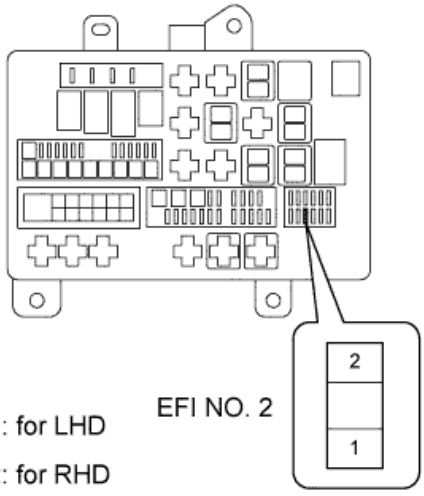
a. Check the wire harness and connectors between the VSV for ACIS and ECM.

i. Disconnect the VSV for ACIS connector.



ii. Disconnect the ECM connector.

iii. Measure the resistance according to the value(s) in the table below.



Front view of wire harness connector:
(to VSV for ACIS)

Front view of wire harness connector:
(to ECM)

Front view of wire harness connector:
(to Engine Room Relay Block)

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

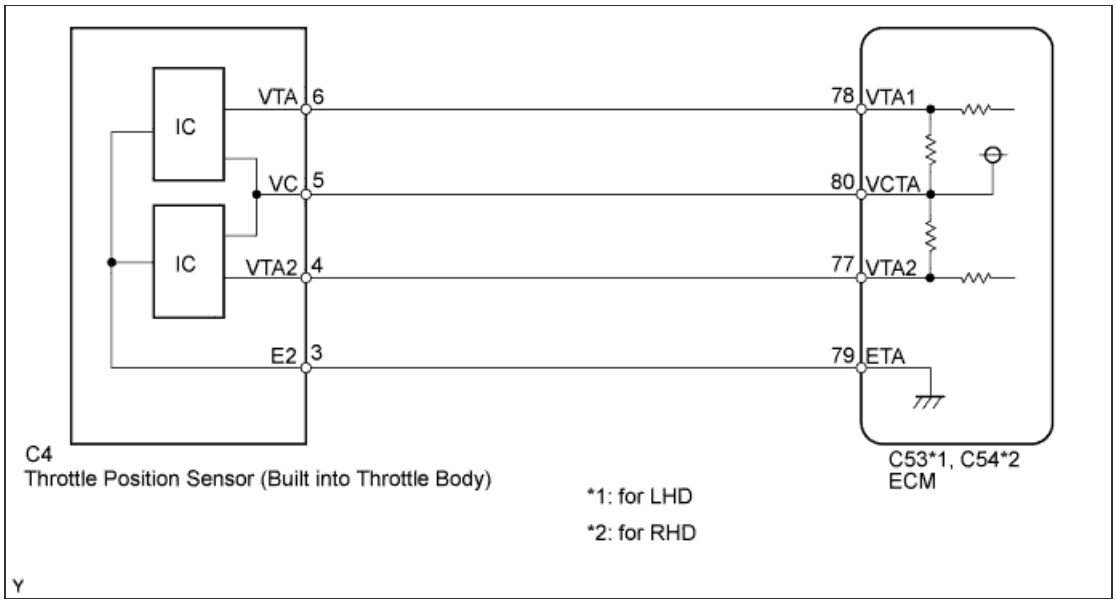
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

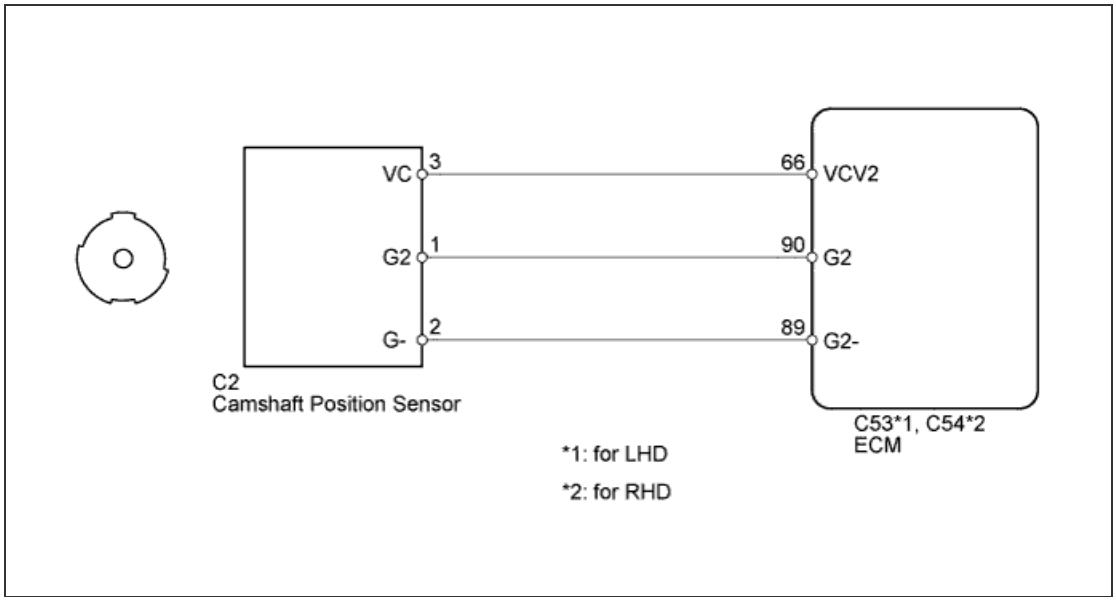
DTC P1340 Camshaft Position Sensor "A" (Bank 1 Sensor 2)

DTC P1342 Camshaft Position Sensor "A" Low Input (MRE)

DTC P1343 Camshaft Position Sensor "A" High Input (MRE)

for Preparation Click here

DESCRIPTION



The camshaft position sensor (G signal) consists of a magnet and MRE (Magnetic Resistance Element).
The camshaft drive gear (LH) has 3 teeth on its inner circumstance. When the camshaft gear rotates, air gap changes between the protrusion on the teeth and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE.
The crankshaft position sensor plate has 34 teeth and is installed to the rear end of the crankshaft. The crankshaft position sensor generates 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No camshaft position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing plate LH • ECM
	No camshaft position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

The camshaft position sensor (G signal) consists of a magnet and MRE.
The camshaft drive gear has 3 teeth on its inner circumference. When the camshaft gear rotates, air gap changes between the protrusion on the gear and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE. The crankshaft position sensor plate has 34 teeth and outputs 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

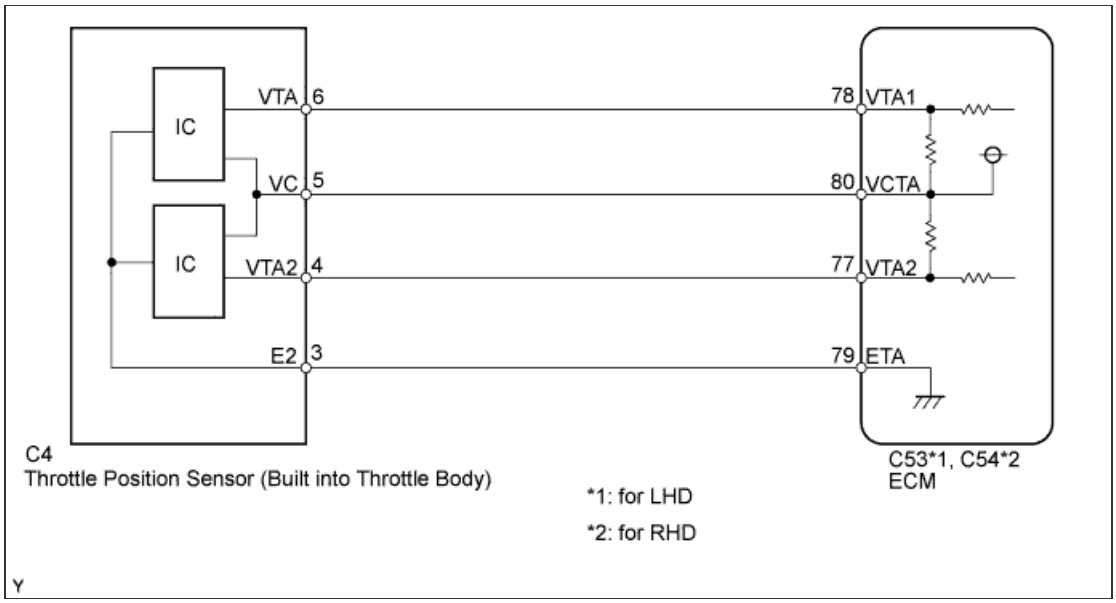
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

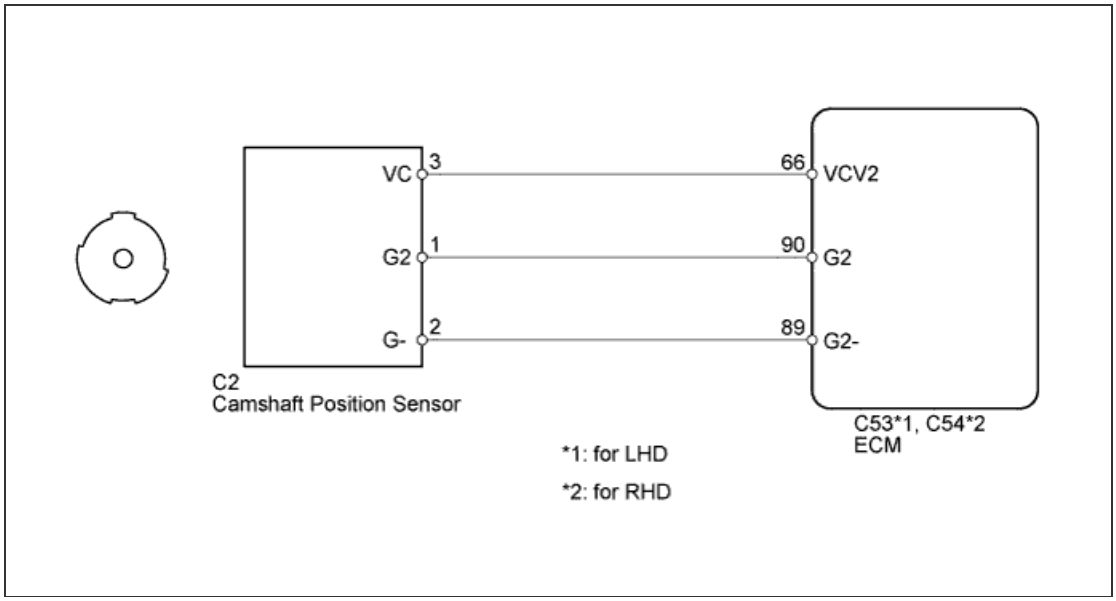
DESCRIPTION



The camshaft position sensor (G signal) consists of a magnet and MRE (Magnetic Resistance Element).
The camshaft drive gear (LH) has 3 teeth on its inner circumstance. When the camshaft gear rotates, air gap changes between the protrusion on the teeth and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE.
The crankshaft position sensor plate has 34 teeth and is installed to the rear end of the crankshaft. The crankshaft position sensor generates 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No camshaft position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing plate LH • ECM
	No camshaft position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

The camshaft position sensor (G signal) consists of a magnet and MRE.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

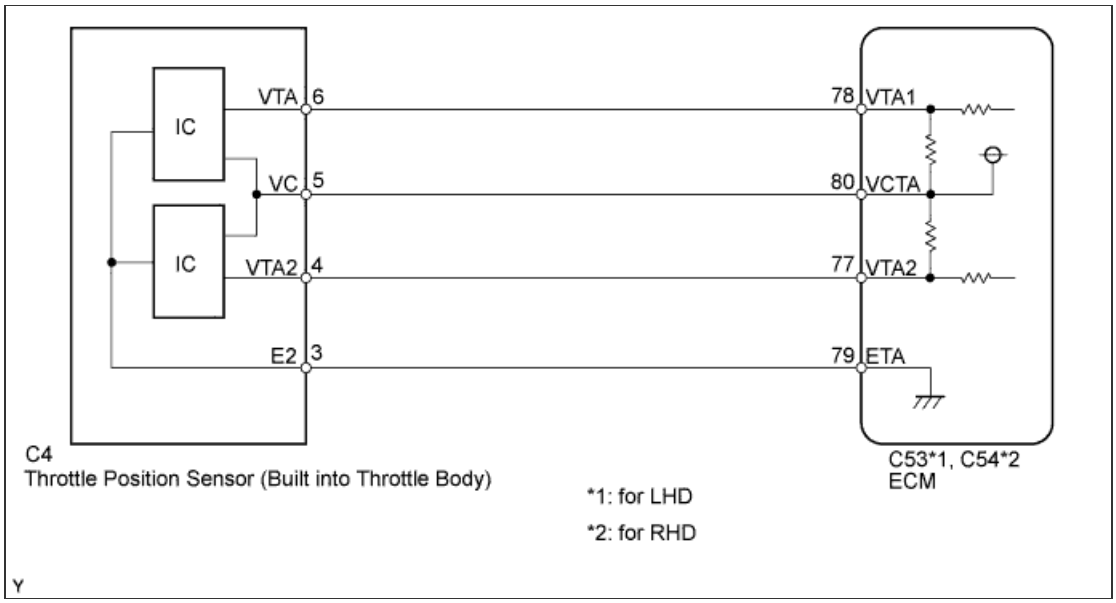
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

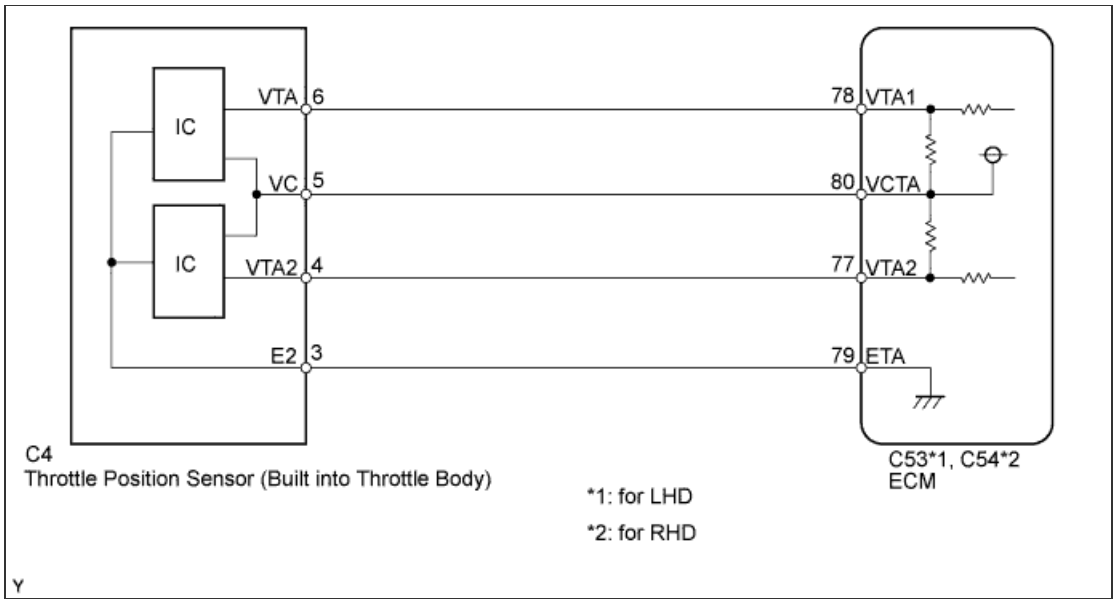
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

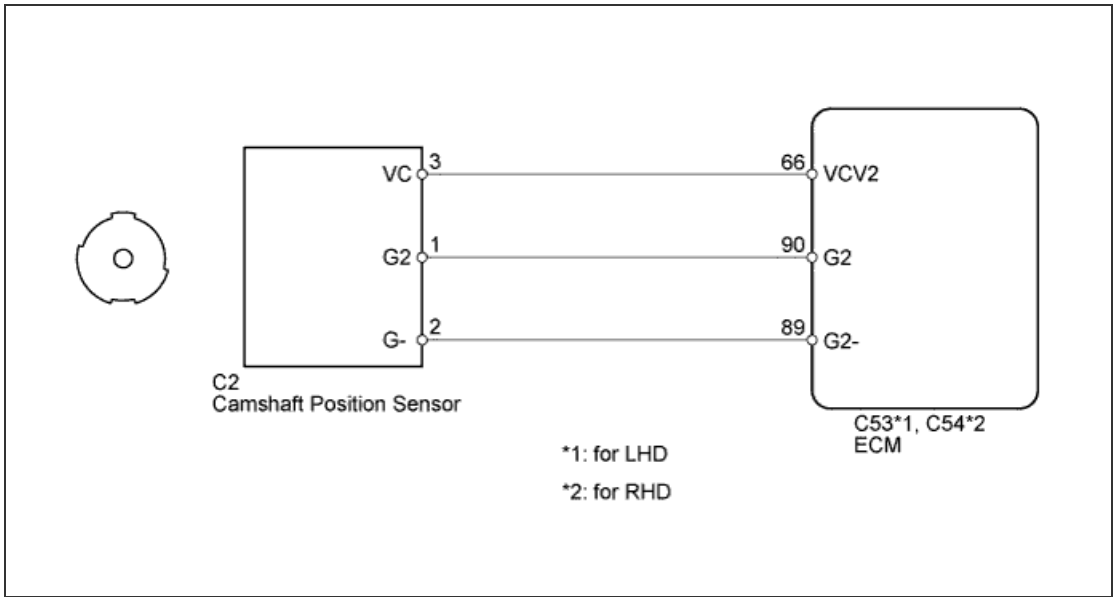
for Preparation Click here

DESCRIPTION



The camshaft position sensor (G signal) consists of a magnet and MRE (Magnetic Resistance Element).
The camshaft drive gear (LH) has 3 teeth on its inner circumstance. When the camshaft gear rotates, air gap changes between the protrusion on the teeth and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE.
The crankshaft position sensor plate has 34 teeth and is installed to the rear end of the crankshaft. The crankshaft position sensor generates 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No camshaft position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing plate LH • ECM
	No camshaft position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

The camshaft position sensor (G signal) consists of a magnet and MRE.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

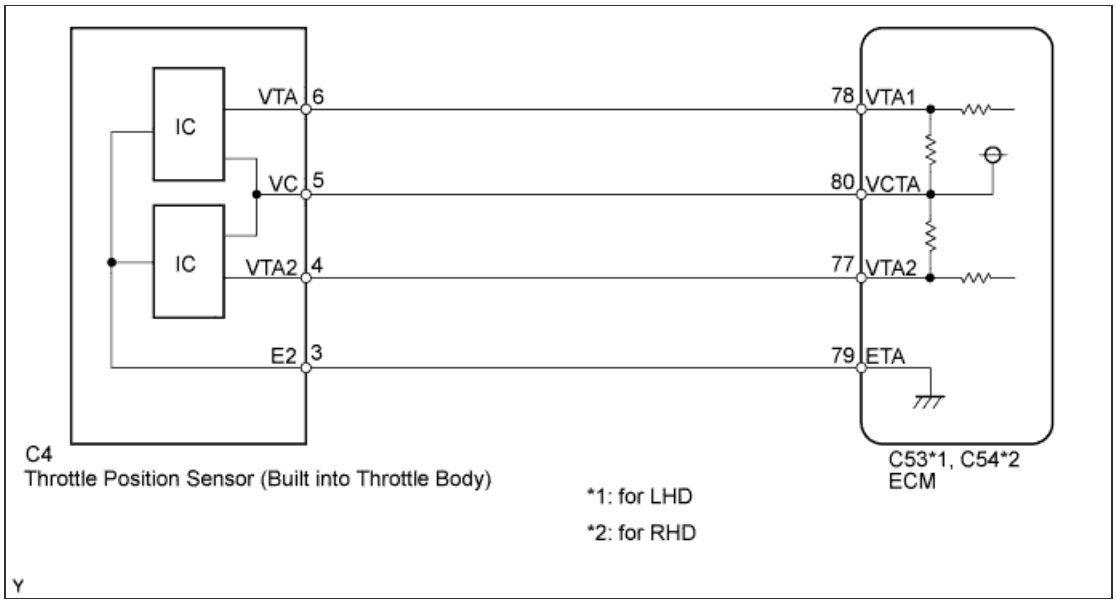
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

(b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

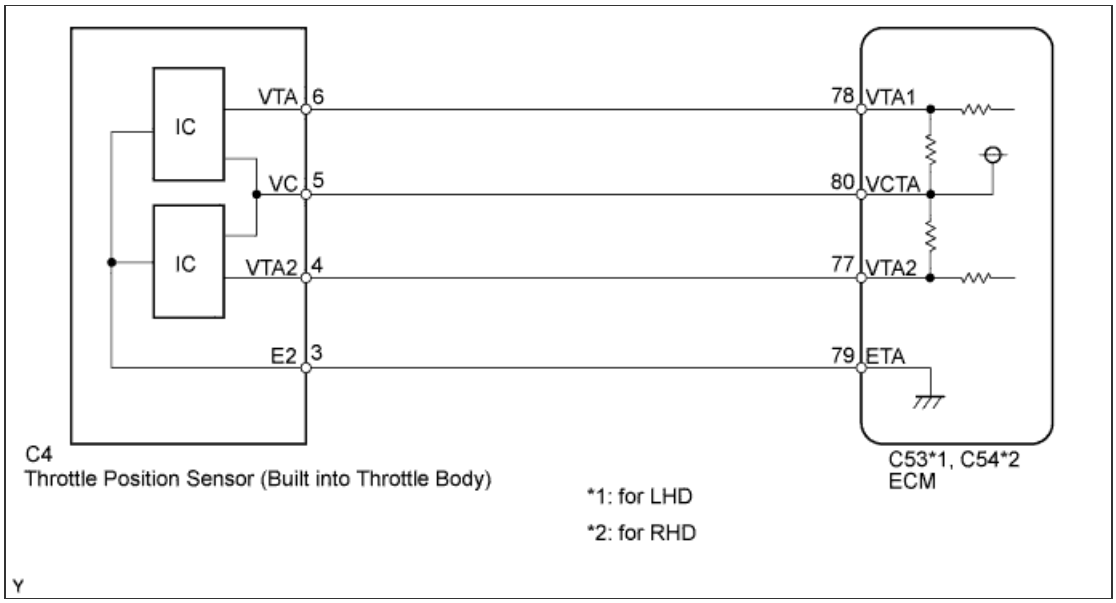
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

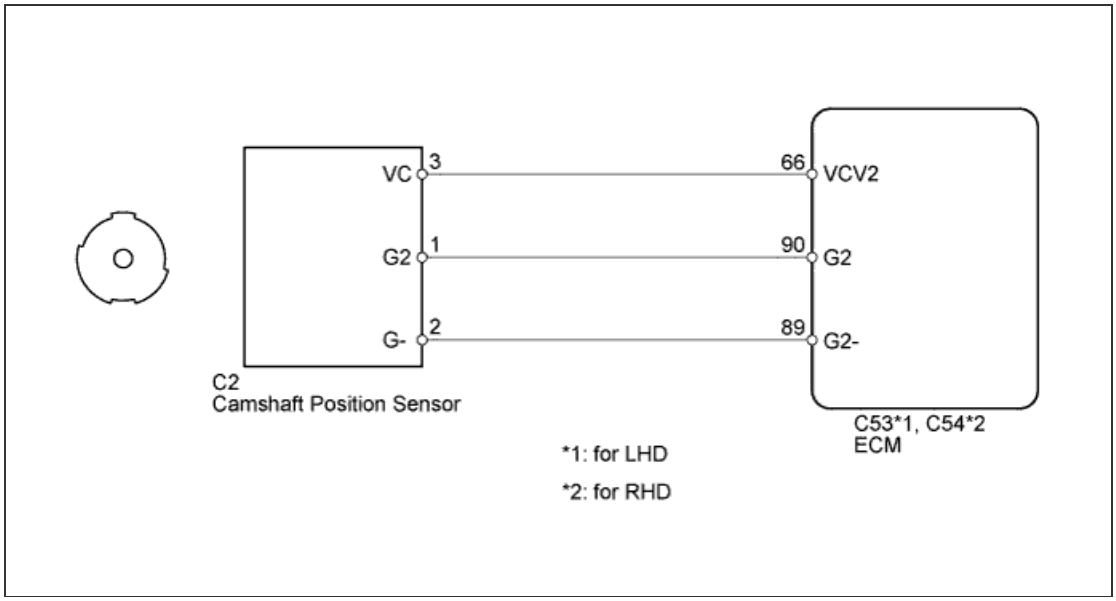
DTC P1343 Camshaft Position Sensor "A" High Input (MRE)

for Preparation Click here

DESCRIPTION



The camshaft position sensor (G signal) consists of a magnet and MRE (Magnetic Resistance Element).
The camshaft drive gear (LH) has 3 teeth on its inner circumstance. When the camshaft gear rotates, air gap changes between the protrusion on the teeth and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE.
The crankshaft position sensor plate has 34 teeth and is installed to the rear end of the crankshaft. The crankshaft position sensor generates 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No camshaft position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing plate LH • ECM
	No camshaft position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

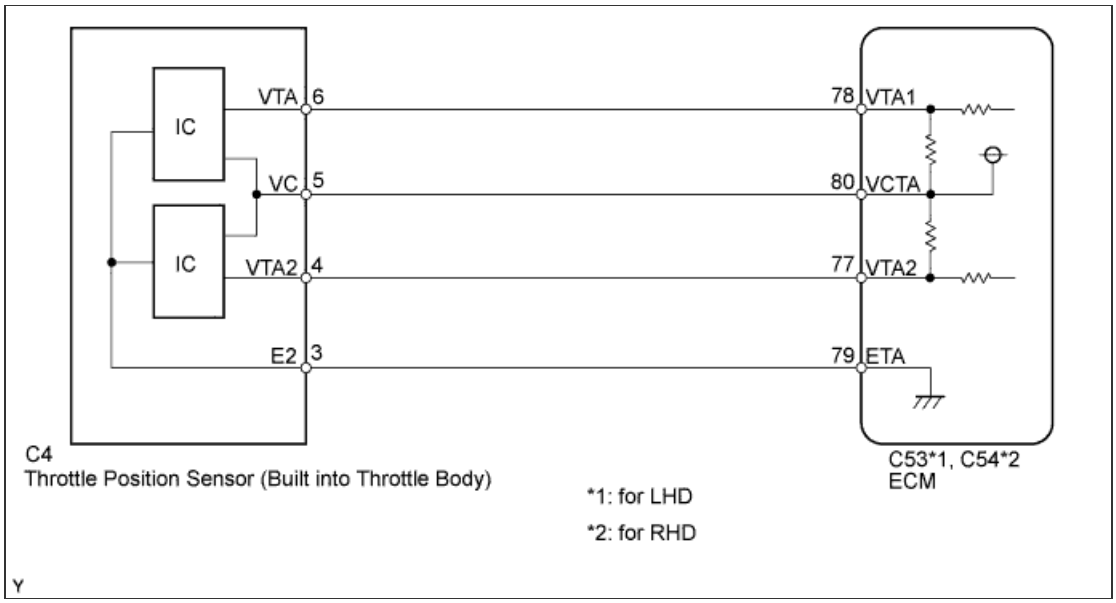
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

HINT:

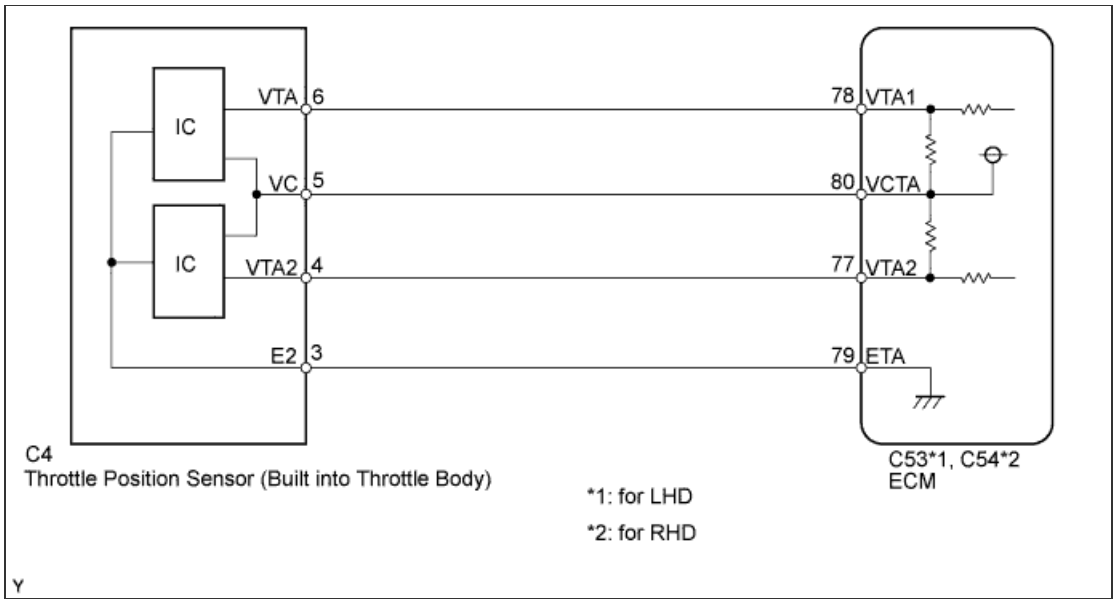
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

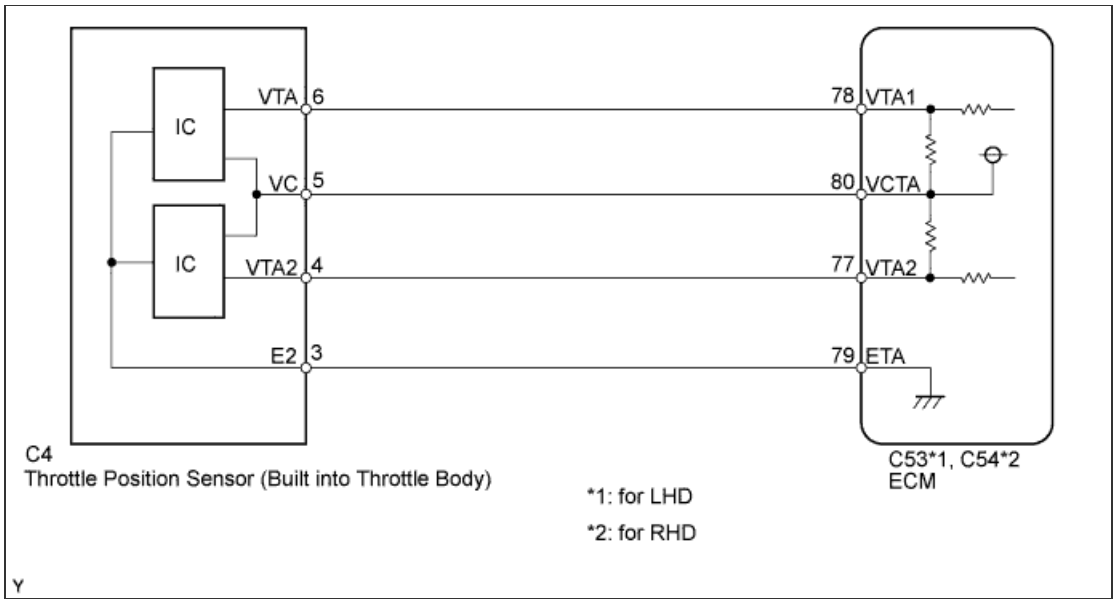
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

DTC P1613 Secondary Air Injection Driver Malfunction

DTC P1614 Secondary Air Injection System Driver Bank 2

for Preparation Click here

DESCRIPTION

Refer to DTC P0412 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P1613 P1614	Either of the following conditions (1) or (2) is met: (1) All of the following conditions are met (1 trip detection logic): • Either the air pump or the air switching valve is not operating. • The diagnostic signal from the Air Injection Control Driver (AID) is 80%. • The battery voltage is 8 V or higher. (2) Both of the following conditions are met (1 trip detection logic): • The battery voltage is 8 V or higher. • The diagnostic signal from the AID is abnormal (duty signal other than 0, 20, 40, 80 and 100%).	• Air Injection Control Driver (AID) • Open in AID ground circuit
P1613 P1614	All of the following conditions are met (1 trip detection logic): 1. The air injection system is operating (Air Switching Valve [ASV] ON and air pump ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 0%. 3. The battery voltage is 8 V or higher.	• Short in diagnostic information signal circuit (AID - ECM) • Open or short in air pump and air switching valve command signal circuit (AID - ECM) • Open in AID ground circuit • AID • ECM
P1613 P1614	Both of the following conditions are met (1 trip detection logic): 1. The battery voltage is 8 V or higher. 2. The diagnostic signal from the Air Injection Control Driver (AID) is 100%.	• Open or short in AID +B circuit • Open in diagnostic information signal circuit (AID - ECM) • AID • ECM

MONITOR DESCRIPTION

For a short time after a cold engine start, the ECM transmits command signals to the Air Injection Control Driver (AID) to drive the air pump and the Air Switching Valve (ASV). The AID detects open and short circuits according to the voltages at the AID terminals to the air pump and ASV, and the circuit voltage of the AID power source, and transmits diagnostic information as a signal to the ECM.
If the Secondary Air Injection (AIR) system circuit or the AID itself malfunctions, the AID sends a malfunction signal (duty signal) as diagnostic information to the ECM (when the system is normal, a system normal signal is sent). The ECM stores the DTC based on the diagnostic information from the AID.
EXAMPLE:

1. The duty ratio of the diagnostic signal from the AID is 0 or 100% (remains at 0 V or the same as battery voltage).
2. The duty ratio of the diagnostic signal from the AID shows an impossible ratio (other than 0, 20, 40, 80 and 100%).
3. The AID outputs the normal signal (normal duty signal: 80%) while the system is not operating.

