- **Graphs can be displayed by transferring the stored snapshot from the tester to a PC. Intelligent Viewer must be installed on the PC.**
- **The condition of the turbocharger can be determined by fully depressing the accelerator pedal while driving at 15 km/h (9 mph) in 2nd gear to accelerate the vehicle (obey all laws and regulations, and pay attention to driving conditions while driving the vehicle), and then comparing MAP with Target Booster Pressure at an engine speed of 3000 rpm.**

f. Compare MAP with Target Booster Pressure.

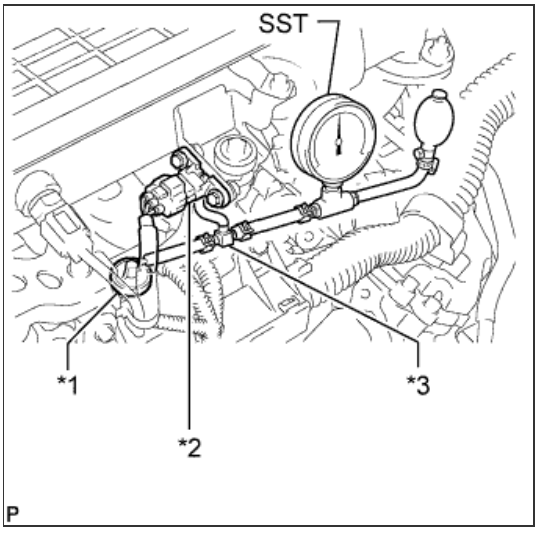
Standard:
MAP is within 35 kPa of Target Booster Pressure when accelerating with accelerator pedal fully depressed.

HINT:

- **The specification above denotes the difference between the absolute pressure values.**
- **The inspection above is only for vehicles equipped with a manual transmission.**
- **If the driving inspection using the intelligent tester above cannot be performed (e.g. due to road conditions), perform the following inspection.**

i. Warm up the engine.

HINT:



Be sure to perform the inspection when the engine coolant temperature is between 75 and 90°C (167 and 194°F).

ii. Using a 3-way connector, connect SST (turbocharger pressure gauge) between the diesel turbo pressure sensor (manifold absolute pressure sensor) and the gas filter.

SST
09992-00242

Text in Illustration

*1	Gas Filter
*2	Diesel Turbo Pressure Sensor
*3	3-Way Connector

iii. Fully apply the parking brake and chock the 4 wheels.

iv. for Manual Transmission:
While depressing the clutch pedal, fully depress the accelerator pedal. Measure the boost pressure at maximum engine speed (4700 to 4900 rpm).

v. for Automatic Transmission:
Move the shift lever to P or N, and then fully depress the accelerator pedal. Measure the boost pressure at maximum engine speed (4700 to 4900 rpm).

Standard Pressure (Gauge Pressure):
30 to 60 kPa (0.30 to 0.61 kgf/cm^2, 4.3 to 8.7 psi)

If the pressure is lower than the standard, the following problems may be present.

- The intake system or exhaust system has leakage or blockage.
- The turbocharger sub-assembly or turbo motor driver is malfunctioning.
- The EGR valve does not close.
- The diesel throttle body does not open.
- The vacuum hose connected to the diesel turbo pressure sensor (manifold absolute pressure sensor) is cracked or disconnected.

- The mass air flow meter is malfunctioning.
- A fuel injector is malfunctioning.

If the pressure is higher than the standard, check the turbocharger and/or boost control components (turbo motor driver, pressure sensor, vacuum hose, wire harness, etc.).

g. Chart showing the suspected trouble areas when the pressure is lower than the standard.

HINT:

- **○: If a problem listed in the leftmost column of the chart exists, or if the part in the leftmost column of the chart has a malfunction, the value of the Data List item in the uppermost row of the chart will meet the conditions shown in the row labeled "Value which represents a malfunction".**
- **The values in the chart are applicable when the engine coolant temperature is between 75 and 90°C (167 and 194°F).**
- **The values in the chart are for vehicles equipped with a manual transmission. For vehicles with an automatic transmission, use these values as a reference only as they may differ from the actual values.**
- **The values in the chart are valid in an area with an absolute atmospheric pressure higher than 95 kPa. (Standard atmospheric pressure is 101 kPa. Atmospheric pressure decreases by 1 kPa for every 100 m increase in altitude, and is also affected by the current weather conditions.)**
- **When the altitude increases, atmospheric pressure and MAP decrease.**

Item	MAP (Absolute pressure inside intake manifold)	MAF (Intake air flow rate)	Accel Position	Actual Throttle Position (#2)	Actual EGR Valve Pos. (#2)	EGR Close Lrn. Status (#2) (EGR valve fully closed position learning status)	Fuel Pressure	Injection Feedback Val #1 (to #4)
Values taken from an actual normal vehicle *1	-	228 g/sec.	99% or more	0%	0%	OK	-	-3 to +3 mm^3/st
Values which represent a malfunction *1	MAP is below Target Booster Pressure by 35 kPa or more	MAF is less than 190 g/sec.	Accel Position is not fully depressed position *2	Actual Throttle Position (#2) is not within 10% of Target Throttle Position (#2)	Actual EGR Valve Pos. (#2) is more than 10% *3	NG (Determined after performing learning)	Fuel Pressure is below Target Common Rail Pressure by 10 MPa or more (Check while condition steady)	Outside of above range
Turbocharger	○	○	-	-	-	-	-	-
EGR valve does not close or has problem with movement	○	○	-	-	○ (Problem with EGR valve movement) *4	○ (EGR valve does not close) *4	-	-
Problem with diesel throttle movement	○ (Intake airflow decreases)	○	-	○	-	-	-	-
Accelerator pedal cannot be fully depressed or problem with accelerator pedal position sensor exists	-	○	○	-	-	-	-	-
Intake air system leakage or blockage	○	○	-	-	-	-	-	-
Exhaust gas leakage before turbocharger or blockage	○	○	-	-	-	-	-	-
Manifold								

absolute pressure sensor	○	○	-	-	-	-	-	-
Manifold absolute pressure sensor hose is disconnected	○	○	-	-	-	-	-	-
Mass air flow meter sub-assembly	-	○	-	-	-	-	-	-
Fuel system (injector, supply pump or common rail)	○	○	-	-	-	-	○ (Fuel injector leakage, decrease in pressure discharge valve relief pressure or valve is stuck)	○ *5

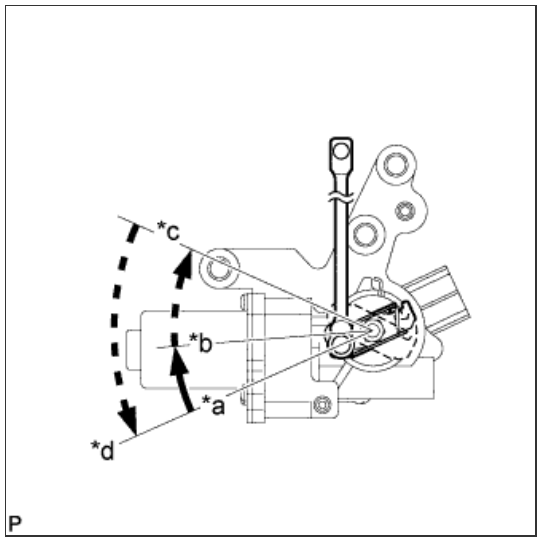
HINT:

- ***1: These values are measured when the transmission is in 2nd gear, the accelerator pedal is fully depressed, the vehicle is accelerating, and the engine speed is 3000 rpm.**
- ***2: The Accel Position is the accelerator opening angle (%) for engine control use. The value indicates around 100% when the accelerator pedal is fully depressed. If the value does not indicate around 100% when the accelerator pedal is fully depressed, the accelerator pedal position sensor circuit or the pedal itself is malfunctioning. When the MIL is illuminated, even with the accelerator pedal fully depressed and an Accel Position of below 70%, it means the fail-safe is restricting the accelerator.**
- ***3: Check that the Actual EGR Valve Pos. is always following the Target EGR Position value (e.g. the Actual EGR Valve Pos. is around fully closed position when the Target EGR Position value indicates 0%). The EGR valve may be malfunctioning if the value is stuck or does not fluctuate smoothly. However, in some cases the EGR valve may be malfunctioning even if the Actual EGR Valve Pos. value is normal. Inspect the EGR valve for any defects (deposits, valve stuck, poor movement, etc.) if necessary.**
- ***4: DTC P0400 (for bank 1) or P1248 (for bank 2) may be stored at this time. If the actual EGR valve position follows the target EGR valve position slowly, a feeling of hesitation may occur.**
- ***5: If Injection Feedback Val # of a cylinder is not within -3 to +3 mm ^{3}/st, the corresponding cylinder may have a malfunction (injector or compression). However, in some cases the cylinder may be malfunctioning even if the value is within -3 to +3 mm^3/st because these values are injection volume correction values calculated by the ECM at the engine idling and not correction values for the high engine load condition related to the boost pressure control and engine output performance.**

5. CHECK TURBOCHARGER SUB-ASSEMBLY

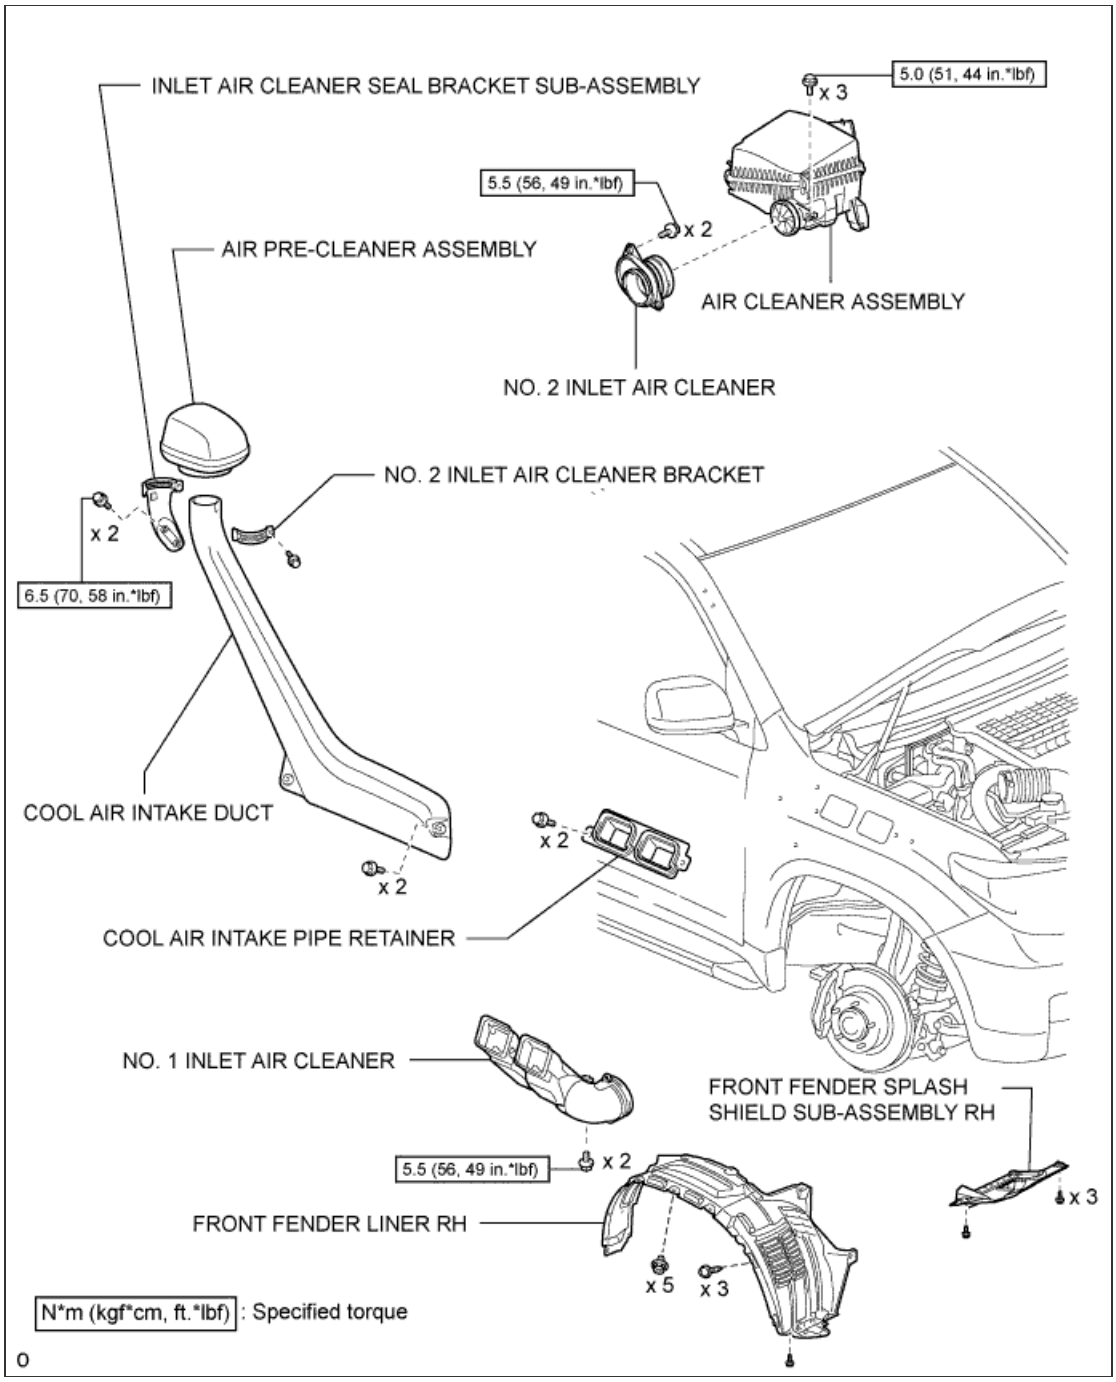
CAUTION:

- **Wear protective gloves to prevent injuries and burns when checking the turbocharger.**
- **The engine compartment becomes hot when the engine is running.**



a. Make sure that the connector is properly connected.

b. Check the motor movement when turning the ignition switch to ON, when starting the engine, and then when turning the ignition switch off.



Text in Illustration

*a	Ignition switch ON
*b	Engine idling
*c	*b → *c → *d: Turn the ignition switch off at idling
*d	Ignition switch off

If the result is not as specified, check the ECM and/or turbo motor driver (Click hereand Click here).

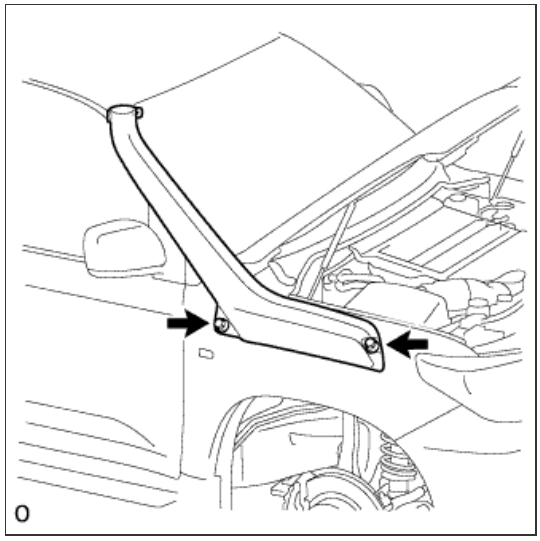
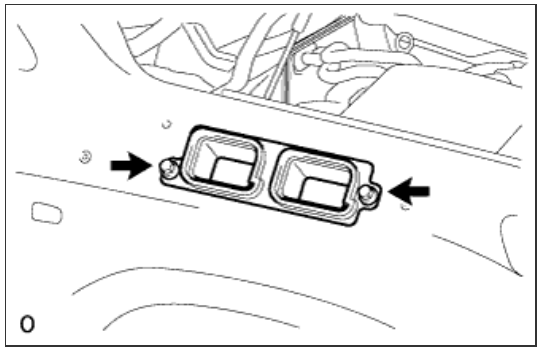
for Preparation Click here

for Preparation Click here



1. REMOVE AIR PRE-CLEANER ASSEMBLY

a. Remove the bolt, air pre-cleaner and No. 2 inlet air cleaner bracket.



2. REMOVE COOL AIR INTAKE DUCT

a. Remove the 2 bolts and cool air intake duct.

3. REMOVE COOL AIR INTAKE PIPE RETAINER

a. Remove the 2 bolts and cool air intake pipe retainer.

4. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Remove the 3 bolts and screw.

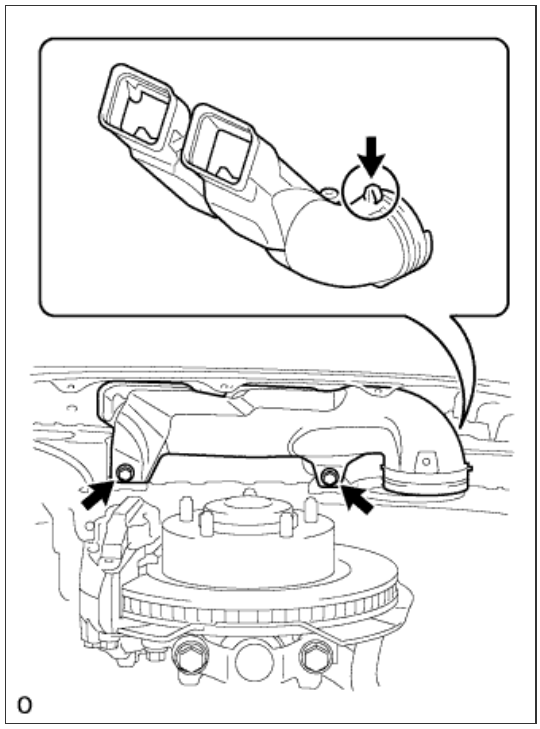
b. Loosen the clip and remove the splash shield.

5. REMOVE FRONT FENDER LINER RH

a. Remove the screw and disconnect the liner from the front bumper cover.

b. Using a T30 "TORX" socket, remove the 3 screws.

c. Remove the 5 clips.



HINT:

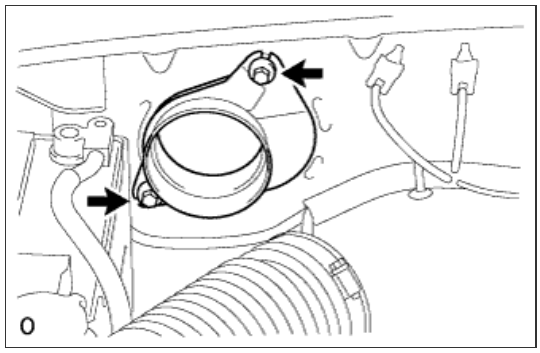
It is not necessary to fully remove the fender liner. Partially remove it so that the air pump can be removed.

6. REMOVE NO. 1 INLET AIR CLEANER

a. Remove the 2 bolts.

b. Detach the claw shown in the illustration, and then remove the No. 1 inlet air cleaner.

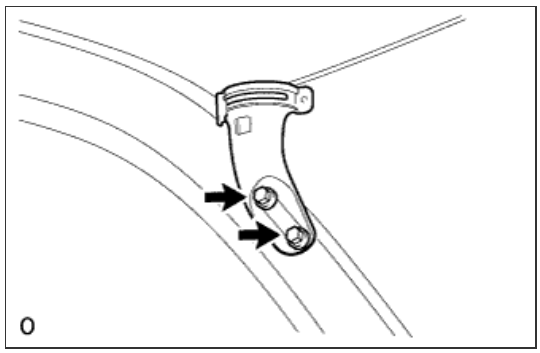
7. REMOVE AIR CLEANER ASSEMBLY



a. Disconnect the mass air flow meter connector and using a clip remover, detach the wire harness clamp from the air cleaner cap.

b. Using a clip remover, detach the wire harness clamp from the air cleaner case.

c. Remove the 3 bolts and air cleaner case.

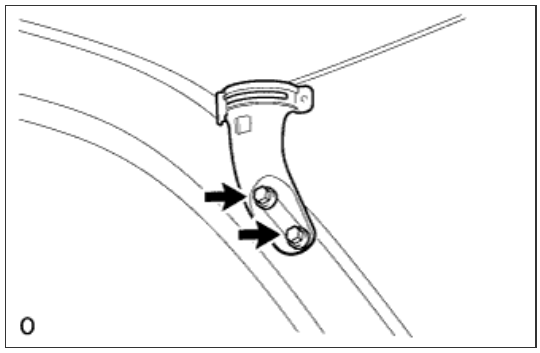


8. REMOVE NO. 2 INLET AIR CLEANER

a. Remove the 2 bolts and inlet air cleaner.

9. REMOVE INLET AIR CLEANER SEAL BRACKET SUB-ASSEMBLY

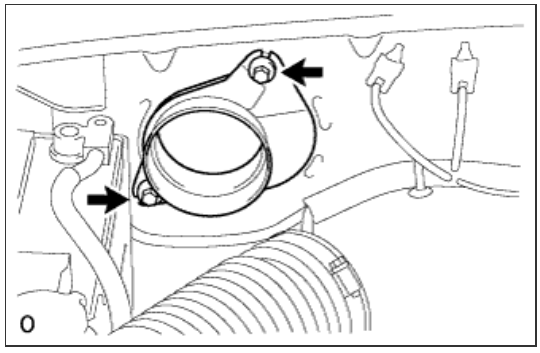
a. Remove the 2 bolts and inlet air cleaner seal bracket.



for Preparation Click here

1. INSTALL INLET AIR CLEANER SEAL BRACKET SUB-ASSEMBLY

a. Install the inlet air cleaner seal bracket with the 2 bolts.



Torque:
6.5 N*m{ 70 kgf*cm , 58 in.*lbf }

2. INSTALL NO. 2 INLET AIR CLEANER

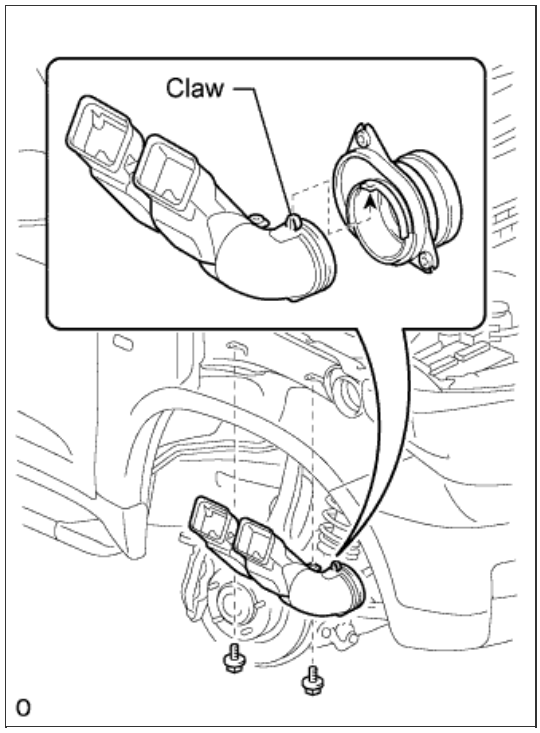
a. Install the No. 2 inlet air cleaner with the 2 bolts.

Torque:
5.5 N*m{ 56 kgf*cm , 49 in.*lbf }

3. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner case with the 3 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }



b. Attach the wire harness clamp to the air cleaner case.

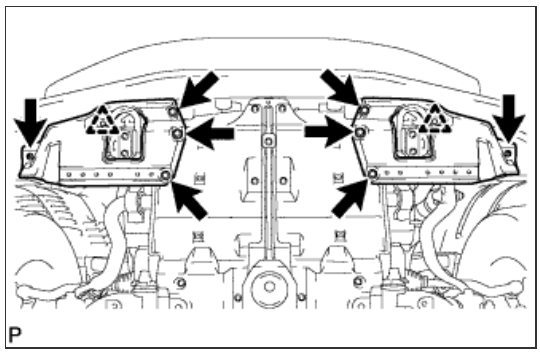
c. Connect the mass air flow meter connector and attach the wire harness clamp to the air cleaner cap.

4. INSTALL NO. 1 INLET AIR CLEANER

a. Attach the claw of the No. 1 inlet air cleaner to the No. 2 inlet air cleaner, and install the No. 1 inlet air cleaner with the 2 bolts.

Torque:
5.5 N*m{ 56 kgf*cm , 49 in.*lbf }

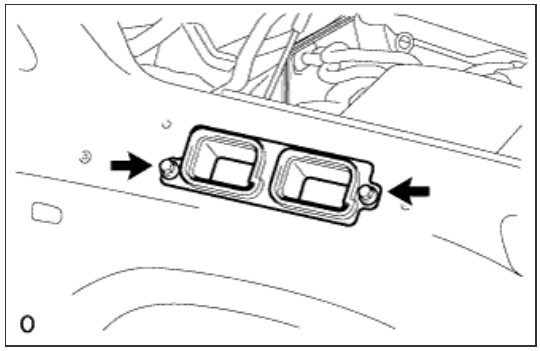
5. INSTALL FRONT FENDER LINER R



a. Install the fender liner with the 5 clips.

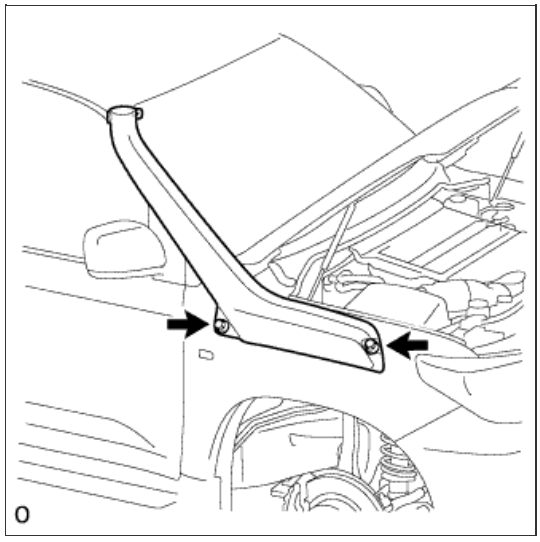
b. Using a T30 "TOR socket, install the 3 screws.

c. Connect the liner to the front bumper cover with the screw.



6. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY R

a. Install the splash shield with the clip, and then install the 3 bolts and screw.

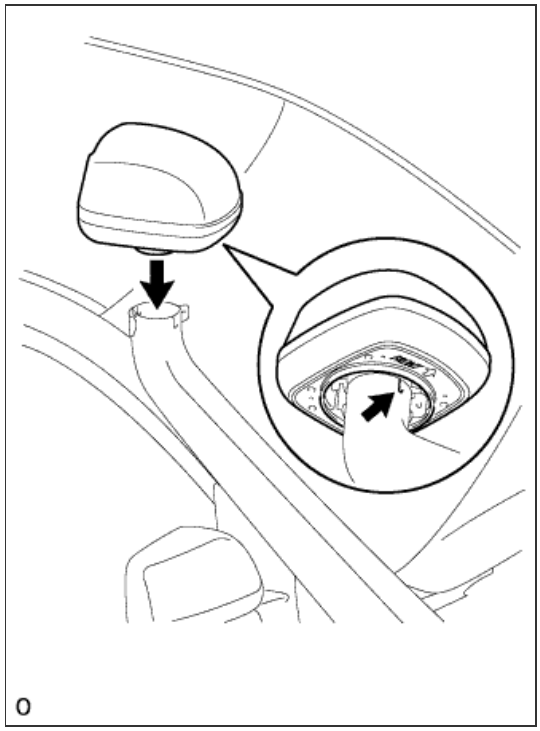


7. INSTALL COOL AIR INTAKE PIPE RETAINER

a. Install the cool air intake pipe retainer with the 2 bolts.

8. INSTALL COOL AIR INTAKE DUCT

a. Install the cool air intake duct with the 2 bolts.



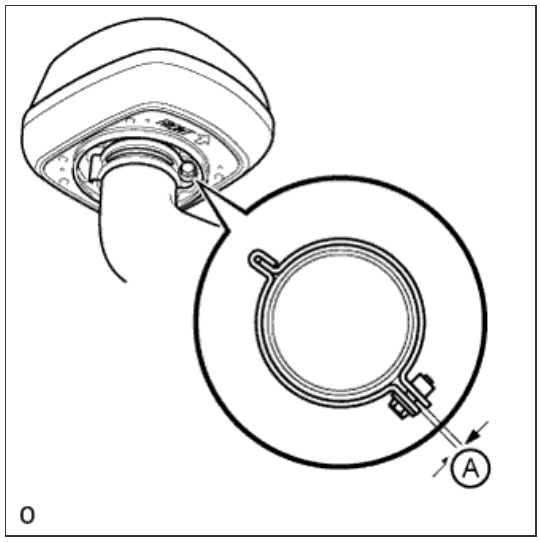
9. INSTALL AIR PRE-CLEANER ASSEMBLY

a. Temporarily install the No. 2 inlet air cleaner bracket to the inlet air cleaner seal bracket with the bolt.

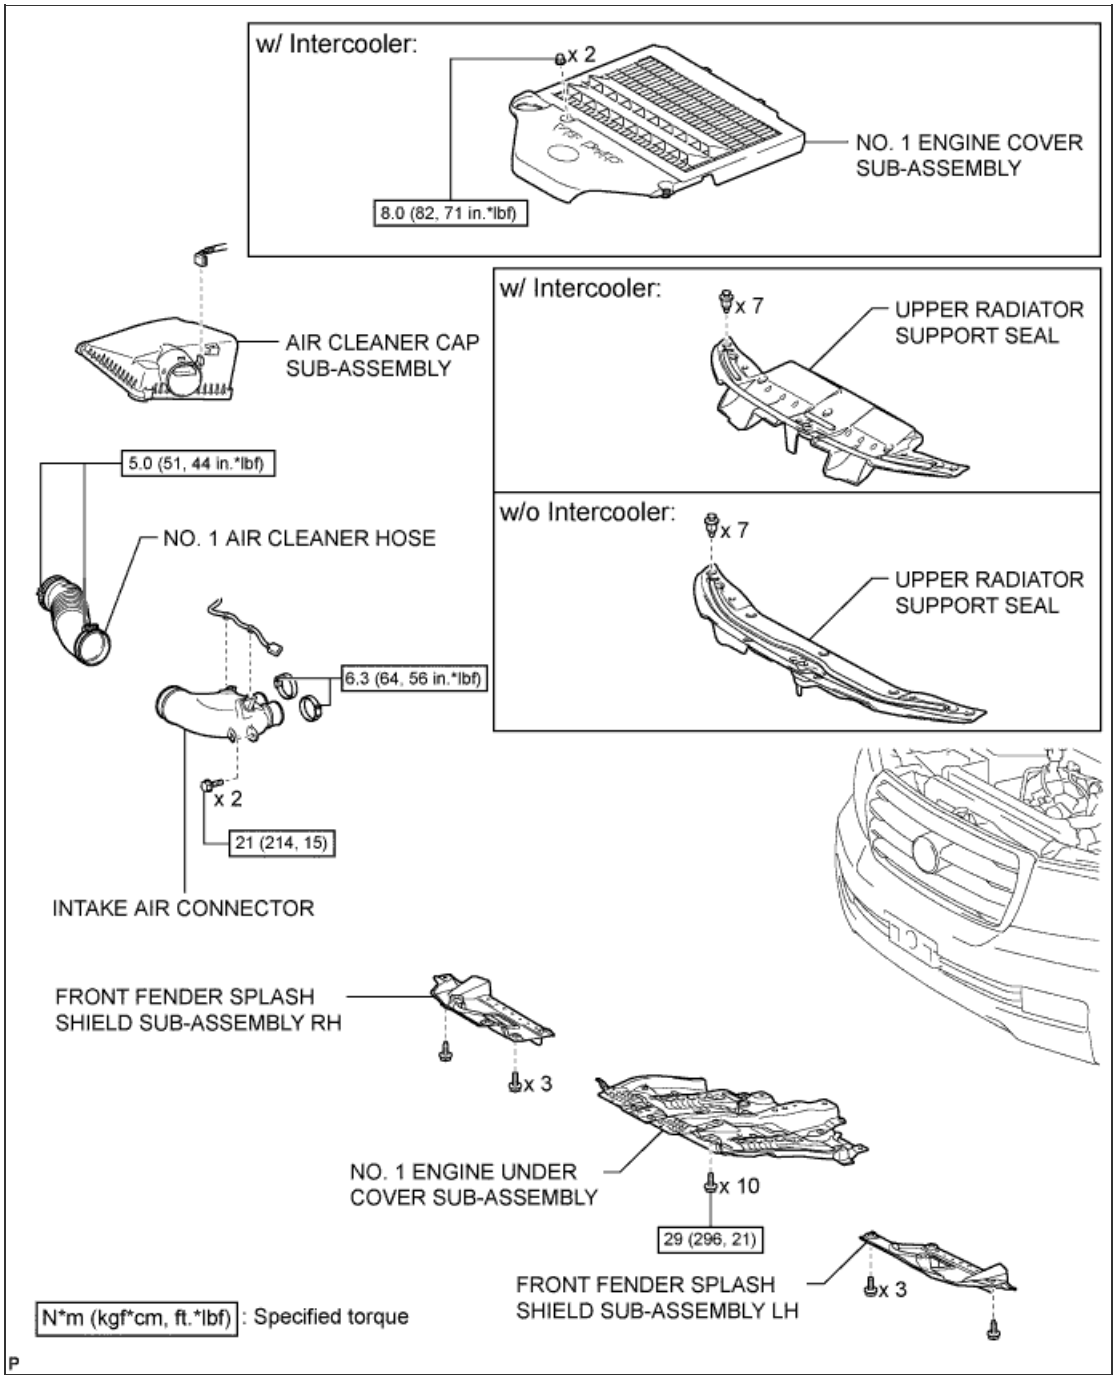
b. Install the air pre-cleaner to the cool air intake duct.

HINT:

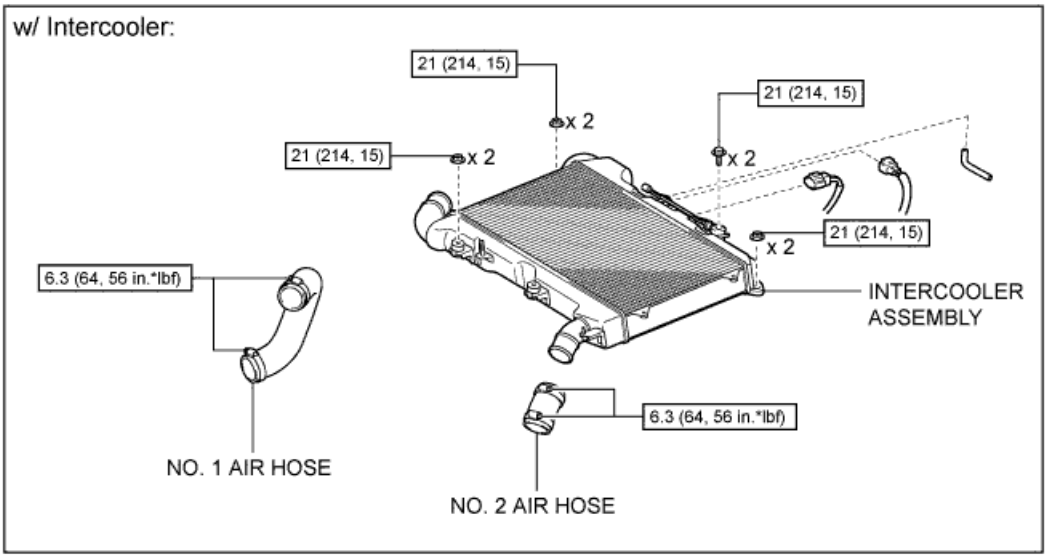
Fit the air pre-cleaner into the groove of the cool air intake duct with the side stamped "FRONT" facing forward.



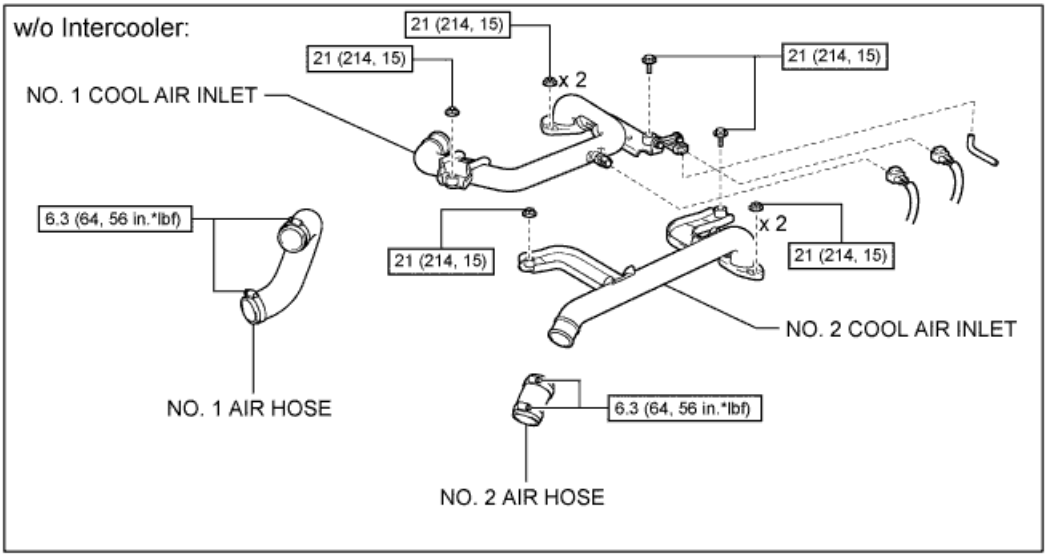
c. Tighten the bolt of the inlet air cleaner bracket.



HINT:



hen tightening bolt, make sure that the clearance labeled A in the illustration os as specified.



Standard clearance:
0 to 5 mm (0 to 1.97 in.)

for Preparation Click here

NOTICE:

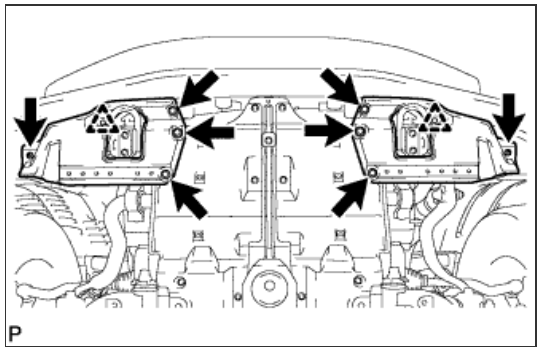
When replacing the injectors (including shuffling the injectors between the cylinders), common rail, cylinder head, or intake manifold, it is necessary to replace the injection pipes with new ones.

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:



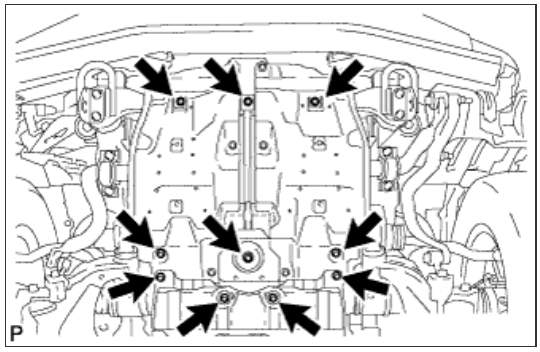
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.



3. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.

4. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

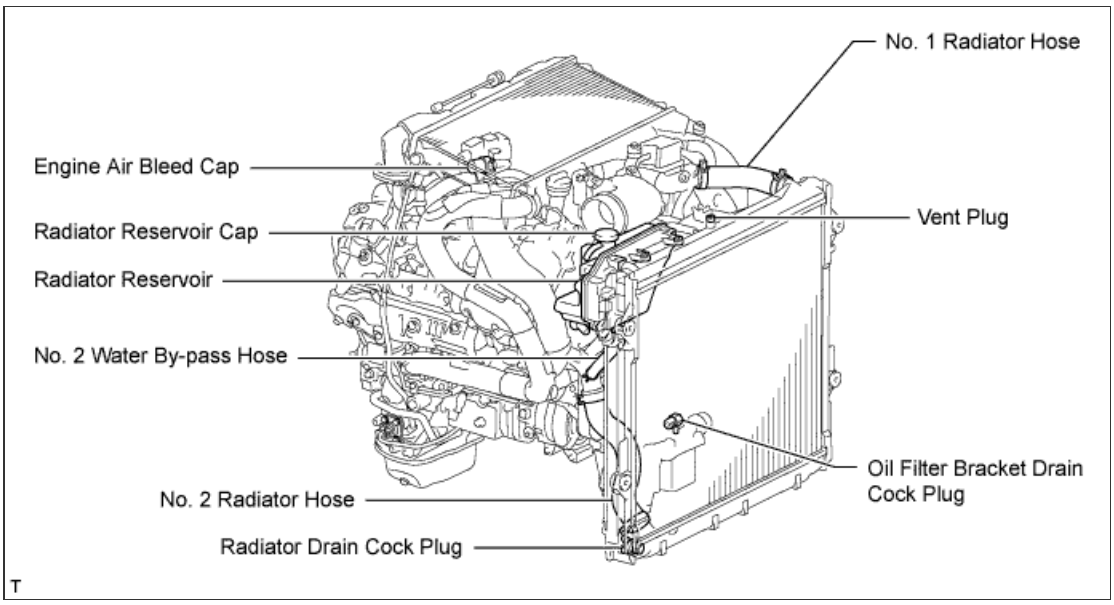
5. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and upper radiator support seal.

6. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

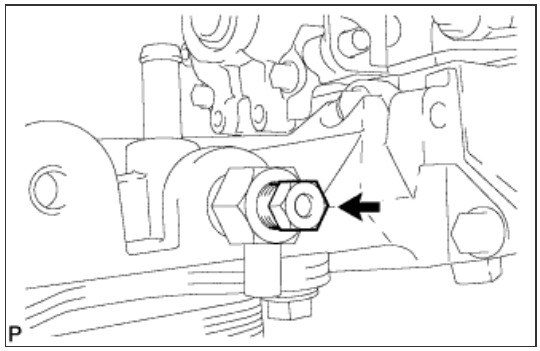


HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

a. Loosen the radiator drain cock plug.

b. Remove the radiator reservoir cap to drain the coolant in the radiator.

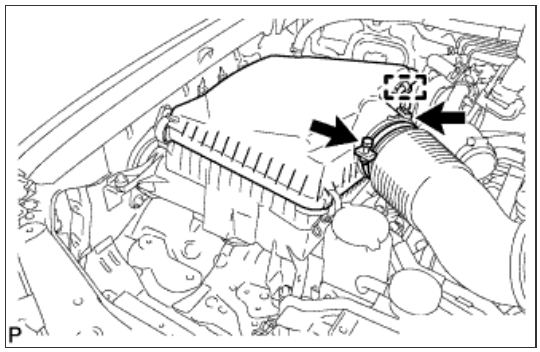


c. Loosen the oil filter bracket drain cock plug to drain the coolant in the engine.

d. Tighten the radiator drain cock plug by hand.

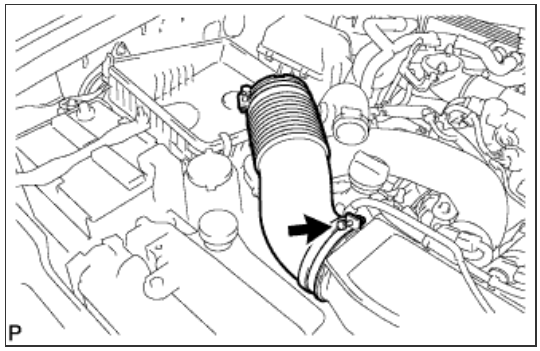
e. Tighten the oil filter bracket drain cock plug.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }



7. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

a. Loosen the hose clamp.



b. Disconnect the mass air flow meter connector and using a clip remover, detach the wire harness clamp from the air cleaner cap.

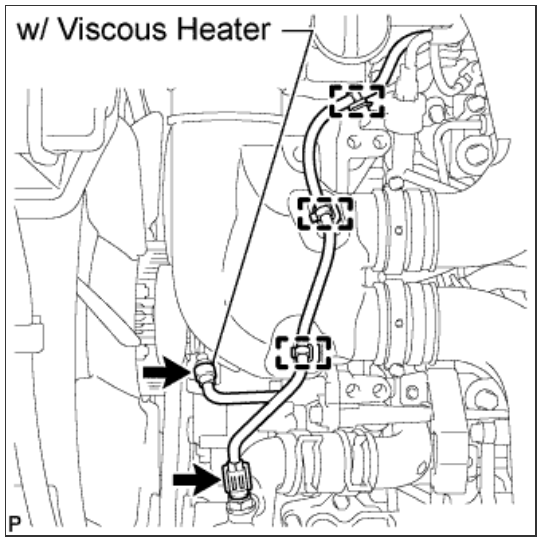
c. Detach the 4 clamps and remove the air cleaner cap.

8. REMOVE NO. 1 AIR CLEANER HOSE

a. Loosen the hose clamp and remove the No. 1 air cleaner hose.

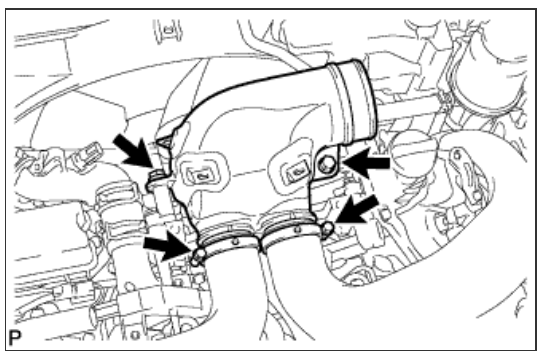
9. REMOVE INTAKE AIR CONNECTOR

a. w/o Viscous Heater:



i. Disconnect the connector from the water temperature sensor.

ii. Using a clip remover, detach the 3 wire harness clamps.

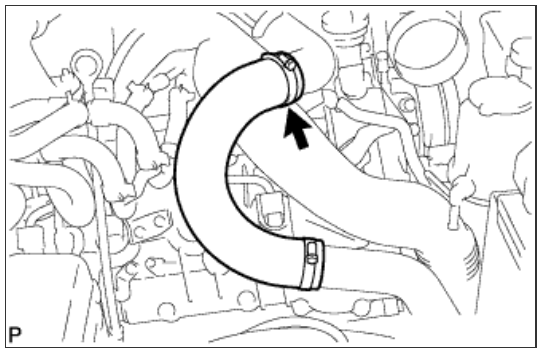


b. w/ Viscous Heater:

i. Disconnect the 2 connectors from the viscous with magnet clutch heater and water temperature sensor.

ii. Using a clip remover, detach the 3 wire harness clamps.

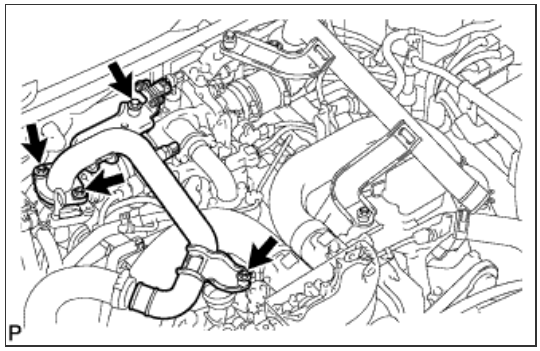
c. Loosen the 2 hose clamps and remove the 2 bolts and intake air connector.



10. REMOVE INTERCOOLER ASSEMBLY (w/ Intercooler

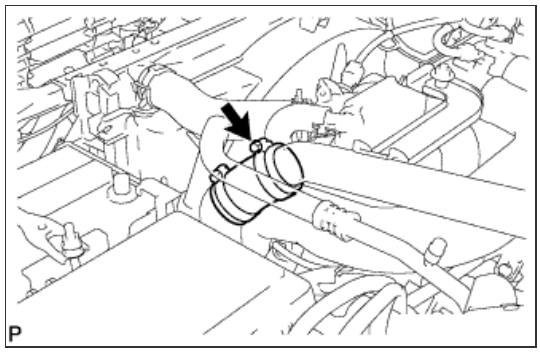
a. Remove the intercooler assembly (Click here).

11. REMOVE NO. 1 COOL AIR INLET (w/o Intercooler



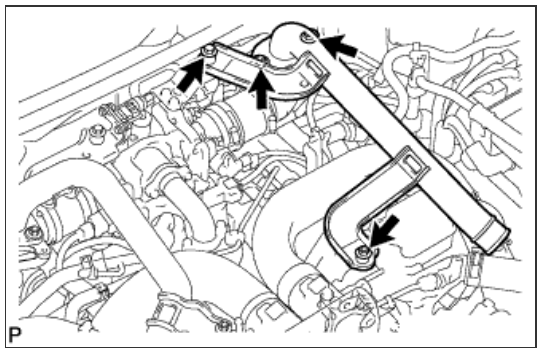
a. Loosen the No. 1 air hose clamp.

b. Disconnect the turbo pressure sensor connector, intake air temperature sensor connector and vacuum hose.



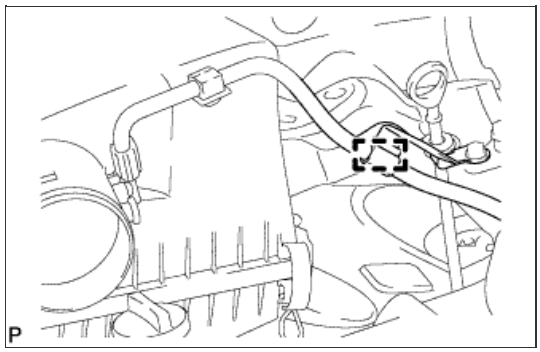
c. Remove the 3 nuts, bolt and No. 1 cool air inlet.

d. Remove the gasket from the air tube RH.



12. REMOVE NO. 2 COOL AIR INLET (w/o Intercooler

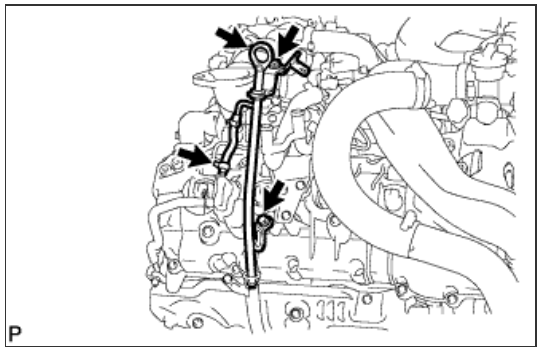
a. Loosen the No. 2 air hose clamp.



b. Remove the 3 nuts, bolt and No. 2 cool air inlet.

c. Remove the gasket from the air tube LH.

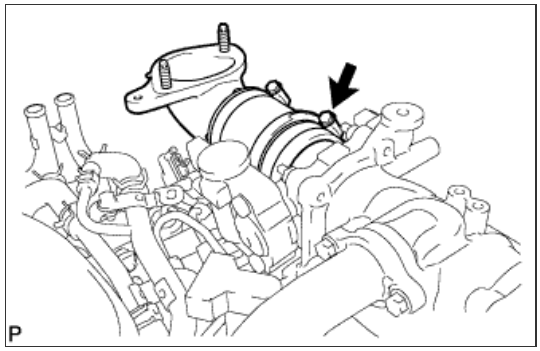
13. REMOVE NO. 2 ENGINE OIL LEVEL DIPSTICK GUIDE



a. Disconnect the wire harness clamp from the No. 2 engine oil level dipstick guide.

b. Disconnect the ventilation hose from the cylinder head cover RH.

c. Remove the 2 bolts and No. 2 engine oil level dipstick guide.

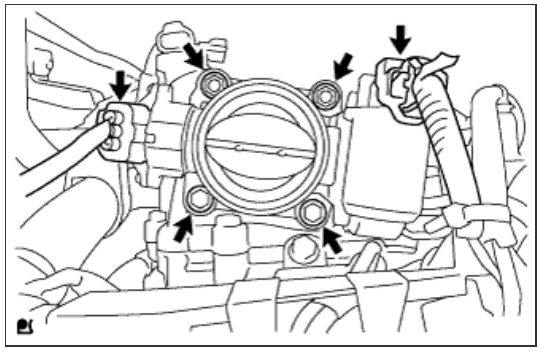


d. Remove the -ring from the No. 2 engine oil level dipstick guide.

14. REMOVE AIR TUBE SUB-ASSEMBLY RH

a. Loosen the hose clamp.

b. Remove the air tube from the throttle body.



15. REMOVE DIESEL THROTTLE BODY ASSEMBLY RH

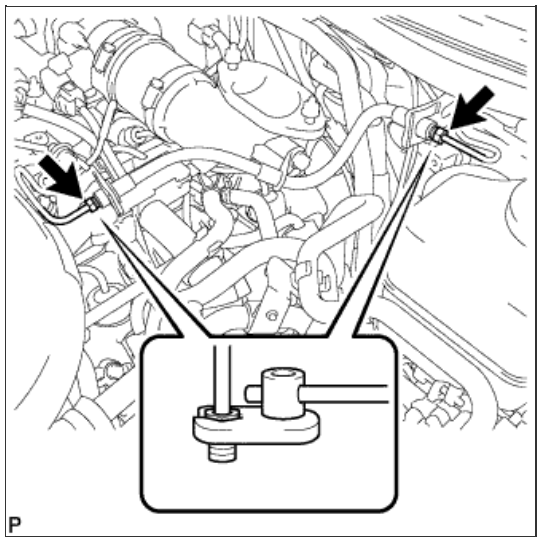
a. Disconnect the throttle position sensor connector.

b. Disconnect the throttle motor connector.

c. Remove the 2 bolts, 2 nuts and throttle body.

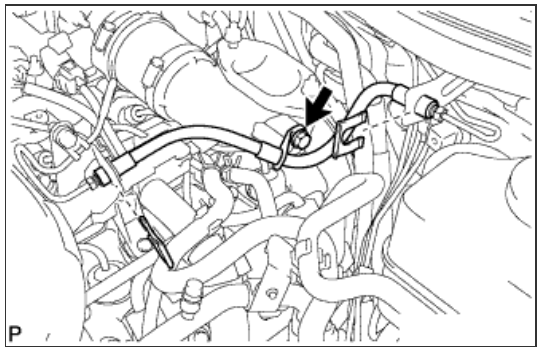
d. Remove the gasket from the intake pipe.

16. DRAIN CLUTCH FLUID (for Manual Transmission



17. REMOVE CLUTCH HOSE (for Manual Transmission

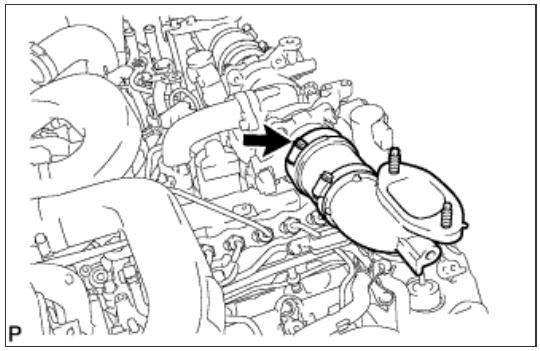
a. Disconnect the 2 flexible hose tubes from the clutch hose with a 10 mm union nut wrench while holding the flexible hose with a wrench.



NOTICE:

- **Do not bend or damage the flexible hose tubes.**
- **Do not allow any foreign matter such as dirt and dust to enter the flexible hose tubes from the connecting point.**

b. Remove the 2 clips.

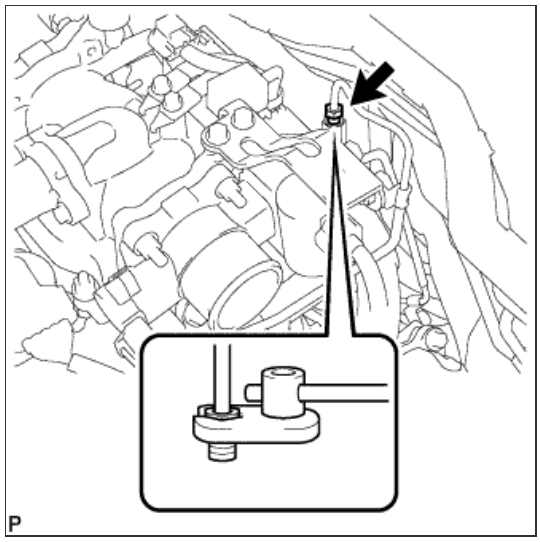


c. Remove the bolt and clutch hose.

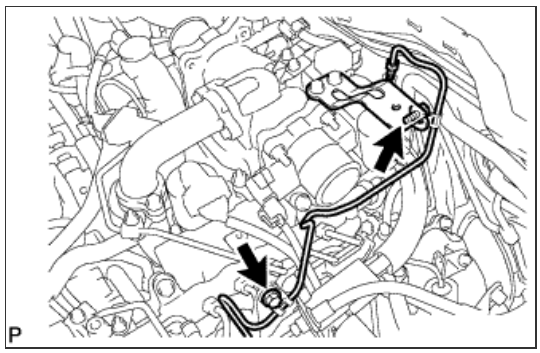
18. REMOVE AIR TUBE SUB-ASSEMBLY LH

a. Loosen the hose clamp.

b. Remove the air tube from the throttle body.



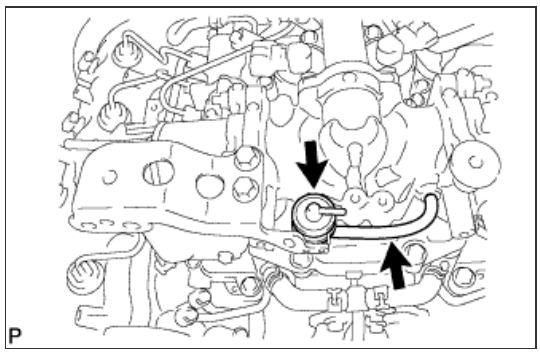
19. REMOVE TUBE CONNECTOR TO FLE BLE HOSE TUBE (for Manual Transmission



a. Using a 10 mm union nut wrench, disconnect the tube connector to flexible hose tube from the clutch tube to release cylinder 2 way.

NOTICE:

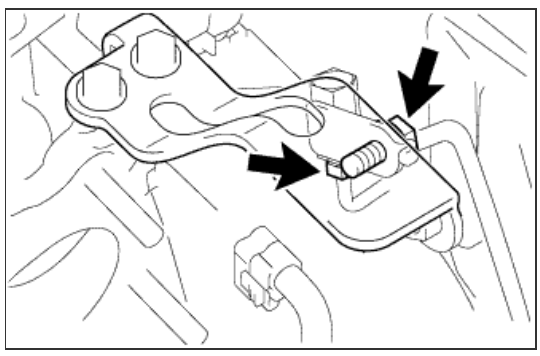
- **Do not bend or damage the flexible hose tube.**
- **Do not allow any foreign matter such as dirt and dust to enter the flexible hose tube from the connecting point.**



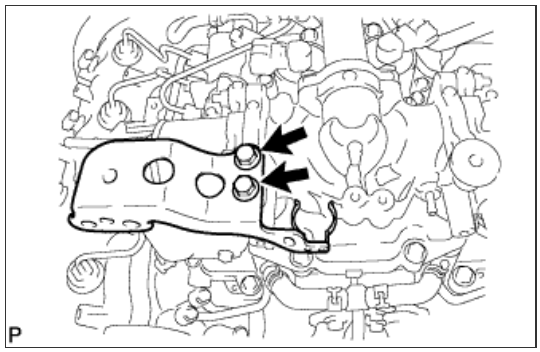
b. Remove the 2 bolts and tube connector to flexible hose tube.

20. REMOVE NO. 1 GAS FILTER

a. Disconnect the hose from the intake pipe.



b. Remove the gas filter.

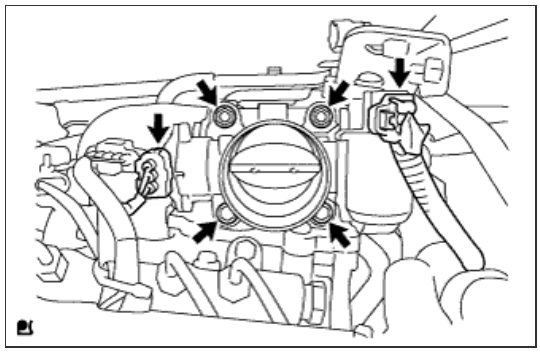


21. REMOVE NO. 3 INTERCOOLER SUPPORT BRACKET

a. for anual Transmission:

i. Remove the bolt and disconnect the clutch tube to release cylinder 2 way from the bracket.

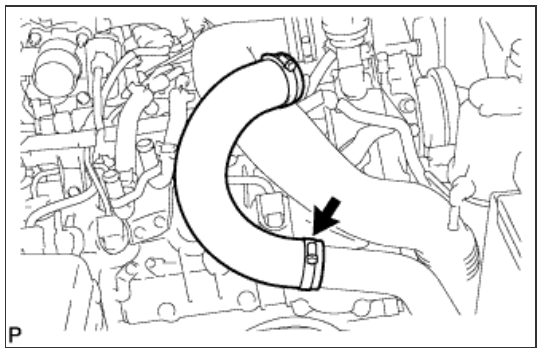
b. Remove the 2 bolts and bracket.



22. REMOVE DIESEL THROTTLE BODY ASSEMBLY LH

a. Disconnect the throttle position sensor connector.

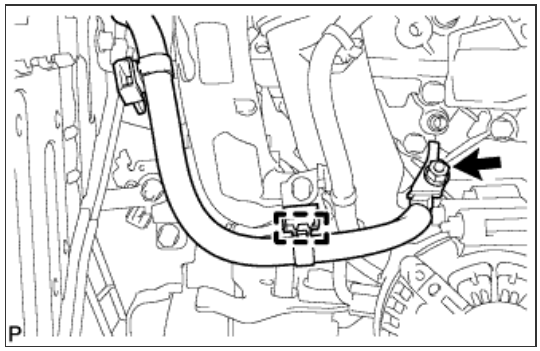
b. Disconnect the throttle motor connector.



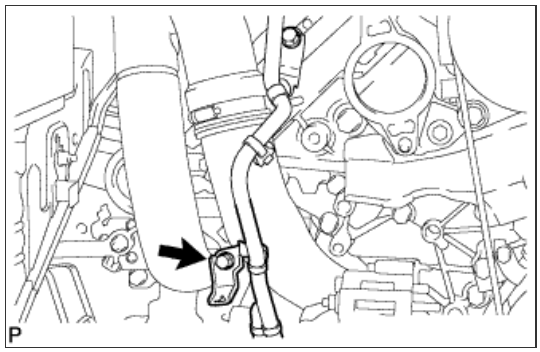
c. Remove the 2 bolts, 2 nuts and throttle body.

d. Remove the gasket from the intake pipe.

23. REMOVE NO. 1 AIR HOSE

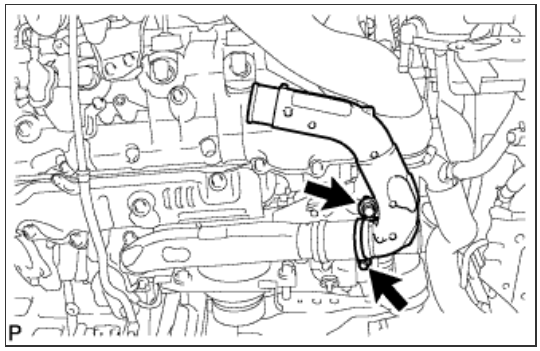


a. Loosen the hose clamp and remove the No. 1 air hose.



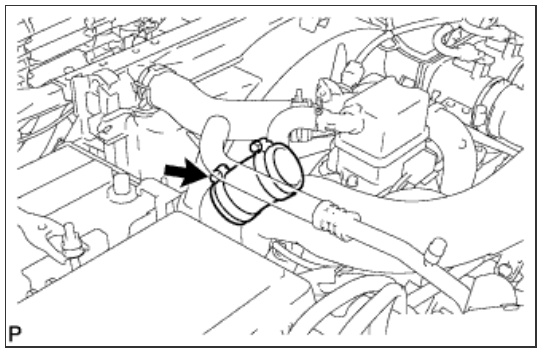
24. REMOVE NO. 3 AIR TUBE

a. Disconnect the wire harness from the clamp.

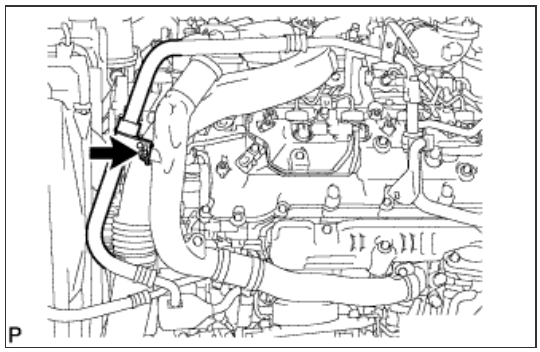


b. Remove the nut and ground wire.

c. Remove the bolt and disconnect the wire harness bracket.

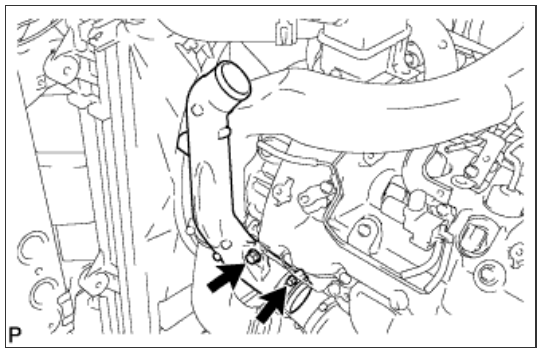


d. Loosen the hose clamp and remove the bolt and No. 3 air tube.



25. REMOVE NO. 2 AIR HOSE

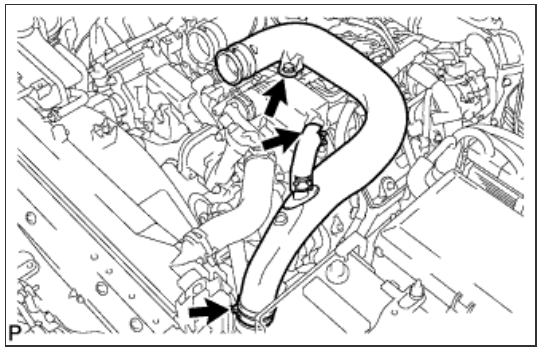
a. Loosen the hose clamp and remove the No. 2 air hose.



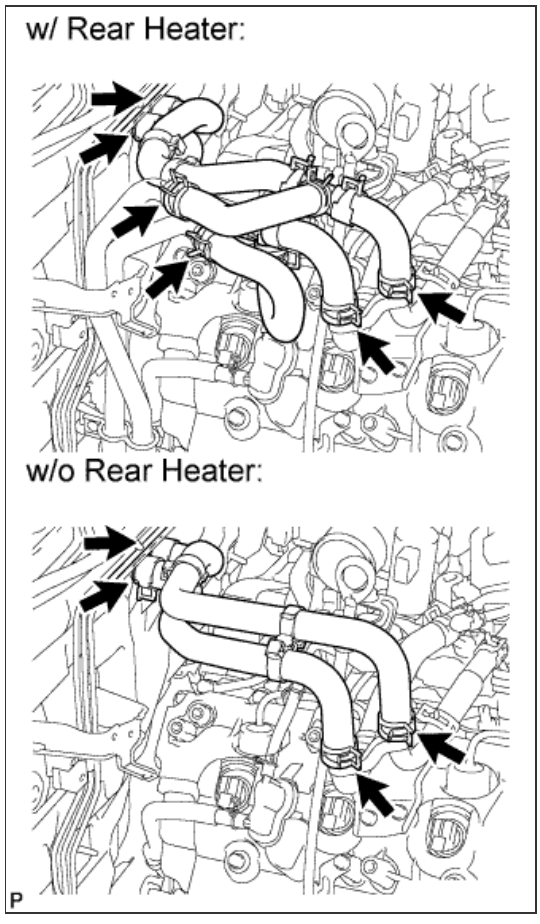
26. REMOVE NO. 4 AIR TUBE

a. Remove the bolt and disconnect the suction hose.

b. Loosen the hose clamp and remove the bolt and No. 4 air tube.



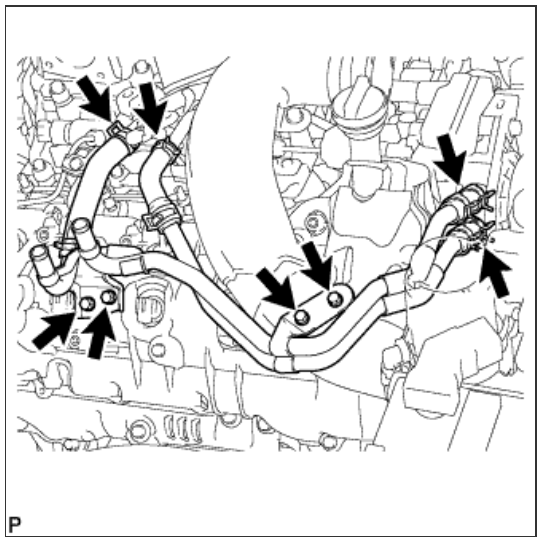
27. REMOVE NO. 2 AIR CLEANER PIPE SUB-ASSEMBLY



a. Disconnect the ventilation hose from the oil separator.

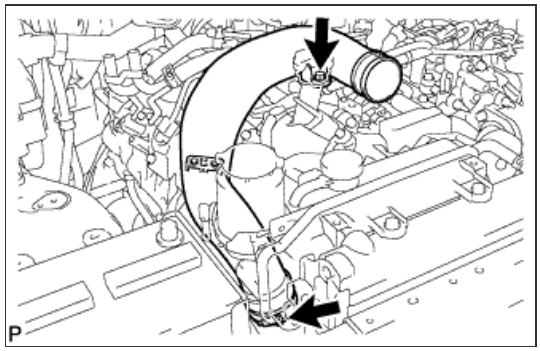
b. Loosen the hose clamp.

c. Remove the bolt and No. 2 air cleaner pipe.

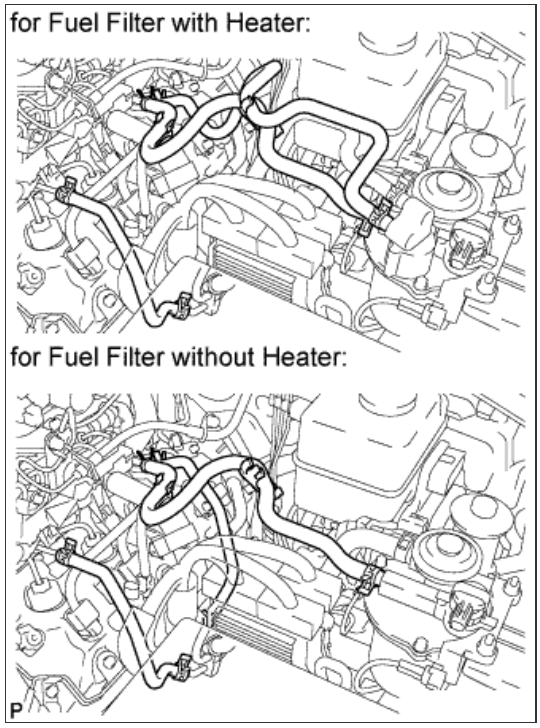


28. DISCONNECT WATER HOSE SUB-ASSEMBLY

29. REMOVE HEATER WATER PIPE SUB-ASSEMBLY (w/ Viscous Heater



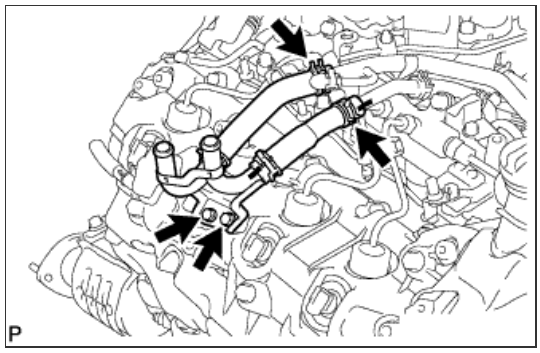
a. Remove the 4 bolts and disconnect the 4 water hose ends, and then remove the heater water pipe.



30. REMOVE NO. 1 AIR CLEANER PIPE SUB-ASSEMBLY

a. Loosen the hose clamp.

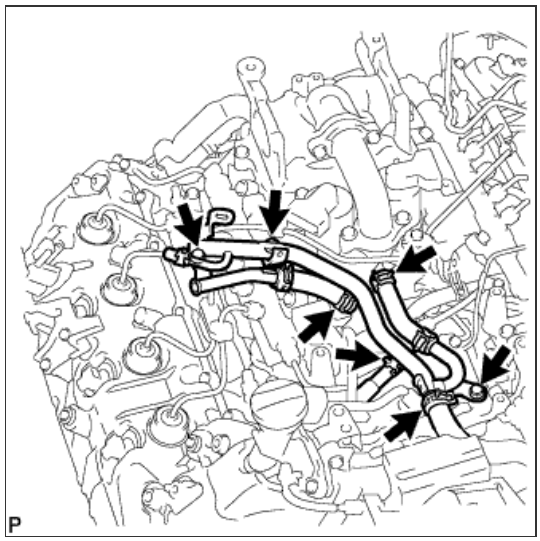
b. Remove the bolt and No. 1 air cleaner pipe.



31. DISCONNECT FUEL HOSE

32. REMOVE NO. 3 WATER BY-PASS PIPE (w/o Viscous Heater

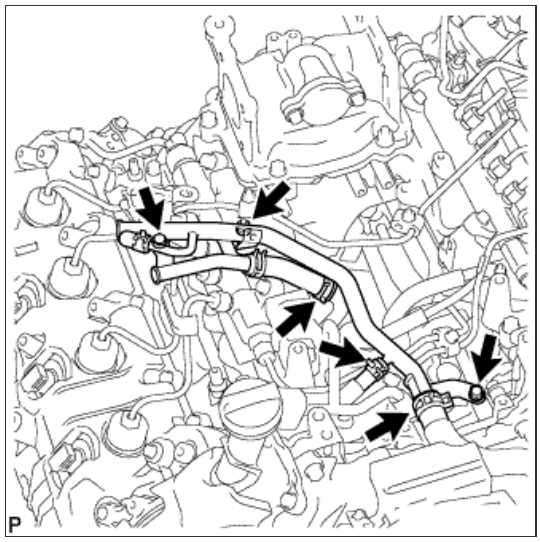
a. Remove the 2 bolts and disconnect the 2 water hose ends, and then remove the No. 3 water by-pass pipe.



33. REMOVE NO. 4 WATER BY-PASS PIPE

a. w/ R System:

i. Remove the 2 bolts and nut.

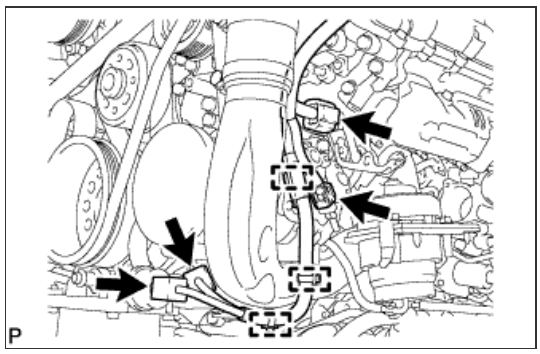


ii. Disconnect the 4 water hose ends, and then remove the No. 4 water by-pass pipe.

b. w/o R System:

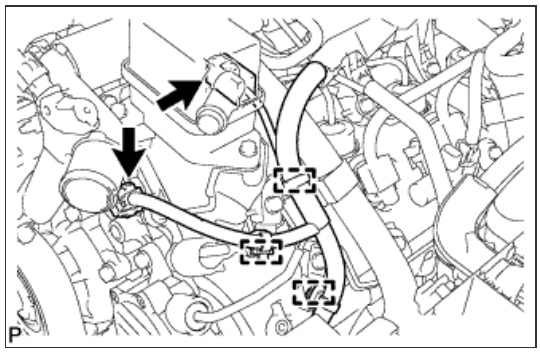
i. Remove the 2 bolts and nut.

ii. Disconnect the 3 water hose ends, and then remove the No. 4 water by-pass pipe.



34. DISCONNECT ENGINE WIRE

a. LH Side:

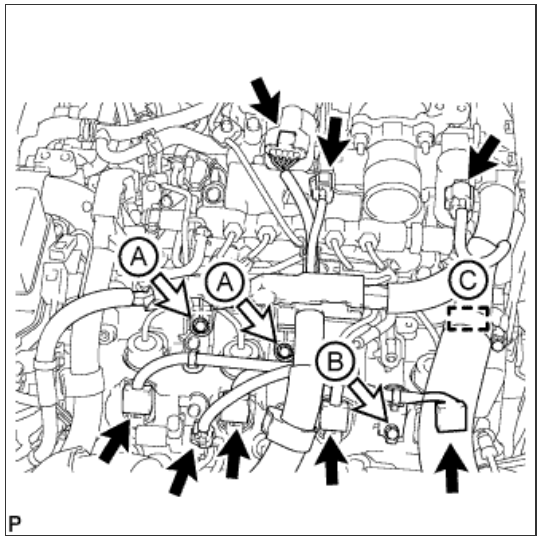


i. Disconnect the 4 connectors.

ii. Using a clip remover, detach the 3 wire harness clamps.

iii. Disconnect the 2 connectors.

i . Using a clip remover, detach the 3 wire harness clamps.



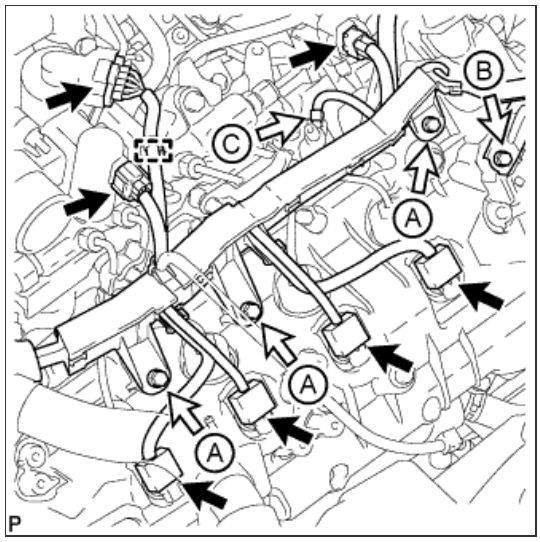
. Disconnect the 8 connectors.

.i Remove the bolt and engine wire harness bracket labeled B.

ii Remove the 2 bolts and disconnect the engine wire protector labeled A.

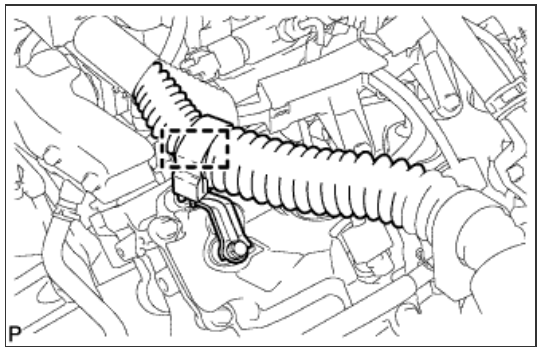
iii for RHD:
Disconnect the wire harness from the wire harness clamp holder labeled C.

b. RH Side:



i. Disconnect the 7 connectors.

ii. Using a clip remover, detach the wire harness clamp.



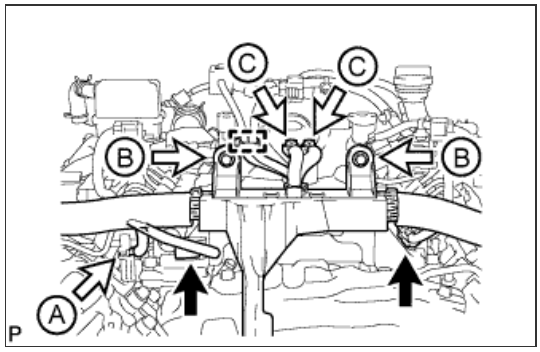
iii. Remove the 3 bolts and disconnect the wire harness protector labeled A.

i . Remove the bolt and wire harness bracket labeled B.

. Remove the nut and glow plug wire harness labeled C.

.i for RHD:
Disconnect the wire harness from the wire harness clamp holder.

c. Rear Side:



i. Using a clip remover, detach the wire harness clamp.

ii. Remove the 2 bolts and 2 ground wires labeled C.

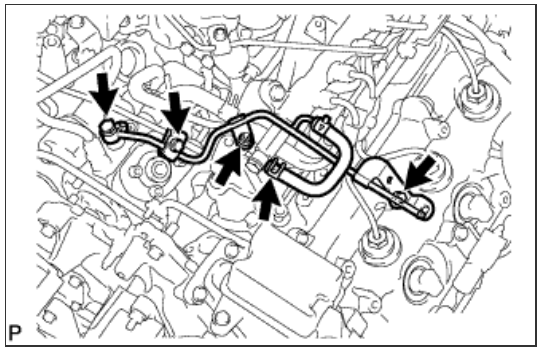
iii. Remove the 2 bolts and disconnect the engine wire harness protector labeled B.

i . Disconnect the 2 common rail connectors.

. Remove the nut and disconnect the glow plug wire harness labeled A.

35. REMOVE NO. 2 FUEL PIPE SUB-ASSEMBLY

NOTICE:



- **After remo ig a fuel pipe, to pre entdirt or foreign objects from entering the fuel pipe ends, co erhe fuel pipe ends with plastic bags.**
- **After remo ig a fuel pipe, to pre entdirt or foreign objects from entering the fuel supply pump hole, co erhe hole with protecti e tape.**

a. Disconnect the fuel hose from the No. 5 nozzle leakage pipe.

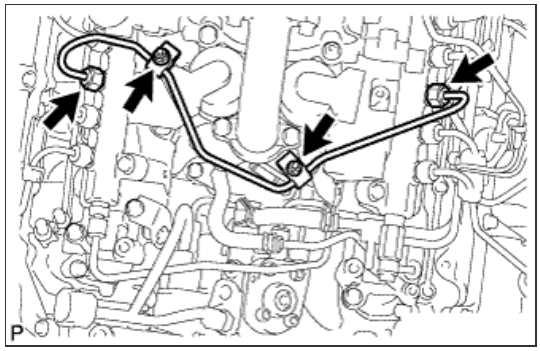
b. Remove the bolt and No. 2 injection pipe clamp.

c. Remove the union bolt and gasket.

d. Remove the bolt, nut and No. 2 fuel pipe.

36. REMOVE NO. 6 INJECTION PIPE SUB-ASSEMBLY

NOTICE:



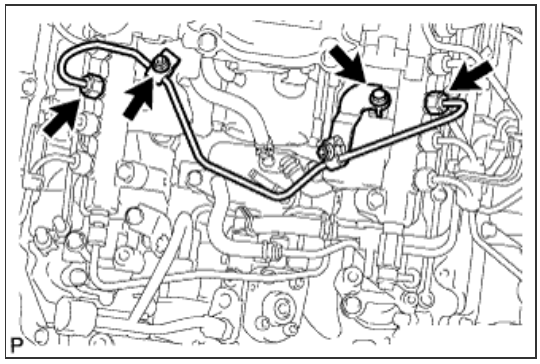
After removing an injection pipe, to prevent dirt or foreign objects from entering the common rail holes, cover the holes with protective tape.

a. w/ EGR System:

i. Using a union nut wrench, loosen the No. 6 injection pipe ends.

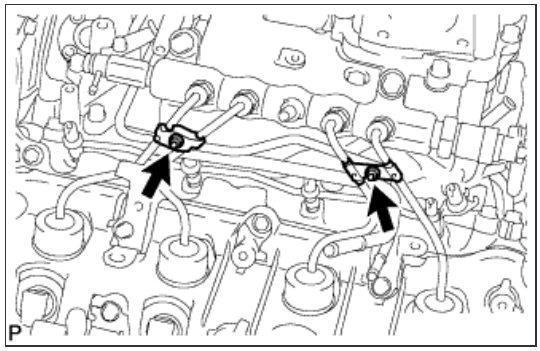
ii. Remove the 2 nuts and 2 No. 2 injection pipe clamps.

iii. Remove the No. 6 injection pipe.



b. w/o EGR System:

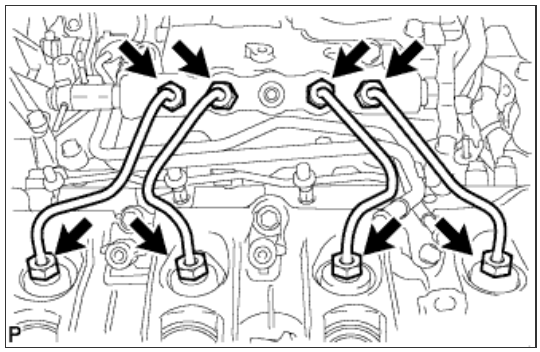
i. Using a union nut wrench, loosen the No. 6 injection pipe ends.



ii. Remove the nut and No. 2 injection pipe clamp.

iii. Remove the bolt and No. 6 injection pipe.

37. REMOVE INJECTION PIPE LH

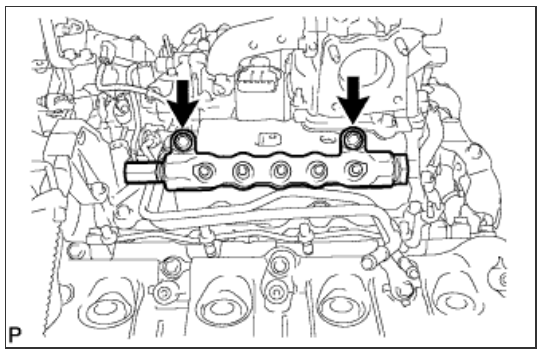


a. w/ Intercooler:
Remove the 2 nuts and 4 injection pipe clamps.

b. Using a union nut wrench, remove the 4 injection pipes.

NOTICE:

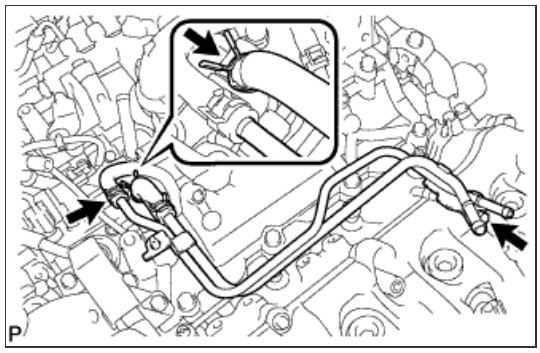
After removing an injection pipe, to prevent dirt or foreign objects from entering the common rail holes or injector holes, cover the holes with protective tape.



38. REMOVE COMMON RAIL ASSEMBLY LH

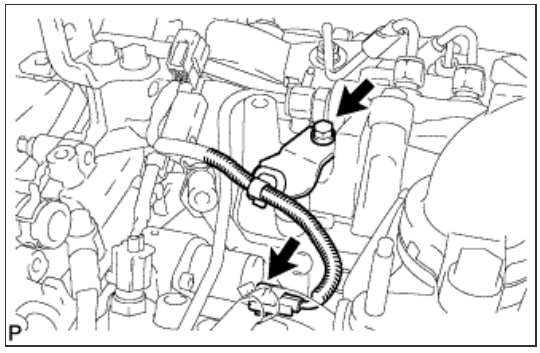
a. Remove the 2 bolts and common rail.

NOTICE:



Do not remove the fuel pressure limiter from the common rail. If it is removed, replace the common rail.

39. REMOVE FUEL FILTER TO INJECTION PUMP FUEL PIPE SUB-ASSEMBLY

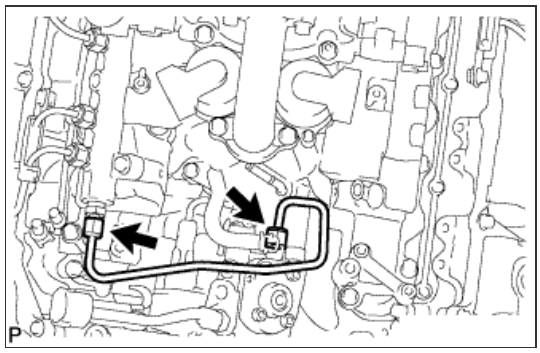


a. Disconnect the 2 hoses from the fuel pipe.

b. Remove the bolt and fuel filter to injection pump fuel pipe.

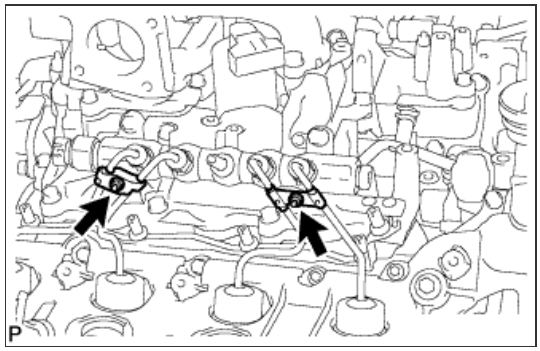
40. DISCONNECT FUEL PUMP MOTOR WIRE

a. Remove the bolt and disconnect the connector from the fuel supply pump.



41. REMOVE NO. 5 INJECTION PIPE SUB-ASSEMBLY

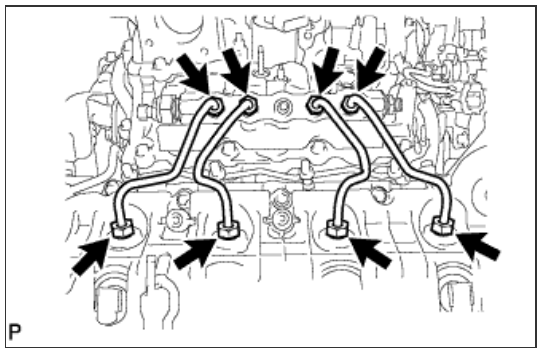
a. Using a union nut wrench, remove the No. 5 injection pipe.



NOTICE:

After removing an injection pipe, to prevent dirt or foreign objects from entering the common rail hole or injection pump hole, cover the holes with protective tape.

42. REMOVE INJECTION PIPE RH

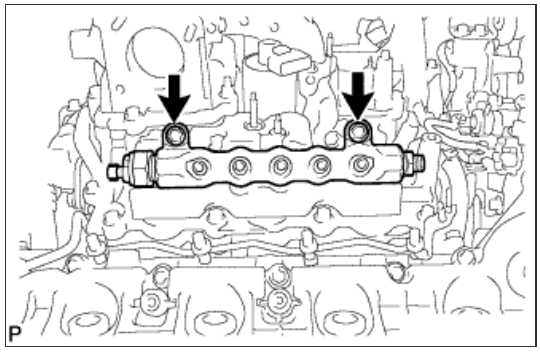


a. w/ Intercooler:
Remove the 2 nuts and 4 injection pipe clamps.

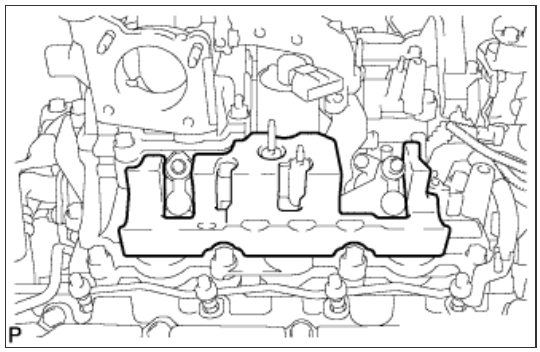
b. Using a union nut wrench, remove the 4 injection pipes.

NOTICE:

After removing an injection pipe, to prevent dirt or foreign objects from entering the common rail holes or injector holes, cover the holes with protective tape.

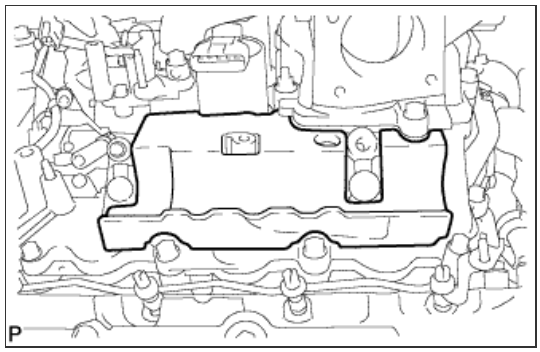


43. REMOVE COMMON RAIL ASSEMBLY RH



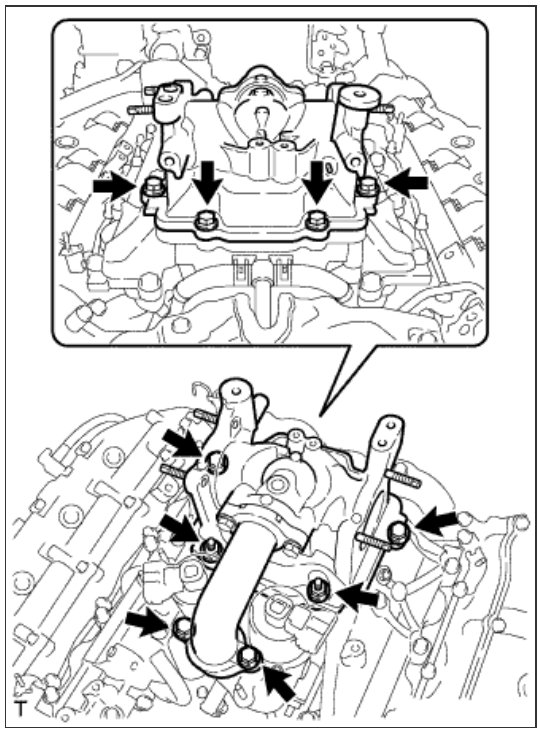
a. Remove the 2 bolts and common rail.

NOTICE:

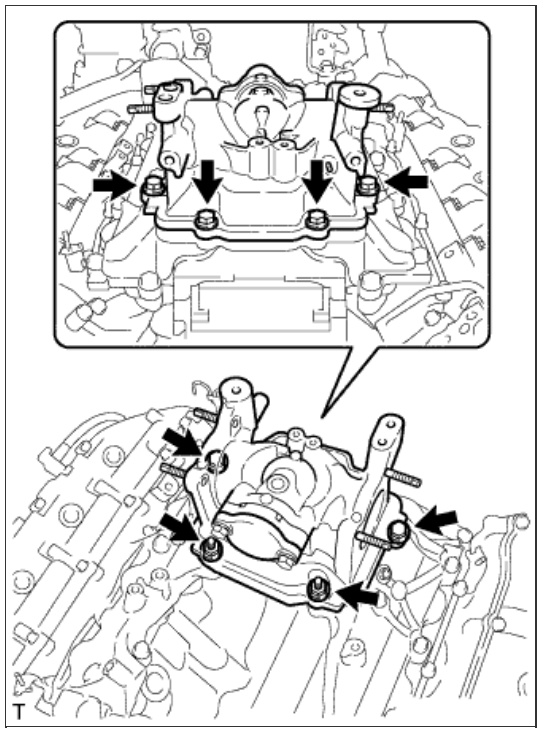


Do not remove the fuel pressure sensor from the common rail. If it is removed, replace the common rail.

44. REMOVE NO. 1 INTAKE MANIFOLD INSULATOR (w/ Intercooler

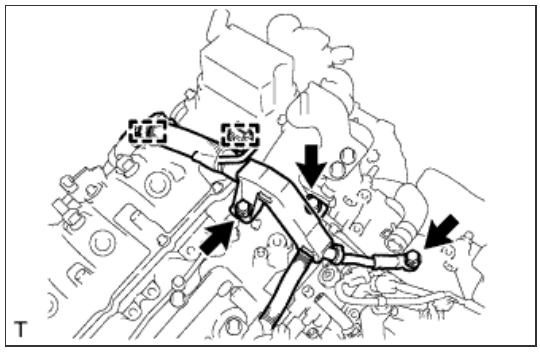


45. REMOVE NO. 2 INTAKE MANIFOLD INSULATOR (w/ Intercooler

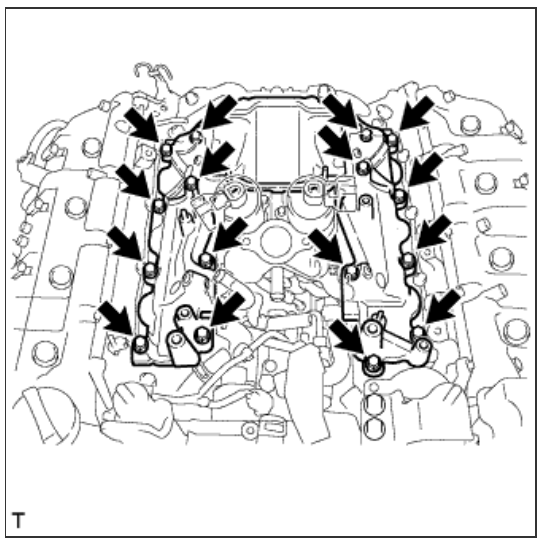


46. REMOVE INTAKE PIPE

a. w/ R System:
Remove the 2 nuts, 6 bolts, intake pipe and 2 gaskets.

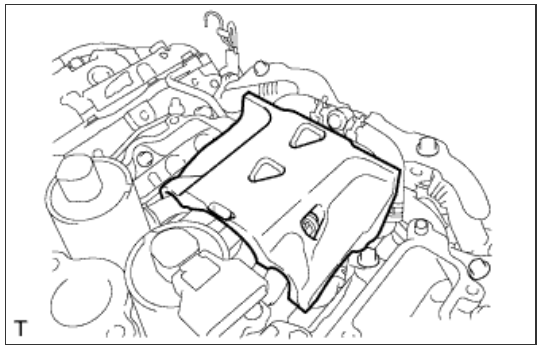


b. w/o R System:
Remove the 2 nuts, 4 bolts, intake pipe and gasket.



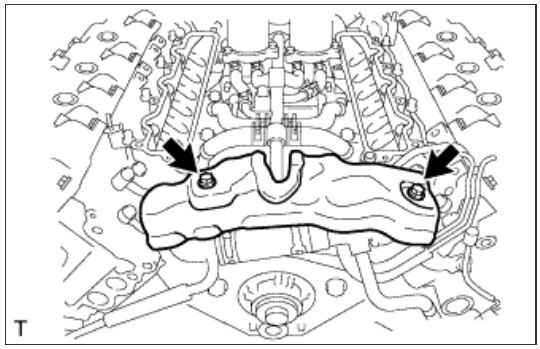
47. DISCONNECT NO. 2 ENGINE WIRE

a. Remove the 3 bolts and using a clip remover, detach the 2 wire harness clamps, and then disconnect the No. 2 engine wire.

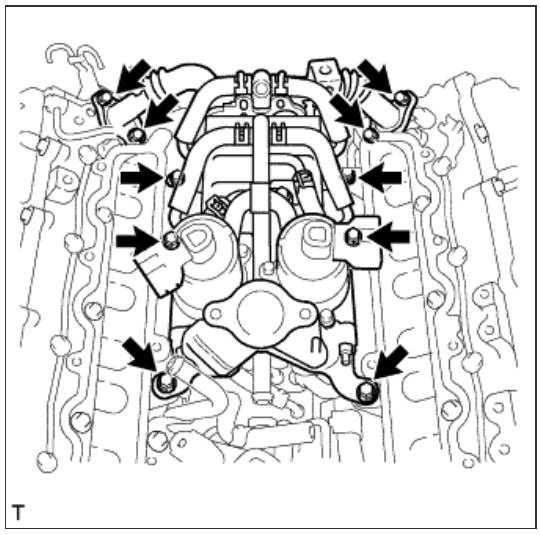


48. REMOVE NO. 3 INTAKE MANIFOLD

a. Remove the 16 bolts, No. 3 intake manifold and 2 gaskets.

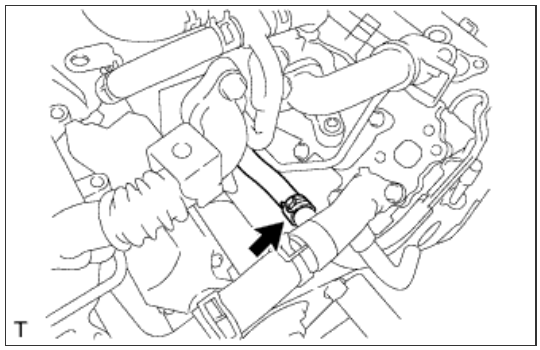


49. REMOVE INTAKE MANIFOLD INSULATOR (w/ EGR System

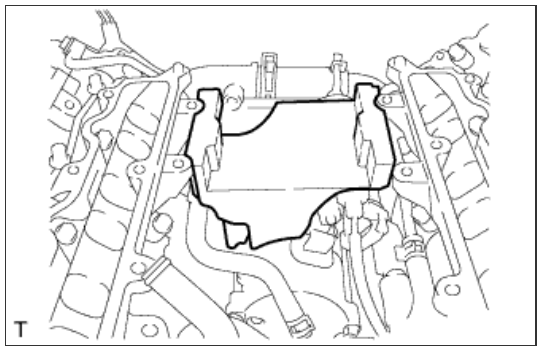


50. REMOVE EGR PIPE INSULATOR (w/ EGR System

a. Remove the 2 bolts and R pipe insulator.



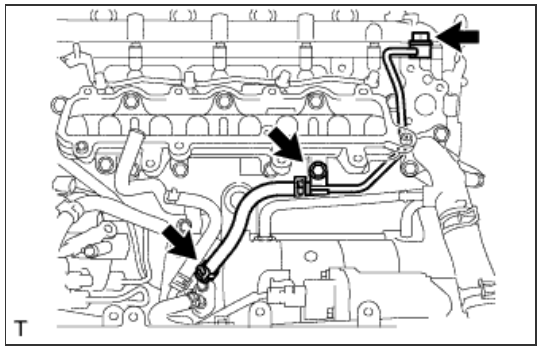
51. REMOVE EGR VALVE ASSEMBLY WITH EGR COOLER (w/ EGR System



a. Remove the 10 bolts, R valve with R cooler and 2 gaskets.

b. Disconnect the No. 5 water by-pass hose from the water by-pass outlet.

52. REMOVE EGR COOLER INSULATOR (w/ EGR System



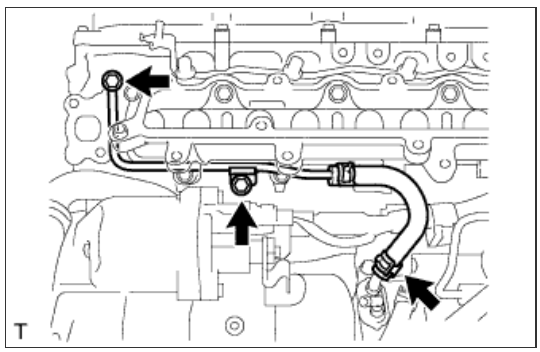
53. REMOVE NO. 3 NO LE LEAKGE PIPE

a. Disconnect the No. 1 fuel hose from the fuel cooler.

b. Remove the union bolt, bolt, No. 3 nozzle leakage pipe and gasket.

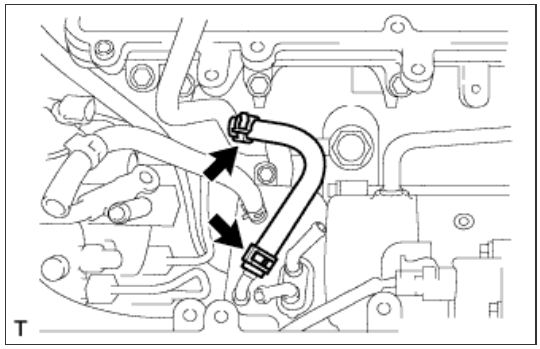
NOTICE:

After removing the nozzle leakage pipe, to prevent dirt or foreign objects from entering the nozzle leakage pipe, cover the nozzle leakage pipe ends with plastic bags.



54. REMOVE NO. 4 NO LE LEAKGE PIPE

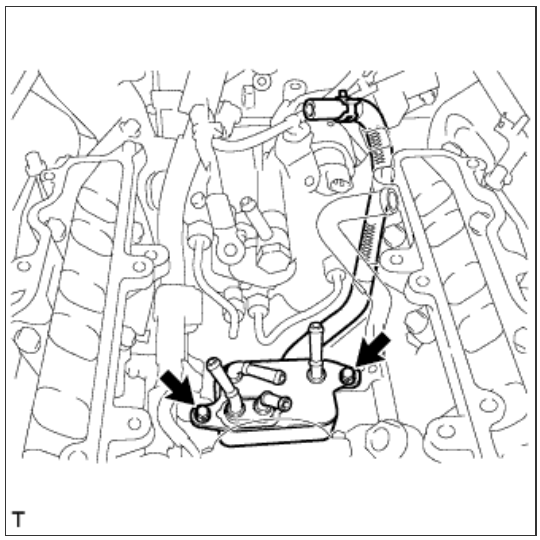
a. Disconnect the No. 2 fuel hose from the fuel cooler.



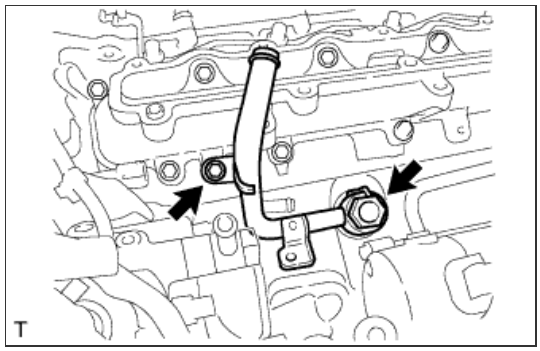
b. Remove the union bolt, bolt, No. 4 nozzle leakage pipe and gasket.

NOTICE:

After removing the nozzle leakage pipe, to prevent dirt or foreign objects from entering the nozzle leakage pipe, cover the nozzle leakage pipe ends with plastic bags.

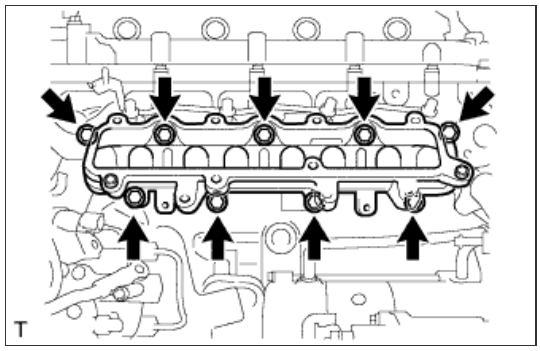


55. DISCONNECT NO. 6 WATER BY-PASS HOSE



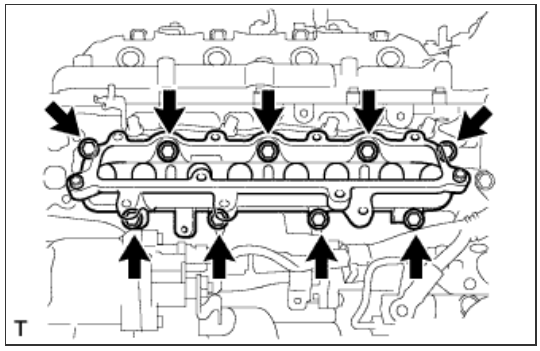
56. REMOVE FUEL COOLER ASSEMBLY

a. Remove the 2 bolts and fuel cooler.



57. REMOVE NO. 1 WATER BY-PASS PIPE

a. Remove the union bolt, bolt, No. 1 water by-pass pipe and gasket.



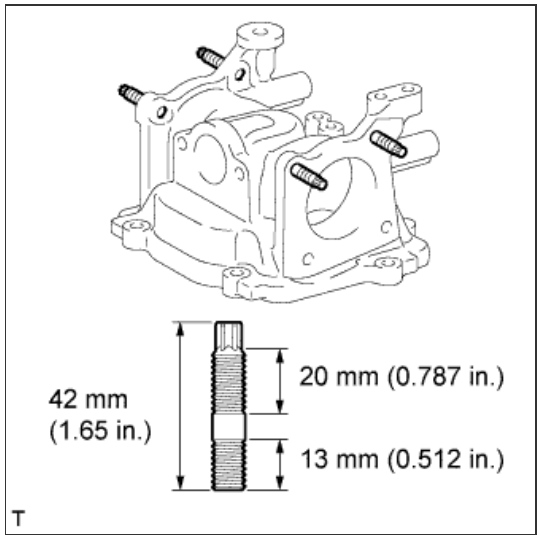
58. REMOVE NO. 1 INTAKE MANIFOLD

a. Remove the 9 bolts, No. 1 intake manifold and gasket.

59. REMOVE NO. 2 INTAKE MANIFOLD

a. Remove the 9 bolts, No. 2 intake manifold and gasket.

60. REPLACE STUD BOLT



HINT:

If a stud bolt is deformed or the threads are damaged, replace it.

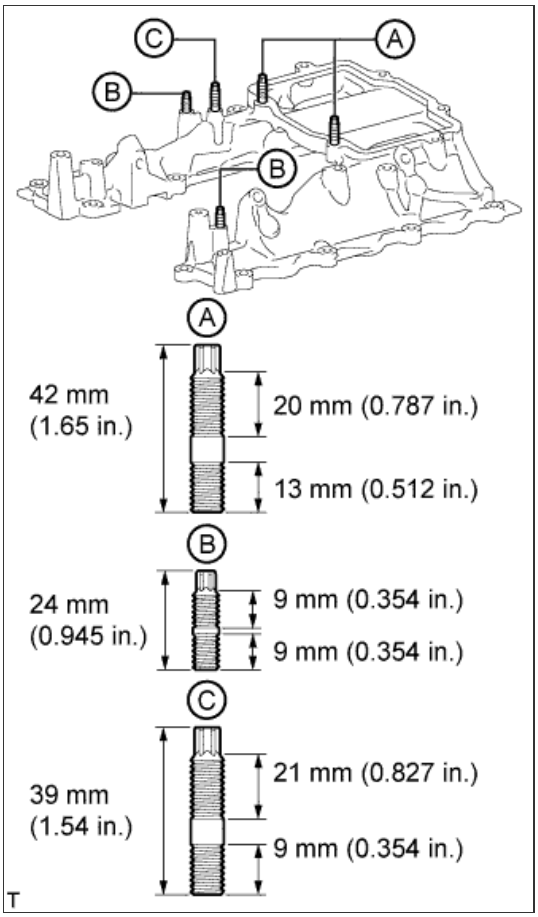
a. The stud bolt of the intake pipe.

i. Using an E8 "TORX" wrench, replace the stud bolts.

Torque:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }

b. The stud bolt of the No. 3 intake manifold.

i. Using an E8 "TORX" wrench, replace the stud bolts labeled A.



Torque:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }

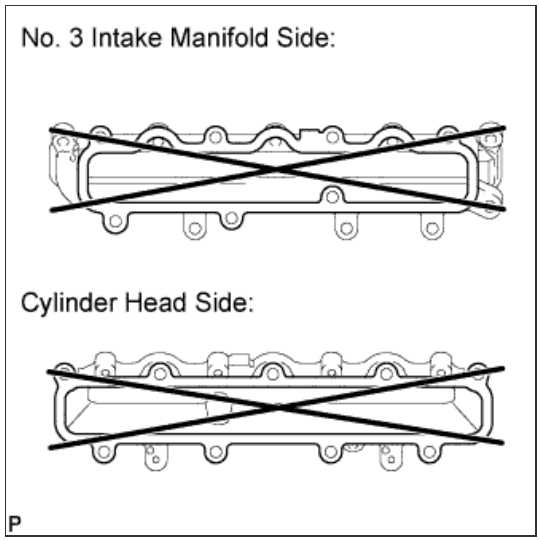
ii. Using an E6 "TORX" wrench, replace the stud bolts labeled B.

Torque:
4.5 N*m{ 46 kgf*cm , 40 in.*lbf }

iii. Using an TORX" wrench, replace the stud bolt labeled C.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

for Preparation Click here



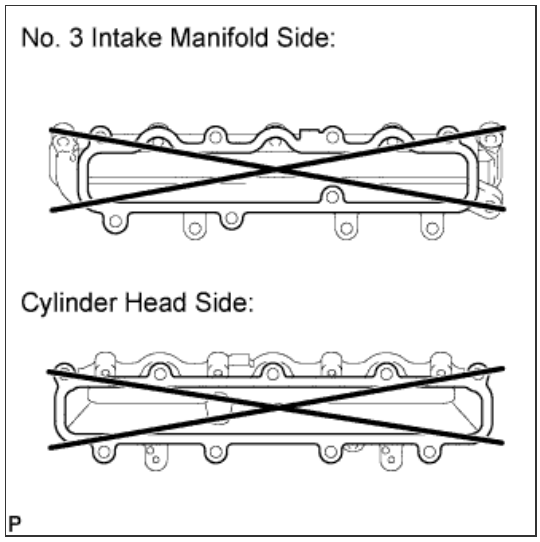
1. INSPECT NO. 1 INTAKE MANIFOLD FOR FLATNESS

a. Using a precision straightedge and feeler gauge, measure the warpage of the contact surface between the No. 1 and No. 3 intake manifold, and the No. 1 intake manifold and cylinder head.

Ma imum Warpage:

tem	Specified Condition
No. 3 intake manifold	0.10 mm (0.00394 in.)
Cylinder head	0.10 mm (0.00394 in.)

f the warpage is more than the maximum, replace the No. 1 intake manifold.



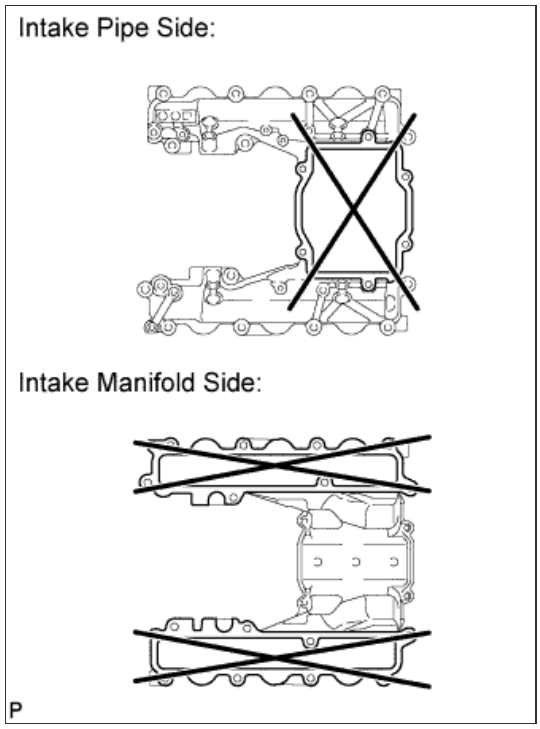
2. INSPECT NO. 2 INTAKE MANIFOLD FOR FLATNESS

a. Using a precision straightedge and feeler gauge, measure the warpage of the contact surface between the No. 2 and No. 3 intake manifold, and the No. 2 intake manifold and cylinder head.

Ma imum Warpage:

tem	Specified Condition
No. 3 intake manifold	0.10 mm (0.00394 in.)
Cylinder head	0.10 mm (0.00394 in.)

f the warpage is more than the maximum, replace the No. 2 intake manifold.



3. INSPECT NO. 3 INTAKE MANIFOLD FOR FLATNESS

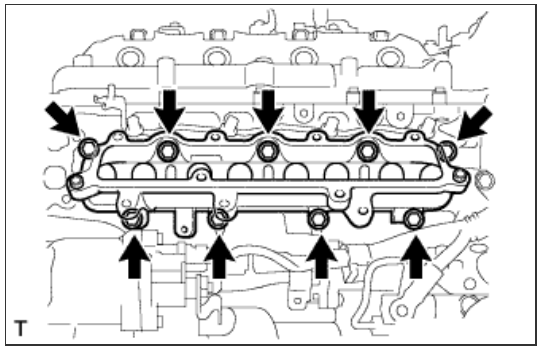
a. Using a precision straightedge and feeler gauge, measure the warpage of the contact surface between the No. 3 and No. 1 intake manifold, the No. 3 and No. 2 intake manifold, and the No. 3 intake manifold and intake pipe.

Ma imum Warpage:

tem	Specified Condition
ntake pipe	0.10 mm (0.00394 in.)
No. 2 and No. 3 intake manifold	0.15 mm (0.00591 in.)

f the warpage is more than the maximum, replace the No. 3 intake manifold.

for Preparation Click here

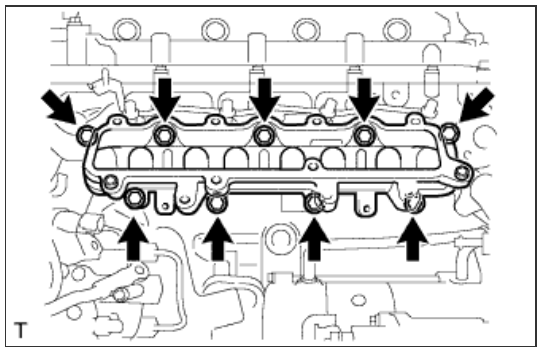


NOTICE:

When replacing the injectors (including shuffling the injectors between the cylinders), common rail, cylinder head, or intake manifold, it is necessary to replace the injection pipes with new ones.

1. INSTALL NO. 2 INTAKE MANIFOLD

a. Install a new gasket and the No. 2 intake manifold with the 9 bolts.

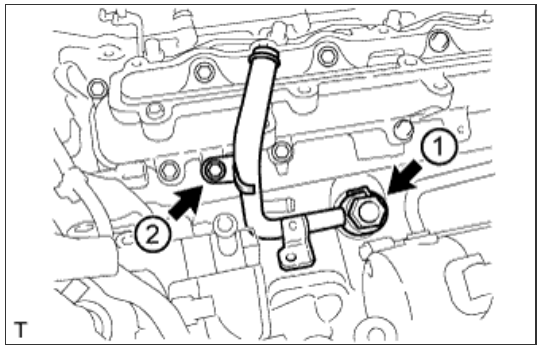


Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

2. INSTALL NO. 1 INTAKE MANIFOLD

a. Install a new gasket and the No. 1 intake manifold with the 9 bolts.

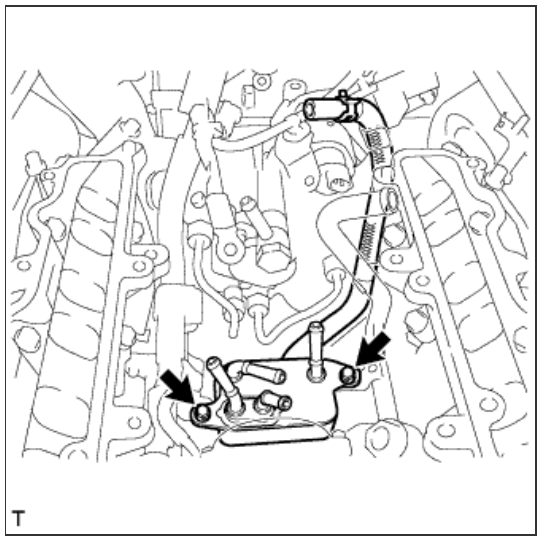
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



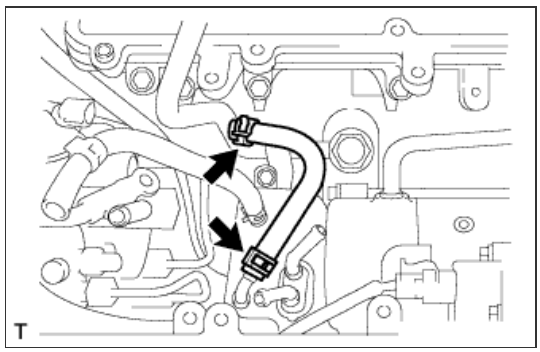
3. INSTALL NO. 1 WATER BY-PASS PIPE

a. Temporarily install a new gasket and the No. 1 water by-pass pipe with the union bolt and bolt.

b. Tighten the union bolt and bolt in the order shown in the illustration.



Torque:
for union bolt:
59 N*m{ 600 kgf*cm , 43 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

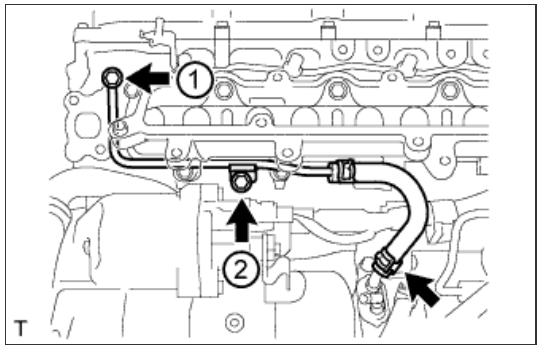


4. INSTALL FUEL COOLER ASSEMBLY

a. Install the fuel cooler with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

5. CONNECT NO. 6 WATER BY-PASS HOSE



6. INSTALL NO. 4 NO LE LEAKAGE PIPE

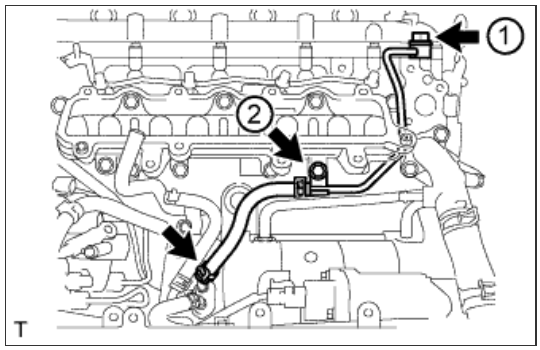
a. Temporarily install a new gasket and the No. 4 nozzle leakage pipe with the union bolt and bolt.

b. Tighten the union bolt and bolt in the order shown in the illustration.

Torque:
for union bolt:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

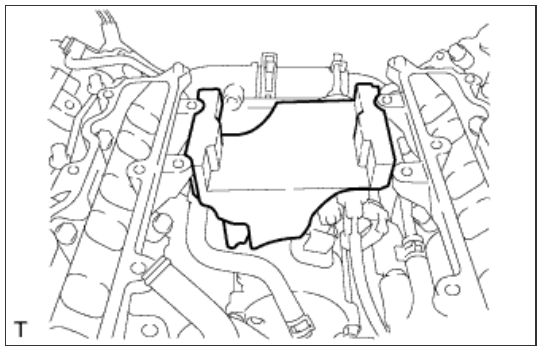
c. Connect the No. 2 fuel hose to the fuel cooler.

7. INSTALL NO. 3 NO LE LEAKAGE PIPE



a. Temporarily install a new gasket and the No. 3 nozzle leakage pipe with the union bolt and bolt.

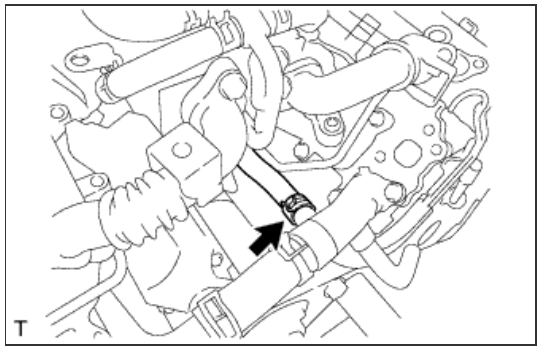
b. Tighten the union bolt and bolt in the order shown in the illustration.



Torque:
for union bolt:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

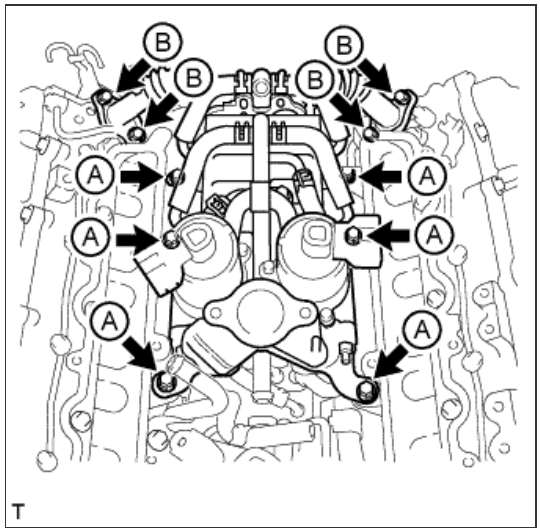
c. Connect the No. 1 fuel hose to the fuel cooler.



8. INSTALL EGR COOLER INSULATOR (w/ EGR System)

9. INSTALL EGR VALVE ASSEMBLY WITH EGR COOLER (w/ EGR System)

a. Connect the No. 5 water by-pass hose to the water by-pass outlet.

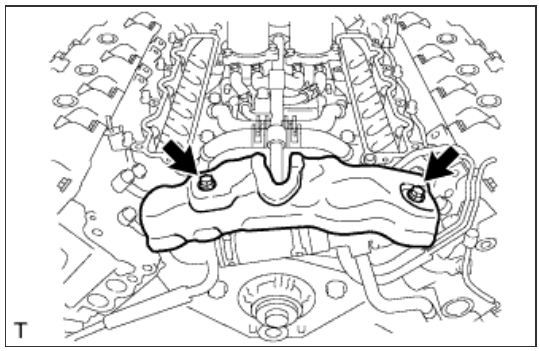


b. Install 2 new gaskets and the EGR valve with EGR cooler with the 6 bolts labeled A and 4 bolts labeled B shown in the illustration.

Torque:
for bolt A:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for bolt B:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

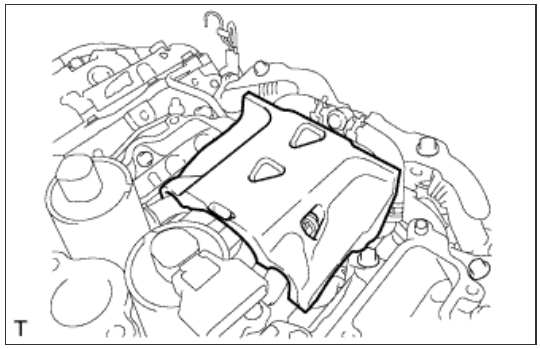
HINT:

The gasket claws should face toward the No. 1 and No. 2 EGR pipes.



10. INSTALL EGR PIPE INSULATOR (w/ EGR System)

a. Install the EGR pipe insulator with the 2 bolts.



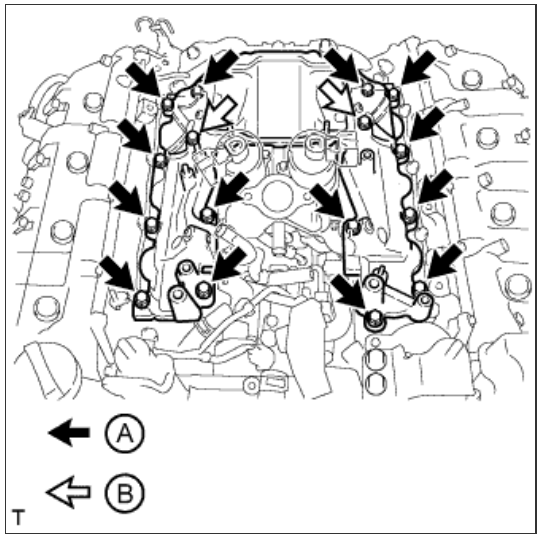
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

NOTICE:

If the No. 1 and No. 2 EGR pipe insulator installation stay is deformed, or the bolt holes of the EGR pipe insulator do not align, replace the No. 1 and No. 2 EGR pipes as a set.

11. INSTALL INTAKE MANIFOLD INSULATOR (w/ EGR System)

12. INSTALL NO. 3 INTAKE MANIFOLD



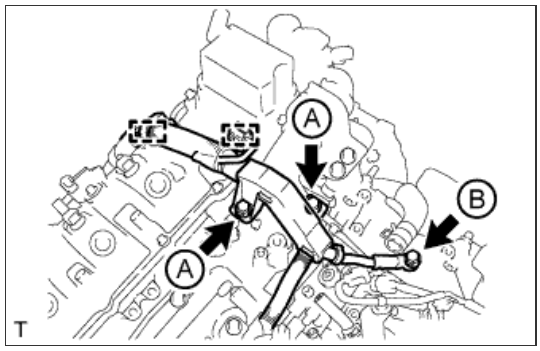
a. Set 2 new gaskets to the No. 1 and No. 2 intake manifolds.

b. Install the No. 3 intake manifold with the 16 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

Bolt Length

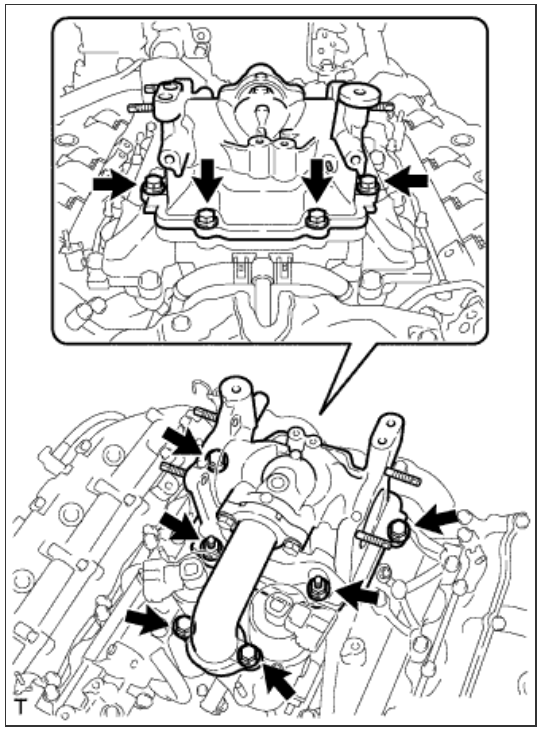
Item	Length
Bolt A	25 mm (0.984 in.)
Bolt B	70 mm (2.76 in.)



13. CONNECT NO. 2 ENGINE WIRE

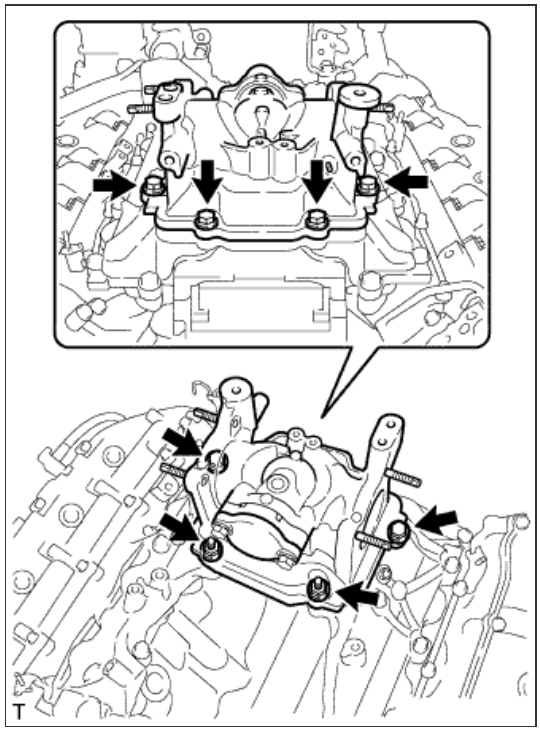
a. Connect the No. 2 engine wire with the 3 bolts.

Torque:
for bolt A:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }
for bolt B:
32 N*m{ 326 kgf*cm , 24 ft.*lbf }



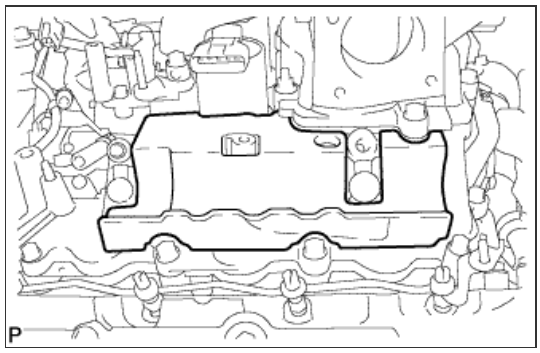
b. Attach the 2 wire harness clamps.

14. INSTALL INTAKE PIPE

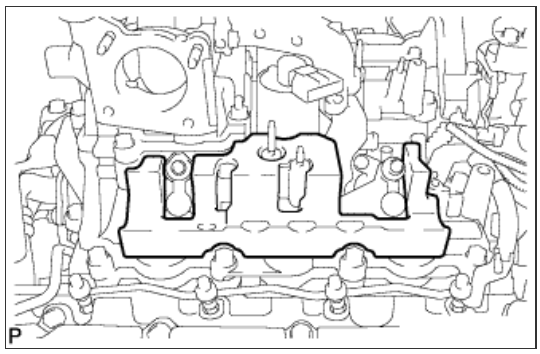


a. w/ EGR System:
Install 2 new gaskets and the intake pipe with the 6 bolts and 2 nuts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

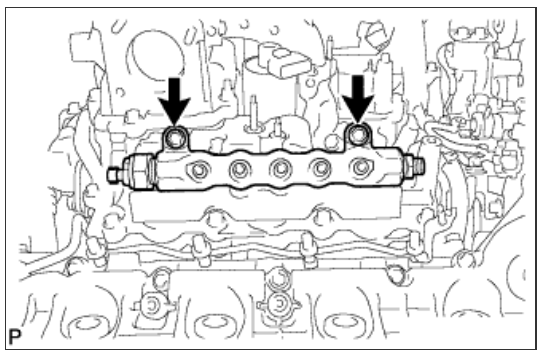


b. w/o EGR System:
Install a new gasket and the intake pipe with the 4 bolts and 2 nuts.



Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

15. INSTALL NO. 2 INTAKE MANIFOLD INSULATOR (w/ Intercooler)

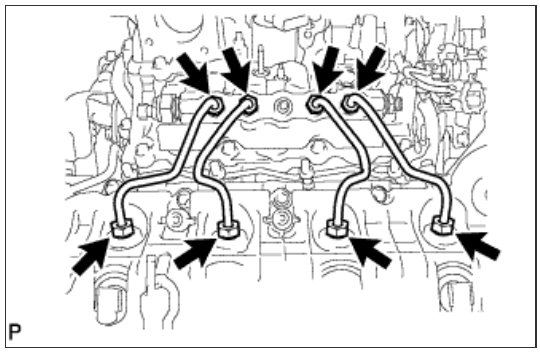


16. INSTALL NO. 1 INTAKE MANIFOLD INSULATOR (w/ Intercooler)

17. INSTALL COMMON RAIL ASSEMBLY RH

a. Install the common rail with the 2 bolts.

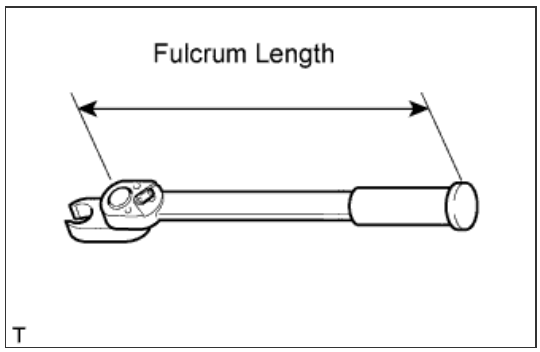
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



18. INSTALL INJECTION PIPE RH

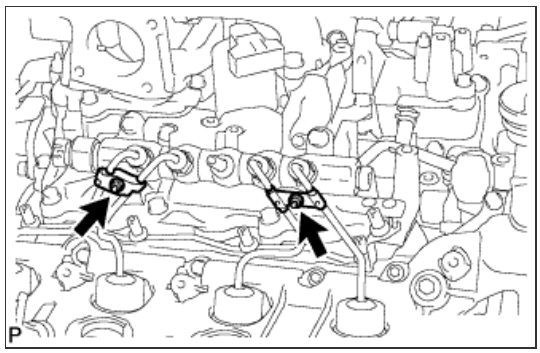
a. Using a union nut wrench, install the 4 new injection pipes.

Torque:
without union nut wrench:
34 N*m{ 347 kgf*cm , 25 ft.*lbf }
with union nut wrench:
31 N*m{ 316 kgf*cm , 23 ft.*lbf }



NOTICE:

Make sure there is no damage or foreign matter on the seal surfaces.

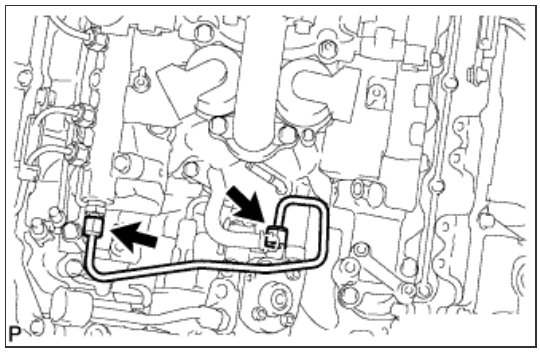


HINT:

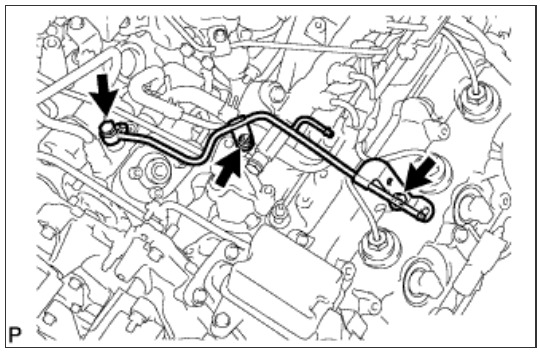
- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.).**
- **Make sure the union nut wrench an the torque wrench are connecte in a straight line.**

b. w/ Intercooler:
Install the 4 injection pipe clamps with the 2 nuts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }



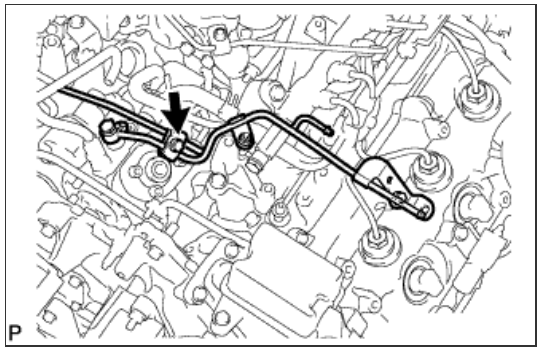
19. INSTALL NO. 5 INJECTION PIPE SUB-ASSEMBLY



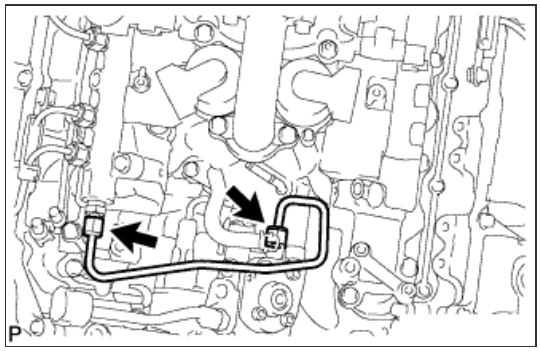
a. Temporarily install a new No. 5 injection pipe by hand.

NOTICE:

Make sure there is no damage or foreign matter on the seal surfaces.

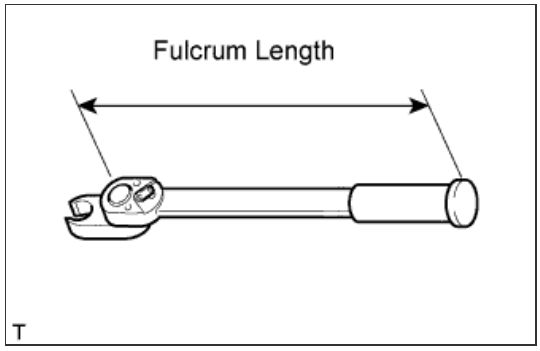


b. Temporarily install the used gasket and No. 2 fuel pipe with the nut, bolt and union bolt.



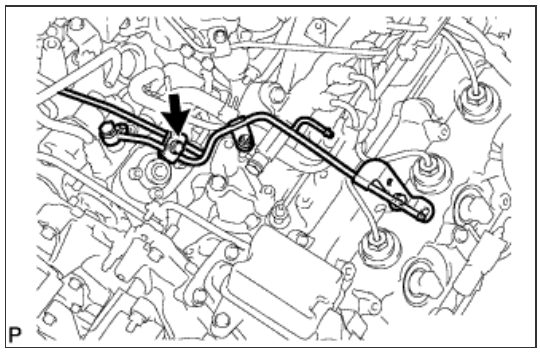
c. Temporarily install the No. 2 injection pipe clamp with the bolt.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }



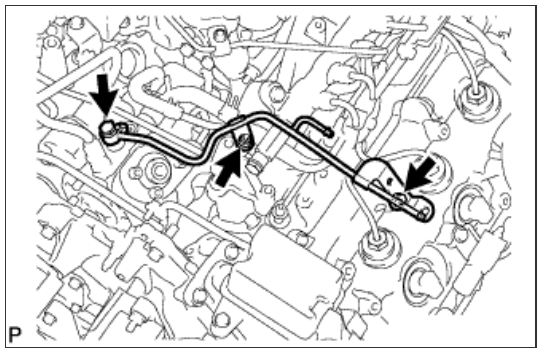
.Using a union nut wrench, tighten the No. 5 injection pipe ends.

Torque:
without union nut wrench:
34 N*m{ 347 kgf*cm , 25 ft.*lbf }
with union nut wrench:
31 N*m{ 316 kgf*cm , 23 ft.*lbf }



HINT:

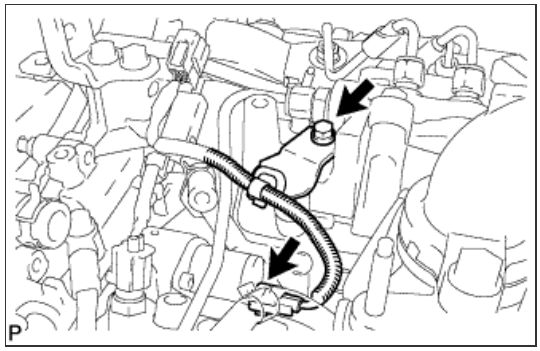
- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.).**
- **Make sure the union nut wrench an the torque wrench are connecte in a straight line.**



e. Remove the bolt and No. 2 injection pipe clamp.

f. Remove the union bolt and gasket.

g. Remove the bolt, nut and No. 2 fuel pipe.

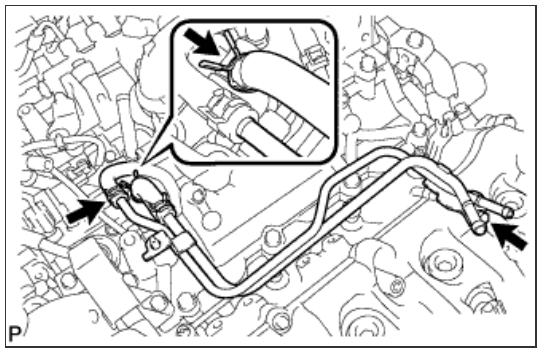


20. CONNECT FUEL PUMP MOTOR WIRE

a. Install the fuel pump motor wire bracket to the No. 3 intake manifold with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

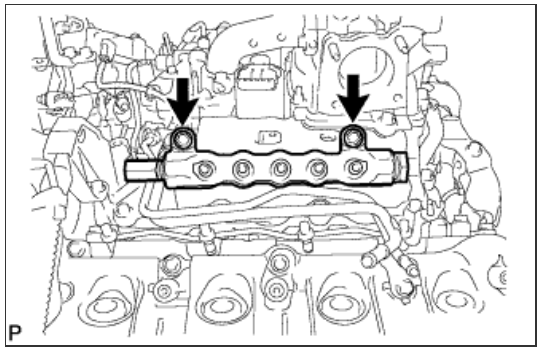
b. Connect the connector to the fuel supply pump.



21. INSTALL FUEL FILTER TO INJECTION PUMP FUEL PIPE SUB-ASSEMBLY

a. Install the fuel filter to injection pump fuel pipe with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

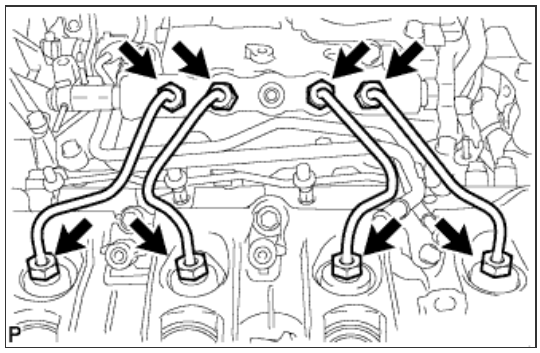


b. Connect the 2 hoses to the fuel pipe.

22. INSTALL COMMON RAIL ASSEMBLY LH

a. Install the common rail with the 2 bolts.

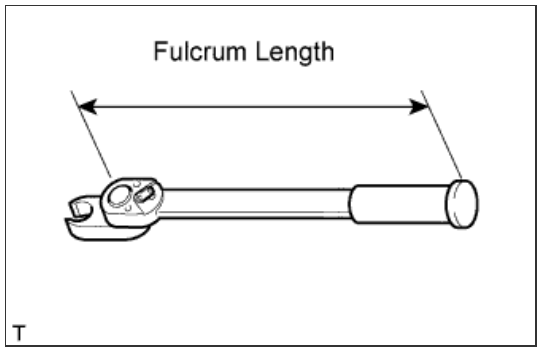
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



23. INSTALL INJECTION PIPE LH

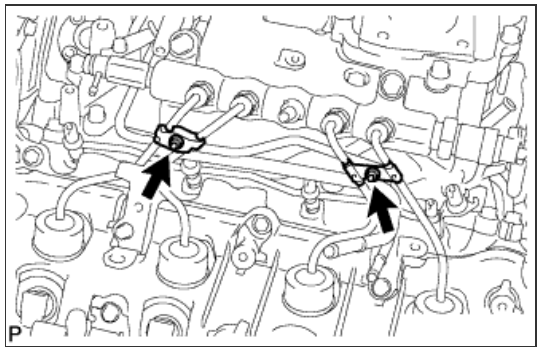
a. Using a union nut wrench, install the 4 new injection pipes.

Torque:
without union nut wrench:
34 N*m{ 347 kgf*cm , 25 ft.*lbf }
with union nut wrench:
31 N*m{ 316 kgf*cm , 23 ft.*lbf }



NOTICE:

Make sure there is no damage or foreign matter on the seal surfaces.



HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.).**
- **Make sure the union nut wrench an the torque wrench are connecte in a straight line.**

b. w/ Intercooler:
Install the 4 injection pipe clamps with the 2 nuts.

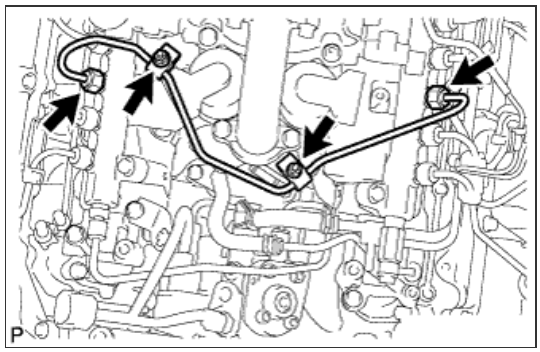
Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

24. CONNECT NO. 6 INJECTION PIPE SUB-ASSEMBLY

a. w/ EGR System:

i. Temporarily install a new No. 6 injection pipe to the common rail LH and RH.

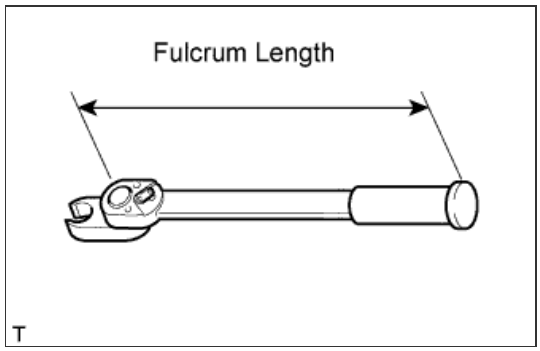
NOTICE:



Make sure there is no damage or foreign matter on the seal surfaces.

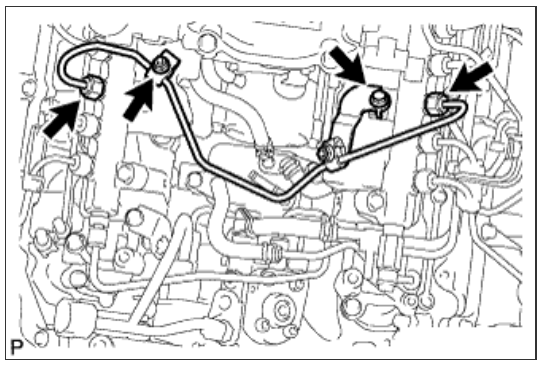
ii. Install the 2 No. 2 injection pipe clamps with the 2 nuts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }



iii. Using a union nut wrench, tighten the No. 6 injection pipe ends.

Torque:
without union nut wrench:
34 N*m{ 347 kgf*cm , 25 ft.*lbf }
with union nut wrench:
31 N*m{ 316 kgf*cm , 23 ft.*lbf }



HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.).**
- **Make sure the union nut wrench an the torque wrench are connecte in a straight line.**

b. w/o EGR System:

i. Temporarily install a new No. 6 injection pipe to the common rail LH and RH.

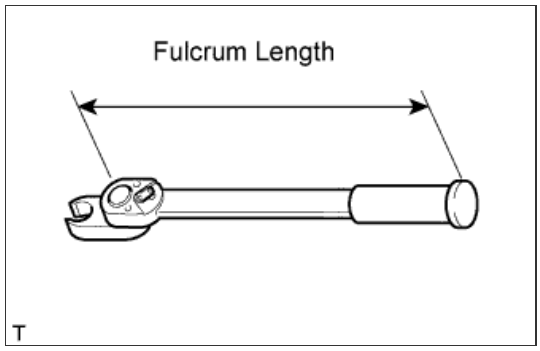
NOTICE:

Make sure there is no damage or foreign matter on the seal surfaces.

ii. Install the bracket to the No. 3 intake manifold with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

iii. Install the No. 2 injection pipe clamp with the nut.



Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

i .Using a union nut wrench, tighten the No. 6 injection pipe ends.

Torque:
without union nut wrench:
34 N*m{ 347 kgf*cm , 25 ft.*lbf }
with union nut wrench:
31 N*m{ 316 kgf*cm , 23 ft.*lbf }

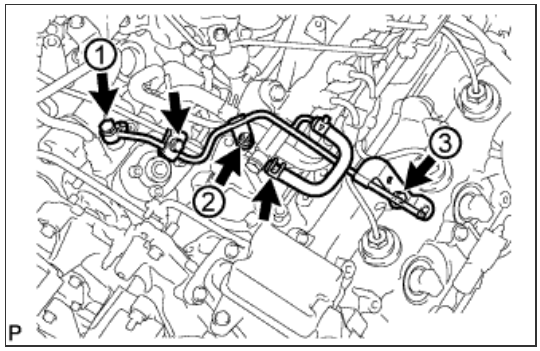
HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.).**
- **Make sure the union nut wrench an the torque wrench are connecte in a straight line.**

25. INSTALL NO. 2 FUEL PIPE SUB-ASSEMBLY

NOTICE:

Check for damage and foreign matter on the fuel pipe installation surface of the supply pump.



If there is foreign matter, remove it from the installation surface. If the installation surface is damaged, replace the fuel supply pump.

a. Temporarily install a new gasket and the No. 2 fuel pipe with the union

bolt, nut and bolt.

b. Tighten the union bolt, nut and bolt in the order shown in the illustration.

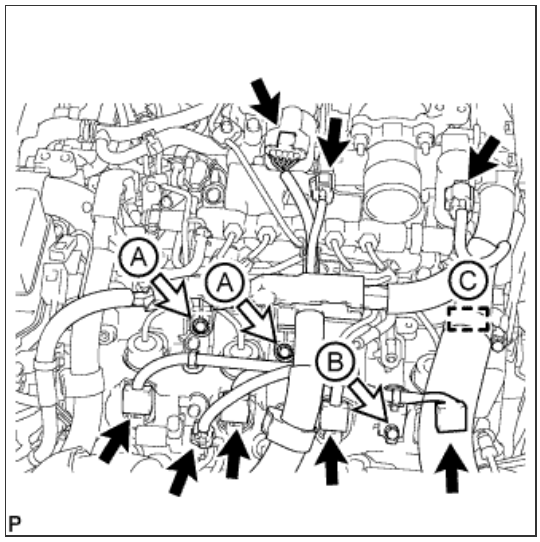
Torque:
for union bolt:
10 N*m{ 105 kgf*cm , 8 ft.*lbf }
for bolt an nut:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

c. Install the No. 2 injection pipe clamp with the bolt.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

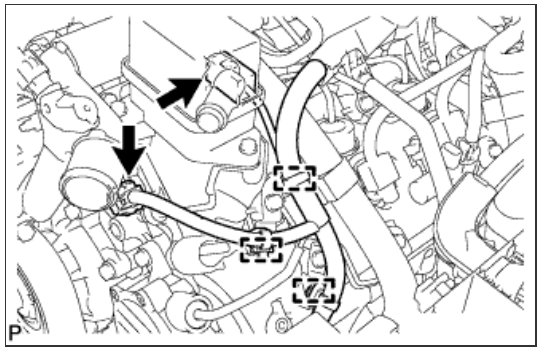
.Connect the fuel hose to the No. 5 nozzle leakage pipe.

26. CONNECT ENGINE WIRE



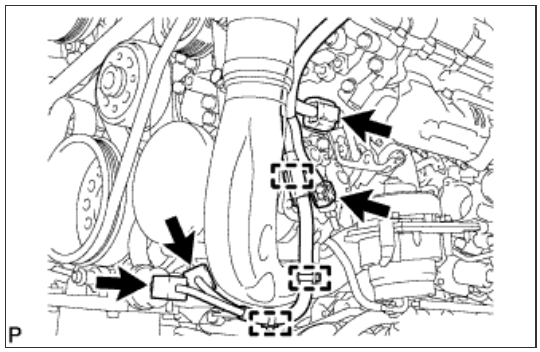
a. LH Side:

i. Install the engine wire protector with the 2 bolts labeled A.



ii. Connect the 8 connectors.

iii. Install the engine wire harness bracket with the bolt labeled B.



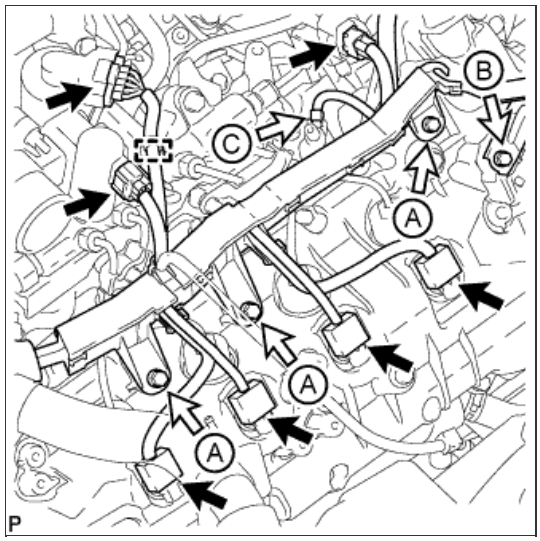
i .for RHD:
Connect the wire harness with the wire harness clamp holder labeled C.

.Attach the 3 wire harness clamps and connect the 2 connectors.

i. Attach the 3 wire harness clamps and connect the 4 connectors.

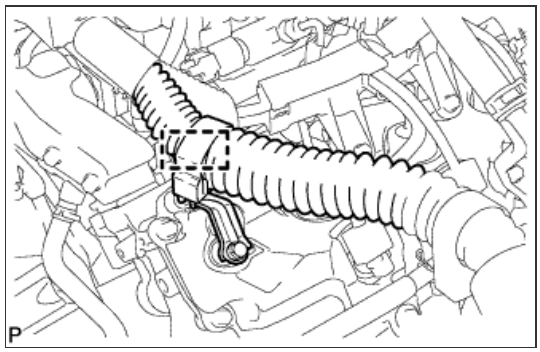
b. RH Side:

i. Install the engine wire harness protector with the 3 bolts labeled A.



ii. Connect the 7 connectors.

iii. Attach the wire harness clamp.



i .Install the wire harness bracket with the bolt labeled B.

.Install the glow plug wire harness labeled C with the nut.

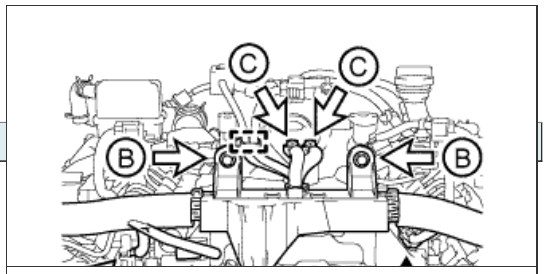
Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

i. for RHD:
Connect the wire harness with the wire harness clamp holder.

c. Rear Side:

i. Install the glow plug wire harness with the nut labeled A.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }



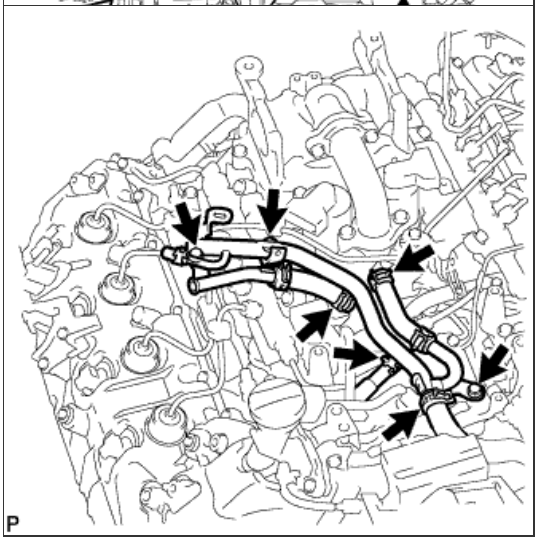
ii. Connect the 2 common rail connectors.

iii. Install the engine wire harness protector with the 2 bolts labeled B.

i .Install the 2 ground wires with the 2 bolts labeled C.

Torque:
8.4 N*m{ 87 kgf*cm , 74 in.*lbf }

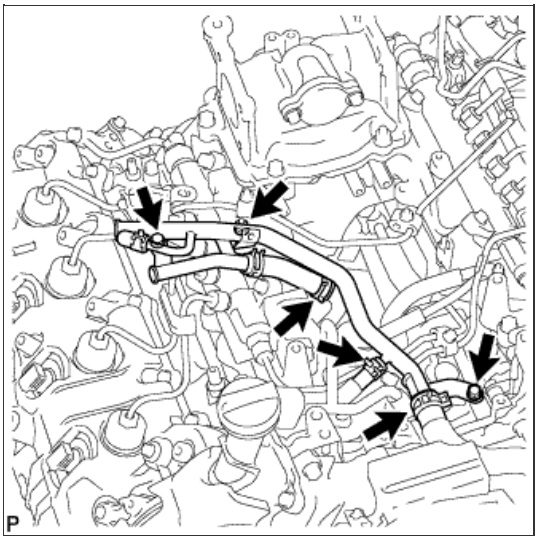
.Attach the wire harness clamp.



27. INSTALL NO. 4 WATER BY-PASS PIPE

a. w/ EGR System:
Connect the 4 water hose ends, and temporarily install the No. 4 water by-pass pipe with the 2 bolts and nut.

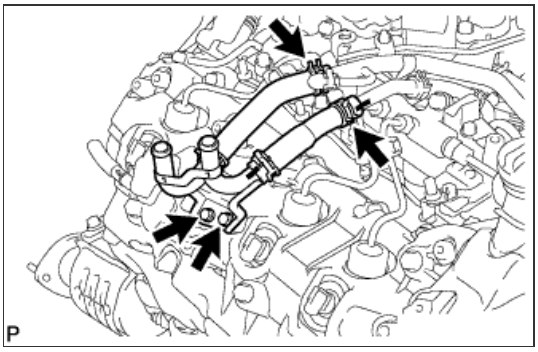
b. First tighten the 2 bolts and then tighten the nut.



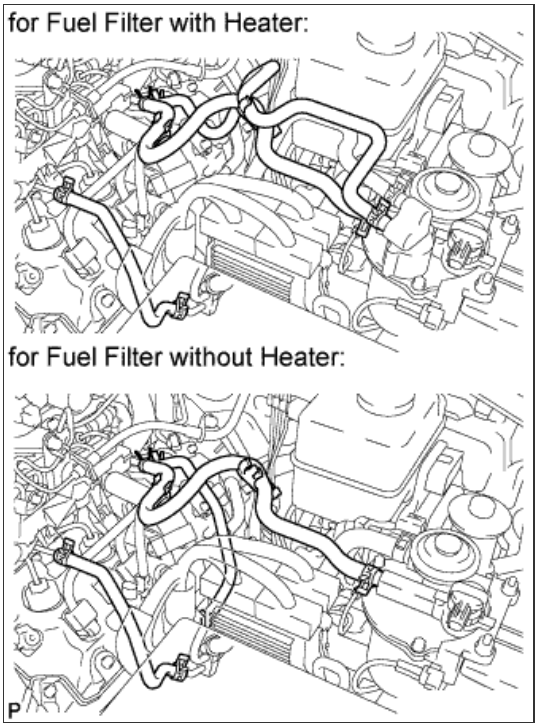
Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

c. w/o EGR System:
Connect the 3 water hose ends, and temporarily install the No. 4 water by-pass pipe with the 2 bolts and nut.

.First tighten the 2 bolts and then tighten the nut.



Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }



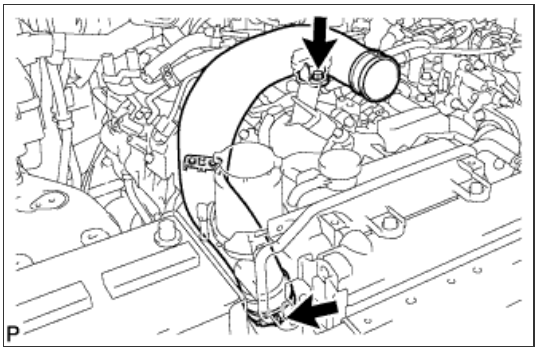
28. INSTALL NO. 3 WATER BY-PASS PIPE (w/o Viscous Heater)

a. Connect the 2 water hose ends, and install the No. 3 water by-pass pipe with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

29. CONNECT FUEL HOSE

30. INSTALL NO. 1 AIR CLEANER PIPE SUB-ASSEMBLY



a. Connect the No. 1 air cleaner pipe to the No. 1 intake air connector pipe.

b. Install the pipe with the bolt.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Tighten the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

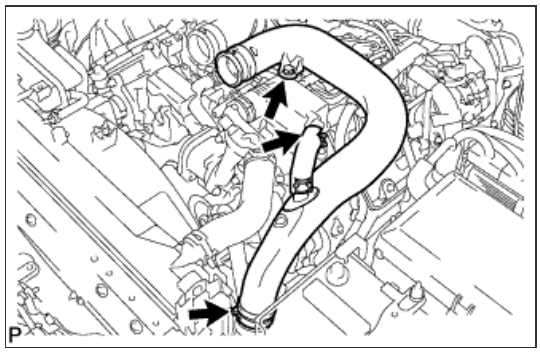
31. INSTALL HEATER WATER PIPE SUB-ASSEMBLY (w/ Viscous Heater)

a. Connect the 4 water hose ends, and install the water pipe with the 4 bolts.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

32. INSTALL NO. 2 AIR CLEANER PIPE SUB-ASSEMBLY

a. Connect the No. 2 air cleaner pipe to the No. 2 intake air connector pipe.



b. Connect the ventilation hose to the oil separator.

c. Install the pipe with the bolt.

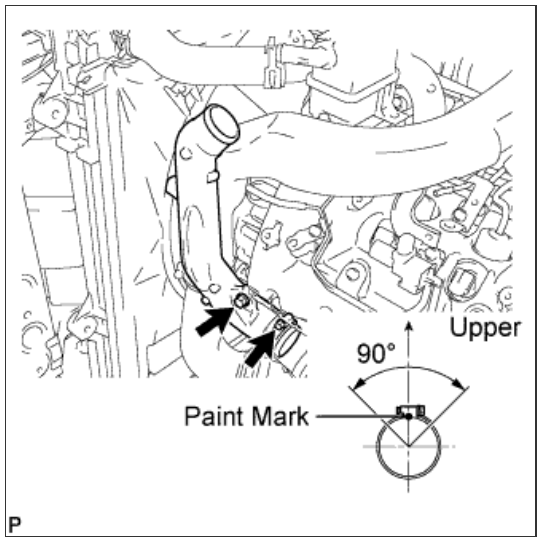
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

.Tighten the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

33. INSTALL NO. 4 AIR TUBE

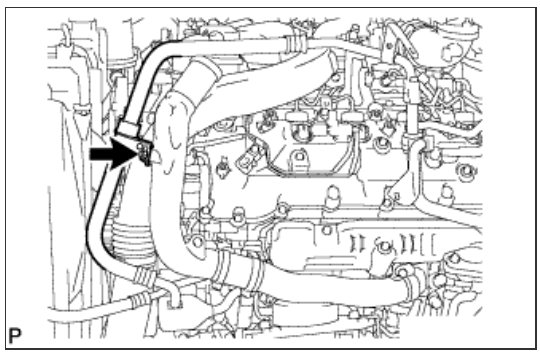
a. Install the No. 4 air tube with the bolt.



Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

b. Tighten the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }



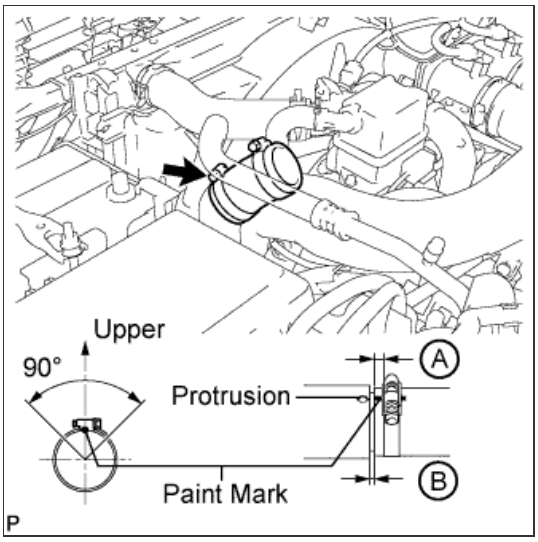
HINT:

Make sure the direction of the hose clamp is as shown in the illustration.

c. Install the suction hose with the bolt.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

34. INSTALL NO. 2 AIR HOSE



a. Connect the No. 2 air hose with the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

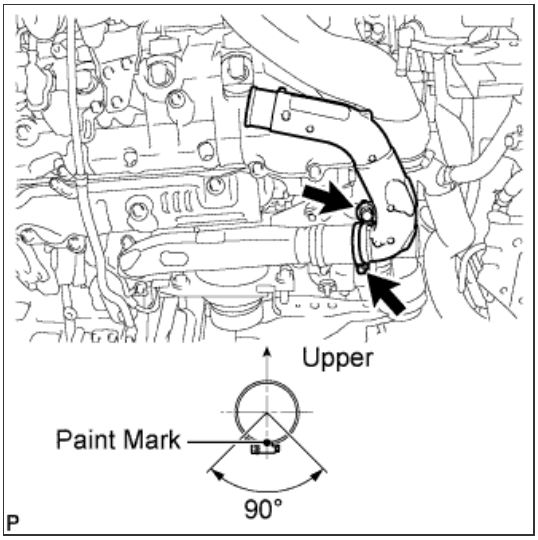
HINT:

- **Align the paint mark of the air hose with the protrusion an push in the air hose so that istance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that istance A is 2 to 6 mm (0.0787 to 0.236 in.).**

- **Make sure the irection of the hose clamp is as shown in the illustration.**

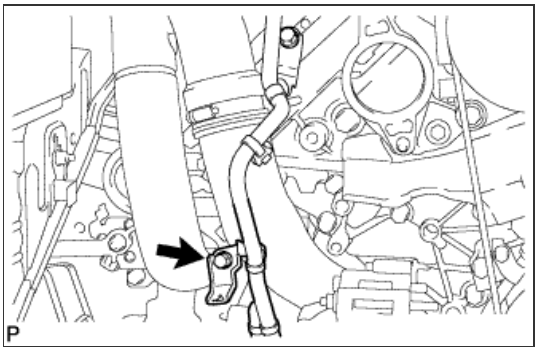
35. INSTALL NO. 3 AIR TUBE

a. Install the No. 3 air tube with the bolt.



Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

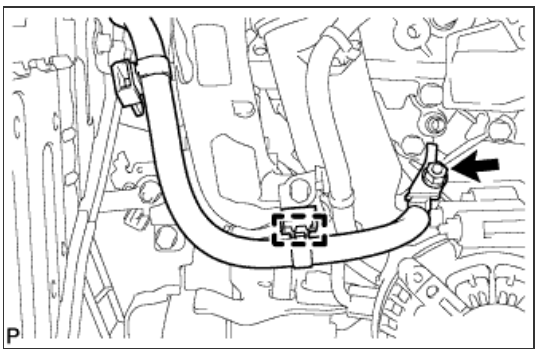
b. Tighten the hose clamp.



Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

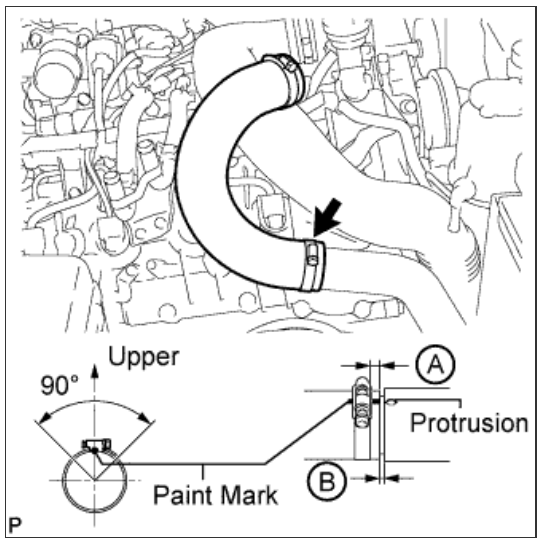
Make sure the direction of the hose clamp is as shown in the illustration.



c. Install the wire harness bracket with the bolt.

.Install the ground wire with the nut, and attach the wire harness clamp.

Torque:
8.4 N*m{ 87 kgf*cm , 74 in.*lbf }



36. INSTALL NO. 1 AIR HOSE

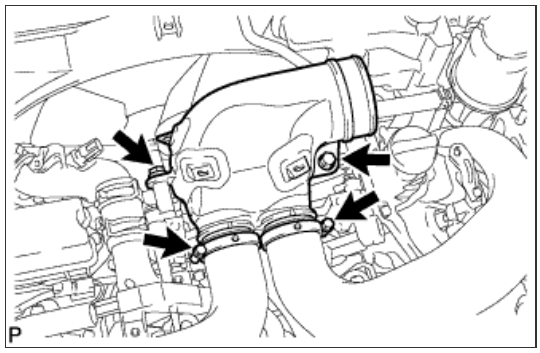
a. Connect the No. 1 air hose with the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

- **Align the paint mark of the air hose with the protrusion an push in the air hose so that istance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that istance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the irection of the hose clamp is as shown in the illustration.**

37. INSTALL INTAKE AIR CONNECTOR

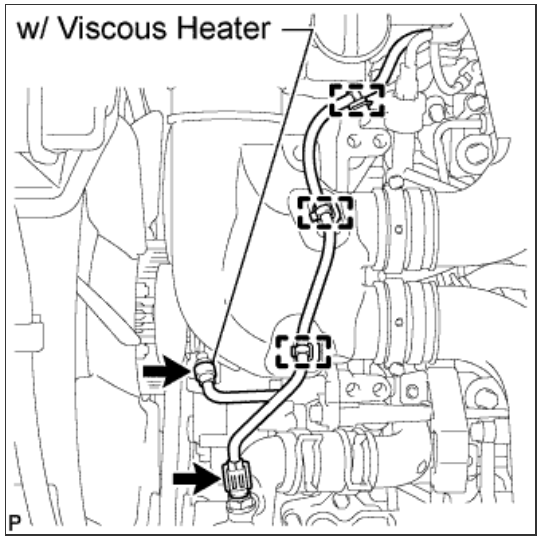


a. Connect the intake air connector to the No. 1 and No. 2 air cleaner pipes.

b. Install the connector with the 2 bolts.

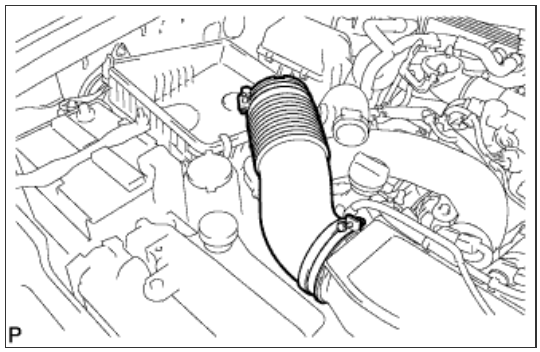
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Tighten the 2 hose clamps.



Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

.Attach the 3 wire harness clamps.

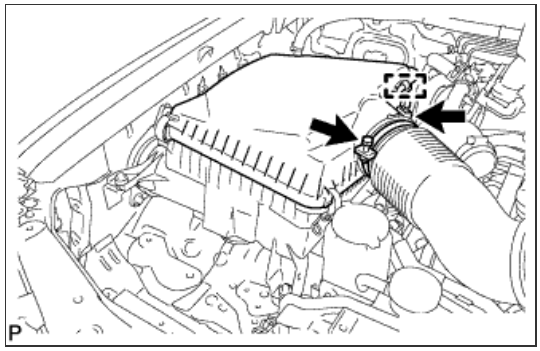


e. w/o Viscous Heater:
Connect the connector to the water temperature sensor.

f. w/ Viscous Heater:
Connect the 2 connectors to the water temperature sensor and viscous with magnet clutch heater.

38. TEMPORARILY INSTALL NO. 1 AIR CLEANER HOSE

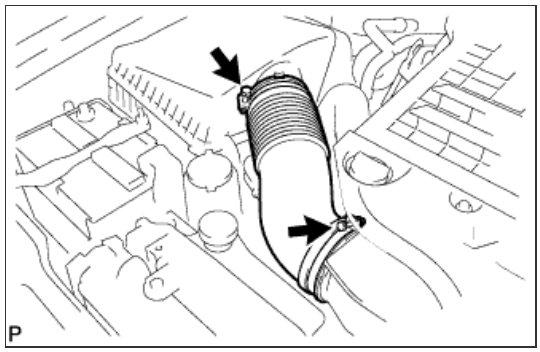
a. Temporarily install the air cleaner hose to the intake air connector.



39. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

a. Connect the air cleaner cap to the air cleaner hose, and install the air cleaner cap with the 4 clamps.

b. Connect the mass air flow meter connector and attach the wire harness clamp to the air cleaner cap.



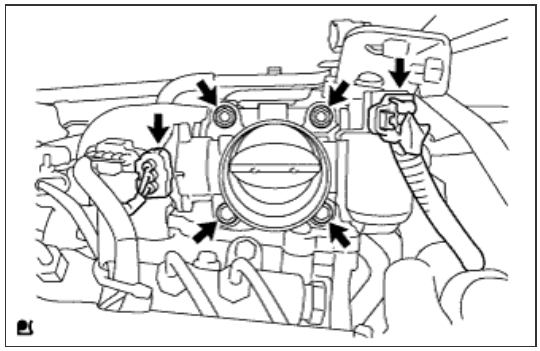
c. Attach the wire harness clamp.

.Align the protrusion of air cleaner cap and concave portion of air cleaner hose.

e. Tighten the 2 hose clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

40. INSTALL DIESEL THROTTLE BODY ASSEMBLY LH



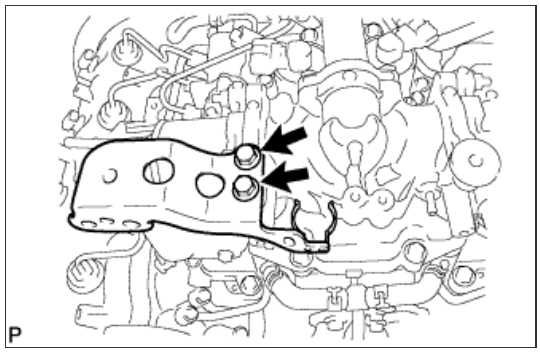
a. Install a new gasket to the intake pipe.

b. Install the throttle body with the 2 bolts and 2 nuts.

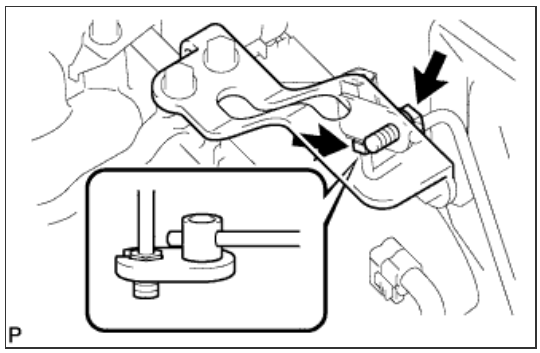
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Connect the throttle position sensor connector.

.Connect the throttle motor connector.



41. INSTALL NO. 3 INTERCOOLER SUPPORT BRACKET



a. Install the bracket with the 2 bolts.

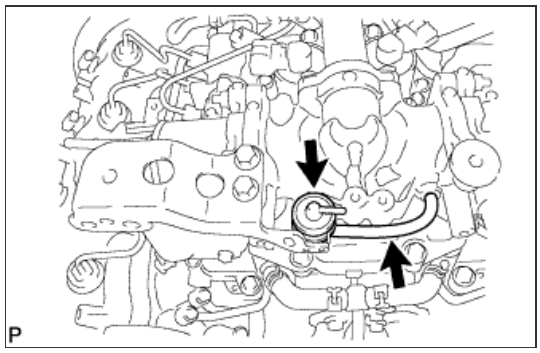
Torque:

21 N*m{ 214 kgf*cm , 15 ft.*lbf }

b. for Manual Transmission:

i. Connect the clutch tube to release cylinder 2 way with the bolt.

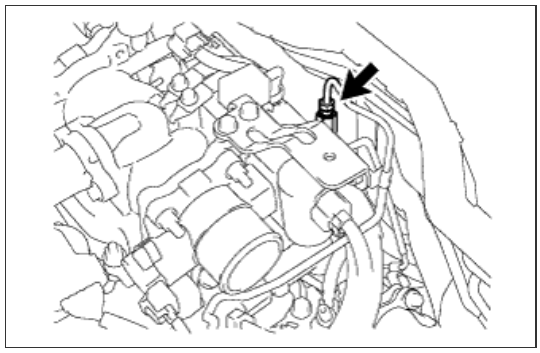
Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }



ii. Check that the union nut is tightened to the specified torque.

Torque:
without union nut wrench:
15 N*m{ 154 kgf*cm , 11 ft.*lbf }
with union nut wrench:
14 N*m{ 141 kgf*cm , 10 ft.*lbf }

42. INSTALL NO. 1 GAS FILTER



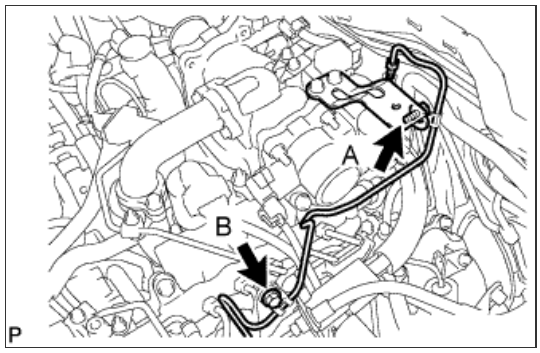
a. Install the gas filter.

b. Connect the hose to the intake pipe.

43. INSTALL TUBE CONNECTOR TO FLEXIBLE HOSE TUBE (for Manual Transmission)

a. Temporarily install the flare nut of the tube connector to flexible hose tube to the clutch tube to release cylinder 2 way by hand.

b. Temporarily install the tube connector to flexible hose tube with the 2 bolts.

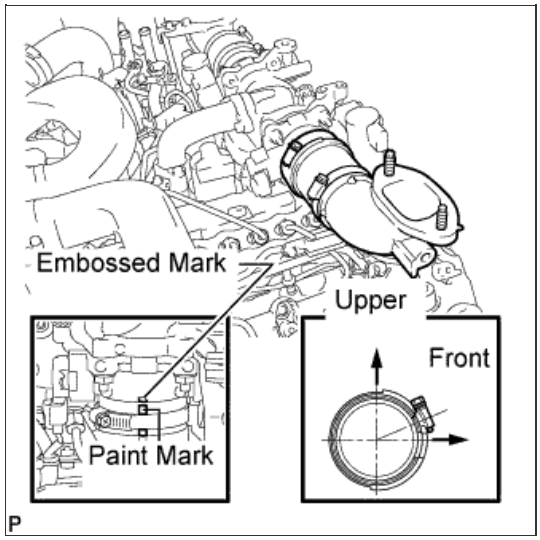


c. Tighten the bolt labeled A.

Torque:

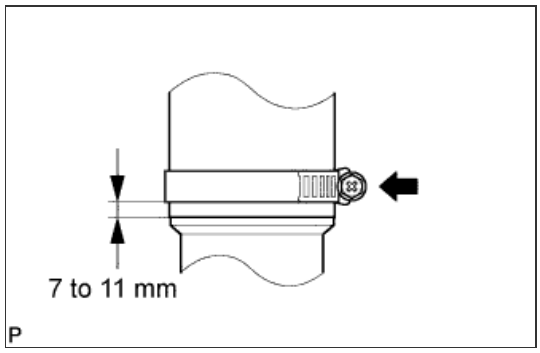
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

NOTICE:



Tighten the bolt labeled B after installing the clutch hose.

44. INSTALL AIR TUBE SUB-ASSEMBLY LH



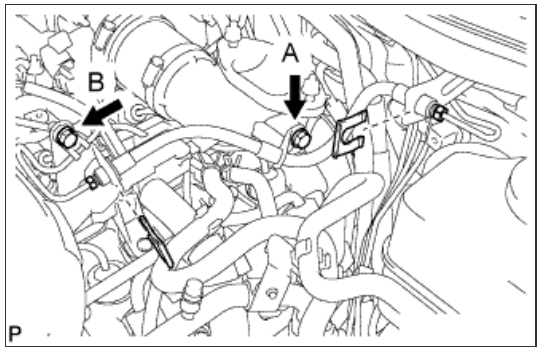
a. Install the air tube to the throttle body.

b. Align the embossed mark of the throttle body with the paint mark of the No. 4 air hose.

c. Tighten the hose clamp so that it is 7 to 11 mm (0.276 to 0.433 in.) from the end of the hose as shown in the illustration.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

45. INSTALL CLUTCH HOSE (for Manual Transmission)



a. Connect the clutch hose to the air tube with the bolt labeled A.

b. Temporarily install the clutch hose to the clutch master cylinder tube to flexible hose tube and tube connector to flexible hose tube, and fix it in place with the 2 clips.

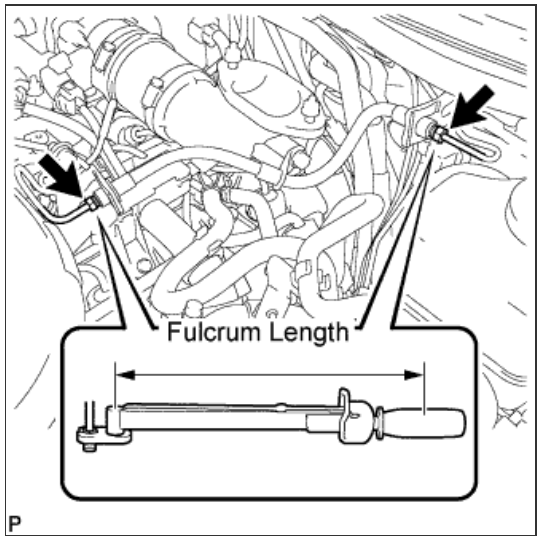
Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

c. Tighten the bolt labeled B.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

.Tighten the flexible hose tube.

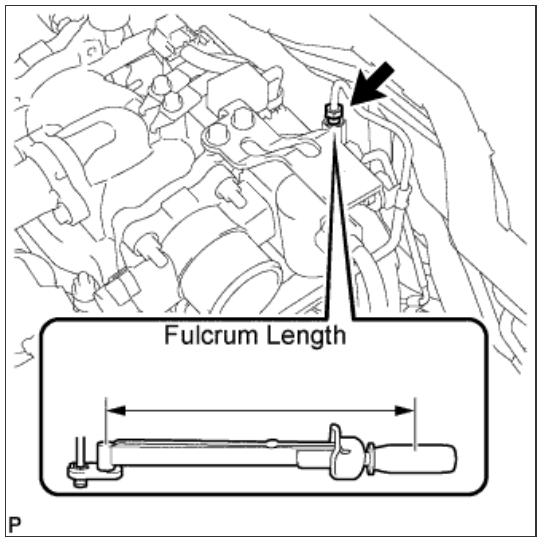
NOTICE:



- **Do not ben or amage the flexible hose tube.**
- **Do not allow any foreign matter such as irt an ust to enter the flexible hose tube from the connecting points.**

HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench an SST base on the ithout SST" torque specification (Click here).**
- **Make sure union nut wrench an the wrench are connecte in a straight line.**



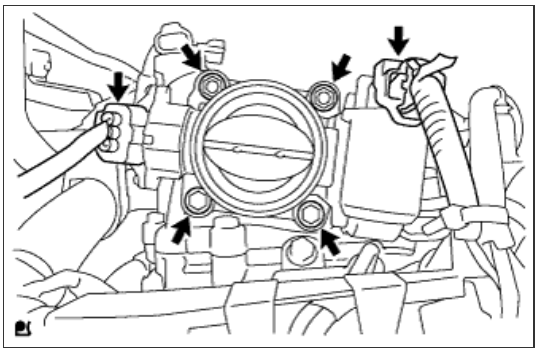
i. Using a 10 mm union nut wrench, tighten the 2 flare nuts of the flexible hose tube.

Torque:
without union nut wrench:
15 N*m{ 154 kgf*cm , 11 ft.*lbf }
with union nut wrench:
14 N*m{ 141 kgf*cm , 10 ft.*lbf }

ii. Using a 10 mm union nut wrench, tighten the flare nut of the flexible hose tube.

Torque:
without union nut wrench:
15 N*m{ 154 kgf*cm , 11 ft.*lbf }
with union nut wrench:
14 N*m{ 141 kgf*cm , 10 ft.*lbf }

46. INSTALL DIESEL THROTTLE BODY ASSEMBLY RH

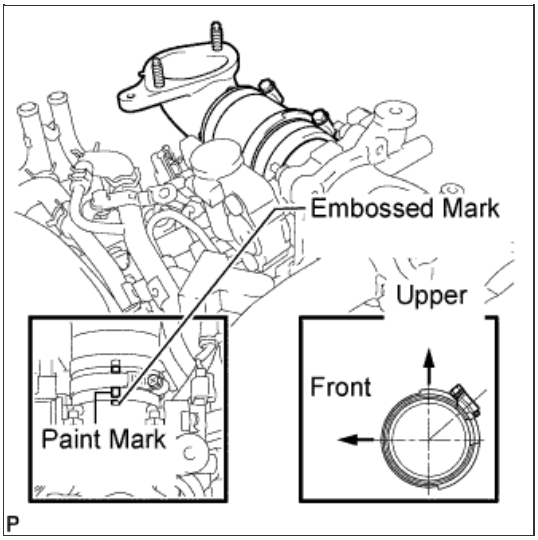


a. Install a new gasket to the intake pipe.

b. Install the throttle body with the 2 bolts and 2 nuts.

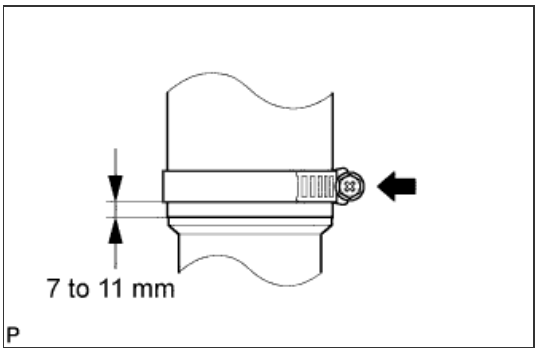
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Connect the throttle position sensor connector.



. Connect the throttle motor connector.

47. INSTALL AIR TUBE SUB-ASSEMBLY RH



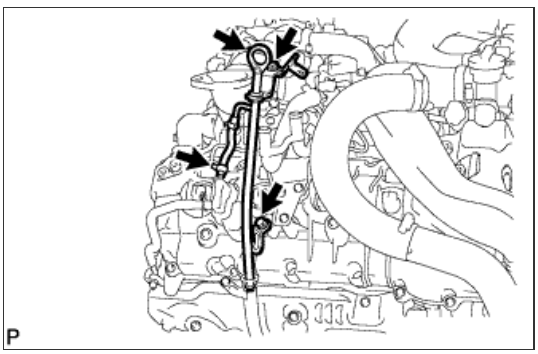
a. Install the air tube to the throttle body.

b. Align the embossed mark of the throttle body with the paint mark of the No. 4 air hose.

c. Tighten the hose clamp so that it is 7 to 11 mm (0.276 to 0.433 in.) from the end of the hose as shown in the illustration.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

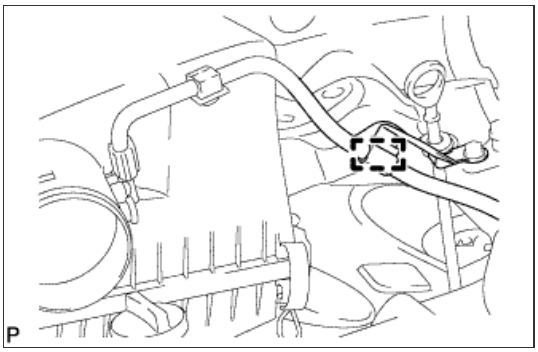
48. INSTALL NO. 2 ENGINE OIL LEVEL DIPSTICK GUIDE



a. Apply a light coat of engine oil to a new -ring.

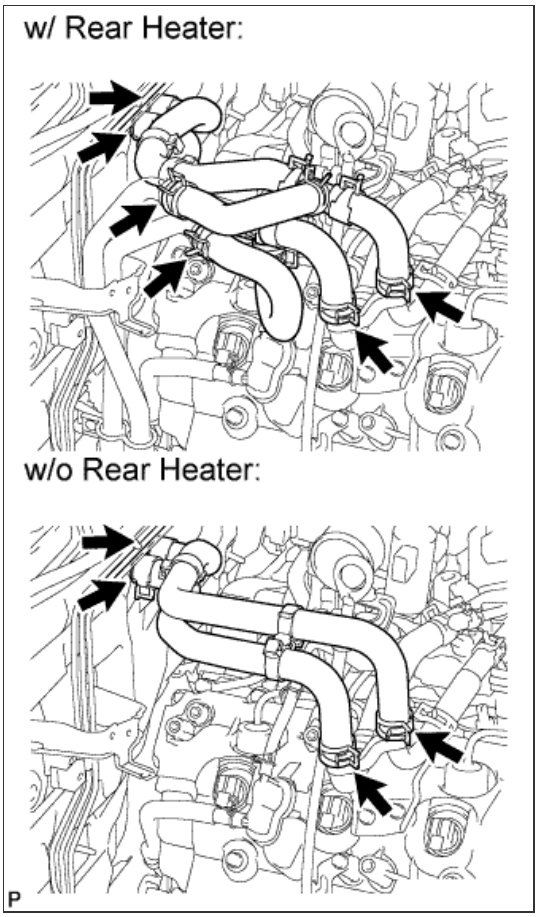
b. Install the -ring to the No. 2 engine oil level dipstick guide.

c. Install the No. 2 engine oil level dipstick guide with the 2 bolts.



Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

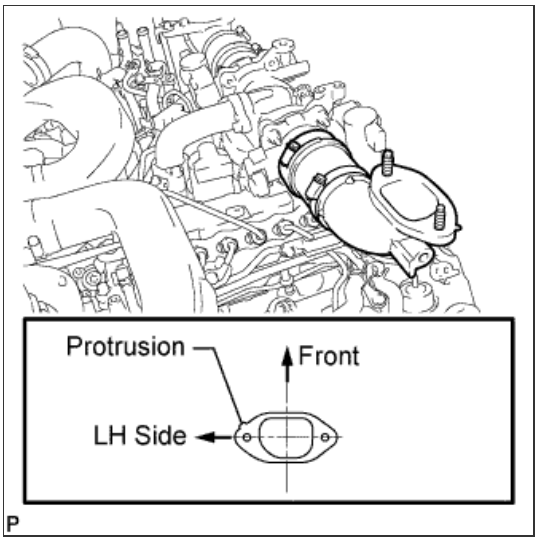
. Connect the ventilation hose to the cylinder head cover RH.



e. Connect the wire harness clamp to the No. 2 engine oil level dipstick guide

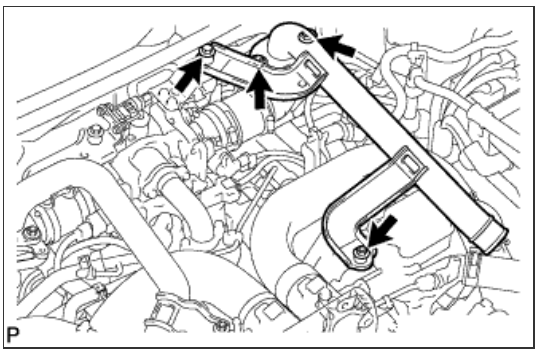
bracket.

49. CONNECT WATER HOSE SUB-ASSEMBLY



50. INSTALL NO. 2 COOL AIR INLET (w/o Intercooler)

a. Install a new gasket to the air tube LH.

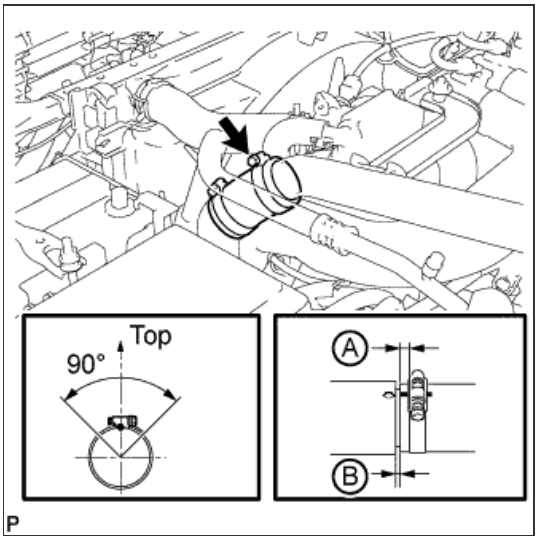


HINT:

Install the gasket with the protrusion facing as shown in the illustration.

b. Install the No. 2 cool air inlet with the 3 nuts and bolt.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



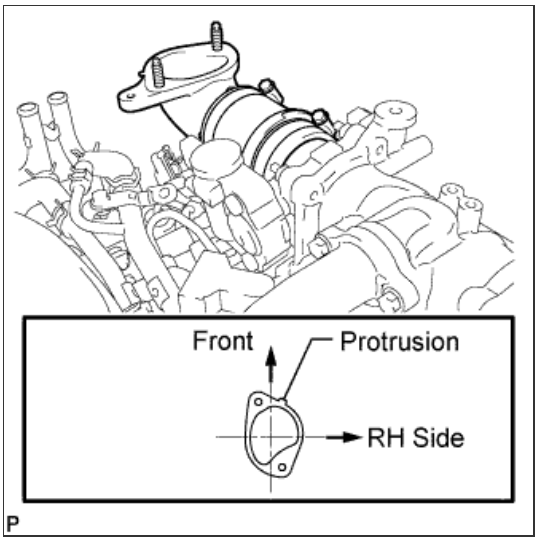
c. Connect the No. 2 air hose to the No. 2 cool air inlet.

. Tighten the No. 2 air hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

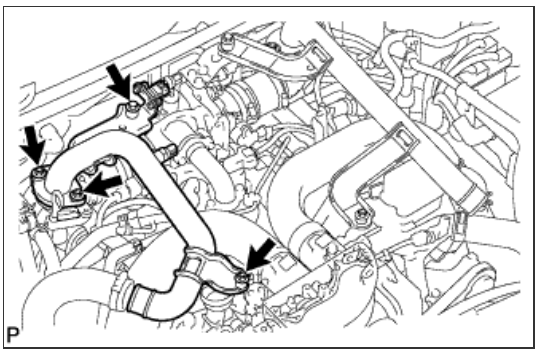
- **Align the paint mark of the air hose with the protrusion an push on the air hose so that istance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that istance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the irection of the hose clamp is as shown in the illustration.**



51. INSTALL NO. 1 COOL AIR INLET (w/o Intercooler)

a. Install a new gasket to the air tube RH.

HINT:

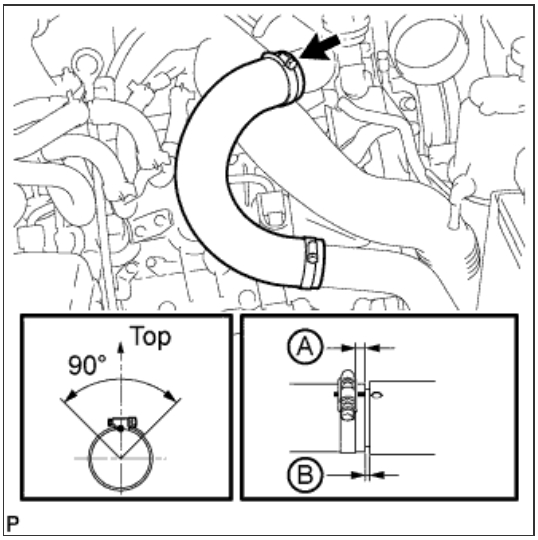


Install the gasket with the protrusion facing as shown in the illustration.

b. Install the No. 1 cool air inlet with the 3 nuts and bolt.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Connect the vacuum hose, intake air temperature sensor connector and turbo pressure sensor connector.