WIRING DIAGRAM

Refer to DTC P0412 (Click here).

INSPECTION PROCEDURE

HINT:

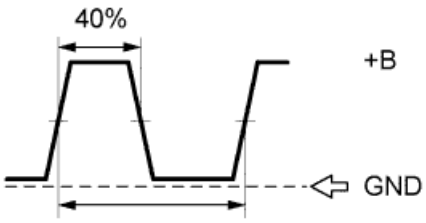
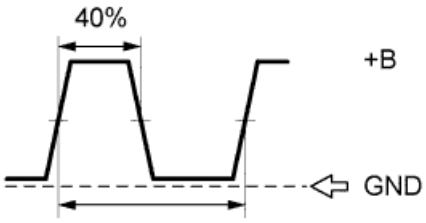
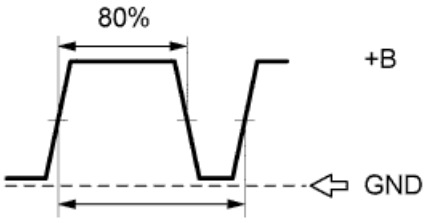
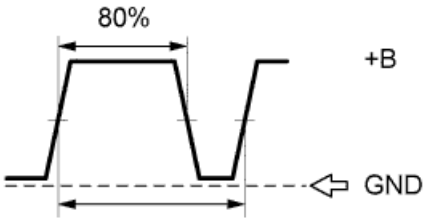
Diagnostic information output by the Air Injection Control Driver (AID) can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the System Check function, allows the possible trouble areas to be narrowed down.









NOTICE:

- **This Secondary Air Injection Check only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore,**

the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
If an ERROR is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.

- Performing the Secondary Air Injection Check repeatedly may cause damage to the AIR system. If necessary, leave an interval of several minutes between system check operations to prevent the system from overheating.
- When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.
- Turn the engine switch off when the Secondary Air Injection Check operation finishes.

AID Diagnostic Signal Waveforms	ECM Commands	DTCs (ECM Output)	Suspected Trouble Areas
100% Duty Ratio 	Any Secondary Air Injection (AIR) System operation	P1613 P1614	• Open in diagnostic signal circuit • Air Injection Control Driver (AID) • Open in AID BATT circuit • Short between +B and diagnostic signal circuits

80% Duty Ratio 	AIR System: ON (Air pump ON, ASV ON)	-	Normal
Other than above (other than 0, 20, 40, 80 and 100% duty)	-	P1613 P1614	• AID • Open in AID ground circuit

HINT:

- **By using the intelligent tester to perform the Secondary Air Injection Check operation in the Utility, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1613 OR P1614)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

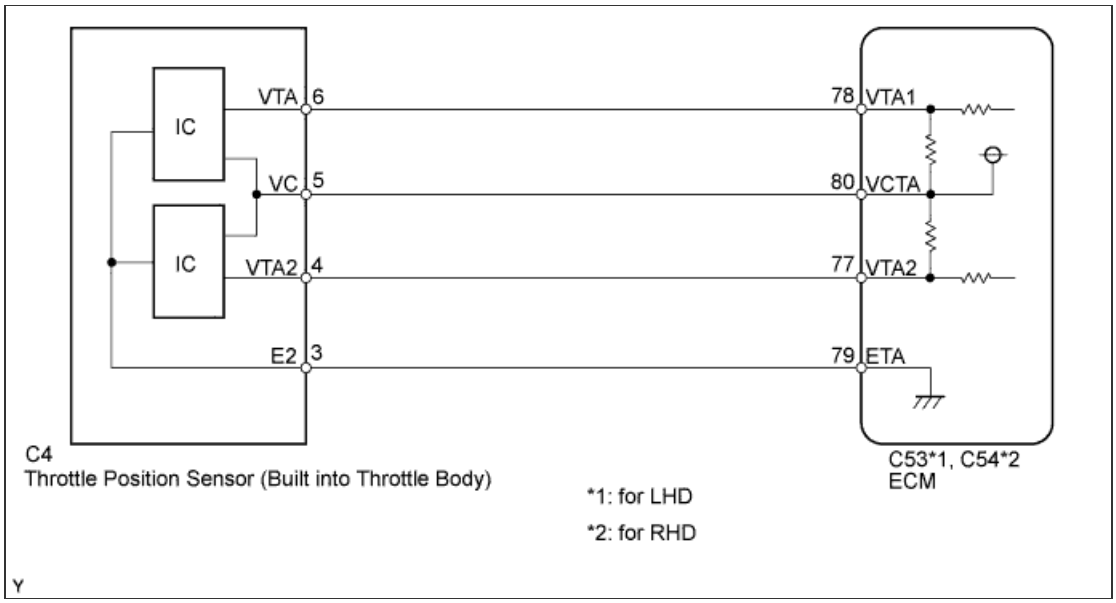
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

DTC P1613 Secondary Air Injection Driver Malfunction

DTC P1614 Secondary Air Injection System Driver Bank 2

for Preparation Click here

DESCRIPTION

Refer to DTC P0412 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P1613 P1614	Either of the following conditions (1) or (2) is met: (1) All of the following conditions are met (1 trip detection logic): • Either the air pump or the air switching valve is not operating. • The diagnostic signal from the Air Injection Control Driver (AID) is 80%. • The battery voltage is 8 V or higher. (2) Both of the following conditions are met (1 trip detection logic): • The battery voltage is 8 V or higher. • The diagnostic signal from the AID is abnormal (duty signal other than 0, 20, 40, 80 and 100%).	• Air Injection Control Driver (AID) • Open in AID ground circuit
P1613 P1614	All of the following conditions are met (1 trip detection logic): 1. The air injection system is operating (Air Switching Valve [ASV] ON and air pump ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 0%. 3. The battery voltage is 8 V or higher.	• Short in diagnostic information signal circuit (AID - ECM) • Open or short in air pump and air switching valve command signal circuit (AID - ECM) • Open in AID ground circuit • AID • ECM
P1613 P1614	Both of the following conditions are met (1 trip detection logic): 1. The battery voltage is 8 V or higher. 2. The diagnostic signal from the Air Injection Control Driver (AID) is 100%.	• Open or short in AID +B circuit • Open in diagnostic information signal circuit (AID - ECM) • AID • ECM

MONITOR DESCRIPTION

For a short time after a cold engine start, the ECM transmits command signals to the Air Injection Control Driver (AID) to drive the air pump and the Air Switching Valve (ASV). The AID detects open and short circuits according to the voltages at the AID terminals to the air pump and ASV, and the circuit voltage of the AID power source, and transmits diagnostic information as a signal to the ECM.
If the Secondary Air Injection (AIR) system circuit or the AID itself malfunctions, the AID sends a malfunction signal (duty signal) as diagnostic information to the ECM (when the system is normal, a system normal signal is sent). The ECM stores the DTC based on the diagnostic information from the AID.
EXAMPLE:

1. The duty ratio of the diagnostic signal from the AID is 0 or 100% (remains at 0 V or the same as battery voltage).
2. The duty ratio of the diagnostic signal from the AID shows an impossible ratio (other than 0, 20, 40, 80 and 100%).
3. The AID outputs the normal signal (normal duty signal: 80%) while the system is not operating.

WIRING DIAGRAM

Refer to DTC P0412 (Click here).

INSPECTION PROCEDURE

HINT:

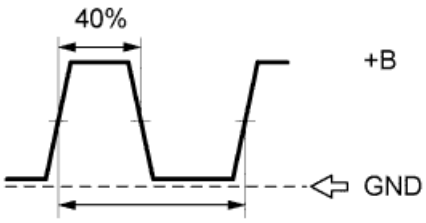
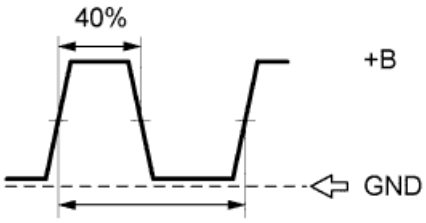
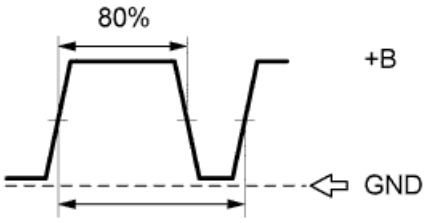
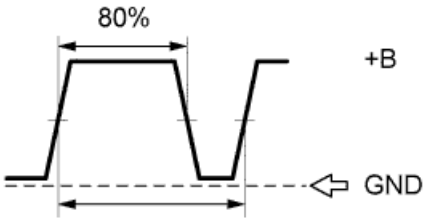
Diagnostic information output by the Air Injection Control Driver (AID) can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the System Check function, allows the possible trouble areas to be narrowed down.









NOTICE:

- **This Secondary Air Injection Check only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore,**

the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
If an ERROR is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.

- Performing the Secondary Air Injection Check repeatedly may cause damage to the AIR system. If necessary, leave an interval of several minutes between system check operations to prevent the system from overheating.
- When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.
- Turn the engine switch off when the Secondary Air Injection Check operation finishes.

AID Diagnostic Signal Waveforms	ECM Commands	DTCs (ECM Output)	Suspected Trouble Areas
100% Duty Ratio 	Any Secondary Air Injection (AIR) System operation	P1613 P1614	• Open in diagnostic signal circuit • Air Injection Control Driver (AID) • Open in AID BATT circuit • Short between +B and diagnostic signal circuits

80% Duty Ratio 	AIR System: ON (Air pump ON, ASV ON)	-	Normal
Other than above (other than 0, 20, 40, 80 and 100% duty)	-	P1613 P1614	• AID • Open in AID ground circuit

HINT:

- **By using the intelligent tester to perform the Secondary Air Injection Check operation in the Utility, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1613 OR P1614)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM

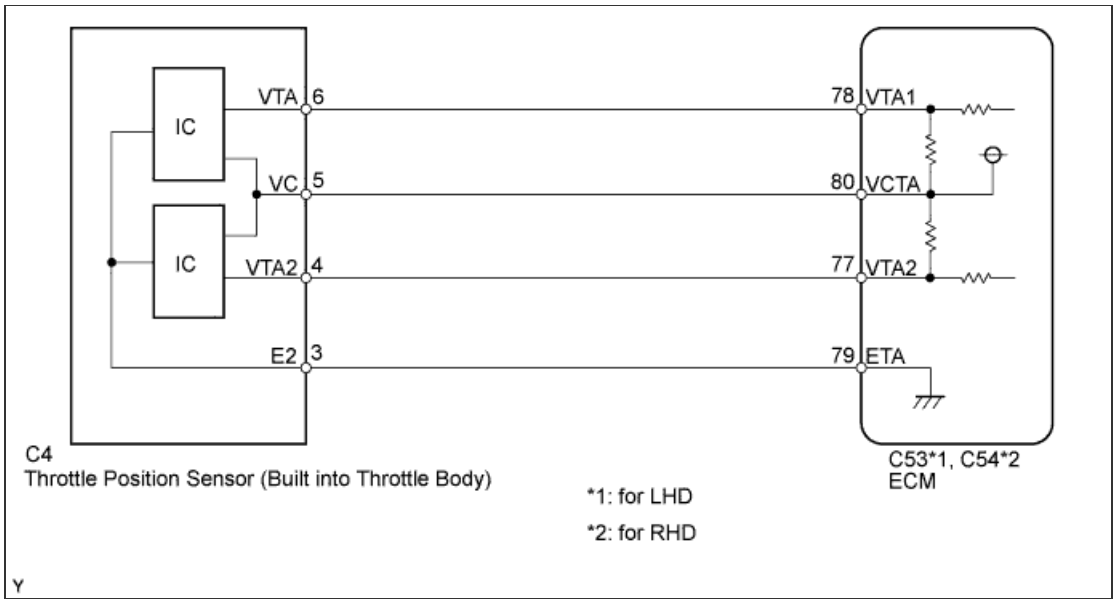
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

TP#1 (VTA1) When Accelerator Pedal Released	TP#2 (VTA2) When Accelerator Pedal Released	TP#1 (VTA1) When Accelerator Pedal Depressed	TP#2 (VTA2) When Accelerator Pedal Depressed	Trouble Area	Proceed to

DTC P1613 Secondary Air Injection Driver Malfunction

DTC P1614 Secondary Air Injection System Driver Bank 2

for Preparation Click here

DESCRIPTION

Refer to DTC P0412 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P1613 P1614	Either of the following conditions (1) or (2) is met: (1) All of the following conditions are met (1 trip detection logic): • Either the air pump or the air switching valve is not operating. • The diagnostic signal from the Air Injection Control Driver (AID) is 80%. • The battery voltage is 8 V or higher. (2) Both of the following conditions are met (1 trip detection logic): • The battery voltage is 8 V or higher. • The diagnostic signal from the AID is abnormal (duty signal other than 0, 20, 40, 80 and 100%).	• Air Injection Control Driver (AID) • Open in AID ground circuit
P1613 P1614	All of the following conditions are met (1 trip detection logic): 1. The air injection system is operating (Air Switching Valve [ASV] ON and air pump ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 0%. 3. The battery voltage is 8 V or higher.	• Short in diagnostic information signal circuit (AID - ECM) • Open or short in air pump and air switching valve command signal circuit (AID - ECM) • Open in AID ground circuit • AID • ECM
P1613 P1614	Both of the following conditions are met (1 trip detection logic): 1. The battery voltage is 8 V or higher. 2. The diagnostic signal from the Air Injection Control Driver (AID) is 100%.	• Open or short in AID +B circuit • Open in diagnostic information signal circuit (AID - ECM) • AID • ECM

MONITOR DESCRIPTION

For a short time after a cold engine start, the ECM transmits command signals to the Air Injection Control Driver (AID) to drive the air pump and the Air Switching Valve (ASV). The AID detects open and short circuits according to the voltages at the AID terminals to the air pump and ASV, and the circuit voltage of the AID power source, and transmits diagnostic information as a signal to the ECM.
If the Secondary Air Injection (AIR) system circuit or the AID itself malfunctions, the AID sends a malfunction signal (duty signal) as diagnostic information to the ECM (when the system is normal, a system normal signal is sent). The ECM stores the DTC based on the diagnostic information from the AID.
EXAMPLE:

1. The duty ratio of the diagnostic signal from the AID is 0 or 100% (remains at 0 V or the same as battery voltage).
2. The duty ratio of the diagnostic signal from the AID shows an impossible ratio (other than 0, 20, 40, 80 and 100%).
3. The AID outputs the normal signal (normal duty signal: 80%) while the system is not operating.

WIRING DIAGRAM

Refer to DTC P0412 (Click here).

INSPECTION PROCEDURE

HINT:

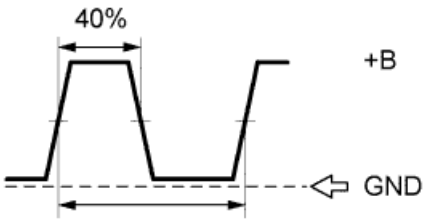
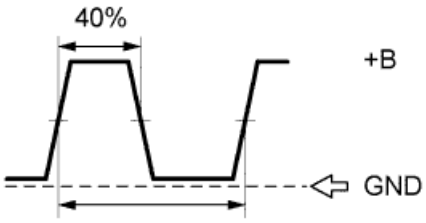
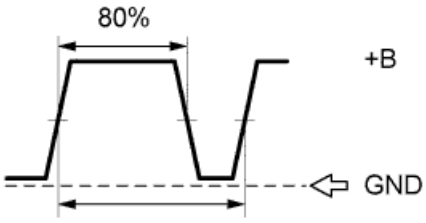
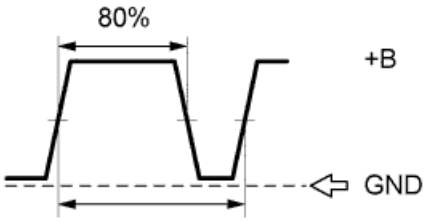
Diagnostic information output by the Air Injection Control Driver (AID) can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the System Check function, allows the possible trouble areas to be narrowed down.









NOTICE:

- **This Secondary Air Injection Check only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore,**

the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
If an ERROR is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.

- Performing the Secondary Air Injection Check repeatedly may cause damage to the AIR system. If necessary, leave an interval of several minutes between system check operations to prevent the system from overheating.
- When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.
- Turn the engine switch off when the Secondary Air Injection Check operation finishes.

AID Diagnostic Signal Waveforms	ECM Commands	DTCs (ECM Output)	Suspected Trouble Areas
100% Duty Ratio 	Any Secondary Air Injection (AIR) System operation	P1613 P1614	• Open in diagnostic signal circuit • Air Injection Control Driver (AID) • Open in AID BATT circuit • Short between +B and diagnostic signal circuits
0% Duty Ratio 	AIR System: ON (Air pump ON, ASV ON)	P1613 P1614	• Open or short in air pump or Air Switching Valve (ASV) command signal circuit (ECM - AID) • Short between diagnostic signal circuit and body ground • AID • ECM

80% Duty Ratio 	AIR System: ON (Air pump ON, ASV ON)	-	Normal
Other than above (other than 0, 20, 40, 80 and 100% duty)	-	P1613 P1614	• AID • Open in AID ground circuit

HINT:

- **By using the intelligent tester to perform the Secondary Air Injection Check operation in the Utility, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1613 OR P1614)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P1613 and/or P1614 are output	A
P1613 and/or P1614 and other DTCs are output	B

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

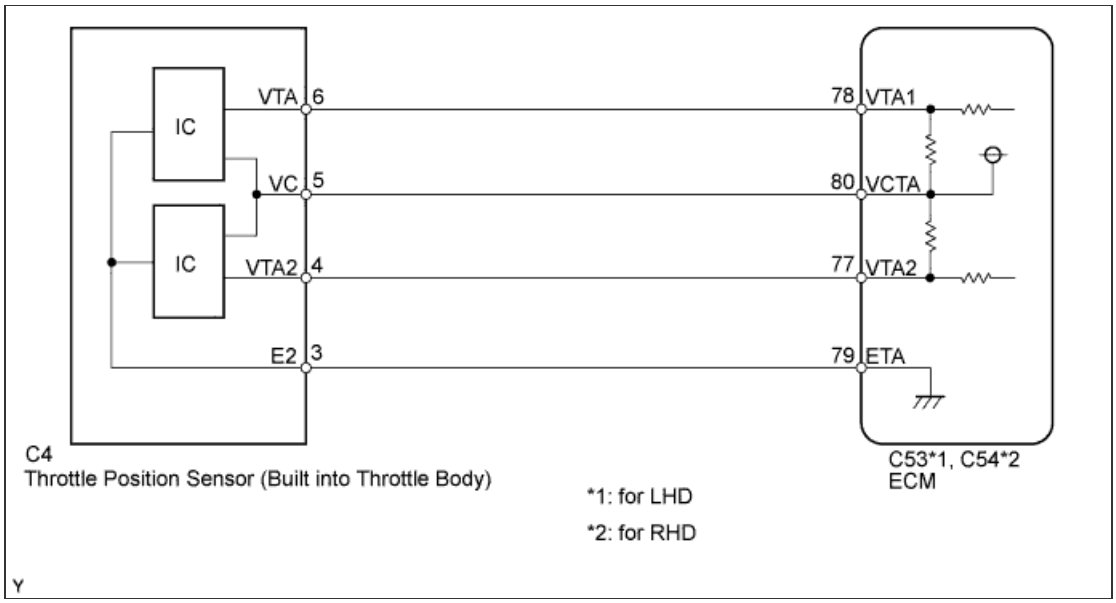
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

DTC P1613 Secondary Air Injection Driver Malfunction

DTC P1614 Secondary Air Injection System Driver Bank 2

for Preparation Click here

DESCRIPTION

Refer to DTC P0412 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P1613 P1614	Either of the following conditions (1) or (2) is met: (1) All of the following conditions are met (1 trip detection logic): • Either the air pump or the air switching valve is not operating. • The diagnostic signal from the Air Injection Control Driver (AID) is 80%. • The battery voltage is 8 V or higher. (2) Both of the following conditions are met (1 trip detection logic): • The battery voltage is 8 V or higher. • The diagnostic signal from the AID is abnormal (duty signal other than 0, 20, 40, 80 and 100%).	• Air Injection Control Driver (AID) • Open in AID ground circuit
P1613 P1614	All of the following conditions are met (1 trip detection logic): 1. The air injection system is operating (Air Switching Valve [ASV] ON and air pump ON). 2. The diagnostic signal from the Air Injection Control Driver (AID) is 0%. 3. The battery voltage is 8 V or higher.	• Short in diagnostic information signal circuit (AID - ECM) • Open or short in air pump and air switching valve command signal circuit (AID - ECM) • Open in AID ground circuit • AID • ECM
P1613 P1614	Both of the following conditions are met (1 trip detection logic): 1. The battery voltage is 8 V or higher. 2. The diagnostic signal from the Air Injection Control Driver (AID) is 100%.	• Open or short in AID +B circuit • Open in diagnostic information signal circuit (AID - ECM) • AID • ECM

MONITOR DESCRIPTION

For a short time after a cold engine start, the ECM transmits command signals to the Air Injection Control Driver (AID) to drive the air pump and the Air Switching Valve (ASV). The AID detects open and short circuits according to the voltages at the AID terminals to the air pump and ASV, and the circuit voltage of the AID power source, and transmits diagnostic information as a signal to the ECM.
If the Secondary Air Injection (AIR) system circuit or the AID itself malfunctions, the AID sends a malfunction signal (duty signal) as diagnostic information to the ECM (when the system is normal, a system normal signal is sent). The ECM stores the DTC based on the diagnostic information from the AID.
EXAMPLE:

1. The duty ratio of the diagnostic signal from the AID is 0 or 100% (remains at 0 V or the same as battery voltage).
2. The duty ratio of the diagnostic signal from the AID shows an impossible ratio (other than 0, 20, 40, 80 and 100%).
3. The AID outputs the normal signal (normal duty signal: 80%) while the system is not operating.

WIRING DIAGRAM

Refer to DTC P0412 (Click here).

INSPECTION PROCEDURE

HINT:

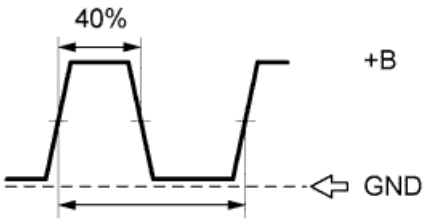
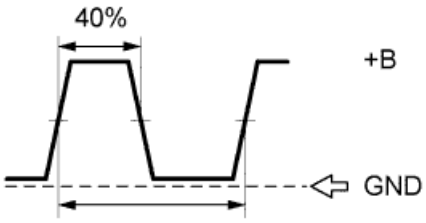
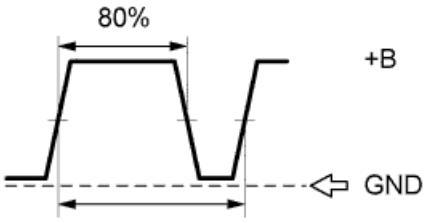
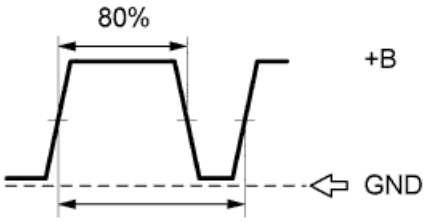
Diagnostic information output by the Air Injection Control Driver (AID) can be confirmed by connecting an oscilloscope to the diagnostic information terminal of the AID. Reading the waveform while performing the AIR system intrusive operation provided in the System Check function, allows the possible trouble areas to be narrowed down.









NOTICE:

- **This Secondary Air Injection Check only allows technicians to operate the AIR system for a maximum of 5 seconds. Furthermore,**

the check can only be performed up to 4 times per trip. If the test is repeated, intervals of at least 30 seconds are required between checks. While AIR system operation using the intelligent tester is prohibited, the tester display indicates the prohibition (WAIT or ERROR).
If an ERROR is displayed on the tester during the test, stop the engine for 10 minutes, and then try again.

- Performing the Secondary Air Injection Check repeatedly may cause damage to the AIR system. If necessary, leave an interval of several minutes between system check operations to prevent the system from overheating.
- When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.
- Turn the engine switch off when the Secondary Air Injection Check operation finishes.

AID Diagnostic Signal Waveforms	ECM Commands	DTCs (ECM Output)	Suspected Trouble Areas
100% Duty Ratio 	Any Secondary Air Injection (AIR) System operation	P1613 P1614	• Open in diagnostic signal circuit • Air Injection Control Driver (AID) • Open in AID BATT circuit • Short between +B and diagnostic signal circuits
0% Duty Ratio 	AIR System: ON (Air pump ON, ASV ON)	P1613 P1614	• Open or short in air pump or Air Switching Valve (ASV) command signal circuit (ECM - AID) • Short between diagnostic signal circuit and body ground • AID • ECM
0% Duty Ratio 	AIR System: OFF (Air pump OFF, ASV OFF)	-	Normal
20% Duty Ratio 	Air Pump: ON	P0418 P0419	• Short between air pump drive circuit and body ground • Harness and connector (AID - Pump) • Air pump • AID • ECM
20% Duty Ratio 	Air Pump: OFF	P0418 P0419	• Open in air pump drive circuit (AID - Pump) • Harness and connector (AID - Pump) • Air pump • AID • ECM

40% Duty Ratio 	ASV: OFF	P0412 P0415	• Open in ASV drive circuit (AID-ASV) • Harness and connector (AID - ASV) • AID • ASV • ECM
80% Duty Ratio 	AIR System: OFF (Air pump OFF, ASV OFF)	P1613 P1614	• AID • ECM
80% Duty Ratio 	AIR System: ON (Air pump ON, ASV ON)	-	Normal
Other than above (other than 0, 20, 40, 80 and 100% duty)	-	P1613 P1614	• AID • Open in AID ground circuit

HINT:

- **By using the intelligent tester to perform the Secondary Air Injection Check operation in the Utility, the air-fuel ratio and the pressure in the secondary air injection system passage can be checked while the secondary air injection system is operating. This helps technicians to troubleshoot the system when it malfunctions.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1613 OR P1614)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P1613 and/or P1614 are output	A
P1613 and/or P1614 and other DTCs are output	B

If any DTCs other than P1613 and P1614 are output, troubleshoot those DTCs first.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

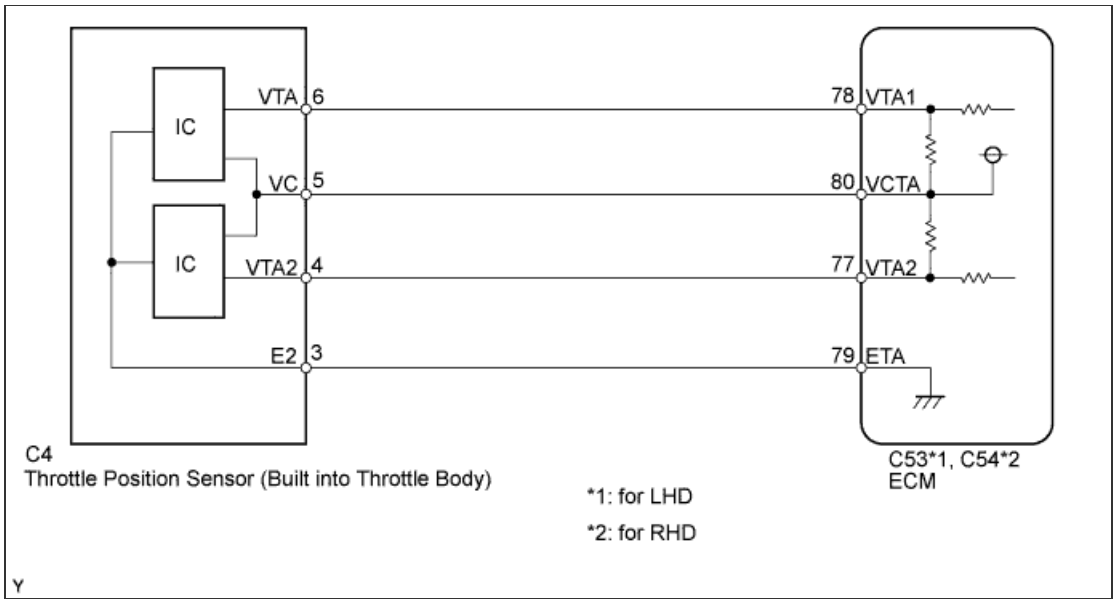
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

A

REPLACE ECM (Click here)

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
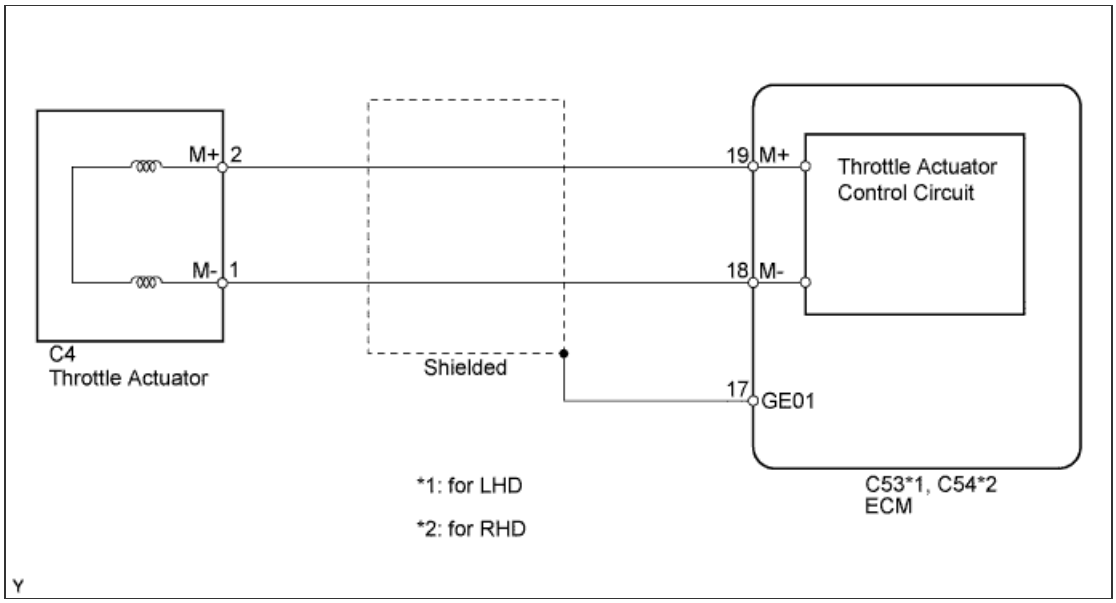
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is below 0.5 A.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions is met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**



MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the electrical current is below 0.5 A and the throttle actuator duty ratio exceeds 80%, the ECM interprets this as the current being outside the standard range, illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine is started and has idled for 5 seconds.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

for Preparation Click here

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

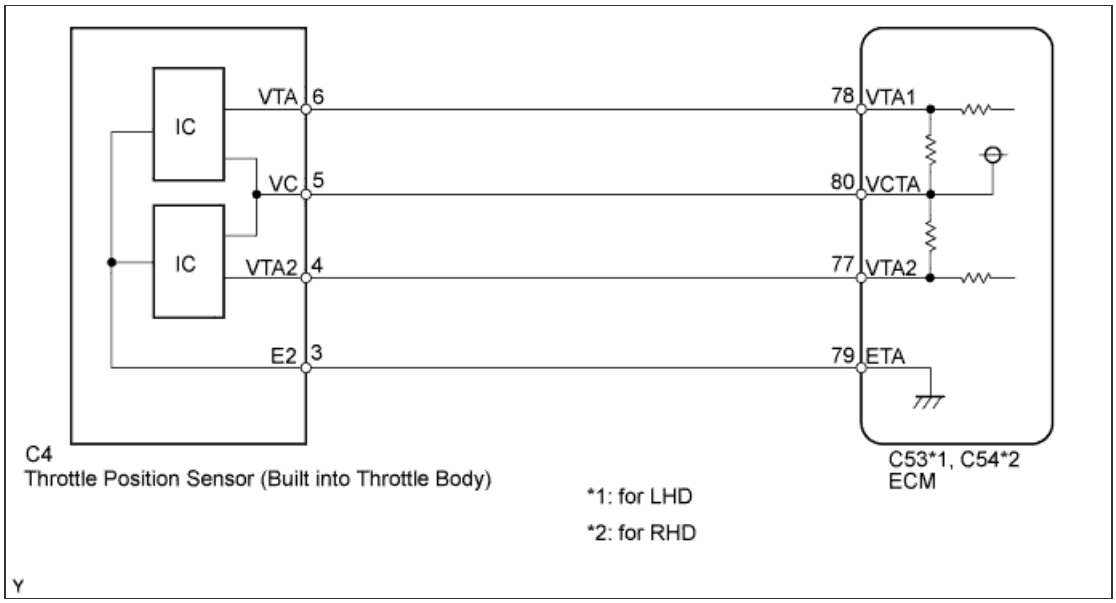
The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

TP#1 (VTA1) When Accelerator Pedal Released	TP#2 (VTA2) When Accelerator Pedal Released	TP#1 (VTA1) When Accelerator Pedal Depressed	TP#2 (VTA2) When Accelerator Pedal Depressed	Trouble Area	Proceed to

REPLACE ECM (Click here)

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is below 0.5 A.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions is met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the electrical current is below 0.5 A and the throttle actuator duty ratio exceeds 80%, the ECM interprets this as the current being outside the standard range, illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine is started and has idled for 5 seconds.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

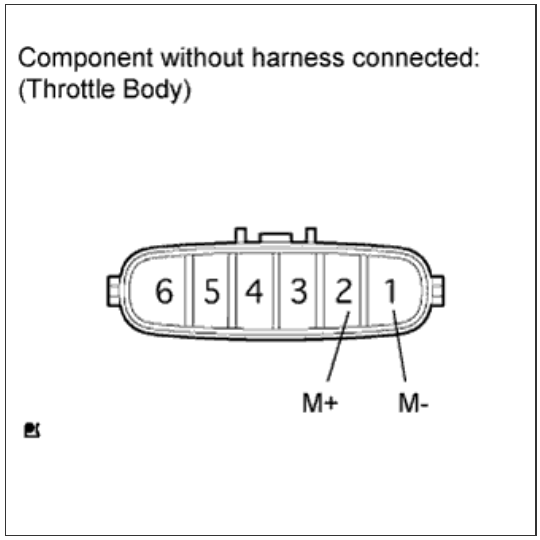
When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **The throttle actuator current (Throttle Motor Current) and the throttle actuator duty ratio (Throttle Motor Open Duty / Throttle Motor Close Duty) can be read using the intelligent tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.**



1.INSPECT THROTTLE BODY ASSEMBLY (RESISTANCE OF THROTTLE ACTUATOR)

a. Disconnect the C4 throttle body connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

REPLACE ECM (Click here)

DTC P0121 Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0120 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0121	The difference between the VTA1 and VTA2 voltages is below 0.8 V, or higher than 1.6 V for 2 seconds (1 trip detection logic).	Throttle Position (TP) sensor (built into throttle body)

MONITOR DESCRIPTION

The ECM uses the TP sensor to monitor the throttle valve opening angle.
This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1.
The ECM performs several checks to confirm the proper operation of the TP sensor and VTA1.
For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the output voltage difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction of the TP sensor. The ECM illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The throttle actuator does not close when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**
P2112	The throttle actuator does not open when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION

Active Air-Fuel Ratio Control

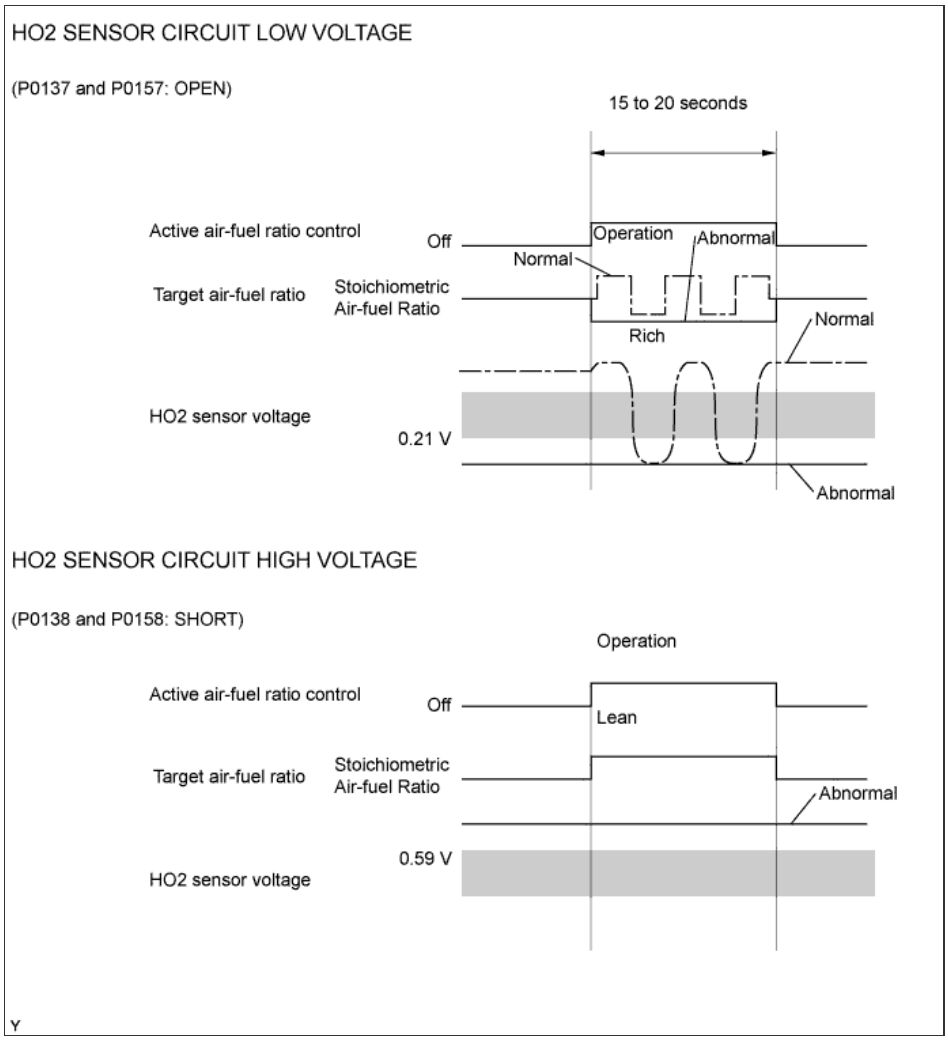
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
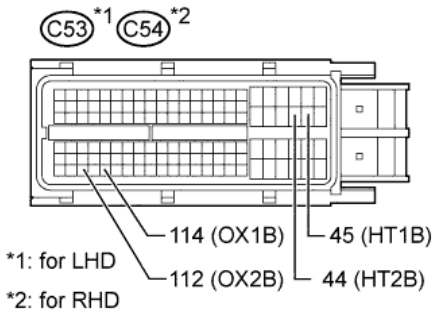
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

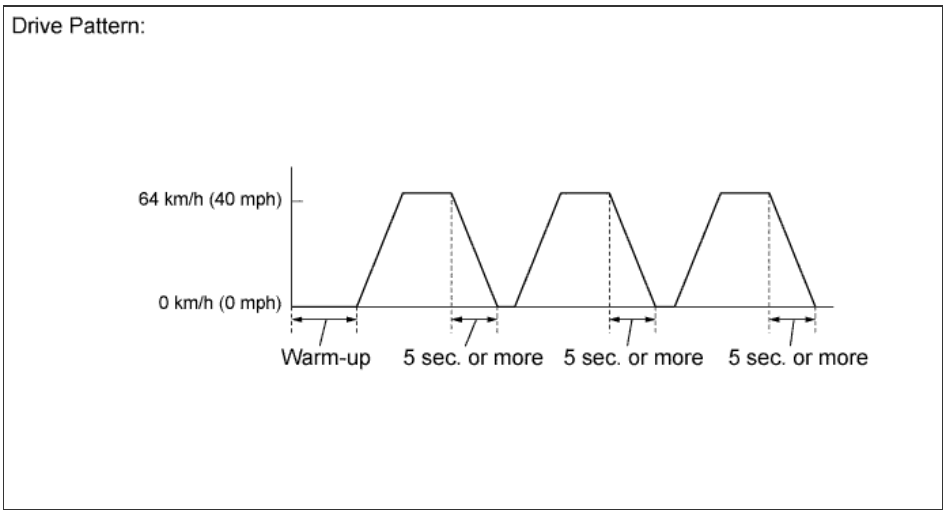
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

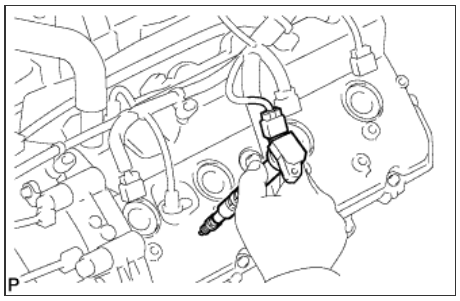
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

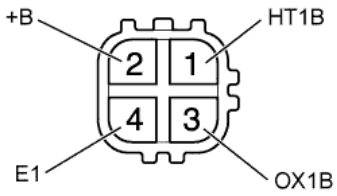
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
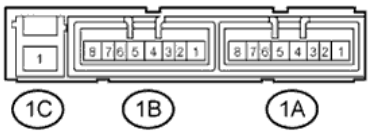
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The throttle actuator does not close when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**
P2112	The throttle actuator does not open when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2111 or P2112 is output	A
P2111 or P2112 and other DTCs are output	B

HINT:

If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

a. Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION

Active Air-Fuel Ratio Control

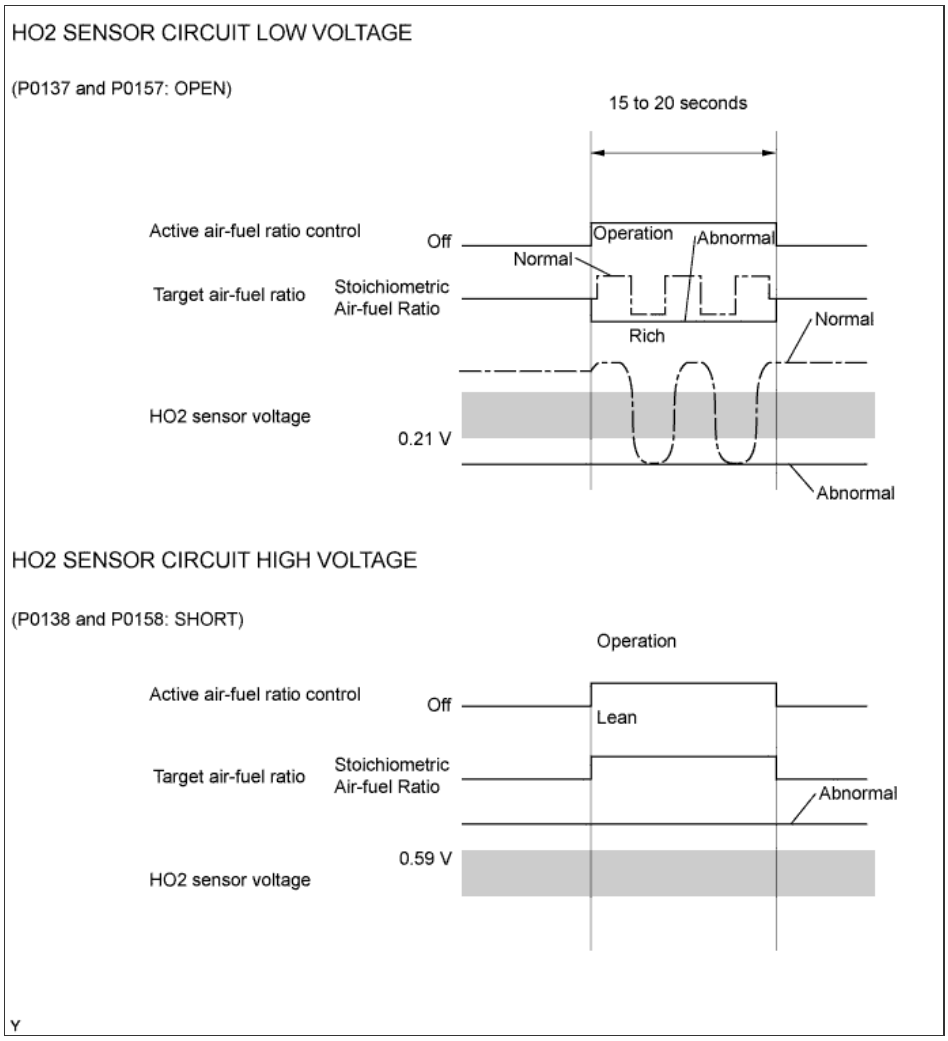
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
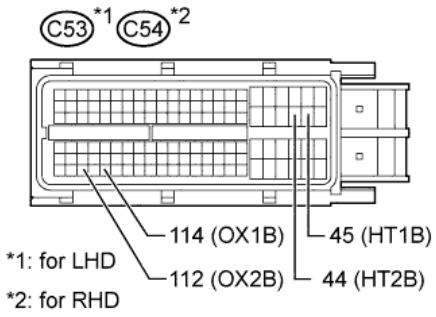
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

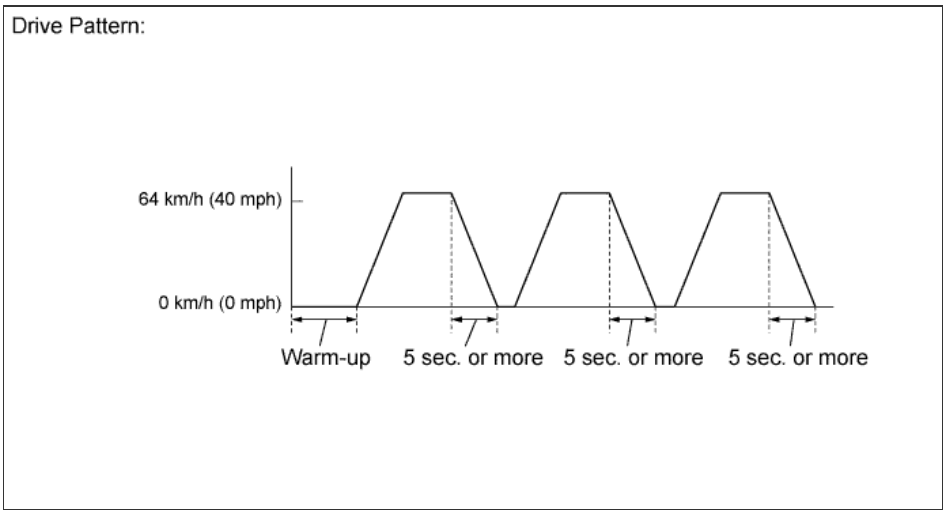
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

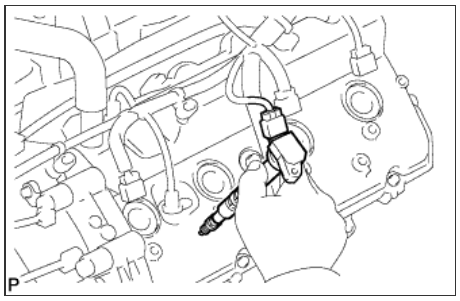
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

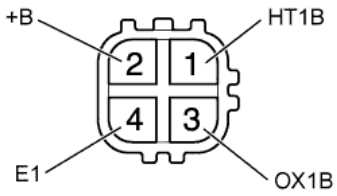
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
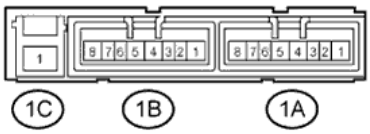
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The throttle actuator does not close when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**
P2112	The throttle actuator does not open when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2111 or P2112 is output	A
P2111 or P2112 and other DTCs are output	B

HINT:

If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

a. Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No DTC is output	A
P2111 or P2112 is output	B

B → REPLACE ECM (Click here)

A

for Preparation Click here

DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION

Active Air-Fuel Ratio Control

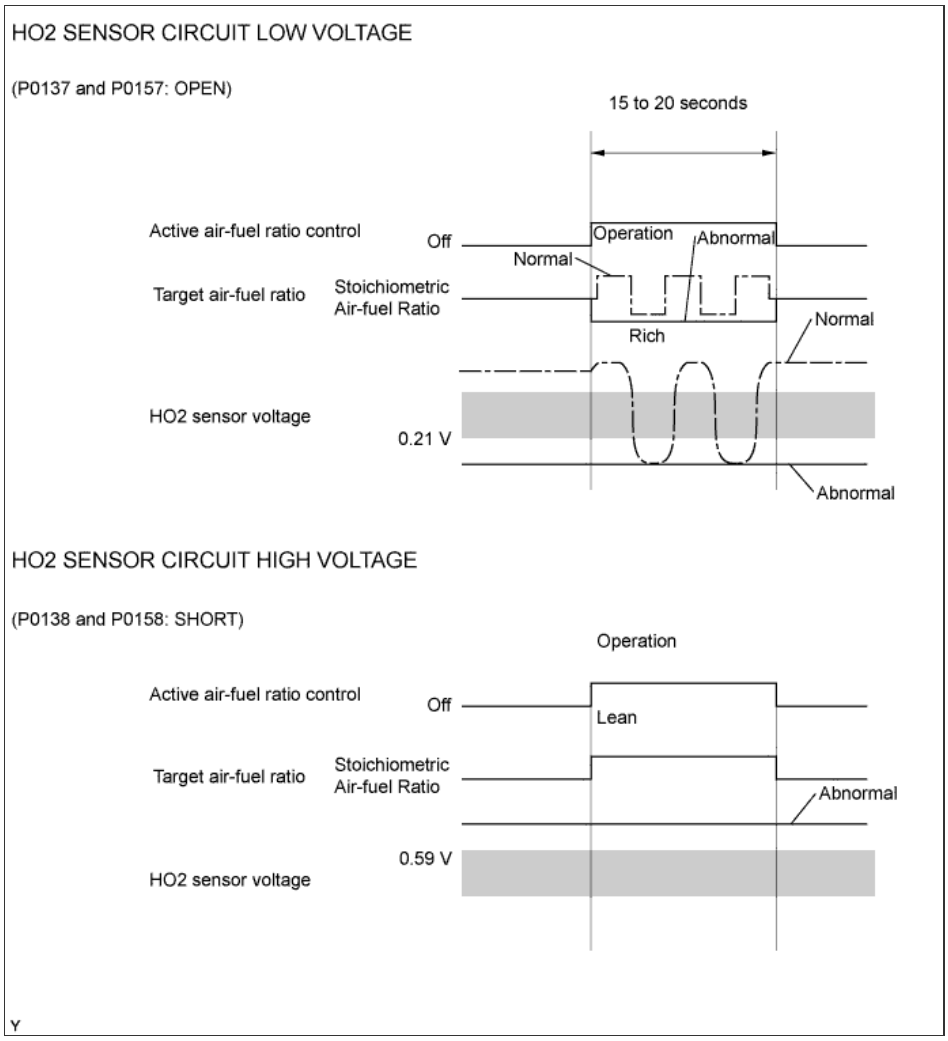
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
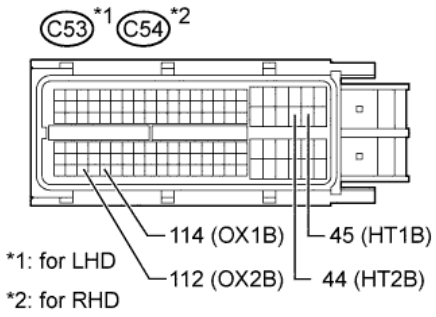
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

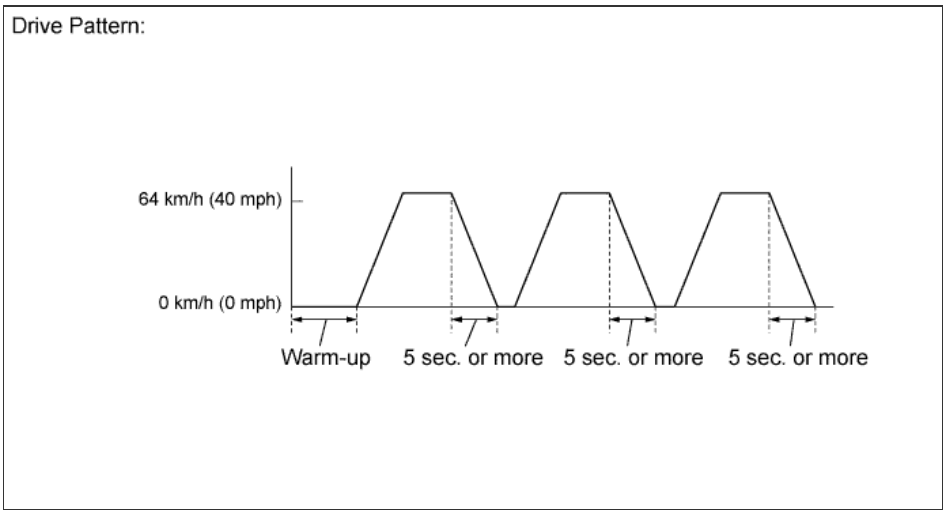
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

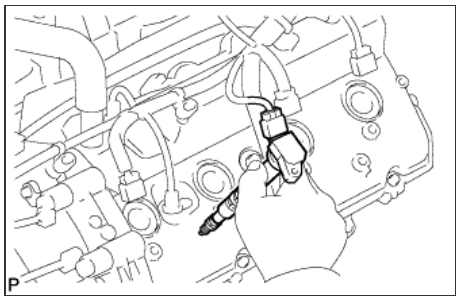
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

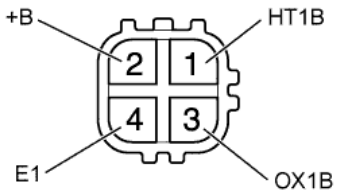
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
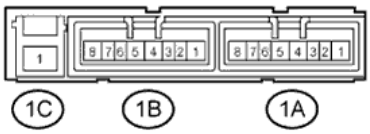
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

DESCRIPTION

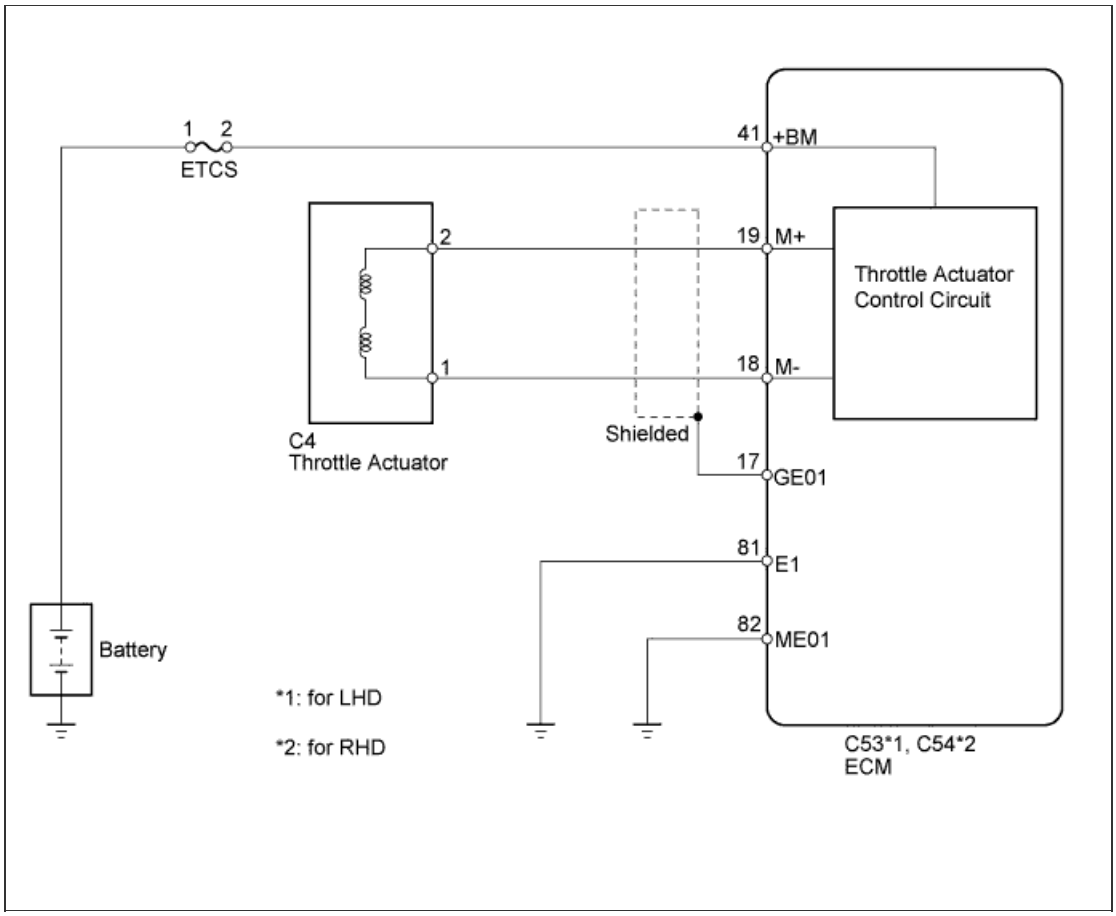
The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (below 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the engine switch off. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.

HINT:

The ETCS does not use a throttle cable.

Reference (System Diagram):

DTC Code	DTC Detection Condition	Trouble Area
P2118	An open in the ETCS power source (+BM) circuit (1 trip detection logic).	• Open in ETCS power source circuit • ETCS fuse • ECM



MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored 5 seconds after the engine is next started.

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

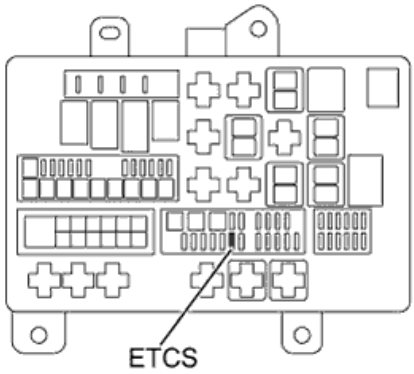
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT FUSE (ETCS)



a. Remove the ETCS fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

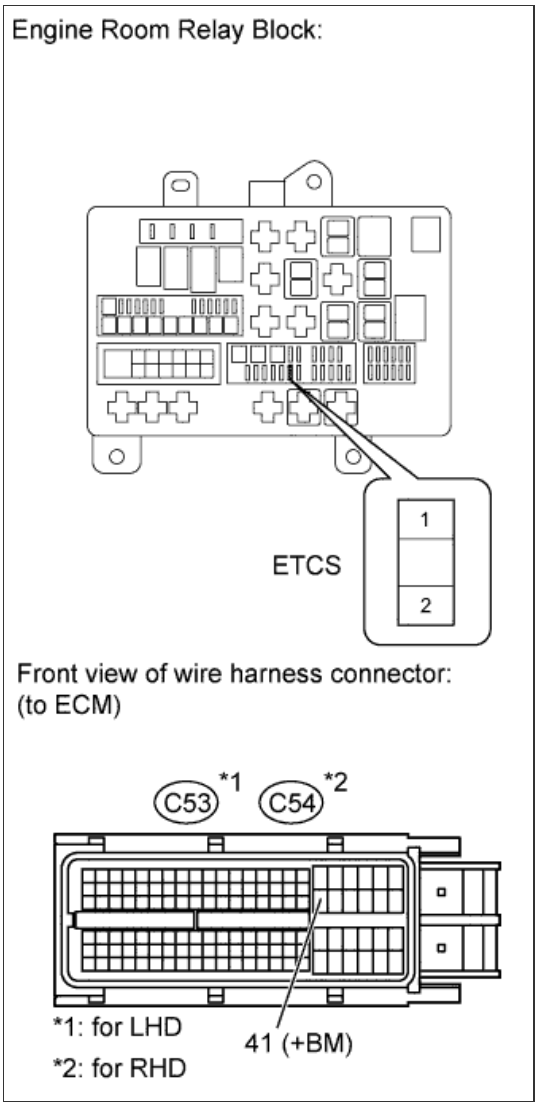
Standard Resistance:

Tester Connection	Condition	Specified Condition
ETCS fuse	Always	Below 1 Ω

Engine Room Relay Block:

NG → CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK



2.CHECK HARNESS AND CONNECTOR (ECM - ETCS FUSE, ETCS FUSE - BATTERY)

a. Check the harness and connector between the ETCS fuse and ECM.

i. Remove the ETCS fuse from the engine room relay block.

ii. Disconnect the C53 or C54 ECM connector.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
ETCS fuse terminal 2 - C53-41 (+BM)	Always	Below 1 Ω
ETCS fuse terminal 2 or C53-41 (+BM) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
ETCS fuse terminal 2 - C54-41 (+BM)	Always	Below 1 Ω
ETCS fuse terminal 2 or C54-41 (+BM) - Body ground	Always	10 kΩ or higher

b. Check the harness and connector between the ETCS fuse and positive battery cable.

i. Remove the ETCS fuse from the engine room relay block.

ii. Disconnect the cable from the positive (+) battery terminal.