. Connect the No. 1 air hose to the No. 1 cool air inlet.

e. Tighten the No. 1 air hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

- **Align the paint mark of the air hose with the protrusion an push on the air hose so that istance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that istance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the irection of the hose clamp is as shown in the illustration.**

52. INSTALL INTERCOOLER ASSEMBLY (w/ Intercooler)

a. Install the intercooler assembly (Click here).

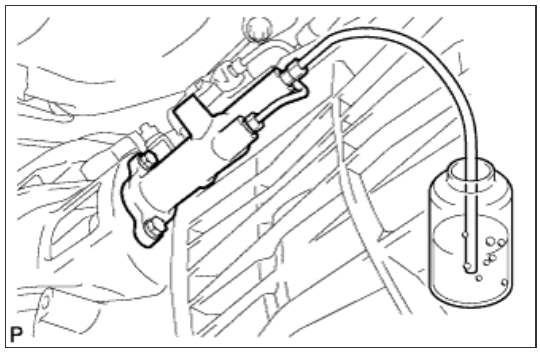
53. BLEED CLUTCH LINE

a. Remove the release cylinder bleeder plug cap.

b. Connect a vinyl tube to the bleeder plug.

c. Depress the clutch pedal several times, and then loosen the bleeder plug while the pedal is depressed.

. When fluid no longer comes out, tighten the bleeder plug, and then release the clutch pedal.



e. Repeat the previous 2 steps until all the air in the fluid is completely bled.

f. Tighten the bleeder plug.

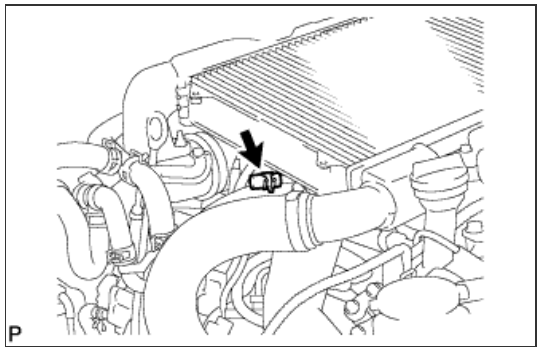
Torque:
11 N*m{ 110 kgf*cm , 8 ft.*lbf }

g. Install the bleeder plug cap.

h. Check that all the air has been bled from the clutch line.

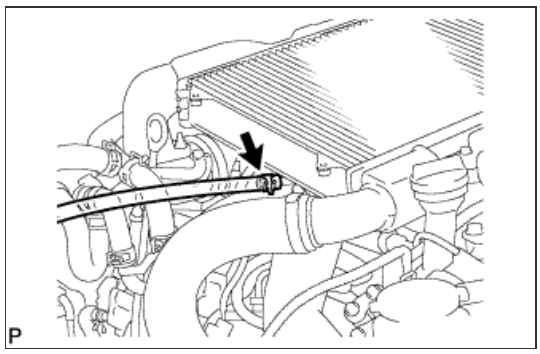
54. CHECK FOR CLUTCH FLUID LEAK

55. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



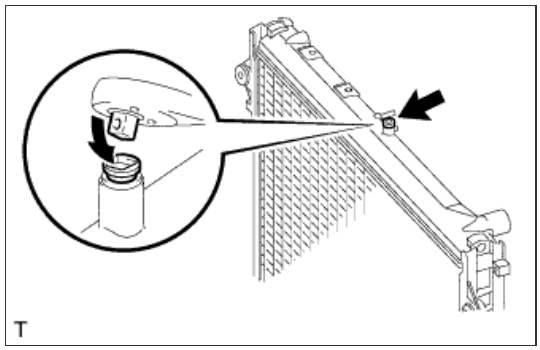
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

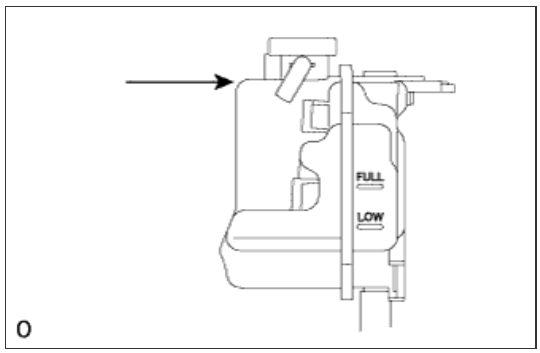


a. Connect the cables to the negative (-) main battery and sub-battery terminals.

56. ADD ENGINE COOLANT



a. Remove the engine air bleed cap.



b. Connect a clear hose to the engine air bleed pipe.

c. Using a wrench, remove the vent plug.

. Fill the radiator with T TA SLLC to the radiator reservoir filler neck.

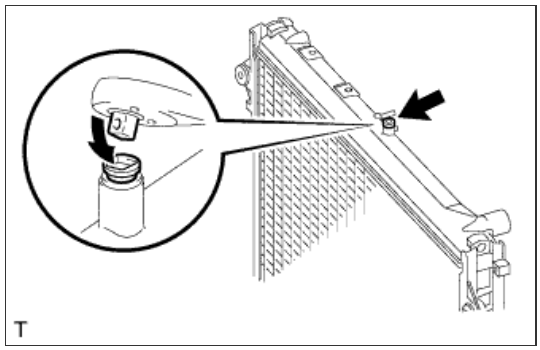
HINT:

our T TA SLLC until it spills out of the engine air bleed pipe.

Stan ar Capacity (for Automatic Transmission):

Item	Specified Condition
Front heater only	14.8 liters (15.6 US qts, 13.0 Imp. qts)
Front heater and rear heater	17.6 liters (18.6 US qts, 15.5 Imp. qts)
Front heater with viscous heater	15.2 liters (16.1 US qts, 13.4 Imp. qts)
Front heater and rear heater with viscous heater	18.0 liters (19.0 US qts, 15.4 Imp. qts)

Stan ar capacity (for Manual Transmission):
15.4 liters (16.3 US qts, 13.6 Imp. qts)



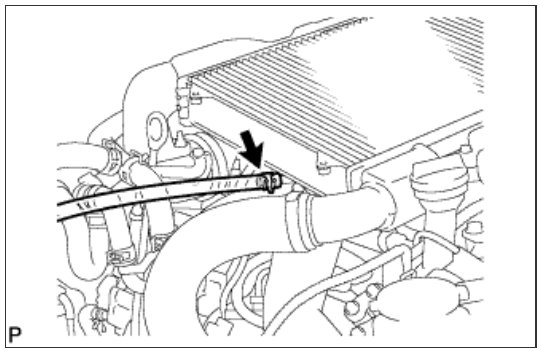
NOTICE:

Do not substitute plain water for engine coolant.

HINT:

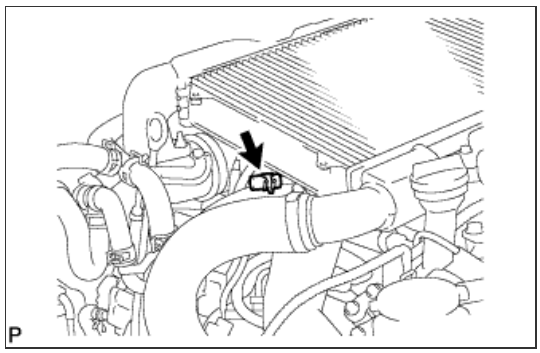
T TA vehicles are filled with T TA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use T TA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

e. Install the vent plug.



Torque:
2.0 N*m{ 20 kgf*cm , 18 in.*lbf }

NOTICE:



Do not tighten the plug to 5.0 N*m (51 kgf*cm, 44 in.*lbf) or more, as the plug will be damaged.

f. Disconnect the clear hose from the engine air bleed pipe.

g. Install the engine air bleed cap when coolant comes out.

h. Install the radiator reservoir cap.

i. Start the engine.

NOTICE:

Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the FULL line.

.Maintain an engine speed of 3000 rpm for approximately 10 minutes so that the thermostat opens and air bleeding is performed.

CAUTION:

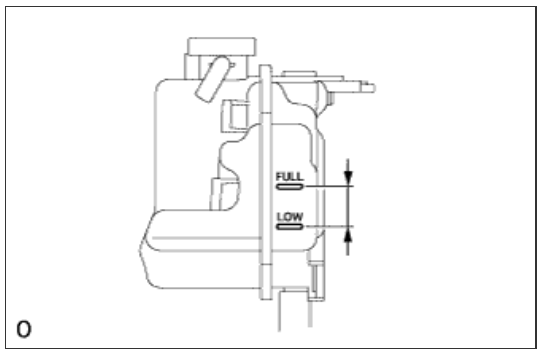
When pressing the ra iator hoses:

- **Wear protecti e glo es.**
- **Be careful as the ra iator hoses are hot.**
- **Keep your han away from the ra iator fan**

NOTICE:

- **Pay attention to the nee le of the water temperature meter. Make sure that the nee le oes not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or o erheat.**

HINT:



The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

k. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. ressurized, hot engine coolant and steam may be released and cause serious burns.

l. Check that the coolant level is between the FULL and L Wines.
If the coolant level is above the FULL line, drain coolant so that the coolant level is between the FULL and L Wines.

57. INSPECT FOR FUEL LEAK

a. erform Active Test.

i. Connect the intelligent tester to the DLC3.

ii. Turn the ignition switch to N.

iii. Start the engine.

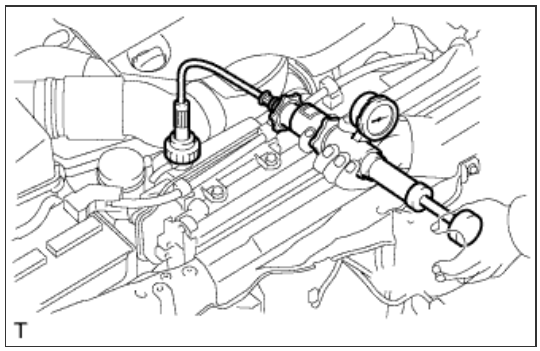
i .Turn the intelligent tester N.

.Enter the following menus: owertrain / Engine / Active Test.

i. erform the Active Test.

Tester Display	Test Detail	Control Range	Diagnostic Note
Test the Fuel Leak	essurizes fuel inside common rail and checks for fuel leaks	Stop/Start	• The fuel inside the common rail is pressurized to the specified value and the engine speed increases to 2000 rpm when Start is selected. • The above conditions are preserved while Start is selected.

58. CHECK FOR ENGINE COOLANT LEAK



CAUTION:

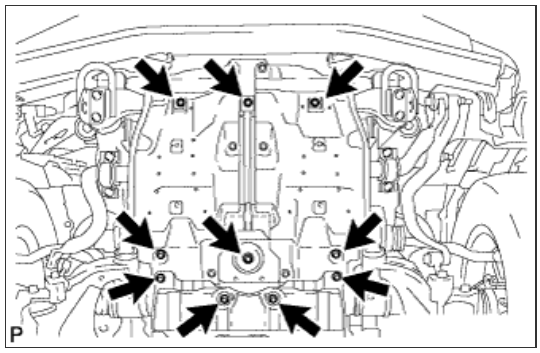
Do not remove the radiator reservoir cap while the engine and radiator are still hot. ressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 k a1(.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.

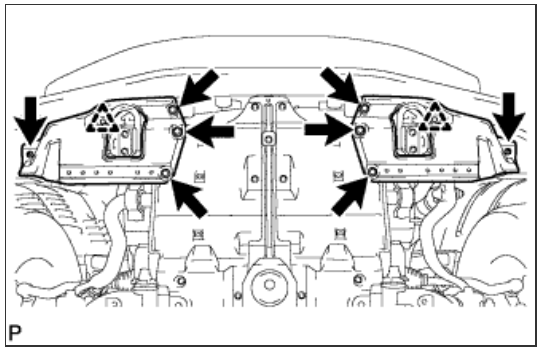
59. INSPECT FOR OIL LEAK



60. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the upper radiator support seal with the 7 clips.

61. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

62. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Install the splash shield with the clip, and then install the 3 bolts and screw.

63. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

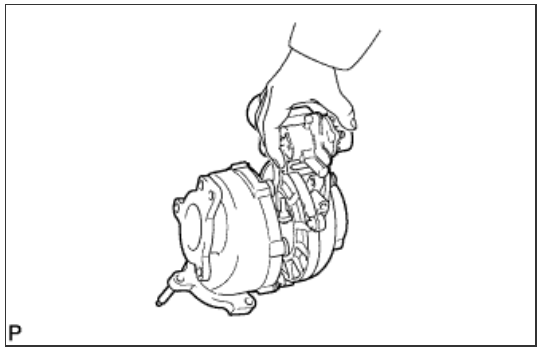
a. Install the splash shield with the clip, and then install the 3 bolts and screw.

for Preparation Click here

1.MAINTENANCE PRECAUTION

a. Do not stop the engine immediately after pulling a trailer, driving at a high speed, or driving uphill. Let the engine idle for 20 to 120 seconds before turning the engine switch off. According to the driving conditions, vary the idling time.

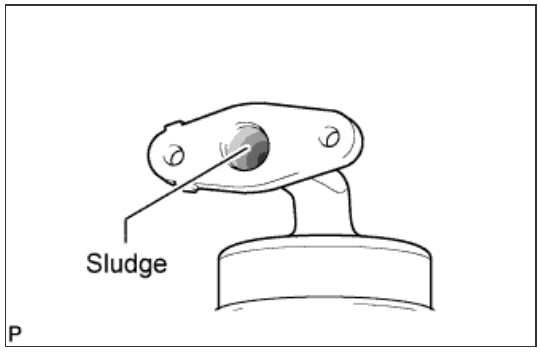
b. Avoid quick acceleration or quickly increasing the engine speed immediately after starting a cold engine.



c. If the turbocharger is found to be defective, it must be replaced. Also, inspect the source of the trouble including the conditions under which the turbocharger was used. Repair or replace the following as necessary:

i. Engine oil (level and quality)

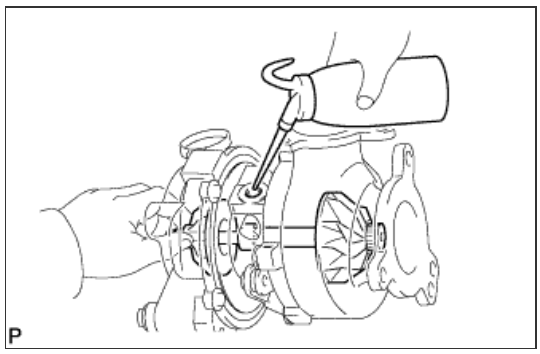
ii. Oil lines leading to the turbocharger



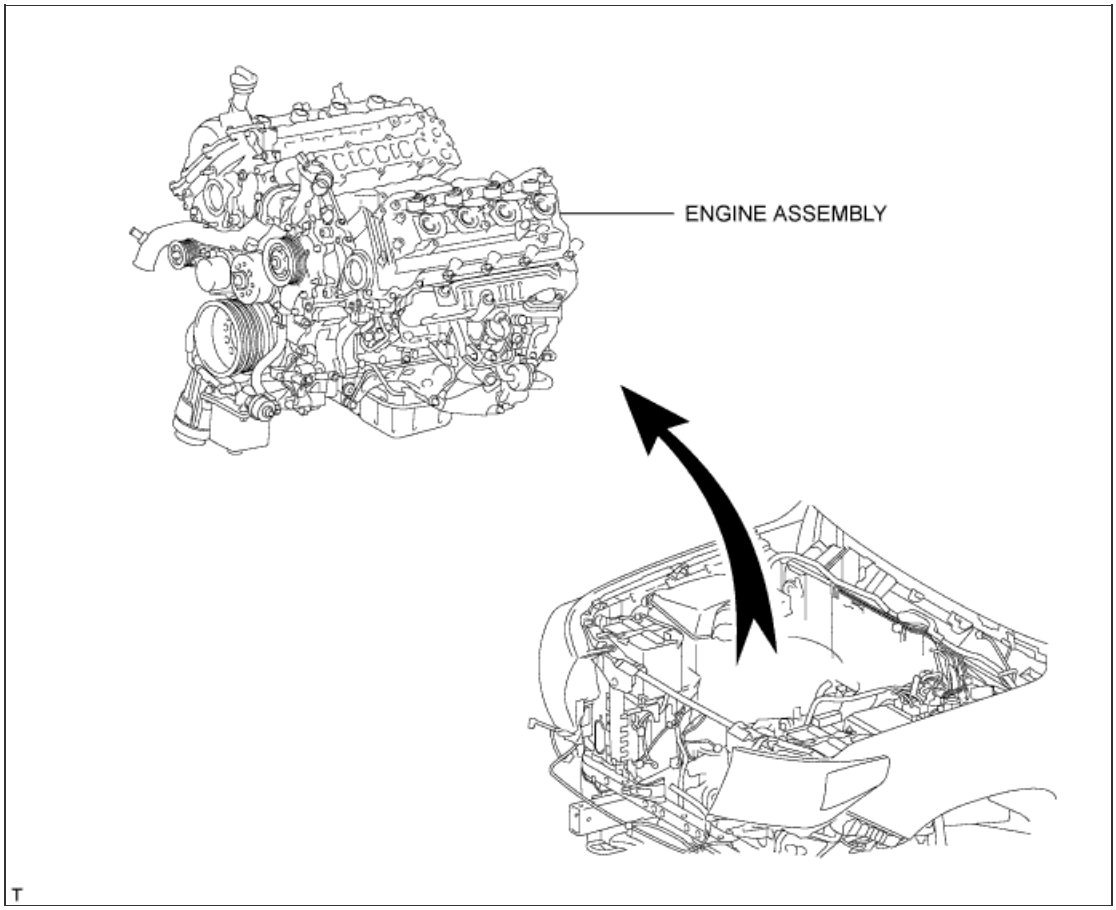
d. Be careful when removing and installing the turbocharger. Do not drop, strike, or grasp easily deformed assembly parts such as the DC motor or push rod during removal and installation.

e. Before removal, cover both the intake and exhaust ports and the oil inlet to prevent dirt or foreign objects from entering.

f. If replacing the turbocharger, check for accumulation of sludge particles in the oil pipe. If necessary, replace the No. 1 turbo oil pipe.

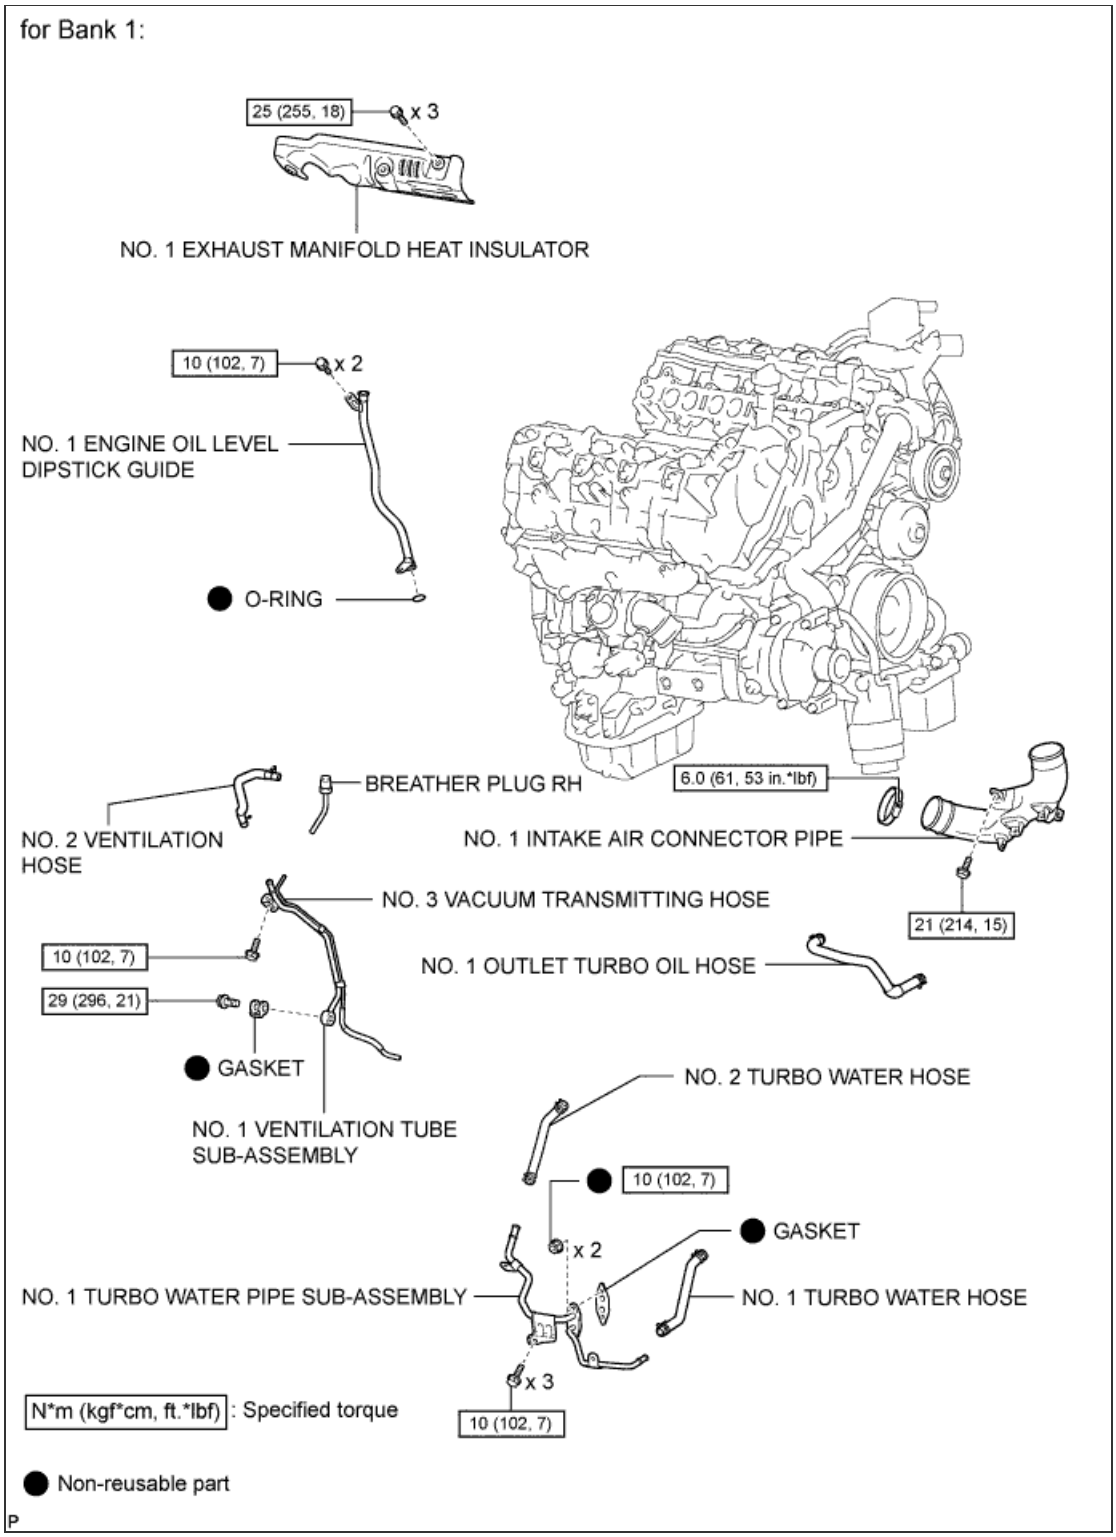


g. If replacing the bolts or nuts, use TOYOTA genuine parts to prevent breakage or deformation.



h. If replacing the turbocharger, put 20 cc (1.2 cu. in.) of fresh oil into the inlet turbocharger oil hole and turn the turbine wheel by hand to spread oil over the bearing.

i. If overhauling or replacing the engine, cut the fuel supply after reassembly and crank the engine for 30 seconds to distribute oil throughout the engine. Then reconnect the fuel supply and allow the engine to idle for 60 seconds.



j. Since the turbine wheel runs at an extremely high speed, if the engine is running without the air cleaner, air cleaner cap and hose, the turbine wheel will be damaged due to entry of foreign particles.

This section should be used as a guide for troubleshooting when the turbocharger is suspected as the cause of a problem.

OUTLINE OF TURBOCHARGER FAILURE

a. State of Turbocharger Failure Repair:
It is well known that turbocharger malfunctions cause many symptoms as shown below. However, the mechanisms resulting in these symptoms that indicate turbocharger malfunctions are not well understood. As a result, many unnecessary turbocharger replacements and other repairs are being performed due to lack of knowledge about the turbocharger and turbocharger failure. Therefore, knowing the facts regarding turbocharger malfunctions is useful for making effective repairs and saving time.

b. Turbocharger Failure Classification

Symptom		Symptom Description	See page
Noise	Whistling noise	Continuous high pitch noise proportional to engine speed	• "NOISE" listed below • Flowchart "Turbocharger Noise" (Click here)
	Whining noise	Relatively low pitch noise compared to whistling noise	
Oil leak	External oil leak	Oil leak on surface of turbocharger visible from outside of turbocharger	• "OIL LEAK AND WHITE SMOKE" listed below • Flowchart "Turbocharger Oil Leak and White Smoke" (Click here)
	Internal oil leak	Oil leak from inside of bearing housing to inside of either compressor housing or turbine housing through seal ring	
White smoke	Oil smoke	Oil smoke is emitted from exhaust pipe	
	Unburned fuel smoke	Unburned fuel smoke is emitted from exhaust pipe	
Black smoke		Black smoke is emitted from exhaust pipe	• "BLACK SMOKE" listed below • Flowchart "Black Smoke Emitted" (Click here)
Lack of power or hesitation		Vehicle does not reach target speed	• "LACK OF POWER AND HESITATION" listed below • Flowchart "Lack of Power or Hesitation" (Click here)
		Poor acceleration	
		Shock during acceleration	
MIL turns on (DTC)	P0046	Control Solenoid Circuit Range / Performance	Diagnostic Trouble Code Chart (Click here)
	P0047	Boost Control "A" Circuit Low	
	P0048	Boost Control "A" Circuit High	
	P004C	Boost control solenoid "B" circuit low	
	P004D	Boost control solenoid "B" circuit high	
	P00AF	Boost control "A" module performance	
	P00B0	Boost control "B" module performance	
	P0299	Underboost	
	P1251	Overboost Condition (Too High)	
	P1258	Position sensor circuit range/performance bank 2 sensor 1	
	P1259	Position sensor low bank 2 sensor 1	
	P1260	Position sensor high bank 2	

	sensor 1
P1262	Position sensor low bank 2 sensor 2
P1263	Position sensor high bank 2 sensor 2
P2563	Position Sensor "A" Circuit Range/Performance
P2564	Position Sensor "A" Circuit Low
P2565	Position Sensor "A" Circuit High
P2588	Position Sensor "B" Circuit Low
P2589	Position Sensor "B" Circuit High

HINT:

This table shows only typical problems related to the turbocharger.

NOISE

Description

Probable Cause	Probable Failed Component
Turbine shaft imbalance	Turbocharger
Leakage from intake line	Intake line
Gear noise (Mistaken for turbocharger noise)	• Gear inside engine • Transmission gear

HINT:

It is easy to confirm whether the turbocharger is the cause of the noise or not, and confirming this before inspecting the turbocharger or removing it from the engine is an effective way to reduce troubleshooting time.

a. Connect the intelligent tester to the DLC3.

HINT:

The software version installed on the intelligent tester must be V2009.2 or later.

b. Start the engine and warm it up.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / Active Test / Activate the VN Turbo Open.

HINT:

This Active Test function operates both the turbocharger actuators (bank 1 and bank 2) at the same time.

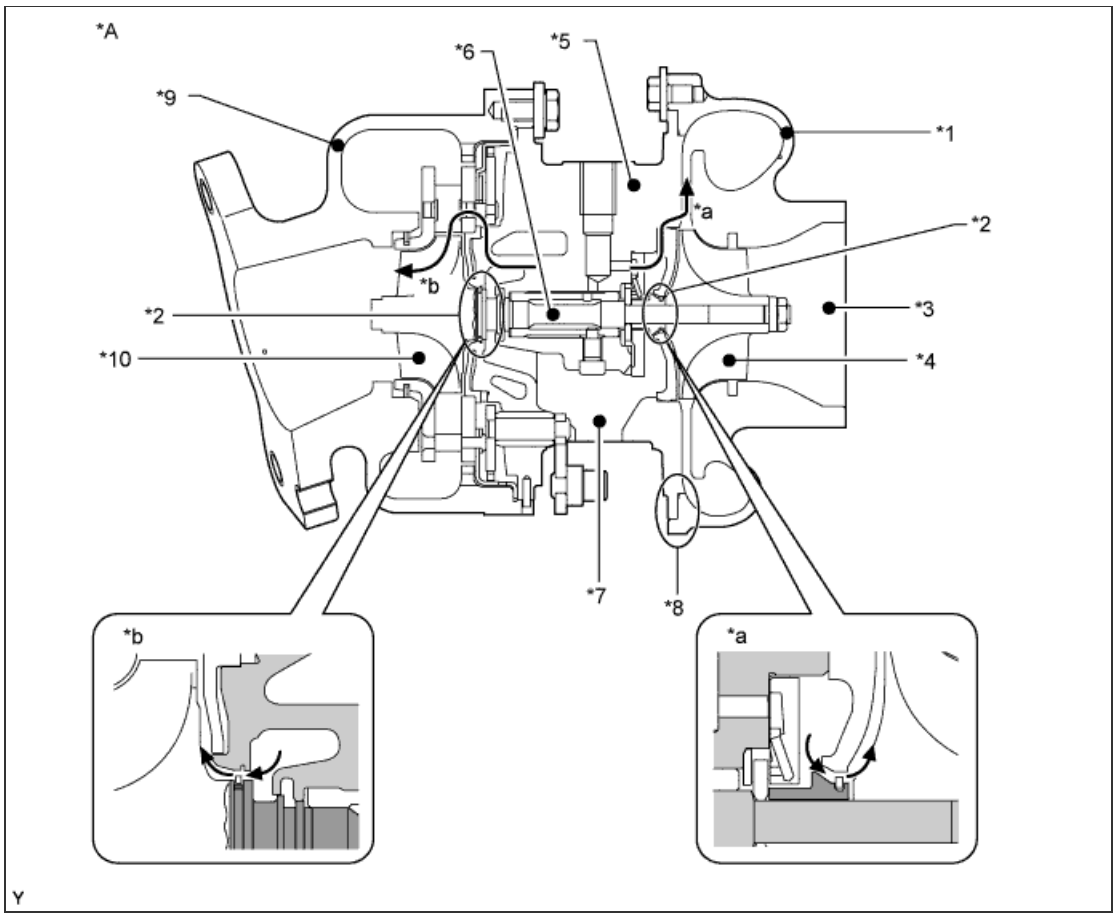
e. Perform the Active Test and rev the engine up several times.

f. Check whether the noise is reduced or not compared with the noise under the condition that the Active Test is not performed.

Result

Result	Cause of Noise
The noise is reduced (or disappears)	Turbocharger
The noise does not change	Not turbocharger (other parts)

HINT:



Refer to the flowchart "Turbocharger Noise" (Click here).

OIL LEAK AND WHITE SMOKE

Description

Oil Leak Type	Description	Main Trouble Area
Internal oil	• Oil leak from bearing housing to either compressor housing (intake side) or turbine housing (exhaust side) through seal rings.	• Compressor side seal ring • Turbine side seal ring • Clogging of oil drain

leak (White smoke)	• This type of oil leak is not visible from outside of turbocharger. • If oil leak occurs from turbine side seal, large amount of white smoke is emitted from exhaust pipe.	• Shaft breakage • Shaft or bearing seizure • Compressor impeller damage
External oil leak	• Oil leak from inside of turbocharger to outside of turbocharger. • Includes oil leaks visible from outside of turbocharger.	• FIPG sealing part • Oil pipe flange • Oil pipe union • Hose connection of intake pipe

Text in Illustration

*A	DC Motor Type Turbocharger (No. 1)	-	-
*1	Compressor Housing	*2	Seal Ring
*3	Compressor Inlet	*4	Compressor Impeller
*5	Bearing Housing	*6	Turbine Shaft
*7	Oil Drain (Outlet)	*8	FIPG Sealing Part
*9	Turbine Housing	*10	Turbine Wheel
*a	Internal oil leak to compressor housing	*b	Internal oil leak to turbine housing

HINT:

- **Above illustration is an example.**
- **When there is an internal oil leak, white smoke is emitted from the exhaust pipe and oil is consumed excessively. However, the cause of white smoke or excessive oil consumption can vary. Therefore, do not assume that the turbocharger is the cause of the failure when there is white smoke emission or excessive oil consumption.**
- **When there is an external oil leak, the sources of the oil leak are limited to the points mentioned in the table above. If oil leaks from a FIPG sealing part, replace the turbocharger. If oil leaks from an oil pipe flange or a hose connection, do not replace the turbocharger, but confirm and repair the flange or hose.**
- **Refer to the flowchart "Turbocharger Oil Leak and White Smoke" (Click here).**

BLACK SMOKE

a. Malfunctions are classified into 2 types as shown below.

Description

Malfunction	Main Fault
Intake air volume shortage	Insufficient mass air flow due to, for example, excessively low boost pressure, which results in fuel injection volume being relatively excessive with respect to mass air flow.
Excessive injection volume	Excessive injection volume or incorrect injection timing due to fuel system trouble.

b. Main Components Related to Black Smoke:

Possible Faulty Component	Main Fault
Turbocharger	Abnormally low boost pressure
Intake system	Leakage between turbocharger and intake manifold
Fuel system	• Excessive fuel injection volume • Incorrect fuel injection timing
EGR valve	Stuck or does not close completely
Diesel throttle	Stuck or does not move smoothly

HINT:

The components listed above are only the main ones. Not all the components potentially related to black smoke are listed. For details regarding the troubleshooting of black smoke, refer to the flowchart "Black Smoke Emitted" (Click here).

c. Relation between Turbocharger and Black Smoke:
If the boost pressure is lower than normal due to a turbocharger failure, black smoke may occur due to a lack of mass air flow. However, abnormally low boost pressure can be caused by the failure of various components such as intake lines, the EGR valve, etc. Therefore, do not assume that the turbocharger is the cause of abnormally low boost pressure, but check all the components possibly related to abnormally low boost pressure. Components related to abnormal boost pressure are shown in a chart listed in the On-vehicle Inspection for Intake System (Click here). For simple and effective troubleshooting, refer to the chart before starting troubleshooting.

LACK OF POWER AND HESITATION

a. Malfunctions are classified into 2 types as shown below.

Description

Malfunction	Main Fault
Intake air volume shortage	Insufficient mass air flow due to, for example, excessively low boost pressure, which results in fuel injection volume being restricted.
Abnormal injection volume	Abnormal injection volume or timing due to fuel system trouble.

b. Main Components Related to Lack of Power and Hesitation:

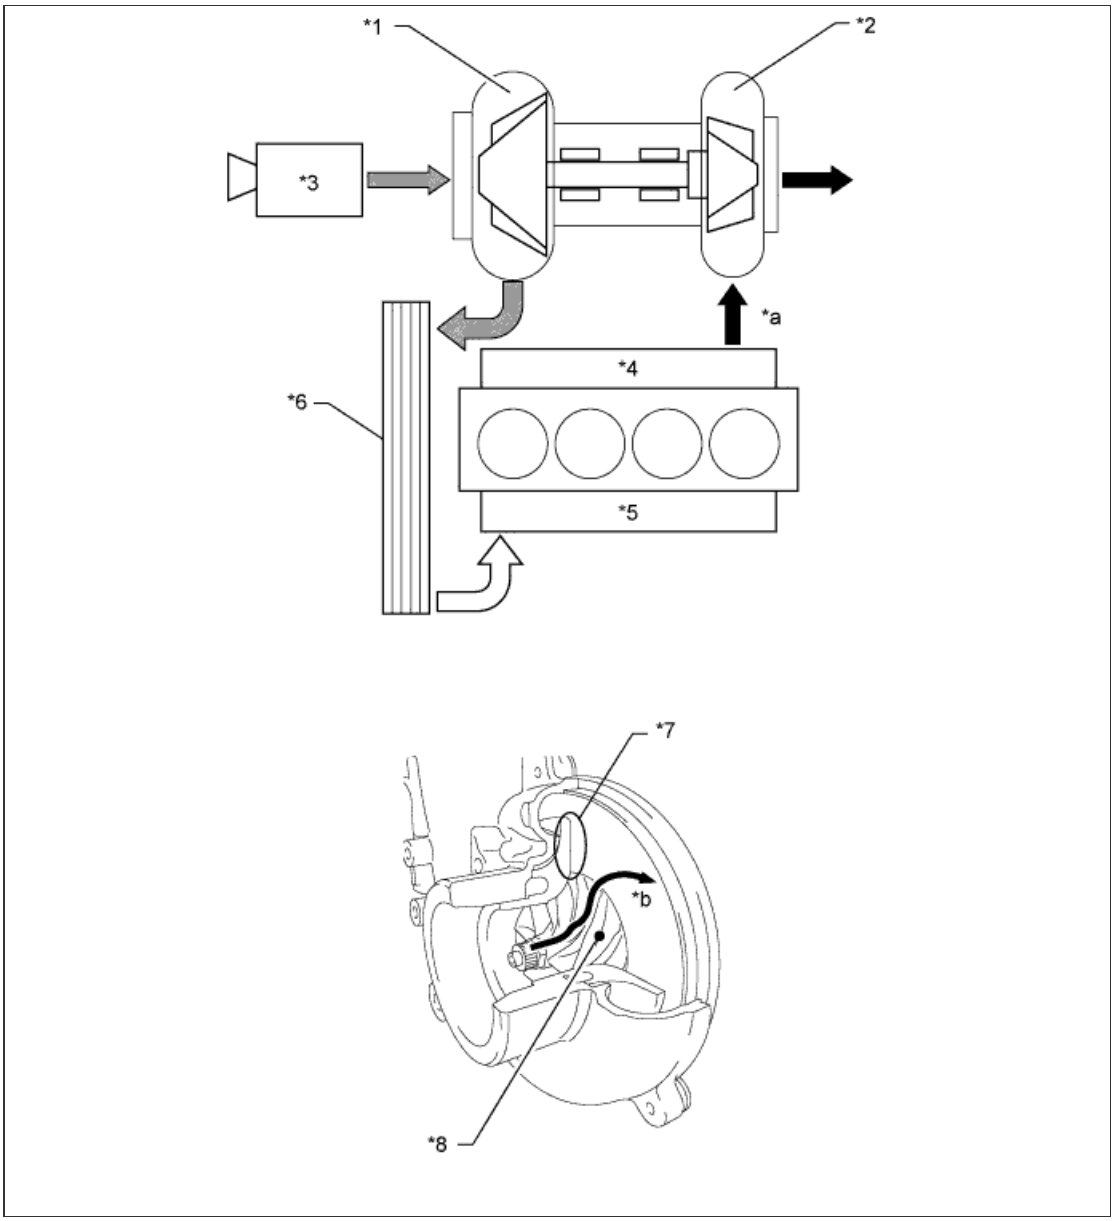
Possible Faulty Component	Main Fault
Turbocharger	• Abnormal boost pressure • VN does not move smoothly
Intake system	• Leakage between turbocharger and intake manifold • Clogging or blockage of intake line
Fuel system	• Abnormal injection volume • Incorrect fuel injection timing
EGR valve	Stuck or does not close completely
Diesel throttle	Stuck or does not move smoothly
Exhaust system	Clogging of exhaust line

HINT:

- **The components listed above are only the main ones. Not all the components potentially related to lack of power and hesitation are listed. For details regarding the troubleshooting of lack of power and hesitation, refer to the flowchart "Lack of Power or Hesitation" (Click here).**
- **If obvious malfunction (lack of power) has not been reproduced, perform test driving another vehicle, which is the same model and has the same engine, and compare the engine conditions and performance. If a great difference does not present in engine performance, explain to the customer that lack of power the customer mentioned is not abnormal.**

c. Relation between Turbocharger and Abnormal Boost Pressure:
If the boost pressure is lower than normal due to a turbocharger failure, lack of power could occur due to an intake air volume shortage. However, abnormal boost pressure can be caused by the failure of various components such as intake lines, the EGR valve, etc. Therefore, do not assume that the turbocharger is the cause of abnormal boost pressure, but check all the components possibly related to abnormal boost pressure. Components related to abnormal boost pressure are shown in a chart listed in the On-vehicle Inspection for Intake System

(Click here). For simple and effective troubleshooting, refer to the chart before starting troubleshooting.



MIL TURNS ON

If a DTC related to a turbocharger malfunction is stored, refer to the troubleshooting section for each DTC (Click here).

BRIEF OUTLINE OF TURBOCHARGER OPERATION AND CONSTRUCTION

a. A turbocharger is a component used to supply a larger air volume to the cylinders by recovering exhaust gas energy using a turbine coaxially connected to a compressor.

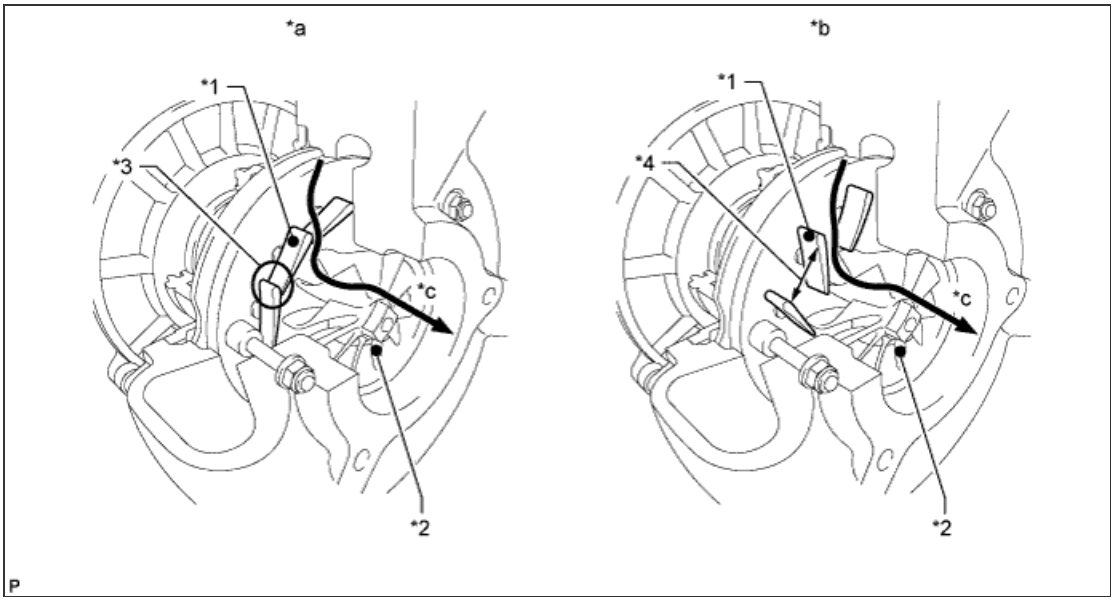
b. Principle of Turbocharging:
Boost pressure is proportional to turbocharger speed, because the intake air is accelerated by centrifugal force generated by the rotation of the compressor and the increased kinetic energy, i.e. the velocity of the intake air, is converted to pressure energy by the diffuser located around the outlet of the compressor impeller. The compressor is driven by the turbine connected coaxially by the turbine shaft. The turbine is driven by exhaust gas energy. Therefore, when the turbocharger begins boosting the intake air, a larger air volume is supplied to the cylinders and more fuel can be injected. As a result, more exhaust energy will be available and the turbocharger boost increases.

Text in Illustration

*1	Compressor	*2	Turbine
*3	Air Cleaner	*4	Exhaust Manifold
*5	Intake Manifold	*6	Intercooler (w/ Intercooler)
*7	Diffuser	*8	Compressor

*a	See HINT below	*b	Intake air flow

HINT:



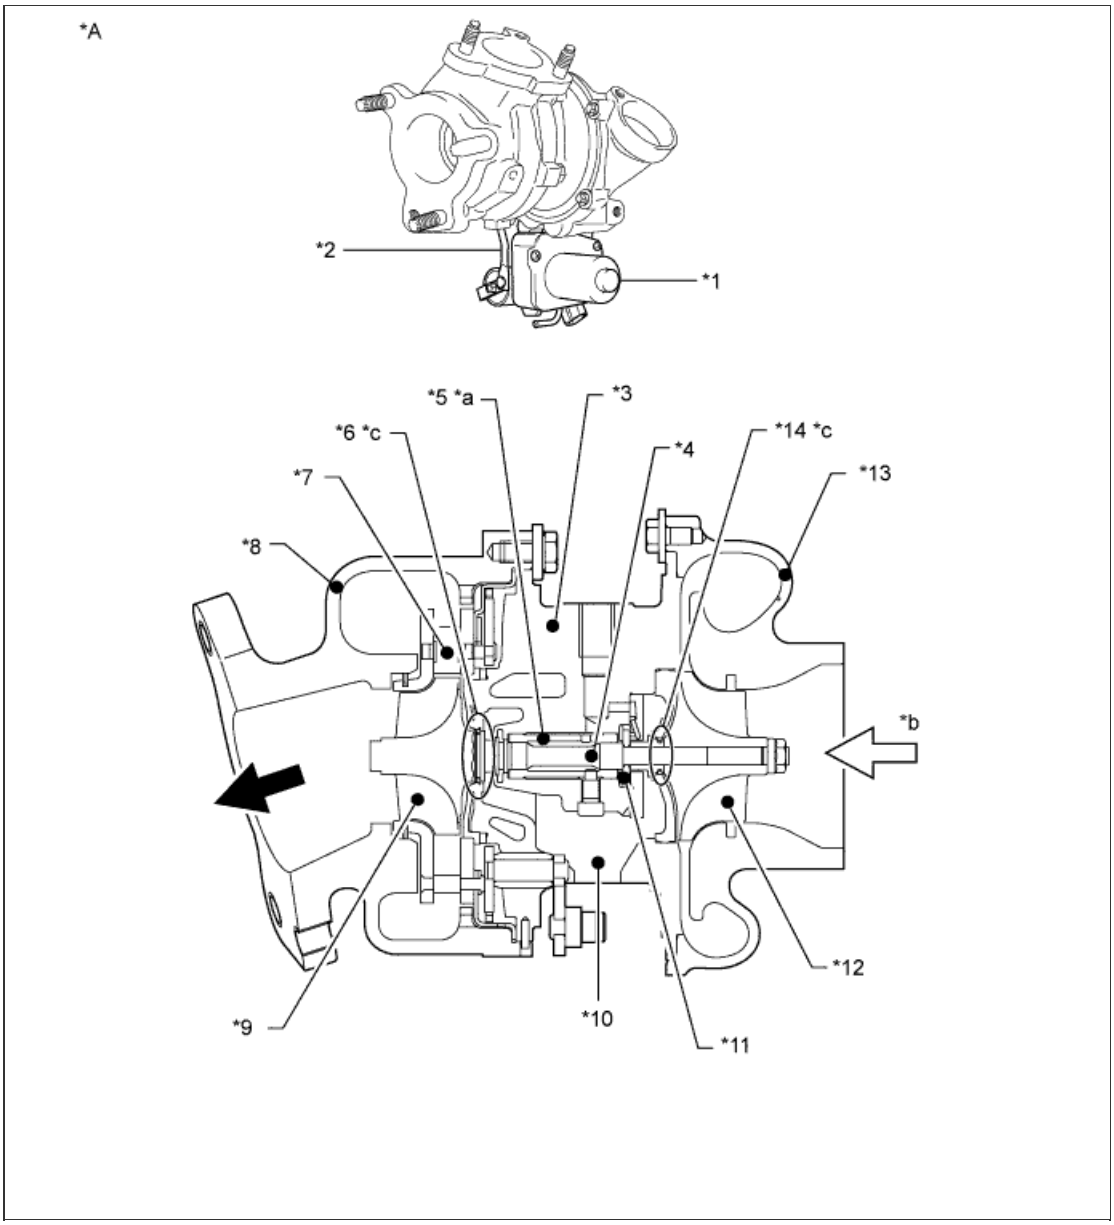
- ***a: If sufficient exhaust gas energy is not available, the turbocharger cannot generate the required boost pressure even when the turbocharger does not have a malfunction.**
- **Considering the fact that the turbocharger is driven by exhaust gas energy, if sufficient exhaust gas is not available due to abnormal injection volume, etc., the required boost pressure will not be available even when the turbocharger does not have a malfunction. Therefore, when boost pressure is abnormally low, checking all the related components using the correct troubleshooting procedure is necessary for simple and effective repair.**

c. Boost Pressure Control:

The amount of energy the turbine can obtain from the exhaust gas is proportional to the expansion ratio, which is defined as the ratio of the turbine inlet exhaust gas pressure to the pressure at the turbine outlet.

To control boost pressure, a Variable Nozzle (VN) is used just upstream of the turbine wheel inlet, and controls the expansion ratio. If the VN is closed, the gap between neighboring vanes is narrowed and the turbine inlet exhaust gas pressure, and correspondingly the expansion ratio, increases. Therefore, when the VN is closed, the turbine receives more energy, and the turbine speed and boost pressure increase. On the other hand, if the VN is opened, the turbine inlet exhaust gas pressure decreases, and the turbine speed and boost pressure decrease.

The VN is actuated by a DC motor. The ECM controls the VN opening angle through the turbo motor driver in accordance with the engine condition. When a high engine power is required, the actuation rod is moved by the actuator to close the VN and boost pressure increases.



Text in Illustration

*1	VN (Variable Nozzle)	*2	Turbine Wheel
*3	Narrow Gap	*4	Wide Gap
*a	VN Closed	*b	VN Opened
*c	Exhaust Gas Flow	-	-

HINT:

If the VN becomes stuck open, the necessary boost pressure will not be available. If the VN becomes stuck closed, overboost will occur.

d. Mechanical Construction of Turbocharger:

Text in Illustration

➡	Exhaust Gas Flow	⇨	Intake Air Flow
*A	DC Motor Type Turbocharger (No. 1)	-	-
*1	VN Actuator (DC Motor)	*2	VN Actuating Rod
*3	Bearing Housing	*4	Turbine Shaft
*5	Radial Bearing	*6	Turbine Side Seal Ring
*7	VN (Variable Nozzle)	*8	Turbine Housing
*9	Turbine Wheel	*10	Oil Drain
*11	Thrust Bearing	*12	Compressor Impeller
*13	Compressor Housing	*14	Compressor Side Seal Ring
*a	See HINT below	*b	See HINT below
*c	See HINT below	-	-

HINT:

- **Above illustration is an example.**
- ***a: The clearances of the radial bearing and thrust bearing are on the order of 100 µm, and for the accurate measurement of these clearances, an accurate process and accurate tools are essential.**
- ***b: A certain amount of oil mist from PCV gas is contained in the intake air. Therefore, a certain amount of oil at the inlet of the compressor is normal, and is not an oil leak.**
- ***c: The seal rings are C-shaped rings just like piston rings, and have a gap. Therefore, complete sealing is impossible**

by the seal rings alone. The oil is sealed in with the aid of the boost pressure in the compressor housing, and the exhaust gas pressure in the turbine housing. These pressures prevent oil from exiting the bearing housing through the gap of the seal rings. Therefore, if the turbine shaft is inclined from the horizontal, oil may flow out through the gap of a seal ring. This should not be interpreted as an oil leak due to seal ring failure.

for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

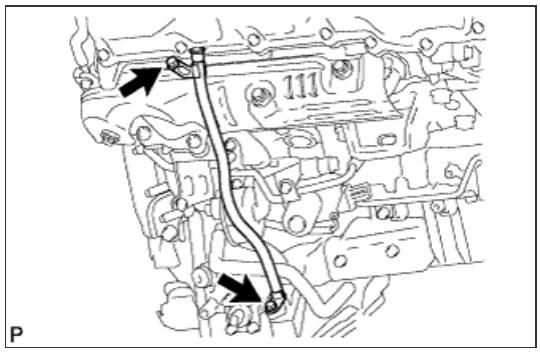
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.

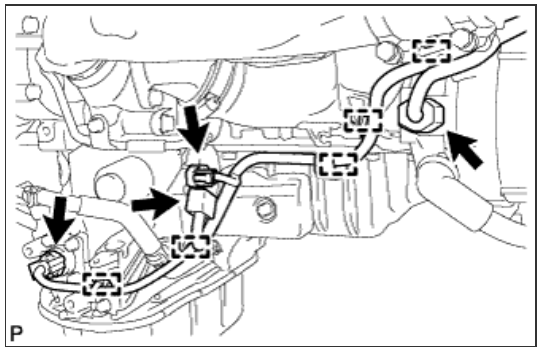


2. REMOVE ENGINE ASSEMBLY

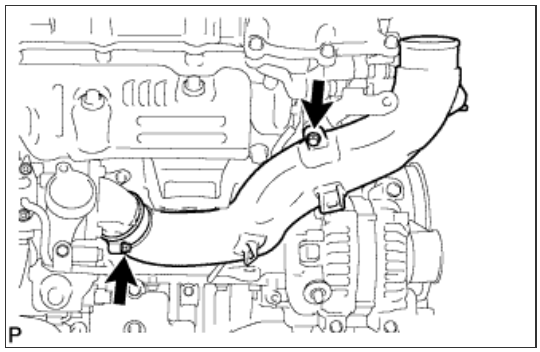
a. Remove the engine assembly from the vehicle (Click here).

3. REMOVE NO. 1 ENGINE OIL LEVEL DIPSTICK GUIDE (for Bank 1)

a. Remove the 2 bolts and No. 1 engine oil level dipstick guide.

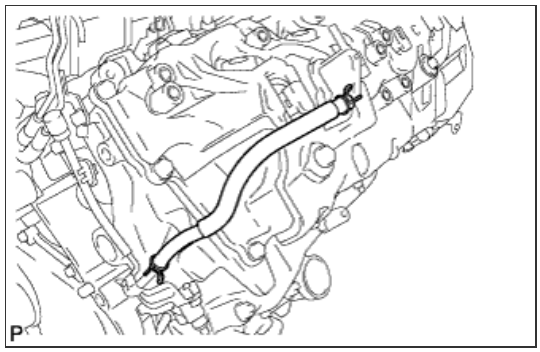


b. Remove the O-ring from the No. 1 engine oil level dipstick.

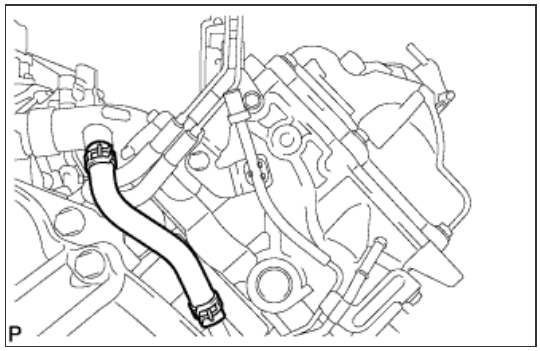


4. REMOVE NO. 1 INTAKE AIR CONNECTOR PIPE (for Bank 1)

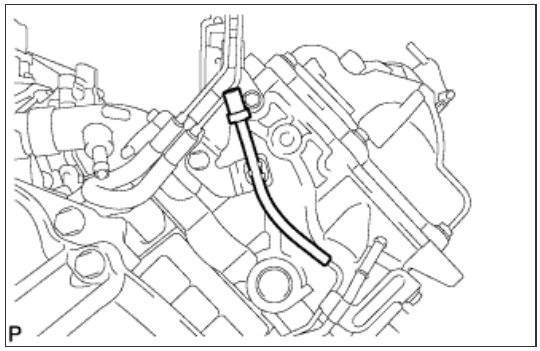
a. Disconnect the 4 connectors.



b. Using a clip remover, detach the 5 wire harness clamps.

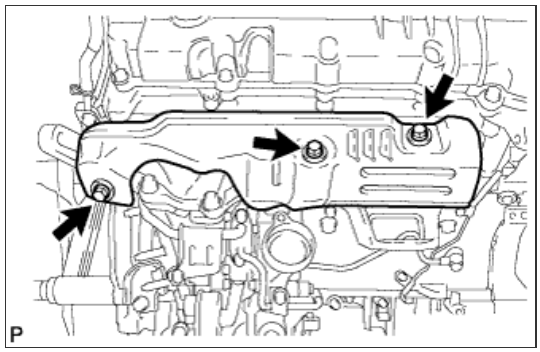


c. Loosen the hose clamp, and remove the bolt and No. 1 intake air connector pipe.

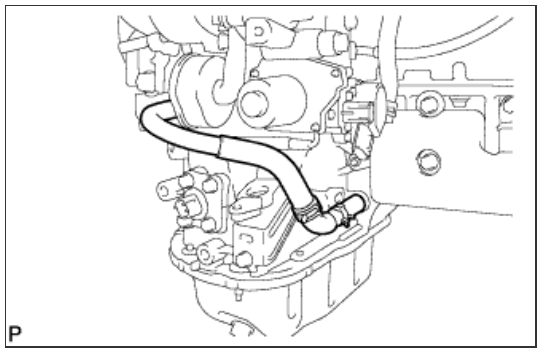


5. DISCONNECT NO. 2 VENTILATION HOSE (for Bank 1)

6. DISCONNECT NO. 2 TURBO WATER HOSE (for Bank 1)

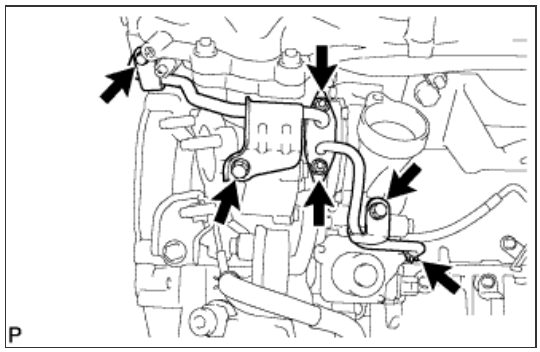


7. DISCONNECT BREATHER PLUG RH (for Bank 1)



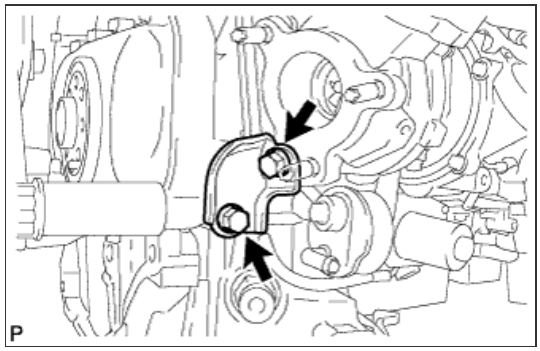
8. REMOVE NO. 1 EXHAUST MANIFOLD HEAT INSULATOR (for Bank 1)

a. Remove the 3 bolts and No. 1 exhaust manifold heat insulator.



9. DISCONNECT NO. 1 OUTLET TURBO OIL HOSE (for Bank 1)

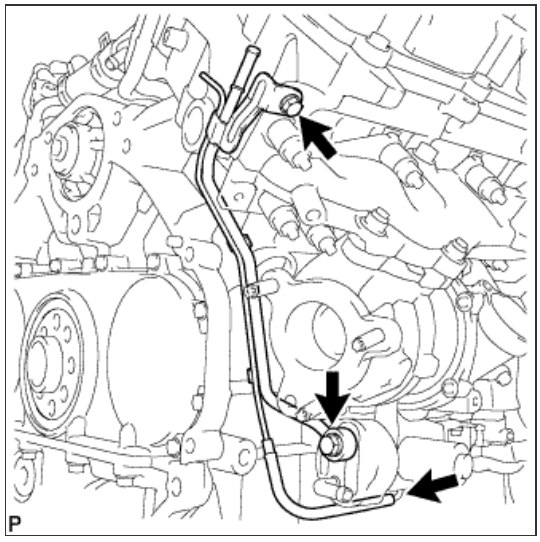
10. REMOVE NO. 1 TURBO WATER PIPE SUB-ASSEMBLY (for Bank 1)



a. Disconnect the water hose.

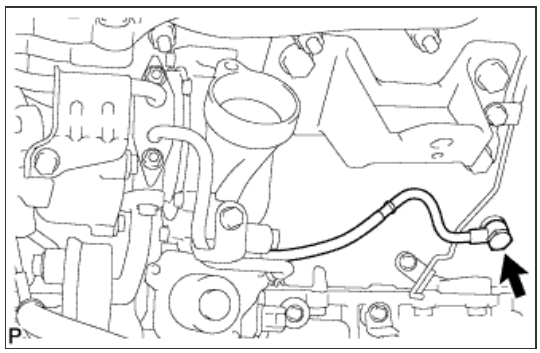
b. Remove the 3 bolts, 2 nuts, No. 1 turbo water pipe and gasket.

11. REMOVE NO. 1 TURBOCHARGER STAY (for Bank 1)



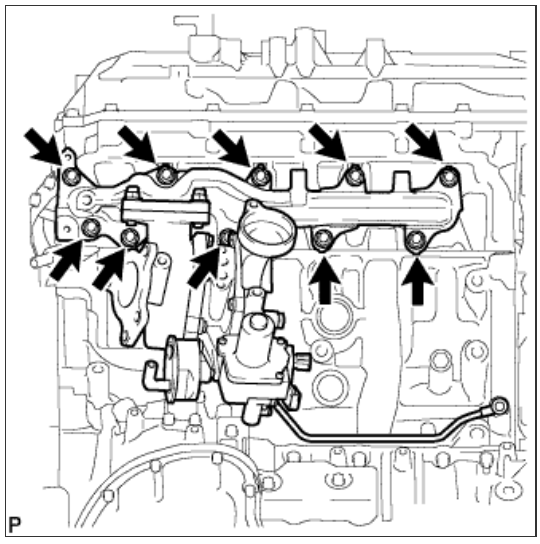
a. Remove the 2 bolts and No. 1 turbocharger stay.

12. REMOVE NO. 1 VENTILATION TUBE SUB-ASSEMBLY (for Bank 1)

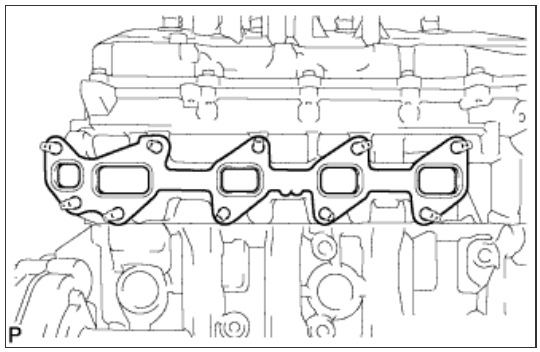


a. Disconnect the vacuum hose.

b. Remove the union bolt, bolt, No. 1 ventilation tube and gasket.

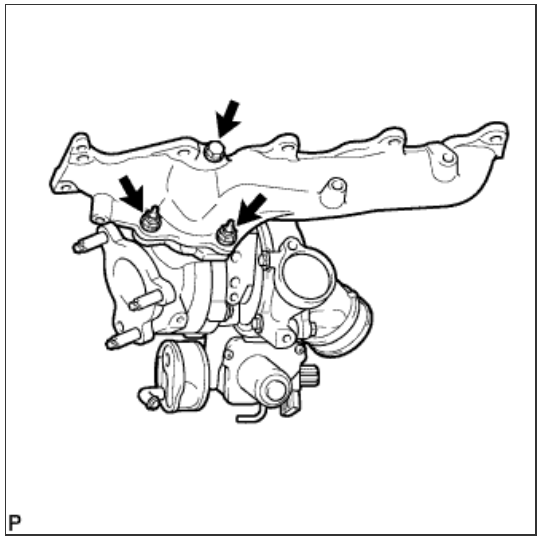


13. REMOVE NO. 1 TURBOCHARGER SUB-ASSEMBLY WITH EXHAUST MANIFOLD RH (for Bank 1)

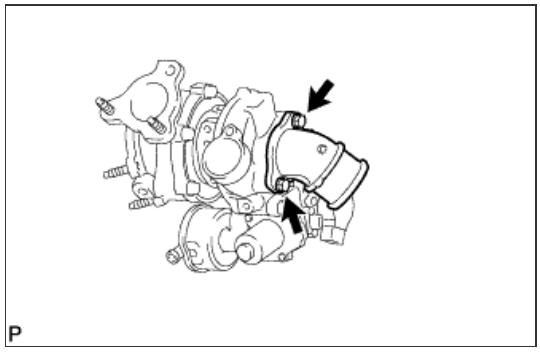


a. Remove the union bolt and gasket, and disconnect the No. 1 inlet turbo oil pipe from the cylinder block.

b. Remove the 10 nuts, 10 collars and No. 1 turbocharger with exhaust manifold RH.

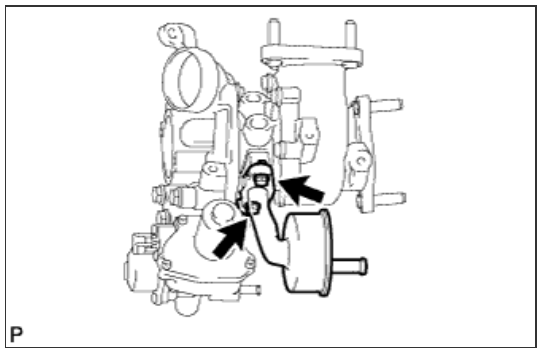


c. Remove the gasket.



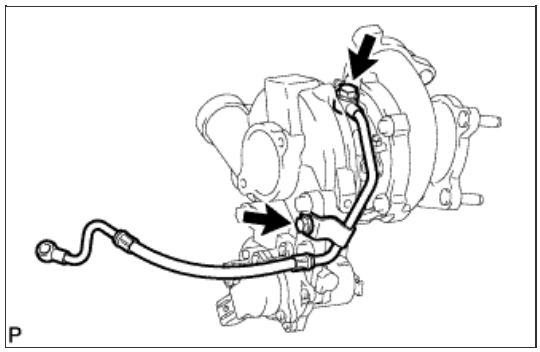
d. Remove the 2 nuts and bolt, and separate the No. 1 turbocharger and exhaust manifold RH.

e. Remove the gasket from the No. 1 turbocharger.



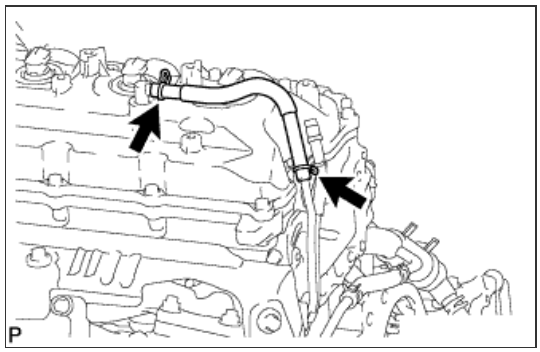
14. REMOVE NO. 1 INLET COMPRESSOR ELBOW (for Bank 1)

a. Remove the 2 bolts, No. 1 inlet compressor elbow and gasket.

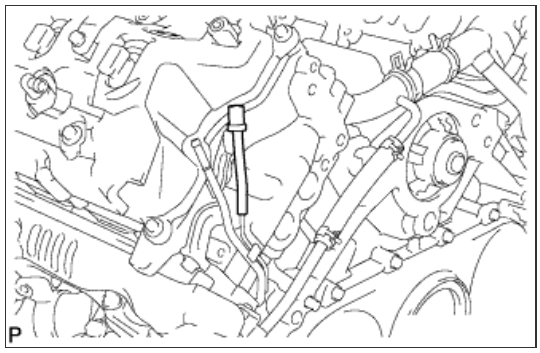


15. REMOVE NO. 1 TURBO OIL PIPE (for Bank 1)

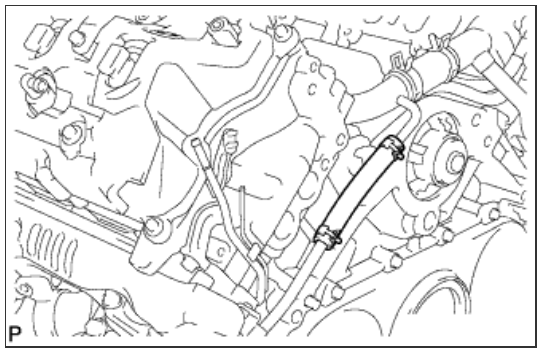
a. Remove the 2 bolts, No. 1 turbo oil pipe and gasket.



16. REMOVE NO. 1 INLET TURBO OIL PIPE SUB-ASSEMBLY (for Bank 1)

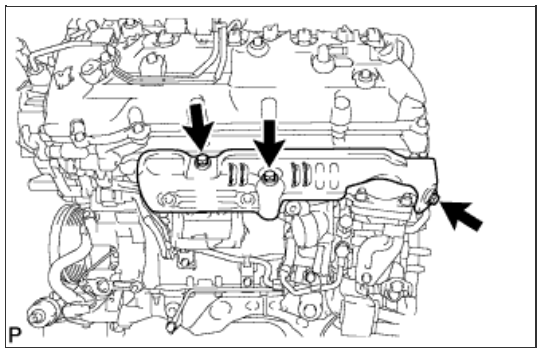


a. Remove the union bolt, bolt, No. 1 inlet turbo oil pipe and gasket.

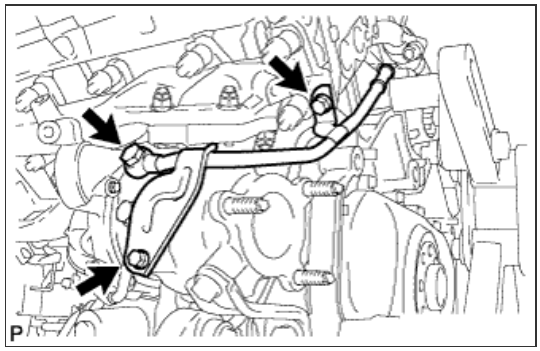


17. DISCONNECT NO. 3 VENTILATION HOSE (for Bank 2)

18. DISCONNECT BREATHER PLUG LH (for Bank 2)

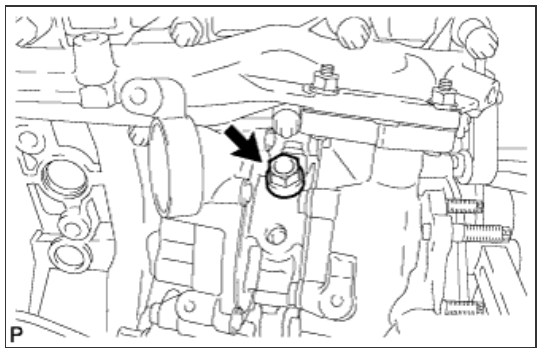


19. DISCONNECT NO. 2 TURBO WATER HOSE (for Bank 2)



20. REMOVE NO. 2 EXHAUST MANIFOLD HEAT INSULATOR (for Bank 2)

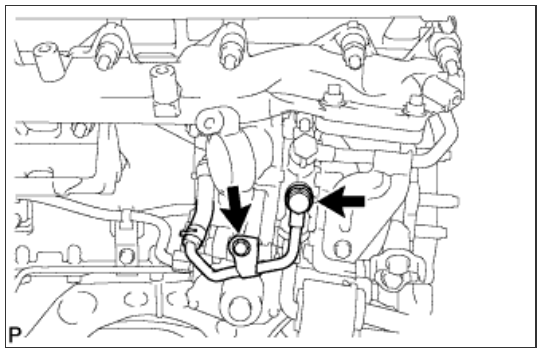
a. Remove the 3 bolts and No. 2 exhaust manifold heat insulator.



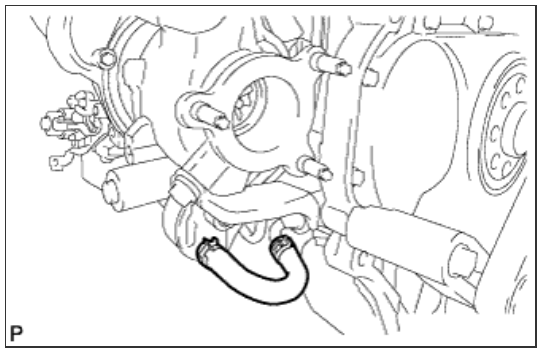
21. REMOVE NO. 3 TURBO WATER PIPE SUB-ASSEMBLY (for Bank 2)

a. Remove the 2 bolts, union bolt, No. 3 turbo water pipe and gasket.

22. REMOVE FRONT WATER BY-PASS JOINT (for Bank 2)



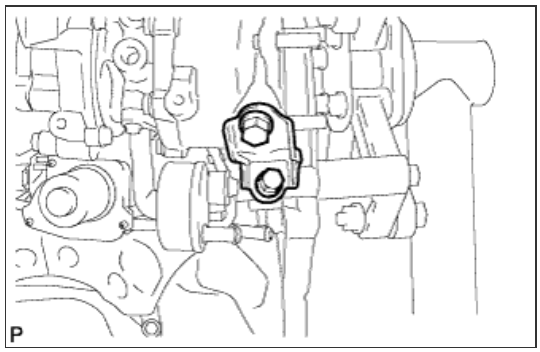
a. Remove the front water by-pass joint and gasket.



23. REMOVE NO. 2 TURBO WATER PIPE SUB-ASSEMBLY (for Bank 2)

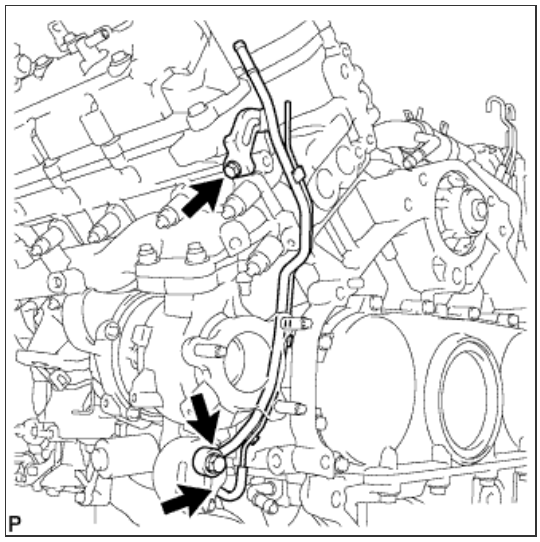
a. Disconnect the water hose.

b. Remove the union bolt, bolt, No. 2 turbo water pipe and gasket.



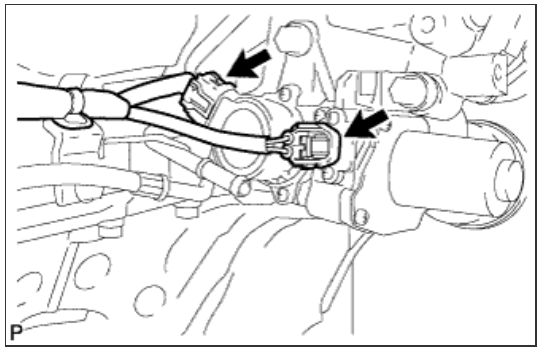
24. DISCONNECT NO. 2 OUTLET TURBO OIL HOSE (for Bank 2)

25. REMOVE NO. 2 TURBOCHARGER STAY (for Bank 2)



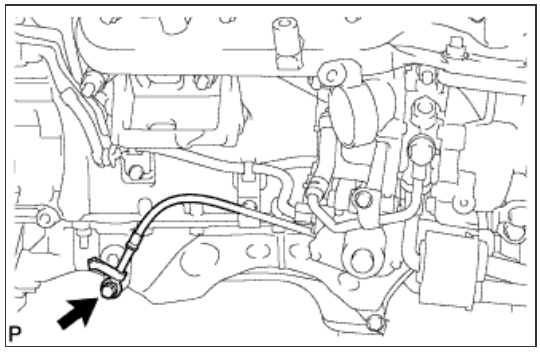
a. Remove the 2 bolts and No. 2 turbocharger stay.

26. REMOVE NO. 2 VENTILATION TUBE SUB-ASSEMBLY (for Bank 2)

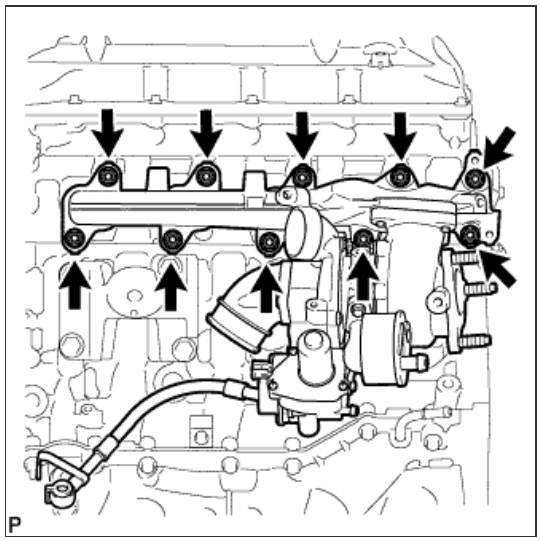


a. Disconnect the No. 2 vacuum transmitting hose.

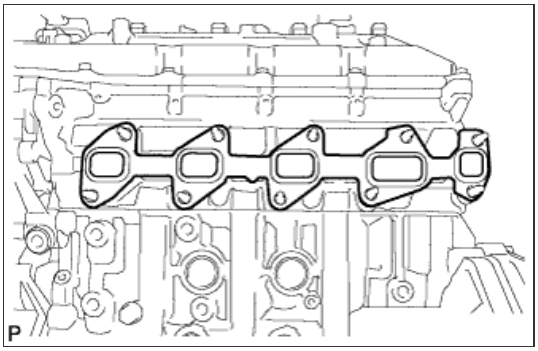
b. Remove the union bolt, bolt, No. 2 ventilation tube and gasket.



27. REMOVE NO. 2 TURBOCHARGER SUB-ASSEMBLY WITH EXHAUST MANIFOLD LH (for Bank 2)

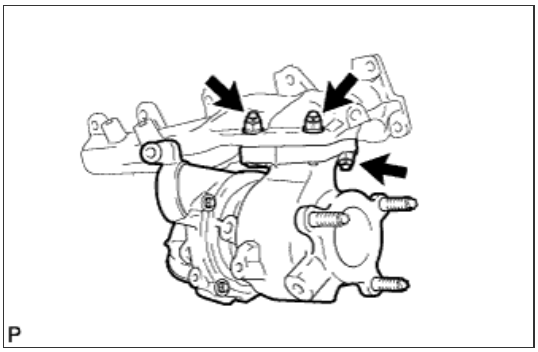


a. Disconnect the 2 connectors from the turbocharger.

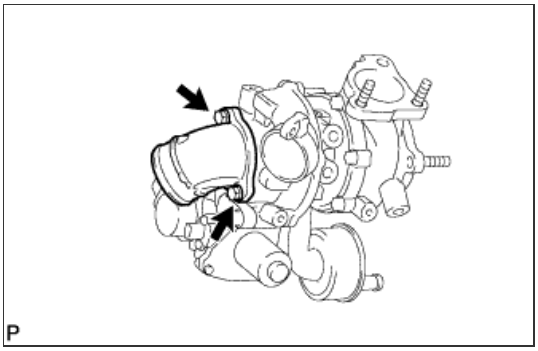


b. Remove the union bolt and gasket, and disconnect the No. 2 inlet turbo oil pipe.

c. Remove the 10 nuts, 10 collars and No. 2 turbocharger with exhaust manifold LH.

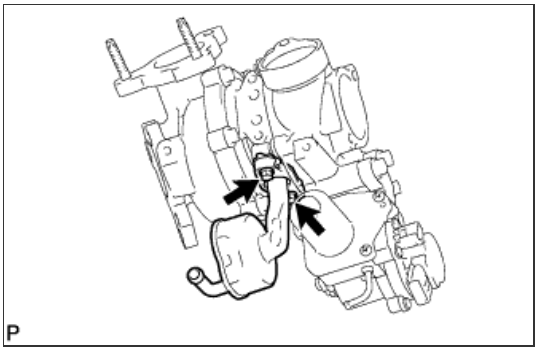


d. Remove the gasket.



e. Remove the 3 nuts, and separate the No. 2 turbocharger and exhaust manifold LH.

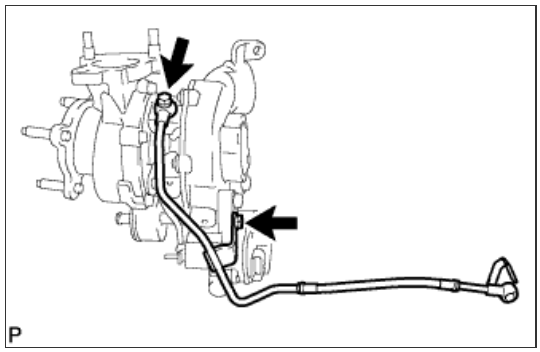
f. Remove the gasket from the turbocharger.



28. REMOVE NO. 2 INLET COMPRESSOR ELBOW (for Bank 2)

a. Remove the 2 bolts, No. 2 inlet compressor elbow and gasket.

29. REMOVE NO. 2 TURBO OIL PIPE (for Bank 2)



a. Remove the 2 bolts, No. 2 turbo oil pipe and gasket.

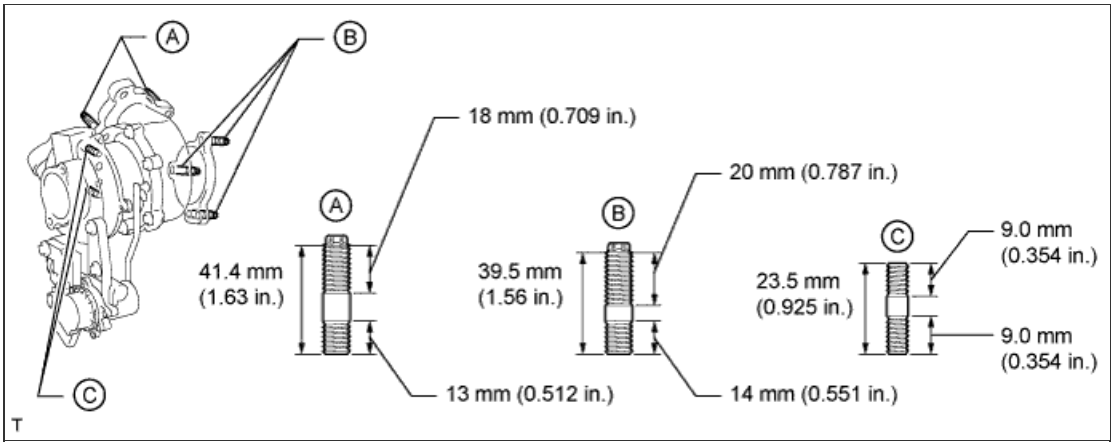
30. REMOVE NO. 2 INLET TURBO OIL PIPE SUB-ASSEMBLY (for Bank 2)

a. Remove the union bolt, bolt, No. 2 inlet turbo oil pipe and gasket.

a. Remove the union bolt, bolt, No. 2 inlet turbo oil pipe and gasket.

31. REPLACE STUD BOLT

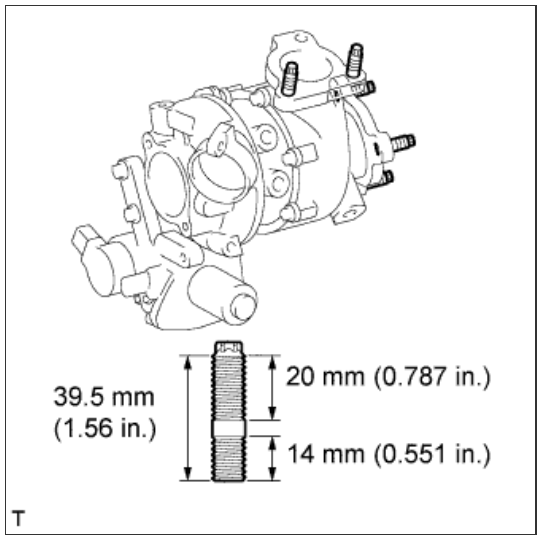
HINT:



If a stud bolt is deformed or the threads are damaged, replace it.

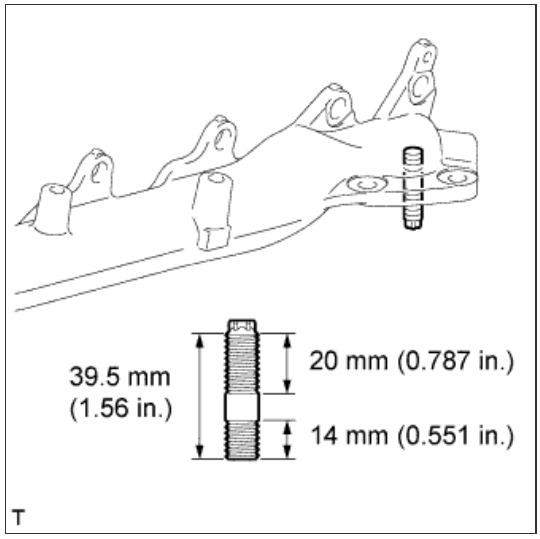
a. for No. 1 Turbocharger:
Using an E10 "TORX" wrench, replace the stud bolts labeled A and B shown in the illustration below.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }



b. for No. 1 Turbocharger:
Replace the stud bolts labeled C shown in the illustration below.

Torque:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }



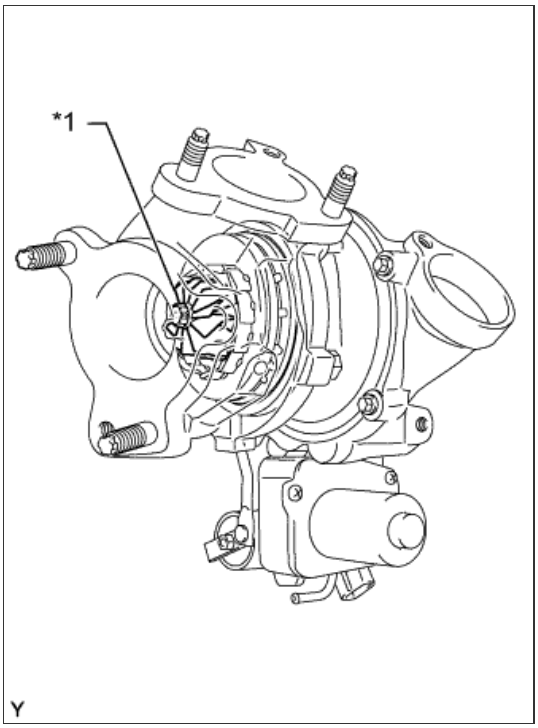
c. for No. 2 Turbocharger:
Using an E10 "TORX" wrench, replace the stud bolt.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

d. for Exhaust Manifold RH:
Using an E10 "TORX" wrench, replace the stud bolt.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

for Preparation Click here



1. VISUALLY CHECK TURBOCHARGER SUB-ASSEMBLY

a. Check for deformation and cracks in the turbine wheel on the exhaust side.

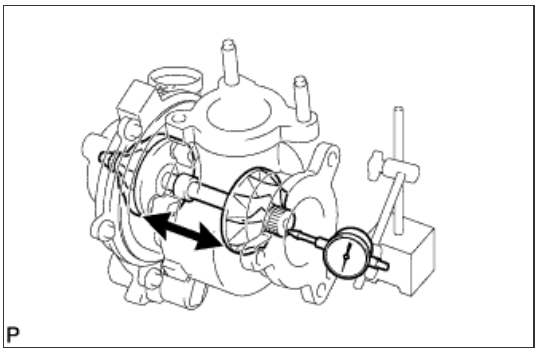
Text in Illustration

*1	Turbine Wheel

If the turbine wheel is cracked or deformed, replace the turbocharger sub-assembly.

2. INSPECT AXIAL PLAY OF TURBINE SHAFT

a. Using a dial indicator, insert the needle of the dial indicator into the exhaust side of the turbine shaft.



b. Move the turbine shaft in an axial direction and measure the axial play of the turbine shaft.

NOTICE:

Turbocharger sub-assembly and dial indicators are surely fixed when performing measurement.

Maximum axial play:
0.09 mm (0.00354 in.)

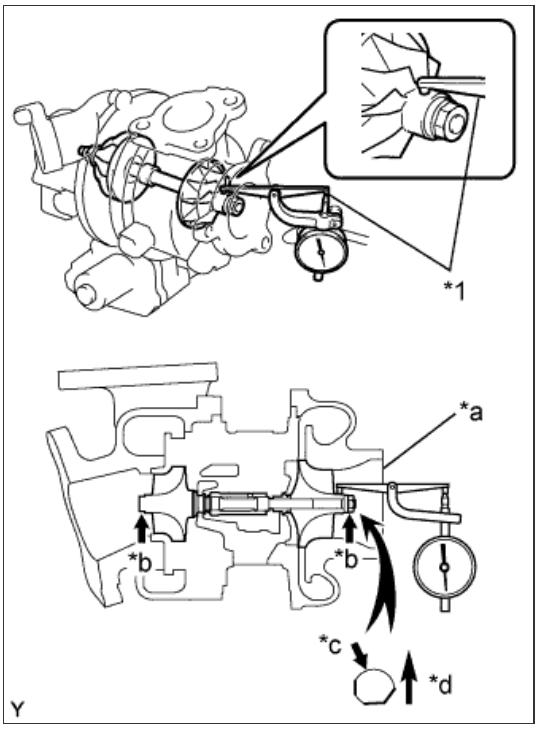
If the axial play is more than the maximum, replace the turbocharger sub-assembly.

3. INSPECT RADIAL PLAY OF TURBINE SHAFT

a. Connect a lever probe to a dial indicator.

*1	Lever Probe
*a	Air Intake Side
*b	Lift Up

*c *d	Not Cut for Balancing Upward



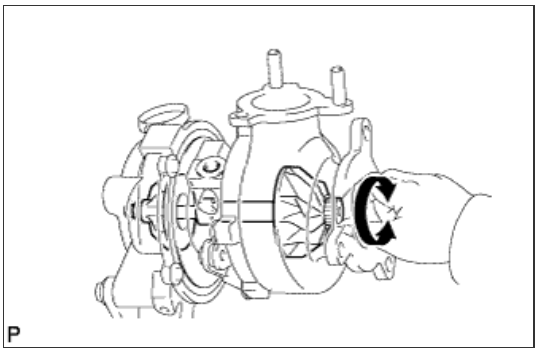
b. Rotate the turbine shaft so that a part that has not been cut for shaft balancing is facing upwards on the air intake side.

c. Place the lever probe against the shaft at the position shown in the illustration.

d. Lift up the both sides of the turbine shaft, move it in a radial direction and measure the radial play of the turbine shaft.

Maximum radial play:
0.16 mm (0.00630 in.)

If the radial play is more than the maximum, replace the turbocharger sub-assembly.



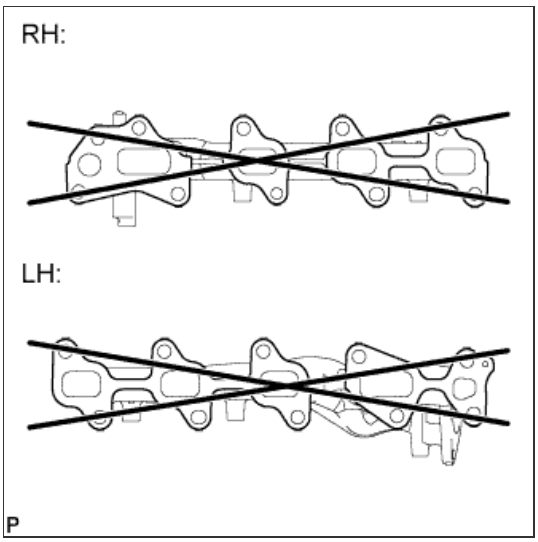
4. CHECK TURBINE SHAFT ROTATION

a. Rotate the turbine wheel on the exhaust side with your finger and check that it rotates smoothly.

HINT:

Even if it takes effort a little to rotate the turbine wheel, this is not a problem.

If the turbine wheel does not rotate smoothly, replace the turbocharger sub-assembly.

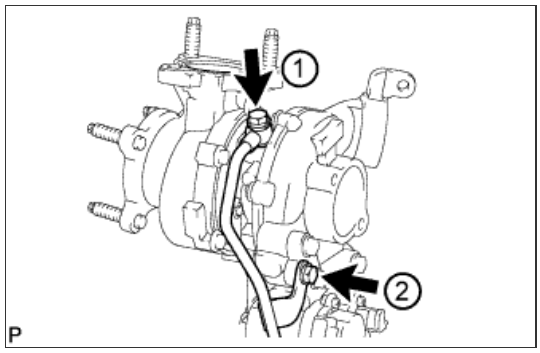


5. INSPECT EXHAUST MANIFOLD RH AND LH

a. Using a precision straightedge and feeler gauge, measure the warpage of the contact surface between the exhaust manifold and cylinder head.

Maximum warpage:
0.80 mm (0.0315 in.)

If the warpage is more than the maximum, replace the exhaust manifold.



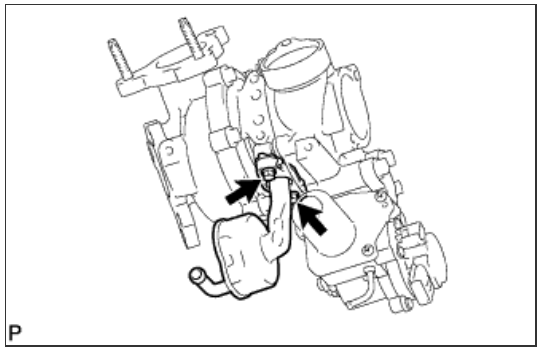
for Preparation Click here

1. INSTALL NO. 2 INLET TURBO OIL PIPE SUB-ASSEMBLY (for Bank 2)

a. Temporarily install a new gasket and the No. 2 inlet turbo oil pipe with the union bolt and bolt.

b. Tighten the union bolt and bolt in the order shown in the illustration.

Torque:
for union bolt:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }



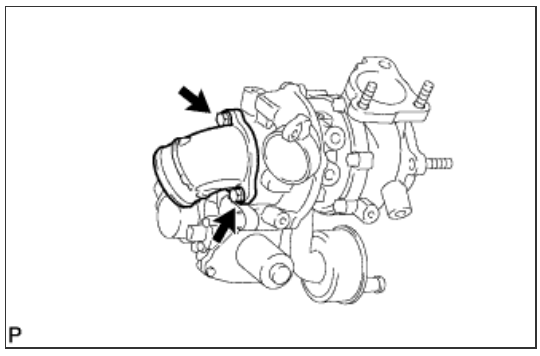
2. INSTALL NO. 2 TURBO OIL PIPE (for Bank 2)

a. Install a new gasket and the No. 2 turbo oil pipe with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

HINT:

The gasket claws should face the pipe.



3. INSTALL NO. 2 INLET COMPRESSOR ELBOW (for Bank 2)

a. Install a new gasket and the No. 2 inlet compressor elbow with the 2 bolts.

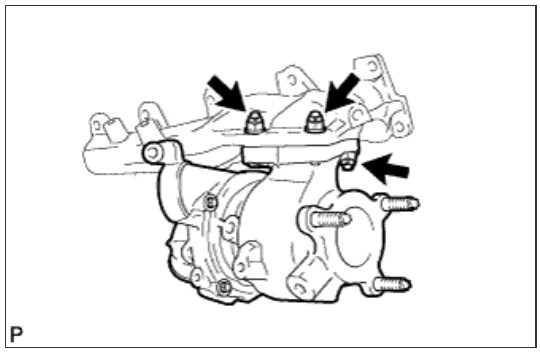
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

HINT:

Install the No. 2 inlet compressor elbow with the "L" mark facing toward the outside of the vehicle.

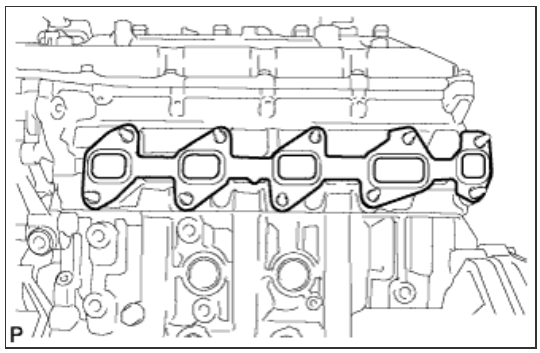
4. INSTALL NO. 2 TURBOCHARGER SUB-ASSEMBLY WITH EXHAUST MANIFOLD LH (for Bank 2)

a. Set a new gasket to the No. 2 turbocharger.



b. Install the exhaust manifold LH to the No. 2 turbocharger with 3 new nuts.

Torque:

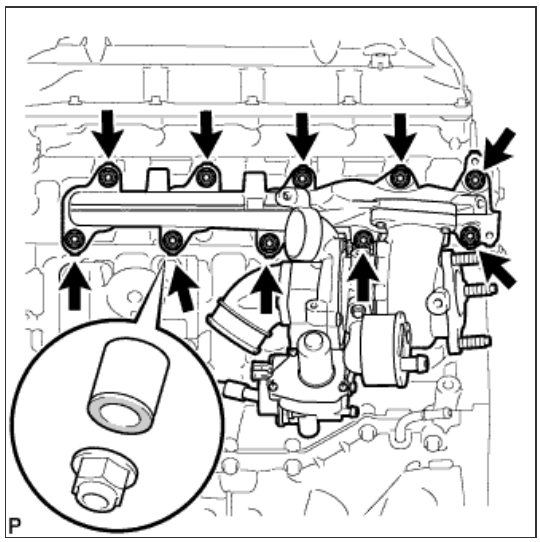


60 N*m{ 612 kgf*cm , 44 ft.*lbf }

HINT:

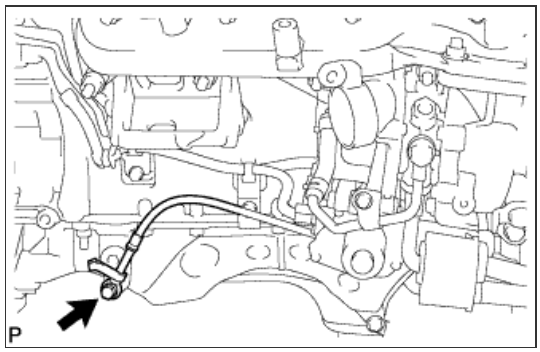
The gasket claw should face toward the outside of the vehicle.

c. Set a new gasket to the cylinder head LH.



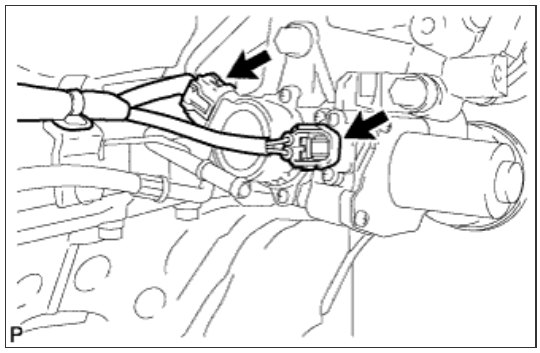
d. Install the No. 2 turbocharger with exhaust manifold LH and 10 collars to the cylinder head LH with 10 new nuts.

Torque:
36 N*m{ 367 kgf*cm , 27 ft.*lbf }



HINT:

Install the collars with the colored side facing the nuts.



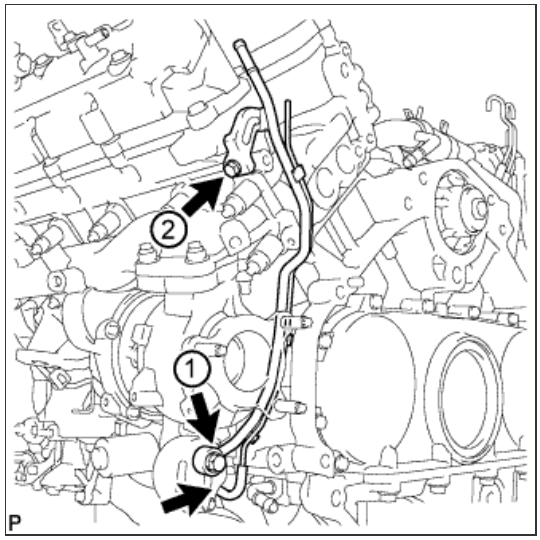
e. Install a new gasket and the No. 2 inlet turbo oil pipe to the No. 1 oil pan with the union bolt.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

f. Connect the 2 connectors to the turbocharger.

5. INSTALL NO. 2 VENTILATION TUBE SUB-ASSEMBLY (for Bank 2)

a. Temporarily install a new gasket and the No. 2 ventilation tube with the union bolt and bolt.

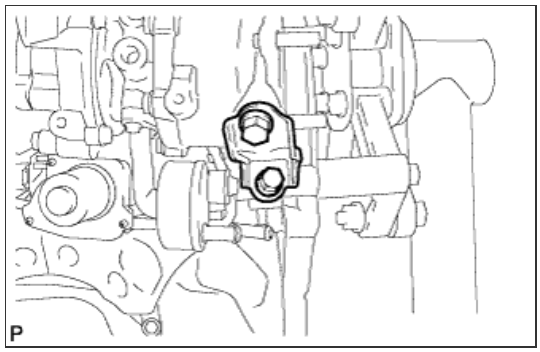


b. Tighten the union bolt and bolt in the order shown in the illustration.

Torque:
for union bolt:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

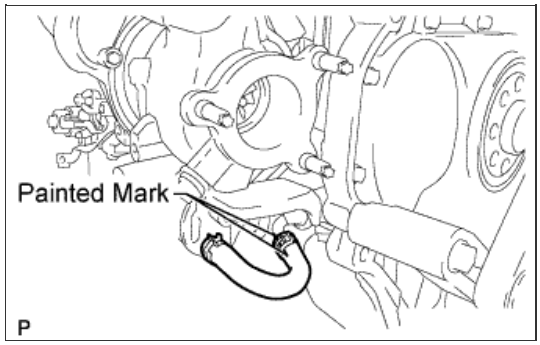
Clean and remove any oil labeled 1shown in the illustration.



c. Connect the No. 2 vacuum transmitting hose.

6. INSTALL NO. 2 TURBOCHARGER STAY (for Bank 2)

a. Install the No. 2 turbocharger stay with the 2 bolts.

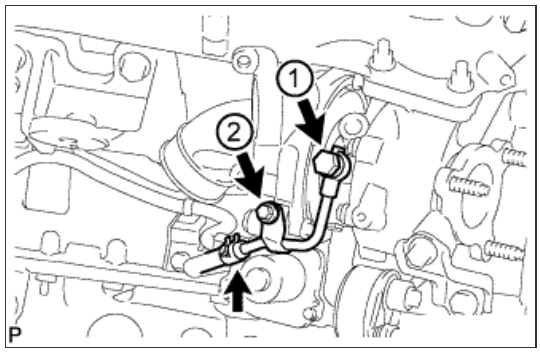


Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }

7. CONNECT NO. 2 OUTLET TURBO OIL HOSE (for Bank 2)

HINT:

Align the white paint marks on the oil hose and pipe, and connect the hose.

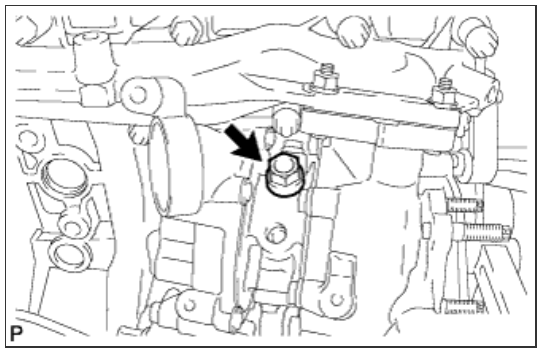


8. INSTALL NO. 2 TURBO WATER PIPE SUB-ASSEMBLY (for Bank 2)

a. Temporarily install a new gasket and the No. 2 turbo water pipe with the union bolt and bolt.

b. Tighten the union bolt and bolt in the order shown in the illustration.

Torque:
for union bolt:
35 N*m{ 357 kgf*cm , 26 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

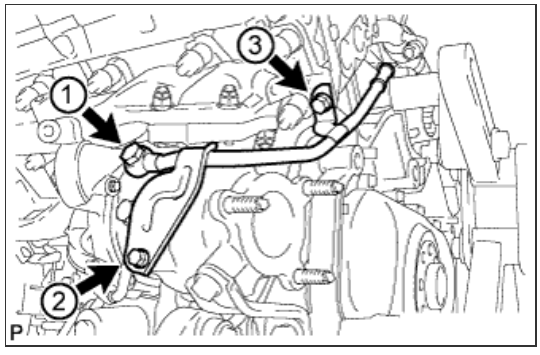


c. Connect the water hose to the pipe.

9. INSTALL FRONT WATER BY-PASS JOINT (for Bank 2)

a. Install a new gasket and the front water by-pass joint.

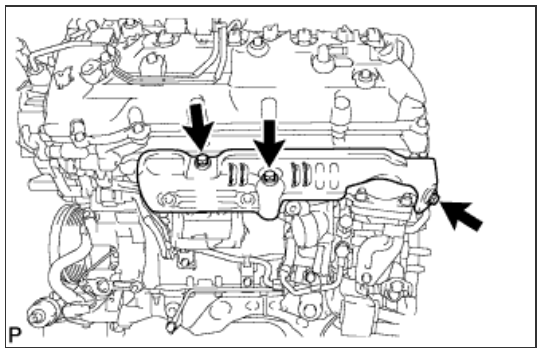
Torque:
50 N*m{ 510 kgf*cm , 37 ft.*lbf }



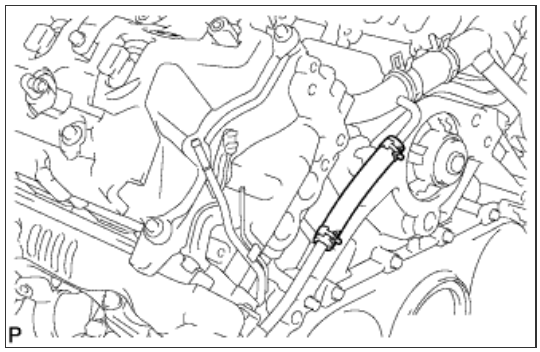
10. INSTALL NO. 3 TURBO WATER PIPE SUB-ASSEMBLY (for Bank 2)

a. Temporarily install a new gasket and the No. 3 turbo water pipe with the union bolt and 2 bolts.

b. Tighten the union bolt and 2 bolts in the order shown in the illustration.

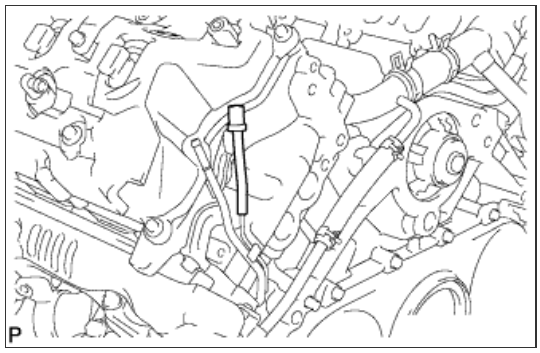


Torque:
for union bolt:
35 N*m{ 357 kgf*cm , 26 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

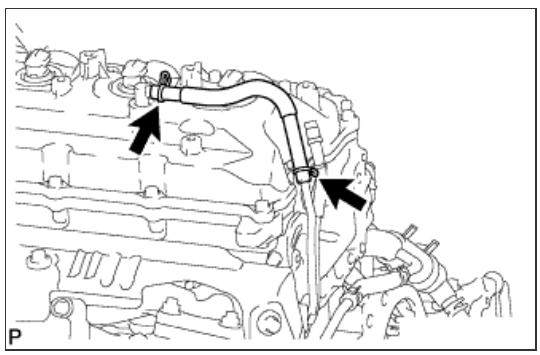


11. INSTALL NO. 2 EXHAUST MANIFOLD HEAT INSULATOR (for Bank 2)

a. Install the No. 2 exhaust manifold heat insulator with the 3 bolts.



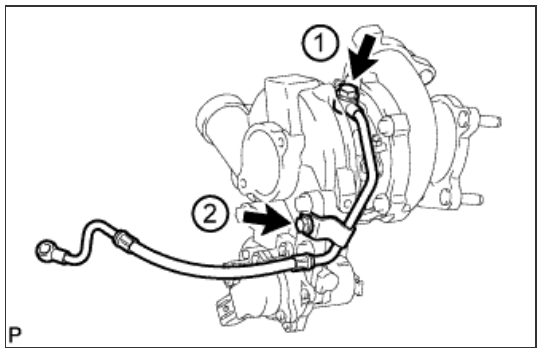
Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }



12. CONNECT NO. 2 TURBO WATER HOSE (for Bank 2)

13. CONNECT BREATHER PLUG LH (for Bank 2)

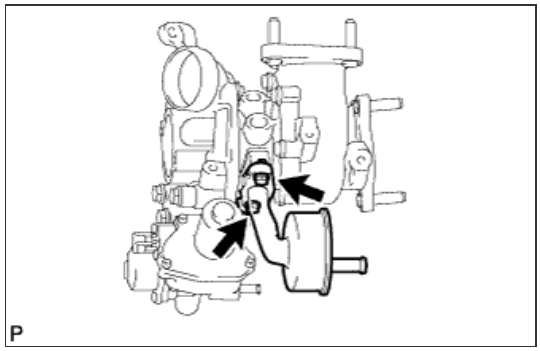
14. CONNECT NO. 3 VENTILATION HOSE (for Bank 2)



15. INSTALL NO. 1 INLET TURBO OIL PIPE SUB-ASSEMBLY (for Bank 1)

a. Temporarily install a new gasket and the No. 1 inlet turbo oil pipe with the union bolt and bolt.

b. Tighten the union bolt and bolt in the order shown in the illustration.

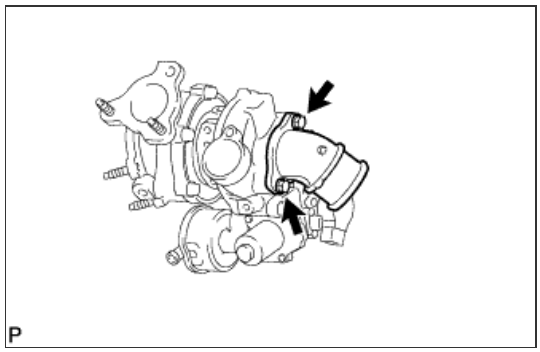


Torque:
for union bolt:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

16. INSTALL NO. 1 TURBO OIL PIPE (for Bank 1)

a. Install a new gasket and the No. 1 turbo oil pipe with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }



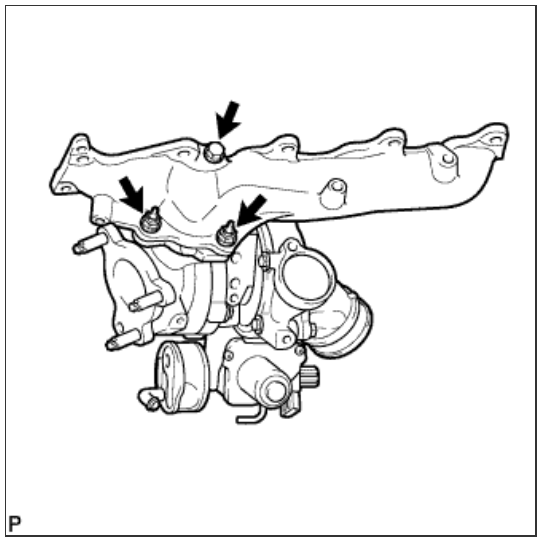
17. INSTALL NO. 1 INLET COMPRESSOR ELBOW (for Bank 1)

a. Install a new gasket and the No. 1 inlet compressor elbow with the 2 bolts.

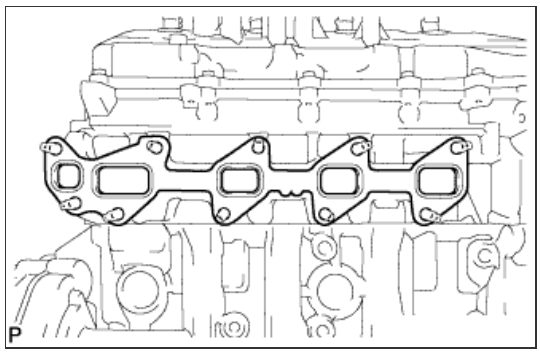
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

HINT:

Install the No. 1 inlet compressor elbow with the "R" mark facing toward the outside of the vehicle.



18. INSTALL NO. 1 TURBOCHARGER SUB-ASSEMBLY WITH EXHAUST MANIFOLD RH (for Bank 1)

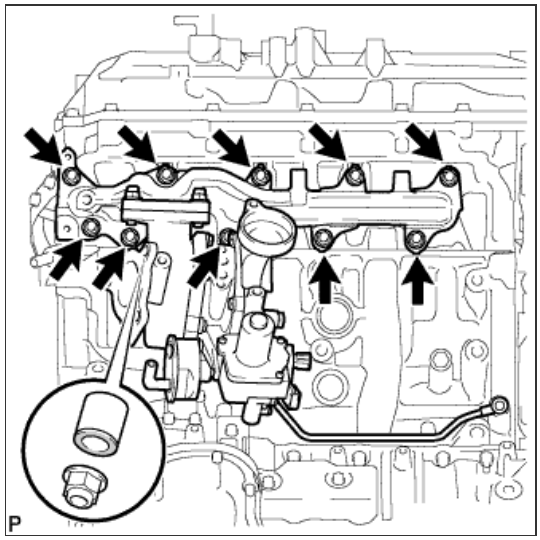


a. Set a new gasket to the No. 1 turbocharger.

b. Install the exhaust manifold RH to the No. 1 turbocharger with 2 new nuts and the bolt.

Torque:
60 N*m{ 612 kgf*cm , 44 ft.*lbf }

c. Set a new gasket to the cylinder head RH.

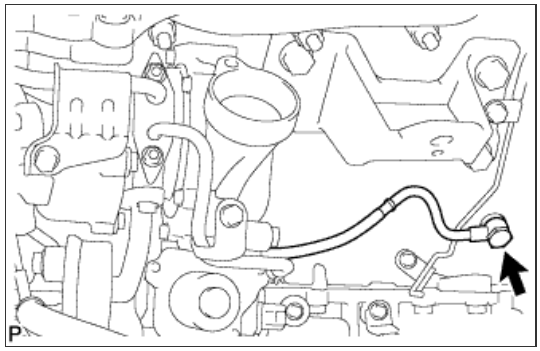


d. Install the No. 1 turbocharger with exhaust manifold RH to the cylinder head RH with the 10 collars and 10 new nuts.

Torque:
36 N*m{ 367 kgf*cm , 27 ft.*lbf }

HINT:

Install the collars with the colored side facing the nuts.



e. Install a new gasket and the No. 1 inlet turbo oil pipe to the cylinder block with the union bolt.

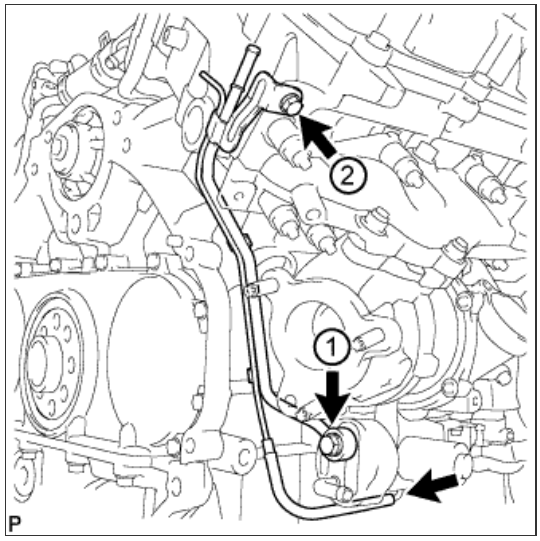
Torque:
Case i dry:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }
Case i et
23 N*m{ 235 kgf*cm , 17 ft.*lbf }

NOTICE:

- **The ca e i dry" when there i olutel no engine oil on the union bolt and c lider block bolt hole.**
- **The ca e i et hen the engine oil on the union bolt and c lider block bolt hole.**

19. INSTALL NO. 1 VENTILATION TUBE SUB-ASSEMBLY (for Bank 1)

a. Temporarily install a new gasket and the No. 1 ventilation tube with the union bolt and bolt.



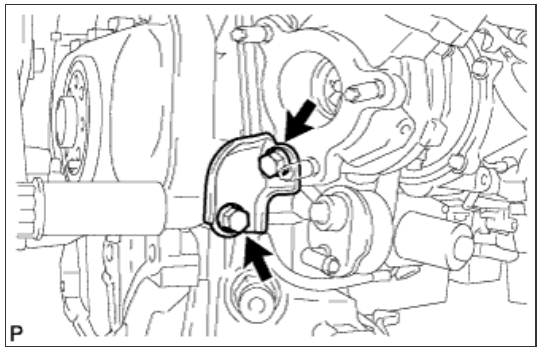
b. Tighten the union bolt and bolt in the order shown in the illustration.

Torque:
for union bolt:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }
for bolt:
10 N*m{ 102 kgf*cm , 7 in.*lbf }

NOTICE:

Clean and remove any oil labeled 1 shown in the illustration.

c. Connect the vacuum hose.

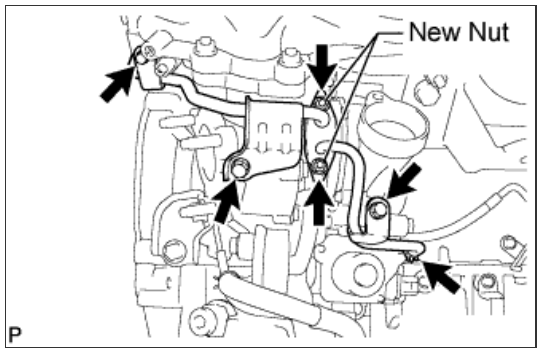


20. INSTALL NO. 1 TURBOCHARGER STAY (for Bank 1)

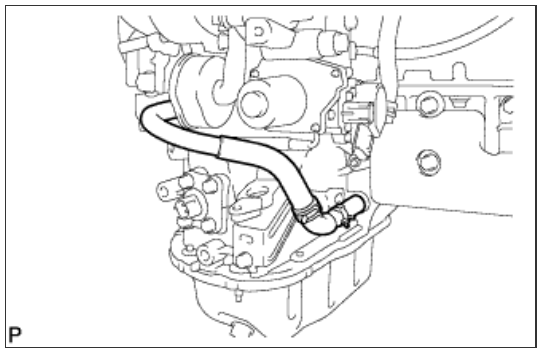
a. Temporarily install the No. 1 turbocharger stay with the 2 bolts.

b. Tighten the 2 bolts.

Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }



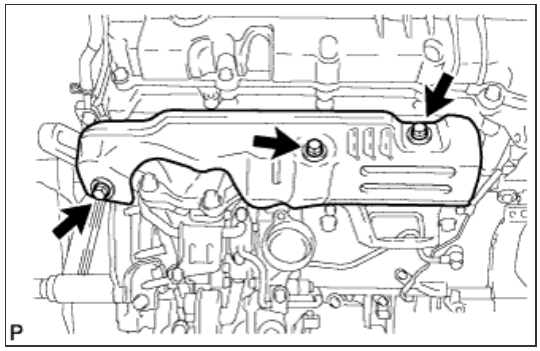
21. INSTALL NO. 1 TURBO WATER PIPE SUB-ASSEMBLY (for Bank 1)



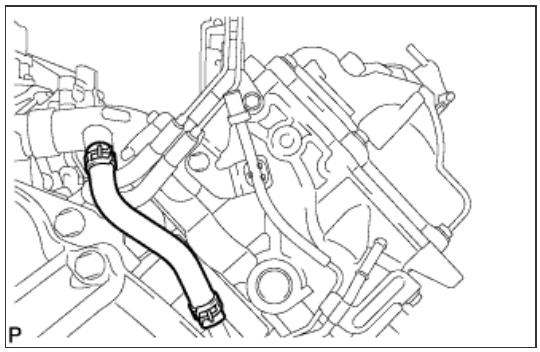
a. Install a new gasket and the No. 1 turbo water pipe with 2 new nuts and 3 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Connect the water hose.

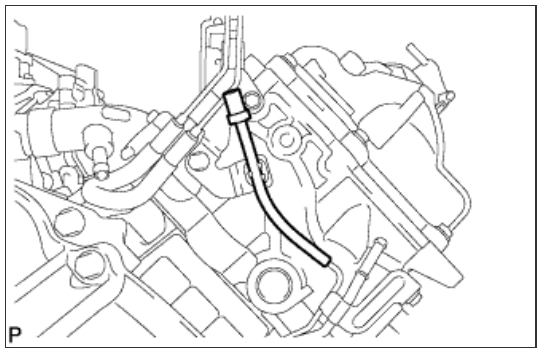


22. CONNECT NO. 1 OUTLET TURBO OIL HOSE (for Bank 1)

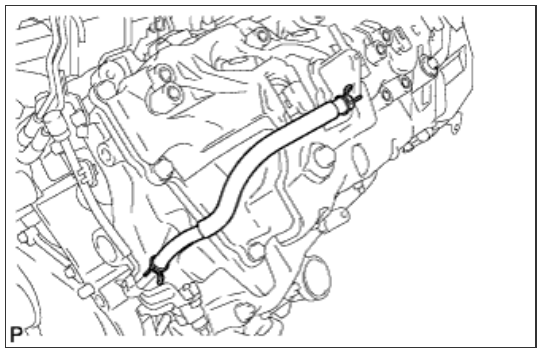


23. INSTALL NO. 1 EXHAUST MANIFOLD HEAT INSULATOR (for Bank 1)

a. Install the No. 1 exhaust manifold heat insulator with the 3 bolts.

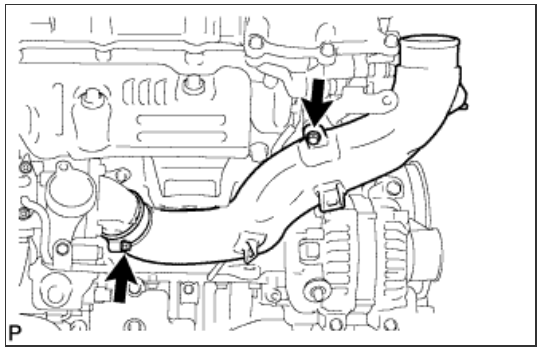


Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }

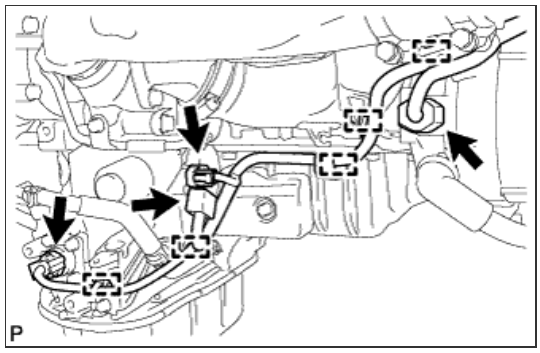


24. CONNECT NO. 2 TURBO WATER HOSE (for Bank 1)

25. CONNECT BREATHER PLUG RH (for Bank 1)



26. CONNECT NO. 2 VENTILATION HOSE (for Bank 1)

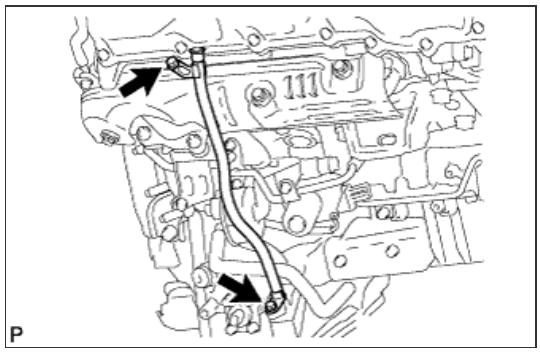


27. INSTALL NO. 1 INTA E AIR CONNECTOR PIPE (for Bank 1)

a. Install the No. 1 intake air connector pipe with the bolt. Then tighten the hose clamp.

Torque:
for bolt:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for clamp:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }

b. Connect the 4 connectors and attach the 5 wire harness clamps.



28. INSTALL NO. 1 ENGINE OIL LEVEL DIPSTIC GUIDE (for Bank 1)

a. Apply a light coat of engine oil to a new O-ring and install it to the No. 1 engine oil level dipstick guide.

b. Install the No. 1 engine oil level dipstick guide with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

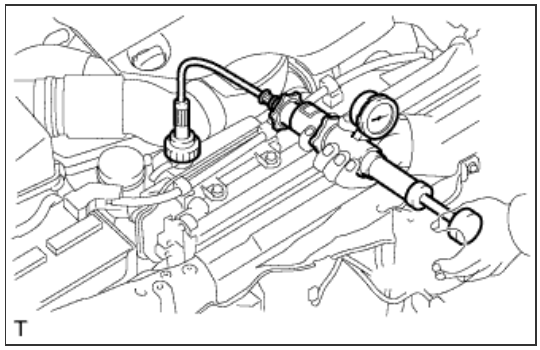
29. INSTALL ENGINE ASSEMBLY

a. Install the engine assembly to the vehicle (Click here).

30. INSPECT FOR OIL LEA

a. Warm up the engine and check for an engine oil leak.

31. INSPECT FOR COOLANT LEA



CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.

b. Warm up the engine.

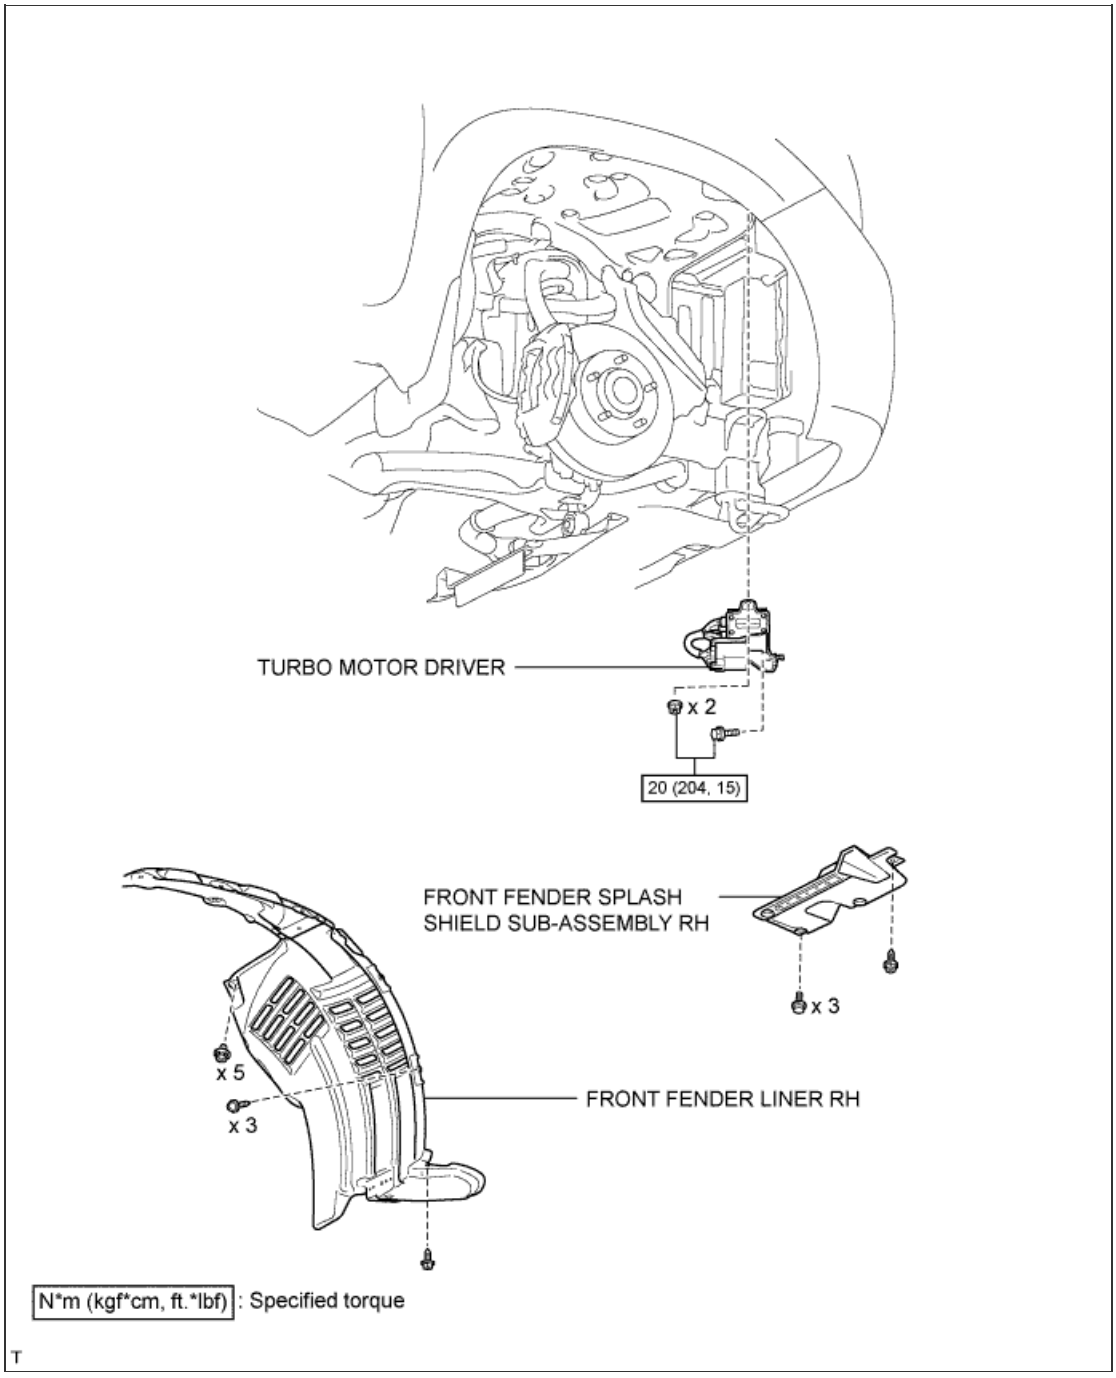
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.

32. CHEC ENGINE OIL LEVEL

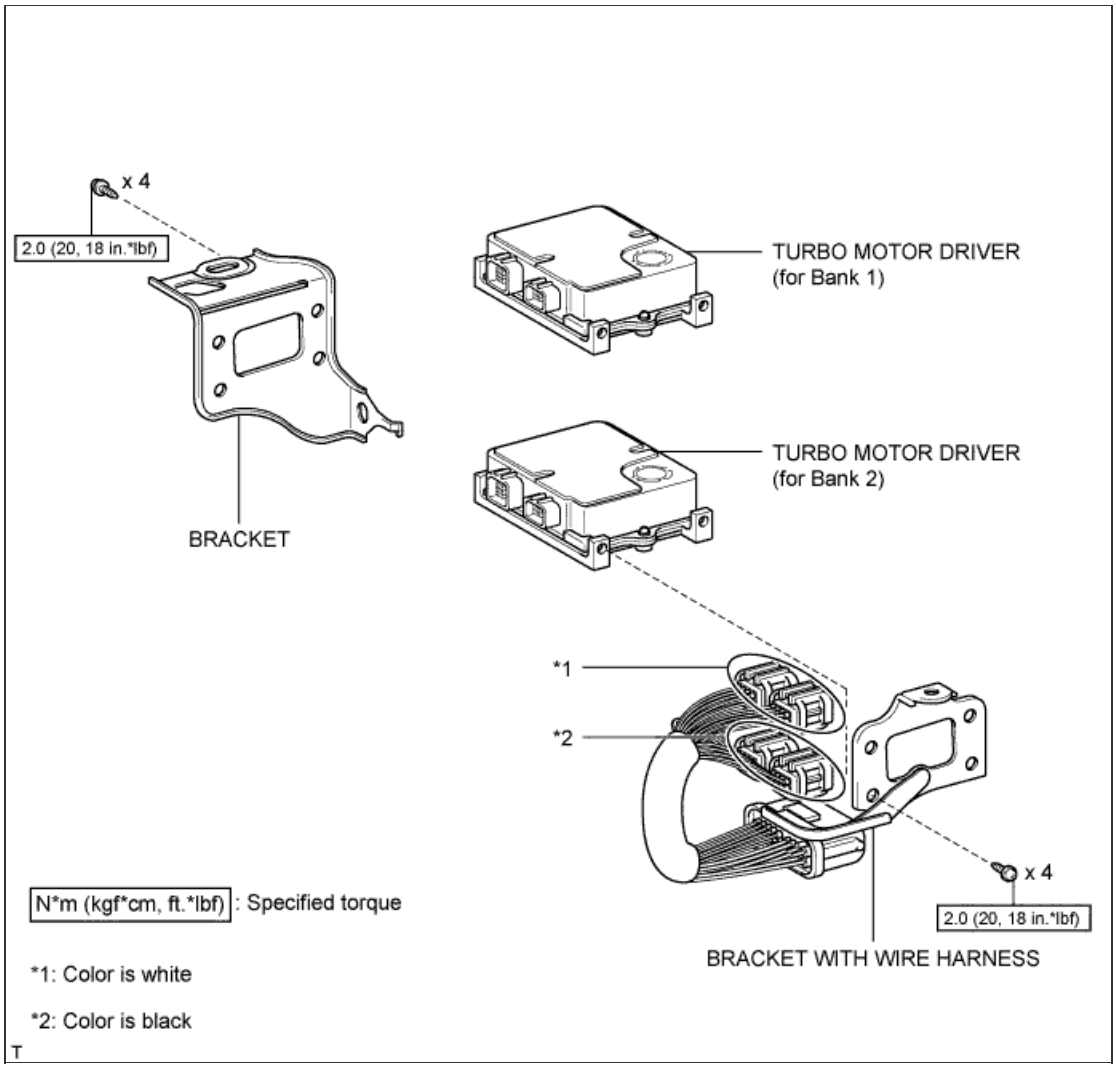
a. Warm up the engine, stop the engine and wait 5 minutes. The engine oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill engine oil above the full level mark.



33. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Connect the cables to negative (-) main battery and sub-battery terminals.

for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.

2. REMOVE FRONT FENDER SPLASH SHIELD SUB ASSEMBLY RH

a. Remove the 3 bolts and screw.

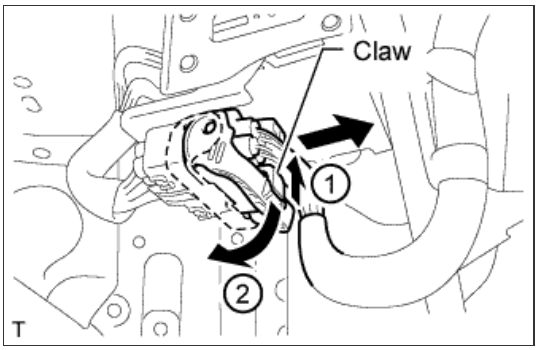
b. Loosen the clip and remove the splash shield.

3. REMOVE FRONT FENDER LINER RH

a. Remove the screw and disconnect the liner from the front bumper cover.

b. Using a T30 "TORX" socket, remove the 3 screws.

c. Remove the 5 clips.



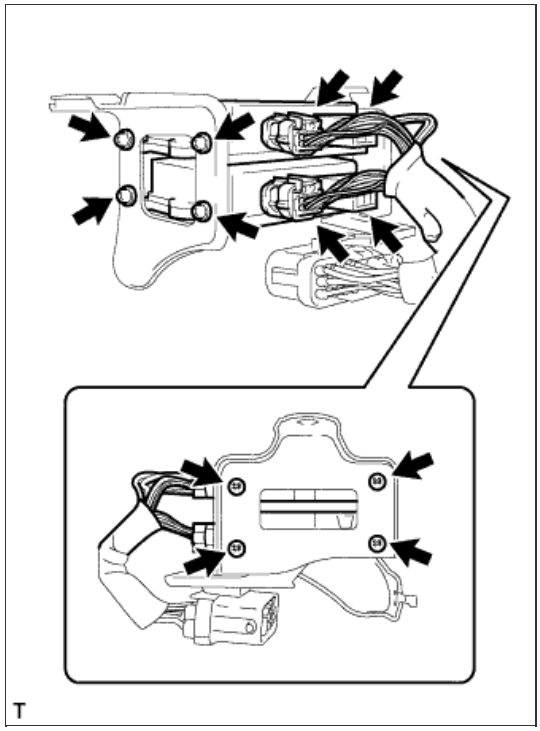
HINT:

It is not necessary to fully remove the fender liner. Partially remove it so that the air pump can be removed.

4. REMOVE TURBO MOTOR DRIVER

a. Disconnect the connector.

i. Disconnect the connector as follows: (1) push the claw upward, and (2) move the lock lever to release the lock.



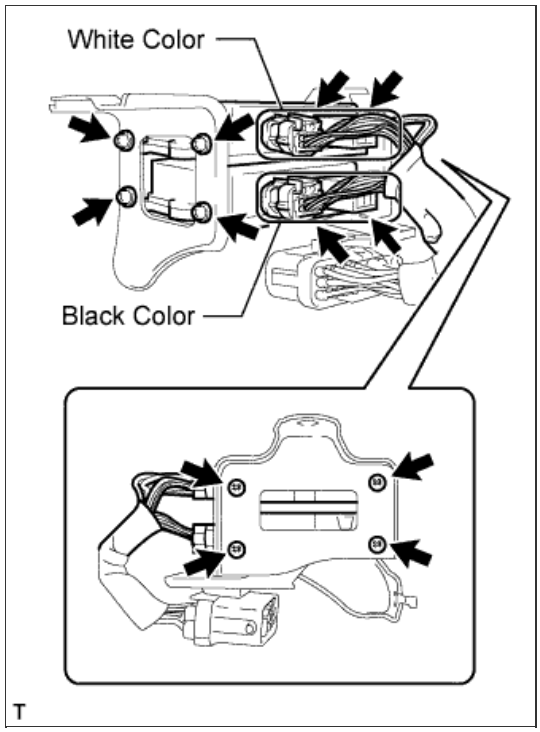
b. Remove 2 nuts, bolt and turbo motor driver.

c. Disconnect the 4 connectors from the turbo motor driver.

d. Remove the 8 screws and 2 turbo motor drivers from the brackets.

for Preparation Click here

1. INSTALL TURBO MOTOR DRIVER

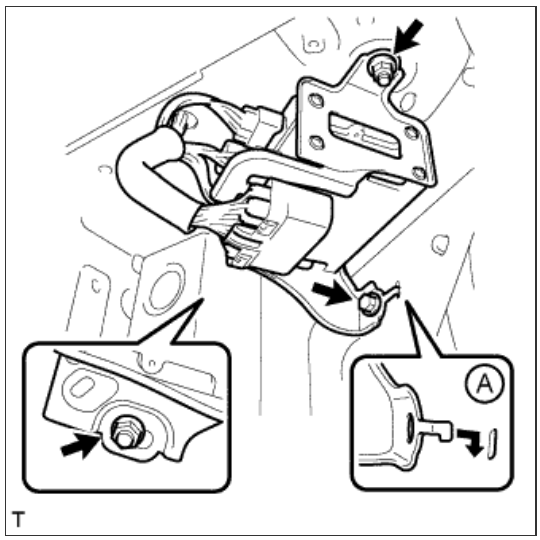


a. Install the 2 turbo motor drivers to the brackets with the 8 screws.

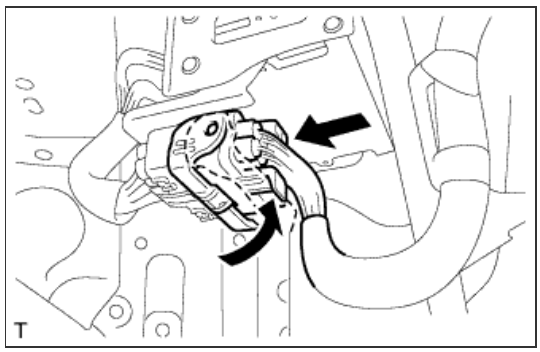
Torque:
2.0 N*m{ 20 kgf*cm , 18 in.*lbf }

b. Connect the 4 connectors to the turbo motor driver.

NOTICE:



- **Mach the 10 pin and 4 pin connector colors when connecting them to the turbo motor driver.**
- **Make sure to connect the white connectors to the upper side and the black connectors to the lower side.**



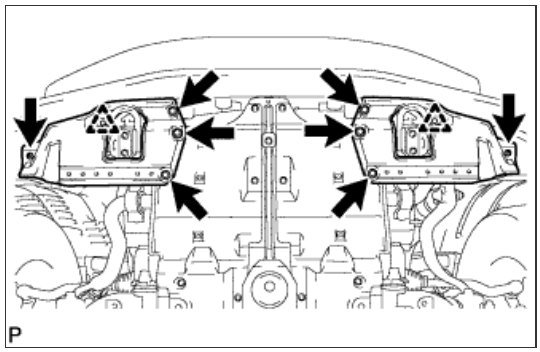
c. Insert the bracket tab into the slot labeled A and insert the 2 stud bolts into the bracket hole as shown in illustration.

d. Install the 2 nuts and bolt.

Torque:
20 N*m{ 199 kgf*cm , 14 ft.*lbf }

e. Connect the connector. Then move the lock lever as shown in the illustration to lock the connectors.

2. INSTALL FRONT FENDER LINER RH



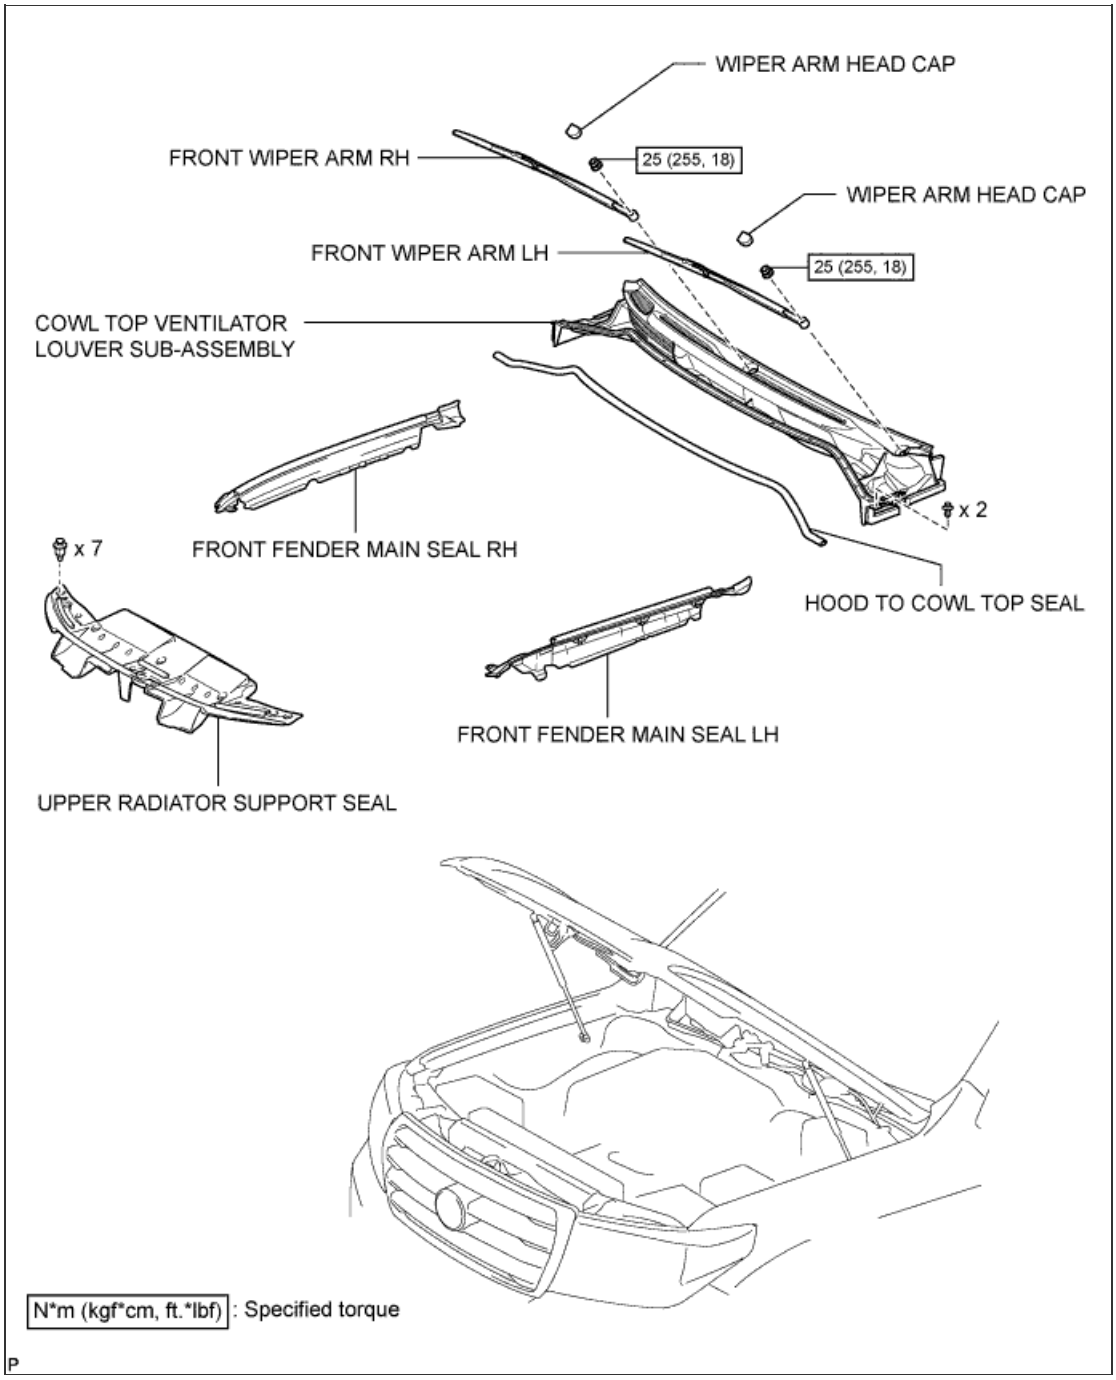
a. Install the fender liner with the 5 clips.

b. Using a T30 "TORX" socket, install the 3 screws.

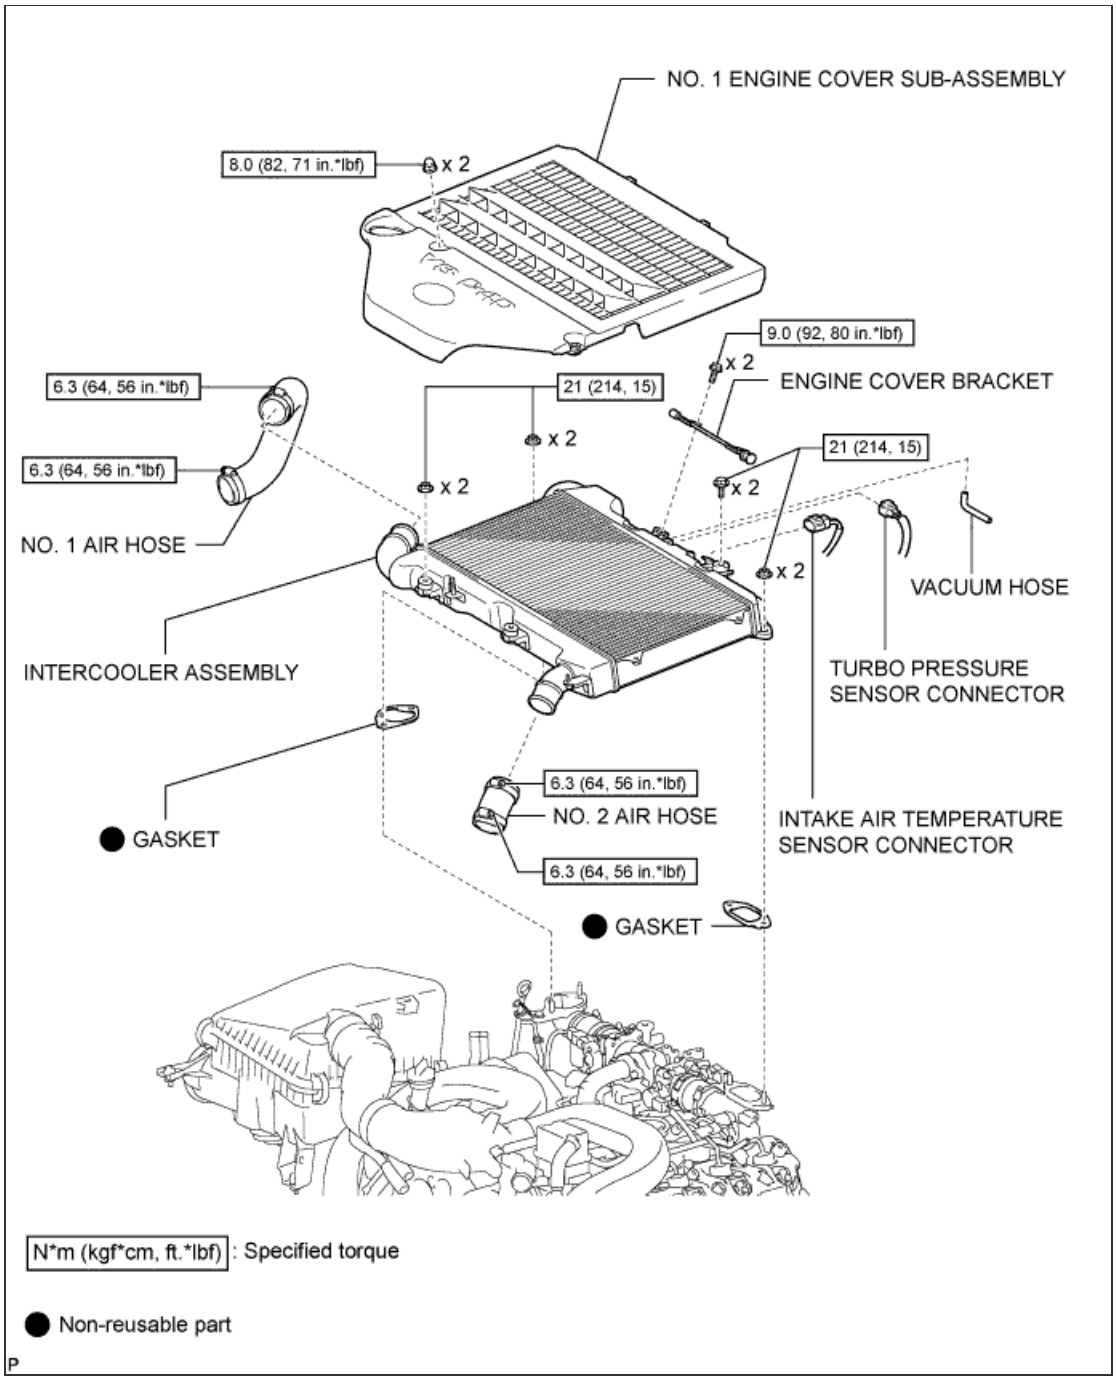
c. Connect the liner to the front bumper cover with the screw.

3. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Install the splash shield with the clip, and then install the 3 bolts and screw.



4. CONNECT CABLE TO NEGATIVE NEGATIVE BATTERY TERMINAL



NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Connect the cables to the negative (-) main battery and sub-battery terminals.

for Preparation Click here

1. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and upper radiator support seal.

2. REMOVE FRONT FENDER MAIN SEAL LH

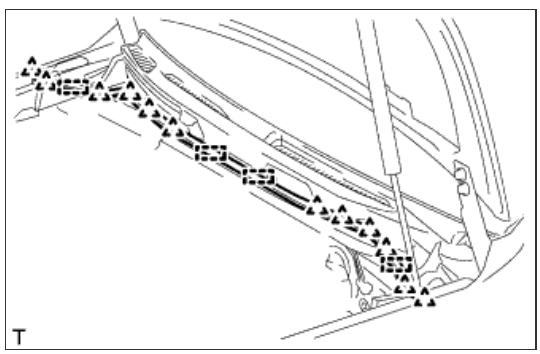
a. Using a clip remover, detach the 3 clips and remove the fender main seal.

3. REMOVE FRONT FENDER MAIN SEAL RH

HINT:

Use the same procedures described for the LH side.

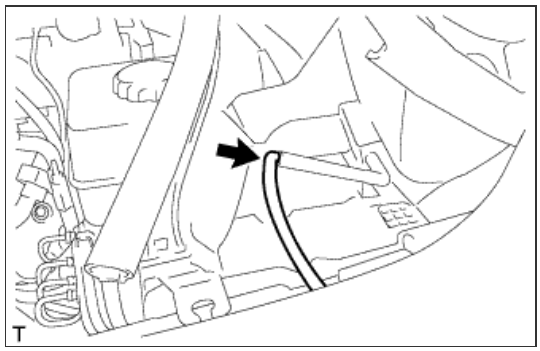
4. REMOVE FRONT WIPER ARM LH



a. Remove the nut, wiper arm and blade.

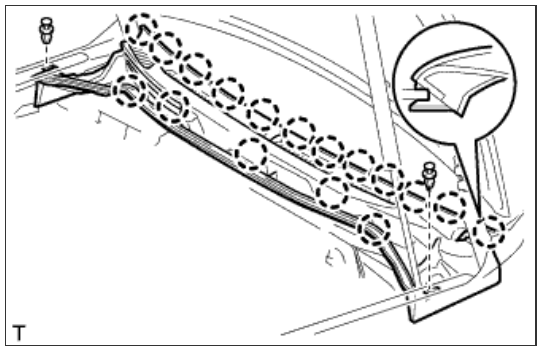
5. REMOVE FRONT WIPER ARM RH

a. Remove the nut, wiper arm and blade.



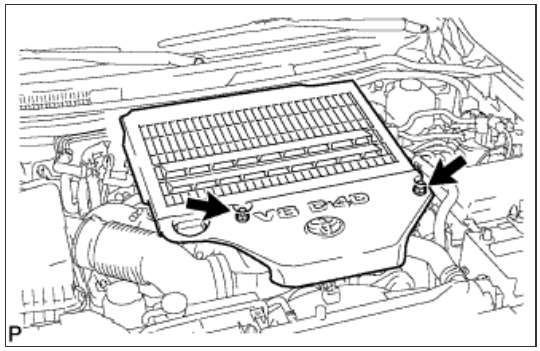
6. REMOVE HOOD TO COWL TOP SEAL

a. Using a clip remover, detach the 12 clips, 4 clamps and remove the hood to cowl top seal.



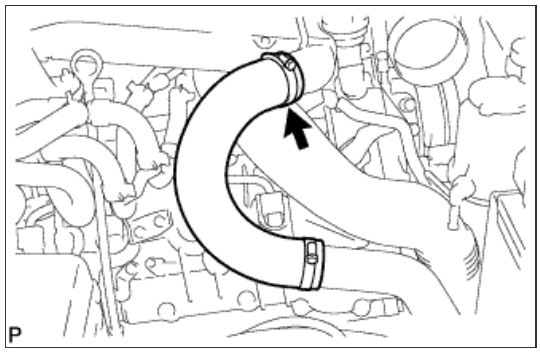
7. REMOVE COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

a. Remove the washer hose.



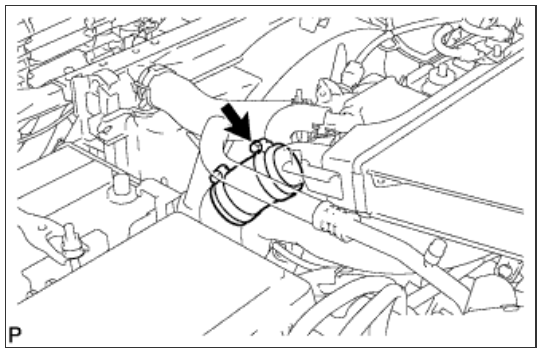
b. Remove the 2 clips.

c. Detach the 17 claws and remove the cowl top ventilator louver sub-assembly.

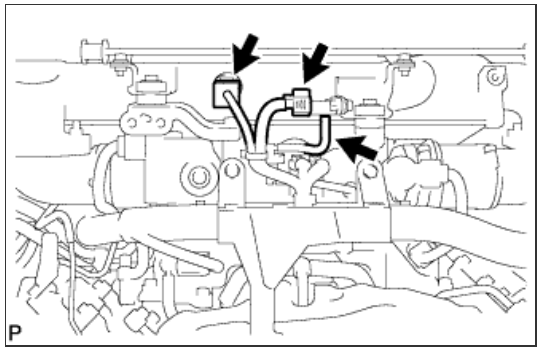


8. REMOVE NO. 1 ENGINE COVER SUB-ASSEMBLY

a. Remove the 2 nuts and No. 1 engine cover.



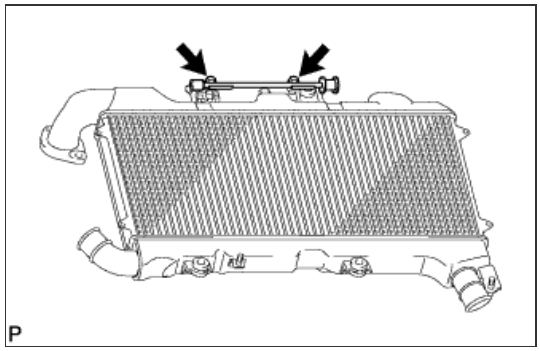
9. REMOVE INTERCOOLER ASSEMBLY



a. Loosen the No. 1 air hose clamp.

b. Loosen the No. 2 air hose clamp.

c. Disconnect the turbo pressure sensor connector, intake air temperature sensor connector and vacuum hose.

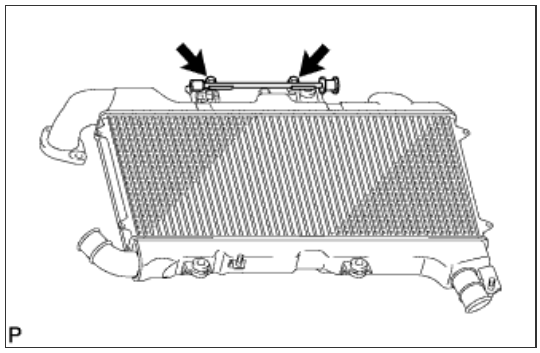


d. Remove the 6 nuts, 2 bolts and intercooler.

e. Remove the 2 gaskets from the air tube LH and RH.

10. REMOVE ENGINE COVER BRACKET

a. Remove the 2 bolts and engine cover bracket.

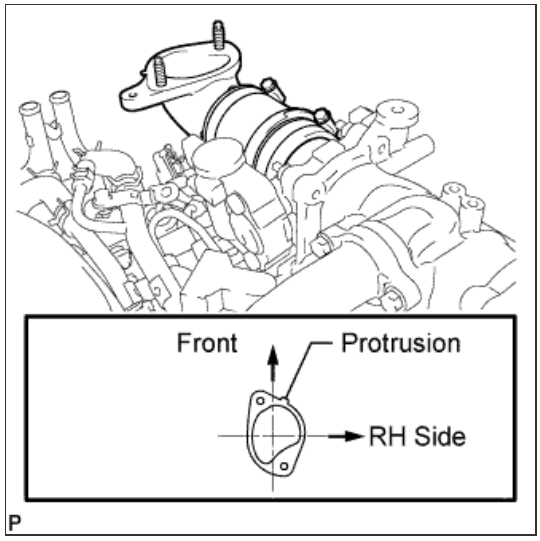


for Preparation Click here

1. INSTALL ENGINE COVER BRACKET

a. Install the engine cover bracket with the 2 bolts.

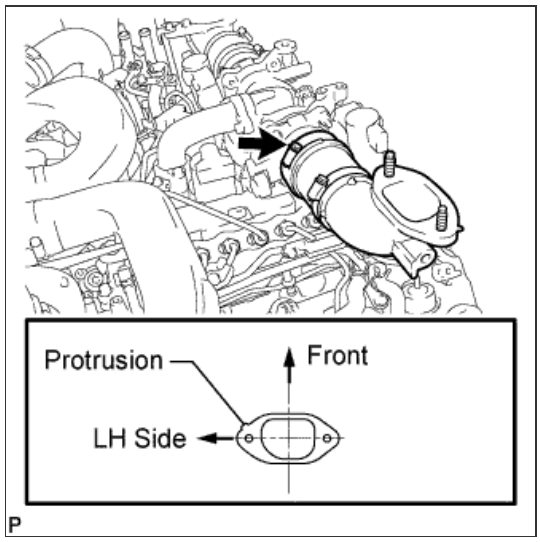
Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }



2. INSTALL INTERCOOLER ASSEMBLY

a. Install a new gasket to the air tube RH.

HINT:

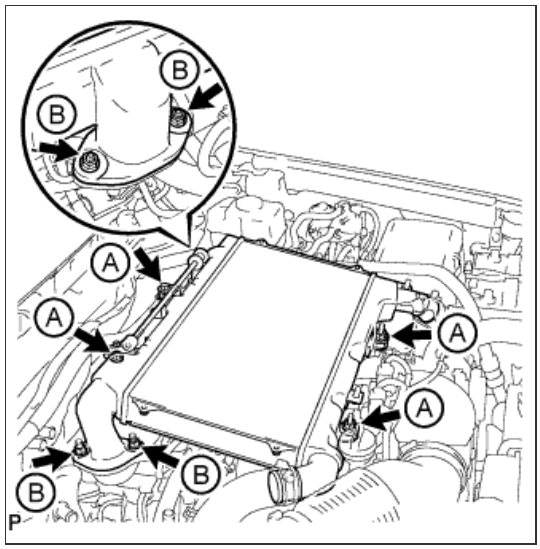


Install the gasket with the protrusion facing as shown in the illustration.

b. Install a new gasket to the air tube LH.

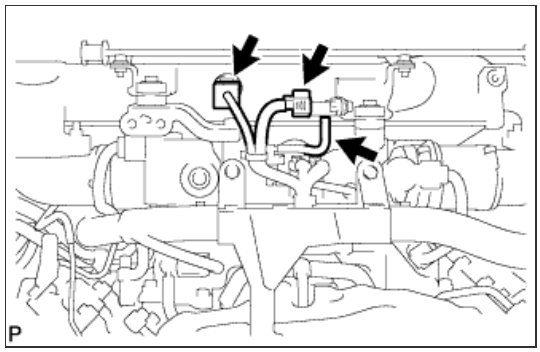
HINT:

Install the gasket with the protrusion facing as shown in the illustration.



c. Align the No. 1 and No. 2 air hoses and intercooler pipes and connect them, and install the intercooler with the 2 bolts and 2 nuts labeled A in the illustration.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

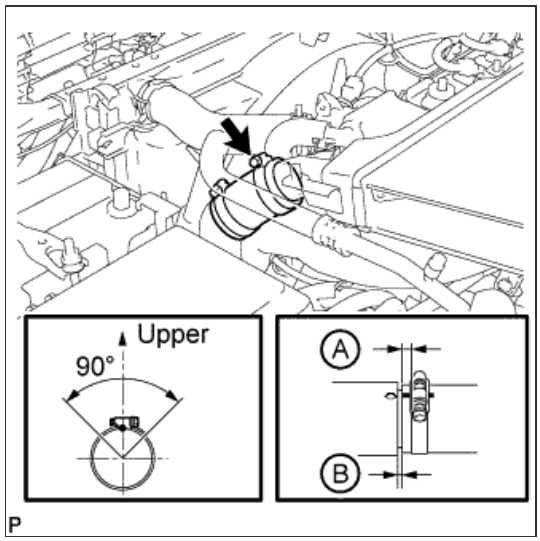


. Temporarily install the 4 nuts labeled B in the illustration.

e. Tighten the air tube LH and RH with the 4 nuts labeled B shown in the illustration.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

f. Connect the vacuum hose, intake air temperature sensor connector and turbo pressure sensor connector.

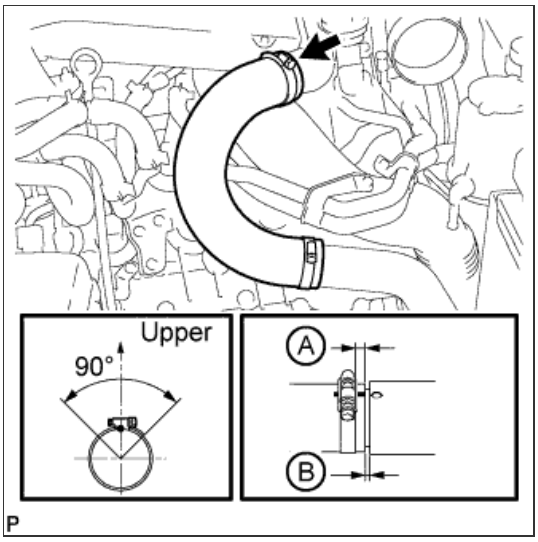


g. Tighten the clamp of the No. 2 air hose.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

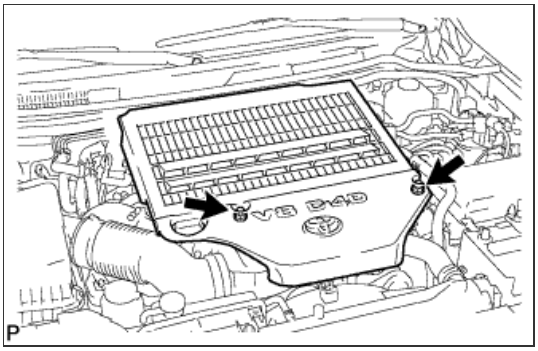
- **Align the paint mark of the air hose with the protrusion an push in the air hose so that istance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that istance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the irection of the hose clamp is as shown in the illustration.**



h. Tighten the clamp of the No. 1 air hose.

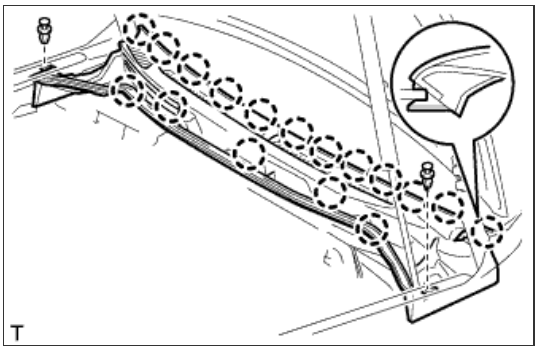
Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:



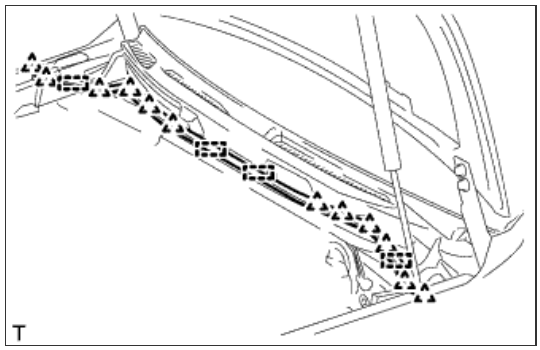
- **Align the paint mark of the air hose with the protrusion an push in the air hose so that istance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that istance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the irection of the hose clamp is as shown in the illustration.**

3. INSTALL NO. 1 ENGINE COVER SUB-ASSEMBLY



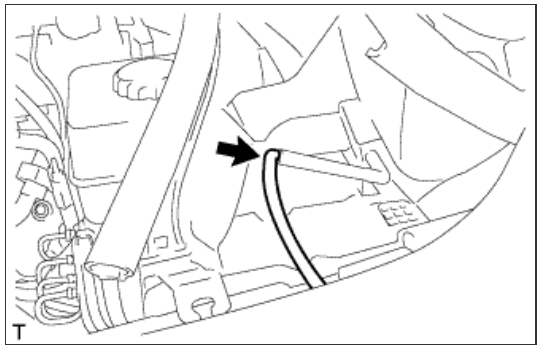
a. Install the engine cover with the 2 nuts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



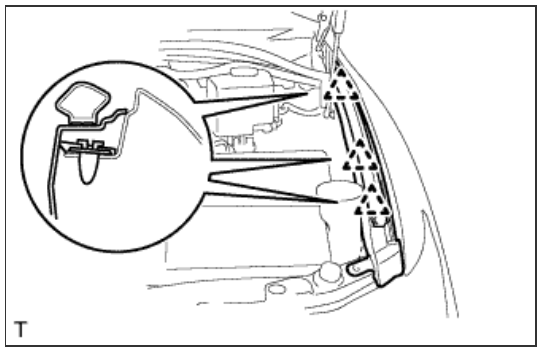
4. INSTALL COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

a. Push the ventilator louver in the direction indicated by the arrow in the illustration to attach the 17 claws and 2 clips and install the ventilator louver.



5. INSTALL HOOD TO COWL TOP SEAL

a. Attach the 12 clips and 4 clamps to install the hood to cowl top seal.

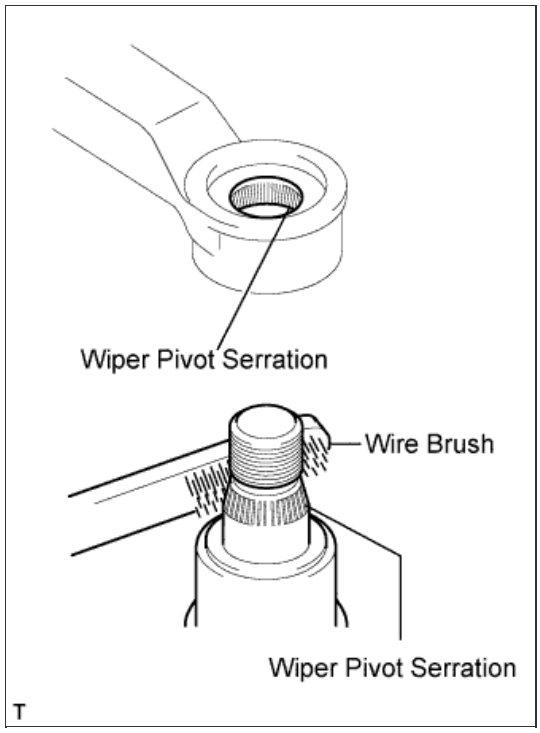


b. Install the washer hose.

6. INSTALL FRONT FENDER MAIN SEAL LH

a. Attach the 3 clips to install the fender main seal.

7. INSTALL FRONT FENDER MAIN SEAL RH



HINT:

Use the same procedures described for the LH side.

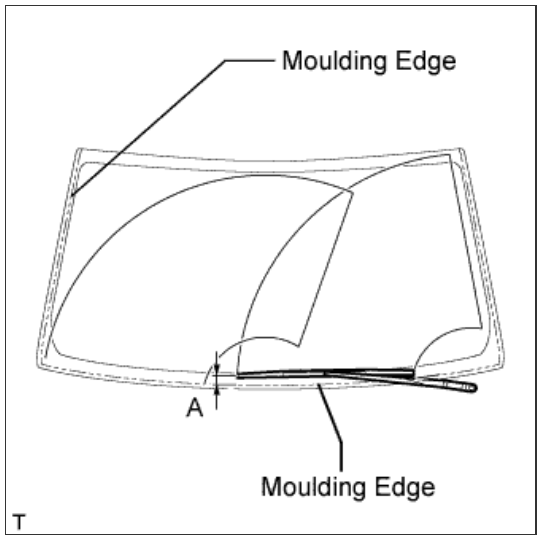
8. INSTALL FRONT WIPER ARM LH

a. Stop the wiper motor at the automatic stop position.

b. Clean the wiper pivot serration with a wire brush.

c. Install the wiper arm and blade with the nut. Make sure that the wiper arm and blade comes to the position shown in the illustration.

Stan ar Measurement:

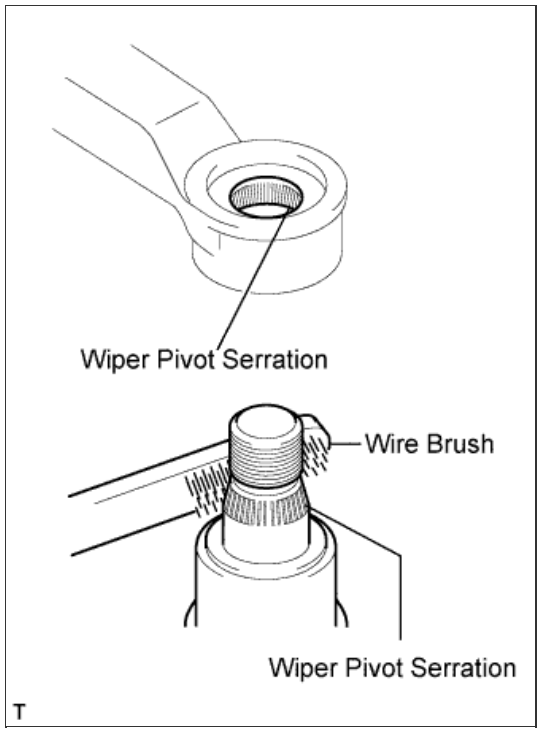


Position	Specified Condition
A	16.8 to 36.8 mm (0.661 to 1.45 in.)

Torque:

25 N*m{ 255 kgf*cm , 18 ft.*lbf }

HINT:



Hold down the wiper arm hinge with your hand while tightening the nut.

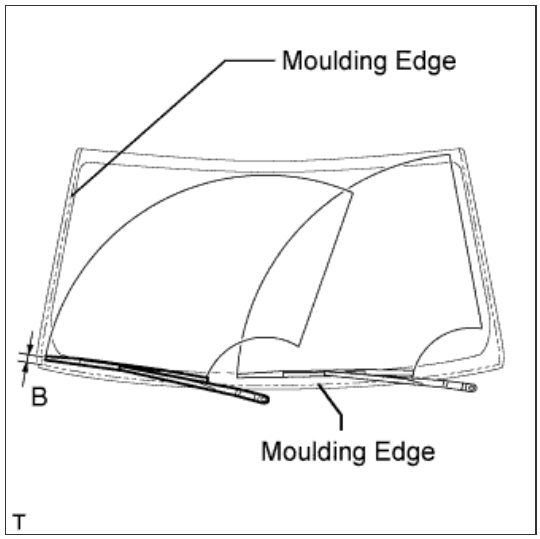
9. INSTALL FRONT WIPER ARM RH

a. Stop the wiper motor at the automatic stop position.

b. Clean the wiper pivot serration with a wire brush.

c. Install the wiper arm and blade with the nut. Make sure that the wiper arm and blade comes to the position shown in the illustration.

Stan ar Measurement:

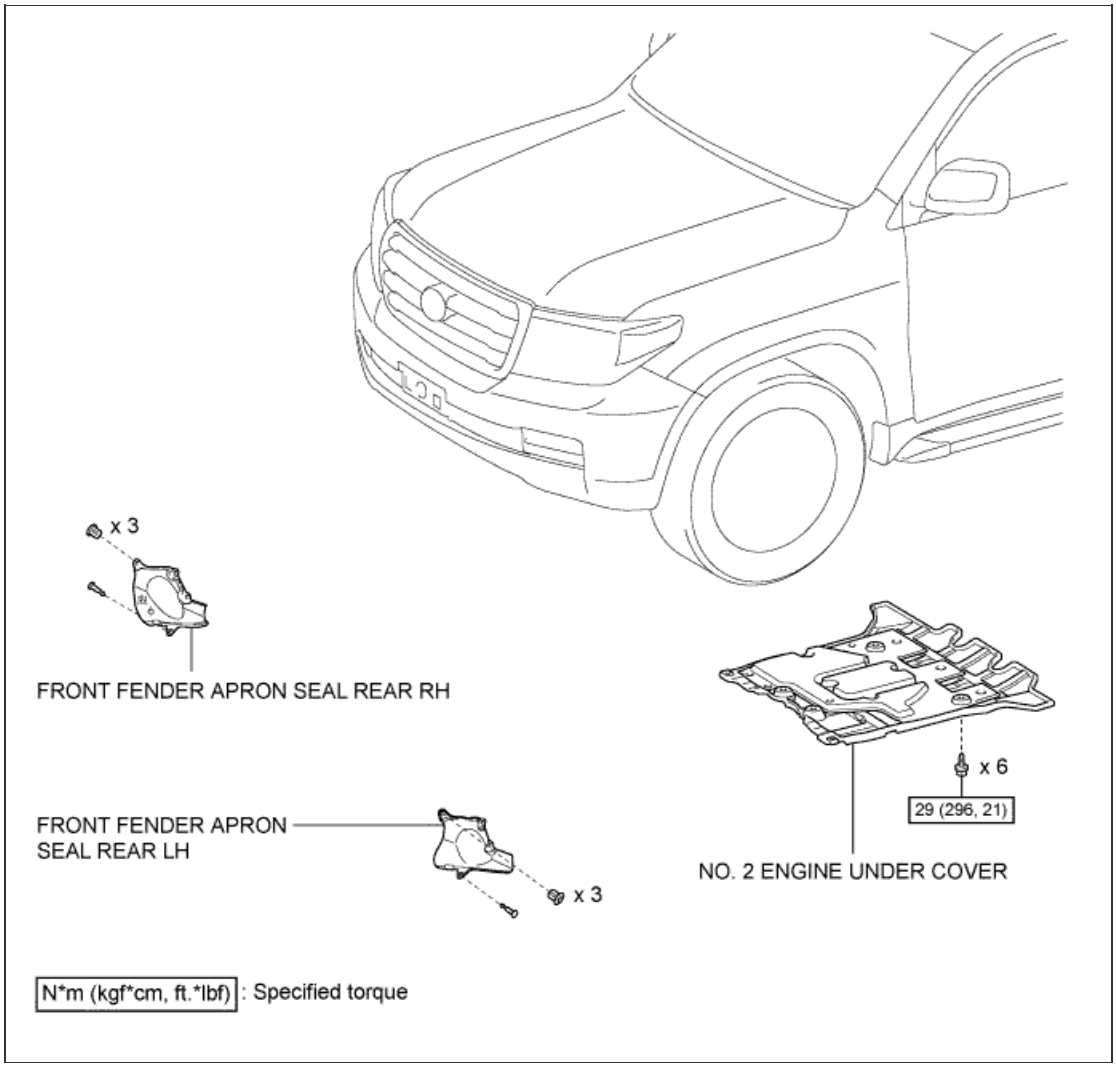


Position	Specified Condition
B	20.0 to 40.0 mm (0.787 to 1.57 in.)

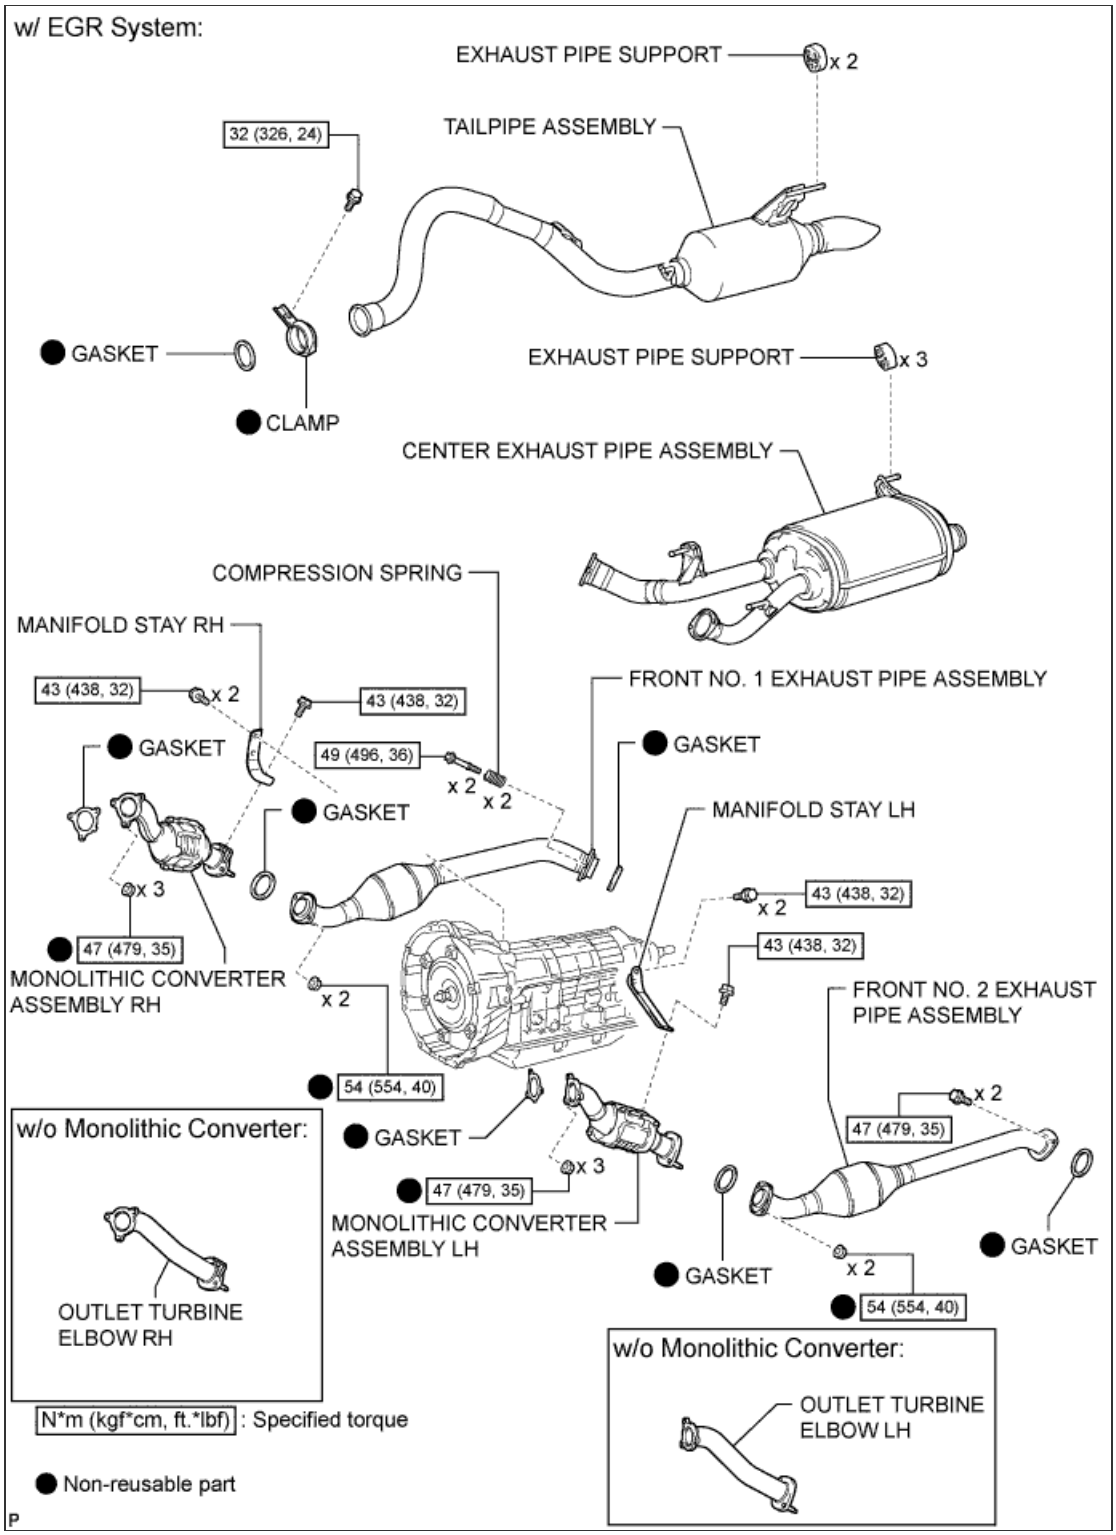
Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }

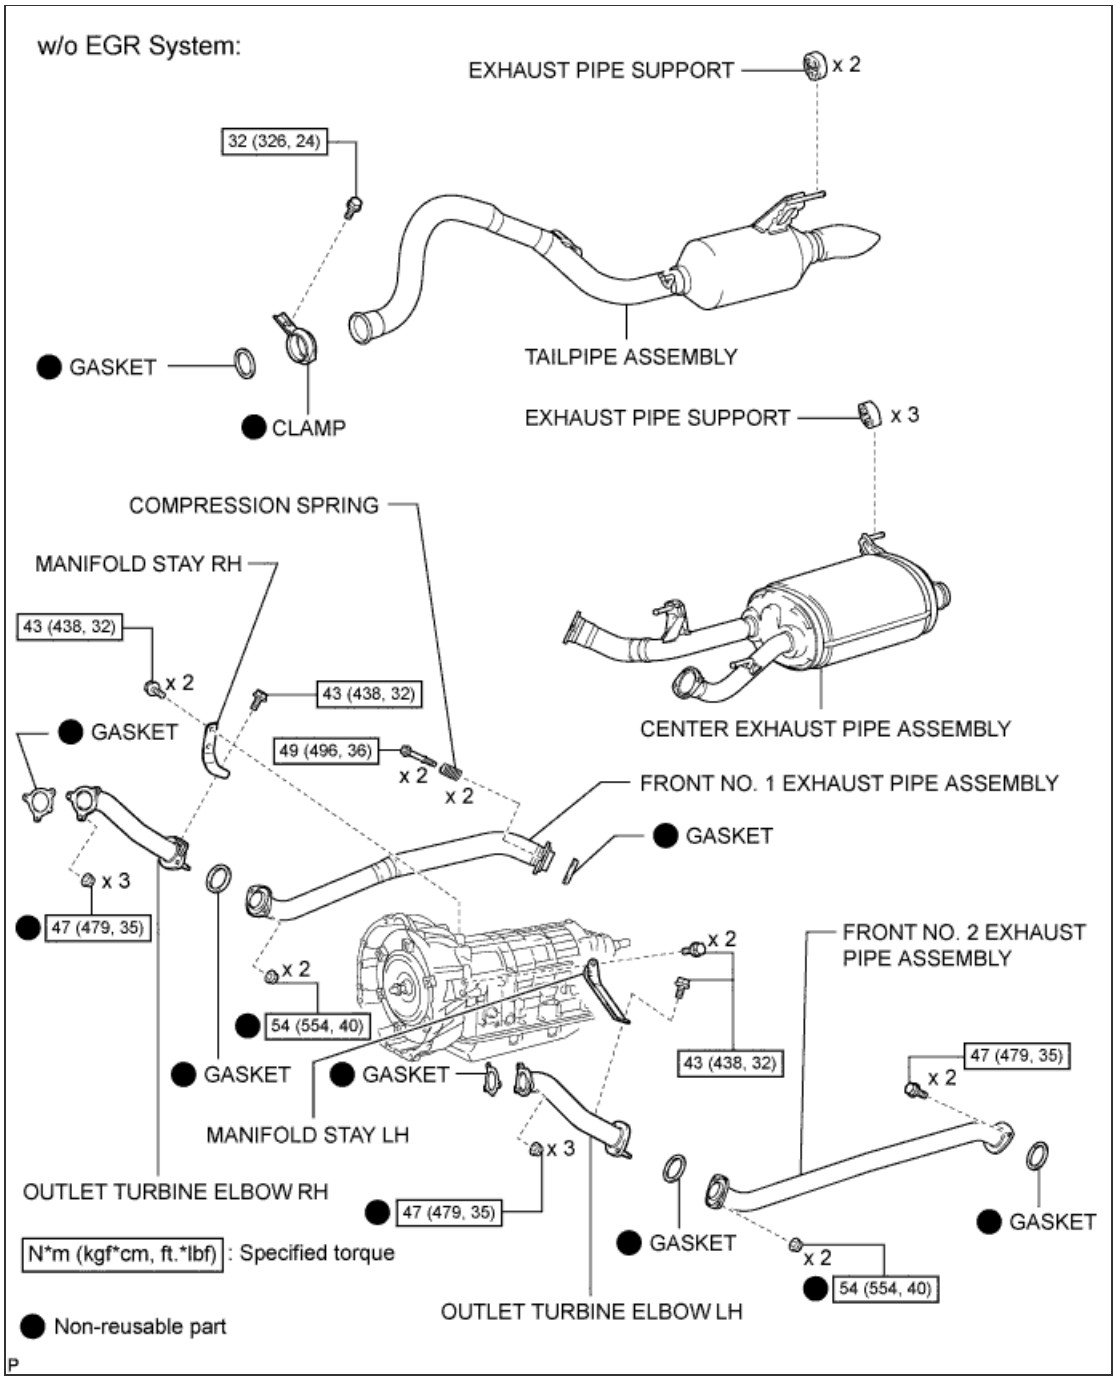
HINT:

Hold down the wiper arm hinge with your hand while tightening the nut.



- Operate the front wipers while spraying washer fluid on the windshield glass. Make sure that the front wipers function properly and there is no interference with the vehicle body.





10. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the upper radiator support seal with the 7 clips.

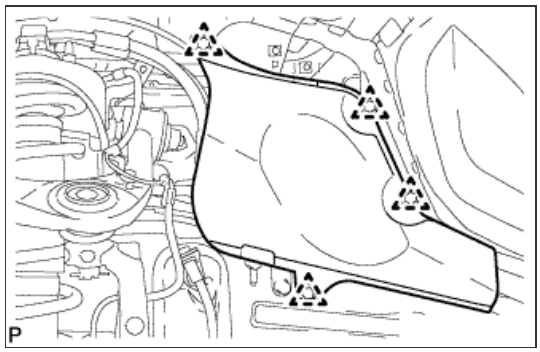
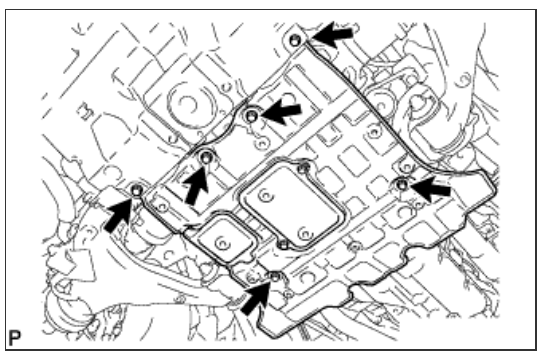
CAUTION:

- **Wear protective gloves and protective glasses when removing the exhaust pipe.**
- **The exhaust pipe is extremely hot immediately after the engine has stopped.**
- **Confirm that the exhaust pipe has cooled down before removing it.**



1. REMOVE FRONT FENDER APRON SEAL REAR RH

a. Using a clip remover, remove the 4 clips and fender apron seal.



2. REMOVE FRONT FENDER APRON SEAL REAR LH

a. Using a clip remover, remove the 4 clips and fender apron seal.

3. REMOVE NO. 2 ENGINE UNDER COVER

a. Remove the bolts and under cover.

4. REMOVE TAILPIPE ASSEMBLY

a. Remove the bolt, clamp and gasket.

b. Disconnect the tailpipe from the 2 exhaust pipe supports.

5. REMOVE CENTER EXHAUST PIPE ASSEMBLY

a. Remove the 4 bolts and 2 compression springs.

b. Disconnect the center exhaust pipe from the 3 exhaust pipe supports.

c. Remove the gasket from the front exhaust pipe.

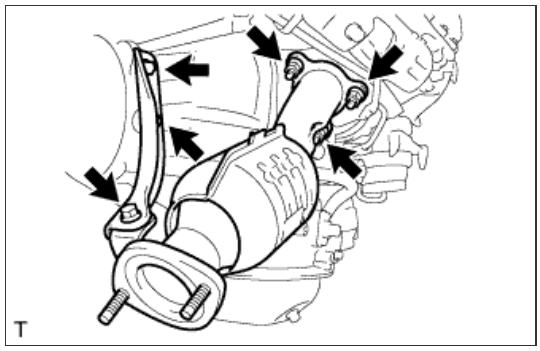
6. REMOVE FRONT NO. 1 EXHAUST PIPE ASSEMBLY

a. Remove the 2 nuts and front exhaust pipe.

b. Remove the gasket.

7. REMOVE FRONT NO. 2 EXHAUST PIPE ASSEMBLY

a. Remove the 2 nuts, 2 bolts and front exhaust pipe.



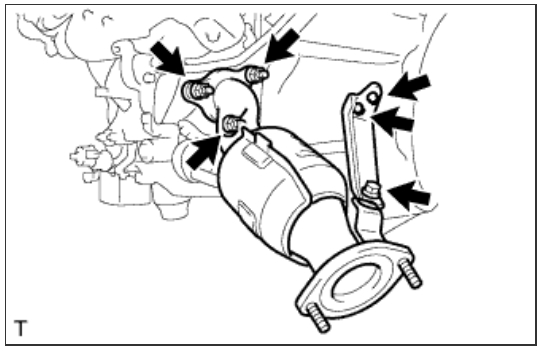
b. Remove the gasket.

8. REMOVE MONOLITHIC CONVERTER ASSEMBLY RH (w/ Monolithic Converter)

a. Remove the 3 bolts and manifold stay RH.

b. Remove the 3 nuts and monolithic converter RH.

c. Remove the gasket from the turbocharger.

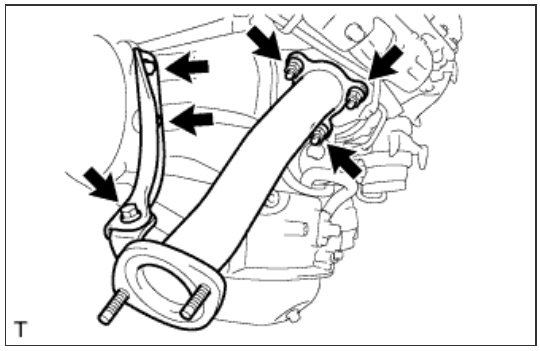


9. REMOVE MONOLITHIC CONVERTER ASSEMBLY LH (w/ Monolithic Converter)

a. Remove the 3 bolts and manifold stay LH.

b. Remove the 3 nuts and monolithic converter LH.

c. Remove the gasket from the turbocharger.

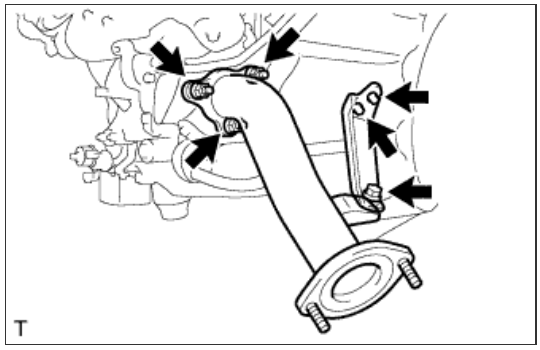


10. REMOVE OUTLET TURBINE ELBOW RH (w/o Monolithic Converter)

a. Remove the 3 bolts and manifold stay RH.

b. Remove the 3 nuts and outlet turbine elbow RH.

c. Remove the gasket from the turbocharger.



11. REMOVE OUTLET TURBINE ELBOW LH (w/o Monolithic Converter)

a. Remove the 3 bolts and manifold stay LH.

b. Remove the 3 nuts and outlet turbine elbow LH.

c. Remove the gasket from the turbocharger.

for Preparation Click here

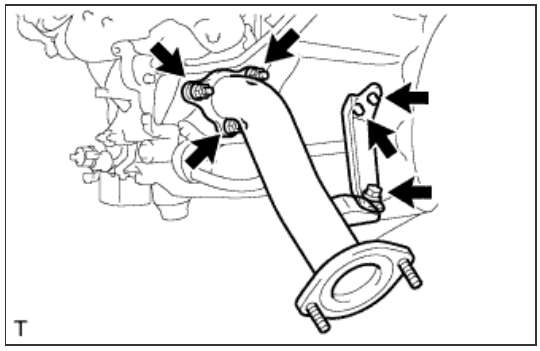
CAUTION:

- **Wear protective gloves and protective glasses when installing the exhaust pipe.**
- **The exhaust pipe is extremely hot immediately after the engine has stopped.**
- **Confirm that the exhaust pipe has cooled down before removing it.**

1. INSTALL OUTLET TURBINE ELBOW LH (w/o Monolithic Converter)

a. Set a new gasket to the turbocharger.

b. Temporarily install the outlet turbine elbow LH with 3 new nuts.



c. Temporarily install the manifold stay LH with the 3 bolts.

d. Tighten the 3 nuts of the outlet turbine elbow LH.

Torque:
47 N*m{ 479 kgf*cm , 35 ft.*lbf }

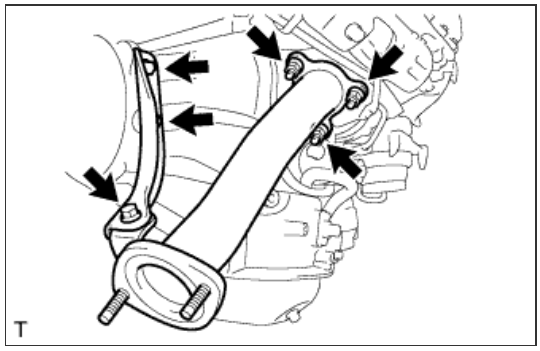
e. Tighten the 3 bolts of the manifold stay LH.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

2. INSTALL OUTLET TURBINE ELBOW RH (w/o Monolithic Converter)

a. Set a new gasket to the turbocharger.

b. Temporarily install the outlet turbine elbow RH with 3 new nuts.



c. Temporarily install the manifold stay RH with the 3 bolts.

d. Tighten the 3 nuts of the outlet turbine elbow RH.

Torque:
47 N*m{ 479 kgf*cm , 35 ft.*lbf }

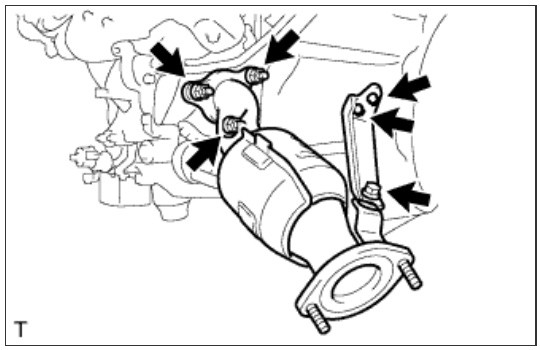
e. Tighten the 3 bolts of the manifold stay RH.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

3. INSTALL MONOLITHIC CONVERTER ASSEMBLY LH (w/ Monolithic Converter)

a. Set a new gasket to the turbocharger.

b. Temporarily install the monolithic converter LH with 3 new nuts.



c. Temporarily install the manifold stay LH with the 3 bolts.

d. Tighten the 3 nuts of the monolithic converter LH.

Torque:
47 N*m{ 479 kgf*cm , 35 ft.*lbf }

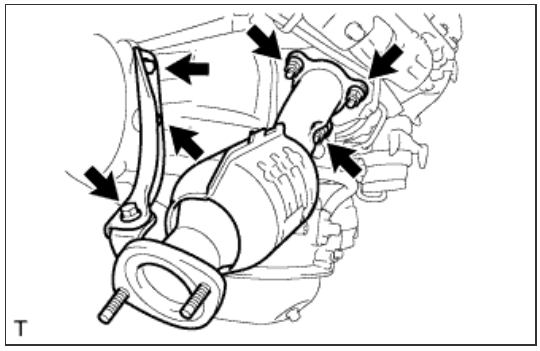
e. Tighten the 3 bolts of the manifold stay LH.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

4. INSTALL MONOLITHIC CONVERTER ASSEMBLY RH (w/ Monolithic Converter)

a. Set a new gasket to the turbocharger.

b. Temporarily install the monolithic converter RH with 3 new nuts.



c. Temporarily install the manifold stay RH with the 3 bolts.

d. Tighten the 3 nuts of the monolithic converter RH.

Torque:
47 N*m{ 479 kgf*cm , 35 ft.*lbf }

e. Tighten the 3 bolts of the manifold stay RH.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

5. INSTALL FRONT NO. 2 EXHAUST PIPE ASSEMBLY

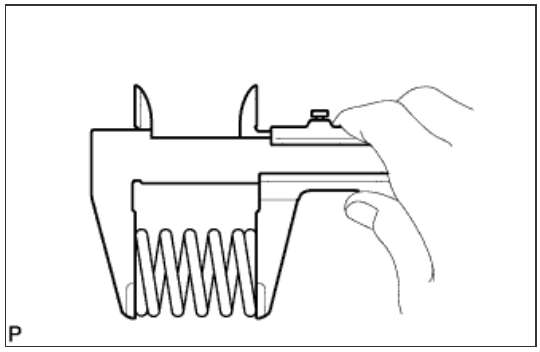
a. Install a new gasket and the front No. 2 exhaust pipe to the monolithic converter/outlet turbine elbow with 2 new nuts.

Torque:
54 N*m{ 554 kgf*cm , 40 ft.*lbf }

. INSTALL FRONT NO. 1 EXHAUST PIPE ASSEMBLY

a. Install a new gasket and the front No. 1 exhaust pipe to the converter/outlet turbine elbow with 2 new nuts.

Torque:
54 N*m{ 554 kgf*cm , 40 ft.*lbf }



7. INSTALL CENTER EXHAUST PIPE ASSEMBLY

a. Check the free length.

i. Using a vernier caliper, measure the free length of the compression spring.

Free length:
43 mm (1. 9 in.)

If the free length is less that the minimum, replace the compression spring.

b. Connect the center exhaust pipe to the 3 exhaust pipe supports.

c. Set 2 new gaskets to the front No. 1 and No. 2 exhaust pipes.

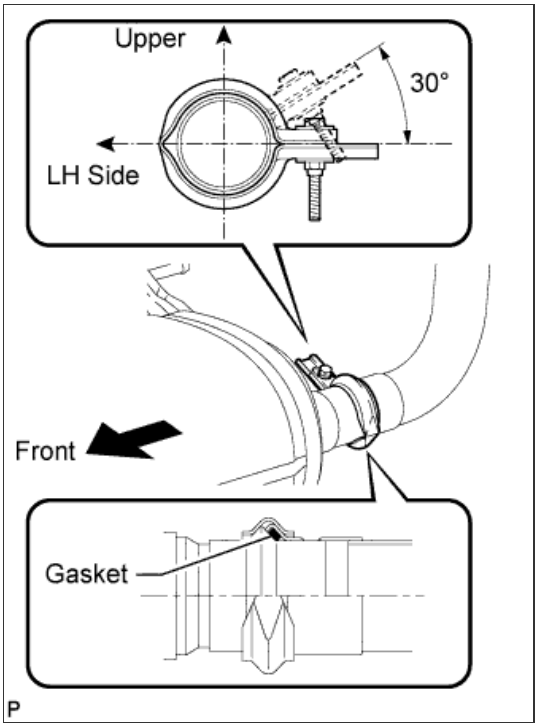
d. Install the center exhaust pipe with the 4 bolts and 2 compression springs.

Torque:
for center exhaust pipe and front No. 1 exhaust pipe:
49 N*m{ 49 kgf*cm , 3 ft.*lbf }
for center exhaust pipe and front No. 2 exhaust pipe:
48 N*m{ 489 kgf*cm , 35 ft.*lbf }

8. INSTALL TAILPIPE ASSEMBLY

a. Connect the tailpipe to the 2 exhaust pipe supports.

b. Set a new gasket to the center exhaust pipe.



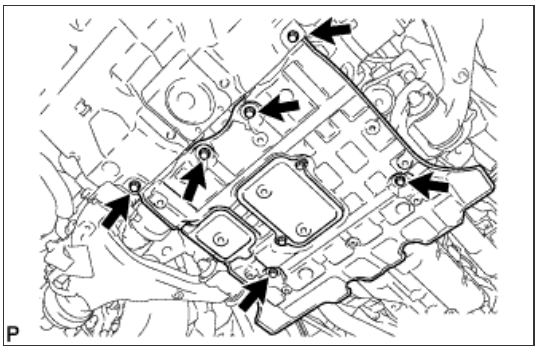
c. Connect the tailpipe to the center exhaust pipe with a new clamp.

HINT:

Install the clamp within the angle range shown in the illustration.

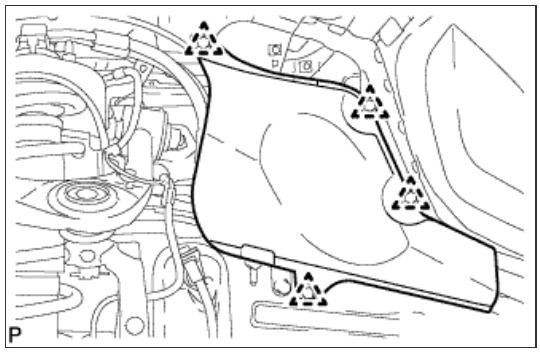
d. Tighten the bolt.

Torque:
32 N*m{ 32 kgf*cm , 24 ft.*lbf }



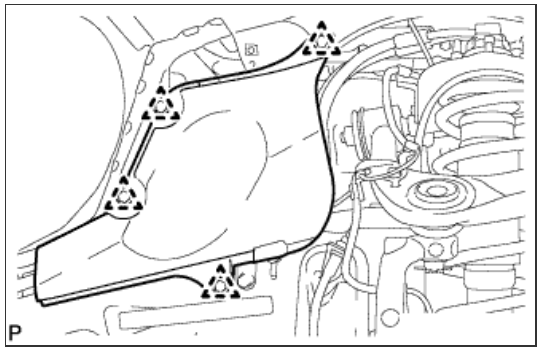
9. INSPECT FOR EXHAUST AS LEAK

10. INSTALL NO. 2 EN INE UNDER COVER



a. Install the under cover the with the 6 bolts.

Torque:
29 N*m{ 29 kgf*cm , 21 ft.*lbf }



11. INSTALL FRONT FENDER APRON SEAL REAR LH

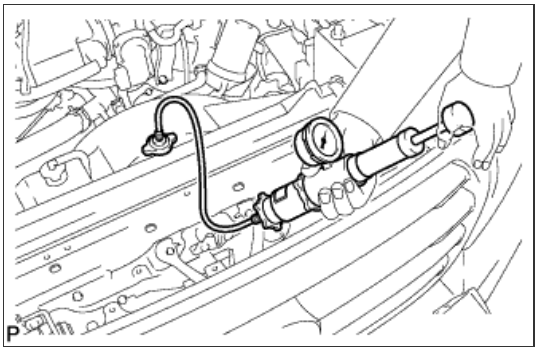
a. Install the fender apron seal with the 4 clips.

12. INSTALL FRONT FENDER APRON SEAL REAR RH

a. Install the fender apron seal with the 4 clips.

for Preparation Click here

1. INSPECT FOR COOLANT LEAK



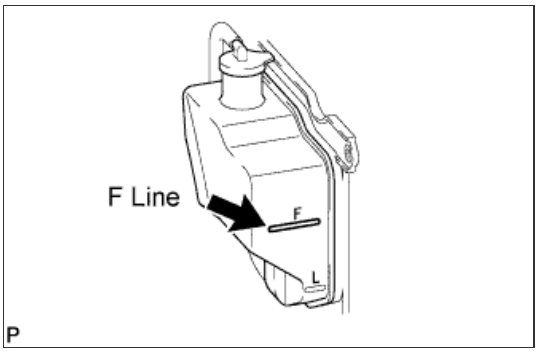
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.



2. CHECK ENGINE COOLANT LEVEL IN RESERVOIR

a. Check that the engine coolant level is between the L and F lines when the engine is cold.
If the engine coolant is low, check for leaks and add "TO OTA Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the F line.

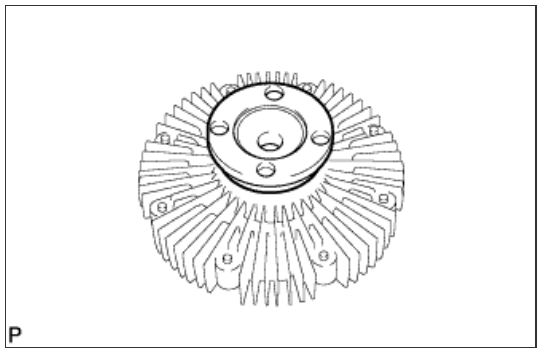
NOTICE:

Do not substitute plain water for engine coolant.

3. CHECK ENGINE COOLANT ALITY

a. Remove the radiator cap.

CAUTION:



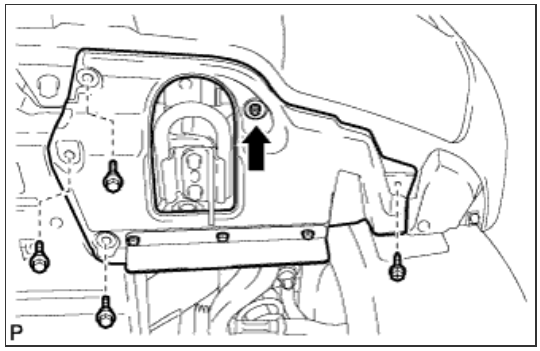
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

b. Check if there are any excessive deposits of rust or scales around the radiator cap and radiator filler hole. Also, the coolant should be free of oil.
If excessively dirty, clean the coolant passage and replace the coolant.

c. Install the radiator cap.

4. INSPECT FLUID COUPLING ASSEMBLY

a. Check the fluid coupling for damage or silicon oil leaks.
If necessary, replace the fluid coupling.



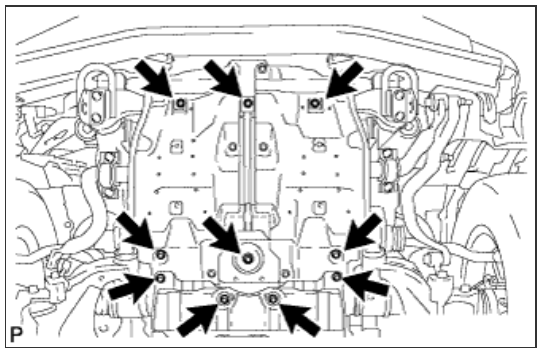
P

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

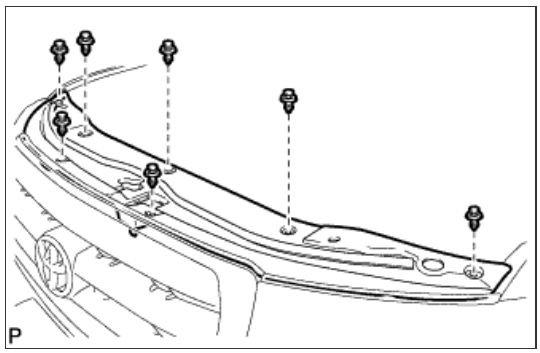
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. REMOVE UPPER RADIATOR SUPPORT SEAL

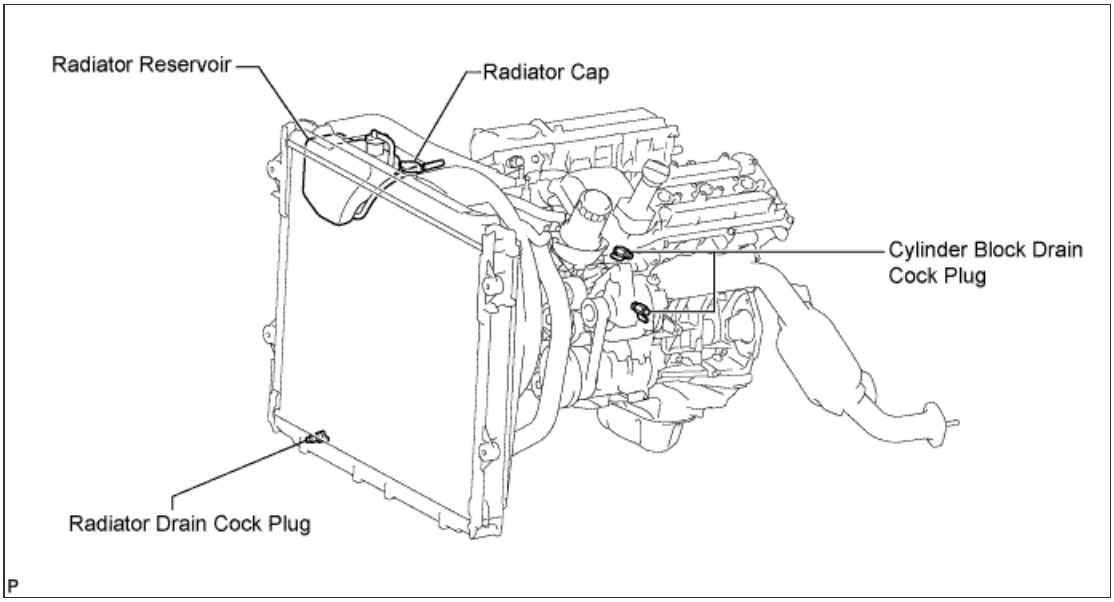
a. Remove the 7 clips and radiator support seal.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.



b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

d. Tighten the radiator drain cock plug by hand.

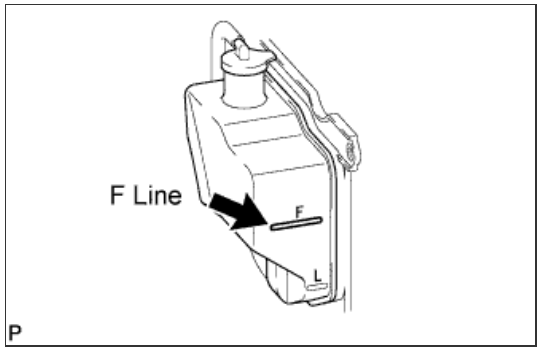
6. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, . Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for anual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

NOTICE:



Do not substitute plain water for engine coolant.

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical

problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the o. 1 and o. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WAR
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the o. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

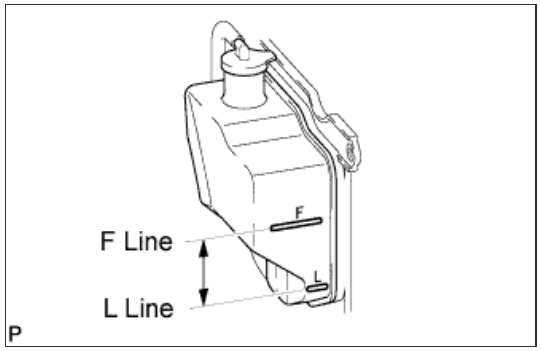
h. aintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the o. 1 and o. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

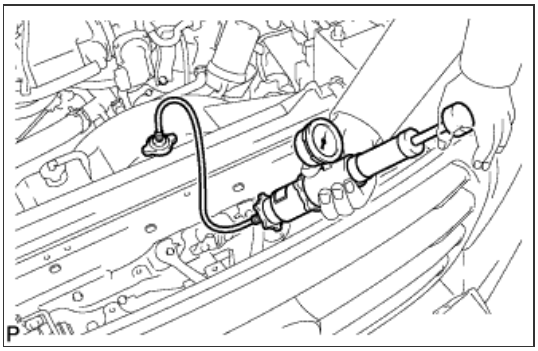
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

7. INSPECT FOR ENGINE COOLANT LEAK

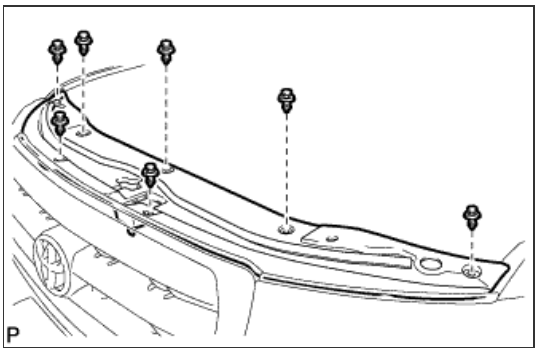
CAUTION:



Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause

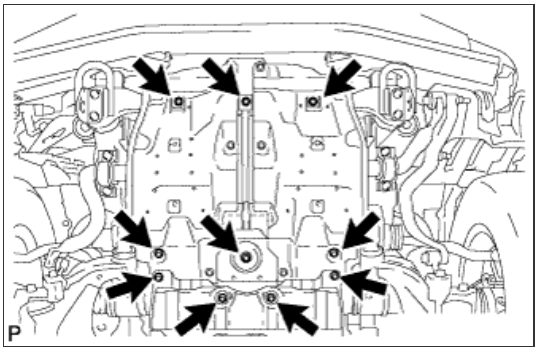
serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.



b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.



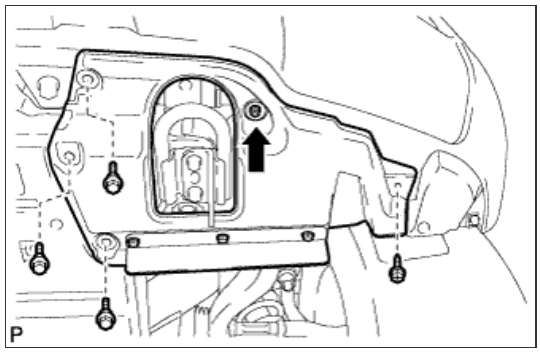
8. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the radiator support seal with the 7 clips.

9. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

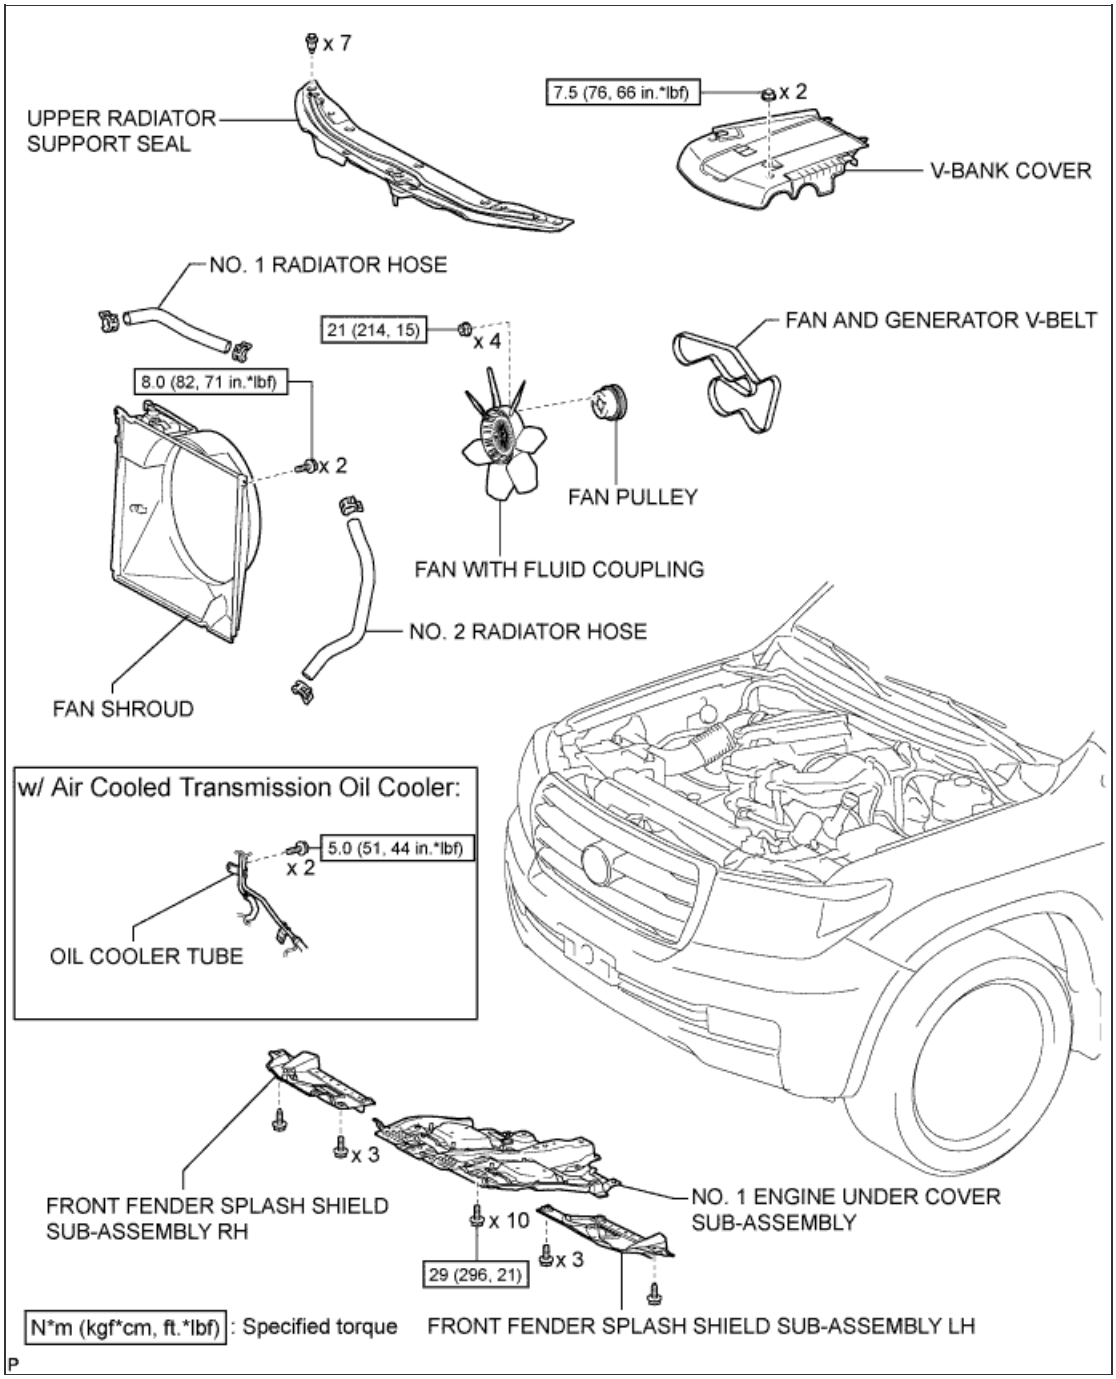
a. Install the under cover with the 10 bolts.

10. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

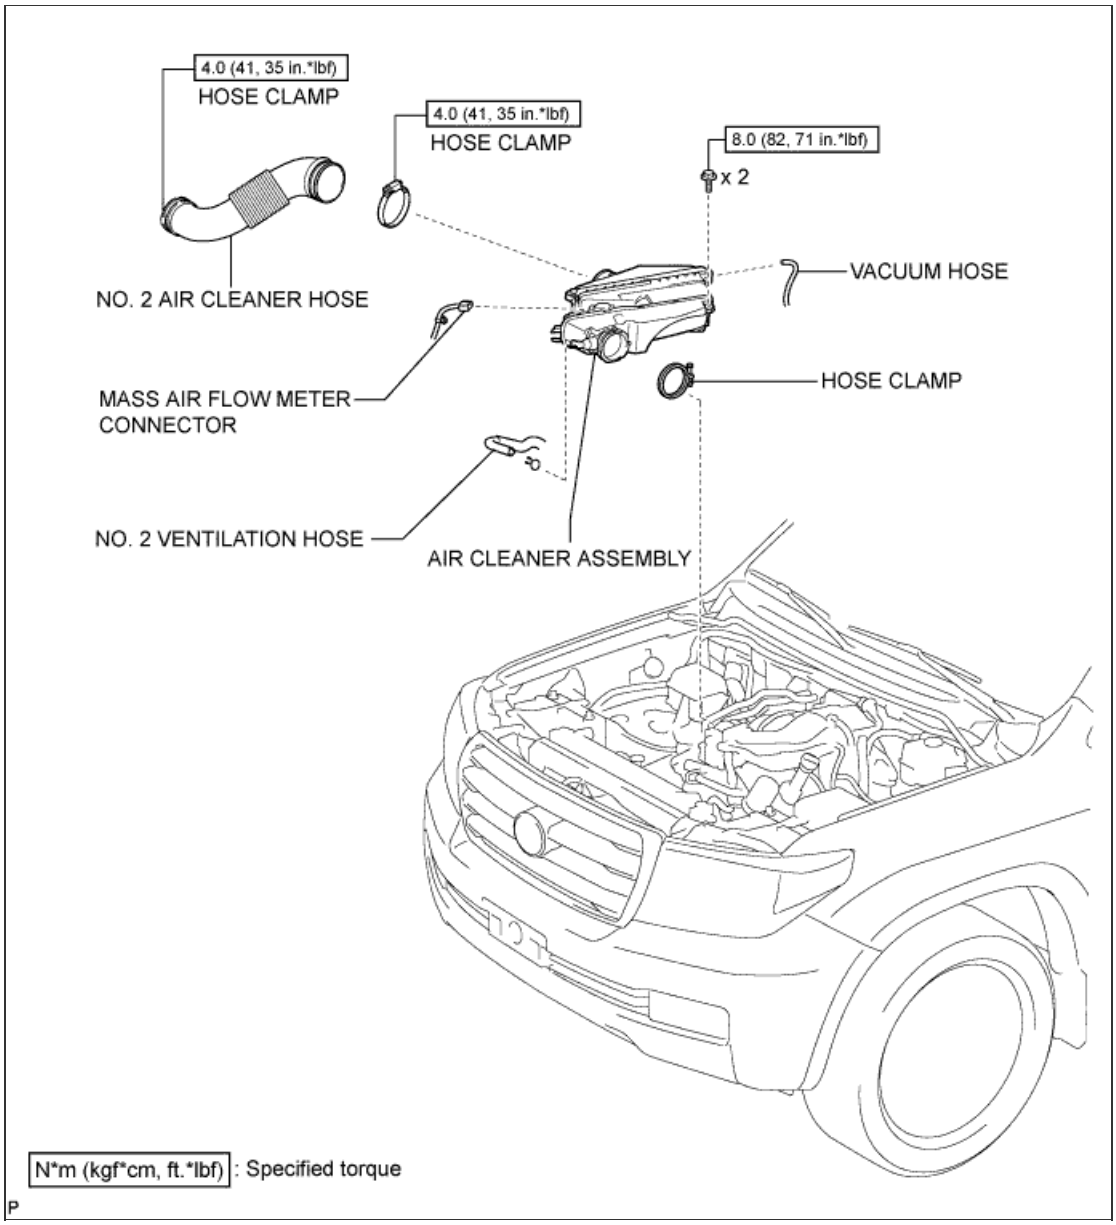


HINT:

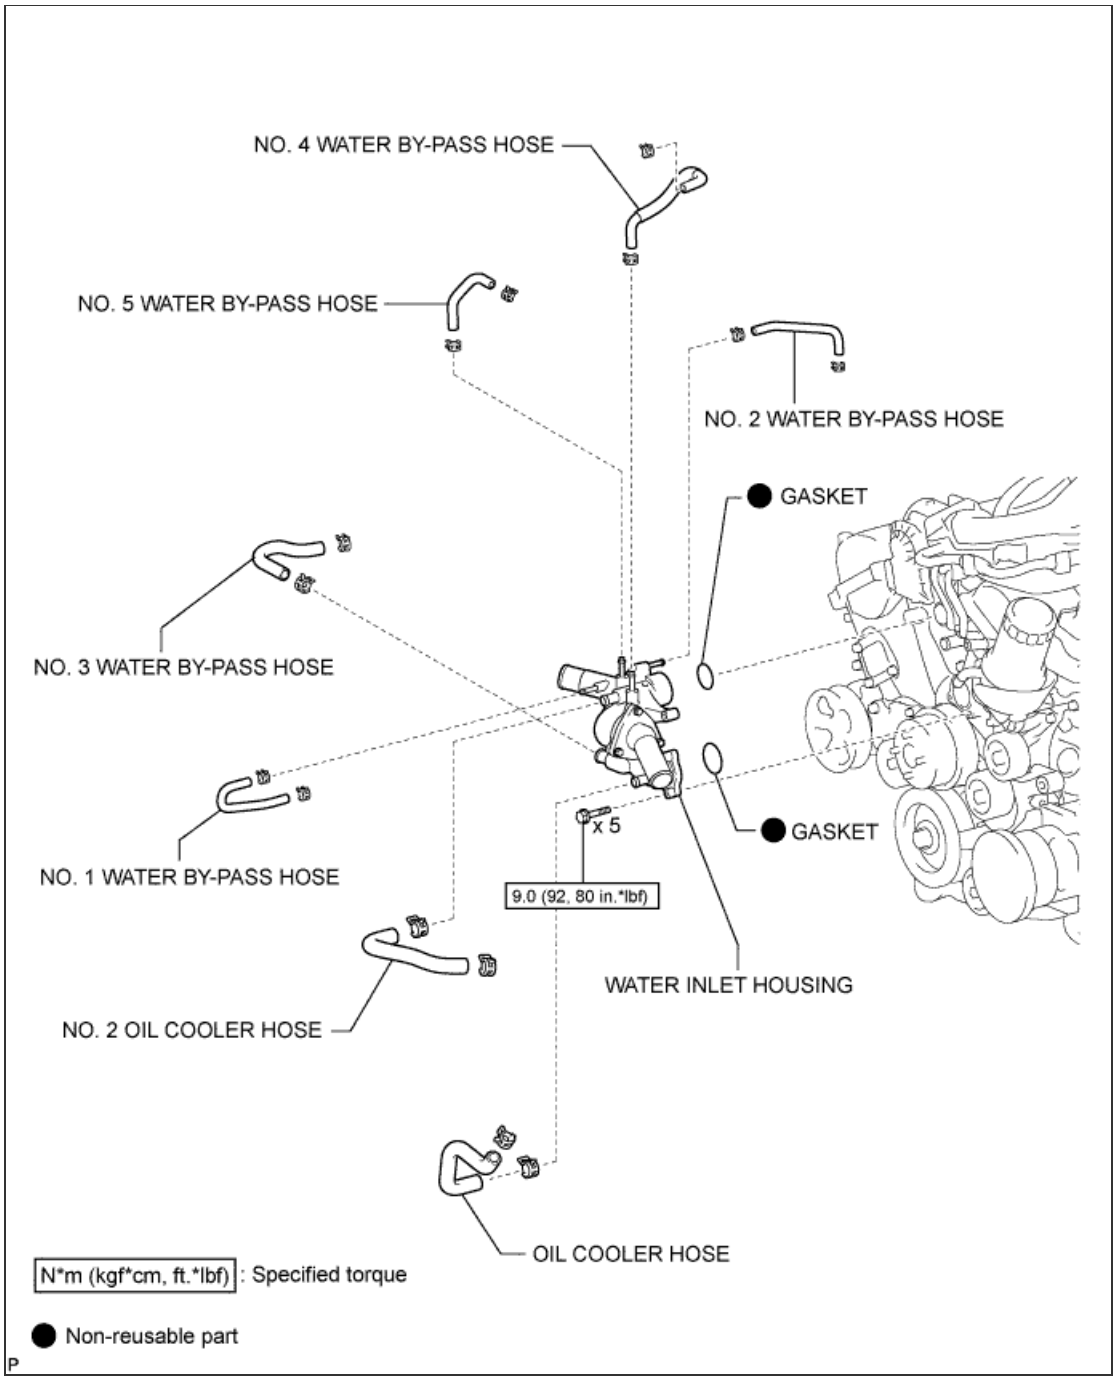
Use the same procedures described for the LH side.



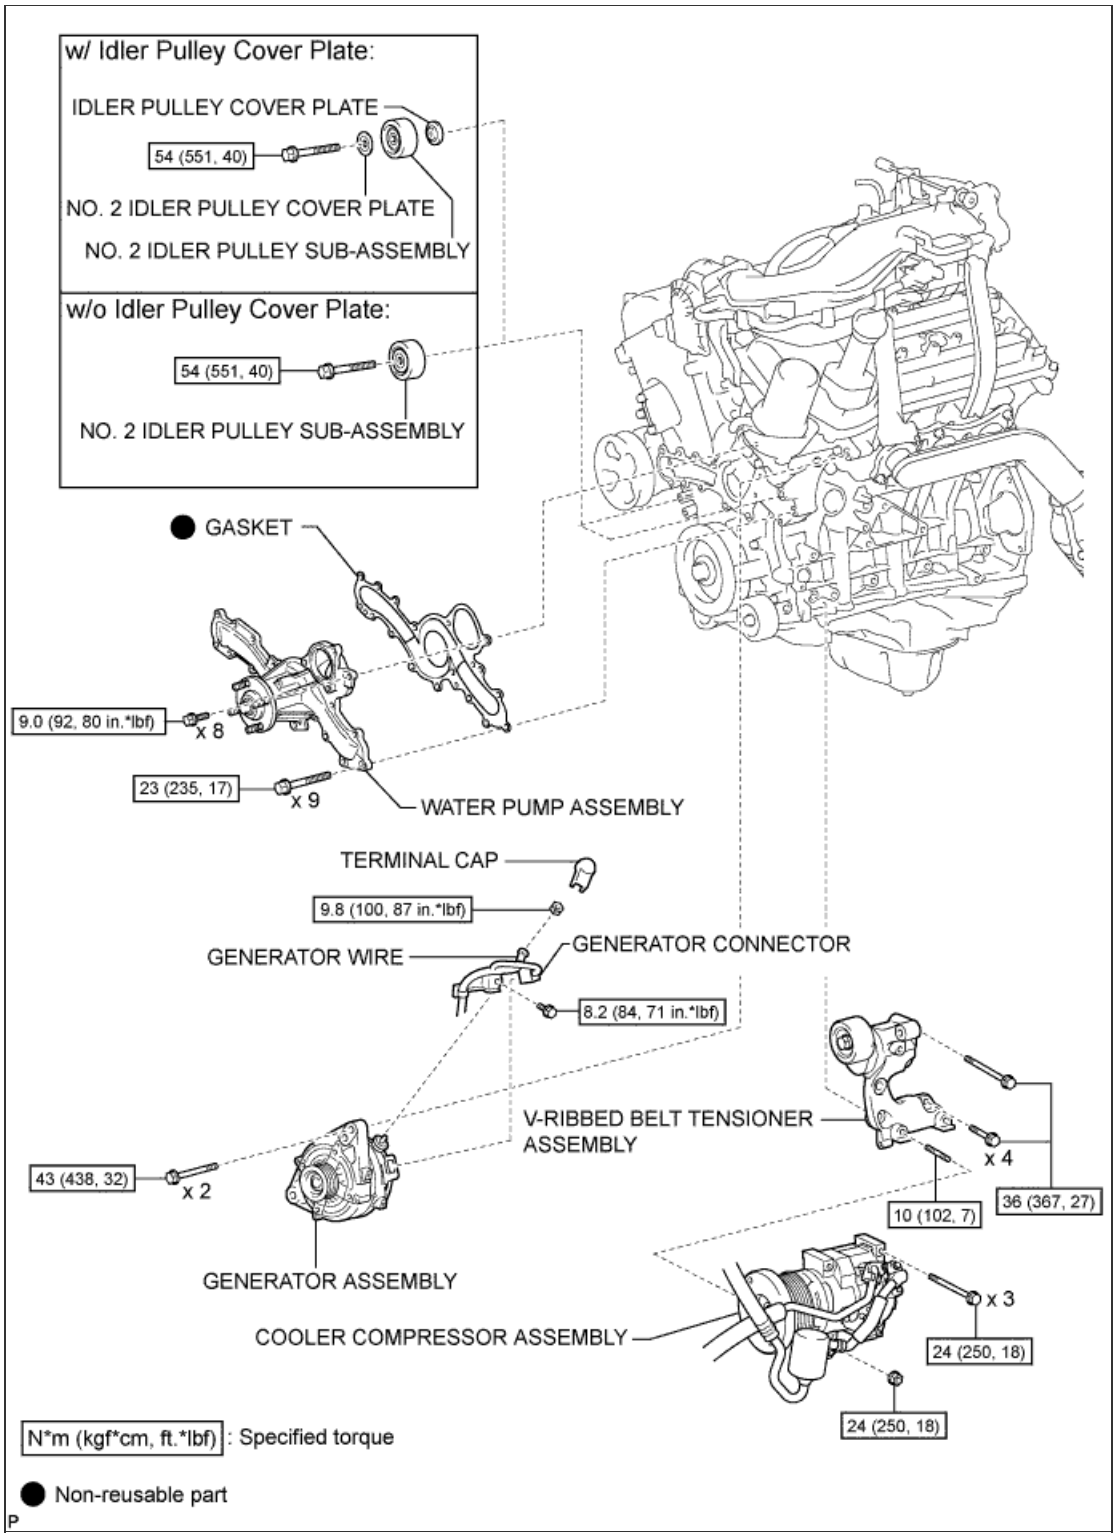
11. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



a. Remove the 3 bolts and screw.



b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



P

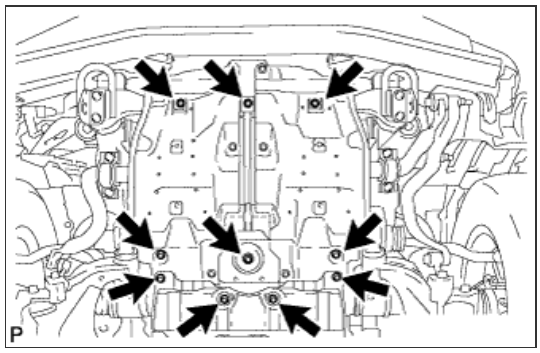
for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

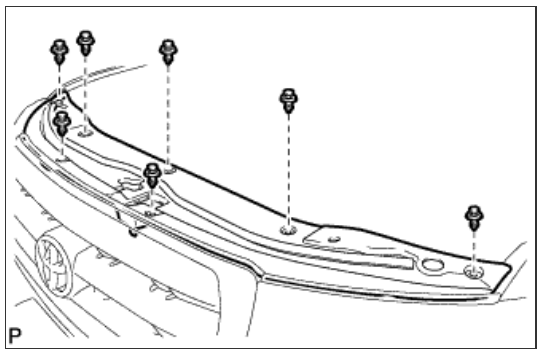
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. REMOVE UPPER RADIATOR SUPPORT SEAL

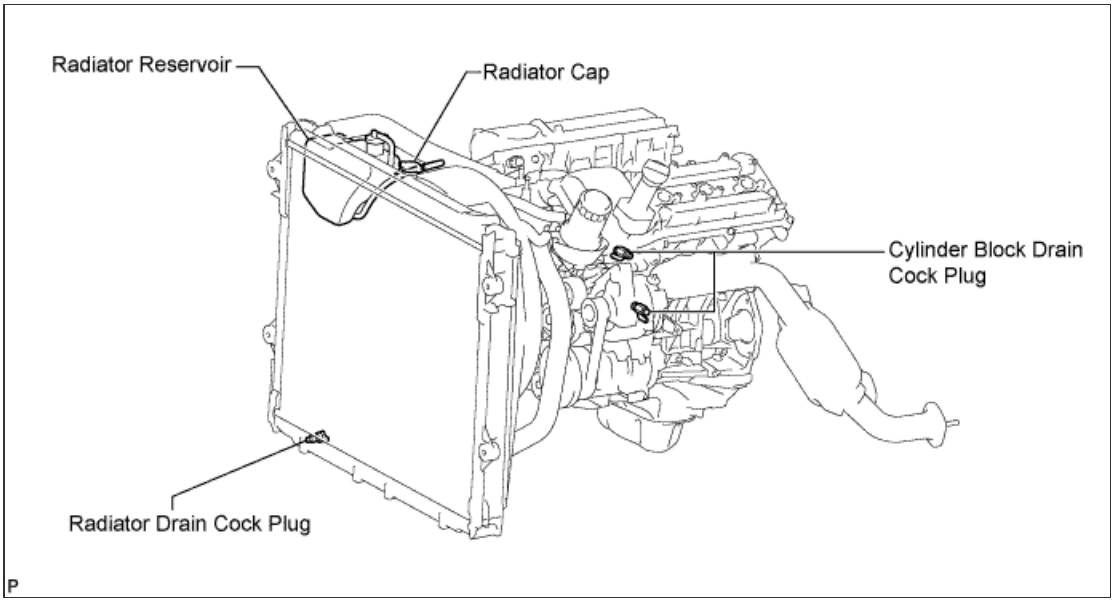
a. Remove the 7 clips and radiator support seal.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.

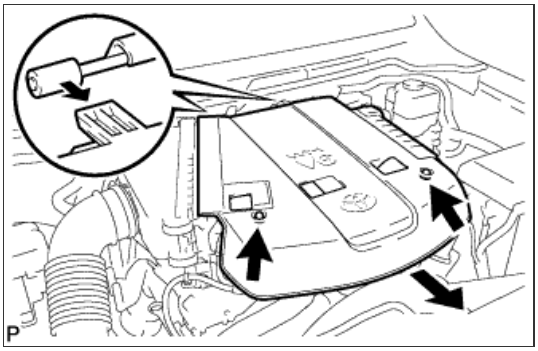


b. Remove the radiator cap. Then drain the coolant.

HINT:

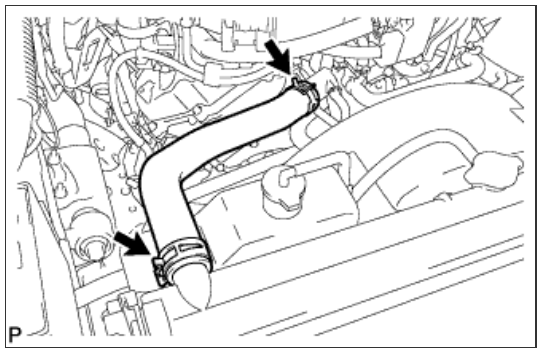
Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.



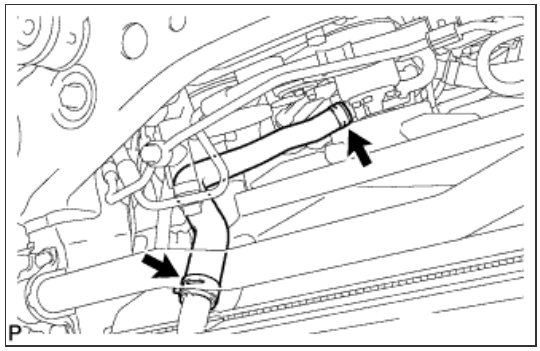
Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

d. Tighten the radiator drain cock plug by hand.



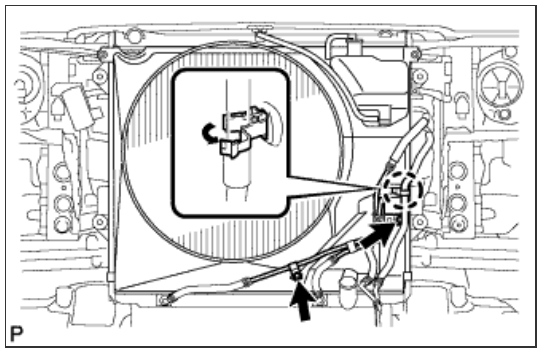
6. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.



7. REMOVE NO. 1 RADIATOR HOSE

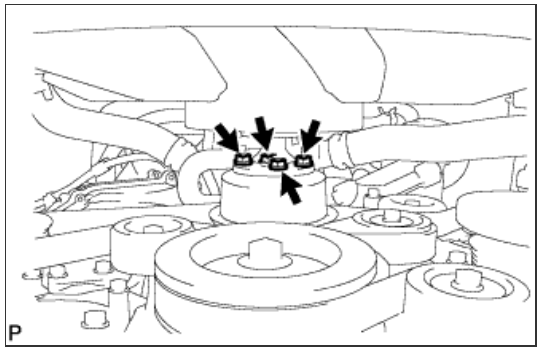
a. Remove the radiator hose.



8. REMOVE NO. 2 RADIATOR HOSE

a. Remove the radiator hose.

9. DISCONNECT OIL COOLER TUBE (w/ Air Cooled Transmission Oil Cooler)



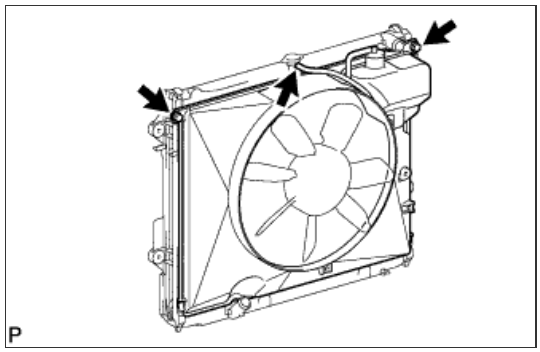
a. Detach the claw to open the flexible hose clamp, and then remove the 2 bolts to disconnect the oil cooler tube from the fan shroud.

10. REMOVE FAN SHROUD

a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the fan and generator V-belt (Click here).

c. Disconnect the reservoir hose from the upper side of the radiator tank.

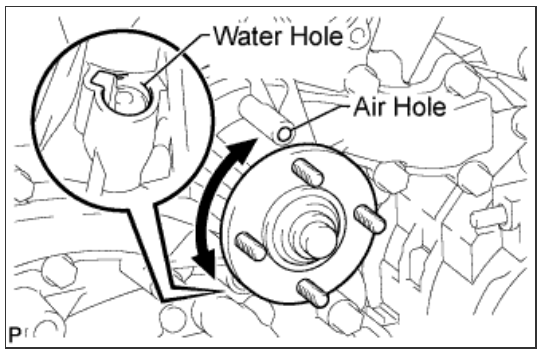


d. Remove the 2 bolts holding the fan shroud.

e. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the coupling fan.

NOTICE:

Be careful not to damage the radiator core.



f. Remove the fan pulley from the water pump.

11. INSPECT WATER PUMP ASSEMBLY

a. Visually check the air hole and water hole for coolant leakage.
If leakage is found, replace the water pump assembly.

b. Turn the pulley and check that the water pump bearing moves smoothly and quietly.
If necessary, replace the water pump assembly.

12. INSTALL FAN SHROUD

a. Install the fan pulley to the water pump.

b. Place the shroud together with the coupling fan between the radiator and engine.

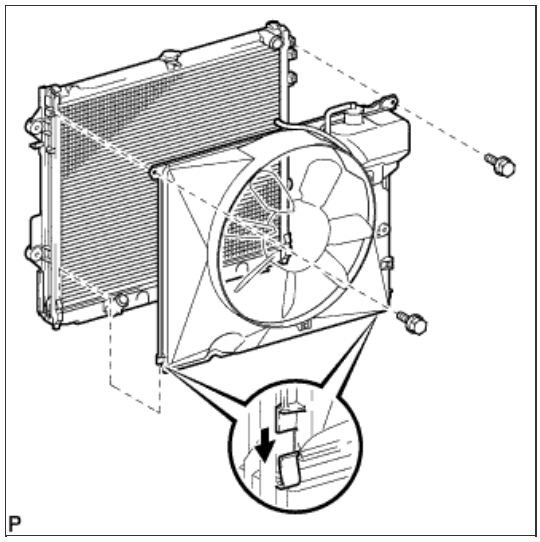
NOTICE:

Be careful not to damage the radiator core.

c. Temporarily install the fluid coupling fan to the water pump with the 4 nuts. Tighten the nuts as much as possible by hand.

d. Attach the claws of the shroud to the radiator as shown in the illustration.

e. Install the shroud with the 2 bolts.



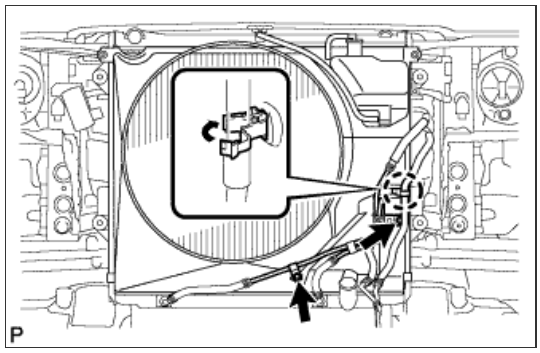
Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

f. Connect the reservoir hose to upper side of the radiator tank upper.

g. Install the fan and generator V-belt (Click here).

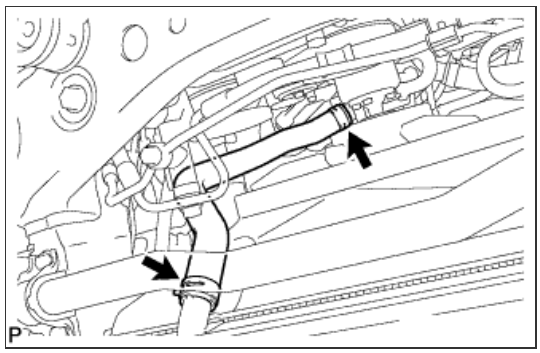
h. Tighten the 4 nuts of the fluid coupling fan.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



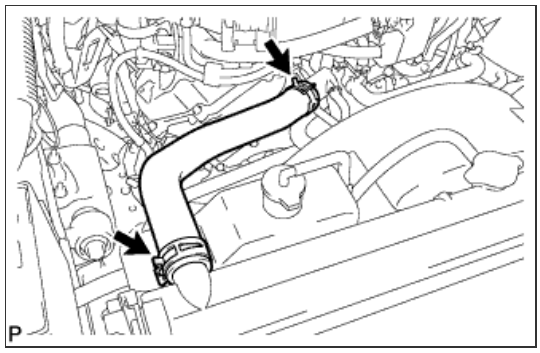
13. CONNECT OIL COOLER TUBE (w/ Air Cooled Transmission Oil Cooler)

a. Connect the oil cooler tube with the 2 bolts, and attach the claw to close the



flexible hose clamp.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }



14. INSTALL NO. 2 RADIATOR HOSE

a. Install the radiator hose.

15. INSTALL NO. 1 RADIATOR HOSE

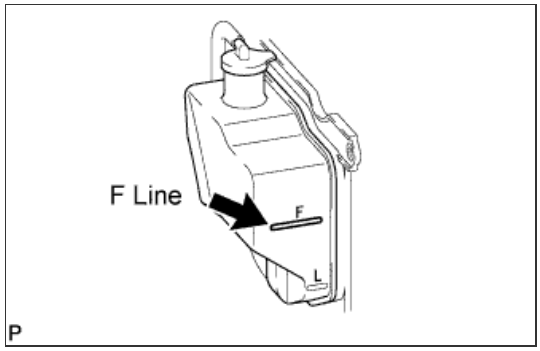
a. Install the radiator hose.

16. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US ts, 9.9 Imp. ts)
	w/ Rear Heater	14.4 liters (15.2 US ts, 12.7 Imp. ts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US ts, 10.6 Imp. ts)
	w/ Rear Heater	14.6 liters (15.4 US ts, 12.8 Imp. ts)



NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TO TA vehicles are filled with TO TA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TO TA SLLC or similar high uality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward RM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

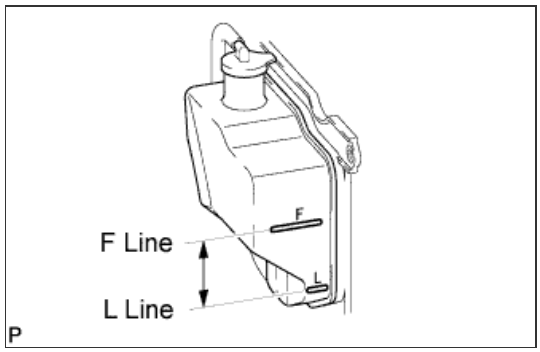
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

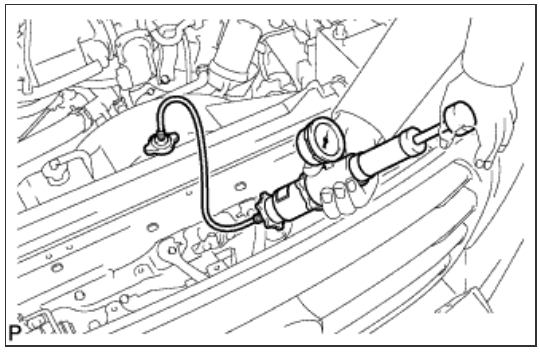
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

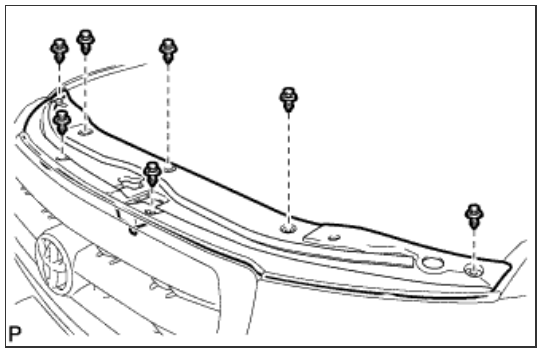
17. INSPECT FOR COOLANT LEAK



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

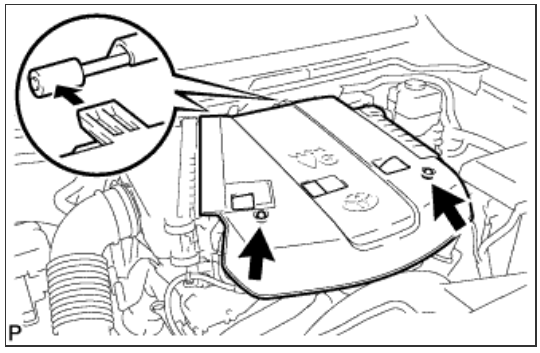
a. Fill the radiator with coolant and attach a radiator cap tester.



b. arm up the engine.

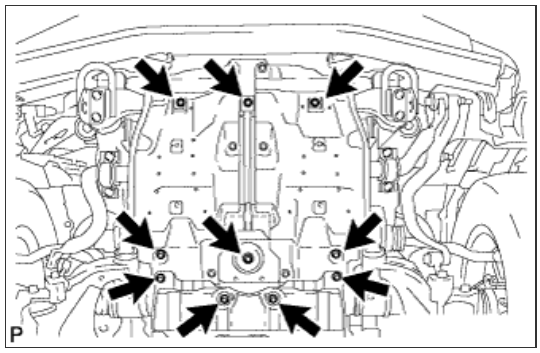
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

18. INSTALL UPPER RADIATOR SUPPORT SEAL



a. Install the radiator support seal with the 7 clips.

19. INSTALL V-BANK COVER



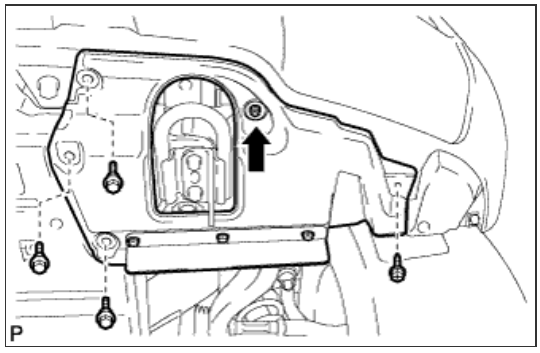
a. Install the V-bank cover with the 2 cap nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

20. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the under cover with the 10 bolts.

21. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



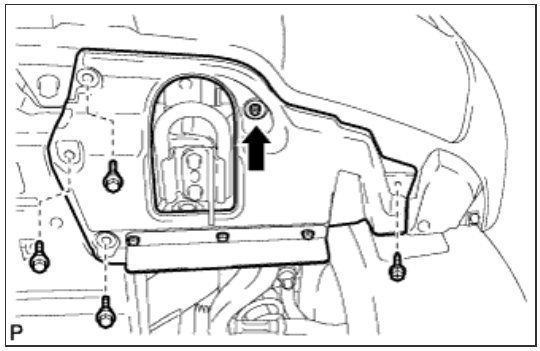
HINT:

Use the same procedures described for the LH side.

22. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

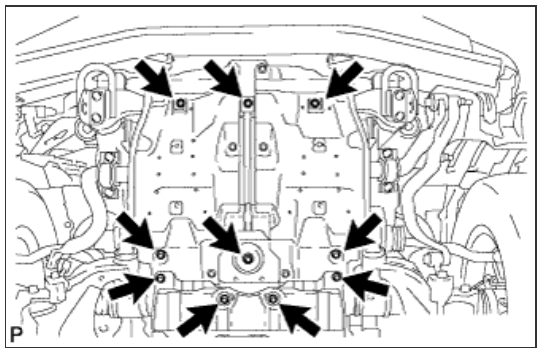


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

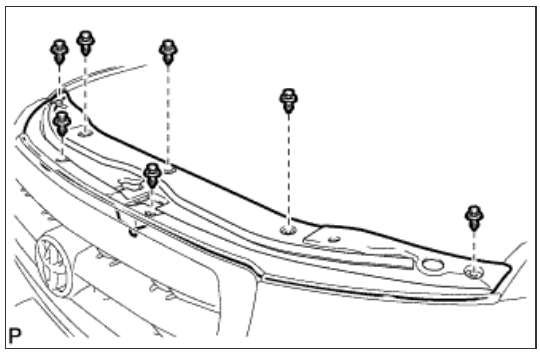
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. REMOVE UPPER RADIATOR SUPPORT SEAL

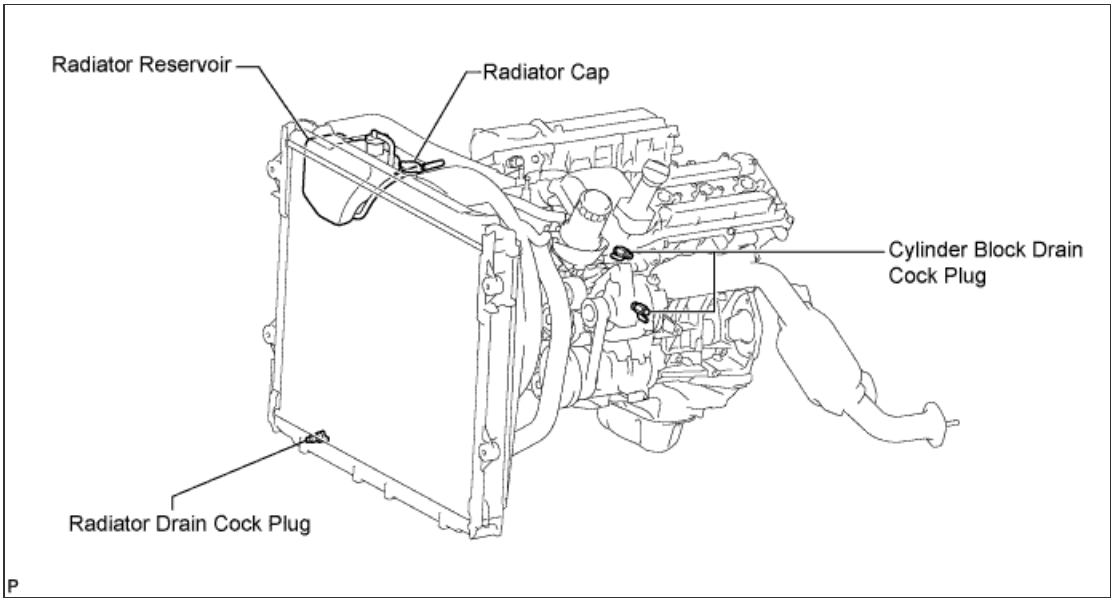
a. Remove the 7 clips and radiator support seal.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.

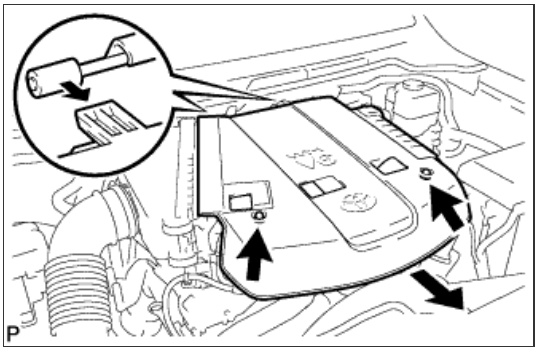


b. Remove the radiator cap. Then drain the coolant.

HINT:

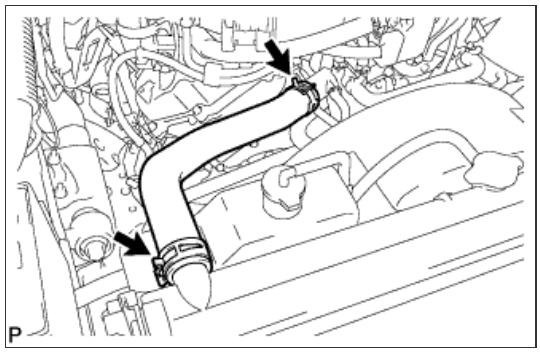
Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.



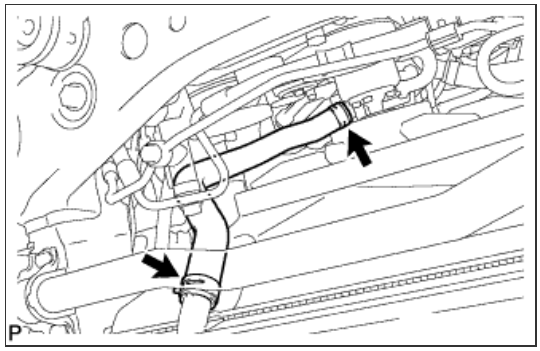
Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

d. Tighten the radiator drain cock plug by hand.



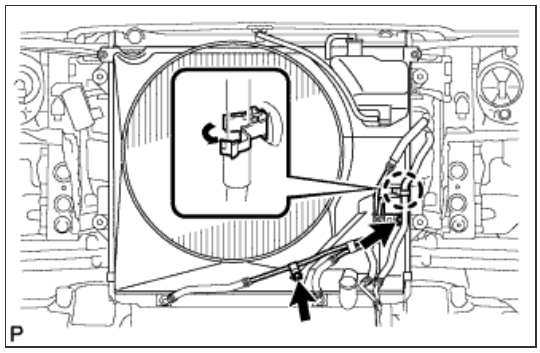
6. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.



7. REMOVE NO. 1 RADIATOR HOSE

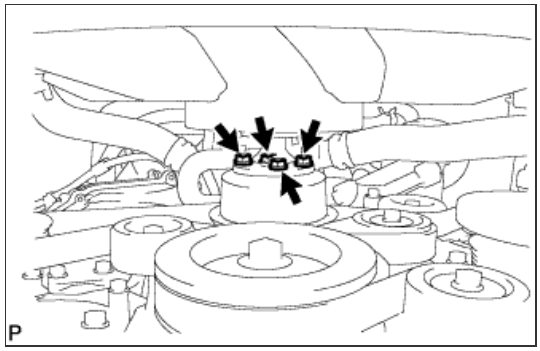
a. Remove the radiator hose.



8. REMOVE NO. 2 RADIATOR HOSE

a. Remove the radiator hose.

9. DISCONNECT OIL COOLER TUBE (w/ Air Cooled Transmission Oil Cooler)



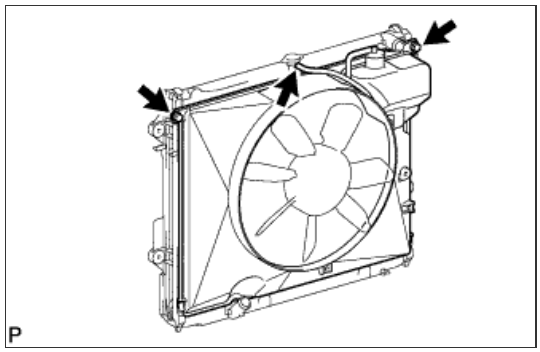
a. Detach the claw to open the flexible hose clamp, and then remove the 2 bolts to disconnect the oil cooler tube from the fan shroud.

10. REMOVE FAN SHROUD

a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the fan and generator V-belt (Click here).

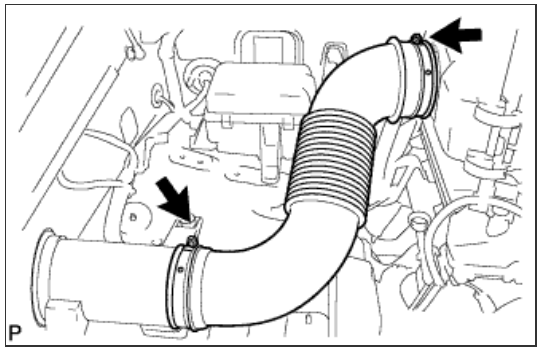
c. Disconnect the reservoir hose from the upper side of the radiator tank.



d. Remove the 2 bolts holding the fan shroud.

e. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the coupling fan.

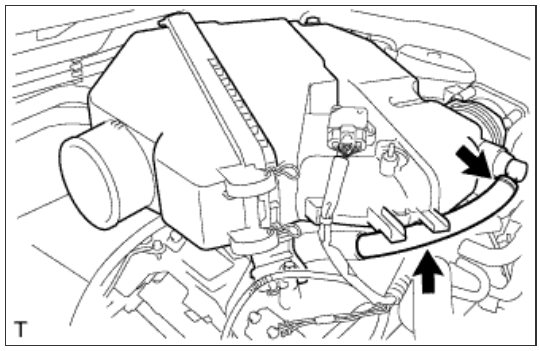
NOTICE:



Be careful not to damage the radiator core.

f. Remove the fan pulley from the water pump.

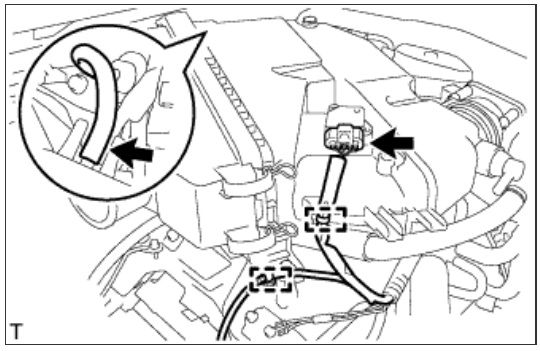
11. REMOVE NO. 2 AIR CLEANER HOSE



a. Loosen the 2 hose clamps and remove the air cleaner hose.

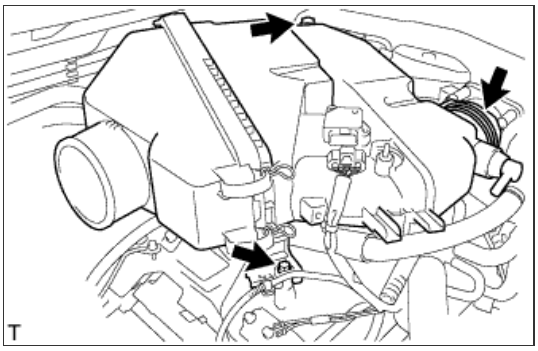
12. REMOVE AIR CLEANER ASSEMBLY

a. Disconnect the No. 2 ventilation hose.



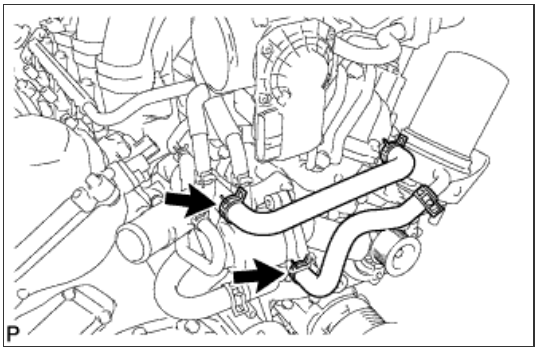
b. Detach the hose clamp.

c. Disconnect the vacuum hose.



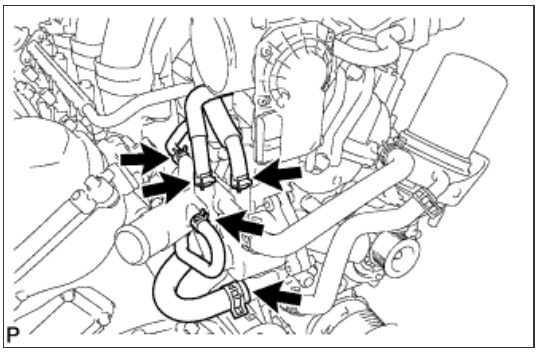
d. Disconnect the MAF meter connector.

e. Using a clip remover, detach the 2 wire harness clamps.



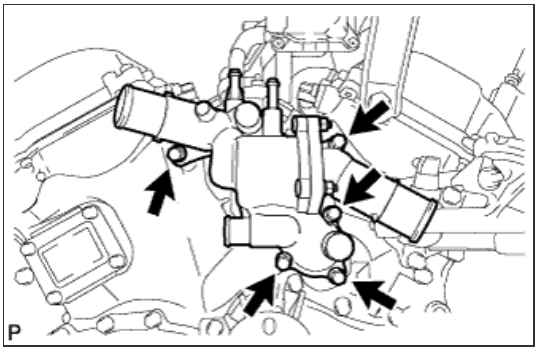
f. Loosen the hose clamp.

g. Remove the 2 bolts and air cleaner assembly.



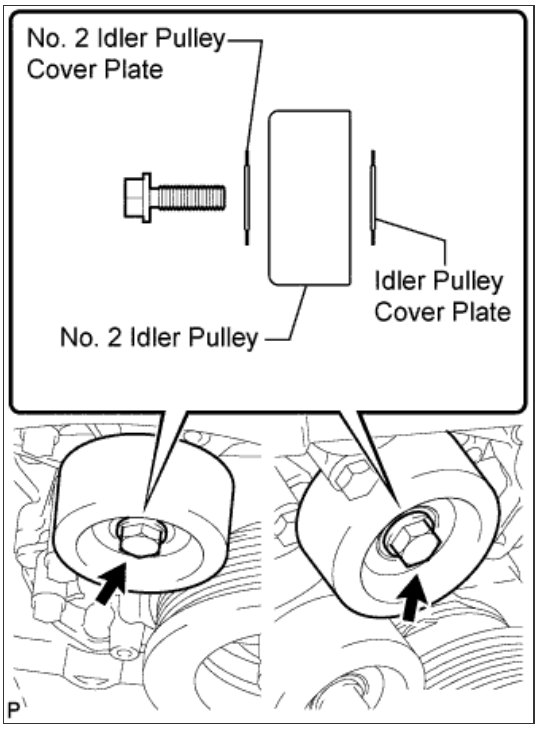
13. REMOVE WATER INLET HOUSING

a. Disconnect the 2 oil cooler hoses.



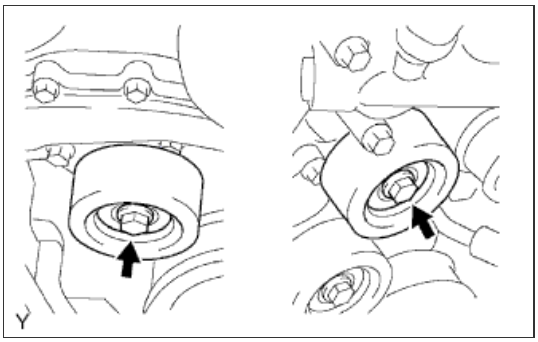
b. Disconnect the 5 water by-pass hoses.

c. Remove the 5 bolts and water inlet.



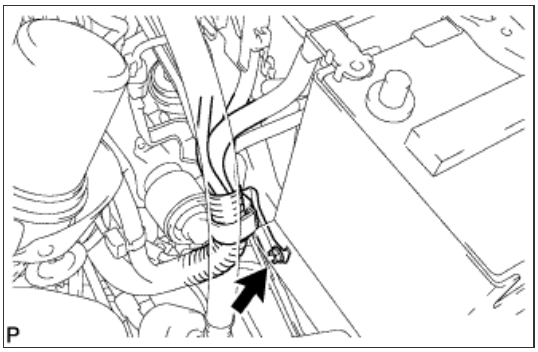
d. Remove the gasket from the water outlet pipe.

e. Remove the gasket from the water pump.



14. REMOVE NO. 2 IDLER PULLEY SUB-ASSEMBLY

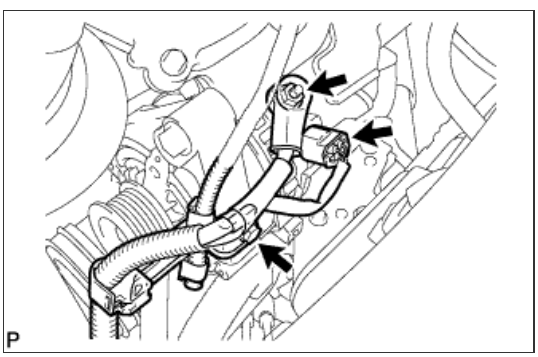
a. w/ Pulley Cover Plate:
Remove the 2 bolts, 2 No. 2 idler pulley cover plate, 2 idler pulley and 2 idler pulley cover plate.



b. w/o Pulley Cover Plate:
Remove the 2 bolts and 2 No. 2 idler pulleys.

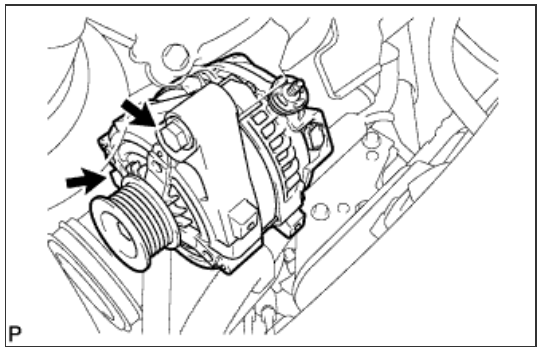
15. REMOVE GENERATOR ASSEMBLY

a. Remove the nut and disconnect the wire harness clamp bracket.



b. Disconnect the generator connector.

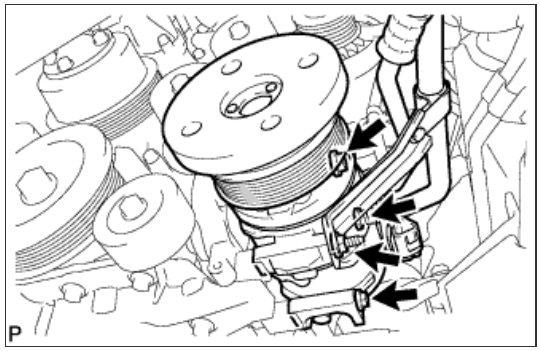
c. Remove the terminal cap.



d. Remove the nut and disconnect the generator wire.

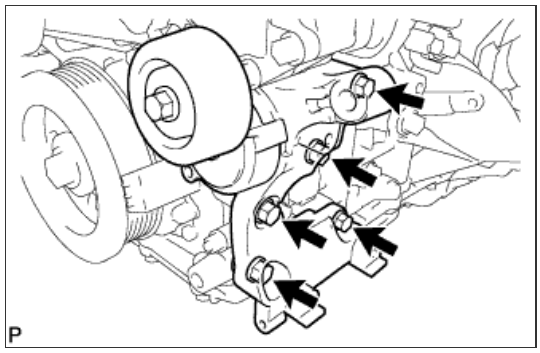
e. Remove the wire harness clamp.

f. Remove the bolt and disconnect the wire harness clamp bracket.



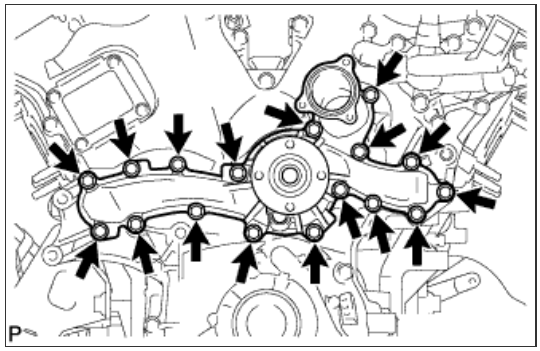
g. Remove the 2 bolts and generator.

16. DISCONNECT COOLER COMPRESSOR ASSEMBLY



a. Disconnect the cooler compressor connector.

b. Remove the nut, 3 bolts and stud bolt, and disconnect the cooler compressor.

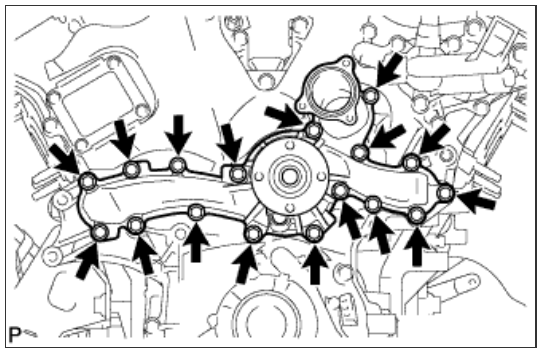


17. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY

a. Remove the 5 bolts and V-ribbed belt tensioner.

18. REMOVE WATER PUMP ASSEMBLY

a. Remove the 17 bolts, water pump and gasket.



for Preparation Click here

1. INSTALL WATER PUMP ASSEMBLY

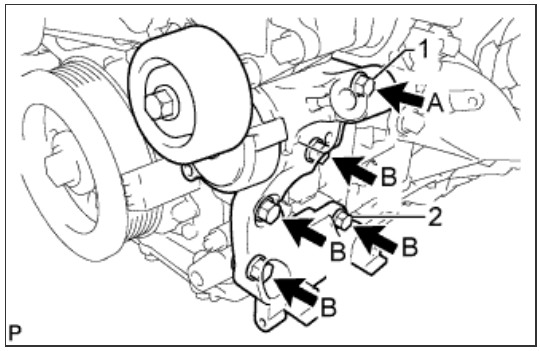
a. Install a new gasket and the water pump with the 17 bolts.

Torque:
for 10 mm head:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }
for 12 mm head:
23 N*m{ 235 kgf*cm , 17 ft.*lbf }

2. INSTALL V-RIBBED BELT TENSIONER ASSEMBLY

a. Temporarily install the V-ribbed belt tensioner with the 5 bolts.

b. Tighten bolt 1 and 2 in numerical order.



Torque:
36 N*m{ 367 kgf*cm , 27 ft.*lbf }

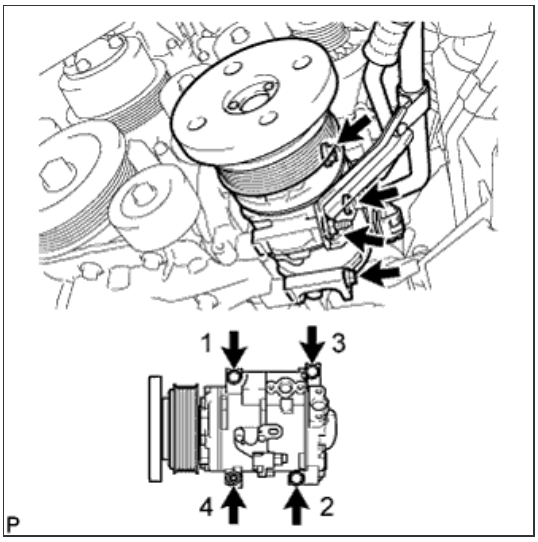
c. Tighten the other bolts.

Torque:
36 N*m{ 367 kgf*cm , 27 ft.*lbf }

Standard Bolt:

Item	Length
A	70 mm (2.76 in.)
B	33 mm (1.30 in.)

3. CONNECT COOLER COMPRESSOR ASSEMBLY

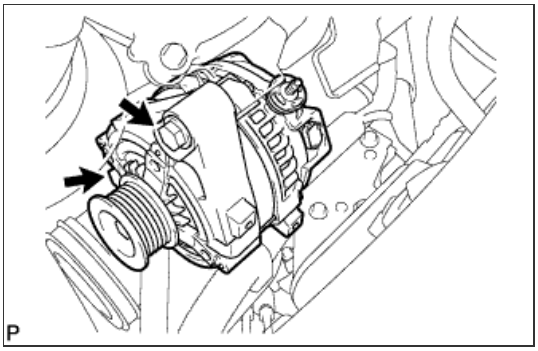


a. Fix the cooler compressor in place with the stud bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install the cooler compressor with the nut and 3 bolts in several steps in the sequence shown in the illustration.

Torque:
24 N*m{ 250 kgf*cm , 18 ft.*lbf }



c. Connect the cooler compressor connector.

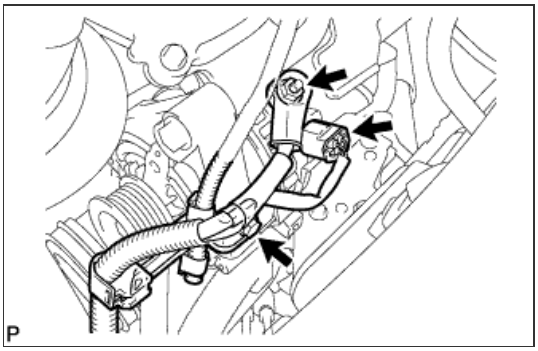
4. INSTALL GENERATOR ASSEMBLY

a. Install the generator with the 2 bolts.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

b. Connect the wire harness clamp bracket with the bolt.

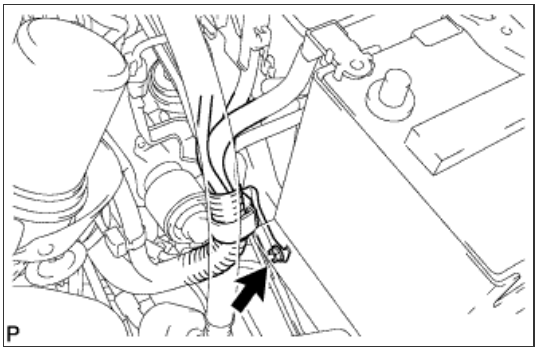
Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



c. Install the wire harness clamp to the bracket.

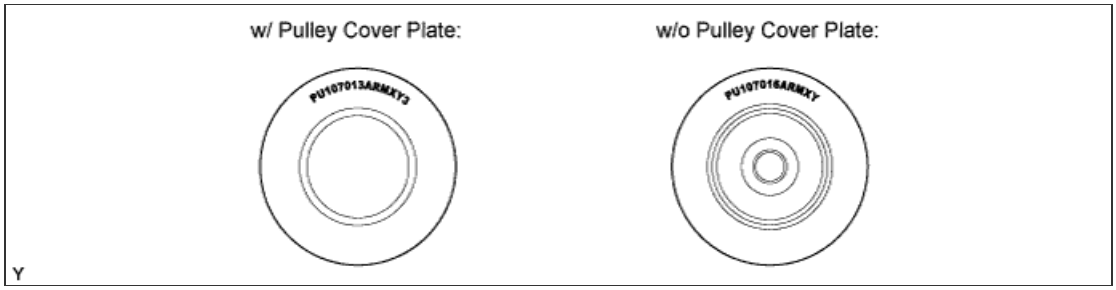
d. Connect the generator wire with the nut.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }



e. Install the terminal cap.

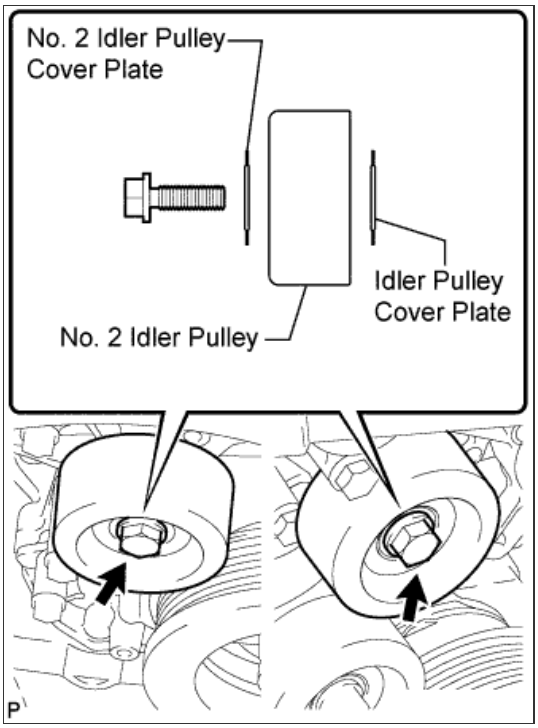
f. Connect the generator connector.



g. Connect the wire harness clamp bracket with the nut.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

5. INSTALL NO. 2 IDLER PULLEY SUB-ASSEMBLY

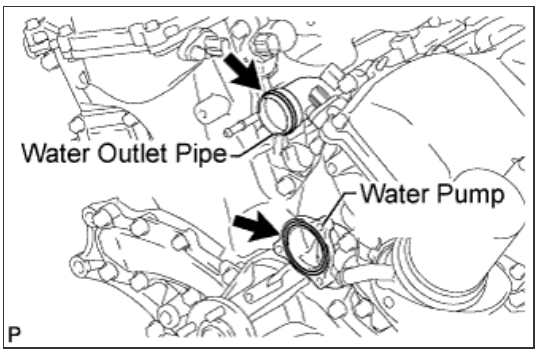


a. w/ Pulley Cover Plate:

i. Install the idler pulley cover plate, idler pulley and No. 2 idler pulley cover plate with the bolt.

Torque:
54 N*m{ 551 kgf*cm , 40 ft.*lbf }

NOTICE:

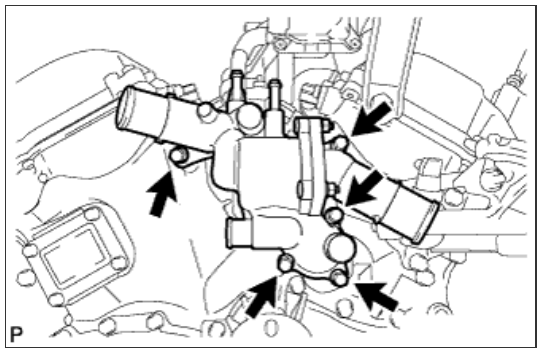


If it is necessary to replace the pulley or either plate, replace the No. 2 idler pulley cover plate, No. 2 idler pulley and idler pulley cover plate as a set with new parts.

b. w/o Pulley Cover Plate:
Install the 2 No. 2 idler pulleys with the 2 bolts.

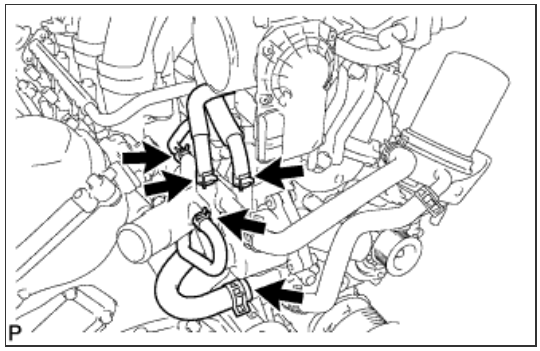
Torque:
54 N*m{ 551 kgf*cm , 40 ft.*lbf }

6. INSTALL WATER INLET HOUSING



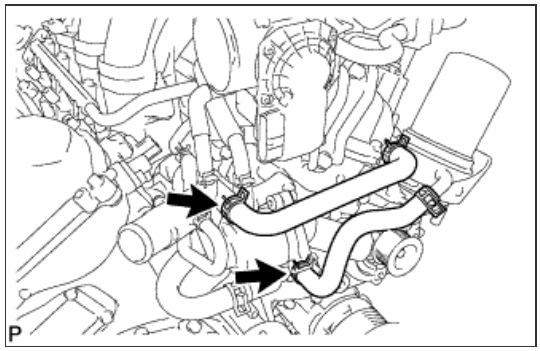
a. Install a new gasket to the water outlet pipe.

b. Install a new gasket to the water pump.



c. Apply soapy water to the gasket of the water outlet pipe.

d. Install the water inlet with the 5 bolts.



Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

e. Connect the 5 water by-pass hoses.

f. Connect the 2 oil cooler hoses.

7. INSTALL FAN SHROUD

a. Install the fan pulley to the water pump.

b. Place the shroud together with the coupling fan between the radiator and engine.

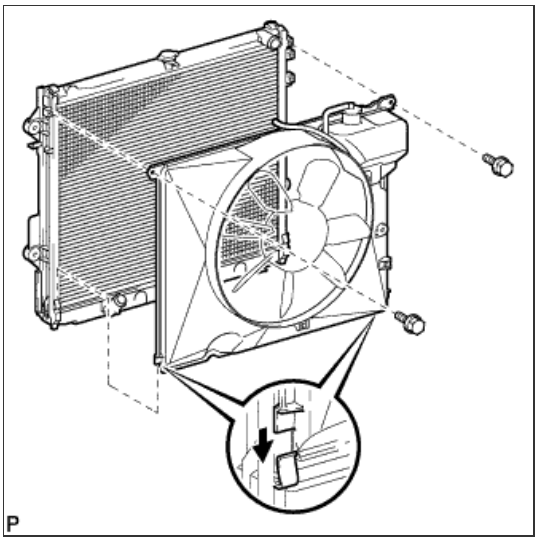
NOTICE:

Be careful not to damage the radiator core.

c. Temporarily install the fluid coupling fan to the water pump with the 4 nuts. Tighten the nuts as much as possible by hand.

d. Attach the claws of the shroud to the radiator as shown in the illustration.

e. Install the shroud with the 2 bolts.

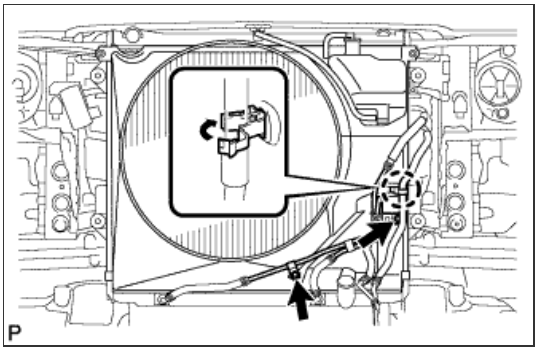


Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

f. Connect the reservoir hose to upper side of the radiator tank upper.

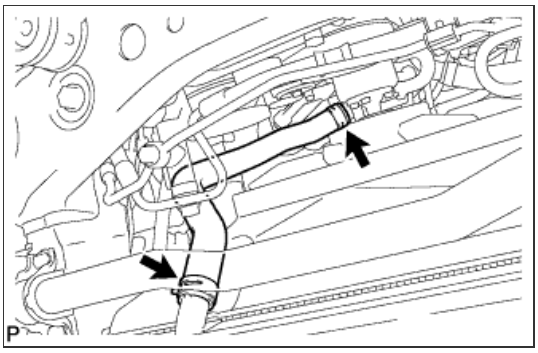
g. Install the fan and generator V-belt (Click here).

h. Tighten the 4 nuts of the fluid coupling fan.



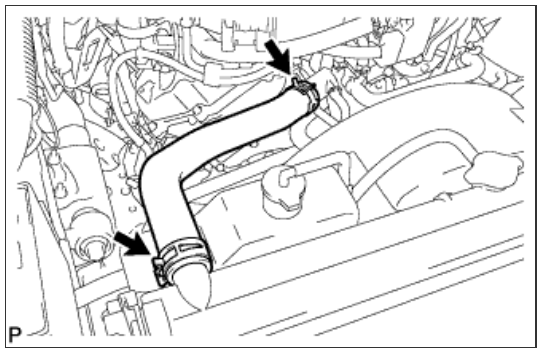
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

8. CONNECT OIL COOLER TUBE (w/ Air Cooled Transmission Oil Cooler)



a. Connect the oil cooler tube with the 2 bolts, and attach the claw to close the flexible hose clamp.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }



9. INSTALL NO. 2 RADIATOR HOSE

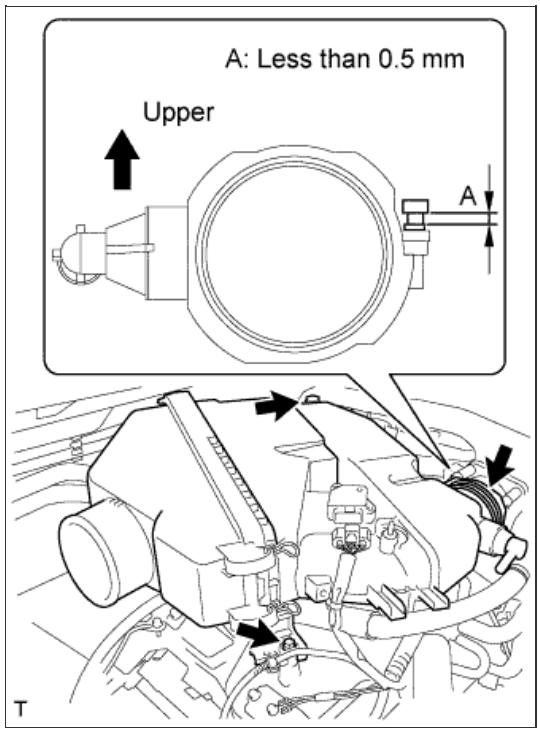
a. Install the radiator hose.

10. INSTALL NO. 1 RADIATOR HOSE

a. Install the radiator hose.

11. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner assembly with the 2 bolts.

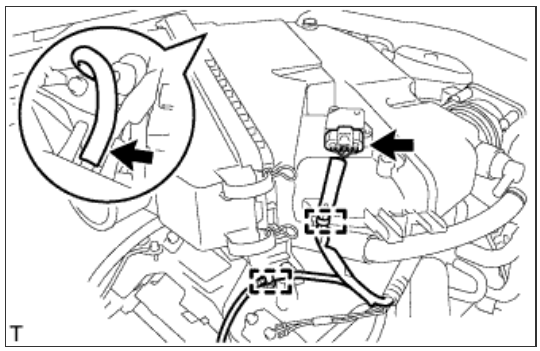


Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

b. Tighten the hose clamp.

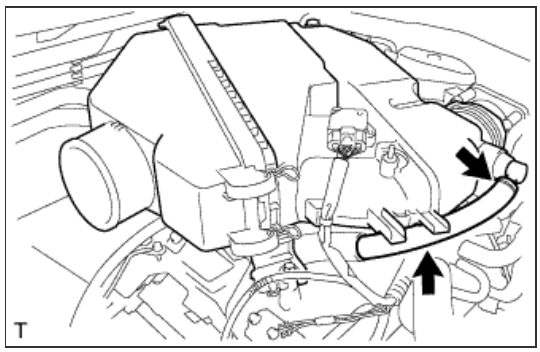
HINT:

Tighten the hose clamp until it reaches the specified protrusion height labeled A shown in the illustration.



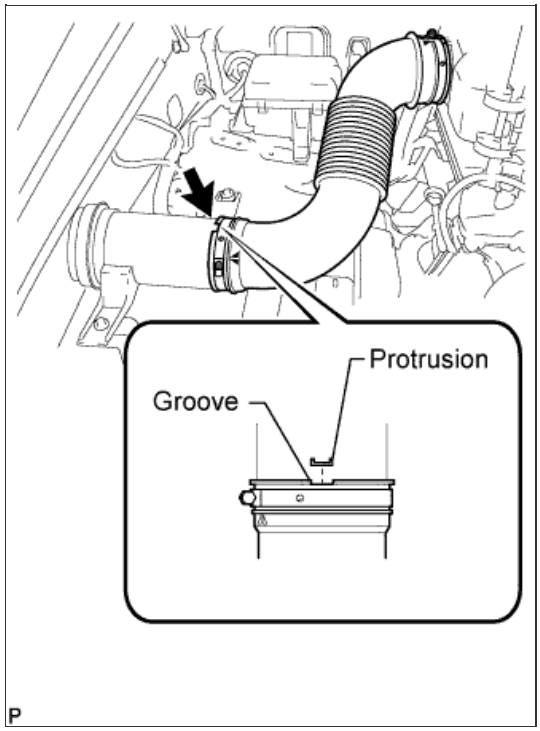
Standard protrusion height:
Less than 0.5 mm (0.0197 in.)

c. Connect the MAF meter connector.



d. Attach the 2 wire harness clamps.

e. Connect the vacuum hose.

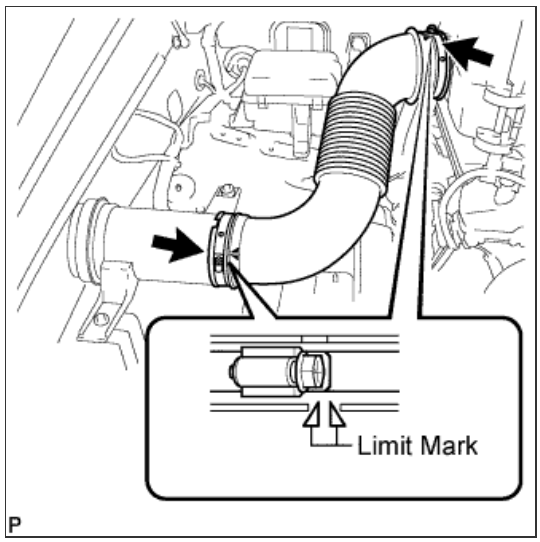


f. Attach the hose clamp.

g. Connect the No. 2 ventilation hose.

12. INSTALL NO. 2 AIR CLEANER HOSE

a. Align the protrusion of the pre-cleaner with the groove of the No. 2 air cleaner hose as shown in the illustration.



b. Tighten the 2 hose clamps.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

HINT:

Tighten the clamp until the end of the clamp band is within both limit marks.

13. ADD ENGINE COOLANT

a. Add engine coolant.

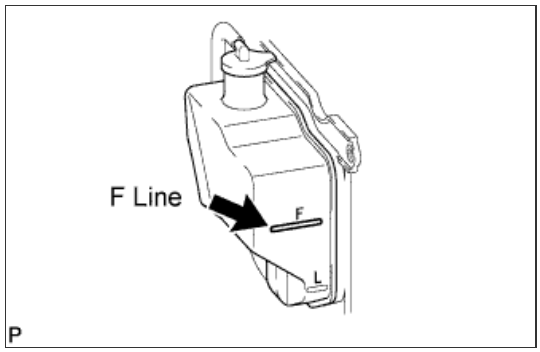
Standard Capacit :

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:



TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

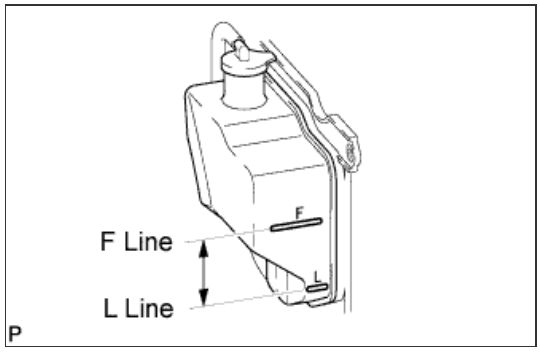
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pa attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormall high temperature.**
- **If there is not enough coolant, the engine ma burn out or overheat.**
- **Immediatel after starting the engine, if the radiator reservoir does not have an coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts ma injure our hands.**
- **Be careful as the radiator hoses are hot.**
- **eep our hands awa from the fan.**

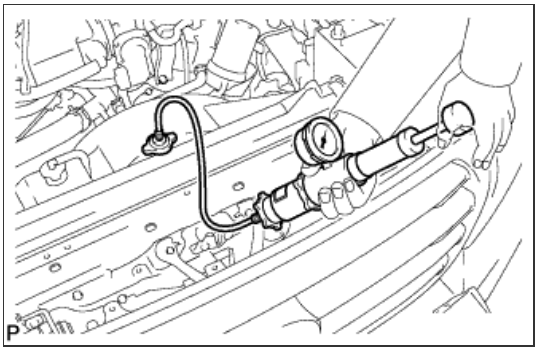
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

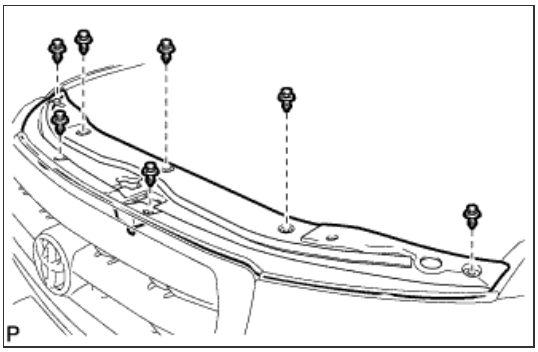
14. INSPECT FOR COOLANT LEA



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

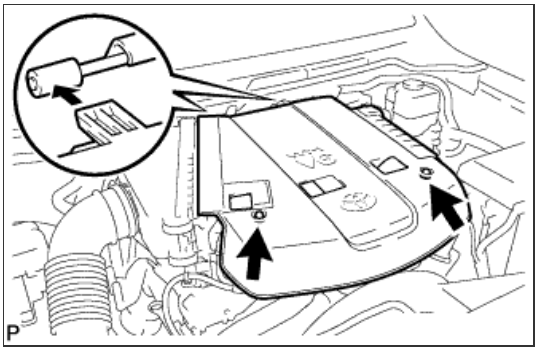
a. Fill the radiator with coolant and attach a radiator cap tester.



b. Warm up the engine.

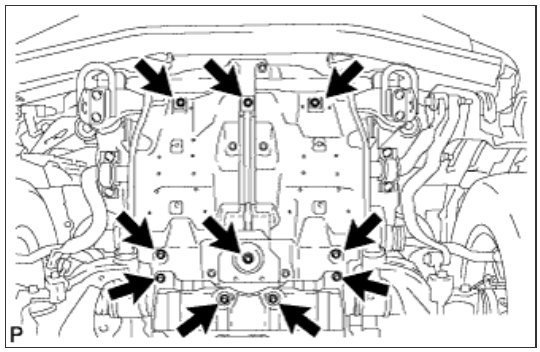
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

15. INSTALL UPPER RADIATOR SUPPORT SEAL



a. Install the radiator support seal with the 7 clips.

16. INSTALL V-BAN COVER



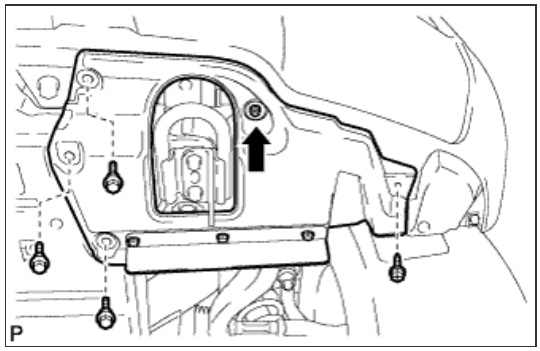
a. Install the V-bank cover with the 2 cap nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

17. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

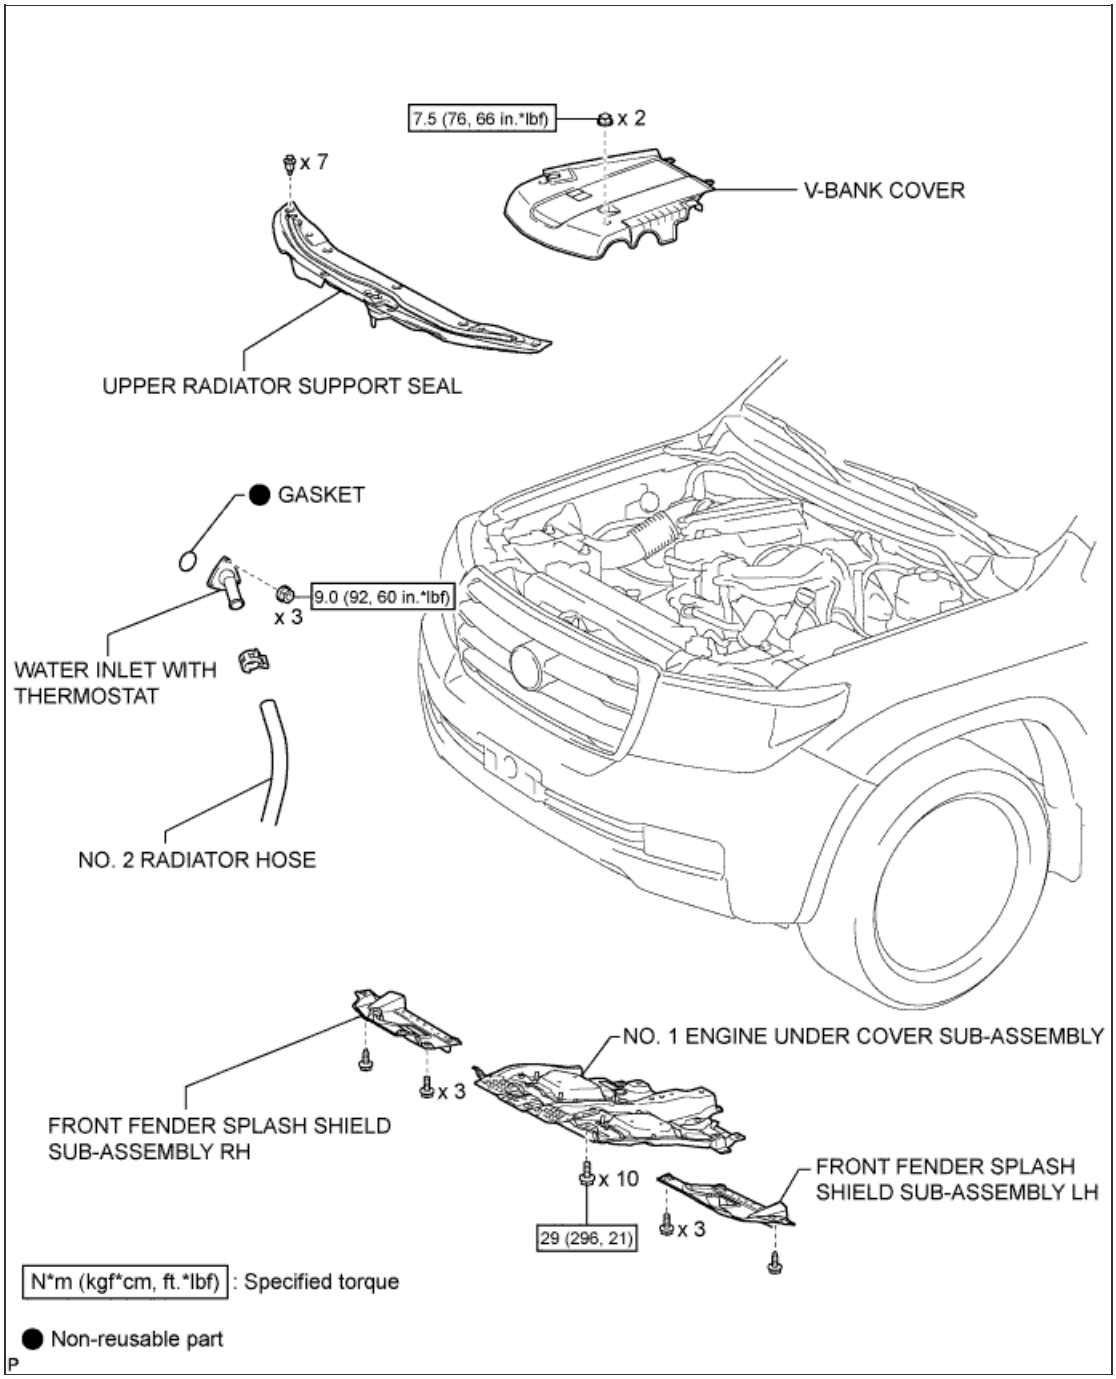
a. Install the under cover with the 10 bolts.

18. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

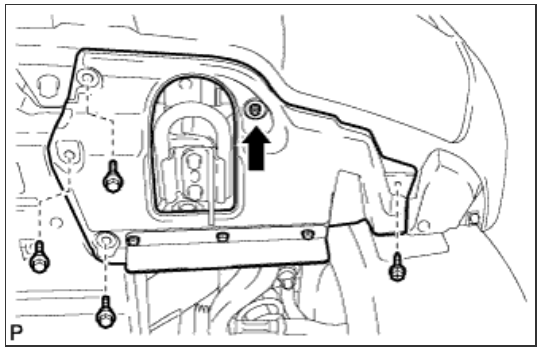


19. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

for Preparation [Click here]

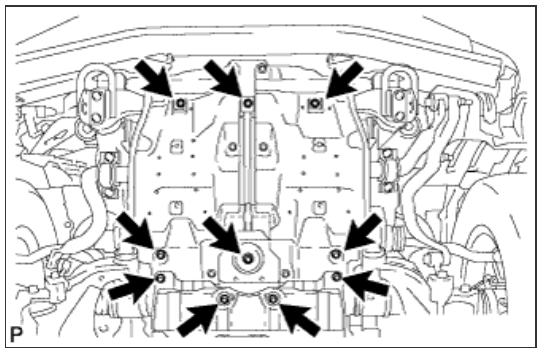


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

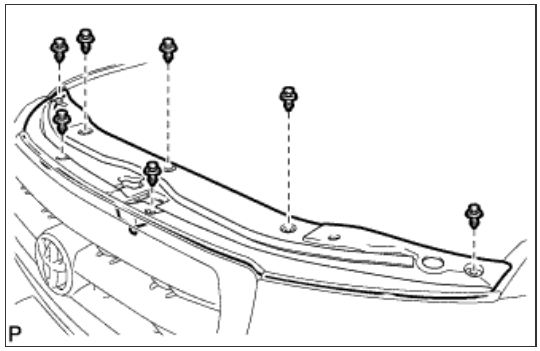
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. REMOVE UPPER RADIATOR SUPPORT SEAL

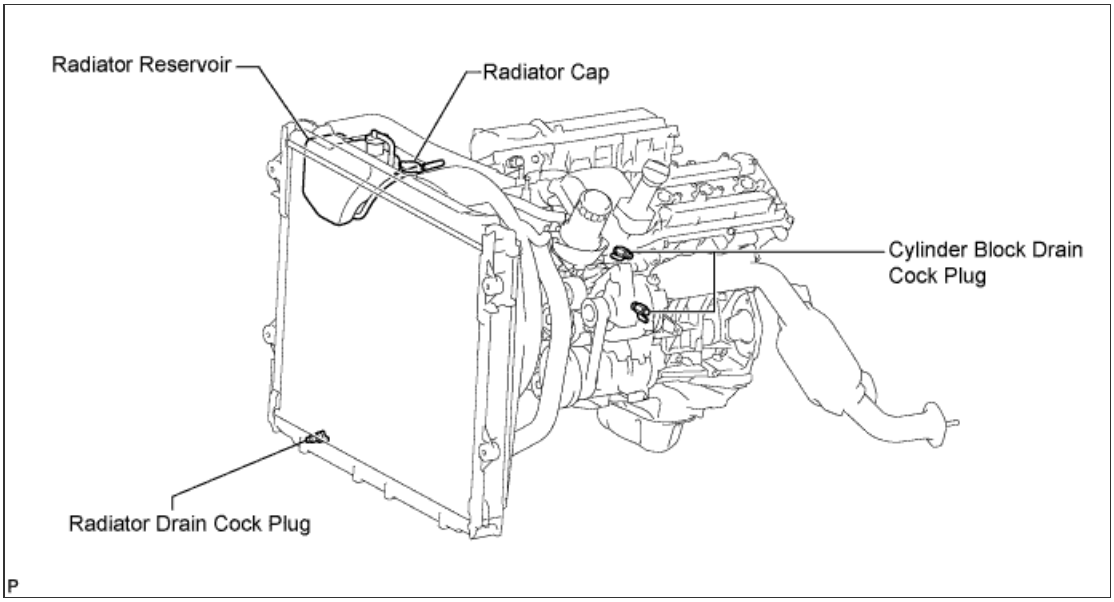
a. Remove the 7 clips and radiator support seal.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.

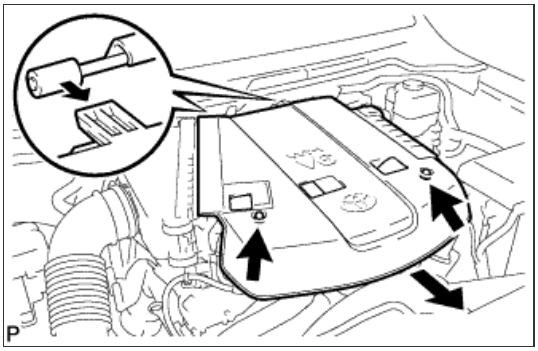


b. Remove the radiator cap. Then drain the coolant.

HINT:

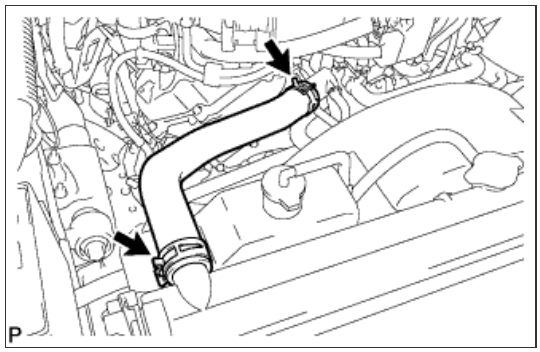
Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.



Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

d. Tighten the radiator drain cock plug by hand.

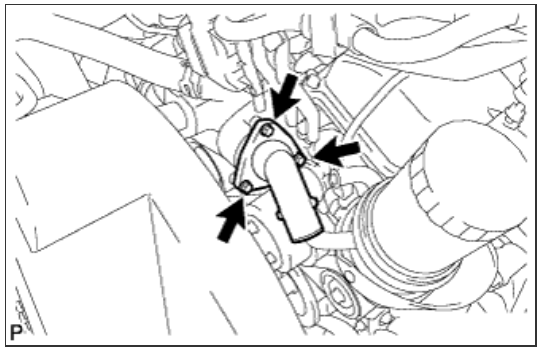


6. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.

7. REMOVE NO. 2 RADIATOR HOSE

a. Remove the radiator hose.

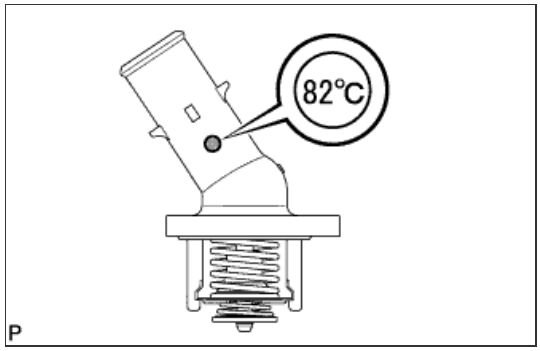


8. REMOVE WATER INLET WITH THERMOSTAT

HINT:

If the thermostat was not installed, cooling efficiency would decrease. Even if the engine tends to overheat, do not remove the thermostat.

a. Remove the 3 nuts, water inlet with thermostat and gasket.

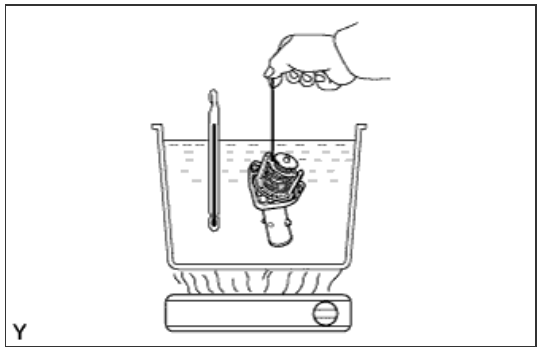


for Preparation Click here

1. INSPECT WATER INLET WITH THERMOSTAT

HINT:

The valve opening temperature is inscribed on the thermostat.

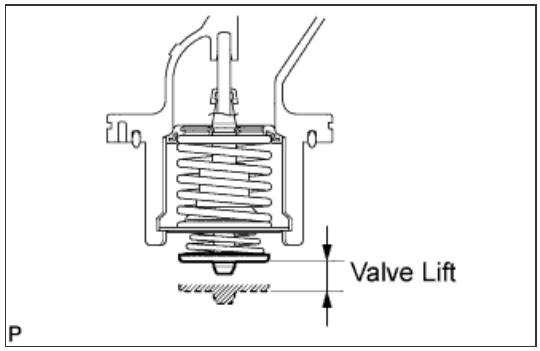


a. Immerse the thermostat in water, then gradually heat the water.

b. Check the valve opening temperature of the thermostat.

Standard valve opening temperature:
80 to 84°C (176 to 183°F)

If the valve opening temperature is not as specified, replace the water inlet with thermostat.

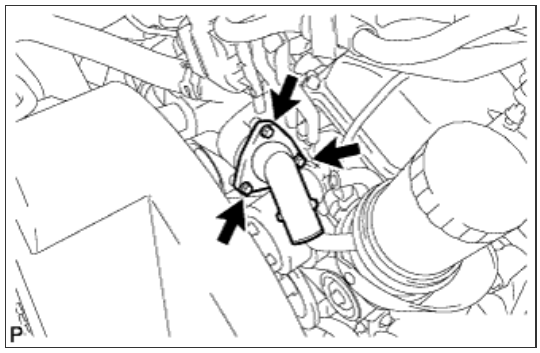


c. Check the valve lift.

Standard valve lift:
8.0 mm (0.315 in.) or more at 95°C (203°F)

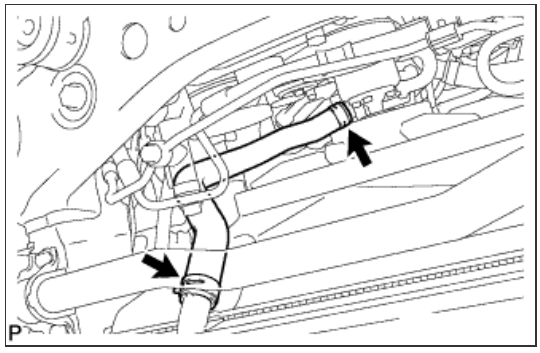
If the valve lift is not as specified, replace the water inlet with thermostat.

d. Check that the valve is fully closed when the water inlet with thermostat is at a low temperature (below 77 C (171 .
If not fully closed, replace the thermostat.



for Preparation Click here

1. INSTALL WATER INLET WITH THERMOSTAT



a. Install a new gasket and the water inlet with thermostat with the 3 nuts.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

2. INSTALL NO. 2 RADIATOR HOSE

a. Install the radiator hose.

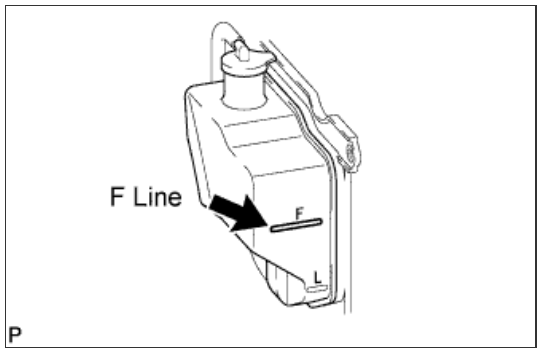
3. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

NOTICE:



Do not substitute plain water for engine coolant.

HINT:

TO A ehicles are filled with TO A SLL at the factor . In order to a oid damage to the engine cooling s stem and other technical problems, onl use TO A SLL or similar high qualit eth lene gl col based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life h brid organic acid technolog (coolant with long-life h brid organic acid technolog consists of a combination of low

phosphates and organic acids).

b. Slowl pour coolant into the radiator reser oir until it reaches the F line.

c. Install the reser oir cap.

d. Press the No. 1 and No. 2 radiator hoses se eral times b hand, and then check the coolant le el. If the coolant le el is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	ondition
Fan speed	An etting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed b pressing the No. 2 radiator hose b hand, and checking when the engine coolant starts to flow inside the hose.

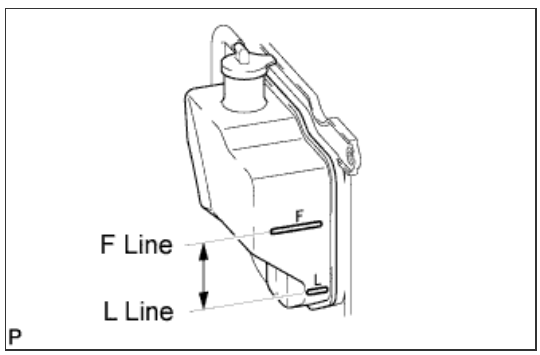
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the line.**
- **Run the engine at 2000 rpm until the coolant level has stabili d.**

i. Press the No. 1 and No. 2 radiator hoses se eral times b hand to bleed air.

CA TION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

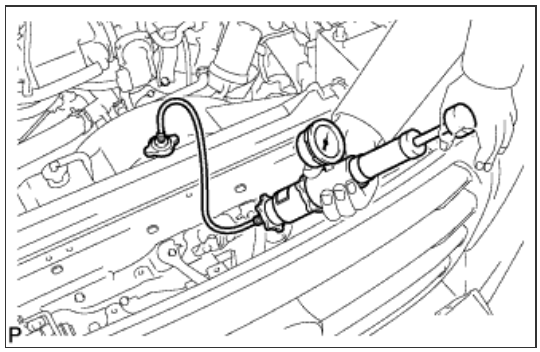
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CA TION:

Do not remo e the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam ma be released and cause serious burns.

k. heck that the coolant le el is between the F and L lines.
If the coolant le el is below the L line, repeat all of the procedures abo e.
If the coolant le el is abo e the F line, drain coolant so that the coolant le el is between the F and L lines.

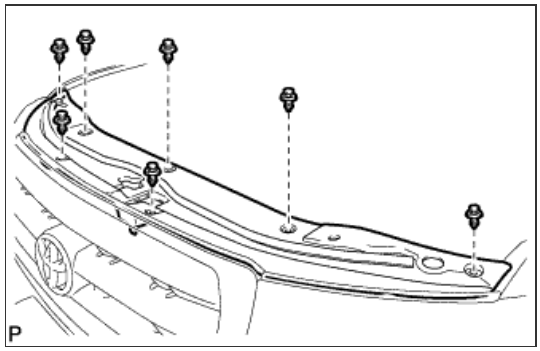
4. INSPECT OR ENGINE COOLANT LEA



CA TION:

Do not remo e the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam ma be released and cause serious burns.

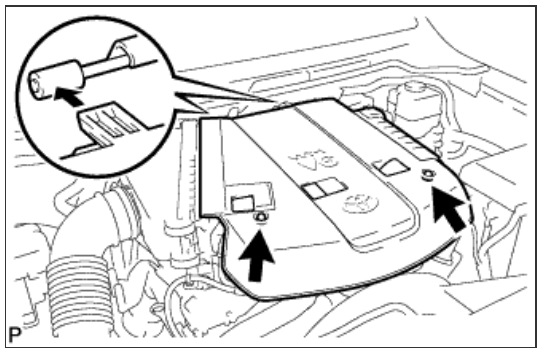
a. Fill the radiator with coolant and attach a radiator cap tester.



b. Warm up the engine.

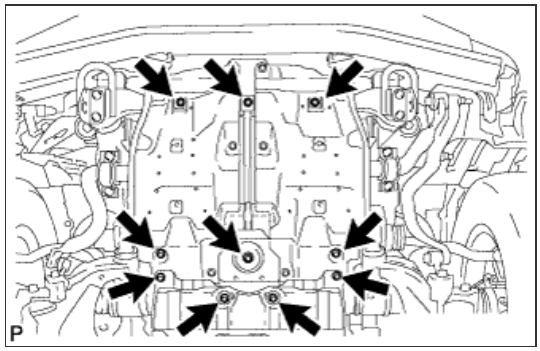
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, c inder block and head.

5. INSTALL PPER RADIATOR S PPORT SEAL



a. Install the radiator support seal with the 7 clips.

6. INSTALL V-BANK CO ER



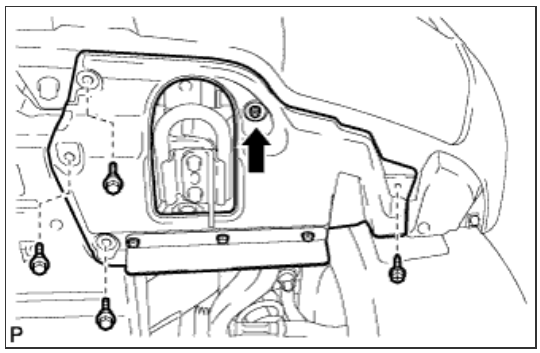
a. Install the V-bank co er with the 2 cap nuts.

Torque:
.5 N*m{ kgf*cm , 66 in.*lbf }

. INSTALL NO. 1 ENGINE DER CO ER S ASSEM L

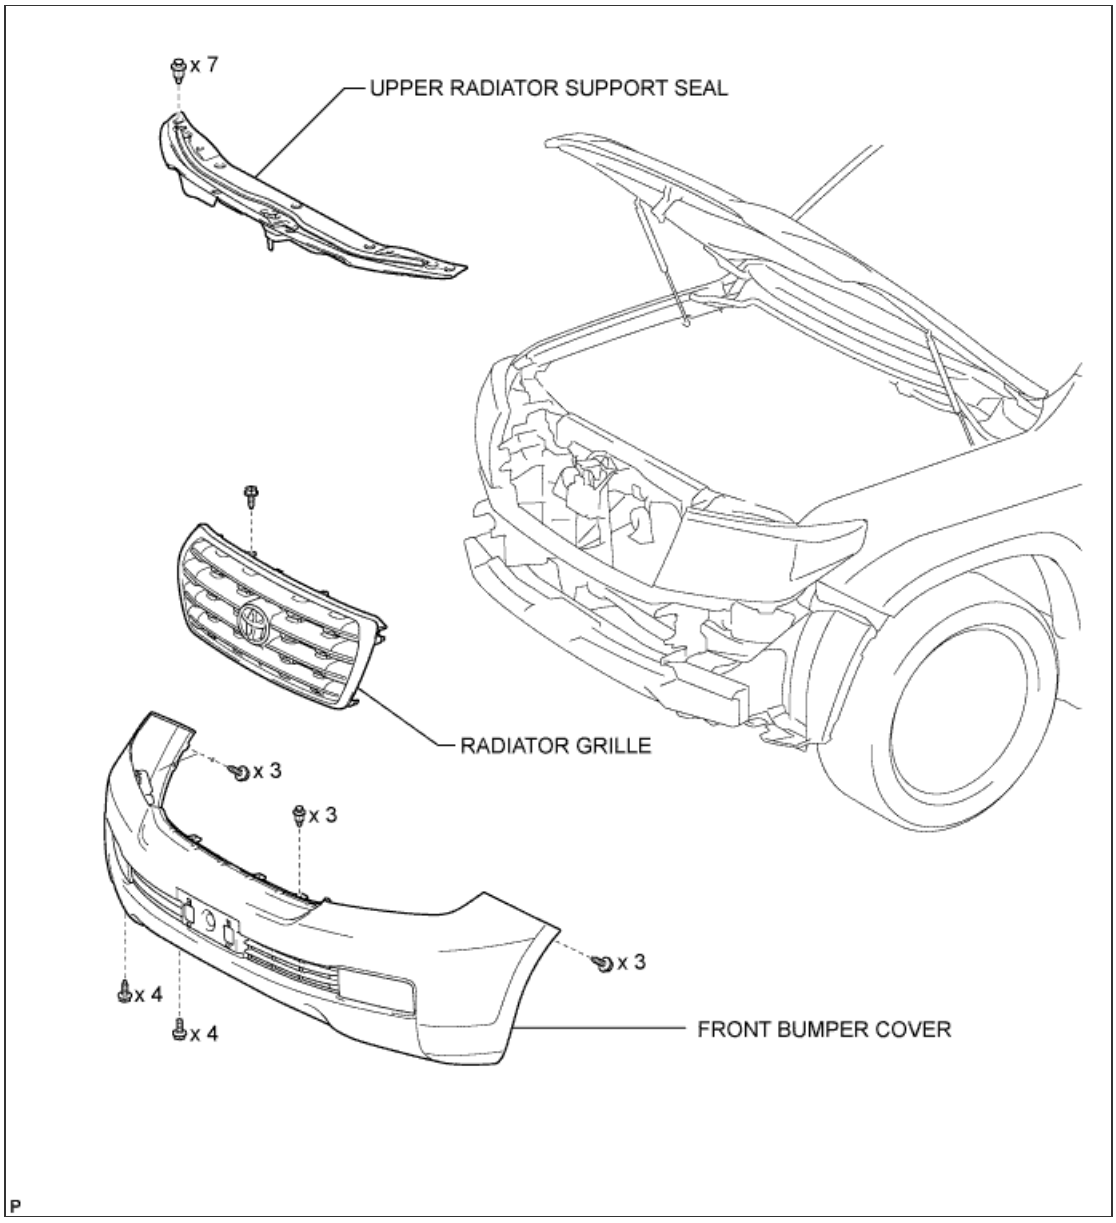
a. Install the under co er with the 10 bolts.

8. INSTALL FRONT FENDER SPLASH SHIELD ASSEMBLY RH

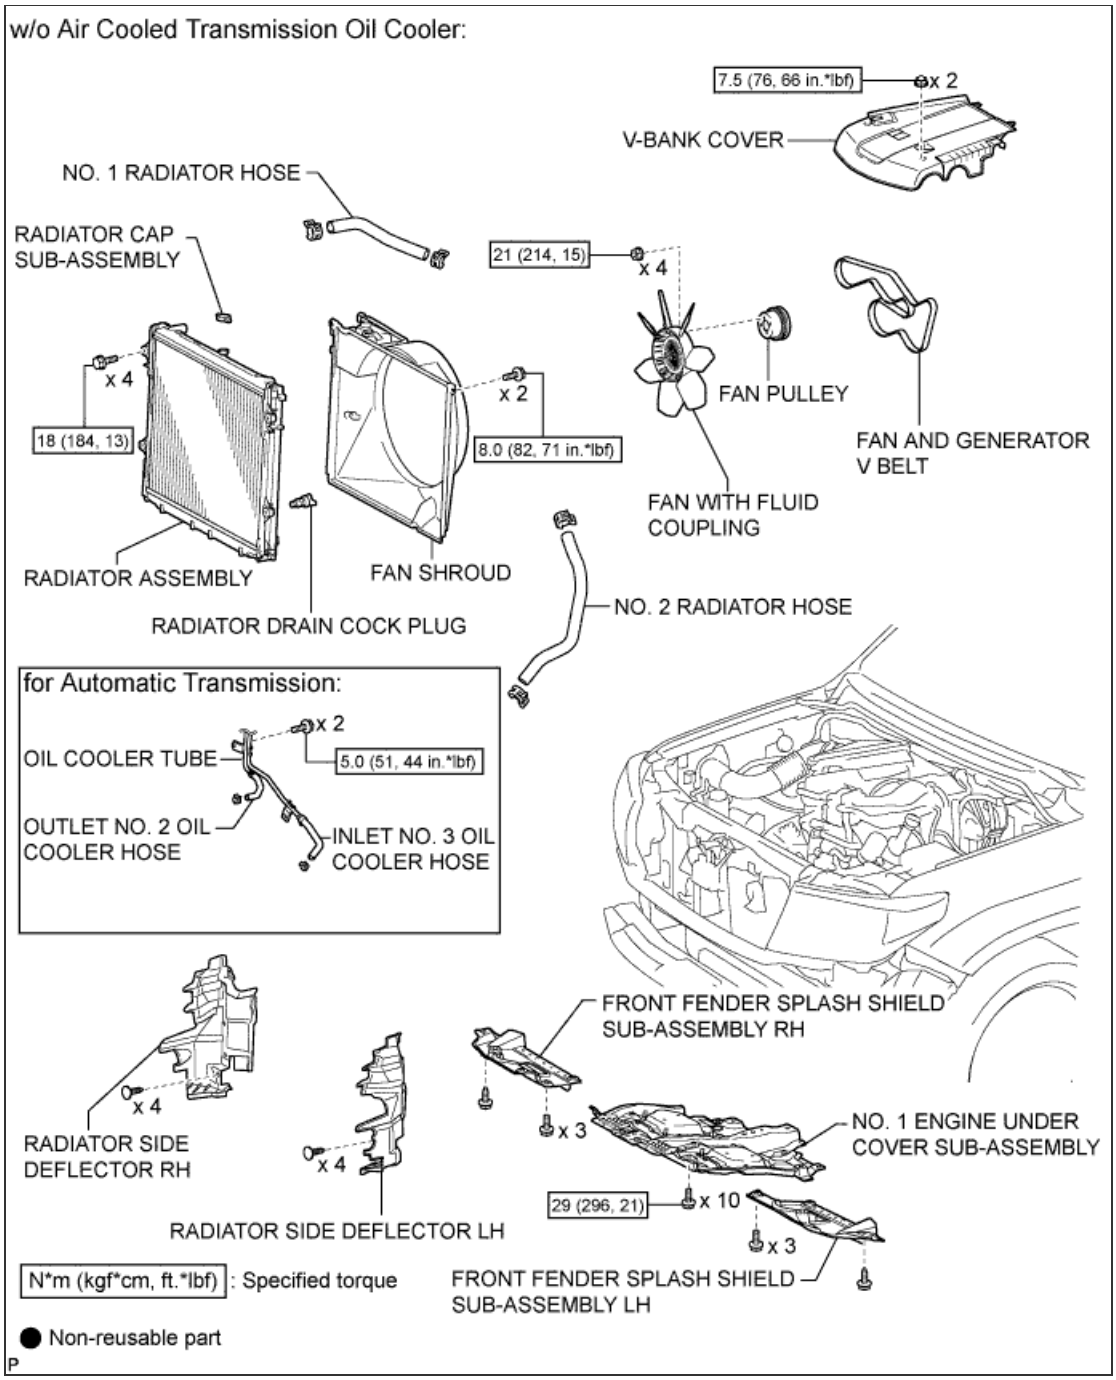


HINT:

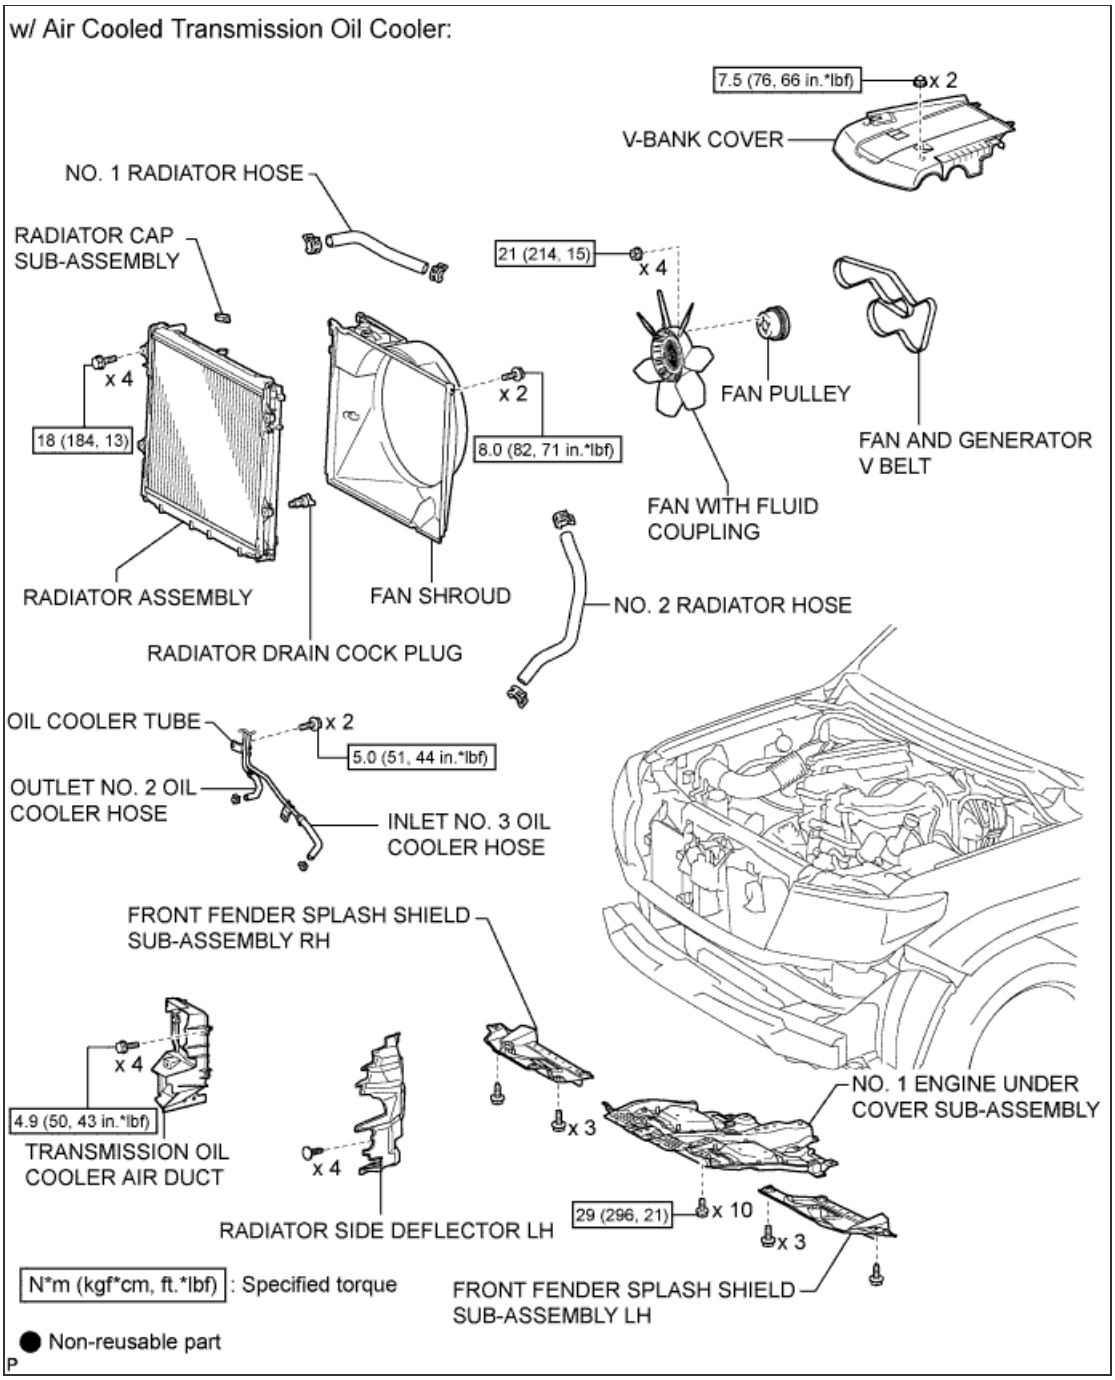
Use the same procedures described for the LH side.



9. INSTALL FRONT FENDER SPLASH SHIELD ASSEMBLY LH



a. Remove the 3 bolts and screw.



b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

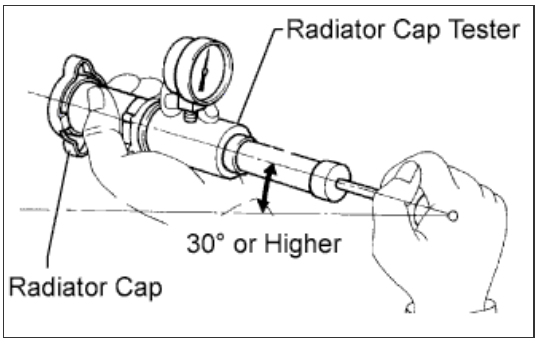
1. INSPECT RADIATOR CAP SUB-ASSEMBLY

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Measure the valve opening pressure.

i. If there are water stains or foreign matter on rubber packing 1, 2 or 3, clean it by using water and finger scouring.



ii. Check that rubber packing 1, 2 and 3 are not deformed, cracked or swollen.

iii. Check that rubber packing 3 and 4 are not stuck together.

iv. Apply engine coolant to rubber packing 2 and 3.

v. Prepare a radiator cap tester, and tilt it more than 30°.

vi. Pump the cap tester several times, and check the maximum pressure*.

Pumping speed:
1 pump per second

HINT:

*: Even if the cap cannot maintain the maximum pressure, it is not a defect.

Standard Judgment Criterion:

Item	Specified Condition
Standard value (for brand-new cap)	30 to 123 kPa (1.0 to 1.3 kgf/cm^2, 13.5 to 18 psi)
Minimum standard value (after using cap)	7 kPa (0.8 kgf/cm^2, 11.4 psi)

If the maximum pressure is less than the minimum standard value, replace the radiator cap sub-assembly.

2. INSPECT FINS FOR BLOCKAGE

a. Check that the fins of the radiator core are not blocked with leaves, dirt, or insects.
If the fins are blocked, wash them with water or a steam cleaner.

NOTICE:

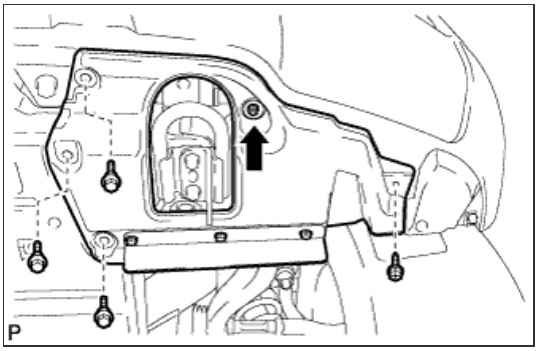
- **If the distance between the steam cleaner and core is too close, the fins may be damaged.**
- **Keep the following injection distance.**

Standard Injection Distance:

Injection Distance	Injection Pressure

300 mm (11.8 in.)	2 42 to 4 03 kPa (30.0 to 50.0 kgf/cm^2, 427 to 711 psi)
500 mm (1 .7 in.)	4 03 to 7845 kPa (50.0 to 80.0 kgf/cm^2, 711 to 1138 psi)

- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Never apply water directly onto the electric components.**



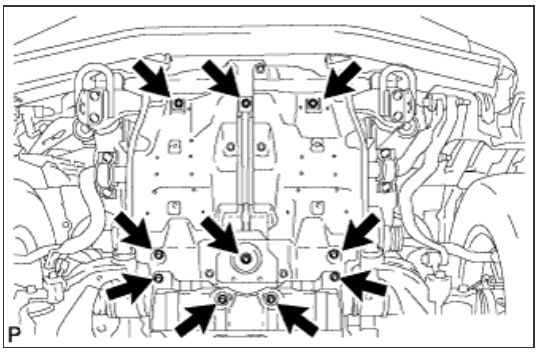
b. Dry the fins with compressed air.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

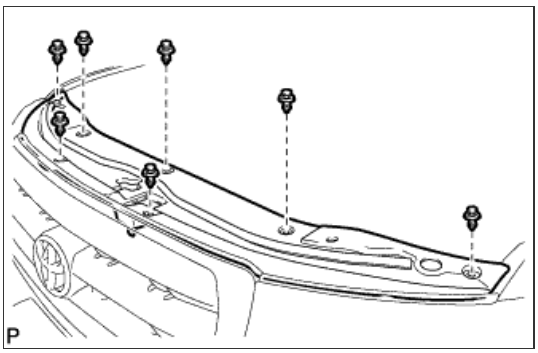
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. REMOVE UPPER RADIATOR SUPPORT SEAL

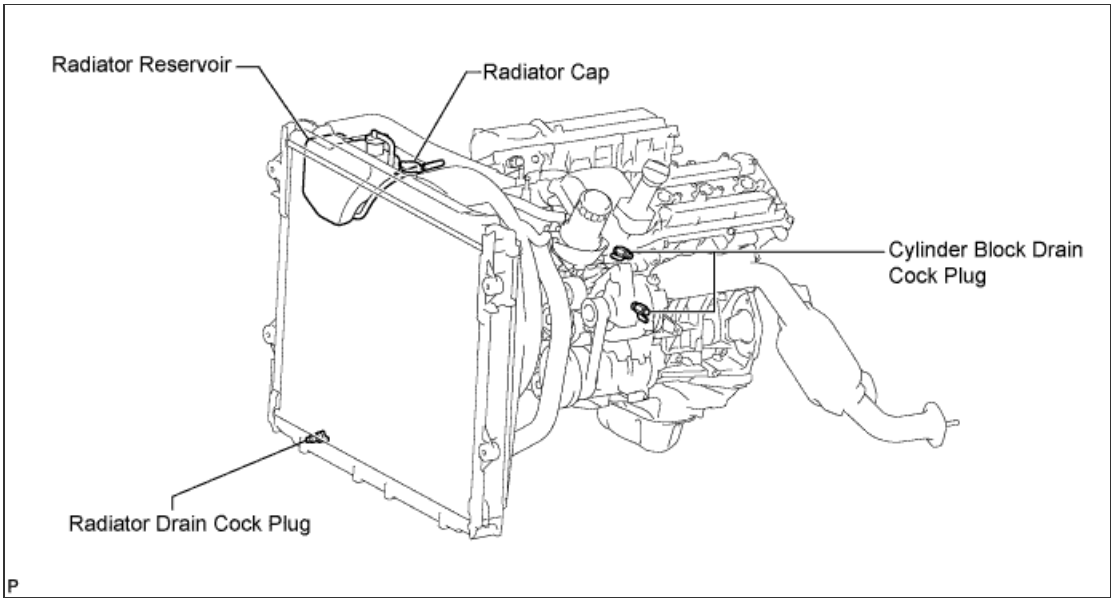
a. Remove the 7 clips and radiator support seal.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.

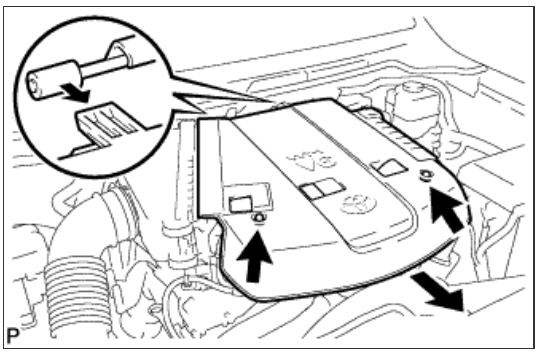


b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.

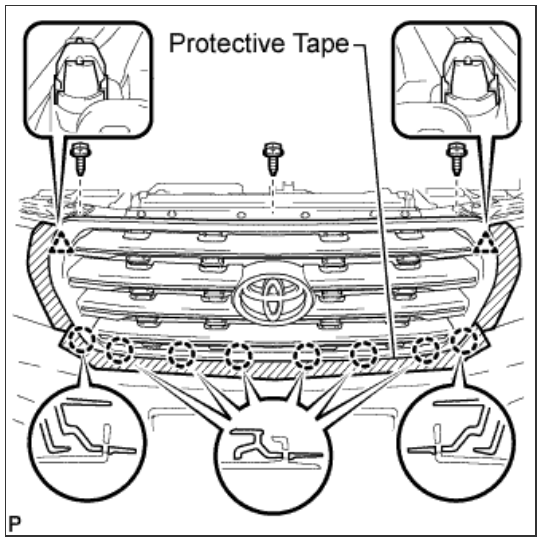


Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

d. Tighten the radiator drain cock plug by hand.

6. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.



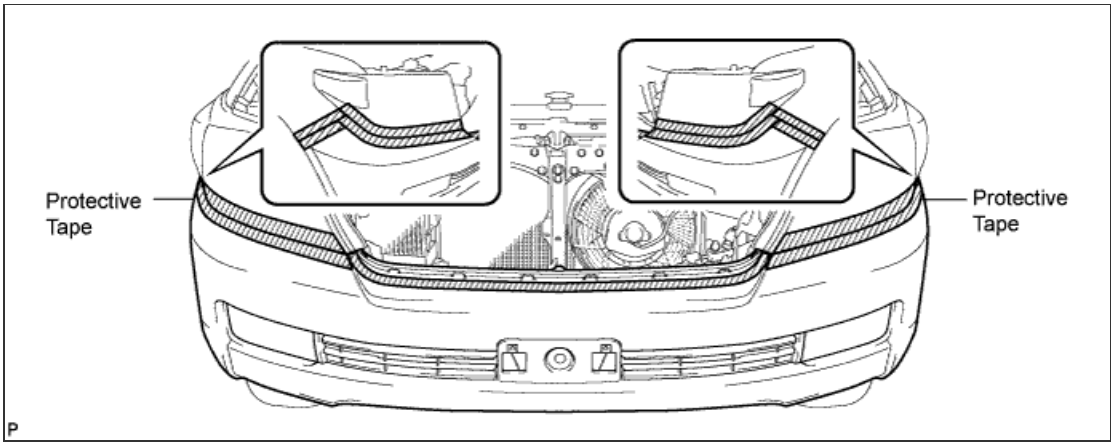
7. REMOVE FRONT BUMPER WINCH COVER SUB-ASSEMBLY Winch

REMOVE RADIATOR GRILLE

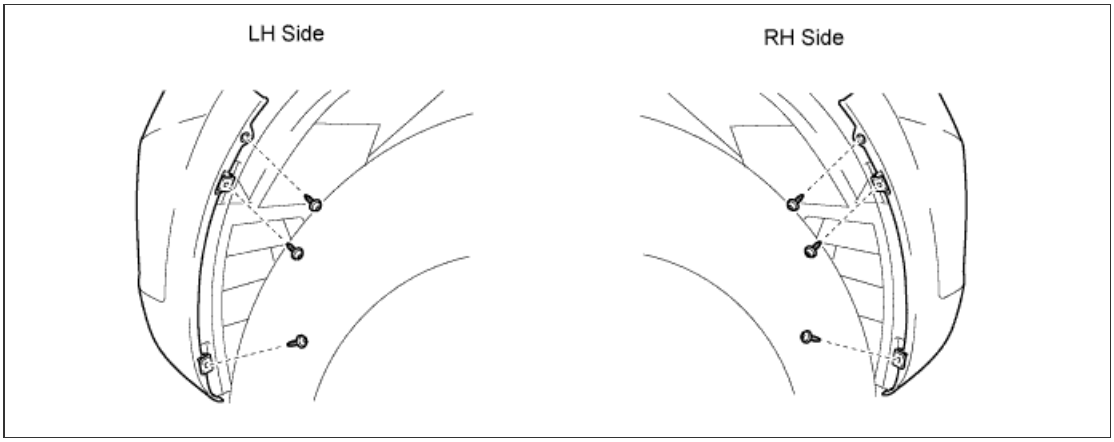
a. Put protective tape around the radiator grille.

b. Remove the 3 screws.

c. Detach the 2 clips and 8 claws, and remove the radiator grille.



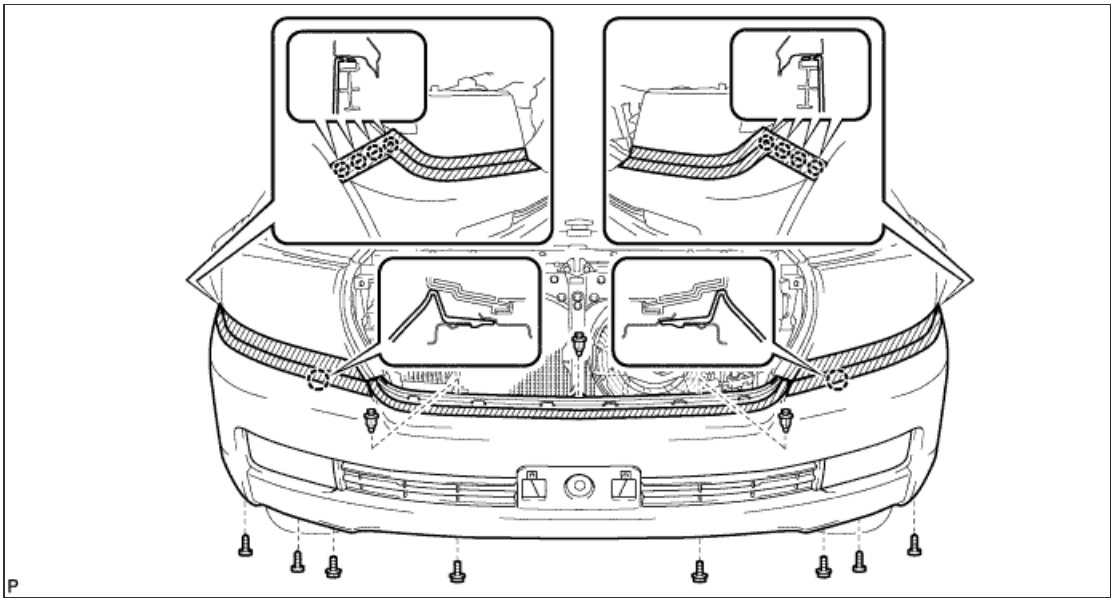
REMOVE FRONT BUMPER COVER



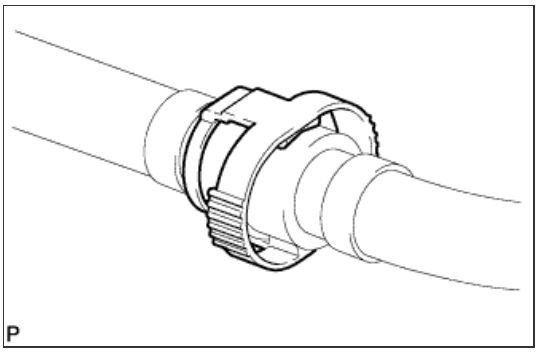
HINT:

For the front bumper cover with garnish, use the procedures described below.

a. Put protective tape around the bumper cover.



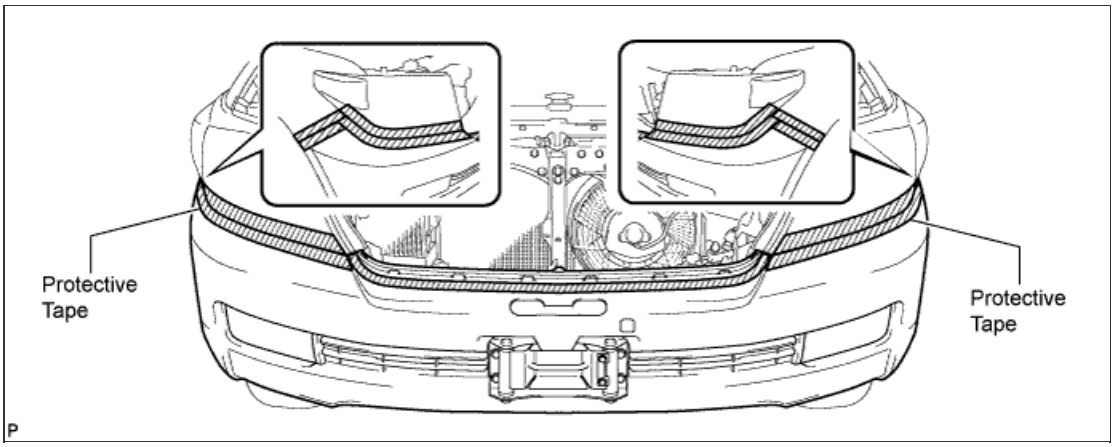
b. Using a T30 "TOR " socket, remove the 6 screws.



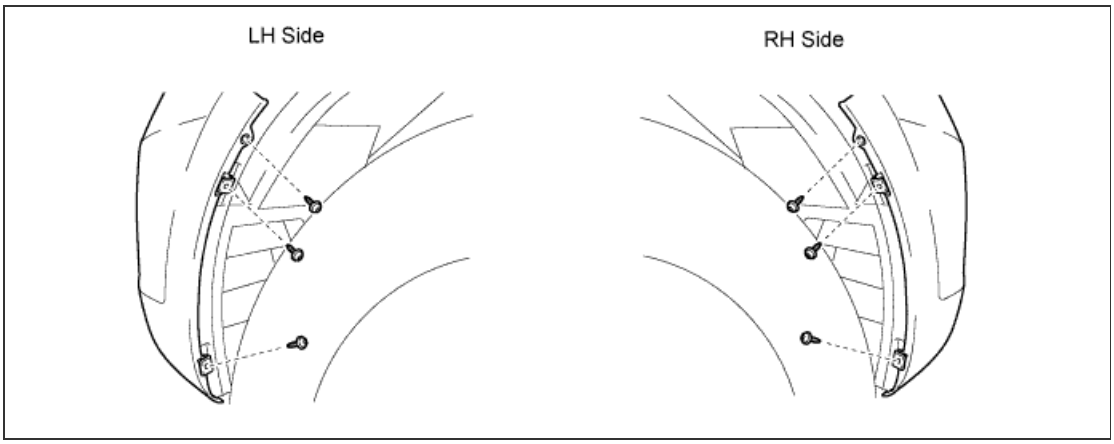
c. Remove the 3 clips, 4 screws and 4 bolts.

d. w/o TO OTA Parking Assist-sensor System, w/o Fog Light:
Detach the 10 claws and remove the bumper cover.

e. w/ TO OTA Parking Assist-sensor System or w/ Fog Light:
Detach the 10 claws, disconnect the No. 4 engine room wire connector and remove the bumper cover.



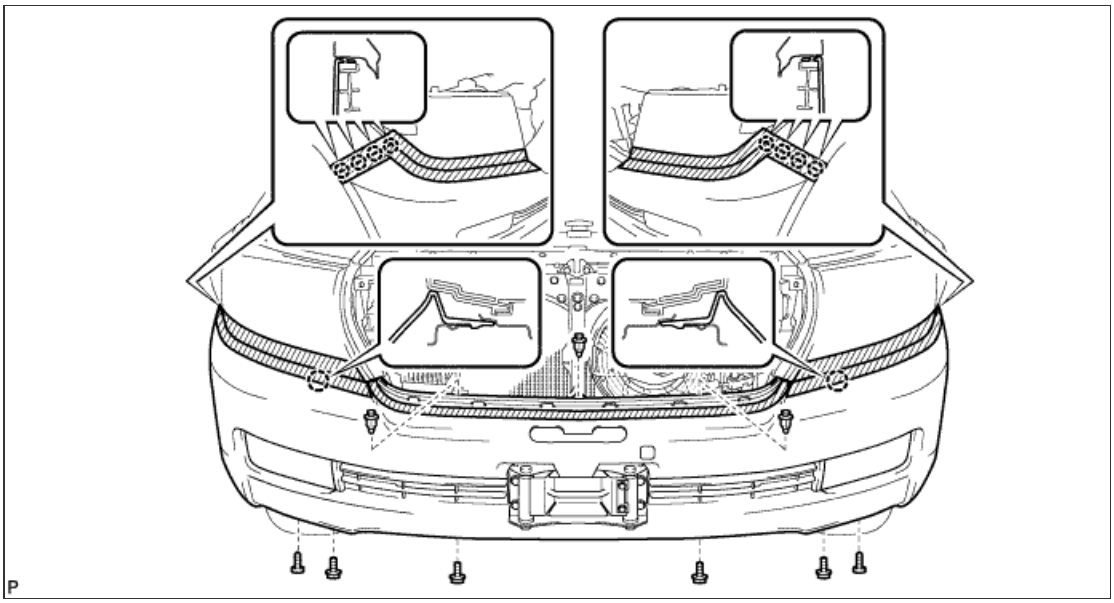
f. w/ Headlight Cleaner System:
Disconnect the headlight cleaner hose and remove the bumper cover.



10. REMOVE FRONT BUMPER COVER Winch

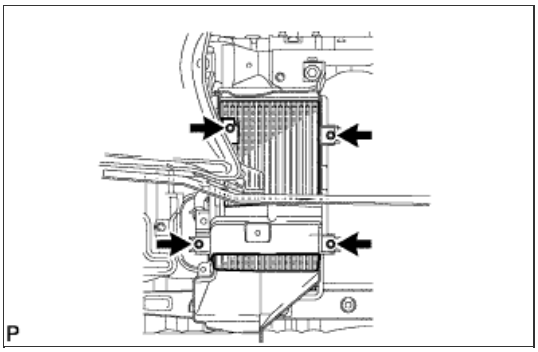
a. Put protective tape around the bumper cover.

b. Using a T30 "TOR " socket, remove the 6 screws.



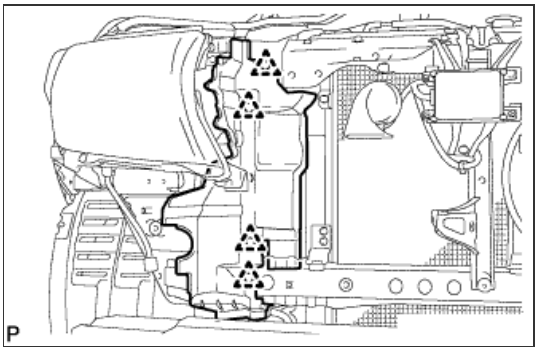
c. Remove the 3 clips, 4 screws and 4 bolts.

d. Detach the 10 claws.



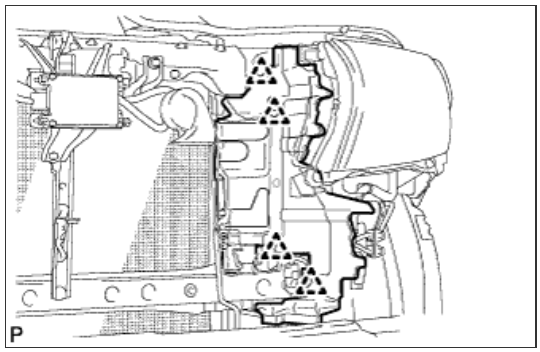
e. w/o TO OTA Parking Assist-sensor System, w/o Fog Light:
Disconnect the winch control wire connector and remove the bumper cover.

f. w/ TO OTA Parking Assist-sensor System or w/ Fog Light:
Disconnect the No. 4 engine room wire connector and winch control wire connector and remove the bumper cover.



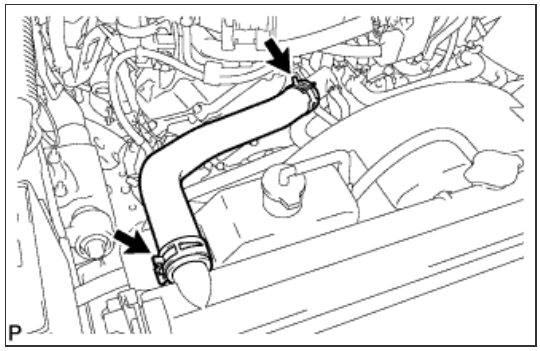
11. REMOVE TRANSMISSION OIL COOLER AIR DUCT Air Cooled Tran mi ion Oil Cooler

a. Remove the 4 bolts and oil cooler air duct.



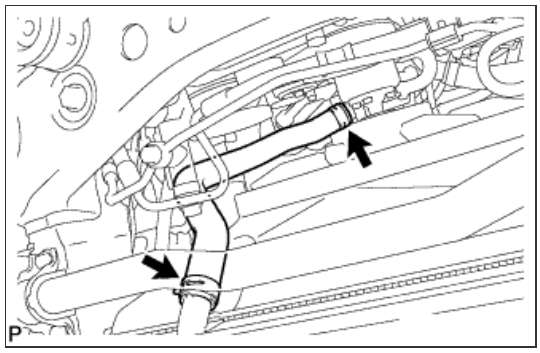
12. REMOVE RADIATOR SIDE DEFLECTOR RH o Air Cooled Tran mi ion Oil Cooler

a. Using a clip remover, remove the 4 clips and move the side deflector so that the radiator can be removed in the step below.



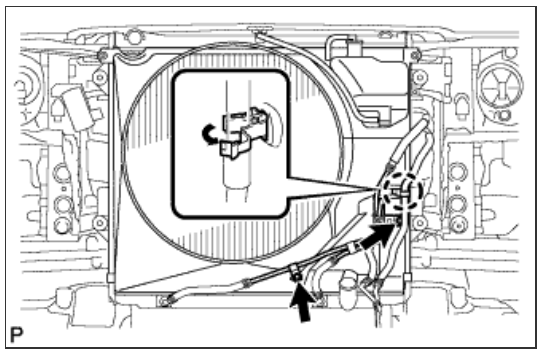
13. REMOVE RADIATOR SIDE DEFLECTOR LH

a. Using a clip remover, remove the 4 clips and move the side deflector so that the radiator can be removed in the step below.



14. REMOVE NO. 1 RADIATOR HOSE

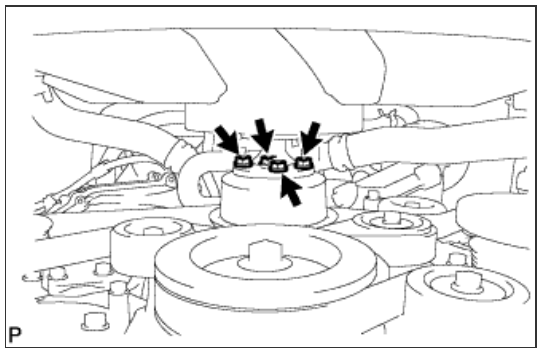
a. Remove the radiator hose.



15. REMOVE NO. 2 RADIATOR HOSE

a. Remove the radiator hose.

16. DISCONNECT OIL COOLER TUBE Air Cooled Tran mi iOil Cooler



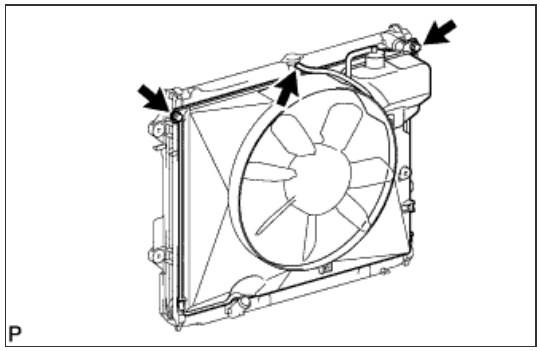
a. Detach the claw to open the fle ible hose clamp, and then remove the 2 bolts to disconnect the oil cooler tube from the fan shroud.

17. REMOVE FAN SHROUD

a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the fan and generator V-belt (Click here).

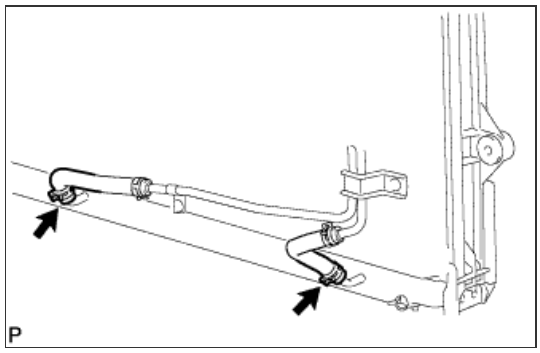
c. Disconnect the reservoir hose from the upper side of the radiator tank.



d. Remove the 2 bolts holding the fan shroud.

e. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the coupling fan.

NOTICE:

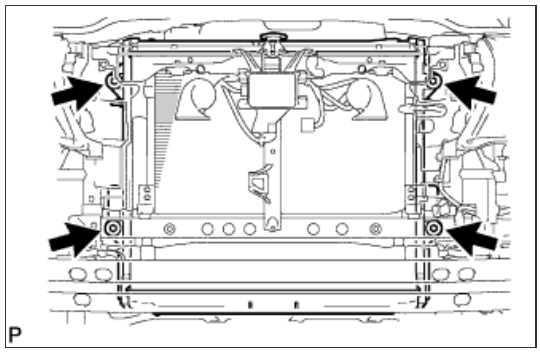


Be careful not to damage the radiator core.

f. Remove the fan pulley from the water pump.

18. DISCONNECT INLET NO. 3 OIL COOLER HOSE for Automatic Tran mi ion

a. Disconnect the oil cooler hose.



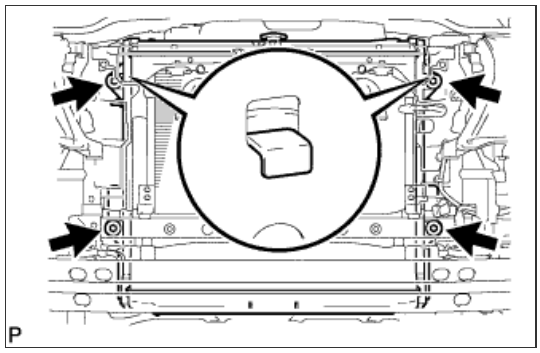
1 DISCONNECT OUTLET NO. 2 OIL COOLER HOSE for Automatic Tran mi ion

a. Disconnect the oil cooler hose.

20. REMOVE RADIATOR ASSEMBLY

a. Remove the 4 bolts and radiator.

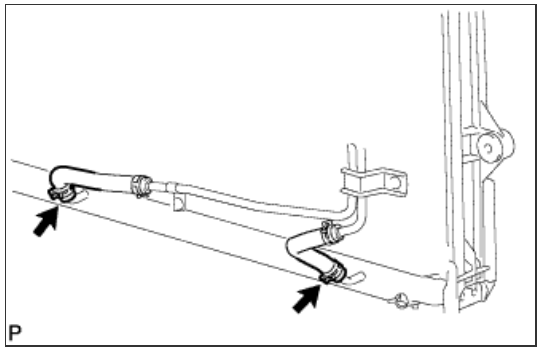
P



for Preparation Click here

1. INSTALL RADIATOR ASSEMBLY

a. Set the radiator bracket hooks into the radiator support holes.



b. Install the radiator with the 4 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

2. CONNECT OUTLET NO. 2 OIL COOLER HOSE (for Automatic Transmission)

a. Connect the cooler hose.

3. CONNECT INLET NO. 3 OIL COOLER HOSE (for Automatic Transmission)

a. Connect the cooler hose.

4. INSTALL AN SHROUD

a. Install the fan pulley to the water pump.

b. Place the shroud together with the coupling fan between the radiator and engine.

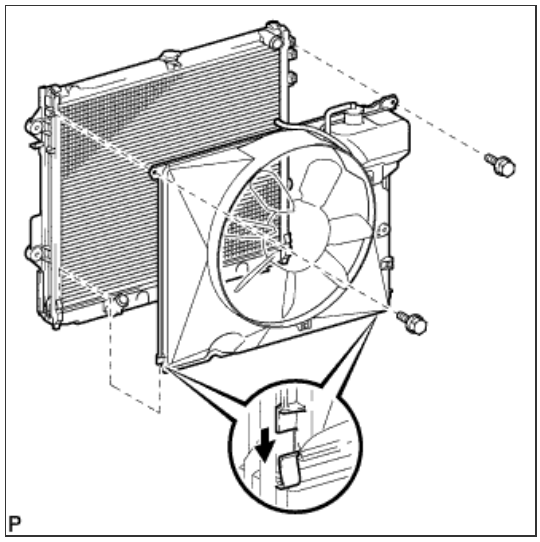
NOTICE:

Be careful not to damage the radiator core.

c. Temporarily install the fluid coupling fan to the water pump with the 4 nuts. Tighten the nuts as much as possible by hand.

d. Attach the claws of the shroud to the radiator as shown in the illustration.

e. Install the shroud with the 2 bolts.

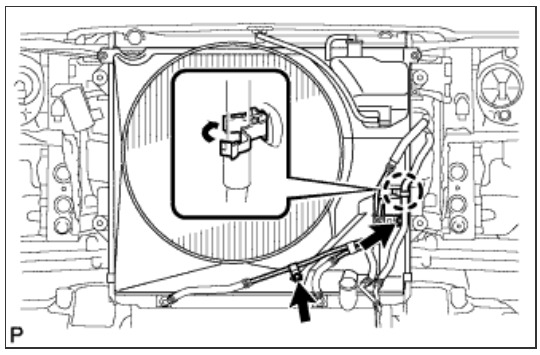


Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

f. Connect the reservoir hose to upper side of the radiator tank upper.

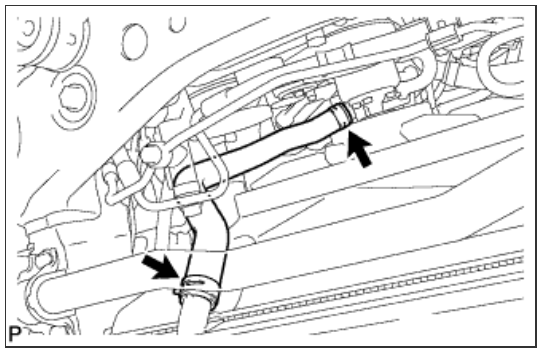
g. Install the fan and generator V-belt (Click here).

h. Tighten the 4 nuts of the fluid coupling fan.



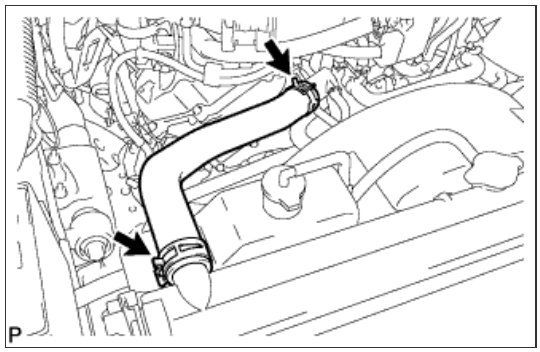
Torque:
21 N*m{ 214 kgf*cm , 1 ft.*lbf }

. CONNECT OIL COOLER TUBE (Air Cooled Transmission Oil Cooler)



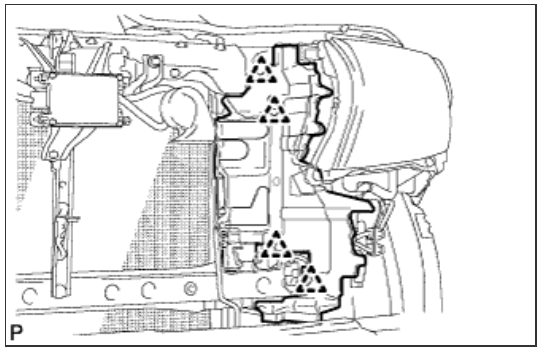
a. Connect the oil cooler tube with the 2 bolts, and attach the claw to close the flexible hose clamp.

Torque:
.0 N*m{ 1kgf*cm , 44 in.*lbf }



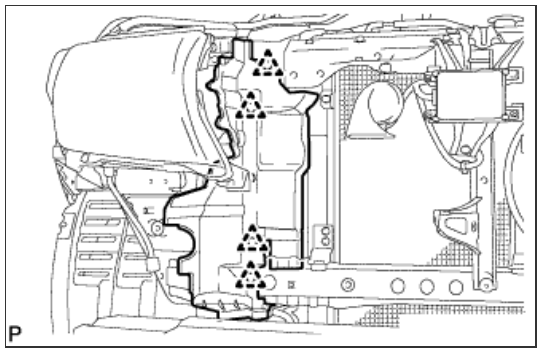
. INSTALL NO. 2 RADIATOR HOSE

a. Install the radiator hose.



7. INSTALL NO. 1 RADIATOR HOSE

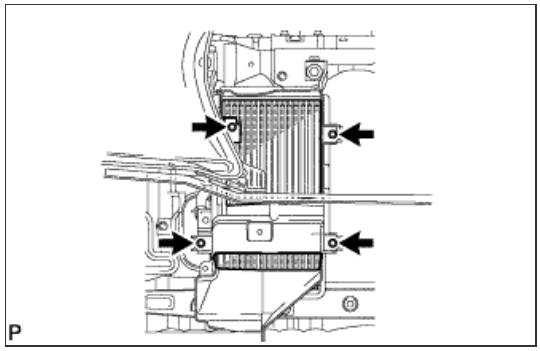
a. Install the radiator hose.



8. INSTALL RADIATOR SIDE DE LECTOR LH

a. Install the deflector with the 4 clips.

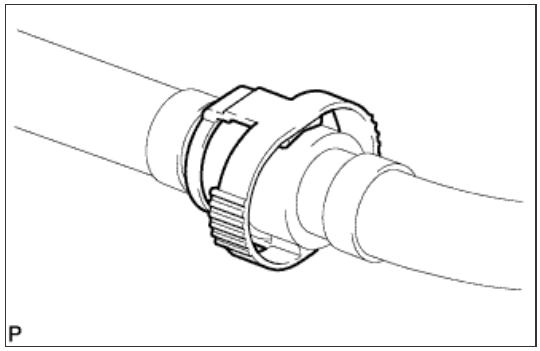
9. INSTALL RADIATOR SIDE DE LECTOR RH (o Air Cooled Transmission Oil Cooler)



a. Install the deflector with the 4 clips.

10. INSTALL TRANSMISSION OIL COOLER AIR DUCT (Air Cooled Transmission Oil Cooler)

a. Install the oil cooler air duct with the 4 bolts.

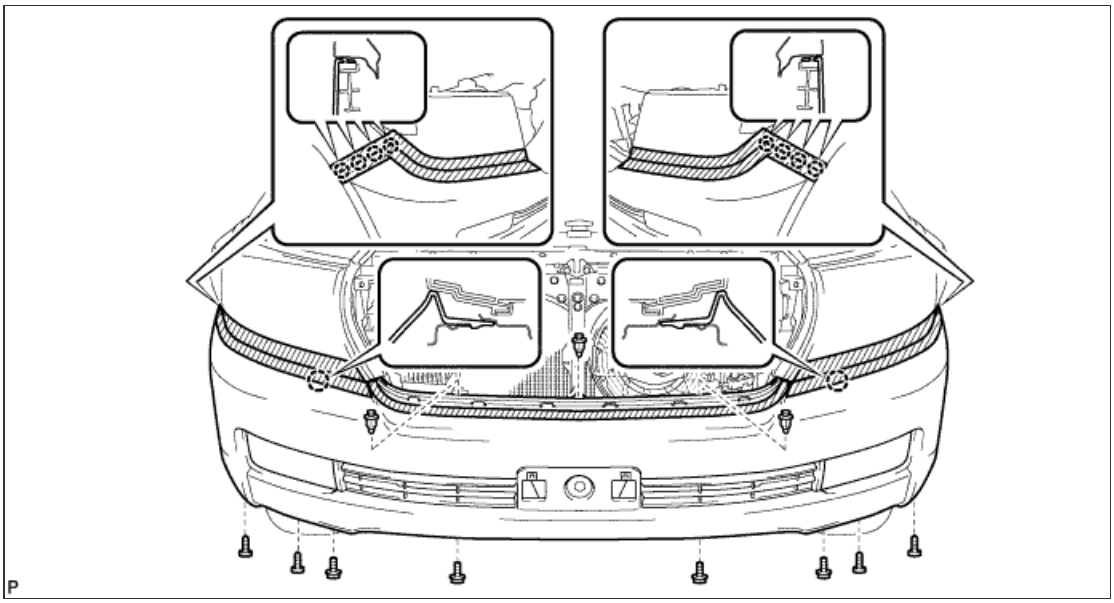


Torque:
4.9 N*m{ kgf*cm , 43 in.*lbf }

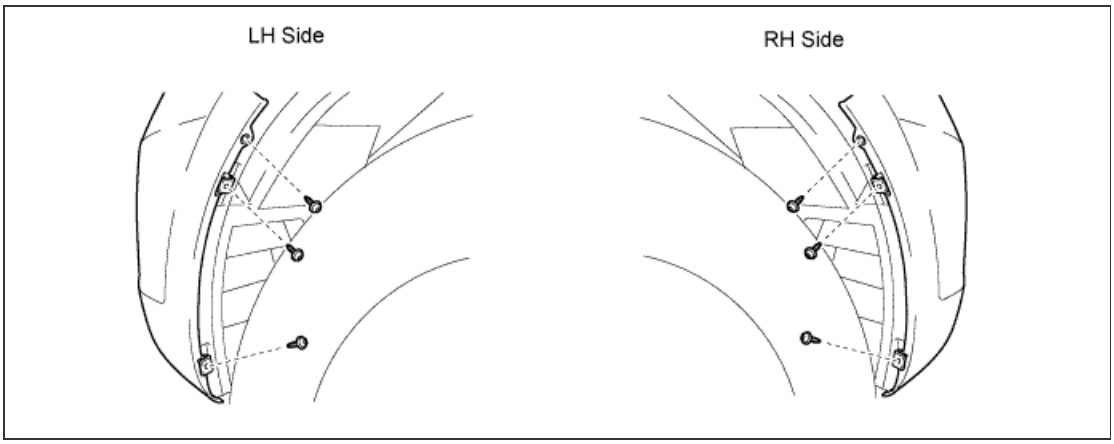
11. INSTALL RONT BUMPER CO ER

HINT:

For the front bumper cover with garnish, use the procedures described below.



a. w/ Headlight Cleaner System:
Connect the headlight cleaner hose.

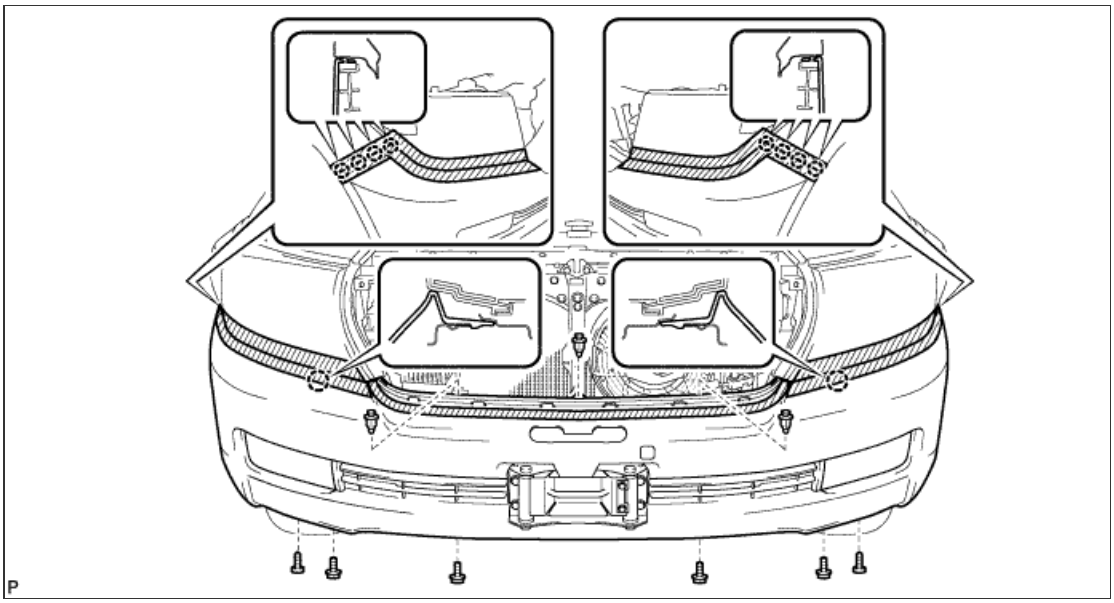


b. w/o TOYOTA Parking Assist-sensor System, w/o Fog Light:
Attach the 10 claws to install the bumper cover.

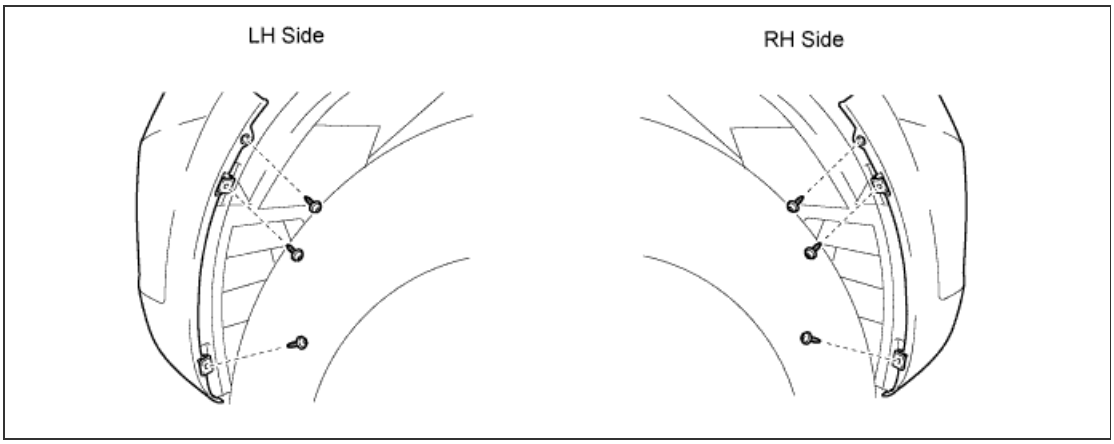
c. w/ TOYOTA Parking Assist-sensor System or w/ Fog Light:
Connect the No. 4 engine room wire connector and attach the 10 claws to install the bumper cover.

d. Install the 3 clips, 4 screws and 4 bolts.

e. Using a T30 "TORX" socket, install the 6 screws.



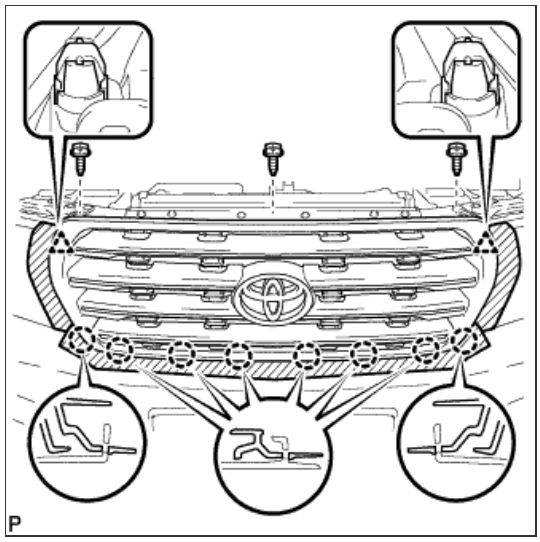
12. INSTALL RONT BUMPER CO ER (Winch)



a. w/o TOYOTA Parking Assist-sensor System, w/o Fog Light:
Connect the winch control wire connector and attach the 10 claws to install the bumper cover.

b. w/ TOYOTA Parking Assist-sensor System or w/ Fog Light:
Connect the No. 4 engine room wire connector and winch control wire connector, and attach the 10 claws to install the bumper cover.

c. Install the 3 clips, 4 screws and 4 bolts.



d. Using a T30 "TORX" socket, install the 6 screws.

13. INSTALL RADIATOR GRILLE

a. Attach the 2 clips and 8 claws to install the radiator grille.

b. Install the 3 screws.

14. INSTALL RONT BUMPER WINCH CO ER SUB-ASSEMBLY (Winch)

1 . ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacit :

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

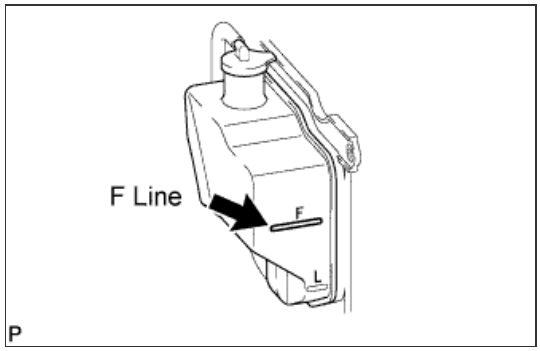
NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.



c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

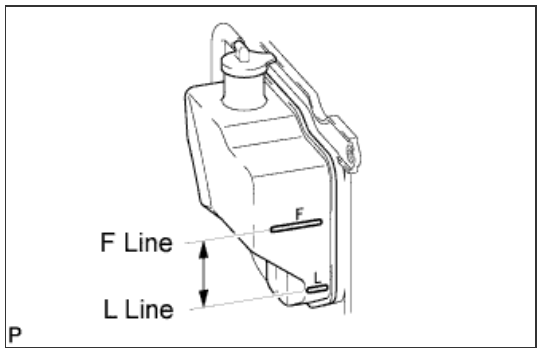
h. aintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pa attention to the needle of the ater temperature meter. Make sure that the needle does not sho an abnormall high temperature.**
- **If there is not enough coolant, the engine ma burn out or overheat.**
- **Immediatel after starting the engine, if the radiator reservoir does not have an coolant, perform the follo ing: 1) stop the engine, 2) ait until the coolant has cooled do n, and 3) add coolant until the coolant is filled to the line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts ma injure our hands.**
- **Be careful as the radiator hoses are hot.**
- **eep our hands a a from the fan.**

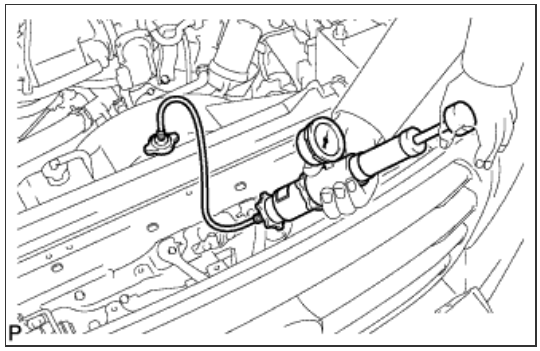
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

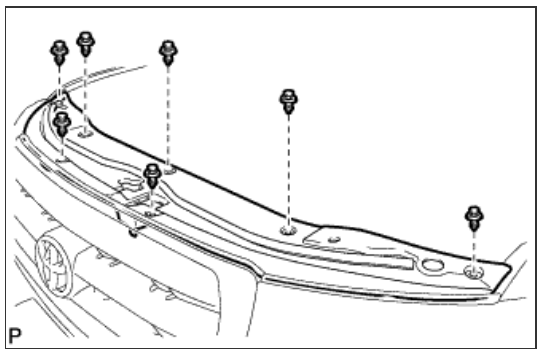
1 . INSPECT R COOLANT LEA



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

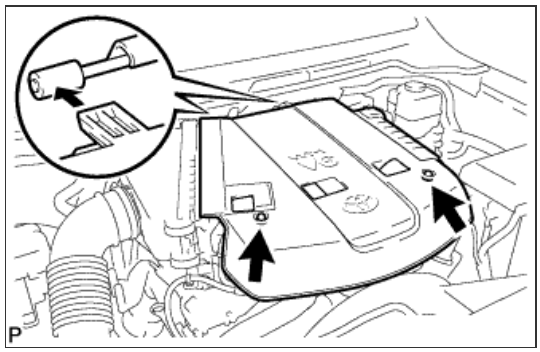
a. Fill the radiator with coolant and attach a radiator cap tester.



b. Warm up the engine.

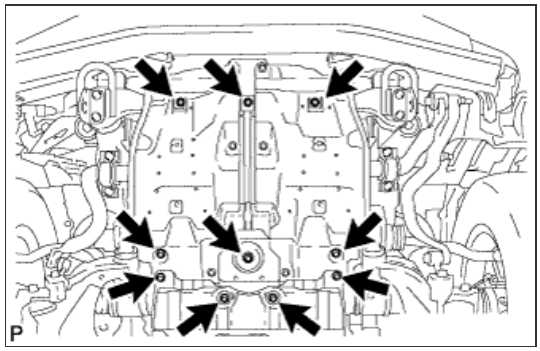
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

17. INSTALL UPPER RADIATOR SUPPORT SEAL



a. Install the radiator support seal with the 7 clips.

18. INSTALL V-BAN CO ER



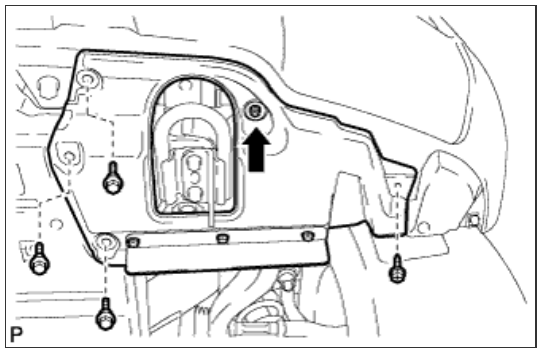
a. Install the V-bank cover with the 2 cap nuts.

Torque:
7. N*m{ 7 kgf*cm , in.*lbf }

19. INSTALL NO. 1 ENGINE UNDER CO ER SUB-ASSEMBLY

a. Install the under cover with the 10 bolts.

20. INSTALL RONT ENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

21. INSTALL RONT ENDER SPLASH SHIELD SUB-ASSEMBLY LH

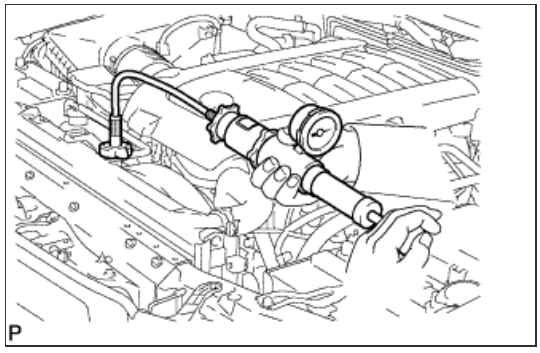
a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

P

for Preparation Click here

1. INSPECT FOR COOLANT LEAK



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

2. INSPECT ENGINE COOLANT LEVEL IN RESERVOIR

a. Check that the engine coolant level is between the L and F lines when the engine is cold.
If the engine coolant is below the L line, check for leaks and add "TO OTA Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the F line.

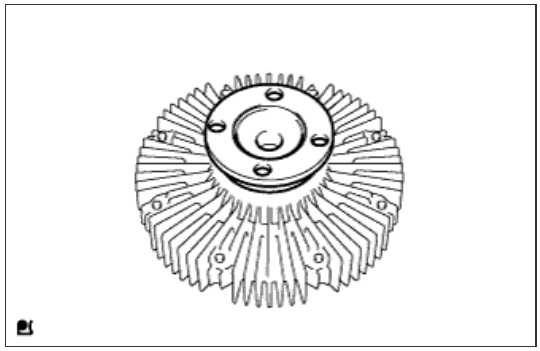
NOTICE:

Do not substitute plain water for engine coolant.

3. INSPECT ENGINE COOLANT ALITY

a. Remove the radiator cap.

CAUTION:



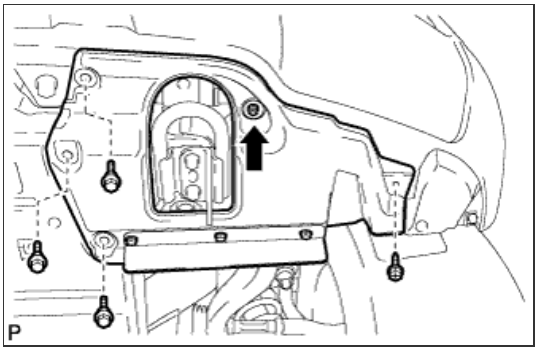
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

b. Check if there are any excessive deposits of rust or scales around the radiator cap and radiator filler hole. Also, the coolant should be free of oil.
If excessively dirty, clean the coolant passage and replace the coolant.

c. Install the radiator cap.

4. INSPECT FLUID COUPLING ASSEMBLY

a. Check the fluid coupling for damage or silicon oil leaks.
If necessary, replace the fluid coupling.

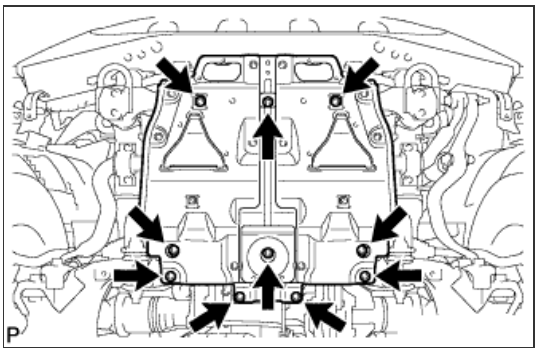


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE COOLANT

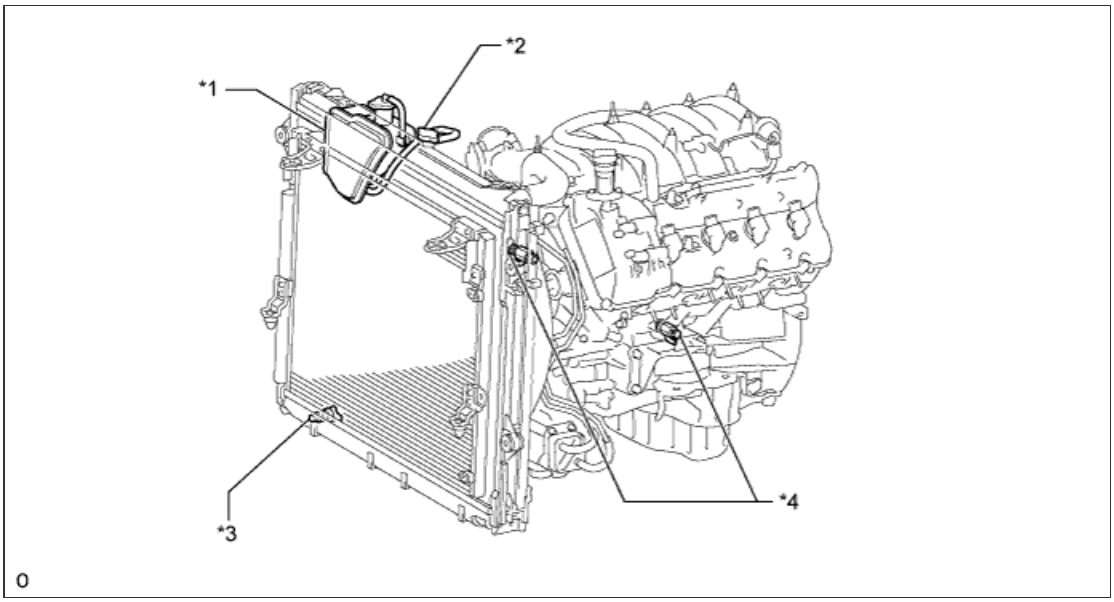
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.



b. Remove the radiator cap. Then drain the coolant from the radiator.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

Torque:

13 N*m{ 133 kgf*cm , 1 ft.*lbf }

Text in Illustration

*1	Radiator Reservoir	*2	Radiator Cap
*3	Radiator Drain Cock Plug	*4	Cylinder Block Drain Cock Plug

e. Tighten the radiator drain cock plug by hand.

. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacit :

Item	Specified Condition
with rear heater	16.2 liters (17.1 US qts, 14.3 Imp. qts)
without rear heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TO TA vehicles are filled with TO TA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TO TA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the radiator inlet hose by hand, and checking when the engine coolant starts to flow inside the hose.

g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**

- Pa attention to the needle of the ater temperature meter. Make sure that the needle does not sho an abnormall high temperature.
- If there is not enough coolant, the engine ma burn out or overheat.
- Immediatel after starting the engine, if the radiator reservoir does not have an coolant, perform the follo ing: 1 stop the engine, 2) ait until the coolant has cooled do n, and 3) add coolant until the coolant is filled to the F line.
- Run the engine at 2000 rpm until the coolant level has stabili ed.

h. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep our hands a a from the fan.**

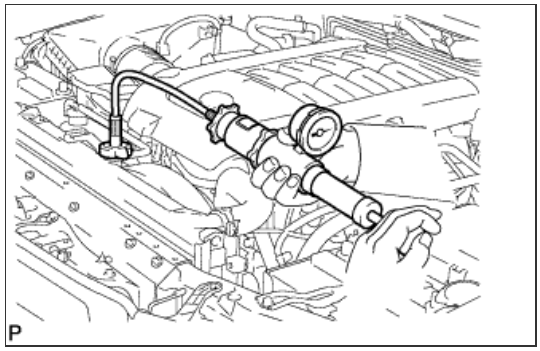
i. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

. INSPECT FOR COOLANT LEAK



CAUTION:

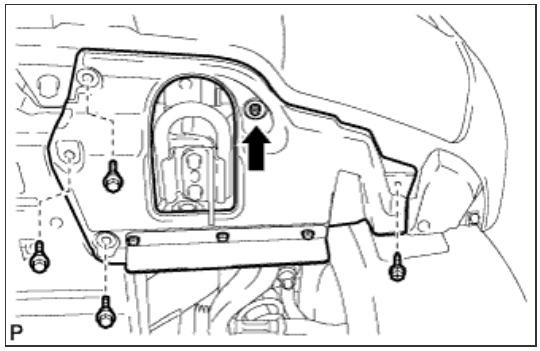
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



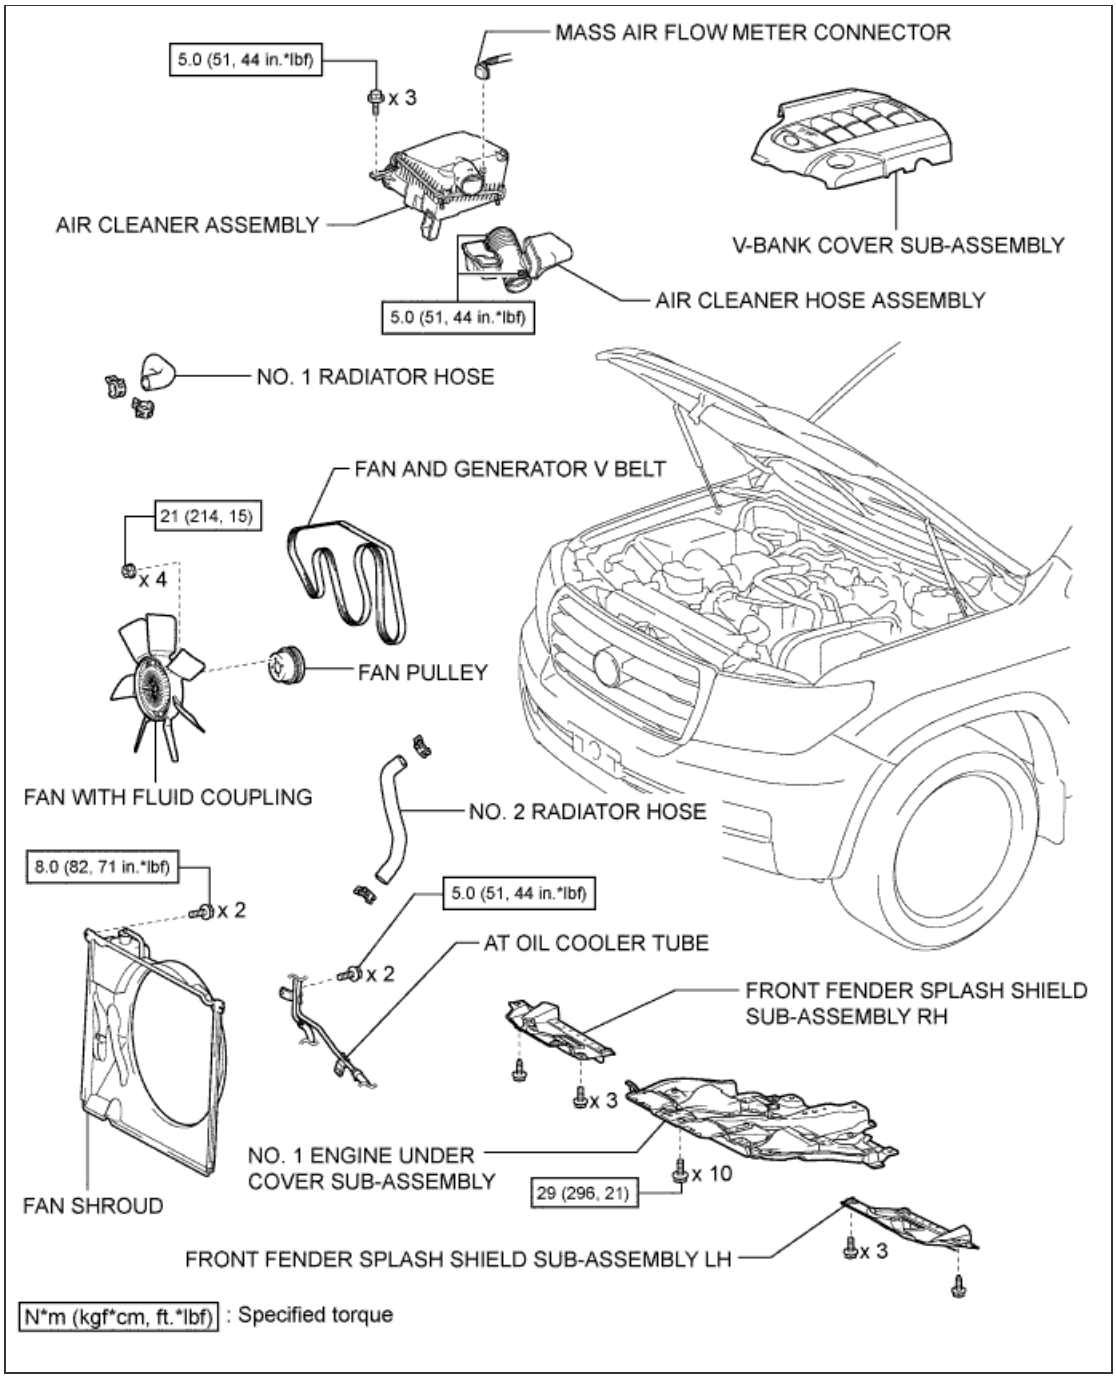
a. Install the No. 1 engine under cover with the 10 bolts.

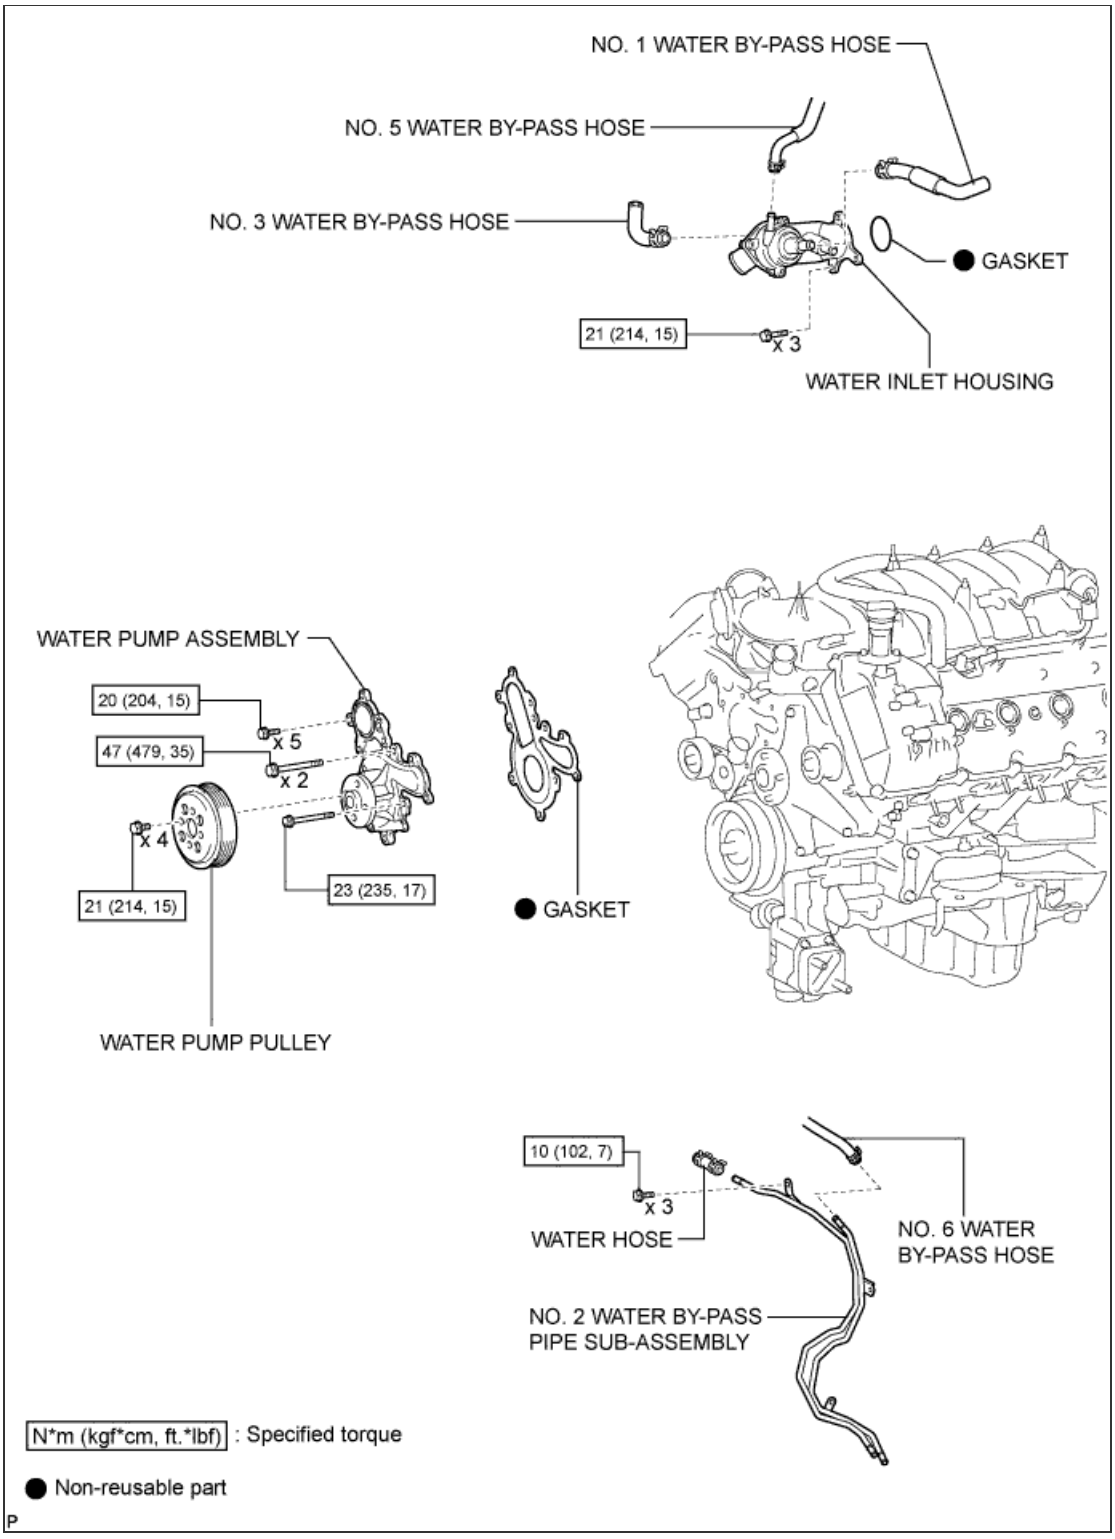
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.





. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

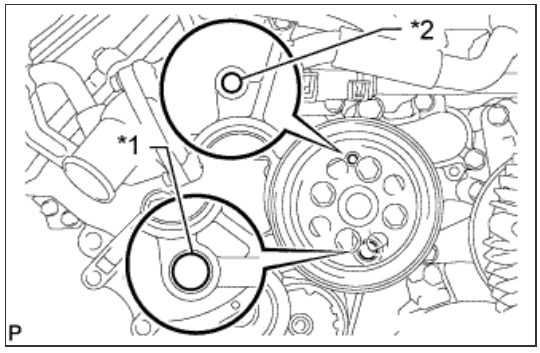
1. INSPECT WATER PUMP ASSEMBLY

a. Turn the pulley and check that the water pump bearing moves smoothly and quietly.
If necessary, replace the water pump.

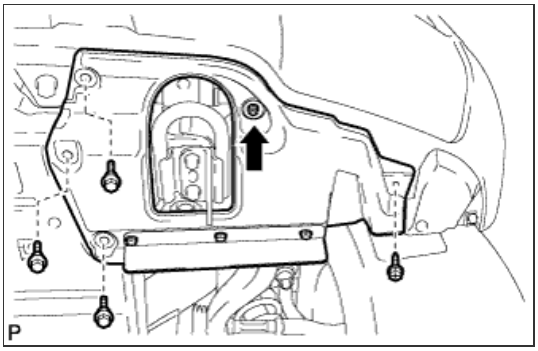


b. Visually check the air hole and drain hole for coolant leakage.

Text in Illustration

*1	Drain Hole
*2	Air Hole

If leakage is found, replace the water pump.

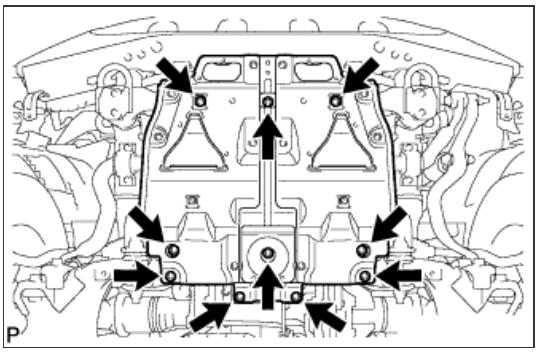


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE COOLANT

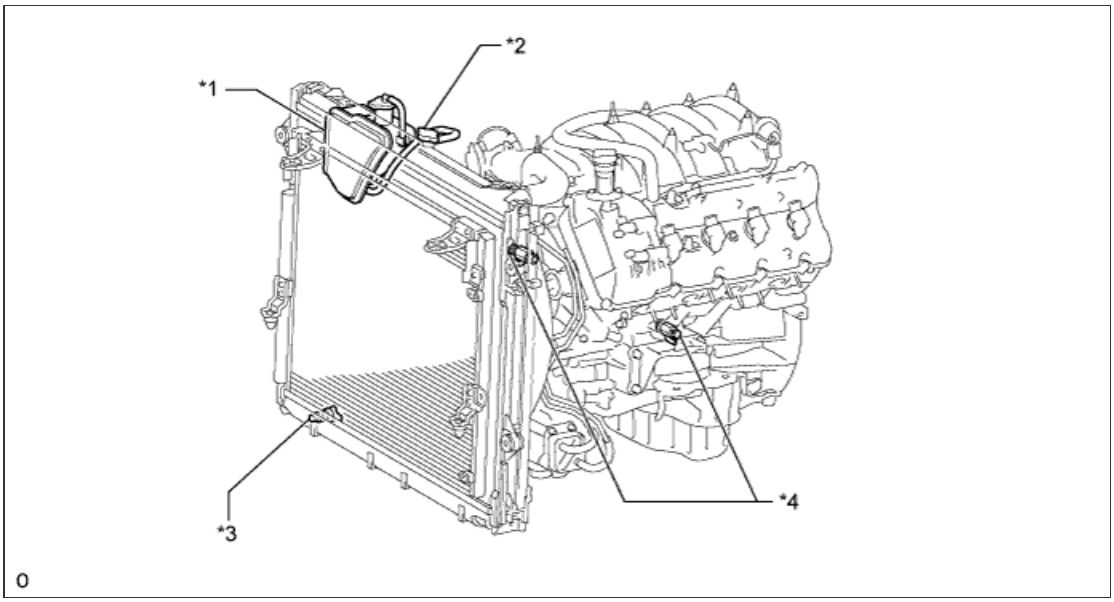
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.



b. Remove the radiator cap. Then drain the coolant from the radiator.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

Torque:

13 N*m{ 133 kgf*cm , 10 ft.*lbf }

Text in Illu tration

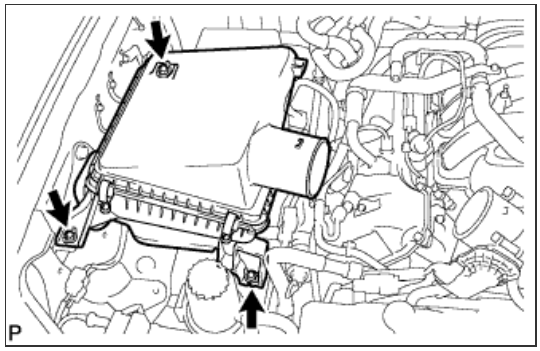
REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum hose and No. 2 ventilation hose.

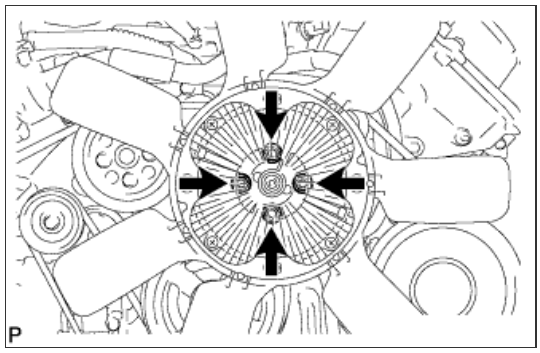


b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

7. REMOVE AIR CLEANER ASSEMBLY

a. Remove the 3 bolts and air cleaner.



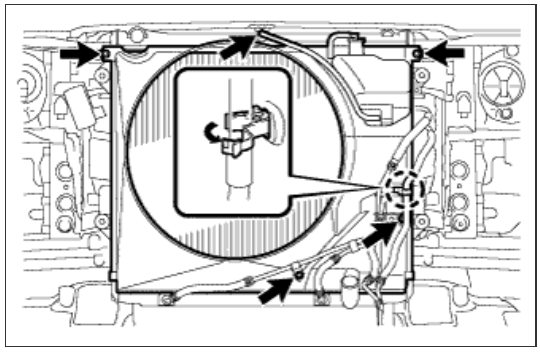
8. REMOVE NO. 1 RADIATOR HOSE

9. REMOVE NO. 2 RADIATOR HOSE

10. REMOVE FAN SHROUD

a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the fan and generator V-belt (Click here).



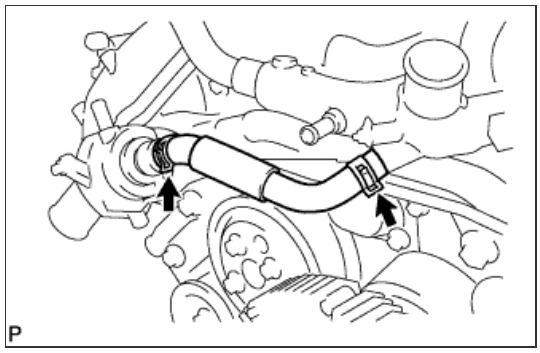
c. Disconnect the reservoir hose from the upper radiator tank.

d. Detach the claw to open the flexible hose clamp.

e. Remove the 2 bolts and disconnect the oil cooler tube from the fan shroud.

f. Remove the 2 bolts holding the fan shroud.

g. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the coupling fan.



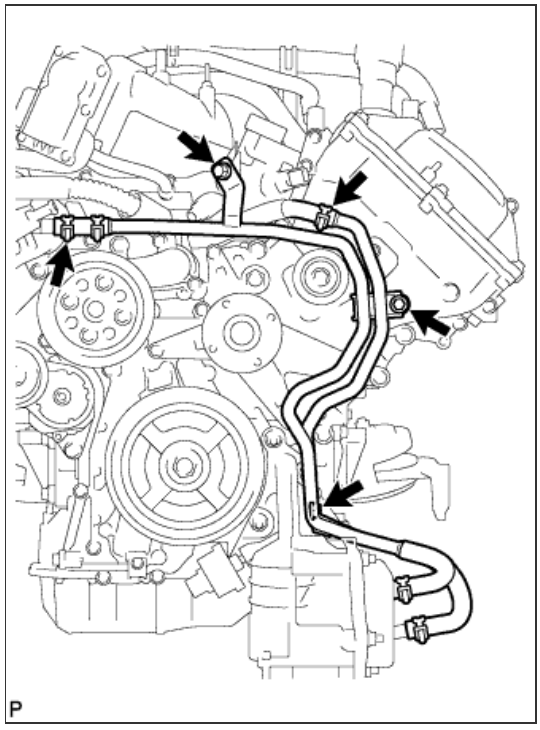
NOTICE:

Be careful not to damage the radiator core.

h. Remove the fan pulley.

11. REMOVE NO. 1 WATER BY-PASS HOSE

a. Remove the No. 1 water by-pass hose by disconnecting the hose from the water inlet housing and front water by-pass oint.

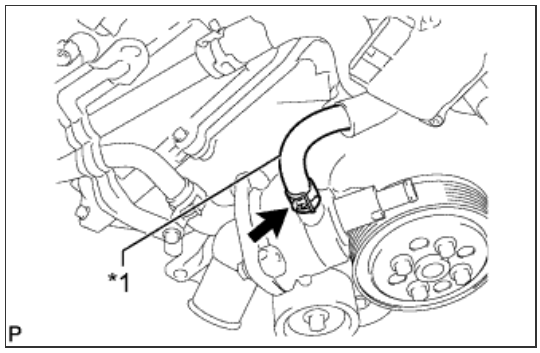


12. DISCONNECT NO. 2 WATER BY-PASS PIPE SUB-ASSEMBLY

a. Disconnect the No. 6 water by-pass hose.

b. Remove the 3 bolts.

c. Disconnect the water by-pass pipe with water hose.

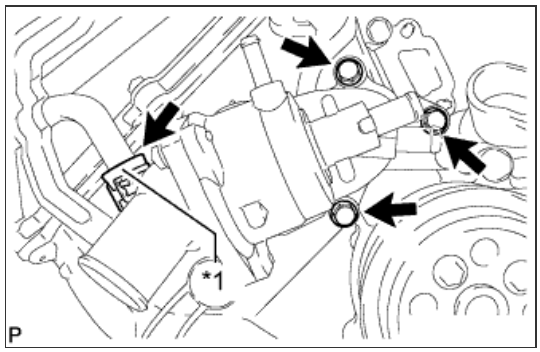


13. REMOVE WATER INLET HOUSING

a. Disconnect the No. 5 water by-pass hose.

Text in Illu tration

*1	No. 5 Water By-pass Hose

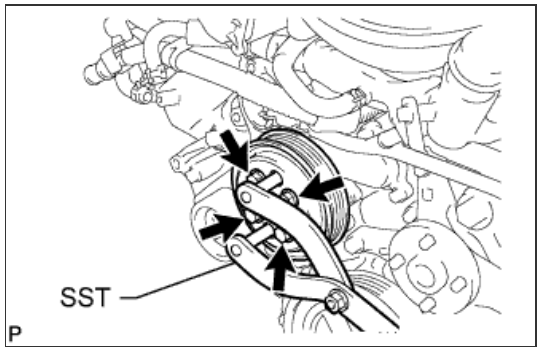


b. Disconnect the No. 3 water by-pass hose and remove the 3 bolts and water inlet housing.

Text in Illu tration

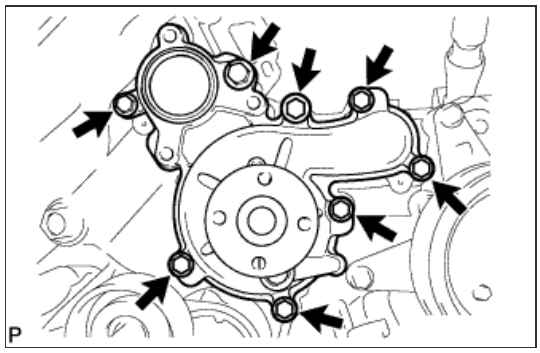
*1	No. 3 Water By-pass Hose

c. Remove the gasket from the water pump.



14. REMOVE WATER PUMP PULLEY

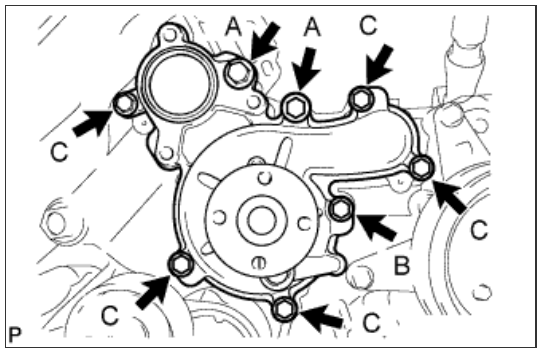
a. Using SST, hold the water pump pulley.



SST
099 -10010 (099 2-01000, 099 3-01000)

b. Remove the 4 bolts and water pump pulley.

1 REMOVE WATER PUMP ASSEMBLY



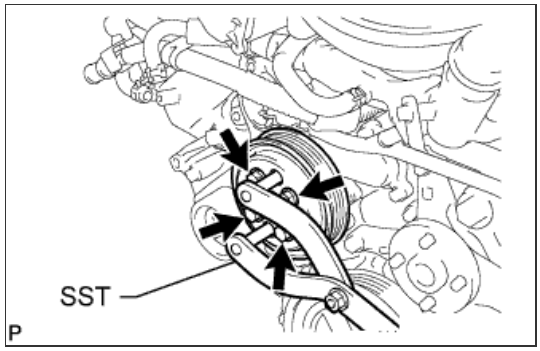
a. Remove the 8 bolts, water pump and gasket.

for Preparation Click here

1. INSTALL WATER PUMP ASSEMBLY

a. Install a new gasket and the water pump with the 8 bolts shown in the illustration.

Torque:
for bolt A:
47 N*m{ 479 kgf*cm , 35 ft.*lbf }
for bolt B:
23 N*m{ 235 kgf*cm , 17 ft.*lbf }
for bolt C:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }



Standard Bolt:

Item	Length	Thread Diameter
Bolt A	80 mm (3.15 in.)	10 mm (0.394 in.)
Bolt B	70 mm (2.76 in.)	8 mm (0.315 in.)
Bolt C	25 mm (0.984 in.)	8 mm (0.315 in.)

2. INSTALL WATER PUMP PULLEY

a. Temporarily install the pulley with the 4 bolts.

b. Using SST, hold the pulley and tighten the 4 bolts.

SST
09960-10010 (09962-01000, 09963-01000)

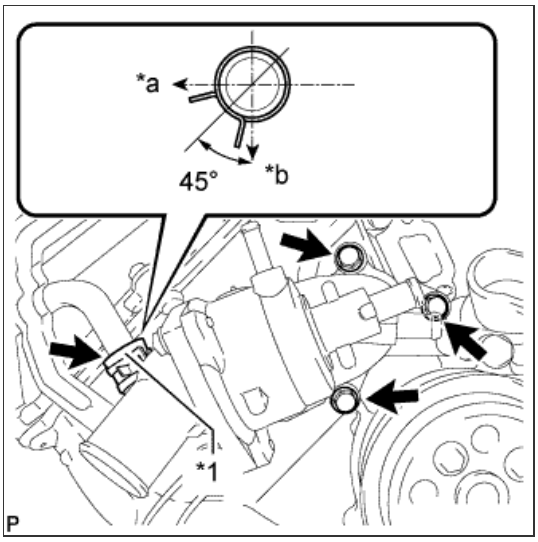
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

3. INSTALL WATER INLET HOUSING

a. Install a new gasket to the water pump.

b. Install the water inlet housing with the 3 bolts and connect the No. 3 water by pass hose.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



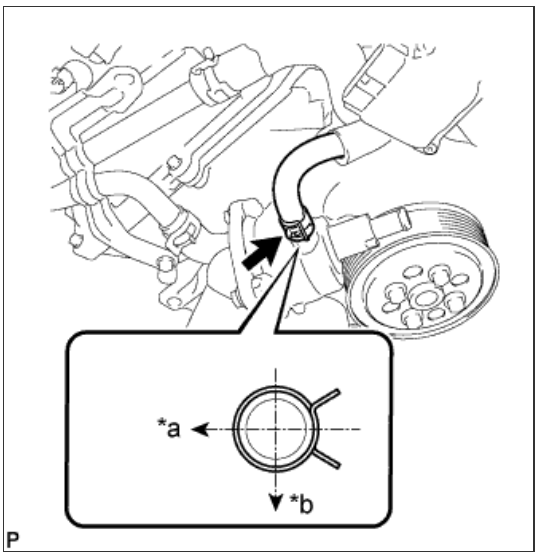
Text in Illustration

*1	No. 3 Water By pass Hose
*a	RH Side
*b	Front

HINT:

Install the hose so that the direction o the hose clamp is as indicated in the

illustration.



c. Connect the No. 5 water by pass hose.

Text in Illustration

*a	RH Side
*b	Front

HINT:

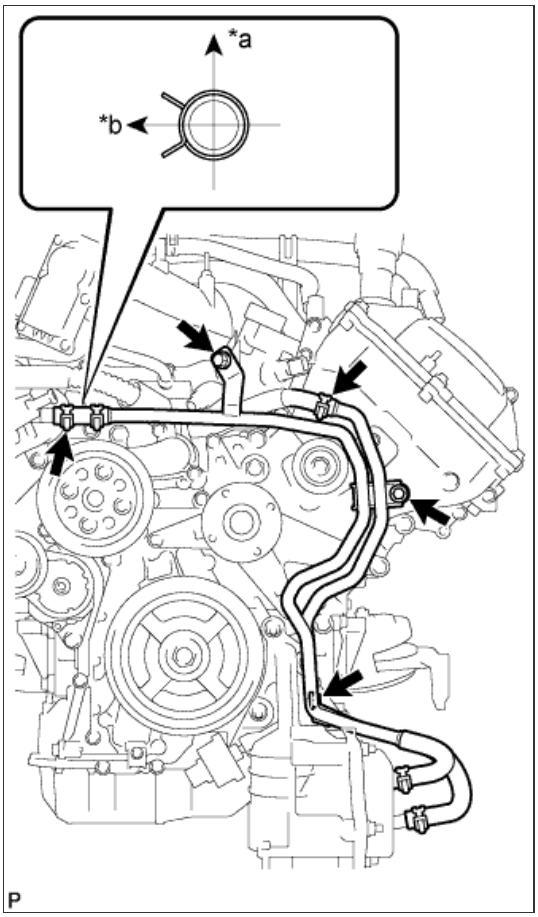
Install the hose so that the direction o the hose clamp is as indicated in the illustration.

4. CONNECT NO. 2 WATER BY-PASS PIPE SUB-ASSEMBLY

a. Connect the water by pass pipe with water hose.

Text in Illustration

*a	Upper
*b	Front



HINT:

Install the hose so that the direction o the hose clamp is as indicated in the illustration.

b. Install the 3 bolts.

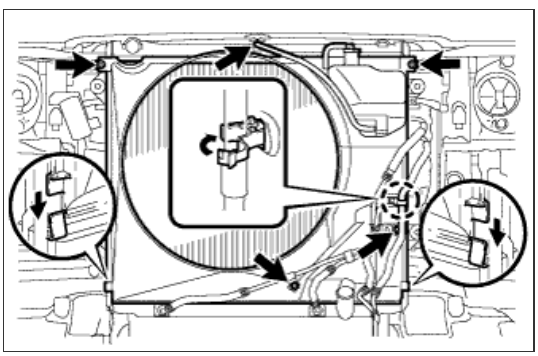
Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

c. Connect the No. 6 water by pass hose.

5. INSTALL NO. 1 WATER BY-PASS HOSE

a. Install the No. 1 water by pass hose by connecting the hose to the water inlet housing and front water by pass joint.

6. INSTALL FAN SHROUD



a. Install the fan pulley.

b. Place the shroud together with the coupling fan between the radiator and engine.

NOTICE:

Be careful not to damage the radiator core.

c. Temporarily install the fluid coupling and the fluid coupling bracket with the 4 nuts. Tighten the nuts as much as possible by hand.

d. Attach the claws of the shroud to the radiator as shown in the illustration.

e. Install the shroud with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

f. Connect the oil cooler tube to the fan shroud with the 2 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

g. Pass the hose through the flexible hose clamp and close the clamp as shown in the illustration.

h. Connect the reservoir hose to the upper radiator tank.

i. Install the fan and generator V belt (Click here).

j. Tighten the 4 nuts of the fluid coupling fan

Torque:

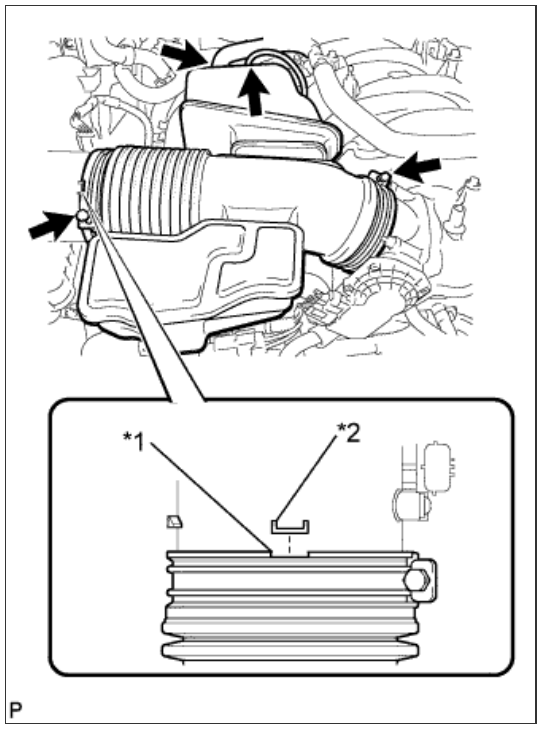
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

7. INSTALL NO. 1 RADIATOR HOSE

8. INSTALL NO. 2 RADIATOR HOSE

9. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner with the 3 bolts.



Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

10. INSTALL AIR CLEANER HOSE ASSEMBLY

a. Install the air cleaner hose so that the protrusion o lte air cleaner cap aligns with the groo e o lte hose as shown in the illustration.

Text in Illustration

*1	roo e
*2	Protrusion

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the auum hose.

d. Connect the No. 2 entilation hose.

11. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item	Speci ied Condition
with rear heater	16.2 liters (17.1 US qts, 14.3 Imp. qts)
without rear heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)

NOTICE:

Do not substitute plain water or engine coolant.

HINT:

TO TA ehicles are illed with TO TA SLLC at the atory. In order to a oid damage to the engine cooling system and other technical problems, only use TO TA SLLC or similar high quality ethylene glycol based non sicate, non amine, non itrite, non borate coolant with long ile hybrid organic acid technology (coolant with long ile hybrid organic acid technology consists o a combination o dw phosphates and organic acids).

b. Slowly pour coolant into the radiator reser oir until it reaches the F line.

c. Install the reser oir cap.

d. Press the No. 1 and No. 2 radiator hoses se eral times by hand, and then check the coolant le el. I hte coolant le el is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be con irmed by pressing the radiator inlet hose by hand, and checking when the engine coolant starts to dw inside the hose.

g. intain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the No. 1 and No. 2 radiator hoses se eral times by hand to bleed air.

CAUTION:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

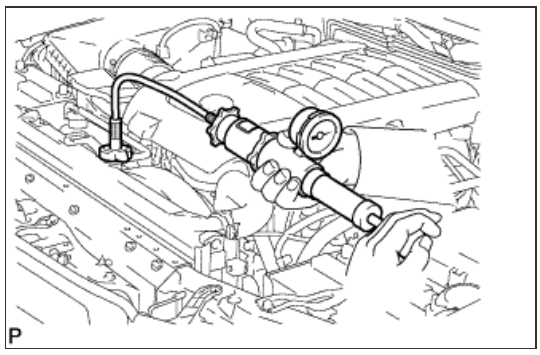
i. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remo e the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant le el is between the F and L lines.
I hte coolant le el is below the L line, repeat all o hte procedures abo e.
I hte coolant le el is abo e the F line, drain coolant so that the coolant le el is between the F and L lines.

12. INSPECT FOR COOLANT LEAK



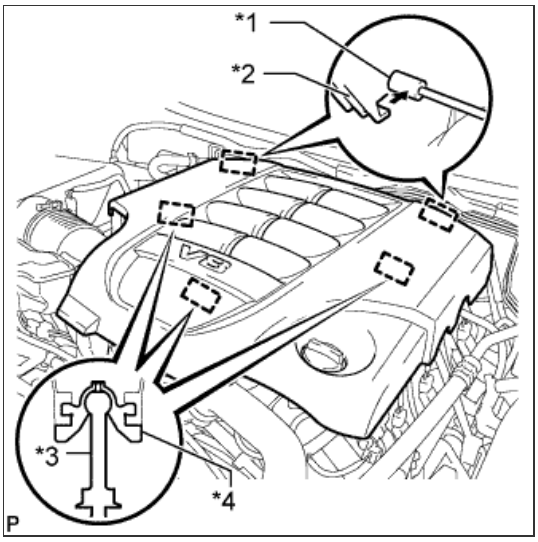
CAUTION:

Do not remo e the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kg cm^2, 18 psi), and check that the pressure does not drop.
I hte pressure drops, check the hoses, radiator and water pump or leaks. I o e ernal leaks are ound, check the heater core, cylinder block and head.



13. INSTALL V-BANK COVER SUB-ASSEMBLY

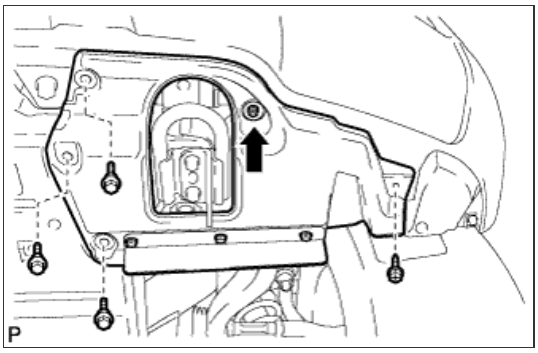
a. Attach the 2 V bank co er hooks to the bracket. Then align the 3 V bank co er grommets with the 3 pins, and press down on the V bank co er to attach the pins.

Text in Illustration

*1	Bracket

*2	Hook
*3	Pin
*4	rommet

14. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



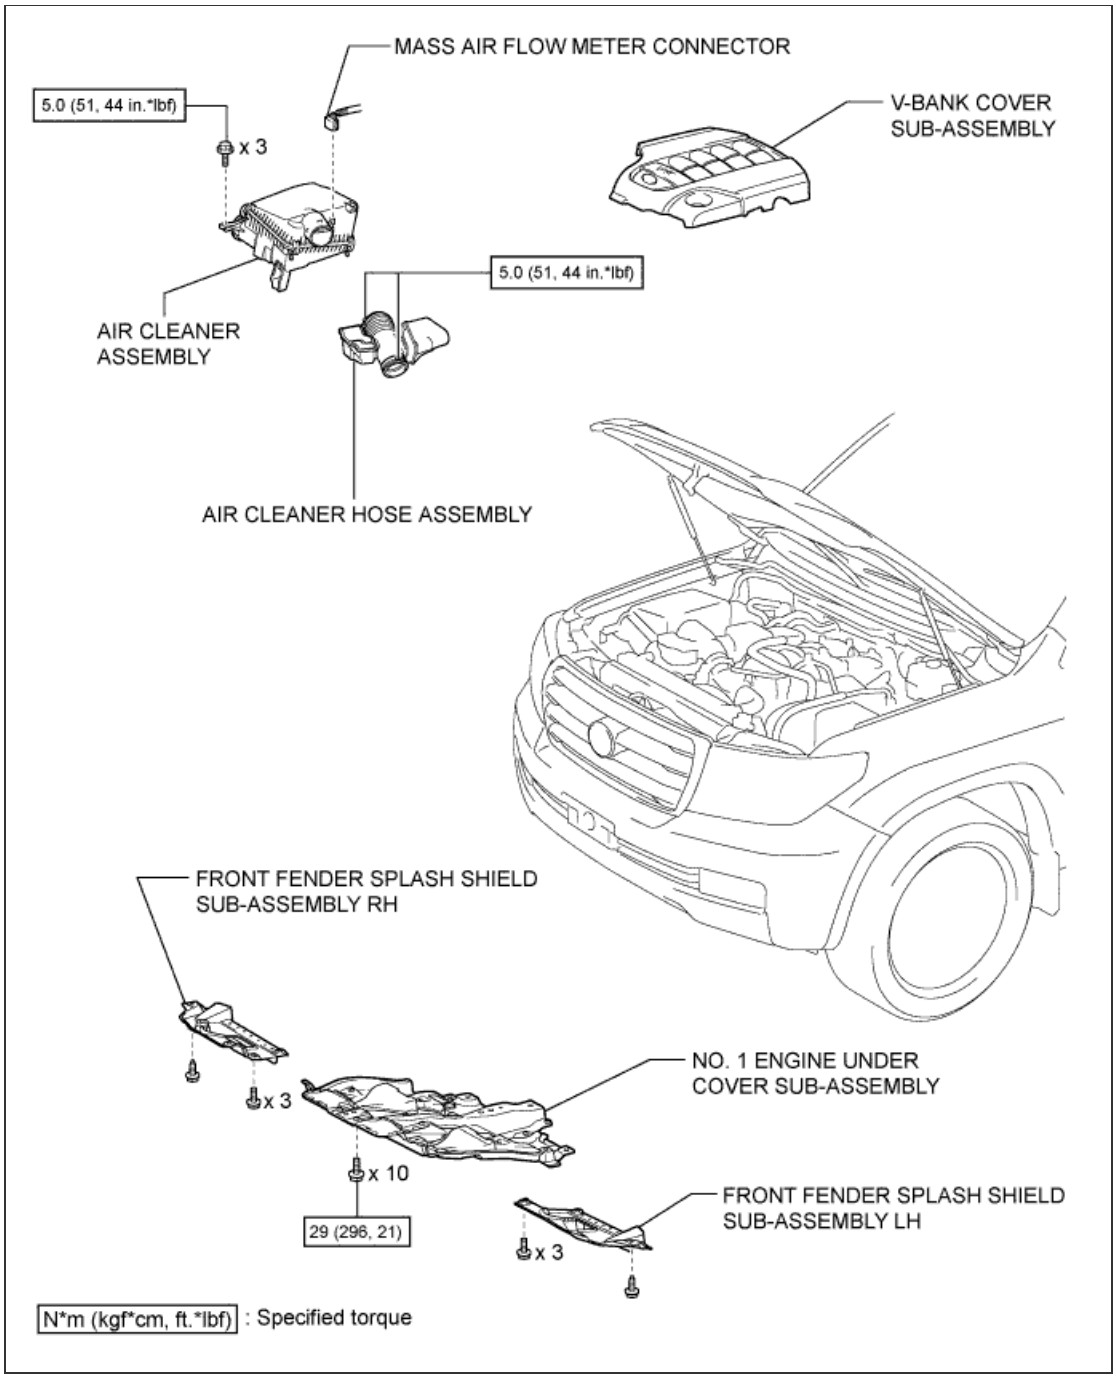
a. Install the No. 1 engine under co er with the 10 bolts.

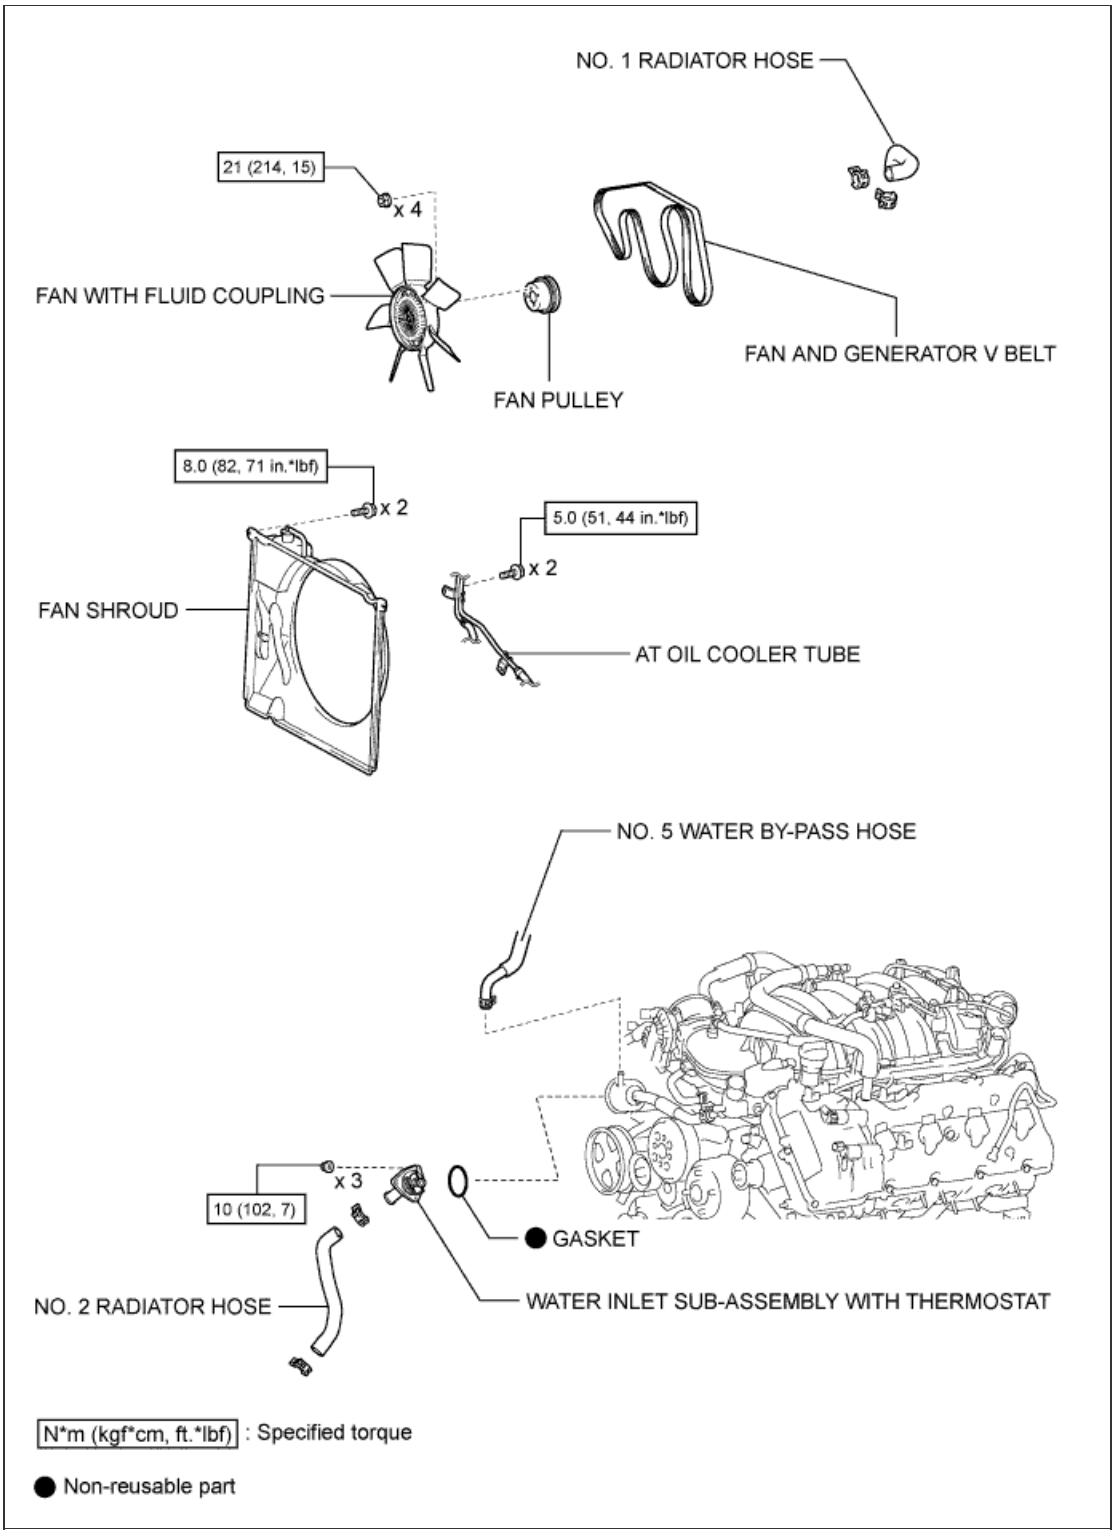
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

15. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the ender splash shield.

b. Install the 3 bolts and screw.





16. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described or the LH side.

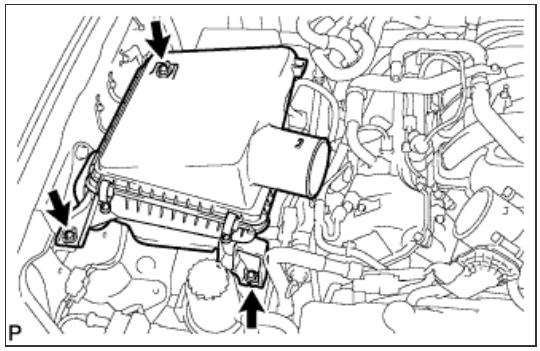
6. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum hose and No. 2 ventilation hose.

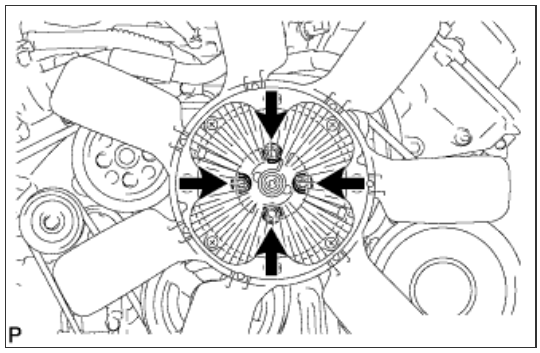


b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

7. REMOVE AIR CLEANER ASSEMBLY

a. Remove the 3 bolts and air cleaner.



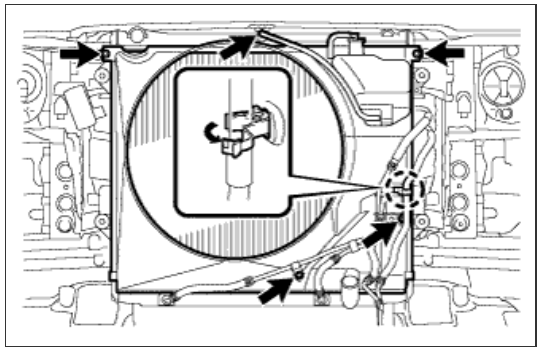
8. REMOVE NO. 1 RADIATOR HOSE

9. REMOVE NO. 2 RADIATOR HOSE

10. REMOVE FAN SHROUD

a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the fan and generator V belt (Click here).



c. Disconnect the reservoir hose from the upper radiator tank.

d. Detach the claw to open the flexible hose clamp.

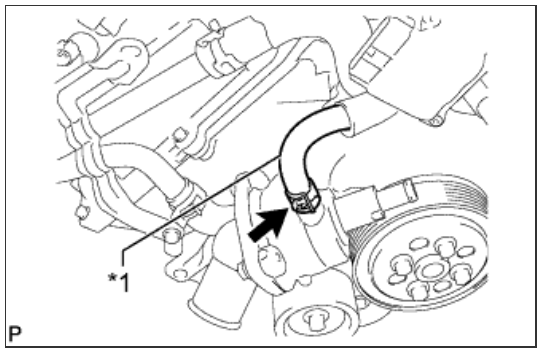
e. Remove the 2 bolts and disconnect the oil cooler tube from the fan shroud.

f. Remove the 2 bolts holding the fan shroud.

g. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the coupling fan.

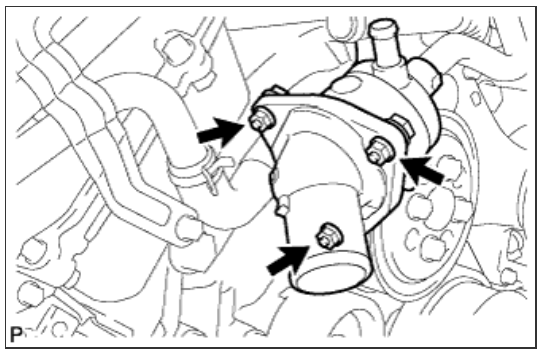
NOTICE:

Be careful not to damage the radiator core.



h. Remove the fan pulley.

11. REMOVE WATER INLET SUB-ASSEMBLY WITH THERMOSTAT

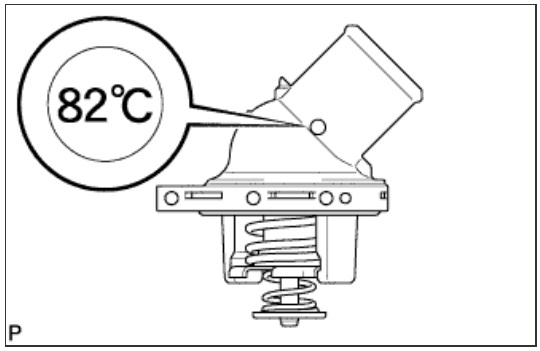


a. Disconnect the No. 5 water by pass hose.

Text in Illustration

*1	No. 5 Water By pass Hose

b. Remove the 3 nuts, water inlet with thermostat and gasket.

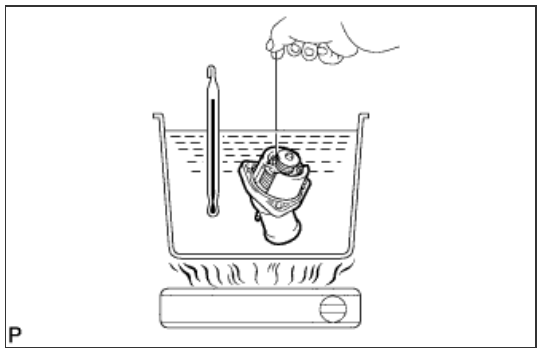


for Preparation Click here

1. INSPECT WATER INLET SUB-ASSEMBLY WITH THERMOSTAT

HINT:

The valve opening temperature is stamped on the water inlet with thermostat.



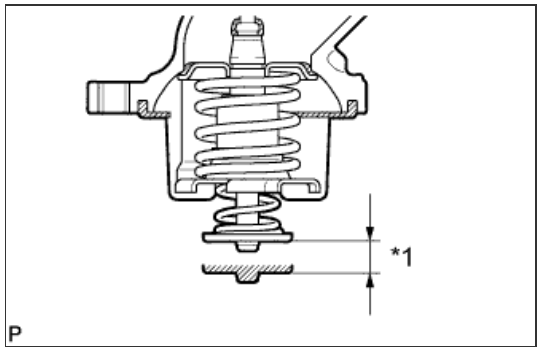
a. Immerse the water inlet with thermostat in water and gradually heat the water.

b. Check the valve opening temperature.

Standard valve opening temperature:
80 to 84°C (176 to 183°F)

If the valve opening temperature is not within the specified range, replace the water inlet with thermostat.

c. Check the valve lift.



Standard valve lift:
10.0 mm (0.394 in.) or more at 95°C (03°F)

Text in Illustration

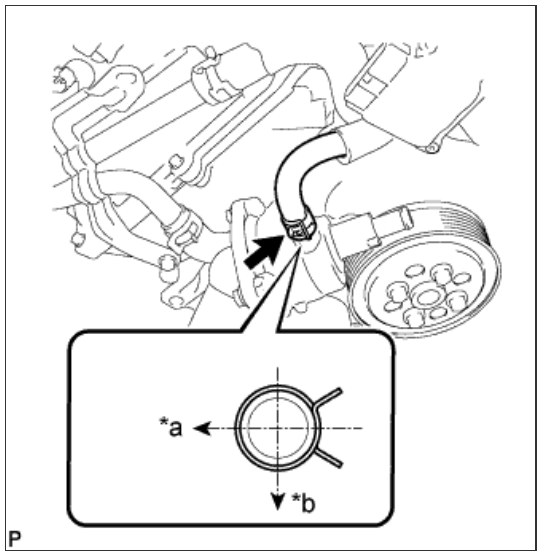
	alve Lift

If the valve lift is not as specified, replace the water inlet with thermostat.

d. Check that the valve is fully closed when the water inlet with thermostat is at a low temperature (below 77°C (171°F)).
If it is not fully closed, replace the water inlet with thermostat.

for Preparation Click here

1. INSTALL WATER INLET SUB-ASSEMBLY WITH THERMOSTAT



a. Install a new gasket and the water inlet with thermostat with the 3 nuts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Connect the No. 5 water by-pass hose.

Text in Illustration

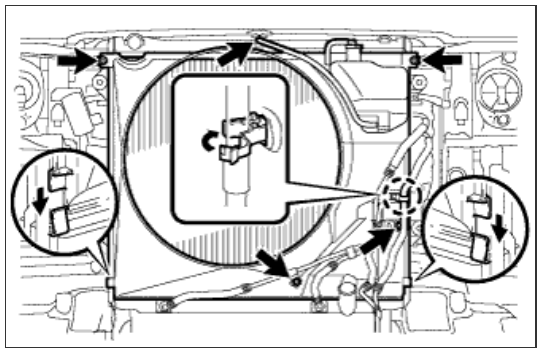
*a	RH Side
*b	Front

HINT:

Install the hose so that the direction of the hose clamp is as indicated in the illustration.

2. INSTALL FAN SHROUD

a. Install the fan pulley.



b. Place the shroud together with the coupling fan between the radiator and engine.

NOTICE:

Be careful not to damage the radiator core.

c. Temporarily install the fluid coupling fan to the fluid coupling bracket with the 4 nuts. Tighten the nuts as much as possible by hand.

d. Attach the claws of the shroud to the radiator as shown in the illustration.

e. Install the shroud with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

f. Connect the oil cooler tube to the fan shroud with the 2 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

g. Pass the hose through the flexible hose clamp and close the clamp as shown in the illustration.

h. Connect the reservoir hose to the upper radiator tank.

i. Install the fan and generator V-belt (Click here).

j. Tighten the 4 nuts of the fluid coupling fan.

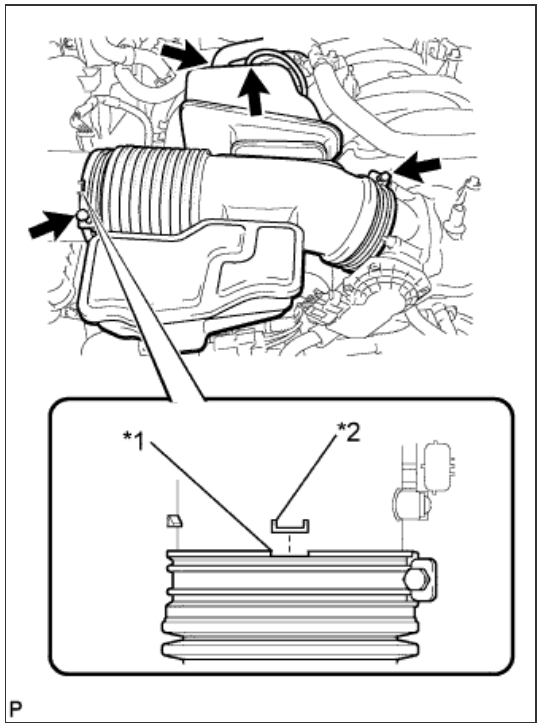
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

3. INSTALL NO. 2 RADIATOR HOSE

4. INSTALL NO. 1 RADIATOR HOSE

5. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner with the 3 bolts.



Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

. INSTALL AIRCLEANER HOSE ASSEMBLY

a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

Text in Illustration

*1	Groove
*2	Protrusion

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum hose.

d. Connect the No. 2 ventilation hose.

7. ADD EN INECOOLANT

a. Add engine coolant.

Standard Capacity:

Item	Specified Condition
with rear heater	16.2 liters (17.1 US qts, 14.3 Imp. qts)
without rear heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the radiator inlet hose by hand, and checking when the engine coolant starts to flow inside the hose.

g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

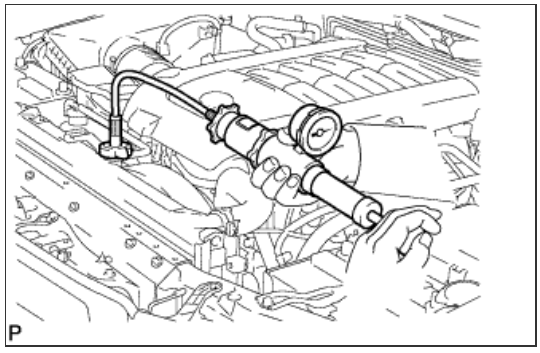
i. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

8. INSPECT FOR COOLANT LEAK



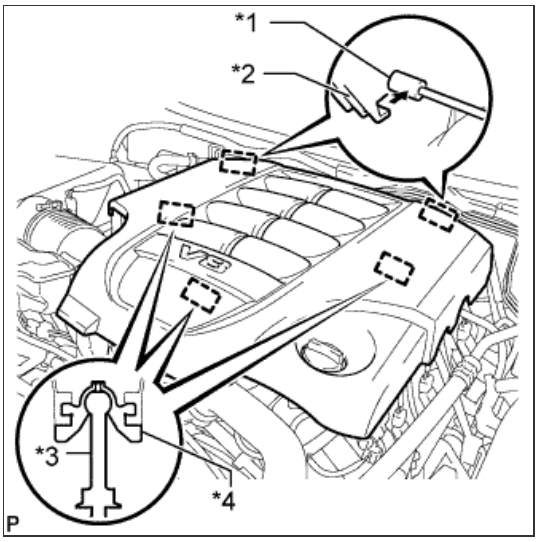
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.



. INSTALL -BANK CO ER SUB-ASSEMBLY

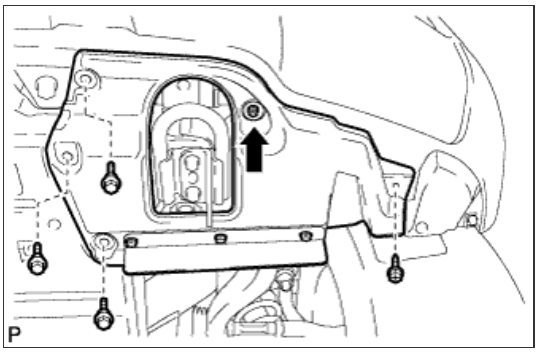
a. Attach the 2 V-bank cover hooks to the bracket. Then align the 3 V-bank cover grommets with the 3 pins, and press down on the V-bank cover to attach the pins.

Text in Illustration

*1	Bracket
*2	Hook

*3	Pin
*4	Grommet

10. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



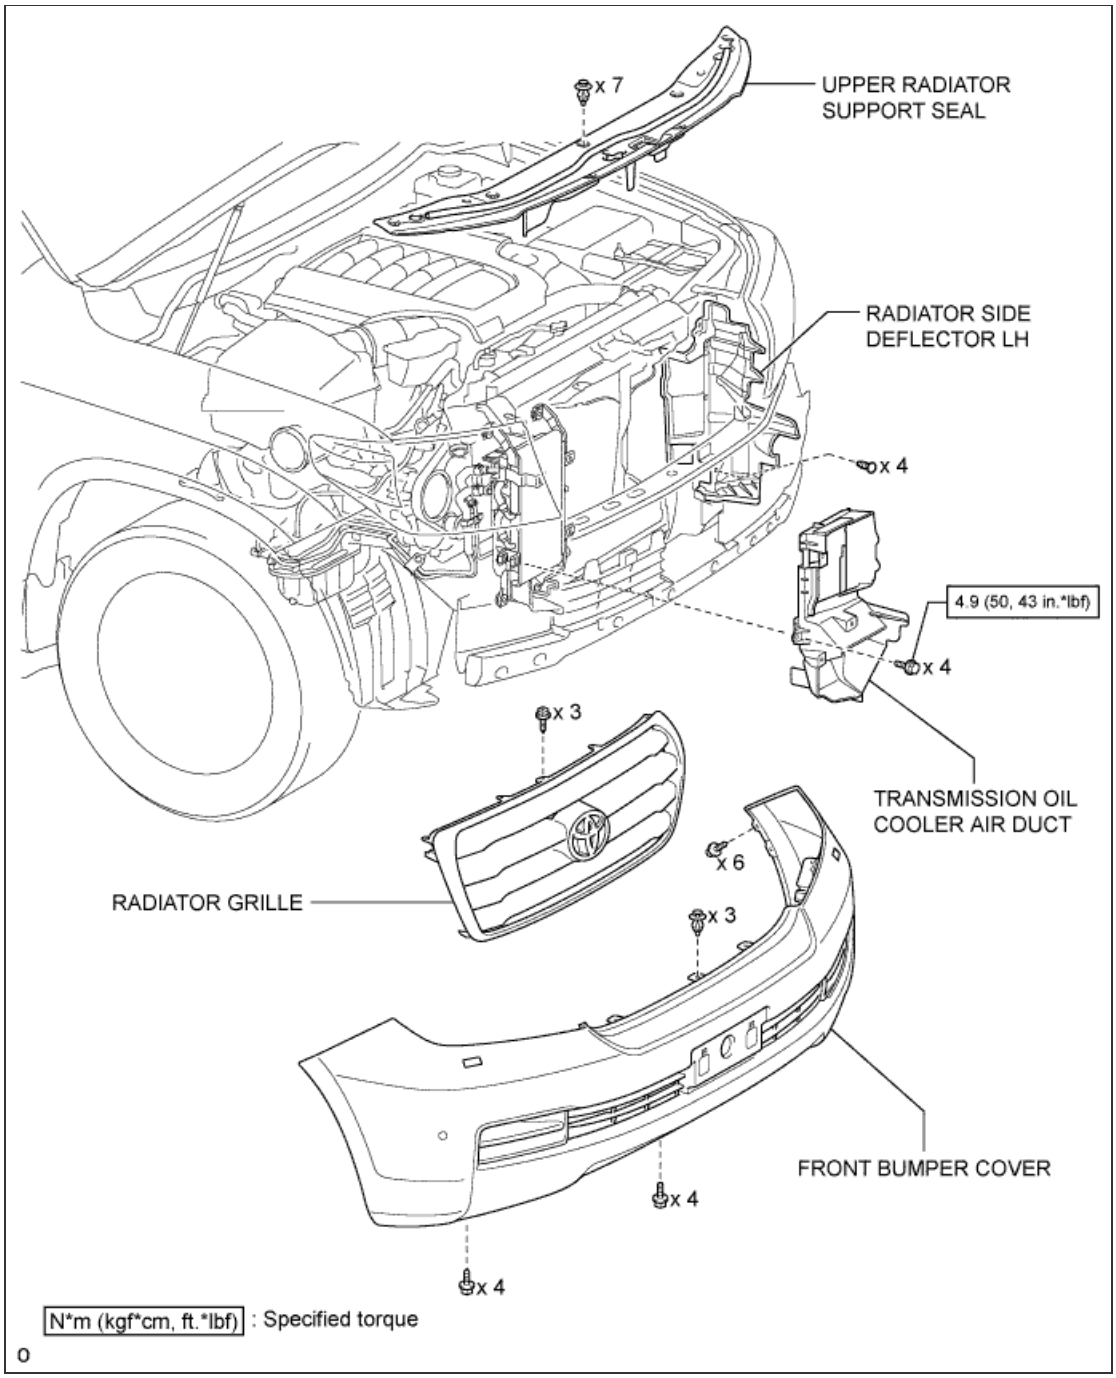
a. Install the No. 1 engine under cover with the 10 bolts.

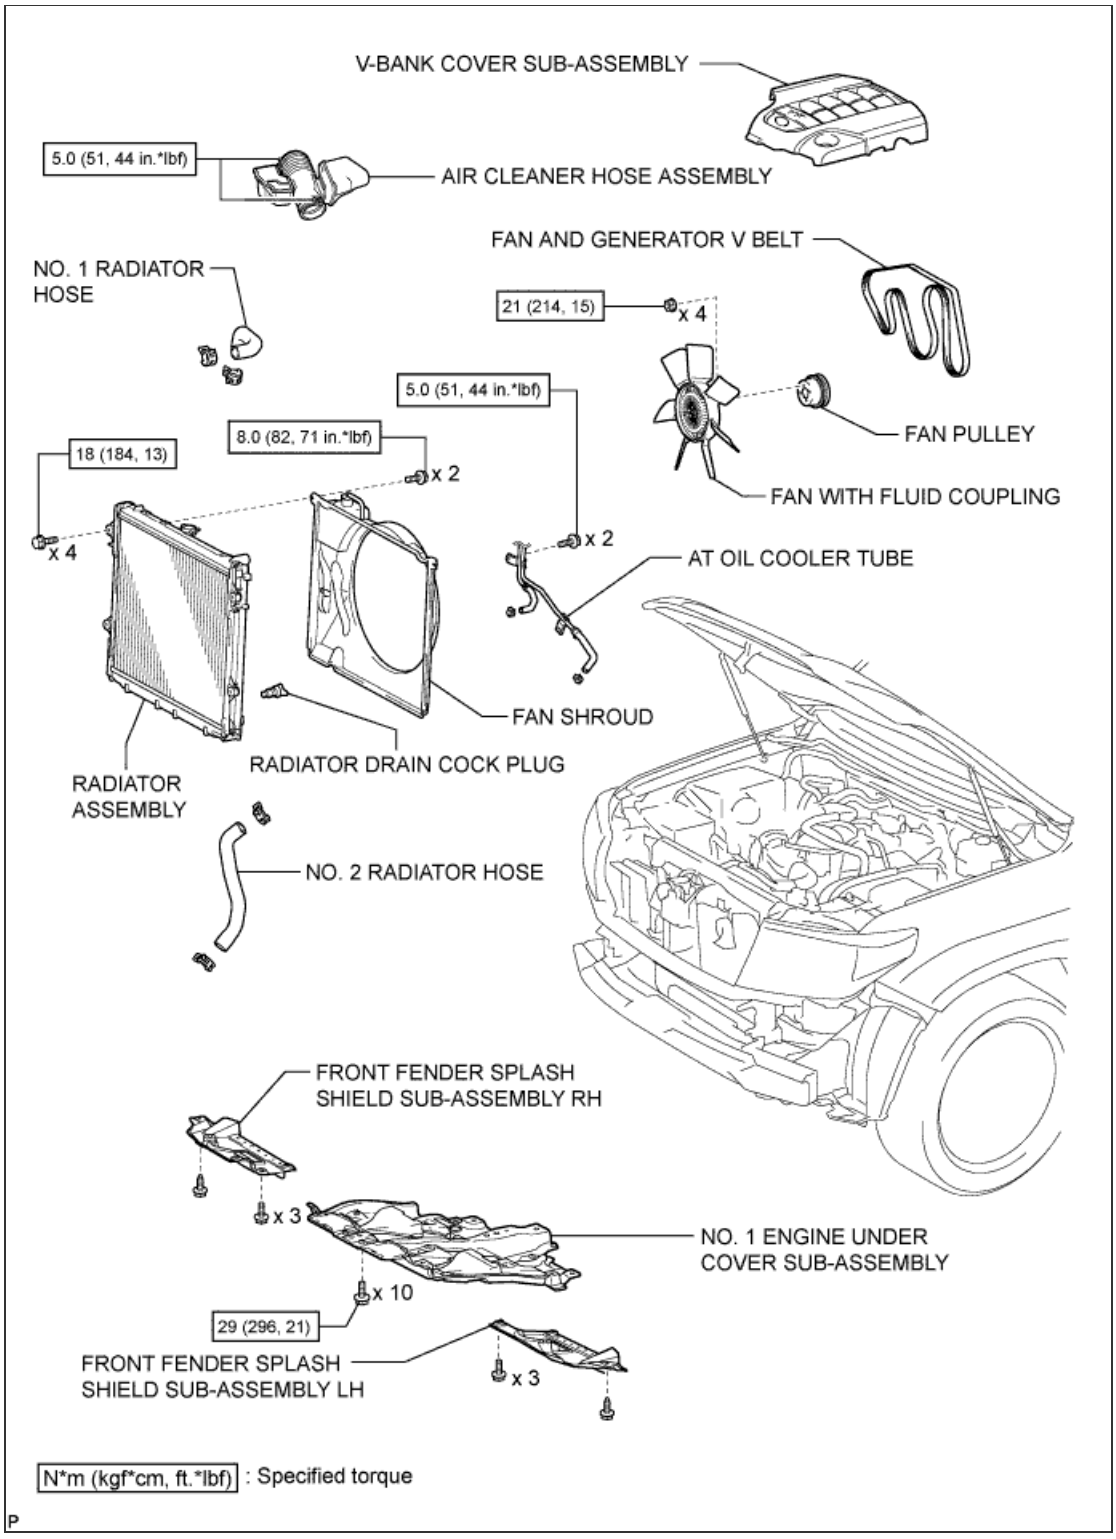
Torque:
2 Nm{ 2 kgf*cm , 21 ft.*lbf }

11. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.





12. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

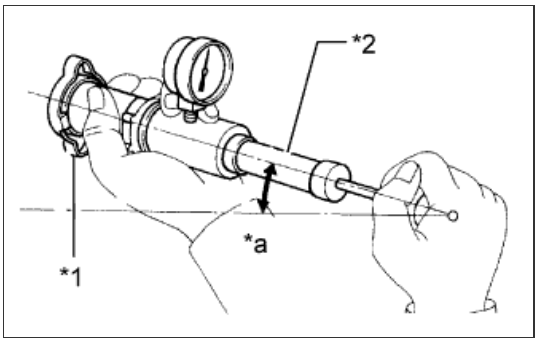
1. INSPECT RADIATOR CAP SUB-ASSEMBLY

CAUTION:

To avoid the danger of being burned, do not remove the radiator cap while the engine and radiator are still hot, as fluid and steam can be blown out under pressure.

a. Measure the valve opening pressure.



i. If there are water stains or foreign matter on rubber packing 1, 2 or 3, clean it by using water and finger scouring.

ii. Check that rubber packing 1, 2 and 3 are not deformed, cracked or swollen.

iii. Check that rubber packing 3 and 4 are not stuck together.

iv. Apply engine coolant to rubber packing 2 and 3.

v. Prepare a radiator cap tester, and tilt it more than 30°.

Text in Illustration

*1	Radiator Cap
*2	Radiator Cap Tester
*a	30° or more

vi. Pump the cap tester several times, and check the maximum pressure*.

Pumping speed:
1 pump per second

HINT:

*: Even if the cap cannot maintain the maximum pressure, it is not a defect.

Standard Judgment Criterion:

Item	Specified Condition
Standard value (for brand-new cap)	3 to 123 kPa (1.0 to 1.3 kgf/cm^2, 13.5 to 17.8 psi)
Minimum standard value (after using cap)	7 kPa (0.8 kgf/cm^2, 11.4 psi)

If the maximum pressure is less than the minimum standard value, replace the radiator cap sub-assembly.

2. INSPECT FINS FOR BLOCKAGE

a. Check that the radiator and condenser are not blocked with leaves, dirt, or insects. Clean the hose connections.
If the fins are blocked, wash them with water or a steam cleaner.

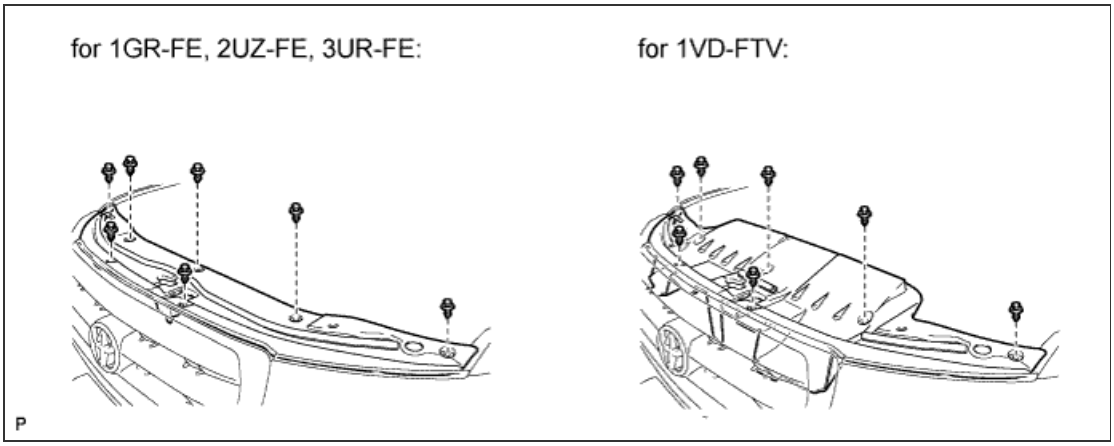
NOTICE:

- **If the distance between the steam cleaner and core is too close, the fins may be damaged.**

- **Keep the following injection distance.**

  Standard Injection Distance:

Injection Condition	Injection Pressure
300 mm (11.8 in.)	2 42 to 4 03 kPa (30.0 to 50.0 kgf/cm^2, 427 to 711 psi)
500 mm (1 .7 in.)	4 03 to 7845 kPa (50.0 to 80.0 kgf/cm^2, 711 to 1138 psi)



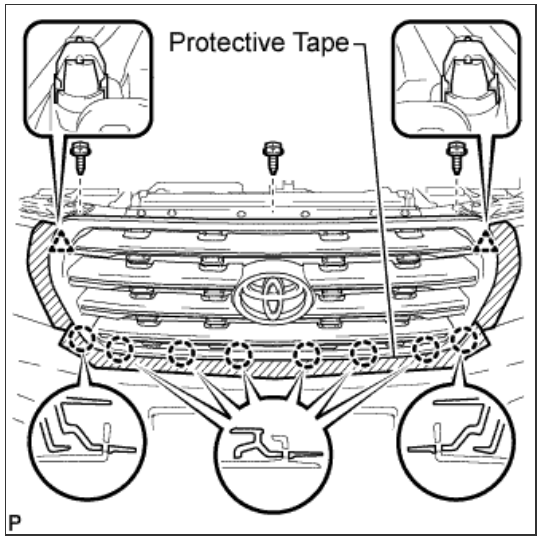
- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Never apply water directly onto the electric components.**

b. Dry the fins with compressed air.

for Preparation Click here

1. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and radiator support seal.

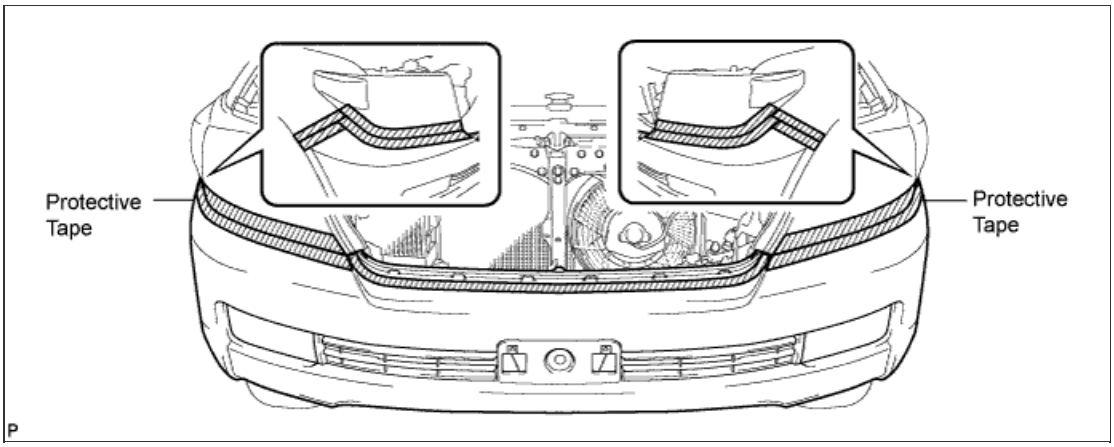


2. REMOVE RADIATOR GRILLE

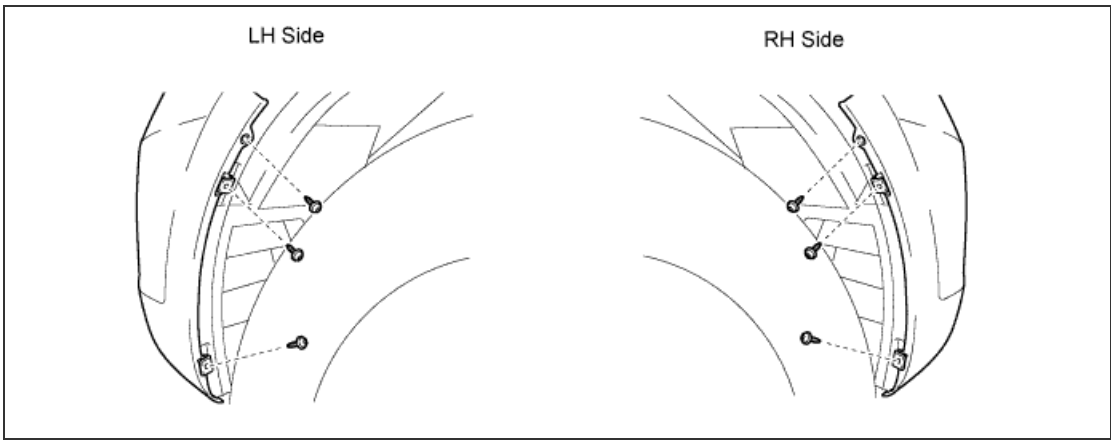
a. Put protective tape around the radiator grille.

b. Remove the 3 screws.

c. Detach the 2 clips and 8 claws, and remove the radiator grille.



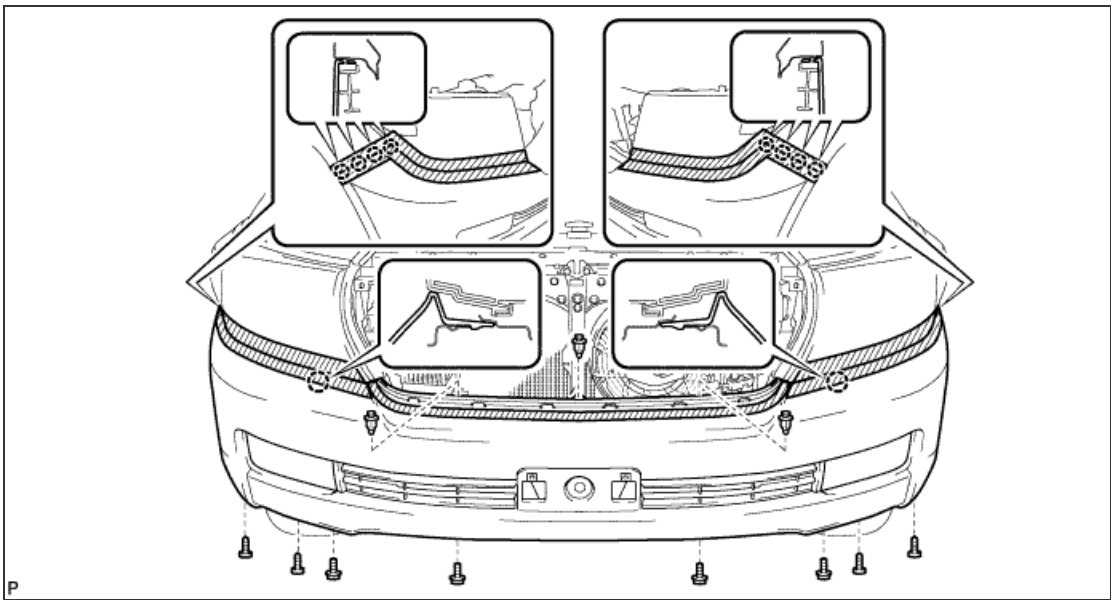
3. REMOVE FRONT BUMPER COVER



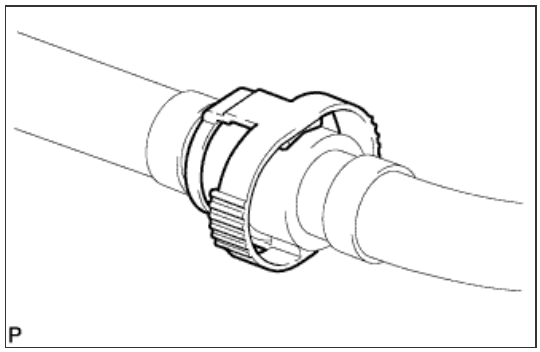
HINT:

For the front bumper cover with garnish, use the procedures described below.

a. Put protective tape around the bumper cover.



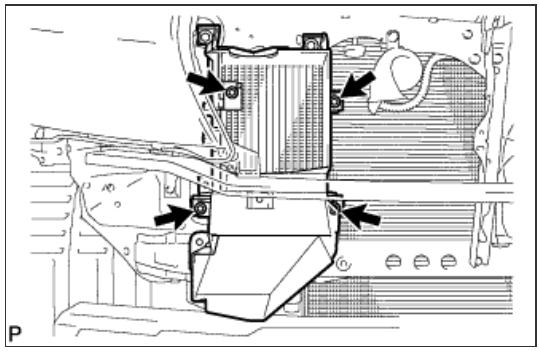
b. Using a T30 "TORX" socket, remove the 6 screws.



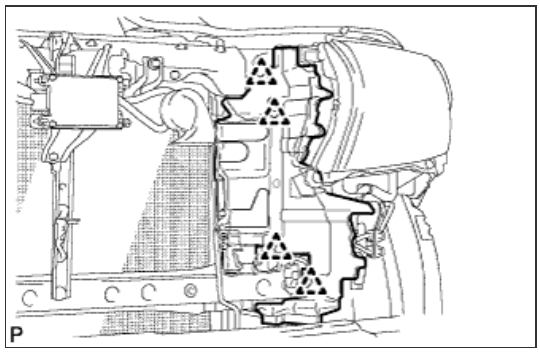
c. Remove the 3 clips, 4 screws and 4 bolts.

d. w/o TOYOTA Parking Assist-sensor System, w/o Fog Light:
Detach the 10 claws and remove the bumper cover.

e. w/ TOYOTA Parking Assist-sensor System or w/ Fog Light:
Detach the 10 claws, disconnect the No. 4 engine room wire connector and remove the bumper cover.



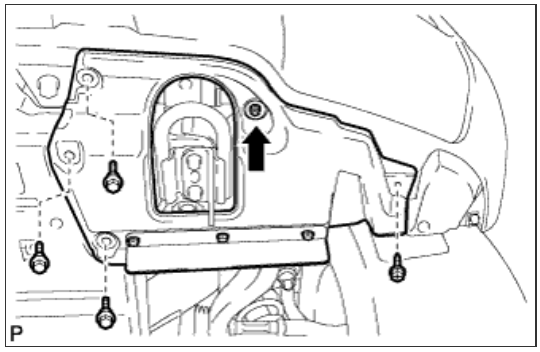
f. w/ Headlight Cleaner System:
Disconnect the headlight cleaner hose and remove the bumper cover.



4. REMOVE TRANSMISSION OIL COOLER AIR DUCT

a. Remove the 4 bolts and oil cooler air duct.

5. DISCONNECT RADIATOR SIDE DEFLECTOR LH

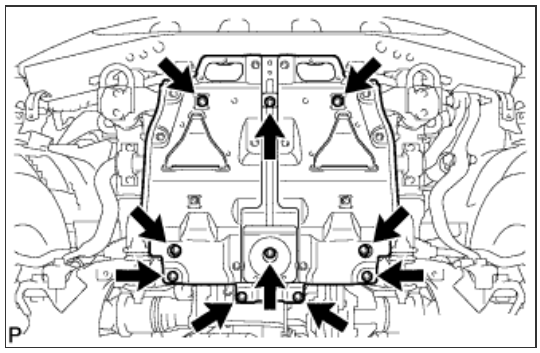


a. Using a clip remover, remove the 4 clips and disconnect the side deflector.

6. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



7. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

8. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

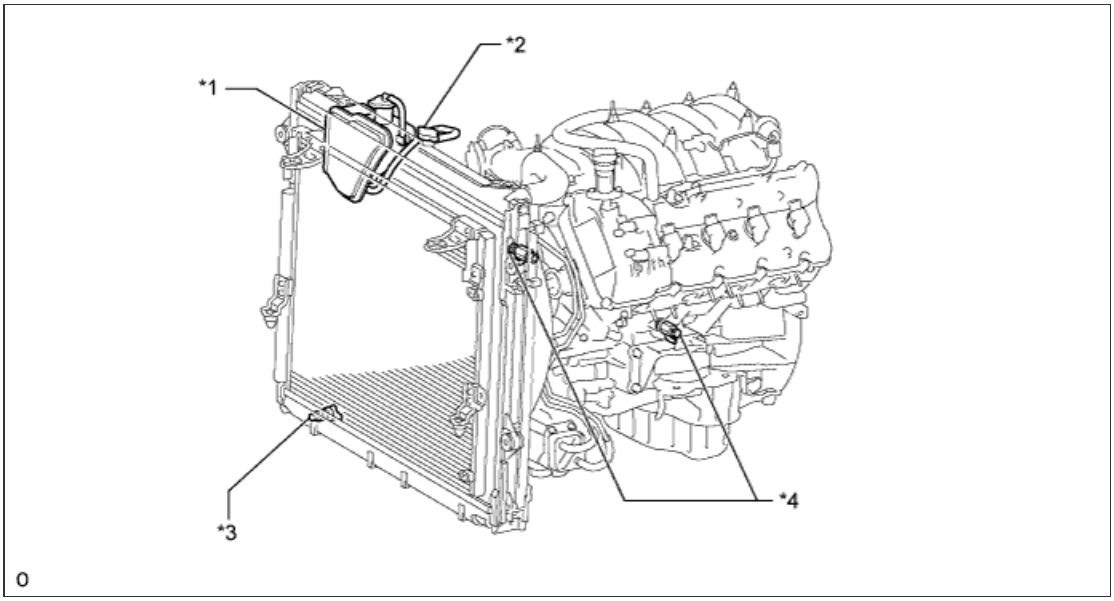
9. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

HINT:



Collect the coolant in a container and dispose of it according to the regulations in your area.

b. Remove the radiator cap. Then drain the coolant from the radiator.

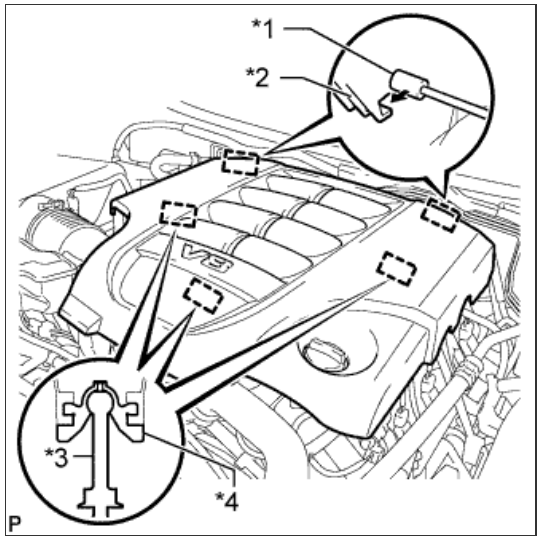
c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N 133 k f c 10 ft. lbf }

Text in Illu tration

*1	Radiator Reservoir	*2	Radiator Cap
*3	Radiator Drain Cock Plug	*4	Cylinder Block Drain Cock Plug



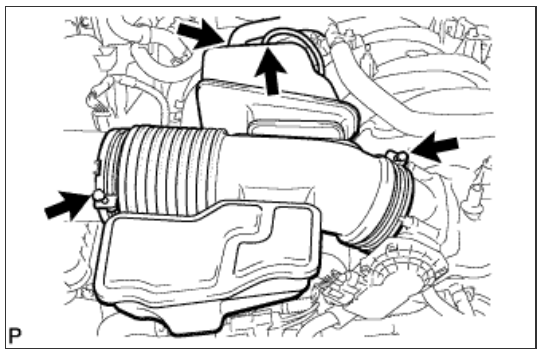
e. Tighten the radiator drain cock plug by hand.

10. REMOVE V-BAN COVER SUB-ASSEMBLY

a. Raise the front of the V-bank cover to detach the 3 pins. Then remove the 2 V-bank cover hooks from the bracket, and remove the V-bank cover.

Text in Illu tration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

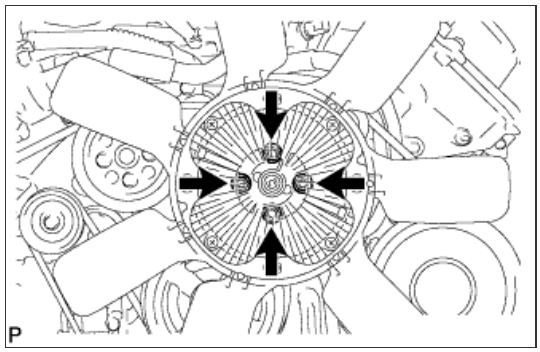


11. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum hose and No. 2 ventilation hose.

b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.



12. REMOVE NO. 1 RADIATOR HOSE

13. REMOVE NO. 2 RADIATOR HOSE

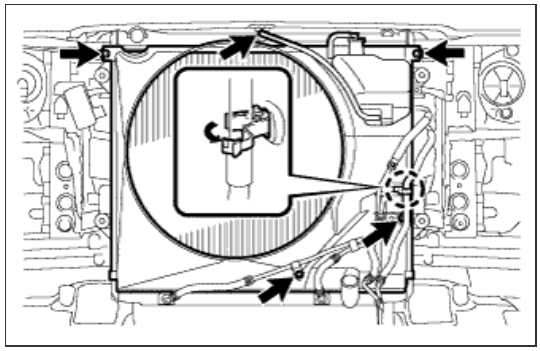
14. REMOVE FAN SHROUD

a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the fan and generator V-belt (Click here).

c. Disconnect the reservoir hose from the upper radiator tank.

d. Detach the claw to open the flexible hose clamp.

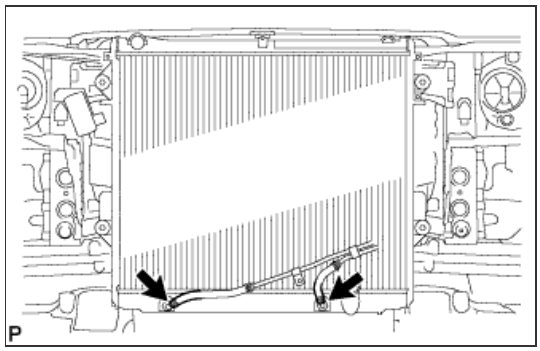


e. Remove the 2 bolts and disconnect the oil cooler tube from the fan shroud.

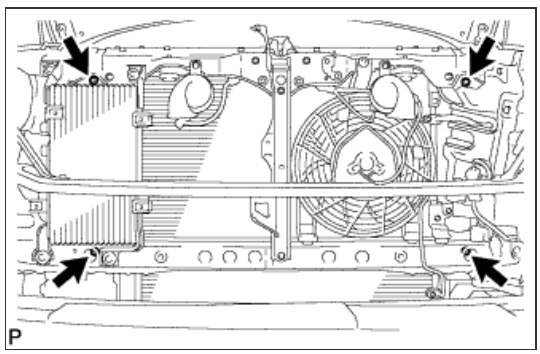
f. Remove the 2 bolts holding the fan shroud.

.Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the coupling fan.

NOTICE:



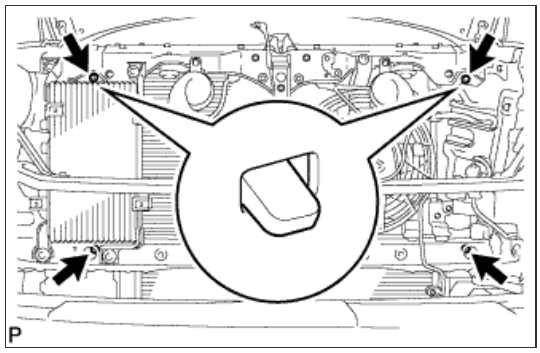
Be careful not to damage the radiator core.



h. Remove the fan pulley.

15. REMOVE RADIATOR ASSEMBLY

a. Disconnect the 2 oil cooler hoses.



b. Remove the 4 bolts and radiator.

for Preparation Click here

1. INSTALL RADIATOR ASSEMBLY

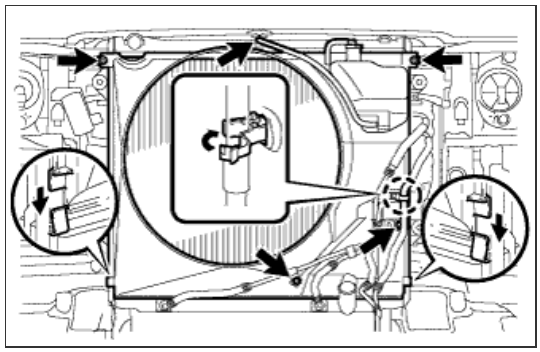
a. Set the radiator bracket hooks to the radiator support holes.

b. Install the radiator with the 4 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

c. Connect the 2 oil cooler hoses.

2. INSTALL FAN SHROUD



a. Install the fan pulley.

b. Place the shroud together with the coupling fan between the radiator and engine.

NOTICE:

Be careful not to damage the radiator core.

c. Temporarily install the fluid coupling fan to the fluid coupling bracket with the 4 nuts. Tighten the nuts as much as possible by hand.

d. Attach the claws of the shroud to the radiator as shown in the illustration.

e. Install the shroud with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

f. Connect the oil cooler tube to the fan shroud with the 2 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

g. Pass the hose through the flexible hose clamp and close the clamp as shown in the illustration.

h. Connect the reservoir hose to the upper radiator tank.

i. Install the fan and generator V-belt (Click here).

. Tighten the 4 nuts of the fluid coupling fan.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

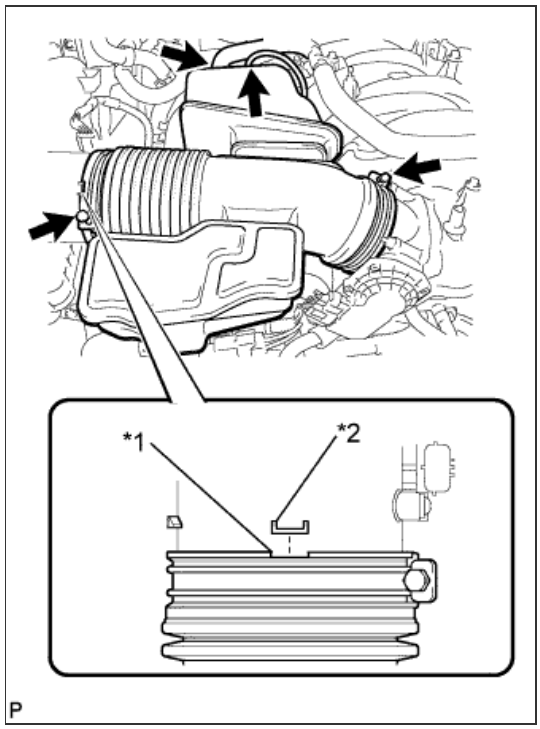
3. INSTALL NO. 2 RADIATOR HOSE

4. INSTALL NO. 1 RADIATOR HOSE

5. INSTALL AIR CLEANER HOSE ASSEMBLY

a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

Text in Illu tration



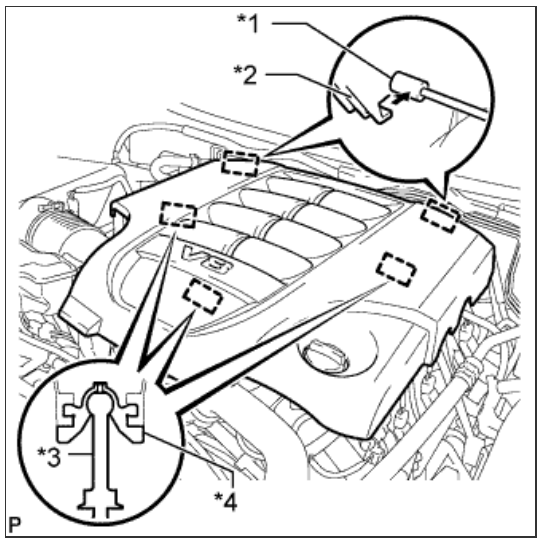
*1	Groove
*2	Protrusion

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum hose.

d. Connect the No. 2 ventilation hose.



6. INSTALL V BANK COVER SUB ASSEMBLY

a. Attach the 2 V-bank cover hooks to the bracket. Then align the 3 V-bank cover grommets with the 3 pins, and press down on the V-bank cover to attach the pins.

Text in Illu tration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

7. ADD EN INE COOLANT

a. Add engine coolant.

Standard Capacity:

Item	Specified Condition
with rear heater	16.2 liters (17.1 US qts, 14.3 Imp. qts)
without rear heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TO TA vehicles are filled with TO TA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical

problems, only use TO TA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the radiator inlet hose by hand, and checking when the engine coolant starts to flow inside the hose.

g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make ure that the radiator re ervoir till ha ome coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make ure that the needle doe not how an abnormally high temperature.**
- **If there i not enough coolant, the engine may burn out or overheat.**
- **Immediately after tarting the engine, if the radiator re ervoir doe not have any coolant, perform the following: 1) top the engine, 2) wait until the coolant ha cooled down, and 3) add coolant until the coolant i filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level ha tabilized.**

h. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:

- **Wear protective glove .**
- **Be careful a the radiator ho e are hot.**
- **Keep your hand away from the fan.**

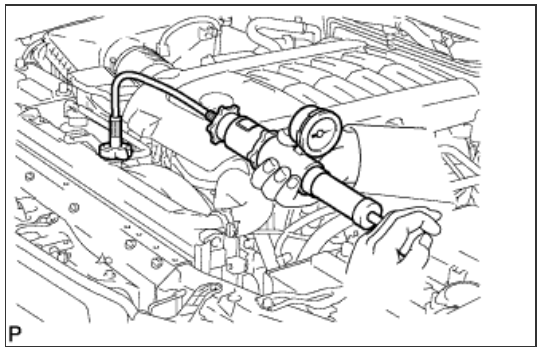
i. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

8. INSPECT FOR COOLANT LEAK



CAUTION:

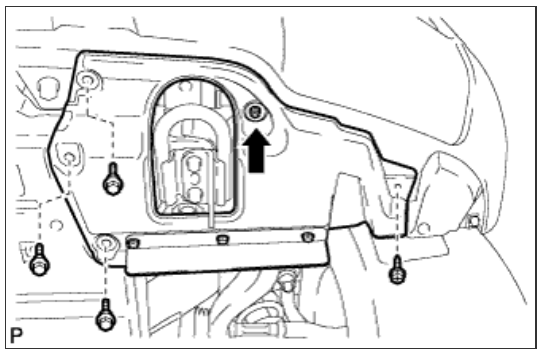
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

9. INSTALL NO. 1 EN INE UNDER COVER SUB ASSEMBLY



a. Install the No. 1 engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

10. INSTALL FRONT FENDER SPLASH SHIELD SUB ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

11. INSTALL FRONT FENDER SPLASH SHIELD SUB ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

12. CONNECT RADIATOR SIDE DEFLECTOR LH

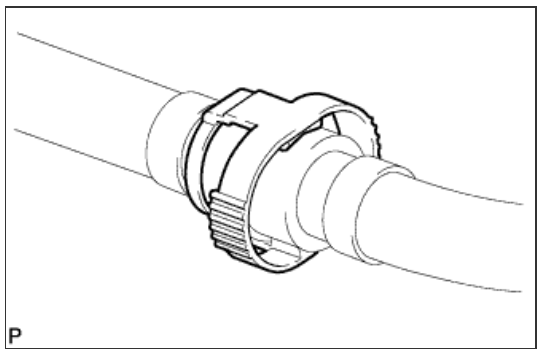
a. Connect the deflector with the 4 clips.

13. INSTALL TRANSMISSION OIL COOLER AIR DUCT

a. Install the oil cooler air duct with the 4 bolts.

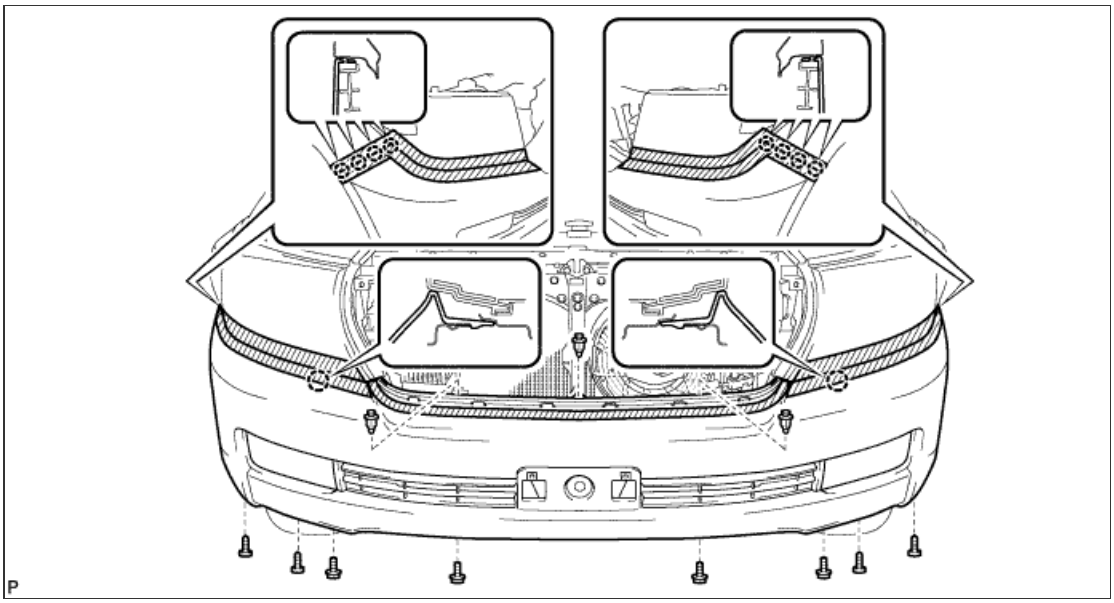
Torque:
4.9 N*m{ 50 kgf*cm , 43 in.*lbf }

14. INSTALL FRONT BUMPER COVER



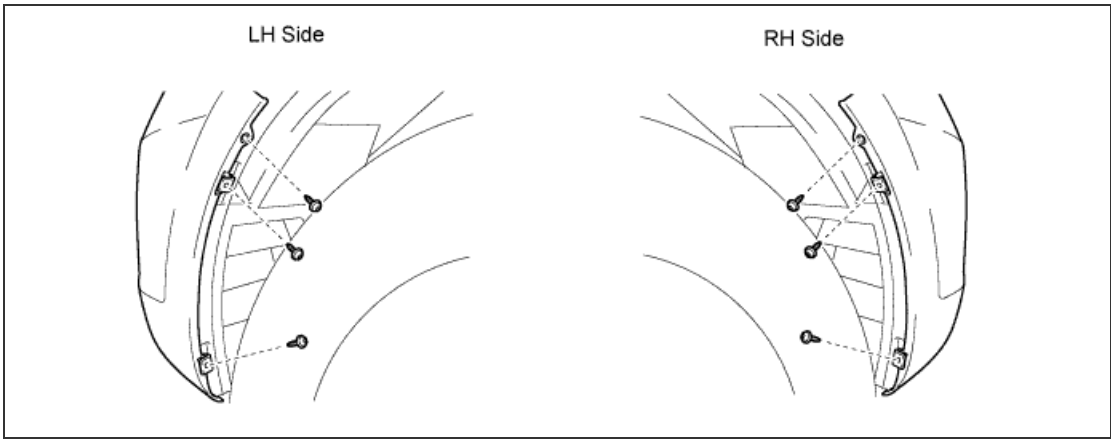
HINT:

For the front bumper cover with garnish, use the procedures described below.



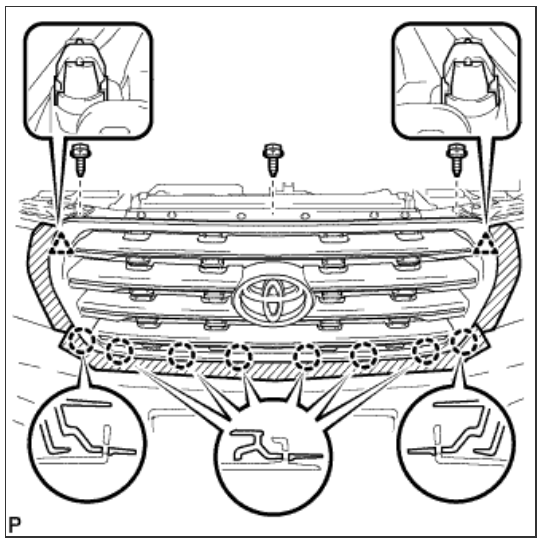
a. w/ Headlight Cleaner System:
Connect the headlight cleaner hose.

b. w/o TO TA Parking Assist-sensor System, w/o Fog Light:
Attach the 10 claws to install the bumper cover.



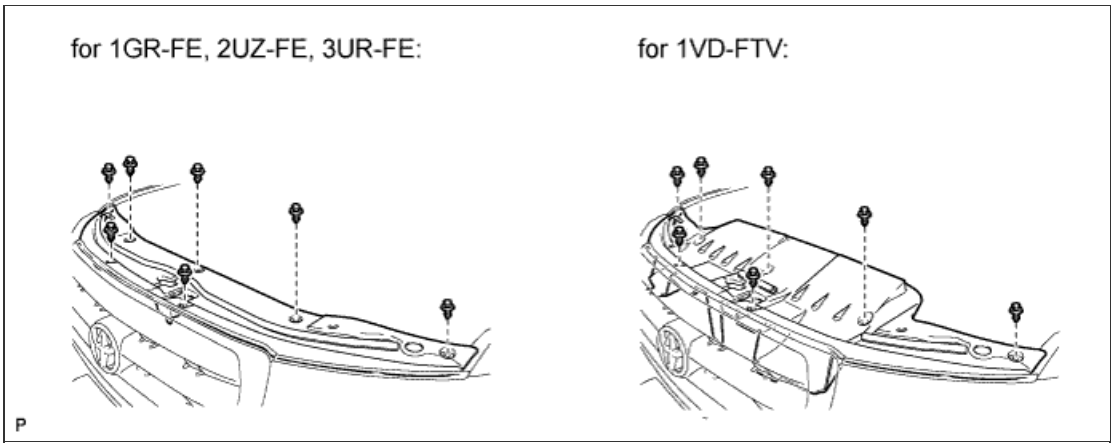
c. w/ TO TA Parking Assist-sensor System or w/ Fog Light:
Connect the No. 4 engine room wire connector and attach the 10 claws to install the bumper cover.

d. Install the 3 clips, 4 screws and 4 bolts.



e. Using a T30 "TO socket, install the 6 screws.

15. INSTALL RADIATOR RILLE



a. Attach the 2 clips and 8 claws to install the radiator grille.

b. Install the 3 screws.

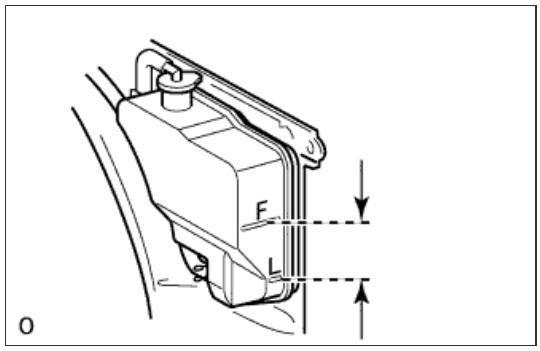
16. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the radiator support seal with the 7 clips.

for Preparation Click here

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.



1. CHECK ENGINE COOLANT LEVEL

a. Check that the engine coolant level is between the L and F lines when the engine is cold.
If the engine coolant is low, check for leaks and add "TOYOTA Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the F line.

NOTICE:

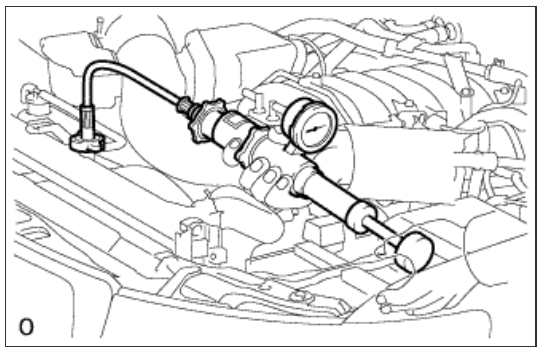
Do not substitute plain water for engine coolant.

b. Remove the radiator cap, and check that the coolant level is up to the radiator filler hole.

2. INSPECT ENGINE COOLANT UALITY

a. Remove the radiator cap.

b. Check if there are any excessive deposits of rust or scales around the radiator cap and radiator filler hole. Also, the coolant should be free of oil.
If excessively dirty, clean the coolant passage and replace the coolant.



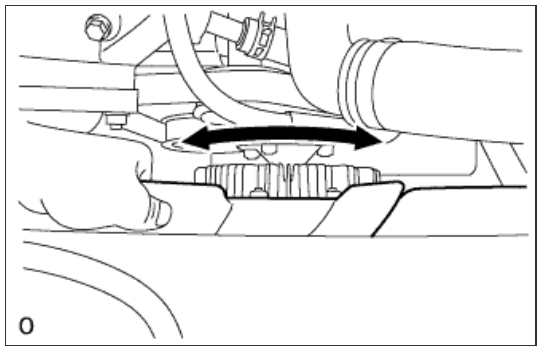
c. Install the radiator cap.

3. INSPECT FOR COOLANT LEAK

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.



4. INSPECT FLUID COUPLING ASSEMBLY

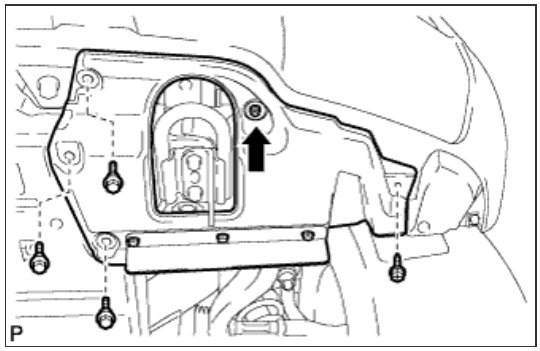
a. Check the turning smoothness of the fluid coupling.
If necessary, replace the fluid coupling assembly.

b. Check that the fluid coupling is not damaged and that no silicon oil leaks.

If necessary, replace the fluid coupling assembly.

for Preparation Click here

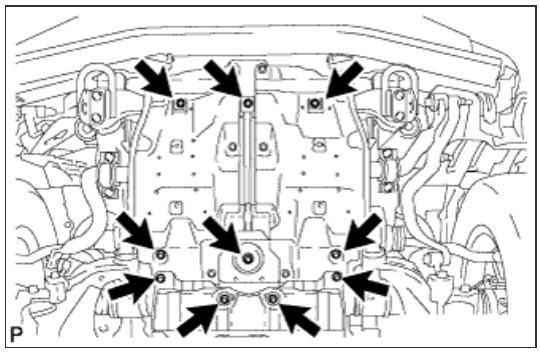
1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

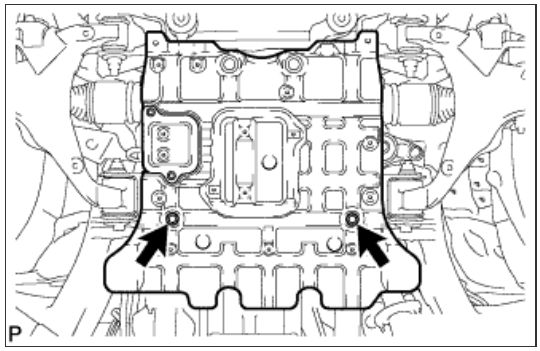
Use the same procedures described for the LH side.

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



a. Remove the 3 bolts and screw.

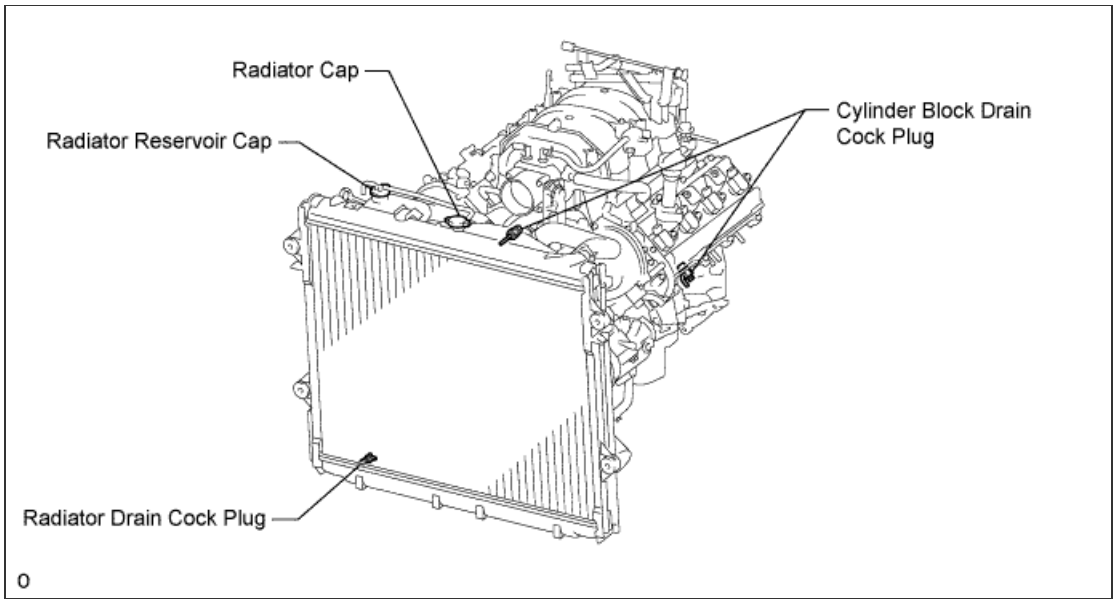
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

4. REMOVE NO. 2 ENGINE UNDER COVER



a. Remove the 2 bolts and No. 2 engine under cover.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

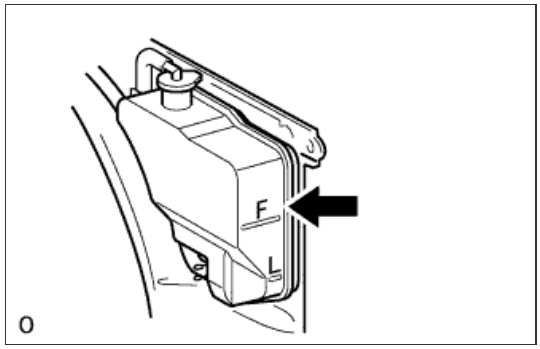
Torque:
13 N*m{ 130 kgf*cm , 9 ft.*lbf }

e. Tighten the radiator drain cock plug by hand.

6. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacit :



Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	16.3 liters (17.2 US qts, 14.3 Imp. qts)
w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	16.9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical

problems, only use T TA SLLC or similar high quality ethylene glycol based non silicate, non amine, non nitrite, non borate coolant with long life hybrid organic acid technology (coolant with long life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the line.

c. Install the radiator reservoir cap.

d. Press the inlet and outlet radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

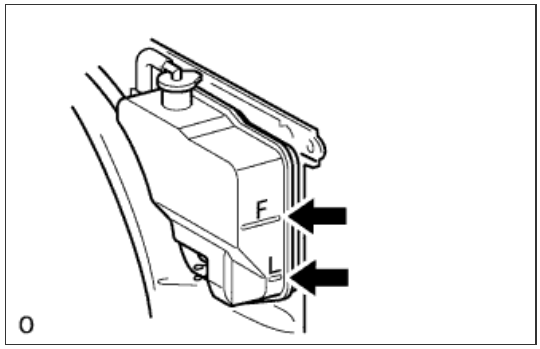
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the inlet and outlet radiator hoses several times by hand to bleed air.

CAUTION:



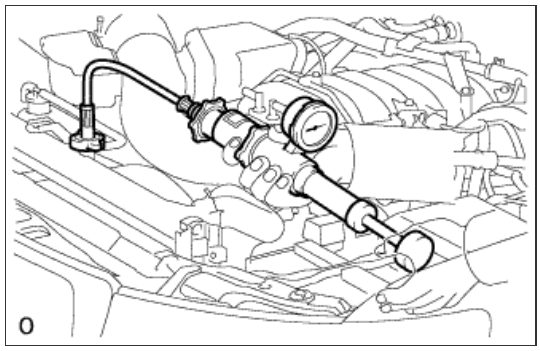
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

i. Stop the engine, and wait until the engine coolant cools down to the ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

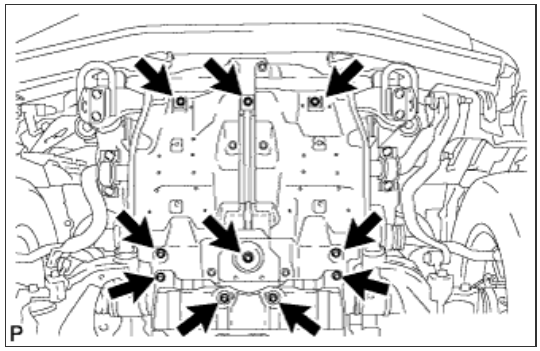
j. Check that the coolant level is between the and L lines. If the coolant level is below the L line, repeat all of the procedures above. If the coolant level is above the line, drain coolant so that the coolant level is between the and L lines.



7. INSPECT FOR COOLANT LEAK

a. ill the radiator with coolant and attach a radiator cap tester.

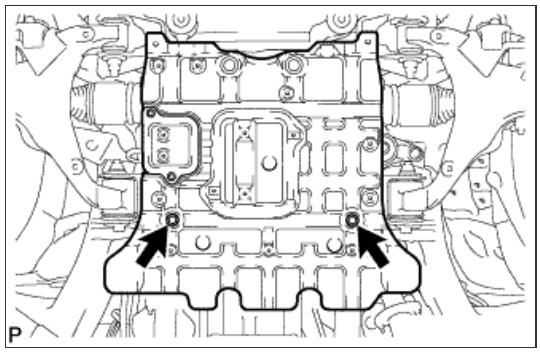
b. Warm up the engine.



c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

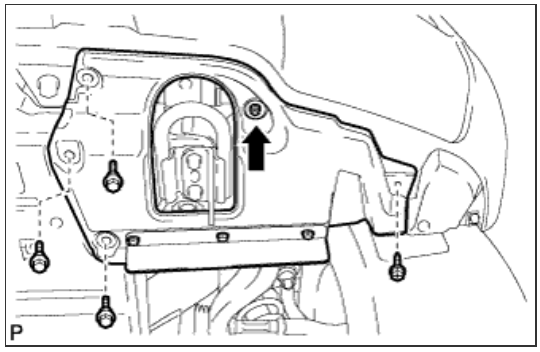
a. Install the No. 1 engine under cover with the 10 bolts.



Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

9. INSTALL NO. 2 ENGINE UNDER COVER

a. Install the No. 2 engine under cover with the 2 bolts.



Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

10. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

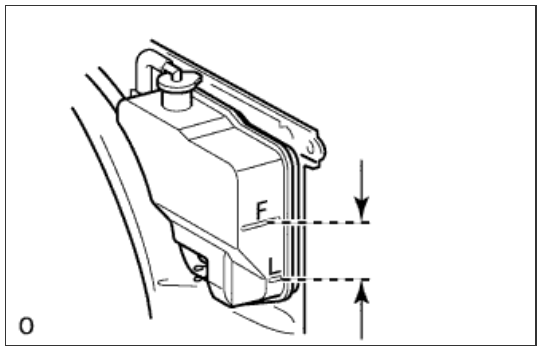
a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

11. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

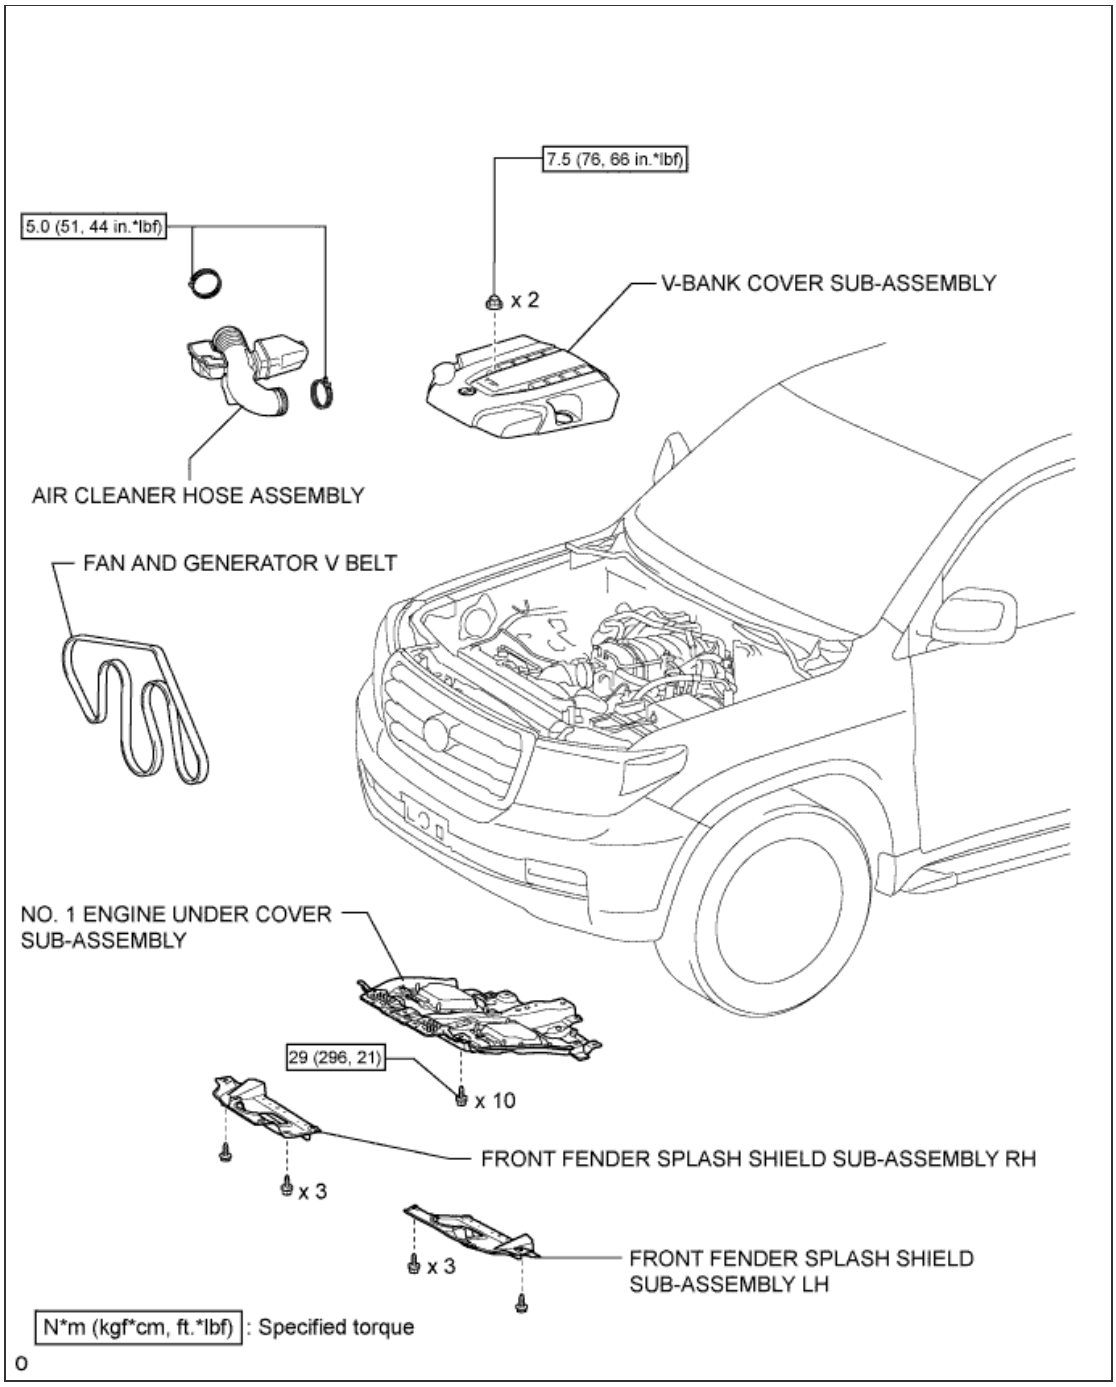
HINT:

Use the same procedures described for the LH side.

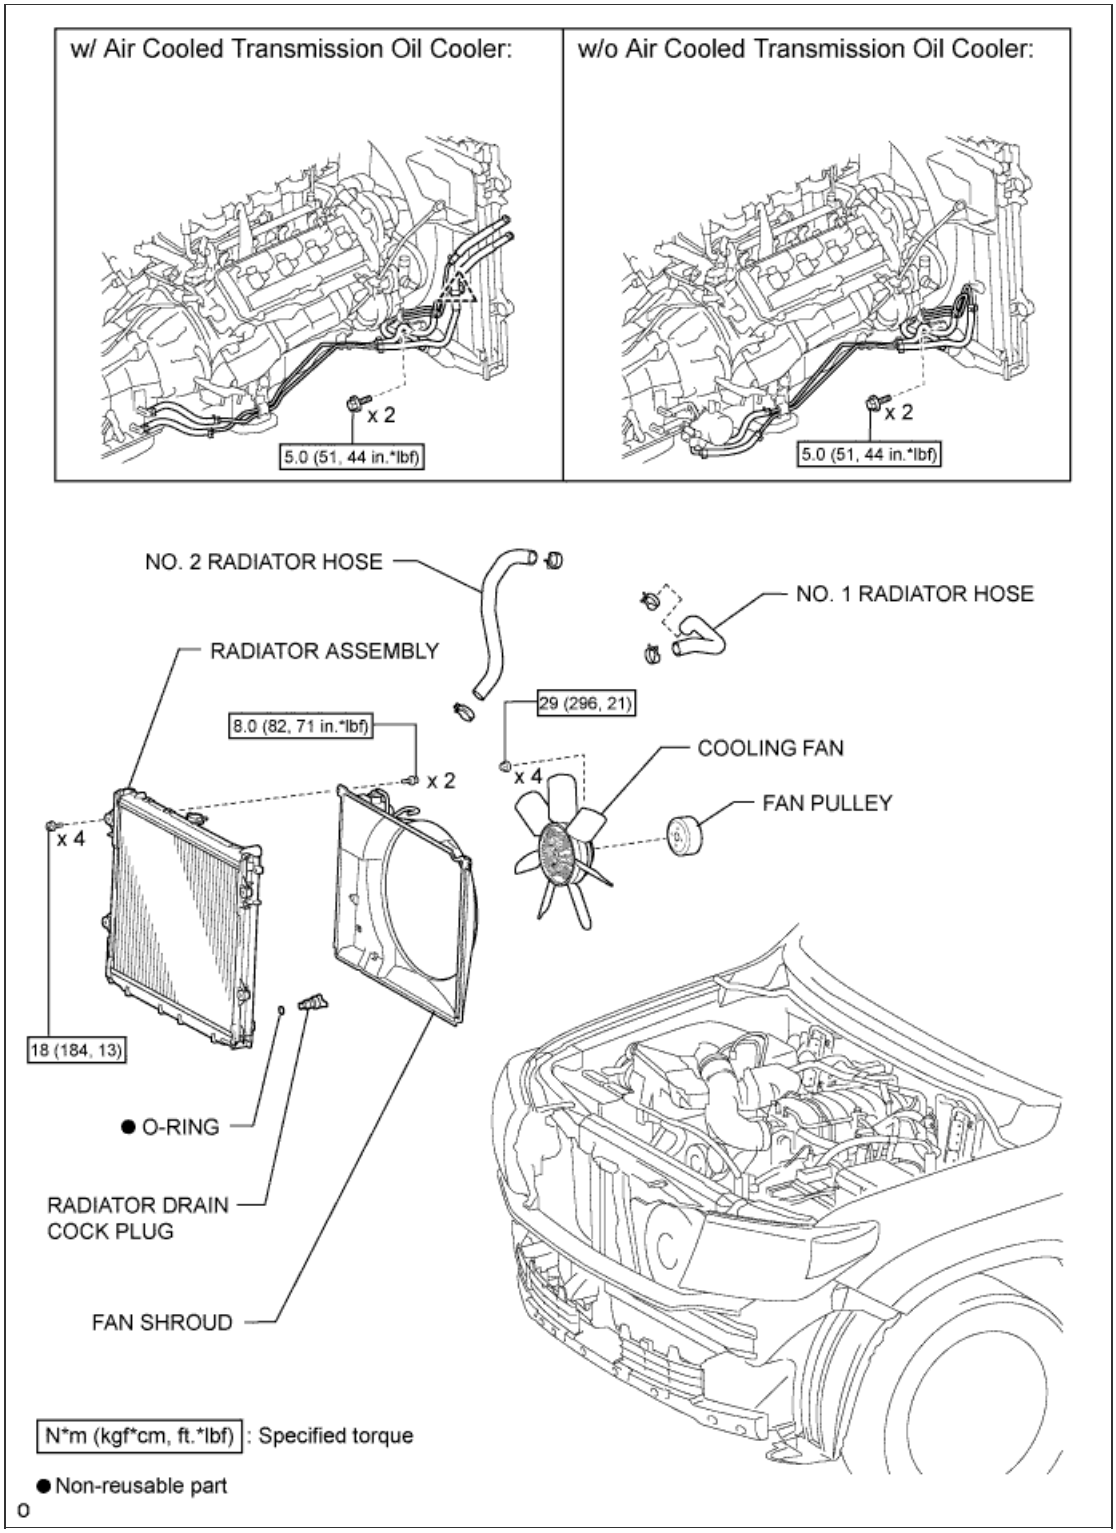


12. INSPECT ENGINE COOLANT LEVEL

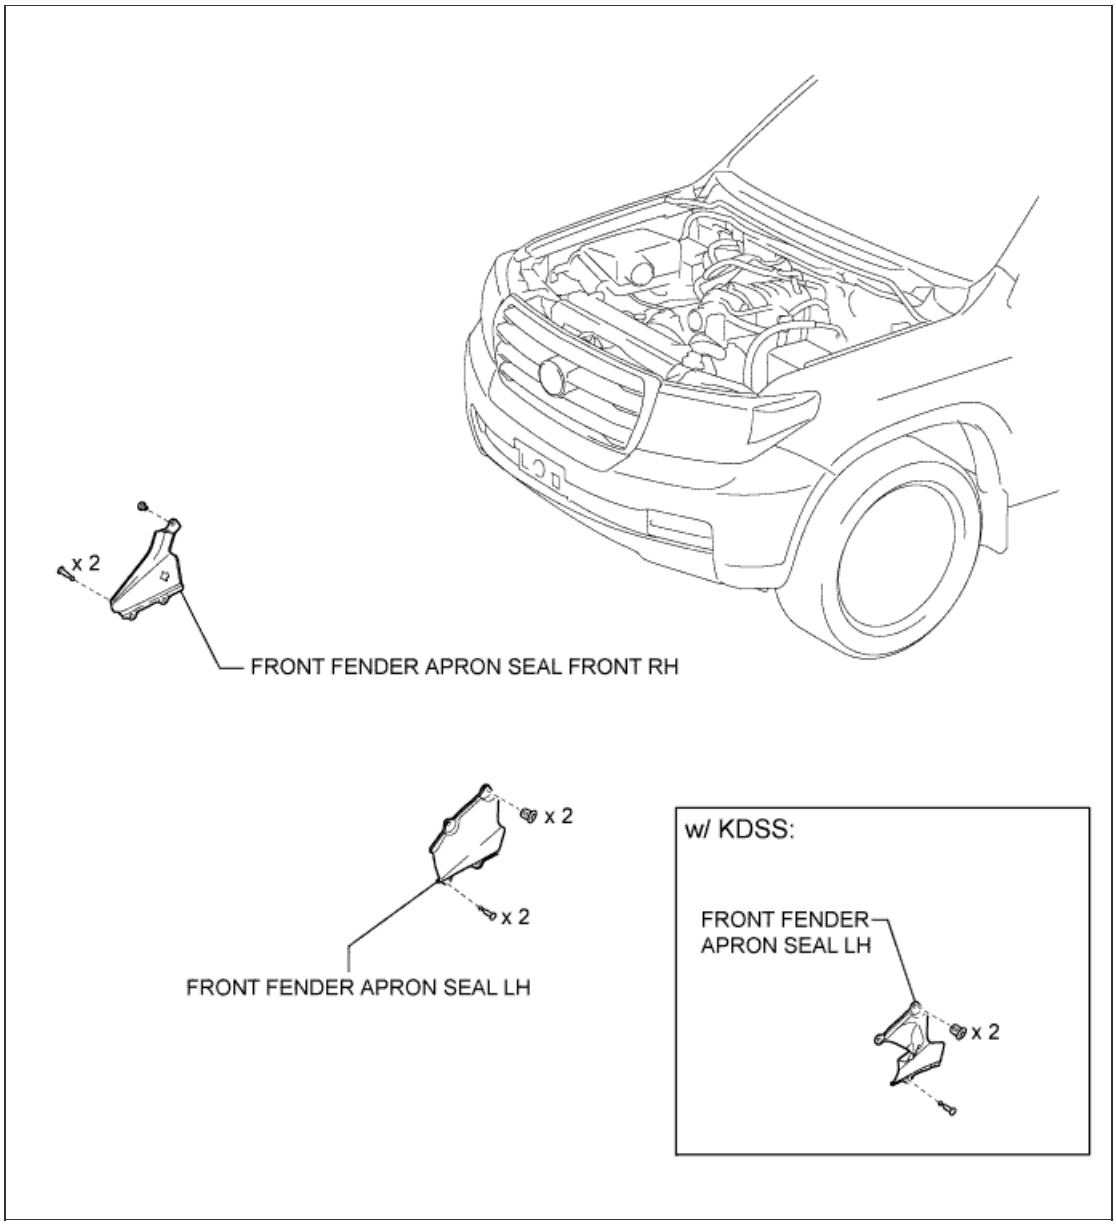
a. Check that the engine coolant level is between the L and lines when the engine is cold.
If the engine coolant is low, check for leaks and add "T TA Super Long Life Coolant" or similar high quality ethylene glycol based non silicate, non amine, non nitrite and non borate coolant with long life hybrid organic acid technology to the line.



NOTICE:



Do not substitute plain water for engine coolant.



b. Remove the radiator cap, and check that the coolant level is up to the radiator filler hole.

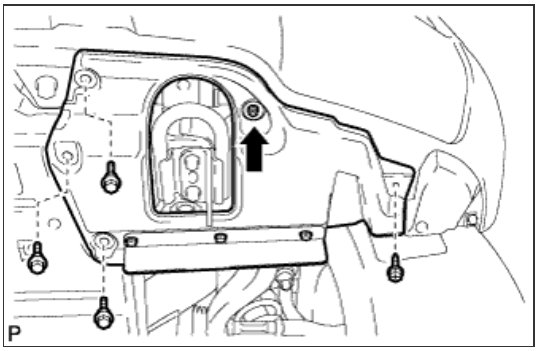
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.



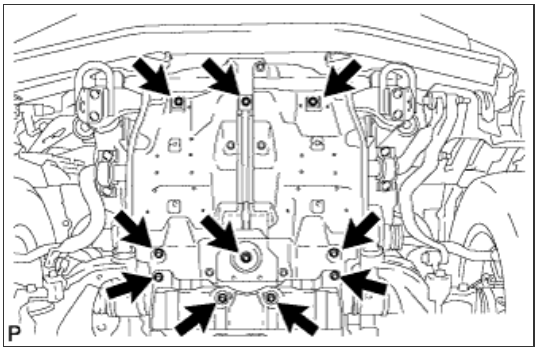
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

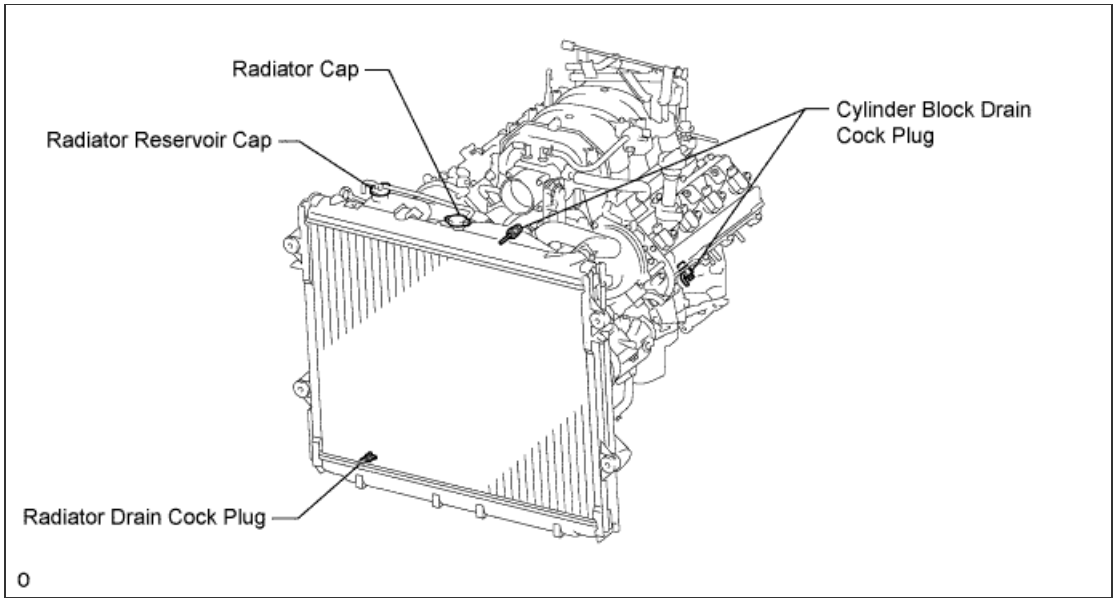


3. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

4. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Remove the 10 bolts and No. 1 engine under cover.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

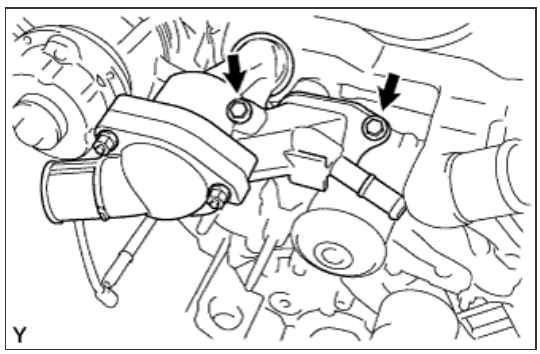
c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 130 kgf*cm , 9 ft.*lbf }

e. Tighten the radiator drain cock plug by hand.

6. REMOVE TIMING BELT

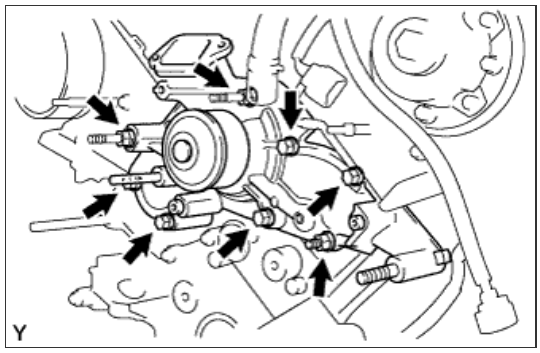


a. For the timing belt, refer to the following procedures (Click here).

7. REMOVE WATER INLET HOUSING

a. Remove the 2 bolts holding the water inlet housing to the water pump.

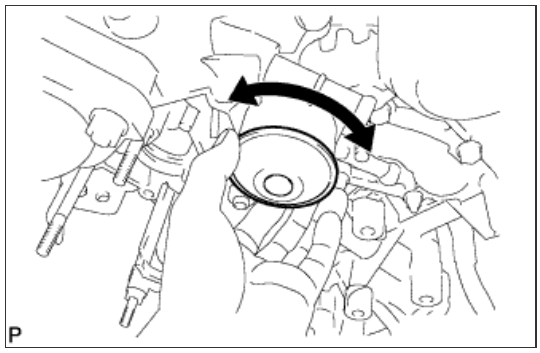
b. Disconnect the water inlet housing from the front water by-pass oint and water pump. Then remove the water inlet and inlet housing assembly.



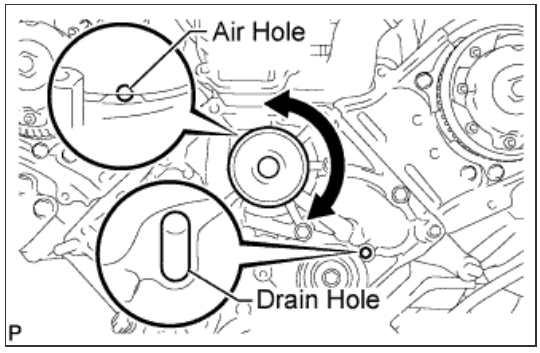
c. Remove the O-ring from the water inlet housing.

8. REMOVE WATER PUMP ASSEMBLY

a. Remove the 5 bolts, 2 stud bolts, nut, water pump and gasket.



b. Remove the O-ring from the water by-pass pipe.



for Preparation Click here

1. INSPECT WATER PUMP ASSEMBLY

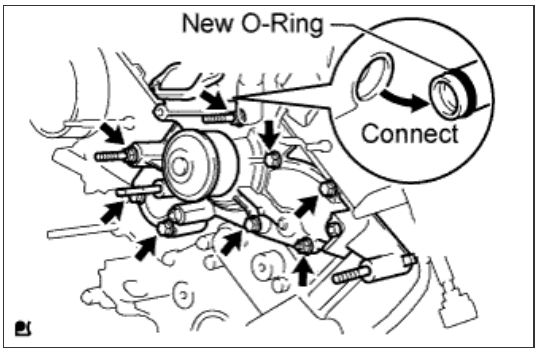
a. Turn the pulley and check that the water pump bearing moves smoothly and quietly.
If necessary, replace the water pump assembly.

b. Visually check the air hole and drain hole for coolant leakage.
If leakage is found, replace the water pump assembly and timing belt.

for Preparation Click here

1. INSTALL WATER PUMP ASSEMBLY

a. Apply soapy water to a new O-ring.



b. Install the O-ring to the water by-pass pipe end.

c. Install a new gasket to the cylinder block.

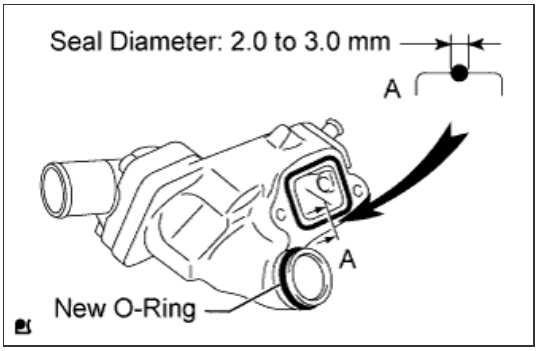
d. Connect the water pump to the water by-pass pipe end.

e. Temporarily install the water pump with the 5 bolts, 2 stud bolts and nut. Uniformly tighten the bolts, stud bolts and nut in several passes.

Torque:
for bolt:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for stud bolt, nut:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

2. INSTALL WATER INLET HOUSING

a. Apply soapy water to a new O-ring and install it to the water inlet housing.



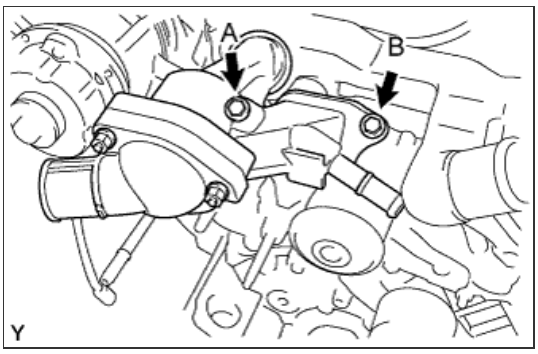
b. Apply seal packing in a continuous line to the places shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing 1282B, Three Bond 1282B or equivalent

Standard seal diameter:
2.0 to 3.0 mm (0.0787 to 0.118 in.)

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the water inlet housing within 3 minutes after applying seal packing.**



c. Temporarily install the water inlet housing with the 2 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

Bolt Length:

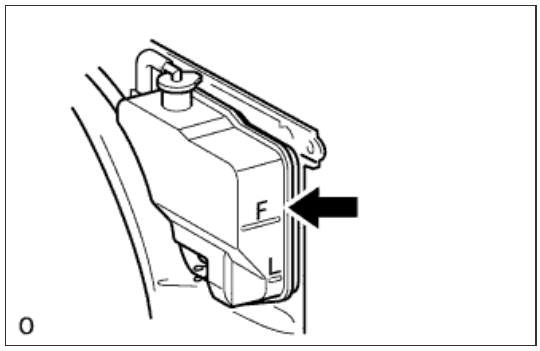
Item	Length
Bolt A	77 mm (3.03 in.)
Bolt B	22 mm (0.866 in.)

3. INSTALL TIMING BELT

a. For the timing belt, refer to the following procedures (Click here).

4. ADD ENGINE COOLANT

a. Add engine coolant.



Standard Capacity:

Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	16.3 liters (17.2 US qts, 14.3 Imp. qts)
w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	16.9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the radiator reservoir cap.

d. Press the inlet and outlet radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

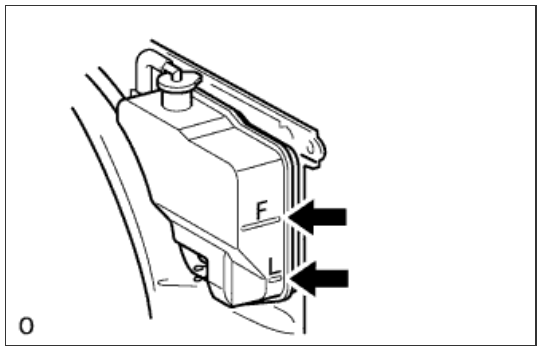
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the inlet and outlet radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

i. Stop the engine, and wait until the engine coolant cools down to the ambient temperature.

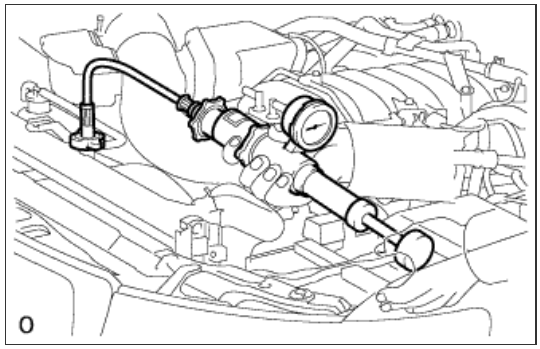
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines. If the coolant level is below the L line, repeat all of the procedures above. If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

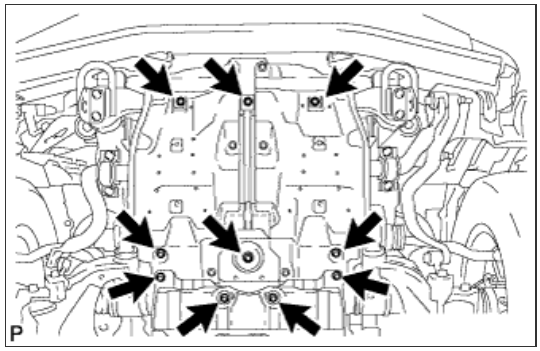


When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

6. INSPECT FOR COOLANT LEAK

a. Fill the radiator with coolant and attach a radiator cap tester.

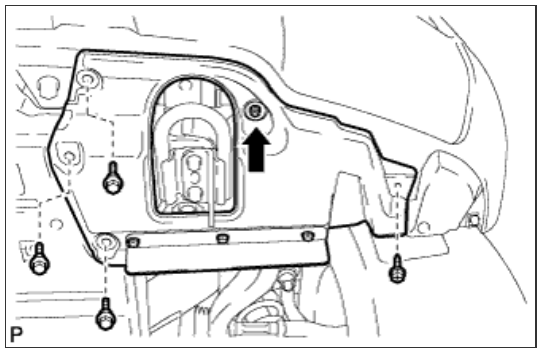
b. Warm up the engine.



c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

7. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.



Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

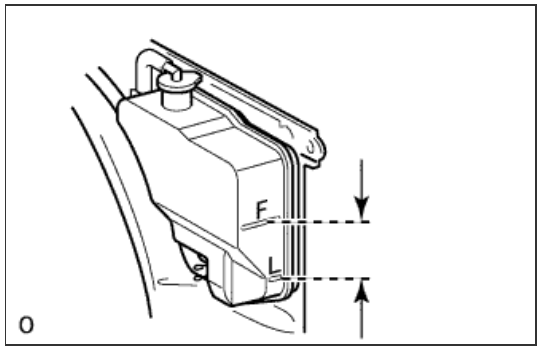
a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

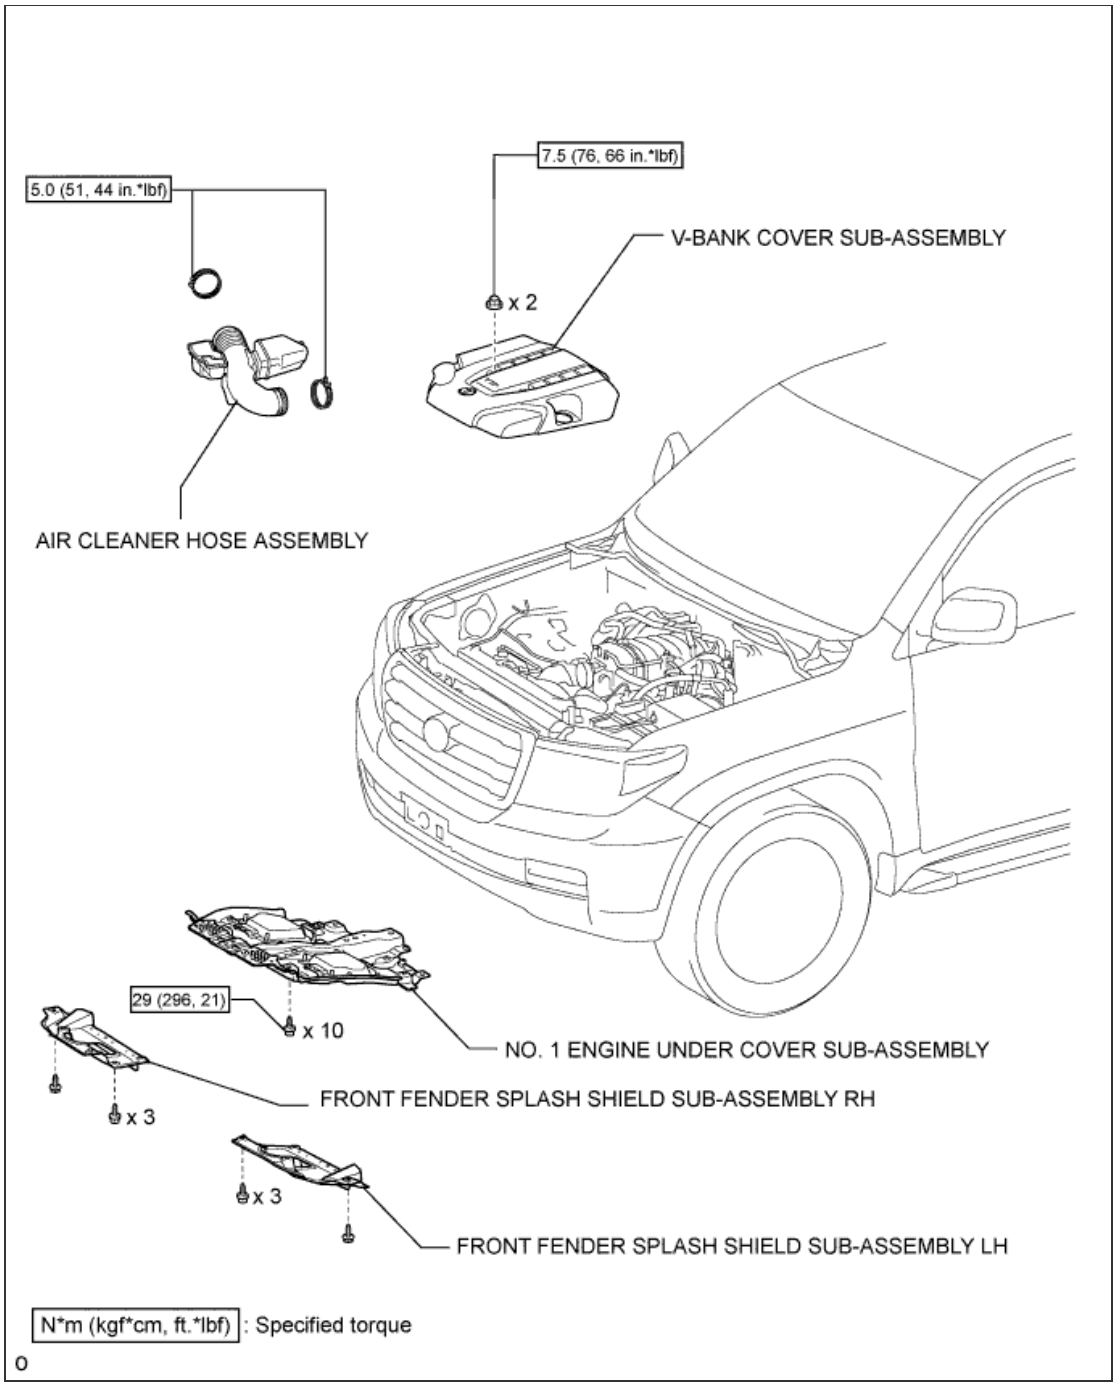
HINT:

Use the same procedures described for the LH side.

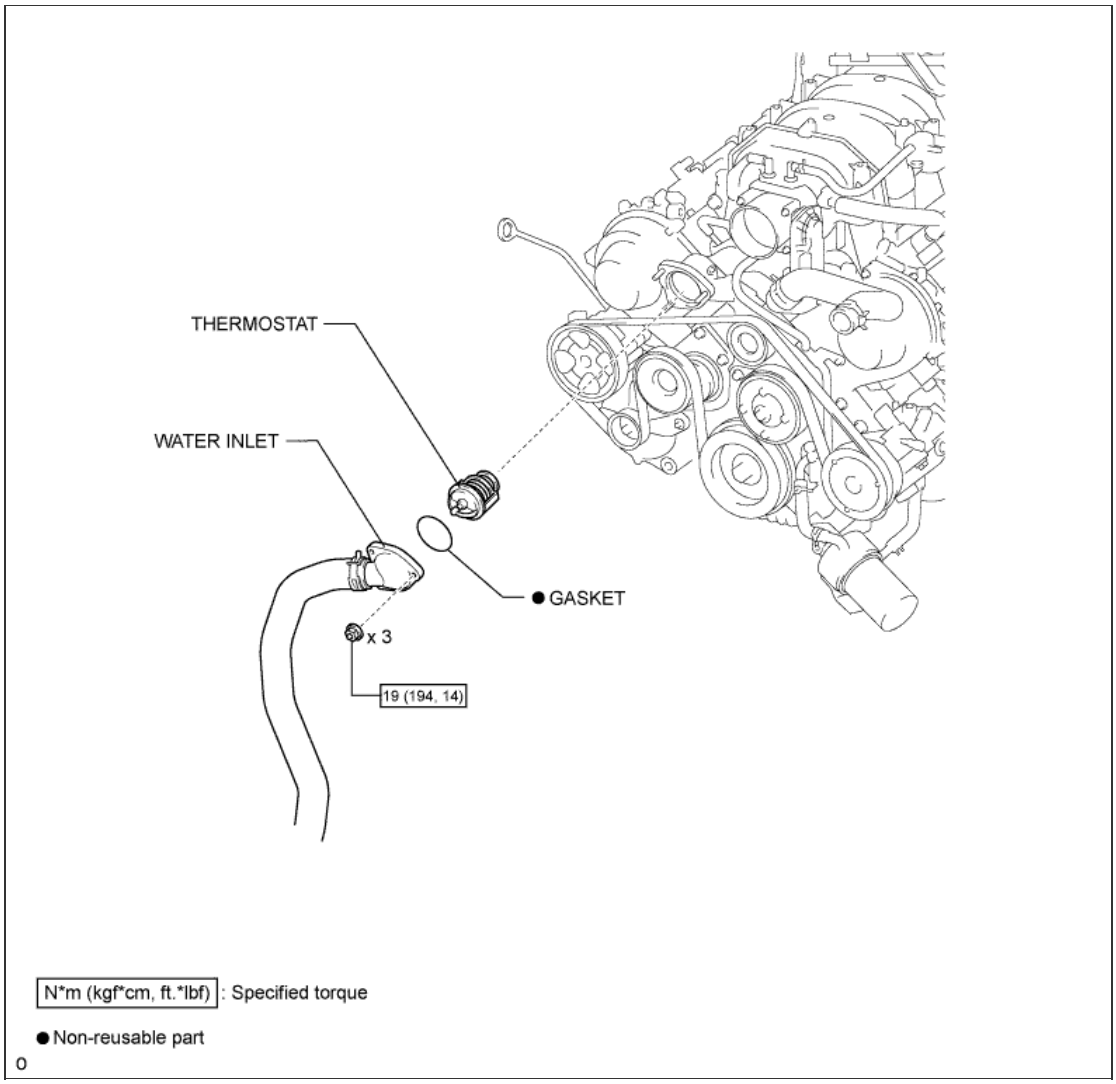


10. INSPECT ENGINE COOLANT LEVEL

a. Check that the engine coolant level is between the L and F lines when the engine is cold.
If the engine coolant is low, check for leaks and add "TOYOTA Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the F line.



NOTICE:



Do not substitute plain water for engine coolant.

b. Remove the radiator cap, and check that the coolant level is up to the radiator filler hole.

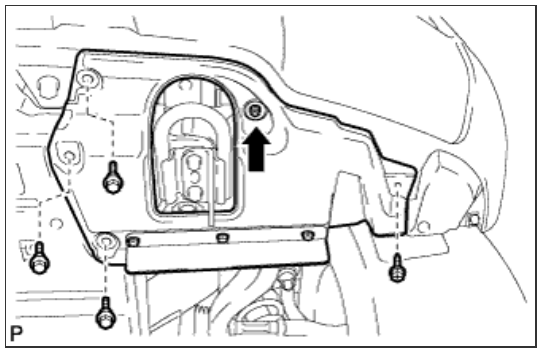
for Preparation [Click here]

N*m (kgf*cm, ft.*lbf) : Specified torque

● Non-reusable part

o

for Preparation Click here



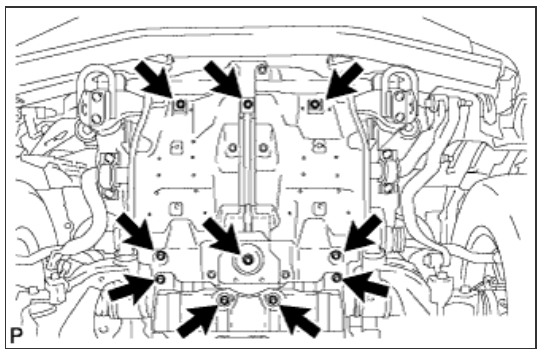
HINT:

If the thermostat is not installed, cooling efficiency decreases. Do not remove the thermostat as this will cause the engine to overheat easily.

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

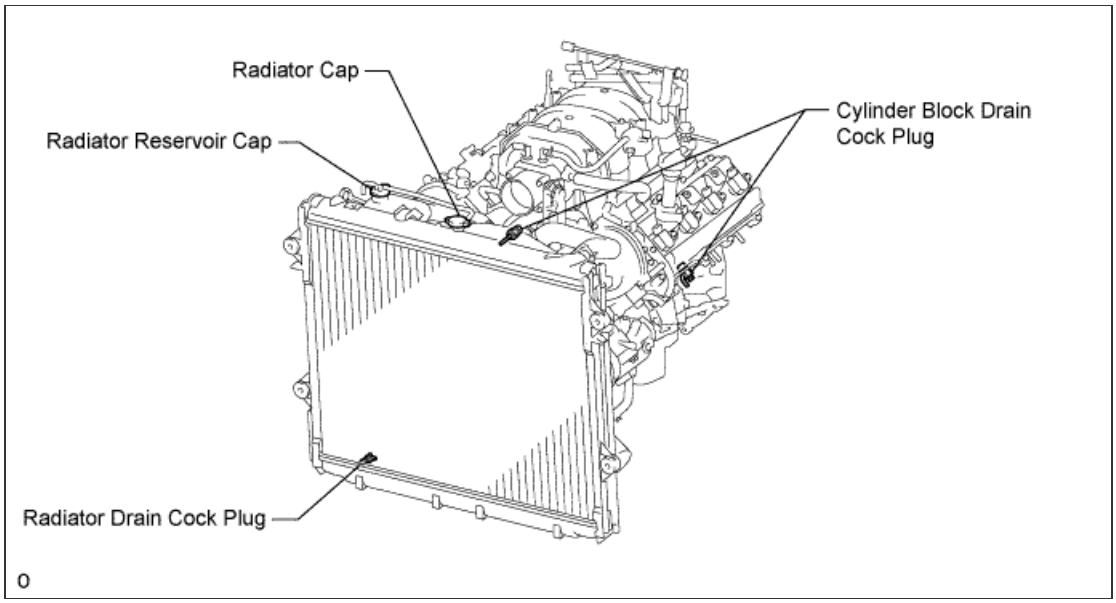


2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

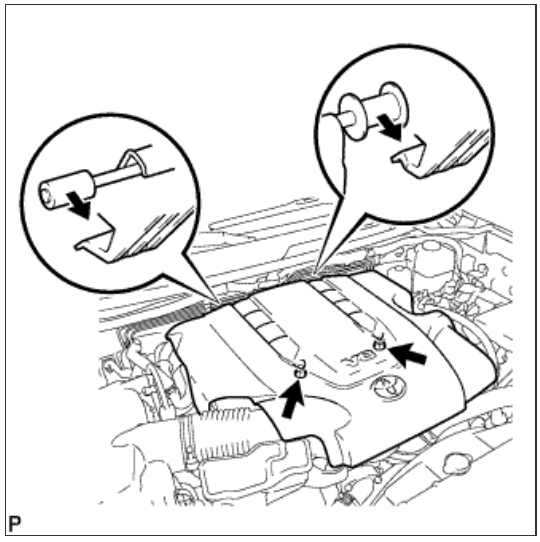
a. Loosen the radiator drain cock plug.

b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.



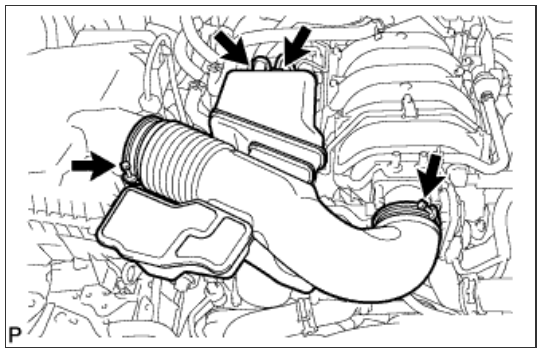
d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 130 kgf*cm , 9 ft.*lbf }

e. Tighten the radiator drain cock plug by hand.

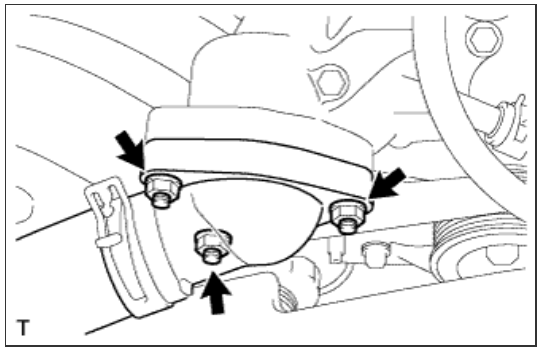
5. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Remove the 2 nuts and V-bank cover.



6. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum transmitting hose and No. 2 ventilation hose.



b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

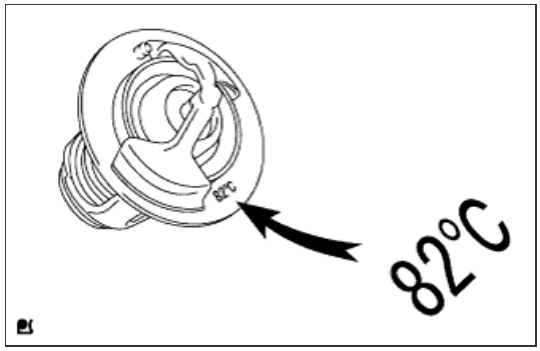
7. DISCONNECT WATER INLET

a. Remove the 3 nuts, and disconnect the water inlet from the water inlet housing.

8. REMOVE THERMOSTAT

a. Remove the thermostat.

b. Remove the gasket from the thermostat.



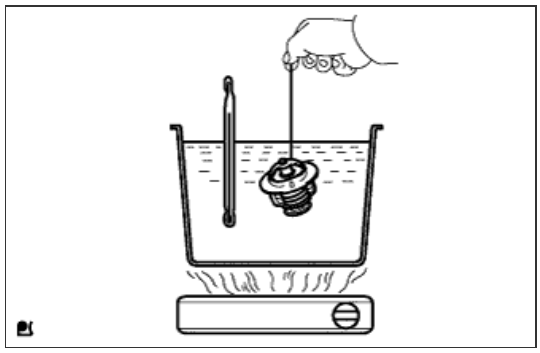
for Preparation Click here

1. INSPECT THERMOSTAT

HINT:

The valve opening temperature is inscribed on the thermostat.

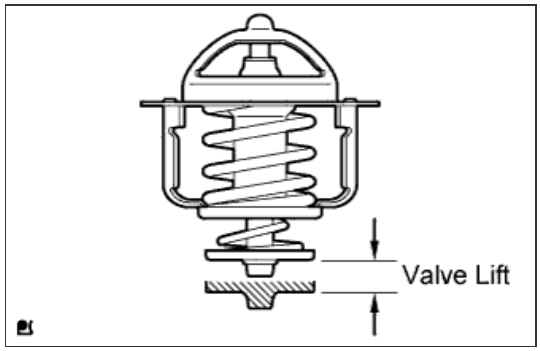
a. Check that the valve is fully closed when the thermostat is at a low temperature (below 77 C (171 .
If not fully closed, replace the thermostat.



b. Immerse the thermostat in water, then gradually heat the water.

c. Check the valve opening temperature of the thermostat.

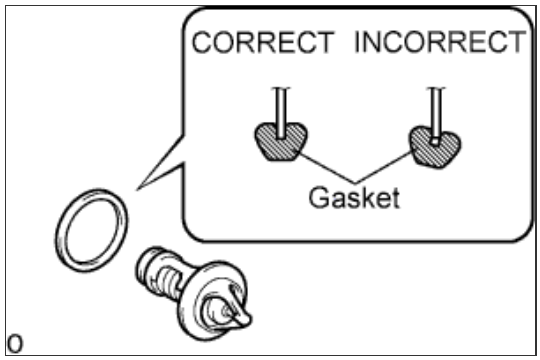
Standard valve opening temperature:
80 to 84°C (176 to 183°F)



If the valve opening temperature is not as specified, replace the thermostat.

d. Check the valve lift.

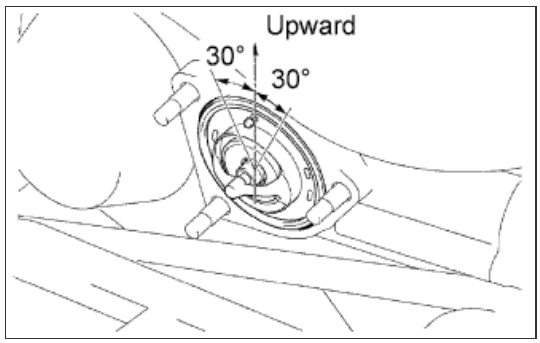
Standard valve lift:
10.0 to 11.3 mm (0.394 to 0.445 in.) or more at 95°C (203°F)



If the valve lift is not as specified, replace the thermostat.

for Preparation Click here

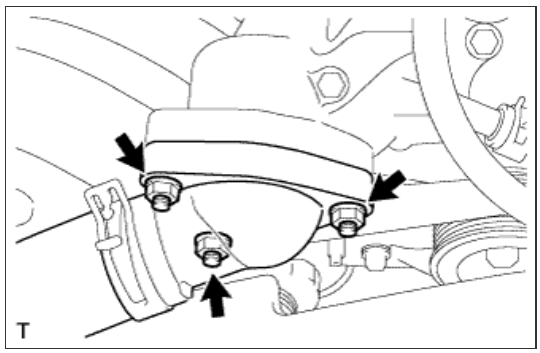
1. INSTALL THERMOSTAT



a. Install a new gasket to the thermostat.

b. Insert the thermostat into the water inlet housing with the jiggle valve facing straight upward.

HINT:



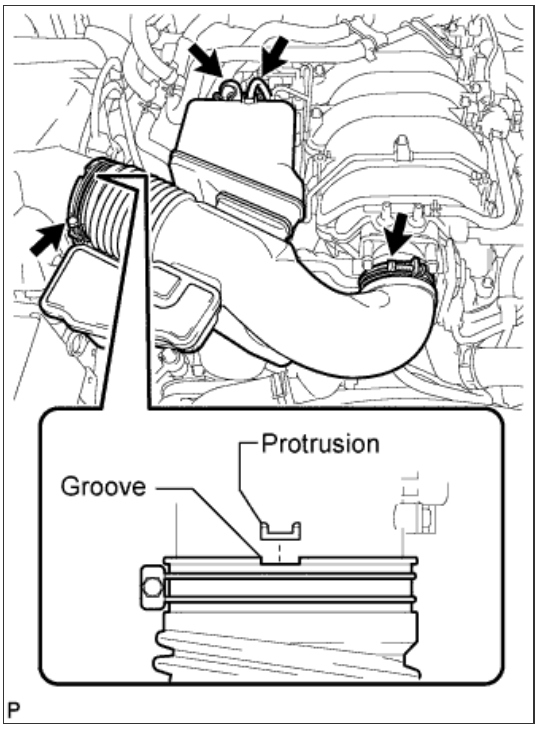
The jiggle valve may be set within 30° of either side of the prescribed position.

2. CONNECT WATER INLET

a. Connect the water inlet with the 3 nuts.

Torque:
19 N*m{ 194 kgf*cm , 14 ft.*lbf }

3. INSTALL AIR CLEANER HOSE ASSEMBLY



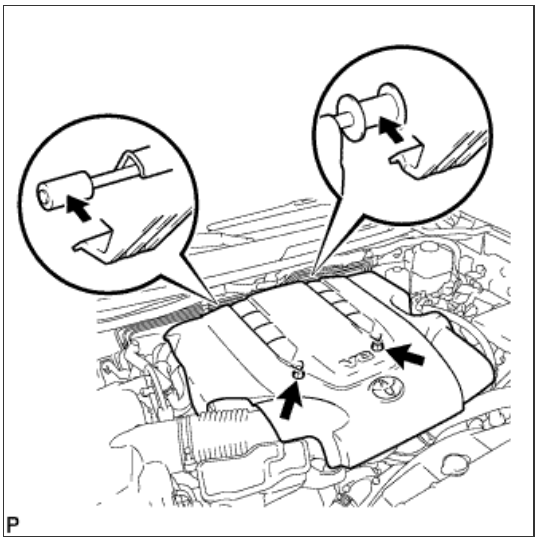
a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum transmitting hose.

d. Connect the No. 2 ventilation hose.



4. INSTALL V-BANK COVER SUB-ASSEMBLY

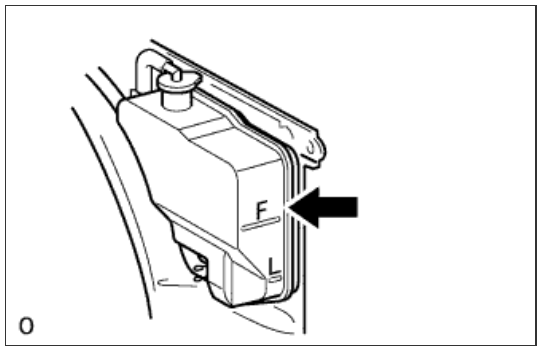
a. Attach the 2 V-bank cover hooks to the bracket.

b. Install the V-bank cover with the 2 nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

5. ADD ENGINE COOLANT

a. Add engine coolant.



Standard Capacity:

Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	16.3 liters (17.2 US qts, 14.3 Imp. qts)
w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	16.9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the radiator reservoir cap.

d. Press the inlet and outlet radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

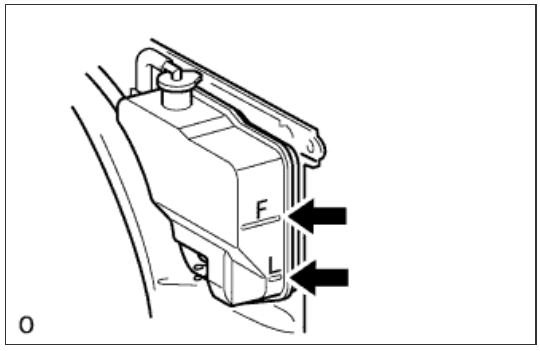
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1 stop the engine, 2 wait until the coolant has cooled down, and 3 add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the inlet and outlet radiator hoses several times by hand to bleed air.

CAUTION:



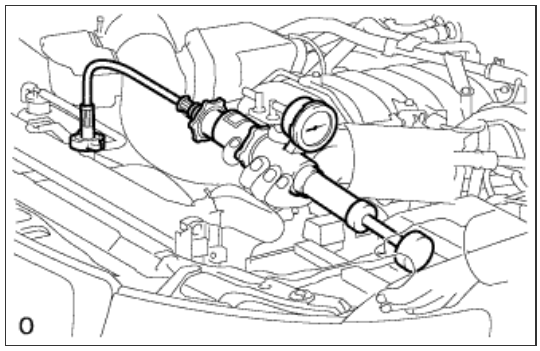
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

i. Stop the engine, and wait until the engine coolant cools down to the ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines. If the coolant level is below the L line, repeat all of the procedures above. If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

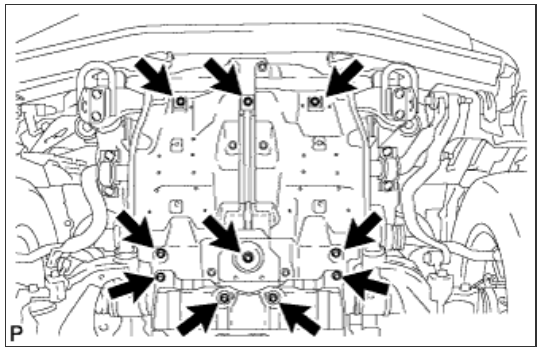


6. INSPECT FOR COOLANT LEAK

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123



kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

7. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

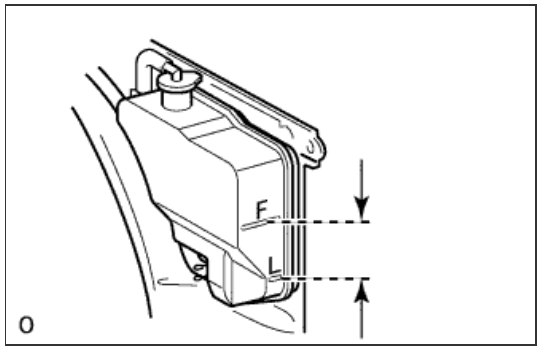
HINT:

Use the same procedures described for the LH side.

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

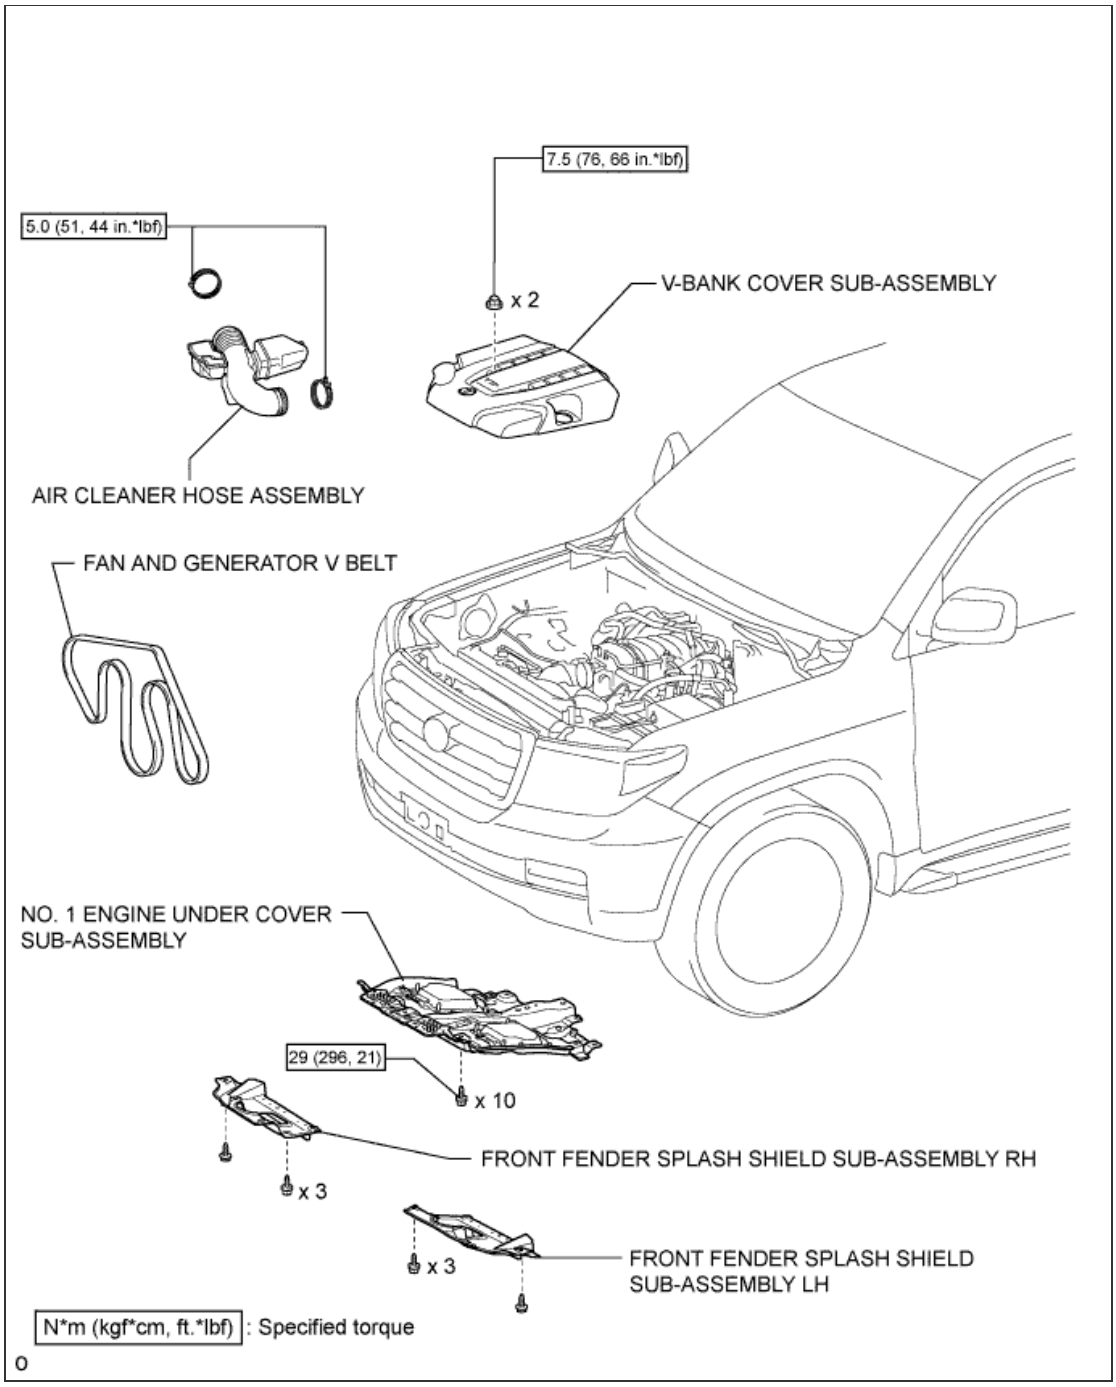
HINT:

Use the same procedures described for the LH side.

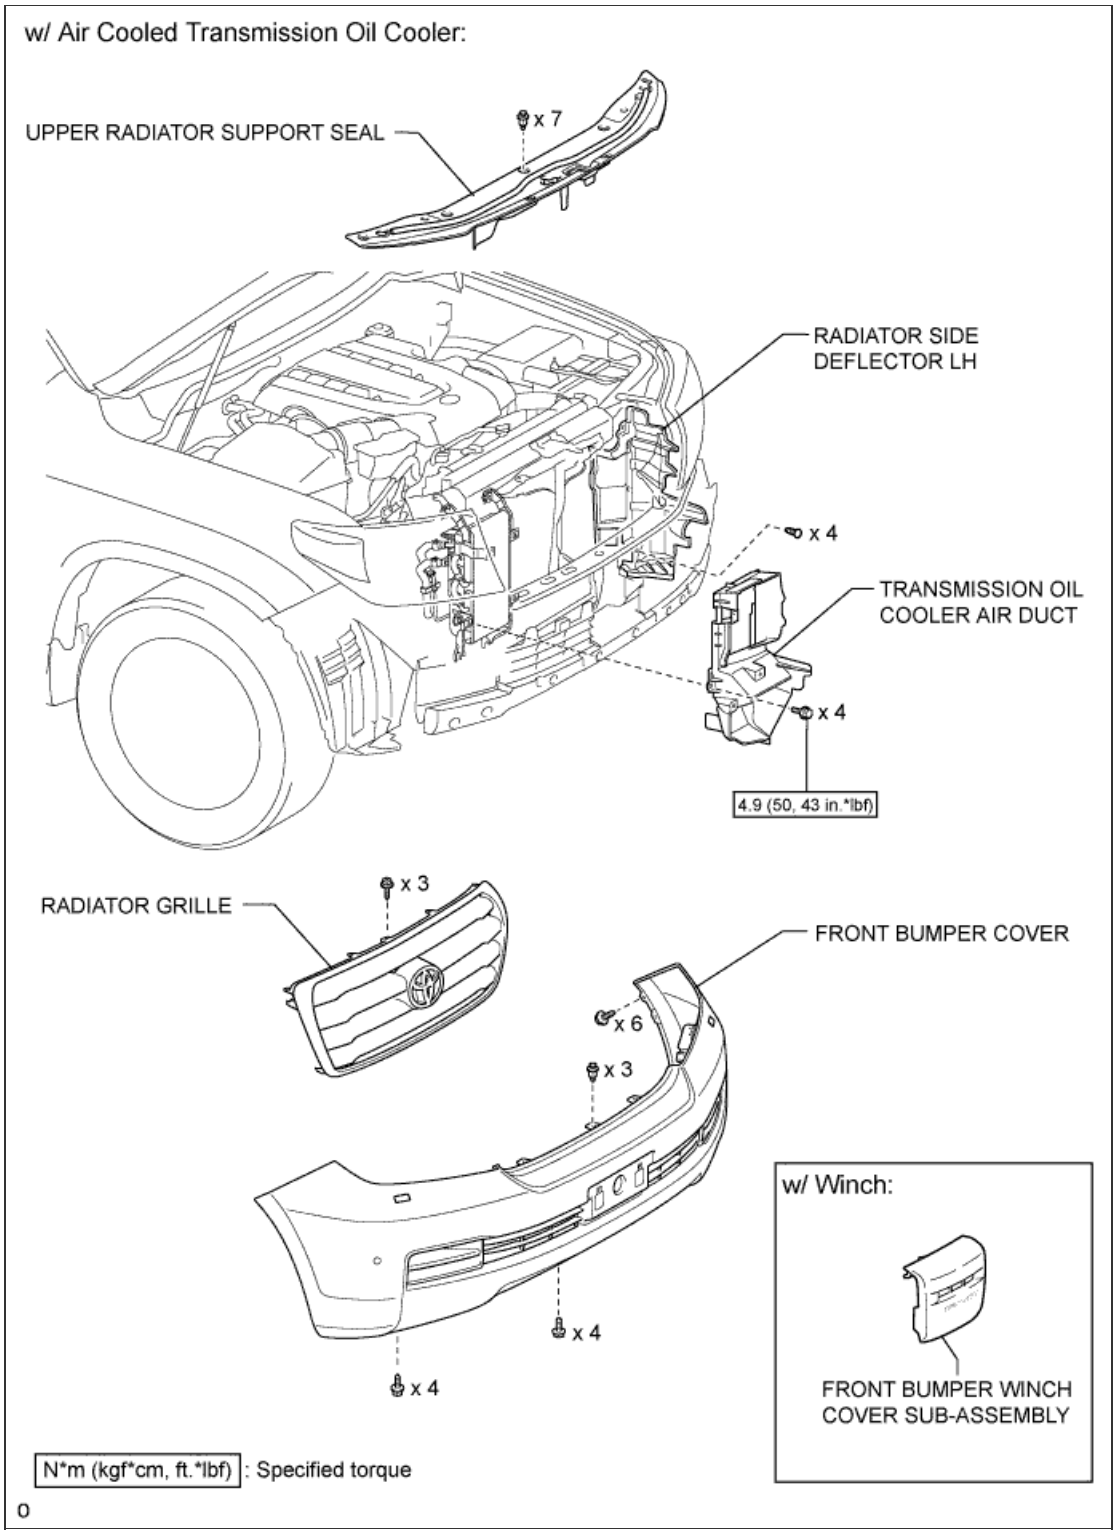


10. INSPECT ENGINE COOLANT LEVEL

a. Check that the engine coolant level is between the L and F lines when the engine is cold.
If the engine coolant is low, check for leaks and add "TOYOTA Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the F line.



NOTICE:



Do not substitute plain water for engine coolant.

b. Remove the radiator cap, and check that the coolant level is up to the radiator filler hole.

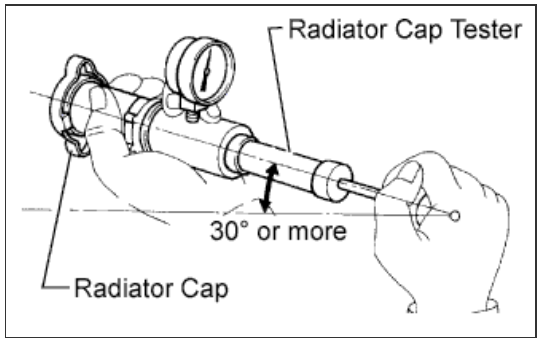
1. INSPECT RADIATOR CAP SUB-ASSEMBLY

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Visually check the radiator cap.



i. If there are water stains or foreign matter on rubber packing 1, 2 or 3, clean it with water and finger scouring.

ii. Check that rubber packing 1, 2 or 3 is not deformed, cracked or swollen.

iii. Check that rubber packing 3 and 4 are not stuck together.

b. Measure the valve opening pressure.

i. Apply engine coolant to rubber packing 2 and 3 before using a radiator cap tester.

ii. When using the cap tester, tilt it more than 30°.

iii. Pump the cap tester several times, and check the maximum pressure.

Pumping speed:
1 pump per second

HINT:

Even if the cap cannot maintain the maximum pressure, it is not a defect.

Standard udgment Criterion:

Item	Specified Condition
Standard (for brand-new cap)	93 to 123 kPa (1.0 to 1.3 kgf/cm^2, 13.5 to 18 psi)
Minimum (after using cap)	79 kPa (0.8 kgf/cm^2, 11.4 psi)

If the maximum pressure is less than the minimum standard value, replace the radiator cap sub-assembly.

2. INSPECT FINS FOR BLOCKAGE

a. Check that the radiator and condenser are not blocked with leaves, dirt, or insects. Clean the hose connections.
If the fins are blocked, wash them with water or a steam cleaner.

NOTICE:

- **If the distance between the steam cleaner and core is too close, the fins may be damaged.**
- **Keep the following in ection distance.**

Standard In ection Distance:

In ection Distance	In ection Pressure

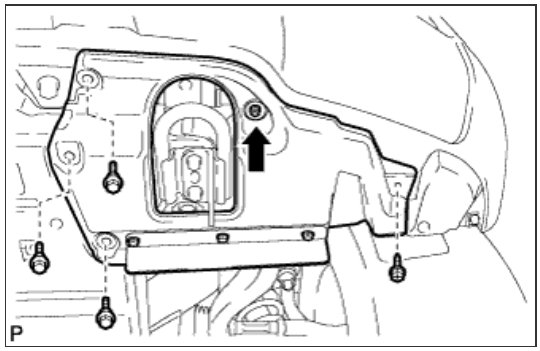
300 mm (11.8 in.)	2942 to 4903 kPa (30.0 to 50.0 kgf/cm^2, 427 to 711 psi)
500 mm (19.7 in.)	4903 to 7845 kPa (50.0 to 80.0 kgf/cm^2, 711 to 1138 psi)

- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Never apply water directly onto the electric components.**

b. Dry the fins with compressed air.

for Preparation Click here

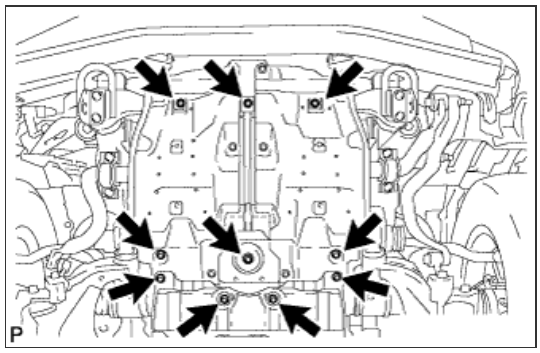
1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

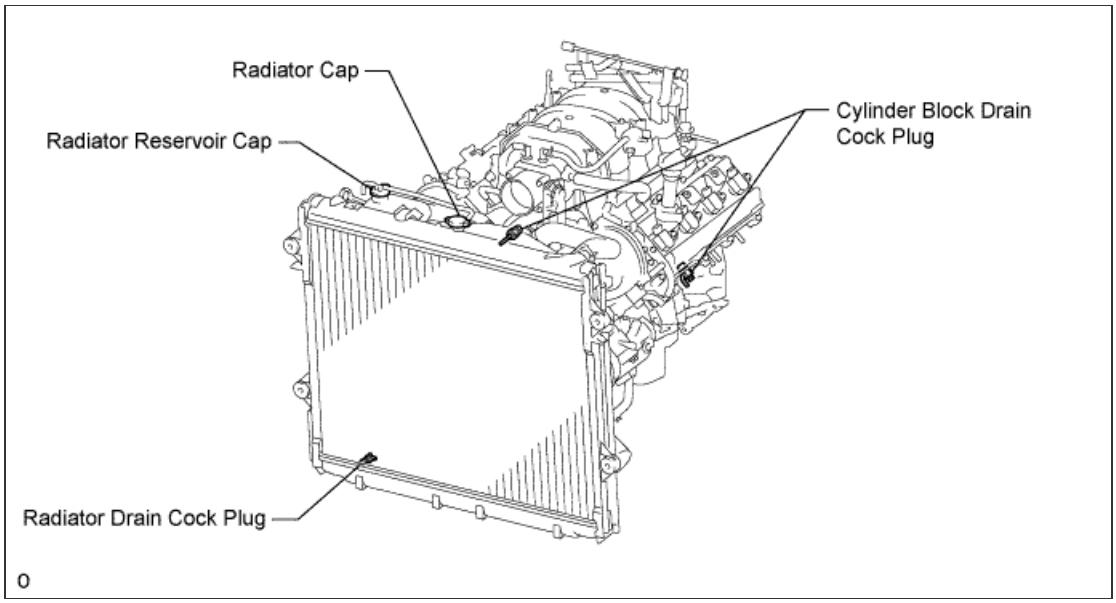
2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

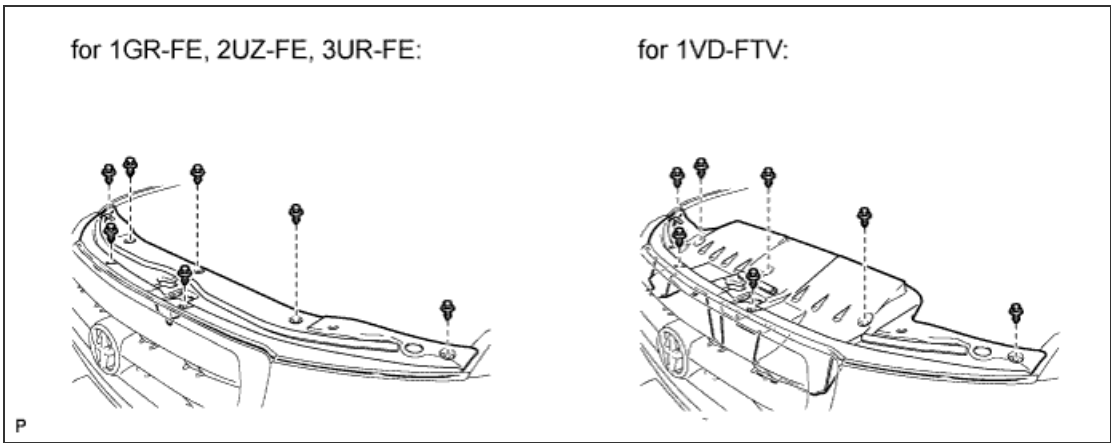
a. Loosen the radiator drain cock plug.

b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.