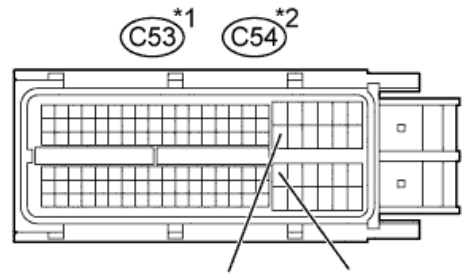
iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive battery cable - ETCS fuse terminal 1	Always	Below 1 Ω
Positive battery cable or ETCS	Always	10 kΩ or higher

fuse terminal 1 - Body ground		

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

3.INSPECT ECM (+BM VOLTAGE)

a. Disconnect the C53 or C54 ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Front view of wire harness connector: (to ECM)

*1: for LHD

*2: for RHD

Standard Voltage:

for LHD

Tester Connection	Condition	Specified Condition
C53-41 (+BM) - C53-81 (E1)	Always	11 to 14 V

for RHD

Tester Connection	Condition	Specified Condition
C54-41 (+BM) - C54-81 (E1)	Always	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (TERMINAL E1 - BODY GROUND)

OK

REPLACE ECM (Click here)

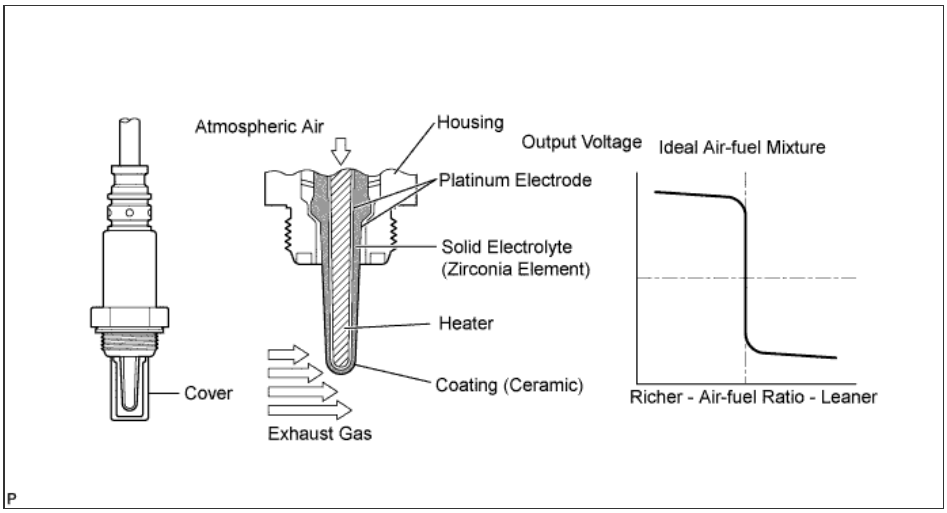
DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

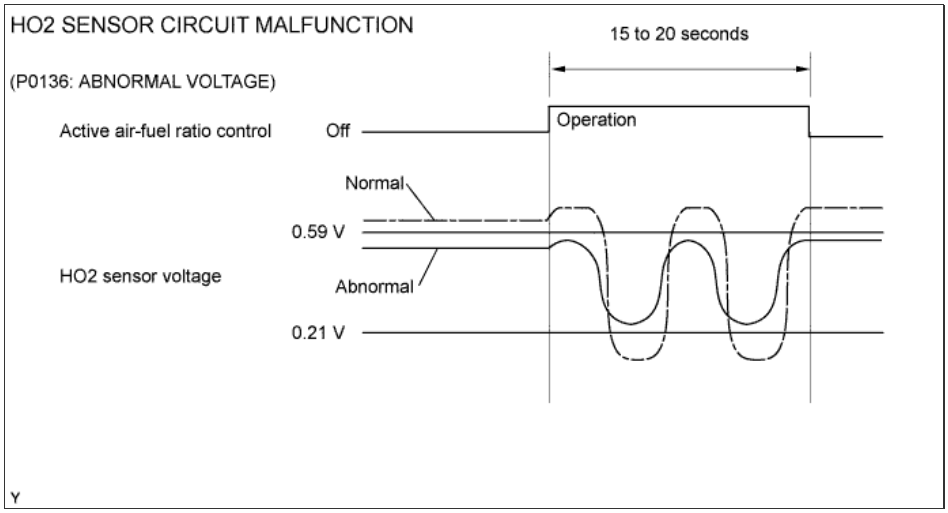
The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

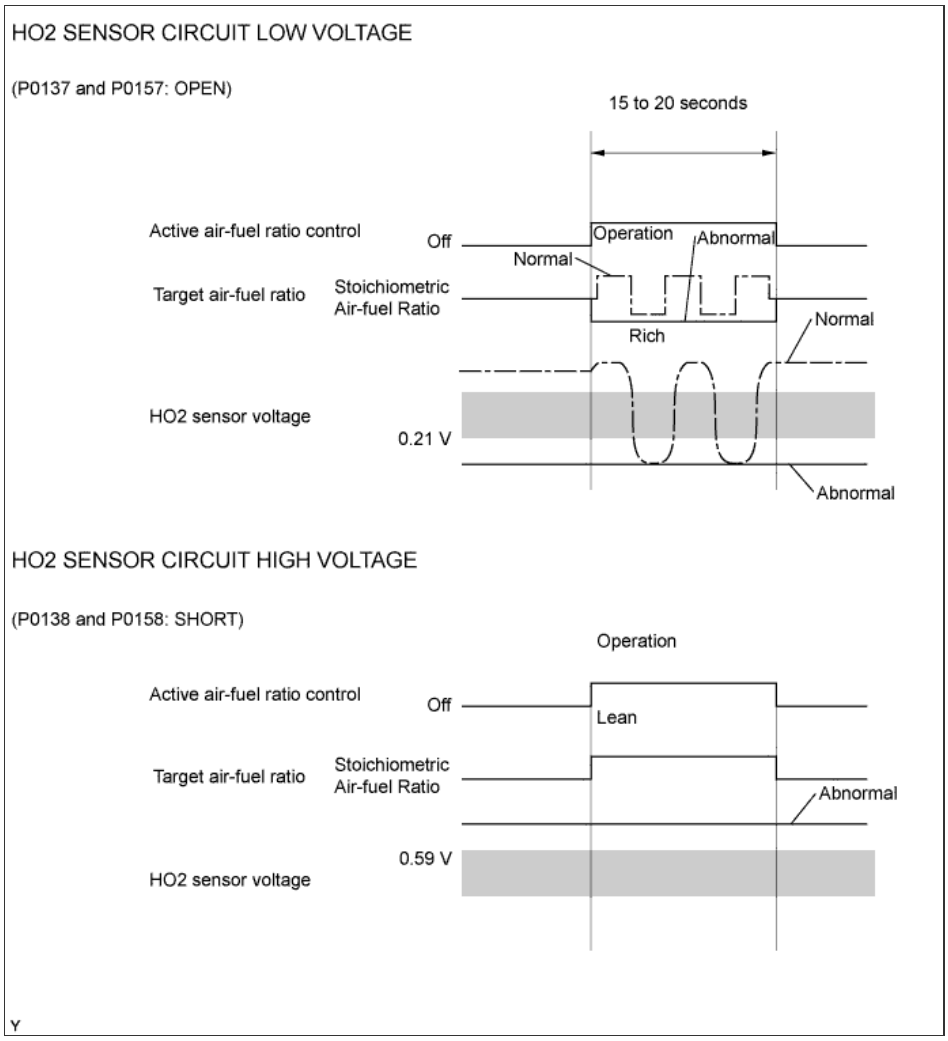
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

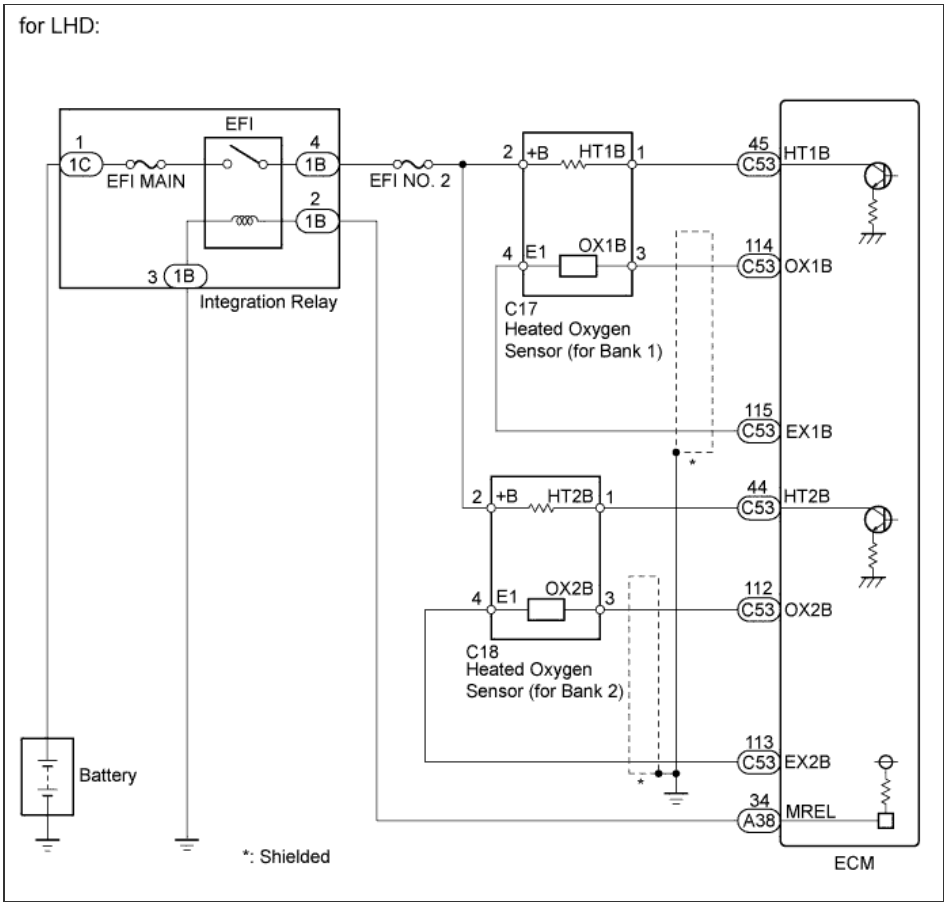
While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)

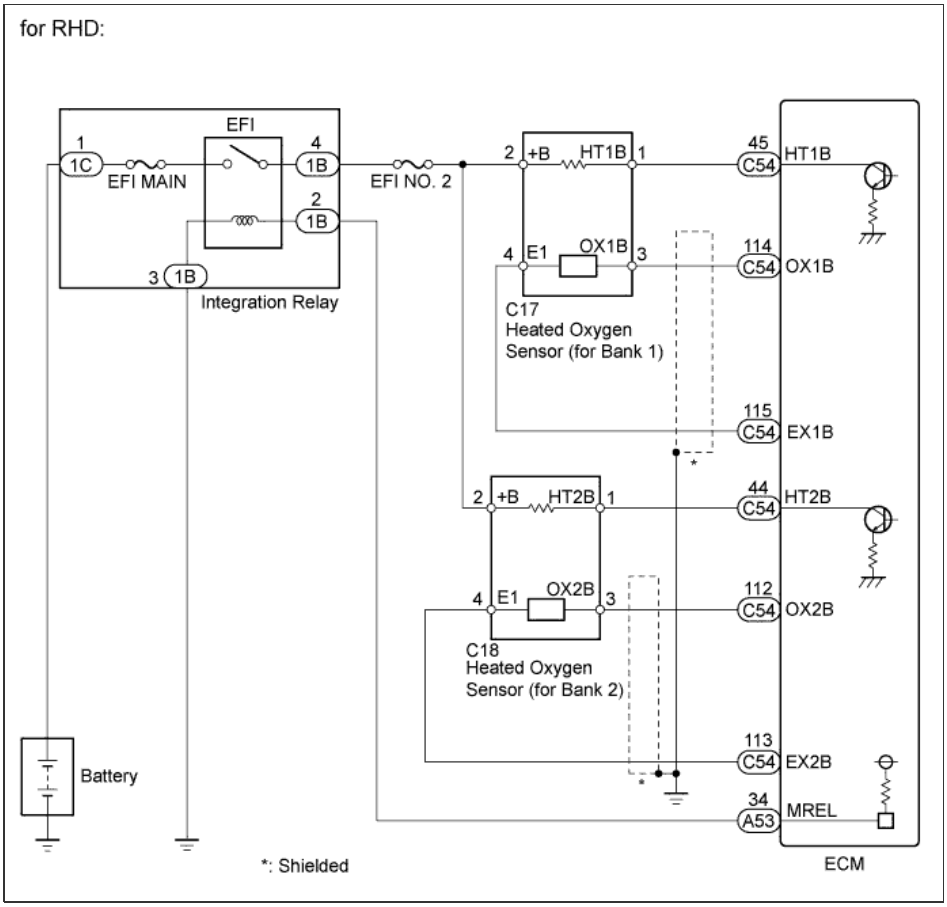


During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.



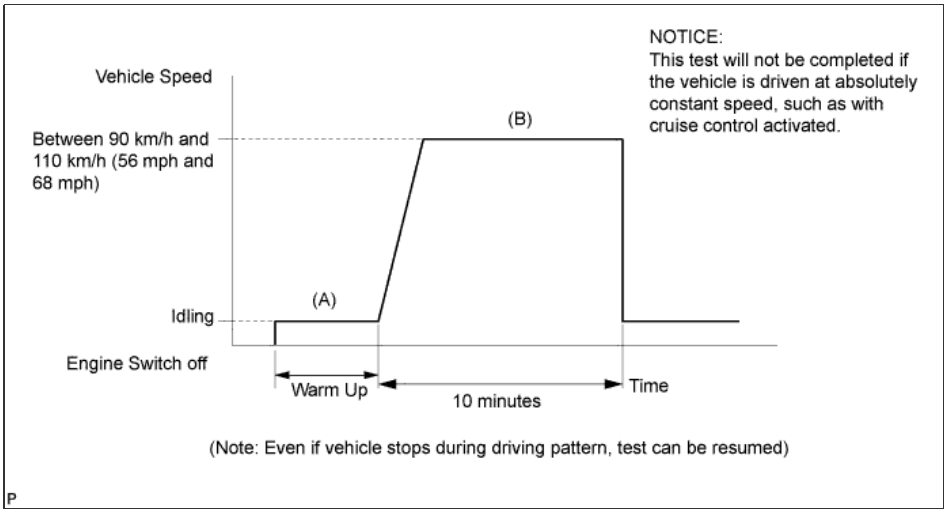
HINT:



DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

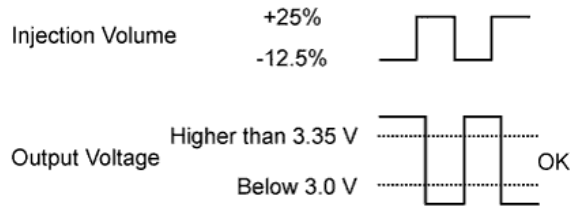
INSPECTION PROCEDURE

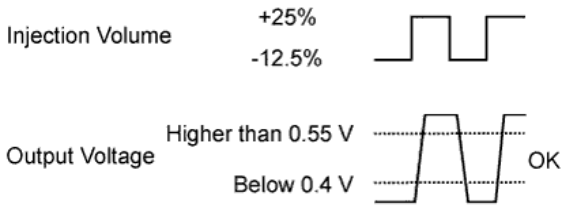
HINT:

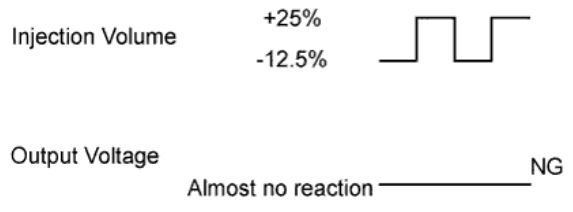
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

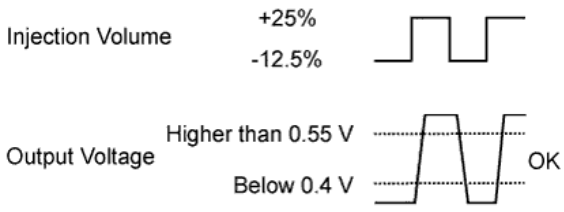
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

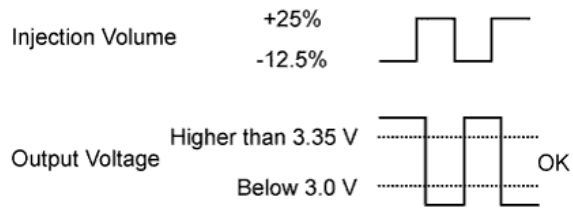
1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

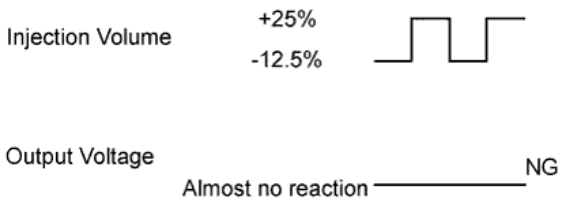












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

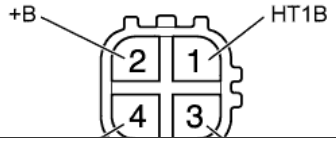
Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

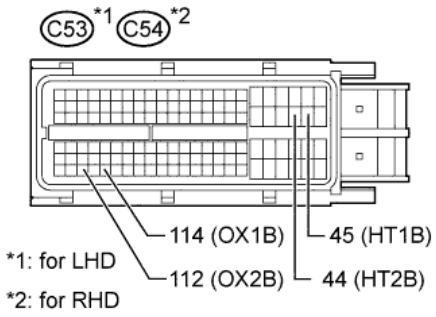
a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

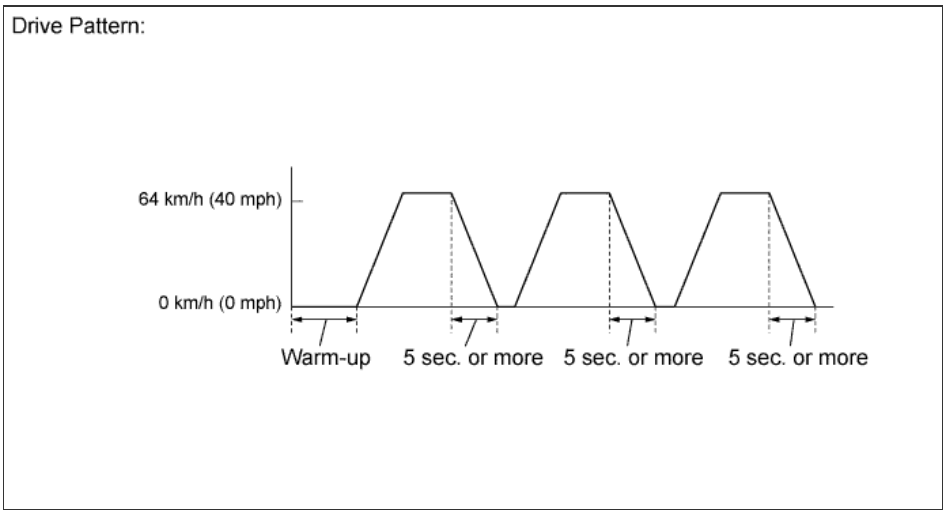
REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

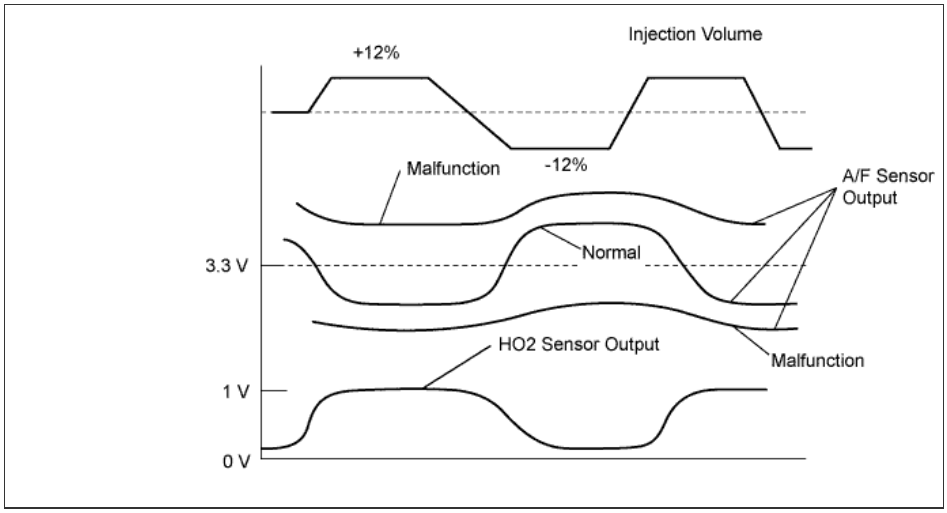
b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:



- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

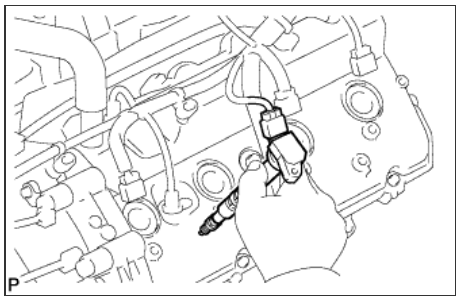
a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

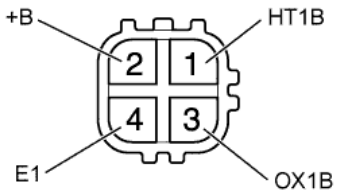
16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

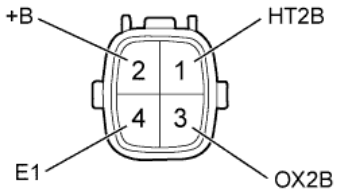
OK

17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

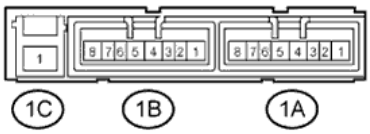
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

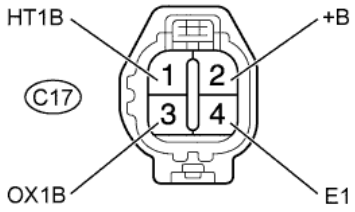
Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

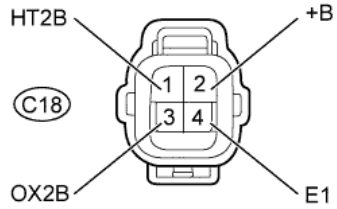
NG → REPLACE INTEGRATION NO.1 RELAY

OK



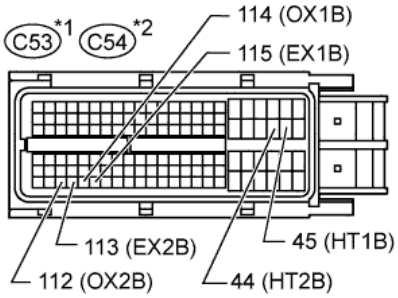
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



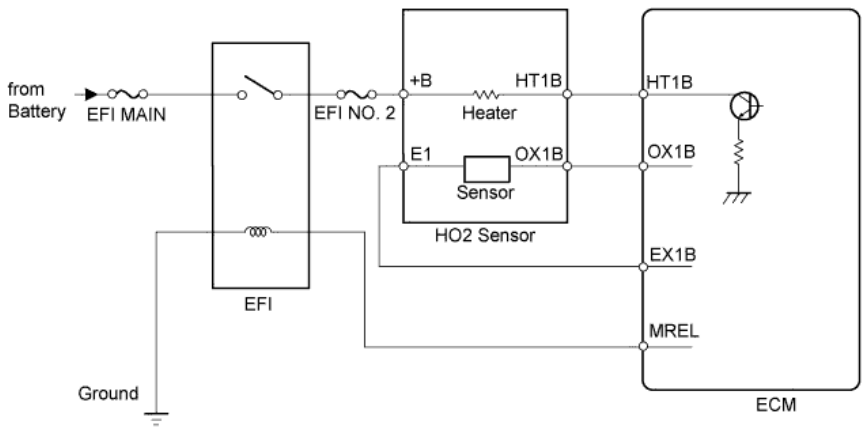
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)



Front view of wire harness connector:
(to ECM)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for at least 10 minutes.

e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

g. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

h. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern adding the vehicle speed and using the second gear to decelerate the vehicle.

OK:
No DTC is output.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK → REPAIR COMPLETE

DTC P2119 Throttle Actuator Control Throttle Body Range / Performance

for Preparation Click here

DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P2119	The throttle valve opening angle continues to vary greatly from the target opening angle (1 trip detection logic).	• ETCS • ECM

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2119 is output	A
P2119 and other DTCs are output	B

HINT:

If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Allow the engine to idle for 15 seconds.

g. Fully depress and release the accelerator pedal several times quickly.

h. Enter the following menus: Powertrain / Engine and ECT / DTC.

i. Read DTCs.

OK:
No DTC is output.

HINT:

The output voltage of the throttle position sensor can be checked using the tester. Variations in the output voltage indicate that the throttle actuator is in operation. To check the output voltage using the tester, enter the following menus: Powertrain / Engine and ECT / ETCS / Throttle Position No. 1.

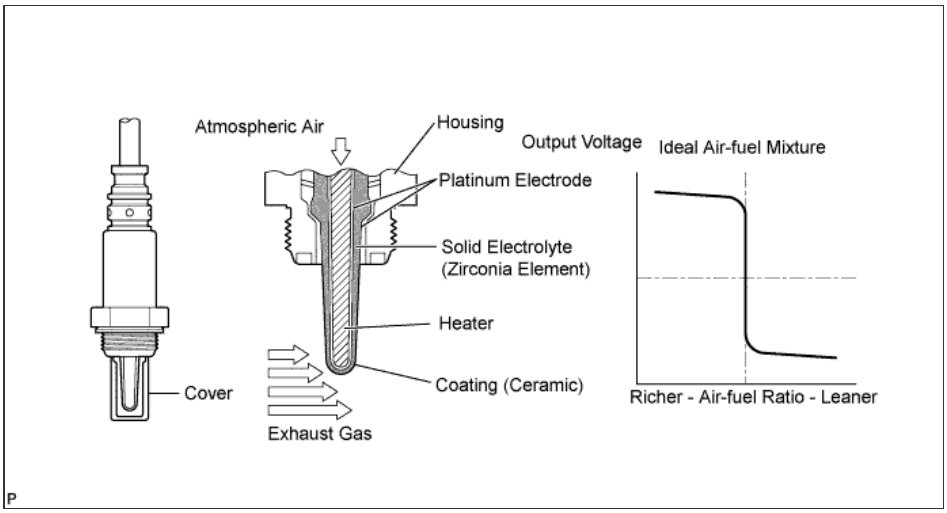
DTC P0158 Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)

for Preparation Click here

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

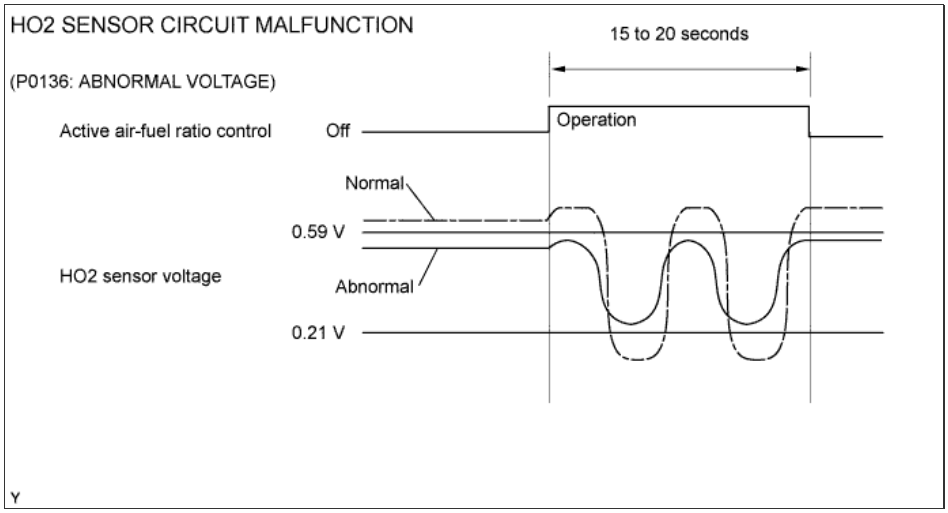
The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

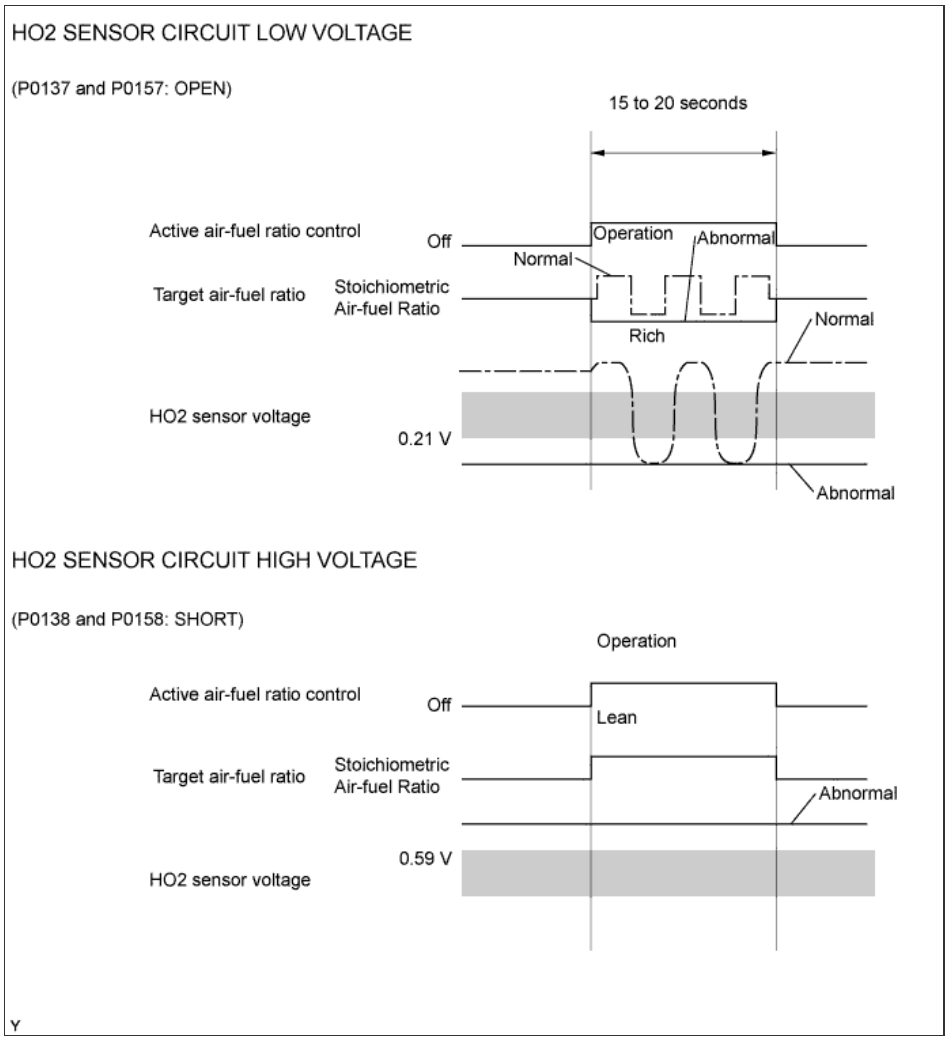
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

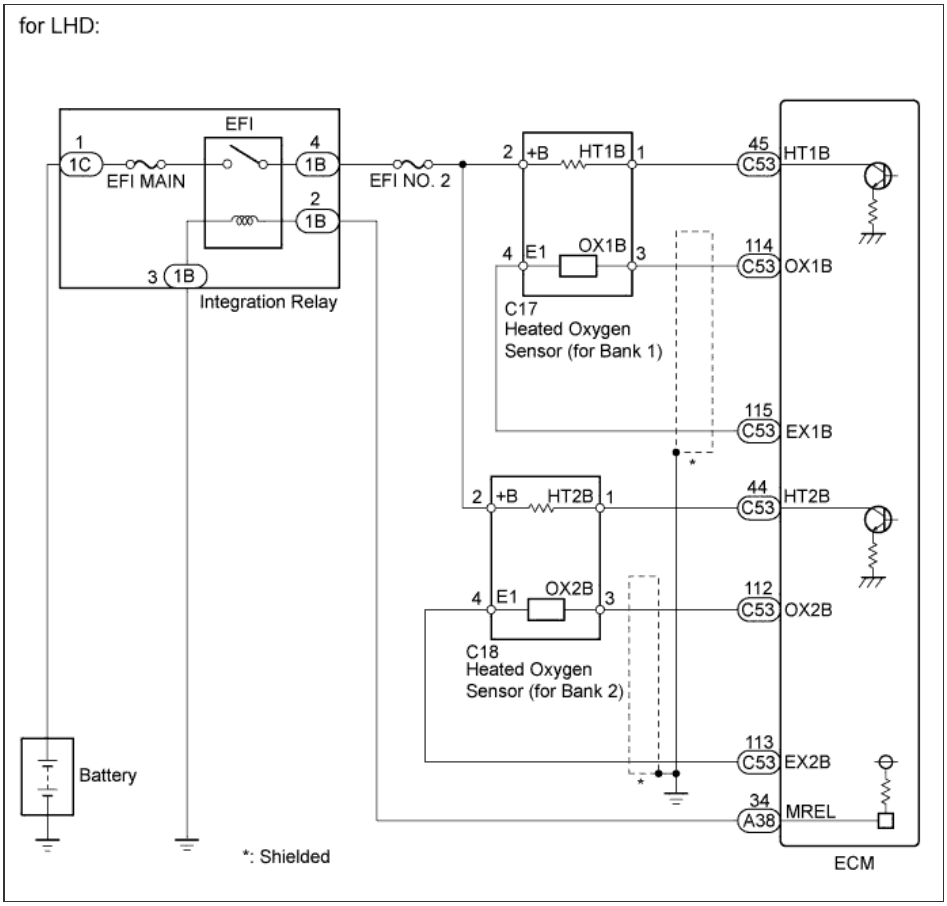
While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)

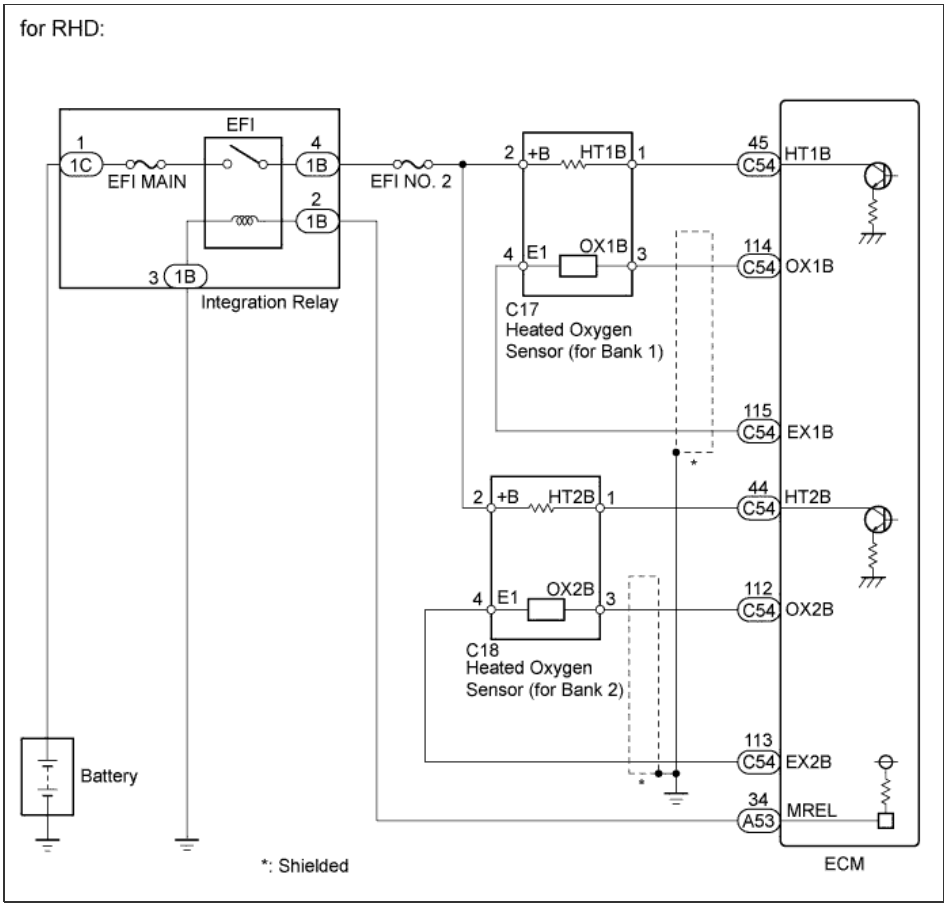


During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.