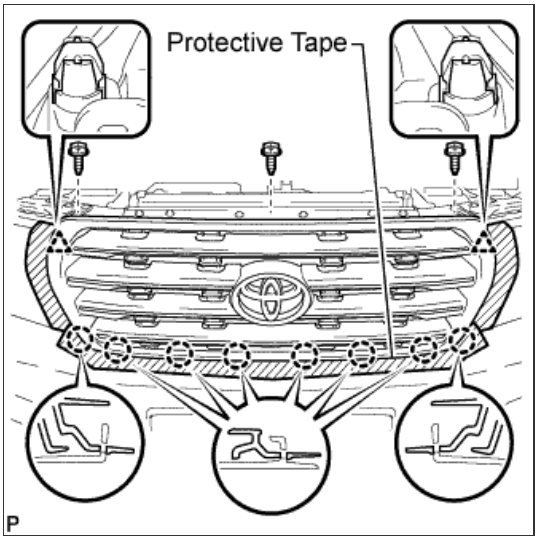
d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 130 kgf*cm , 9 ft.*lbf }

e. Tighten the radiator drain cock plug by hand.

5. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and radiator support seal.



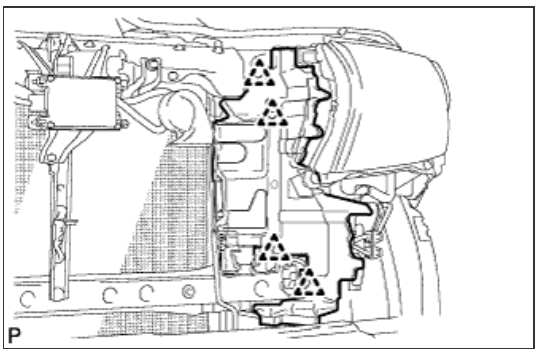
6. REMOVE FRONT BUMPER WINCH COVER SUB-ASSEMBLY (w/ Winch)

7. REMOVE RADIATOR GRILLE

a. Put protective tape around the radiator grille.

b. Remove the 3 screws.

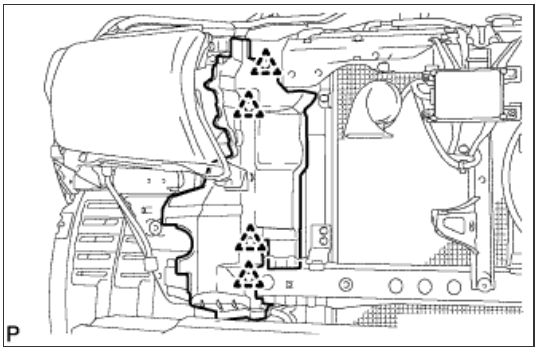
c. Detach the 2 clips and 8 claws, and remove the radiator grille.



8. REMOVE FRONT BUMPER COVER

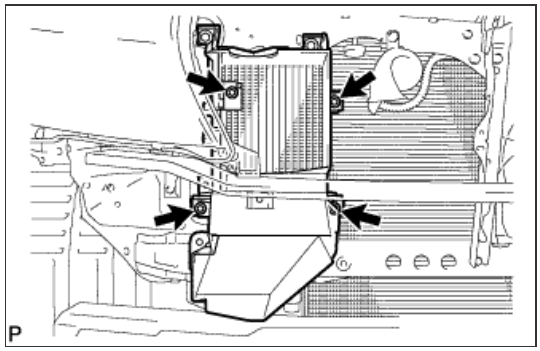
a. for Standard Type:
Refer to the following procedures (Click here).

b. w/ Winch Type:
Refer to the following procedures (Click here).



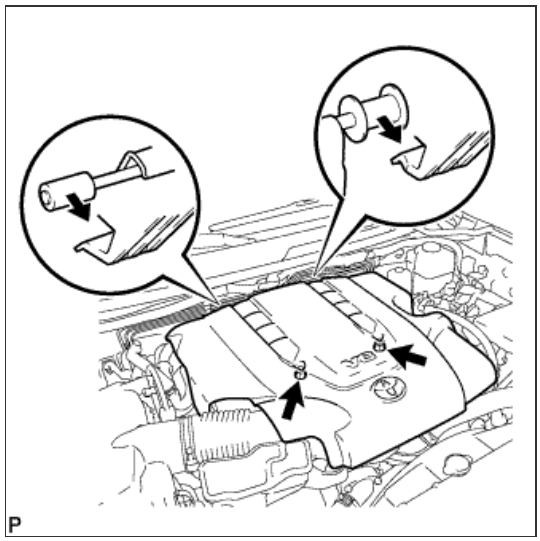
9. DISCONNECT RADIATOR SIDE DEFLECTOR LH

a. Using a clip remover, remove the 4 clips and disconnect the side deflector.



10. DISCONNECT RADIATOR SIDE DEFLECTOR RH (w/o Air Cooled Transmission Oil Cooler)

a. Using a clip remover, remove the 4 clips and disconnect the side deflector.

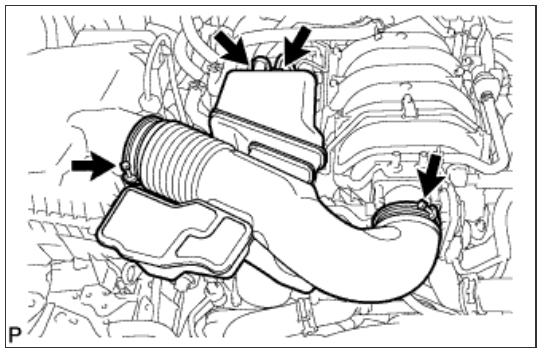


11. REMOVE TRANSMISSION OIL COOLER AIR DUCT (w/ Air Cooled Transmission Oil Cooler)

a. Remove the 4 bolts and oil cooler air duct.

12. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Remove the 2 nuts and V-bank cover.

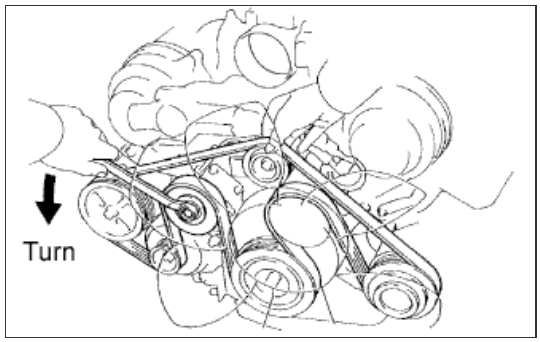


13. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum transmitting hose and No. 2 ventilation hose.

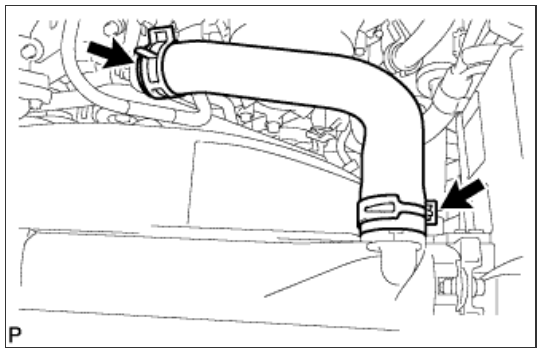
b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.



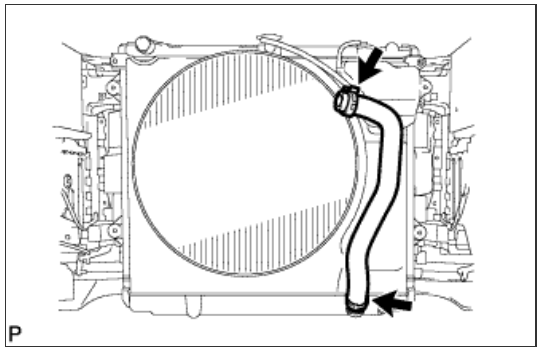
14. REMOVE FAN & GENERATOR V BELT

a. Loosen the belt tension by turning the belt tensioner counterclockwise, and then remove the fan and generator V belt.



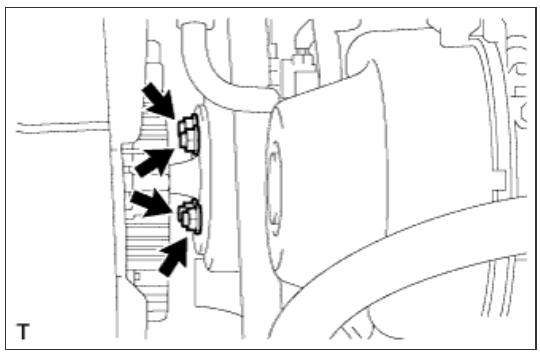
HINT:

The pulley bolt for the belt tensioner has left-hand thread.



15. REMOVE NO. 1 RADIATOR HOSE

a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to remove the radiator hose.



16. REMOVE NO. 2 RADIATOR HOSE

a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to remove the radiator hose.

17. REMOVE FAN SHROUD

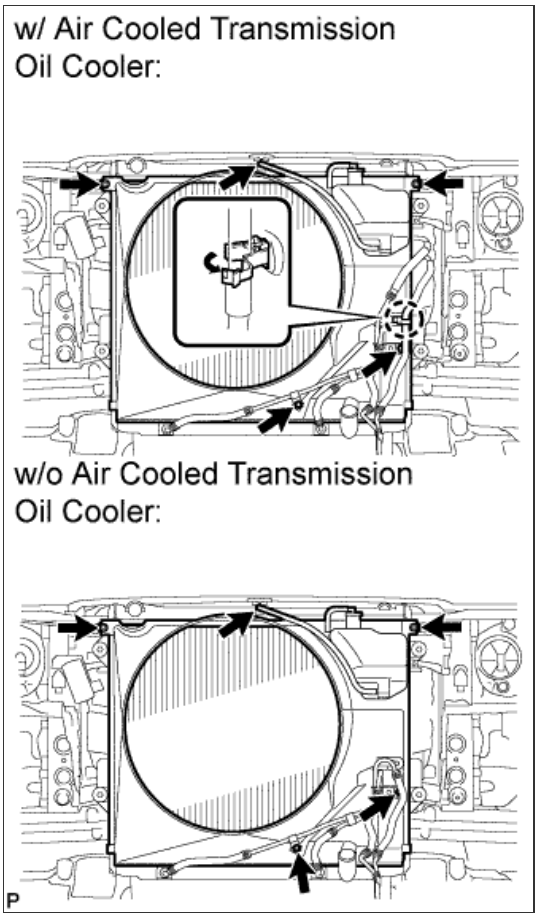
a. Loosen the 4 nuts holding the cooling fan.

b. Disconnect the reservoir hose from the upper side of the radiator tank.

c. w/ Air Cooled Transmission Oil Cooler:

Detach the claw to open the flexible hose clamp.

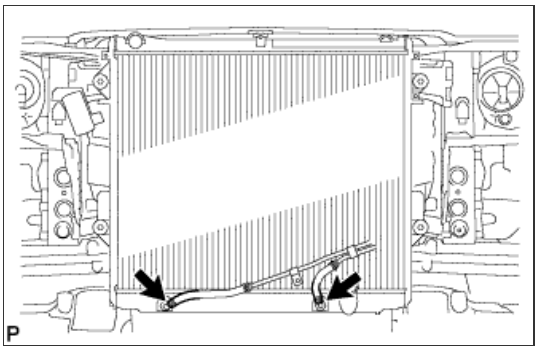
d. Remove the 2 bolts and disconnect the oil cooler tube from the fan shroud.



e. Remove the 2 bolts holding the fan shroud.

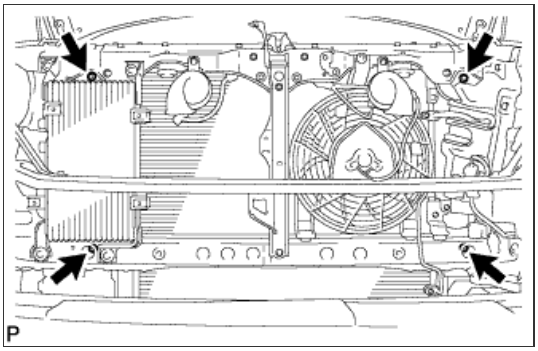
f. Remove the 4 nuts of the cooling fan, and then remove the shroud together with the cooling fan.

NOTICE:



Be careful not to damage the radiator core.

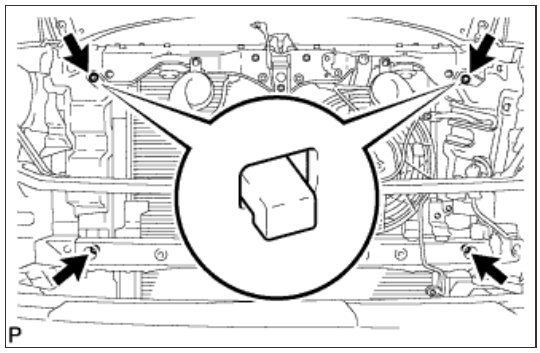
g. Remove the fan pulley from the water pump.



18. REMOVE RADIATOR ASSEMBLY

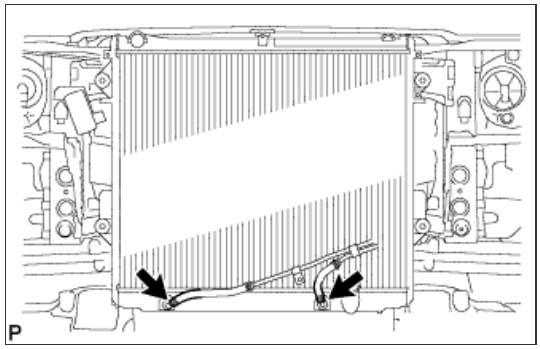
a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to disconnect the 2 oil cooler hoses.

b. Remove the 4 bolts and radiator.



for Preparation Click here

1. INSTALL RADIATOR ASSEMBLY



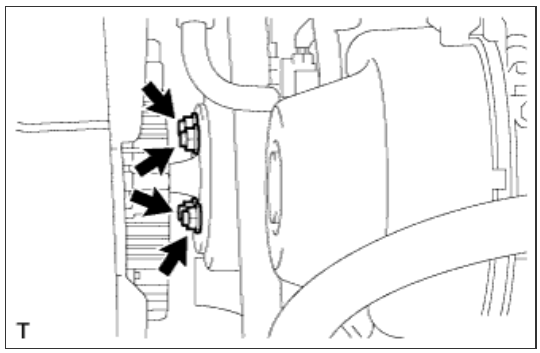
a. Set the radiator bracket hooks to the radiator support holes.

b. Install the radiator with the 4 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

c. Connect the 2 oil cooler hoses.

2. INSTALL FAN SHROUD



a. Install the fan pulley to the water pump.

b. Place the shroud together with the cooling fan between the radiator and engine.

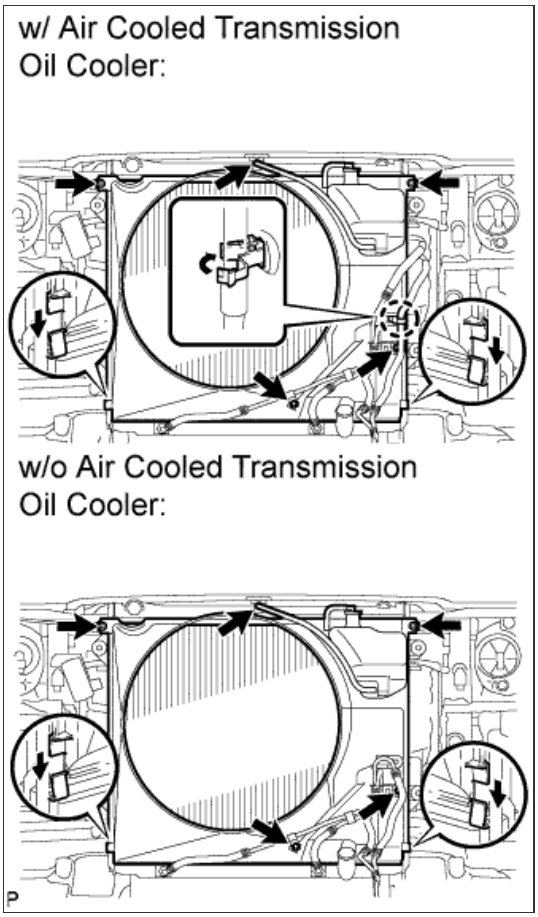
NOTICE:

Be careful not to damage the radiator core.

c. Temporarily install the cooling fan to the water pump with the 4 nuts. Tighten the nuts as much as possible by hand.

d. Attach the claws of the shroud to the radiator as shown in the illustration.

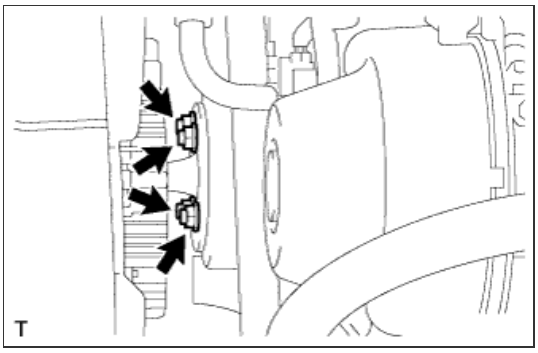
e. Install the shroud with the 2 bolts.



Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

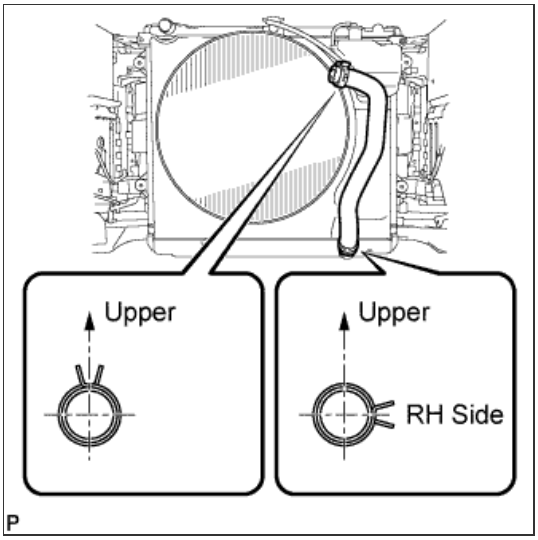
f. Connect the oil cooler tube to the fan shroud with the 2 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }



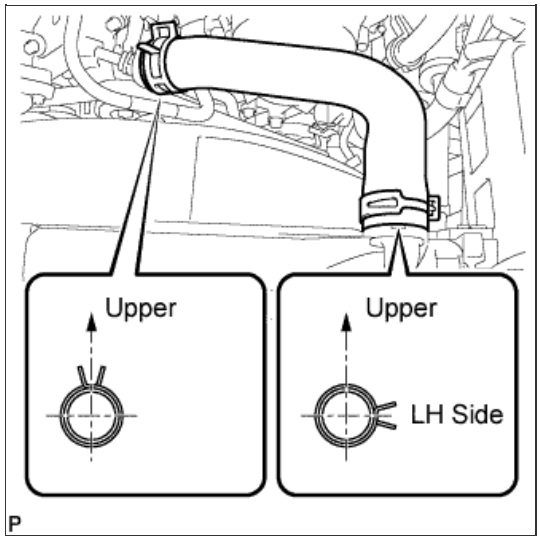
g. w/ Air Cooled Transmission Oil Cooler:
Pass the hose through the flexible hose clamp and close the clamp as shown in the illustration.

h. Connect the reservoir hose to the upper side of the radiator tank.



i. Tighten the 4 nuts of the cooling fan.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

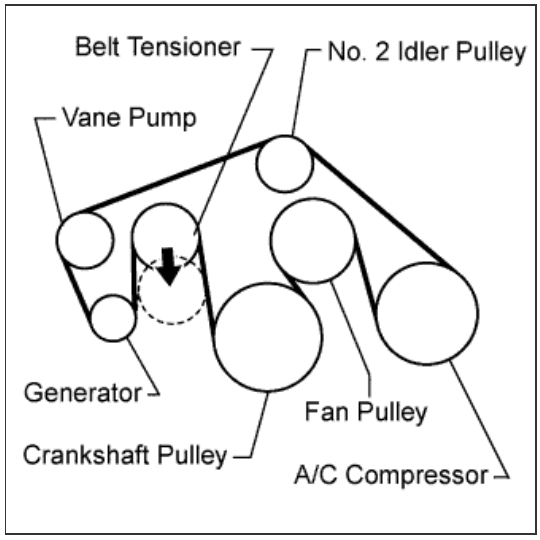


3. INSTALL NO. 2 RADIATOR HOSE

a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to install the radiator hose.

4. INSTALL NO. 1 RADIATOR HOSE

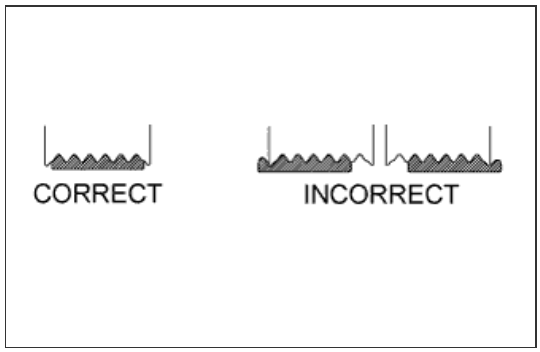
a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to install the radiator hose.



5. INSTALL FAN & GENERATOR V BELT

a. Set the V belt onto every part except the belt tensioner, as shown in the illustration.

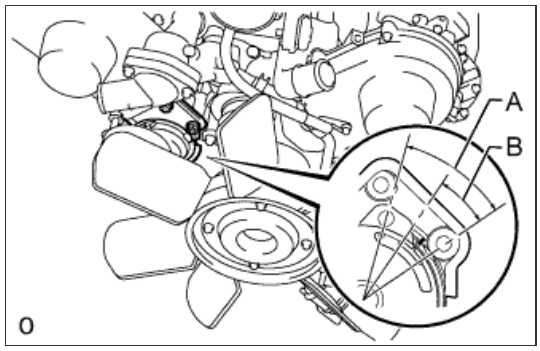
b. Loosen the V belt by turning the belt tensioner counterclockwise.



c. Set the V belt to the belt tensioner.

d. Check that the belt fits properly in the ribbed grooves.

HINT:



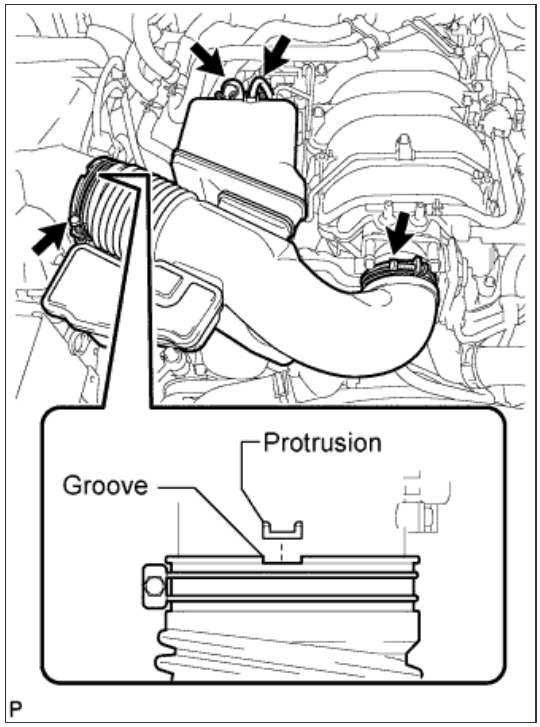
Make sure to check by hand that the belt has not slipped out of the grooves on the bottom of the pulley.

e. Check that the arrow on the belt tensioner is within area "A".
If the arrow is outside area "A", replace the fan and generator V belt.

HINT:

When a new belt is installed, the arrow should be within area "B". If not, the fan and generator V belt is not installed correctly.

6. INSTALL AIR CLEANER HOSE ASSEMBLY



a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum transmitting hose.

d. Connect the No. 2 ventilation hose.

7. ADD ENGINE COOLANT

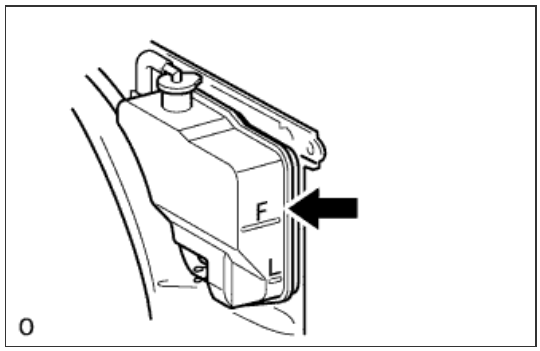
a. Add engine coolant.

Standard Capacity:

Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	16.3 liters (17.2 US qts, 14.3 Imp. qts)
w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	16.9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).



b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the radiator reservoir cap.

d. Press the inlet and outlet radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

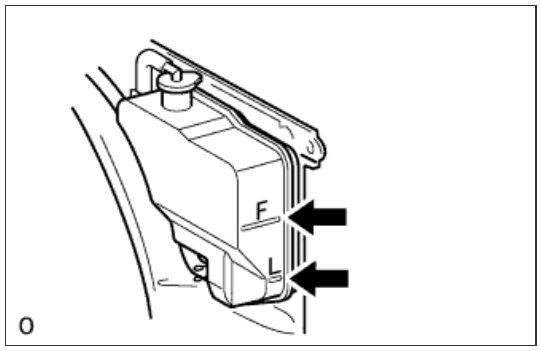
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the inlet and outlet radiator hoses several times by hand to bleed air.

CAUTION:



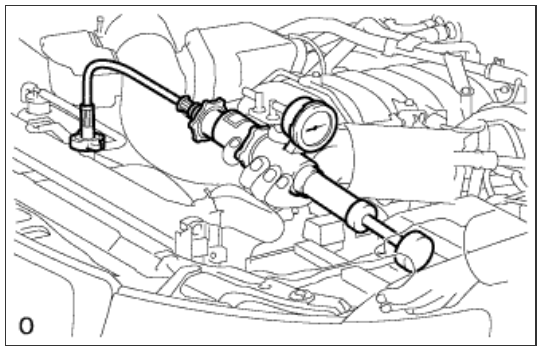
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

i. Stop the engine, and wait until the engine coolant cools down to the ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

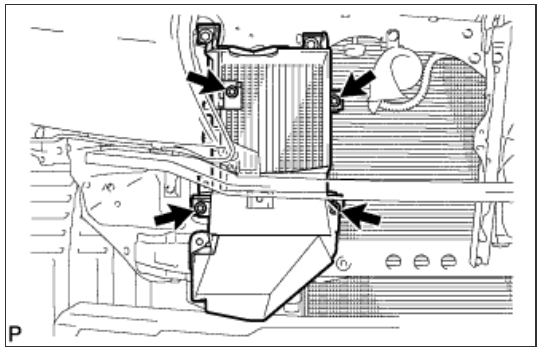
j. Check that the coolant level is between the F and L lines. If the coolant level is below the L line, repeat all of the procedures above. If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.



8. INSPECT FOR COOLANT LEAK

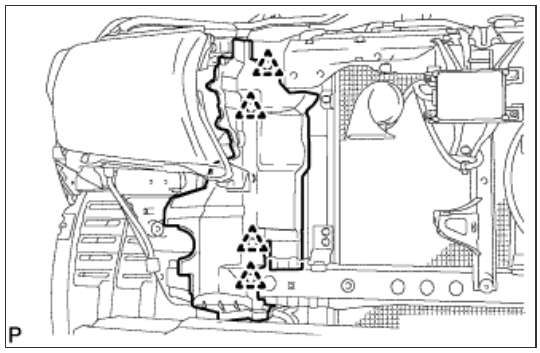
a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.



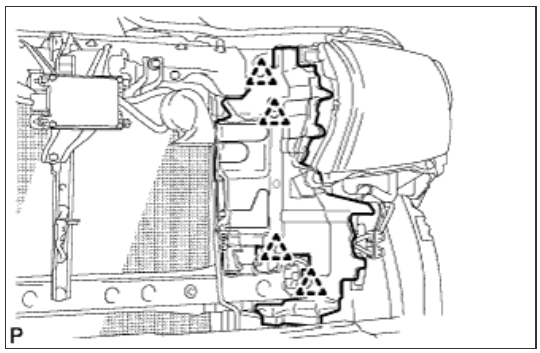
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

9. INSTALL TRANSMISSION OIL COOLER AIR DUCT (w/ Air Cooled Transmission Oil Cooler)



a. Install the oil cooler air duct with the 4 bolts.

Torque:
4.9 N*m{ 50 kgf*cm , 43 in.*lbf }



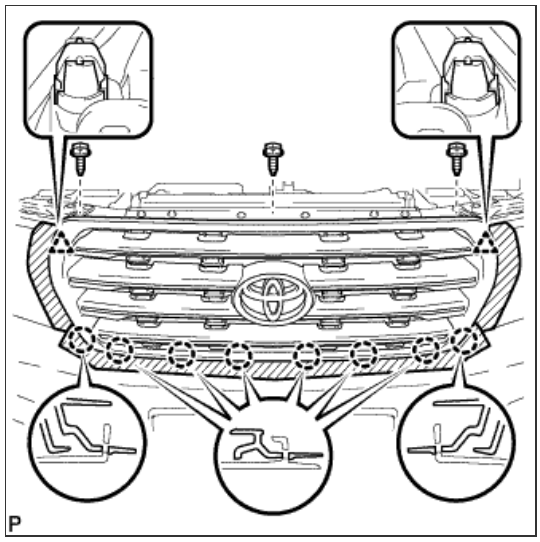
10. CONNECT RADIATOR SIDE DEFLECTOR RH (w/o Air Cooled Transmission Oil Cooler)

a. Connect the deflector with the 4 clips.

11. CONNECT RADIATOR SIDE DEFLECTOR LH

a. Connect the deflector with the 4 clips.

12. INSTALL FRONT BUMPER COVER

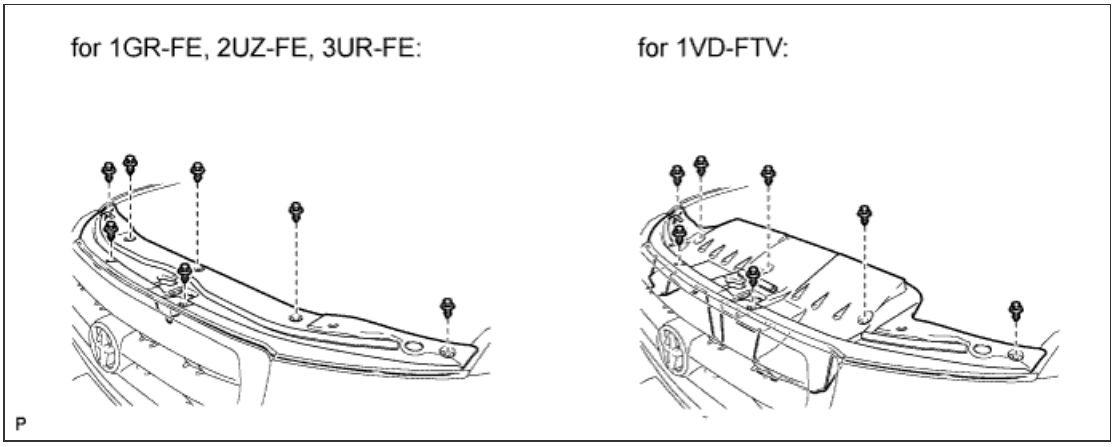


a. for Standard Type:
Refer to the following procedures (Click here).

b. w/ Winch Type:
Refer to the following procedures. (Click here).

13. INSTALL RADIATOR GRILLE

a. Attach the 2 clips and 8 claws to install the radiator grille.

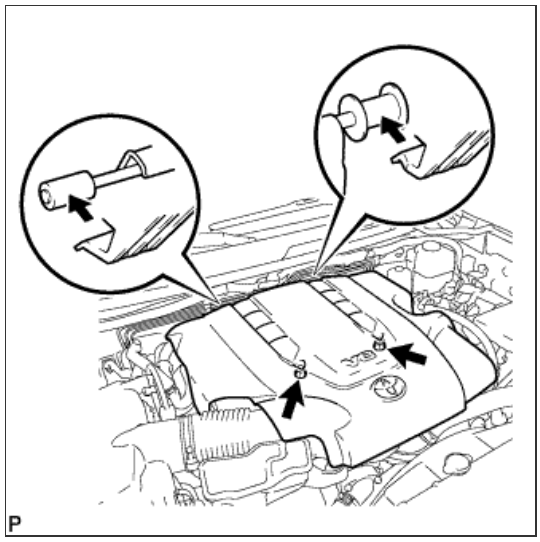


b. Install the 3 screws.

14. INSTALL FRONT BUMPER WINCH COVER SUB-ASSEMBLY (w/ Winch)

15. INSTALL UPPER RADIATOR SUPPORT SEAL

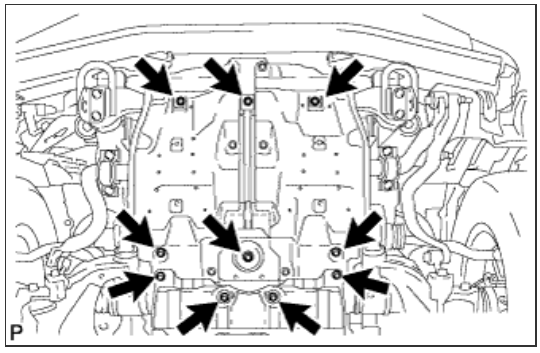
a. Install the radiator support seal with the 7 clips.



16. INSTALL V-BANK COVER SUB-ASSEMBLY

a. Attach the 2 V-bank cover hooks to the bracket.

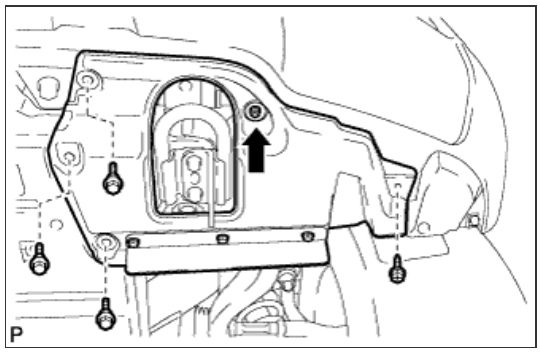
b. Install the V-bank cover with the 2 nuts.



Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

17. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.



Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

18. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

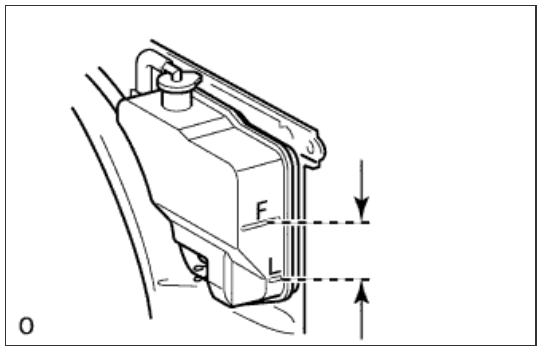
b. Install the 3 bolts and screw.

19. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

20. INSPECT ENGINE COOLANT LEVEL



a. Check that the engine coolant level is between the L and F lines when the engine is cold.
If the engine coolant is low, check for leaks and add "TOYOTA Super Long Life

Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the F line.

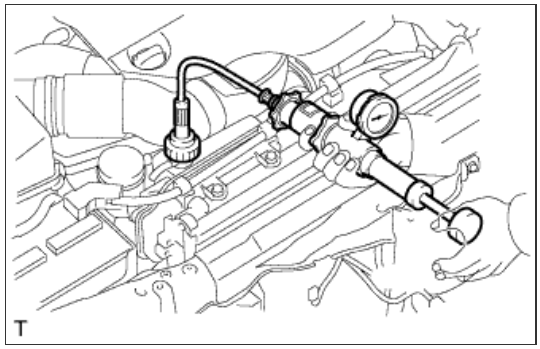
NOTICE:

Do not substitute plain water for engine coolant.

b. Remove the radiator cap, and check that the coolant level is up to the radiator filler hole.

for Preparation Click here

1. INSPECT FOR COOLANT LEAK



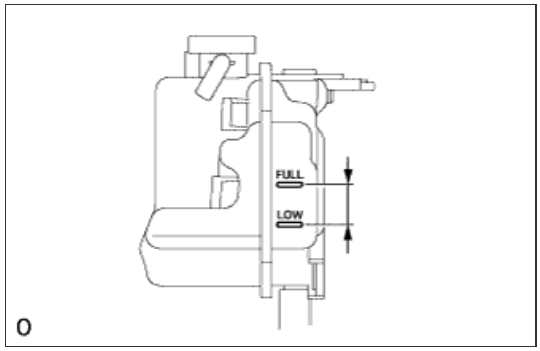
CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.



2. CHECK ENGINE COOLANT LEVEL IN RESERVOIR

a. Check that the engine coolant level is between the LOW and FULL lines when the engine is cold.
If the engine coolant is low, check for leaks and add "TOYOTA Super Long Life Coolant (SLLC)" or similar high ality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the FULL line.

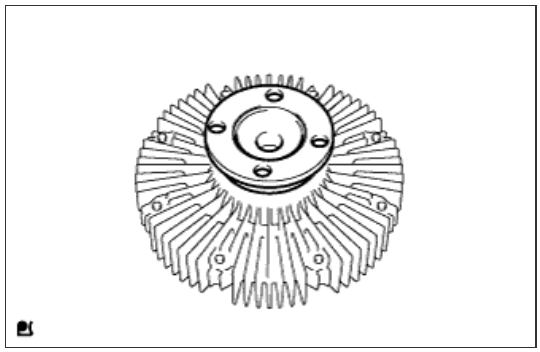
NOTICE:

Do not substitute plain water for engine coolant.

3. CHECK ENGINE COOLANT ALITY

a. Remove the radiator reservoir cap.

CAUTION:



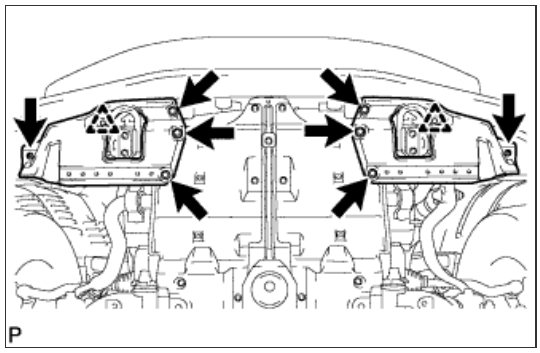
Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

b. Check if there are excessive deposits of rust or scales around the radiator reservoir cap and radiator filler hole. Also, the coolant should be free of oil.
If excessively dirty, replace the coolant.

c. Install the radiator reservoir cap.

4. INSPECT FLUID COUPLING ASSEMBLY

a. Check that the fluid coupling is not damaged and that no silicon oil leaks.
If necessary, replace the fluid coupling assembly.

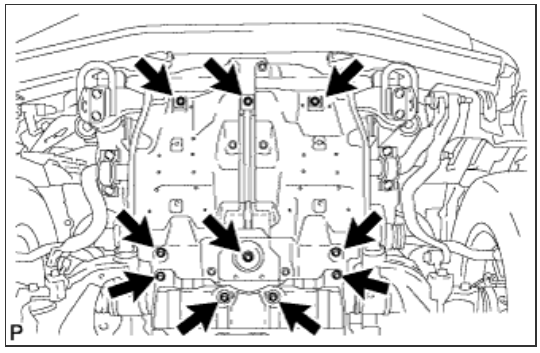


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

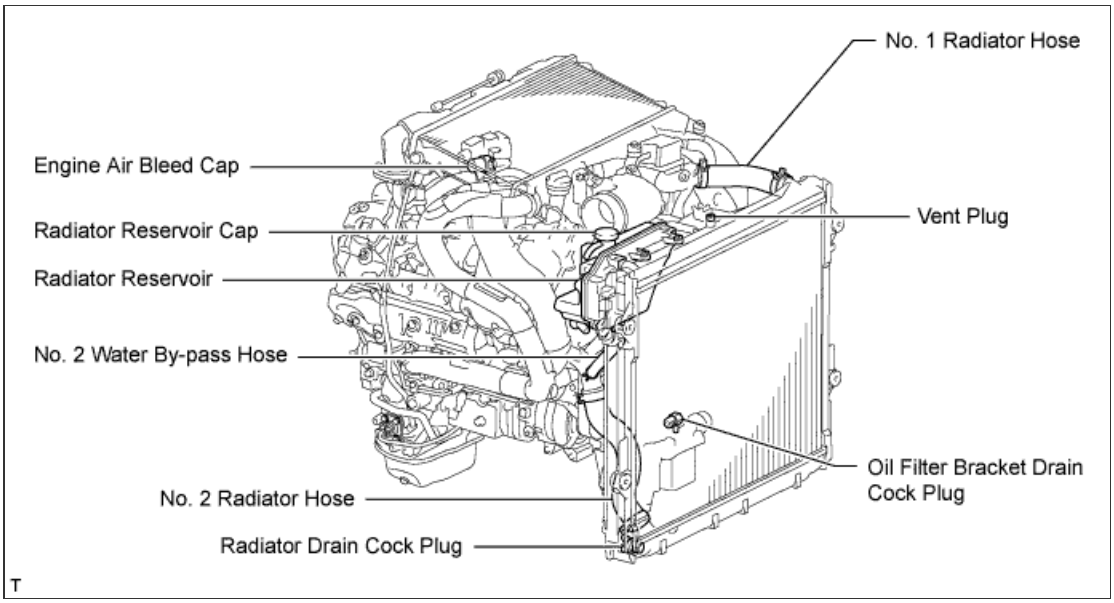
4. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and upper radiator support seal.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

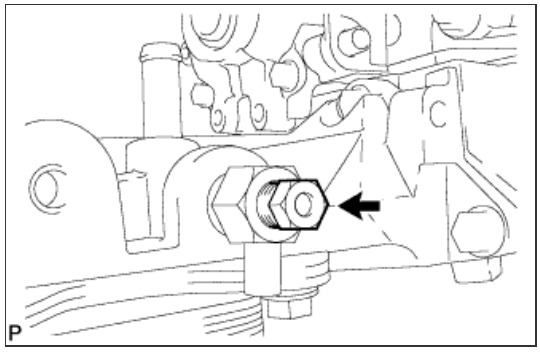


HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

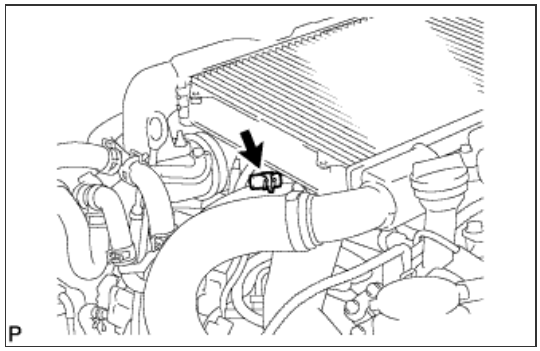
a. Loosen the radiator drain cock plug.

b. Remove the radiator reservoir cap to drain the coolant in the radiator.



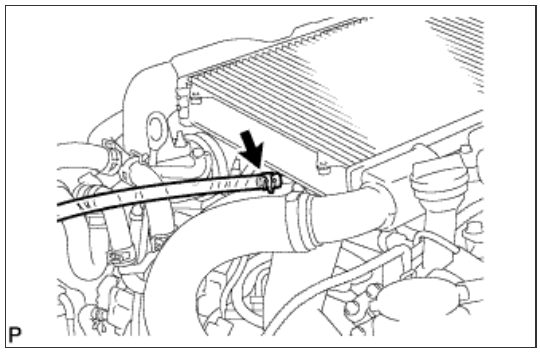
c. Loosen the oil filter bracket drain cock plug to drain the coolant in the engine.

d. Tighten the radiator drain cock plug by hand.

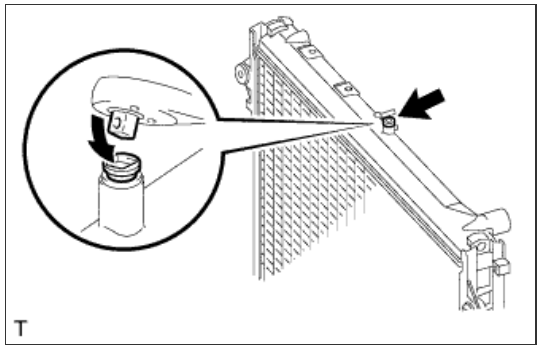


e. Tighten the oil filter bracket drain cock plug.

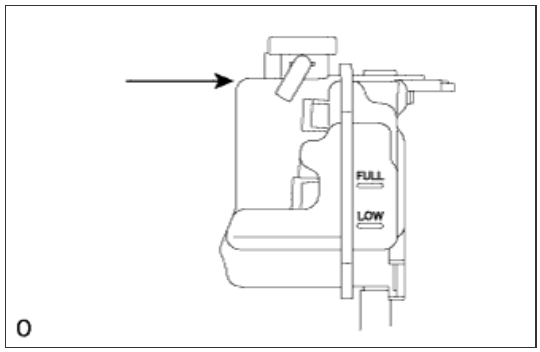
Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }



6. ADD ENGINE COOLANT



a. Remove the engine air bleed cap.



b. Connect a clear hose to the engine air bleed pipe.

c. Using a wrench, remove the vent plug.

d. Fill the radiator with TOYOTA SLLC to the radiator reservoir filler neck.

HINT:

Pour TOYOTA SLLC until it spills out of the engine air bleed pipe.

Standard Capacity (for Automatic Transmission):

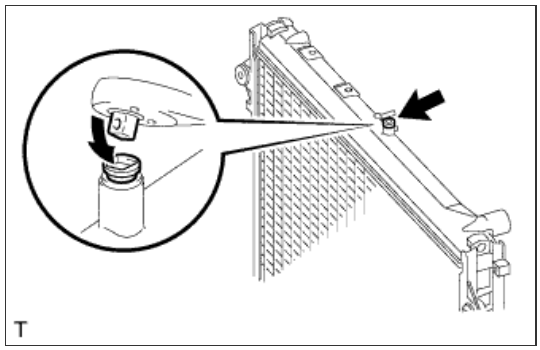
Item	Specified Condition
Front heater only	14.8 liters (15.6 US qts, 13.0 Imp. qts)
Front heater and rear heater	17.6 liters (18.6 US qts, 15.5 Imp. qts)
Front heater with viscous heater	15.2 liters (16.1 US qts, 13.4 Imp. qts)
Front heater and rear heater with viscous heater	18.0 liters (19.0 US qts, 15.4 Imp. qts)

Standard capacity (for Manual Transmission):
15.4 liters (16.3 US qts, 13.6 Imp. qts)

NOTICE:

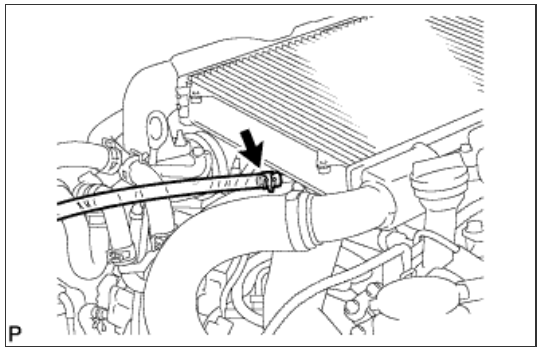
Do not substitute plain water for engine coolant.

HINT:



TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

e. Install the vent plug.

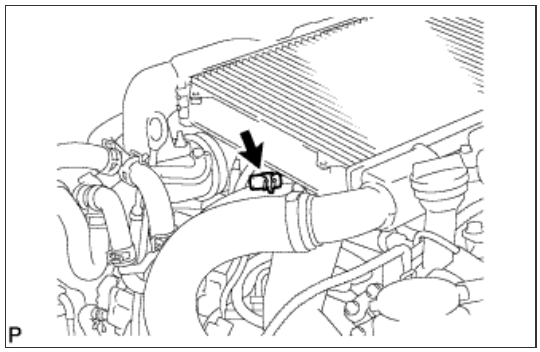


Torque:
2.0 N*m{ 20 kgf*cm , 18 in.*lbf }

NOTICE:

Do not tighten the plug to 5.0 N*m (51 kgf*cm, 44 in.*lbf) or more, as the plug will be damaged.

f. Disconnect the clear hose from the engine air bleed pipe.



g. Install the engine air bleed cap when coolant comes out.

h. Install the radiator reservoir cap.

i. Start the engine.

NOTICE:

Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the FULL line.

j. Maintain an engine speed of 3000 rpm for approximately 10 minutes so that the thermostat opens and air bleeding is performed.

CAUTION:

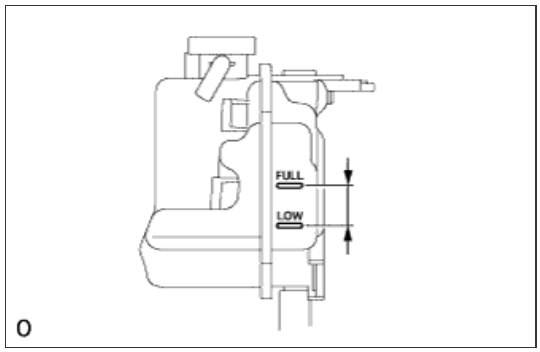
When pressing the radiator hoses:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the radiator fan**

NOTICE:

- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**

HINT:



The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

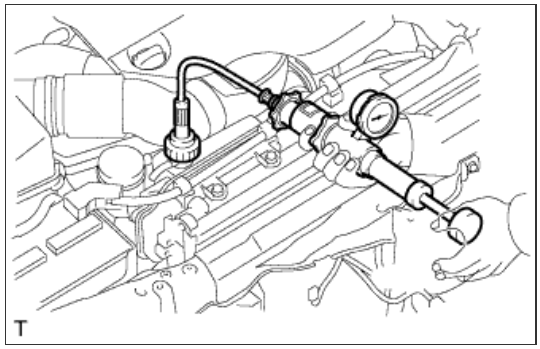
k. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

l. Check that the coolant level is between the FULL and LOW lines.
If the coolant level is above the FULL line, drain coolant so that the coolant level is between the FULL and LOW lines.

7. INSPECT FOR COOLANT LEAK



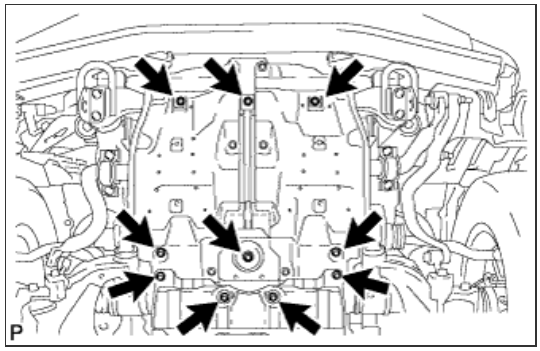
CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.

b. Warm up the engine.

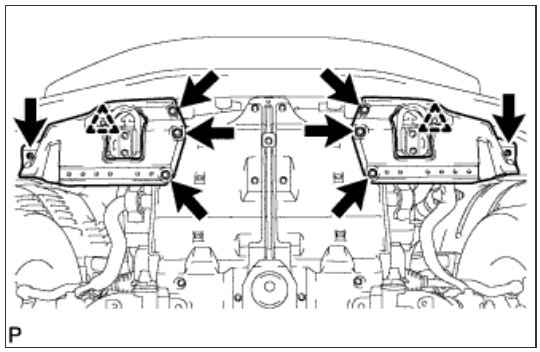
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.



8. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the upper radiator support seal with the 7 clips.

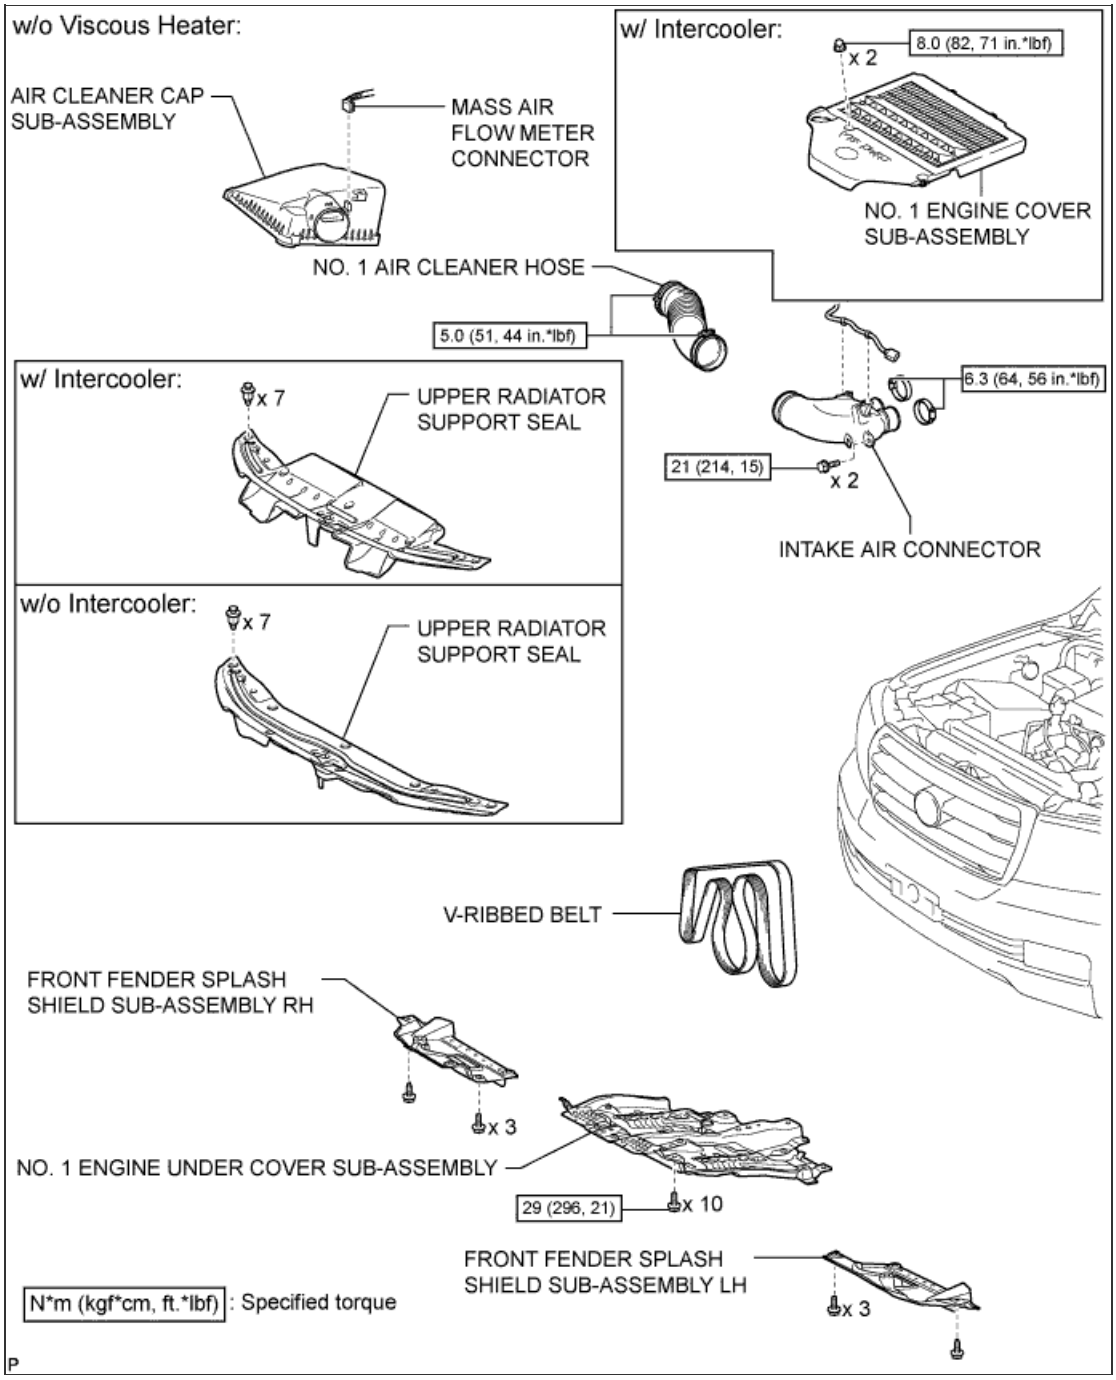
9. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



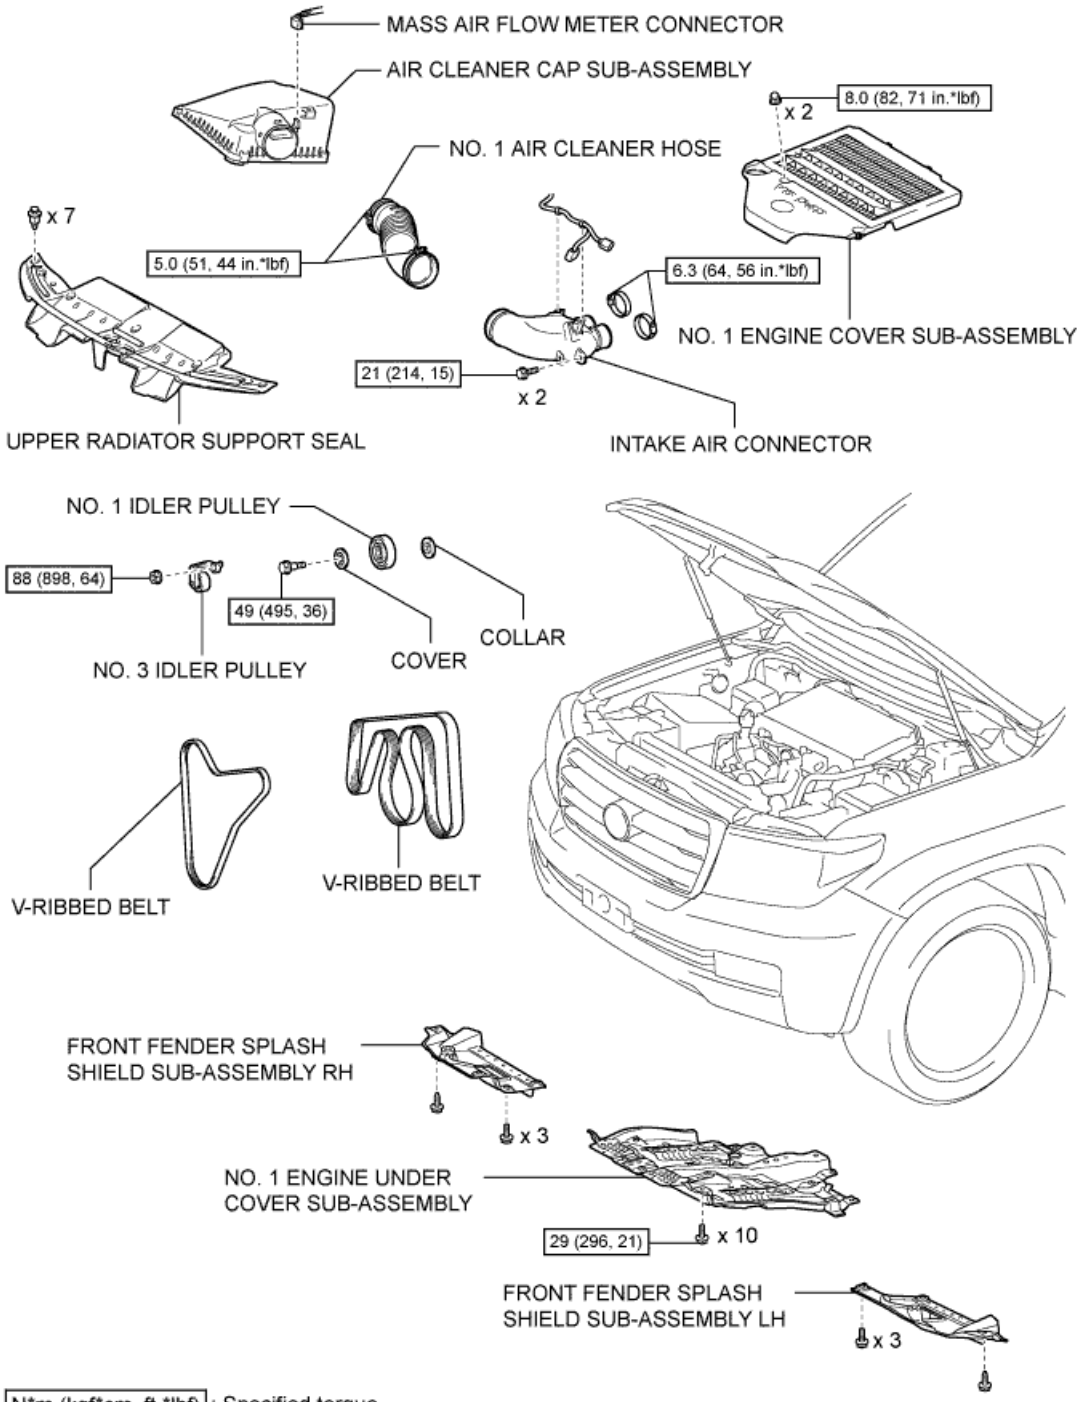
a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

10. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



a. Install the splash shield with the clip, and then install the 3 bolts and screw.



11. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Install the splash shield with the clip, and then install the 3 bolts and screw.

for Preparation Click here

1. INSPECT WATER PUMP ASSEMBLY

a. Visually check the water hole and air hole for coolant leakage.
If leakage is found, replace the water pump assembly.

b. Turn the pulley, and check that the pump bearing moves smoothly and quietly.
If it moves roughly or noisily, replace the water pump assembly.

for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

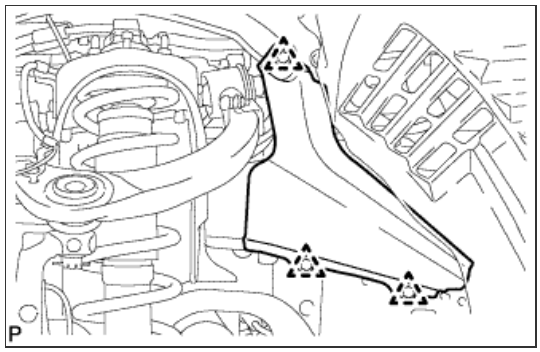
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.

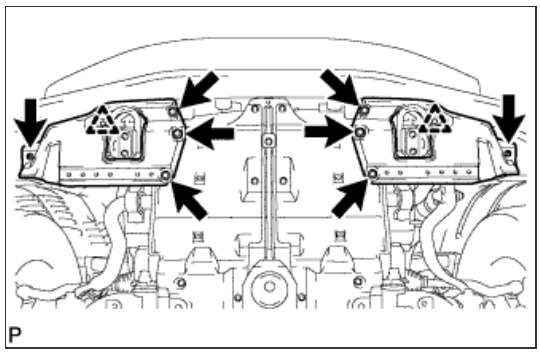


2. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and upper radiator support seal.

3. REMOVE FRONT WHEEL RH

4. REMOVE FRONT FENDER APRON SEAL FRONT RH

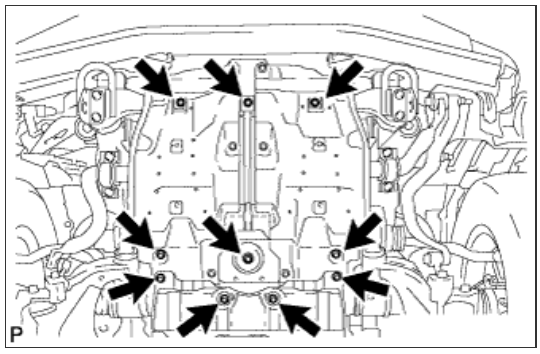


a. Remove the 3 clips and front fender apron seal front RH.

5. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.



6. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.

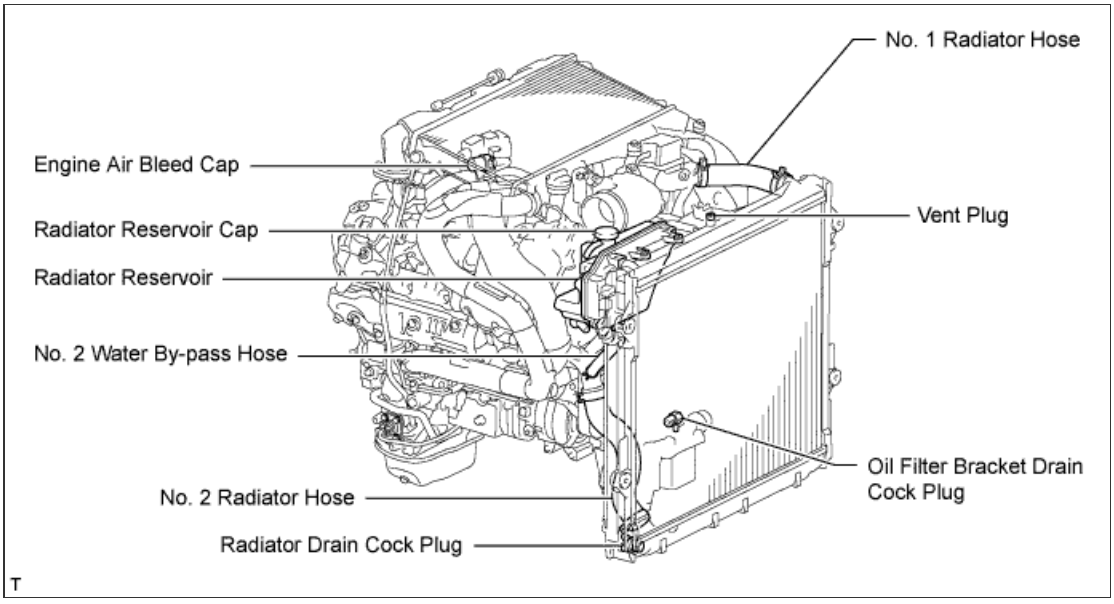
7. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

8. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.



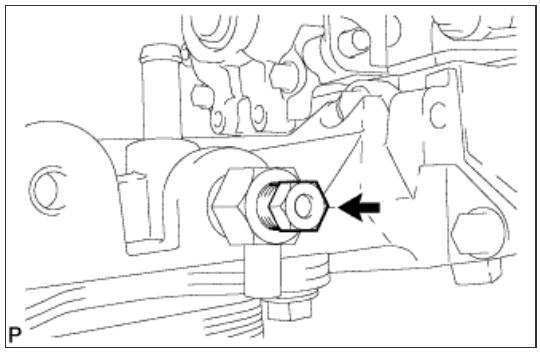
HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

a. Loosen the radiator drain cock plug.

b. Remove the radiator reservoir cap to drain the coolant in the radiator.

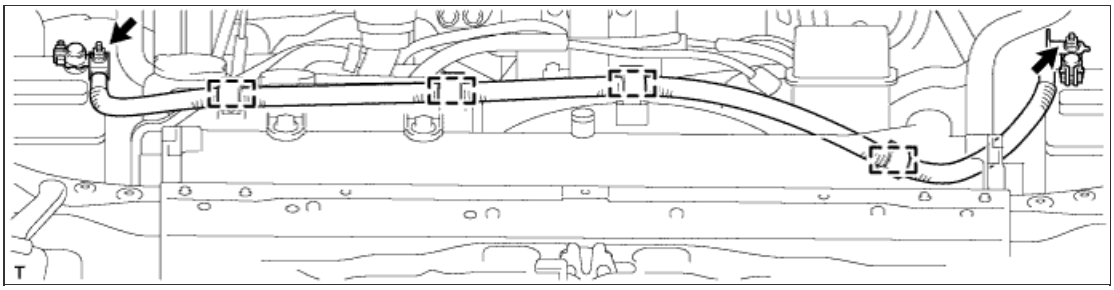
c. Loosen the oil filter bracket drain cock plug to drain the coolant in the engine.



d. ighten the radiator drain cock plug by hand.

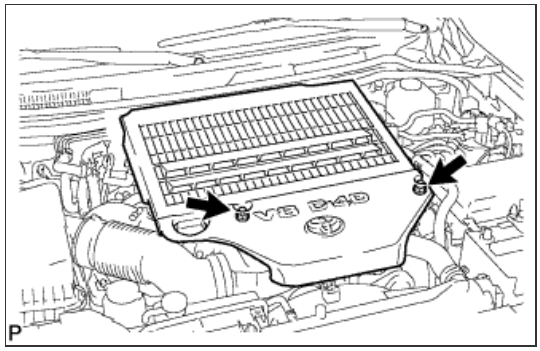
e. ighten the oil filter bracket drain cock plug.

Torque:



13 N*m{ 133 kgf*cm , 10 ft.*lbf }

9. REMOVE NO. 3 ENGINE ROOM WIRE

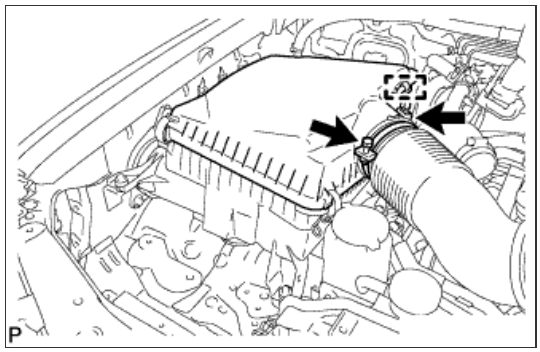


a. Disconnect the 4 wire harness clamps.

b. Remove the 2 nuts and No. 3 engine room wire.

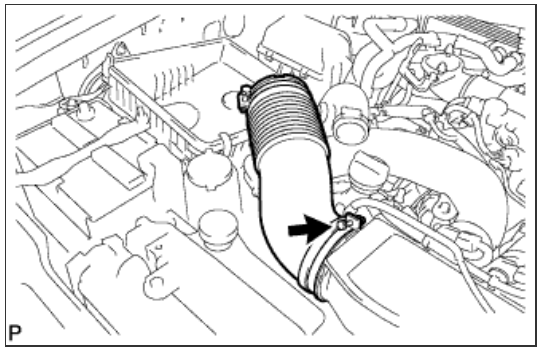
10. REMOVE NO. 1 ENGINE COVER SUB-ASSEMBLY (w/ Intercooler

a. Remove the 2 nuts and No. 1 engine cover.



11. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

a. Loosen the hose clamp.



b. Disconnect the mass air flow meter connector and using a clip remover, detach the wire harness clamp from the air cleaner cap.

c. Detach the 4 clamps and remove the air cleaner cap.

12. REMOVE NO. 1 AIR CLEANER HOSE

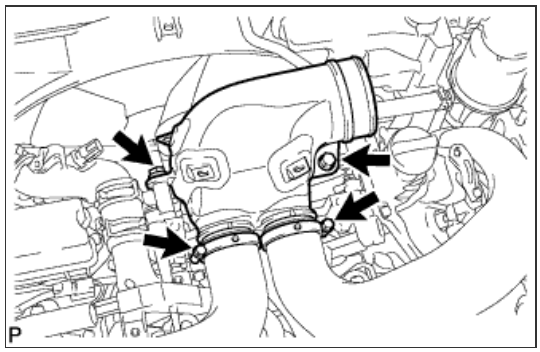
a. Loosen the hose clamp and remove the No. 1 air cleaner hose.

13. REMOVE INTAKE AIR CONNECTOR

a. w/o Viscous Heater:

   i. Disconnect the connector from the water temperature sensor.

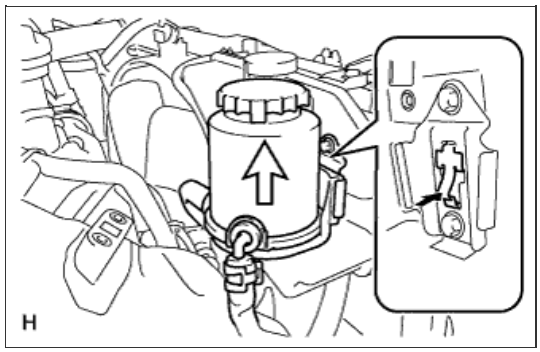
   ii. Using a clip remover, detach the 3 wire harness clamps.



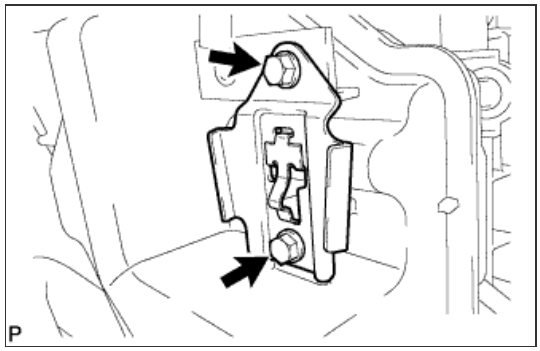
b. w/ Viscous Heater:

   i. Disconnect the 2 connectors from the viscous with magnet clutch heater and water temperature sensor.

   ii. Using a clip remover, detach the 3 wire harness clamps.



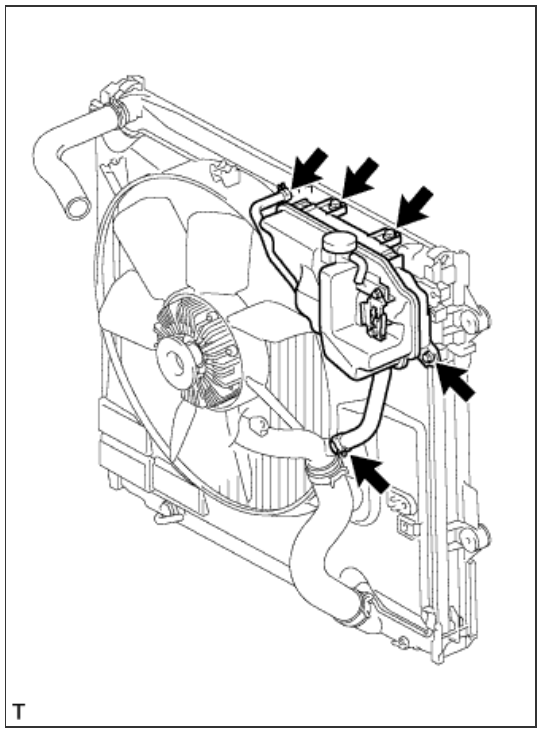
c. Loosen the 2 hose clamps and remove the 2 bolts and intake air connector.



14. REMOVE VANE PUMP OIL RESERVOIR ASSEMBLY

a. Insert a screwdriver between the reservoir and oil reservoir bracket, push the claw, and then disconnect the reservoir by pulling it upwards.

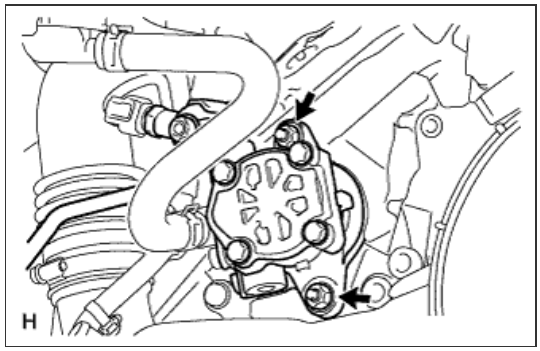
15. REMOVE NO. 1 OIL RESERVOIR BRACKET



a. Remove the 2 bolts and bracket.

16. REMOVE RADIATOR RESERVOIR ASSEMBLY

a. Disconnect the 2 hoses.

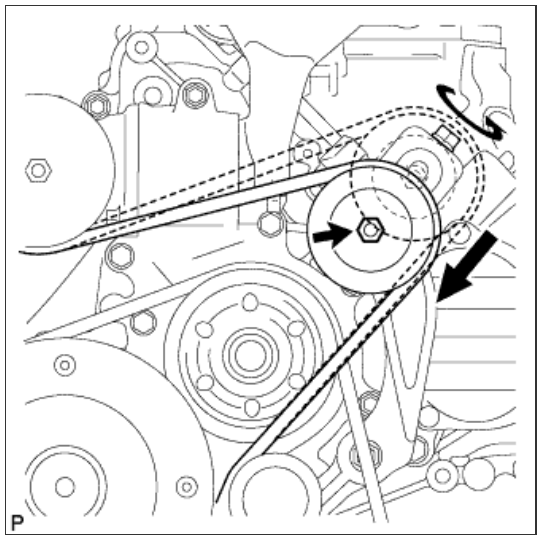


b. Remove the 3 bolts and radiator reservoir.

17. REMOVE VANE PUMP ASSEMBLY

a. Remove the 2 nuts and vane pump.

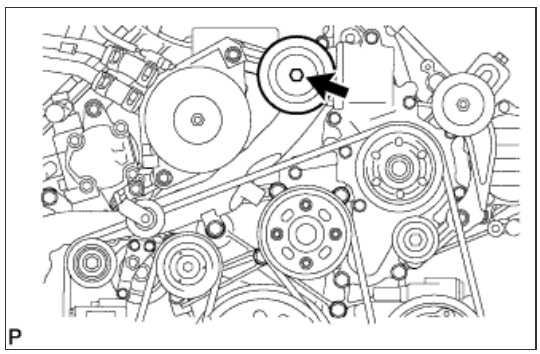
b. Remove the O-ring from the vane pump.



18. DISCONNECT NO. 1 RADIATOR HOSE

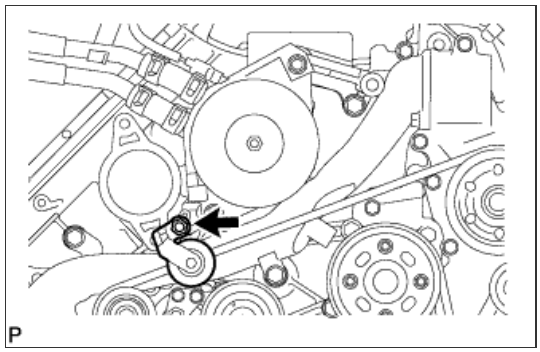
19. DISCONNECT NO. 2 RADIATOR HOSE

20. REMOVE V-RIBBED BELT (w/ Viscous Heater



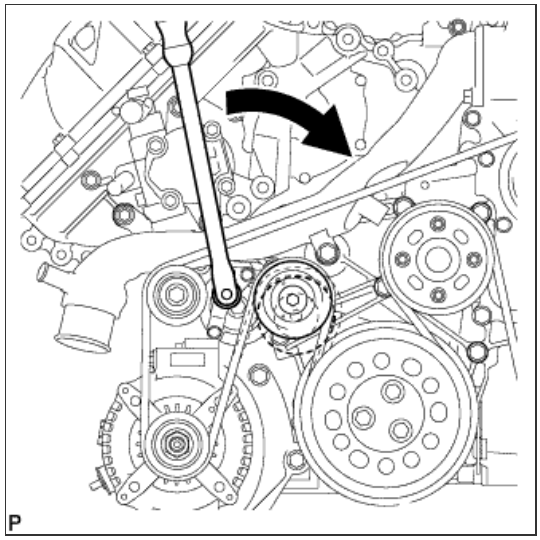
a. Loosen the lock nut and turn the bolt counterclockwise.

b. Remove the V-ribbed belt.



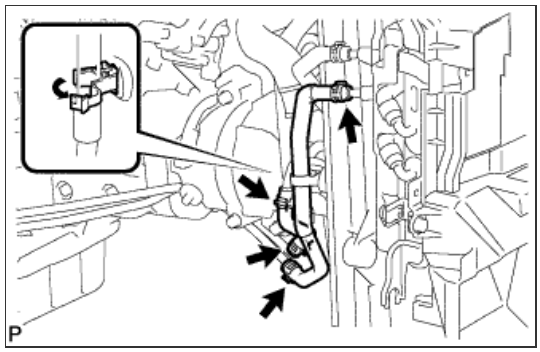
21. REMOVE NO. 1 IDLER PULLEY (w/ Viscous Heater

a. Remove the bolt, cover, No. 1 idler pulley and collar.



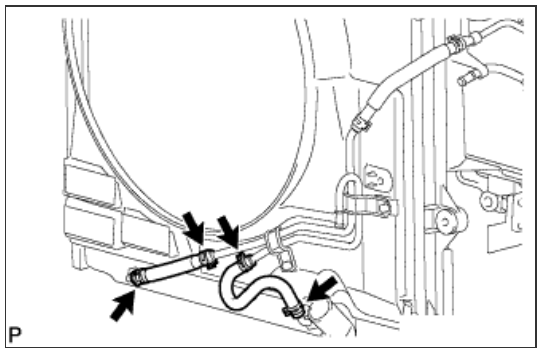
22. REMOVE NO. 3 IDLER PULLEY (w/ Viscous Heater

a. Remove the nut and No. 3 idler pulley.

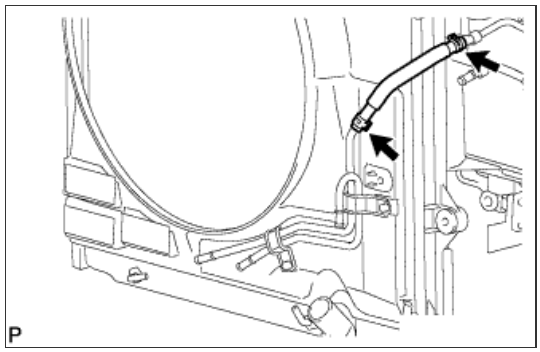


23. REMOVE V-RIBBED BELT

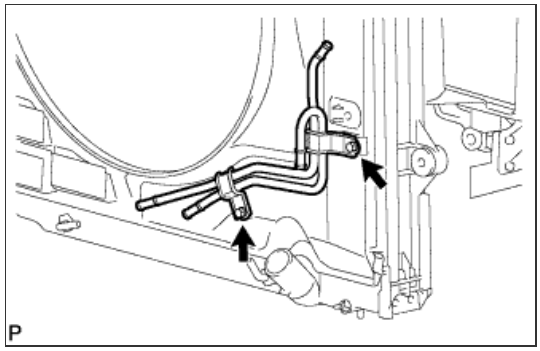
a. Using a wrench to the V-ribbed belt tensioner bracket, turn the wrench clockwise and remove the V-ribbed belt.



24. REMOVE OIL COOLER TUBE (for Automatic Transmission

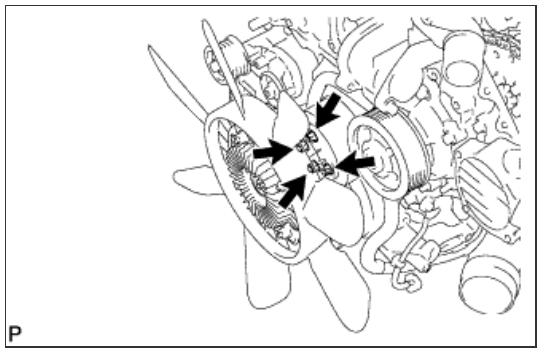


a. Disconnect the inlet and outlet No. 1 oil cooler hose.

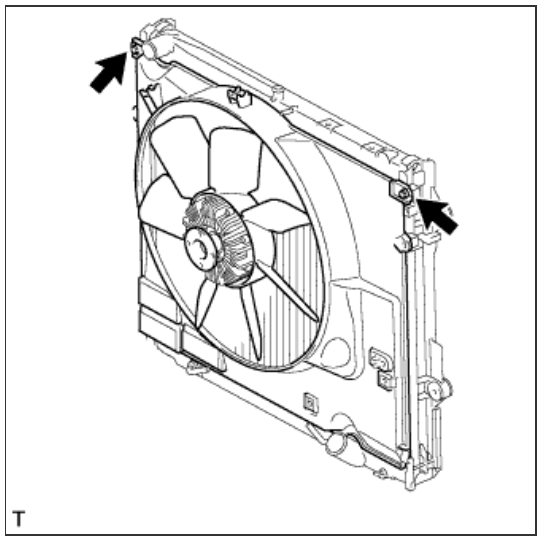


b. Disconnect the inlet No. 2 and No. 3 oil cooler hoses.

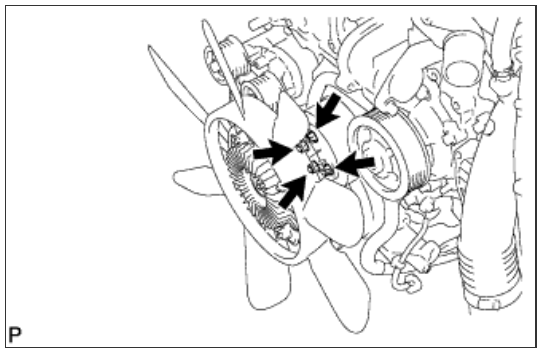
c. Disconnect the inlet No. 4 oil cooler hose.



d. Remove the 2 bolts and transmission oil cooler tube.

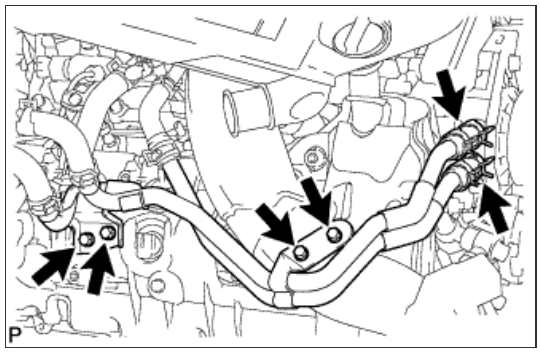


25. REMOVE FAN SHROUD WITH FAN



a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the 2 bolts holding the fan shroud.

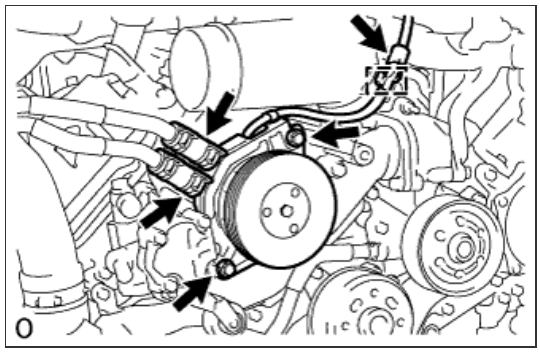


c. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the fluid coupling fan.

26. REMOVE FAN PULLEY

27. REMOVE HEATER WATER PIPE SUB-ASSEMBLY (w/ Viscous Heater

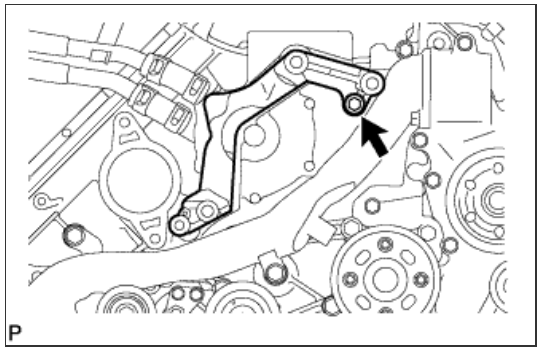
a. Remove the 4 bolts and disconnect the heater water pipe from the viscous heater with magnet clutch.



28. REMOVE VISCOUS WITH MAGNET CLUTCH HEATER ASSEMBLY (w/ Viscous Heater

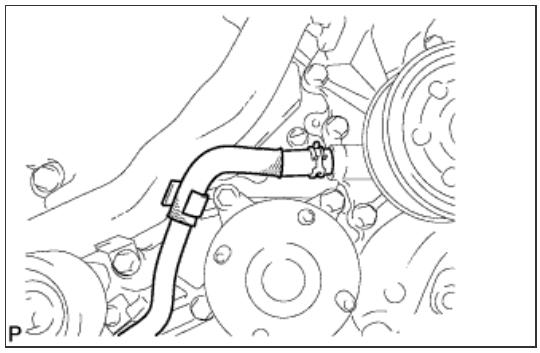
a. Disconnect the connector and detach the clamp.

b. Using pliers, grip the claws of the clips and slide the 2 clips.



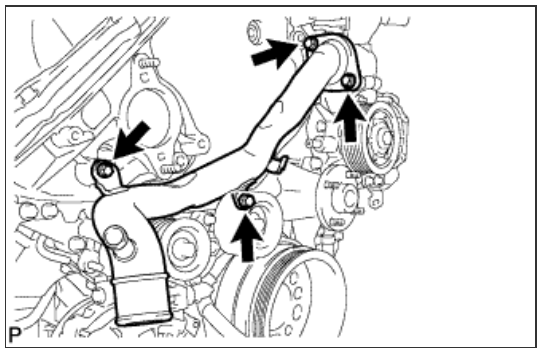
c. Disconnect the 2 heater hoses.

d. Remove the 2 bolts and heater assembly.



29. REMOVE NO. 1 IDLER PULLEY BRACKET (w/ Viscous Heater

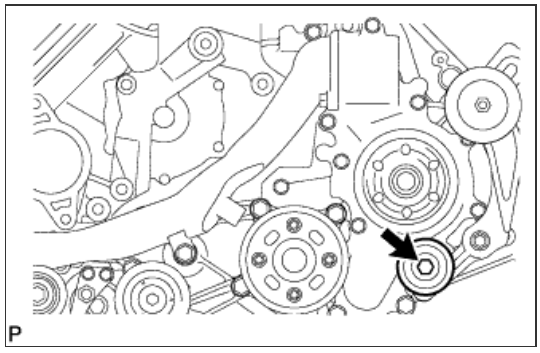
a. Remove the bolt and No. 1 idler pulley bracket.



30. REMOVE WATER INLET

a. Disconnect the No. 2 oil cooler hose from the water pump and clamp.

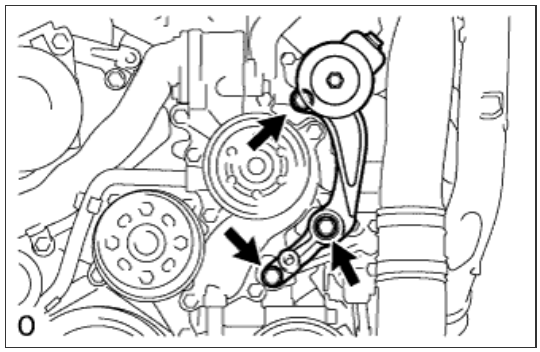
b. Remove the 4 bolts and water inlet.



31. REMOVE THERMOSTAT

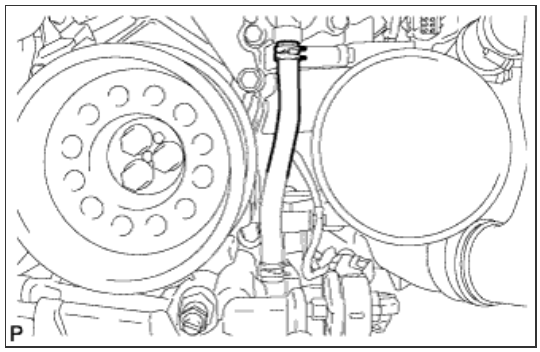
a. Remove the thermostat.

b. Remove the gasket from the thermostat.



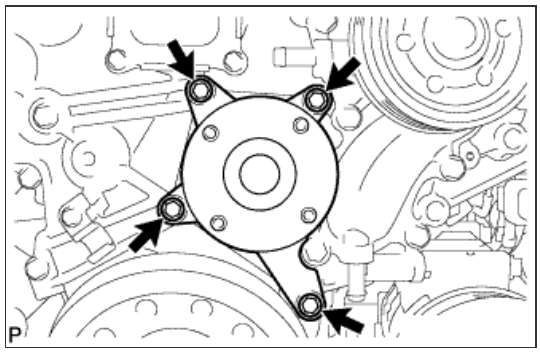
32. REMOVE NO. 2 IDLER PULLEY (w/ Viscous Heater

a. Remove the bolt, cover, No. 2 idler pulley and collar.



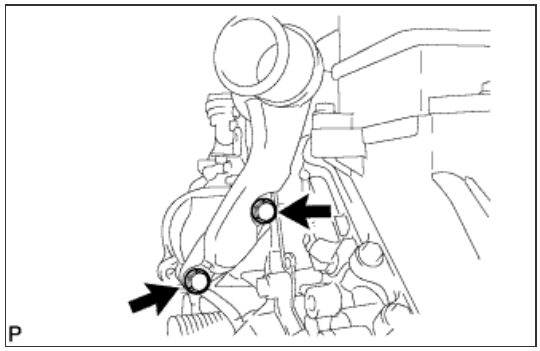
33. REMOVE NO. 2 IDLER PULLEY BRACKET (w/ Viscous Heater

a. Remove the 3 bolts and idler pulley bracket.



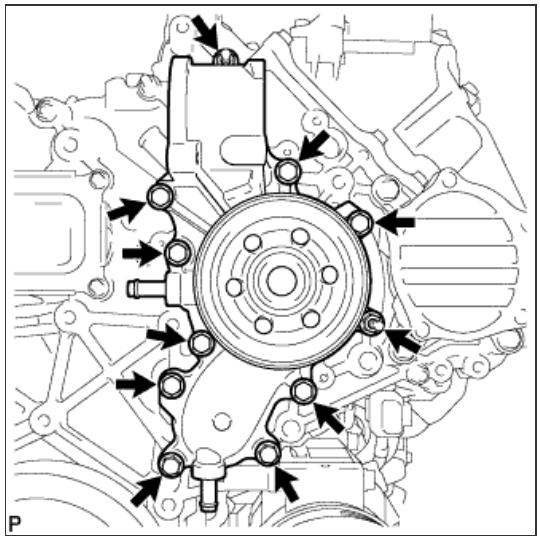
34. DISCONNECT NO. 1 OIL COOLER HOSE

35. REMOVE FAN BRACKET SUB-ASSEMBLY



a. Remove the 4 bolts and fan bracket.

36. REMOVE WATER OUTLET

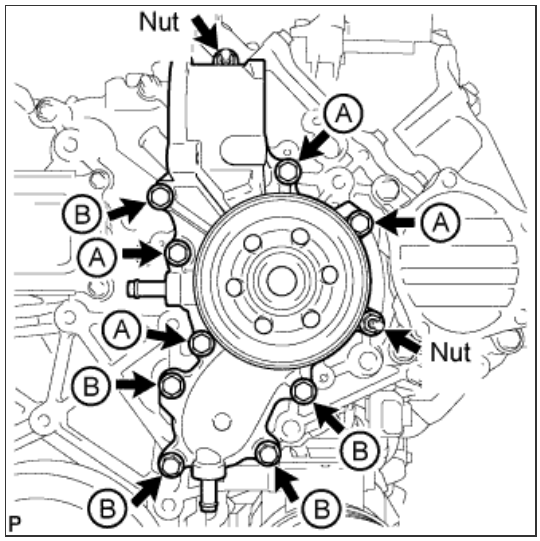


a. Disconnect the engine coolant temperature sensor connector.

b. Remove the 2 bolts, disconnect the water outlet from the No. 2 water hose joint, and remove the water outlet and gasket.

37. REMOVE WATER PUMP ASSEMBLY

a. Remove the 9 bolts, 2 nuts, water pump and gasket.



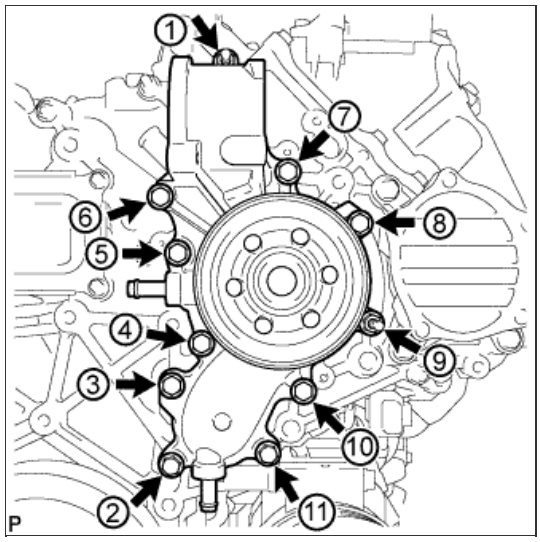
for Preparation [Click here]

1. INSTALL WATER PUMP ASSEMBLY

a. Temporarily install a new gasket and the water pump with the 9 bolts and 2 nuts.

Bolt Length

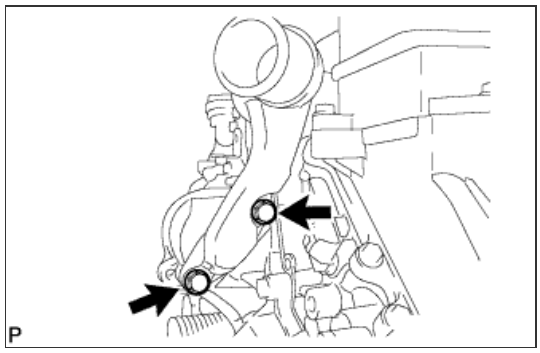
Item	Length
Bolt A	30 mm (1.18 in.)
Bolt B	80 mm (3.15 in.)



b. Uniformly tighten the 9 bolts and 2 nuts of the water pump in the order shown in the illustration.

Torque:
25 N*m{ 250 kgf*cm , 18 ft.*lbf }

NOTICE:

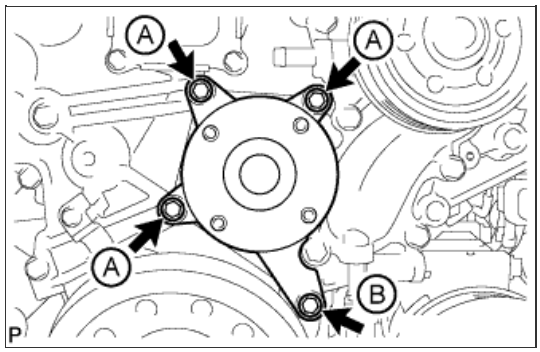


After installing all of the bolts and nuts, check that all of the bolts and nuts are tightened to the torque specification.

2. INSTALL WATER OUTLET

a. Connect the water outlet to the No. 2 water hose joint, and install a new gasket and the water outlet with the 2 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

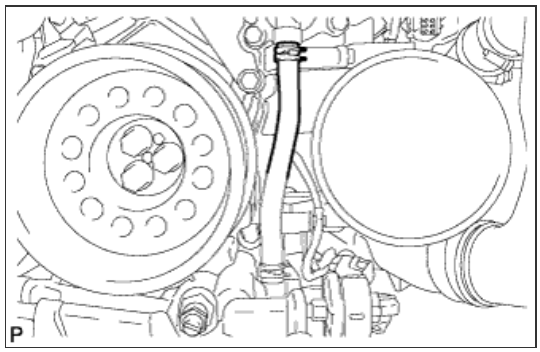


3. INSTALL FAN BRACKET SUB-ASSEMBLY

a. Install the fan bracket with the 4 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

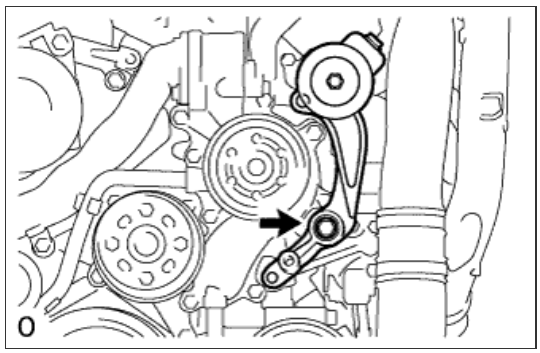
Bolt Length



Item	Length
Bolt A	30 mm (1.18 in.)
Bolt B	80 mm (3.15 in.)

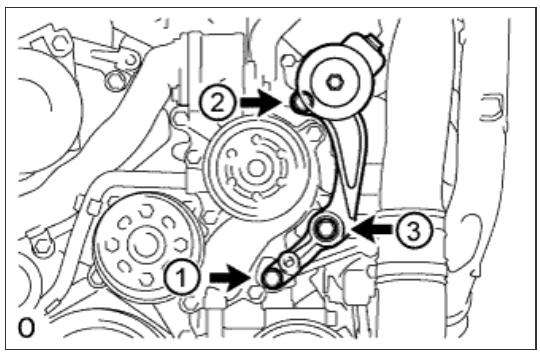
4. INSTALL NO. 1 OIL COOLER HOSE

NOTICE:



Make sure that there is clearance between the oil cooler hose and crankshaft pulley.

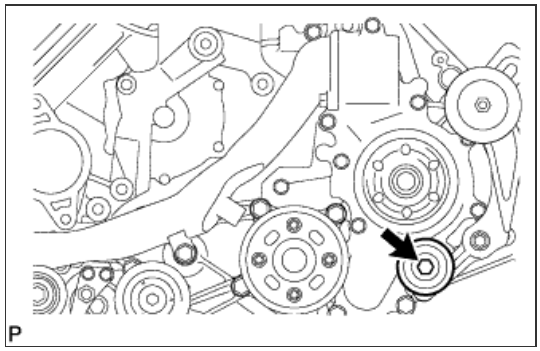
5. INSTALL NO. 2 IDLER PULLEY BRACKET (w/ Viscous Heater)



a. Temporarily install the No. 2 idler pulley bracket with the bolt.

b. Temporarily install the 2 bolts to the No. 2 idler pulley bracket bolt hole.

c. Uniformly tighten the 3 bolts of the No. 2 idler pulley bracket in the order shown in the illustration.



Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }

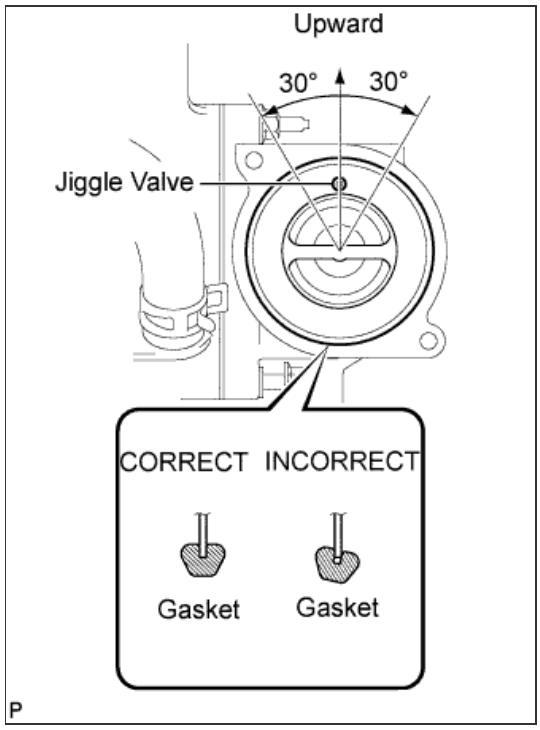
6. INSTALL NO. 2 IDLER PULLEY (w/ Viscous Heater)

a. Install the collar, No. 2 idler pulley and cover with the bolt.

Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }

7. INSTALL THERMOSTAT

a. Install a new gasket to the thermostat.

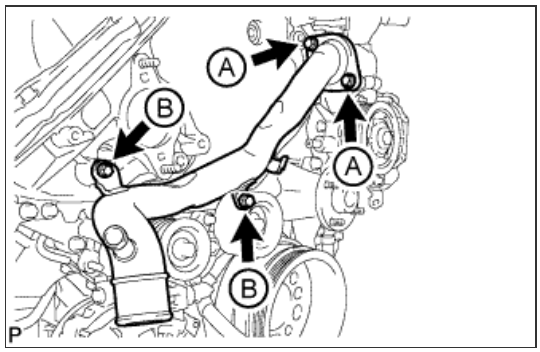


NOTICE:

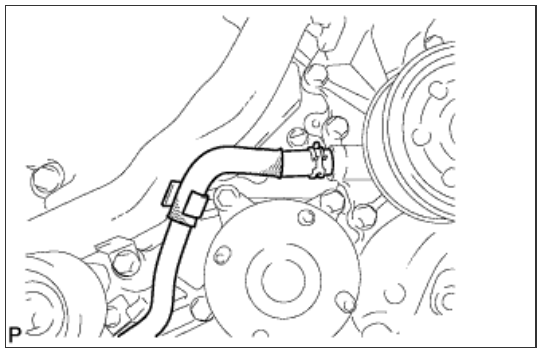
When installing the gasket to the thermostat, be careful not to deform the gasket. Make sure that the groove of the gasket is properly installed onto the thermostat, as shown in the illustration.

b. Insert the thermostat into the water pump with the jiggle valve facing straight upward.

HINT:



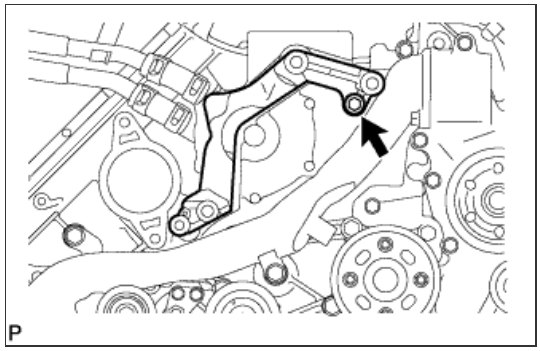
The jiggle valve may be set within 30° of either side of the prescribed position.



8. INSTALL WATER INLET

a. Install the water inlet with the 4 bolts.

Torque:
for bolt A:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for bolt B:
25 N*m{ 250 kgf*cm , 18 ft.*lbf }



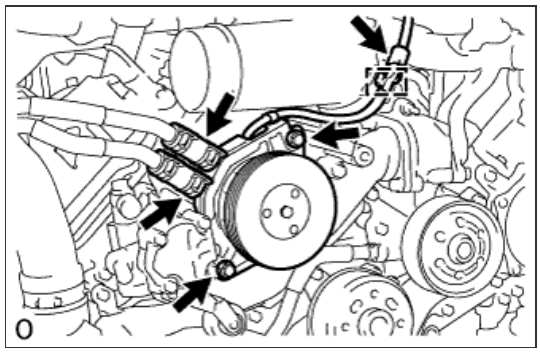
b. Connect the No. 2 oil cooler hose to the clamp and water pump.

9. INSTALL NO. 1 IDLER PULLEY BRACKET (w/ Viscous Heater)

a. Install the No. 1 idler pulley bracket with the bolt.

Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }

10. INSTALL VISCOUS WITH MAGNET CLUTCH HEATER ASSEMBLY (w/ Viscous Heater)

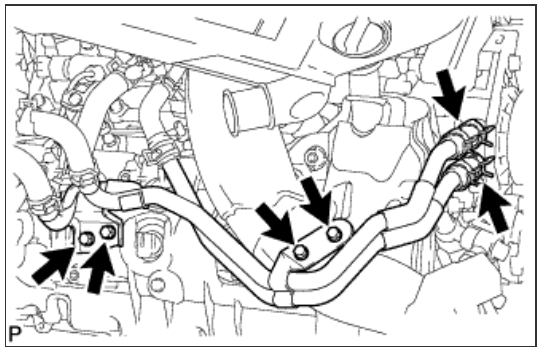


a. Install the heater assembly with the 2 bolts.

Torque:
48.5 N*m{ 495 kgf*cm , 36 ft.*lbf }

b. Connect the 2 heater hoses.

c. Using pliers, grip the claws of the clips and slide the 2 clips.



. Connect the connector and attach the clamp.

11. INSTALL HEATER WATER PIPE SUB-ASSEMBLY (w/ Viscous Heater)

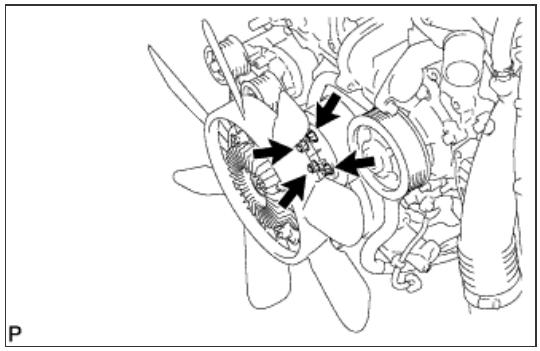
a. Connect the heater water pipe to the viscous heater with magnet clutch, and install the 4 bolts.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

12. INSTALL FAN PULLEY

13. INSTALL FAN SHROUD WITH FAN

a. Install the shroud together with the fluid coupling fan between the radiator and engine components.

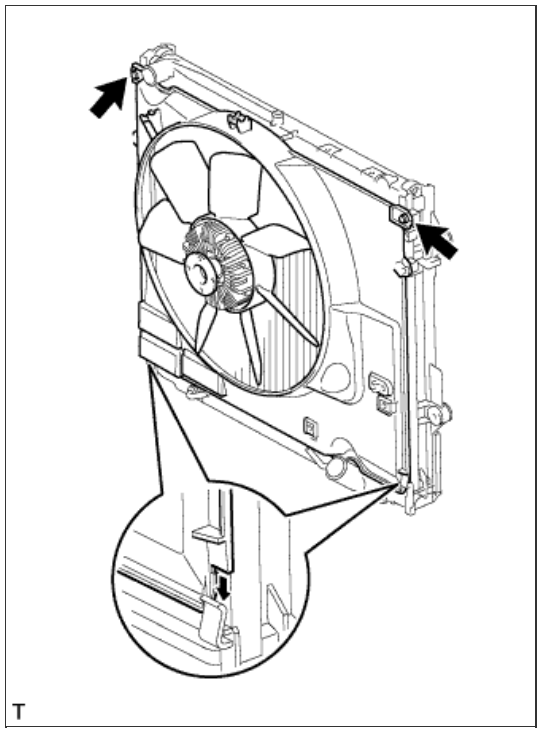


NOTICE:

Be careful not to damage the radiator core.

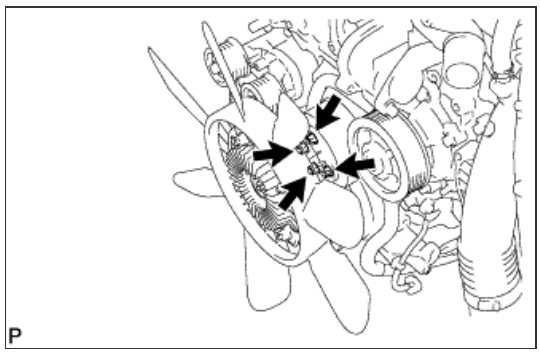
b. Temporarily install the fluid coupling fan to the fan bracket with the 4 nuts.

HINT:



Tighten the nuts as much as possible by hand.

c. Attach the shroud claws to the radiator.

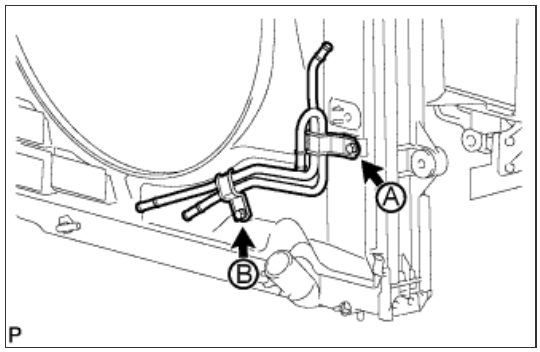


. Install the shroud with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

e. Tighten the 4 nuts of the fluid coupling fan.

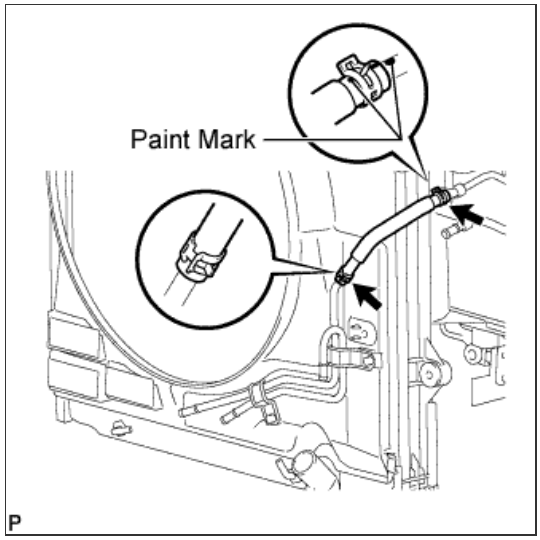
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



14. INSTALL OIL COOLER TUBE (for Automatic Transmission)

a. Temporarily install the oil cooler tube to the fan shroud with the bolt labeled A.

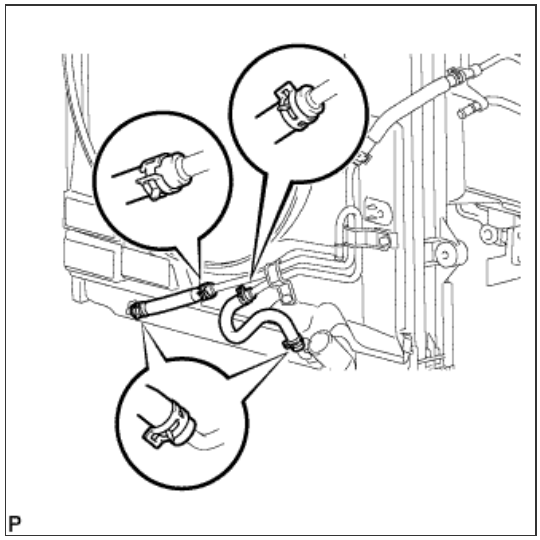
Install the bolt labeled B. Then tighten the bolt labeled A to the specified torque.



Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

b. Connect the inlet No. 4 oil cooler hose as shown in the illustration.

NOTICE:

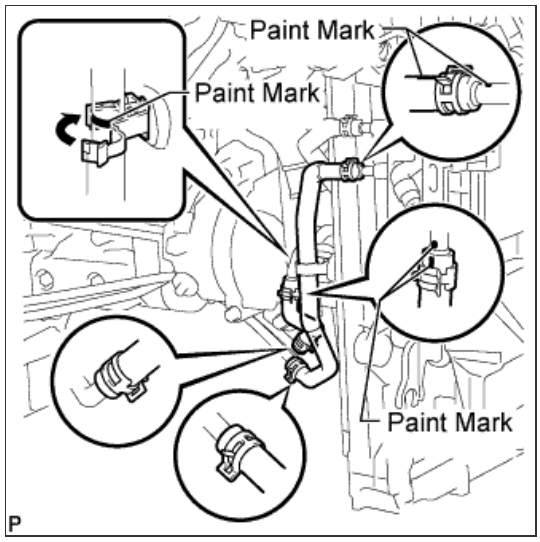


Make sure the pinching portion of each clip is facing the direction shown in the illustration.

c. Connect the inlet No. 2 and No. 3 oil cooler hoses as shown in the illustration.

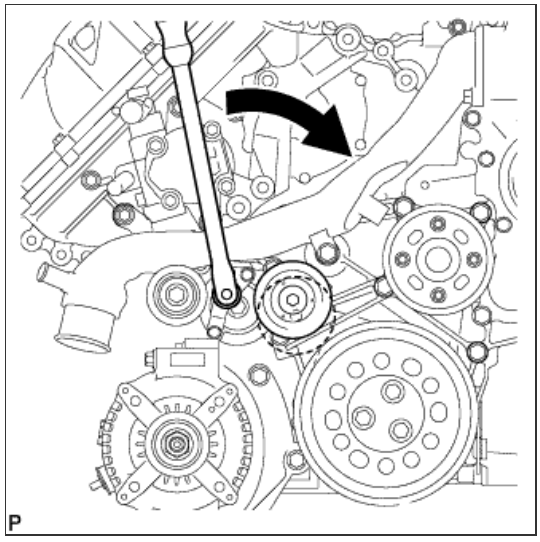
NOTICE:

Make sure the pinching portion of each clip is facing the direction shown in the illustration.



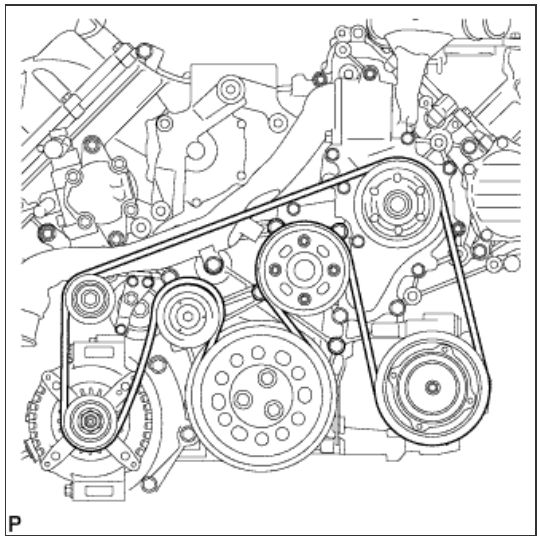
. Connect the inlet and outlet No. 1 oil cooler hoses as shown in the illustration.

NOTICE:



Make sure the pinching portion of each clip is facing the direction shown in the illustration.

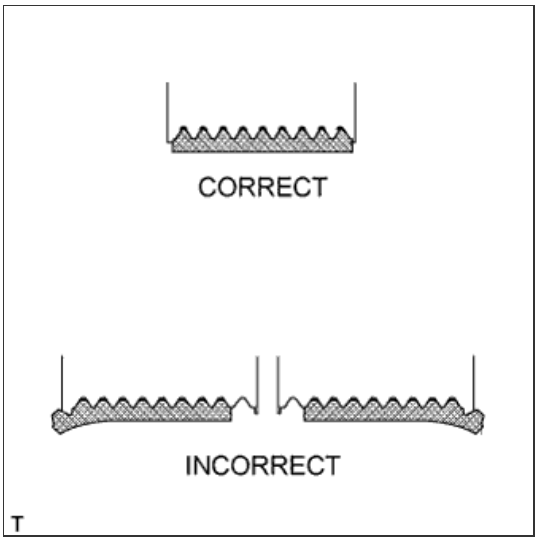
e. Pass the hose through the flexible hose clamp and close the clamp shown in the illustration.



15. INSTALL V-RIBBED BELT

a. Attach a wrench to the V-ribbed belt tensioner bracket and turn the wrench clockwise.

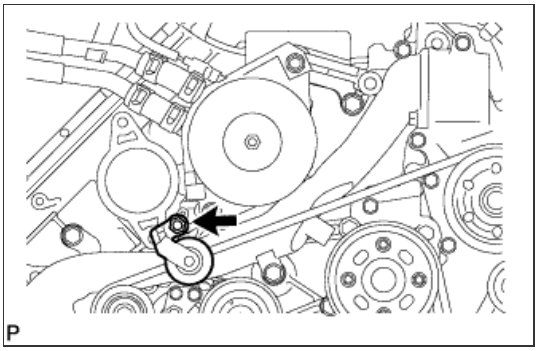
b. Install the V-ribbed belt as shown in the illustration.



c. Check that the belt fits properly in the ribbed grooves.

HINT:

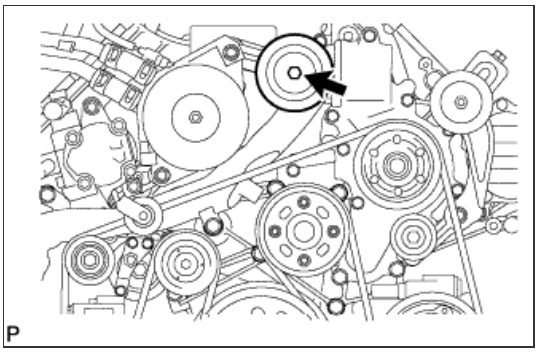
Check with your hand to confirm that the belt has not slipped out of the groove on the bottom of the pulley.



If it has slipped out, replace the V-ribbed belt. Install a new V-ribbed belt.

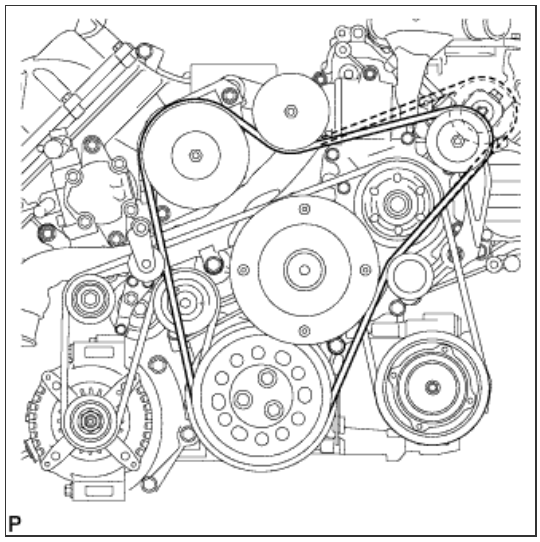
16. INSTALL NO. 3 IDLER PULLEY (w/ Viscous Heater)

a. Align the No. 3 idler pulley bracket knock pin and No. 1 idler pulley bracket knock pin hole and install the No. 3 idler pulley with the nut.



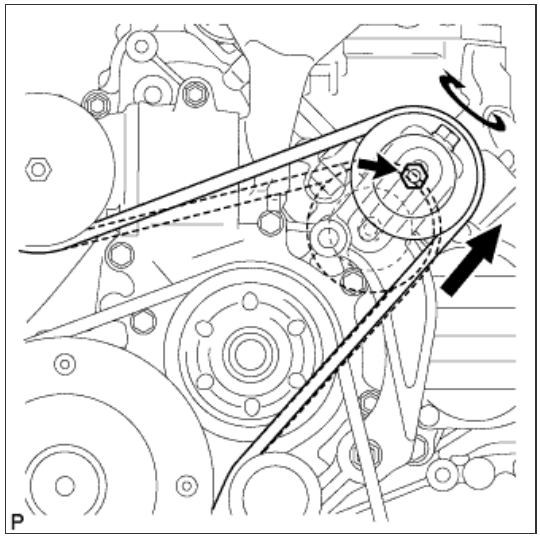
Torque:
88 N*m{ 898 kgf*cm , 64 ft.*lbf }

17. INSTALL NO. 1 IDLER PULLEY (w/ Viscous Heater)



a. Install the collar, No. 1 idler pulley and cover with the bolt.

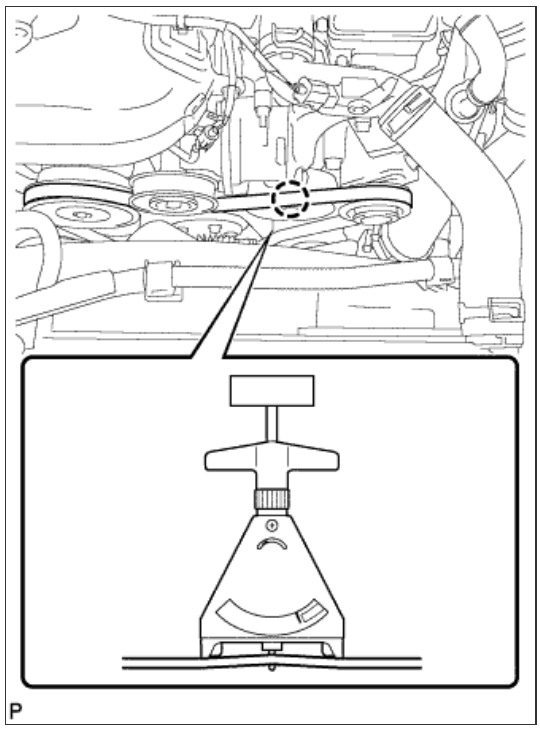
Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }



18. INSTALL V-RIBBED BELT (w/ Viscous Heater)

a. Install the V-ribbed belt as shown in the illustration.

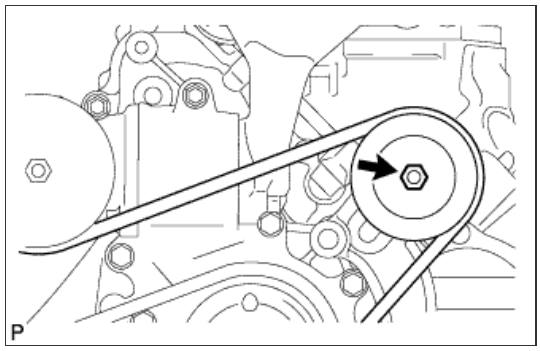
b. Temporarily install the lock nut, and turn the bolt clockwise.



c. Using a belt tension gauge, adjust belt tension.

Stan ar Belt Tension:

Item	Specified Condition
New belt	400 to 650 N (41 to 66 kgf, 89.9 to 146.1 lbf)
Used belt	300 to 500 N (31 to 51 kgf, 67.4 to 112.4 lbf)

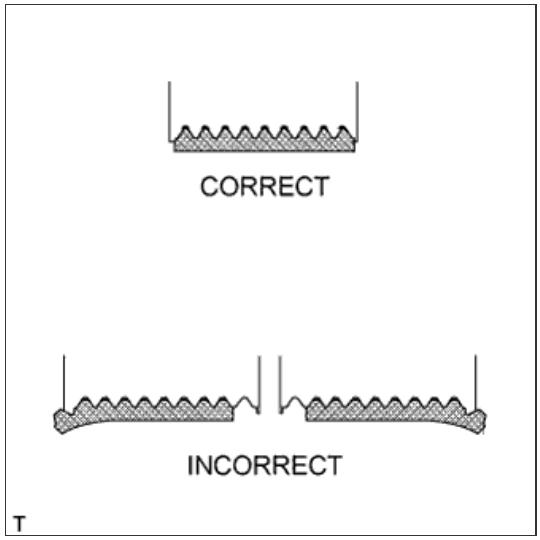


HINT:

- **A new belt is a belt which has been use for less than 5 minutes on a running engine.**
- **A use belt is a belt which has been use on a running engine for 5 minutes or more.**
- **After installing a new belt, run the engine for appro imately 5 minutes an then recheck the tension.**

. Tighten the nut.

Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }



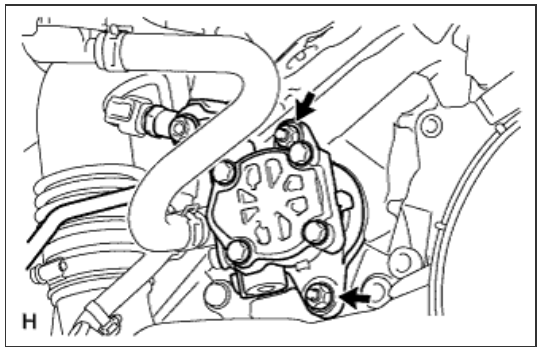
e. Check that the belt fits properly in the ribbed grooves.

HINT:

Check with your hand to confirm that the belt has not slipped out of the groove on the bottom of the pulley.

If it has slipped out, replace the V-ribbed belt. Install a new V-ribbed belt.

19. CONNECT NO. 2 RADIATOR HOSE



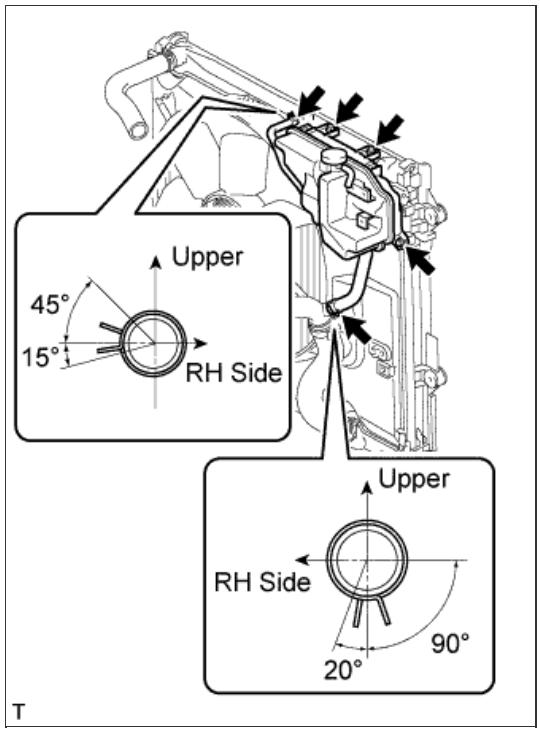
20. CONNECT NO. 1 RADIATOR HOSE

21. INSTALL VANE PUMP ASSEMBLY

a. Apply a light coat of engine oil to a new O-ring, and install it to the vane pump.

b. Install the vane pump with 2 new nuts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

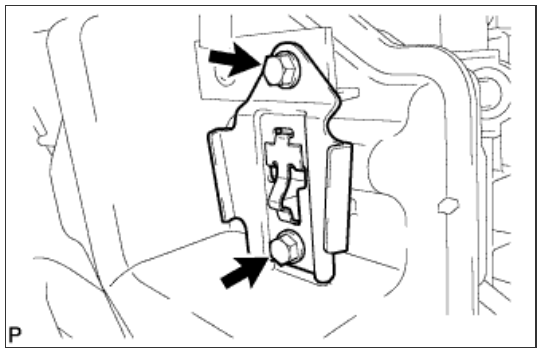


22. INSTALL RADIATOR RESERVOIR ASSEMBLY

a. Install the radiator reservoir with the 3 bolts.

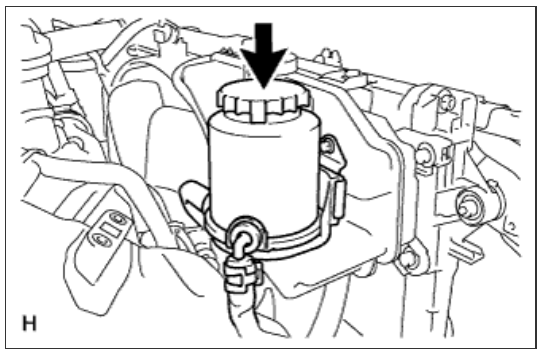
b. Connect the 2 hoses to the upper radiator tank and water inlet.

HINT:



Make sure the directions of the hose clamps are as shown in the illustration.

23. INSTALL NO. 1 OIL RESERVOIR BRACKET



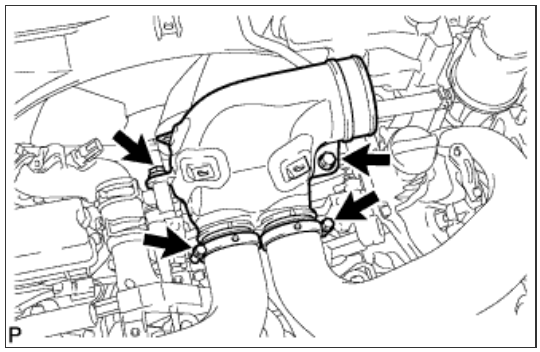
a. Install a new bracket with the 2 bolts.

Torque:
4.5 N*m{ 46 kgf*cm , 40 in.*lbf }

24. INSTALL VANE PUMP OIL RESERVOIR ASSEMBLY

a. Install the vane pump oil reservoir to the bracket.

25. INSTALL INTAKE AIR CONNECTOR

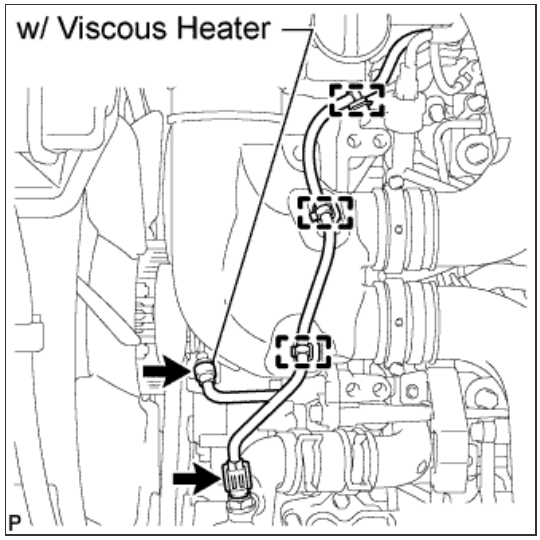


a. Connect the intake air connector to the No. 1 and No. 2 air cleaner pipes.

b. Install the connector with the 2 bolts.

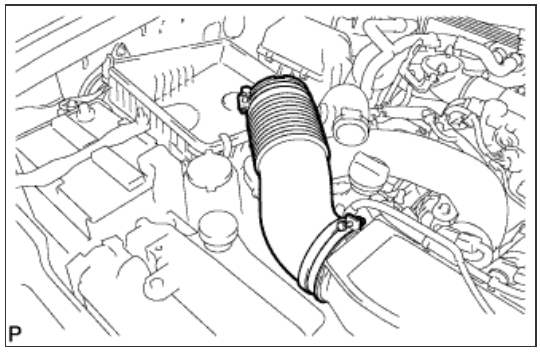
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Tighten the 2 hose clamps.



Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

. Attach the 3 wire harness clamps.

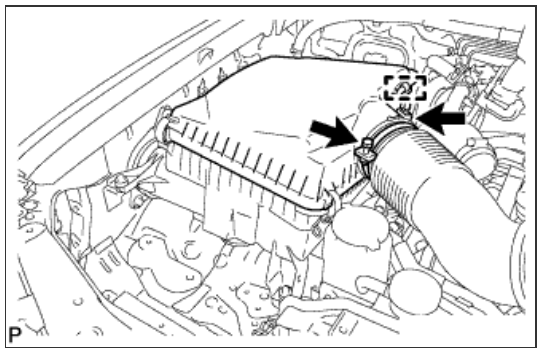


e. w/o Viscous Heater:
Connect the connector to the water temperature sensor.

f. w/ Viscous Heater:
Connect the 2 connectors to the water temperature sensor and viscous with magnet clutch heater.

26. TEMPORARILY INSTALL NO. 1 AIR CLEANER HOSE

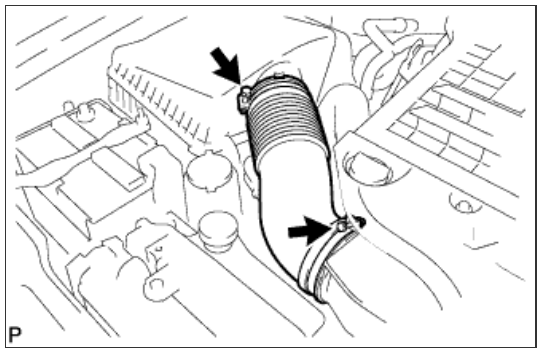
a. Temporarily install the air cleaner hose to the intake air connector.



27. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

a. Connect the air cleaner cap to the air cleaner hose, and install the air cleaner cap with the 4 clamps.

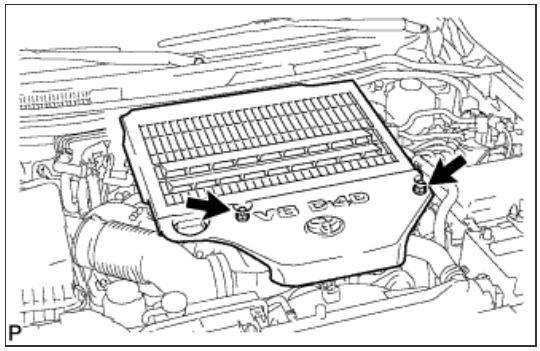
b. Connect the mass air flow meter connector and attach the wire harness clamp to the air cleaner cap.



c. Attach the wire harness clamp.

. Align the protrusion of air cleaner cap and concave portion of air cleaner hose.

e. Tighten the 2 hose clamps.

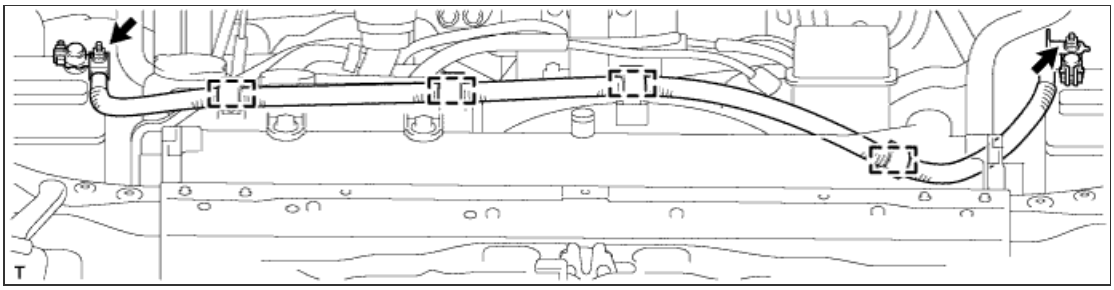


Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

28. INSTALL NO. 1 ENGINE COVER SUB-ASSEMBLY (w/ Intercooler)

a. Install the engine cover with the 2 nuts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



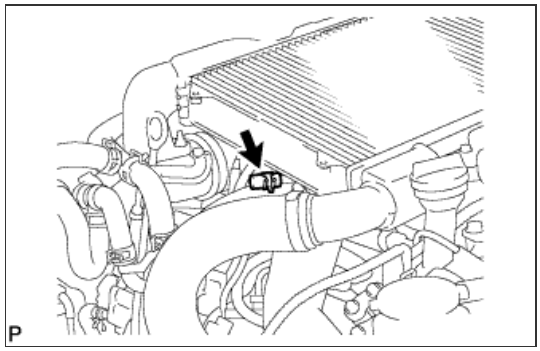
29. INSTALL NO. 3 ENGINE ROOM WIRE

a. Install the No. 3 engine room wire to the main battery and sub-battery positive terminals with the 2 nuts.

Torque:
7.6 N*m{ 77 kgf*cm , 67 in.*lbf }

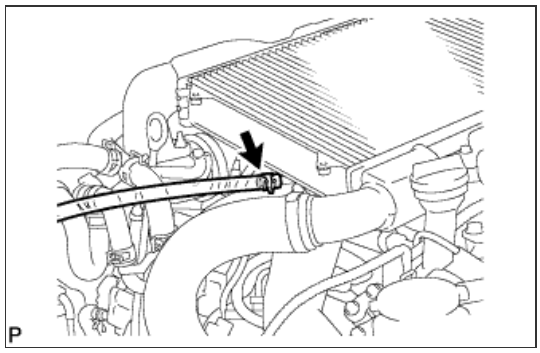
b. Connect the No. 3 engine room wire with the 4 clamps.

30. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



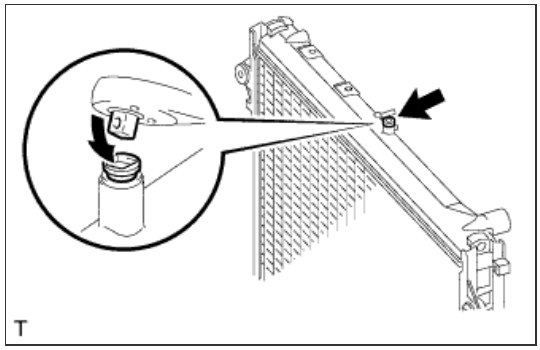
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

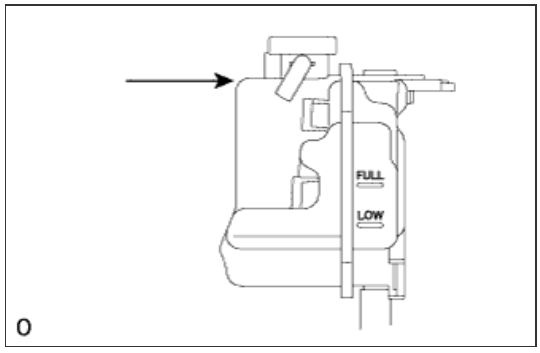


a. Connect the cables to negative (-) main battery and sub-battery terminals.

31. ADD ENGINE COOLANT



a. Remove the engine air bleed cap.



b. Connect a clear hose to the engine air bleed pipe.

c. Using a wrench, remove the vent plug.

. Fill the radiator with TOYOTA SLLC to the radiator reservoir filler neck.

HINT:

Pour TOYOTA SLLC until it spills out of the engine air bleed pipe.

Stan ar Capacity (for Automatic Transmission):

Item	Specified Condition
Front heater only	14.8 liters (15.6 US qts, 13.0 Imp. qts)
Front heater and rear heater	17.6 liters (18.6 US qts, 15.5 Imp. qts)
Front heater with viscous heater	15.2 liters (16.1 US qts, 13.4 Imp. qts)
Front heater and rear heater with viscous heater	18.0 liters (19.0 US qts, 15.4 Imp. qts)

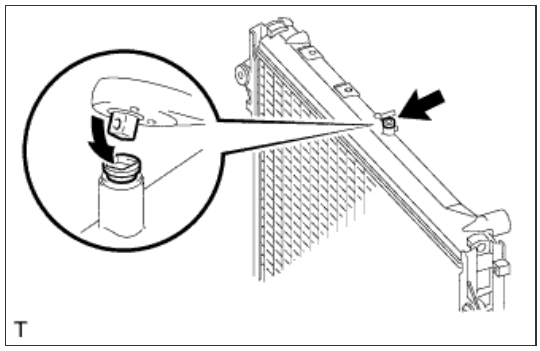
Stan ar capacity (for Manual Transmission):
15.4 liters (16.3 US qts, 13.6 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

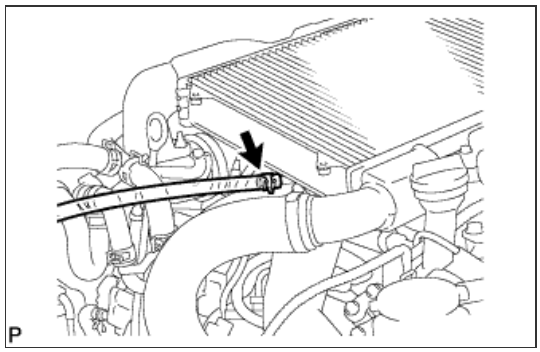
HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low



phosphates and organic acids).

e. Install the vent plug.

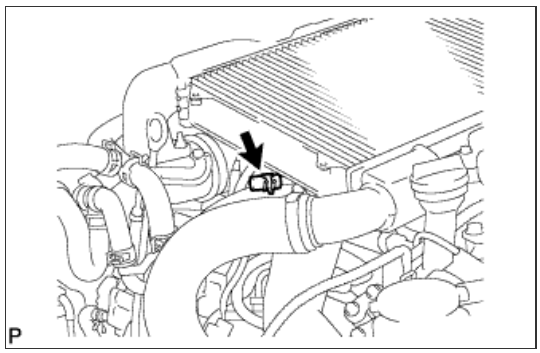


Torque:
2.0 N*m{ 20 kgf*cm , 18 in.*lbf }

NOTICE:

Do not tighten the plug to 5.0 N*m (51 kgf*cm, 44 in.*lbf) or more, as the plug will be damaged.

f. Disconnect the clear hose from the engine air bleed pipe.



g. Install the engine air bleed cap when coolant comes out.

h. Install the radiator reservoir cap.

i. Start the engine.

NOTICE:

Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the FULL line.

j. Maintain an engine speed of 3000 rpm for approximately 10 minutes so that the thermostat opens and air bleeding is performed.

CAUTION:

When pressing the ra iator hoses:

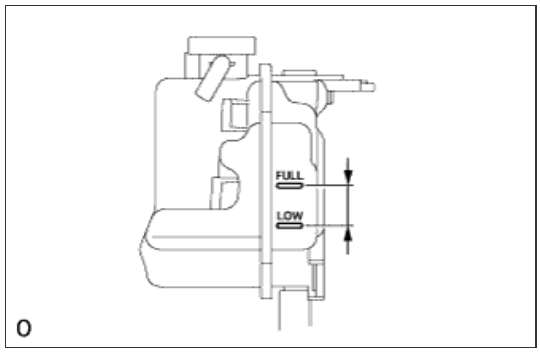
- **Wear protective gloves.**
- **Be careful as the ra iator hoses are hot.**
- **Keep your han s away from the ra iator fan**

NOTICE:

- **Pay attention to the nee le of the water temperature meter. Make sure that the nee le oes not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.



k. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

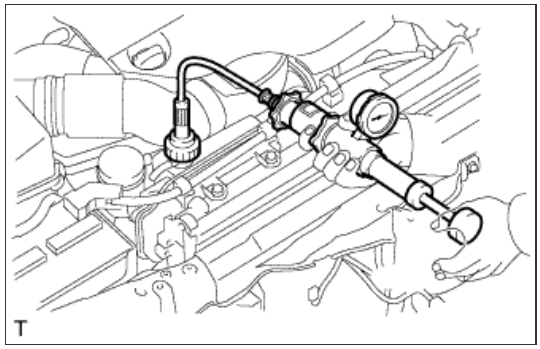
CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

l. Check that the coolant level is between the FULL and LOW lines.
If the coolant level is above the FULL line, drain coolant so that the coolant level

is between the FULL and LOW lines.

32. INSPECT FOR ENGINE COOLANT LEAK



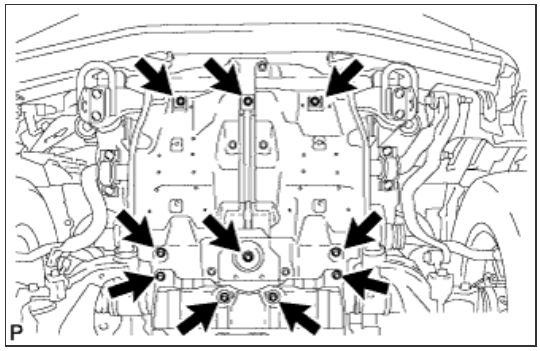
CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.

b. Warm up the engine.

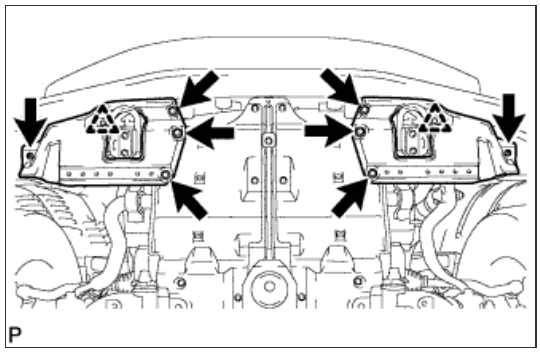
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.



33. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the upper radiator support seal with the 7 clips.

34. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

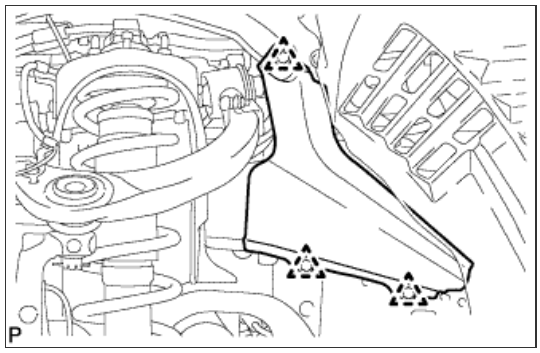


a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

35. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

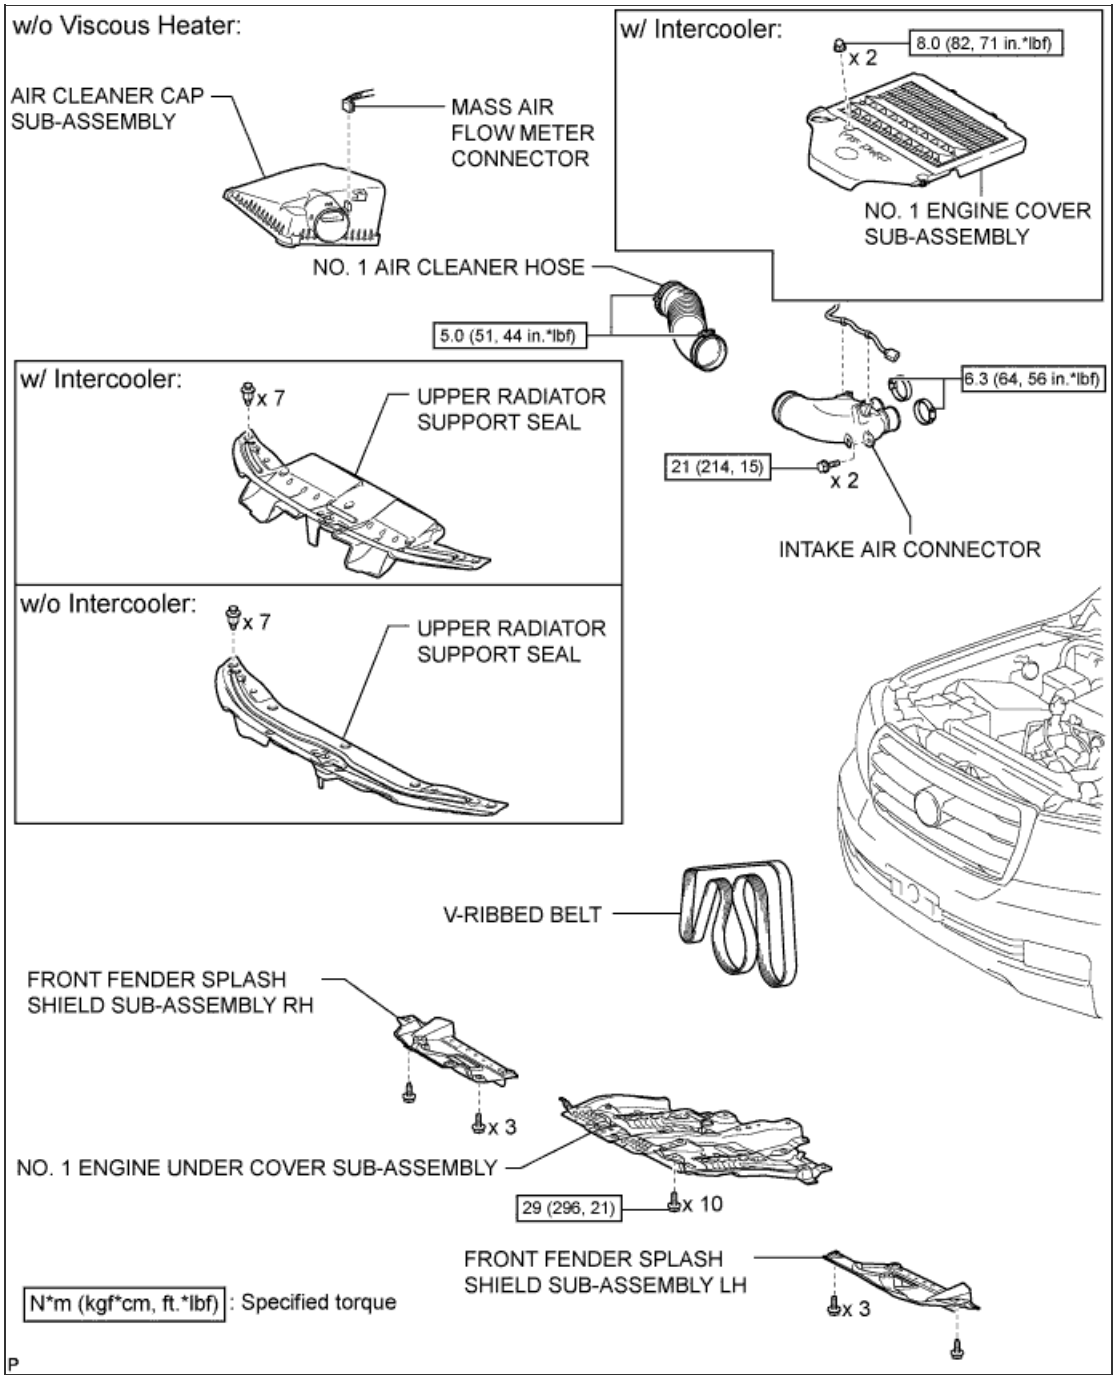
a. Install the splash shield with the clip, and then install the 3 bolts and screw.



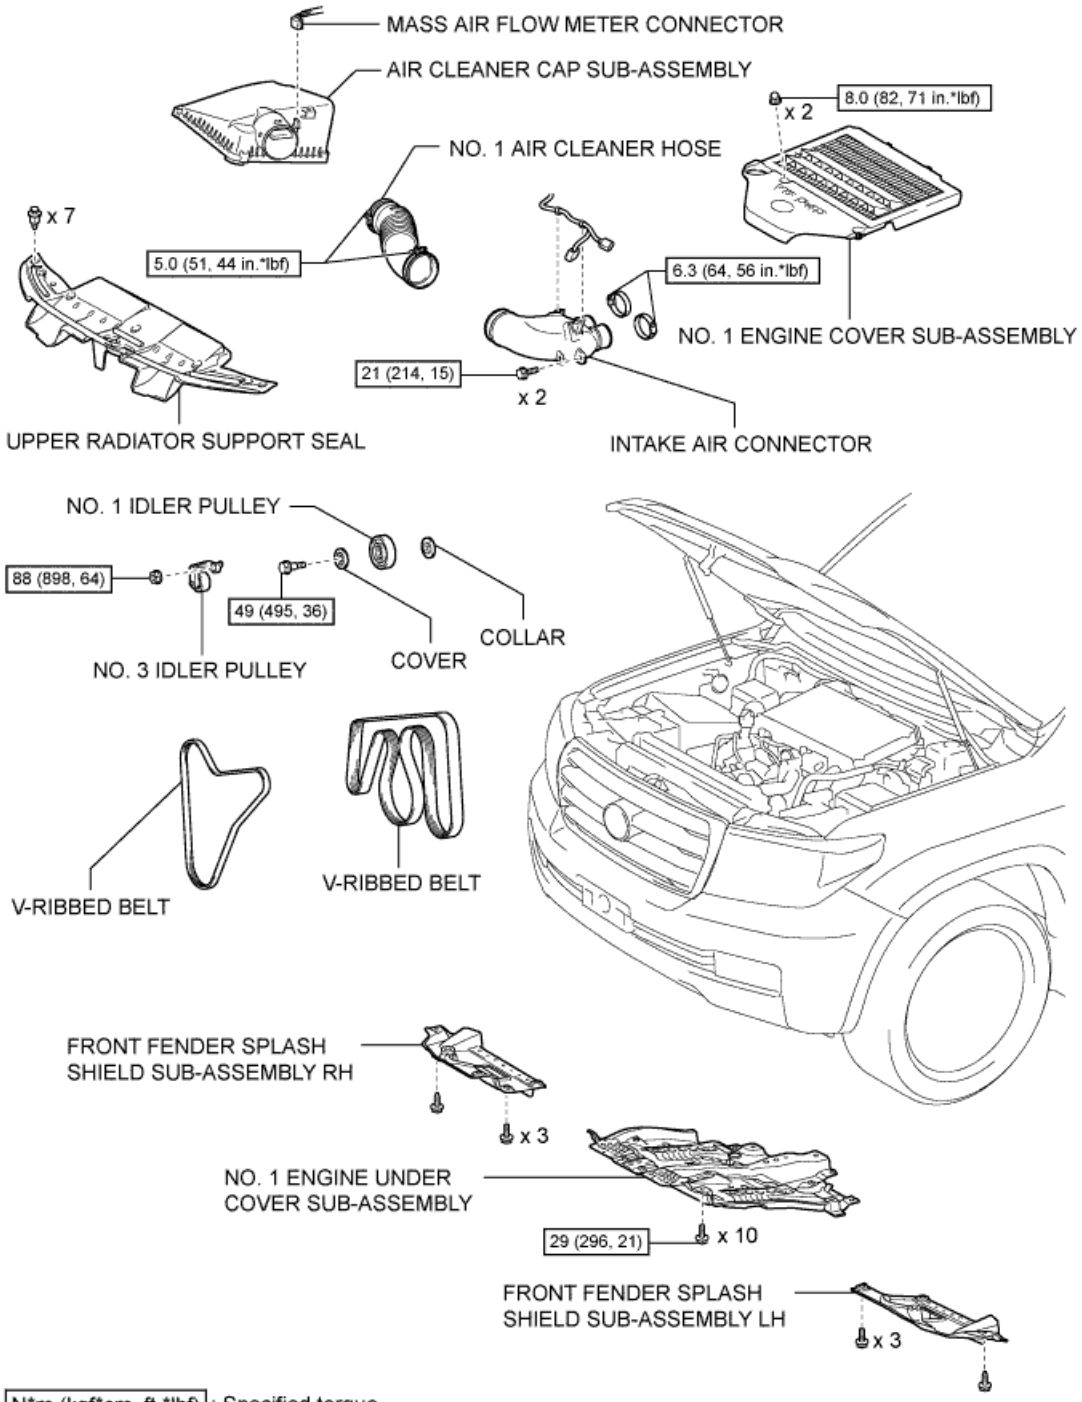
36. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Install the splash shield with the clip, and then install the 3 bolts and screw.

37. INSTALL FRONT FENDER APRON SEAL FRONT RH

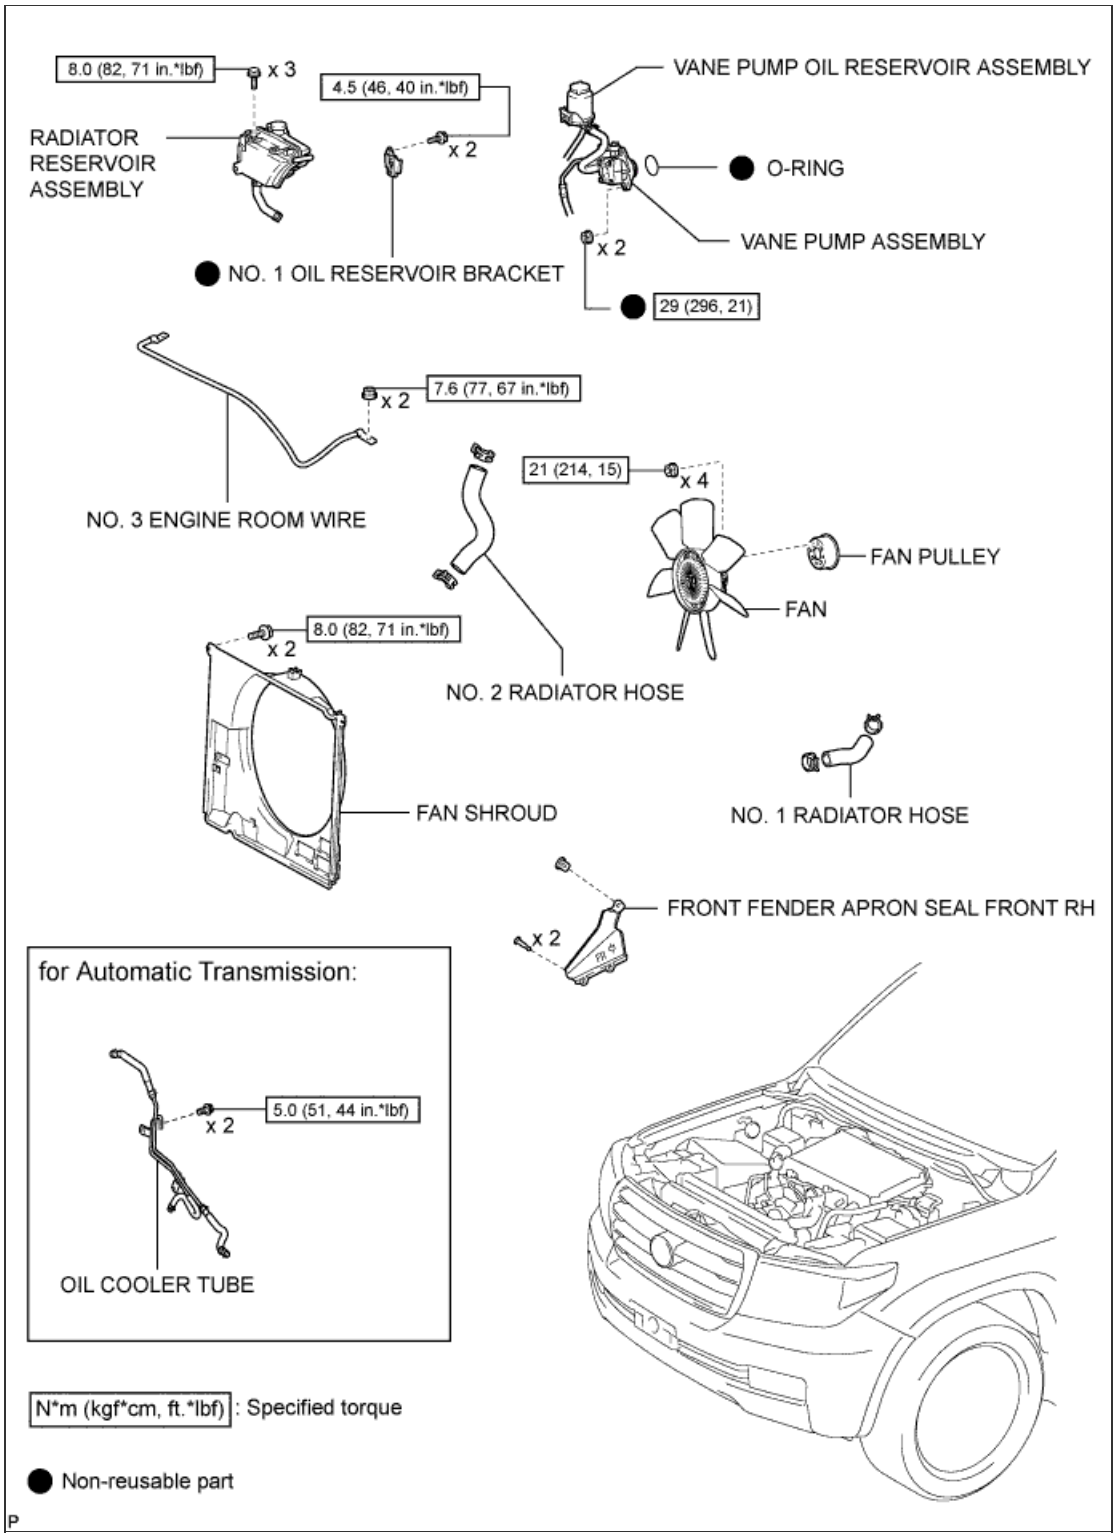


a. Install the front fender apron seal front RH with the 3 clips.



38. INSTALL FRONT WHEEL RH

Torque:
for Aluminum Wheel:
131 N*m{ 1336 kgf*cm , 97 ft.*lbf }
for Steel Wheel:
209 N*m{ 2131 kgf*cm , 154 ft.*lbf }



for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

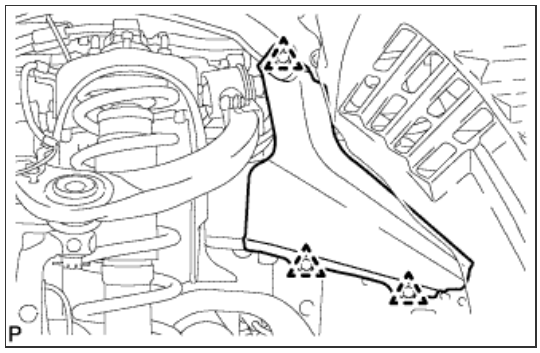
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.

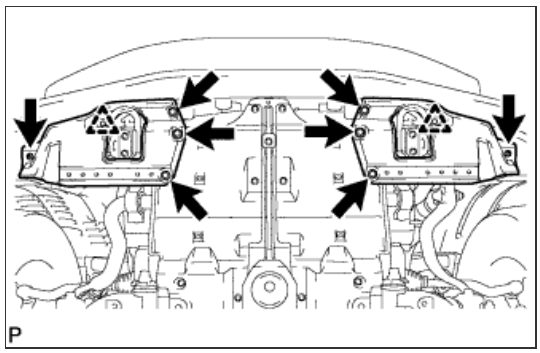


2. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and upper radiator support seal.

3. REMOVE FRONT WHEEL RH

4. REMOVE FRONT FENDER APRON SEAL FRONT RH

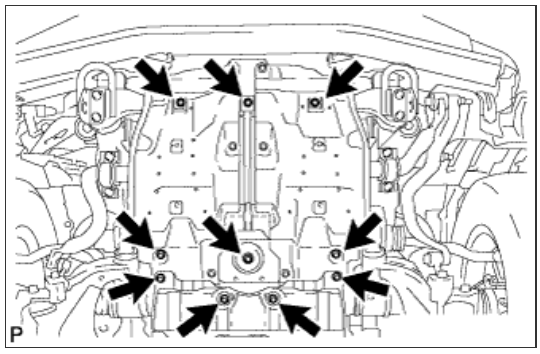


a. Remove the 3 clips and front fender apron seal front RH.

5. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.



6. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.

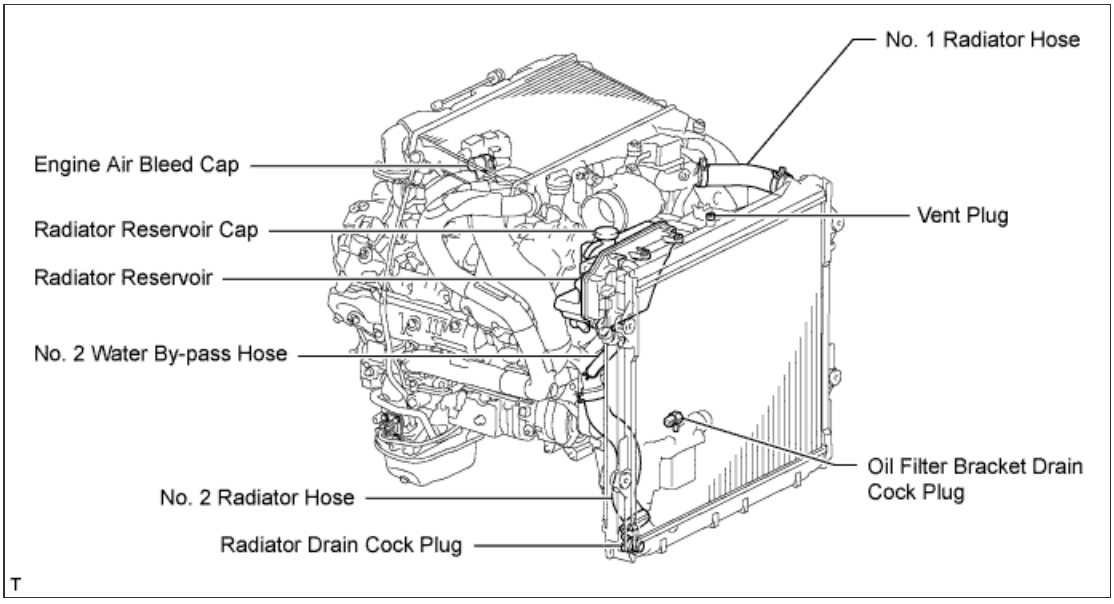
7. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

8. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.



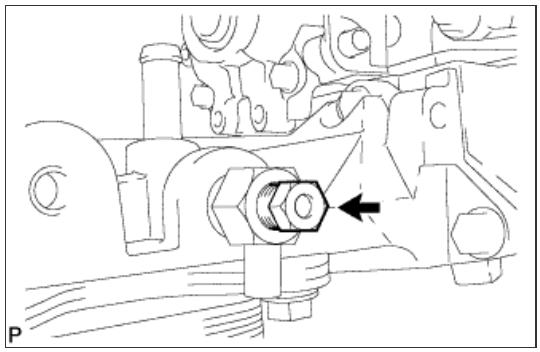
HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

a. Loosen the radiator drain cock plug.

b. Remove the radiator reservoir cap to drain the coolant in the radiator.

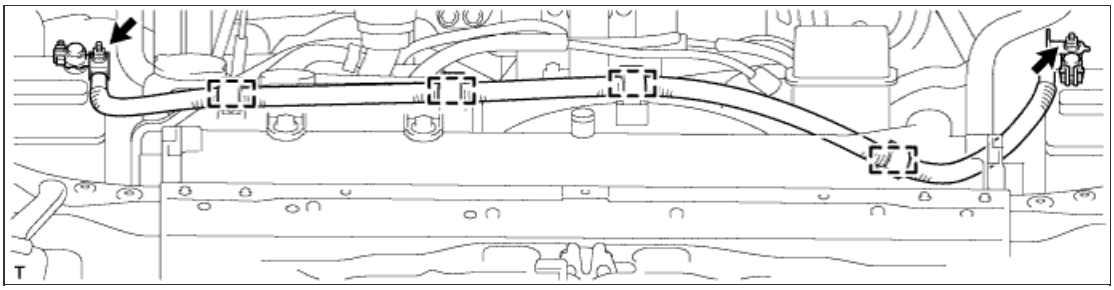
c. Loosen the oil filter bracket drain cock plug to drain the coolant in the engine.



d. ighten the radiator drain cock plug by hand.

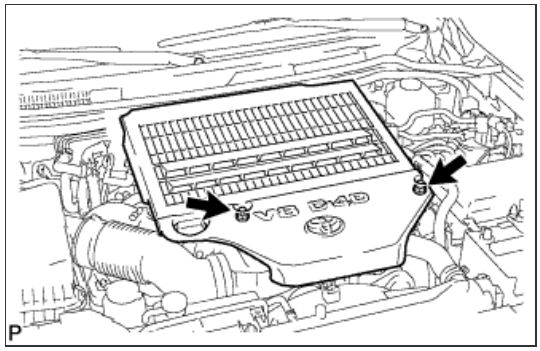
e. ighten the oil filter bracket drain cock plug.

Torque:



13 N*m{ 133 kgf*cm , 10 ft.*lbf }

9. REMOVE NO. 3 ENGINE ROOM WIRE

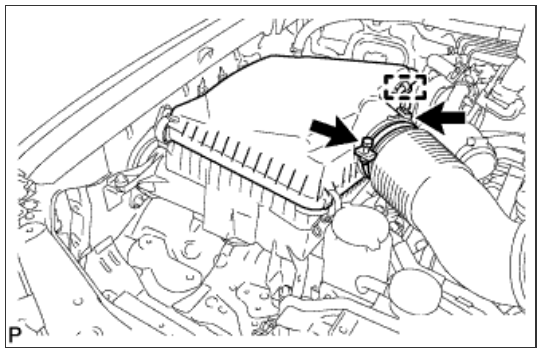


a. Disconnect the 4 wire harness clamps.

b. Remove the 2 nuts and No. 3 engine room wire.

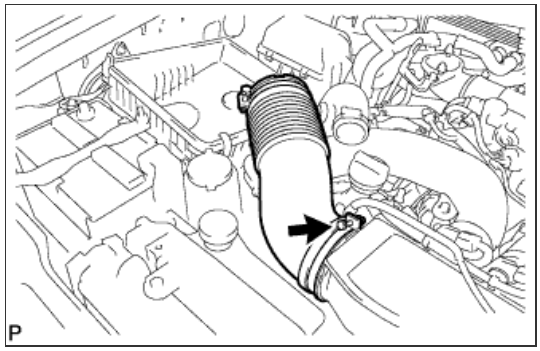
10. REMOVE NO. 1 ENGINE COVER SUB-ASSEMBLY (w/ Intercooler

a. Remove the 2 nuts and No. 1 engine cover.



11. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

a. Loosen the hose clamp.



b. Disconnect the mass air flow meter connector and using a clip remover, detach the wire harness clamp from the air cleaner cap.

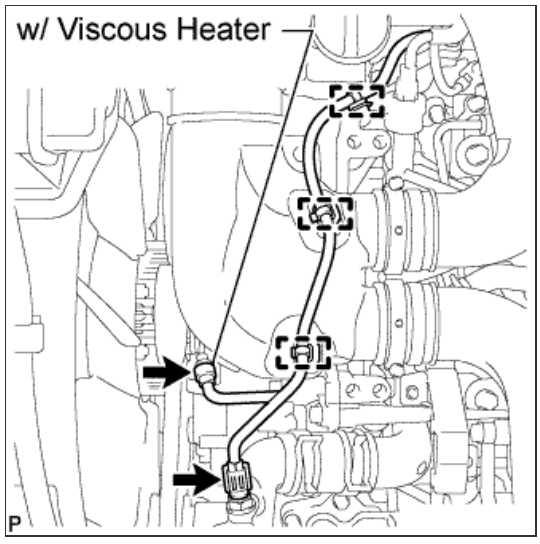
c. Detach the 4 clamps and remove the air cleaner cap.

12. REMOVE NO. 1 AIR CLEANER HOSE

a. Loosen the hose clamp and remove the No. 1 air cleaner hose.

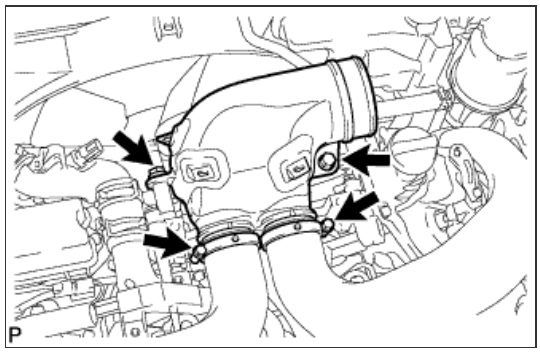
13. REMOVE INTAKE AIR CONNECTOR

a. w/o Viscous Heater:



i. Disconnect the connector from the water temperature sensor.

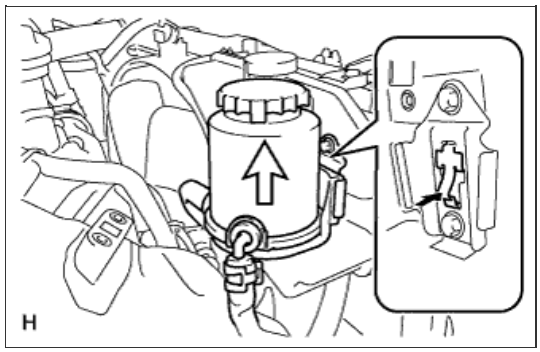
ii. Using a clip remover, detach the 3 wire harness clamps.



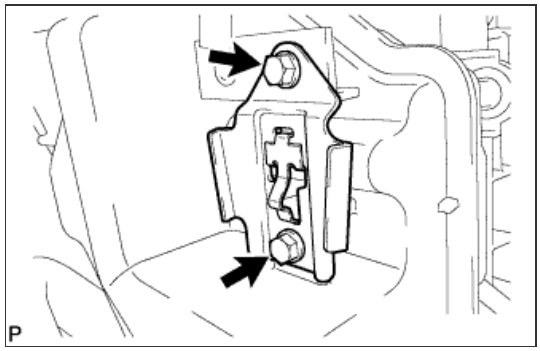
b. w/ Viscous Heater:

i. Disconnect the 2 connectors from the viscous with magnet clutch heater and water temperature sensor.

ii. Using a clip remover, detach the 3 wire harness clamps.



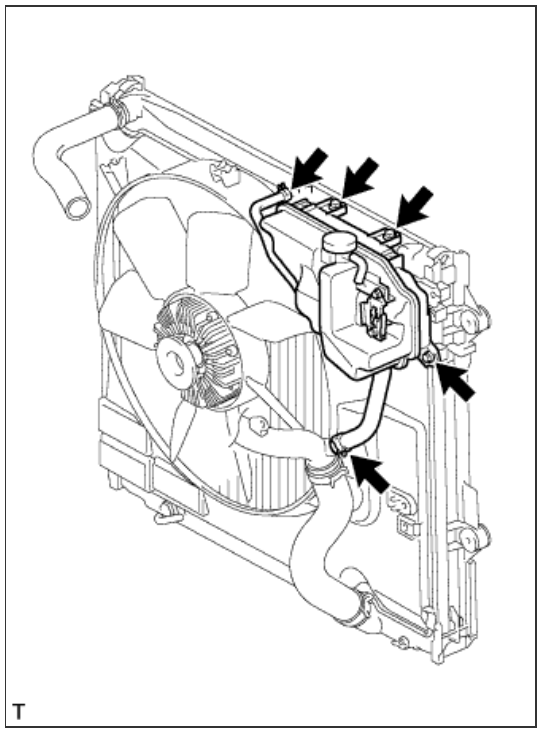
c. Loosen the 2 hose clamps and remove the 2 bolts and intake air connector.



14. REMOVE VANE PUMP OIL RESERVOIR ASSEMBLY

a. Insert a screwdriver between the reservoir and oil reservoir bracket, push the claw, and then disconnect the reservoir by pulling it upwards.

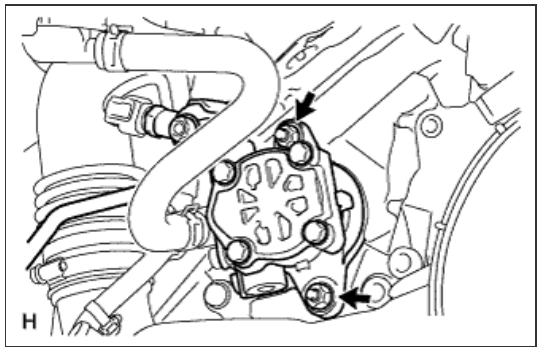
15. REMOVE NO. 1 OIL RESERVOIR BRACKET



a. Remove the 2 bolts and bracket.

16. REMOVE RADIATOR RESERVOIR ASSEMBLY

a. Disconnect the 2 hoses.

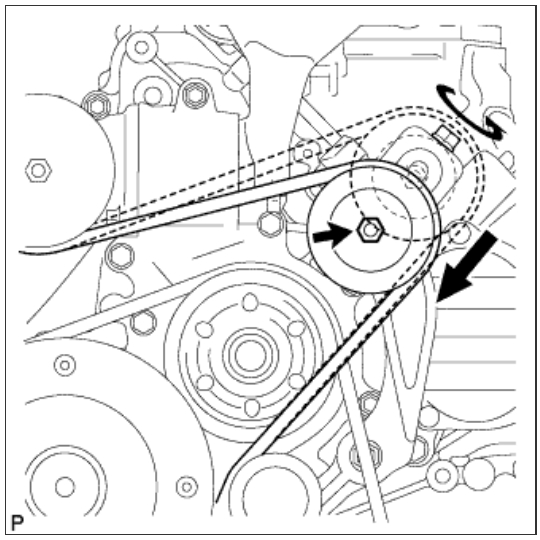


b. Remove the 3 bolts and radiator reservoir.

17. REMOVE VANE PUMP ASSEMBLY

a. Remove the 2 nuts and vane pump.

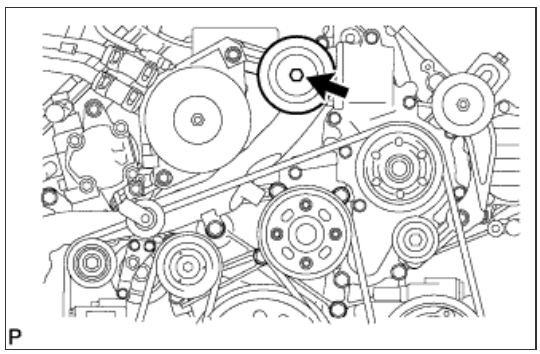
b. Remove the O-ring from the vane pump.



18. DISCONNECT NO. 1 RADIATOR HOSE

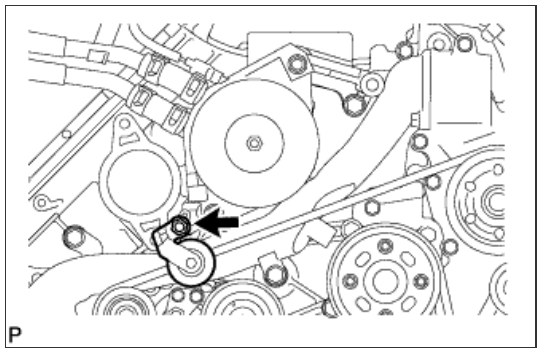
19. DISCONNECT NO. 2 RADIATOR HOSE

20. REMOVE V-RIBBED BELT (w/ Viscous Heater



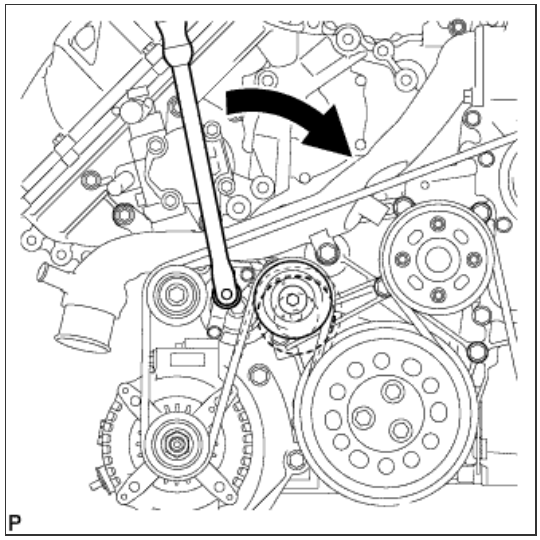
a. Loosen the lock nut and turn the bolt counterclockwise.

b. Remove the V-ribbed belt.



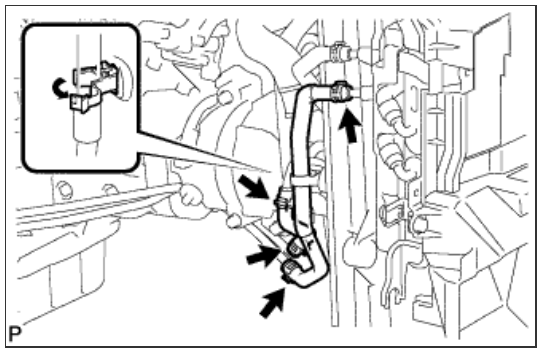
21. REMOVE NO. 1 IDLER PULLEY (w/ Viscous Heater

a. Remove the bolt, cover, No. 1 idler pulley and collar.



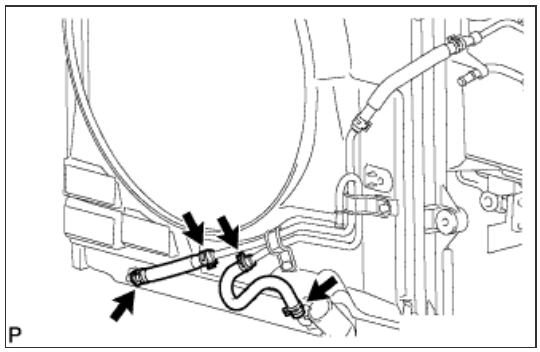
22. REMOVE NO. 3 IDLER PULLEY (w/ Viscous Heater

a. Remove the nut and No. 3 idler pulley.

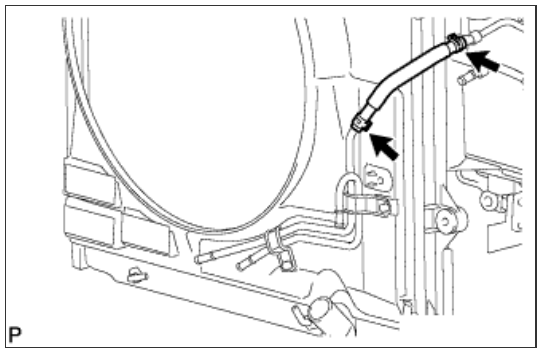


23. REMOVE V-RIBBED BELT

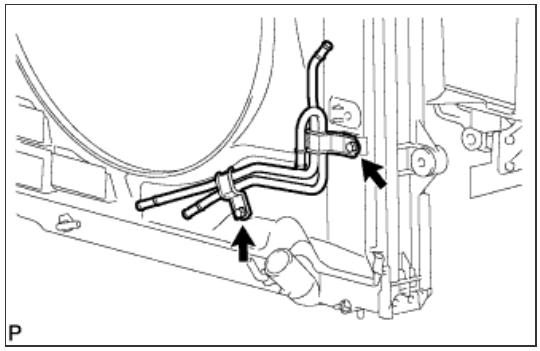
a. Using a wrench to the V-ribbed belt tensioner bracket, turn the wrench clockwise and remove the V-ribbed belt.



24. REMOVE OIL COOLER TUBE (for Automatic Transmission

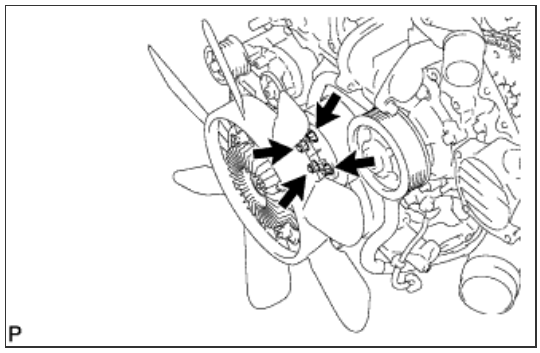


a. Disconnect the inlet and outlet No. 1 oil cooler hose.

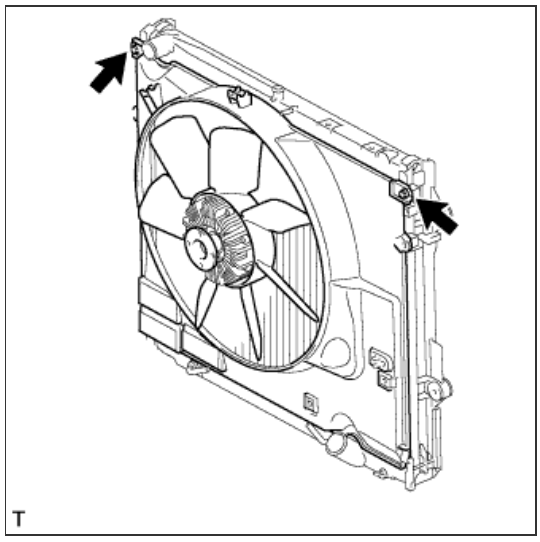


b. Disconnect the inlet No. 2 and No. 3 oil cooler hoses.

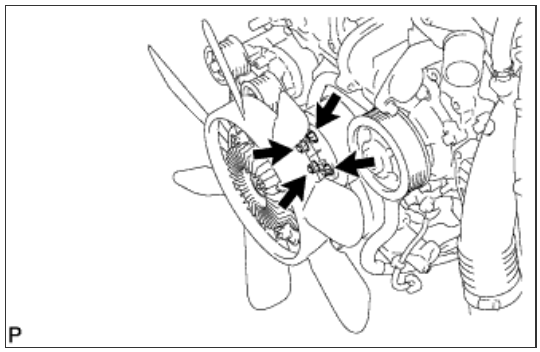
c. Disconnect the inlet No. 4 oil cooler hose.



d. Remove the 2 bolts and transmission oil cooler tube.

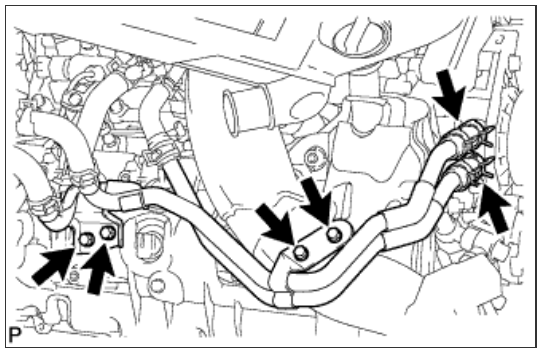


25. REMOVE FAN SHROUD WITH FAN



a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the 2 bolts holding the fan shroud.

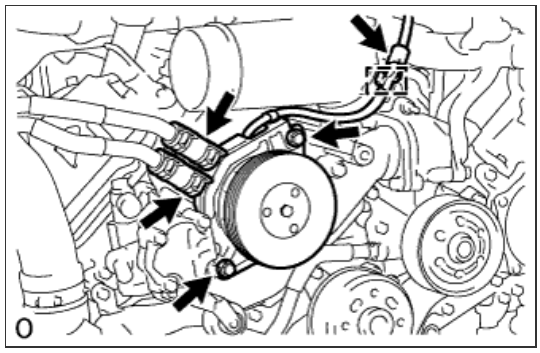


c. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the fluid coupling fan.

26. REMOVE FAN PULLEY

27. REMOVE HEATER WATER PIPE SUB-ASSEMBLY (w/ Viscous Heater

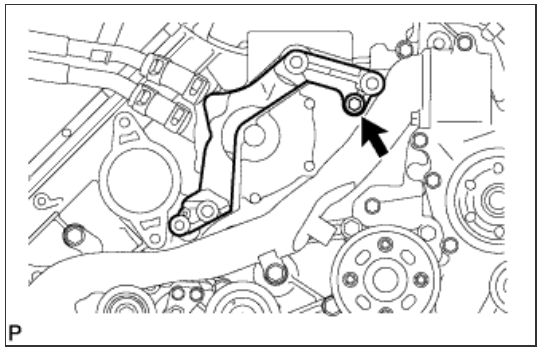
a. Remove the 4 bolts and disconnect the heater water pipe from the viscous heater with magnet clutch.



28. REMOVE VISCOUS WITH MAGNET CLUTCH HEATER ASSEMBLY (w/ Viscous Heater

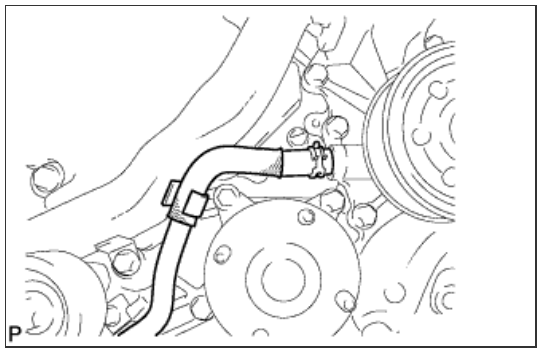
a. Disconnect the connector and detach the clamp.

b. Using pliers, grip the claws of the clips and slide the 2 clips.



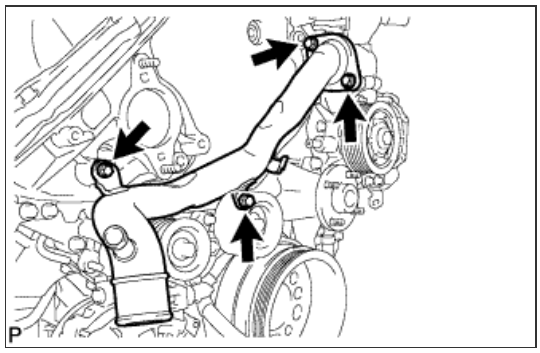
c. Disconnect the 2 heater hoses.

d. Remove the 2 bolts and heater assembly.



29. REMOVE NO. 1 IDLER PULLEY BRACKET (w/ Viscous Heater

a. Remove the bolt and No. 1 idler pulley bracket.



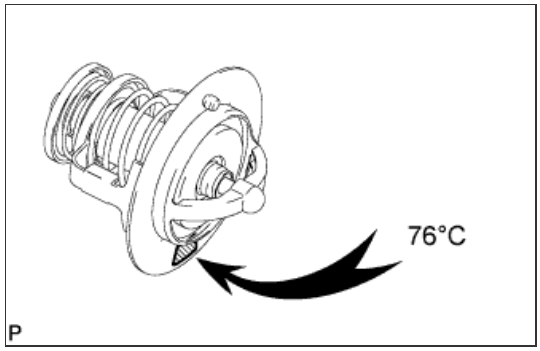
30. REMOVE WATER INLET

a. Disconnect the No. 2 oil cooler hose from the water pump and clamp.

b. Remove the 4 bolts and water inlet.

31. REMOVE THERMOSTAT

a. Remove the thermostat.



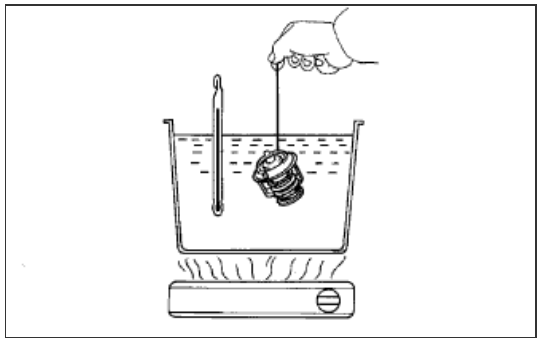
b. Remove the gasket from the thermostat.

for Preparation Click here

1. INSPECT THERMOSTAT

HINT:

The valve opening temperature is inscribed on the thermostat.

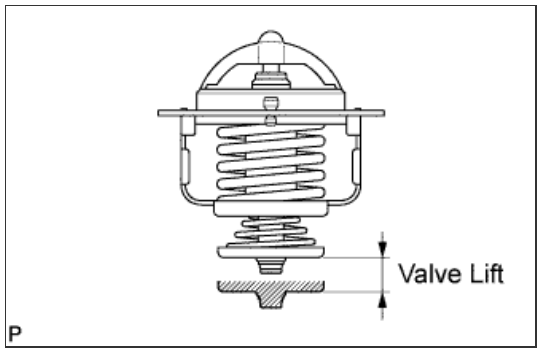


a. Immerse the thermostat in water and then gradually heat the water.

b. Check the valve opening temperature.

Valve opening temperature:
74 to 78°C (165 to 172°F)

If the valve opening temperature is not within the specified range, replace the thermostat.



c. Check the valve lift.

Valve lift:
10 mm (0.394 in.) or more at 90°C (194°F)

If the valve lift is not as specified, replace the thermostat.

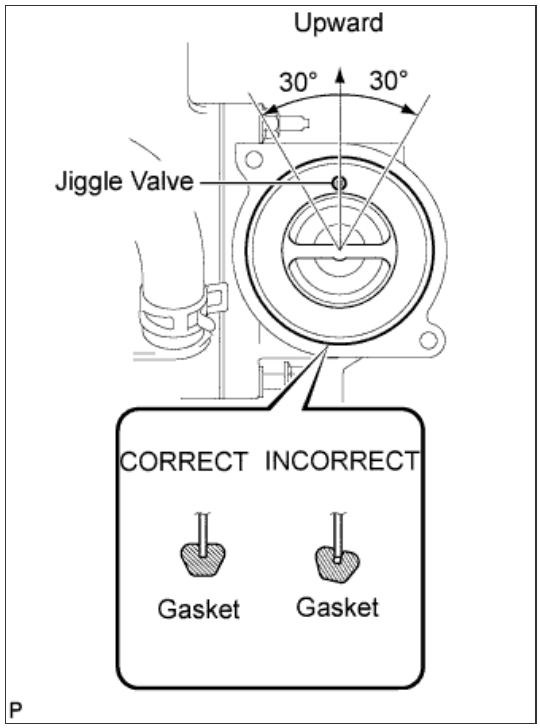
d. Check that the valve is fully closed when the thermostat is at low temperatures (below 40°C (104°F)).

If not fully closed, replace the thermostat.

for Preparation Click here

1. INSTALL THERMOSTAT

a. Install a new gasket to the thermostat.

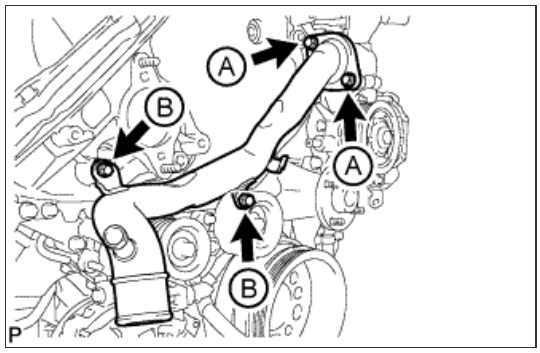


NOTICE:

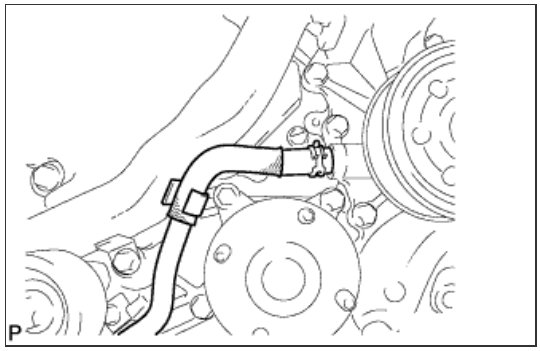
When installing the gasket to the thermostat, be careful not to deform the gasket. Make sure that the groove of the gasket is properly installed onto the thermostat, as shown in the illustration.

b. Insert the thermostat into the water pump with the jiggle valve facing straight upward.

HINT:



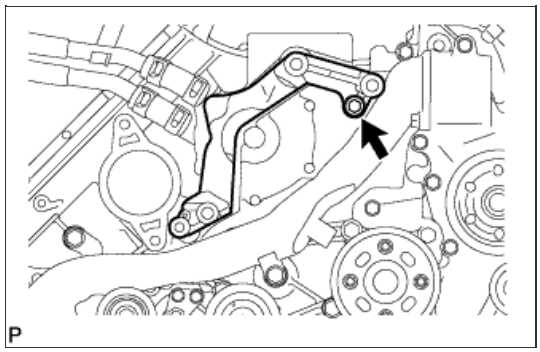
The jiggle valve may be set within 30° of either side of the prescribed position.



2. INSTALL WATER INLET

a. Install the water inlet with the 4 bolts.

Torque:
for bolt A:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for bolt B:
25 N*m{ 250 kgf*cm , 18 ft.*lbf }



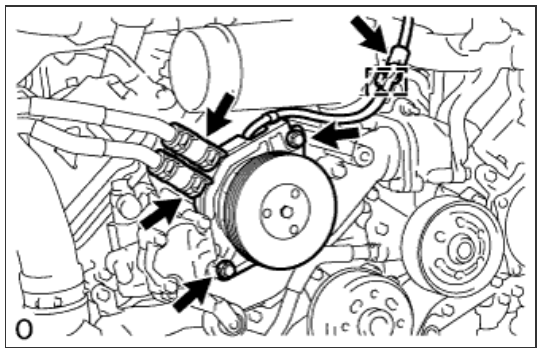
b. Connect the No. 2 oil cooler hose to the clamp and water pump.

3. INSTALL NO. 1 IDLER PULLEY BRACKET (w/ Viscous Heater)

a. Install the No. 1 idler pulley bracket with the bolt.

Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }

4. INSTALL VISCOUS WITH MAGNET CLUTCH HEATER ASSEMBLY (w/ Viscous Heater)

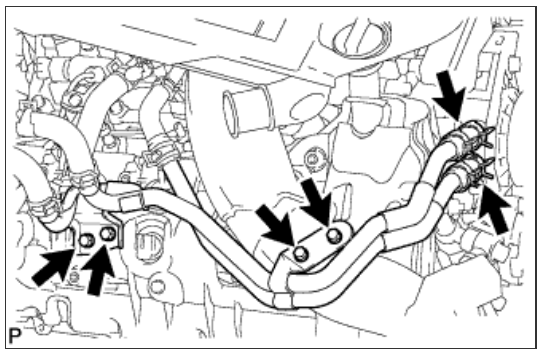


a. Install the heater assembly with the 2 bolts.

Torque:
48.5 N*m{ 495 kgf*cm , 36 ft.*lbf }

b. Connect the 2 heater hoses.

c. Using pliers, grip the claws of the clips and slide the 2 clips.



d. Connect the connector and attach the clamp.

5. INSTALL HEATER WATER PIPE SUB-ASSEMBLY (w/ Viscous Heater)

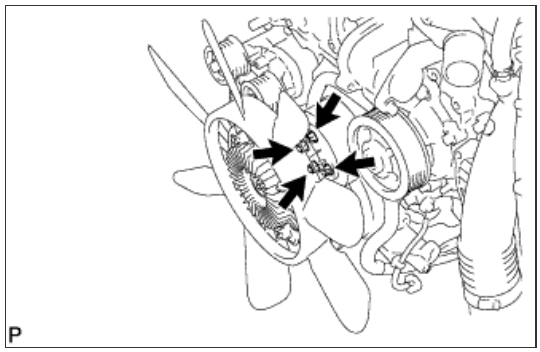
a. Connect the heater water pipe to the viscous heater with magnet clutch, and install the 4 bolts.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

6. INSTALL AN PULLEY

7. INSTALL AN SHROUD WITH AN

a. Install the shroud together with the fluid coupling fan between the radiator and engine components.

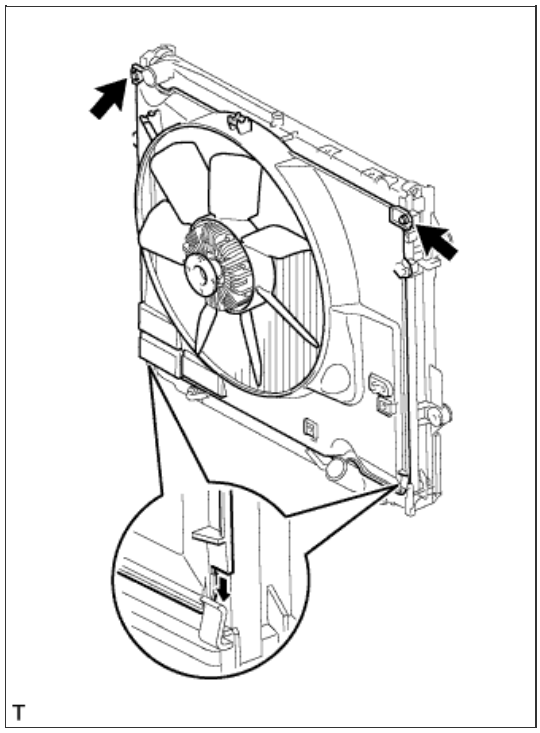


NOTICE:

Be careful not to damage the radiator core.

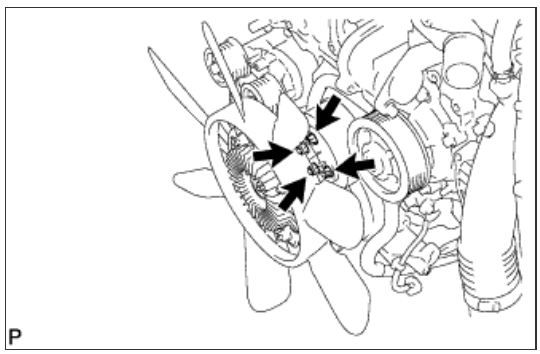
b. Temporarily install the fluid coupling fan to the fan bracket with the 4 nuts.

HINT:



Tighten the nuts as much as possible by hand.

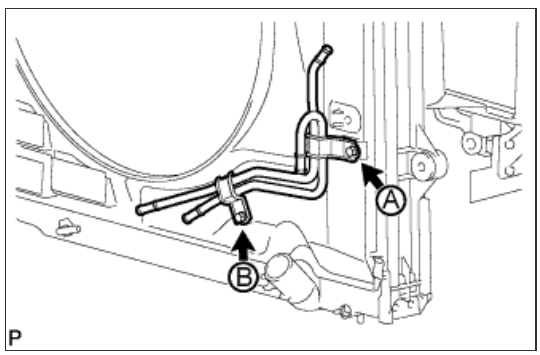
c. Attach the shroud claws to the radiator.



d. Install the shroud with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

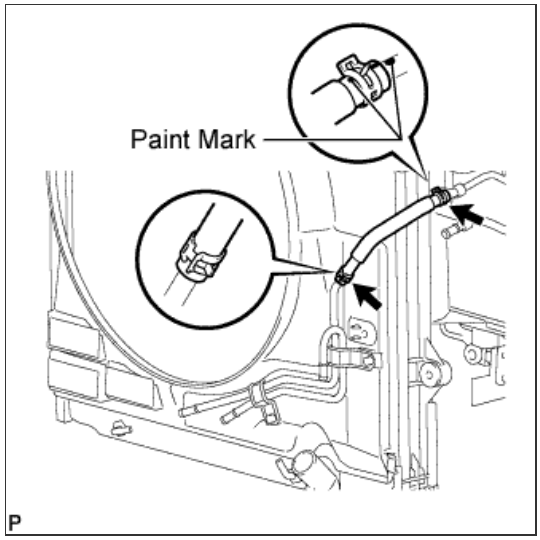
e. Tighten the 4 nuts of the fluid coupling fan.



Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

8. INSTALL OIL COOLER TUBE (for Automatic Transmission)

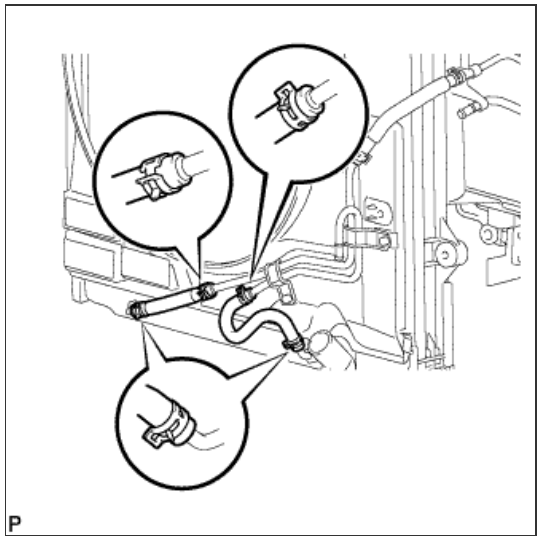
a. Temporarily install the oil cooler tube to the fan shroud with the bolt labeled A. Install the bolt labeled B. Then tighten the bolt labeled A to the specified torque.



Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

b. Connect the inlet No. 4 oil cooler hose as shown in the illustration.

NOTICE:

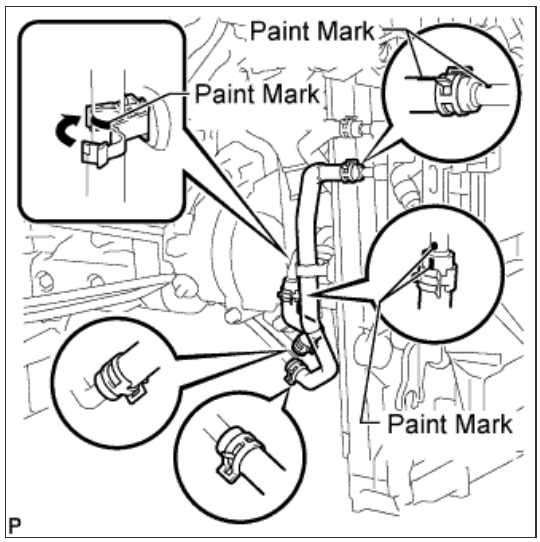


Make sure the pinching portion of each clip is facing the direction shown in the illustration.

c. Connect the inlet No. 2 and No. 3 oil cooler hoses as shown in the illustration.

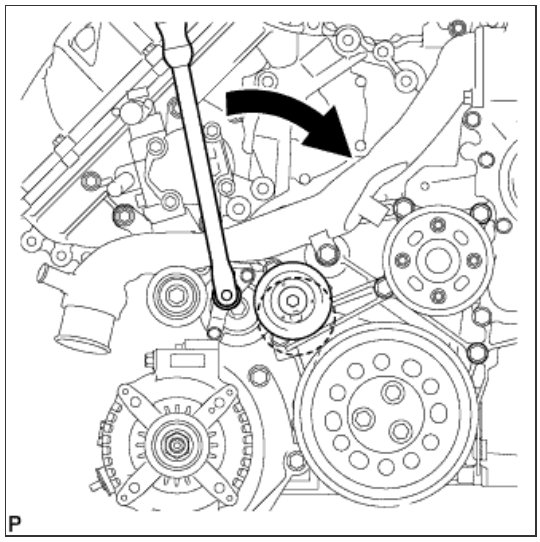
NOTICE:

Make sure the pinching portion of each clip is facing the direction shown in the illustration.



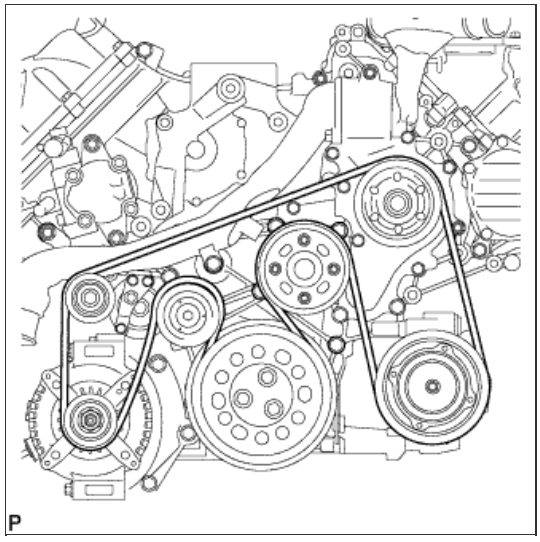
d. Connect the inlet and outlet No. 1 oil cooler hoses as shown in the illustration.

NOTICE:



Make sure the pinching portion of each clip is facing the direction shown in the illustration.

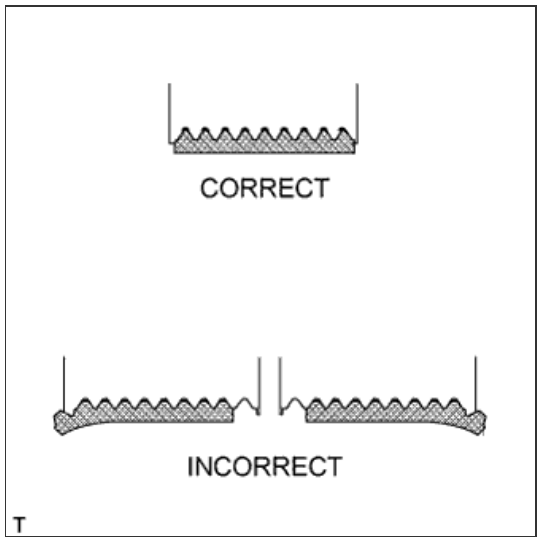
e. Pass the hose through the flexible hose clamp and close the clamp shown in the illustration.



9. INSTALL V-RIBBED BELT

a. Attach a wrench to the V-ribbed belt tensioner bracket and turn the wrench clockwise.

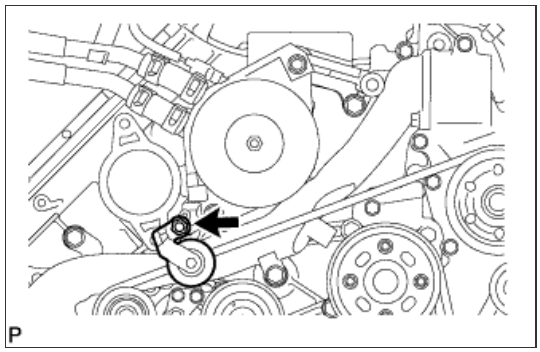
b. Install the V-ribbed belt as shown in the illustration.



c. Check that the belt fits properly in the ribbed grooves.

HINT:

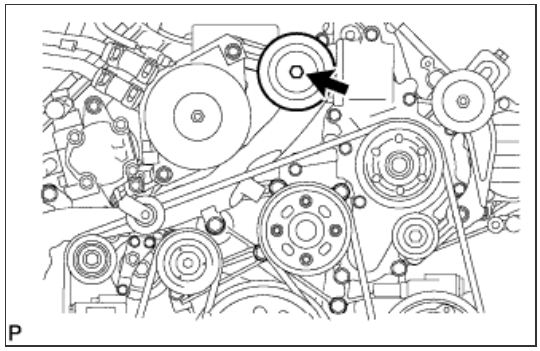
Check with your hand to confirm that the belt has not slipped out of the groove on the bottom of the pulley.



If it has slipped out, replace the V-ribbed belt. Install a new V-ribbed belt.

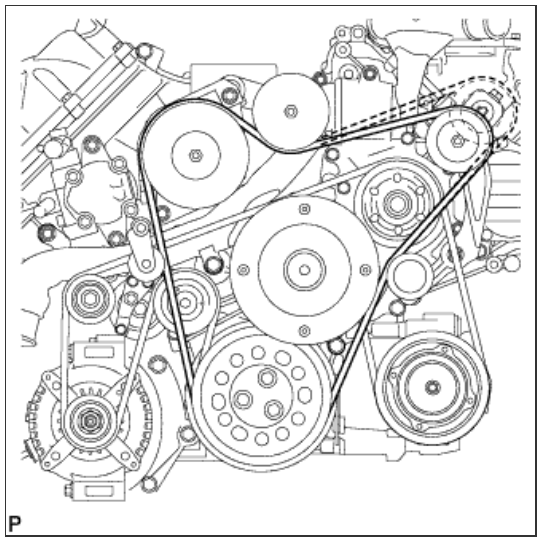
10. INSTALL NO. 3 IDLER PULLEY (w/ Viscous Heater)

a. Align the No. 3 idler pulley bracket knock pin and No. 1 idler pulley bracket knock pin hole and install the No. 3 idler pulley with the nut.



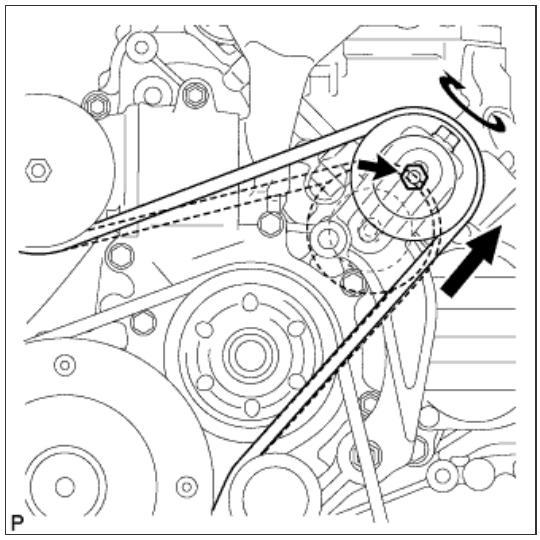
Torque:
88 N*m{ 898 kgf*cm , 64 ft.*lbf }

11. INSTALL NO. 1 IDLER PULLEY (w/ Viscous Heater)



a. Install the collar, No. 1 idler pulley and cover with the bolt.

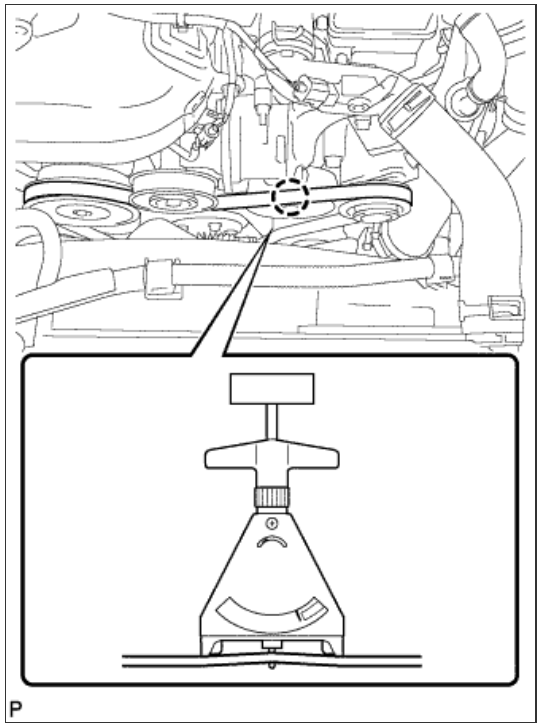
Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }



12. INSTALL V-RIBBED BELT (w/ Viscous Heater)

a. Install the V-ribbed belt as shown in the illustration.

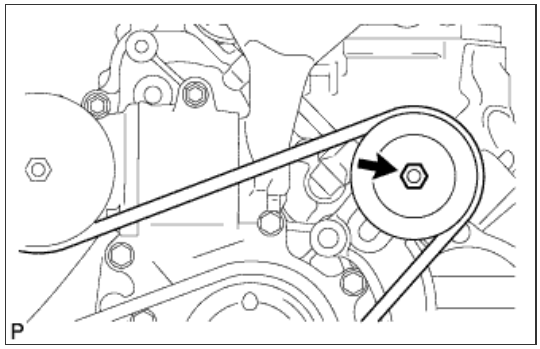
b. Temporarily install the lock nut, and turn the bolt clockwise.



c. Using a belt tension gauge, adjust belt tension.

Standard Belt Tension:

Item	Specified Condition
New belt	400 to 650 N (41 to 66 kgf, 89.9 to 146.1 lbf)
Used belt	300 to 500 N (31 to 51 kgf, 67.4 to 112.4 lbf)

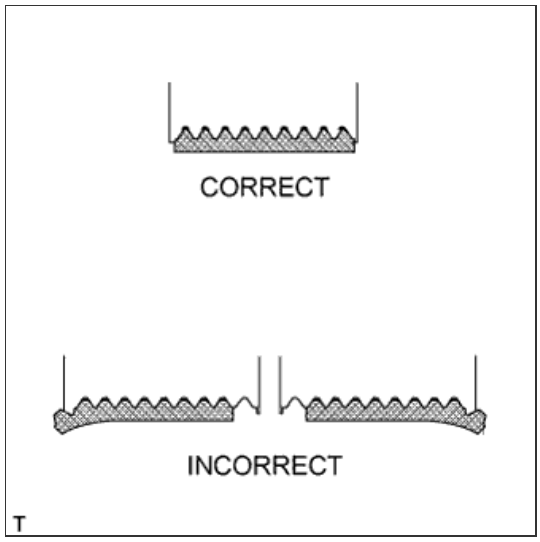


HINT:

- **A new belt is a belt which has been used for less than 5 minutes on a running engine.**
- **A used belt is a belt which has been used on a running engine for 5 minutes or more.**
- **After installing a new belt, run the engine for appro imately 5 minutes and then recheck the tension.**

d. Tighten the nut.

Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }



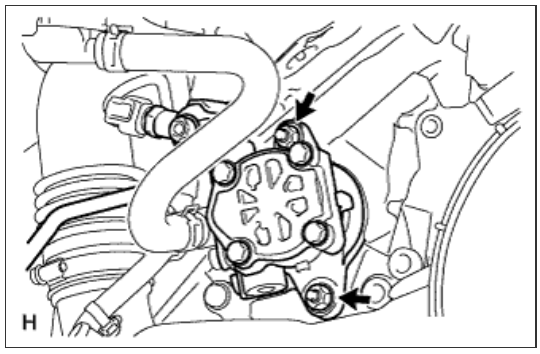
e. Check that the belt fits properly in the ribbed grooves.

HINT:

Check with your hand to confirm that the belt has not slipped out of the groove on the bottom of the pulley.

If it has slipped out, replace the V-ribbed belt. Install a new V-ribbed belt.

13. CONNECT NO. 2 RADIATOR HOSE



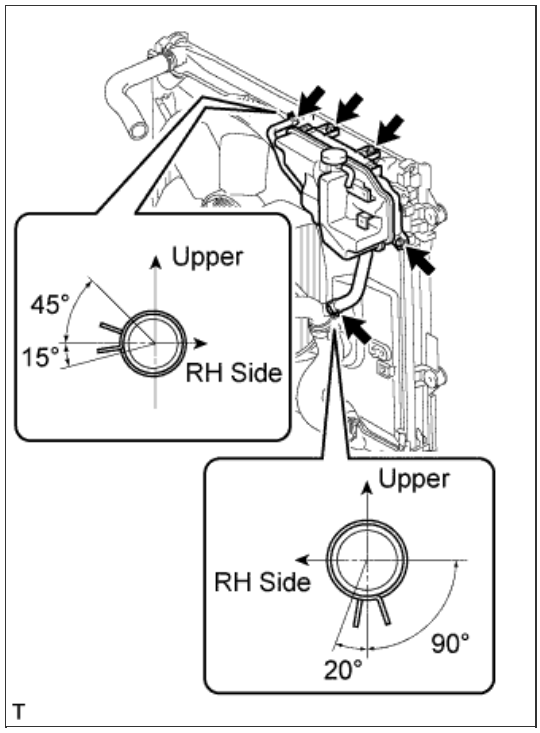
14. CONNECT NO. 1 RADIATOR HOSE

15. INSTALL VANE PUMP ASSEMBLY

a. Apply a light coat of engine oil to a new O-ring, and install it to the vane pump.

b. Install the vane pump with 2 new nuts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

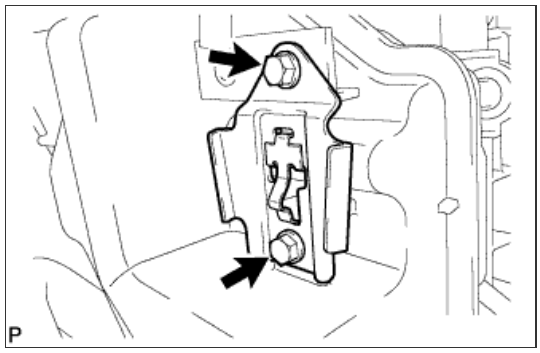


16. INSTALL RADIATOR RESERVOIR ASSEMBLY

a. Install the radiator reservoir with the 3 bolts.

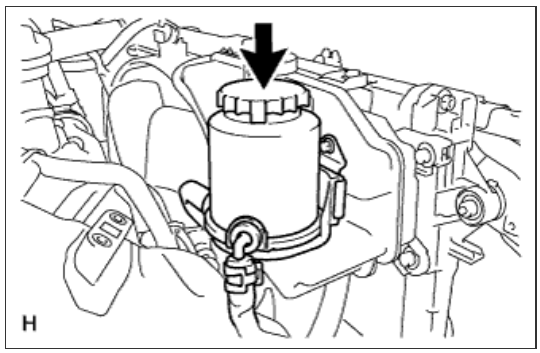
b. Connect the 2 hoses to the upper radiator tank and water inlet.

HINT:



Make sure the directions of the hose clamps are as shown in the illustration.

17. INSTALL NO. 1 OIL RESERVOIR BRACKET



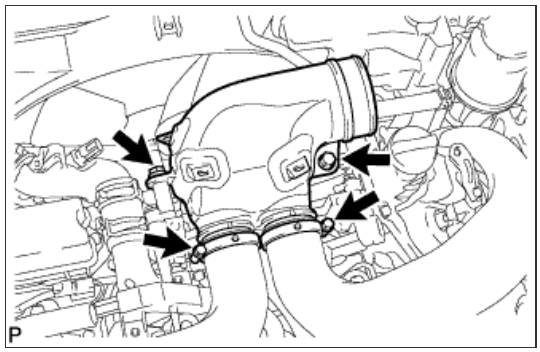
a. Install a new bracket with the 2 bolts.

Torque:
4.5 N*m{ 46 kgf*cm , 40 in.*lbf }

18. INSTALL VANE PUMP OIL RESERVOIR ASSEMBLY

a. Install the vane pump oil reservoir to the bracket.

19. INSTALL INTAKE AIR CONNECTOR

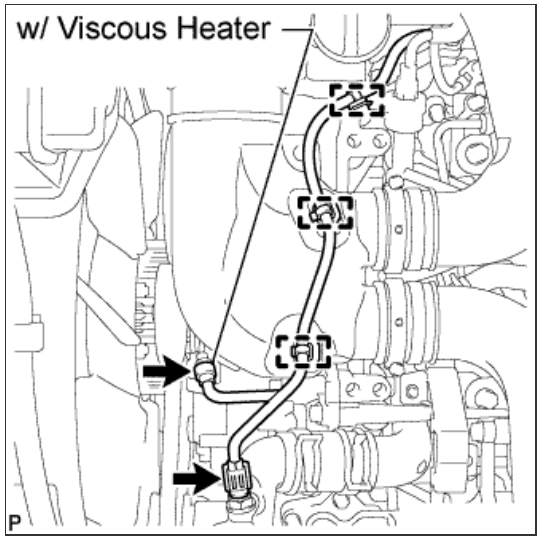


a. Connect the intake air connector to the No. 1 and No. 2 air cleaner pipes.

b. Install the connector with the 2 bolts.

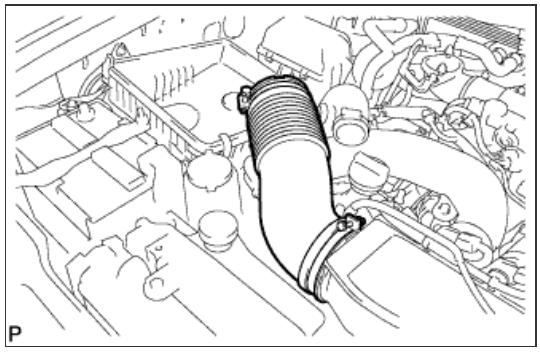
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Tighten the 2 hose clamps.



Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

d. Attach the 3 wire harness clamps.

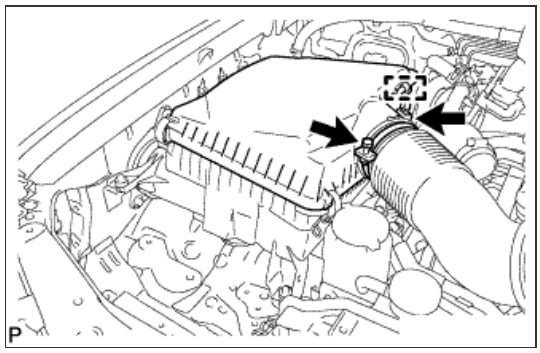


e. w/o Viscous Heater:
Connect the connector to the water temperature sensor.

f. w/ Viscous Heater:
Connect the 2 connectors to the water temperature sensor and viscous with magnet clutch heater.

20. TEMPORARILY INSTALL NO. 1 AIR CLEANER HOSE

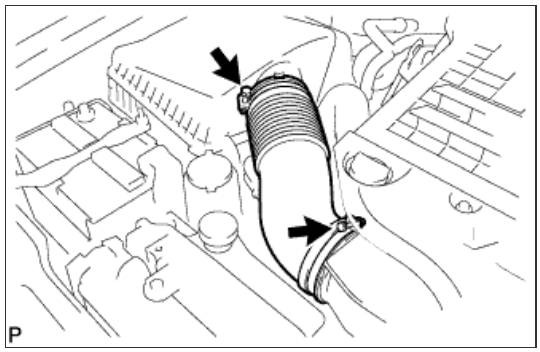
a. Temporarily install the air cleaner hose to the intake air connector.



21. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

a. Connect the air cleaner cap to the air cleaner hose, and install the air cleaner cap with the 4 clamps.

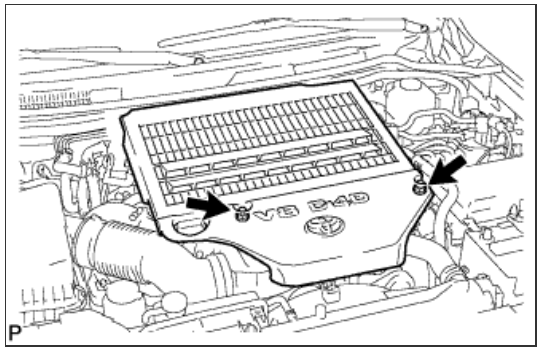
b. Connect the mass air flow meter connector and attach the wire harness clamp to the air cleaner cap.



c. Attach the wire harness clamp.

d. Align the protrusion of air cleaner cap and concave portion of air cleaner hose.

e. Tighten the 2 hose clamps.

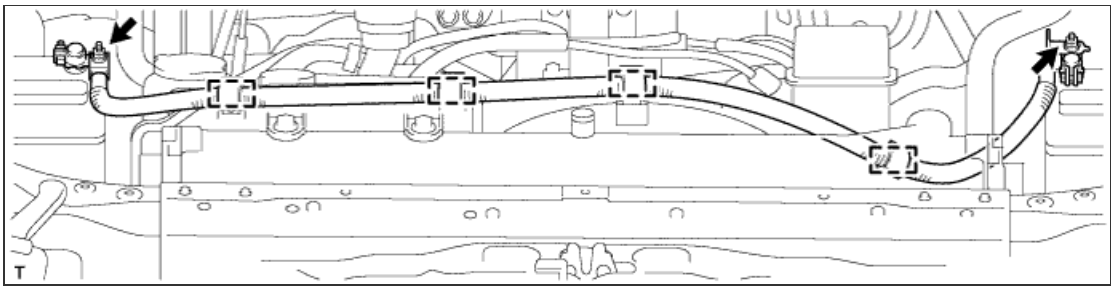


Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

22. INSTALL NO. 1 ENGINE COVER SUB-ASSEMBLY (w/ Intercooler)

a. Install the engine cover with the 2 nuts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



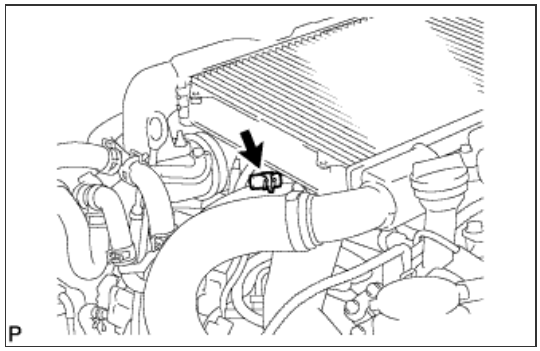
23. INSTALL NO. 3 ENGINE ROOM WIRE

a. Install the No. 3 engine room wire to the main battery and sub-battery positive terminals with the 2 nuts.

Torque:
7.6 N*m{ 77 kgf*cm , 67 in.*lbf }

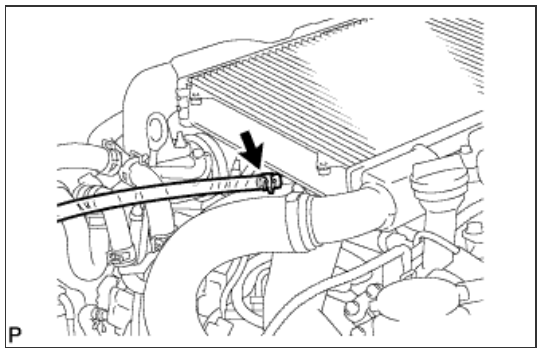
b. Connect the No. 3 engine room wire with the 4 clamps.

24. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



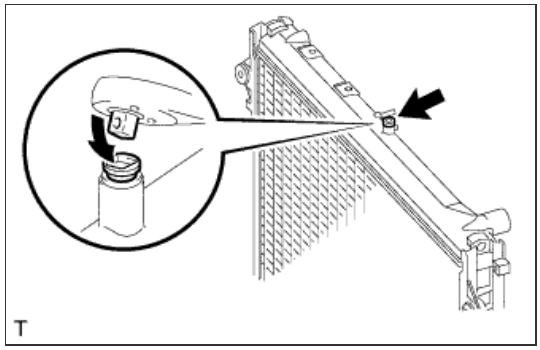
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

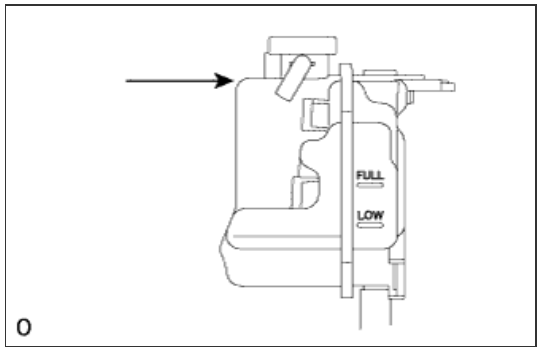


a. Connect the cables to negative (-) main battery and sub-battery terminals.

25. ADD ENGINE COOLANT



a. Remove the engine air bleed cap.



b. Connect a clear hose to the engine air bleed pipe.

c. Using a wrench, remove the vent plug.

d. Fill the radiator with TOYOTA SLLC to the radiator reservoir filler neck.

HINT:

Pour TOYOTA SLLC until it spills out of the engine air bleed pipe.

Standard Capacity (for Automatic Transmission):

Item	Specified Condition
Front heater only	14.8 liters (15.6 US qts, 13.0 Imp. qts)
Front heater and rear heater	17.6 liters (18.6 US qts, 15.5 Imp. qts)
Front heater with viscous heater	15.2 liters (16.1 US qts, 13.4 Imp. qts)
Front heater and rear heater with viscous heater	18.0 liters (19.0 US qts, 15.4 Imp. qts)

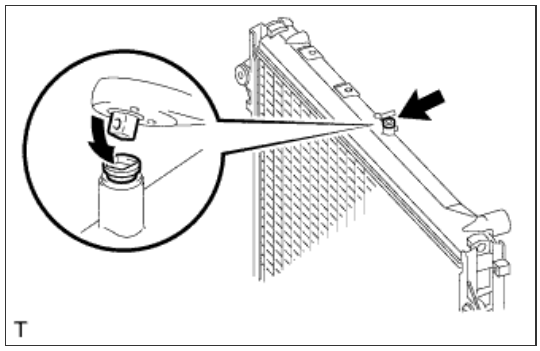
Standard capacity (for Manual Transmission):
15.4 liters (16.3 US qts, 13.6 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

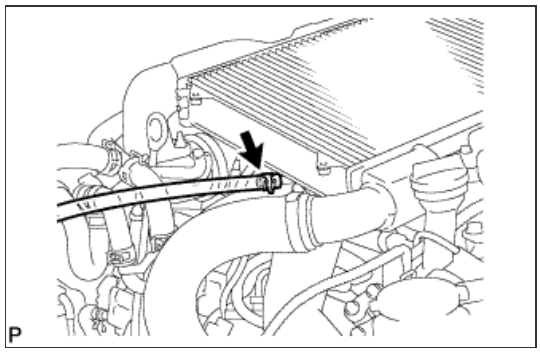
HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low



phosphates and organic acids).

e. Install the vent plug.

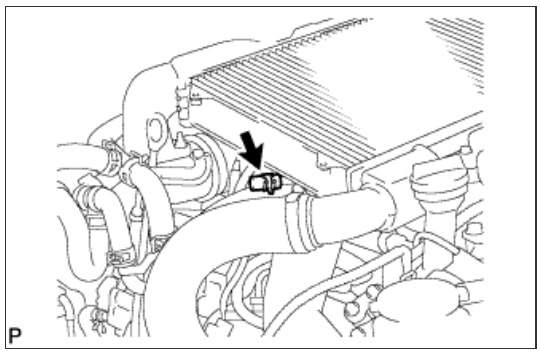


Torque:
2.0 N*m{ 20 kgf*cm , 18 in.*lbf }

NOTICE:

Do not tighten the plug to 5.0 N*m (51 kgf*cm, 44 in.*lbf) or more, as the plug will be damaged.

f. Disconnect the clear hose from the engine air bleed pipe.



g. Install the engine air bleed cap when coolant comes out.

h. Install the radiator reservoir cap.

i. Start the engine.

NOTICE:

Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the FULL line.

j. Maintain an engine speed of 3000 rpm for approximately 10 minutes so that the thermostat opens and air bleeding is performed.

CAUTION:

When pressing the radiator hoses:

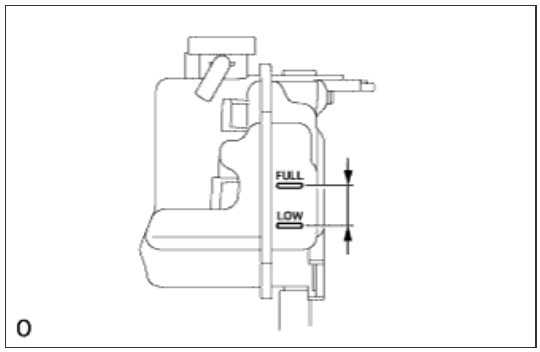
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the radiator fan**

NOTICE:

- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.



k. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

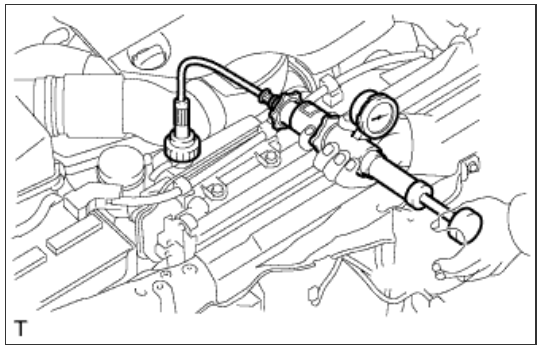
CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

l. Check that the coolant level is between the FULL and LOW lines.
If the coolant level is above the FULL line, drain coolant so that the coolant level

is between the FULL and LOW lines.

26. INSPECT FOR ENGINE COOLANT LEAK



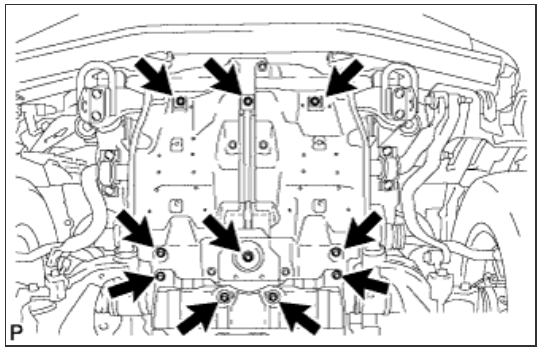
CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.

b. Warm up the engine.

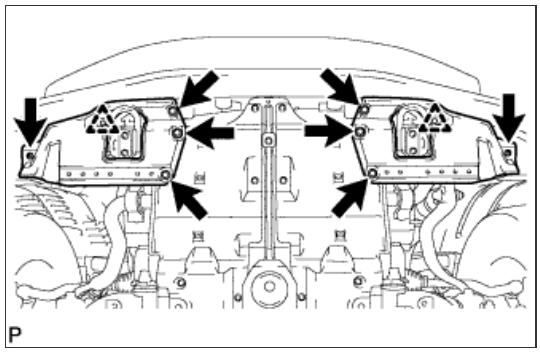
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.



27. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the upper radiator support seal with the 7 clips.

28. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

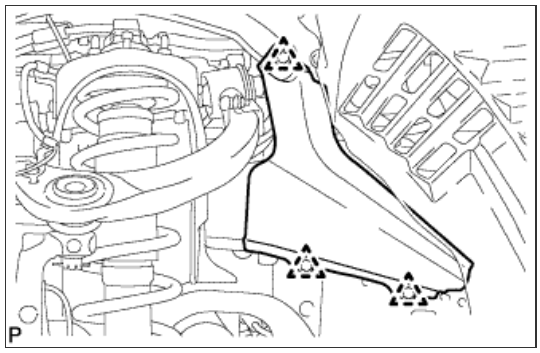


a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

29. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

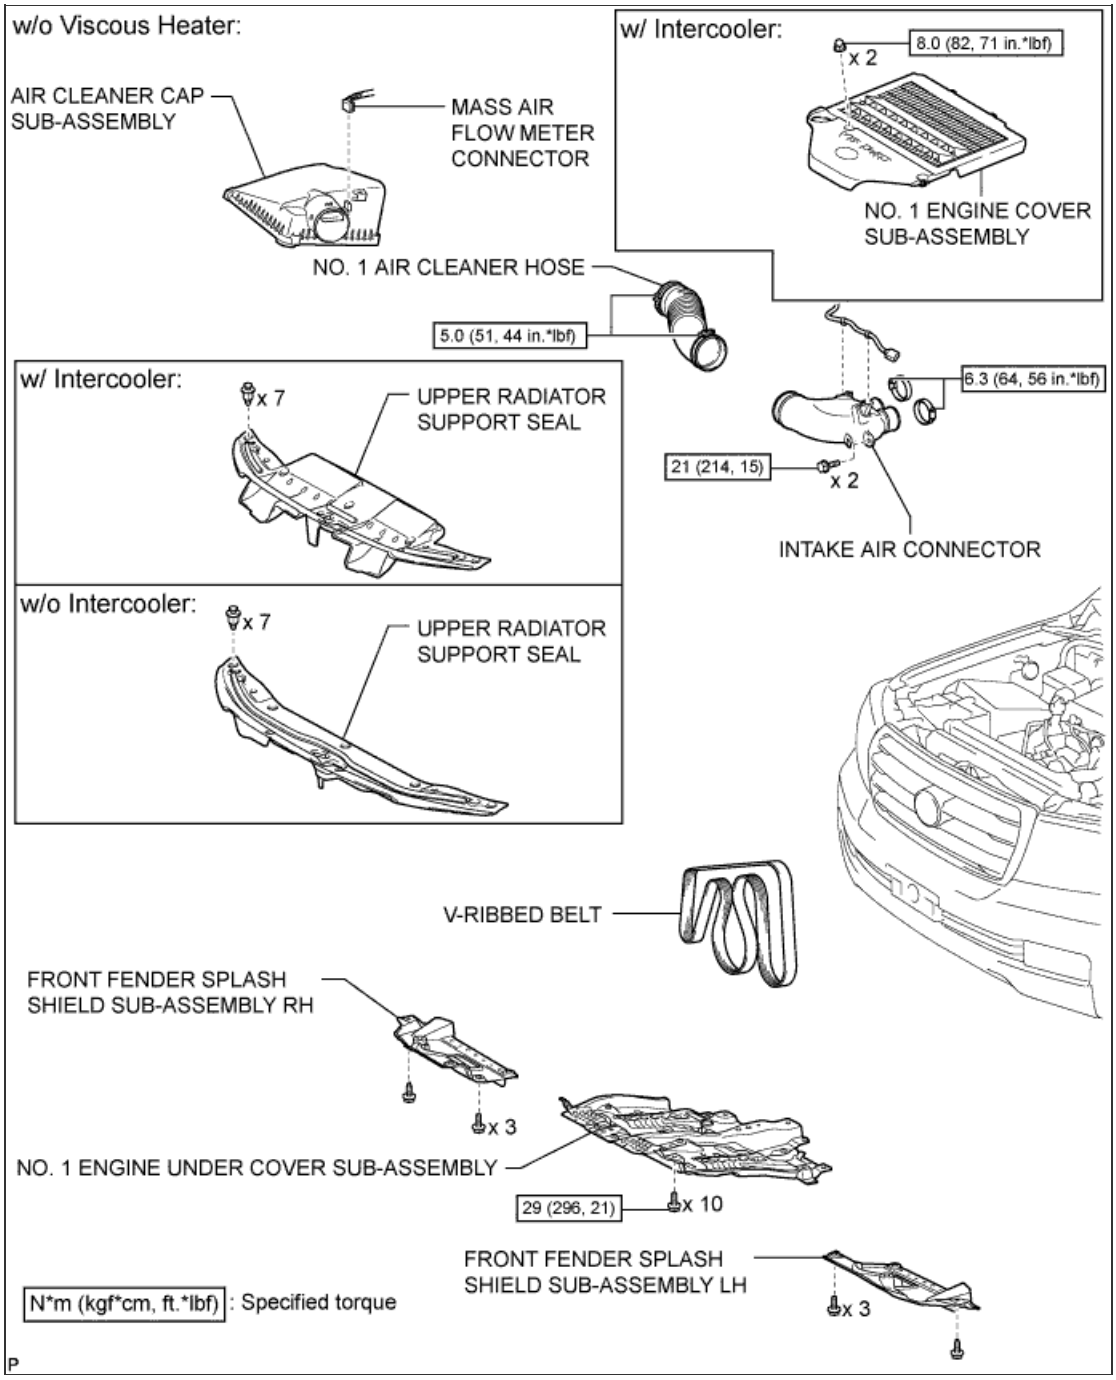
a. Install the splash shield with the clip, and then install the 3 bolts and screw.



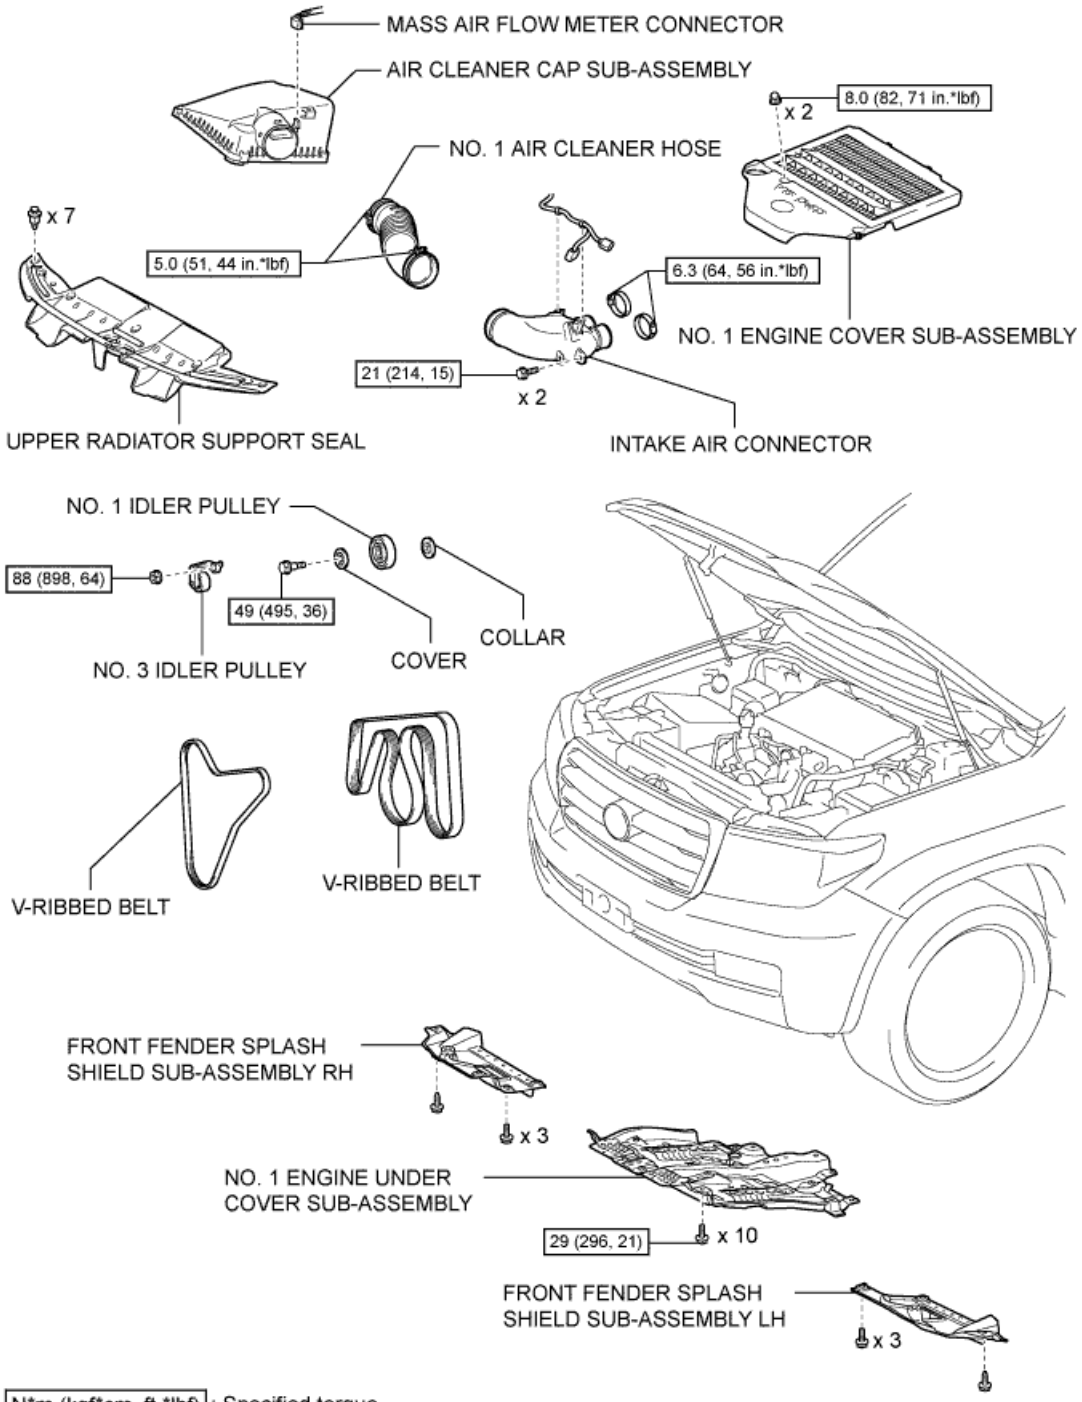
30. INSTALL RONT ENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Install the splash shield with the clip, and then install the 3 bolts and screw.

31. INSTALL RONT ENDER APRON SEAL RONT RH



a. Install the front fender apron seal front RH with the 3 clips.



32. INSTALL RONT WHEEL RH

Torque:
for Aluminum Wheel:
131 N*m{ 1336 kgf*cm , 97 ft.*lbf }
for Steel Wheel:
209 N*m{ 2131 kgf*cm , 154 ft.*lbf }

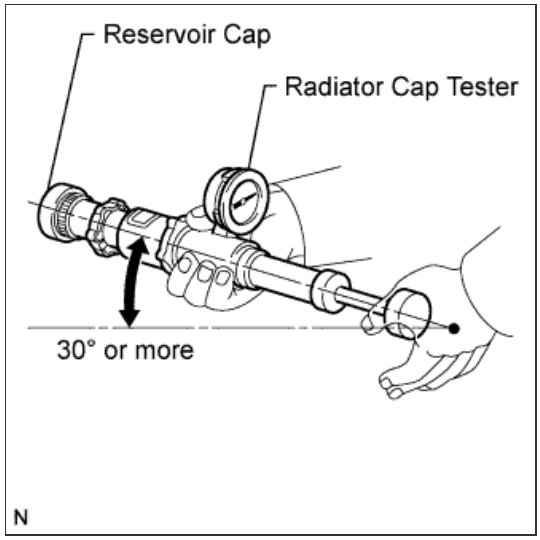
1. INSPECT RADIATOR RESERVOIR CAP

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Measure the valve opening pressure.



i. If there are water stains or foreign matter on O-ring 1, clean it with water and finger scouring.

ii. Check that O-ring 1 is not deformed, cracked or swollen.

iii. Apply engine coolant to O-ring 1 and rubber packing 2.

iv. Prepare a radiator cap tester, and tilt it more than 30°.

v. Pump the cap tester several times, and check the maximum pressure*.

Pumping speed:
1 pump per second

HINT:

*: Even if the cap cannot maintain the maximum pressure, it is not a defect.

Standard Judgment Criterion:

Item	Specified Condition
Standard value (for brand-new cap)	93 to 123 kPa (1.0 to 1.3 kgf/cm^2, 13.5 to 17.8 psi)
Minimum standard value (after using cap)	78.5 kPa (0.8 kgf/cm^2, 11.4 psi)

If the maximum pressure is less than the minimum standard value, replace the radiator reservoir cap sub-assembly.

2. INSPECT FINS FOR BLOCKAGE

a. Check that the radiator and condenser are not blocked with leaves, dirt, or insects. Clean the hose connections.
If the fins are blocked, wash them with water or a steam cleaner.

NOTICE:

- **If the distance between the steam cleaner and core is too close, the fins may be damaged.**
- **Keep the following injection distance.**

Standard Injection Distance:

Injection	

Distance	Injection Pressure
300 mm (11.8 in.)	2942 to 4903 kPa (30.0 to 50.0 kgf/cm^2, 427 to 711 psi)
500 mm (19.7 in.)	4903 to 7845 kPa (50.0 to 80.0 kgf/cm^2, 711 to 1138 psi)

- **If the fins are bent, straighten them with a screwdriver or pliers.**
- **Never apply water directly onto the electric components.**

b. Dry the fins with compressed air.

for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

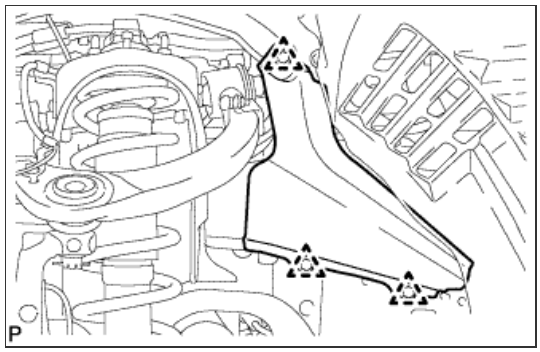
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.

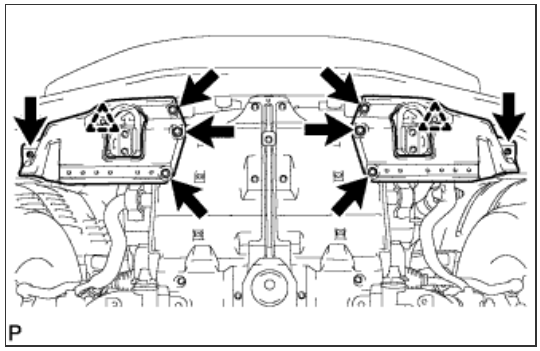


2. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and upper radiator support seal.

3. REMOVE FRONT WHEEL RH

4. REMOVE FRONT FENDER APRON SEAL FRONT RH

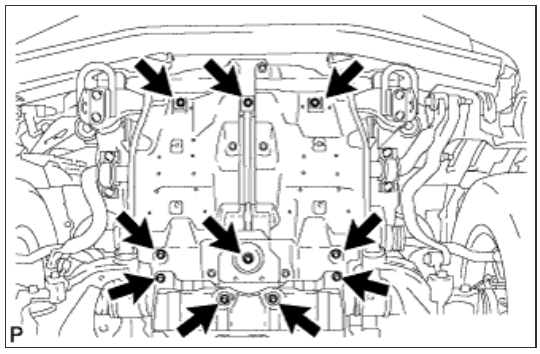


a. Remove the 3 clips and front fender apron seal front RH.

5. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.



6. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Remove the 3 bolts and screw.

b. Loosen the clip and remove the splash shield.

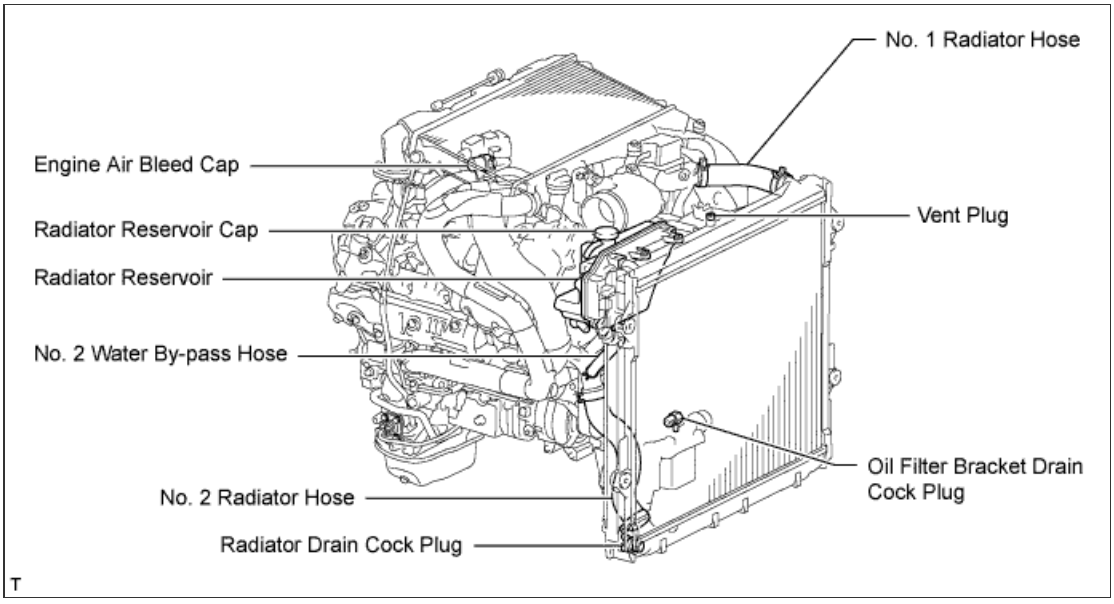
7. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

8. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.



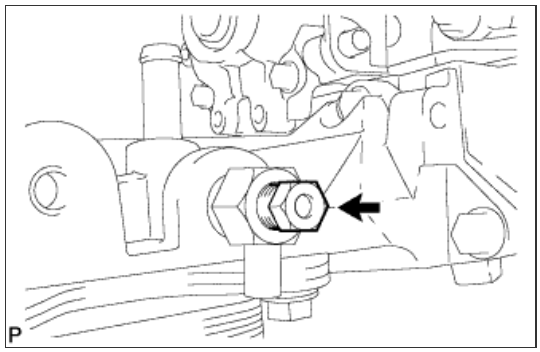
HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

a. Loosen the radiator drain cock plug.

b. Remove the radiator reservoir cap to drain the coolant in the radiator.

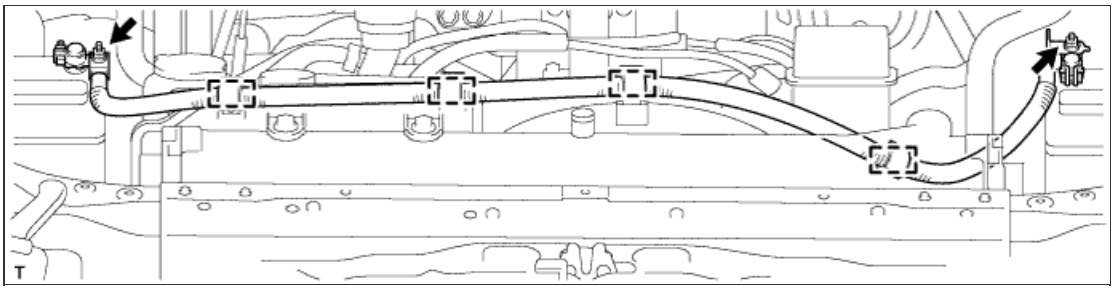
c. Loosen the oil filter bracket drain cock plug to drain the coolant in the engine.



d. Tighten the radiator drain cock plug by hand.

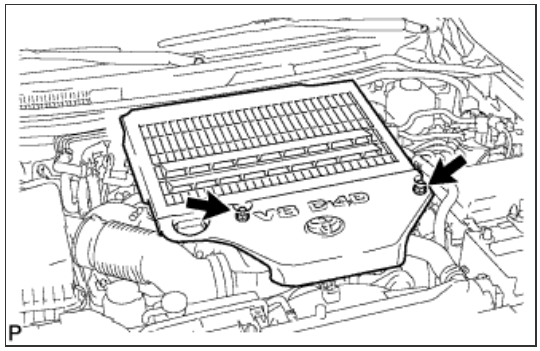
e. Tighten the oil filter bracket drain cock plug.

Torque:



13 N*m{ 133 kgf*cm , 10 ft.*lbf }

9. REMOVE NO. 3 ENGINE ROOM WIRE

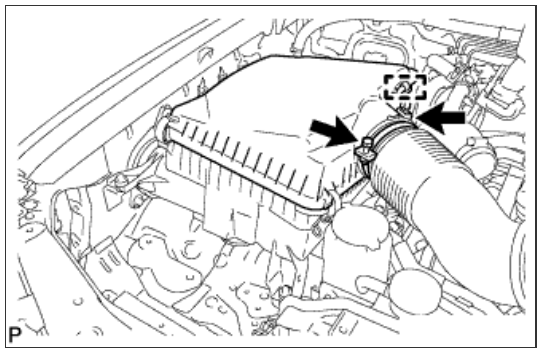


a. Disconnect the 4 wire harness clamps.

b. Remove the 2 nuts and No. 3 engine room wire.

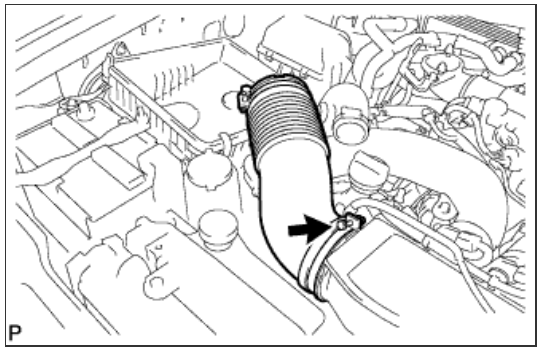
10. REMOVE NO. 1 ENGINE COVER SUB-ASSEMBLY (w/ Intercooler

a. Remove the 2 nuts and No. 1 engine cover.



11. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

a. Loosen the hose clamp.



b. Disconnect the mass air flow meter connector and using a clip remover, detach the wire harness clamp from the air cleaner cap.

c. Detach the 4 clamps and remove the air cleaner cap.

12. REMOVE NO. 1 AIR CLEANER HOSE

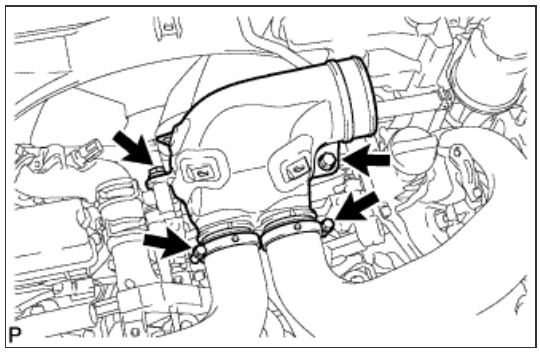
a. Loosen the hose clamp and remove the No. 1 air cleaner hose.

13. REMOVE INTAKE AIR CONNECTOR

a. w/o Viscous Heater:

   i. Disconnect the connector from the water temperature sensor.

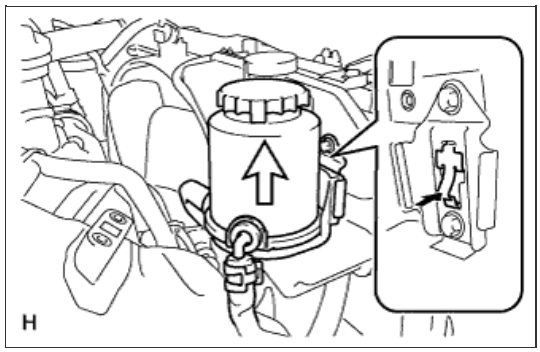
   ii. Using a clip remover, detach the 3 wire harness clamps.



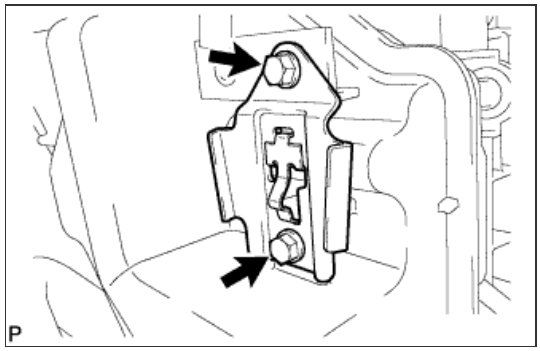
b. w/ Viscous Heater:

   i. Disconnect the 2 connectors from the viscous with magnet clutch heater and water temperature sensor.

   ii. Using a clip remover, detach the 3 wire harness clamps.



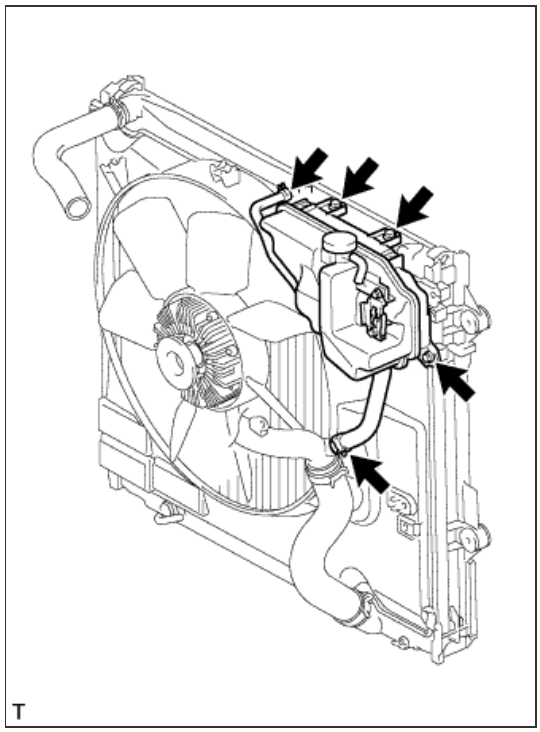
c. Loosen the 2 hose clamps and remove the 2 bolts and intake air connector.



14. REMOVE VANE PUMP OIL RESERVOIR ASSEMBLY

a. Insert a screwdriver between the reservoir and oil reservoir bracket, push the claw, and then disconnect the reservoir by pulling it upwards.

15. REMOVE NO. 1 OIL RESERVOIR BRACKET

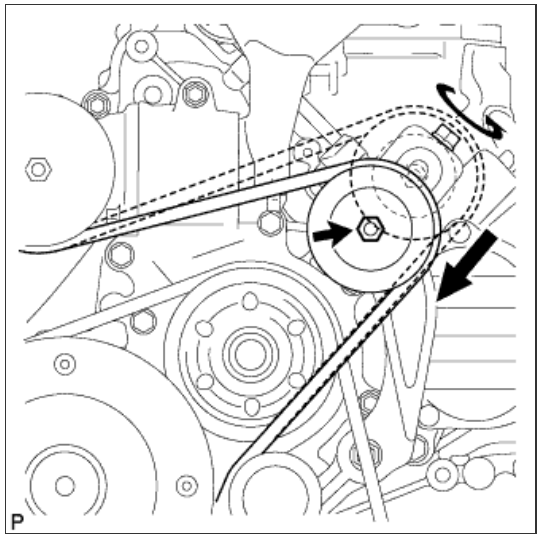


a. Remove the 2 bolts and bracket.

16. REMOVE RADIATOR RESERVOIR ASSEMBLY

a. Disconnect the 2 hoses.

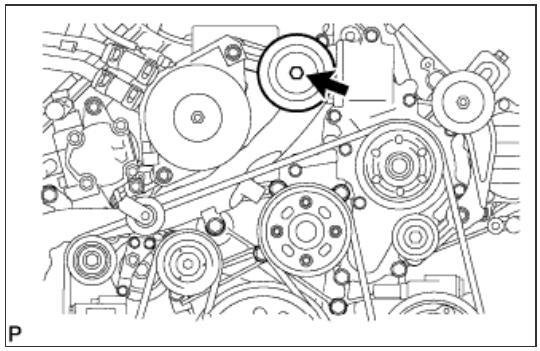
b. Remove the 3 bolts and radiator reservoir.



17. DISCONNECT NO. 1 RADIATOR HOSE

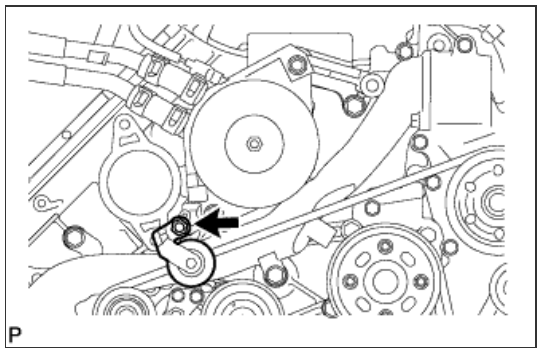
18. DISCONNECT NO. 2 RADIATOR HOSE

19. REMOVE V-RIBBED BELT (w/ Viscous Heater



a. Loosen the lock nut and turn the bolt counterclockwise.

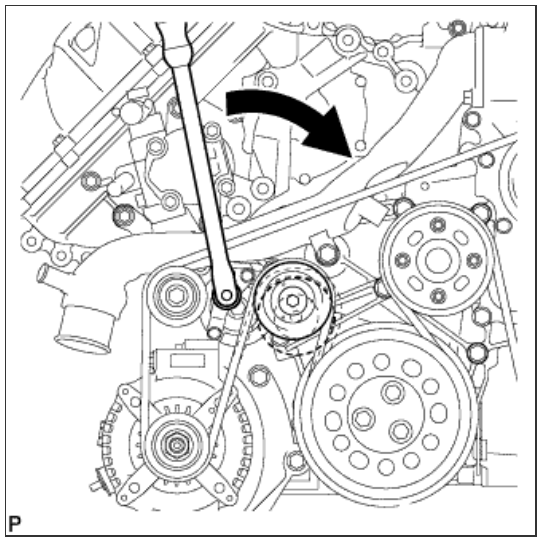
b. Remove the V-ribbed belt.



20. REMOVE NO. 1 IDLER PULLEY (w/ Viscous Heater

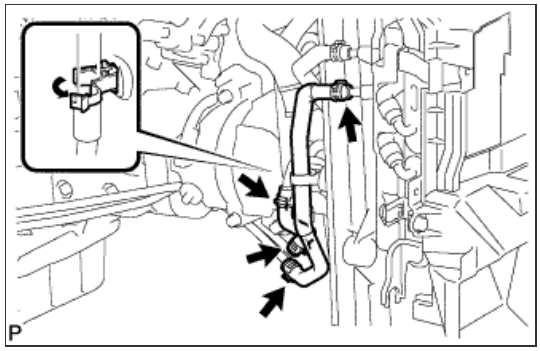
a. Remove the bolt, cover, No. 1 idler pulley and collar.

21. REMOVE NO. 3 IDLER PULLEY (w/ Viscous Heater



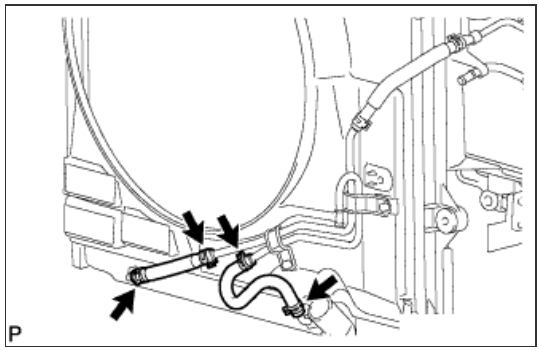
a. Remove the nut and No. 3 idler pulley.

22. REMOVE V-RIBBED BELT

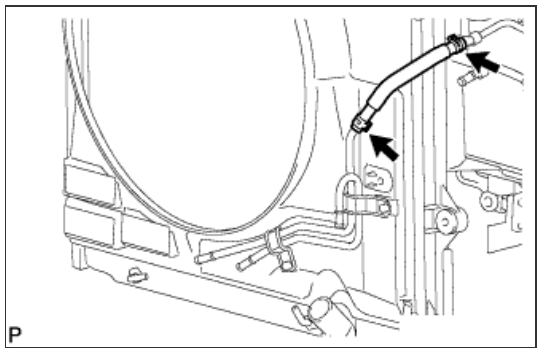


a. Using a wrench to the V-ribbed belt tensioner bracket, turn the wrench clockwise

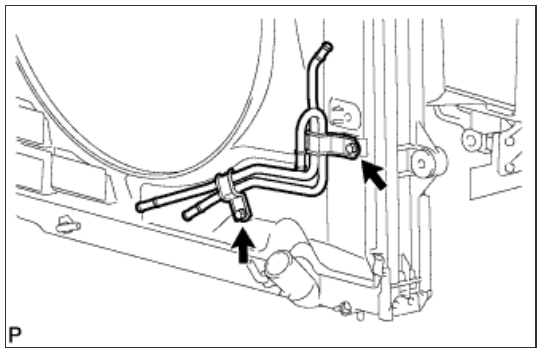
and remove the V-ribbed belt.



23. REMOVE OIL COOLER TUBE (for Automatic Transmission

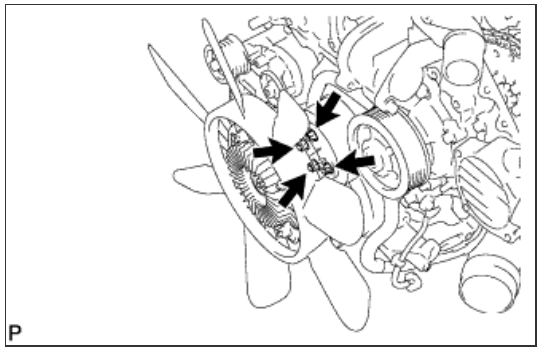


a. Disconnect the inlet and outlet No. 1 oil cooler hose.

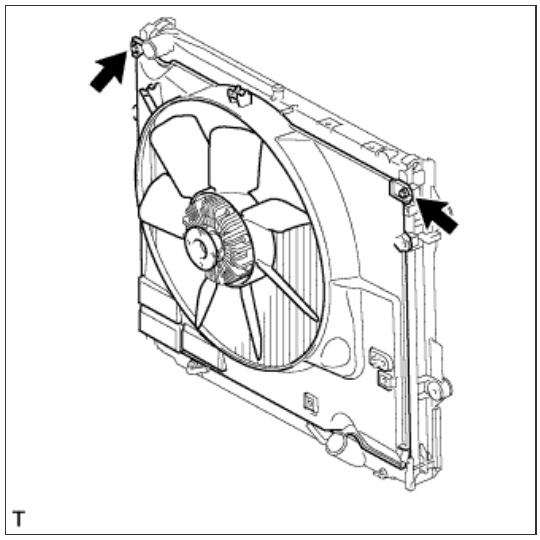


b. Disconnect the inlet No. 2 and No. 3 oil cooler hoses.

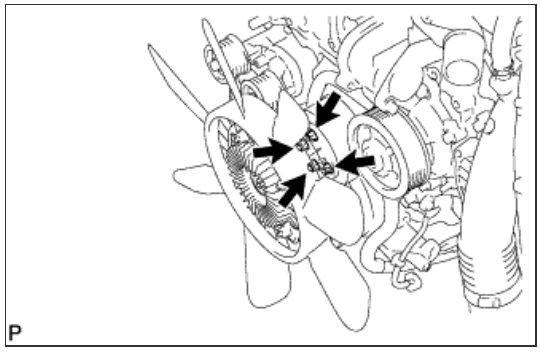
c. Disconnect the inlet No. 4 oil cooler hose.



d. Remove the 2 bolts and transmission oil cooler tube.



24. REMOVE FAN SHROUD WITH FAN

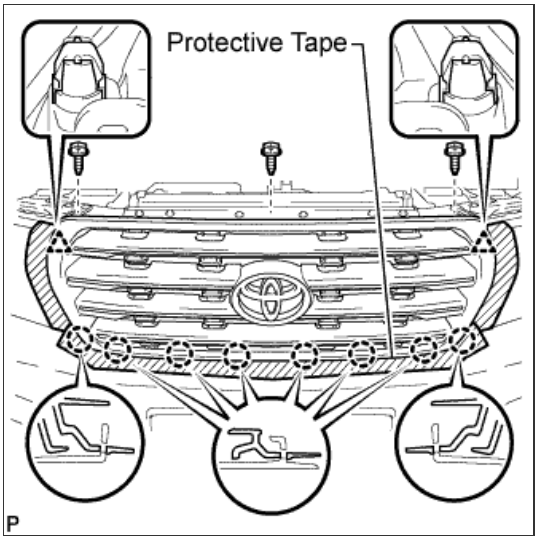


a. Loosen the 4 nuts holding the fluid coupling fan.

b. Remove the 2 bolts holding the fan shroud.

c. Remove the 4 nuts of the fluid coupling fan, and then remove the shroud together with the fluid coupling fan.

25. REMOVE FAN PULLEY



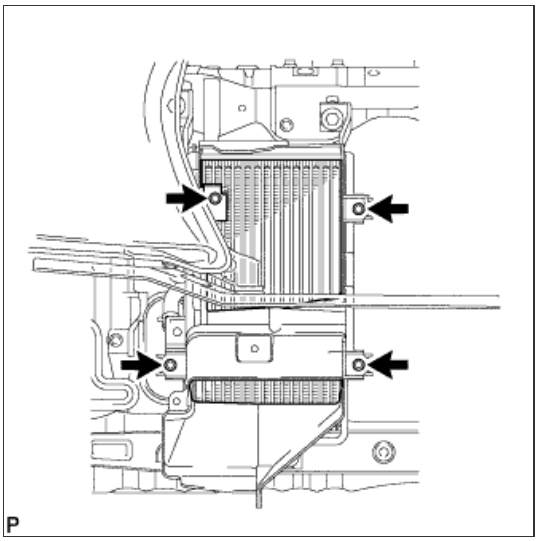
26. REMOVE FRONT BUMPER WINCH COVER (w/ Winch

27. REMOVE RADIATOR GRILLE

a. Put protective tape around the radiator grille.

b. Remove the 3 screws.

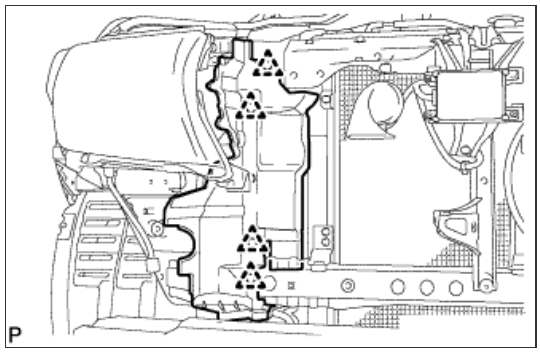
c. Detach the 2 clips and 8 claws, and remove the radiator grille.



28. REMOVE FRONT BUMPER COVER

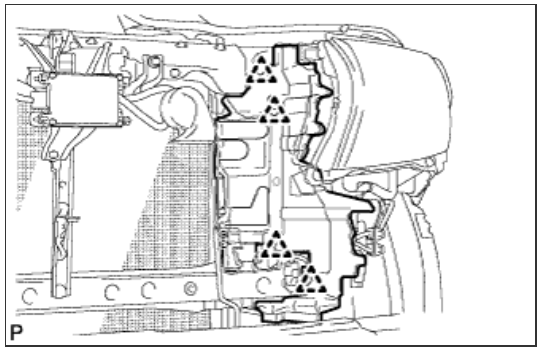
a. for Standard:
Remove the front bumper cover (Click here).

b. w/ Winch:
Remove the front bumper cover (Click here).



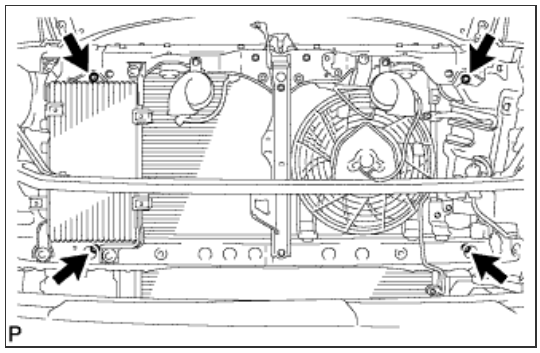
29. REMOVE TRANSMISSION OIL COOLER AIR DUCT (for Automatic Transmission

a. Remove the 4 bolts and oil cooler air duct.



30. REMOVE RADIATOR SIDE DEFLECTOR RH (for Manual Transmission

a. Using a clip remover, remove the 4 clips, and remove the side deflector.

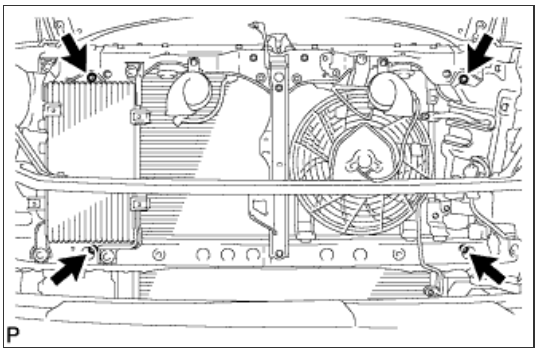


31. REMOVE RADIATOR SIDE DEFLECTOR LH

a. Using a clip remover, remove the 4 clips, and remove the side deflector.

32. REMOVE RADIATOR ASSEMBLY

a. Remove the 4 bolts and radiator.



for Preparation Click here

1. INSTALL RADIATOR ASSEMBLY

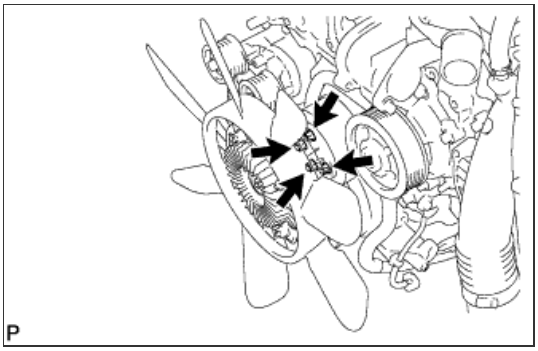
a. Install the radiator with the 4 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

2. INSTALL FAN PULLEY

3. INSTALL FAN SHROUD WITH FAN

a. Install the shroud together with the fluid coupling fan between the radiator and engine components.

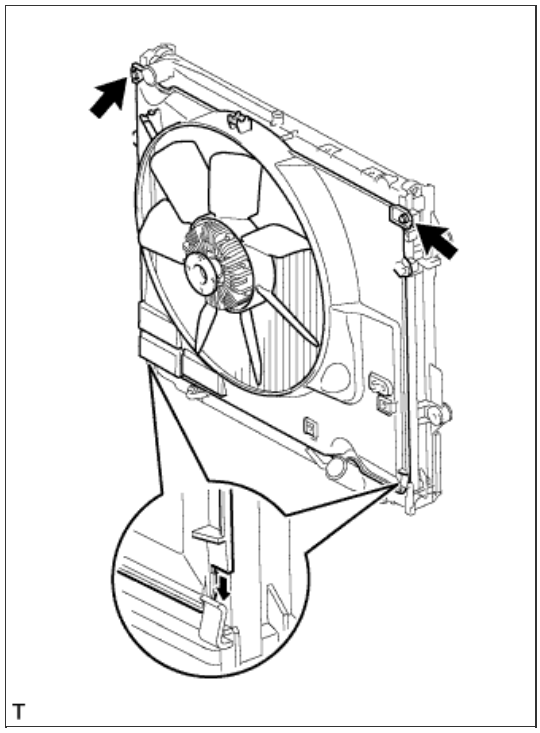


NOTICE:

Be careful not to damage the radiator core.

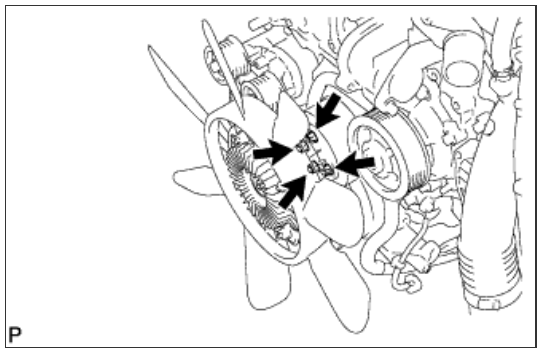
b. Temporarily install the fluid coupling fan to the fan bracket with the 4 nuts.

HINT:



Tighten the nuts as much as possible by hand.

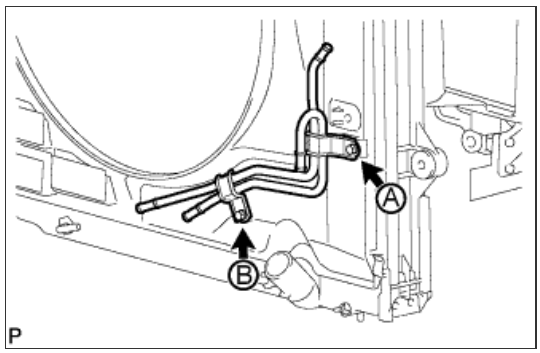
c. Attach the shroud claws to the radiator.



d. Install the shroud with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

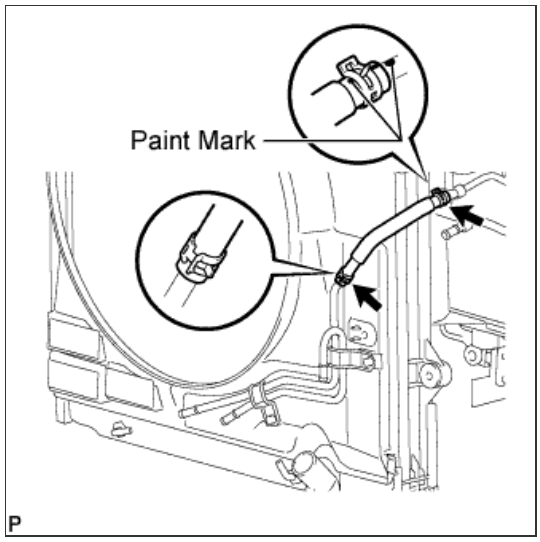
e. Tighten the 4 nuts of the fluid coupling fan.



Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

4. INSTALL OIL COOLER TUBE (for Automatic Transmission)

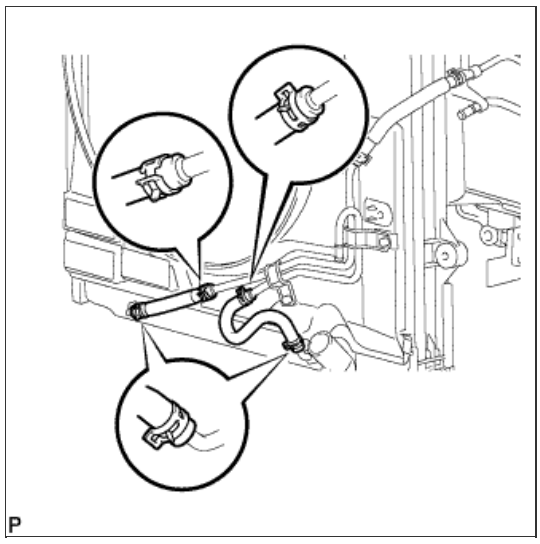
a. Temporarily install the oil cooler tube to the fan shroud with the bolt labeled A. Install the bolt labeled B. Then tighten the bolt labeled A to the specified torque.



Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

b. Connect the inlet No. 4 oil cooler hose as shown in the illustration.

NOTICE:

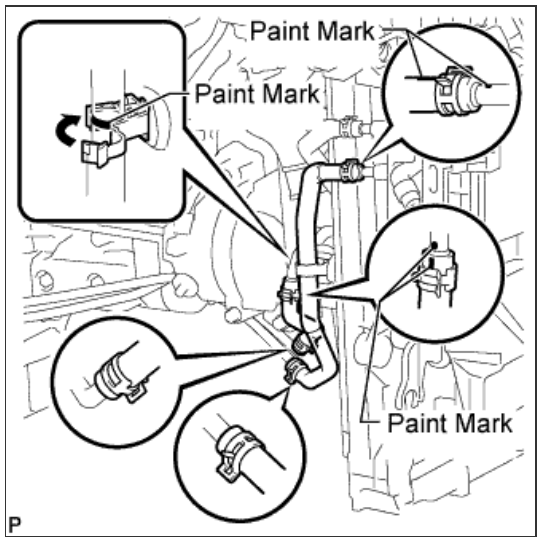


Make sure the pinching portion of each clip is facing the direction shown in the illustration.

c. Connect the inlet No. 2 and No. 3 oil cooler hoses as shown in the illustration.

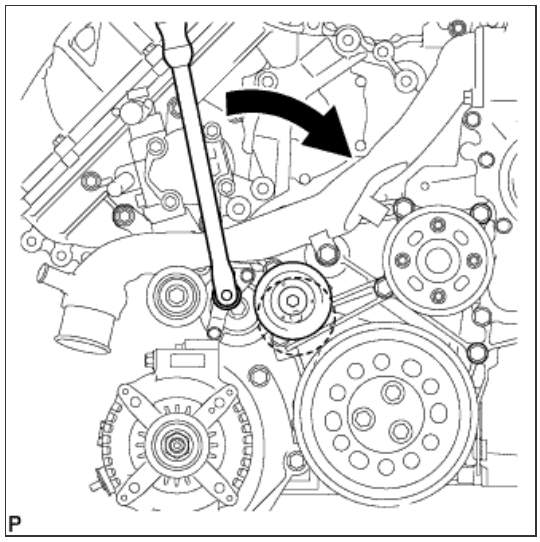
NOTICE:

Make sure the pinching portion of each clip is facing the direction shown in the illustration.



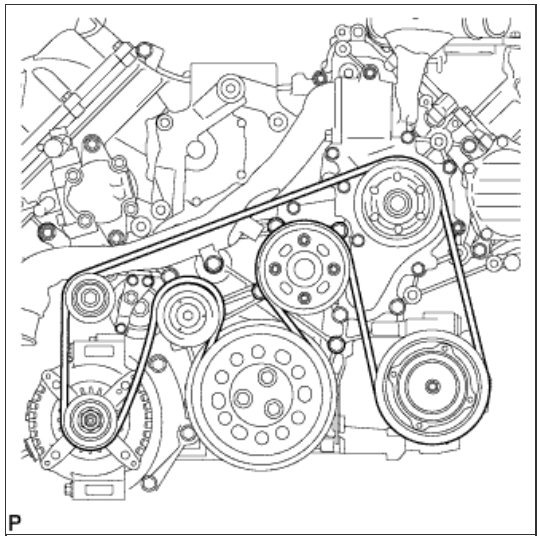
d. Connect the inlet and outlet No. 1 oil cooler hoses as shown in the illustration.

NOTICE:



Make sure the pinching portion of each clip is facing the direction shown in the illustration.

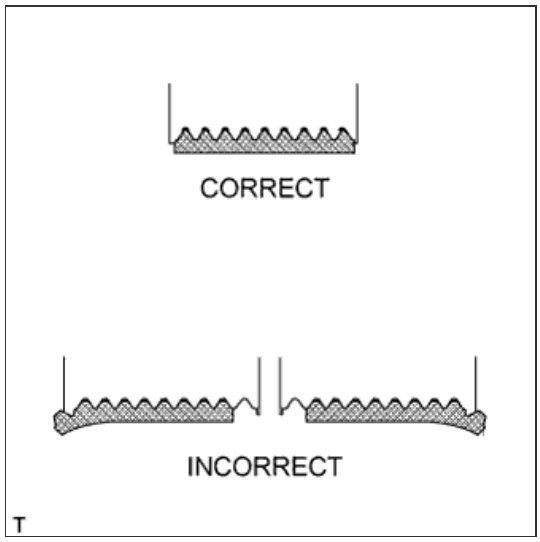
e. Pass the hose through the flexible hose clamp and close the clamp shown in the illustration.



5. INSTALL V-RIBBED BELT

a. Attach a wrench to the V-ribbed belt tensioner bracket and turn the wrench clockwise.

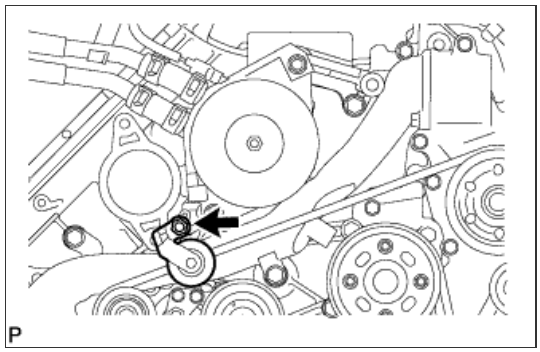
b. Install the V-ribbed belt as shown in the illustration.



c. Check that the belt fits properly in the ribbed grooves.

HINT:

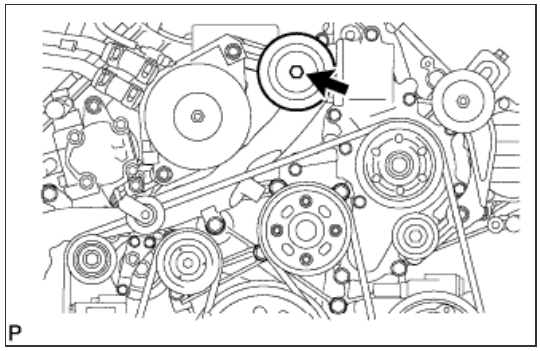
Check with your hand to confirm that the belt has not slipped out of the groove on the bottom of the pulley.



If it has slipped out, replace the V-ribbed belt. Install a new V-ribbed belt.

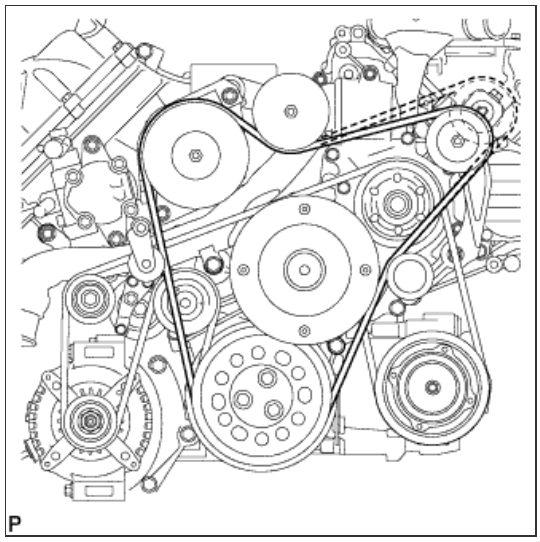
6. INSTALL NO. 3 IDLER PULLEY (w/ Viscous Heater)

a. Align the No. 3 idler pulley bracket knock pin and No. 1 idler pulley bracket knock pin hole and install the No. 3 idler pulley with the nut.



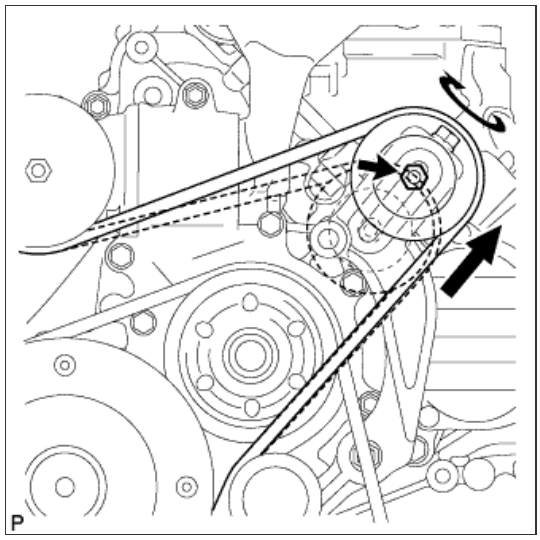
Torque:
88 N*m{ 898 kgf*cm , 64 ft.*lbf }

7. INSTALL NO. 1 IDLER PULLEY (w/ Viscous Heater)



a. Install the collar, No. 1 idler pulley and cover with the bolt.

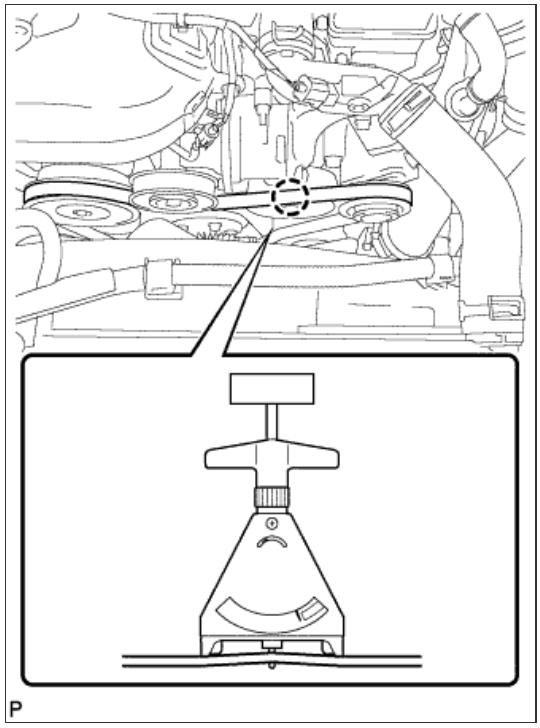
Torque:
49 N*m{ 495 kgf*cm , 36 ft.*lbf }



8. INSTALL V-RIBBED BELT (w/ Viscous Heater)

a. Install the V-ribbed belt as shown in the illustration.

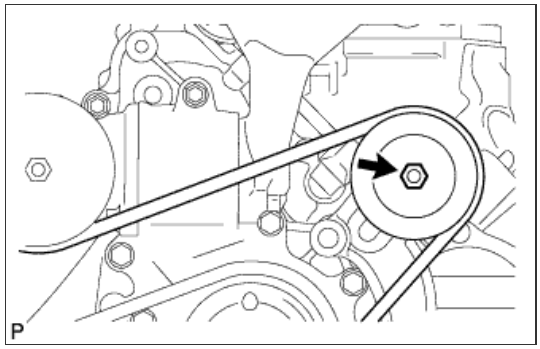
b. Temporarily install the lock nut, and turn the bolt clockwise.



c. Using a belt tension gauge, adjust belt tension.

Standard Belt Tension:

Item	Specified Condition
New belt	400 to 650 N (41 to 66 kgf, 89.9 to 146.1 lbf)
Used belt	300 to 500 N (31 to 51 kgf, 67.4 to 112.4 lbf)

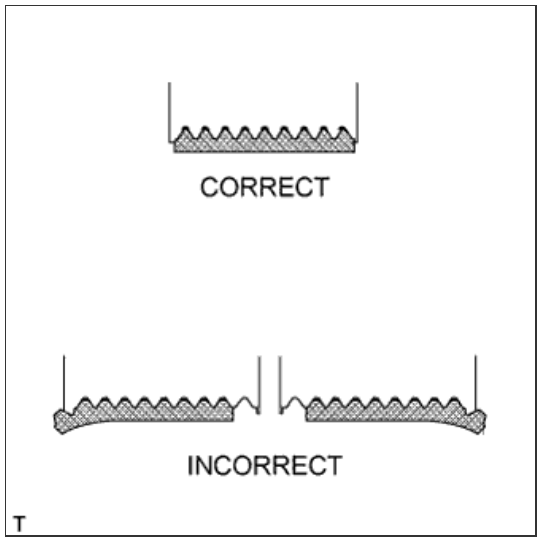


HINT:

- **A new belt is a belt which has been used for less than 5 minutes on a running engine.**
- **A used belt is a belt which has been used on a running engine for 5 minutes or more.**
- **After installing a new belt, run the engine for approximately 5 minutes and then recheck the tension.**

d. Tighten the nut.

Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }



e. Check that the belt fits properly in the ribbed grooves.

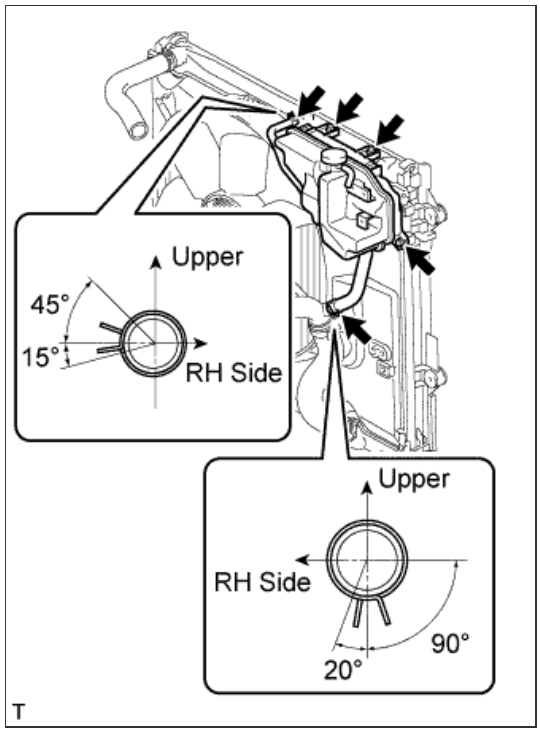
HINT:

Check with your hand to confirm that the belt has not slipped out of the groove on the bottom of the pulley.

If it has slipped out, replace the V-ribbed belt. Install a new V-ribbed belt.

9. CONNECT NO. 2 RADIATOR HOSE

10. CONNECT NO. 1 RADIATOR HOSE

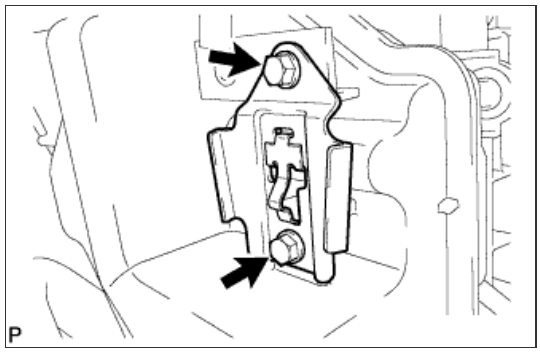


11. INSTALL RADIATOR RESERVOIR ASSEMBLY

a. Install the radiator reservoir with the 3 bolts.

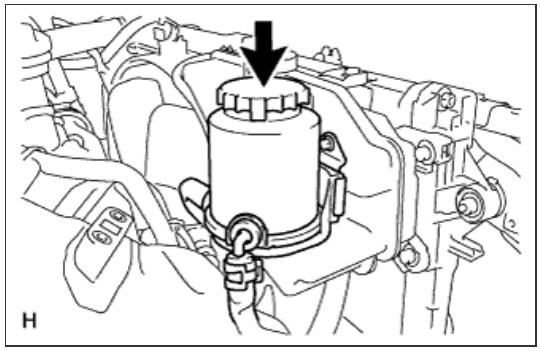
b. Connect the 2 hoses to the upper radiator tank and water inlet.

HINT:



Make sure the directions of the hose clamps are as shown in the illustration.

12. INSTALL NO. 1 OIL RESERVOIR BRACKET



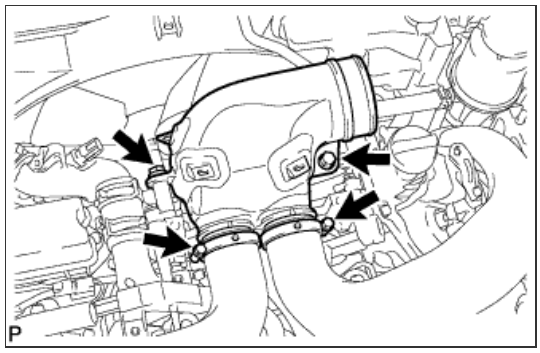
a. Install a new bracket with the 2 bolts.

Torque:
4.5 N*m{ 46 kgf*cm , 40 in.*lbf }

13. INSTALL VANE PUMP OIL RESERVOIR ASSEMBLY

a. Install the vane pump oil reservoir to the bracket.

14. INSTALL INTAKE AIR CONNECTOR

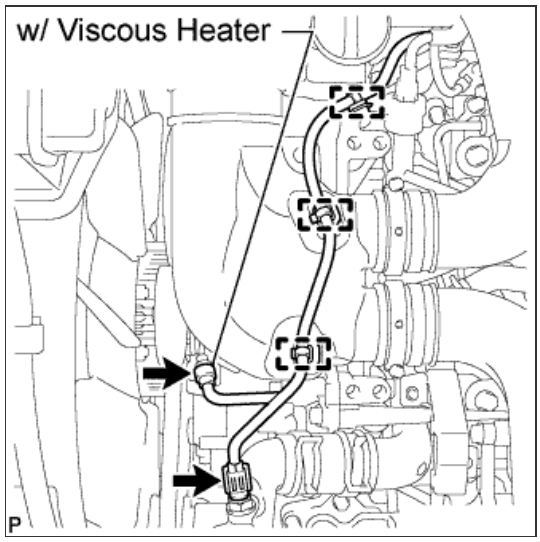


a. Connect the intake air connector to the No. 1 and No. 2 air cleaner pipes.

b. Install the connector with the 2 bolts.

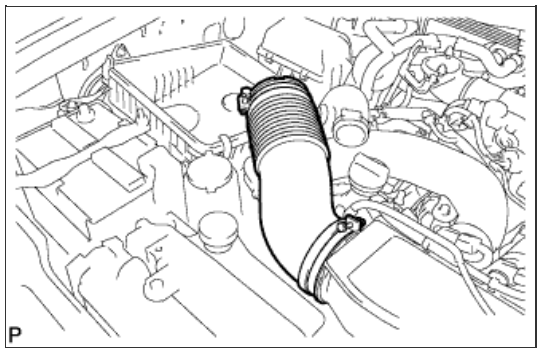
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Tighten the 2 hose clamps.



Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

d. Attach the 3 wire harness clamps.

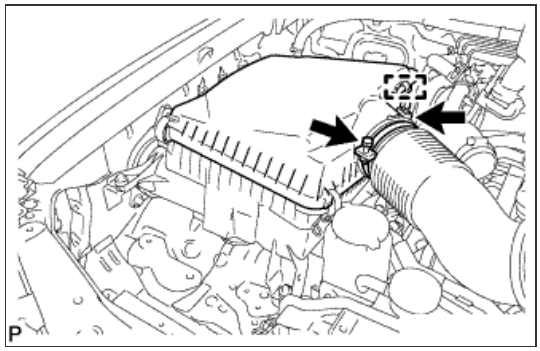


e. w/o Viscous Heater:
Connect the connector to the water temperature sensor.

f. w/ Viscous Heater:
Connect the 2 connectors to the water temperature sensor and viscous with magnet clutch heater.

15. TEMPORARILY INSTALL NO. 1 AIR CLEANER HOSE

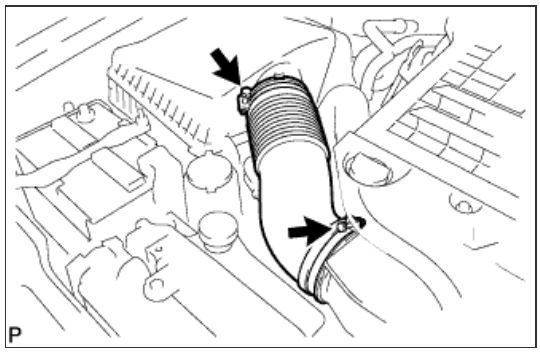
a. Temporarily install the air cleaner hose to the intake air connector.



16. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

a. Connect the air cleaner cap to the air cleaner hose, and install the air cleaner cap with the 4 clamps.

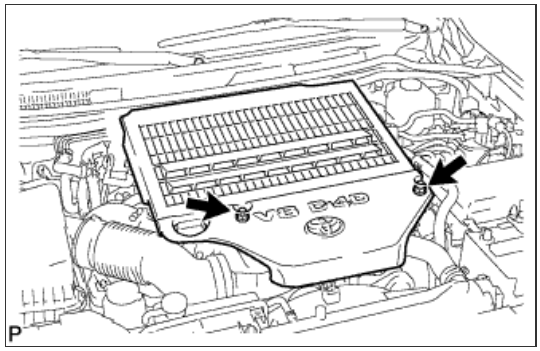
b. Connect the mass air flow meter connector and attach the wire harness clamp to the air cleaner cap.



c. Attach the wire harness clamp.

d. Align the protrusion of air cleaner cap and concave portion of air cleaner hose.

e. Tighten the 2 hose clamps.

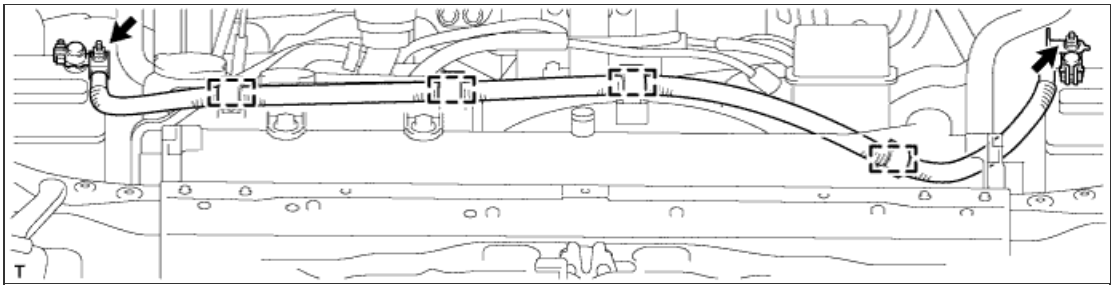


Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

17. INSTALL NO. 1 EN INE COVER SUB-ASSEMBLY (w/ Intercooler)

a. Install the engine cover with the 2 nuts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



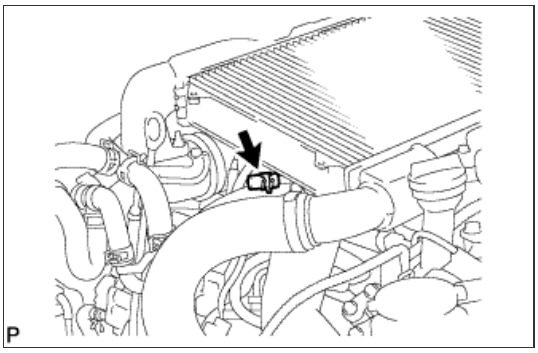
18. INSTALL NO. 3 EN INE ROOM WIRE

a. Install the No. 3 engine room wire to the main battery and sub-battery positive terminals with the 2 nuts.

Torque:
7.6 N*m{ 77 kgf*cm , 67 in.*lbf }

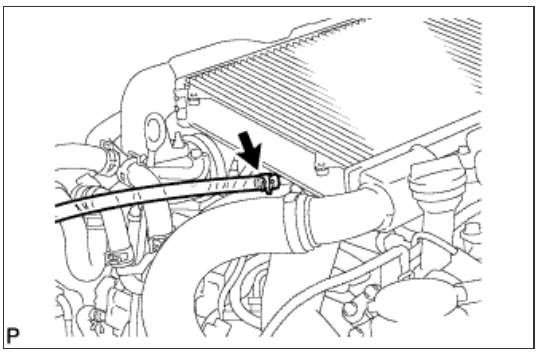
b. Connect the No. 3 engine room wire with the 4 clamps.

19. CONNECT CABLE TO NE ATIVE BATTERY TERMINAL



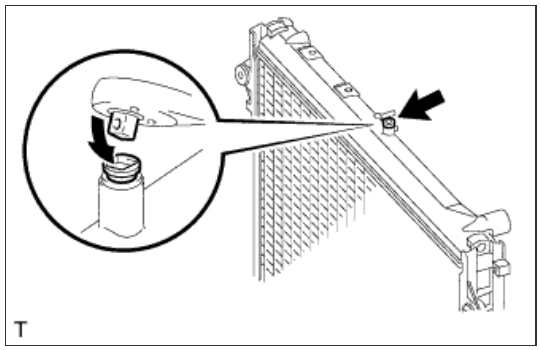
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

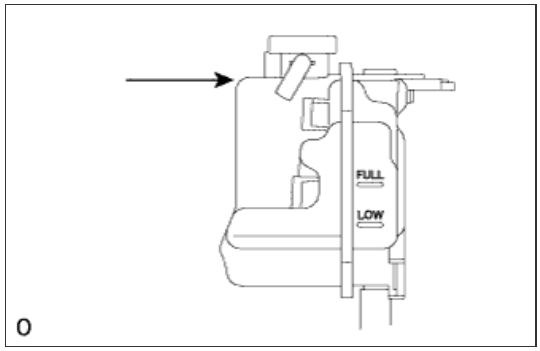


a. Connect the cables to negative (-) main battery and sub-battery terminals.

20. ADD EN INE COOLANT



a. Remove the engine air bleed cap.



b. Connect a clear hose to the engine air bleed pipe.

c. Using a wrench, remove the vent plug.

d. Fill the radiator with TO TA SLLC to the radiator reservoir filler neck.

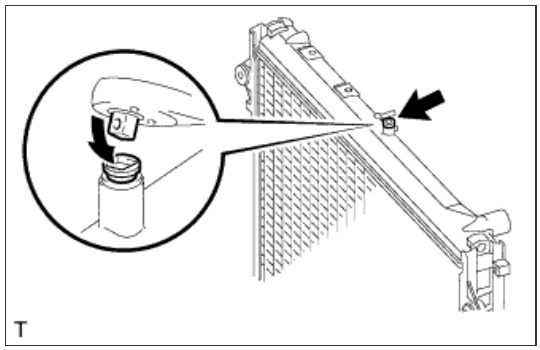
HINT:

Pour TO TA SLLC until it spills out of the engine air bleed pipe.

Standard Capacity (for Automatic Transmission):

Item	Specified Condition
Front heater only	14.8 liters (15.6 US qts, 13.0 Imp. qts)
Front heater and rear heater	17.6 liters (18.6 US qts, 15.5 Imp. qts)
Front heater with viscous heater	15.2 liters (16.1 US qts, 13.4 Imp. qts)
Front heater and rear heater with viscous heater	18.0 liters (19.0 US qts, 15.4 Imp. qts)

Standard capacity (for Manual Transmission):
15.4 liters (16.3 US qts, 13.6 Imp. qts)



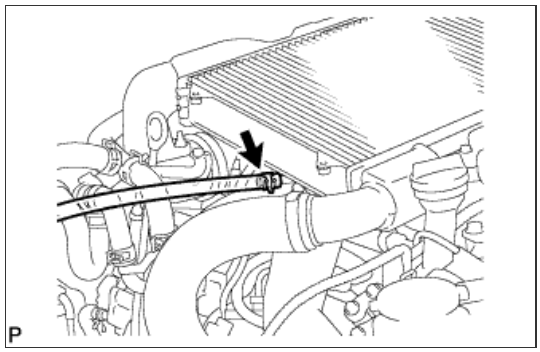
NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TO TA vehicles are filled with TO TA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TO TA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

e. Install the vent plug.

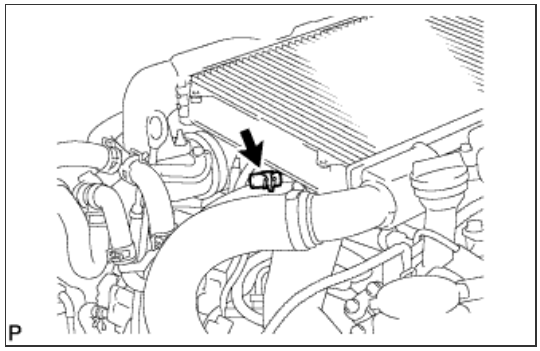


Torque:
2.0 N*m{ 20 kgf*cm , 18 in.*lbf }

NOTICE:

Do not tighten the plug to 5.0 N*m (51 kgf*cm, 44 in.*lbf) or more, as the plug will be damaged.

f. Disconnect the clear hose from the engine air bleed pipe.



g. Install the engine air bleed cap when coolant comes out.

h. Install the radiator reservoir cap.

i. Start the engine.

NOTICE:

Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the FULL line.

j. Maintain an engine speed of 3000 rpm for approximately 10 minutes so that the thermostat opens and air bleeding is performed.

CAUTION:

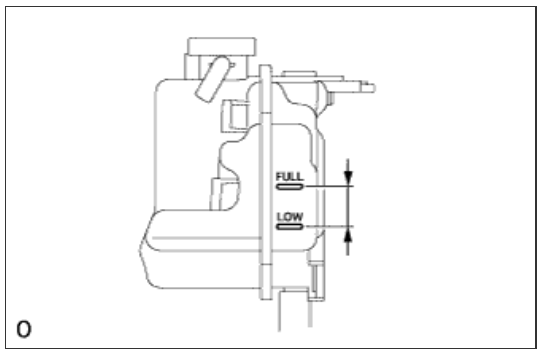
When pressing the radiator hoses:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the radiator fan**

NOTICE:

- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**

HINT:



The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

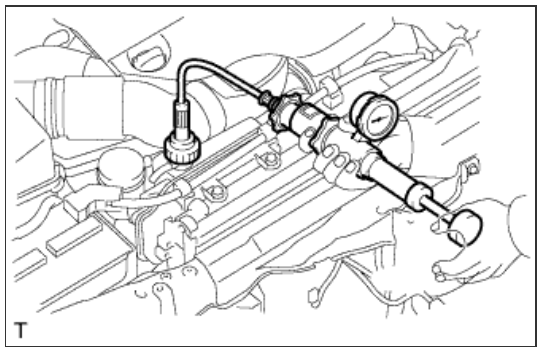
k. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

l. Check that the coolant level is between the FULL and LOW lines.
If the coolant level is above the FULL line, drain coolant so that the coolant level is between the FULL and LOW lines.

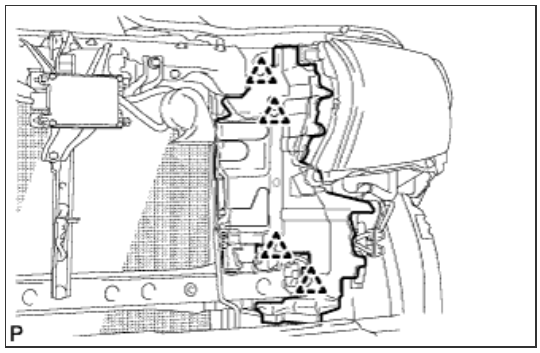
21. INSPECT FOR EN INE COOLANT LEAK



CAUTION:

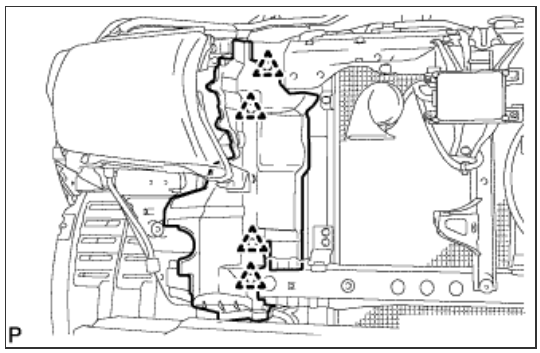
Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.



b. Warm up the engine.

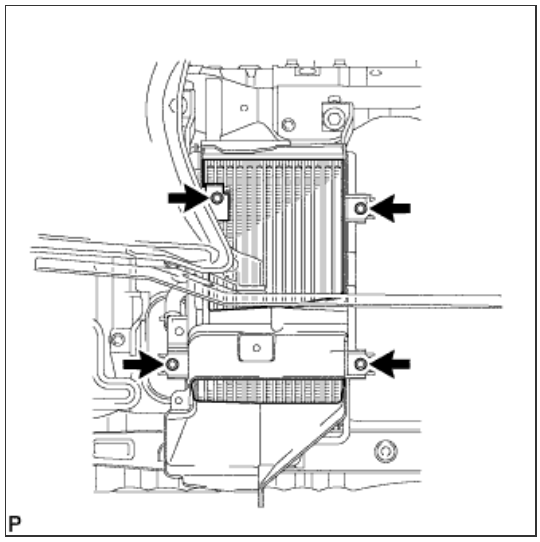
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.



22. INSTALL RADIATOR SIDE DEFLECTOR LH

a. Install the side deflector with the 4 clips.

23. INSTALL RADIATOR SIDE DEFLECTOR RH (for Manual Transmission)



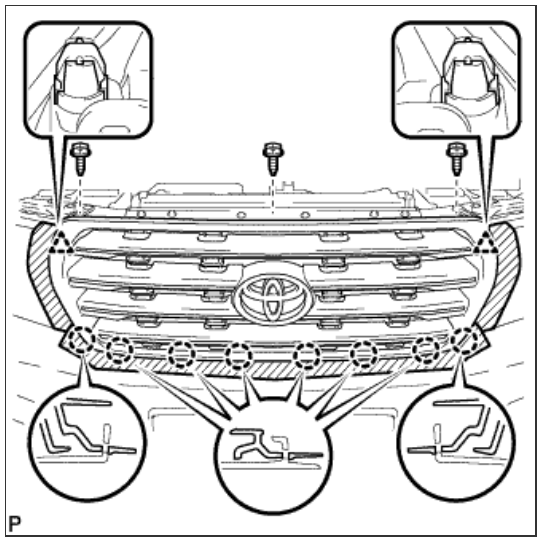
a. Install the deflector with the 4 clips.

24. INSTALL TRANSMISSION OIL COOLER AIR DUCT (for Automatic Transmission)

a. Install the oil cooler air duct with the 4 bolts.

Torque:
4.9 N*m{ 50 kgf*cm , 43 in.*lbf }

25. INSTALL FRONT BUMPER COVER



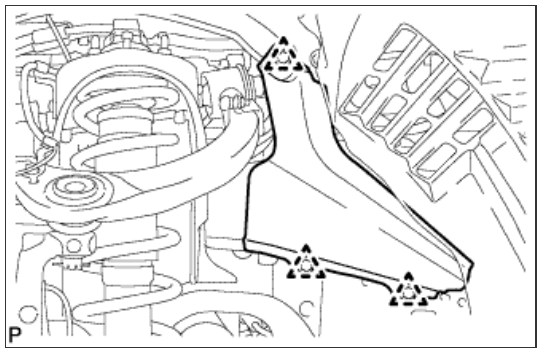
a. for Standard:
Install the front bumper cover (Click here).

b. w/ Winch:
Install the front bumper cover (Click here).

26. INSTALL RADIATOR RILLE

a. Attach the 2 clips and 8 claws to install the radiator grille.

b. Install the 3 screws.



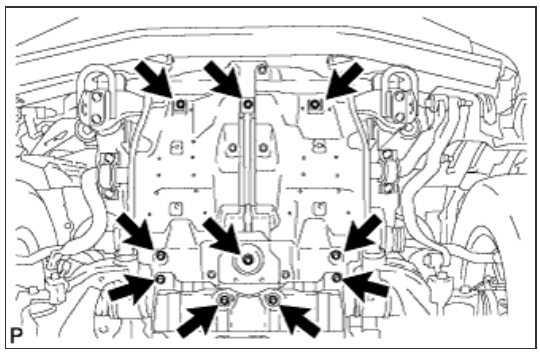
27. INSTALL FRONT BUMPER WINCH COVER (w/ Winch)

28. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the upper radiator support seal with the 7 clips.

29. INSTALL FRONT FENDER APRON SEAL FRONT RH

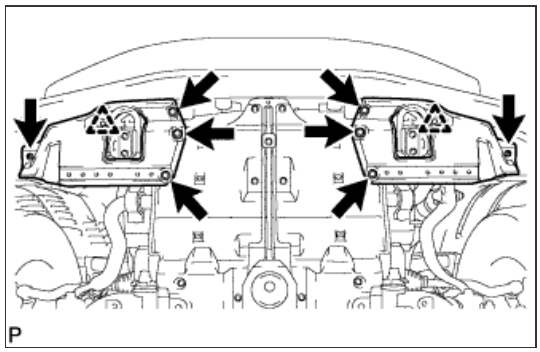
a. Install the front fender apron seal front RH with the 3 clips.



30. INSTALL FRONT WHEEL RH

Torque:
for Aluminum Wheel:
131 N*m{ 1336 kgf*cm , 97 ft.*lbf }
for Steel Wheel:
209 N*m{ 2131 kgf*cm , 154 ft.*lbf }

31. INSTALL NO. 1 EN INE UNDER COVER SUB-ASSEMBLY



a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

32. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

a. Install the splash shield with the clip, and then install the 3 bolts and screw.

33. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Install the splash shield with the clip, and then install the 3 bolts and screw.

for Preparation Click here

1. CHECK ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The oil level should be between the low and full level marks on the dipstick. If the oil level is low, check for leakage and add oil up to the full level mark.

NOTICE:

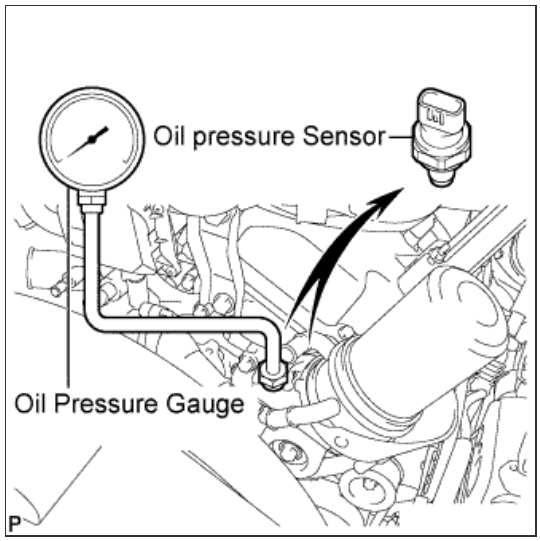
Do not fill engine oil above the full level mark.

2. INSPECT OIL PRESSURE

a. Disconnect the oil pressure sensor connector.

b. Using a 24 mm deep socket wrench, remove the oil pressure sensor.

c. Install an oil pressure gauge.



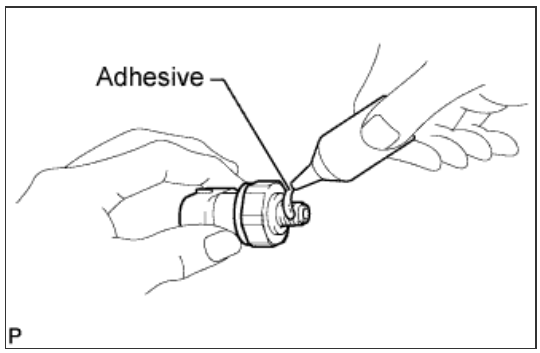
d. Warm up the engine.

e. Measure the oil pressure.

Standard Oil Pressure:

Condition	Specified Condition
Idling	29 kPa (0.3 kgf/cm^2, 4.2 psi) or more
3000 rpm	294 to 588 kPa (3.0 to 6.0 kgf/cm^2, 43 to 85 psi)

If the oil pressure is not as specified, check the oil pump.



f. Remove the oil pressure gauge.

g. Apply adhesive to 2 or 3 threads of the oil pressure sensor.

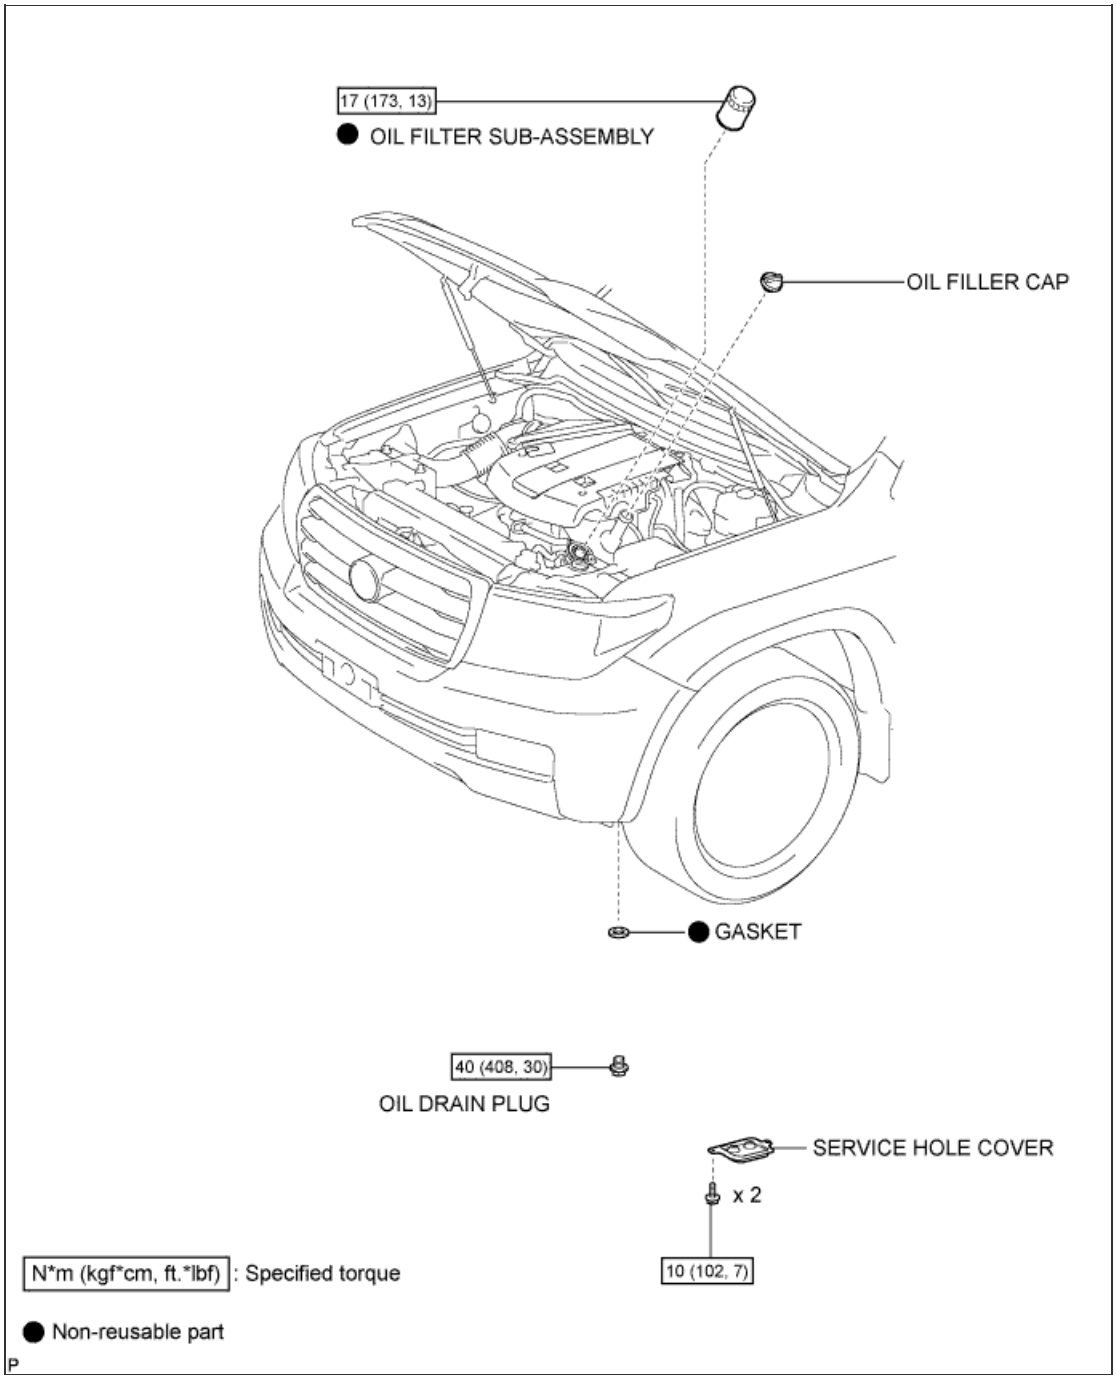
Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not apply adhesive to the oil inlet port of the sensor.

h. Using a 24 mm deep socket wrench, install the oil pressure sensor.

Torque:
15 N*m{ 150 kgf*cm , 11 ft.*lbf }



NOTICE:

Do not start the engine within 1 hour of installation.

i. Connect the oil pressure sensor connector.

j. Start the engine and check for engine oil leaks.

for Preparation Click here

for Preparation Click here

CAUTION:

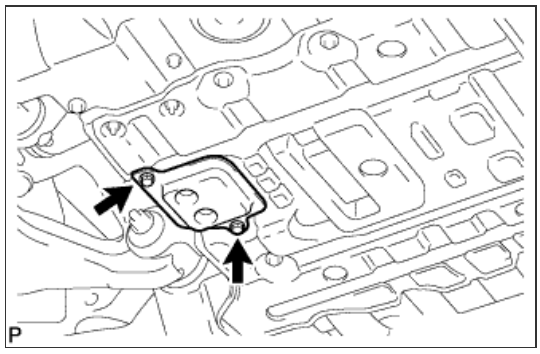
- **Prolonged and repeated contact with engine oil will result in the loss of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.**
- **Wear protective clothing and gloves. Avoid contact with used oil. If contact occurs, wash the area thoroughly with soap and waterless hand cleaner. Never use gasoline, thinners, or solvents to wash the skin.**
- **In order to protect the environment, dispose of used oil and used oil filters at designated disposal sites only.**

1. DRAIN ENGINE OIL

a. Remove the oil filler cap.

b. Remove the 2 bolts and service hole cover from the No. 2 engine under cover.

c. Remove the oil drain plug, and drain the engine oil from the oil pan.



NOTICE:

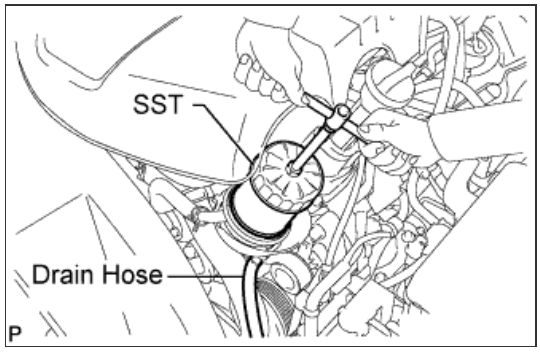
Collect the oil in an oil disposal container.

d. Wipe the oil pan and drain plug.

e. Install a new gasket and the drain plug.

Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

2. REMOVE OIL FILTER SUB-ASSEMBLY



a. Remove the drain pipe cap.

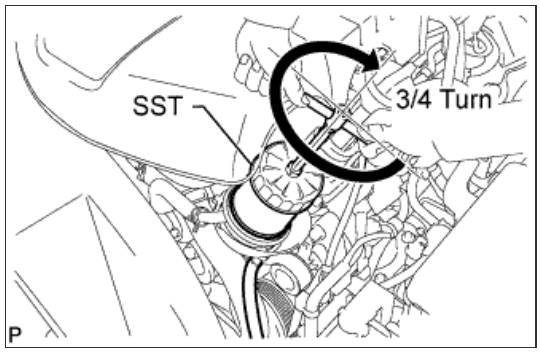
b. Using SST, remove the oil filter.

SST
09228-07501

HINT:

- **Put the disposal container beneath the drain hose to collect the oil from the oil filter cover.**
- **Drain hose inside diameter: 8 mm (0.315 in.)**
- **Drain hose length: 900 mm (2.95 ft.)**

3. INSTALL OIL FILTER SUB-ASSEMBLY



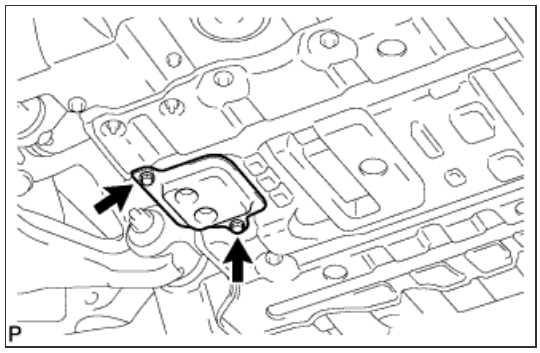
a. Check and clean the oil filter installation surface.

b. Apply clean engine oil to the gasket of a new oil filter.

c. Lightly screw the oil filter into place by hand. Tighten it until the gasket contacts the seat.

d. Using SST, tighten the oil filter. Depending on the work space available, choose from the following.

SST
09228-07501



i. If enough space is available, use a torque wrench to tighten the oil filter.

Torque:
17 N*m{ 173 kgf*cm , 13 ft.*lbf }

ii. If enough space is not available to use a torque wrench, tighten the oil filter a 3/4 turn by hand or with a common wrench.

e. Install the service hole cover to the No. 2 engine under cover with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

4. ADD ENGINE OIL

a. Remove the oil filler cap.

b. Add new oil.

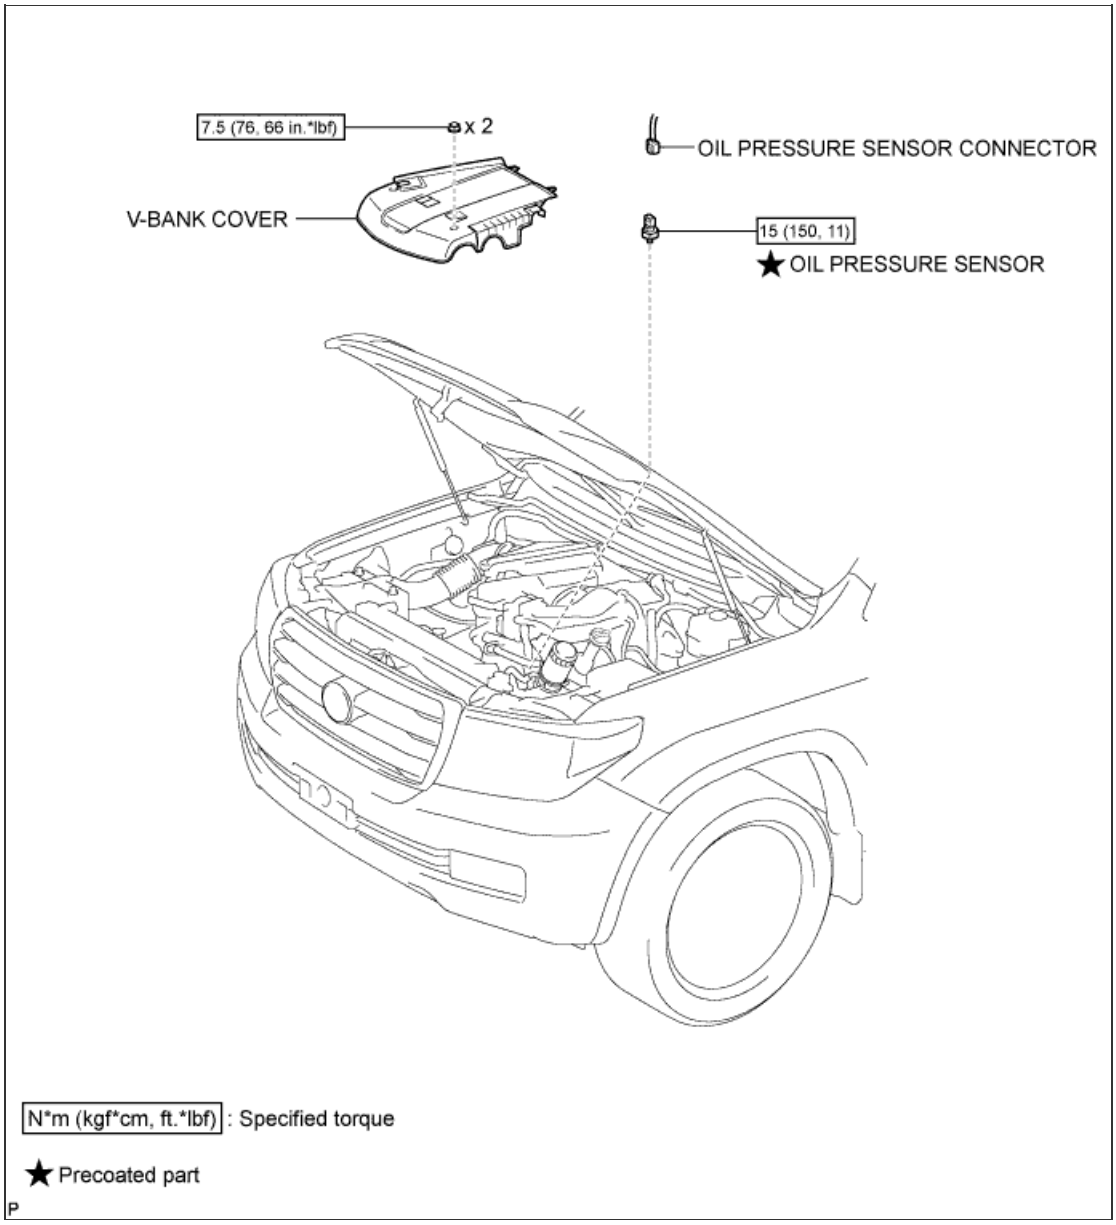
Standard Oil Grade:

Oil Grade	Oil Viscosity (SAE)
API grade SL "Energy-Conserving", SM "Energy-Conserving", SN "Resource-Conserving" or ILSAC multigrade engine oil	5W-30 10W-30
API grade SL, SM or SN multigrade engine oil	15W-40 20W-50

Standard Oil Capacity:

Item	Specified Condition
Drain and refill with oil filter change	5.2 liters (5.5 US qts, 4.6 Imp. qts)
Drain and refill without oil filter change	4.9 liters (5.2 US qts, 4.3 Imp. qts)
Dry fill	6.0 liters (6.3 US qts, 5.3 Imp. qts)

c. Install the oil filler cap.

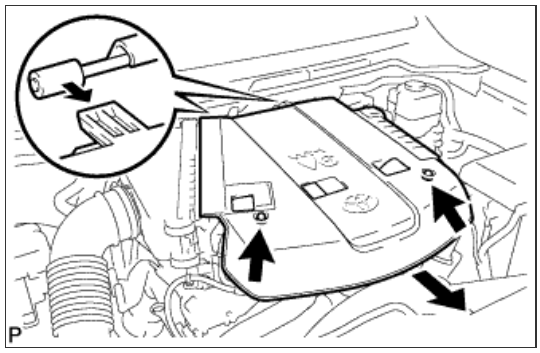


5. INSPECT FOR OIL LEAK

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

6. INSPECT ENGINE OIL LEVEL

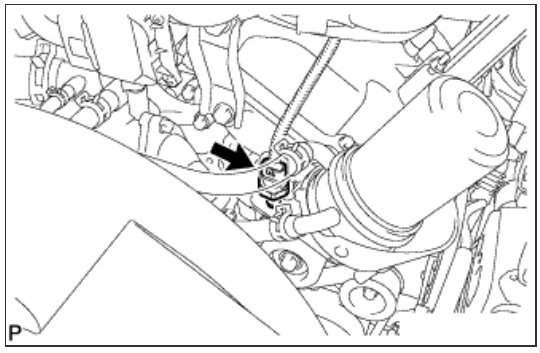
a. Warm up the engine so that the coolant temperature is approximately 80°C (176°F). Check the engine oil level dipstick 5 minutes after the engine is stopped. Then add engine oil to the full level of the engine oil level dipstick.



for Preparation Click here

for Preparation Click here

1. REMOVE V-BANK COVER



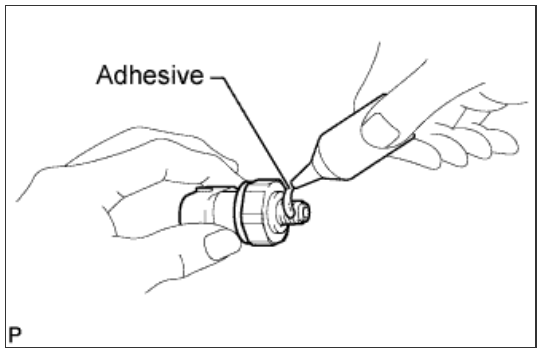
a. Remove the 2 cap nuts and V-bank cover.

2. REMOVE OIL PRESSURE SENSOR

a. Disconnect the oil pressure sensor connector.

b. Using a 24 mm deep socket wrench, remove the oil pressure sensor.

for Preparation Click here



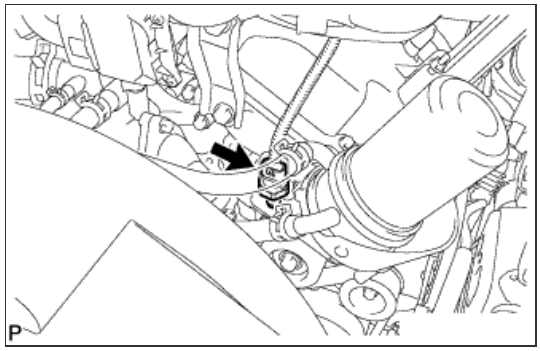
1. INSTALL OIL PRESSURE SENSOR

a. Apply adhesive to 2 or 3 threads of the oil pressure sensor.

Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not apply adhesive to the oil inlet port of the sensor.

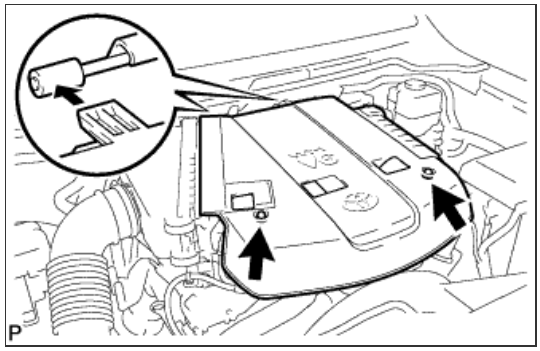


b. Using a 24 mm deep socket wrench, install the oil pressure sensor.

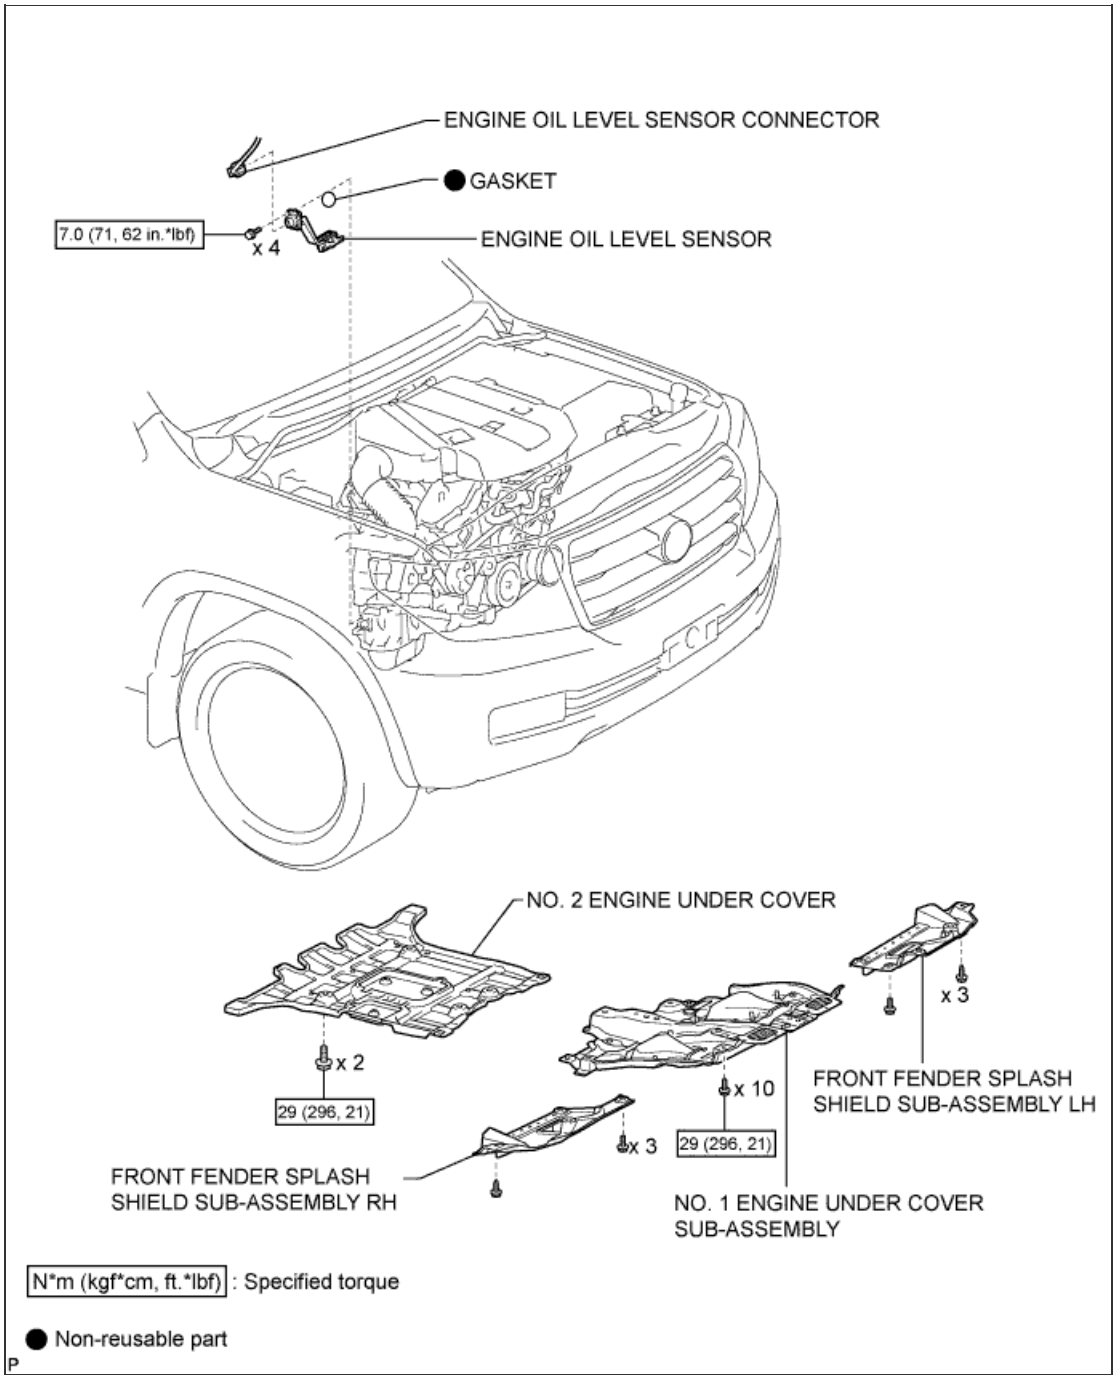
Torque:
15 N*m{ 150 kgf*cm , 11 ft.*lbf }

NOTICE:

Do not start the engine within 1 hour of installation.



c. onnect the oil pressure sensor connector.

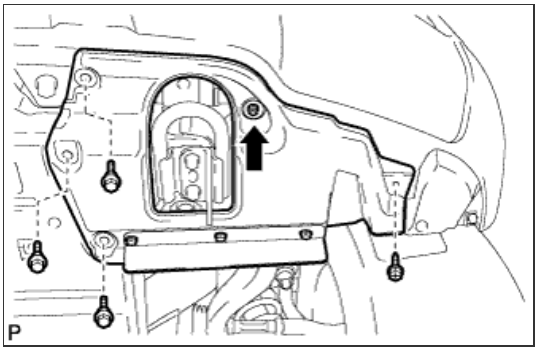


2. INSTALL V-BANK COVER

a. Install the V-bank cover with the 2 cap nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

for Preparation [Click here]

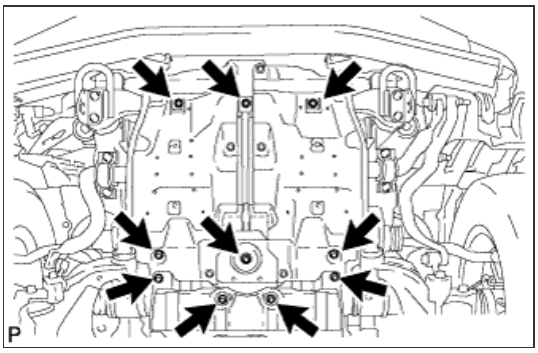


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

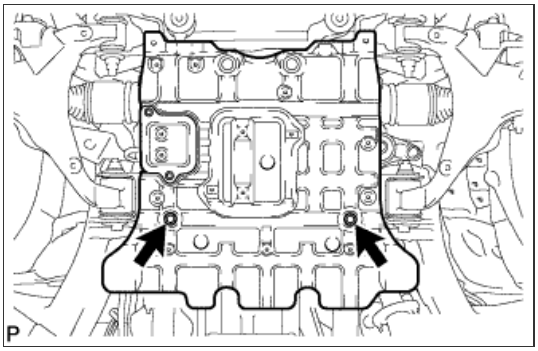
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

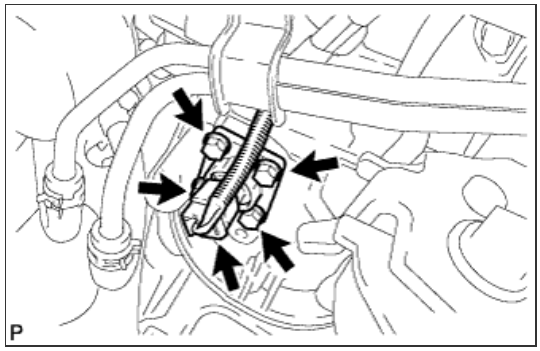
Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. REMOVE NO. 2 ENGINE UNDER COVER



a. Remove the 2 bolts and engine under cover.

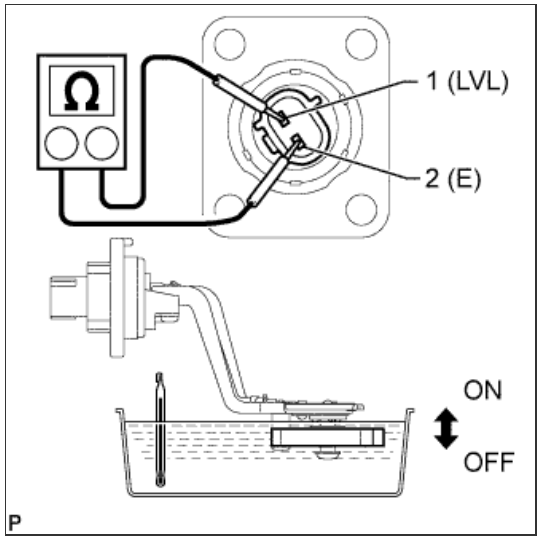
5. REMOVE ENGINE OIL LEVEL SENSOR

a. Disconnect the connector.

b. Remove the 4 bolts, sensor and gasket.

for Preparation Click here

1. INSPECT ENGINE OIL LEVEL SENSOR



a. Partially immerse the sensor in an oil bath and warm up the oil bath.

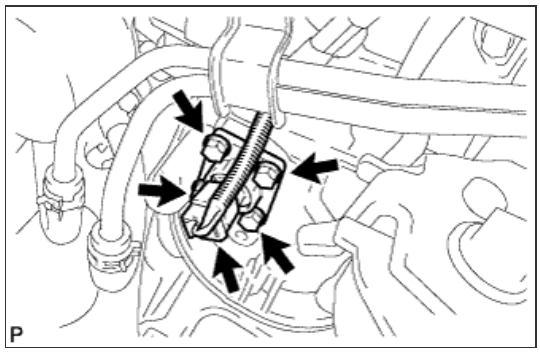
Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (LVL) - 2 (E)	ON, 20°C (68°F)	Below 1 Ω
	OFF, 20°C (68°F)	Below 1 Ω
	ON, 60°C (140°F)	Below 1 Ω
	OFF, 60°C (140°F)	10 kΩ or higher

If the result is not as specified, replace the sensor.

for Preparation Click here

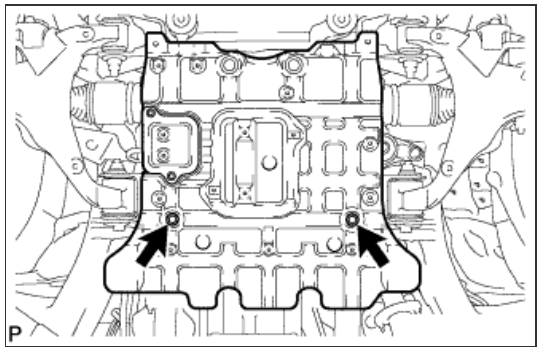


1. INSTALL ENGINE OIL LEVEL SENSOR

a. Install a new gasket to the sensor.

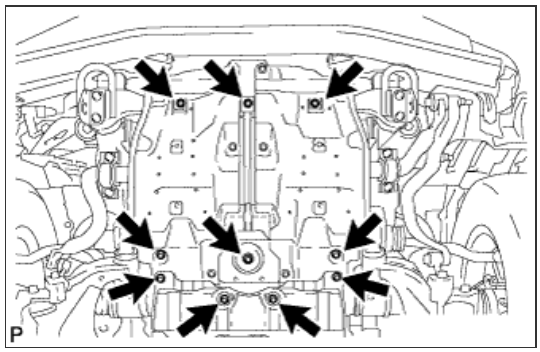
b. Install the sensor with the 4 bolts.

Torque:
7.0 N*m{ 71 kgf*cm , 62 in.*lbf }



c. Connect the connector.

2. INSTALL NO. 2 ENGINE UNDER COVER



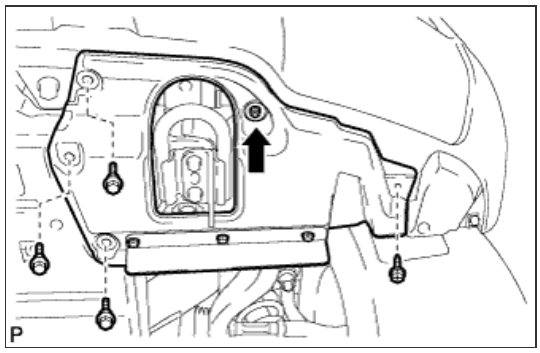
a. Install the under cover with the 2 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

3. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

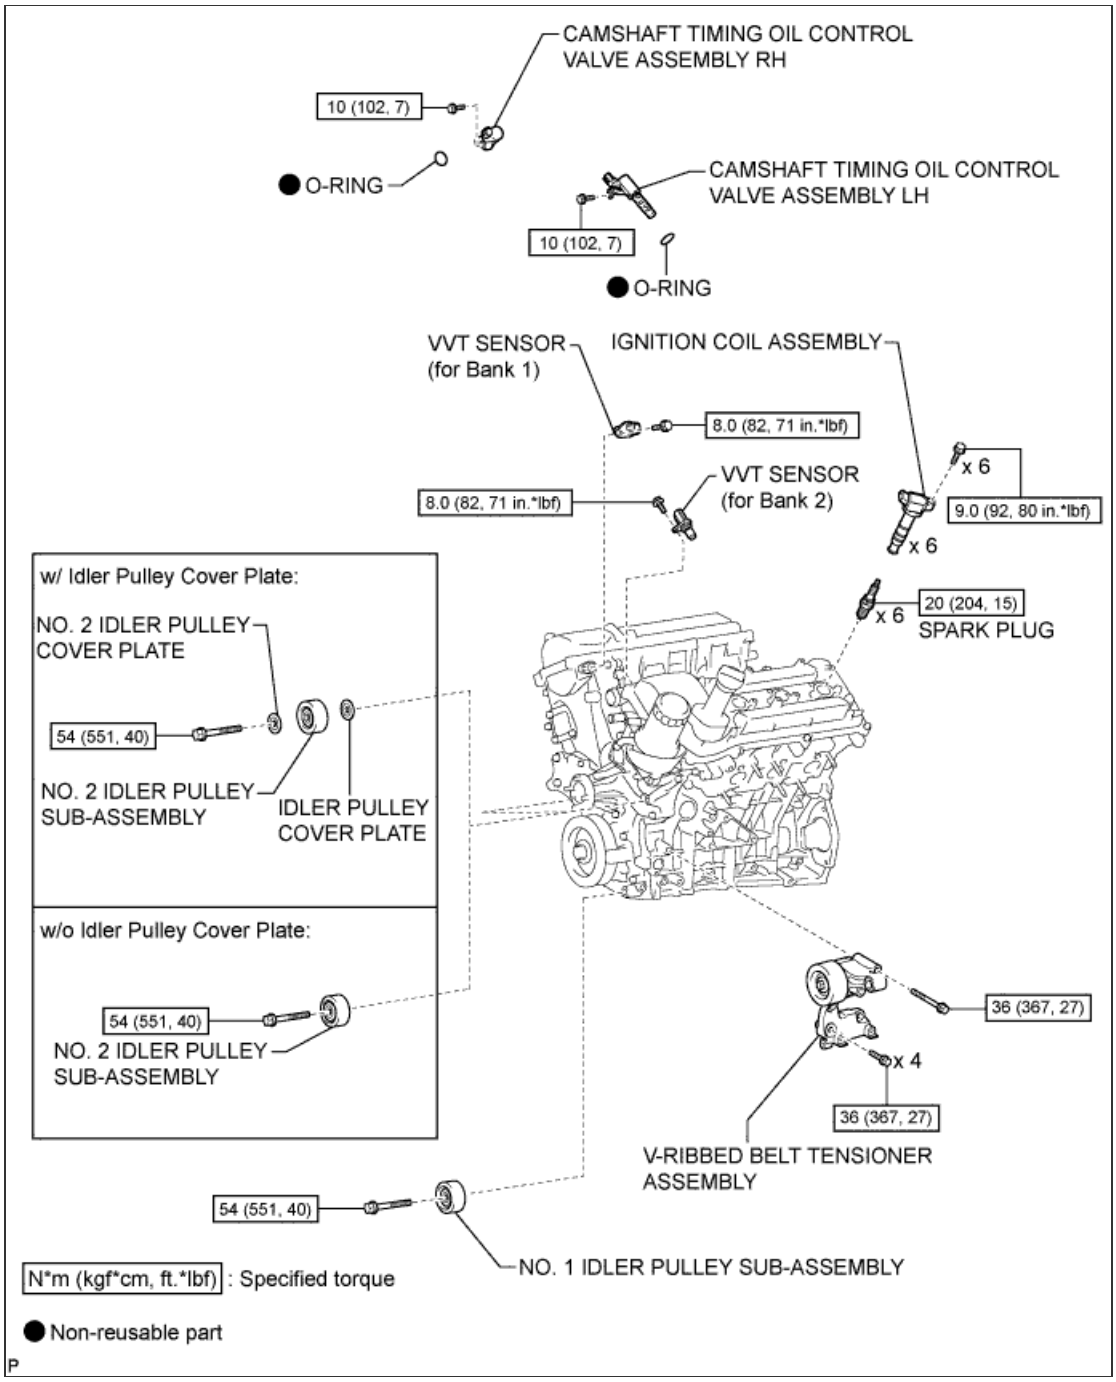
a. Install the under cover with the 10 bolts.

4. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

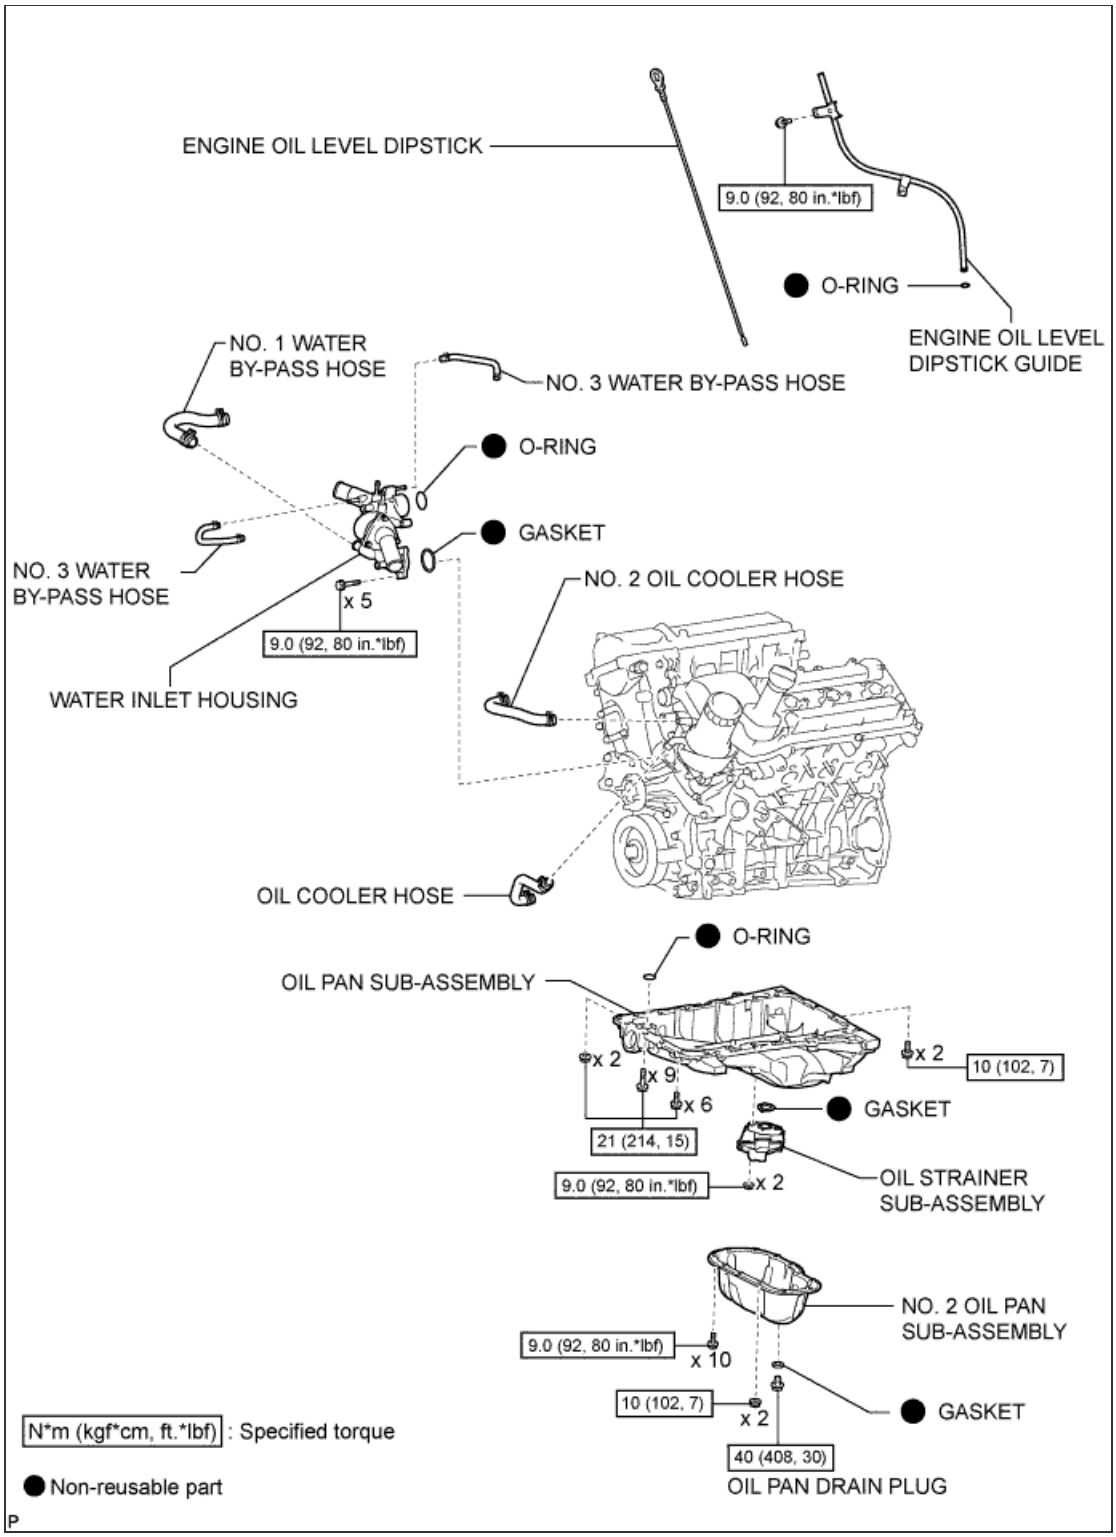


HINT:

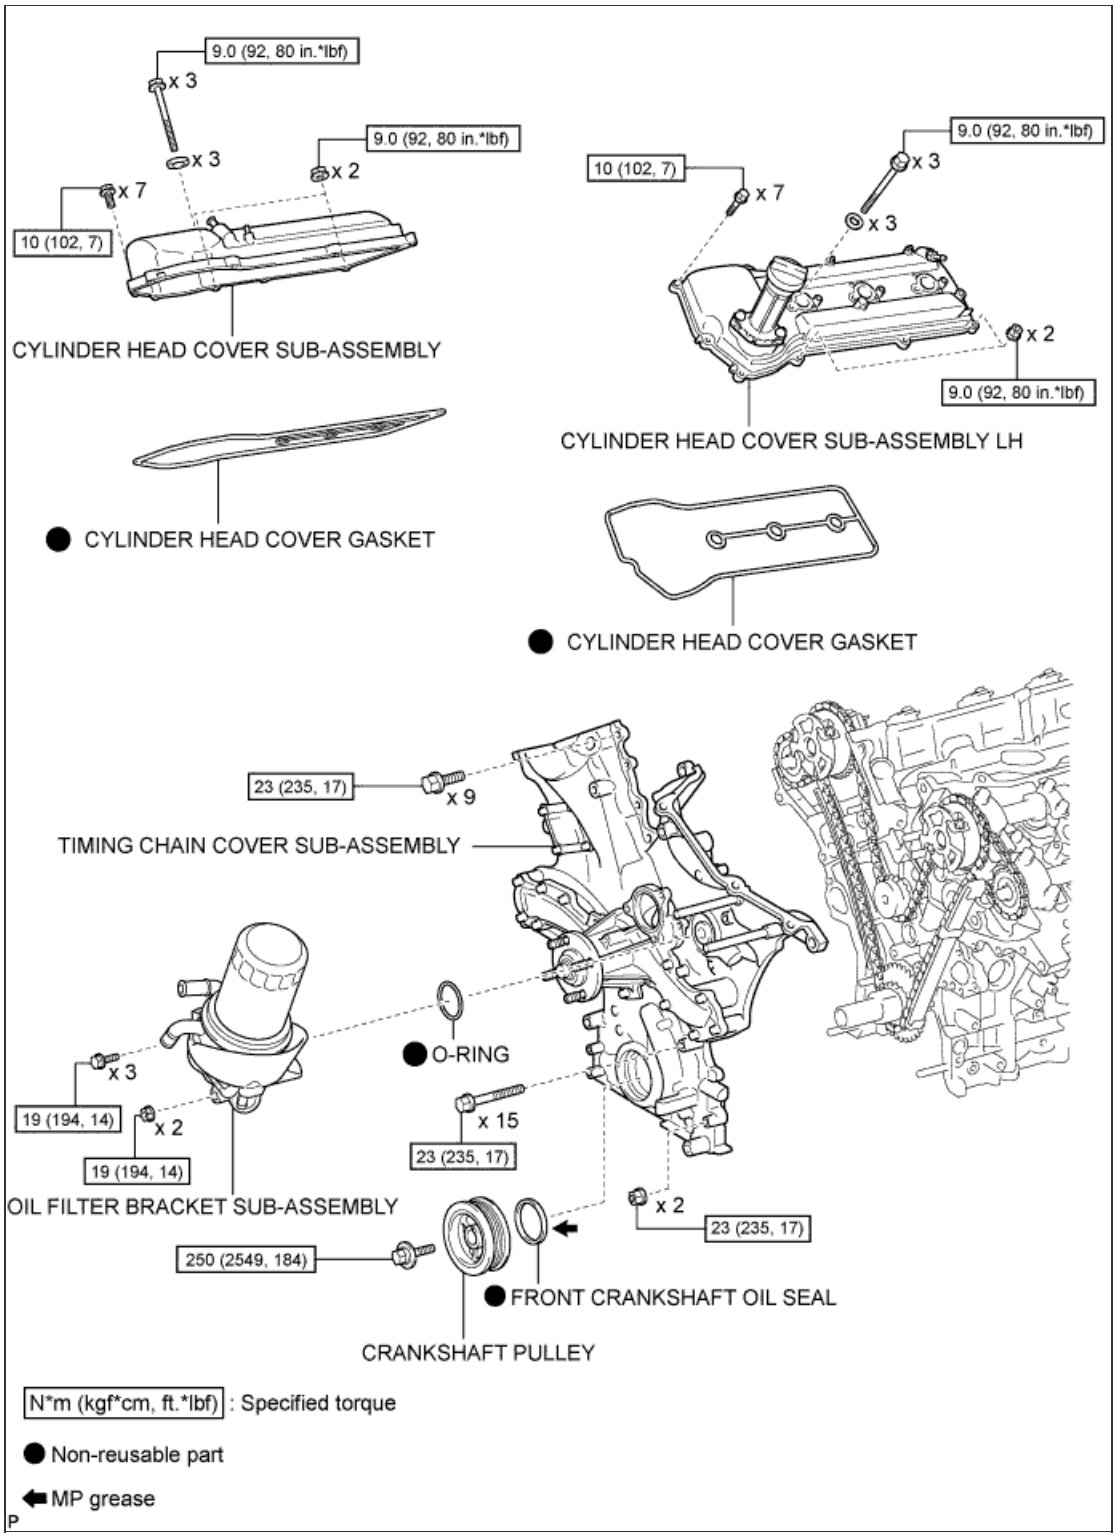
Use the same procedures described for the LH side.



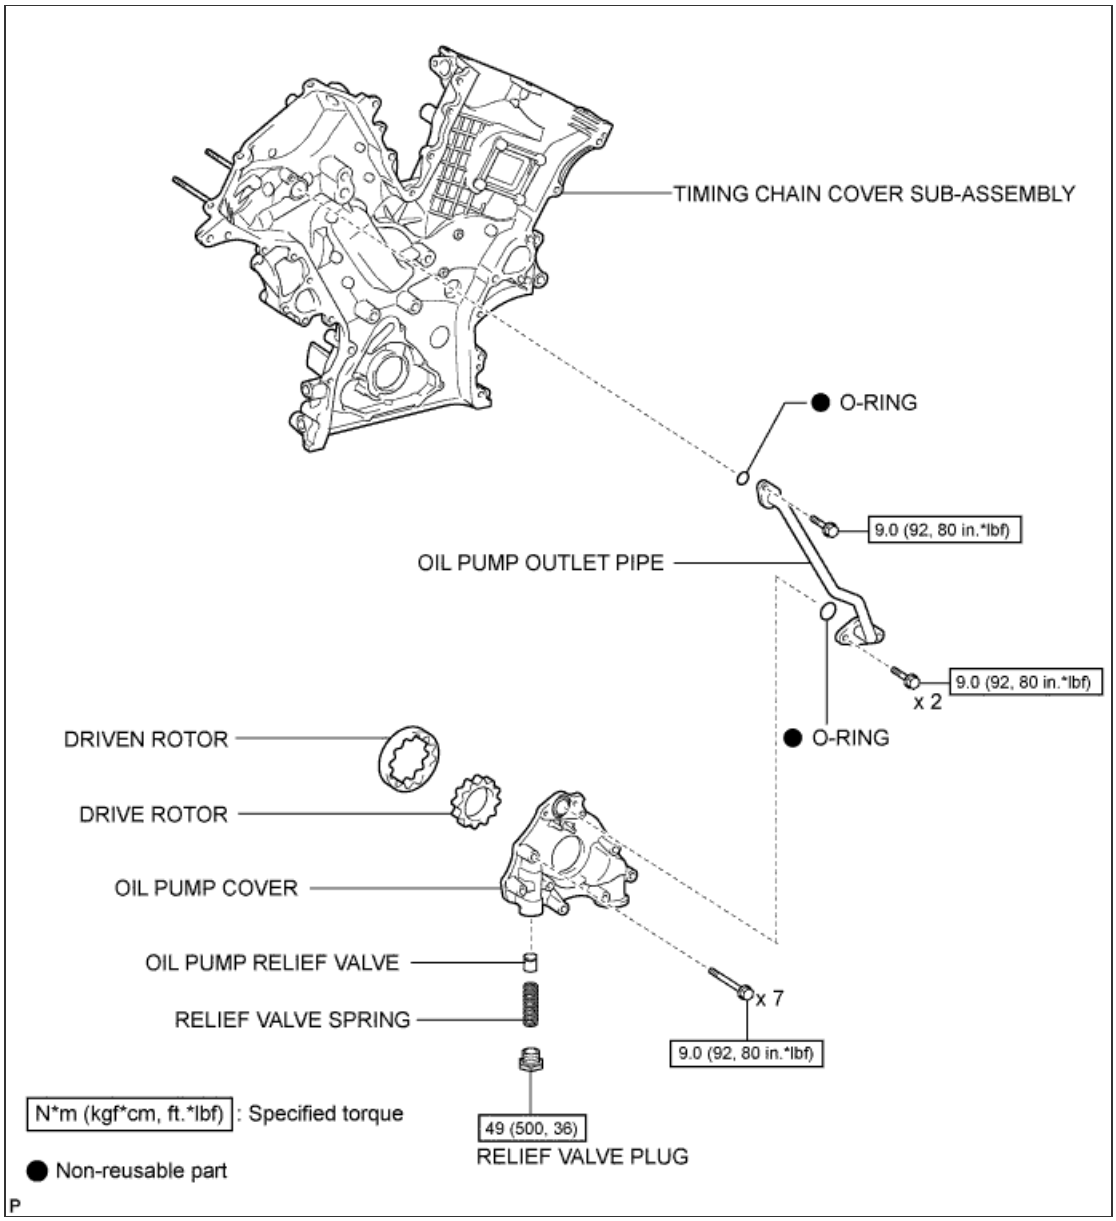
5. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.



b. Install the 3 bolts and screw.



for Preparation Click here

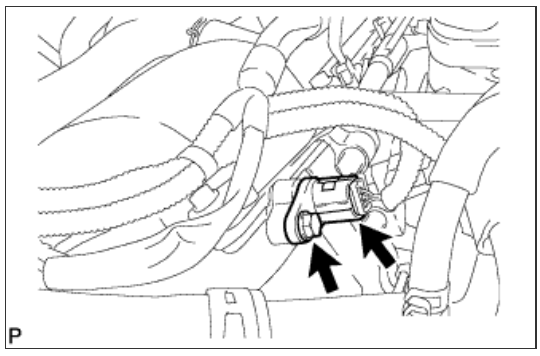
1. REMOVE ENGINE ASSEMBLY

(Click here)

2. REMOVE IGNITION COIL ASSEMBLY

a. Disconnect the 6 ignition coil connectors.

b. Remove the 6 bolts and 6 ignition coils.

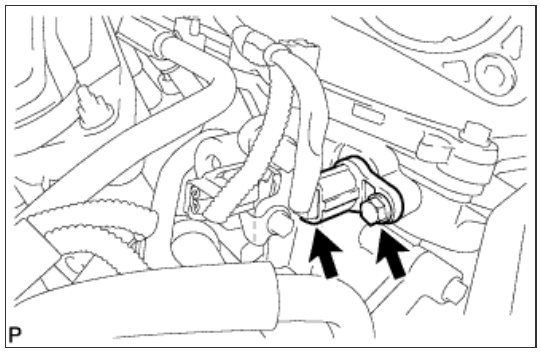


3. REMOVE SPARK PLUG

a. Remove the 6 spark plugs.

4. REMOVE VVT SENSOR (for Bank 1)

a. Disconnect the sensor connector.

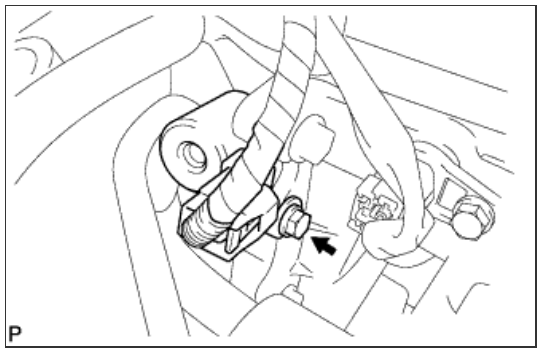


b. Remove the bolt and sensor.

5. REMOVE VVT SENSOR (for Bank 2)

a. Disconnect the sensor connector.

b. Remove the bolt and sensor.

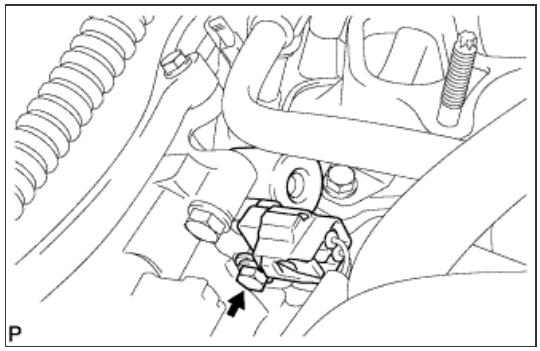


6. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY LH

a. Disconnect the oil control valve connector.

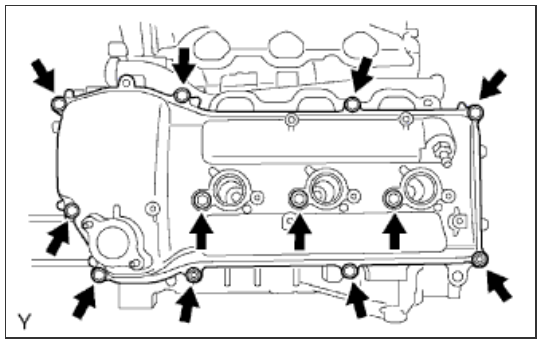
b. Remove the bolt and oil control valve.

c. Remove the O-ring from the oil control valve.



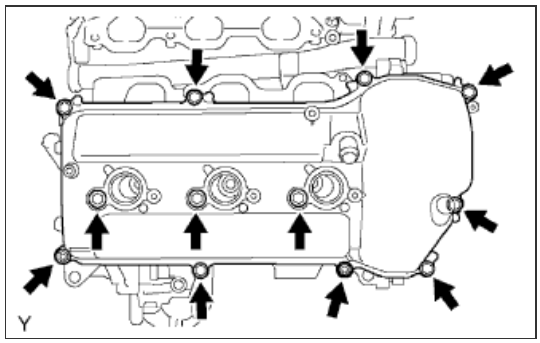
7. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY RH

a. Disconnect the oil control valve connector.



b. Remove the bolt and oil control valve.

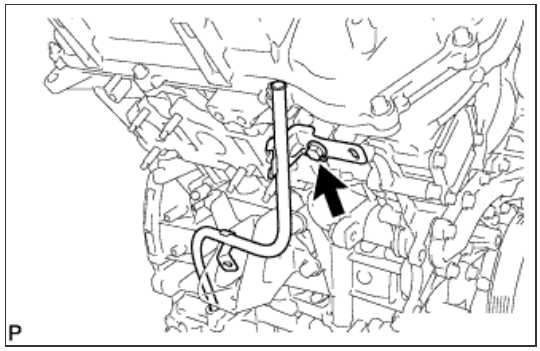
c. Remove the O-ring from the oil control valve.



8. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY LH

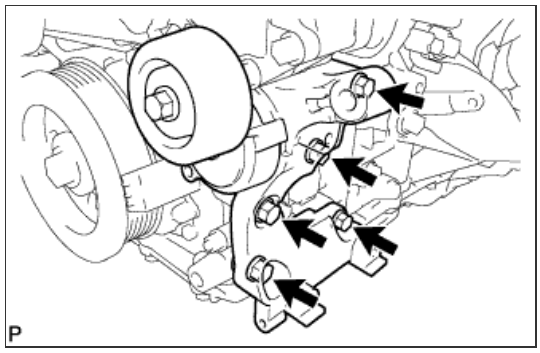
a. Remove the 10 bolts, 3 seal washers, 2 nuts, cylinder head cover and gasket.

9. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY



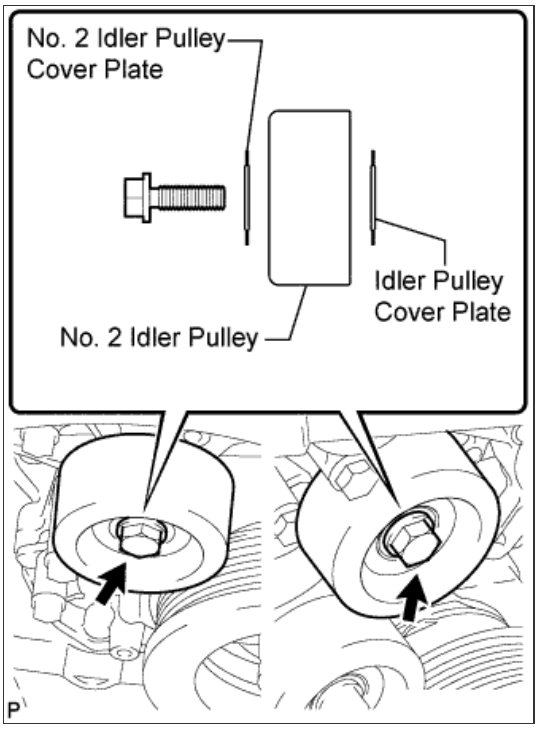
a. Remove the 10 bolts, 3 seal washers, 2 nuts, cylinder head cover and gasket.

10. REMOVE ENGINE OIL LEVEL DIPSTICK GUIDE



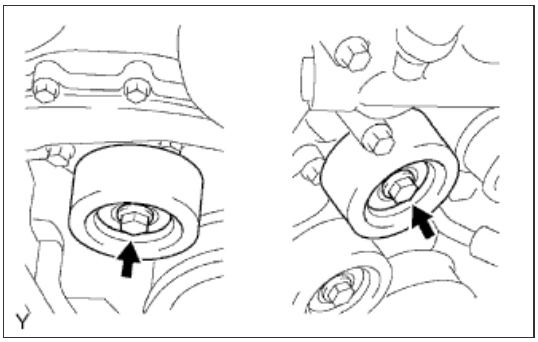
a. Remove the bolt and dipstick guide.

b. Remove the O-ring from the dipstick guide.



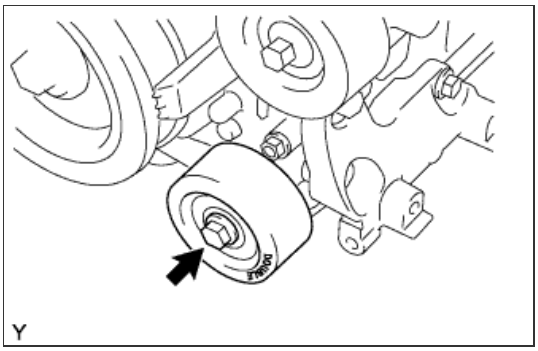
11. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY

a. Remove the 5 bolts and V-ribbed belt tensioner.

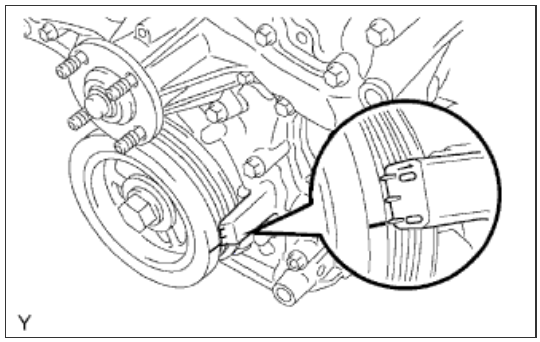


12. REMOVE NO. 2 IDLER PULLEY SUB-ASSEMBLY

a. w/ Pulley Cover Plate:
Remove the 2 bolts, 2 No. 2 idler pulley cover plate, 2 idler pulley and 2 idler pulley cover plate.

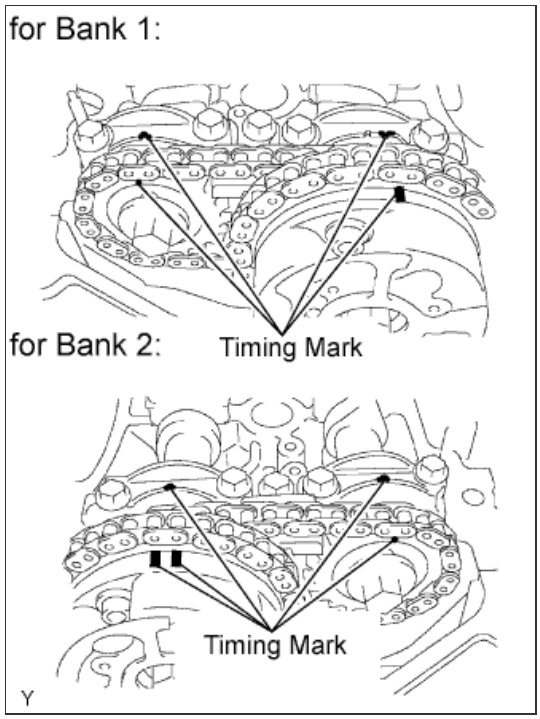


b. w/o Pulley Cover Plate:
Remove the 2 bolts and 2 No. 2 idler pulleys.



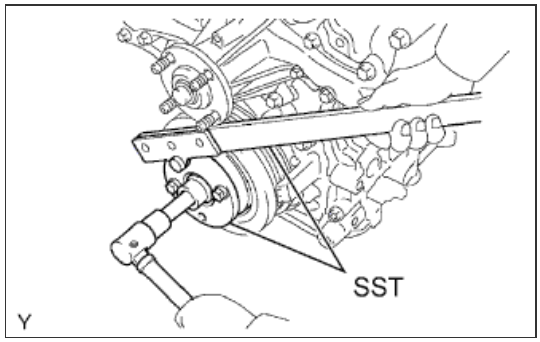
13. REMOVE NO. 1 IDLER PULLEY SUB-ASSEMBLY

a. Remove the bolt and No. 1 idler pulley.



14. REMOVE CRANKSHAFT PULLEY

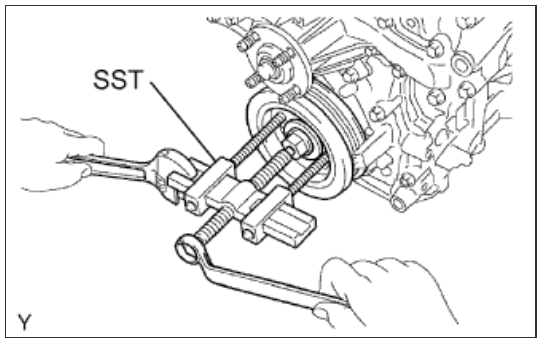
a. Turn the crankshaft pulley, and align the notch with the timing mark "0" of the timing chain cover.



b. Check that the timing marks of the camshaft timing gears and sprockets are aligned with the timing marks of the bearing caps as shown in the illustration.

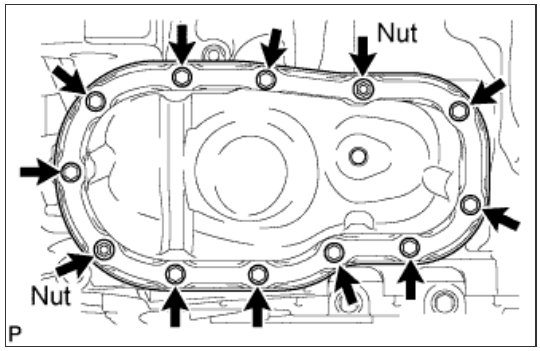
c. Using SST, hold the crankshaft pulley and loosen the pulley set bolt.

SST



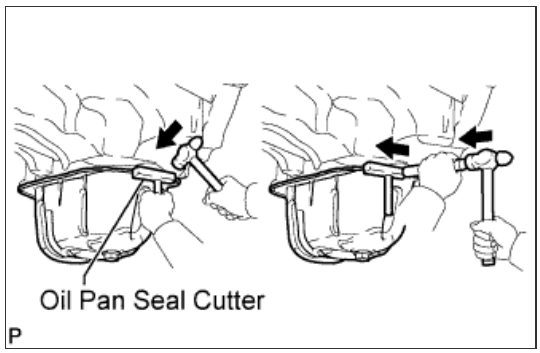
09213-54015 (91651-60855)
09330-00021

d. Using the pulley set bolt and SST, remove the crankshaft pulley.



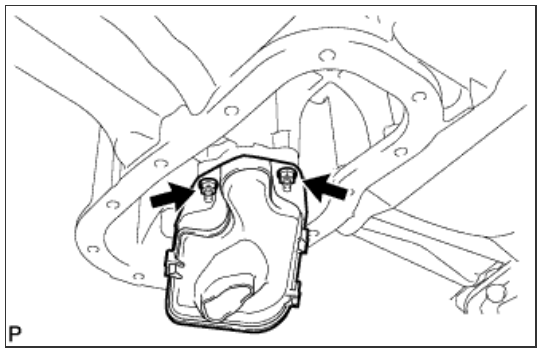
SST

09950-50013 (09951-05010, 09952-05010, 09953-05020, 09954-05030)

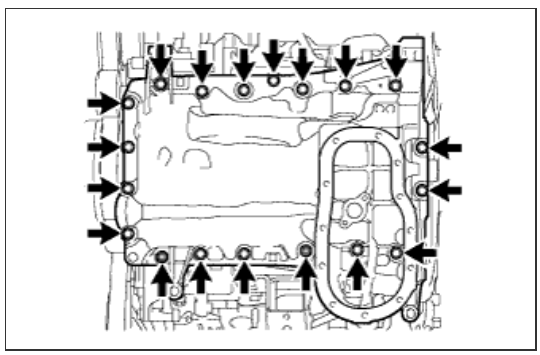


15. REMOVE NO. 2 OIL PAN SUB-ASSEMBLY

a. Remove the 10 bolts and 2 nuts.



b. Insert the blade of an oil pan seal cutter between the oil pans. Cut through the applied sealer and remove the No. 2 oil pan.



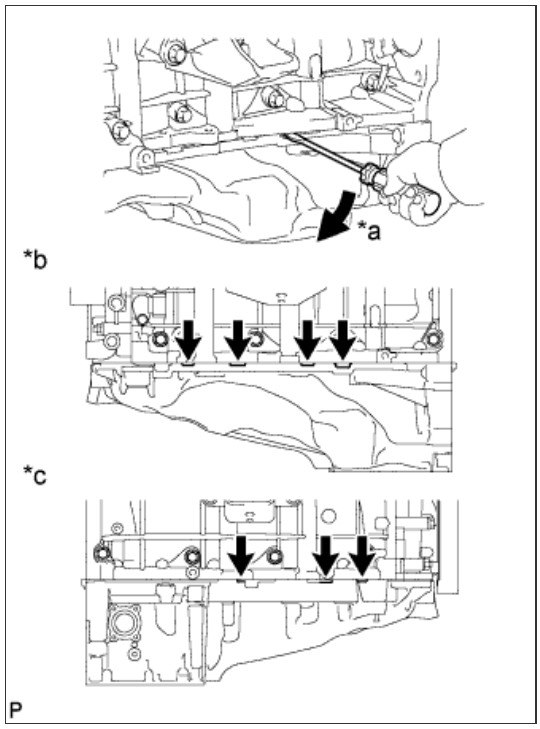
16. REMOVE OIL STRAINER SUB-ASSEMBLY

a. Remove the 2 nuts, oil strainer and gasket.

17. REMOVE OIL PAN SUB-ASSEMBLY

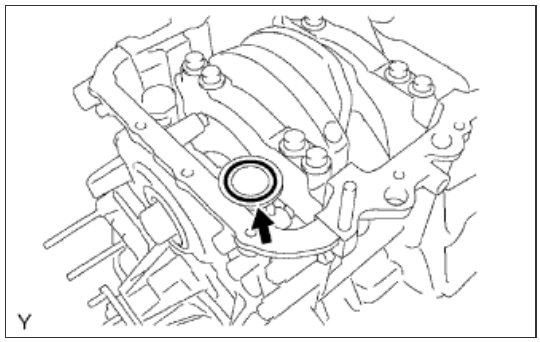
a. Remove the 17 bolts and 2 nuts.

b. Using a screwdriver, remove the oil pan by prying between the oil pan and cylinder block as shown in the illustration.



Text in Illustration

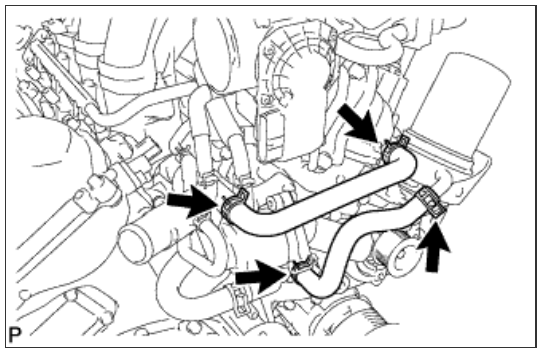
*a	Pry
*b	LH Side



*c	RH Side

NOTICE:

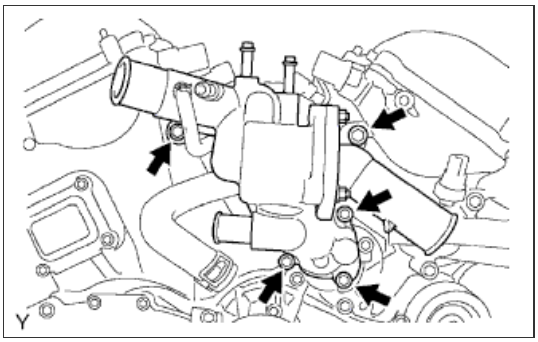
Be careful not to damage the contact surfaces of the cylinder block and oil pan.



c. Remove the O-ring from the timing chain cover.

18. DISCONNECT NO. 2 OIL COOLER HOSE

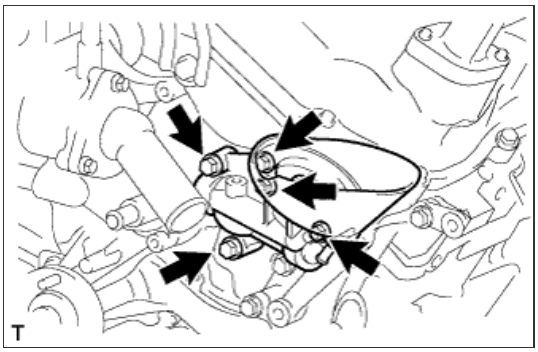
a. Remove the oil cooler hose.



19. DISCONNECT OIL COOLER HOSE

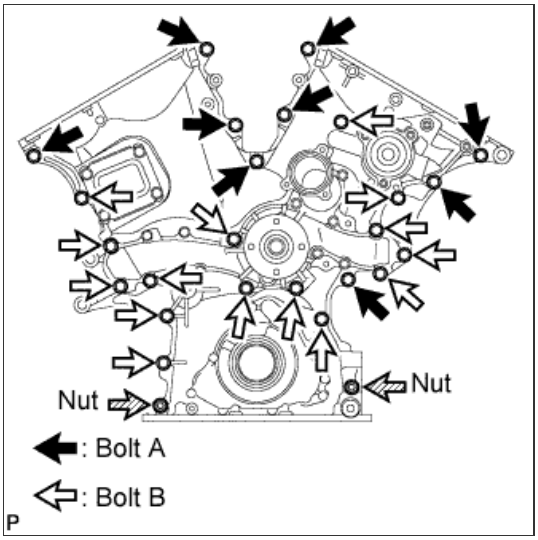
a. Remove the oil cooler hose.

20. REMOVE WATER INLET HOUSING



a. Remove the 5 bolts and water inlet housing.

b. Remove the O-ring and gasket from the water outlet pipe and water pump.