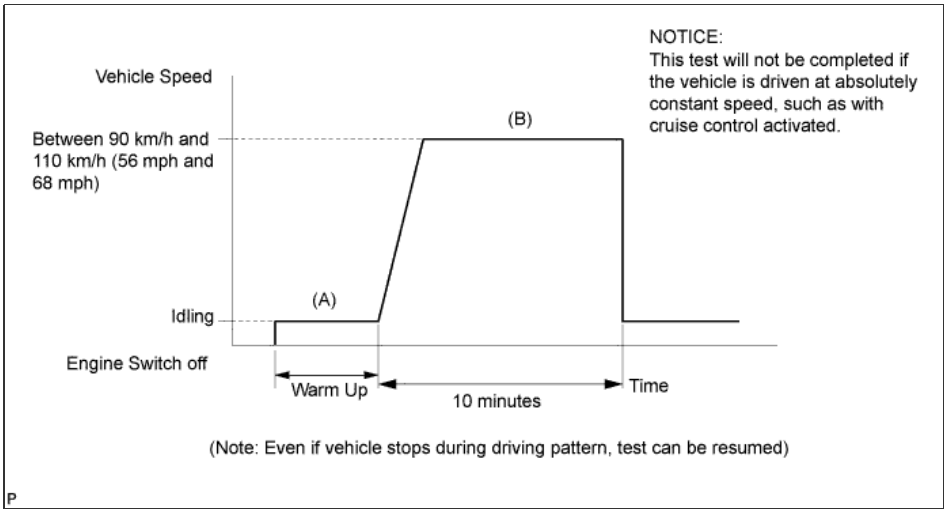
HINT:



DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

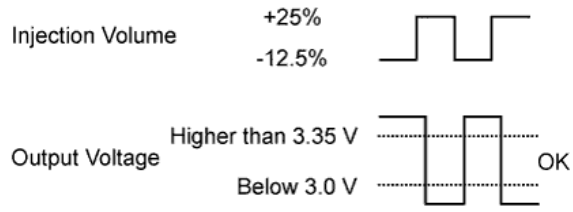
INSPECTION PROCEDURE

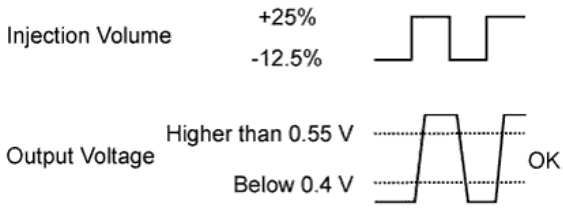
HINT:

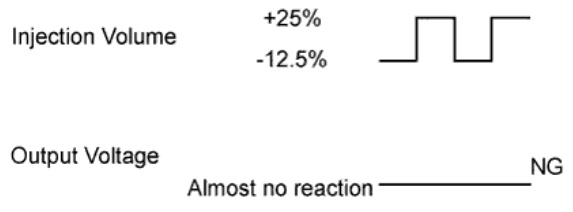
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

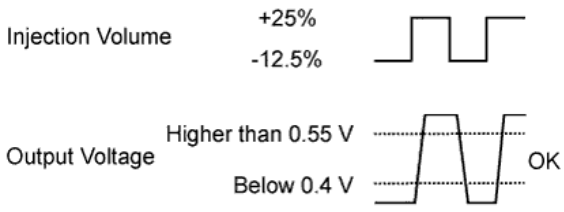
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

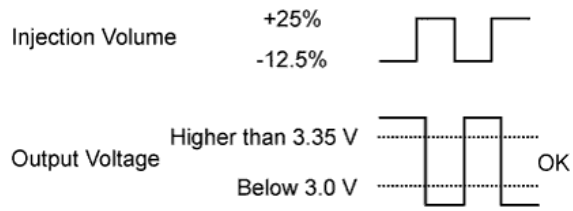
1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

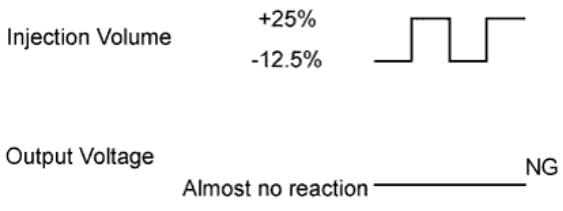












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

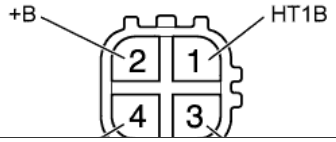
Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

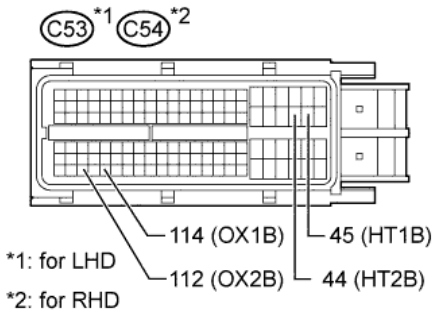
a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

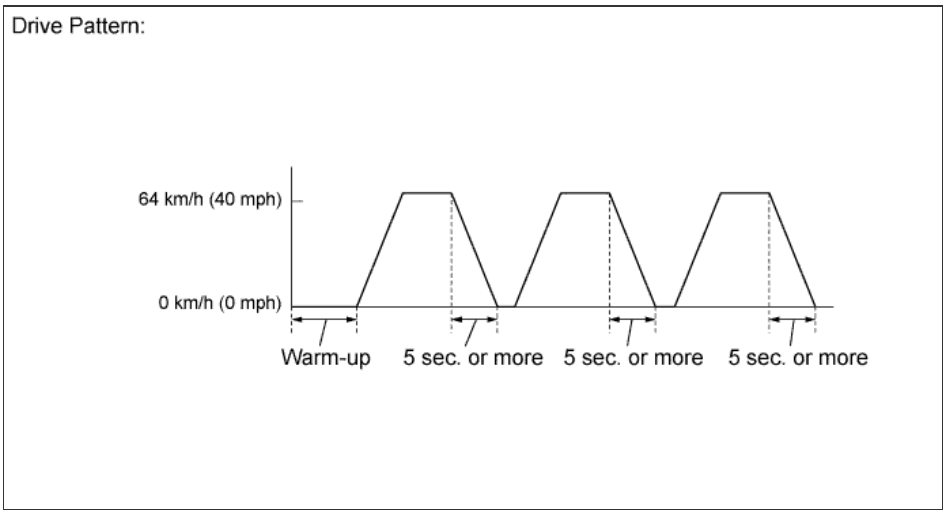
REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

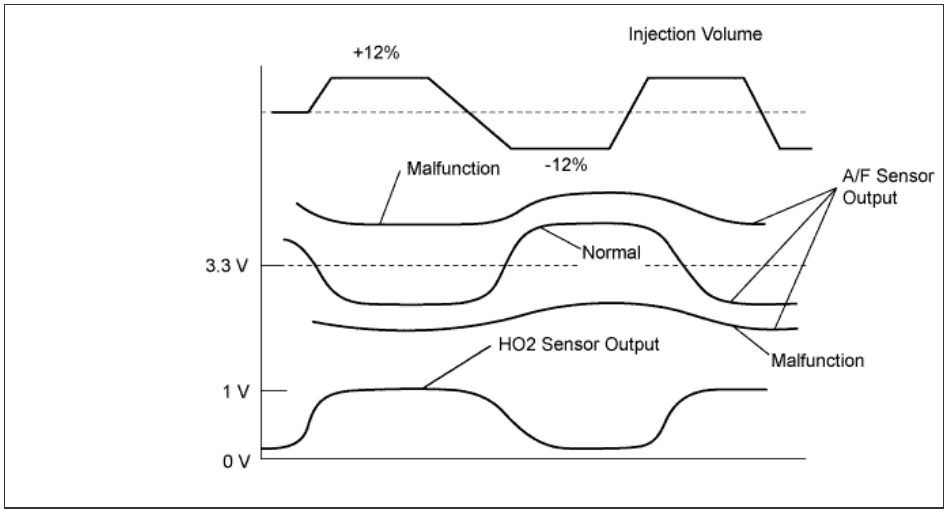
b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:



- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

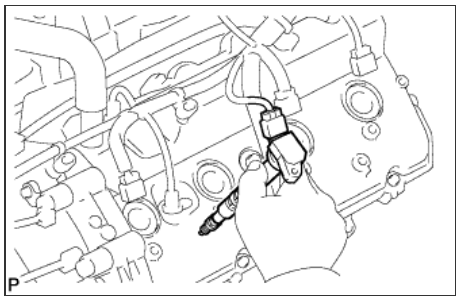
a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

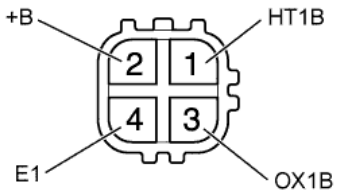
16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

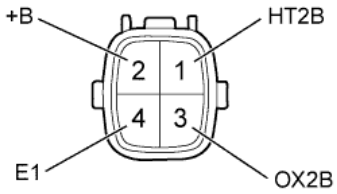
OK

17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

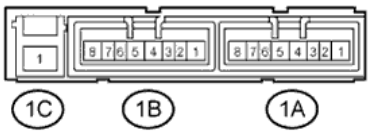
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

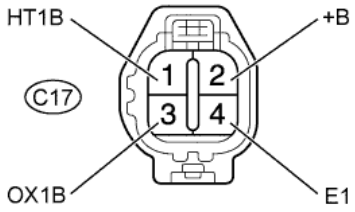
Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

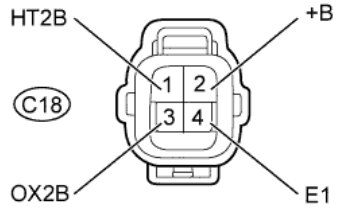
NG → REPLACE INTEGRATION NO.1 RELAY

OK



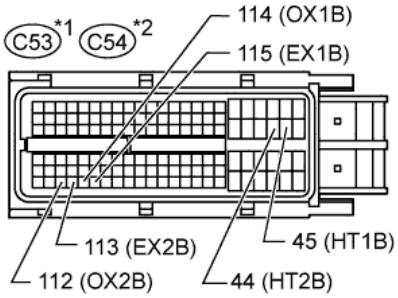
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



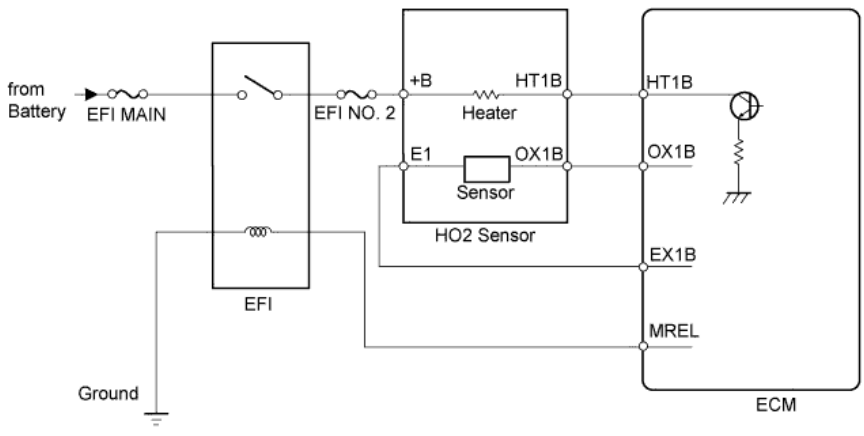
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)



Front view of wire harness connector:
(to ECM)

NEXT

23.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for at least 10 minutes.

e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

g. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

h. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern adding the vehicle speed and using the second gear to decelerate the vehicle.

OK:
No DTC is output.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK → REPAIR COMPLETE

DTC P2119 Throttle Actuator Control Throttle Body Range / Performance

for Preparation Click here

DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P2119	The throttle valve opening angle continues to vary greatly from the target opening angle (1 trip detection logic).	• ETCS • ECM

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2119 is output	A
P2119 and other DTCs are output	B

HINT:

If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Allow the engine to idle for 15 seconds.

g. Fully depress and release the accelerator pedal several times quickly.

h. Enter the following menus: Powertrain / Engine and ECT / DTC.

i. Read DTCs.

OK:
No DTC is output.

HINT:

The output voltage of the throttle position sensor can be checked using the tester. Variations in the output voltage indicate that the throttle actuator is in operation. To check the output voltage using the tester, enter the following menus: Powertrain / Engine and ECT / ETCS / Throttle Position No. 1.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

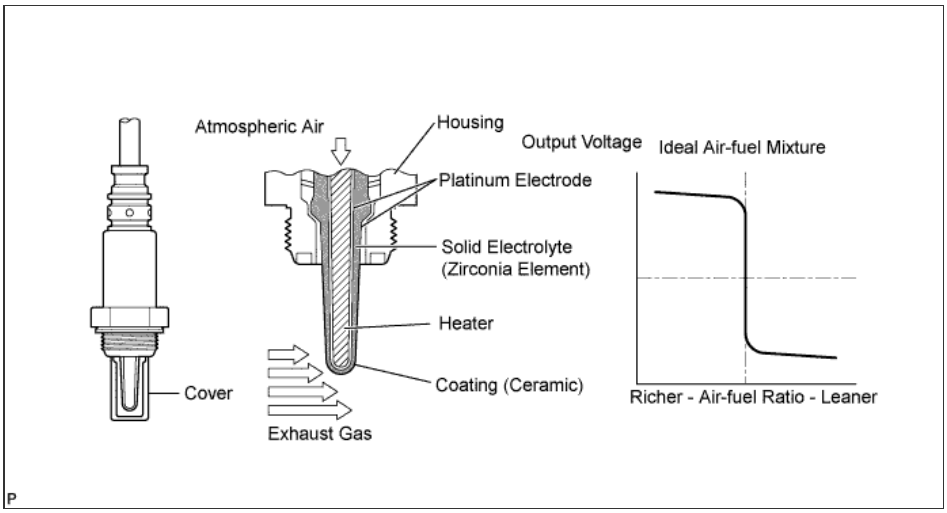
DTC P0158 Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)

for Preparation Click here

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

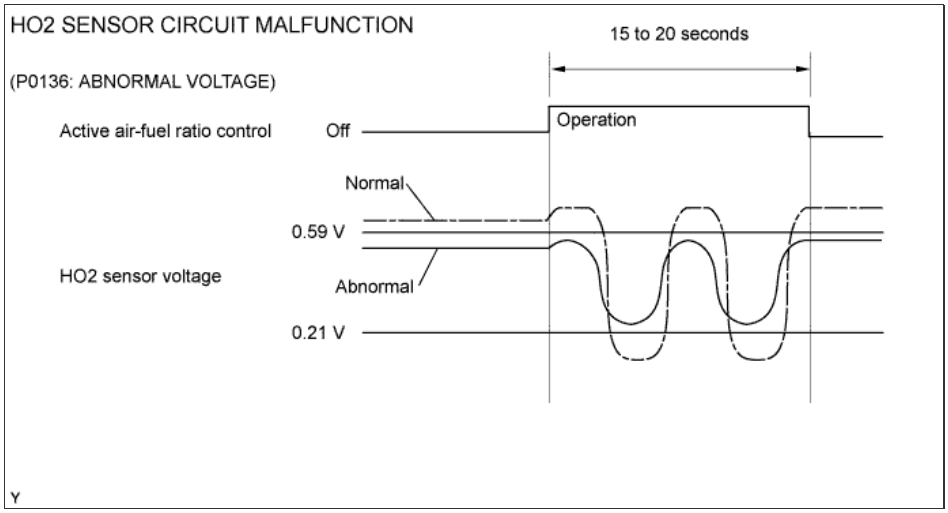
*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

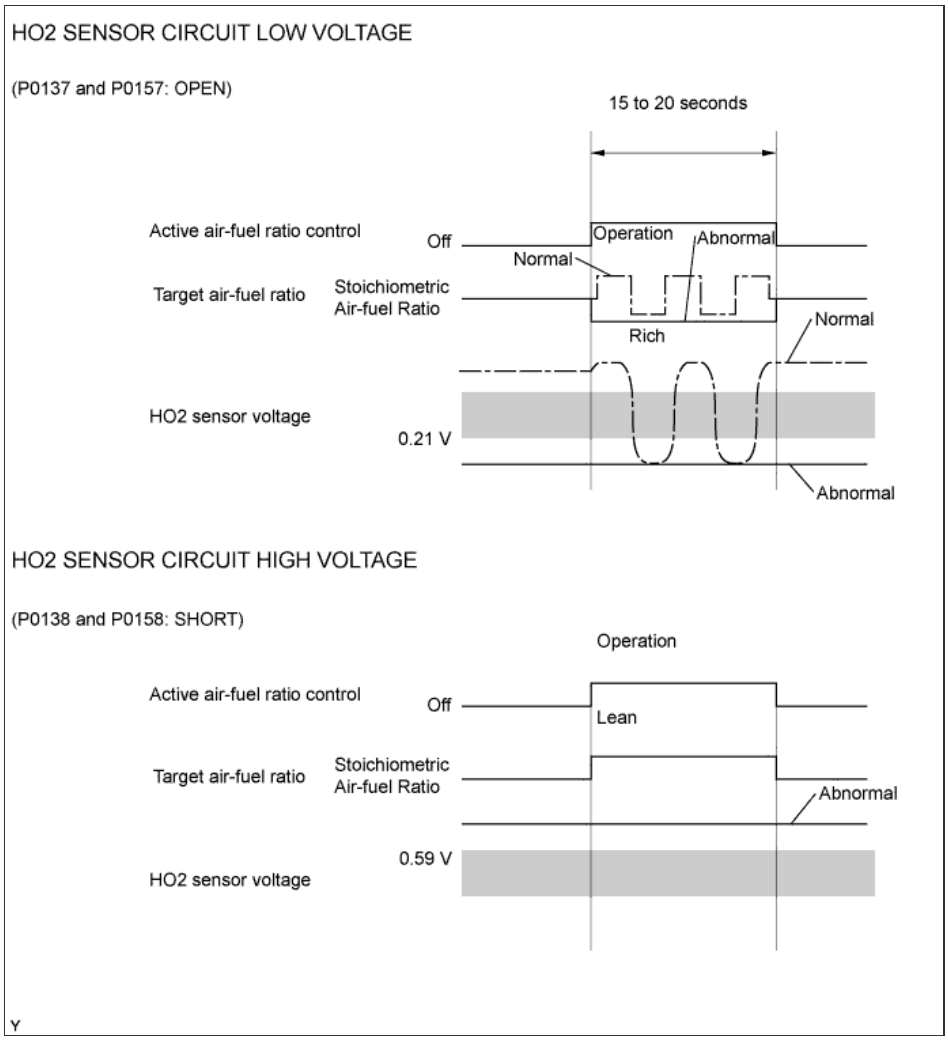
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

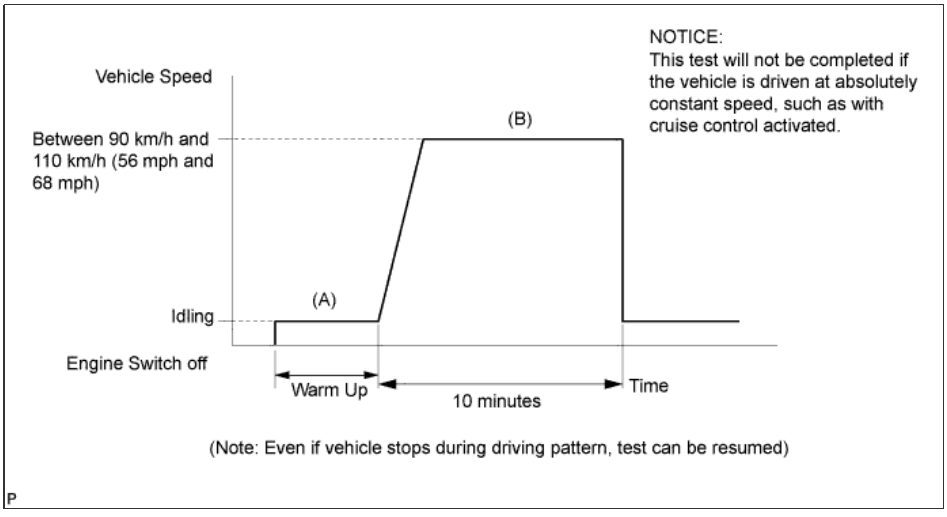
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

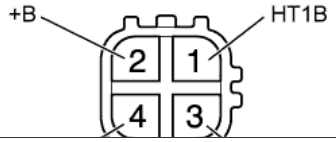
Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

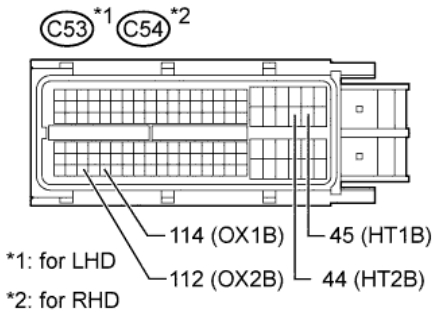
a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

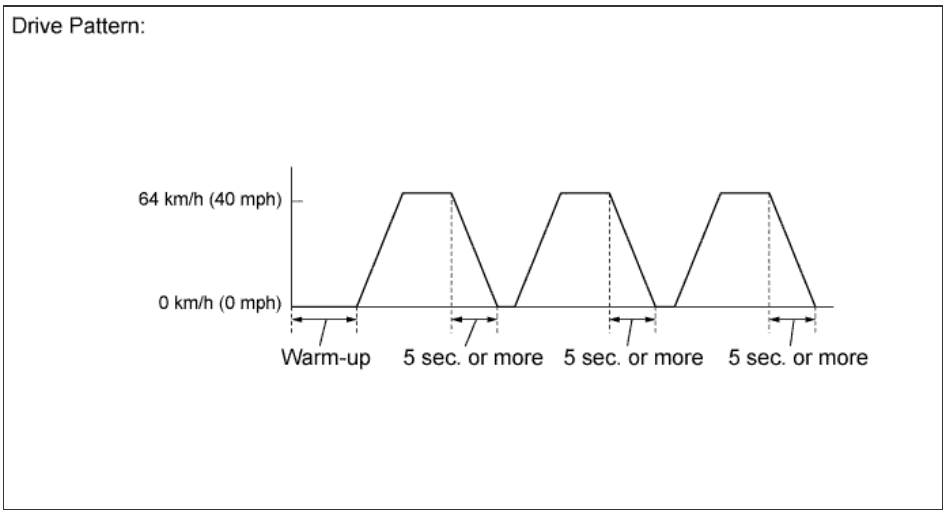
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

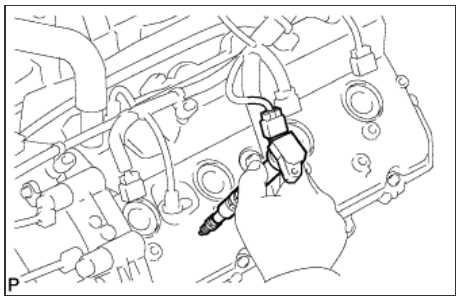
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

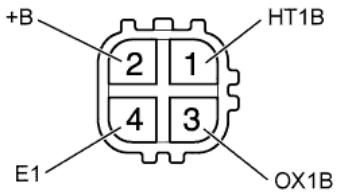
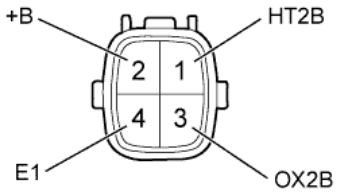
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

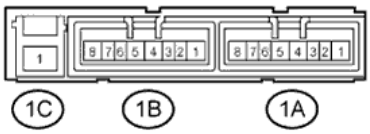
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

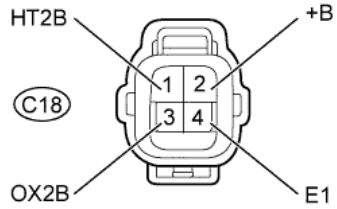
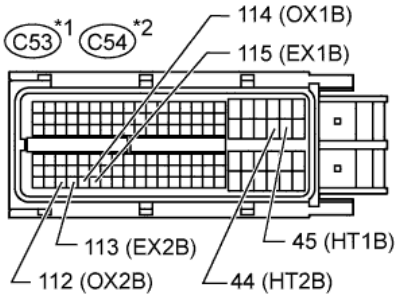
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



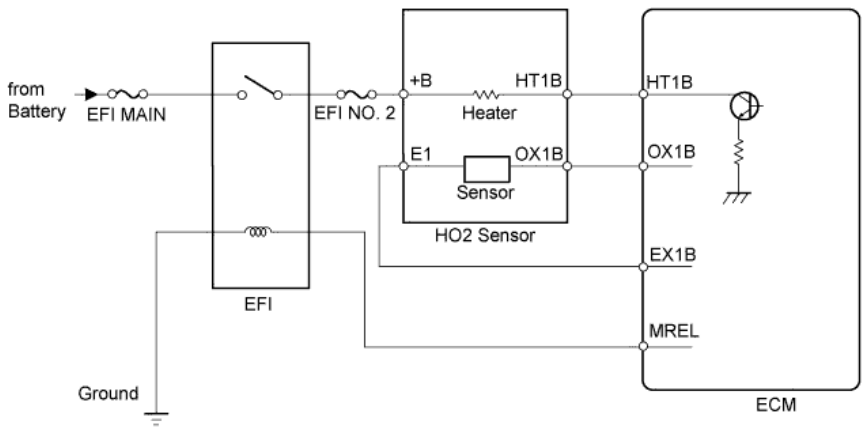
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)



Front view of wire harness connector:
(to ECM)

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

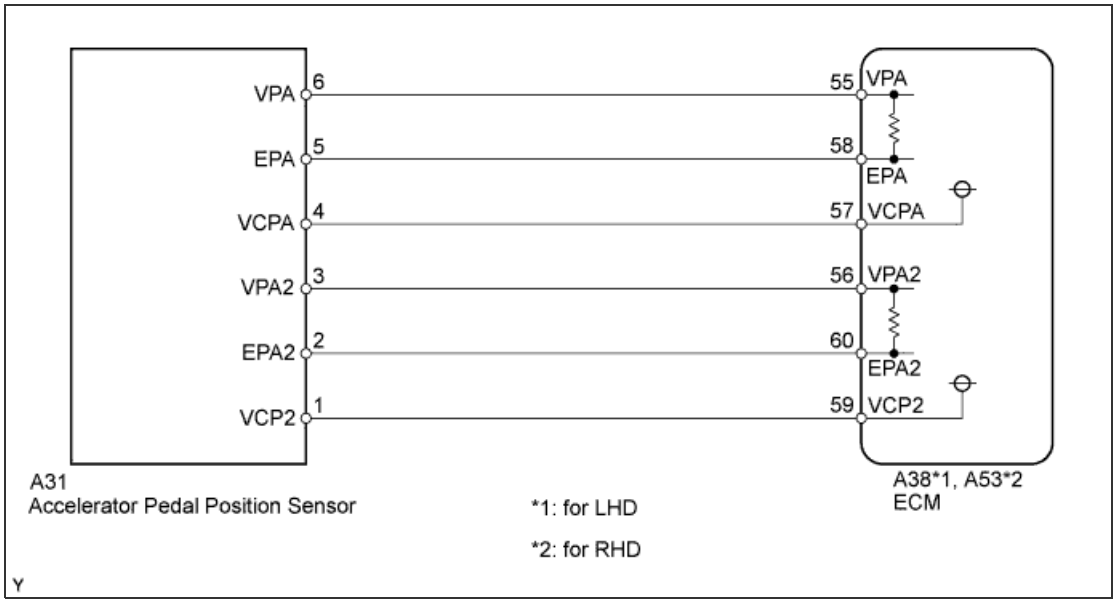
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