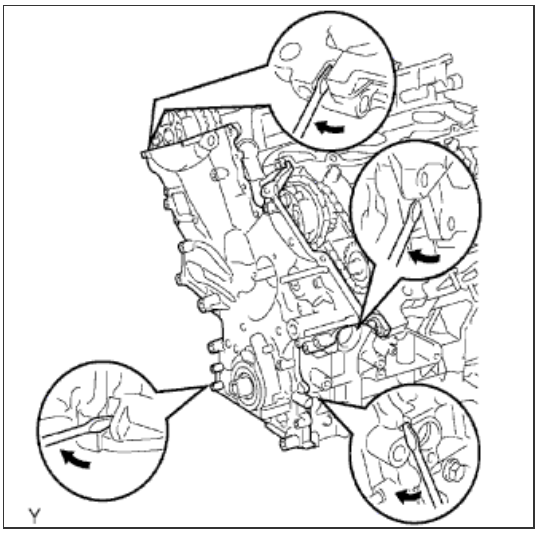


21. REMOVE OIL FILTER BRACKET SUB-ASSEMBLY

a. Remove the 3 bolts, 2 nuts, oil filter bracket and O-ring.

22. REMOVE TIMING CHAIN COVER SUB-ASSEMBLY

a. Remove the 24 bolts labeled A and B, and the 2 nuts.



b. Remove the timing chain cover by prying between the timing chain cover and cylinder head or cylinder block with a screwdriver.

NOTICE:

Be careful not to damage the contact surfaces of the timing chain cover, cylinder block and cylinder head.

c. Remove the O-ring from the cylinder head LH side.

23. REMOVE FRONT CRANKSHAFT OIL SEAL

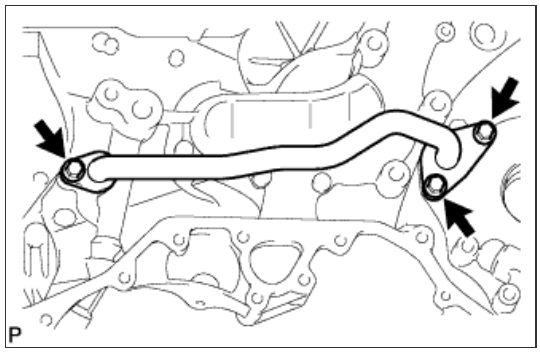
a. If the timing chain case is removed:

i. Using a screwdriver and wooden block, pry out the oil seal.

HINT:

Tape the screwdriver tip before use.

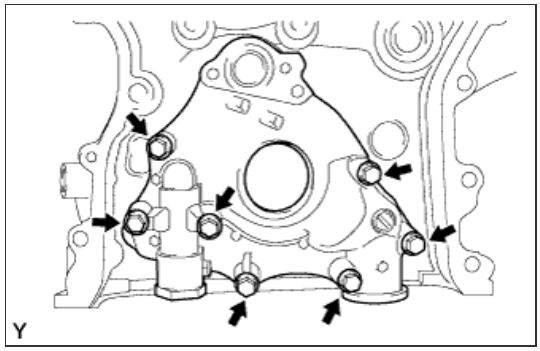
NOTICE:



Do not damage the surface of the oil seal press fit hole and crankshaft.

for Preparation Click here

1. REMOVE OIL PUMP OUTLET PIPE

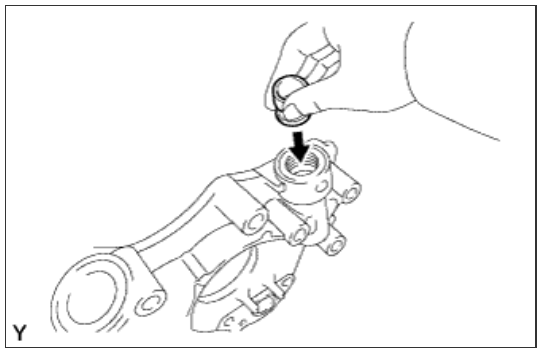


a. Remove the 3 bolts and outlet pipe.

b. Remove the 2 O-rings.

2. REMOVE OIL PUMP COVER

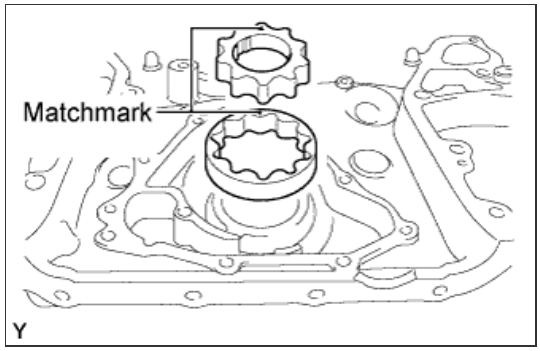
a. Remove the 7 bolts, oil pump cover, drive rotor and driven rotor.



3. REMOVE OIL PUMP RELIEF VALVE

a. Remove the plug, spring and relief valve.

for Preparation Click here

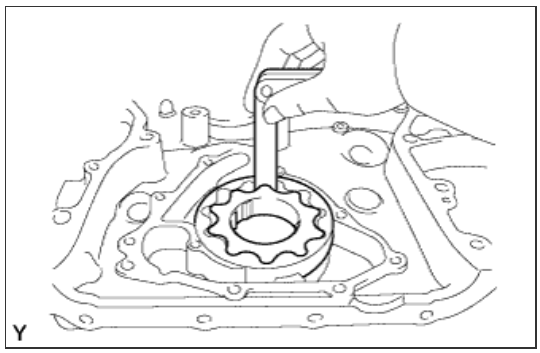


1. INSPECT OIL PUMP RELIEF VALVE

a. Coat the valve with engine oil, then check that it falls smoothly into the valve hole by its own weight.
If it does not, replace the relief valve. If necessary, replace the oil pump assembly.

2. INSPECT OIL PUMP ROTOR SET

a. Place the drive and driven rotors into the timing chain cover with the matchmarks facing upward.



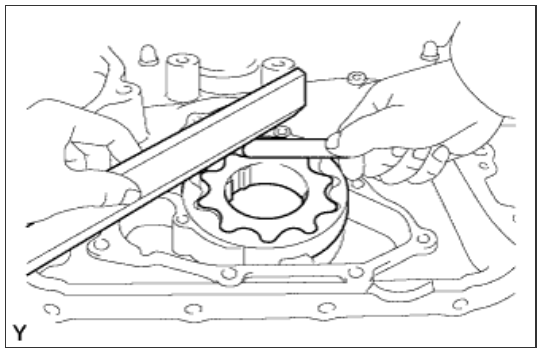
b. Check the rotor tip clearance.

i. Using a feeler gauge, measure the clearance between the drive and driven rotor tips.

Standard tip clearance:
0.06 to 0.16 mm (0.00236 to 0.00630 in.)

Maximum tip clearance:
0.16 mm (0.00630 in.)

If the clearance is more than the maximum, replace the timing chain cover sub-assembly.



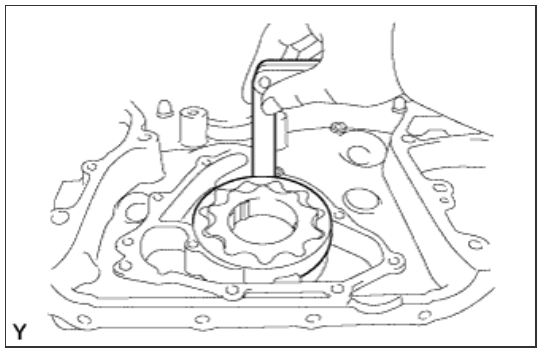
c. Check the rotor side clearance.

i. Using a feeler gauge and precision straightedge, measure the clearance between the rotors and precision straightedge.

Standard side clearance:
0.03 to 0.09 mm (0.00118 to 0.00354 in.)

Maximum side clearance:
0.09 mm (0.00354 in.)

If the clearance is more than the maximum, replace the timing chain cover sub-assembly.



d. Check the rotor body clearance.

i. Using a feeler gauge, measure the clearance between the driven rotor and body.

Standard body clearance:
0.250 to 0.325 mm (0.00984 to 0.0128 in.)

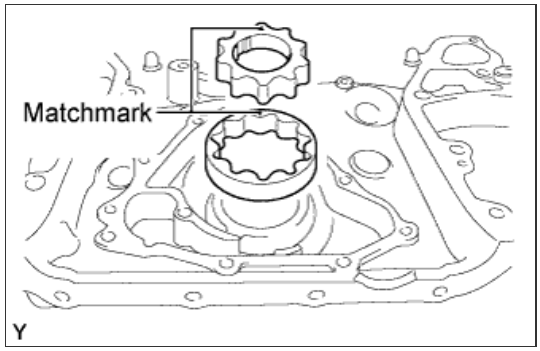
Maximum body clearance:
0.325 mm (0.0128 in.)

If the clearance is more than the maximum, replace the timing chain cover sub-assembly.

for Preparation Click here

1. INSTALL OIL PUMP RELIEF VALVE

a. Coat the relief valve with engine oil and insert the relief valve and spring into the valve hole.



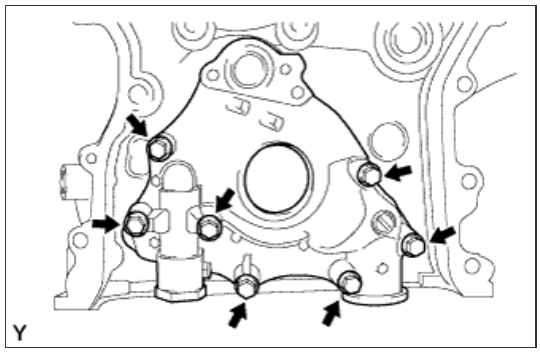
b. Install the relief valve plug.

Torque:
49 N*m{ 500 kgf*cm , 36 ft.*lbf }

2. INSTALL OIL PUMP COVER

a. Apply fresh engine oil to the drive and driven rotors.

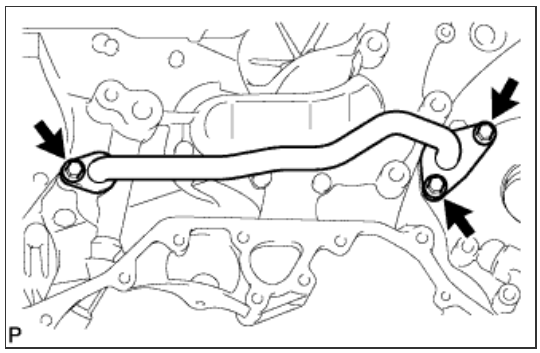
b. Place the drive and driven rotors into the timing chain cover with the matchmarks facing the oil pump cover side.



c. Install the oil pump cover with the 7 bolts.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

d. Install a new O-ring onto the oil pump cover.



e. Install a new O-ring onto the oil pipe.

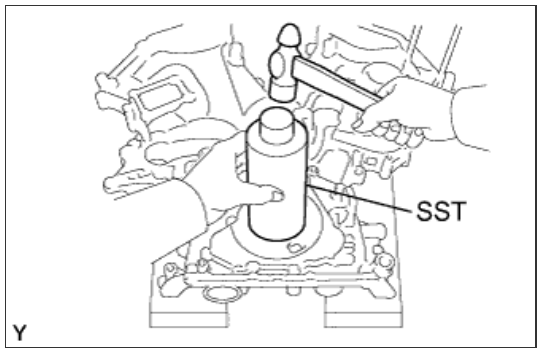
3. INSTALL OIL PUMP OUTLET PIPE

a. Install the outlet pipe with the 3 bolts.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

for Preparation Click here

1. INSTALL FRONT CRANKSHAFT OIL SEAL

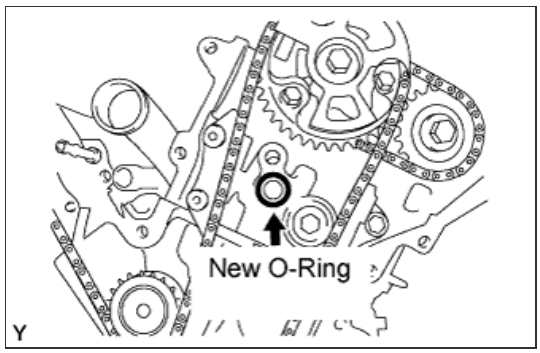


a. Using SST and a hammer, tap in a new oil seal until its surface is flush with the timing chain cover edge.

SST
09226-10010

NOTICE:

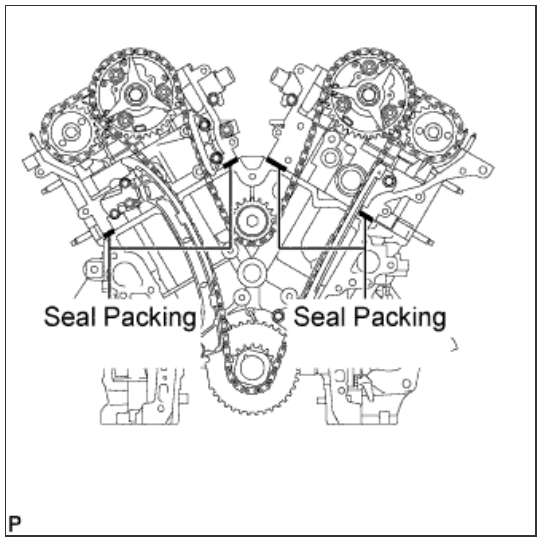
- **Keep the lip free from foreign matter.**
- **Do not tap the oil seal at an angle.**



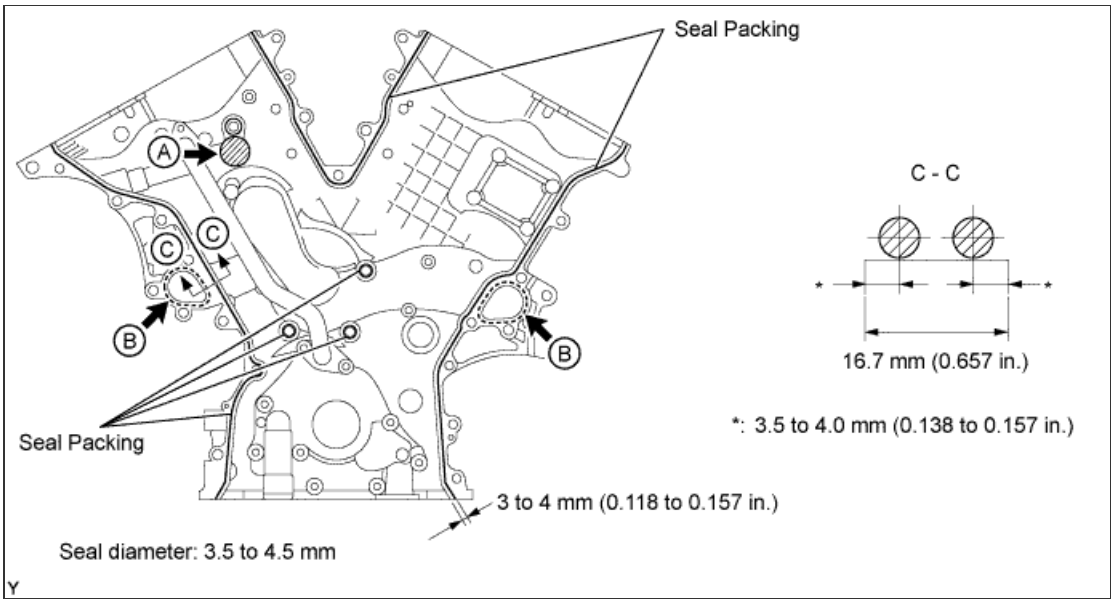
b. Apply MP grease to the lip of the oil seal.

2. INSTALL TIMING CHAIN COVER SUB-ASSEMBLY

a. Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surfaces of the timing chain cover, cylinder head and cylinder block.



b. Install a new O-ring to the cylinder head for bank 2 as shown in the illustration.



c. Apply seal packing as shown in the illustration.

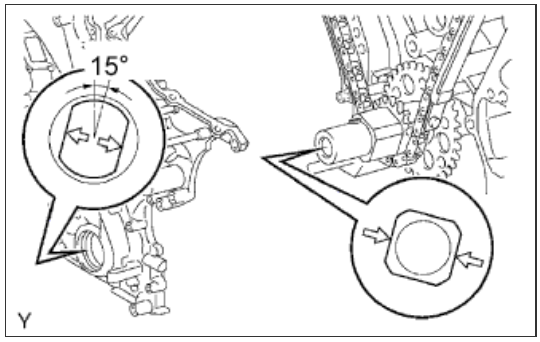
Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard seal diameter:
3.0 to 4.0 mm (0.118 to 0.157 in.)

d. Apply seal packing in a continuous line to the timing chain cover as shown in the illustration.

Seal packing:
for ater related part:
Toyota Genuine Seal Packing 12 2B, Three Bond 12 2B or e uivalent
for oil related part:
Toyota Genuine Seal Packing Black, Three Bond 1207B or e uivalent

Standard seal diameter:
3.5 to . mm (0.13 t0.177 in.)



HINT:

Water related parts are labeled "B" in the illustration.

NOTICE:

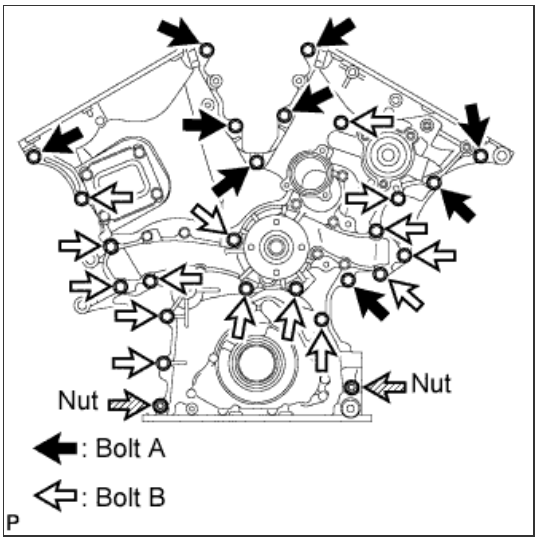
- **Install the timing chain cover within 3 minutes after applying seal packing. After installing it, the timing chain cover bolts and nuts must be tightened within 15 minutes. Otherwise the seal packing must be removed and reapplied.**
- **Do not apply seal packing to A shown in the illustration.**

e. Align the keyway of the oil pump drive rotor with the rectangular portion of the crankshaft timing gear, and slide the timing chain cover into place.

f. Install the timing chain cover with the 24 bolts labeled A and B, and the 2 nuts. Tighten the bolts and nuts uniformly in several steps.

Torque:
23 N m 235 kgf cm , 17 ft. lbf

NOTICE:



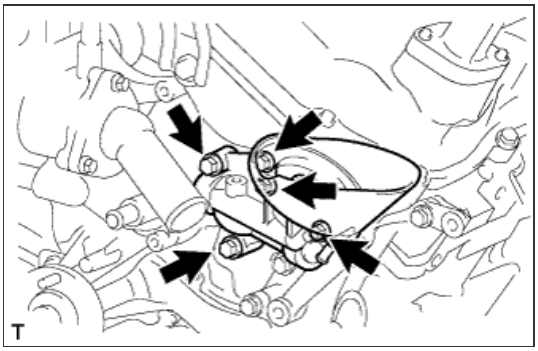
- **Make sure not to wrap the No. 1 chain and slipper over the timing chain cover seal line.**
- **Install the timing chain cover 15 minutes or more after installing the water pump.**

Standard Bolt:

Item	Quantity	Length
Bolt A	9	25 mm (0.984 in.)
Bolt B	15	55 mm (2.17 in.)

NOTICE:

Make sure that there is no oil on the bolt threads.

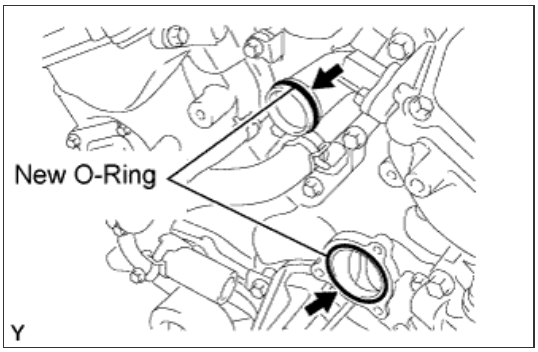


3. INSTALL OIL FILTER BRACKET SUB-ASSEMBLY

a. Set a new O-ring to the timing chain cover.

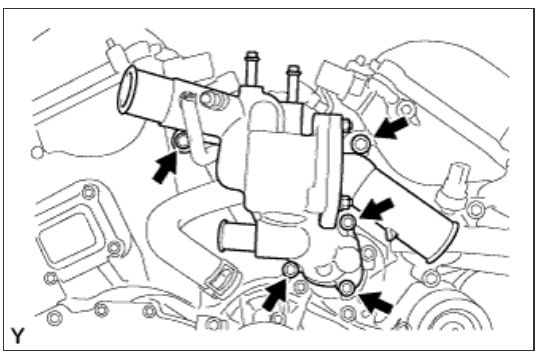
b. Install the oil filter bracket with the 3 bolts and 2 nuts.

Torque:
19 N*m{ 194 kgf*cm , 14 ft.*lbf }



4. INSTALL WATER INLET HOUSING

a. Apply soapy water to a new O-ring, install it to the water outlet pipe.

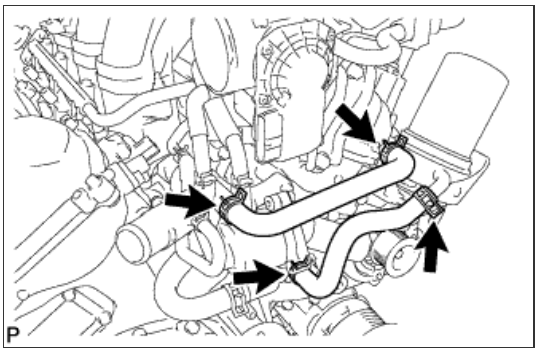


b. Install a new O-ring to the water pump.

c. Install a new gasket to the water pump.

d. Install the water inlet with the 5 bolts.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

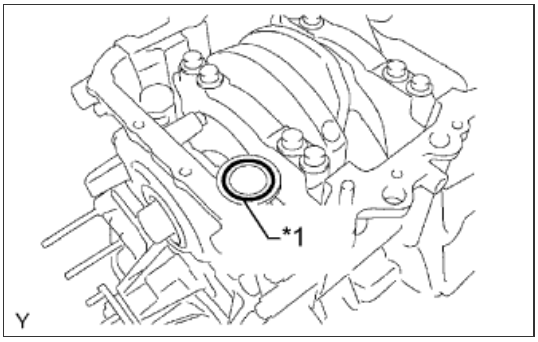


5. INSTALL NO. 2 OIL COOLER HOSE

a. Install the oil cooler hose.

6. INSTALL OIL COOLER HOSE

a. Install the oil cooler hose.



7. INSTALL OIL PAN SUB-ASSEMBLY

a. Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surfaces of the cylinder block, rear oil seal retainer and oil pan.

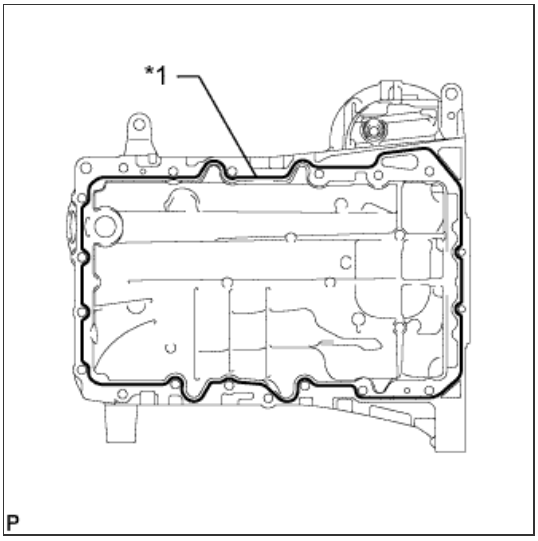
b. Install a new O-ring to the timing chain cover.

Text in Illustration

*1	New O-Ring

c. Apply seal packing in a continuous line as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

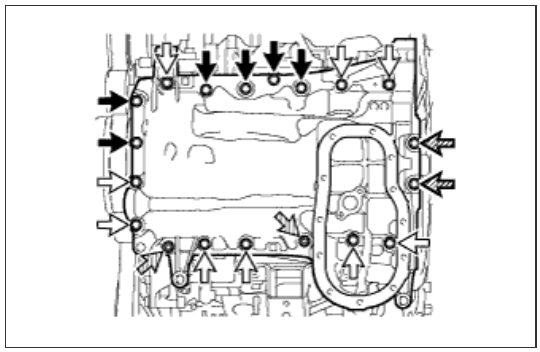


Standard seal diameter:
3 to 4 mm (0.118 to 0.157 in.)

Text in Illustration

*1	Seal Packing

NOTICE:



- **Remove any oil from the contact surface.**
- **Install the oil pan within 3 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after installing.**

d. Install the oil pan with the 17 bolts (A, B and) and 2 nuts. Tighten the bolts and nuts uniformly in several steps.

Torque:

for bolt A, B and nut:
21 N m 214 kgf cm , 15 ft. lbf
for bolt C:
10 N m 102 kgf cm , 7 ft. lbf

Text in Illustration

	Bolt A
	Bolt B
	Bolt
	Nut

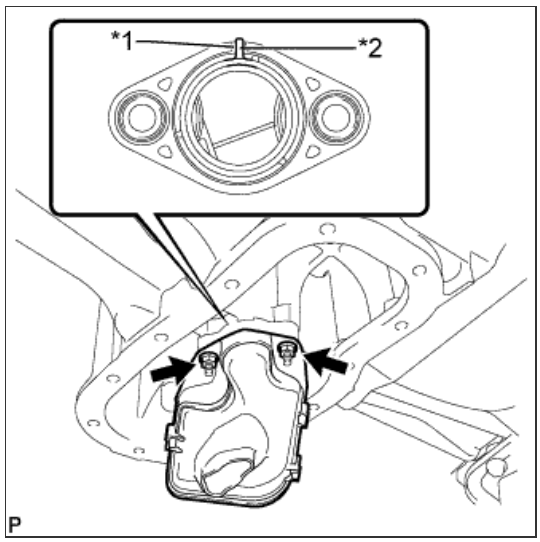
Standard Bolt:

Item	Quantity	Length
A	6	25 mm (0.984 in.)
B	9	45 mm (1.77 in.)
	2	14 mm (0.551 in.)

8. INSTALL OIL STRAINER SUB-ASSEMBLY

a. Install a new gasket to the oil strainer.

Text in Illustration



*1	Groove
*2	Protrusion

HINT:

Align the protrusion of the gasket with the groove of the oil strainer.

b. Install the oil strainer with the 2 nuts.

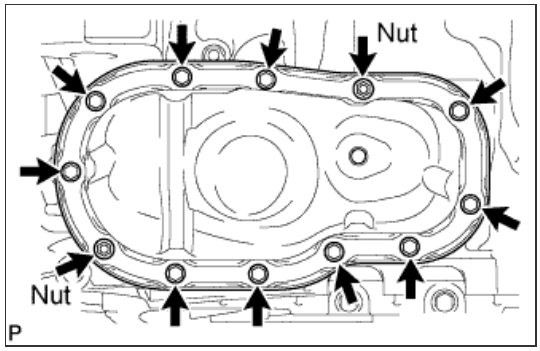
Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

9. INSTALL NO. 2 OIL PAN SUB-ASSEMBLY

a. Apply seal packing in a continuous line as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard seal diameter:
3 to 4 mm (0.118 to 0.157 in.)

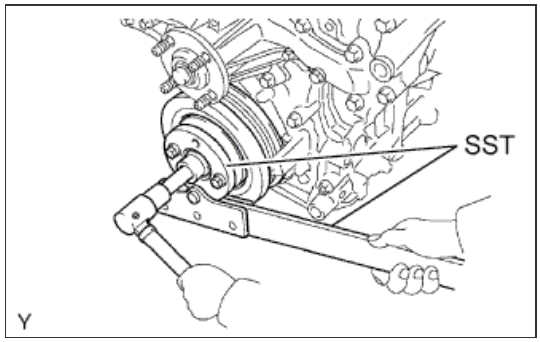


NOTICE:

- Remove any oil from the contact surface.
- Install the No. 2 oil pan within 3 minutes after applying seal packing.
- Do not start the engine for at least 2 hours after the installation.

b. Install the No. 2 oil pan with the 10 bolts and 2 nuts. Tighten the bolts and nuts uniformly in several steps.

Torque:
for bolt:
9.0 N*m{ 92 kgf*cm , 81 in.*lbf }
for nut:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

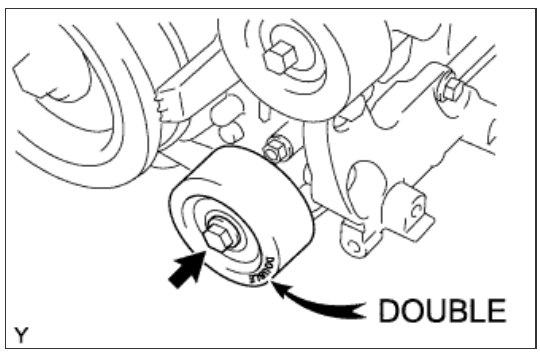


10. INSTALL CRANKSHAFT PULLEY

a. Using SST, install the crankshaft pulley with the pulley set bolt.

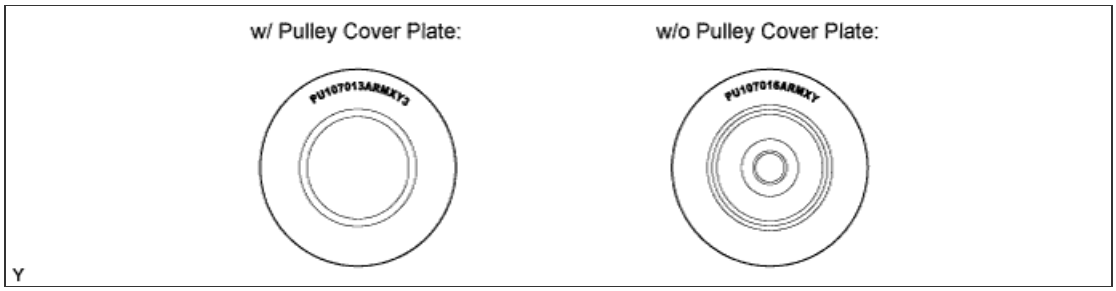
SST
09213-54015 (91651-60855)
09330-00021

Torque:
250 N*m{ 2549 kgf*cm , 184 ft.*lbf }



11. INSTALL NO. 1 IDLER PULLEY SUB-ASSEMBLY

a. Install the No. 1 idler pulley with the bolt.

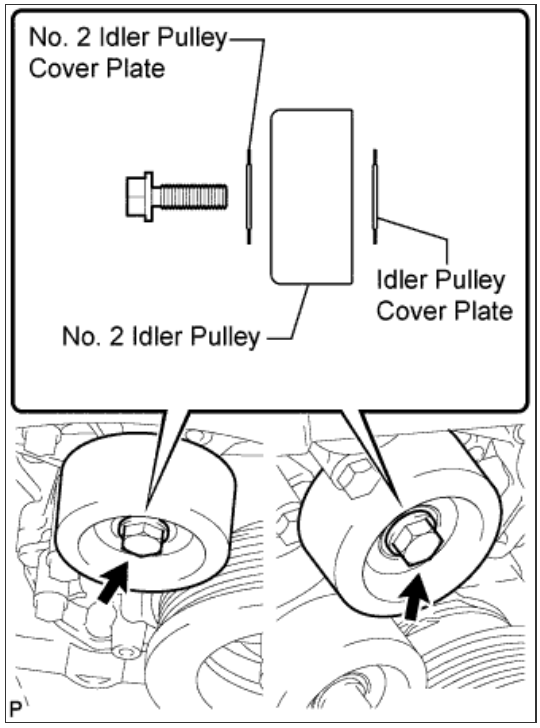


Torque:
54 N*m{ 551 kgf*cm , 40 ft.*lbf }

HINT:

"DOUBL " is marked on the No. 1 idler pulley to distinguish it from the No. 2 idler pulley.

12. INSTALL NO. 2 IDLER PULLEY SUB-ASSEMBLY



a. w/ Pulley over Plate:

i. Install the idler pulley cover plate, idler pulley and No. 2 idler pulley cover plate with the bolt.

Torque:
54 N m 551 kgf cm , 40 ft. lbf

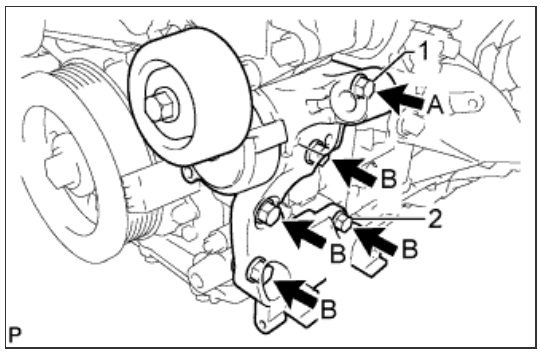
NOTICE:

If it is necessary to replace the pulley or either plate, replace the No. 2 idler pulley cover plate, No. 2 idler pulley and idler pulley cover plate as a set with new parts.

b. w/o Pulley over Plate:
Install the 2 No. 2 idler pulleys with the 2 bolts.

Torque:
54 N m 551 kgf cm , 40 ft. lbf

13. INSTALL V-RIBBED BELT TENSIONER ASSEMBLY



a. Temporarily install the V-ribbed belt tensioner with the 5 bolts.

b. Tighten bolt 1 and 2 in numerical order.

Torque:
36 N*m{ 367 kgf*cm , 27 ft.*lbf }

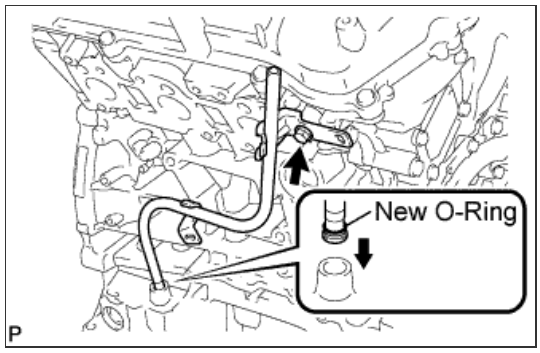
c. Tighten the other bolts.

Torque:
36 N*m{ 367 kgf*cm , 27 ft.*lbf }

Standard Bolt:

Item	Length
A	70 mm (2.76 in.)
B	33 mm (1.30 in.)

14. INSTALL ENGINE OIL LEVEL DIPSTICK GUIDE



a. Install a new O-ring to the dipstick guide.

b. Apply a light coat of engine oil to the O-ring.

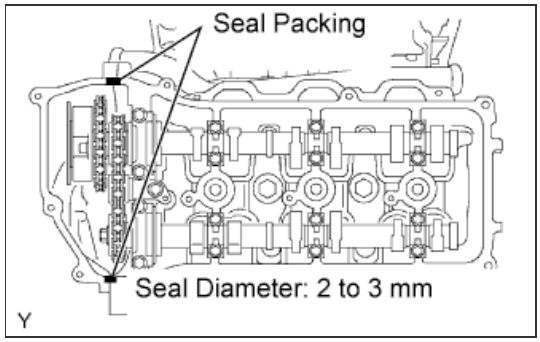
c. Push the dipstick guide end into the guide hole.

d. Install the dipstick guide with the bolt.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

15. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY LH

a. Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surfaces of the cylinder head, timing chain cover and cylinder head cover.



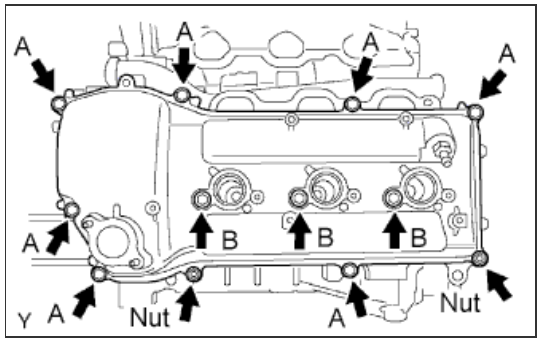
b. Apply seal packing as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard seal diameter:
2 to 3 mm (0.0787 to 0.118 in.)

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the head cover within 3 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after the installation.**



c. Install a new gasket to the cylinder head cover.

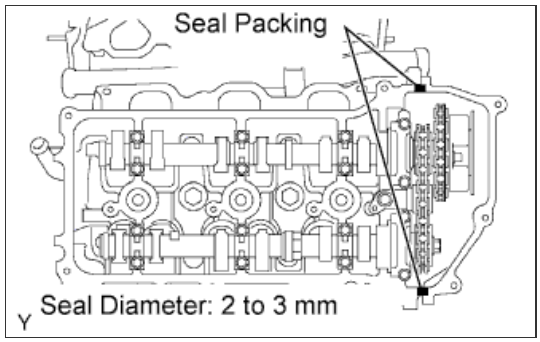
d. Install the seal washers to the bolts.

e. Temporarily install the cylinder head cover with the 10 bolts and 2 nuts. Tighten the bolts and nuts uniformly in several steps.

Torque:
for bolt A:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }
for bolt B and nut:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

16. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY

a. Remove any old packing (FIPG) material and be careful not to drop any oil on the contact surfaces of the cylinder head, timing chain cover and cylinder head cover.



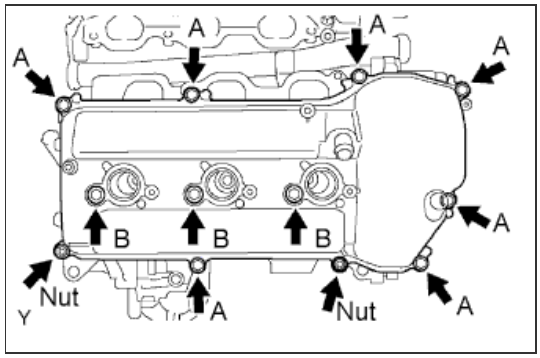
b. Apply seal packing as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard seal diameter:
2 to 3 mm (0.0787 to 0.118 in.)

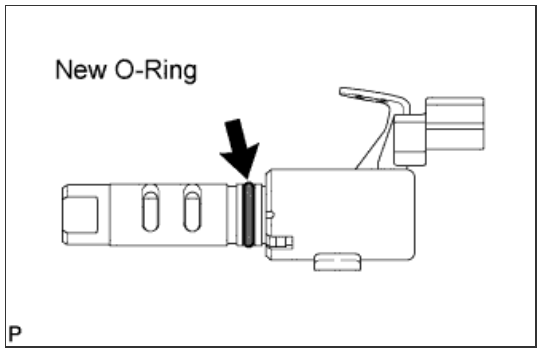
NOTICE:

- **Remove any oil from the contact surface.**
- **Install the head cover within 3 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after the installation.**



c. Install a new gasket to the cylinder head cover.

d. Install the seal washers to the bolts.

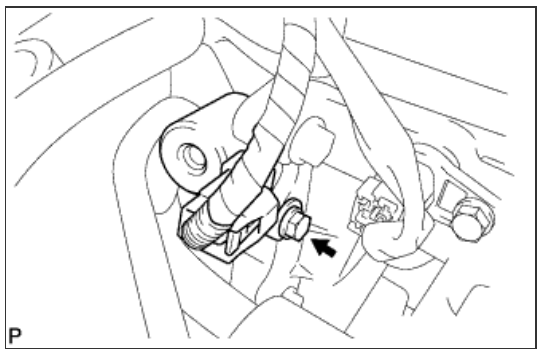


e. Temporarily install the cylinder head cover with the 10 bolts and 2 nuts. Tighten the bolts and nuts uniformly in several steps.

Torque:
for bolt A:
10 N m 102 kgf cm , 7 ft. lbf
for bolt B and nut:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

17. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY LH

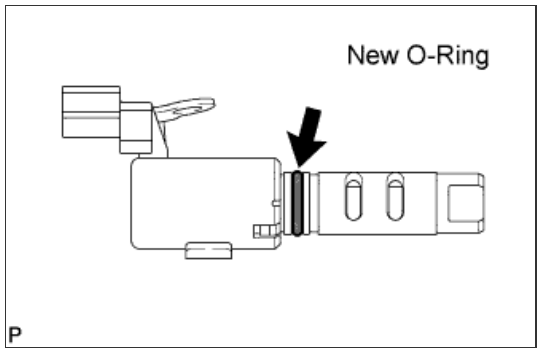
a. Apply a light coat of engine oil to a new O-ring and install it to the oil control valve.



b. Install the oil control valve with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

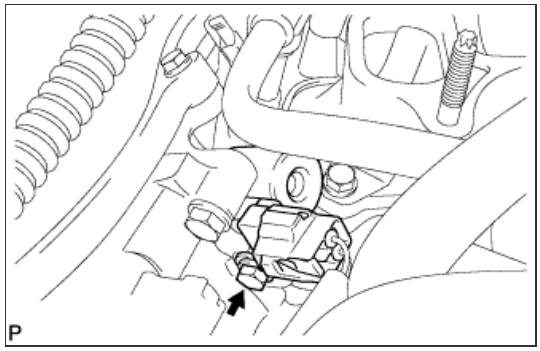


- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head).**
- **Be careful that the O-ring is not cracked when installing the oil control valve.**

c. onnect the oil control valve connector.

18. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY RH

a. Apply a light coat of engine oil to a new O-ring and install it to the oil control valve.



b. Install the oil control valve with the bolt.

Torque:
10 N m 102 kgf cm , 7 ft. lbf

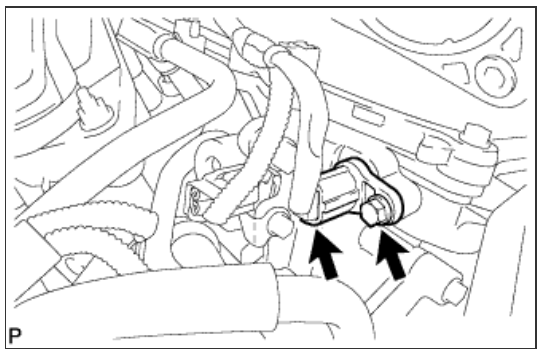
NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head).**
- **Be careful that the O-ring is not cracked when installing the oil control valve.**

c. onnect the camshaft timing oil control valve connector.

19. INSTALL VVT SENSOR (for Bank 2)

a. Apply a light coat of engine oil to the O-ring of the VVT sensor.



NOTICE:

- **When reusing the sensor, inspect the O-ring.**
- **If the O-ring has scratches or cuts, replace the sensor.**

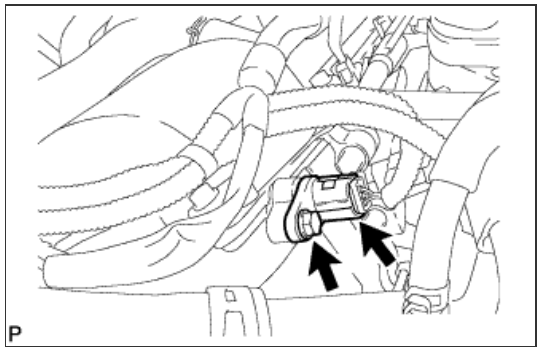
b. Install the VVT sensor with the bolt.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

c. onnect the sensor connector.

20. INSTALL VVT SENSOR (for Bank 1)

a. Apply a light coat of engine oil to the O-ring of the sensor.



NOTICE:

- **When reusing the sensor, inspect the O-ring.**
- **If the O-ring has scratches or cuts, replace the sensor.**

b. Install the sensor with the bolt.

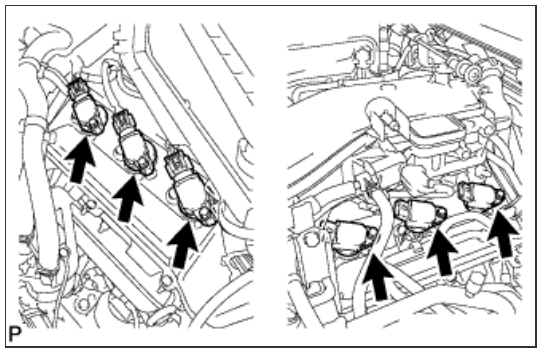
Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

c. onnect the sensor connector.

21. INSTALL SPARK PLUG

a. Install the 6 spark plugs.

Torque:

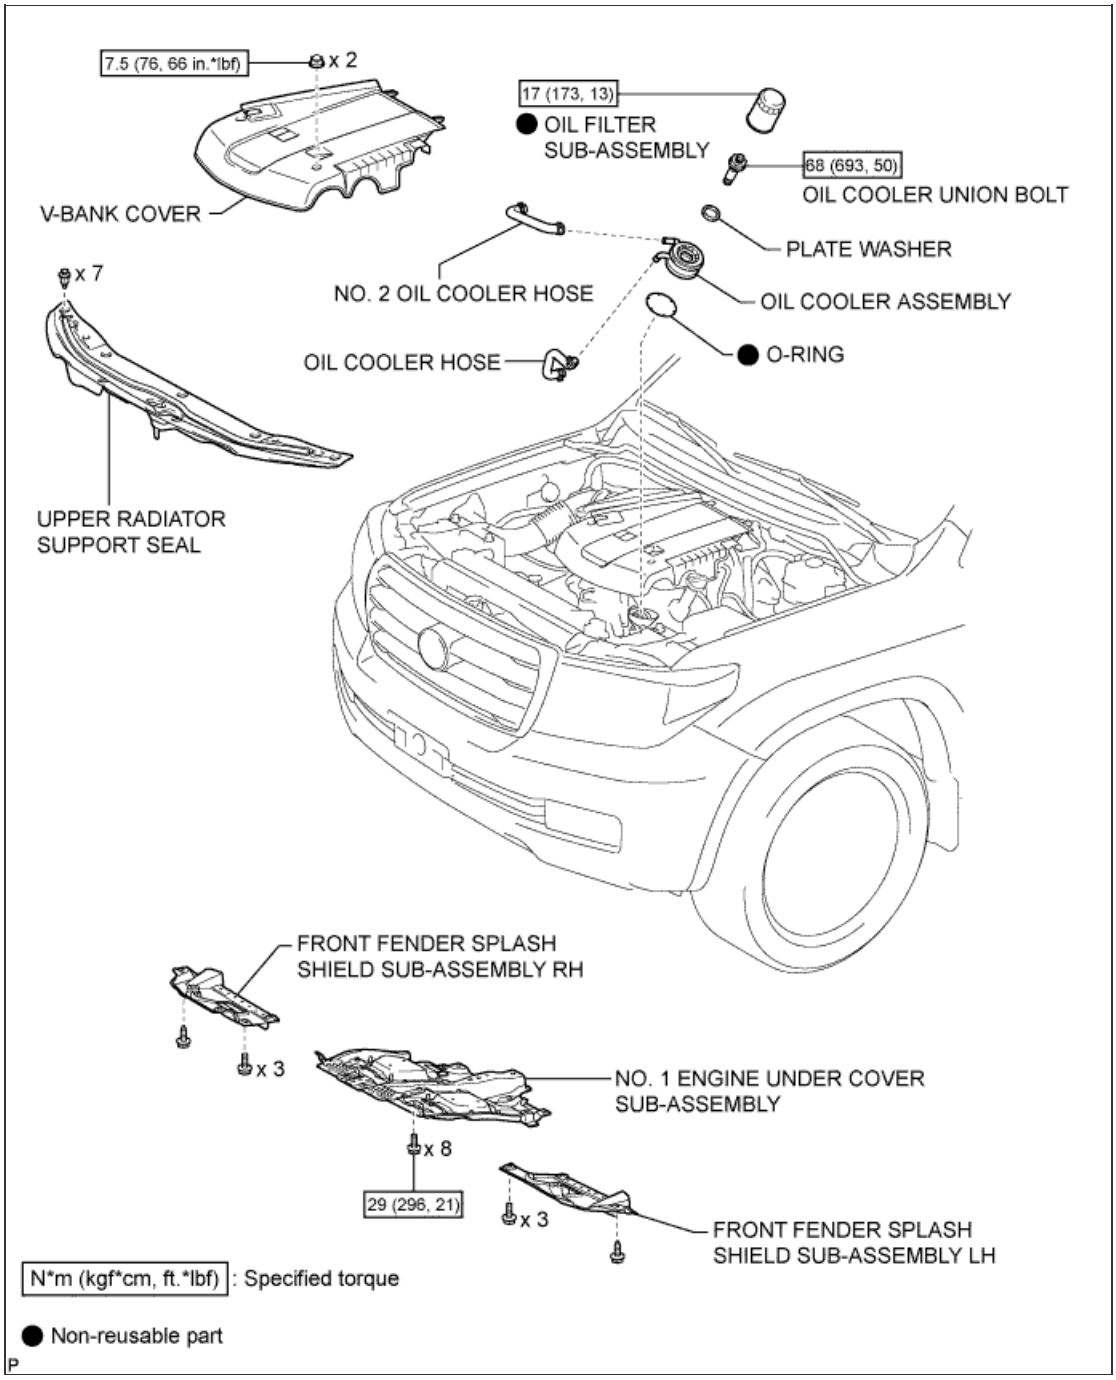


20 N m 204 kgf cm , 15 ft. lbf

22. INSTALL IGNITION COIL ASSEMBLY

a. Install the 6 ignition coils with the 6 bolts.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

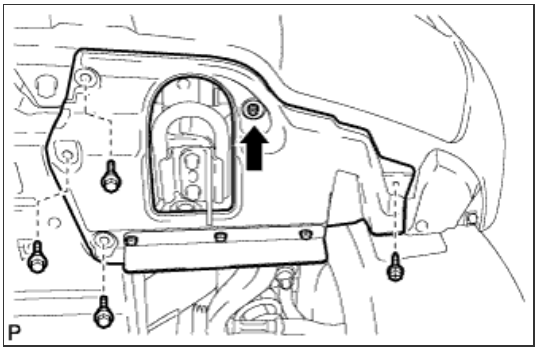


b. onnect the 6 ignition coil connectors.

23. INSTALL ENGINE ASSEMBLY

(lick here)

for Preparation Click here

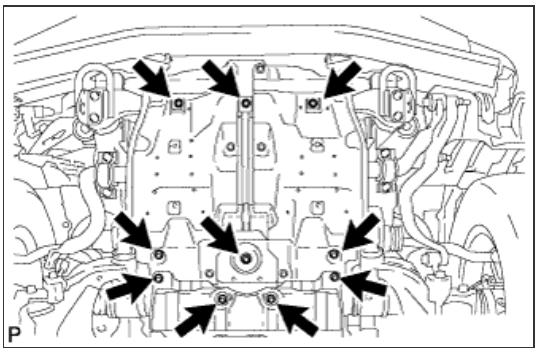


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

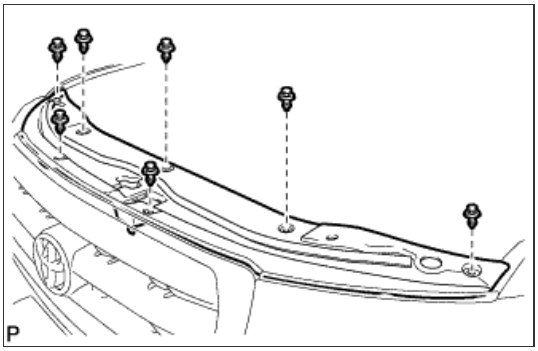
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. REMOVE UPPER RADIATOR SUPPORT SEAL

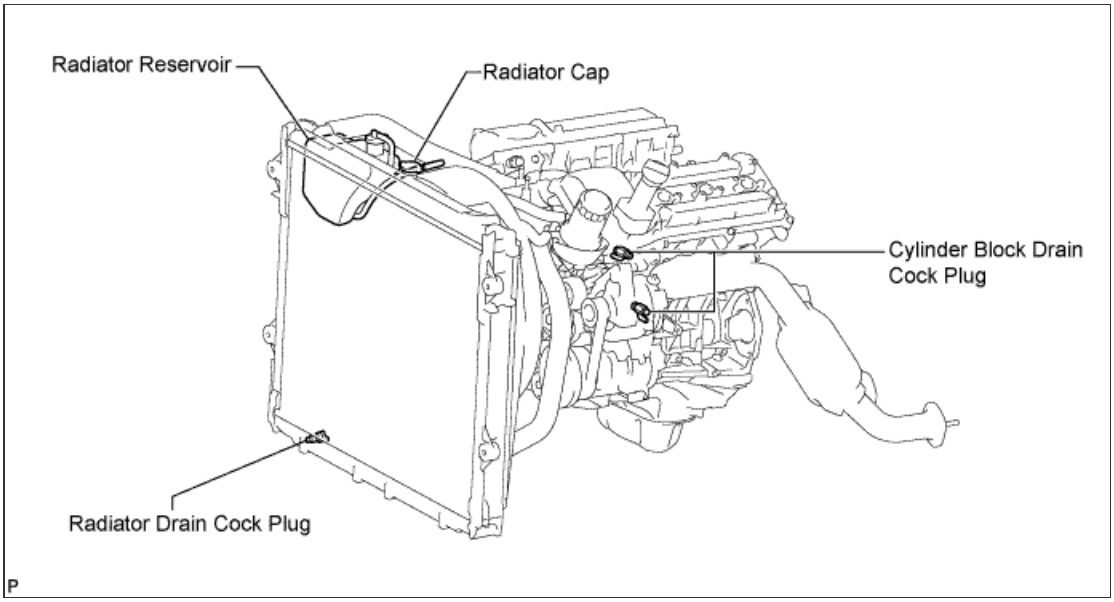
a. Remove the 7 clips and radiator support seal.

5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.

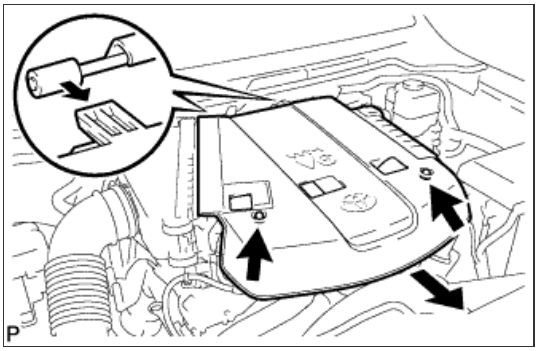


b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.



Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

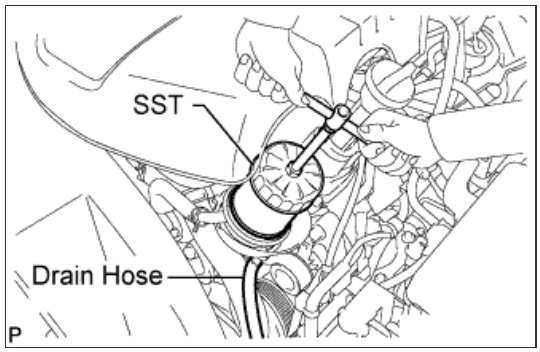
d. Tighten the radiator drain cock plug by hand.

6. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.

7. REMOVE OIL FILTER SUB-ASSEMBLY

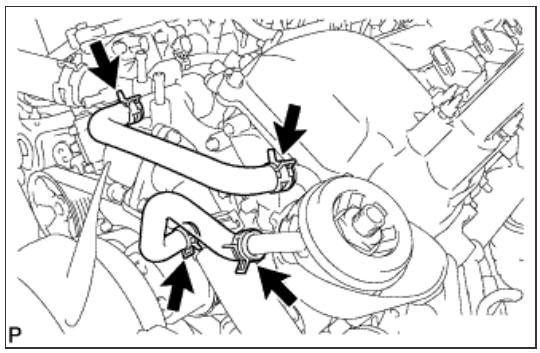
a. Remove the drain pipe cap.



b. Using SST, remove the oil filter.

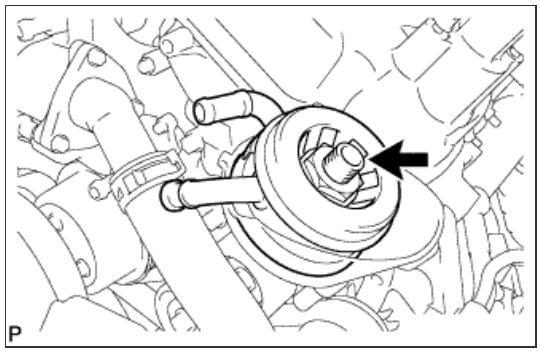
b. Using SST, remove the oil filter.

SST
09228-07501



HINT:

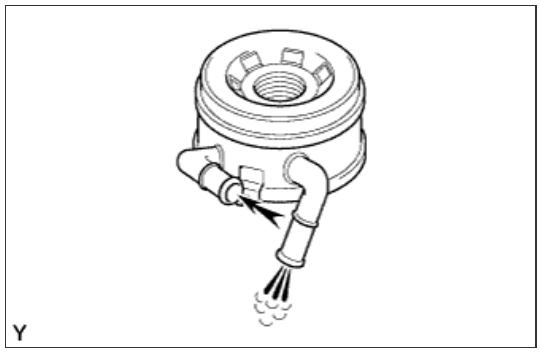
- **Put the disposal container beneath the drain hose to collect the oil from the oil filter cover.**
- **Drain hose inside diameter: 8 mm .315 in.**
- **Drain hose length: 900 mm 2.95 ft.**



8. REMOVE OIL COOLER ASSEMBLY

a. Remove the oil cooler hose and No. 2 oil cooler hose.

b. Remove the union bolt, plate washer and oil cooler.



c. Remove the O-ring from the oil cooler.

for Preparation Click here

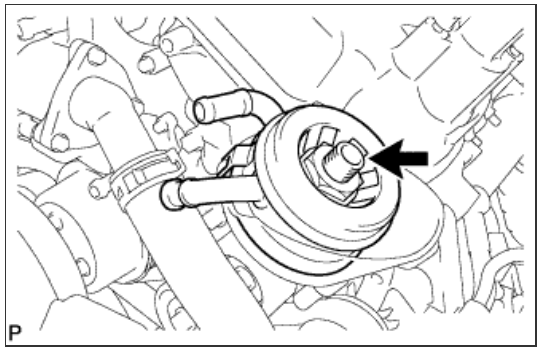
1. INSPECT OIL COOLER ASSEMBLY

a. Check the oil cooler for damage and clogging.
If necessary, replace the oil cooler.

for Preparation Click here

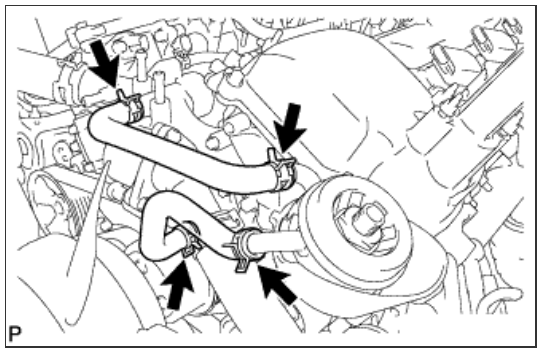
1. INSTALL OIL COOLER ASSEMBLY

a. Clean the oil cooler contact surface on the cooler mounting.



b. Apply a light coat of engine oil to a new O-ring, and install it into the oil cooler.

c. Apply a light coat of engine oil to the threads of the oil cooler union bolt.



d. Align the protrusion of the oil filter bracket with the cutout of the oil cooler.

e. Install the oil cooler with the plate washer and oil cooler union bolt.

Torque:
68 N*m{ 693 kgf*cm , 50 ft.*lbf }

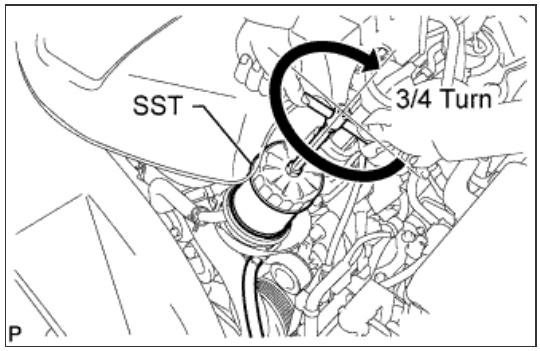
f. Install the oil cooler hose and No. 2 oil cooler hose.

2. INSTALL OIL FILTER SUB-ASSEMBLY

a. Check and clean the oil filter installation surface.

b. Apply clean engine oil to the gasket of a new oil filter.

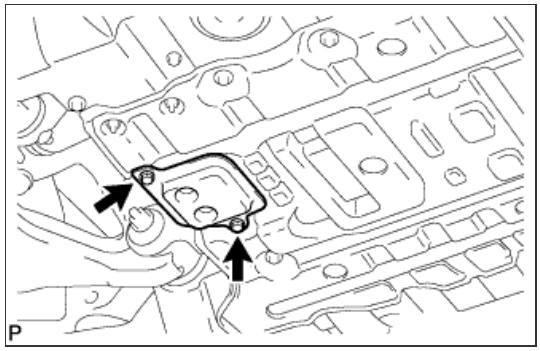
c. Lightly screw the oil filter into place by hand. Tighten it until the gasket contacts the seat.



d. Using SST, tighten the oil filter. Depending on the work space available, choose from the following.

SST
09228-07501

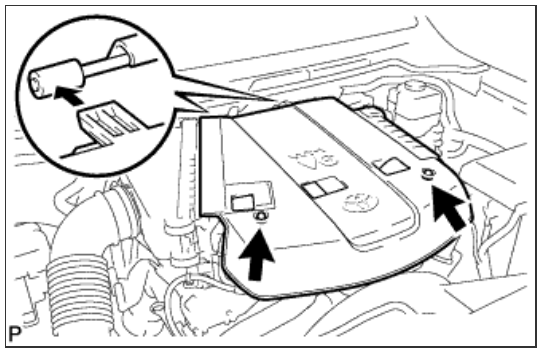
i. If enough space is available, use a torque wrench to tighten the oil filter.



Torque:
17 N*m{ 173 kgf*cm , 13 ft.*lbf }

ii. If enough space is not available to use a torque wrench, tighten the oil filter a 3/4 turn by hand or with a common wrench.

e. Install the service hole cover to the No. 2 engine under cover with the 2 bolts.



Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

3. INSTALL V-BANK COVER

a. Install the V-bank cover with the 2 cap nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

4. ADD ENGINE OIL

a. Remove the oil filler cap.

b. Add new oil.

Standard Oil Grade:

Oil Grade	Oil Viscosity (SAE)
API grade SL "Energy-Conserving", SM "Energy-Conserving", SN "Resource-Conserving" or ILSAC multigrade engine oil	5W-30 10W-30
API grade SL, SM or SN multigrade engine oil	15W-40 20W-50

Standard Oil Capacity:

Item	Specified Condition
Drain and refill with oil filter change	5.2 liters (5.5 US qts, 4.6 Imp. qts)
Drain and refill without oil filter change	4.9 liters (5.2 US qts, 4.3 Imp. qts)
Dry fill	6.0 liters (6.3 US qts, 5.3 Imp. qts)

c. Install the oil filler cap.

5. INSPECT FOR ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The oil level should be between the low and full level marks on the dipstick. If the oil level is low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill engine oil above the full level mark.

6. ADD ENGINE COOLANT

a. Add engine coolant.

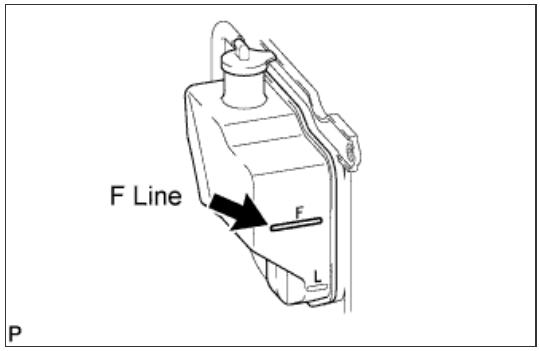
Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12. Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12. US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:



TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

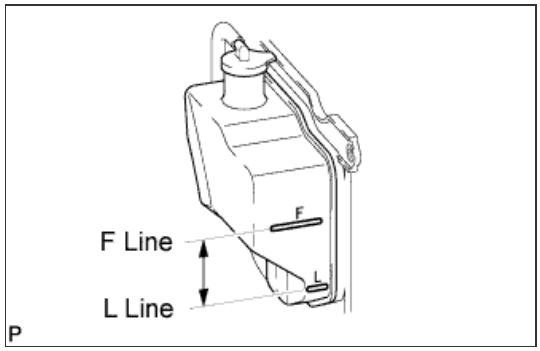
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

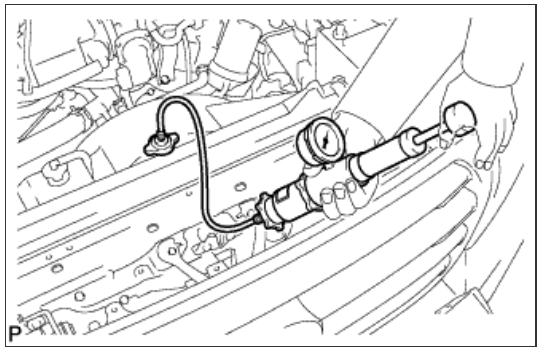
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

7. INSPECT FOR OIL LEAK

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

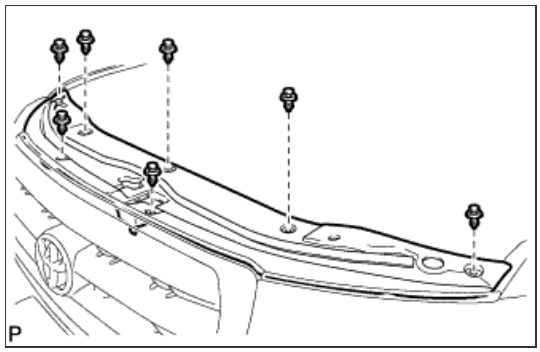
8. INSPECT FOR ENGINE COOLANT LEAK



CAUTION:

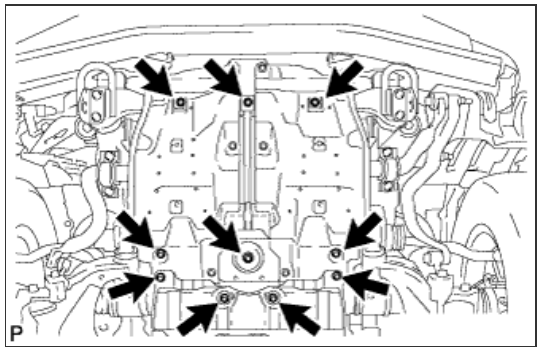
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.



b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.



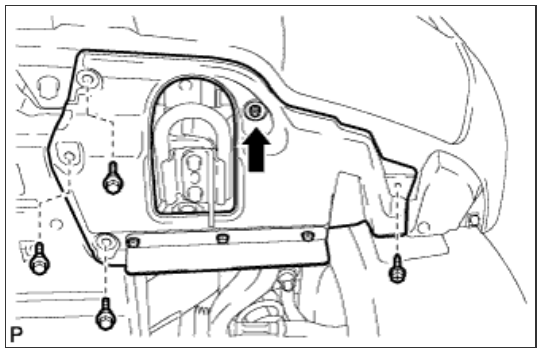
9. INSTALL UPPER RADIATOR SUPPORT SEAL

a. Install the radiator support seal with the clips.

10. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the under cover with the 10 bolts.

11. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

12. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

for Preparation Click here

1. CHECK OIL QUALITY

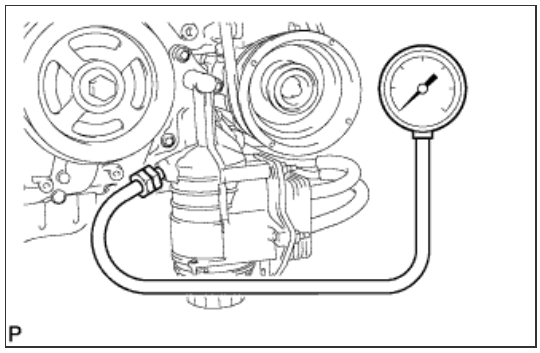
a. Check the oil for deterioration, water contamination, discoloration or thinning.
If the quality is visibly poor, replace the oil and filter (Click here).

2. INSPECT ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill engine oil above the full level mark.



3. INSPECT OIL PRESSURE

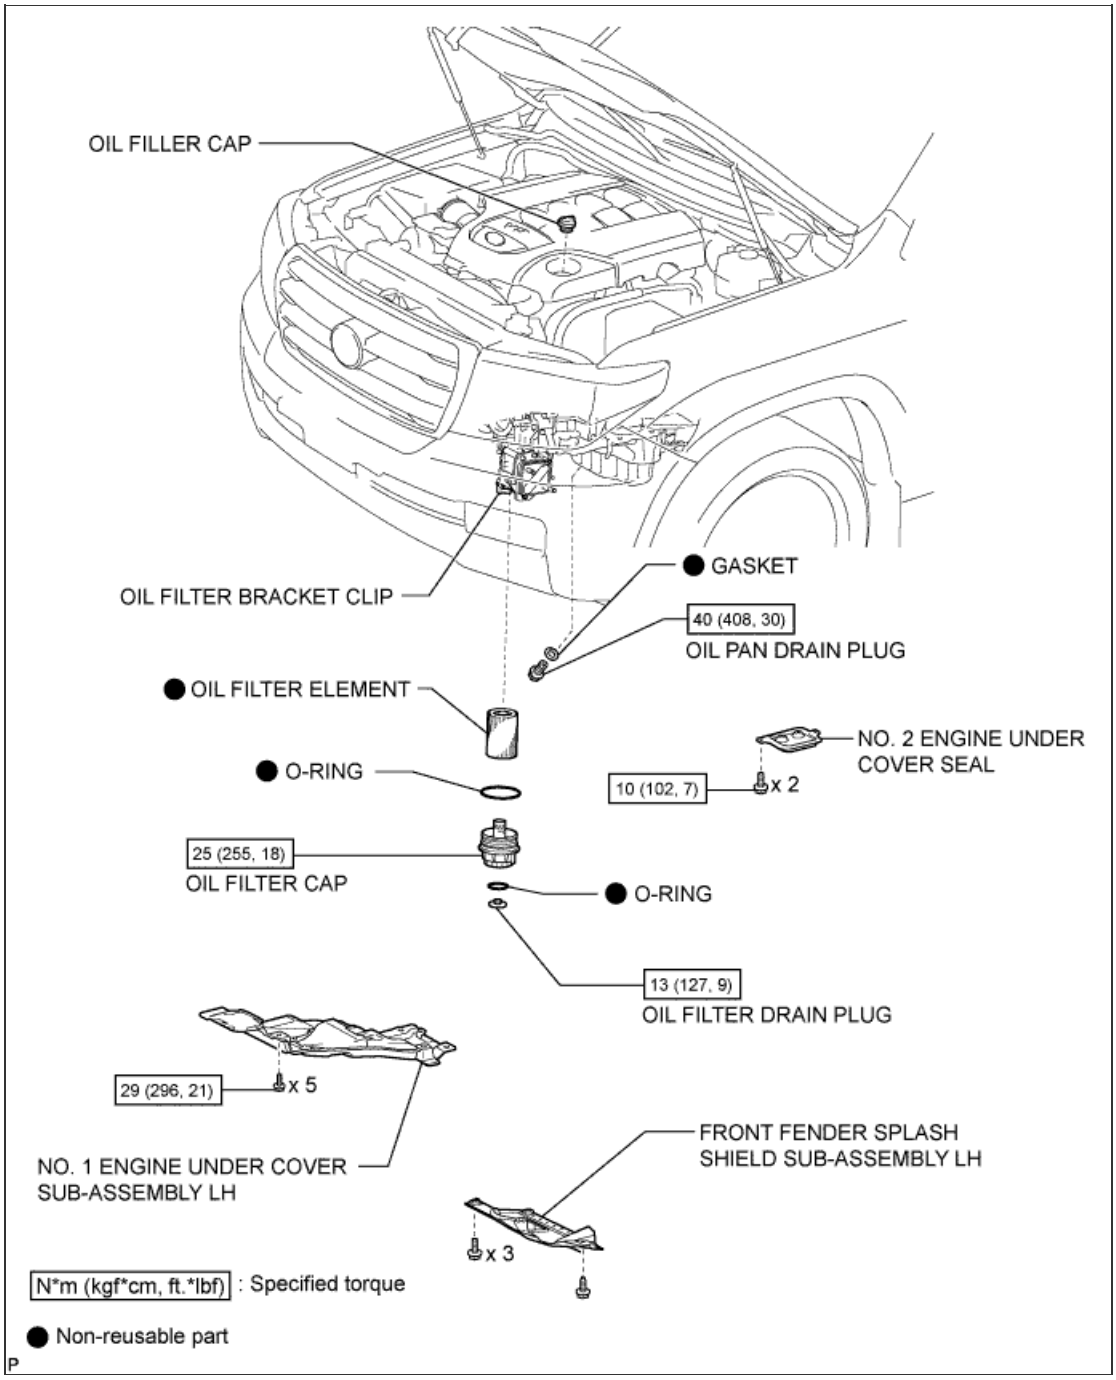
a. Remove the oil pressure sender gauge (Click here).

b. Install an oil pressure gauge with an adapter.

c. Warm up the engine.

d. Measure the engine oil pressure.

Standard Oil Pressure:



Condition	Specified Condition
Idle	70 kPa (0.7 kgf/cm^2, 10.1 psi) or higher
2500 rpm	220 kPa (2.2 kgf/cm^2, 32 psi) or higher

If the pressure is not as specified, check the oil pump (Click here).

e. Remove the oil pressure gauge and adapter.

f. Install the oil pressure sender gauge (Click here).

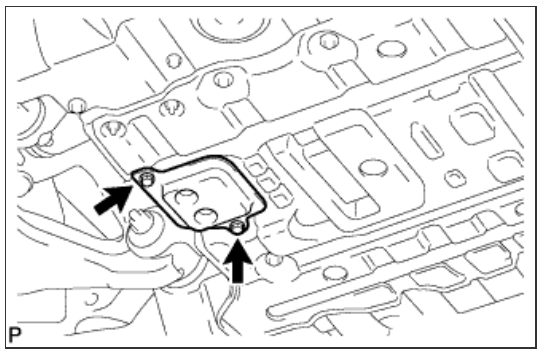
for Preparation Click here

for Preparation Click here

CAUTION:

- **Prolonged and repeated contact with engine oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.**
- **Precautions should be taken when replacing engine oil to minimize the risk of your skin making contact with used engine oil. Protective clothing and gloves that cannot be penetrated by oil should be worn. The skin should be washed with soap and water, or use waterless hand cleaner, to remove any used engine oil thoroughly. Do not use gasoline, thinners, or solvents.**
- **In order to protect the environment, used oil and used oil filters must be disposed of at designated disposal sites.**

1. DRAIN ENGINE OIL

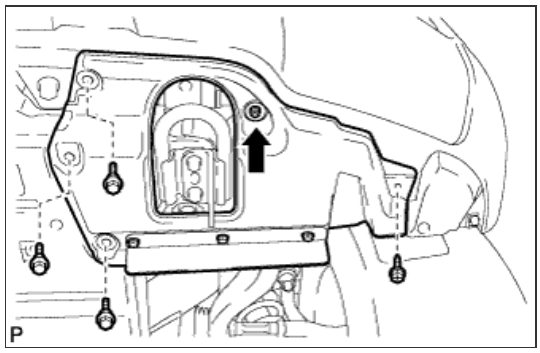


a. Remove the oil filler cap.

b. Remove the 2 bolts and No. 2 engine under cover seal.

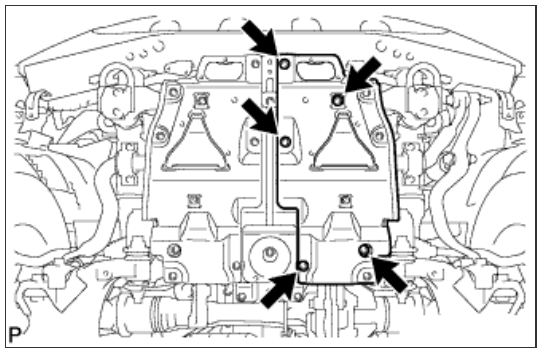
c. Remove the oil pan drain plug and gasket, and drain the engine oil into a container.

d. Install a new gasket and the oil pan drain plug.



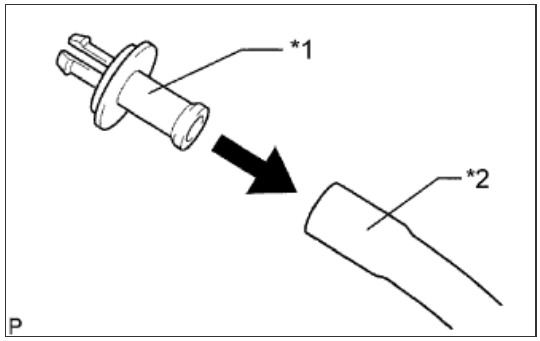
Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



a. Remove the 3 bolts and screw.

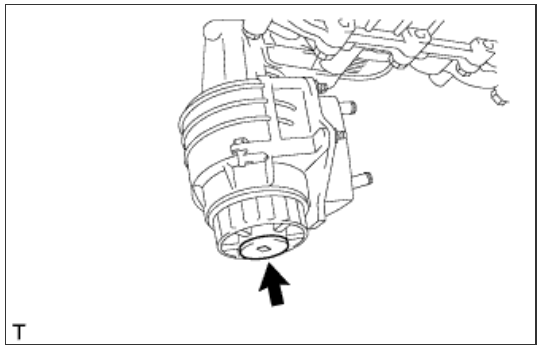
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



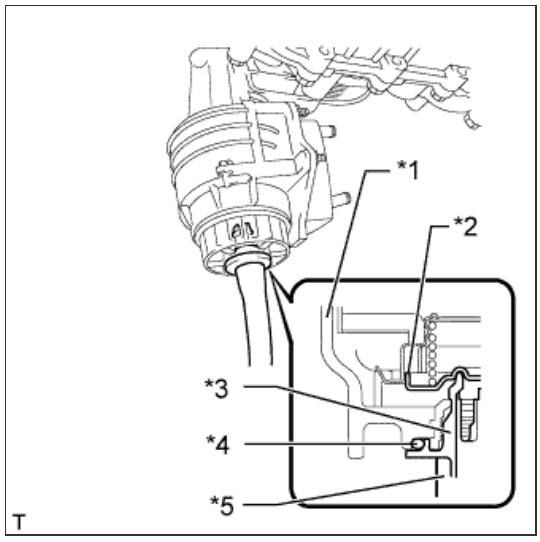
3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY LH

a. Remove the 5 bolts and No. 1 engine under cover sub-assembly LH.

4. REMOVE OIL FILTER ELEMENT



a. Connect a hose with an inside diameter of 15 mm (0.591 in.) to the pipe.



Text in Illustration

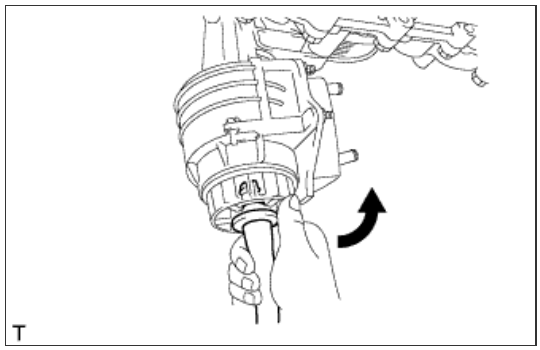
*1	Pipe
*2	Hose

b. Remove the oil filter drain plug.

c. Install the pipe to the oil filter cap.

Text in Illustration

*1	Cap
*2	Valve
*3	Pipe
*4	O-Ring
*5	Hose



NOTICE:

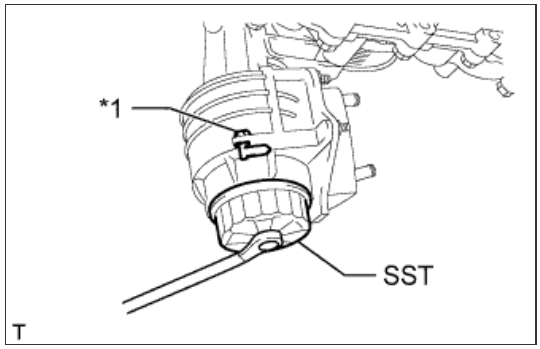
If the O-ring is removed with the drain plug, install the O-ring together with the pipe.

HINT:

Use a container to catch the draining oil.

d. Check that oil is drained from the oil filter. Then disconnect the pipe and remove the O-ring as shown in the illustration.

e. Using SST, remove the oil filter cap.



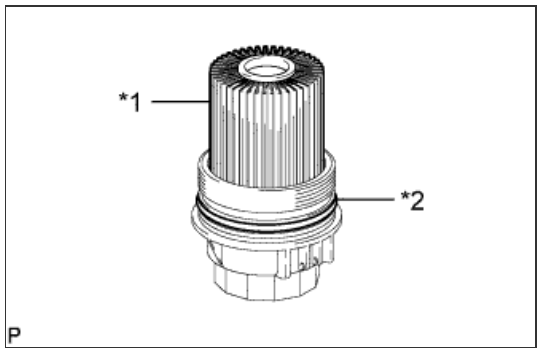
SST
09228-06501

Text in Illustration

*1	Oil Filter Bracket Clip

NOTICE:

Do not remove the oil filter bracket clip.



f. Remove the oil filter element and O-ring from the oil filter cap.

Text in Illustration

*1	Oil Filter Element
*2	O-Ring

NOTICE:

Be sure to remove the cap O-ring by hand, without using any tools, to prevent damage to the cap O-ring groove.

5. INSTALL OIL FILTER ELEMENT

a. Clean the inside of the oil filter cap, its threads and its O-ring groove.

b. Apply a small amount of engine oil to a new O-ring and install it to the oil filter cap.

c. Set a new oil filter element to the oil filter cap.

d. Remove any dirt or foreign matter from the installation surface of the engine.

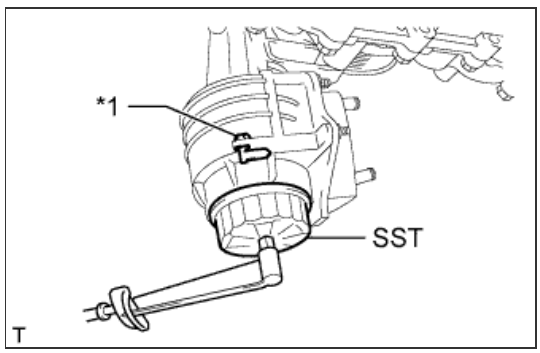
e. Apply a small amount of engine oil to the O-ring again and temporarily install the oil filter cap.

NOTICE:

Do not remove the oil filter bracket clip.

f. Using SST, tighten the oil filter cap.

SST
09228-06501

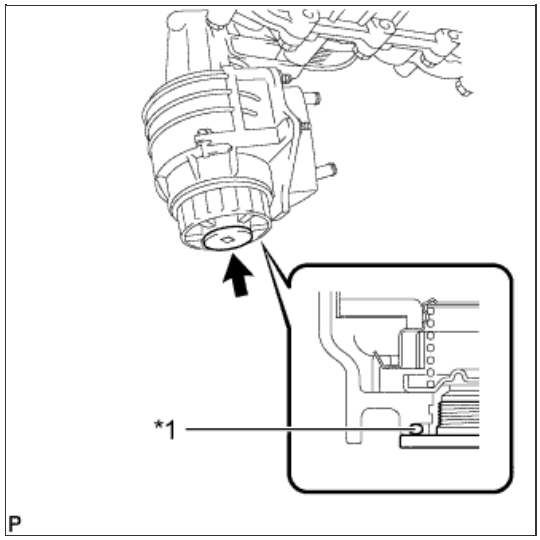


Torque:
2 N*m{ 2 kgf*cm , 18 ft.*lbf }

Text in Illustration

*1	Oil Filter Bracket Clip

NOTICE:



- **When tightening the oil filter cap, do not remove the oil filter**

bracket clip.

- Make sure that the oil filter is installed securely as shown in the illustration.
- Be careful that the O-ring does not get caught between any surrounding parts.

g. Apply a small amount of engine oil to a new drain plug O-ring, and install it to the oil filter cap.

Text in Illustration

*1	O-Ring

NOTICE:

Before installing the O-ring, remove any dirt or foreign matter from the installation surface of the oil filter cap.

h. Install the oil filter drain plug.

Torque:
13 N*m{ 12 kgf*cm , 9 ft.*lbf }

NOTICE:

Be careful that the O-ring does not get caught between any surrounding parts.

i. Install the No. 2 engine under cover seal with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

6. ADD ENGINE OIL

a. Add fresh oil and install the oil filler cap.

Standard Oil Grade:

Oil Grade	Oil Viscosity (SAE)
API grade SL "energy-conserving", API grade SM "energy-conserving" or ILSAC multigrade engine oil	5 -30 10 -30
API grade SL and SM multigrade engine oil	15 -40 20 -50

Standard Oil Capacity:

Item	Specified Condition
Drain and refill without oil filter change	7.1 liters (7.5 US ts, 6.2 Imp. ts)
Drain and refill with oil filter change	7.5 liters (7.9 US ts, 6.6 Imp. ts)
Dry fill	9.3 liters (9.8 US ts, 8.2 Imp. ts)

7. INSPECT FOR OIL LEAK

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

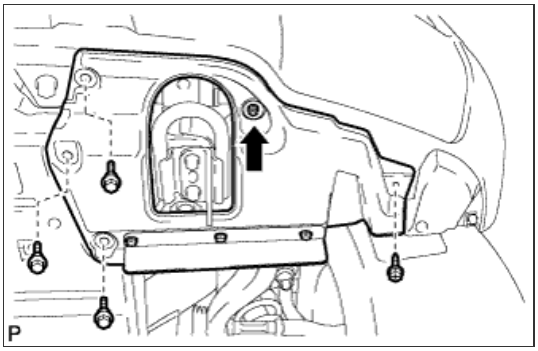
8. INSPECT ENGINE OIL LEVEL

a. arm up the engine, stop the engine and wait 5 minutes. The oil level should be between the dipstick low level mark and full level mark. If low, check for leakage and add oil up to the full level mark.

NOTICE:

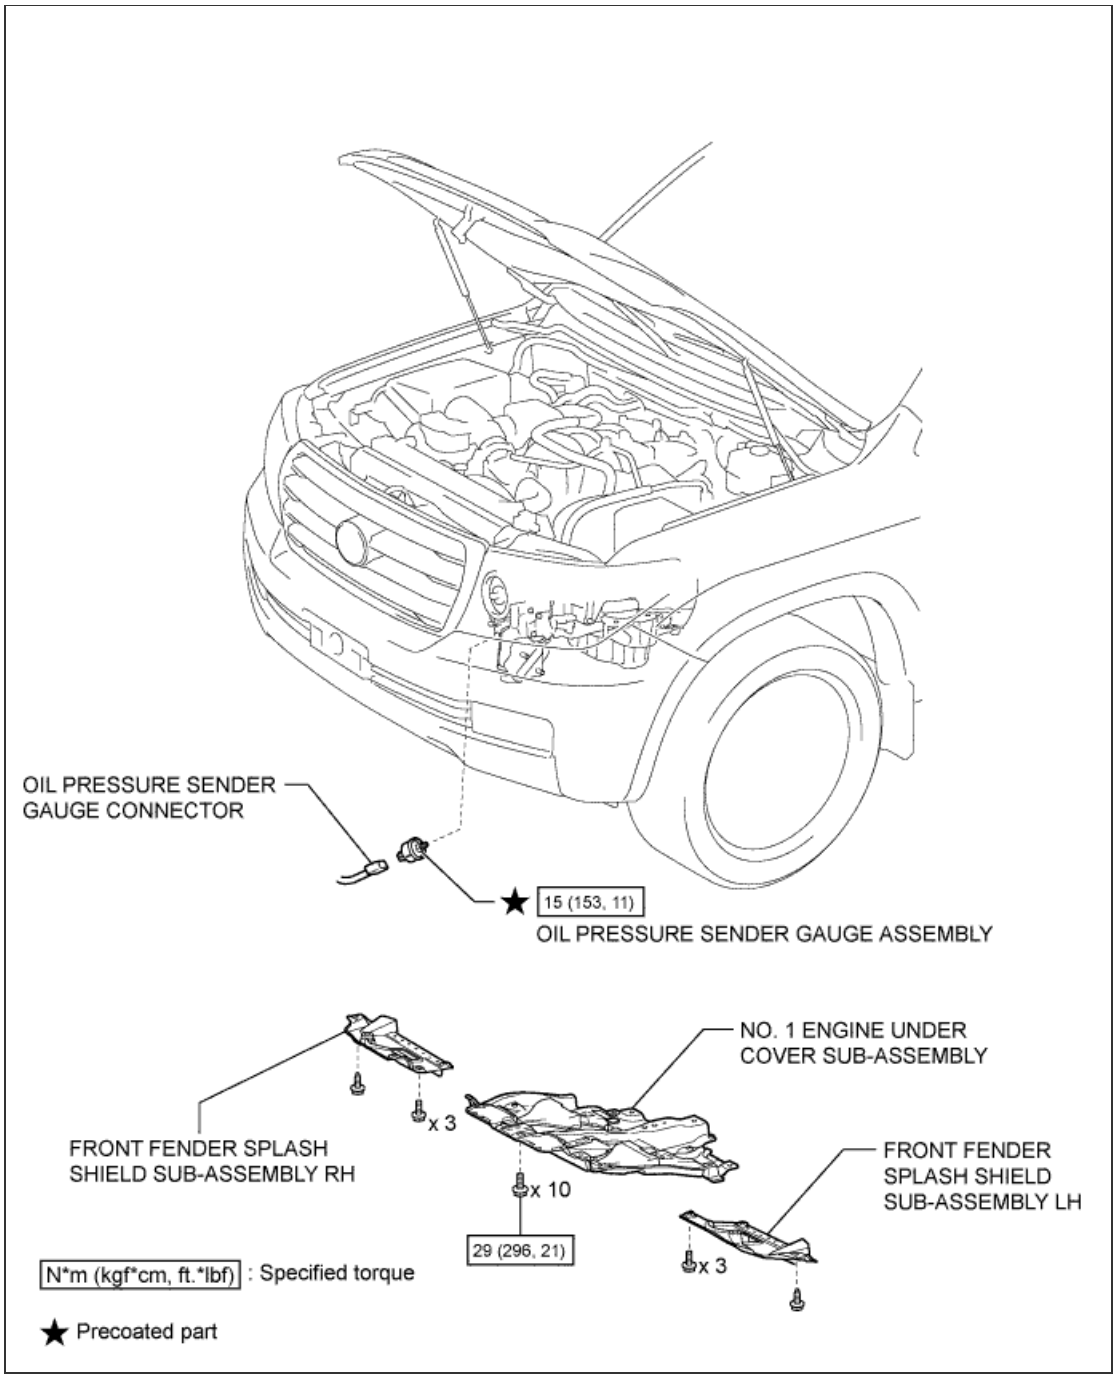
Do not fill engine oil above the full level mark.

9. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY LH



a. Install the No. 1 engine under cover with the 5 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

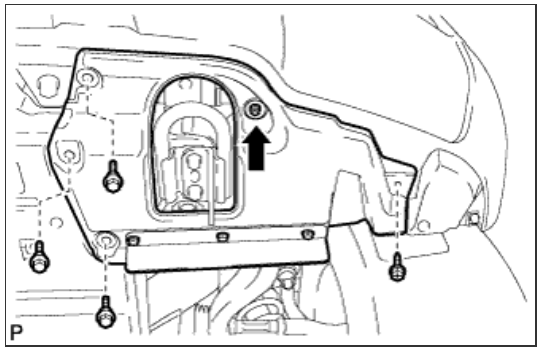


10. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

for Preparation Click here

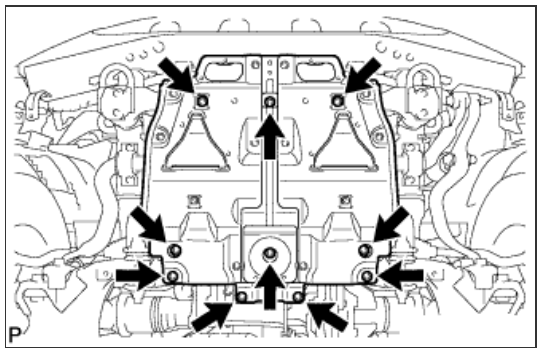


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

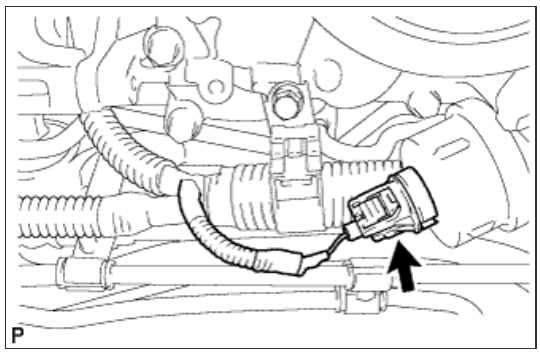
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

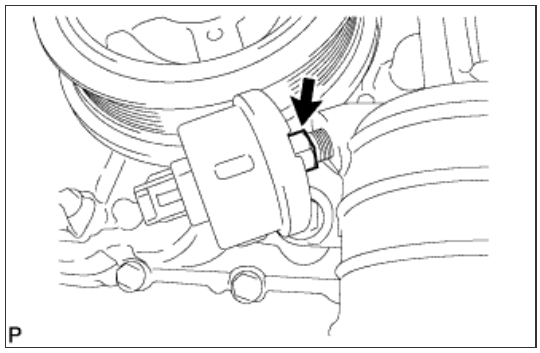
HINT:

Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.



4. REMOVE OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Disconnect the sender gauge connector.

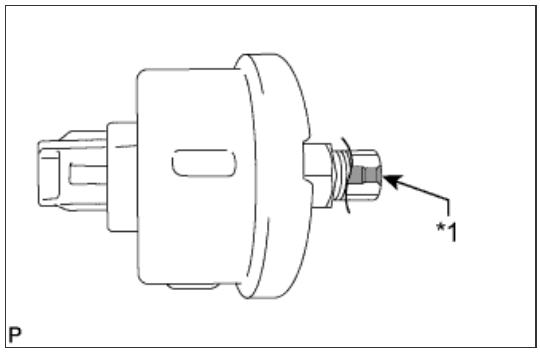
b. Remove the oil pressure sender gauge.

P

for Preparation Click here

1. INSTALL OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Apply adhesive to 2 or 3 threads of the oil pressure sender gauge.



Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not allow adhesive to contact the oil hole.

Text in Illustration

*1	Oil Hole

b. Install the oil pressure sender gauge.

Torque:
15 N*m{ 153 kgf*cm , 11 ft.*lbf }

NOTICE:

Do not start the engine within 1 hour after installation.

c. Connect the sender gauge connector.

2. INSPECT ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The oil level should be between the dipstick low level mark and full level mark. If low, check for leakage and add oil up to the full level mark.

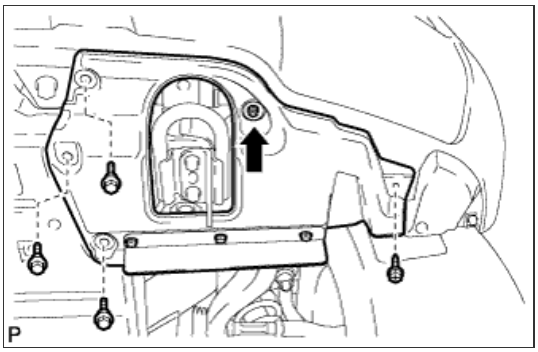
NOTICE:

Do not fill engine oil above the full level mark.

3. INSPECT FOR OIL LEA

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

4. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



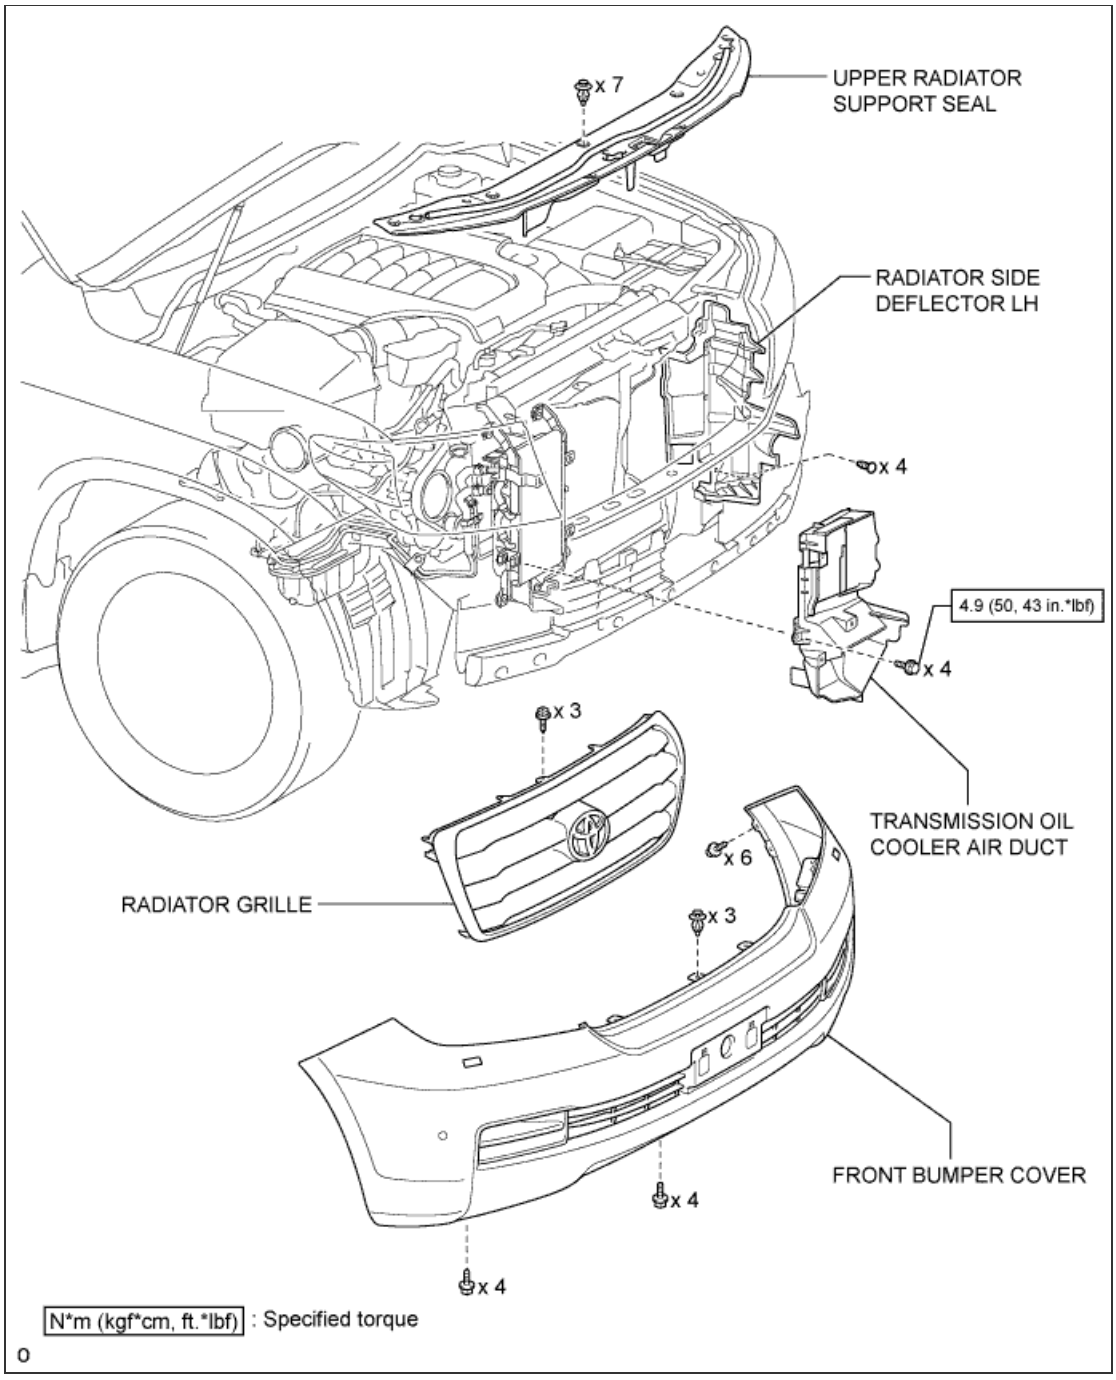
a. Install the No. 1 engine under cover with the 10 bolts.

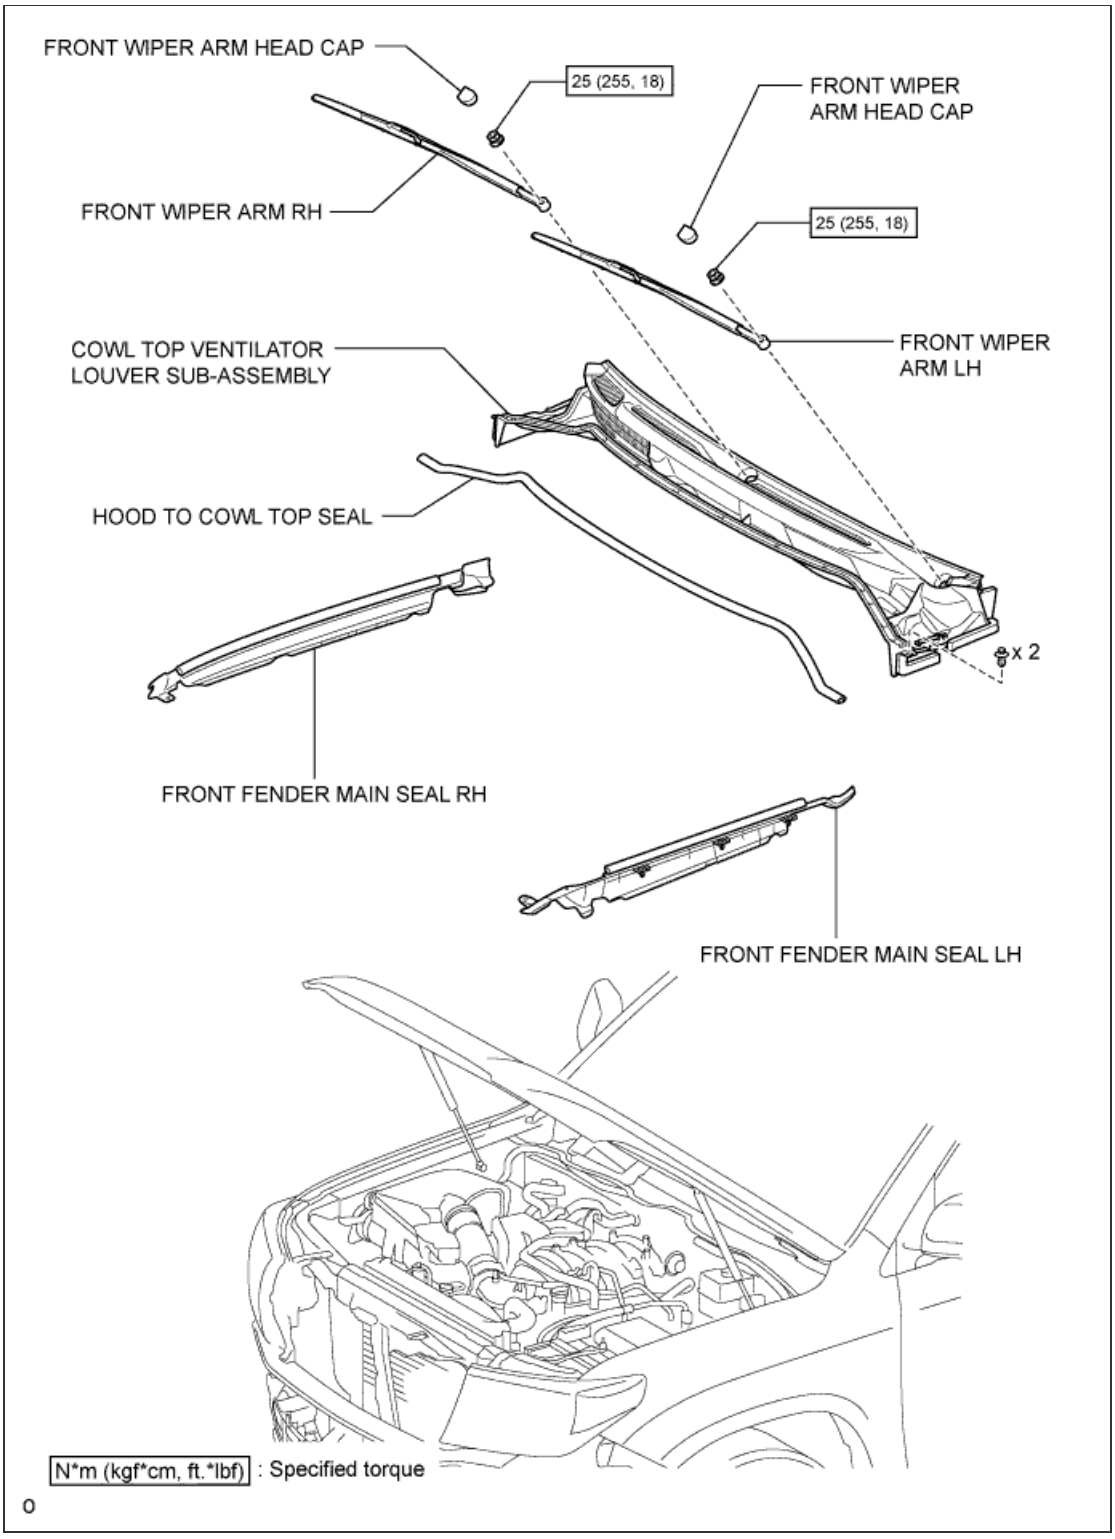
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

5. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

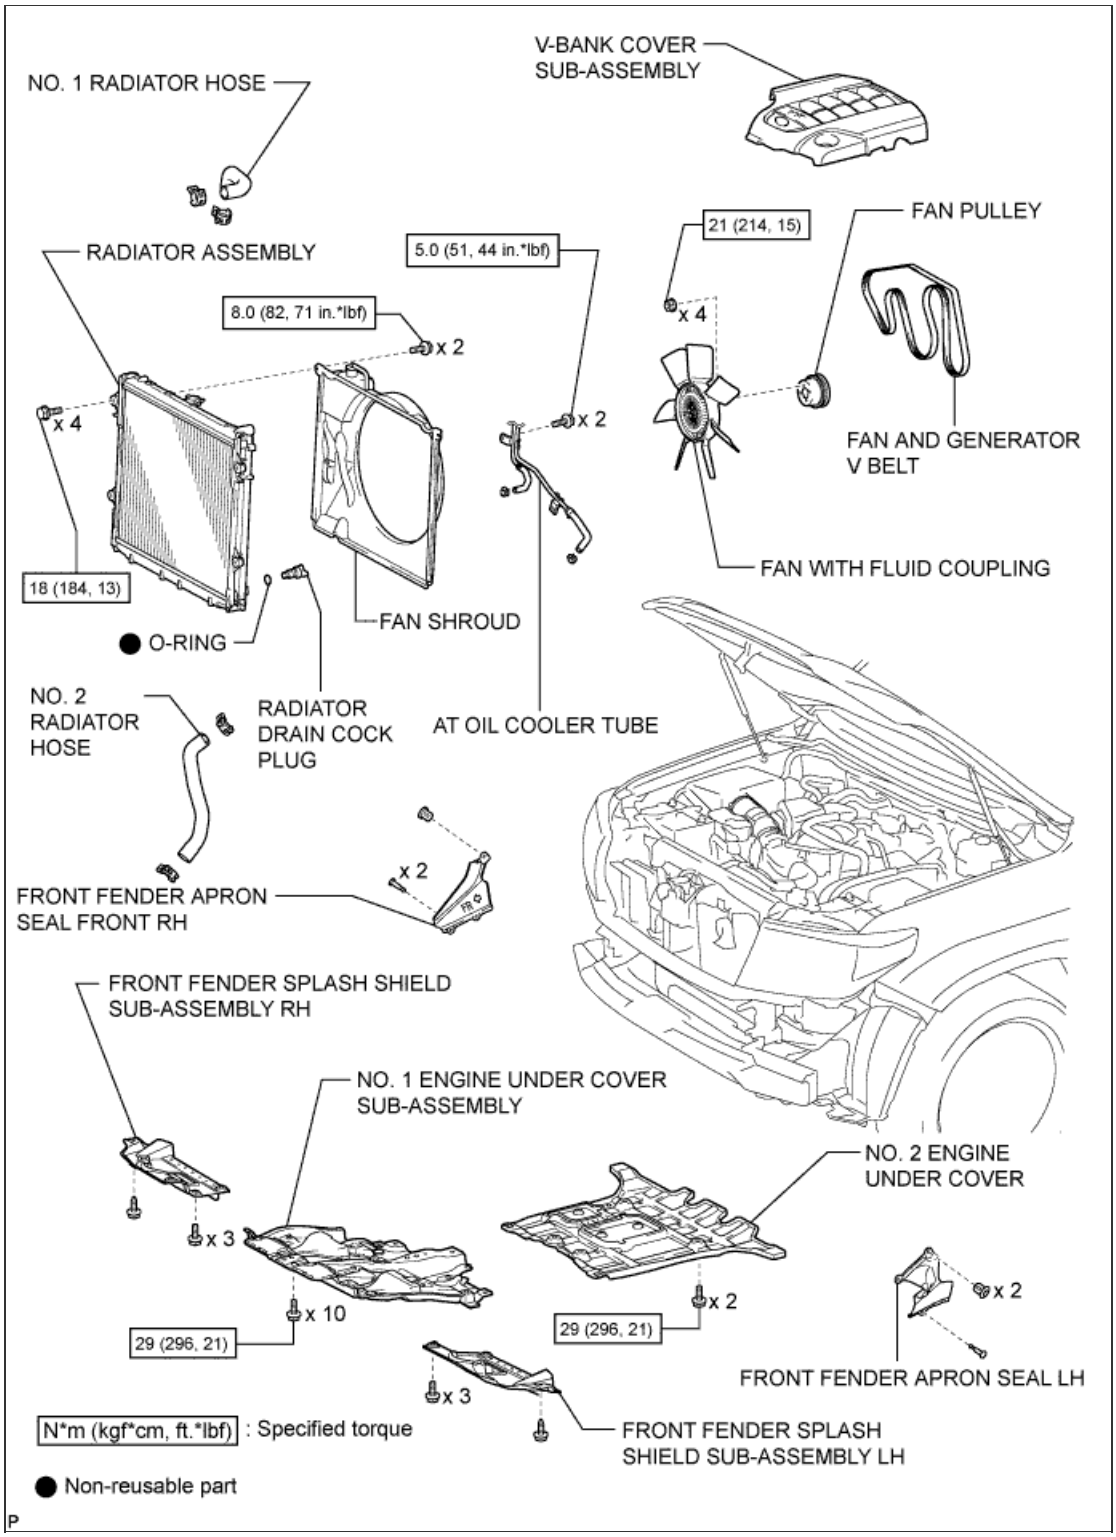
b. Install the 3 bolts and screw.



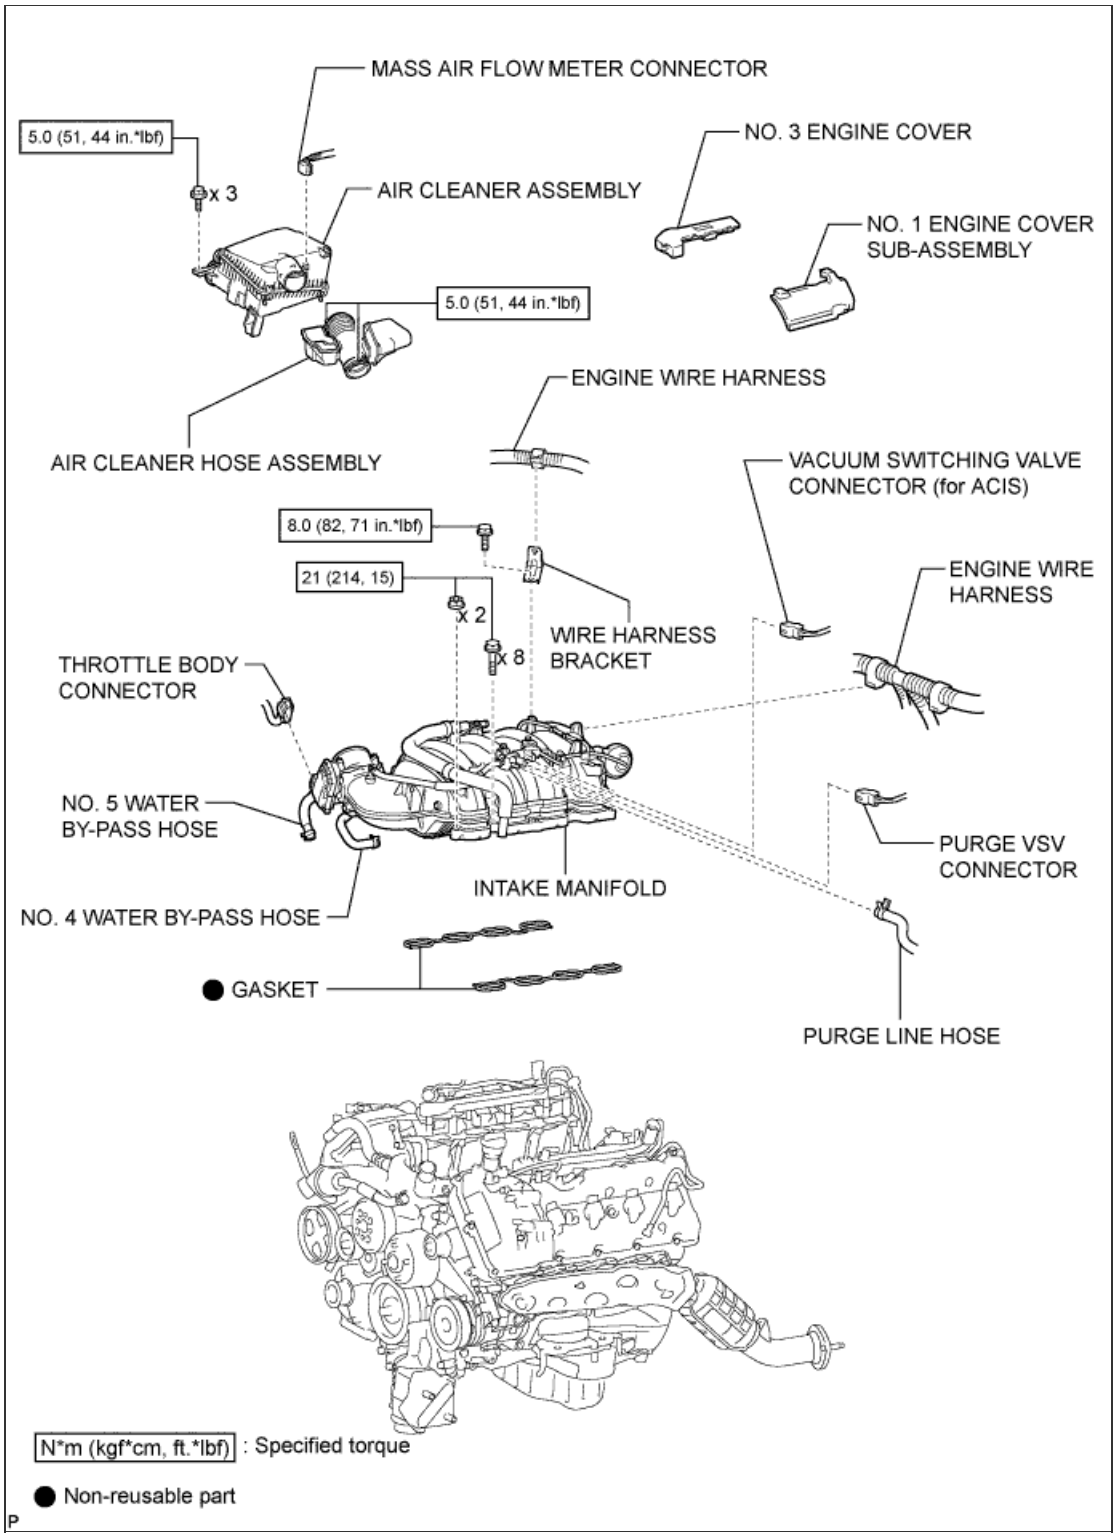


6. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY R

INT



Use the same procedures described for the LH side.



for Preparation Click here

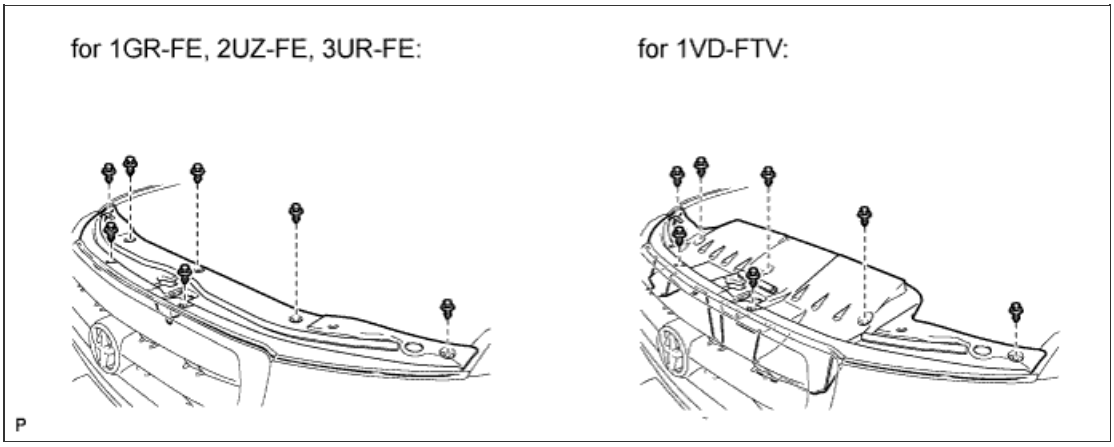
1. DISCHARGE FUEL SYSTEM PRESSURE

(Click here)



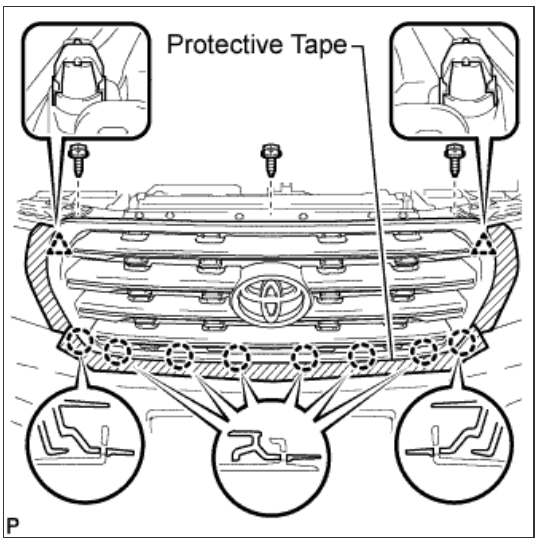
2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

3. REMOVE UPPER RADIATOR SUPPORT SEAL

a. Remove the 7 clips and radiator support seal.

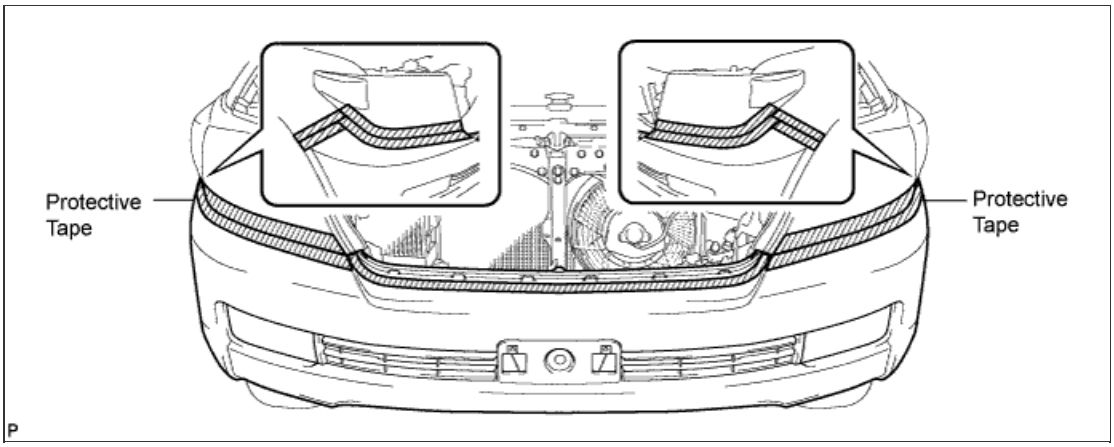


4. REMOVE RADIATOR GRILLE

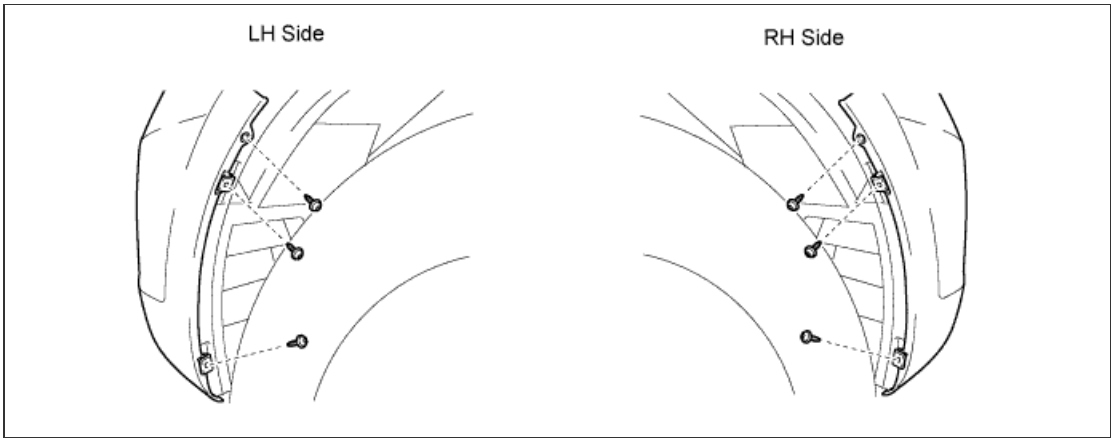
a. Put protective tape around the radiator grille.

b. Remove the 3 screws.

c. Detach the 2 clips and 8 claws, and remove the radiator grille.



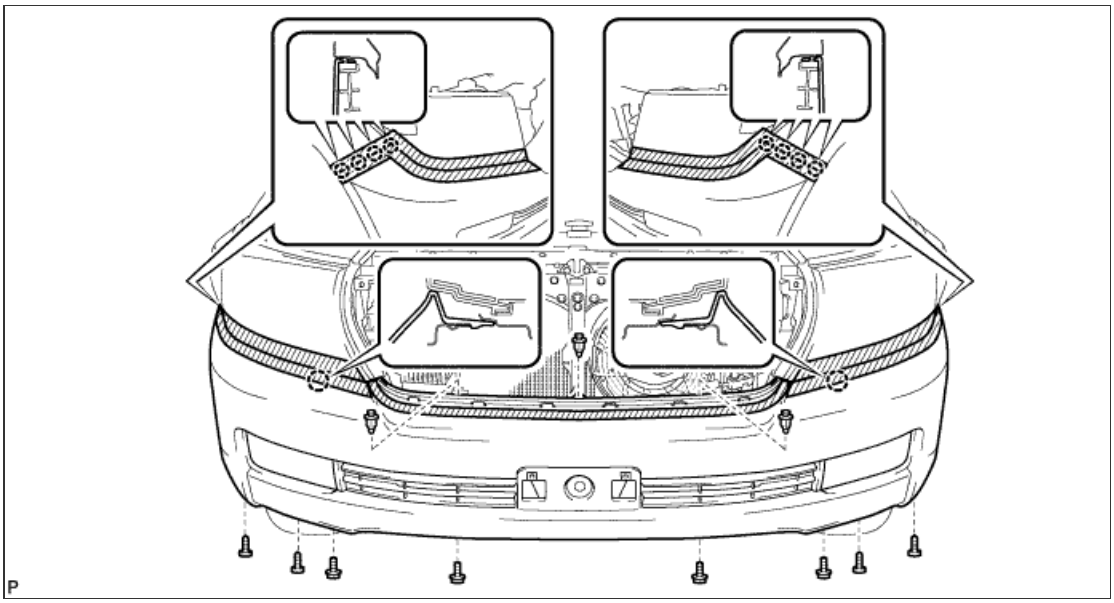
5. REMOVE FRONT BUMPER COVER



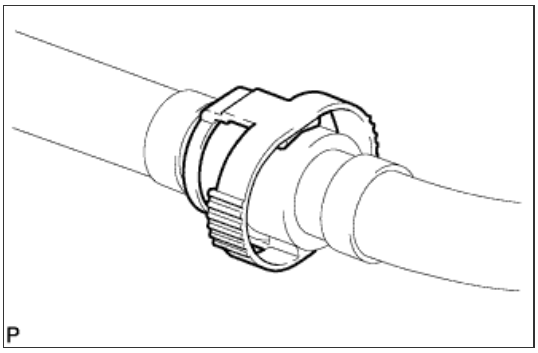
HINT:

For the front bumper cover with garnish, use the procedures described below.

a. Put protective tape around the bumper cover.



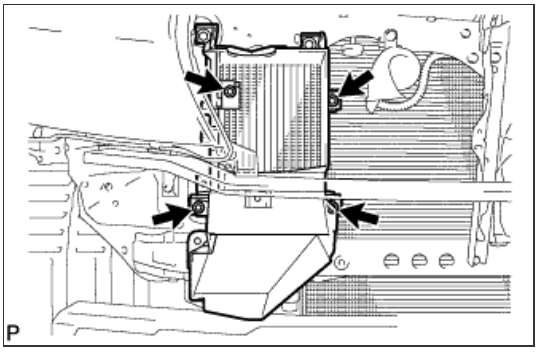
b. Using a T30 "TORX" socket, remove the 6 screws.



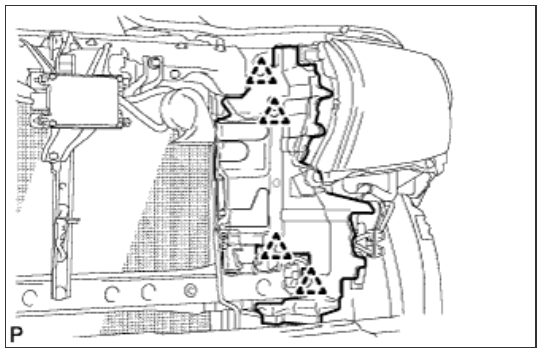
c. Remove the 3 clips, 4 screws and 4 bolts.

d. w/o TOYOTA Parking Assist-sensor System, w/o Fog Light:
Detach the 10 claws and remove the bumper cover.

e. w/ TOYOTA Parking Assist-sensor System or w/ Fog Light:
Detach the 10 claws, disconnect the No. 4 engine room wire connector and remove the bumper cover.



f. w/ Headlight Cleaner System:
Disconnect the headlight cleaner hose and remove the bumper cover.

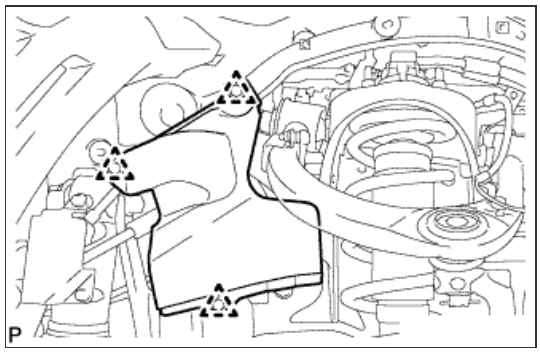


6. REMOVE TRANSMISSION OIL COOLER AIR DUCT

a. Remove the 4 bolts and oil cooler air duct.

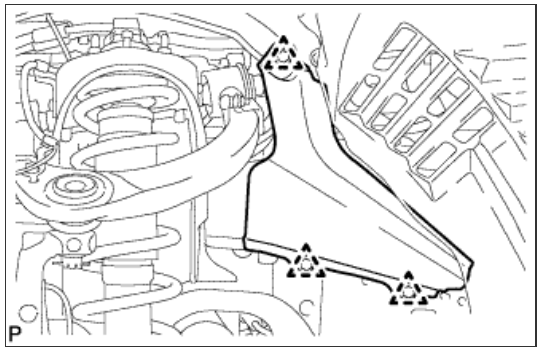
7. DISCONNECT RADIATOR SIDE DEFLECTOR LH

a. Using a clip remover, remove the 4 clips and disconnect the side deflector.



8. REMOVE COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

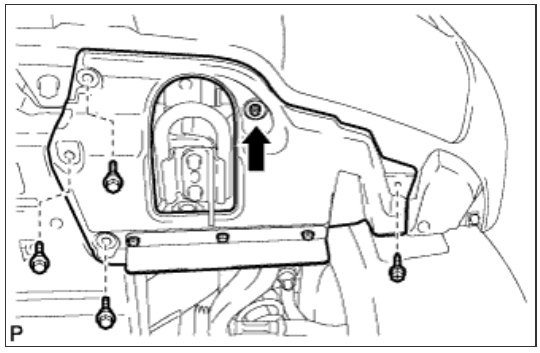
(Click here)



9. REMOVE FRONT FENDER APRON SEAL LH

a. Using a clip remover, remove the 3 clips and fender apron seal.

10. REMOVE FRONT FENDER APRON SEAL FRONT RH

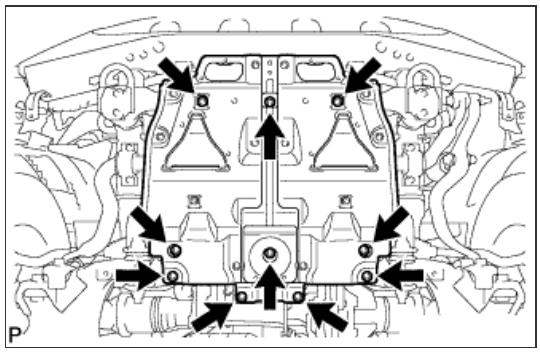


a. Using a clip remover, remove the 3 clips and fender apron seal.

11. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

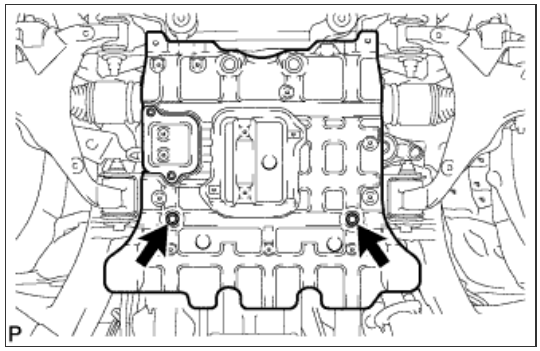
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



12. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



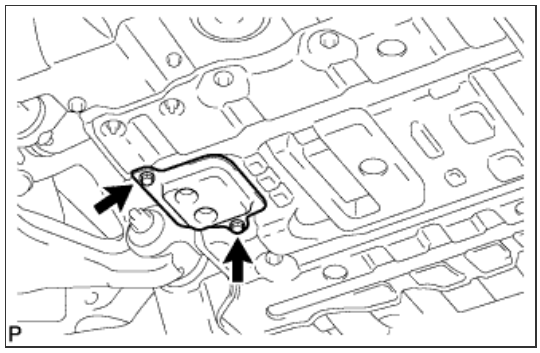
13. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

14. REMOVE NO. 2 ENGINE UNDER COVER

a. Remove the 2 bolts and No. 2 engine under cover.

15. DRAIN ENGINE OIL



a. Remove the oil filler cap.

b. Remove the 2 bolts and No. 2 engine under cover seal.

c. Remove the oil pan drain plug and gasket, and drain the engine oil into a container.

d. Install a new gasket and the oil pan drain plug.

Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

16. DRAIN ENGINE COOLANT

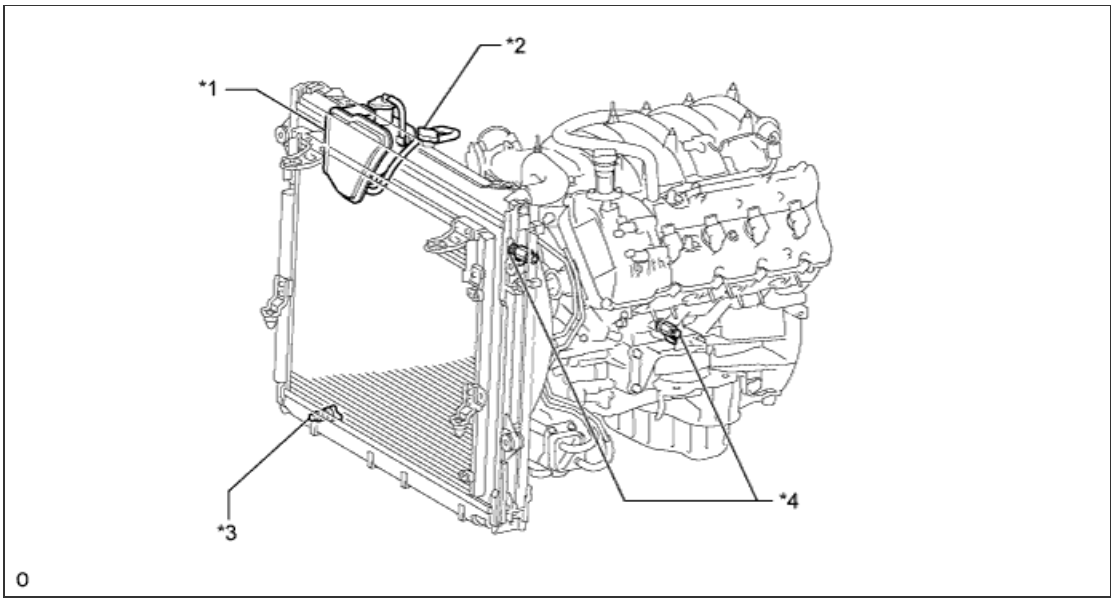
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause

serious burns.

a. Loosen the radiator drain cock plug.

HINT:



Collect the coolant in a container and dispose of it according to the regulations in your area.

b. Remove the radiator cap. Then drain the coolant from the radiator.

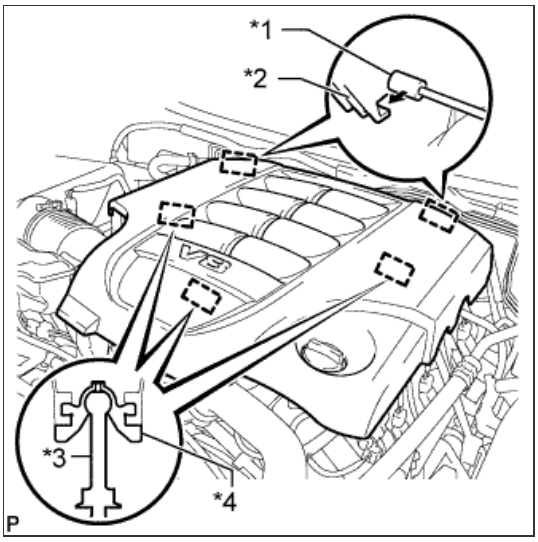
c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

Text in Illustration

*1	Radiator Reservoir	*2	Radiator Cap
*3	Radiator Drain Cock Plug	*4	Cylinder Block Drain Cock Plug



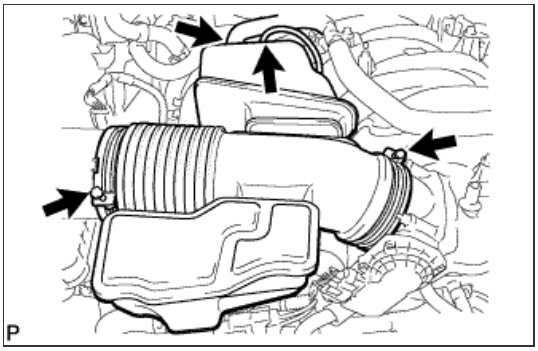
e. Tighten the radiator drain cock plug by hand.

17. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Raise the front of the V-bank cover to detach the 3 pins. Then remove the 2 V-bank cover hooks from the bracket, and remove the V-bank cover.

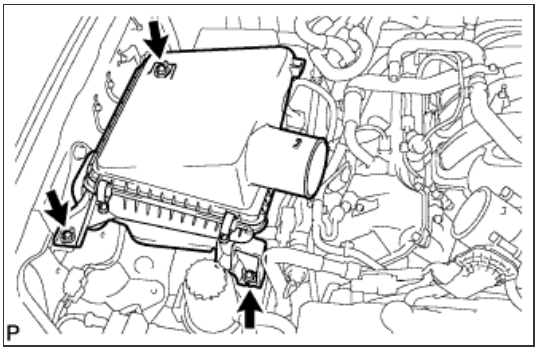
Text in Illustration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet



18. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum hose and No. 2 ventilation hose.



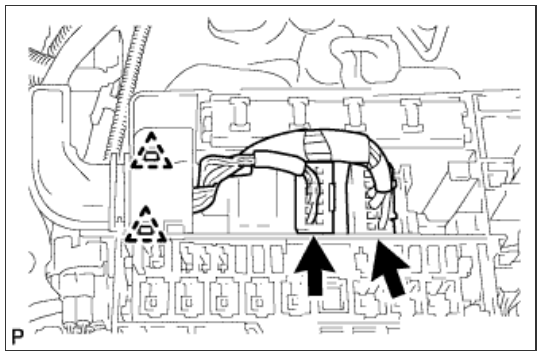
b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

19. REMOVE AIR CLEANER ASSEMBLY

a. Remove the 3 bolts and air cleaner.

20. REMOVE RADIATOR ASSEMBLY



(Click here)

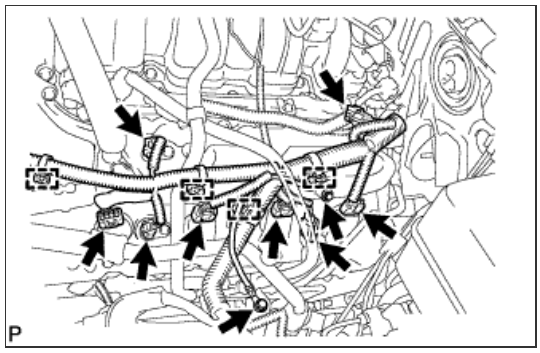
21. DISCONNECT ENGINE WIRE

a. Engine Room LH Side:

i. Remove the engine room relay block cover.

ii. Disconnect the 2 connectors and 2 clips from the engine room junction block.

iii. Disconnect the injector connector.



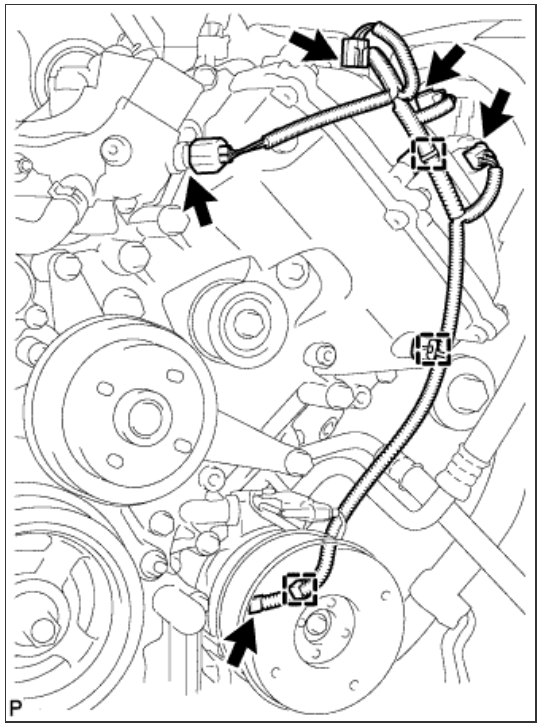
iv. Disconnect the 4 ignition coil connectors.

v. Disconnect the 2 VVT sensor connectors.

vi. Disconnect the 4 clamps.

vii. Remove the 2 bolts and ground wire.

viii. Disconnect the noise filter connector.



ix. Disconnect the engine coolant temperature sensor connector.

x. Disconnect the 2 camshaft timing oil control valve connectors.

xi. Disconnect the camshaft position sensor connector.

xii. Disconnect the 3 clamps.

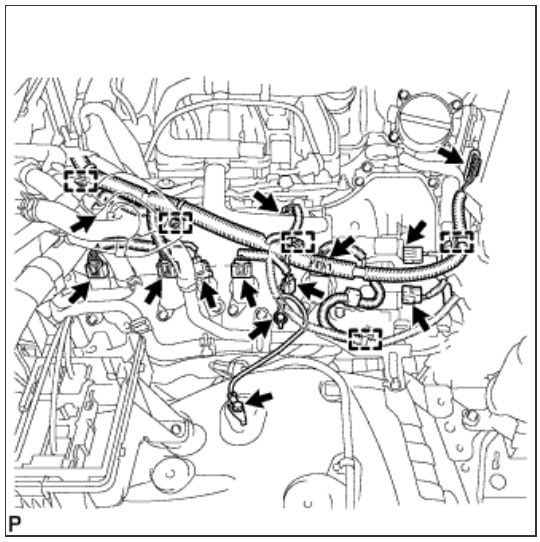
xiii. Disconnect the cooler compressor connector.

b. Engine Room RH Side:

i. Disconnect the 2 camshaft timing oil control valve connectors.

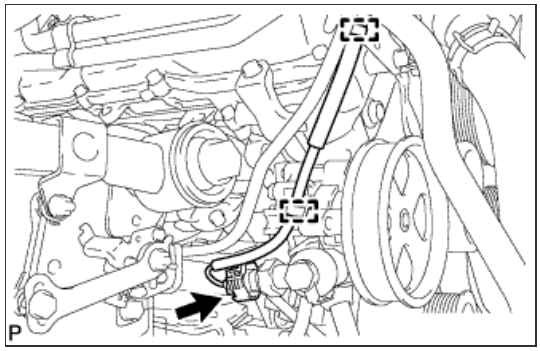
ii. Disconnect the 4 ignition coil connectors.

iii. Disconnect the injector connector.



iv. Disconnect the 2 VVT sensor connectors.

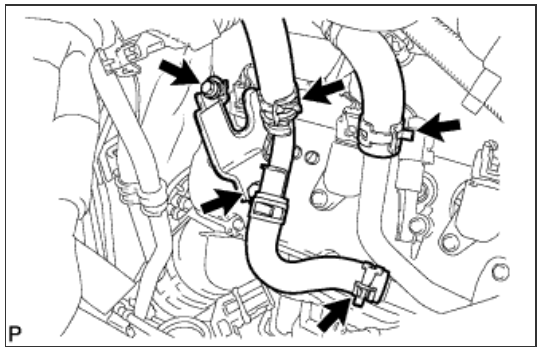
v. Disconnect the noise filter connector.



vi. Remove the 2 bolts and ground wire.

vii. Disconnect the throttle position sensor and throttle control motor connector.

viii. Disconnect the 5 clamps.

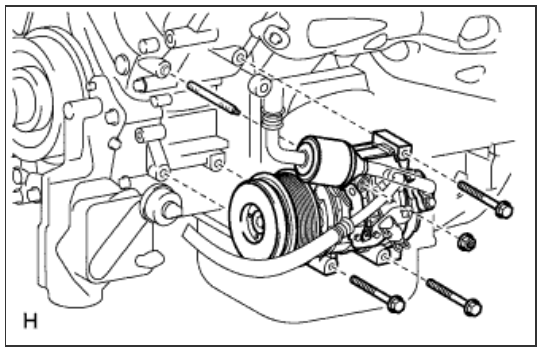


c. Disconnect the 2 clamps and power steering oil pressure switch connector.

22. DISCONNECT WATER PIPE AND HOSE SUB-ASSEMBLY

a. Disconnect the 3 hoses.

b. Remove the 2 bolts and disconnect the water pipe and hose from the cylinder head cover.

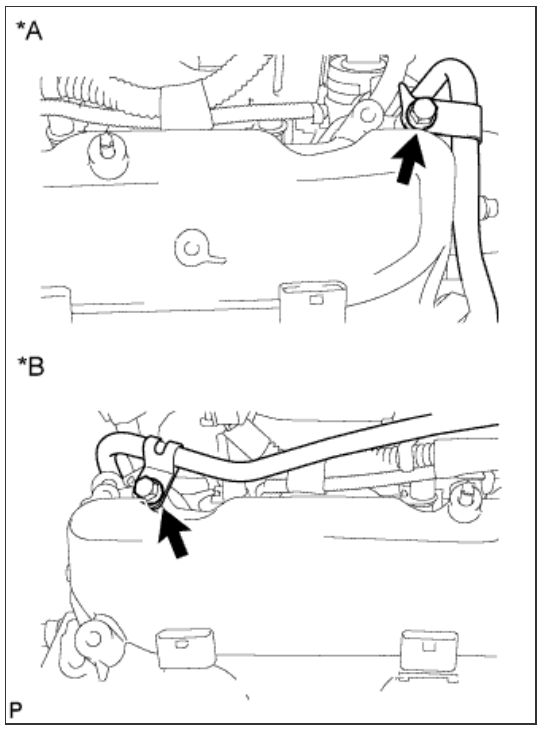


23. DISCONNECT COOLER COMPRESSOR ASSEMBLY

a. Remove the 3 bolts, nut and stud bolt, and disconnect the cooler compressor.

HINT:

It is not necessary to completely remove the compressor. With the hoses connected to the compressor, hang the compressor on the vehicle body with a rope.

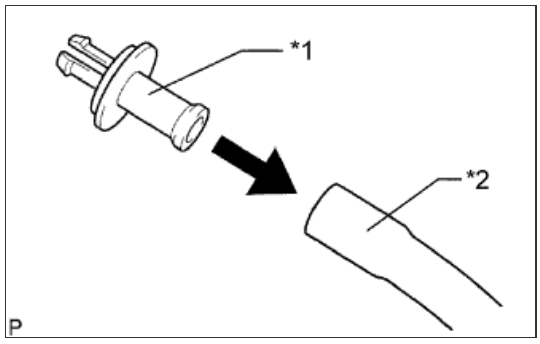


24. DISCONNECT NO. 2 FUEL TUBE SUB-ASSEMBLY

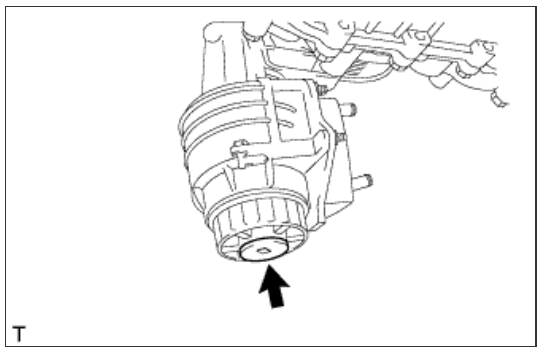
a. Remove the 2 bolts and disconnect the fuel tube.

Text in Illustration

*A	LH Side
*B	RH Side



25. REMOVE OIL FILTER ELEMENT



a. Connect a hose with an inside diameter of 15 mm (0.591 in.) to the pipe.

Text in Illustration

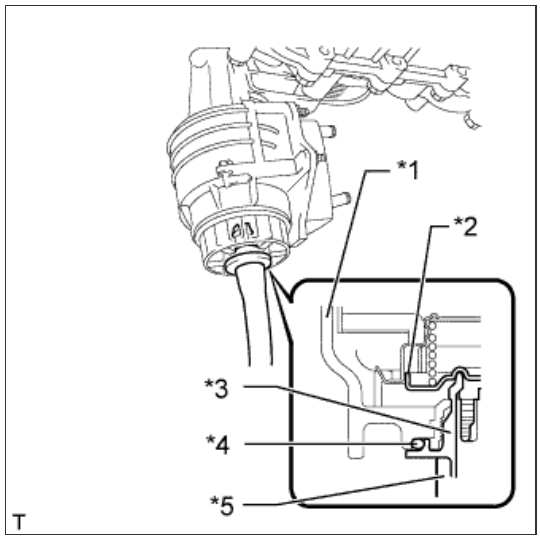
*1	Pipe
*2	Hose

b. Remove the oil filter drain plug.

c. Install the pipe to the oil filter cap.

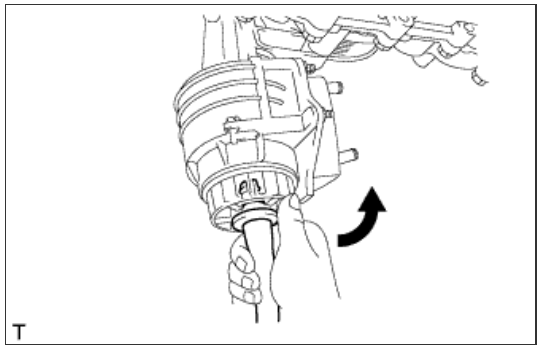
Text in Illustration

*1	Cap
*2	Valve
*3	Pipe
*4	O-Ring



*5	Hose

NOTICE:



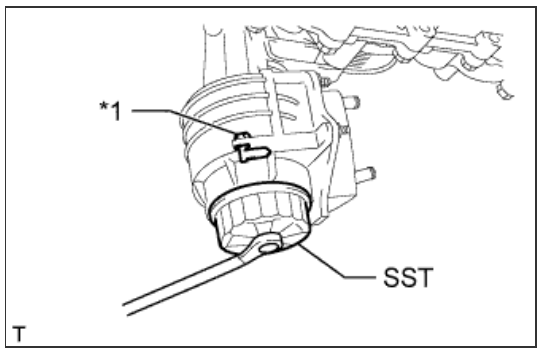
If the O-ring is removed with the drain plug, install the O-ring together with the pipe.

HINT:

Use a container to catch the draining oil.

d. Check that oil is drained from the oil filter. Then disconnect the pipe and remove the O-ring as shown in the illustration.

e. Using SST, remove the oil filter cap.



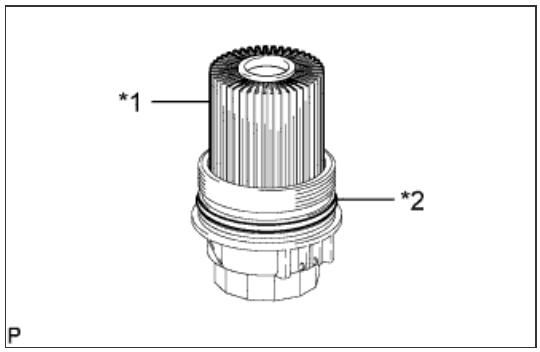
SST
09228-06501

Text in Illustration

*1	Oil Filter Bracket Clip

NOTICE:

Do not remove the oil filter bracket clip.



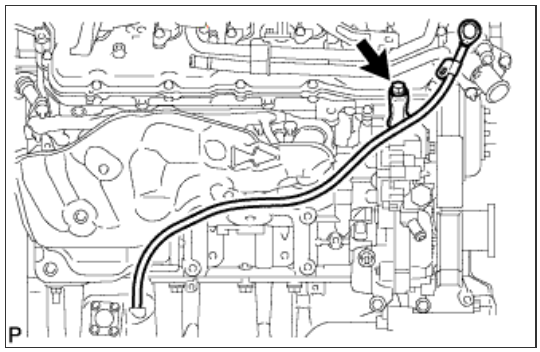
f. Remove the oil filter element and O-ring from the oil filter cap.

Text in Illustration

*1	Oil Filter Element
*2	O-Ring

NOTICE:

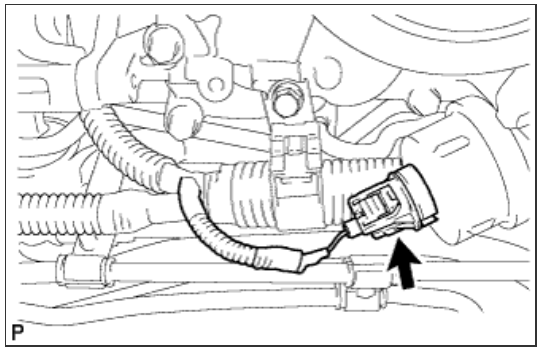
Be sure to remove the cap O-ring by hand, without using any tools, to prevent damage to the cap O-ring groove.



26. REMOVE ENGINE OIL LEVEL DIPSTICK GUIDE

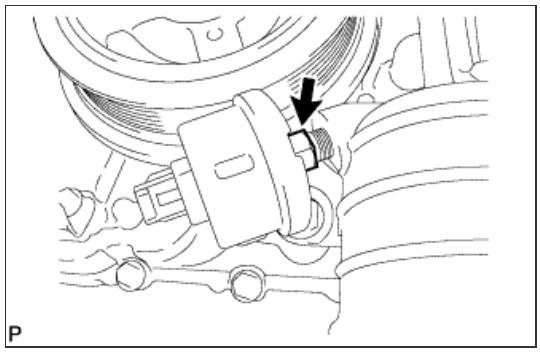
a. Disconnect the wire harness clamp.

b. Remove the dipstick.



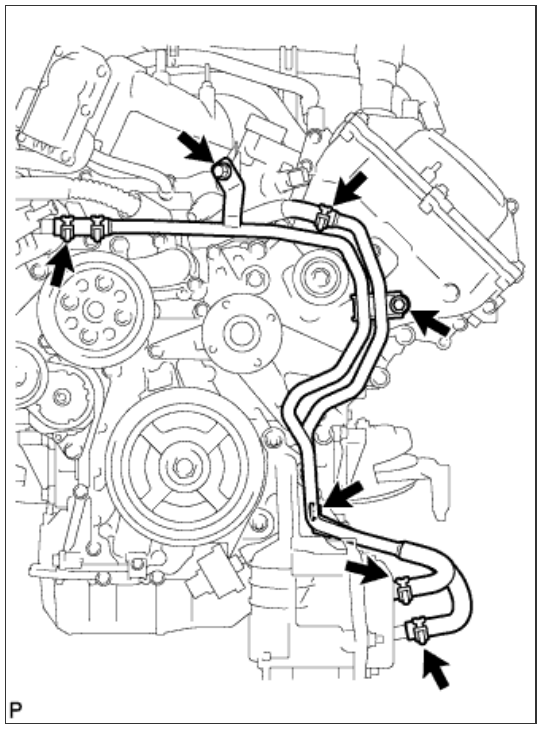
c. Remove the bolt and dipstick guide.

d. Remove the O-ring from the dipstick guide.



27. REMOVE OIL PRESSURE SENDER GAUGE ASSEMBLY

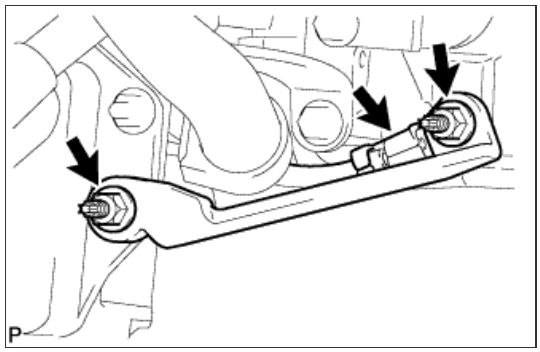
a. Disconnect the sender gauge connector.



b. Remove the oil pressure sender gauge.

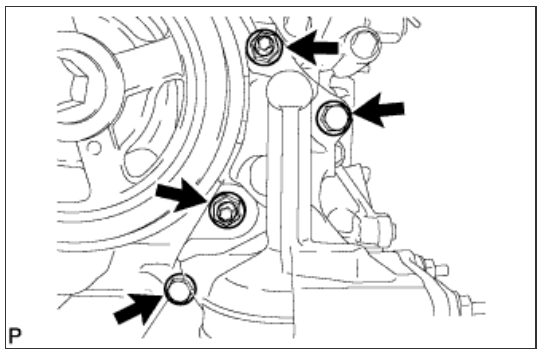
28. REMOVE NO. 2 WATER BY-PASS PIPE SUB-ASSEMBLY

a. Remove the 3 bolts.



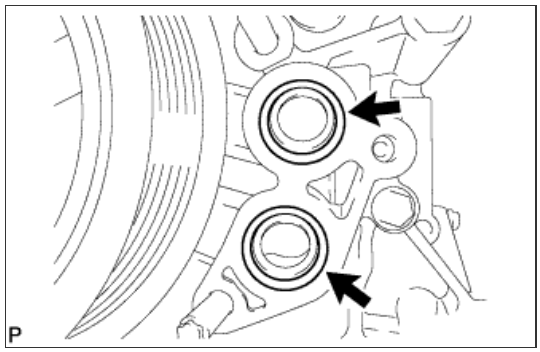
b. Disconnect the 4 hoses and remove the water by-pass pipe.

29. REMOVE NO. 1 OIL COOLER BRACKET



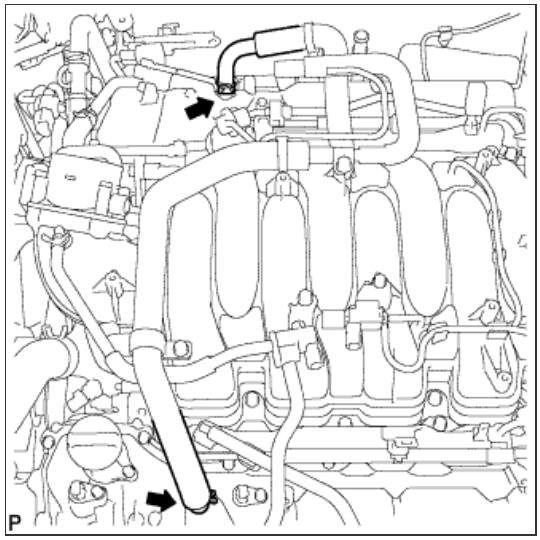
a. Remove the 2 nuts and bracket.

b. Disconnect the ground wire from the cylinder block.

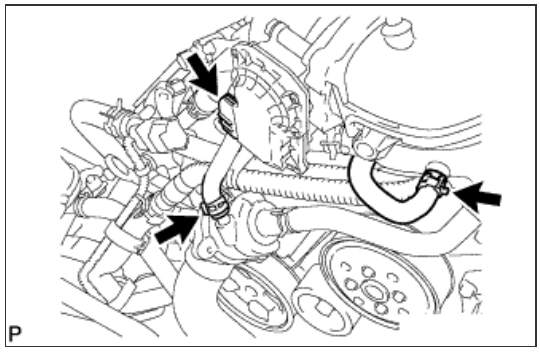


30. REMOVE OIL FILTER BRACKET

a. Remove the 2 bolts, 2 nuts and filter bracket.

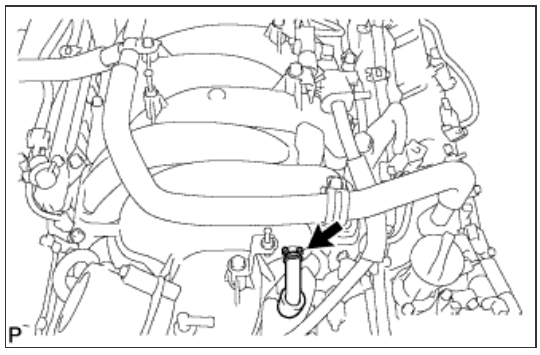


b. Remove the 2 O-rings.



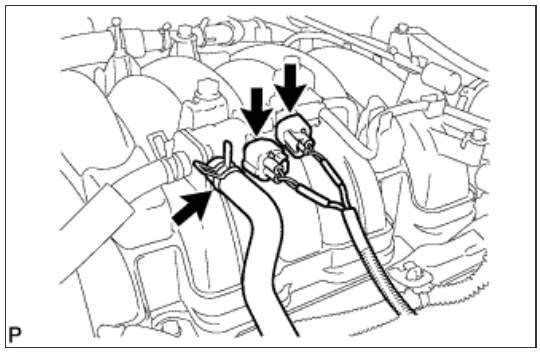
31. REMOVE INTAKE MANIFOLD

a. Disconnect the ventilation hose from the ventilation pipe of the cylinder head cover LH and RH.

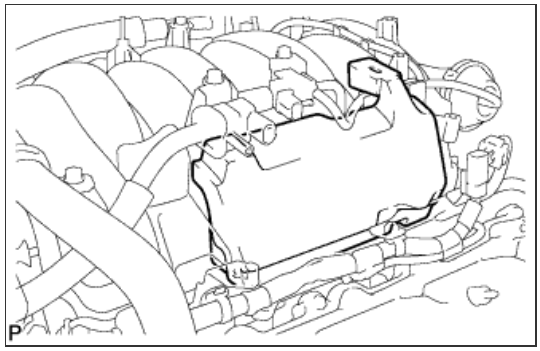


b. Disconnect the 2 water by-pass hoses.

c. Disconnect the throttle body connector.

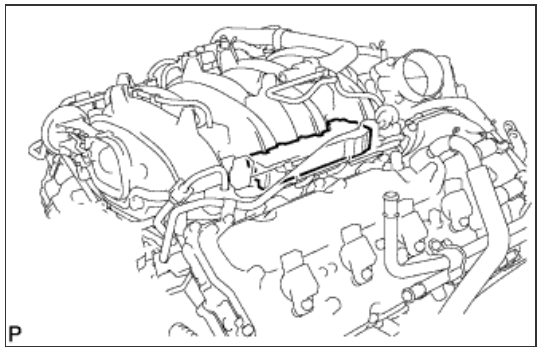


d. Disconnect the No. 1 ventilation hose.

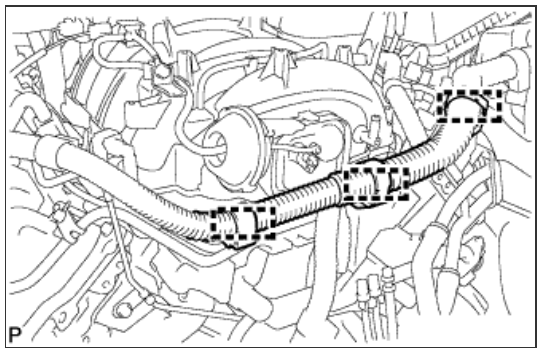


e. Disconnect the purge VSV connector.

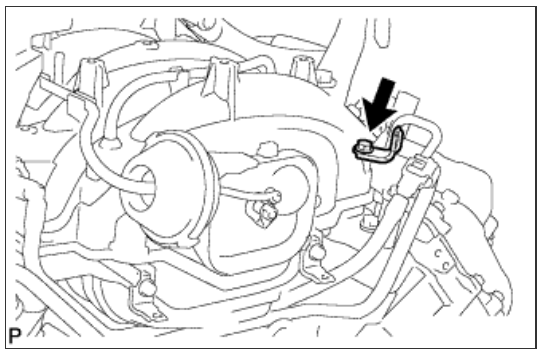
f. Disconnect the purge line hose from the purge VSV.



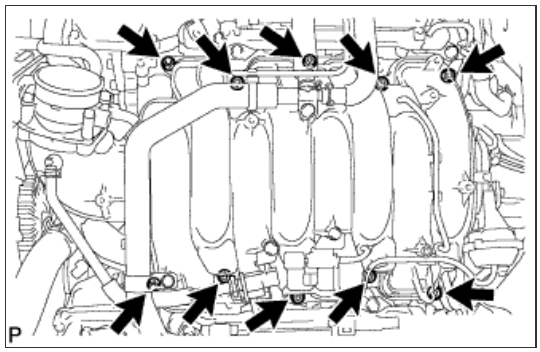
g. Disconnect the vacuum switching valve connector (for ACIS).



h. Remove the No. 1 engine cover sub-assembly.

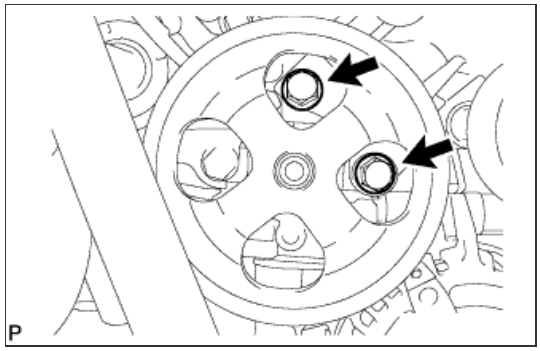


i. Remove the No. 3 engine cover.

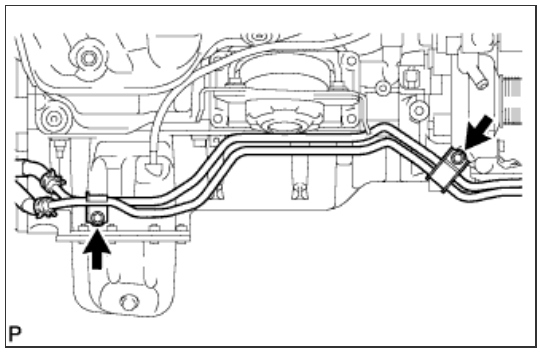


j. Disconnect the 3 wire clamps from the 3 wire brackets.

k. Remove the bolt and wire bracket from the intake manifold.



l. Remove the 2 nuts, 8 bolts, intake manifold and 2 gaskets.

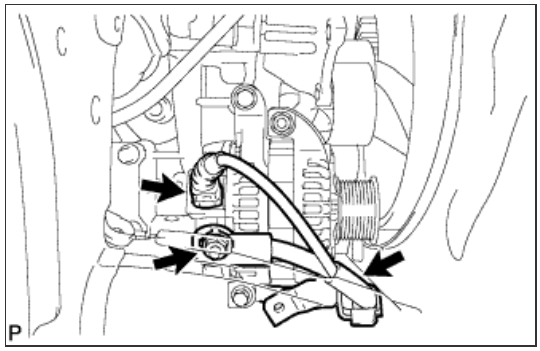


32. DISCONNECT VANE PUMP ASSEMBLY

a. Remove the 2 bolts and disconnect the vane pump.

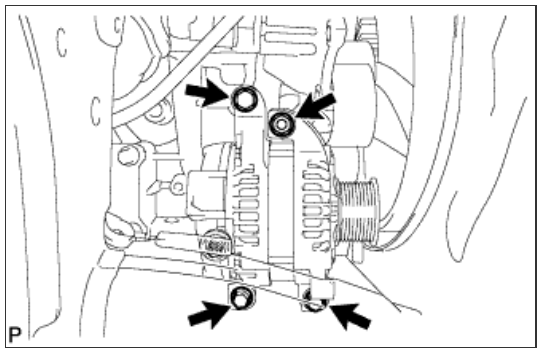
33. DISCONNECT OIL COOLER PIPE ASSEMBLY

a. Remove the 2 bolts and disconnect the oil cooler pipe.



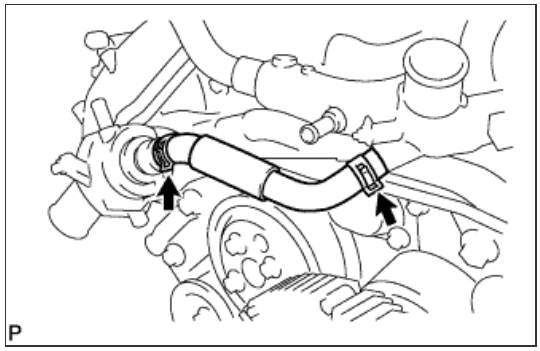
34. REMOVE GENERATOR ASSEMBLY

a. Disconnect the generator connector.



b. Remove the terminal cap and nut, and disconnect the generator wire.

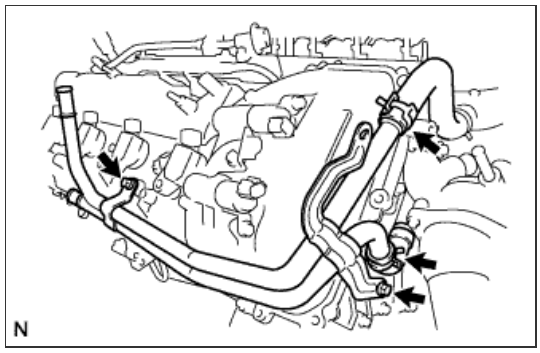
c. Remove the bolt and wire harness bracket from the generator.



d. Remove the 3 bolts, nut and generator.

e. Remove the stud bolt.

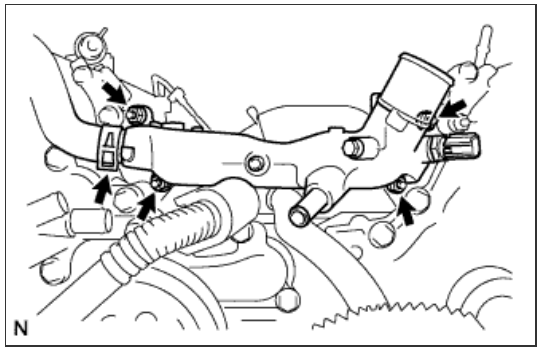
35. REMOVE NO. 1 WATER BY-PASS HOSE



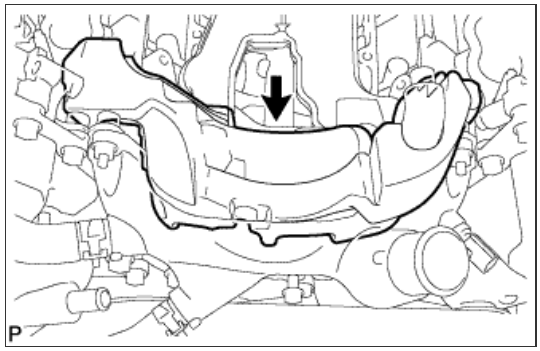
a. Remove the No. 1 water by-pass hose by disconnecting the hose from the water inlet housing and front water by-pass joint.

36. REMOVE WATER BY-PASS PIPE SUB-ASSEMBLY

a. Disconnect the 2 hoses.

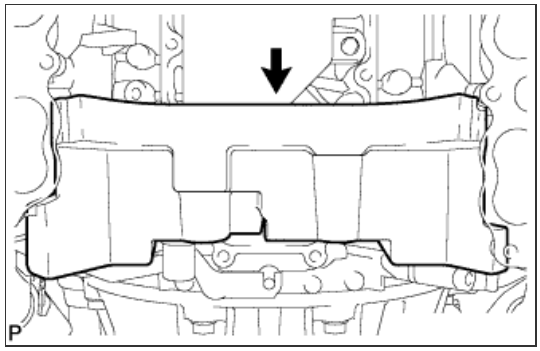


b. Remove the 2 bolts and water by-pass pipe.



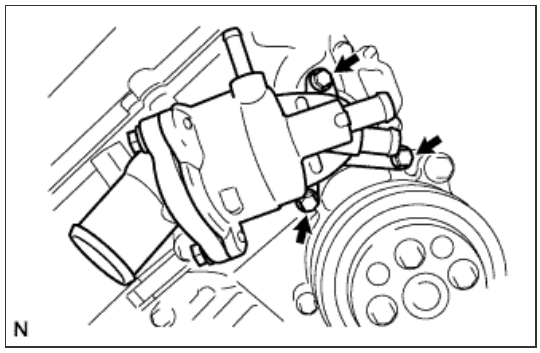
37. REMOVE FRONT WATER BY-PASS JOINT

a. Disconnect the No. 2 water by-pass hose from the water by-pass joint.



b. Remove the 4 nuts, water by-pass joint and 2 gaskets.

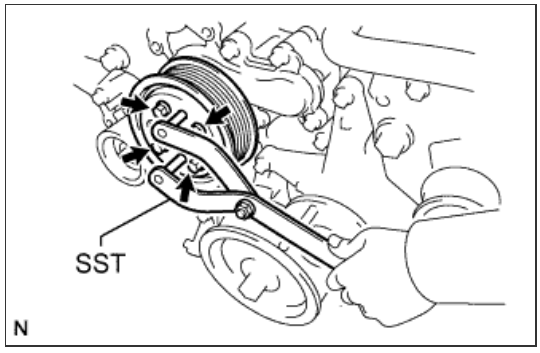
38. REMOVE NO. 2 ENGINE COVER



39. REMOVE NO. 1 ENGINE COVER

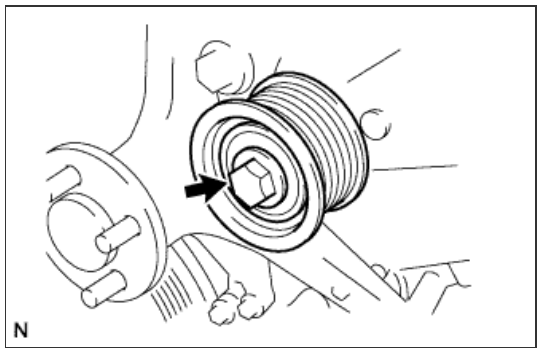
40. REMOVE WATER INLET HOUSING

a. Remove the 3 bolts, water inlet housing and gasket.



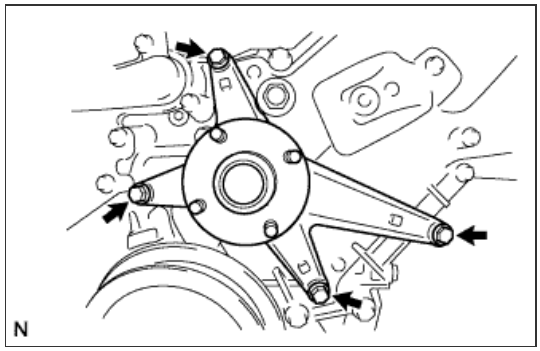
41. REMOVE WATER PUMP PULLEY

a. Using SST, hold the water pump pulley.



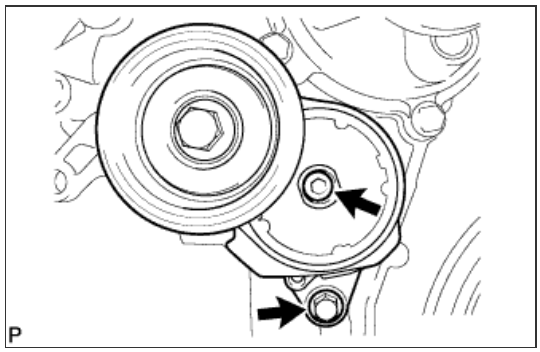
SST
09960-10010 09962-01000, 09963-01000)

b. Remove the 4 bolts and water pump pulley.



42. REMOVE NO. 1 IDLER PULLEY SUB-ASSEMBLY

a. Remove the bolt and idler pulley.



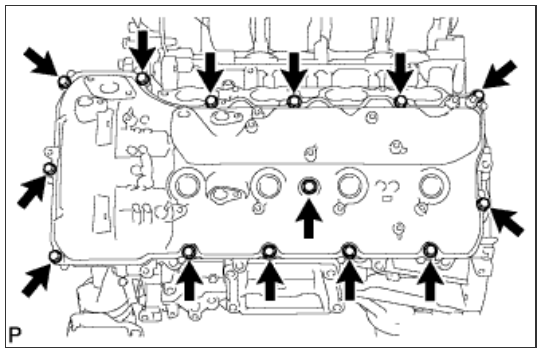
43. REMOVE FLUID COUPLING BRACKET

a. Remove the 4 bolts and fluid coupling bracket.

44. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY

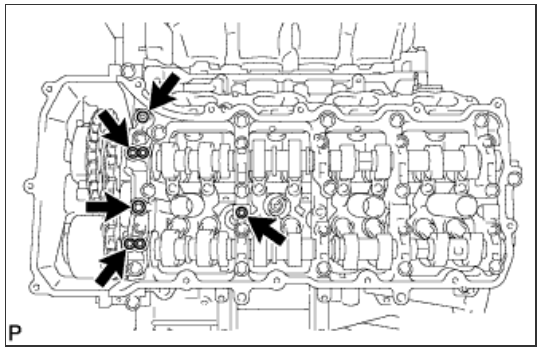
a. Remove the standard bolt, 6 mm he agon wrench bolt and belt tensioner.

45. REMOVE IGNITION COIL ASSEMBLY



a. Remove the 8 bolts and 8 ignition coils.

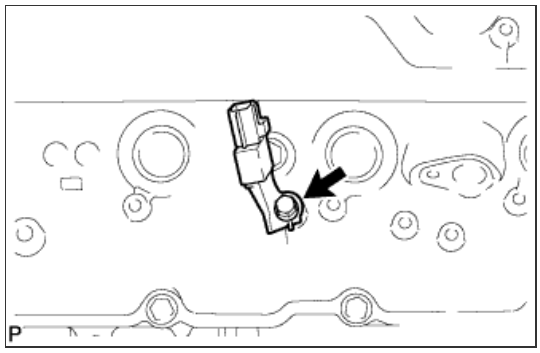
46. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY LH



a. Remove the 14 bolts, seal washer, cylinder head cover and gasket.

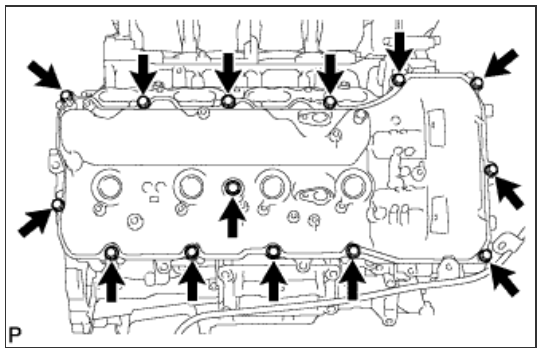
HINT:

Make sure the removed parts are returned to the same places they were removed from.

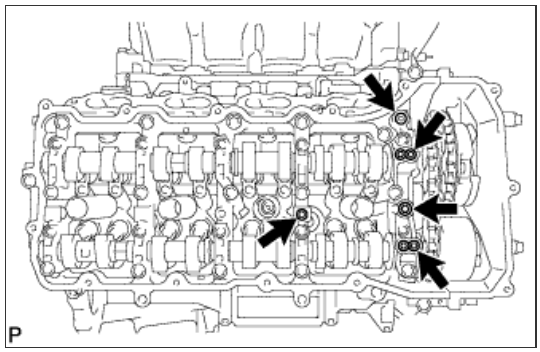


b. Remove the 5 gaskets from the camshaft bearing caps (No. 2, No. 3).

47. REMOVE CYLINDER HEAD COVER SUB-ASSEMBLY RH



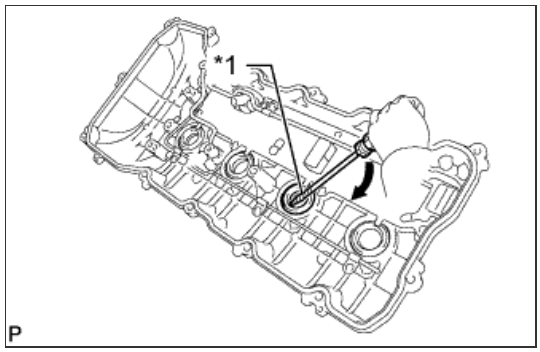
a. Remove the bolt and noise filter.



b. Remove the 14 bolts, seal washer, cylinder head cover and gasket.

HINT:

Make sure the removed parts are returned to the same places they were removed from.



c. Remove the 5 gaskets from the camshaft bearing caps (No. 1, No. 3).

48. REMOVE SPARK PLUG TUBE GASKET

a. Bend the 4 ventilation baffle plate claws on the cylinder head cover to an angle of 90° or more.

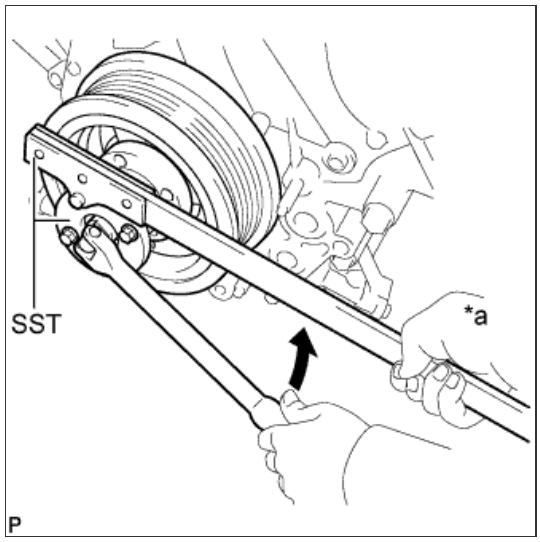
b. Using a screwdriver, pry out the gaskets.

Text in Illustration

*1	Tape
➡	Pry

NOTICE:

- **Be careful not to damage the cylinder head cover.**
- **Be careful not to damage the gasket when removing it, as the removed gasket needs to be used when installing a new one.**



HINT:

Tape the screwdriver tip before use.

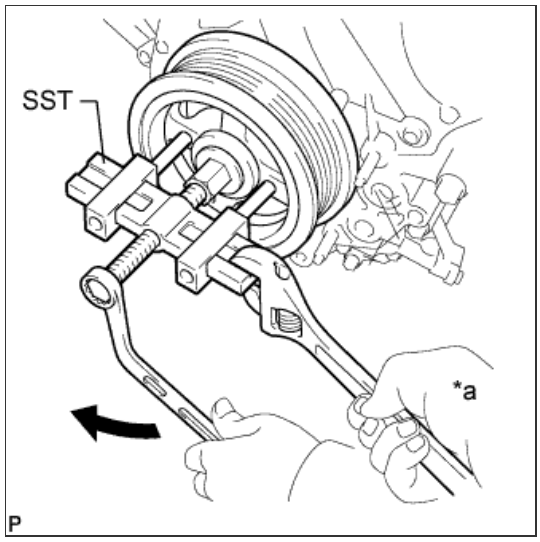
49. REMOVE CRANKSHAFT PULLEY

a. Using SST, loosen the crankshaft pulley set bolt until 2 or 3 threads are engaged.

SST
09213-70011
09330-00021

Text in Illustration

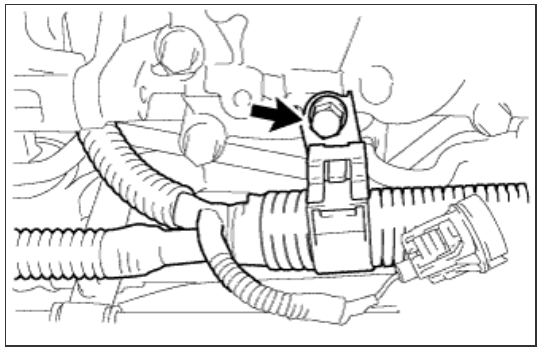
*a	Hold
➡	Turn



b. Using the pulley set bolt and SST, remove the crankshaft pulley.

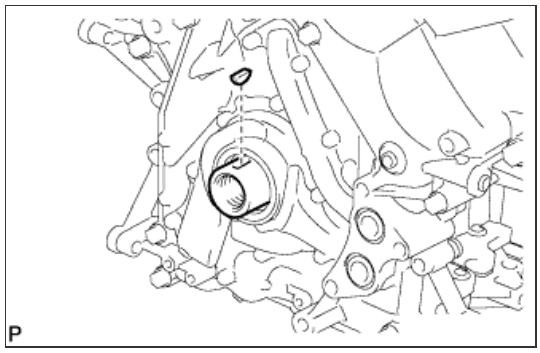
SST
09950-50013 09951-05010, 09952-05010, 09953-05010, 09954-05011)

Text in Illustration



*a	Hold

➡	Turn

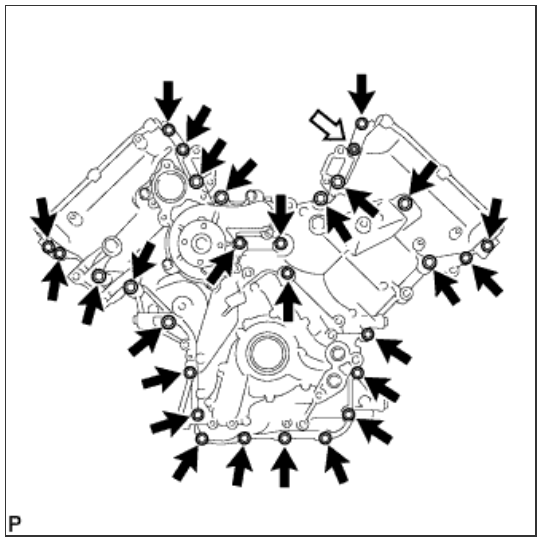


50. DISCONNECT WIRE HARNESS CLAMP BRACKET

a. Remove the bolt and disconnect the bracket.

51. REMOVE CRANKSHAFT TIMING GEAR KEY

a. Using a screwdriver, remove the timing gear key from the crankshaft.

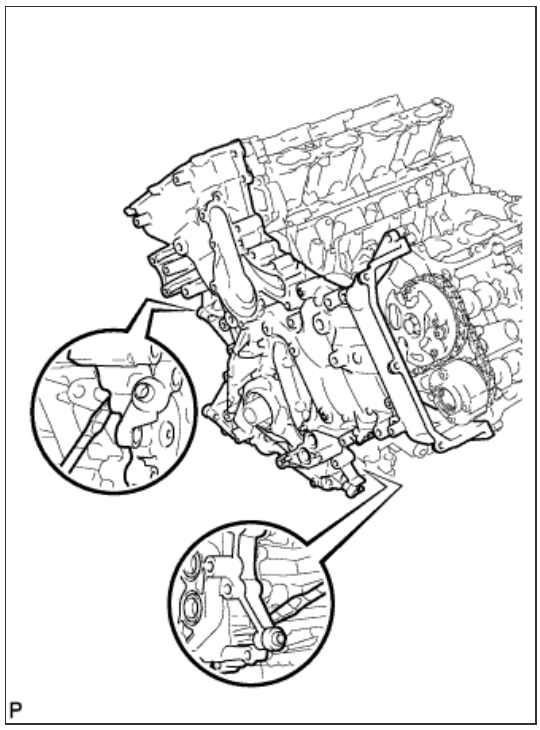


52. REMOVE TIMING CHAIN COVER SUB-ASSEMBLY

a. Remove the 28 bolts and nut shown in the illustration.

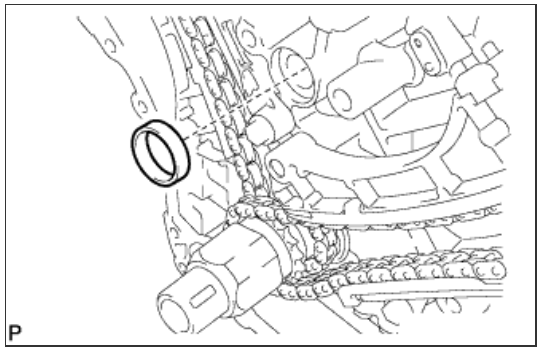
Text in Illustration

➡	Bolt
⇨	Nut



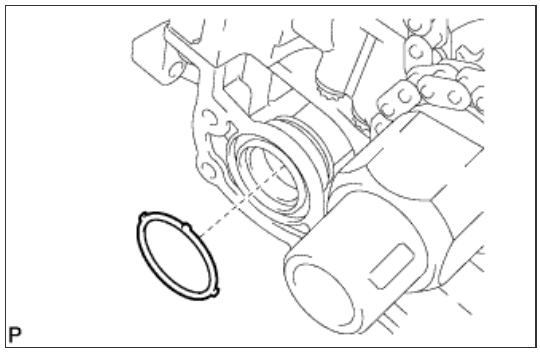
b. Remove the timing chain cover by prying between the timing chain cover and cylinder head or cylinder block with a screwdriver as shown in the illustration.

NOTICE:



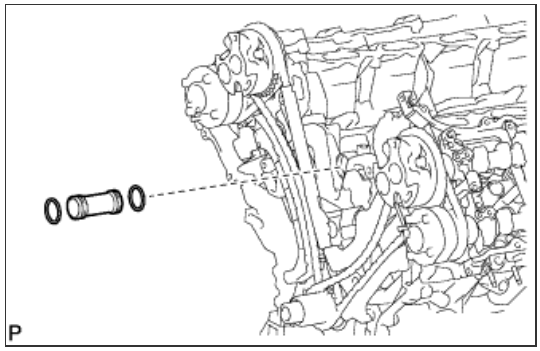
Be careful not to damage the contact surfaces of the cylinder head, cylinder block and chain cover.

HINT:



Tape the screwdriver tip before use.

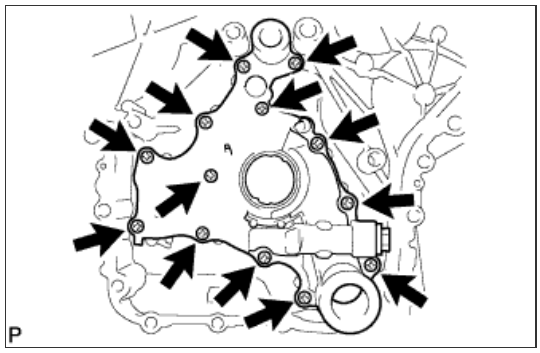
c. Remove the oil pump gasket from the cylinder block.



d. Remove the O-ring from the oil pan.

53. REMOVE WATER INLET PIPE

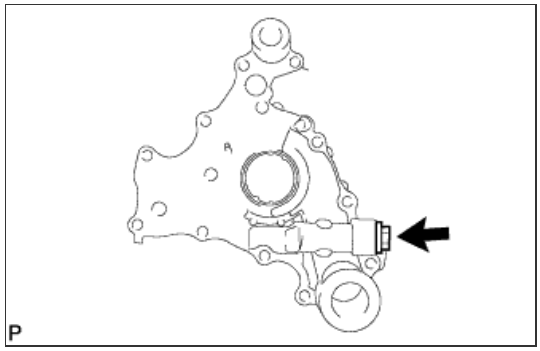
a. Remove the water inlet pipe.



b. Remove the 2 O-rings from the water inlet pipe.

for Preparation Click here

1. REMOVE OIL PUMP COVER

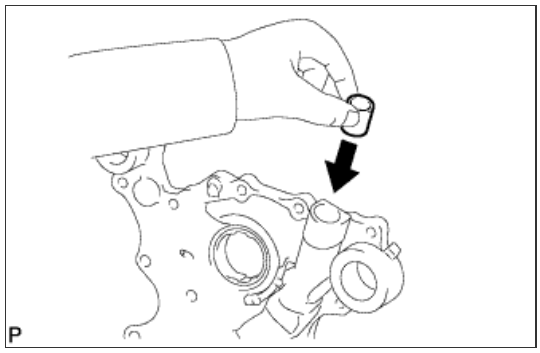


a. Remove the 13 bolts, oil pump cover, drive rotor and driven rotor.

2. REMOVE OIL PUMP RELIEF VALVE

a. Remove the relief valve plug.

b. Remove the valve spring and oil pump relief valve.

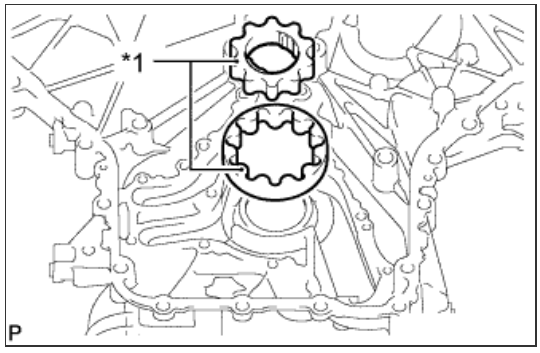


for Preparation Click here

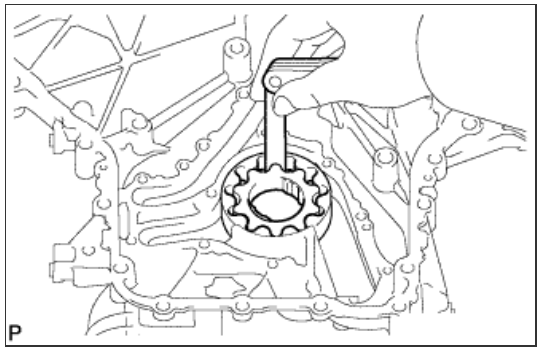
1. INSPECT OIL PUMP RELIEF VALVE

a. Coat the relief valve with engine oil.

b. Check that the relief valve falls smoothly into the valve hole by its own weight. If the relief valve does not fall smoothly, replace it. If necessary, replace the timing chain cover sub-assembly.



2. INSPECT OIL PUMP ROTOR SET



a. Install the rotors to the timing chain cover with the marks of the rotors facing outward. Check that the rotors revolve smoothly.

Text in Illustration

*1	Matchmark

b. Check the tip clearance.

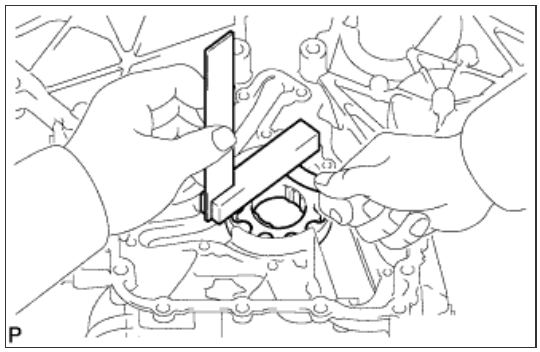
i. Using a feeler gauge, measure the clearance between the drive and driven rotor tips, as shown in the illustration.

Standard tip clearance:
0.180 to 0.300 mm (0.00709 to 0.0118 in.)

Maximum tip clearance:
0.300 mm (0.0118 in.)

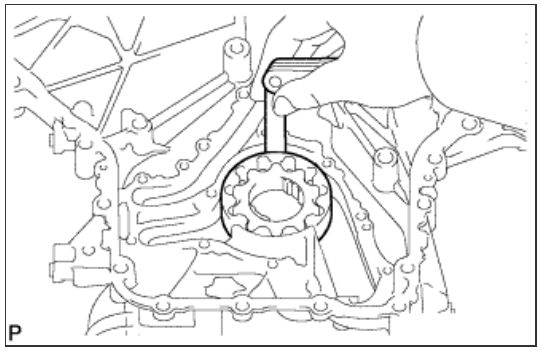
If the tip clearance is more than the maximum, replace the drive and driven rotors together.

c. Check the side clearance.



i. Using a feeler gauge and steel square, measure the clearance between the rotors and steel square as shown in the illustration.

Standard side clearance:
0.030 to 0.090 mm (0.00118 to 0.00354 in.)



Maximum side clearance:
0.090 mm (0.00354 in.)

If the side clearance is more than the maximum, replace the timing

chain cover sub-assembly.

d. Check the body clearance.

i. Using a feeler gauge, measure the clearance between the timing chain cover and driven rotor as shown in the illustration.

Standard body clearance:
0.175 to 0.250 mm (0.00689 to 0.00984 in.)

Maximum body clearance:
0.250 mm (0.00984 in.)

If the body clearance is more than the maximum, replace the timing chain cover sub-assembly.

for Preparation Click here

1. INSTALL OIL PUMP RELIEF VALVE

a. Coat the oil pump relief valve with engine oil.

b. Install the relief valve and relief valve spring into the oil pump cover hole.

c. Install the plug.

Torque:
53 N*m{ 540 kgf*cm , 39 ft.*lbf }

2. INSTALL OIL PUMP COVER

a. Install the driven rotor, drive rotor and oil pump cover with the 13 bolts.

Torque:
10 N*m{ 105 kgf*cm , 8 ft.*lbf }

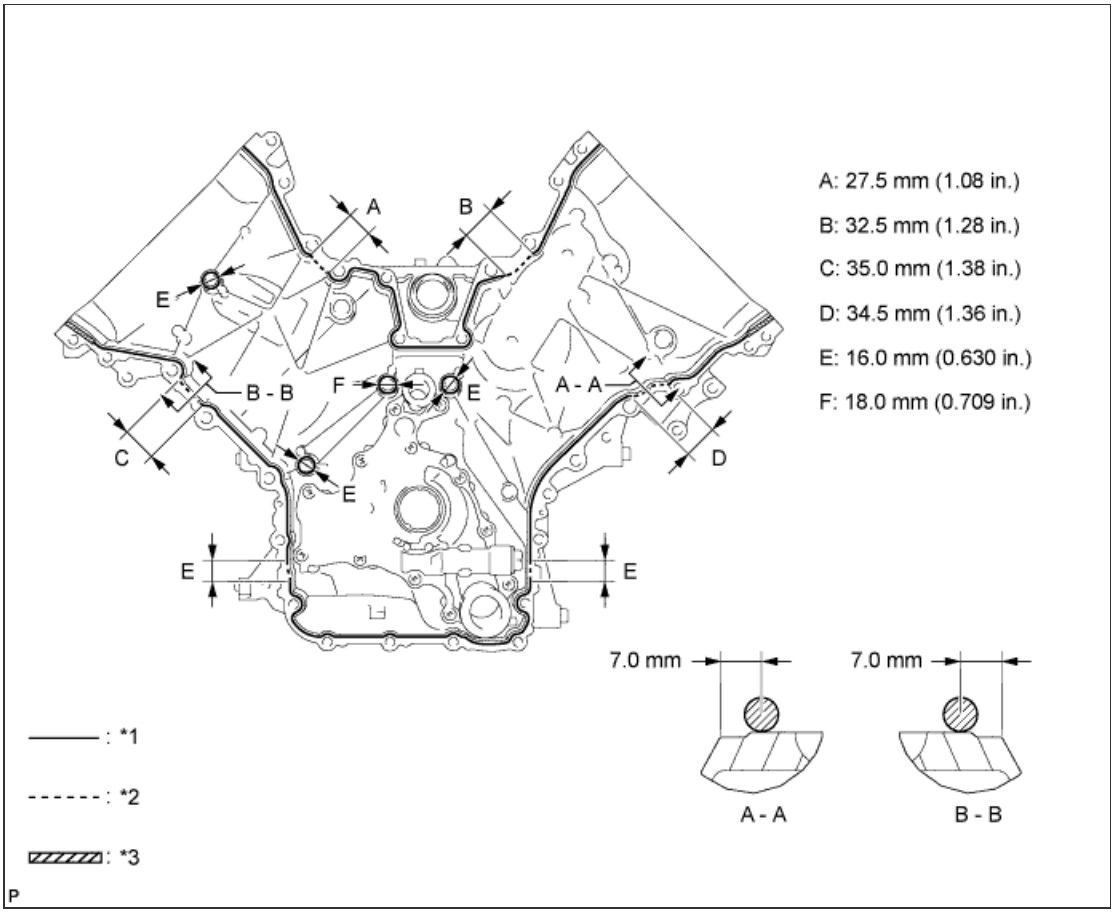
for Preparation Click here

1. INSTALL WATER INLET PIPE

a. Apply soapy water to 2 new O-rings and install them to the inlet pipe.

b. Install the inlet pipe to the No. 1 heat exchanger cover.