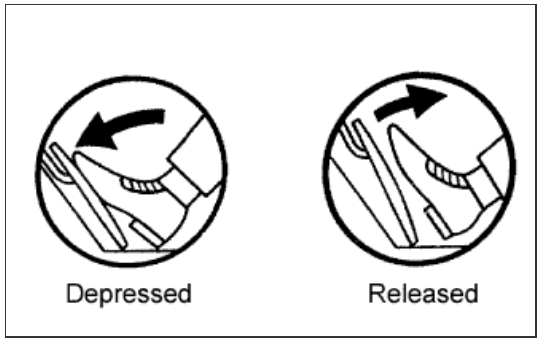
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

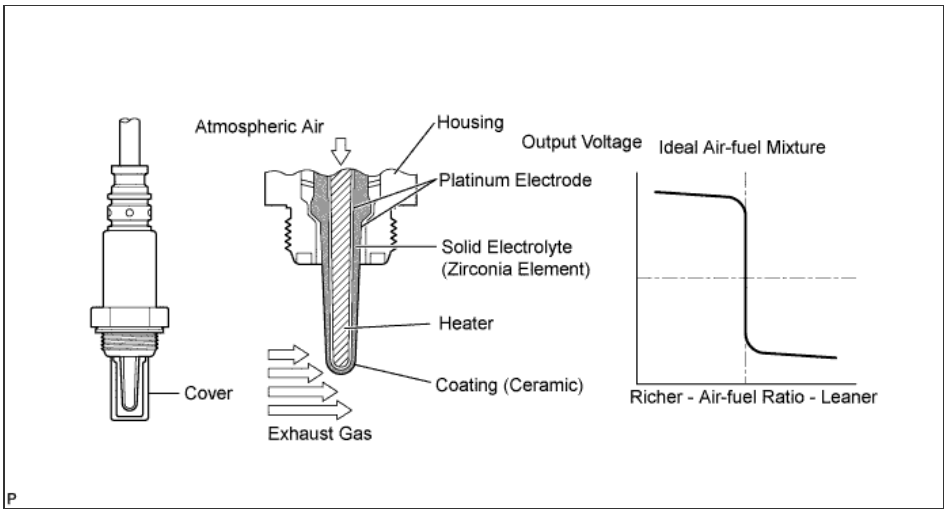
DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

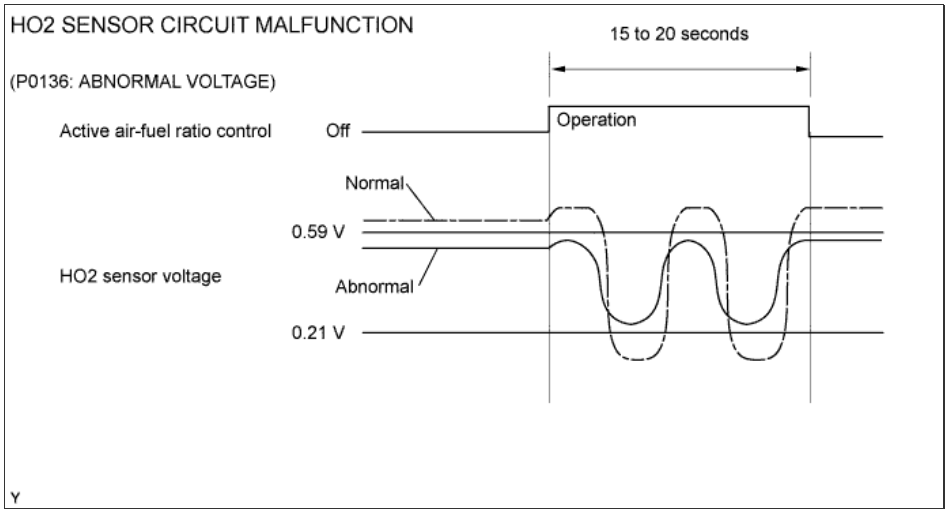
*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

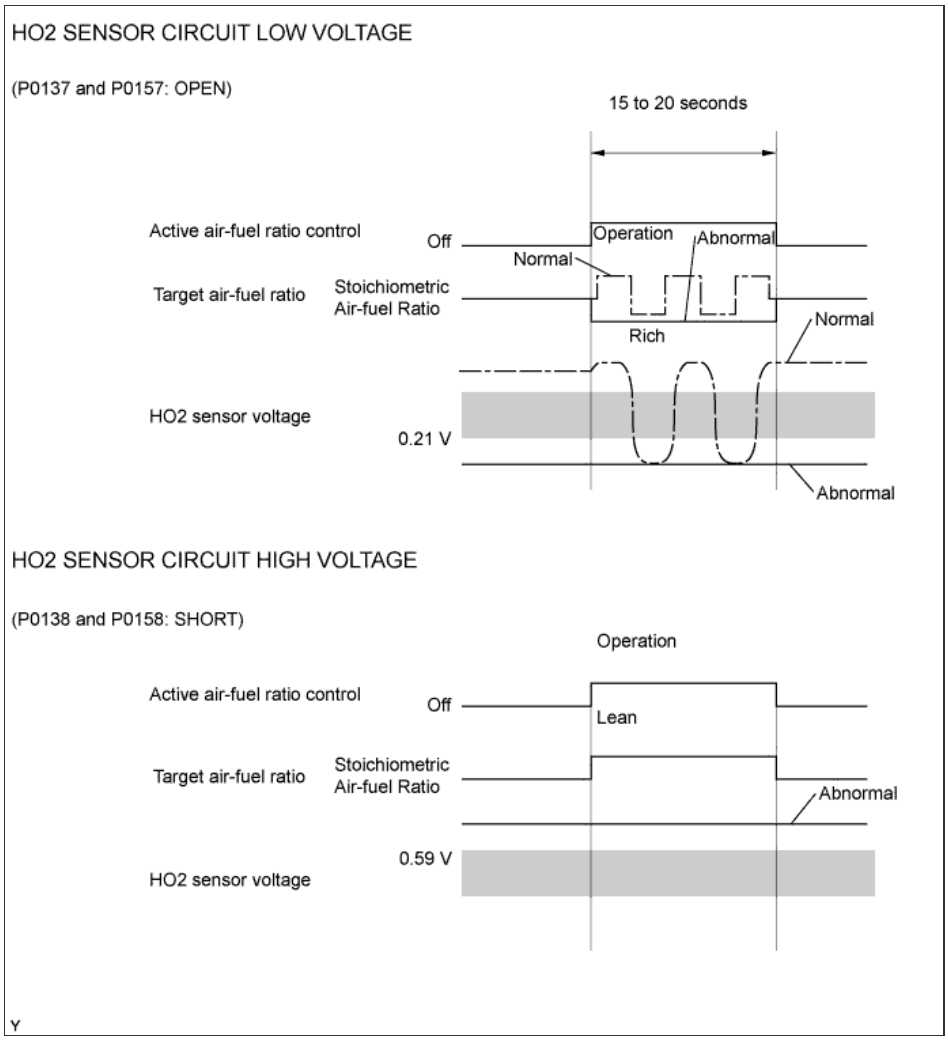
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

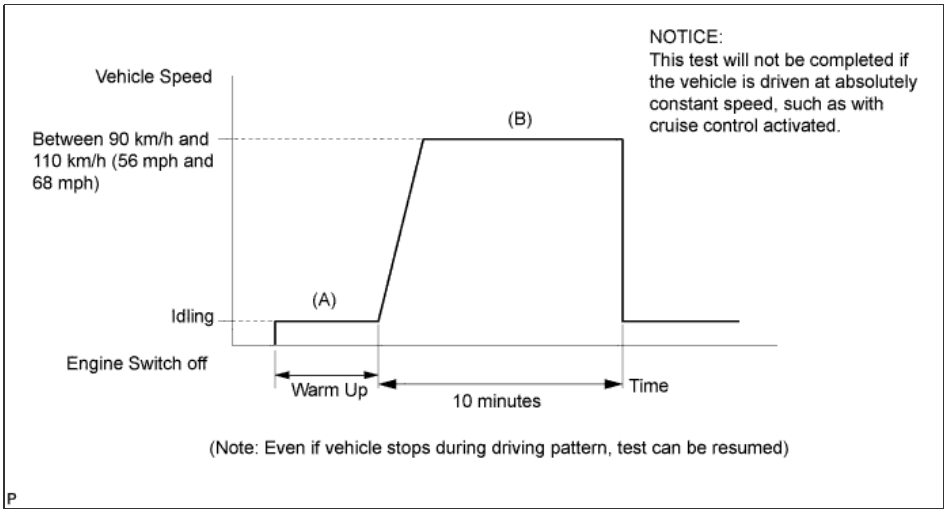
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

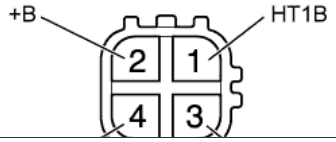
Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
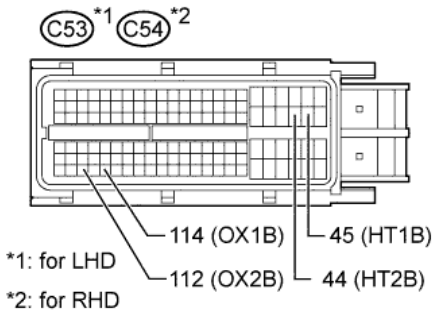
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

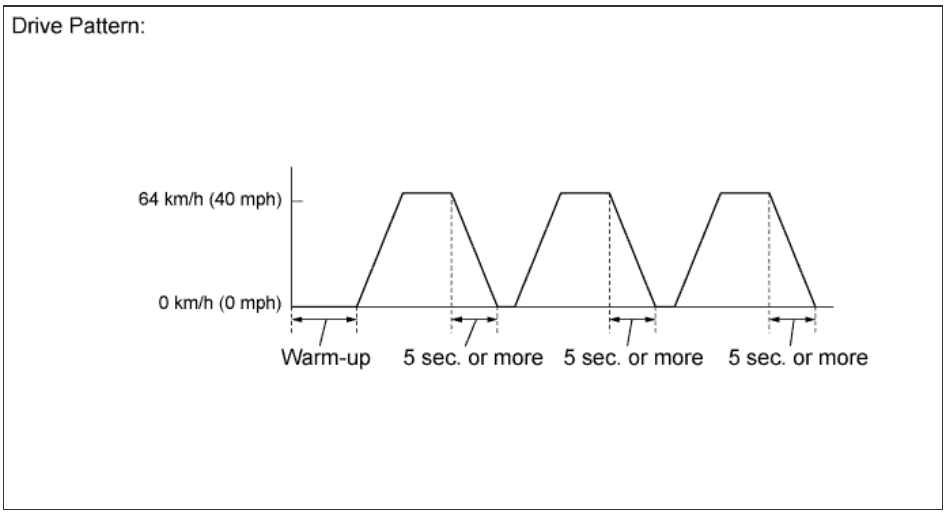
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

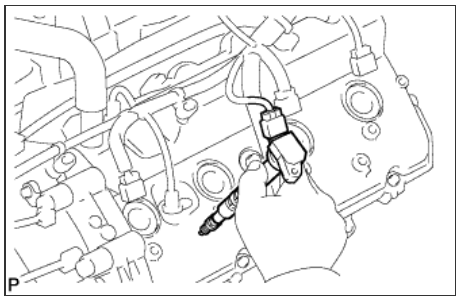
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

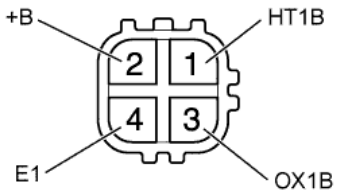
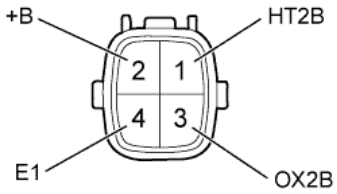
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
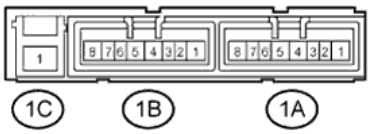
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

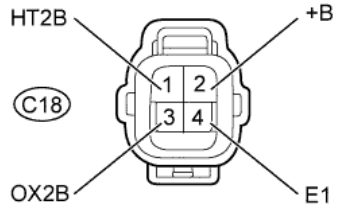
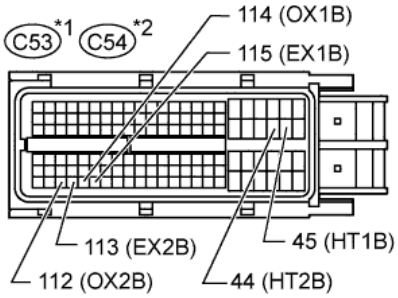
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



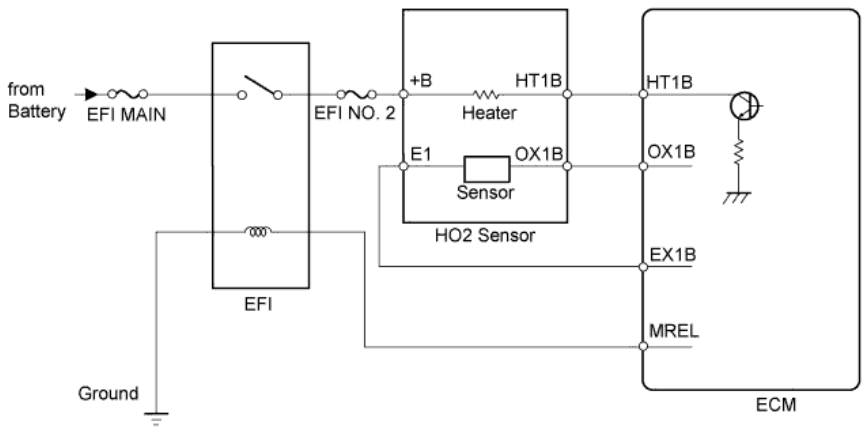
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)



Front view of wire harness connector:
(to ECM)

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

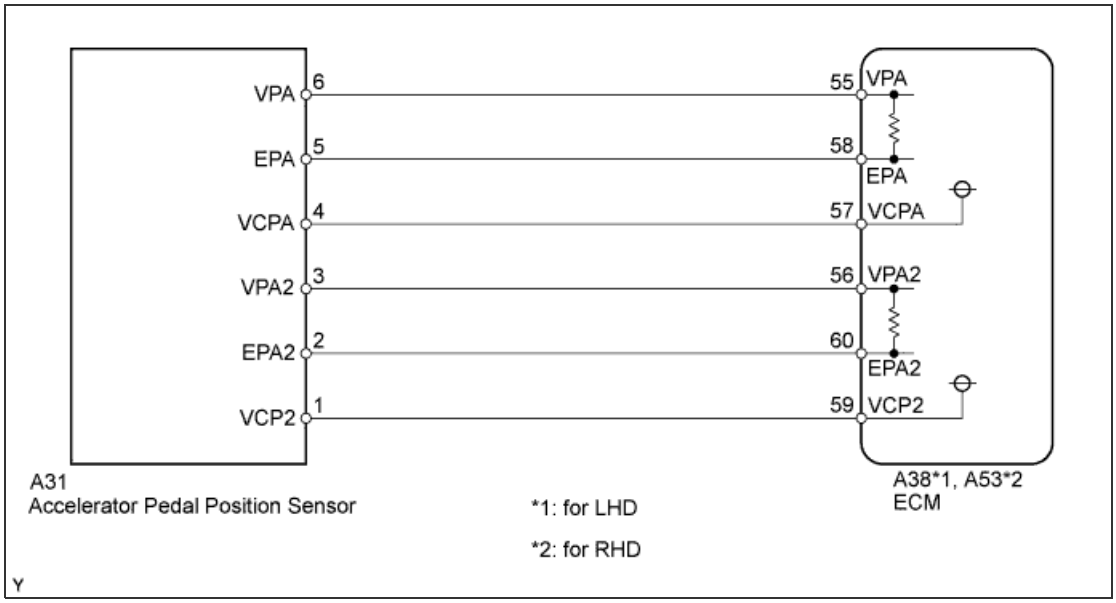
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

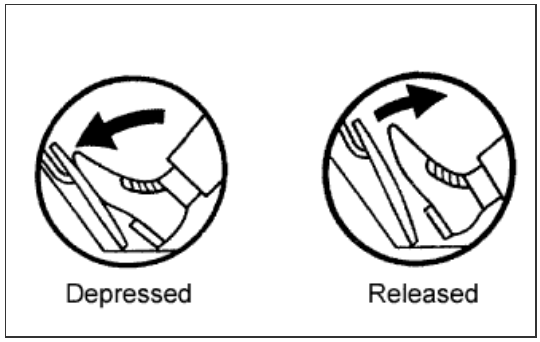
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

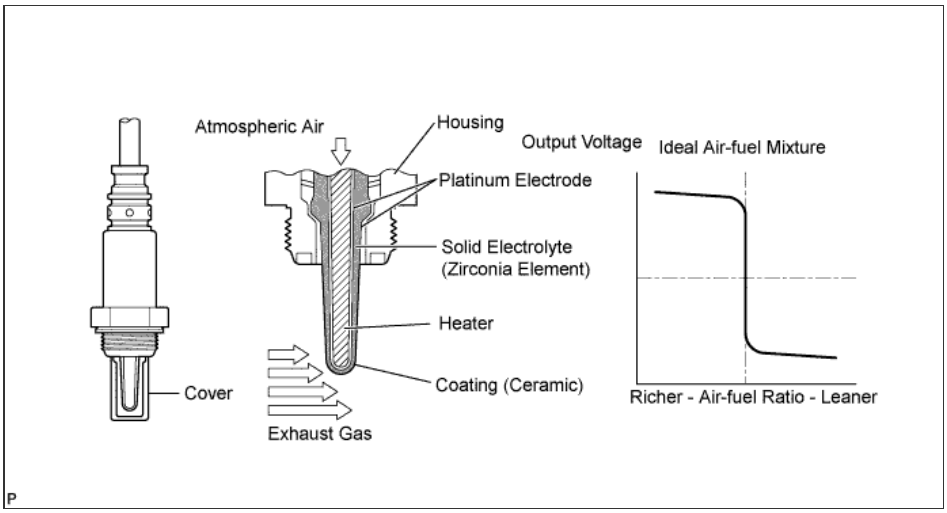
DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

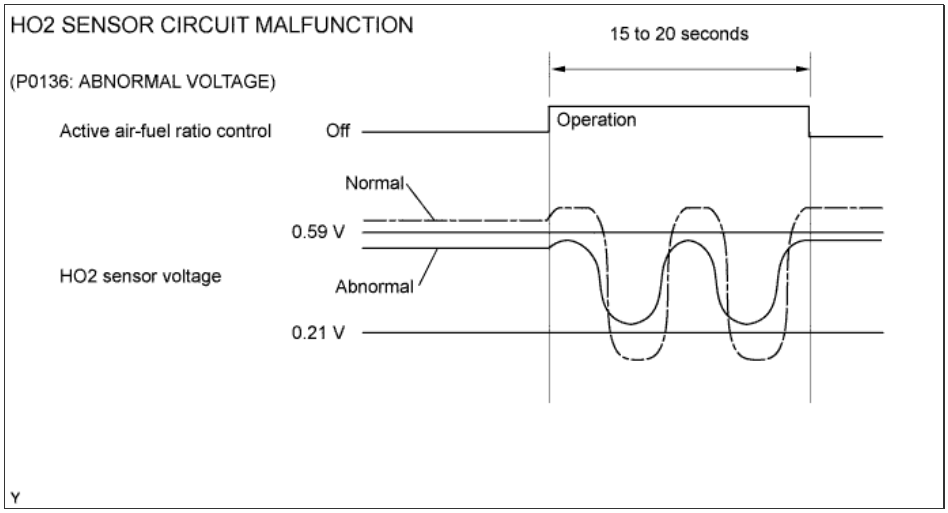
*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

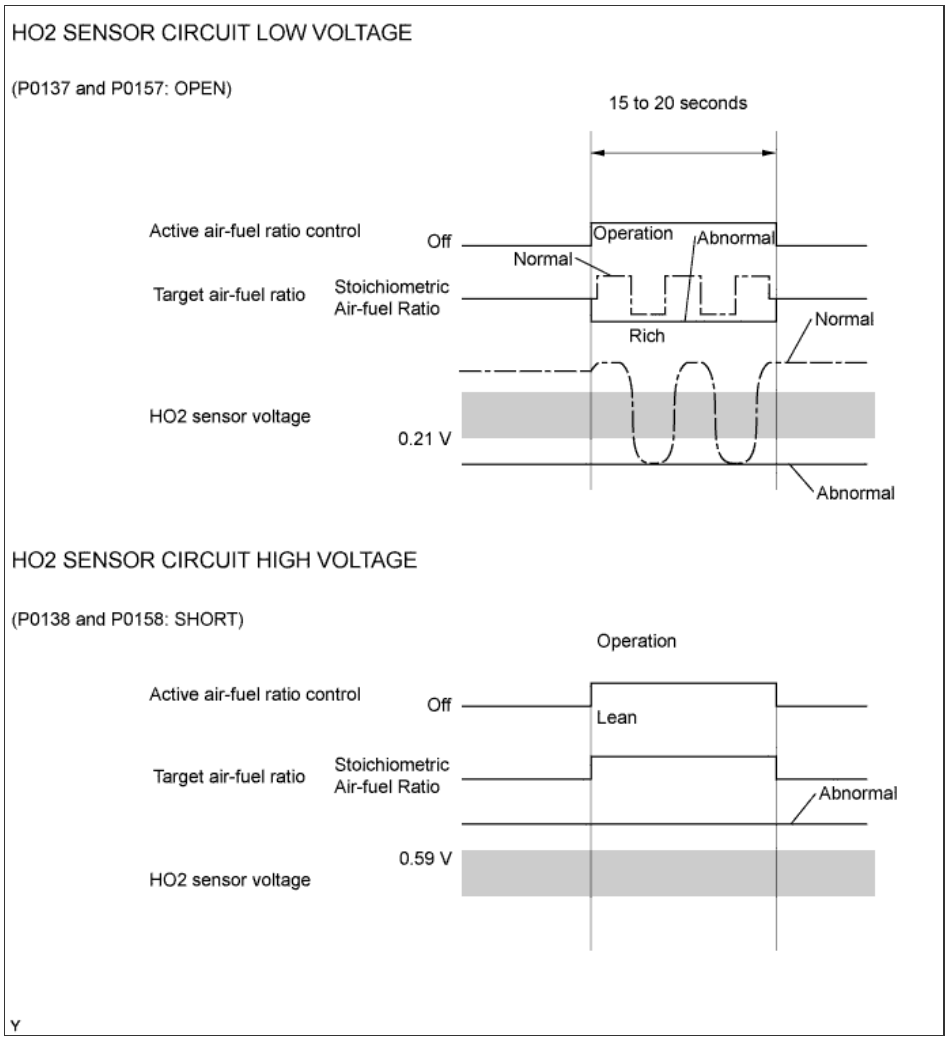
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

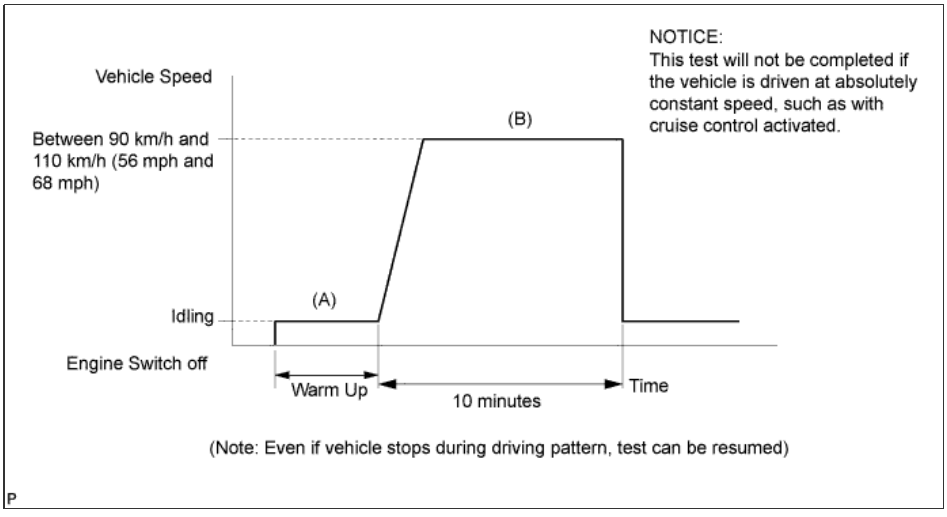
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
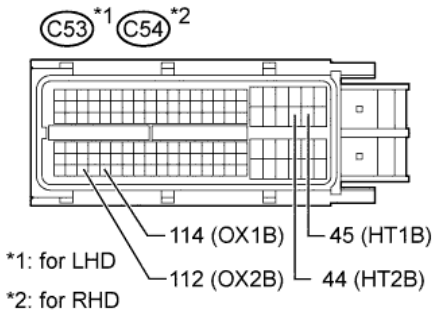
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

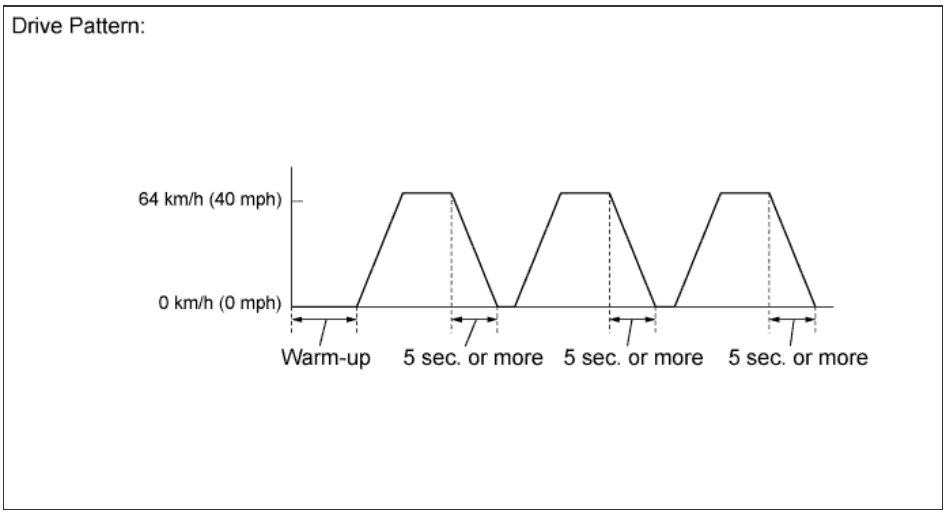
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

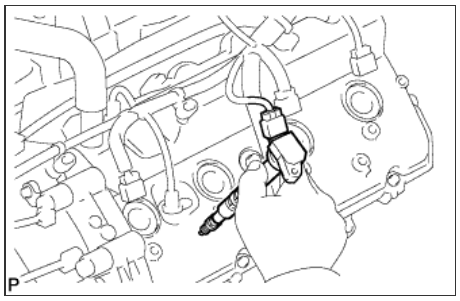
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

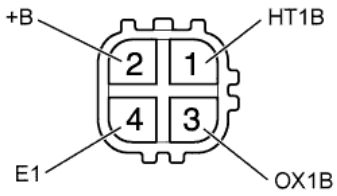
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
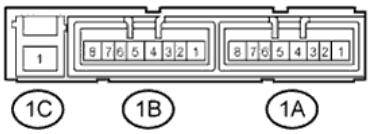
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

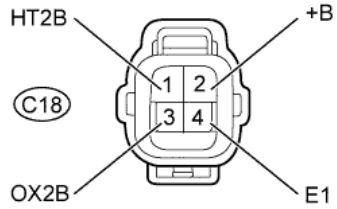
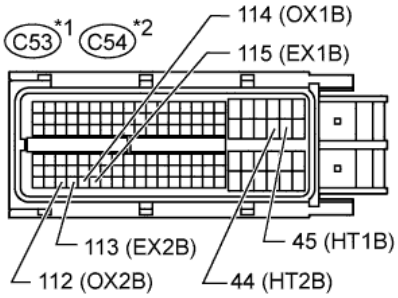
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



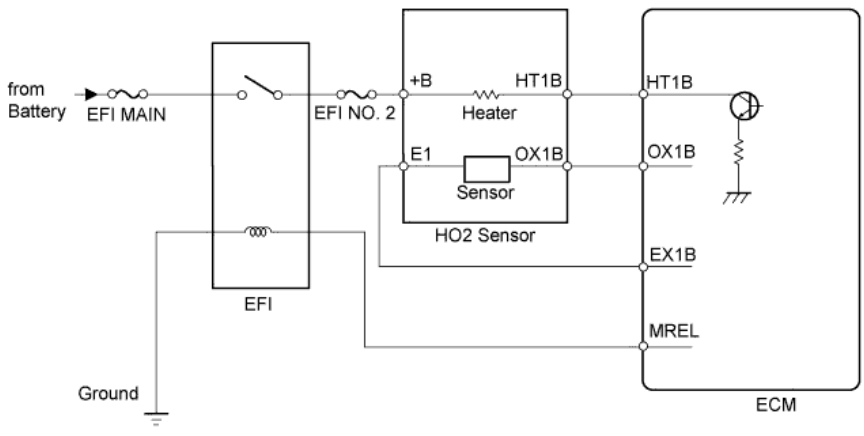
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)



Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Reference (System Diagram):

Y

Tester Connection	Switch Condition	Specified Condition
C17-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C18-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C53 or C54 ECM connector.

e. Measure the resistance according to the value(s) in the table below.

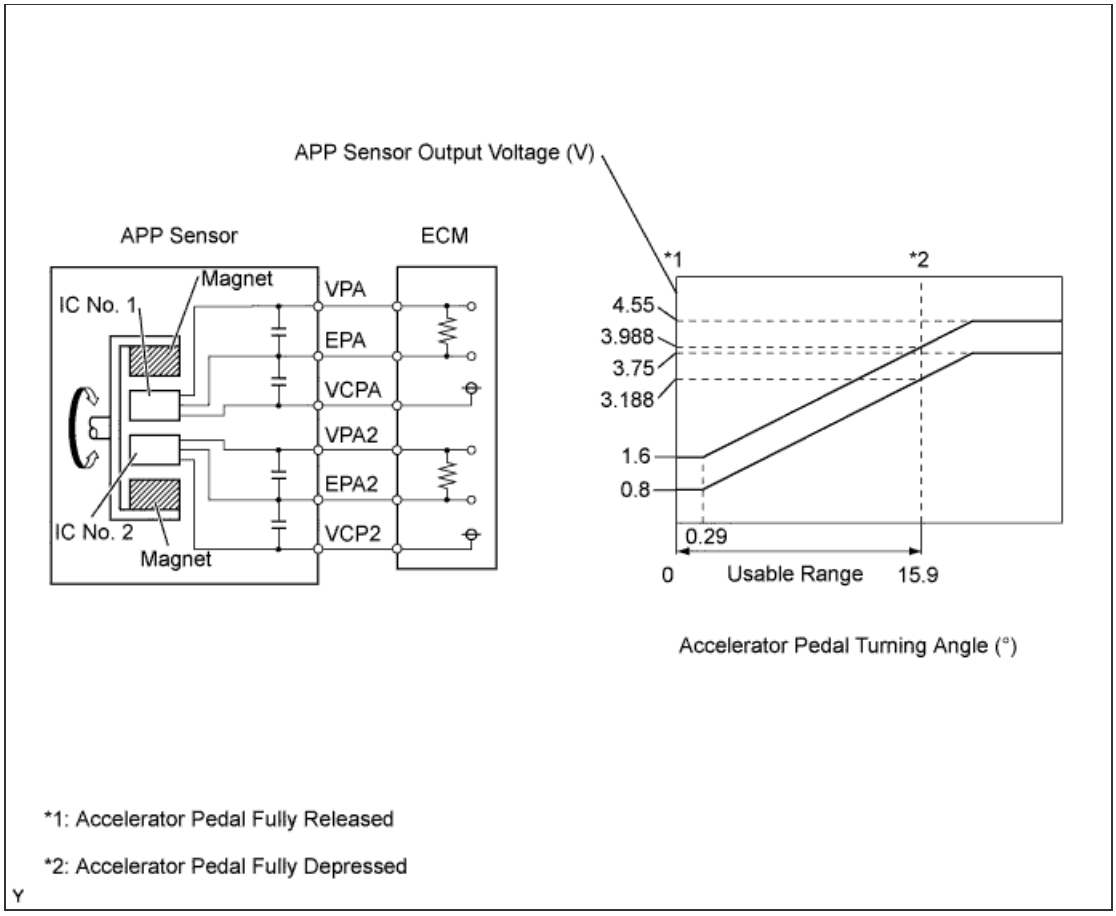
DTC P2138 Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation

for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

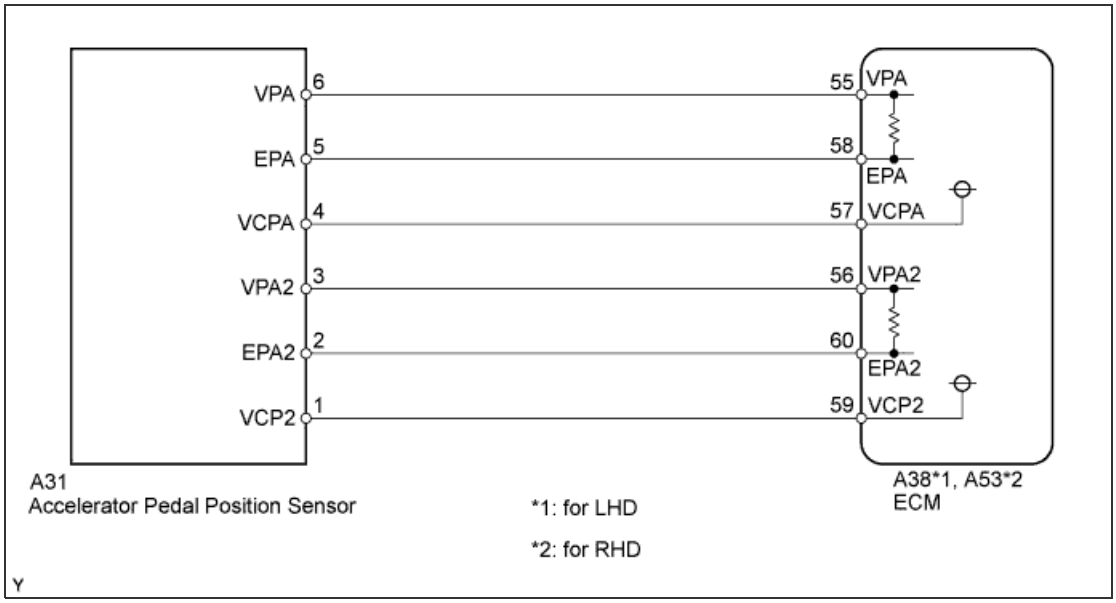
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

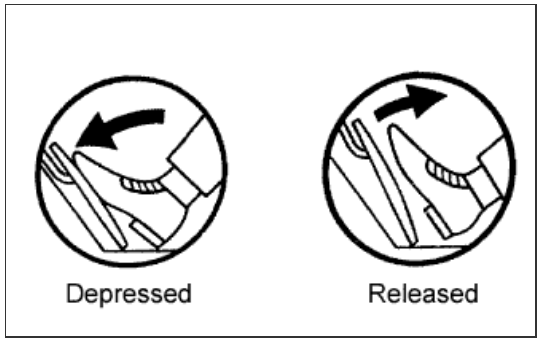
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

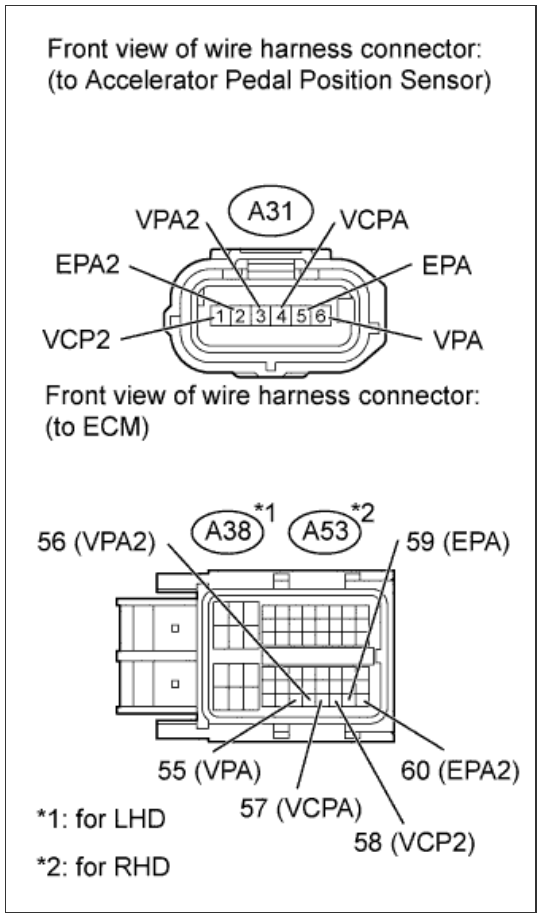
Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

Result

Result	Proceed to
NG	A
OK	B

B → Go to step 5



A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 or A53 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A53-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A53-58 (EPA)	Always	Below 1 Ω

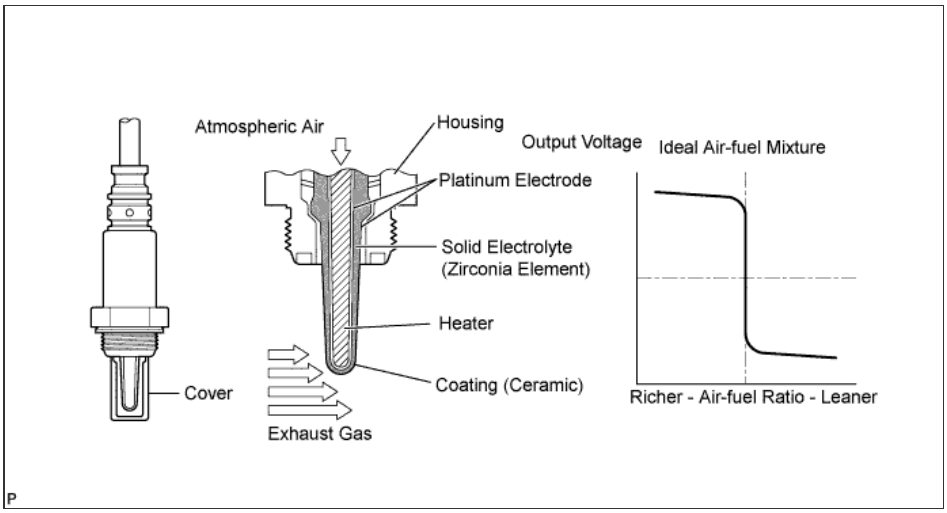
DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

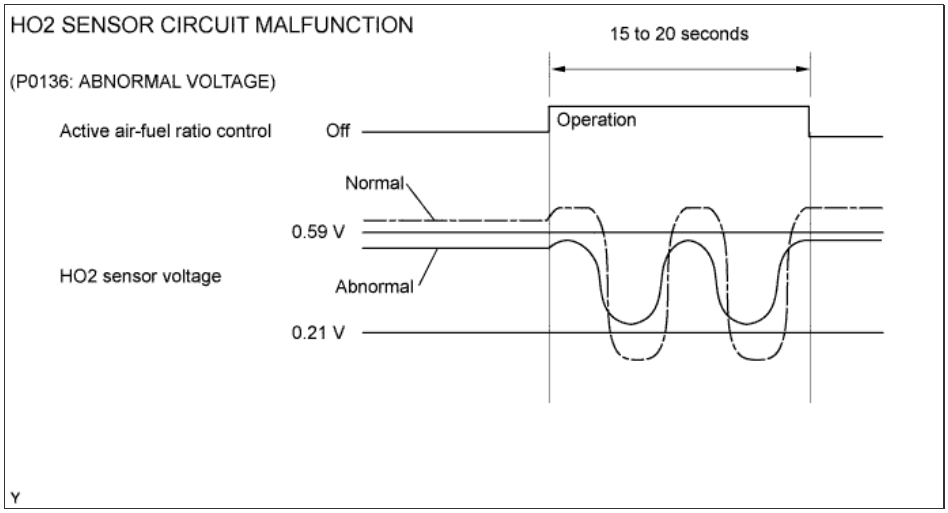
*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

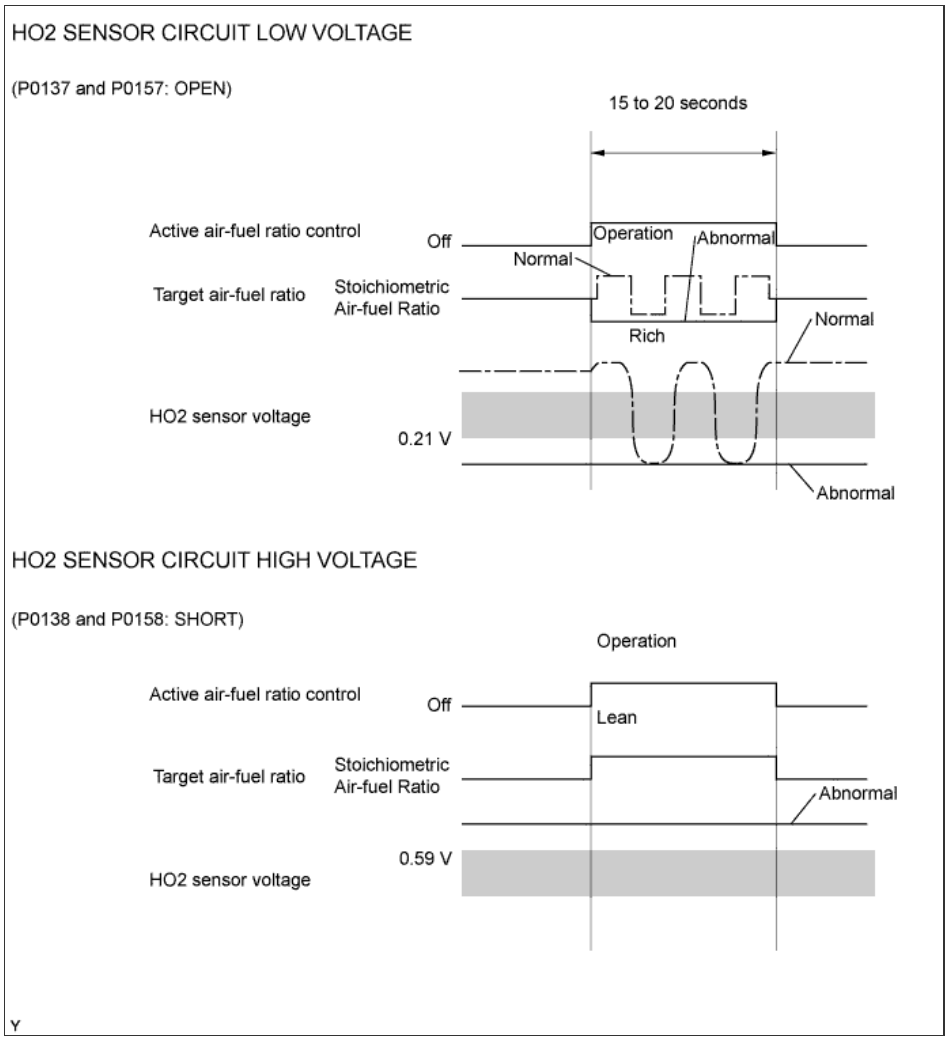
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

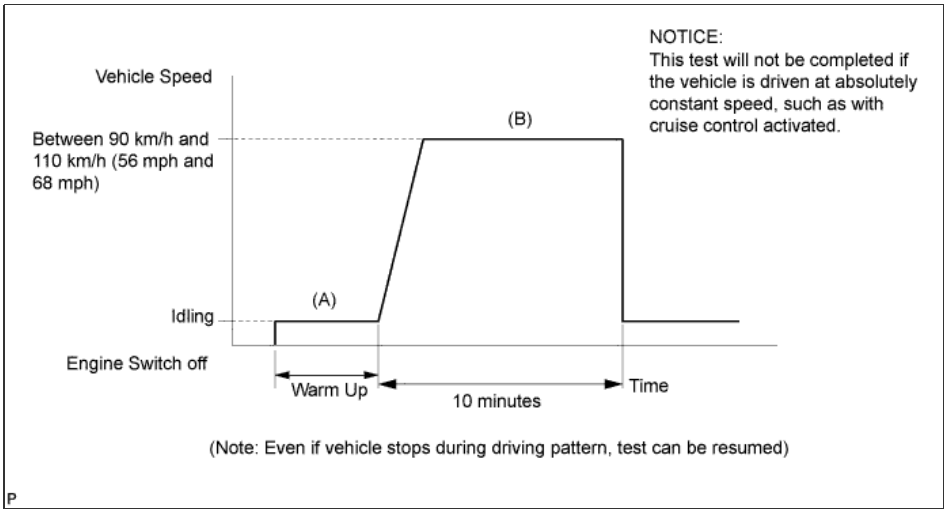
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
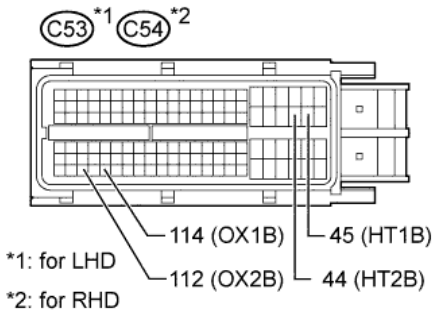
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

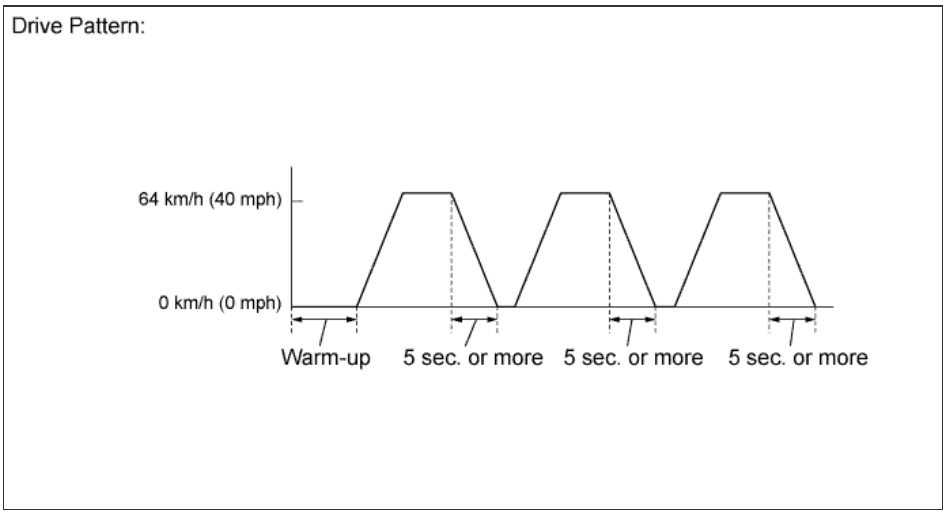
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

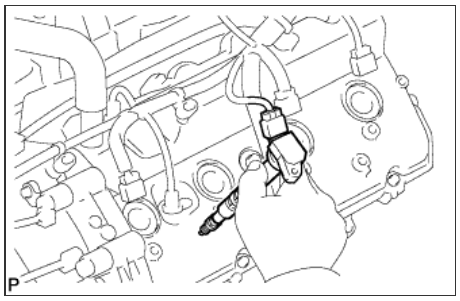
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

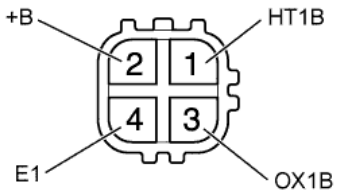
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
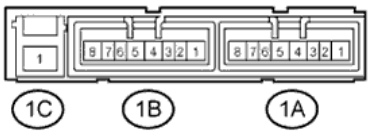
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

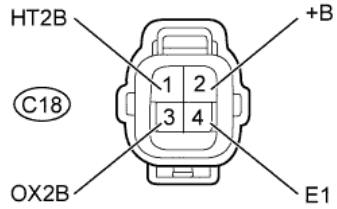
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

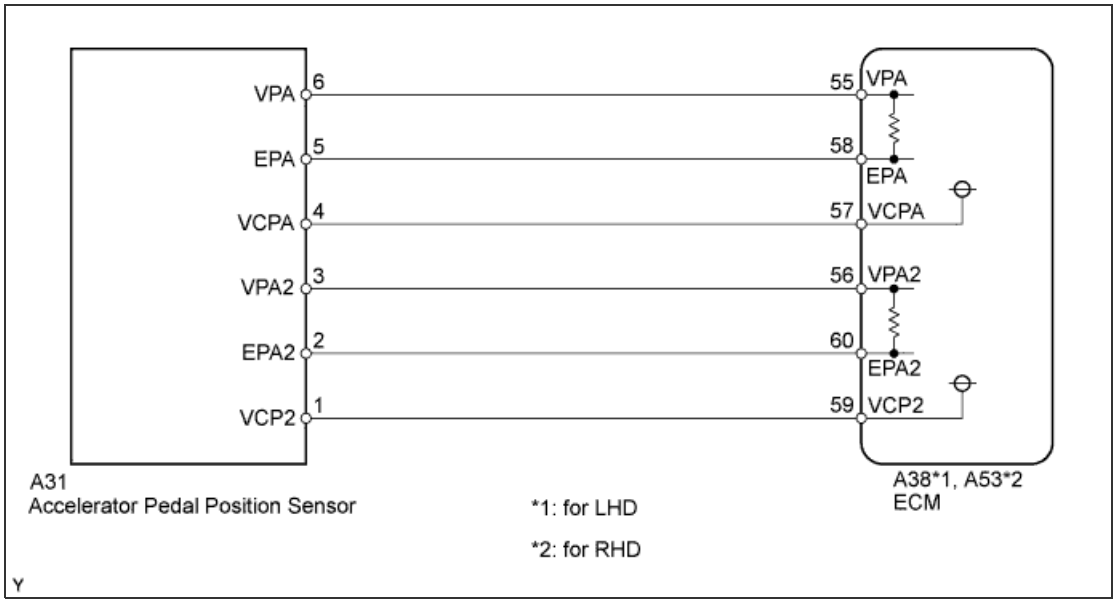
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

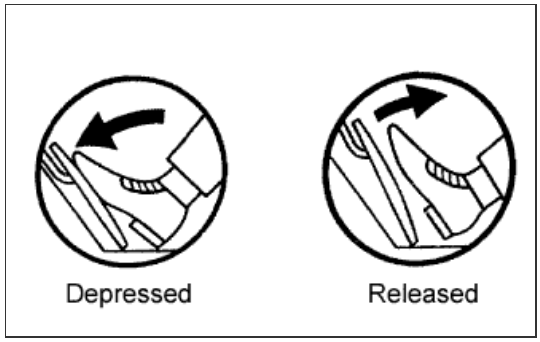
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

Result

Result	Proceed to

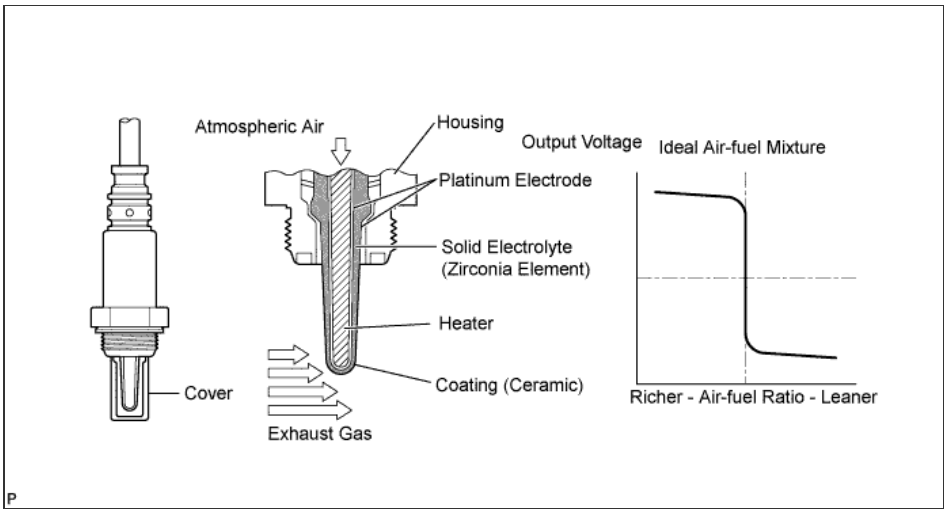
DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

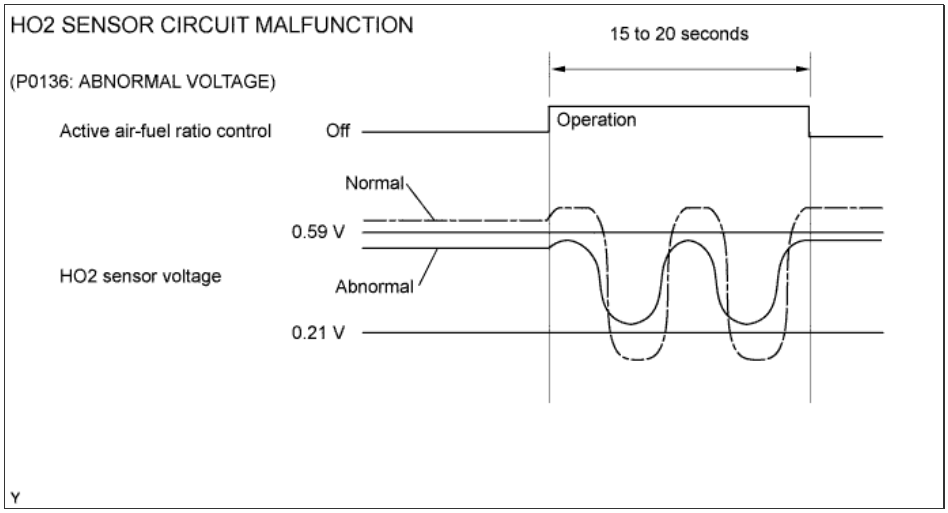
*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

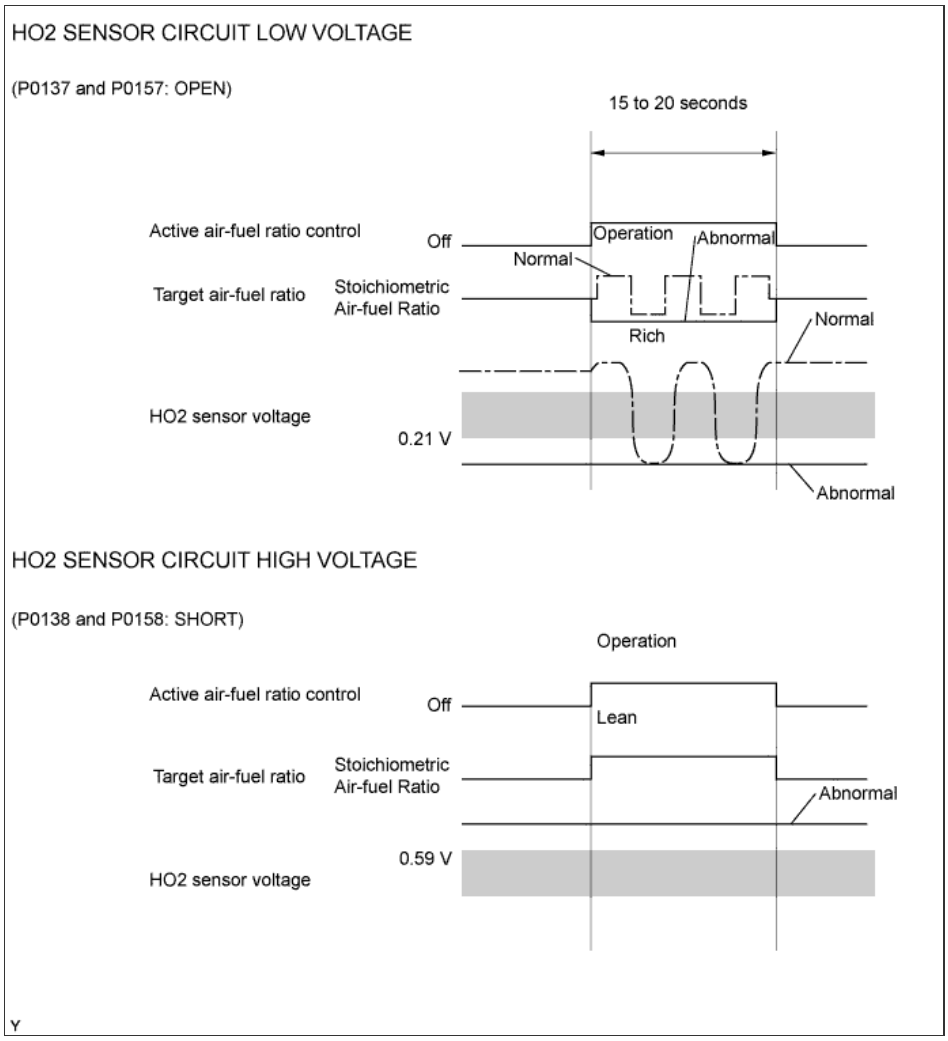
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

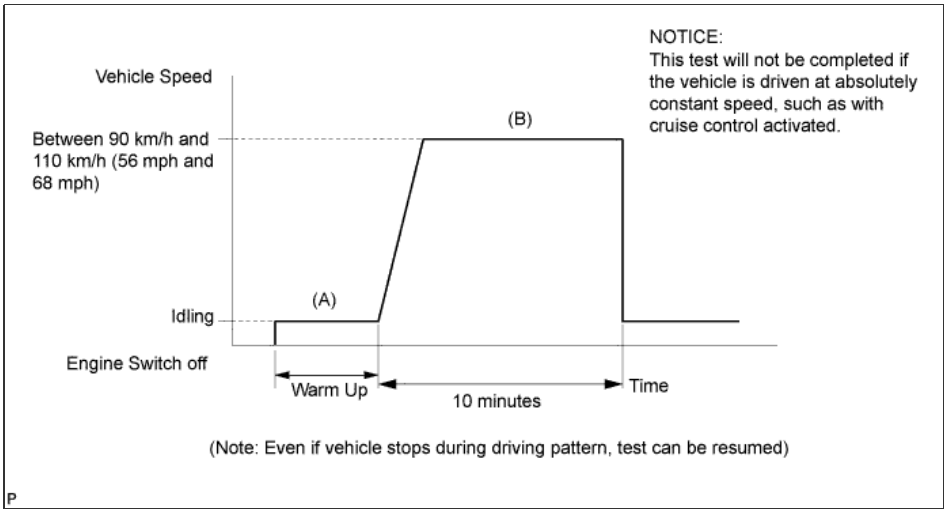
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
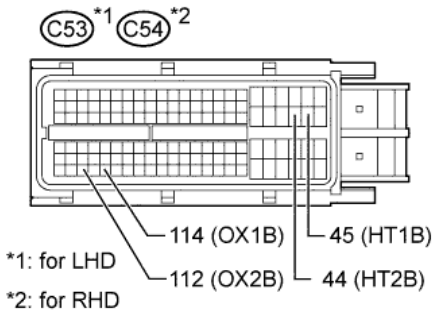
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

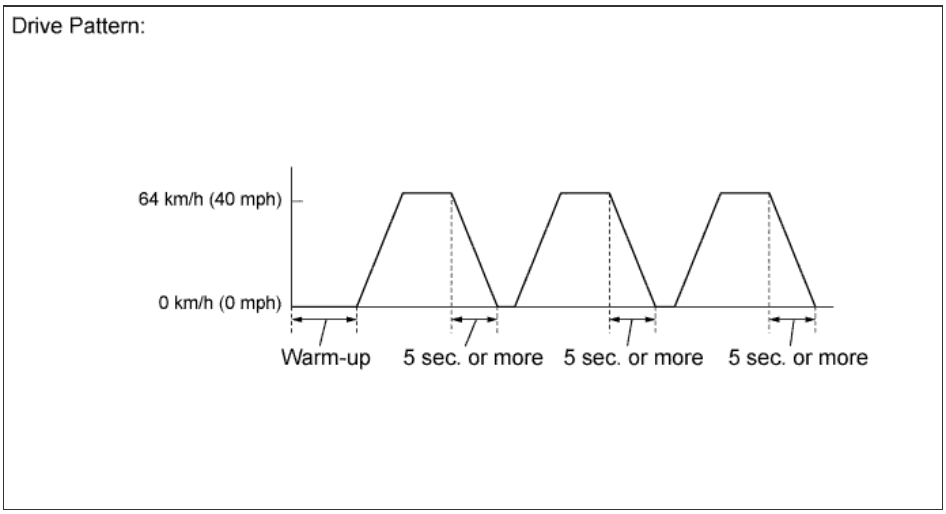
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

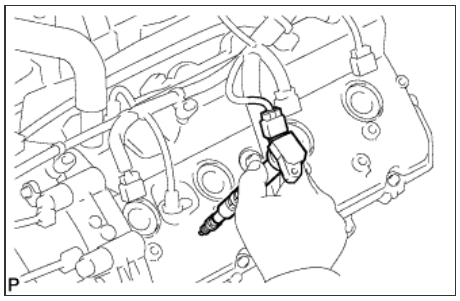
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

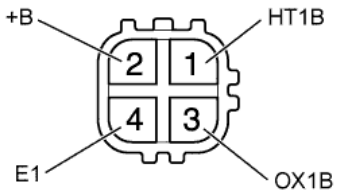
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
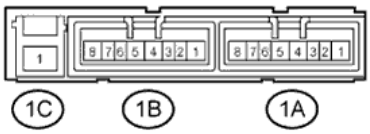
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

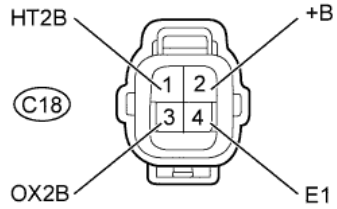
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

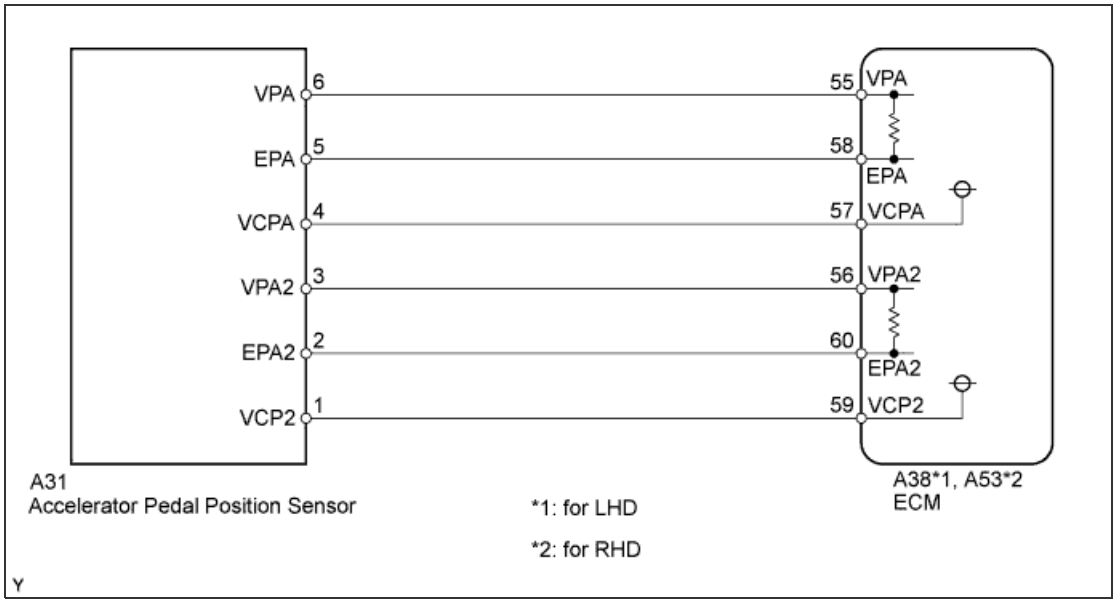
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

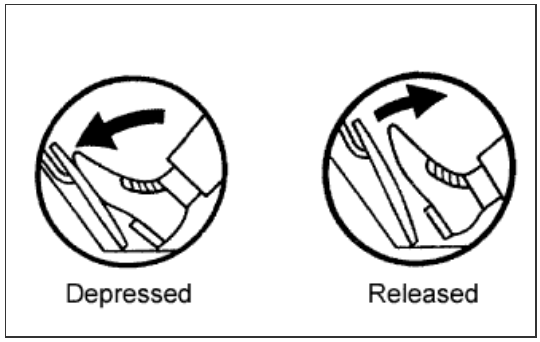
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

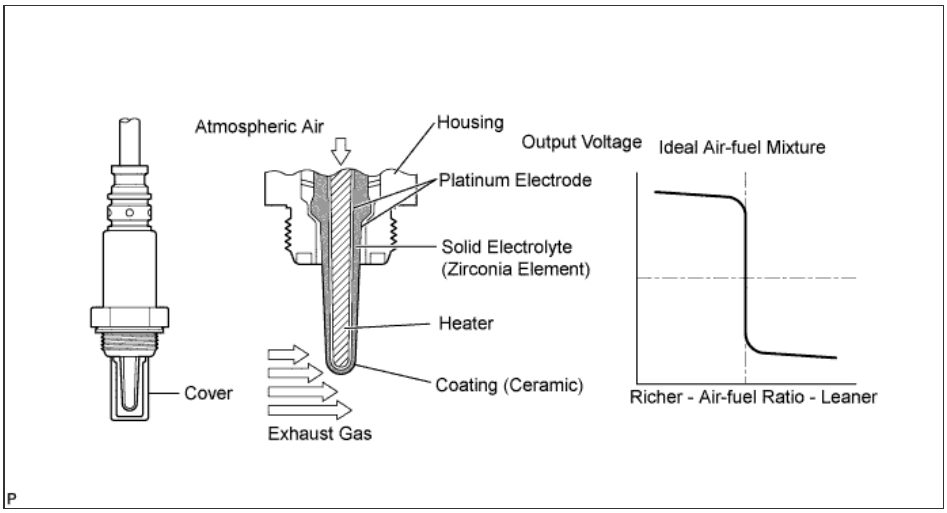
DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

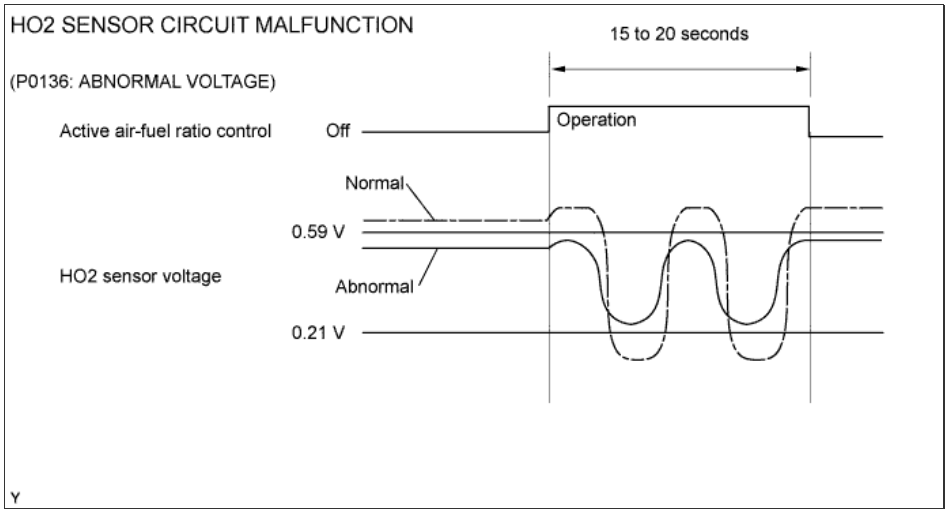
*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

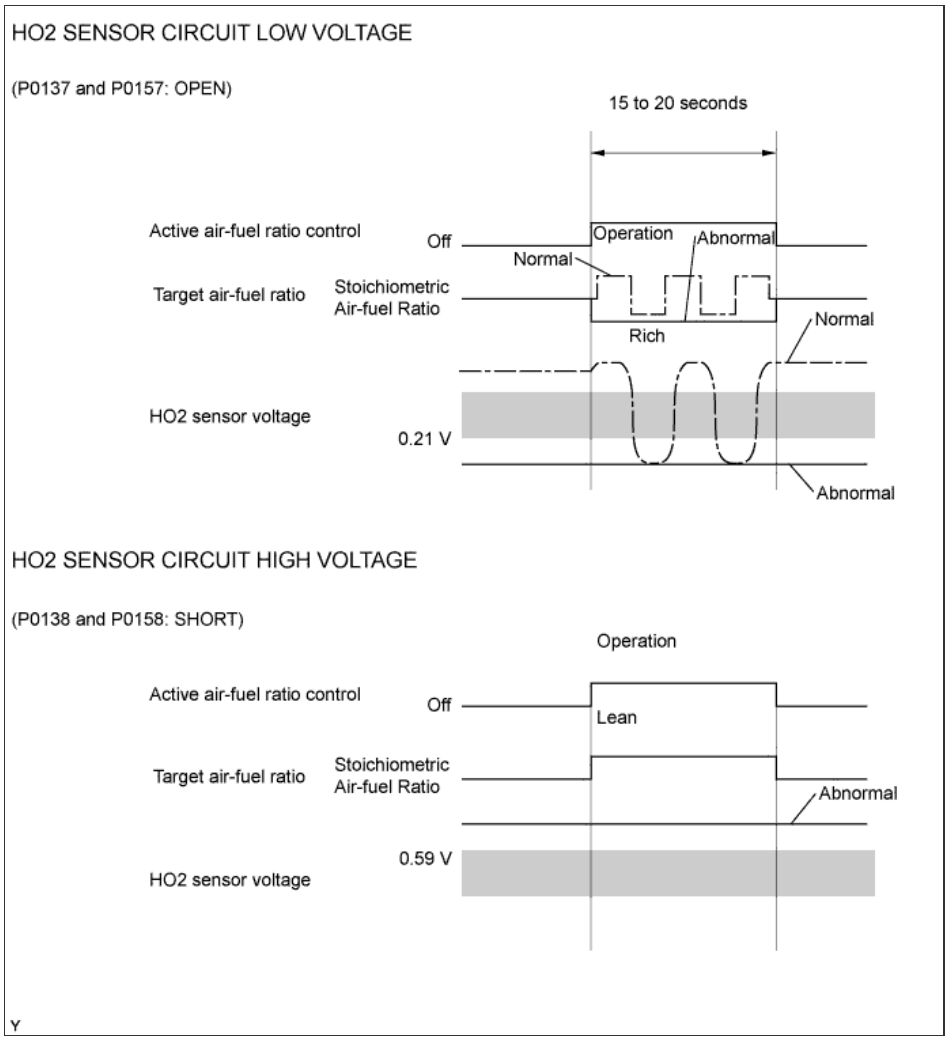
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

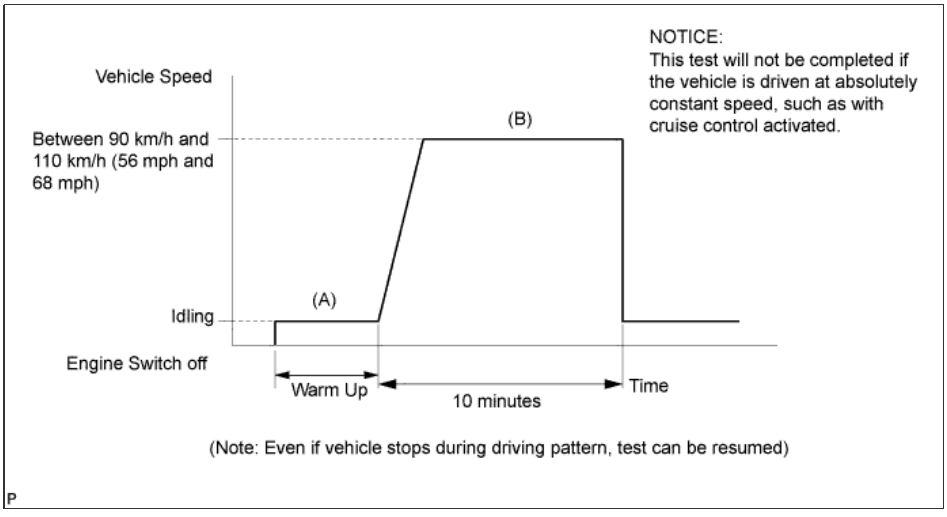
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

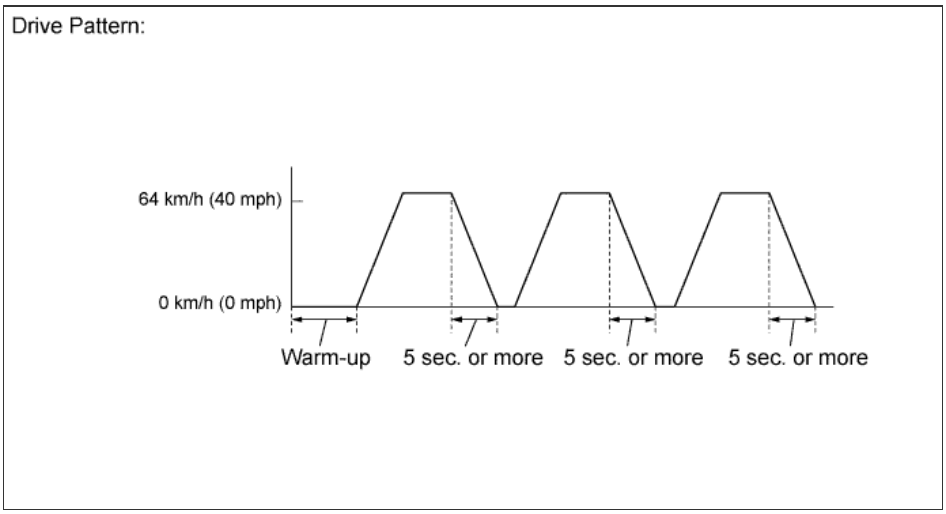
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

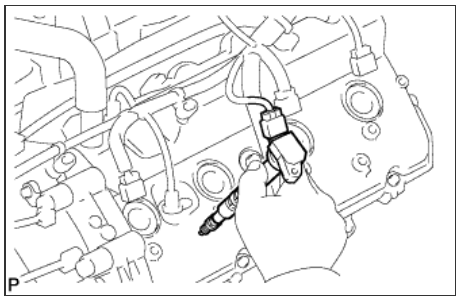
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

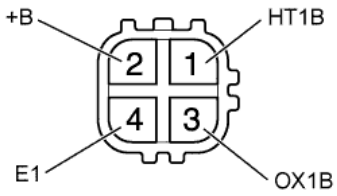
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
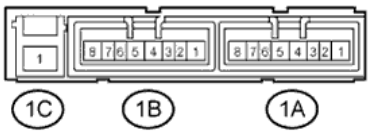
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

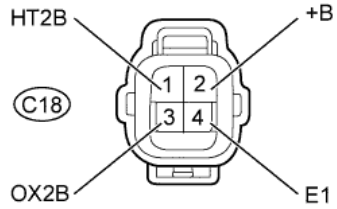
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

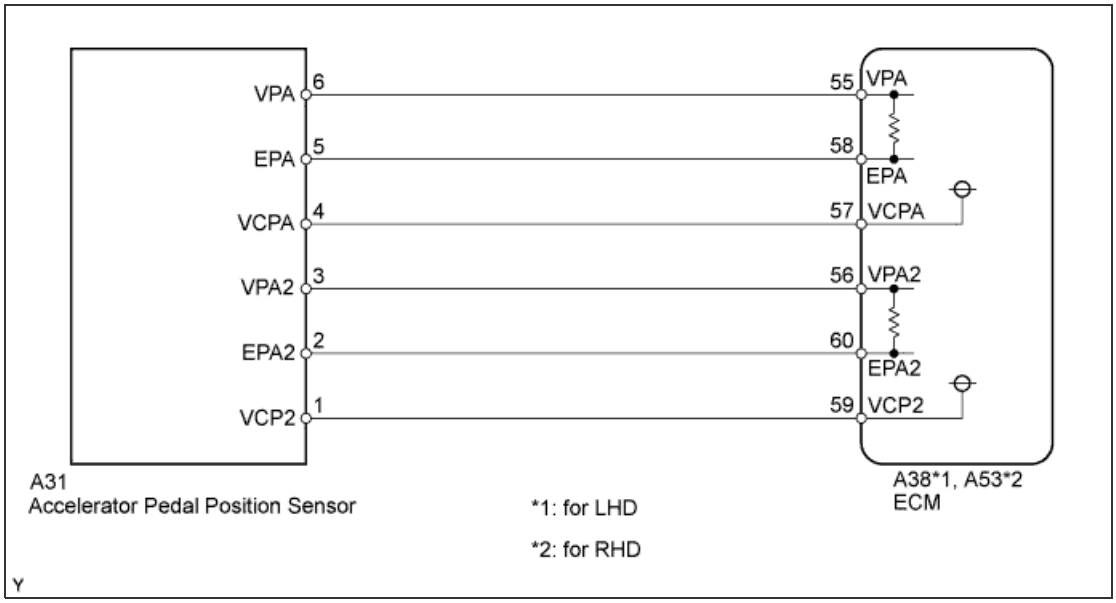
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

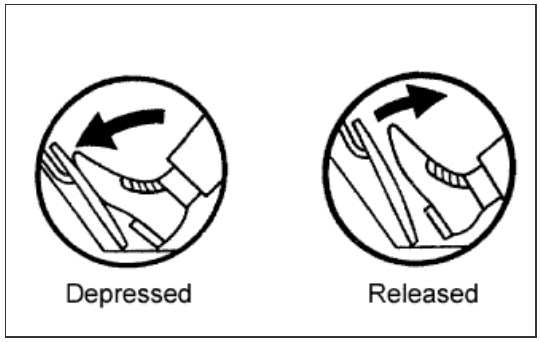
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

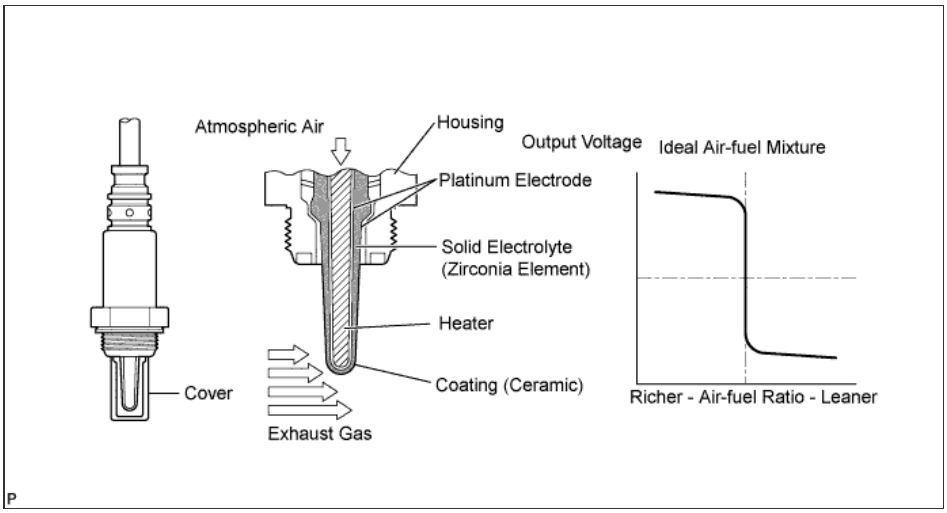
DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136* P0156*	Abnormal voltage is output: During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.59 V 2. The HO2 sensor voltage does not increase to higher than 0.21 V.	• Open or short in Heated Oxygen (HO2) sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Air Fuel ratio (A/F) sensor (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138* P0158*	High voltage (short): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is higher than 0.59 V. 2. The target air-fuel ratio is lean.	• Short in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • ECM internal circuit malfunction • Air Fuel ratio (A/F) sensor (for Bank 1, 2)

HINT:

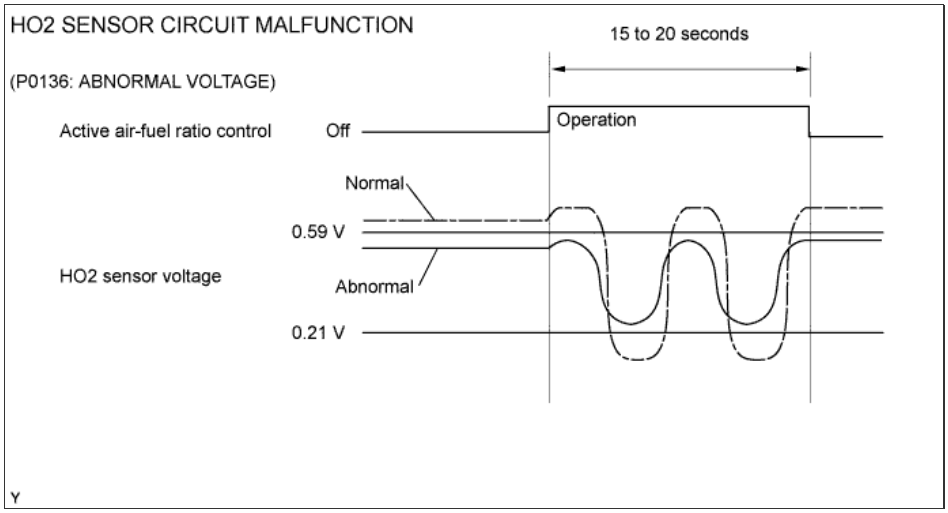
*: DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

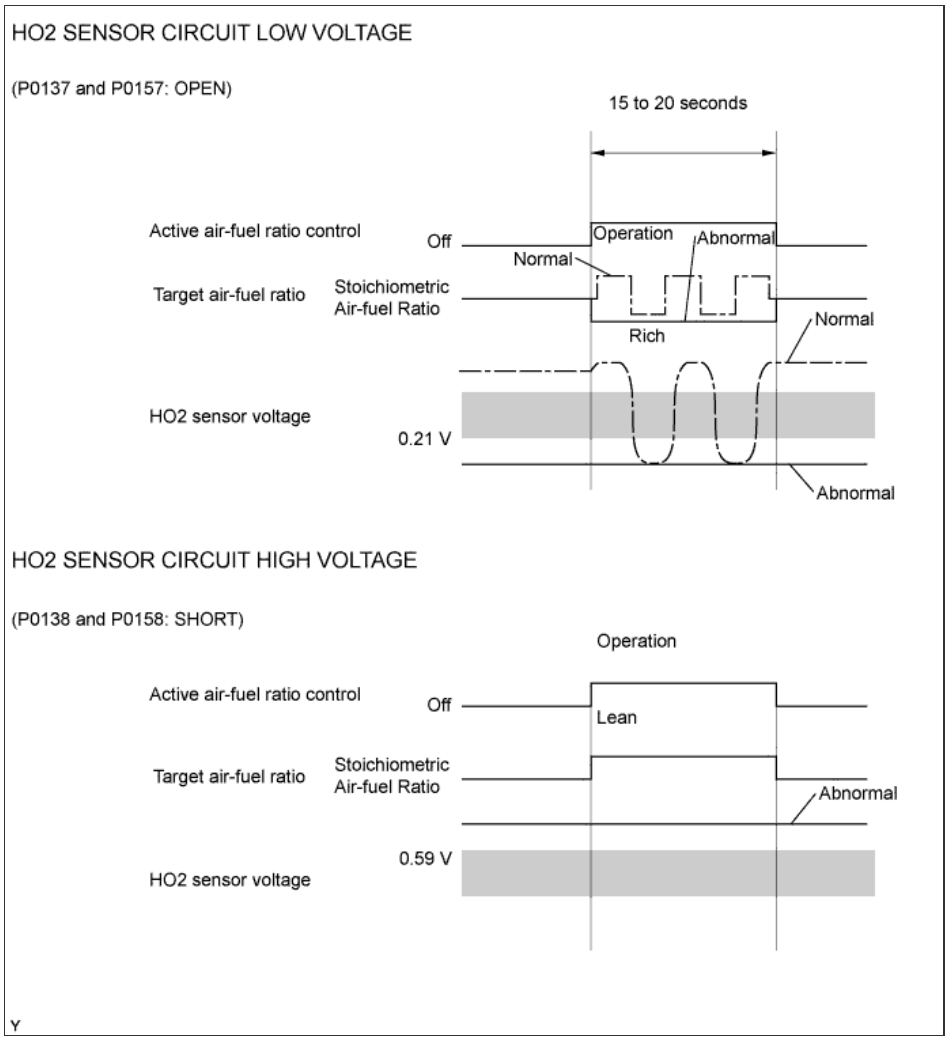
The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

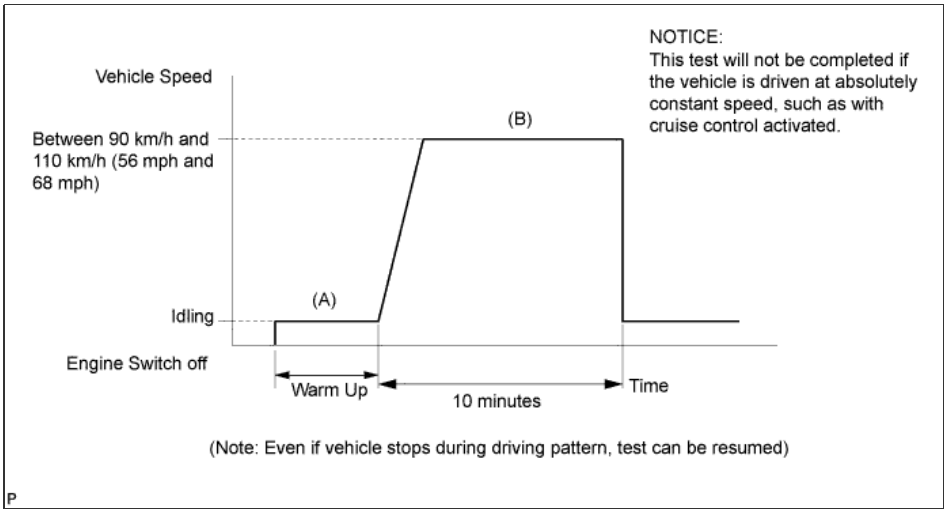
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.

*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.

- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **DTC P0136, P0138, P0156 and P0158 are for Euro-OBD only.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B	Go to step 16
C	Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

Standard voltage:
Below 1.0 V

OK	Go to step 5
NG	Go to step 3

3.CHECK HEATED OXYGEN SENSOR

a. Disconnect the C17 or C18 HO2 sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

Component without harness connected
(HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to ECM)

4.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the C53 or C54 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C53-45 (HT1B) - C53-114 (OX1B)	Always	10 kΩ or higher
C53-44 (HT2B) - C53-112 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C54-45 (HT1B) - C54-114 (OX1B)	Always	10 kΩ or higher
C54-44 (HT2B) - C54-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR

HINT:

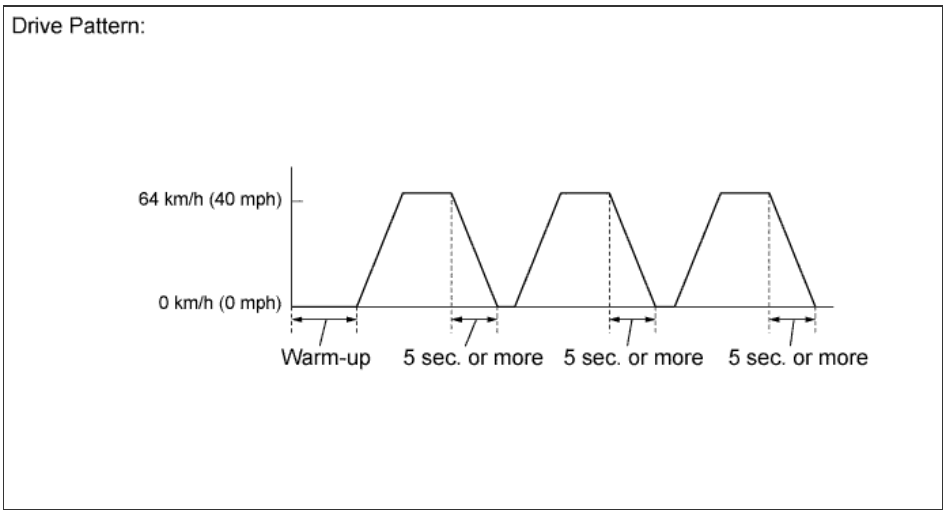
This Air Fuel ratio (A/F) sensor test is to check the A/F sensor current during the fuel cut. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Clear DTC (Click here).



b. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerator the vehicle until 60 km/h (40 mph) or more and decelerate for 5 seconds or more. Perform this 3 times.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 and AFS B2 S1.

d. Read the value.

Standard current:
Below 3.0 mA

NOTICE:

Do not turn the engine switch off during this step because the test results will be lost.

OK	Go to step 20
NG	Go to step 22

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 16

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air Fuel ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the tester.**

Result

Display Item (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either less or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG → Go to step 22

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (**Click here**)

OK ↓

12.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

13.INSPECT PCV HOSE

a. Check the PCV hose connections (Click here).

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

14.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

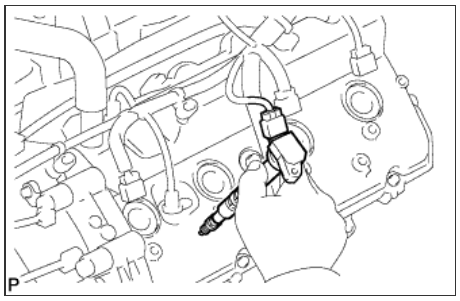
15.CHECK SPARKS AND IGNITION



a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM (Click here)

OK

REPLACE ECM (Click here)

16.CHECK FOR EXHAUST GAS LEAKAGE

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

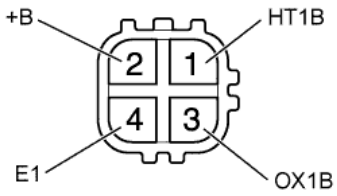
17.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C17 or C18 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

18.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
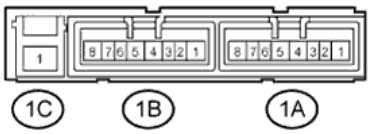
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY

OK

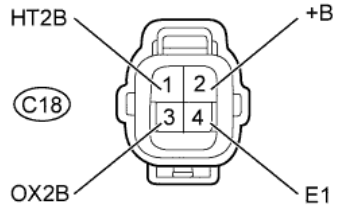
19.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C17 or C18 HO2 sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Front view of wire harness connector:
(to HO2 Sensor for Bank 1)

Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

*1: for LHD

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

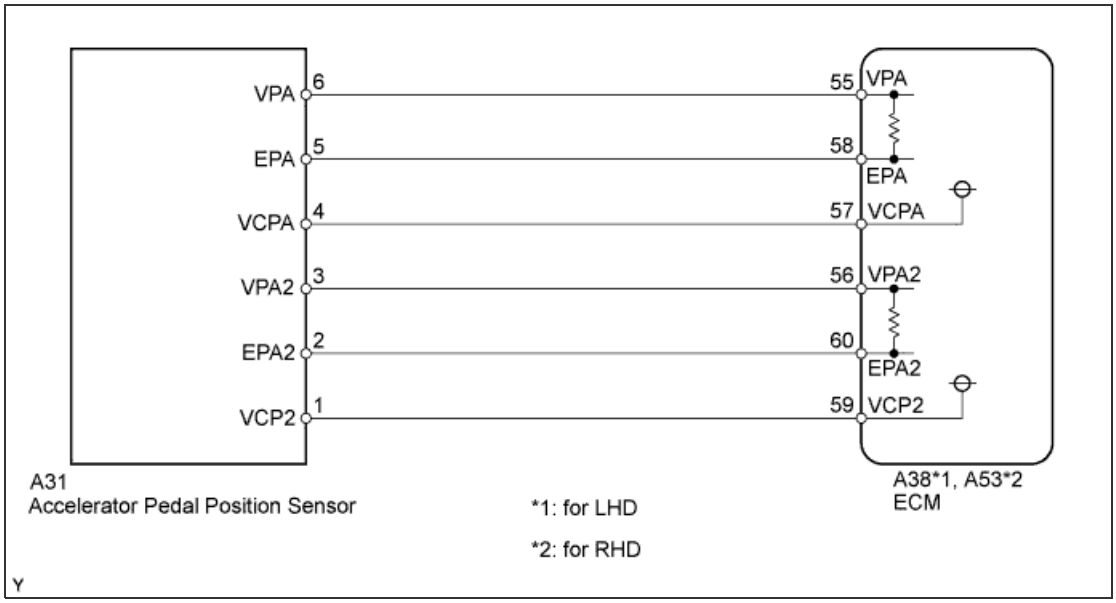
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

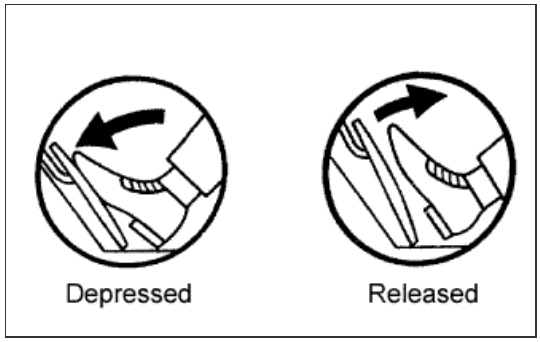
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

Result

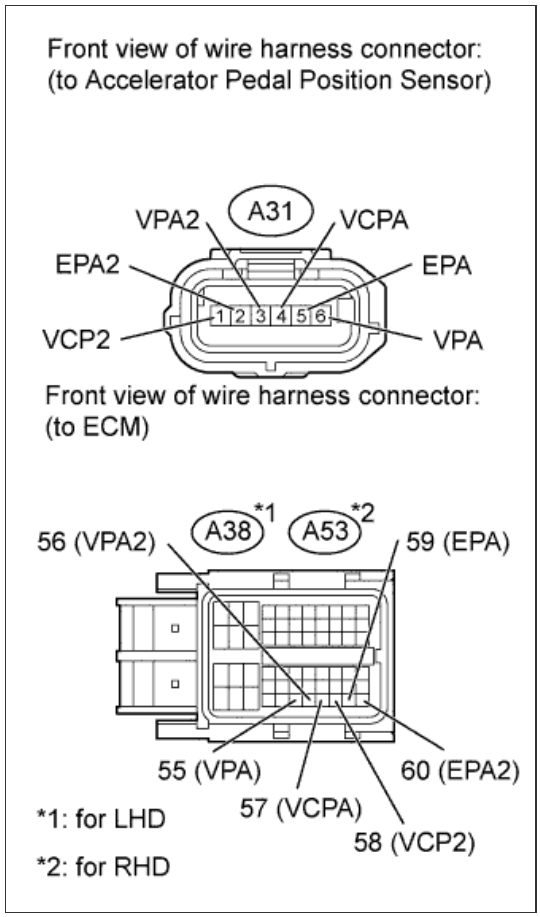
Result	Proceed to
NG	A
OK	B

B → Go to step 5



A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 or A53 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A53-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A53-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A53-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A53-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A53-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A53-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A53-55 (VPA) - body ground	Always	10 kΩ or higher

A31-5 (EPA) or A53-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A53-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A53-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A53-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A53-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

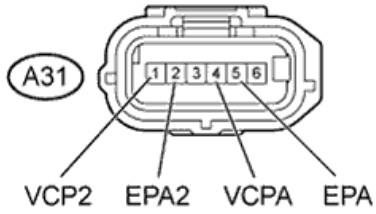
3.CHECK ECM (VCPA AND VCP2 VOLTAGE)



a. Disconnect the A31 APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (IG)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (IG)	4.5 to 5.5 V

Front view of wire harness connector:
(to APP Sensor)

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.