2. INSTALL TIMING CHAIN COVER SUB-ASSEMBLY



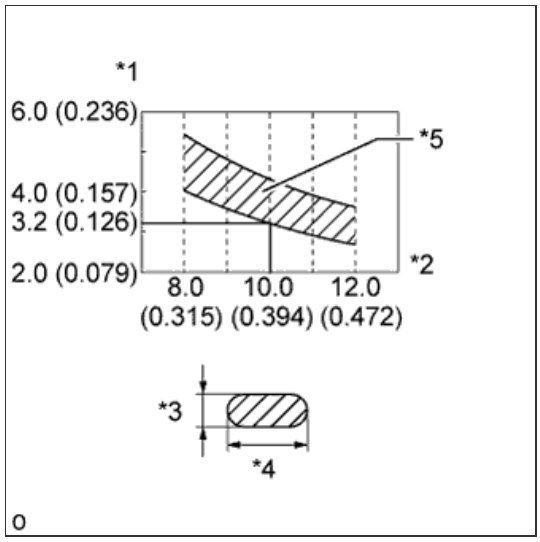
a. Apply a light coat of engine oil to a new oil pump gasket.

b. Install the oil pump gasket.

c. Apply a light coat of engine oil to a new O-ring.

d. Install the O-ring.

e. Apply seal packing in a continuous line to the timing chain cover as shown in the following illustration.



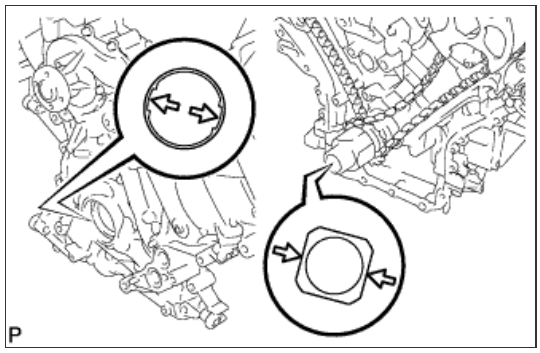
Text in Illustration

*1	Continuous line area	*2	Dashed line area
*3	Diagonal line area	-	-

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Apply Seal Packing as Follows:

Area	Seal Packing Diameter	Application Position from Inside Edge of Cover
Continuous Line Area	3.0 to 4.0 mm (0.118 to 0.157 in.)	2.5 mm (0.0984 in.)
Dashed Line Area	6.4 mm (0.252 in.) or more, or within OK area shown in illustration	7.0 mm (0.276 in.)
Diagonal Line Area	3.0 to 4.0 mm (0.118 to 0.157 in.)	5.5 mm (0.217 in.)



Text in Illustration

*1	Seal Packing Thickness mm (in.)
*2	Seal Packing Width mm (in.)
*3	Seal Packing Thickness
*4	Seal Packing Width
*5	OK Area

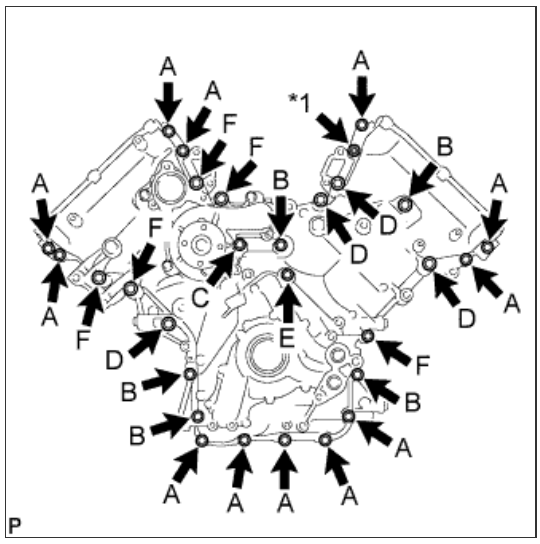
NOTICE:

- **When the contact surfaces are wet, wipe them with an oil-free cloth before applying seal packing.**
- **Install the chain cover within 3 minutes and tighten the bolts within 10 minutes after applying seal packing.**

f. Align the oil pump drive rotor spline and crankshaft as shown in the illustration. Install the spline and chain cover to the crankshaft.

g. Temporarily install the timing chain cover with the 28 bolts and nut.

Standard Bolt:

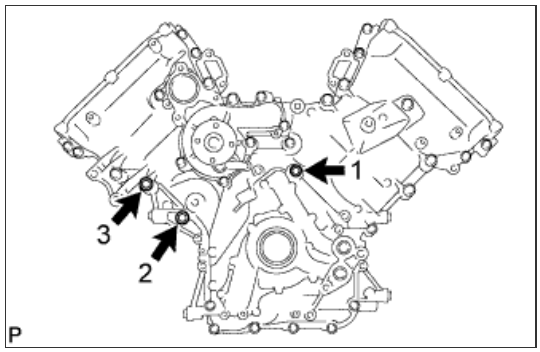


Item	Length	Thread Diameter
Bolt A	25 mm (0.984 in.)	8 mm (0.315 in.)
Bolt B	55 mm (2.17 in.)	8 mm (0.315 in.)
Bolt C	70 mm (2.76 in.)	8 mm (0.315 in.)
Bolt D	35 mm (1.38 in.)	10 mm (0.394 in.)
Bolt E	55 mm (2.17 in.)	10 mm (0.394 in.)
Bolt F	80 mm (3.15 in.)	10 mm (0.394 in.)

Text in Illustration

*1	Nut

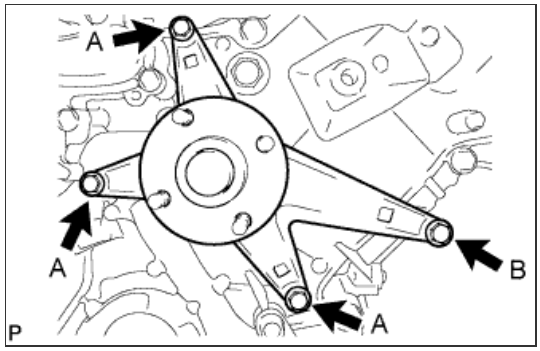
NOTICE:



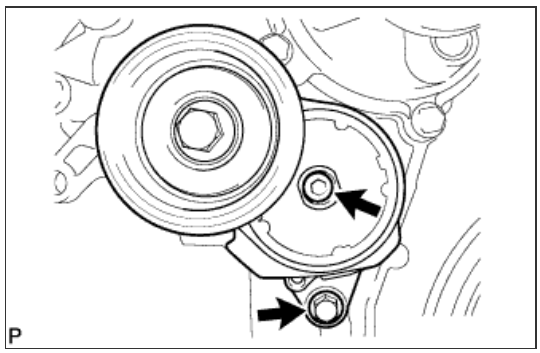
Make sure that there is no oil on the bolt threads.

h. Tighten the 3 bolts in several steps in the sequence shown in the illustration.

Torque:



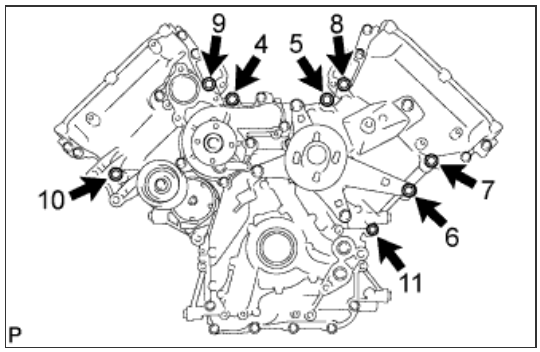
47 N*m{ 479 kgf*cm , 35 ft.*lbf }



i. Temporarily install the fluid coupling bracket with the 4 bolts.

Standard Bolt:

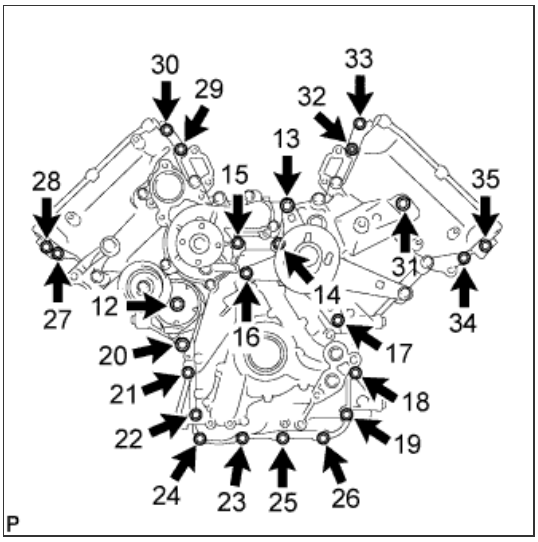
Item	Length	Thread Diameter
Bolt A	70 mm (2.76 in.)	8 mm (0.315 in.)
Bolt B	80 mm (3.15 in.)	10 mm (0.394 in.)



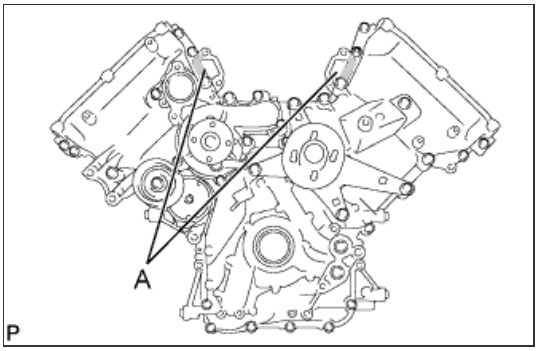
j. Temporarily install the belt tensioner with the standard bolt and 6 mm hexagon wrench bolt.

k. Tighten the 8 bolts labeled 4 to 11 in several steps in the sequence shown in the illustration.

Torque:
47 N*m{ 479 kgf*cm , 35 ft.*lbf }



l. Tighten the 23 bolts and nut labeled 12 to 35 in several steps in the sequence shown in the illustration.

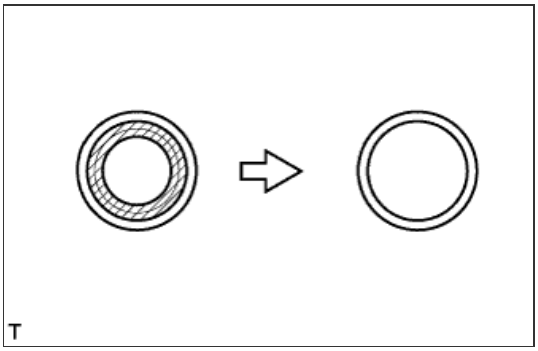


Torque:
23 N*m{ 235 kgf*cm , 17 ft.*lbf }

NOTICE:

- **Do not start the engine for at least 2 hours after installing.**

- **After the installation, if the seal packing has seeped out at the areas labeled A shown in the illustration, wipe it off.**



3. INSTALL SPARK PLUG TUBE GASKET

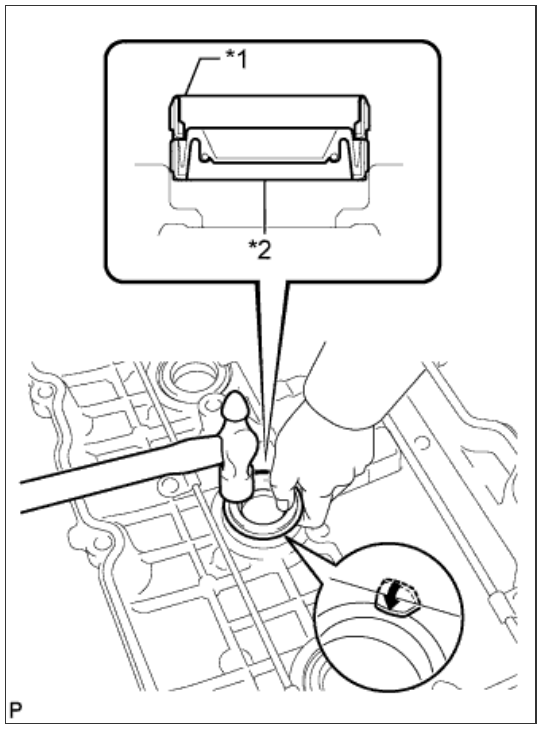
a. Using a cutter knife, cut off the seal part of the removed gasket.

Text in Illustration

	Area to cut off

b. Using the removed gasket and a hammer, tap in a new gasket until it stops.

Text in Illustration



*1	Removed Gasket
*2	New Gasket

HINT:

If the removed gasket does not fit on the new one, correct the removed one with pliers.

c. Apply a light coat of MP grease to the lip of the gasket.

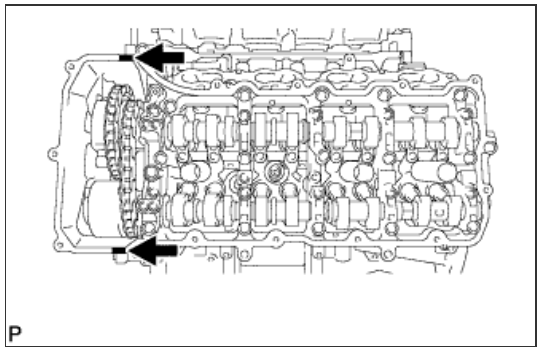
d. Return the 4 ventilation baffle plate claws to the original positions.

4. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY LH

a. Install 5 new gaskets to the camshaft bearing caps (No. 2, No. 3).

b. Install a new gasket to the cylinder head cover.

NOTICE:



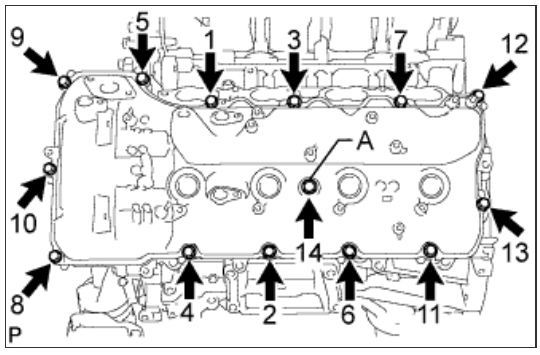
Remove any oil from the contact surface.

c. Apply seal packing as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Text in Illustration

➡	Seal Packing



NOTICE:

- **Remove any oil from the contact surface.**
- **Install the cylinder head cover within 3 minutes and tighten the bolts within 15 minutes after applying seal packing.**

d. Install the cylinder head cover and a new seal washer with the 14 bolts in the order shown in the illustration.

Torque:
for bolt A:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
except bolt A:
12 N*m{ 122 kgf*cm , 9 ft.*lbf }

NOTICE:

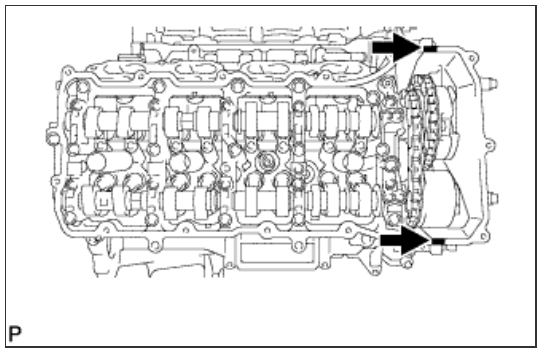
Do not start the engine for at least 2 hours after the installation.

5. INSTALL CYLINDER HEAD COVER SUB-ASSEMBLY RH

a. Install 5 new gaskets to the camshaft bearing caps. (No. 1, No. 3).

b. Install a new gasket to the cylinder head cover.

NOTICE:



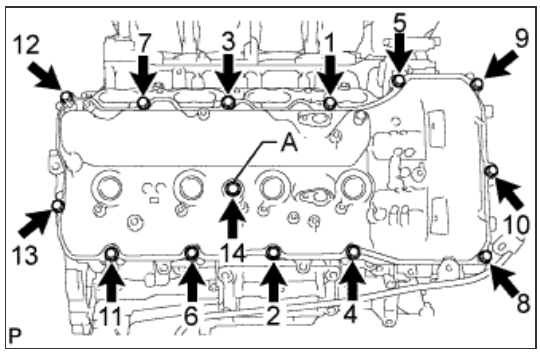
Remove any oil from the contact surface.

c. Apply seal packing as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Text in Illustration

➡	Seal Packing



NOTICE:

- **Remove any oil from the contact surface.**
- **Install the cylinder head cover within 3 minutes and tighten the bolts within 15 minutes after applying seal packing.**

d. Install the cylinder head cover and a new seal washer with the 14 bolts in the order shown in the illustration.

Torque:
for bolt A:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
except bolt A:
12 N*m{ 122 kgf*cm , 9 ft.*lbf }

NOTICE:

Do not start the engine for at least 2 hours after the installation.

e. Install the noise filter to the cylinder head cover with the bolt.

Torque:
7.0 N*m{ 71 kgf*cm , 2 in.*lbf }

. INSTALL IGNITION COIL ASSEMBLY

a. Install the 8 ignition coils with the 8 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

7. INSTALL CRANKSHAFT TIMING GEAR KEY

a. Install the crankshaft timing gear key to the crankshaft.

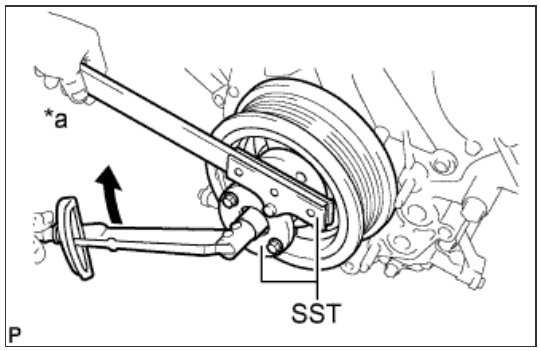
8. CONNECT WIRE HARNESS CLAMP BRACKET

a. Connect the bracket to the timing chain cover with the bolt.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

9. INSTALL CRANKSHAFT PULLEY

a. Align the pulley set key with the key groove of the pulley, and slide on the pulley.



b. Using SST, install the pulley set bolt.

SST
09213-70011
09330-00021

Torque:
300 N*m{ 3059 kgf*cm , 221 ft.*lbf }

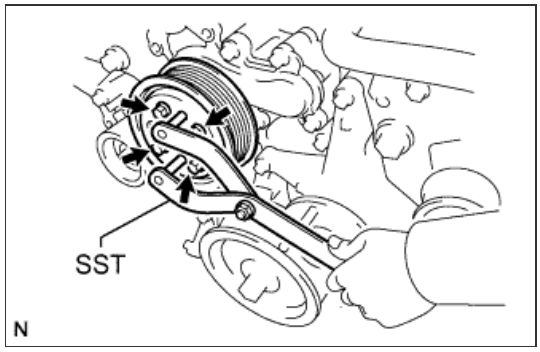
Text in Illustration

*a	Hold
➡	Turn

10. INSTALL NO. 1 IDLER PULLEY SUB-ASSEMBLY

a. Install the idler pulley with the bolt.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }



11. INSTALL WATER PUMP PULLEY

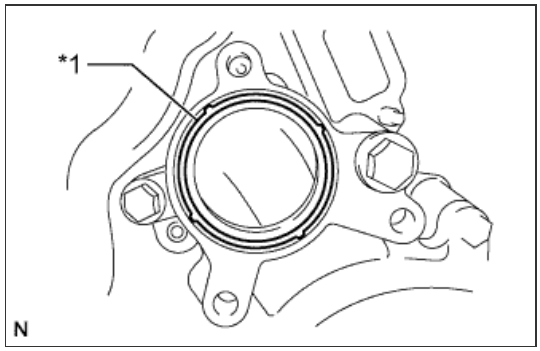
a. Temporarily install the pulley with the 4 bolts.

b. Using SST, hold the pulley and tighten the 4 bolts.

SST
09960-10010 (09962-01000, 09963-01000)

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

12. INSTALL WATER INLET HOUSING



a. Install a new gasket to the timing chain cover.

b. Install the water inlet with the 3 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

Text in Illustration

*1	Gasket

13. INSTALL NO. 1 ENGINE COVER

14. INSTALL NO. 2 ENGINE COVER

15. INSTALL FRONT WATER BY-PASS JOINT

a. Install 2 new gaskets and the water by-pass joint with the 4 nuts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

b. Connect the No. 2 water by-pass hose to the water by-pass joint.

16. INSTALL WATER BY-PASS PIPE SUB-ASSEMBLY

a. Connect the 2 hoses.

b. Install the water by-pass pipe with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

17. INSTALL NO. 1 WATER BY-PASS HOSE

a. Install the No. 1 water by-pass hose by connecting the hose to the water inlet housing and front water by-pass joint.

18. INSTALL GENERATOR ASSEMBLY

a. Install the stud bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install the generator with the 3 bolts and nut.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

c. Connect the generator connector.

d. Connect the generator wire with the nut.

Torque:
12 N*m{ 122 kgf*cm , 9 ft.*lbf }

e. Install the terminal cap.

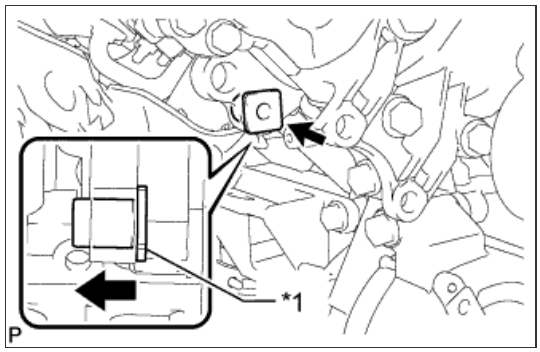
f. Install the harness bracket to the generator with the bolt.

Torque:
31 N*m{ 316 kgf*cm , 23 ft.*lbf }

19. CONNECT OIL COOLER PIPE ASSEMBLY

a. Connect the oil cooler pipe with the 2 bolts.

Torque:
14 N*m{ 143 kgf*cm , 10 ft.*lbf }

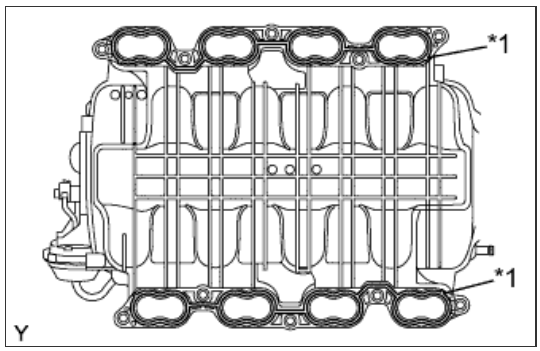


20. CONNECT VANE PUMP ASSEMBLY

HINT:

Before performing the following procedures, move the spacer until the vane pump can be installed.

Text in Illustration



*1	Spacer

a. Connect the vane pump to the timing chain cover with the 2 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

21. INSTALL INTAKE MANIFOLD

a. Place 2 new gaskets on the intake manifold.

Text in Illustration

*1	Gasket

b. Place the intake manifold on the cylinder head.

c. Install and uniformly tighten the 8 bolts and 2 nuts in several steps.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

d. Install the wire bracket to the intake manifold with the bolt.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

e. Connect the 3 wire clamps to the 3 wire brackets.

f. Install the No. 3 engine cover.

g. Install the No. 1 engine cover sub-assembly.

h. Connect the purge VSV connector.

i. Connect the purge line hose to the purge VSV.

j. Connect the vacuum switching valve connector (for ACIS).

k. Connect the No. 1 ventilation hose.

l. Connect the 2 water by-pass hoses.

m. Connect the throttle body connector.

n. Connect the ventilation hose to the ventilation pipe of the cylinder head cover LH and RH.

22. INSTALL OIL FILTER BRACKET

a. Apply a light coat of engine oil to 2 new O-rings.

b. Install the 2 O-rings to the timing chain cover.

c. Install the oil filter bracket with the 2 nuts and 2 bolts.

Torque:
35 N*m{ 357 kgf*cm , 2 ft.*lbf }

23. INSTALL NO. 1 OIL COOLER BRACKET

a. Connect the ground wire to the cylinder block.

b. Install the oil cooler bracket with the 2 nuts.

Torque:

21 N*m{ 214 kgf*cm , 15 ft.*lbf }

24. INSTALL NO. 2 WATER BY-PASS PIPE SUB-ASSEMBLY

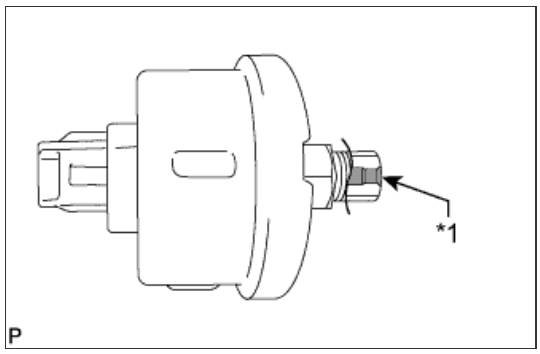
a. Connect the 4 hoses.

b. Install the water by-pass pipe with the 3 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

25. INSTALL OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Apply adhesive to 2 or 3 threads of the oil pressure sender gauge.



Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not allow adhesive to contact the oil hole.

Text in Illustration

*1	Oil Hole

b. Install the oil pressure sender gauge.

Torque:
15 N*m{ 153 kgf*cm , 11 ft.*lbf }

NOTICE:

Do not start the engine within 1 hour after installation.

c. Connect the sender gauge connector.

26. INSTALL ENGINE OIL LEVEL DIPSTICK GUIDE

a. Apply a light coat of engine oil to a new O-ring.

b. Install the O-ring to the guide.

c. Install the dipstick guide with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

d. Install the dipstick.

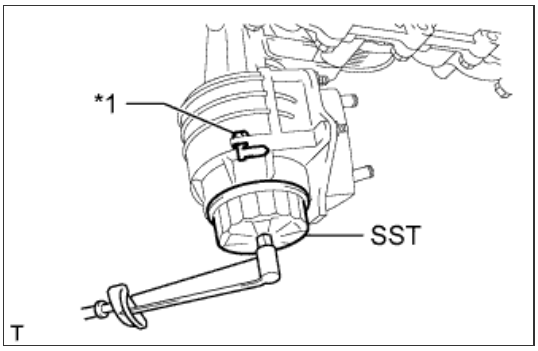
e. Connect the wire harness clamp.

27. INSTALL OIL FILTER ELEMENT

a. Clean the inside of the oil filter cap, its threads and its O-ring groove.

b. Apply a small amount of engine oil to a new O-ring and install it to the oil filter cap.

c. Set a new oil filter element to the oil filter cap.



d. Remove any dirt or foreign matter from the installation surface of the engine.

e. Apply a small amount of engine oil to the O-ring again and temporarily install the oil filter cap.

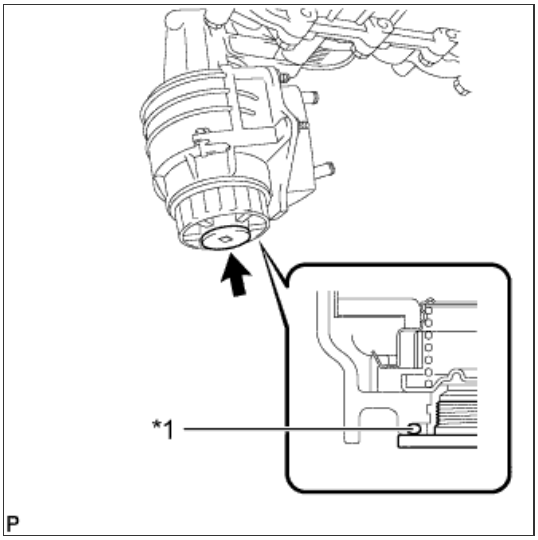
NOTICE:

Do not remove the oil filter bracket clip.

f. Using SST, tighten the oil filter cap.

SST
09228-0 501

Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }



Text in Illustration

*1	Oil Filter Bracket Clip

NOTICE:

- **When tightening the oil filter cap, do not remove the oil filter bracket clip.**
- **Make sure that the oil filter is installed securely as shown in the illustration.**
- **Be careful that the O-ring does not get caught between any surrounding parts.**

g. Apply a small amount of engine oil to a new drain plug O-ring, and install it to the oil filter cap.

Text in Illustration

*1	O-Ring

NOTICE:

Before installing the O-ring, remove any dirt or foreign matter from the installation surface of the oil filter cap.

h. Install the oil filter drain plug.

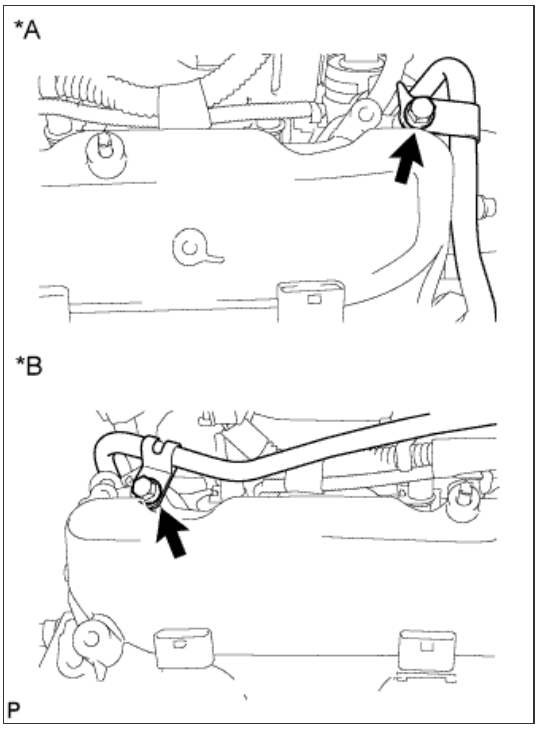
Torque:
13 N*m{ 127 kgf*cm , 9 ft.*lbf }

NOTICE:

Be careful that the O-ring does not get caught between any surrounding parts.

i. Install the No. 2 engine under cover seal with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }



28. CONNECT NO. 2 FUEL TUBE SUB-ASSEMBLY

a. Connect the fuel tube with the 2 bolts.

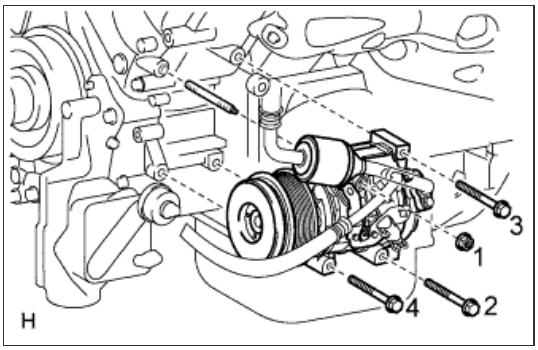
Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

Text in Illustration

*A	LH Side
*B	RH Side

29. CONNECT COOLER COMPRESSOR ASSEMBLY

a. Install the cooler compressor with the stud bolt.



Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install the 3 bolts and nut.

Torque:
25 N*m{ 250 kgf*cm , 18 ft.*lbf }

NOTICE:

Tighten the bolts and nut in the order shown in the illustration to install the cooler compressor.

30. CONNECT WATER PIPE AND HOSE SUB-ASSEMBLY

a. Connect the water pipe and hose to the cylinder head cover with the 2 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

b. Connect the 3 hoses.

31. CONNECT ENGINE WIRE

a. Connect the 2 clamps and power steering oil pressure switch connector.

b. Engine Room RH Side:

i. Connect the 5 clamps.

ii. Connect the throttle position sensor and throttle control motor connector.

iii. Install the ground wire with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

iv. Connect the noise filter connector.

v. Connect the 2 VVT sensor connectors.

vi. Connect the injector connector.

vii. Connect the 4 ignition coil connectors.

viii. Connect the 2 camshaft timing oil control valve connectors.

c. Engine Room LH Side:

i. Connect the cooler compressor connector.

ii. Connect the 3 clamps.

iii. Connect the camshaft position sensor connector.

iv. Connect the 2 camshaft timing oil control valve connectors.

v. Connect the engine coolant temperature sensor connector.

vi. Connect the 4 clamps.

vii. Install the ground wire with the 2 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

viii. Connect the noise filter connector.

ix. Connect the 2 VVT sensor connectors.

x. Connect the 4 ignition coil connectors.

xi. Connect the injector connector.

xii. Connect the 2 connectors and 2 clips to the engine room junction block.

xiii. Install the engine room relay block cover.

32. INSTALL RADIATOR ASSEMBLY

(Click here)

33. INSTALL AIR CLEANER ASSEMBLY

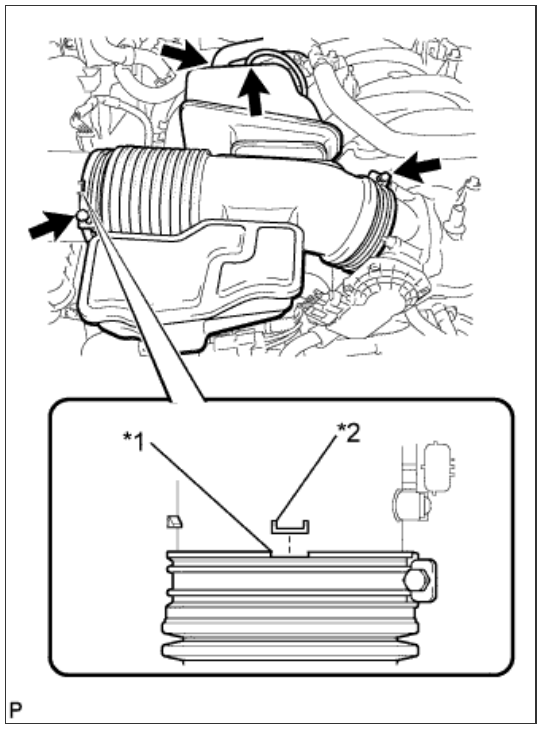
a. Install the air cleaner with the 3 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

34. INSTALL AIR CLEANER HOSE ASSEMBLY

a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

Text in Illustration



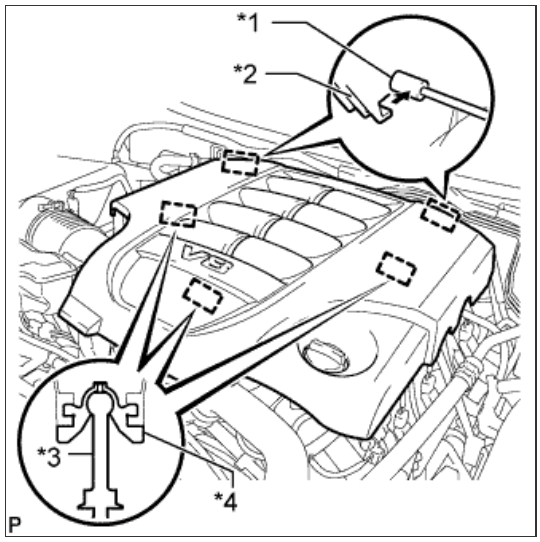
*1	Groove
*2	Protrusion

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum hose.

d. Connect the No. 2 ventilation hose.



35. INSTALL V-BANK COVER SUB-ASSEMBLY

a. Attach the 2 V-bank cover hooks to the bracket. Then align the 3 V-bank cover grommets with the 3 pins, and press down on the V-bank cover to attach the pins.

Text in Illustration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

3 . ADD ENGINE OIL

a. Add fresh oil and install the oil filler cap.

Standard Oil Grade:

Oil Grade	Oil Viscosity (SAE)
API grade SL "energy-conserving", API grade SM "energy-conserving" or ILSAC multigrade engine oil	5W-30 10W-30
API grade SL and SM multigrade engine oil	15W-40 20W-50

Standard Oil Capacity:

Item	Specified Condition
Drain and refill without oil filter change	7.1 liters (7.5 US qts, 6.2 Imp. qts)
Drain and refill with oil filter change	7.5 liters (7.9 US qts, 6.6 Imp. qts)

Dry fill	9.3 liters (9.8 US qts, 8.2 Imp. qts)

37. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item	Specified Condition
with rear heater	16.2 liters (17.1 US qts, 14.3 Imp. qts)
without rear heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the radiator inlet hose by hand, and checking when the engine coolant starts to flow inside the hose.

g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

i. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

38. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

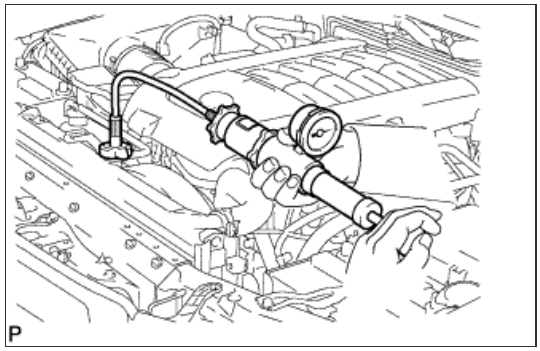
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

39. INSPECT FOR OIL LEAK

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

40. INSPECT FOR COOLANT LEAK



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

41. INSPECT ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

NOTICE:

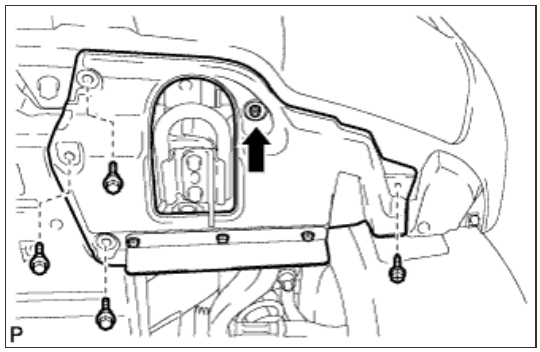
Do not fill engine oil above the full level mark.

42. INSTALL NO. 2 ENGINE UNDER COVER

a. Install the No. 2 engine under cover with the 2 bolts.

Torque:
29 N*m{ 29 kgf*cm , 21 ft.*lbf }

43. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the No. 1 engine under cover with the 10 bolts.

Torque:
29 N*m{ 29 kgf*cm , 21 ft.*lbf }

44. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

45. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

4 . INSTALL FRONT FENDER APRON SEAL FRONT RH

a. Install the fender apron seal with the 3 clips.

47. INSTALL FRONT FENDER APRON SEAL LH

a. Install the fender apron seal with the 3 clips.

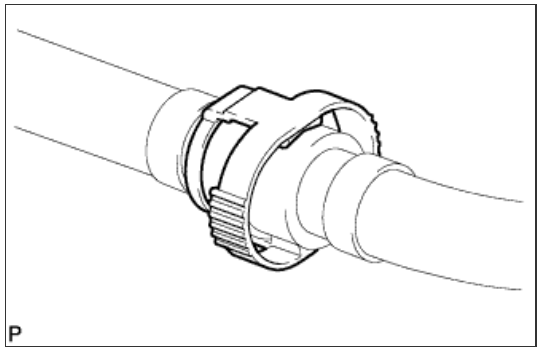
48. INSTALL COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

(Click here)

49. CONNECT RADIATOR SIDE DEFLECTOR LH

a. Connect the deflector with the 4 clips.

50. INSTALL TRANSMISSION OIL COOLER AIR DUCT



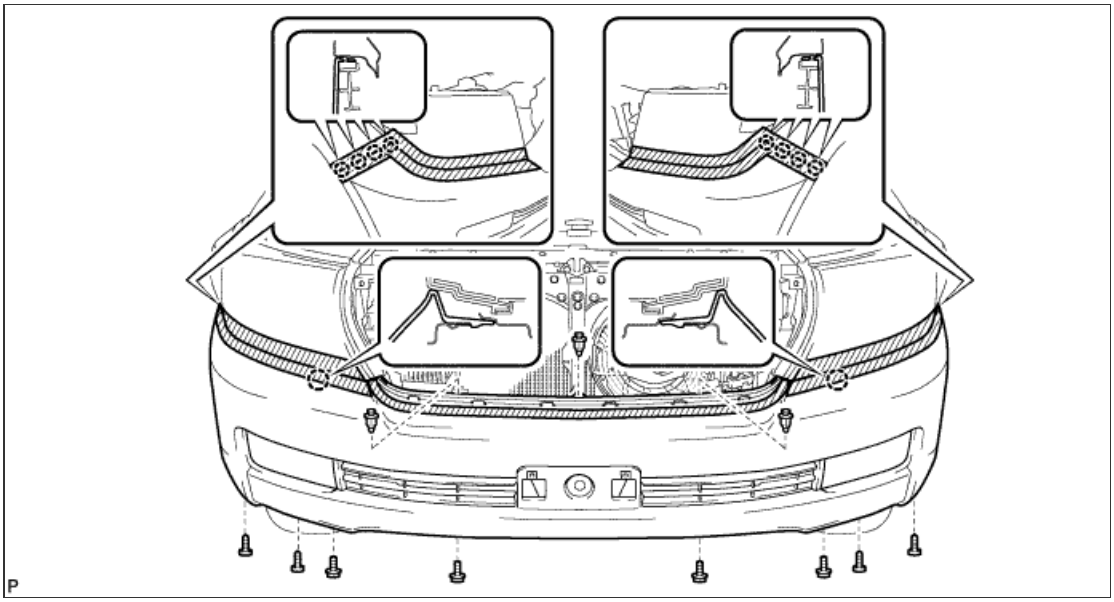
a. Install the oil cooler air duct with the 4 bolts.

Torque:
4.9 N*m{ 50 kgf*cm , 43 in.*lbf }

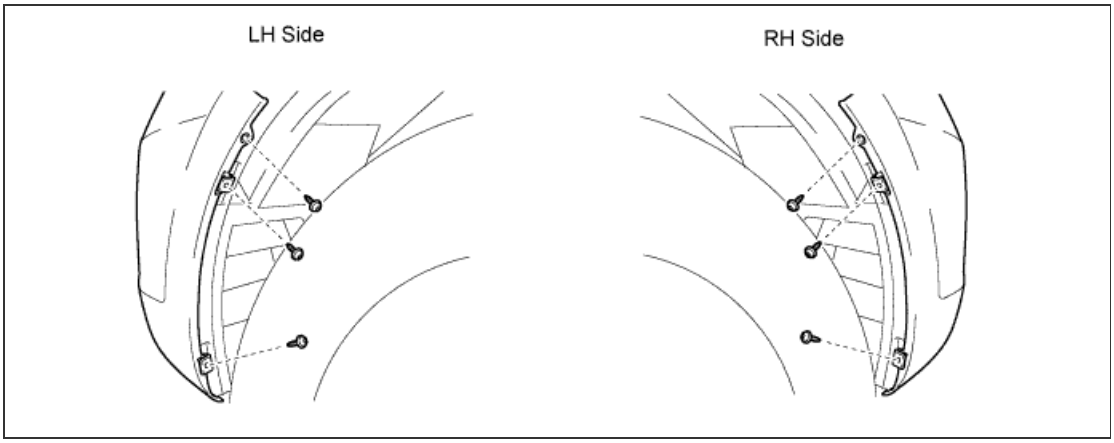
51. INSTALL FRONT BUMPER COVER

HINT:

For the front bumper cover with garnish, use the procedures described below.



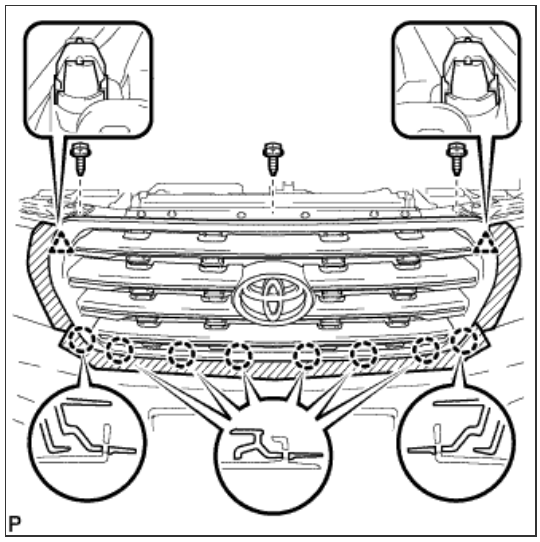
a. w/ Headlight Cleaner System:
Connect the headlight cleaner hose.



b. w/o TOYOTA Parking Assist-sensor System, w/o Fog Light:
Attach the 10 claws to install the bumper cover.

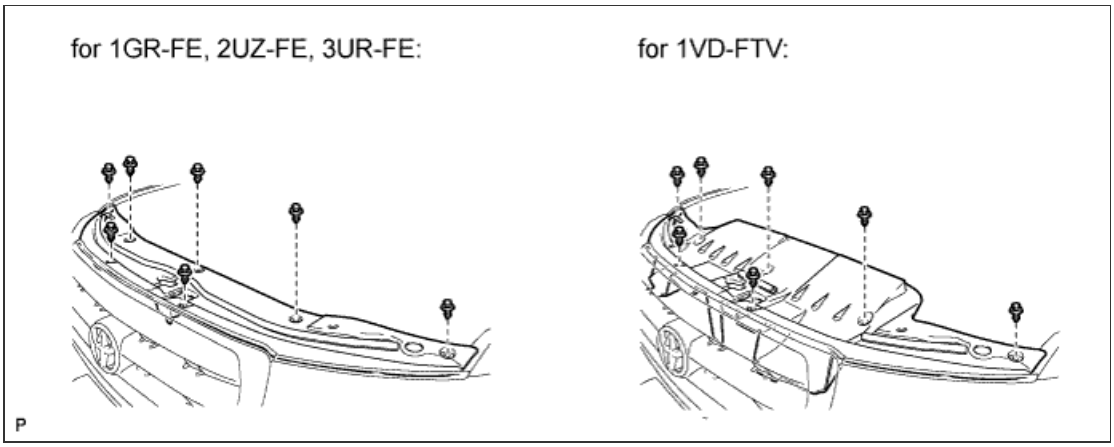
c. w/ TOYOTA Parking Assist-sensor System or w/ Fog Light:
Connect the No. 4 engine room wire connector and attach the 10 claws to install the bumper cover.

d. Install the 3 clips, 4 screws and 4 bolts.



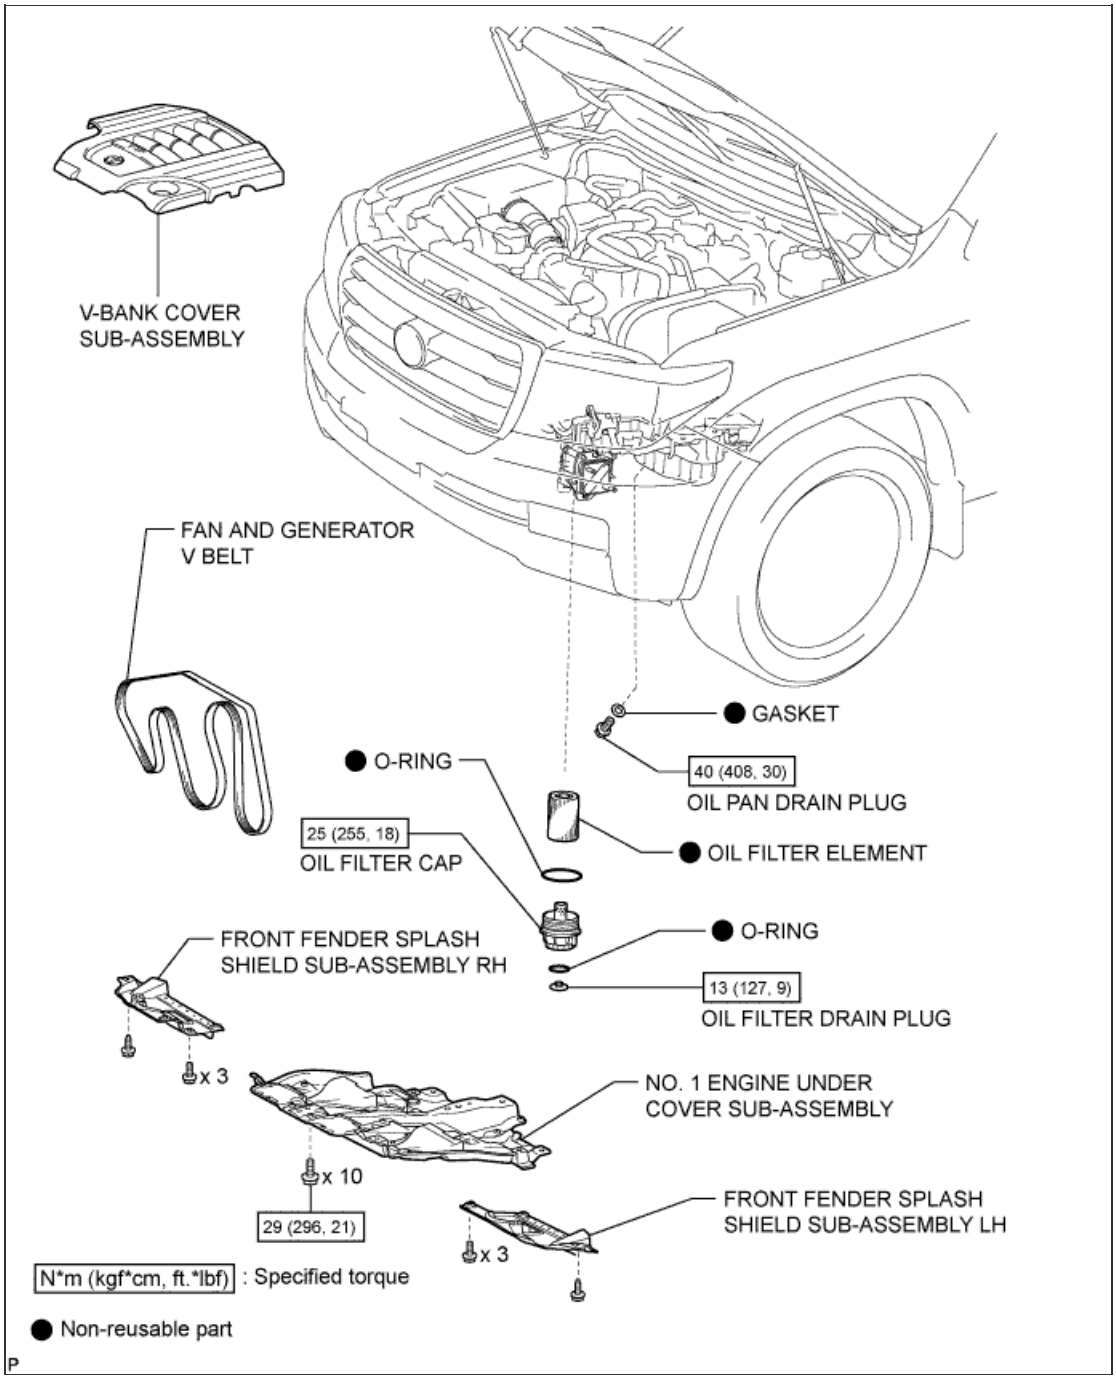
e. Using a T30 "TORX" socket, install the 6 screws.

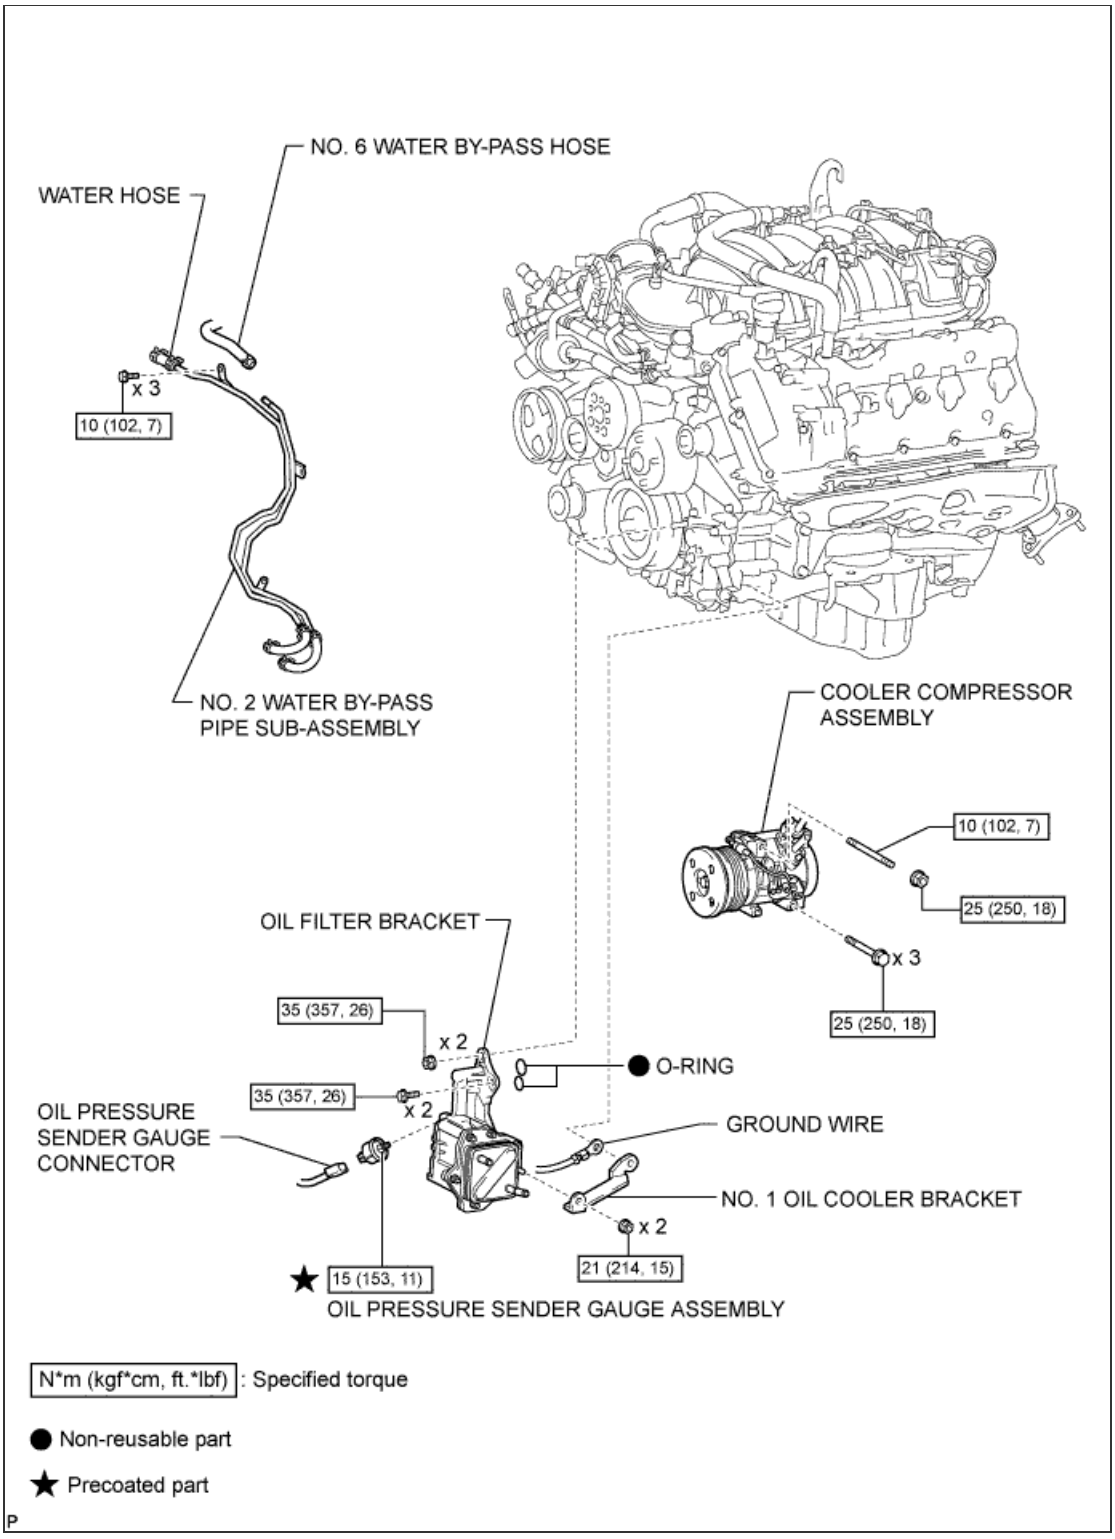
52. INSTALL RADIATOR GRILLE



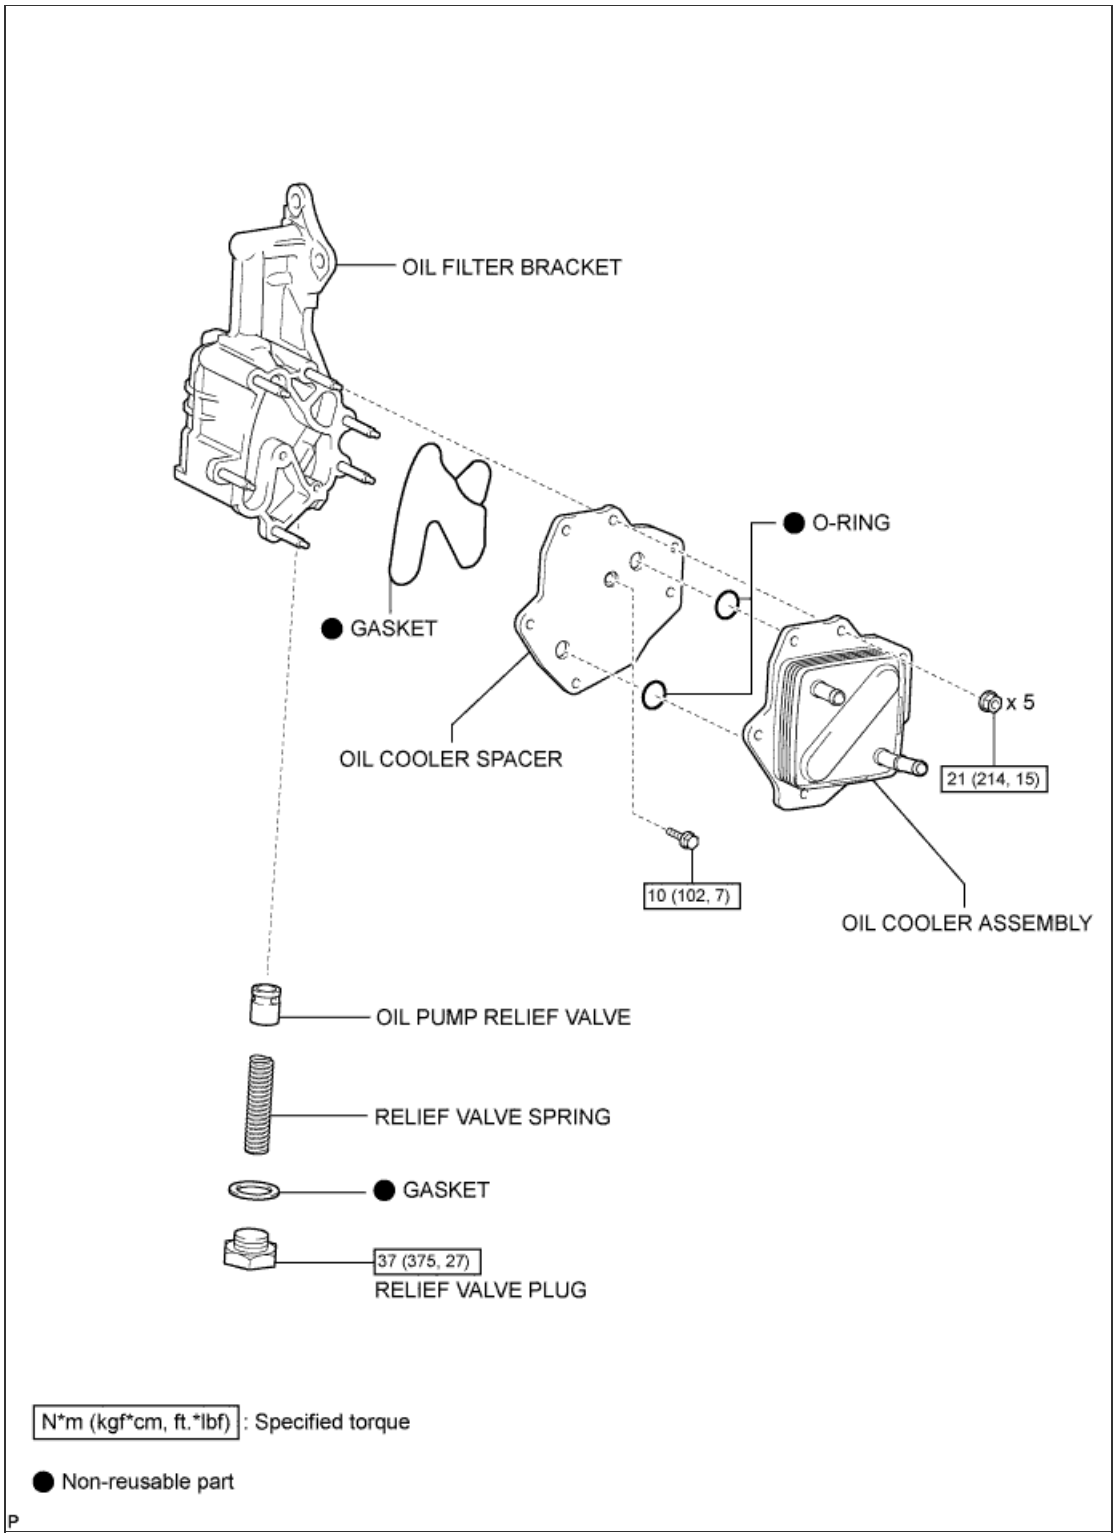
a. Attach the 2 clips and 8 claws to install the radiator grille.

b. Install the 3 screws.





53. INSTALL UPPER RADIATOR SUPPORT SEAL



a. Install the radiator support seal with the 7 clips.

for Preparation Click here

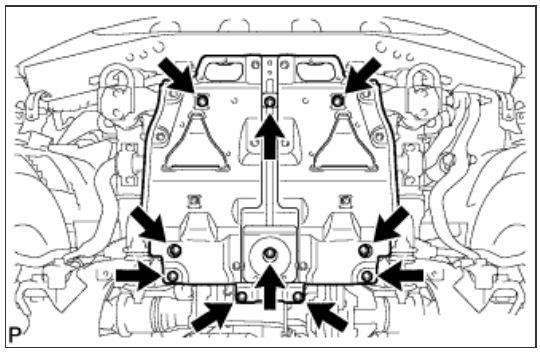
1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

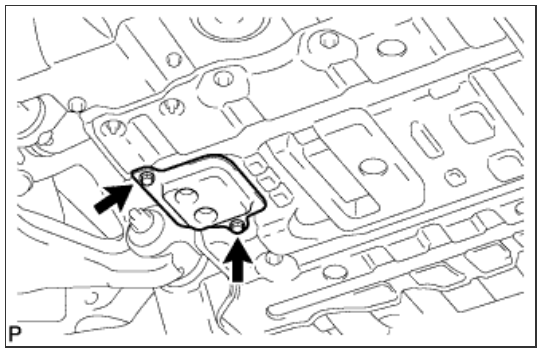
HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE OIL



a. Remove the oil filler cap.

b. Remove the 2 bolts and No. 2 engine under cover seal.

c. Remove the oil pan drain plug and gasket, and drain the engine oil into a container.

d. Install a new gasket and the oil pan drain plug.

Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

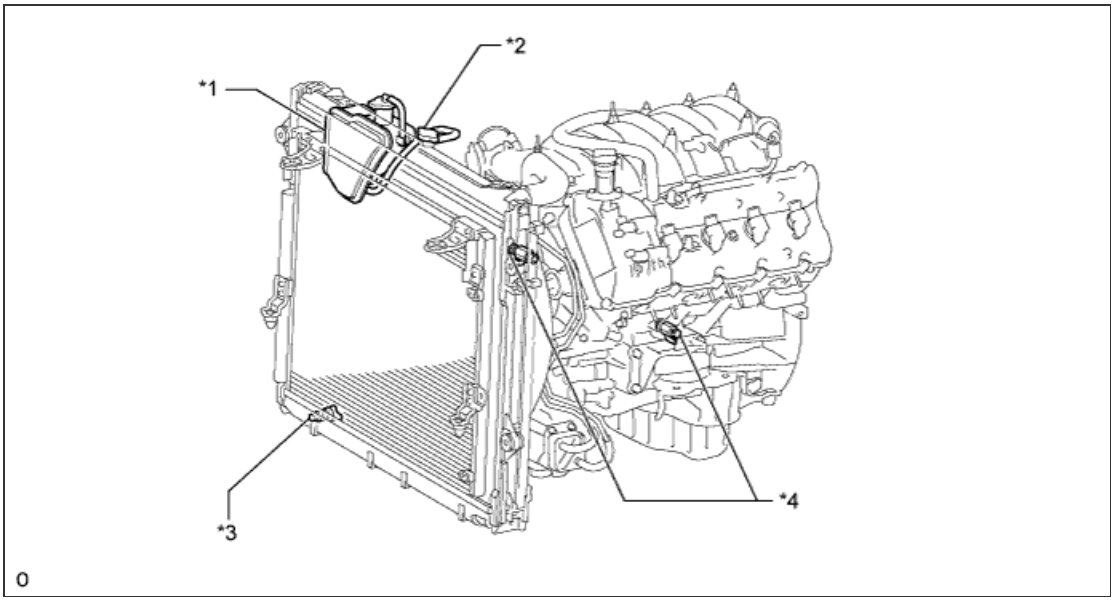
5. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

HINT:



Collect the coolant in a container and dispose of it according to the regulations in your area.

b. Remove the radiator cap. Then drain the coolant from the radiator.

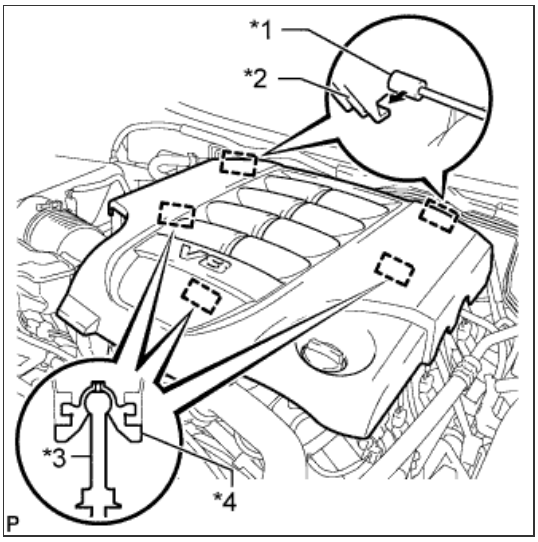
c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

Text in Illustration

*1	Radiator Reservoir	*2	Radiator Cap
*3	Radiator Drain Cock Plug	*4	Cylinder Block Drain Cock Plug



e. Tighten the radiator drain cock plug by hand.

6. REMOVE V-BANK COVER SUB-ASSEMBLY

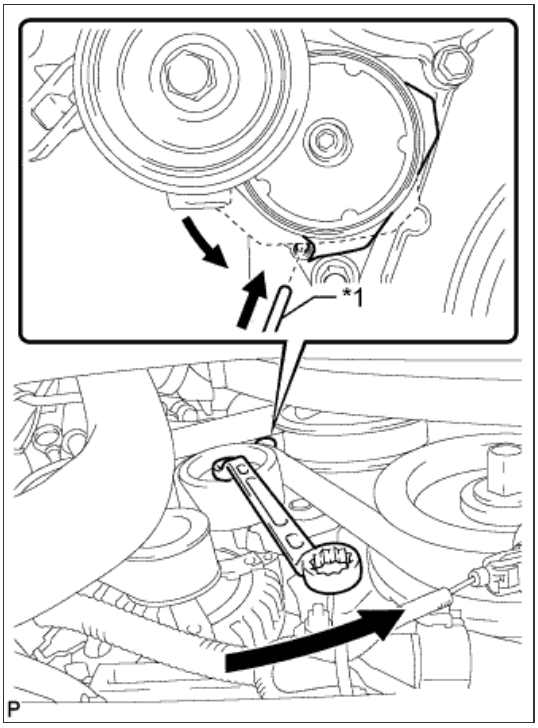
a. Raise the front of the V-bank cover to detach the 3 pins. Then remove the 2 V-bank cover hooks from the bracket, and remove the V-bank cover.

Text in Illustration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

7. REMOVE FAN AND GENERATOR V BELT

a. While turning the belt tensioner counterclockwise, align the service hole for the belt tensioner and the belt tensioner fixing position, and then insert a bar of 5 mm (0.197 in.) into the service hole to fix the belt tensioner in place.



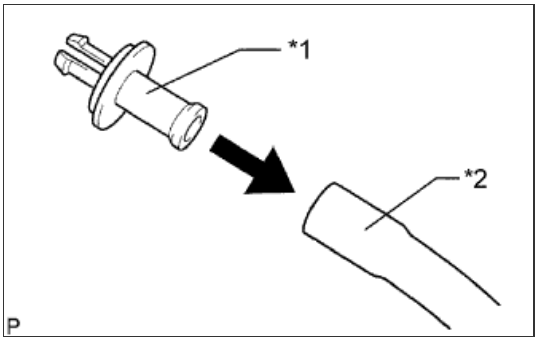
Text in Illustration

*1	Bar

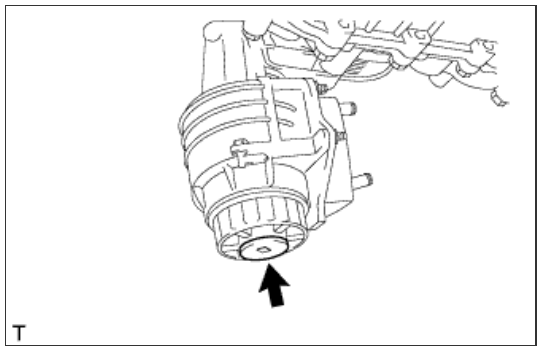
HINT:

The pulley bolt for the belt tensioner has a left-hand thread.

b. Remove the V belt.



8. REMOVE OIL FILTER ELEMENT



a. Connect a hose with an inside diameter of 15 mm (0.591 in.) to the pipe.

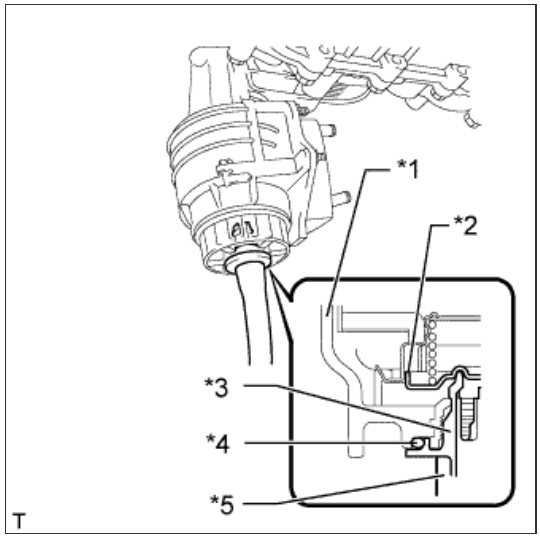
Text in Illustration

*1	Pipe
*2	Hose

b. Remove the oil filter drain plug.

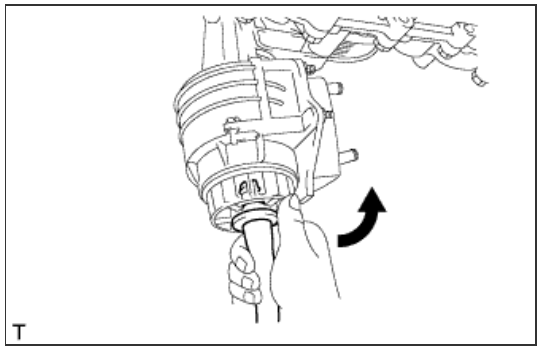
c. Install the pipe to the oil filter cap.

Text in Illustration



*1	Cap
*2	Valve
*3	Pipe
*4	O-Ring
*5	Hose

NOTICE:



If the O-ring is removed with the drain plug, install the O-ring together with the pipe.

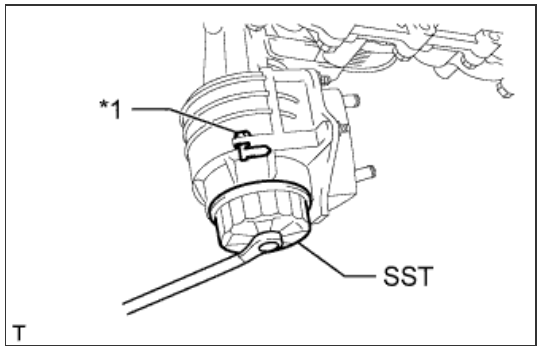
HINT:

Use a container to catch the draining oil.

d. Check that oil is drained from the oil filter. Then disconnect the pipe and remove the O-ring as shown in the illustration.

e. Using SST, remove the oil filter cap.

SST



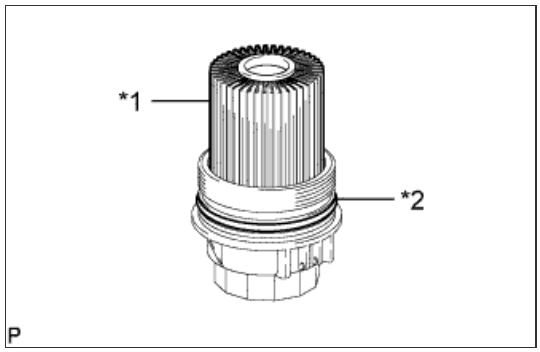
09228-06501

Text in Illustration

*1	Oil Filter Bracket Clip

NOTICE:

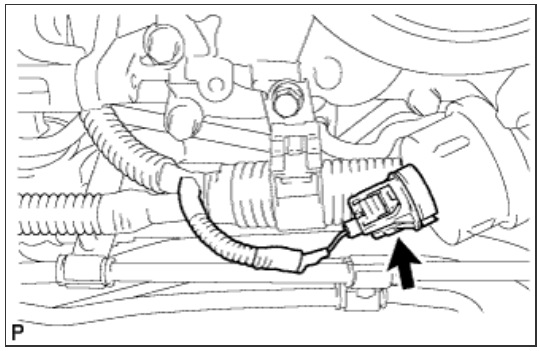
Do not remove the oil filter bracket clip.



f. Remove the oil filter element and O-ring from the oil filter cap.

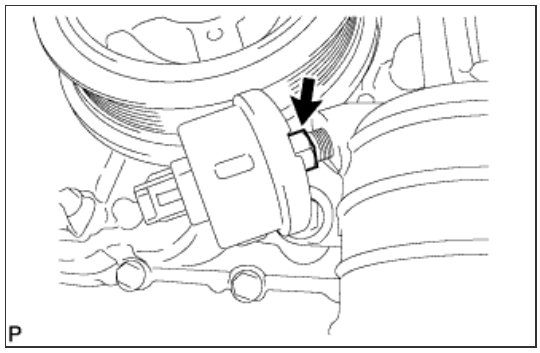
Text in Illustration

*1	Oil Filter Element
*2	O-Ring



NOTICE:

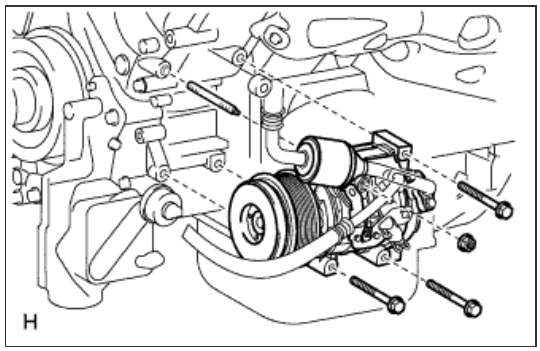
Be sure to remove the cap O-ring by hand, without using any tools, to prevent damage to the cap O-ring groove.



9. REMOVE OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Disconnect the sender gauge connector.

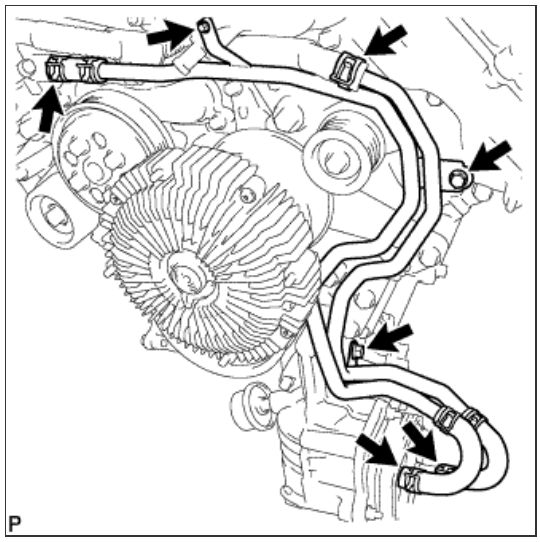
b. Remove the oil pressure sender gauge.



10. DISCONNECT COOLER COMPRESSOR ASSEMBLY

a. Remove the 3 bolts, nut and stud bolt, and disconnect the cooler compressor.

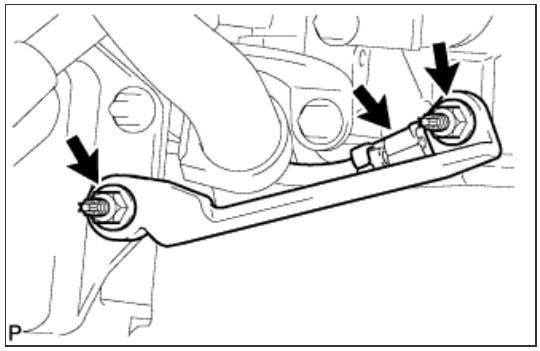
HINT:



It is not necessary to completely remove the compressor. With the hoses connected to the compressor, hang the compressor on the vehicle body with a rope.

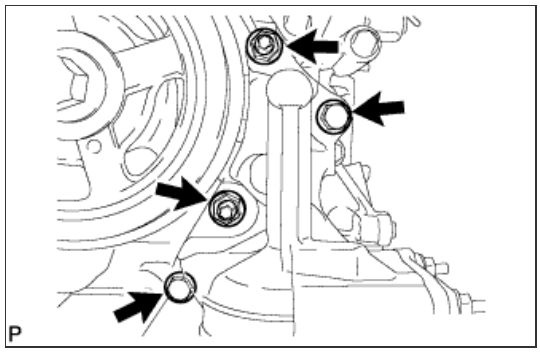
11. REMOVE NO. 2 WATER BY-PASS PIPE SUB-ASSEMBLY

a. Remove the 3 bolts.



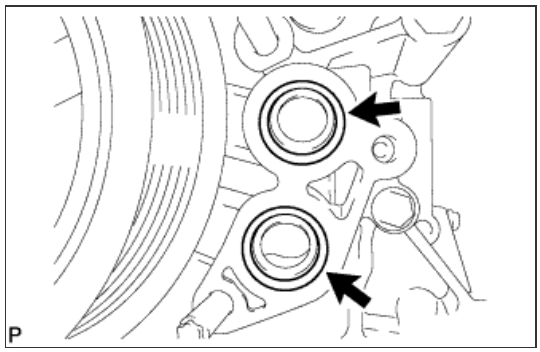
b. Disconnect the 4 hoses and remove the water by-pass pipe.

12. REMOVE NO. 1 OIL COOLER BRACKET



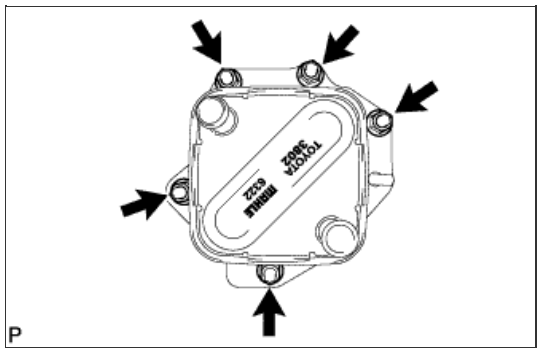
a. Remove the 2 nuts and bracket.

b. Disconnect the ground wire from the cylinder block.

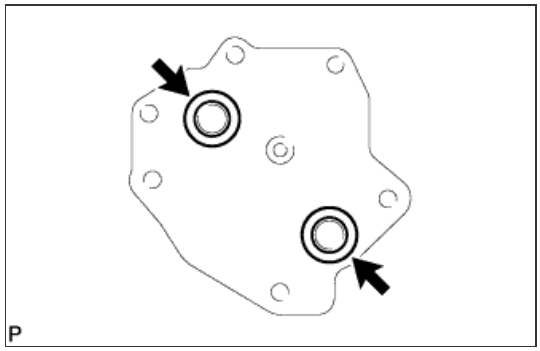


13. REMOVE OIL FILTER BRACKET

a. Remove the 2 bolts, 2 nuts and filter bracket.

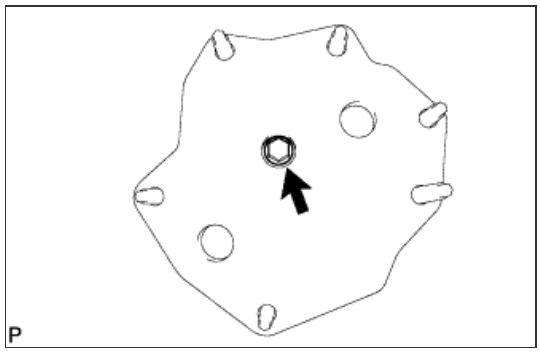


b. Remove the 2 O-rings.



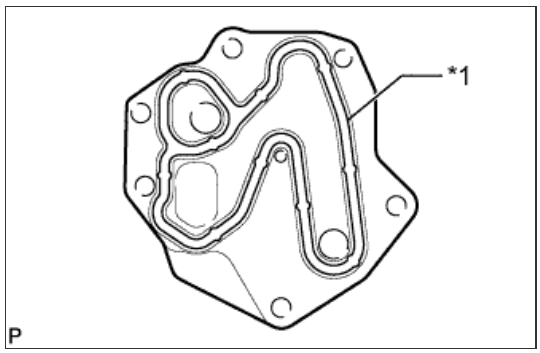
14. REMOVE OIL COOLER ASSEMBLY

a. Remove the 5 nuts and oil cooler from the oil filter bracket.



b. Remove the 2 O-rings.

15. REMOVE OIL COOLER SPACER

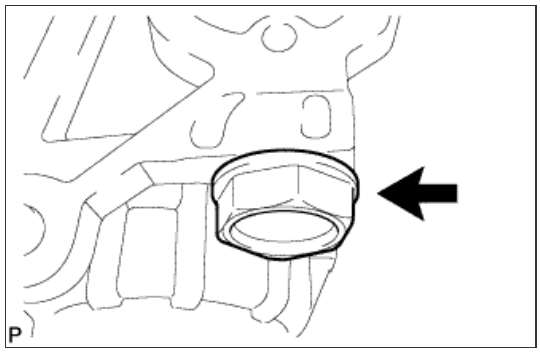


a. Remove the bolt and oil cooler spacer from the oil filter bracket.

b. Remove the gasket.

Text in Illustration

*1	Gasket



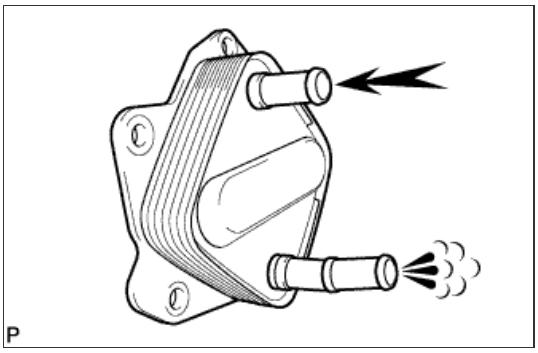
for Preparation Click here

1. REMOVE OIL PUMP RELIEF VALVE

a. Remove the relief valve plug and gasket.

b. Remove the valve spring and oil pump relief valve.

for Preparation Click here

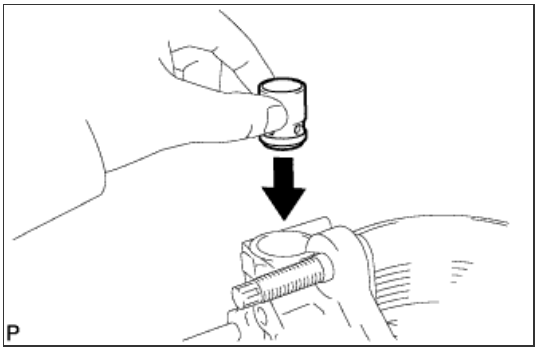


1. INSPECT OIL COOLER ASSEMBLY

a. Check the oil cooler for damage or clogging.

Text in Illustration

➡	Air



If necessary, replace the oil cooler assembly.

2. INSPECT OIL PUMP RELIEF VALVE

a. Coat the relief valve with engine oil.

b. Check that the relief valve falls smoothly into the valve hole by its own weight. If the relief valve does not fall smoothly, replace it. If necessary, replace the oil filter bracket.

for Preparation Click here

1. INSTALL OIL PUMP RELIEF VALVE

a. Coat the oil pump relief valve with engine oil.

b. Install the relief valve and valve spring into the oil pump cover hole.

c. Install a new gasket and the plug.

Torque:
37 N*m{ 375 kgf*cm , 27 ft.*lbf }

for Preparation Click here

1. INSTALL OIL COOLER SPACER

a. Apply a light coat of engine oil to a new gasket.

b. Install the gasket to the oil cooler spacer.

c. Install the oil cooler spacer to the oil filter bracket with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

2. INSTALL OIL COOLER ASSEMBLY

a. Apply a light coat of engine oil to 2 new O-rings.

b. Install the 2 O-rings to the oil cooler.

c. Install the oil cooler with the 5 nuts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

3. INSTALL OIL FILTER BRACKET

a. Apply a light coat of engine oil to 2 new O-rings.

b. Install the 2 O-rings to the timing chain cover.

c. Install the oil filter bracket with the 2 nuts and 2 bolts.

Torque:
35 N*m{ 357 kgf*cm , 26 ft.*lbf }

4. INSTALL NO. 1 OIL COOLER BRACKET

a. Connect the ground wire to the cylinder block.

b. Install the oil cooler bracket with the 2 nuts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

5. INSTALL NO. 2 WATER BY-PASS PIPE SUB-ASSEMBLY

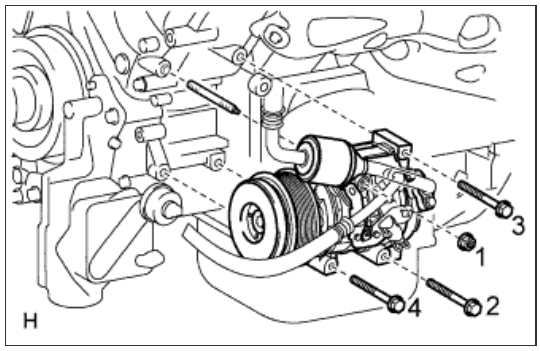
a. Connect the 4 hoses.

b. Install the water by-pass hose with the 3 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

6. CONNECT COOLER COMPRESSOR ASSEMBLY

a. Install the cooler compressor with the stud bolt.



Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install the 3 bolts and nut.

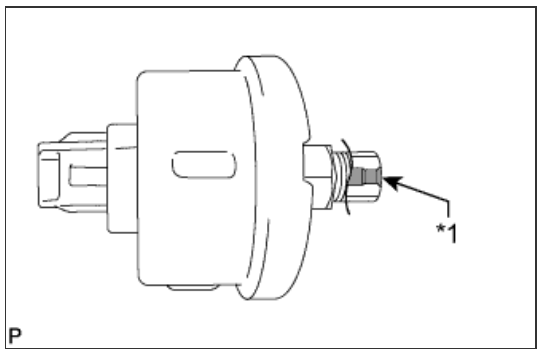
Torque:
25 N*m{ 250 kgf*cm , 18 ft.*lbf }

NOTICE:

Tighten the bolts and nut in the order shown in the illustration to install the cooler compressor.

7. INSTALL OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Apply adhesive to 2 or 3 threads of the oil pressure sender gauge.



Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not allow adhesive to contact the oil hole.

Text in Illustration

*1	Oil Hole

b. Install the oil pressure sender gauge.

Torque:
15 N*m{ 153 kgf*cm , 11 ft.*lbf }

NOTICE:

Do not start the engine within 1 hour after installation.

c. Connect the sender gauge connector.

8. INSTALL OIL FILTER ELEMENT

a. Clean the inside of the oil filter cap, its threads and its O-ring groove.

b. Apply a small amount of engine oil to a new O-ring and install it to the oil filter cap.

c. Set a new oil filter element to the oil filter cap.

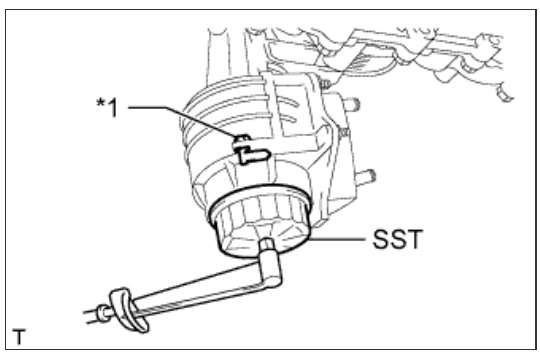
d. Remove any dirt or foreign matter from the installation surface of the engine.

e. Apply a small amount of engine oil to the O-ring again and temporarily install the oil filter cap.

NOTICE:

Do not remove the oil filter bracket clip.

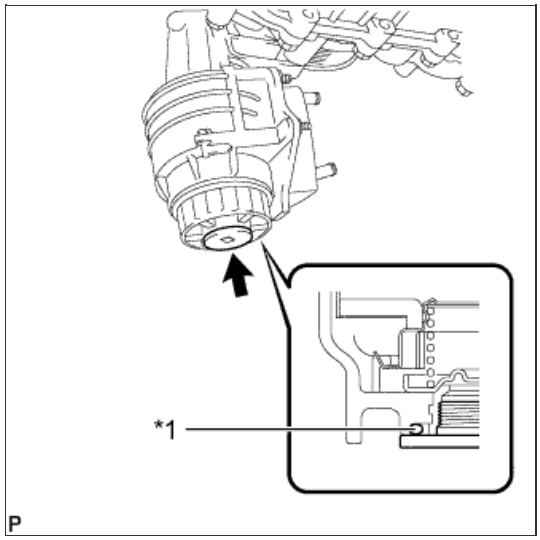
f. Using SST, tighten the oil filter cap.



SST
09228-06501

Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }

Text in Illustration



*1	Oil Filter Bracket Clip

NOTICE:

- When tightening the oil filter cap, do not remove the oil filter bracket clip.
- Make sure that the oil filter is installed securely as shown in the illustration.
- Be careful that the O-ring does not get caught between any surrounding parts.

g. Apply a small amount of engine oil to a new drain plug O-ring, and install it to the oil filter cap.

Text in Illustration

*1	O-Ring

NOTICE:

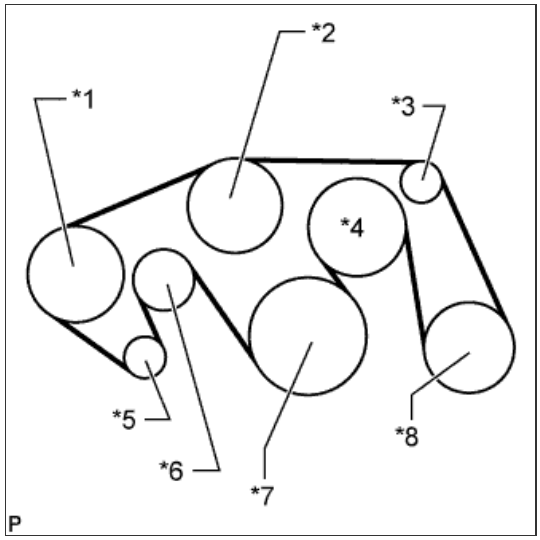
Before installing the O-ring, remove any dirt or foreign matter from the installation surface of the oil filter cap.

h. Install the oil filter drain plug.

Torque:
13 N*m{ 127 kgf*cm , 9 ft.*lbf }

NOTICE:

Be careful that the O-ring does not get caught between any surrounding parts.



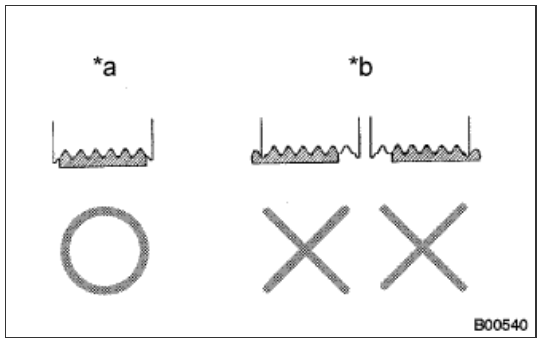
i. Install the No. 2 engine under cover seal with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

9. INSTALL FAN AND GENERATOR V BELT

a. Set the V belt onto every part.

b. While turning the belt tensioner counterclockwise, remove the bar.



Text in Illustration

*1	Vane Pump
*2	Water Pump
*3	No. 1 Idler
*4	Fan
*5	Generator
*6	Belt Tensioner
*7	Crankshaft
*8	Cooler Compressor

NOTICE:

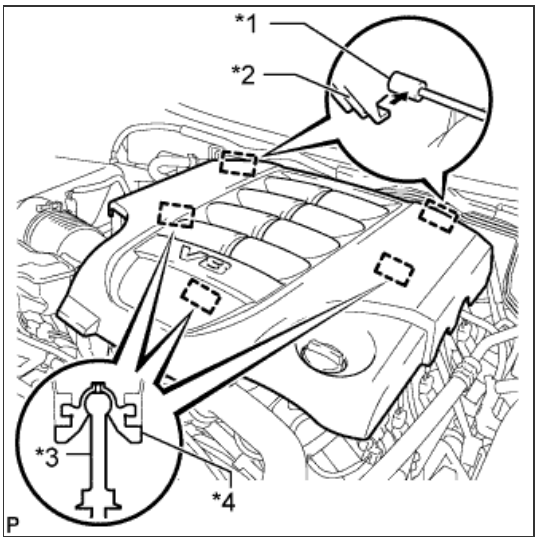
Make sure that the V belt is properly set to each pulley.

c. After installing the belt, check that it fits properly in the ribbed grooves.

Text in Illustration

*a	CORR CT
*b	INCORR CT

HINT:



Make sure to check by hand that the belt has not slipped out of the grooves on the bottom of the pulley.

10. INSTALL V-BANK COVER SUB-ASSEMBLY

a. Attach the 2 V-bank cover hooks to the bracket. Then align the 3 V-bank cover grommets with the 3 pins, and press down on the V-bank cover to attach the pins.

Text in Illustration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

11. ADD ENGINE OIL

a. Add fresh oil and install the oil filler cap.

Standard Oil Grade:

Oil Grade	Oil Viscosity (SA
API grade SL "energy-conserving", API grade SM "energy-conserving" or ILSAC multigrade engine oil	5W-30 10W-30
API grade SL and SM multigrade engine oil	15W-40 20W-50

Standard Oil Capacity:

Item	Specified Condition
Drain and refill without oil filter change	7.1 liters (7.5 US qts, 6.2 Imp. qts)
Drain and refill with oil filter change	7.5 liters (7.9 US qts, 6.6 Imp. qts)
Dry fill	9.3 liters (9.8 US qts, 8.2 Imp. qts)

12. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item	Specified Condition
with rear heater	16.2 liters (17.1 US qts, 14.3 Imp. qts)
without rear heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the radiator inlet hose by hand, and checking when the engine coolant starts to flow inside the hose.

g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

i. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

13. INSPECT FOR OIL LEAK

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

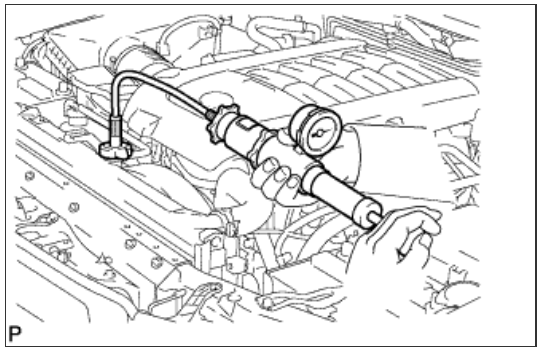
14. INSPECT ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill engine oil above the full level mark.

15. INSPECT FOR COOLANT LEAK



CAUTION:

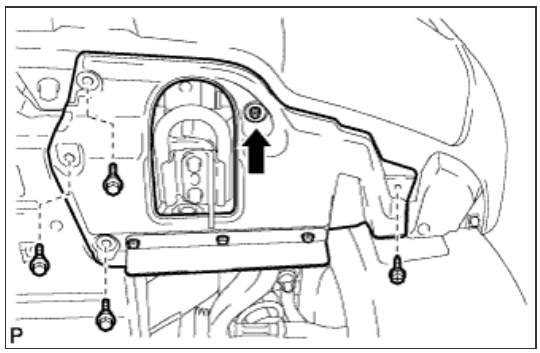
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no e ternal leaks are found, check the heater core, cylinder block and head.

16. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the No. 1 engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

17. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

18. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

for Preparation Click here

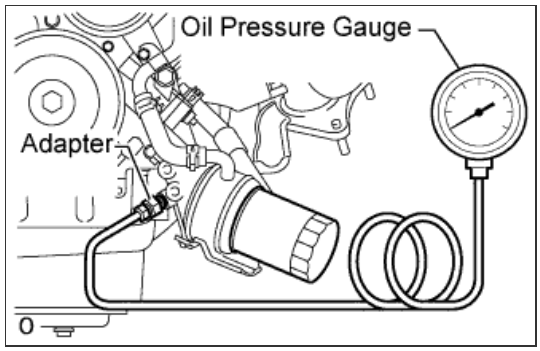
1. CHECK ENGINE OIL QUALITY

a. Check the engine oil for deterioration, water contamination, discoloration or thinning.
If the quality is visibly poor, replace the oil and filter (Click here).

2. CHECK ENGINE OIL LEVEL

a. Warm up the engine, then stop the engine and wait for 5 minutes.

b. Check that the engine oil level is between the low level and full level marks on the dipstick.
If low, check for leakage and add oil up to the full level mark.



NOTICE:

Do not fill engine oil above the full level mark.

3. INSPECT AND ADJUST OIL PRESSURE

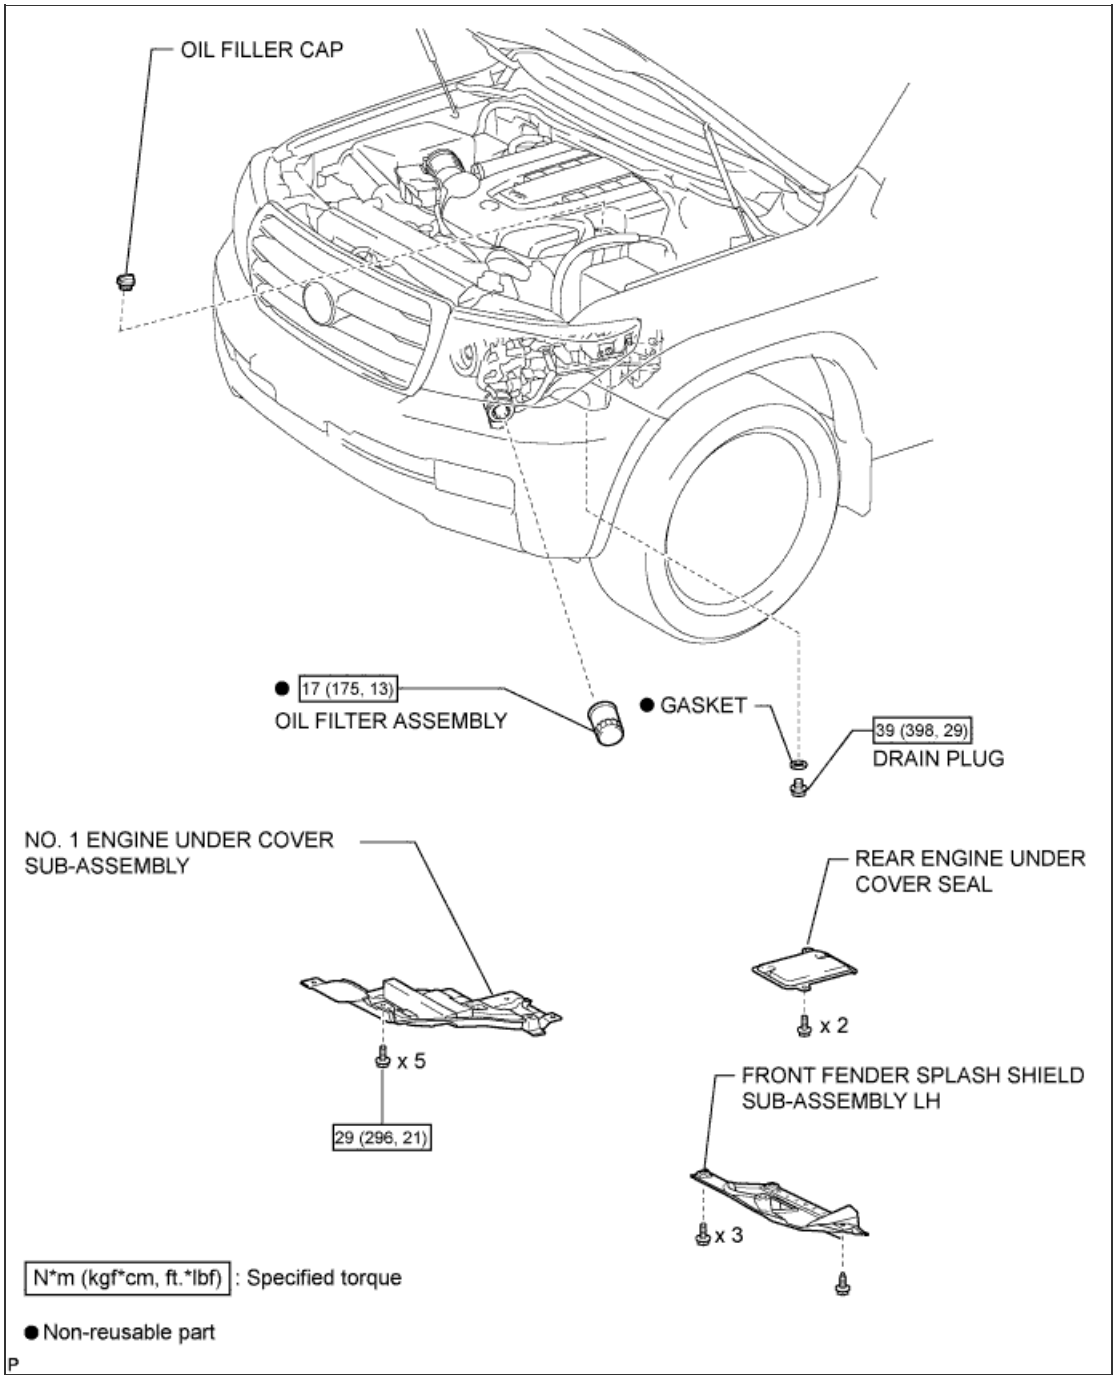
a. Remove the oil pressure sender gauge (Click here).

b. Install an oil pressure gauge with an adapter.

c. Warm up the engine.

d. Measure the oil pressure.

Standard Oil Pressure:



Condition	Specified Condition
Idle	29 kPa (0.3 kgf/cm^2, 4.2 psi) or more
3000 rpm	294 to 588 kPa (3.0 to 6.0 kgf/cm^2, 43 to 85 psi)

If the pressure is not as specified, check the oil pump (Click here).

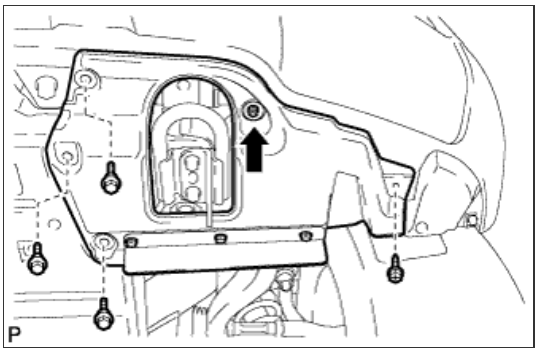
e. Remove the oil pressure gauge and adapter.

f. Install the oil pressure sender gauge (Click here).

for Preparation Click here

for Preparation Click here

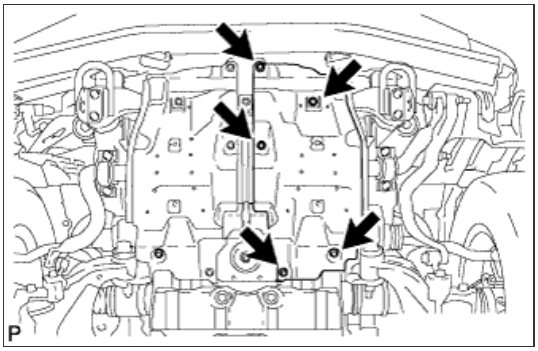
CAUTION:



- **Prolonged and repeated contact with engine oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.**
- **Precautions should be taken when replacing engine oil to minimize the risk of your skin making contact with used engine oil. Protective clothing and gloves that cannot be penetrated by oil should be worn. The skin should be washed with soap and water, or use waterless hand cleaner, to remove any used engine oil thoroughly. Do not use gasoline, thinners, or solvents.**
- **In order to protect the environment, used oil and used oil filters must be disposed of at designated disposal sites.**

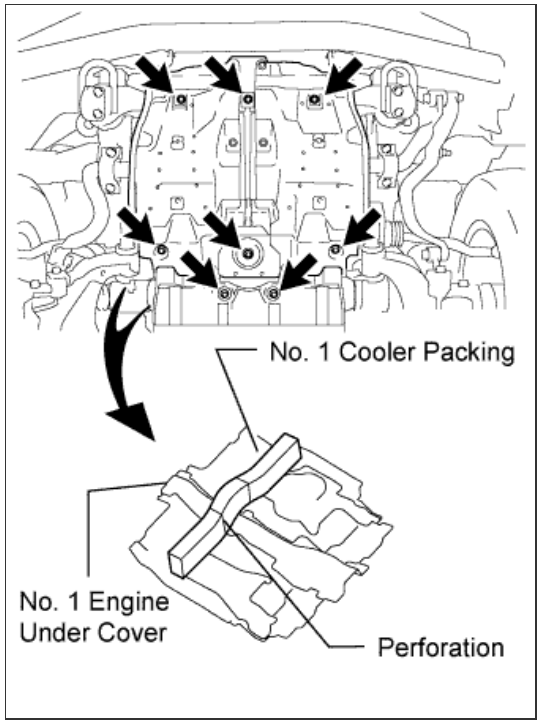
1. REMOVE OIL FILLER CAP SUB-ASSEMBLY

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



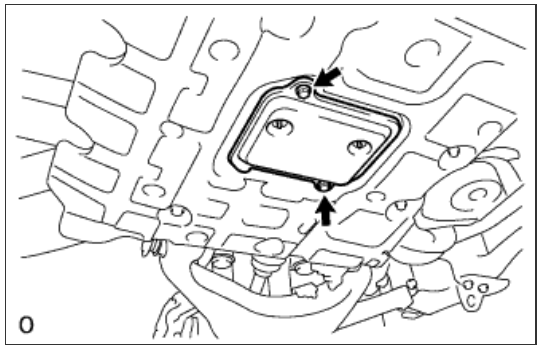
a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



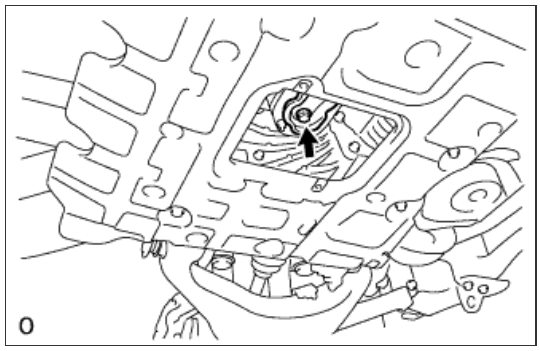
3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 5 bolts and No. 1 engine under cover sub-assembly LH.



HINT:

If the No. 1 cooler packing is not divided, remove both sides of the No. 1 engine under cover and cut the packing at the perforation indicated in the illustration.

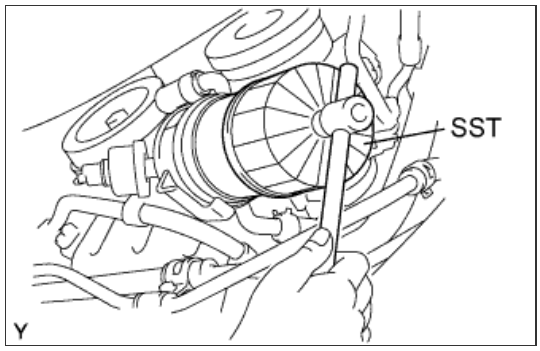


4. REMOVE REAR ENGINE UNDER COVER SEAL

a. Remove the 2 bolts and cover seal.

5. DRAIN ENGINE OIL

a. Remove the oil drain plug and gasket, and drain the engine oil into a container.

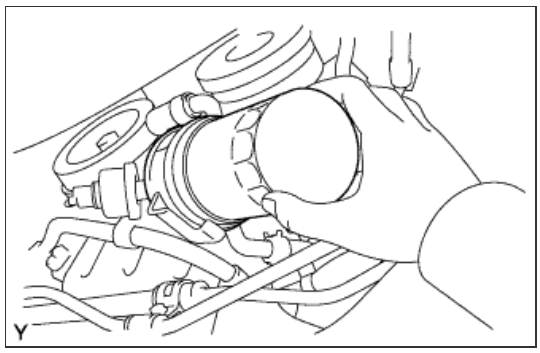


6. REMOVE OIL FILTER ASSEMBLY

a. Using SST, remove the oil filter.

SST

09228-07501

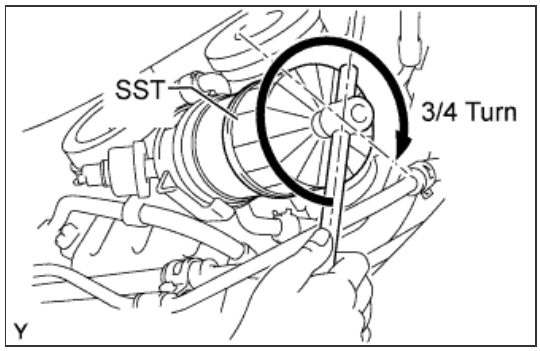


7. INSTALL OIL FILTER ASSEMBLY

a. Clean and check the oil filter installation surface.

b. Apply clean engine oil to the gasket of a new oil filter.

c. Lightly screw the oil filter into place by hand. Tighten it until the gasket contacts the seat.



d. Using SST, tighten the oil filter. Choose from the following to tighten the oil filter.

SST
09228-07501

i. Using a torque wrench, tighten the oil filter.

Torque:
17 N*m{ 175 kgf*cm , 13 ft.*lbf }

ii. Tighten the oil filter a 3/4 turn by hand or with a common wrench.

8. ADD ENGINE OIL

a. Install a new gasket and the drain plug.

Torque:
39 N*m{ 398 kgf*cm , 29 ft.*lbf }

b. Add new engine oil.

Standard Engine Oil:

Oil Grade	Oil Viscosity (SAE)
API grade SL nergy-Conserving , SM nergy-Conserving or ILSAC multigrade engine oil	10W-30 (10W-30 is best choice for fuel economy and good starting in cold weather).
API grade SL or SM multigrade engine oil	10W-30

Standard Oil Capacity:

Item	Specified Condition
Drain and refill with oil filter change	6.2 liters (6.6 US qts, 5.5 Imp. qts)
Drain and refill without oil filter change	5.7 liters (6.0 US qts, 5.0 Imp. qts)
	7.1 liters (7.5 US qts, 6.2

Dry fill	Imp. qts)

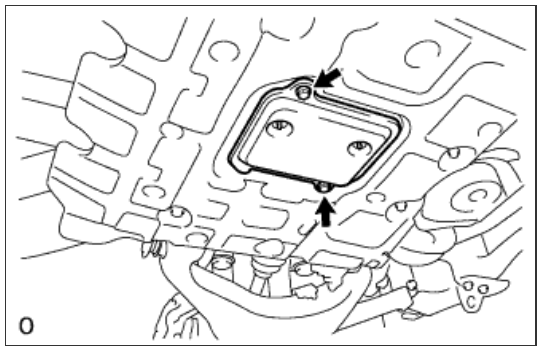
9. INSTALL OIL FILLER CAP SUB-ASSEMBLY

10. CHECK ENGINE OIL LEVEL

a. Warm up the engine, then stop the engine and wait for 5 minutes.

b. Check that the engine oil level is between the low level and full level marks on the dipstick.
If low, check for leakage and add oil up to the full level mark.

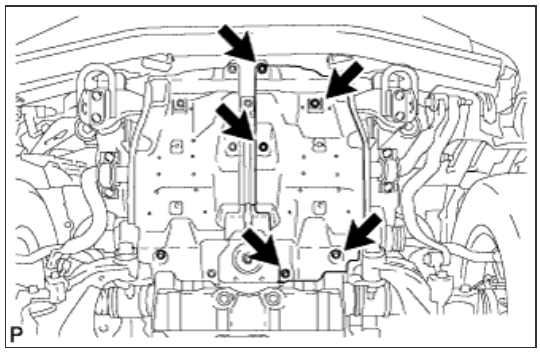
NOTICE:



Do not fill engine oil above the full level mark.

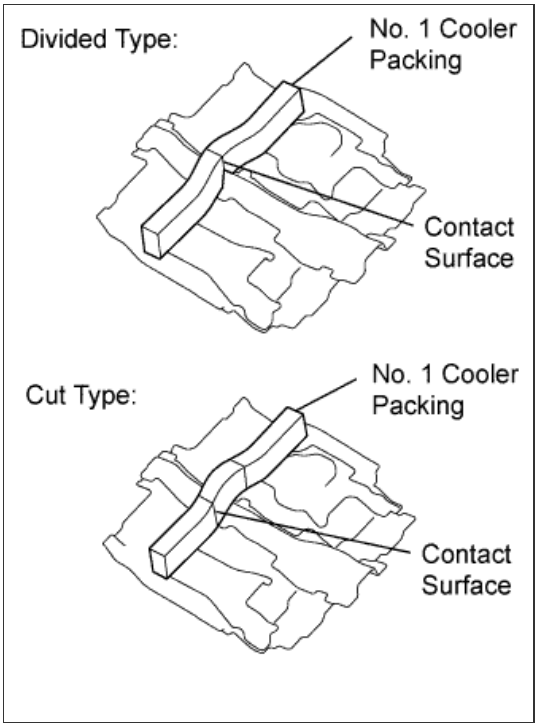
11. INSPECT FOR OIL LEAK

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.



12. INSTALL REAR ENGINE UNDER COVER SEAL

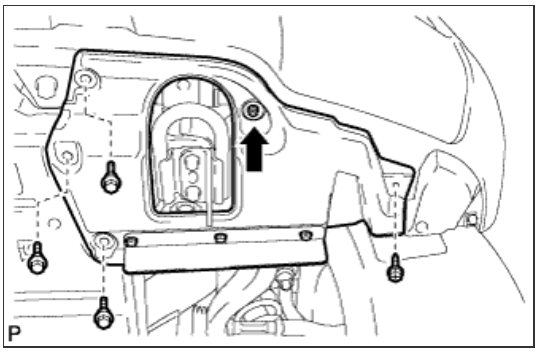
a. Install the cover seal with the 2 bolts.



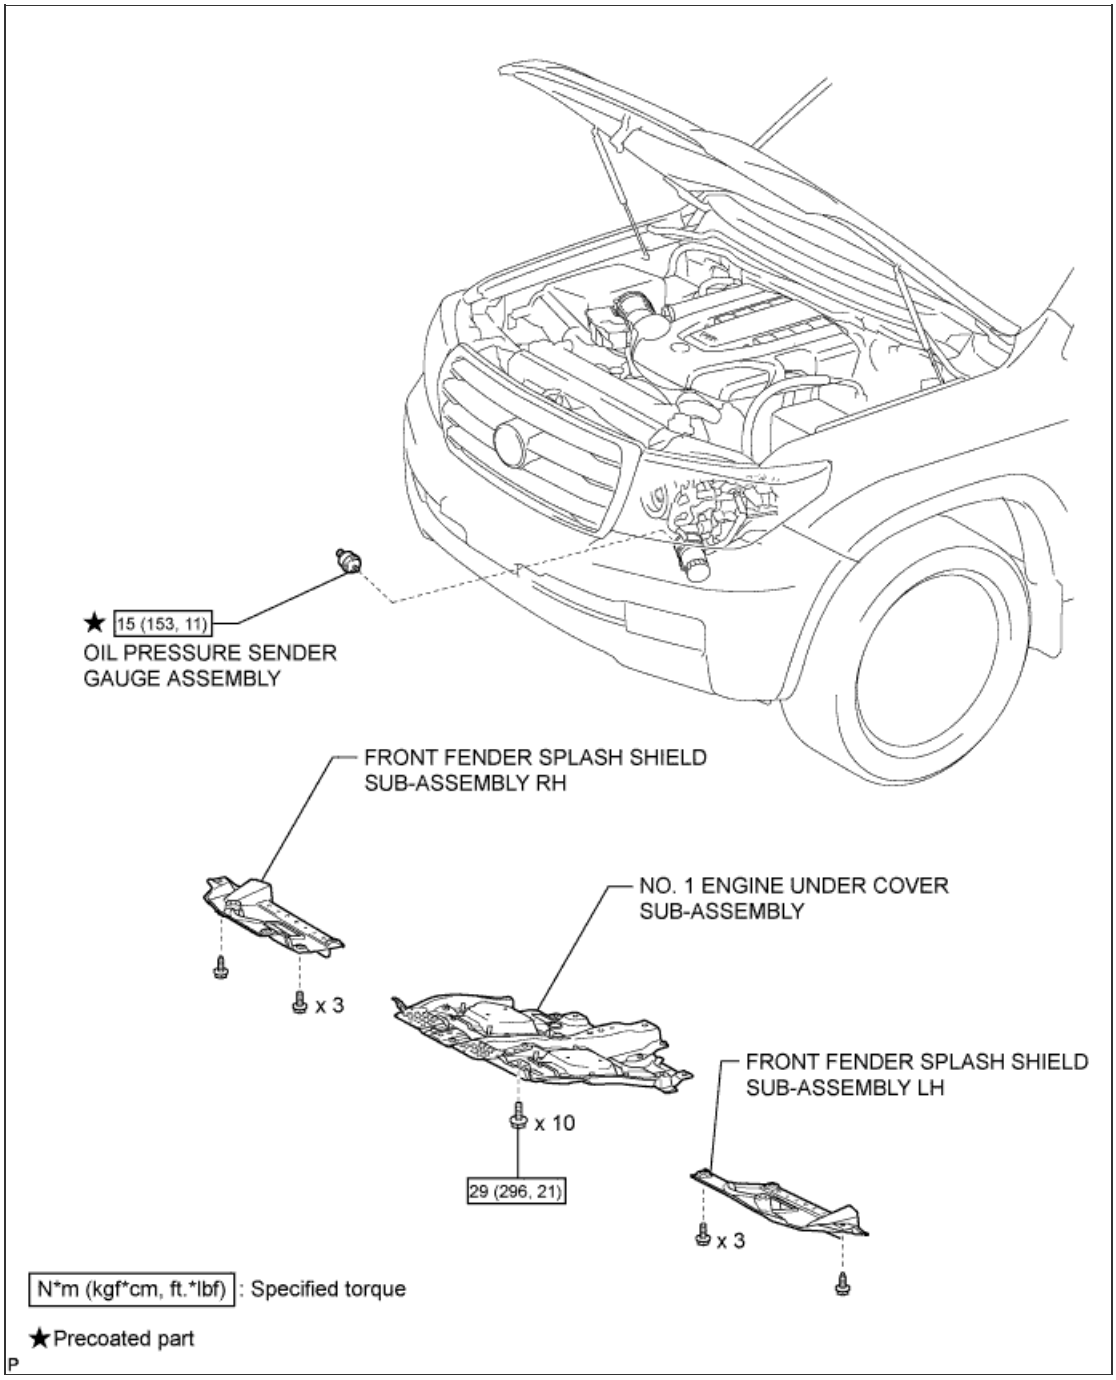
13. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 5 bolts.

HINT:



Make sure there is no gap between the ends of the No. 1 cooler packing.

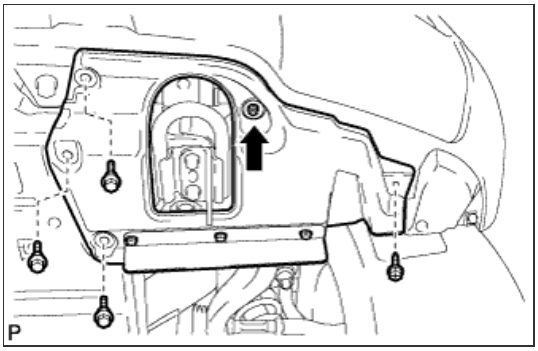


14. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

for Preparation Click here

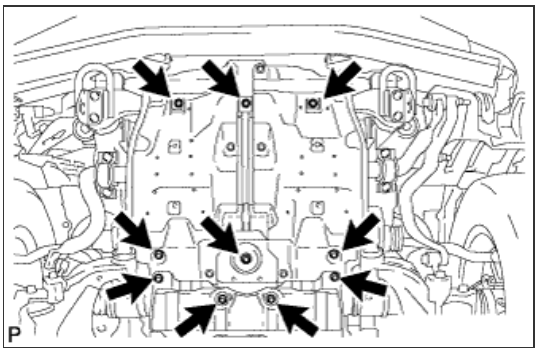


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

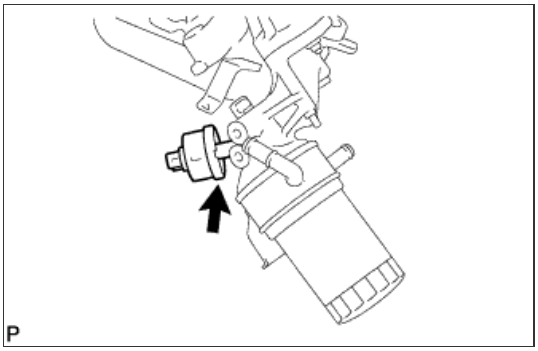


2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



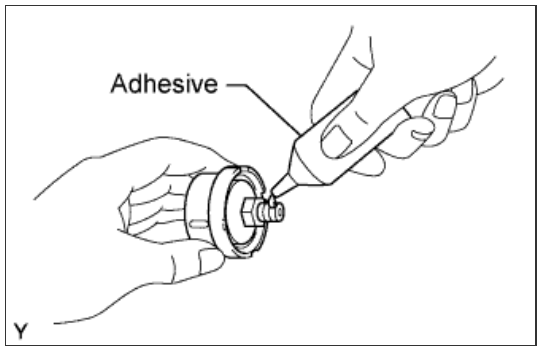
a. Remove the 10 bolts and No. 1 engine under cover.

4. REMOVE OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Disconnect the sender gauge connector.

b. Remove the sender gauge.

for Preparation Click here



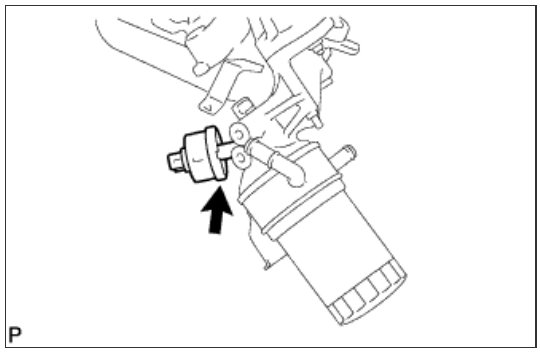
1. INSTALL OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Apply adhesive to 2 or 3 threads of the sender gauge.

Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not let adhesive adhere to the oil hole.



b. Install the sender gauge.

Torque:
15 N*m{ 153 kgf*cm , 11 ft.*lbf }

NOTICE:

Do not start the engine within 1 hour of installation.

c. Connect the sender gauge connector.

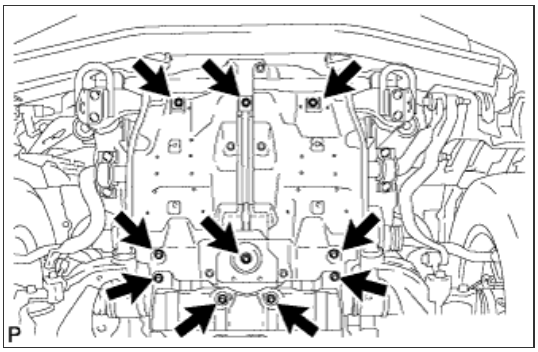
2. CHECK ENGINE OIL LEVEL

a. Warm up the engine, then stop the engine and wait for 5 minutes.

b. Check that the engine oil level is between the low level and full level marks on the dipstick.
If low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill engine oil above the full level mark.

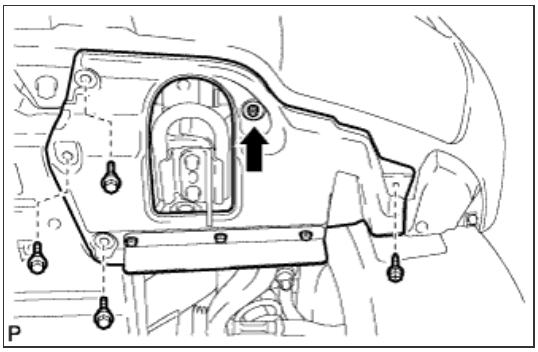


3. INSPECT FOR OIL LEAK

a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

4. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.

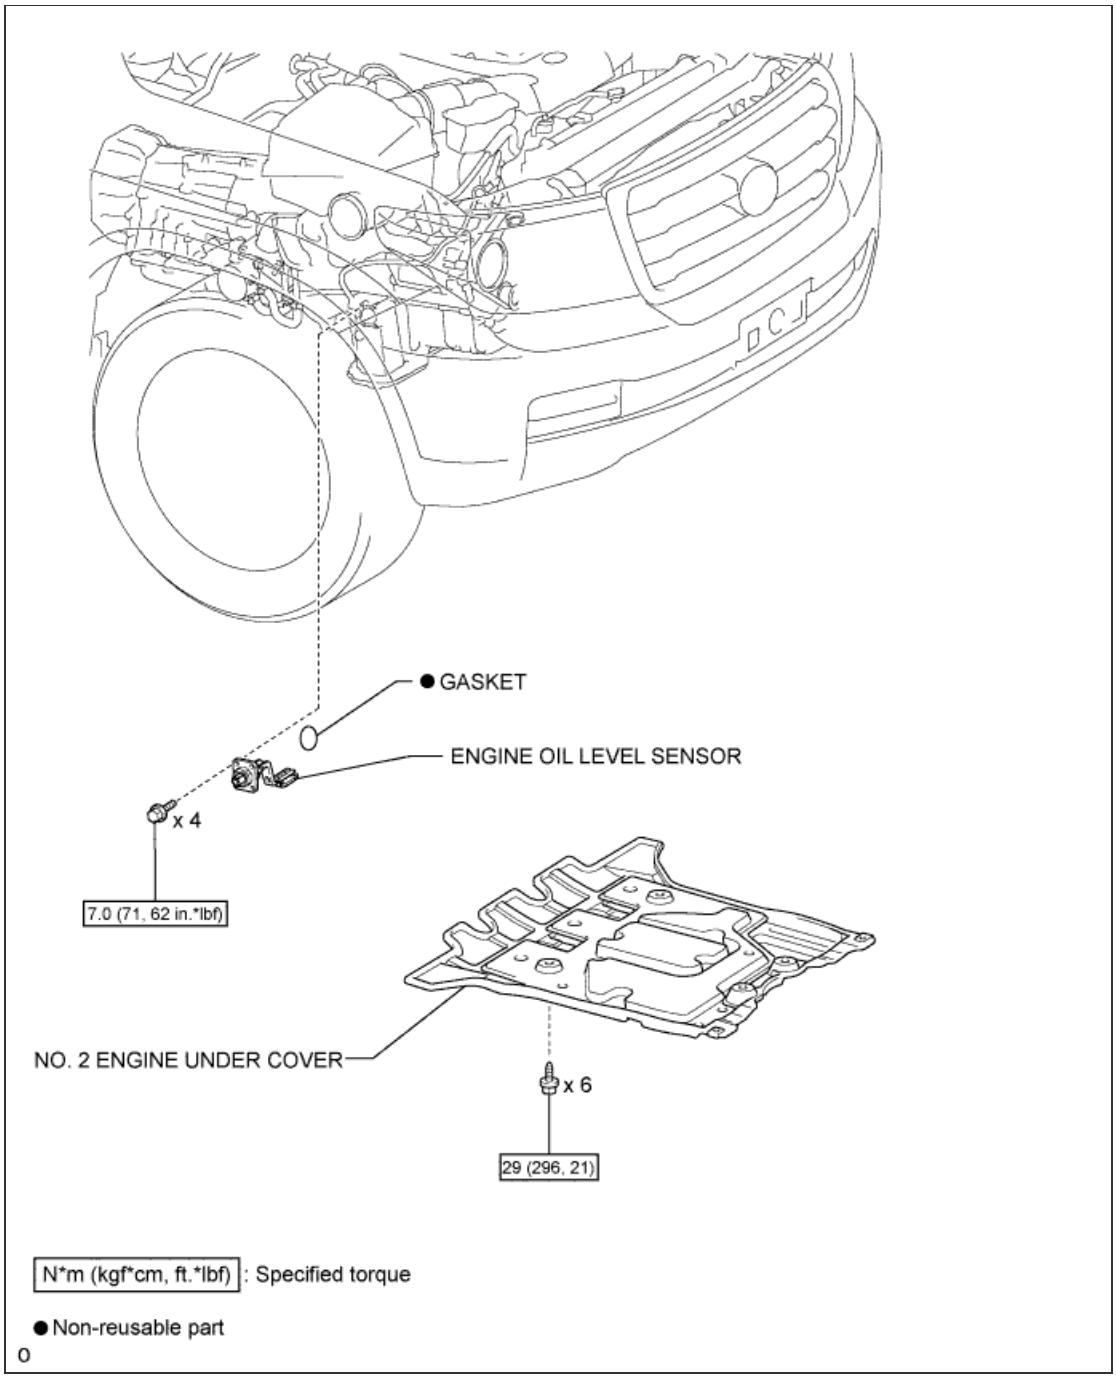


Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

5. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

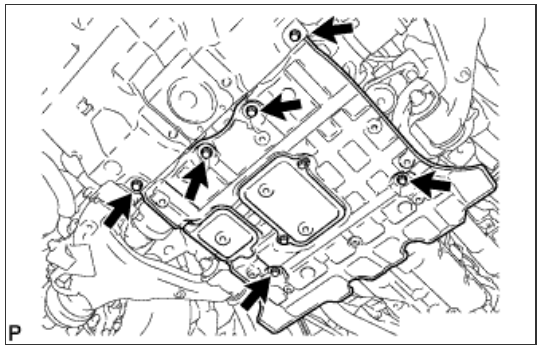


6. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

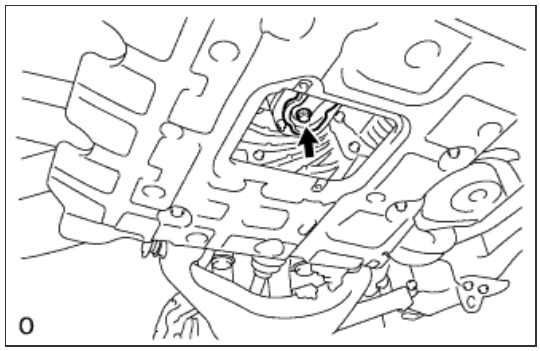
Use the same procedures described for the LH side.

for Preparation Click here



for Preparation Click here

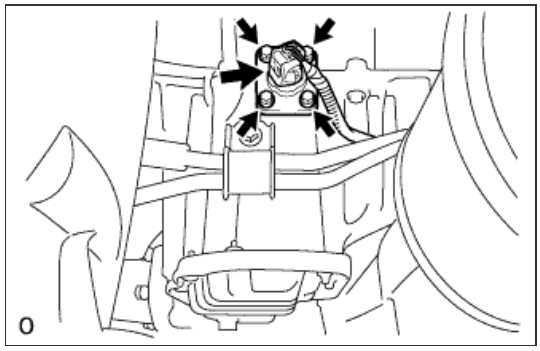
1. REMOVE OIL FILLER CAP SUB-ASSEMBLY



2. REMOVE NO. 2 ENGINE UNDER COVER

a. Remove the 6 bolts and under cover.

3. DRAIN ENGINE OIL

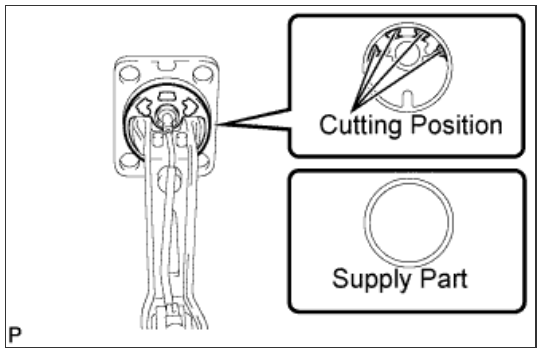


a. Remove the oil drain plug and gasket, and drain the engine oil into a container.

4. REMOVE ENGINE OIL LEVEL SENSOR

a. Disconnect the oil level sensor connector.

b. Remove the bolts and oil level sensor.



c. Cut off the gasket as shown in the illustration.

d. Remove the gasket from the oil level sensor.

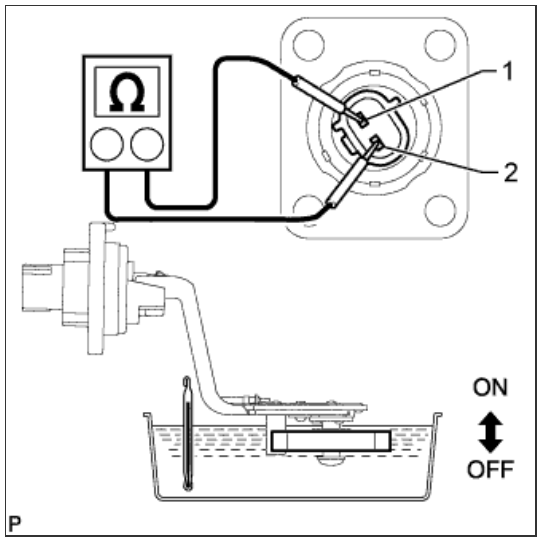
HINT:

After cutting away the parts of the gasket shown in the illustration, remove

only the outer part of the gasket.

for Preparation Click here

1. INSPECT ENGINE OIL LEVEL SENSOR



a. Partially immerse the sensor in an oil bath and warm up the oil bath.

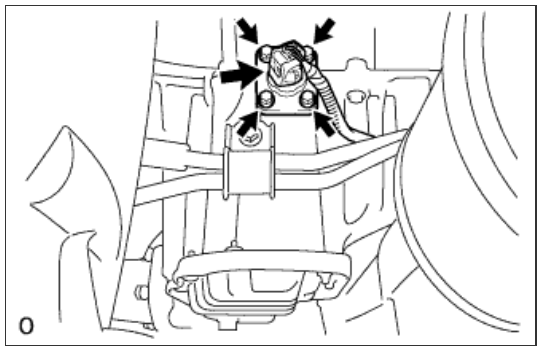
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	ON, 20°C (68°F)	Below 1 Ω
	OFF, 20°C (68°F)	Below 1 Ω
	ON, 60°C (140°F)	Below 1 Ω
	OFF, 60°C (140°F)	10 kΩ or higher

If the result is not as specified, replace the engine oil level sensor.

for Preparation Click here



1. INSTALL ENGINE OIL LEVEL SENSOR

a. Clean the oil level sensor installation surface.

b. Install a new gasket and the oil level sensor with the 4 bolts.

Torque:
7.0 N*m{ 71 kgf*cm , 62 in.*lbf }

c. Connect the oil level sensor connector.

2. ADD ENGINE OIL

a. Install a new gasket and the drain plug.

Torque:
39 N*m{ 398 kgf*cm , 29 ft.*lbf }

b. Add new engine oil.

Standard Engine Oil:

il rade	il Viscosity (SAE)
API grade SL nergy-Conserving SM nergy-Conserving or ILSAC multigrade engine oil	10W-30 (10W-30 is best choice for fuel economy and good starting in cold weather).
API grade SL or SM multigrade engine oil	10W-30

Standard Oil Capacity:

Item	Specified Condition
Drain and refill with oil filter change	6.2 liters (6.6 US ts, 5.5 Imp. ts)
Drain and refill without oil filter change	5.7 liters (6.0 US ts, 5.0 Imp. ts)
Dry fill	7.1 liters (7.5 US ts, 6.2 Imp. ts)

3. INSTALL OIL FILLER CAP SUB-ASSEMBLY

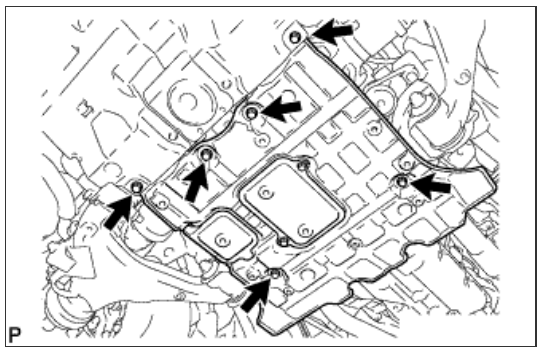
4. CHECK ENGINE OIL LEVEL

a. Warm up the engine, then stop the engine and wait for 5 minutes.

b. Check that the engine oil level is between the low level and full level marks on the dipstick.
If low, check for leakage and add oil up to the full level mark.

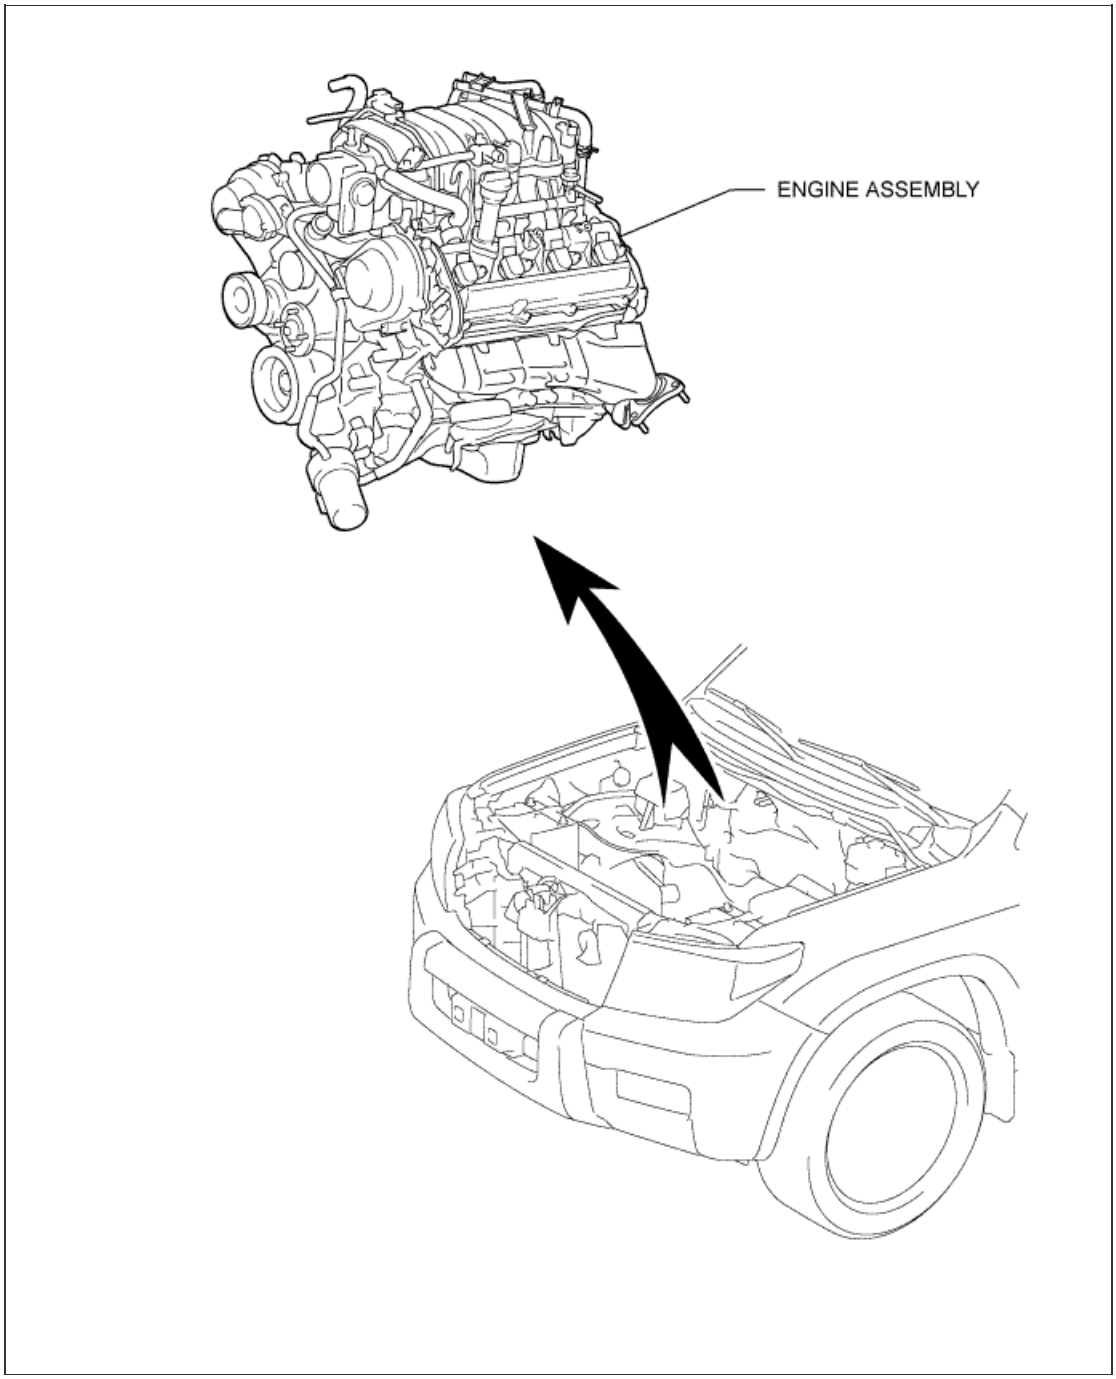
NOTICE:

Do not fill engine oil above the full level mark.

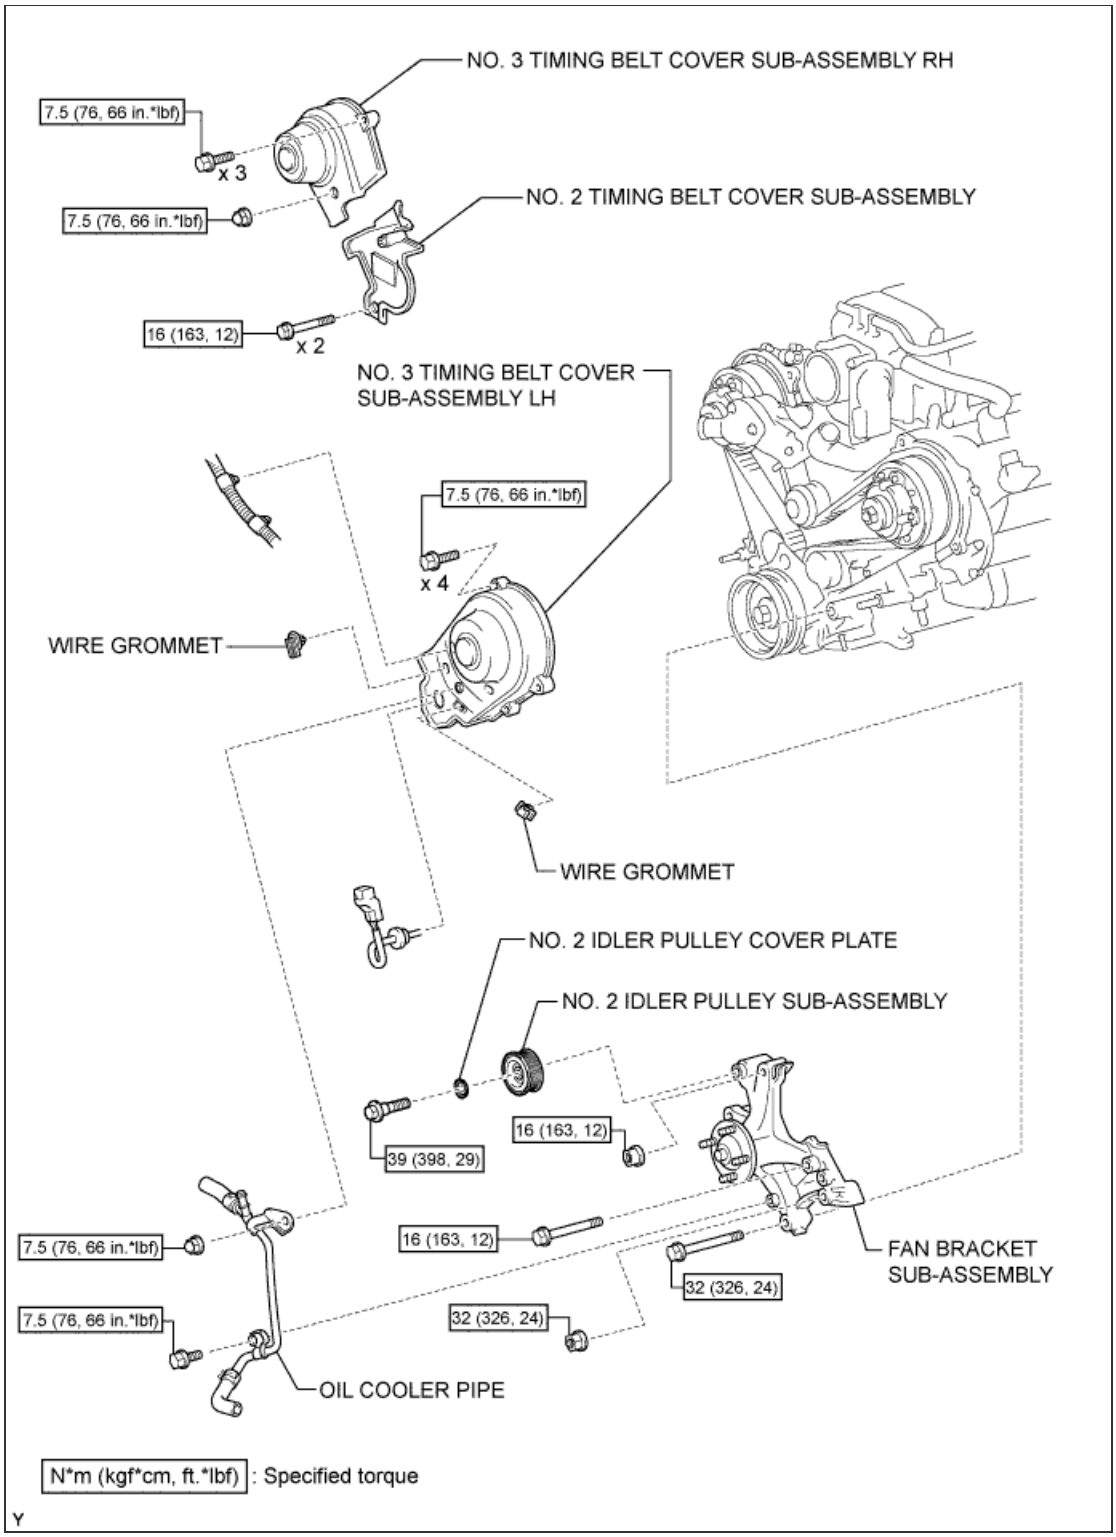


5. INSPECT FOR OIL LEAK

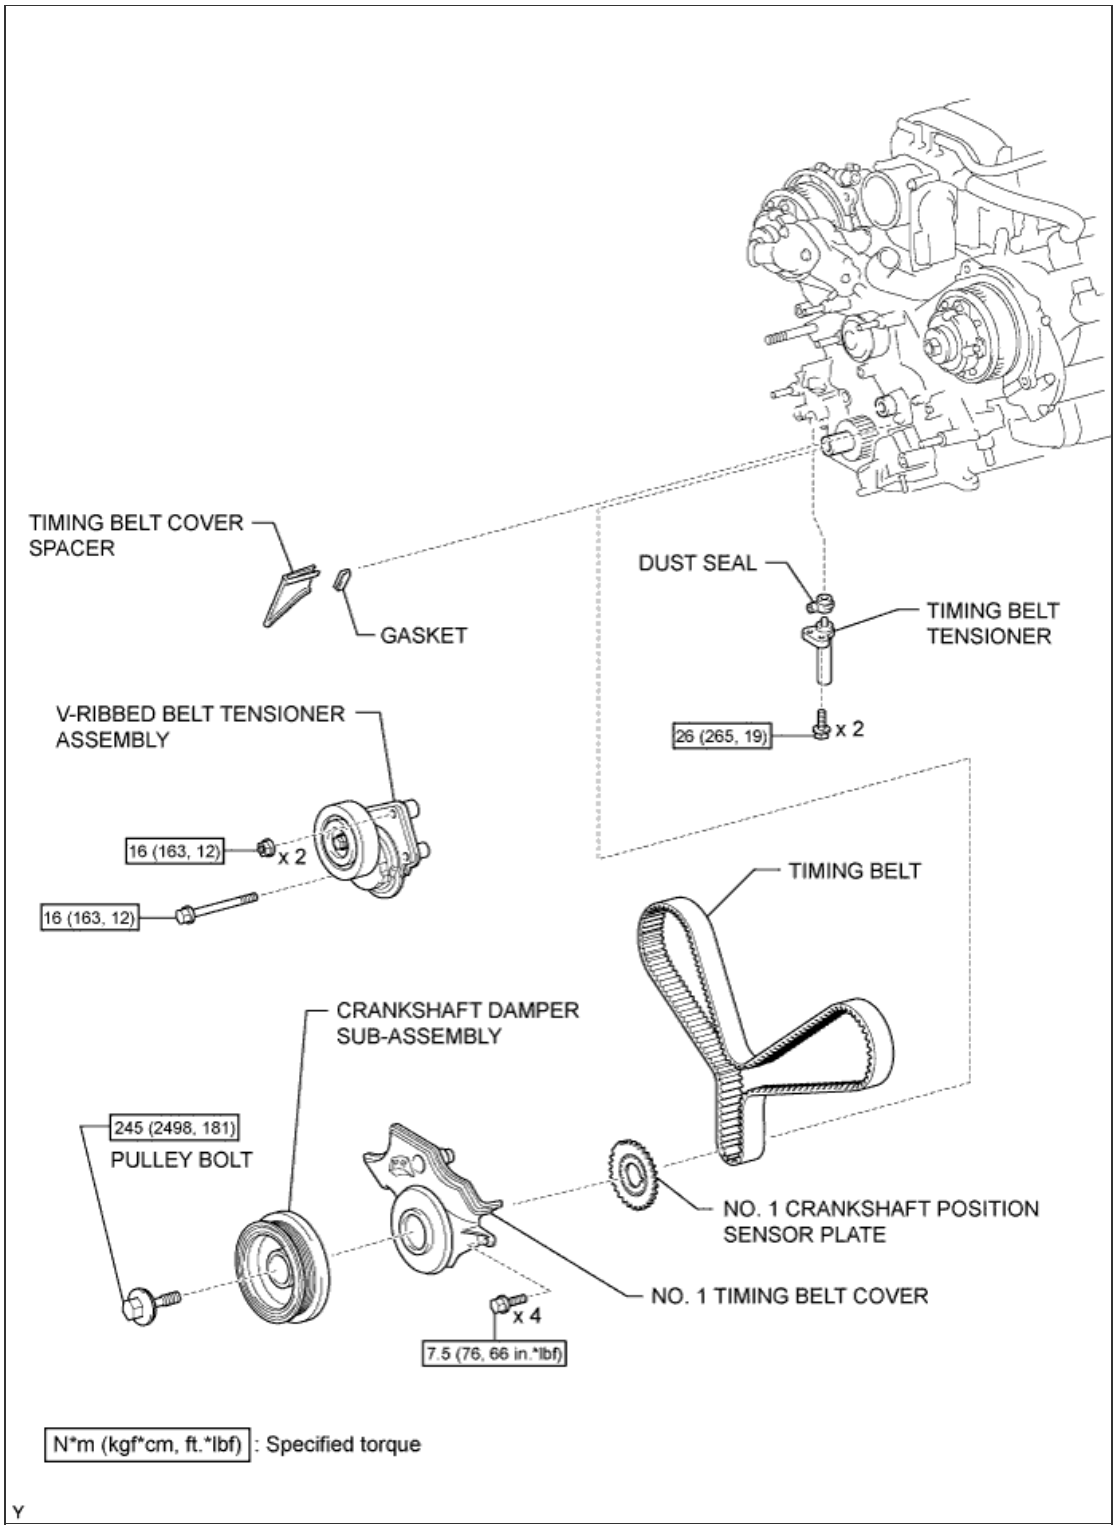
a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.



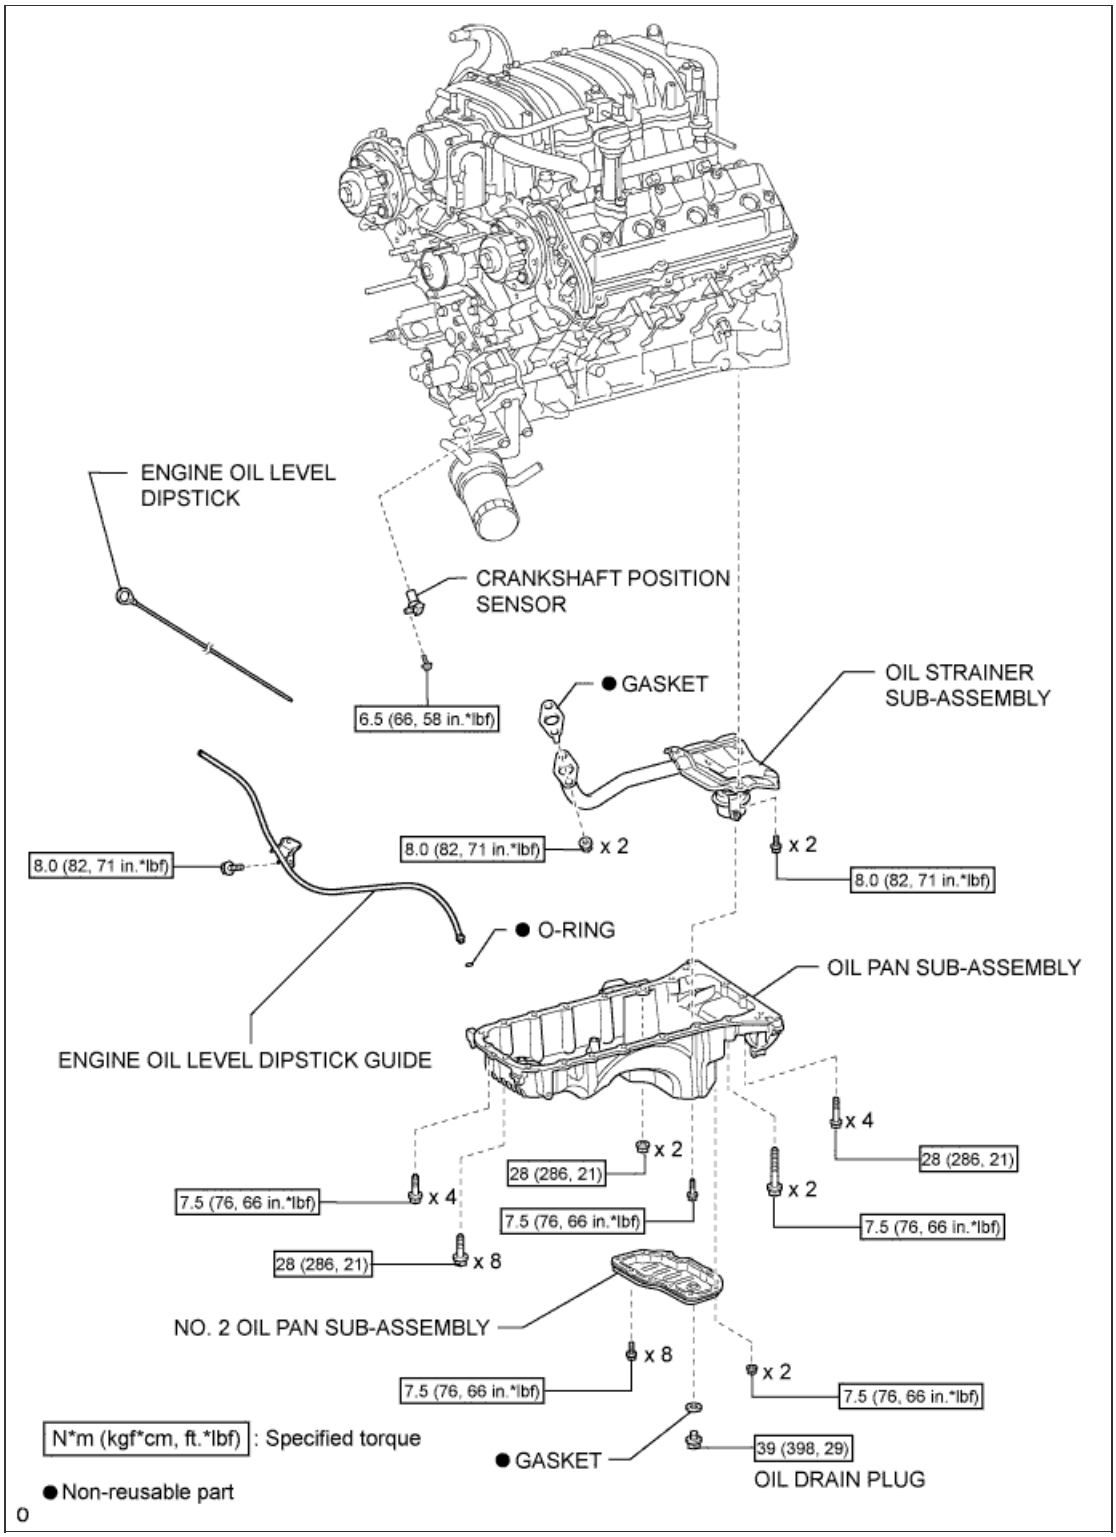
6. INSTALL NO. 2 ENGINE UNDER COVER



a. Install the under cover with the 6 bolts.



Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }



for Preparation Click here

1. DISCHARGE FUEL SYSTEM PRESSURE

a. Discharge the fuel system pressure (Click here).

2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

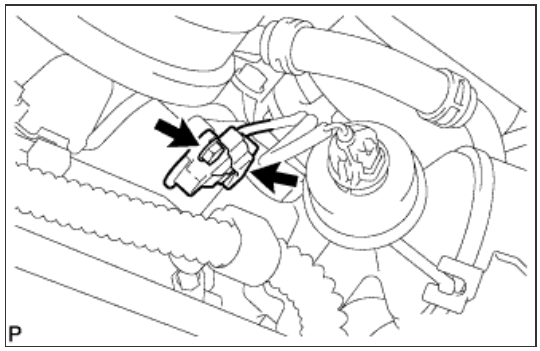
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

3. REMOVE ENGINE ASSEMBLY

a. Remove the engine assembly from the vehicle (Click here).



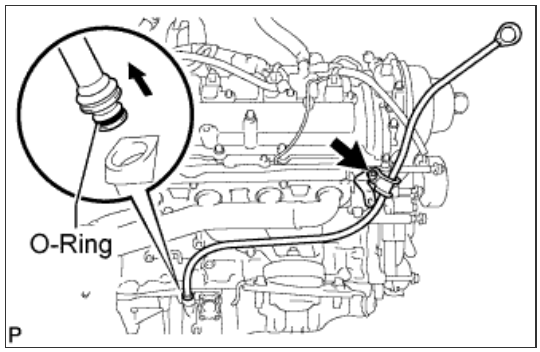
4. REMOVE TIMING BELT

a. Remove the timing belt (Click here).

5. REMOVE CRANKSHAFT POSITION SENSOR

a. Disconnect the sensor connector.

b. Remove the bolt and sensor.



6. REMOVE ENGINE OIL LEVEL DIPSTICK GUIDE

a. Remove the dipstick.

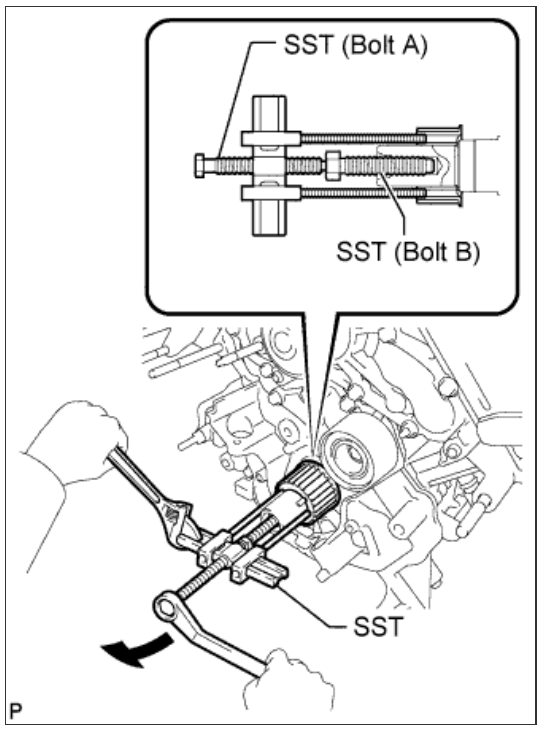
b. Remove the bolt and dipstick guide.

c. Remove the O-ring from the dipstick guide.

7. REMOVE CRANKSHAFT TIMING PULLEY

a. Using SST, remove the timing pulley.

SST

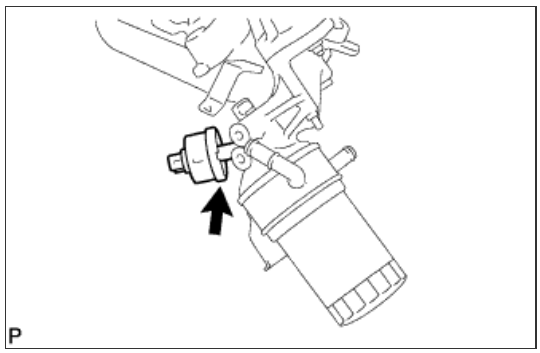


09950-50013 (09951-05010, 09952-05010, 09953-05010, 09953-05020, 09954-05011)

HINT:

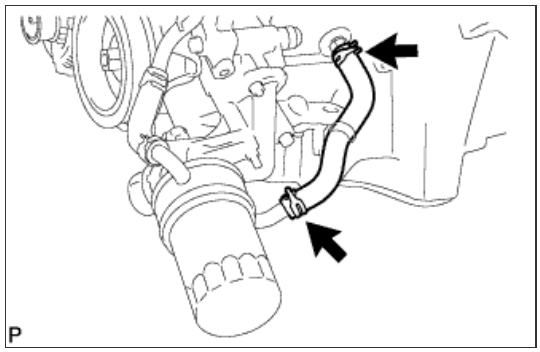
Apply a lubricant to the threads and end of SST.

Parts N ber:



Item	Parts number
SST (Bolt A)	09953-05020
SST (Bolt B)	09953-05010

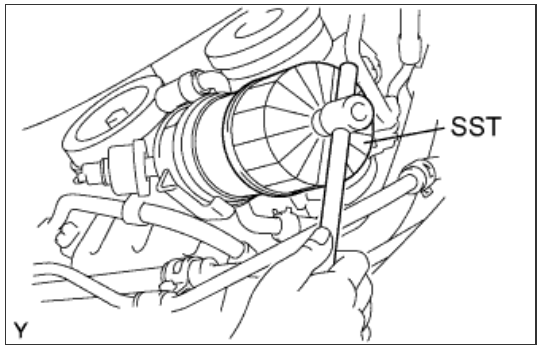
8. REMOVE OIL PRESSURE SENDER GAUGE ASSEMBLY



a. Disconnect the sender gauge connector.

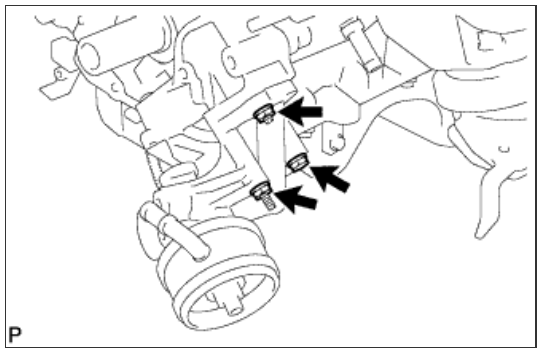
b. Remove the sender gauge.

9. REMOVE OIL COOLER HOSE



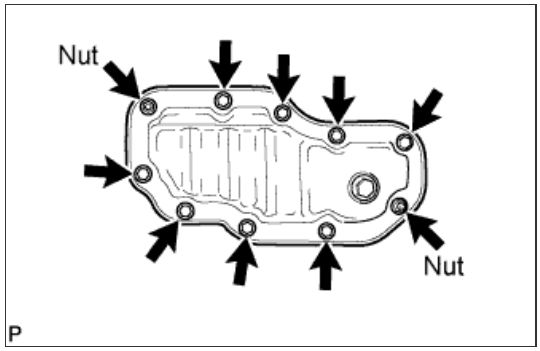
a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to remove the oil cooler hose.

10. REMOVE OIL FILTER ASSEMBLY



a. Using SST, remove the oil filter.

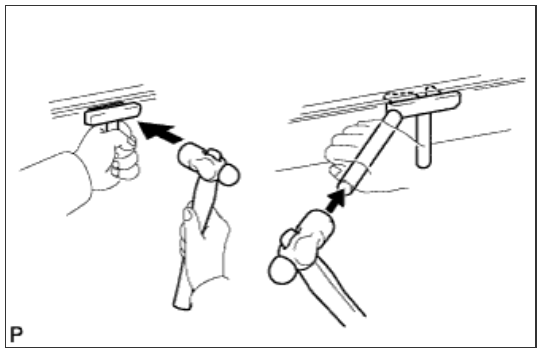
SST
09228-07501



11. REMOVE OIL FILTER BRACKET SUB-ASSEMBLY

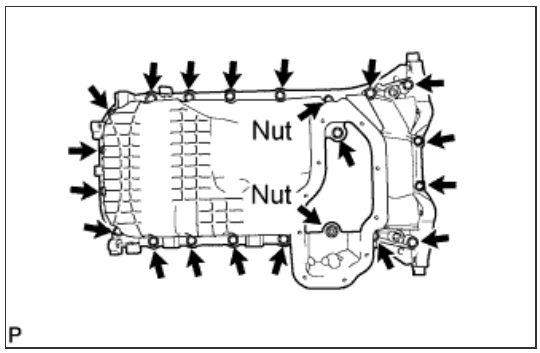
a. Remove the bolt, nut, stud bolt, oil filter bracket and gasket.

12. REMOVE NO. 2 OIL PAN SUB-ASSEMBLY



a. Remove the 8 bolts and 2 nuts.

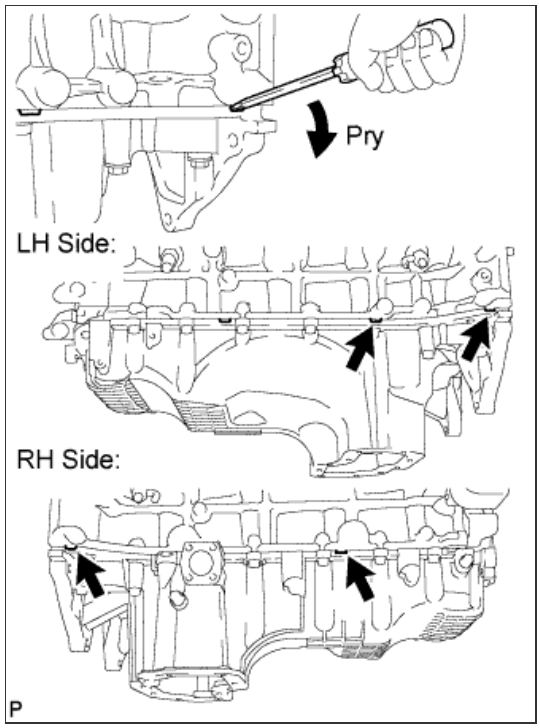
b. Insert the blade of an oil pan seal cutter between the oil pans, cut off applied sealer and remove the No. 2 oil pan.



NOTICE:

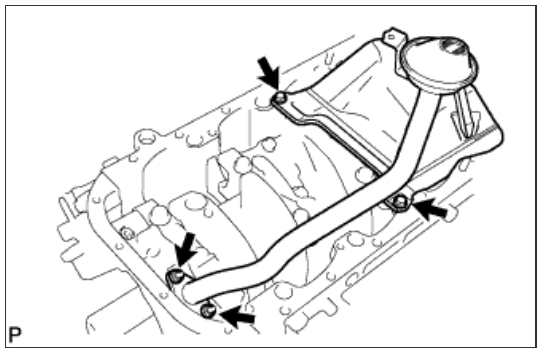
- **Be caref l not to damage the No. 2 oil pan contact s rface of the oil pan.**
- **Be caref l not to damage the No. 2 oil pan flange.**

13. REMOVE OIL PAN SUB-ASSEMBLY



a. Remove the 19 bolts and 2 nuts.

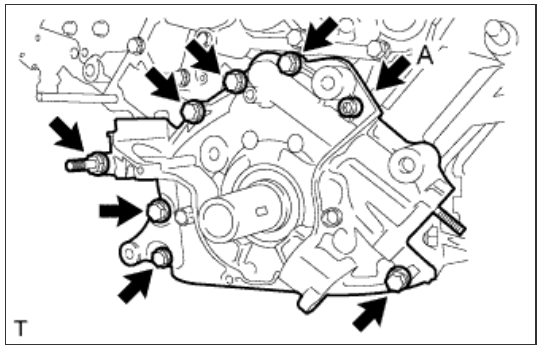
b. Using a screwdriver, remove the oil pan by prying between the oil pan and cylinder block as shown in the illustration.



NOTICE:

Be careful not to damage the contact surfaces of the cylinder block and oil pan.

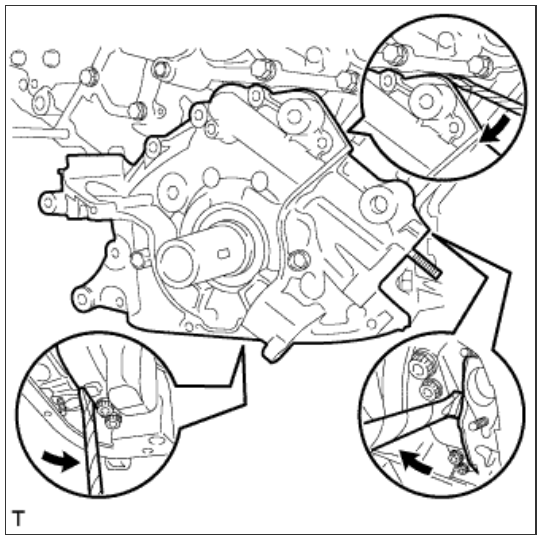
14. REMOVE OIL STRAINER SUB-ASSEMBLY



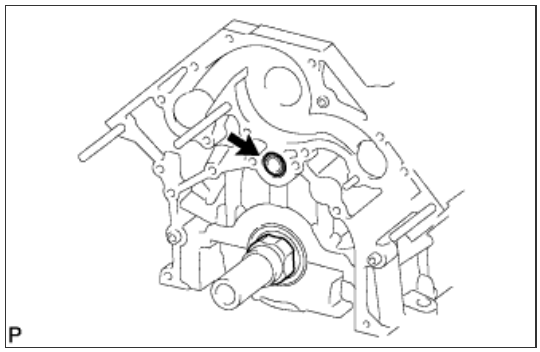
a. Remove the 2 bolts, 2 nuts, oil strainer and gasket.

15. REMOVE OIL PUMP ASSEMBLY

a. Using a 6 mm hexagon wrench, remove bolt A.



b. Remove the 6 bolts and stud bolt.

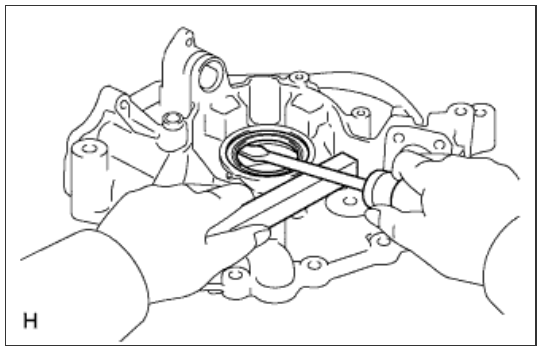


c. Using a screwdriver, remove the oil pump by prying the portions between the oil pump and cylinder block shown in the illustration.

NOTICE:

Be careful not to damage the contact surfaces of the cylinder block and oil pump.

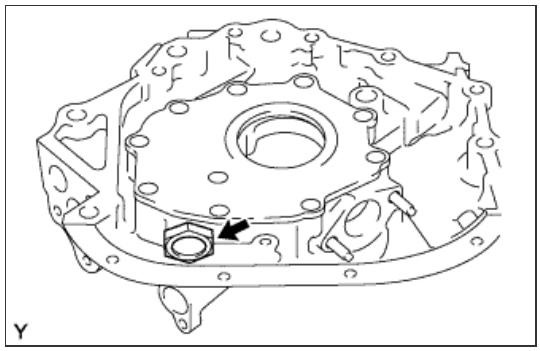
d. Remove the O-ring from the cylinder block.



for Preparation Click here

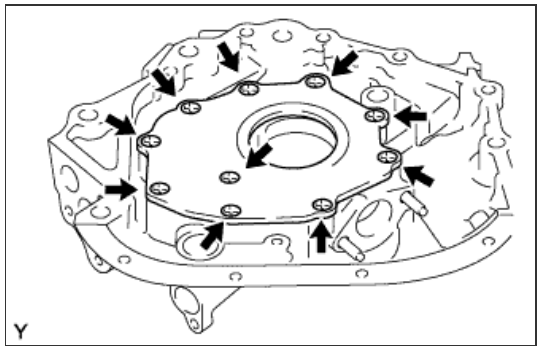
1. REMOVE OIL PUMP SEAL

a. Using a screwdriver and wooden block, pry out the oil seal.



NOTICE:

Do not damage the surface of the oil seal press fit hole.



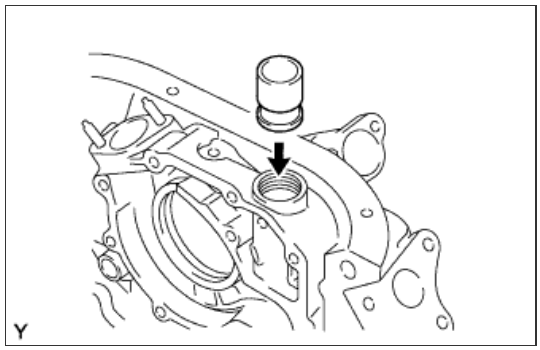
2. REMOVE OIL PUMP RELIEF VALVE

a. Remove the plug, compression spring and relief valve.

3. REMOVE OIL PUMP COVER

a. Remove the 10 screws and pump cover.

4. REMOVE OIL PUMP ROTOR SET



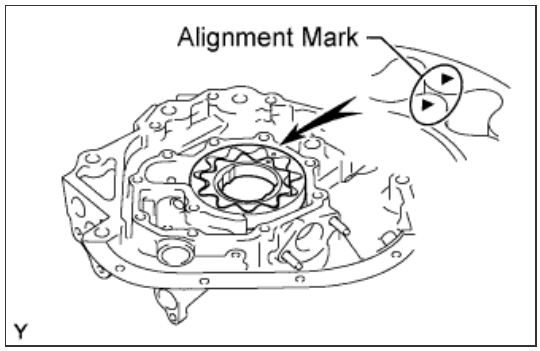
a. Remove the drive and driven rotors.

for Preparation Click here

1. INSPECT OIL PUMP RELIEF VALVE

a. Coat the relief valve with engine oil and drop it into the relief valve hole.

b. Check that the relief valve falls in smoothly by its own weight.
If it does not, replace the relief valve. If necessary, replace the oil pump assembly.



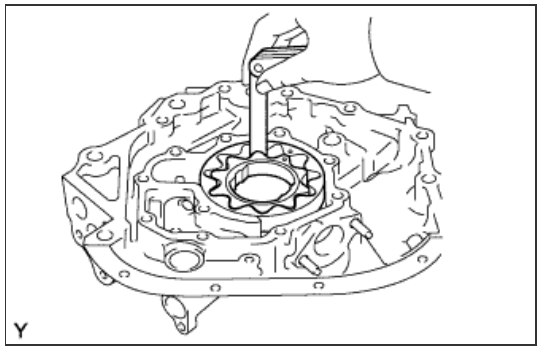
2. INSPECT OIL PUMP ROTOR SET

a. Apply engine oil to the oil pump rotor set.

b. Install the oil pump rotor set to the oil pump body and check that it rotates smoothly.

HINT:

Face the marks on the oil pump rotor set towards the oil pump cover side.



c. Inspect the rotor tip clearance.

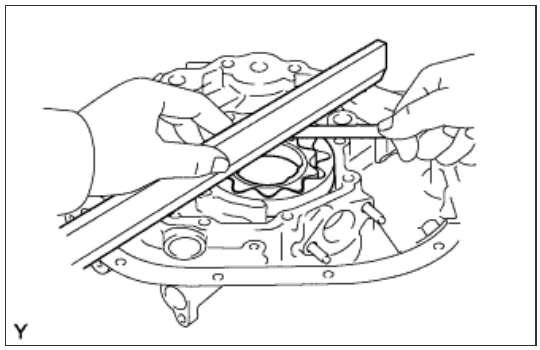
i. Using a feeler gauge, measure the clearance between the drive and driven rotor tips.

Standard tip clearance:
0.06 to 0.18 mm (0.00236 to 0.00709 in.)

Maximum tip clearance:
0.18 mm (0.00709 in.)

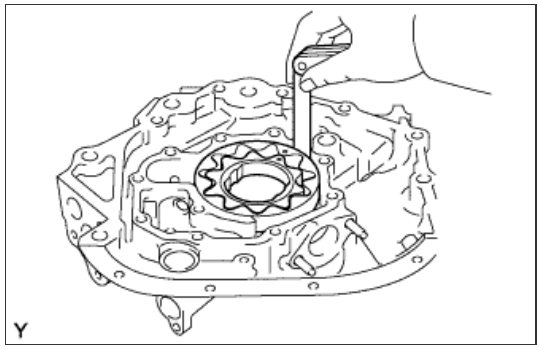
If the tip clearance is more than the maximum, replace the oil pump assembly.

d. Inspect the rotor side clearance.



i. Using a feeler gauge and precision straightedge, measure the clearance between the rotors and precision straightedge.

Standard side clearance:
0.03 to 0.09 mm (0.00118 to 0.00354 in.)



Maximum side clearance:
0.09 mm (0.00354 in.)

If the side clearance is more than the maximum, replace the oil pump

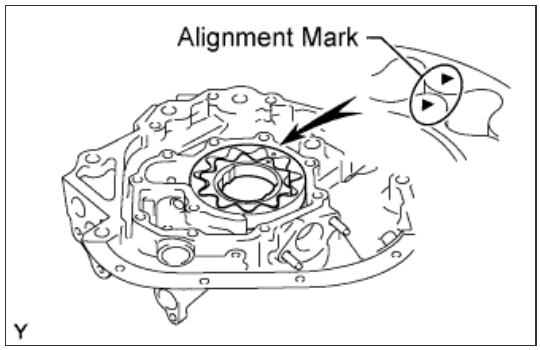
assembly.

e. Inspect the rotor body clearance.

i. Using a feeler gauge, measure the clearance between the driven rotor and body.

Standard body clearance:
0.250 to 0.325 mm (0.00984 to 0.0128 in.)

Maximum body clearance:
0.325 mm (0.0128 in.)

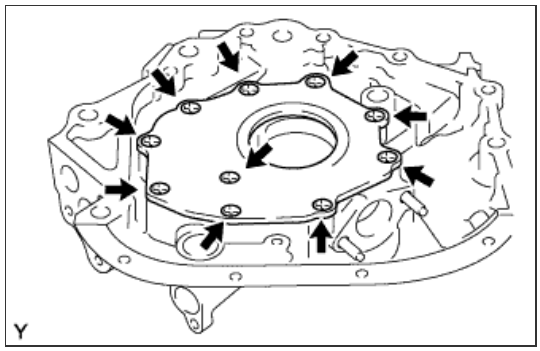


If the body clearance is more than the maximum, replace the oil pump assembly.

for Preparation Click here

1. INSTALL OIL PUMP ROTOR SET

a. Apply engine oil to the oil pump rotor set.

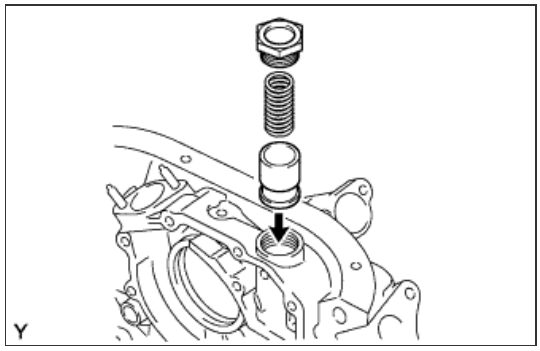


b. Place the drive and driven rotors into the pump body with the marks facing the oil pump cover side.

2. INSTALL OIL PUMP COVER

a. Install the oil pump cover with the 10 screws.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }



3. INSTALL OIL PUMP RELIEF VALVE

a. Insert the relief valve and compression spring into the oil pump body hole.

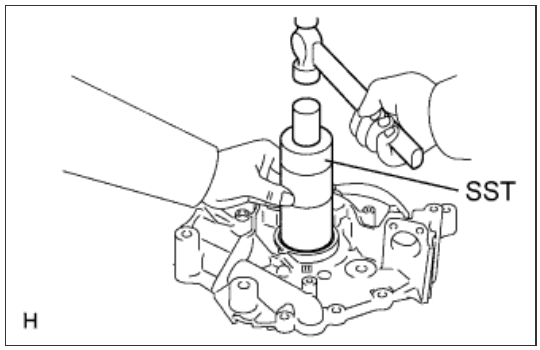
b. Install the relief valve plug.

Torque:
49 N*m{ 500 kgf*cm , 36 ft.*lbf }

4. INSTALL OIL PUMP SEAL

a. Using SST and a hammer, tap in a new oil seal until its surface is flush with the oil pump body edge.

SST
09316-60011 (09316-00011)

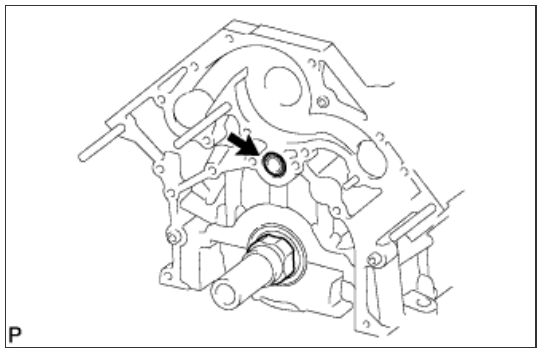


NOTICE:

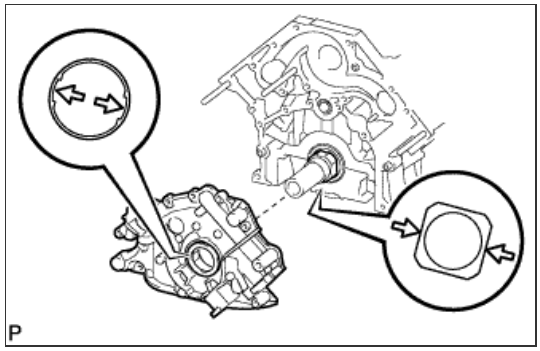
- **Keep the lip free from foreign matter.**
- **Do not tap the oil seal at an angle.**

b. Apply MP grease to the lip of the oil seal.

NOTICE:



- **Do not allow foreign matter to contact the lip.**
- **Do not allow MP grease to contact the dust seal.**

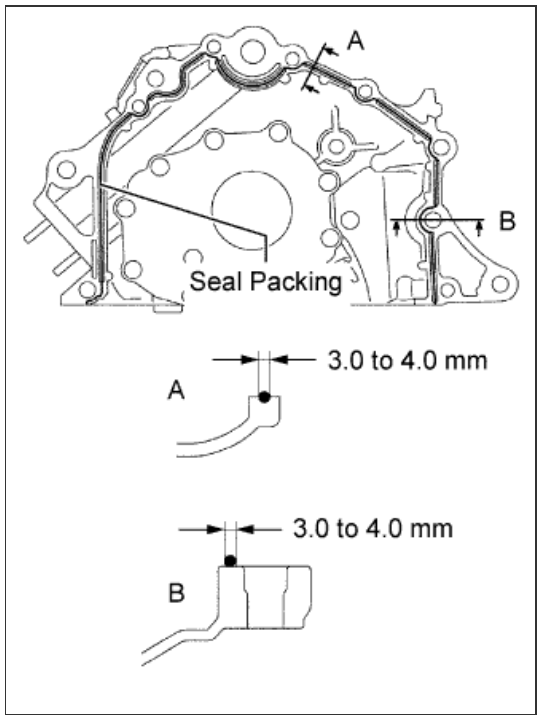


for Preparation Click here

1. INSTALL OIL PUMP ASSEMBLY

a. Apply a light coat of engine oil to a new O-ring and install it to the cylinder block.

b. Align the oil pump drive rotor spline and the crankshaft as shown in the illustration.



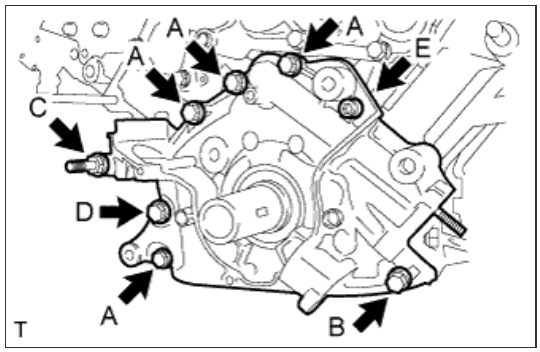
c. Apply seal packing to the oil pump as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard seal diameter:
3.0 to 4.0 mm (0.118 to 0.157 in.)

NOTICE:

- **Install the oil pump within 3 minutes and tighten the bolts within 15 minutes after applying seal packing.**
- **Be careful not to drop any oil on the contact surfaces of the oil pump and cylinder block.**
- **Do not expose the seal to engine oil for at least 2 hours after installing it.**

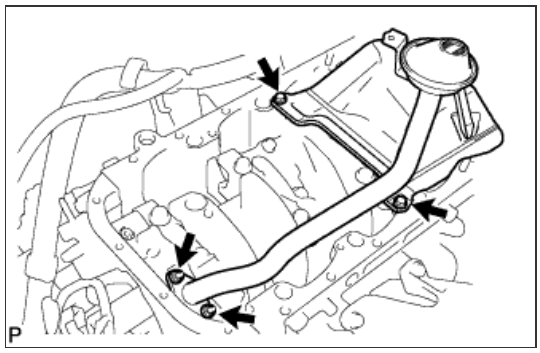


d. Install the oil pump with the stud bolt, 6 standard bolts and the 6 mm hexagon wrench bolt. Uniformly tighten the bolts in several steps.

Torque:
for bolt A, B, C, E:

16 N*m{ 163 kgf*cm , 12 ft.*lbf }
for bolt D:
31 N*m{ 316 kgf*cm , 23 ft.*lbf }

Bolt Length:



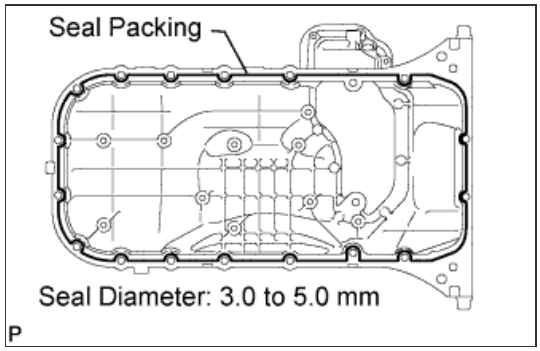
Item	Bolt Head Size	Length
Bolt A	12 mm	35 mm (1.38 in.)
Bolt B	12 mm	50 mm (1.97 in.)
Bolt C	14 mm	103 mm (4.06 in.)
Bolt D	14 mm	44 mm (1.73 in.)
Bolt E	6 mm hexagon	28 mm (1.10 in.)

2. INSTALL OIL STRAINER SUB-ASSEMBLY

a. Install a new gasket and the oil strainer with the 2 bolts and 2 nuts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

3. INSTALL OIL PAN SUB-ASSEMBLY

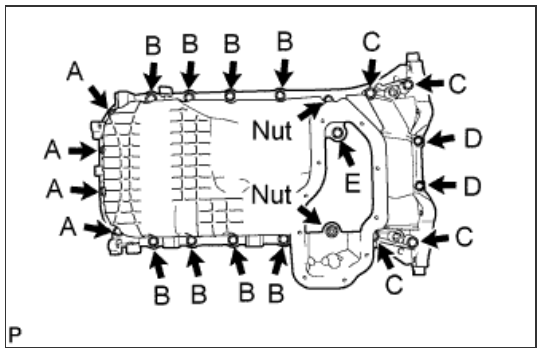


a. Apply seal packing to the oil pan as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard seal diameter:
3.0 to 5.0 mm (0.118 to 0.197 in.)

NOTICE:



- **Install the oil pan within 3 minutes and tighten the bolts within 15 minutes after applying seal packing.**
- **Be careful not to drop any oil on the contact surfaces of the oil pan and cylinder block.**
- **Do not expose the seal to engine oil for at least 2 hours after installing it.**

b. Temporarily install the oil pan with the 19 bolts and 2 nuts.

Bolt Length:

Item	Bolt Head Size	Length
Bolt A	10 mm	22 mm (0.866 in.)
Bolt B	12 mm	25 mm (0.984 in.)
Bolt C	12 mm	60 mm (2.36 in.)
Bolt D	10 mm	35 mm (1.38 in.)
Bolt E	10 mm	22 mm (0.866 in.)

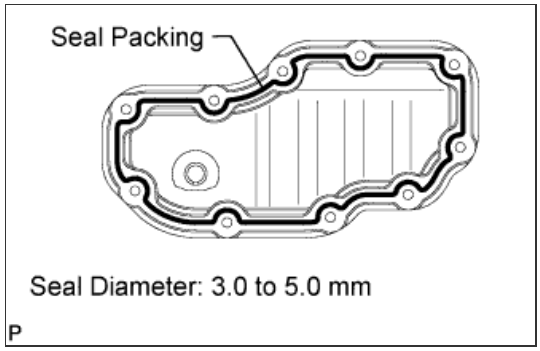
NOTICE:

Make sure the rear ends of the oil pan and cylinder block are aligned. If not, the oil pan may become damaged.

c. Uniformly tighten the bolts and nuts in several passes.

Torque:
for bolt A, D, E:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }
for bolt B, C, nut:
28 N*m{ 286 kgf*cm , 21 ft.*lbf }

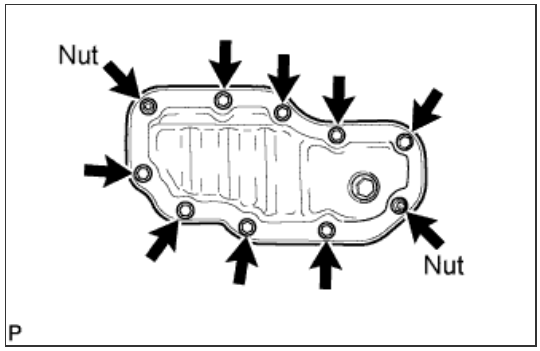
4. INSTALL NO. 2 OIL PAN SUB-ASSEMBLY



a. Apply seal packing to the No. 2 oil pan as shown in the illustration.

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

Standard seal diameter:
3.0 to 5.0 mm (0.118 to 0.197 in.)

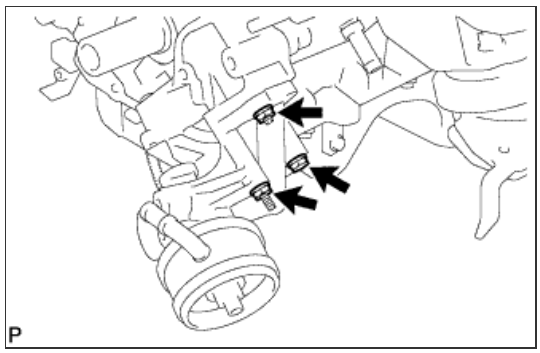


NOTICE:

- **Install the oil pan within 3 minutes and tighten the bolts within 15 minutes after applying seal packing.**
- **Be careful not to drop any oil on the contact surfaces of the oil pan and No. 2 oil pan.**
- **Do not expose the seal to engine oil for at least 2 hours after installing it.**

b. Install the No. 2 oil pan with the 8 bolts and 2 nuts. Uniformly tighten the bolts and nuts in several passes.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

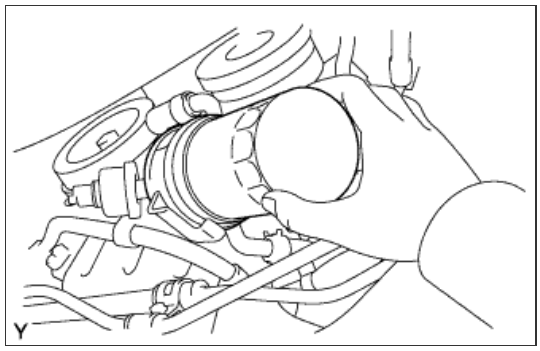


5. INSTALL OIL FILTER BRACKET SUB-ASSEMBLY

a. Install a new gasket to the oil filter bracket.

b. Install the oil filter bracket with the bolt, stud bolt and nut.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }



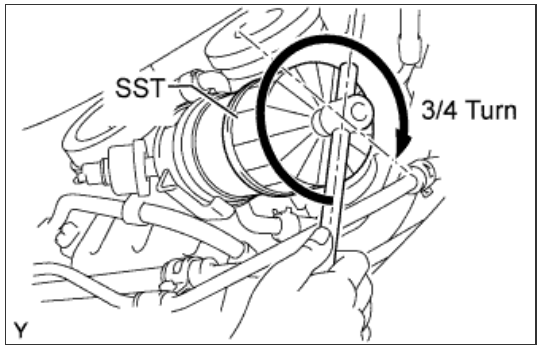
6. INSTALL OIL FILTER ASSEMBLY

a. Clean and check the oil filter installation surface.

b. Apply clean engine oil to the gasket of a new oil filter.

c. Lightly screw the oil filter into place by hand. Tighten it until the gasket contacts

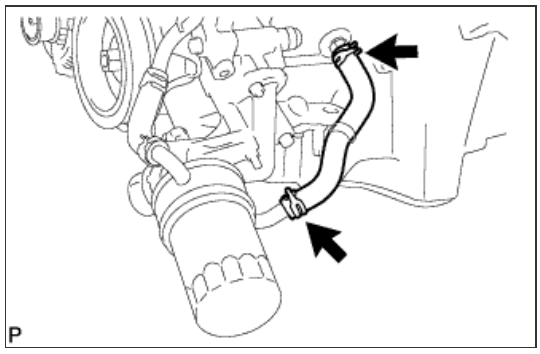
the seat.



d. Using SST, tighten the oil filter. Choose from the following to tighten the oil filter.

SST
09228-07501

i. Using a torque wrench, tighten the oil filter.

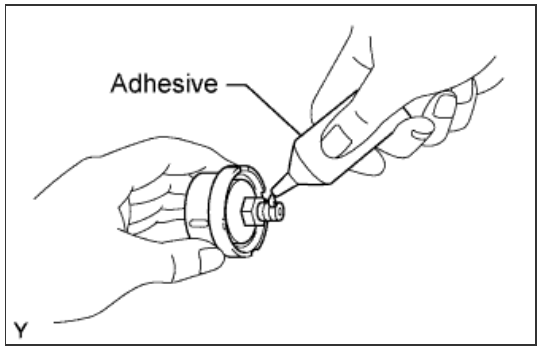


Torque:
17 N*m{ 175 kgf*cm , 13 ft.*lbf }

ii. Tighten the oil filter a 3/4 turn by hand or with a common wrench.

7. INSTALL OIL COOLER HOSE

a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to install the oil cooler hose.



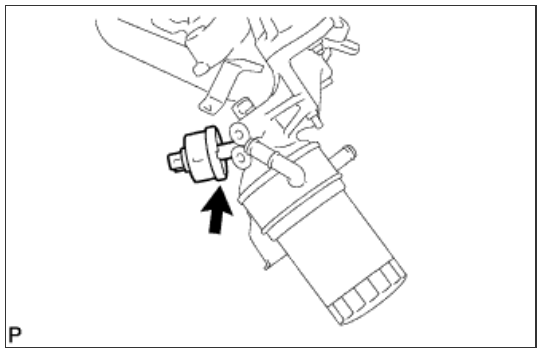
8. INSTALL OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Apply adhesive to 2 or 3 threads of the sender gauge.

Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not let adhesive adhere to the oil hole.



b. Install the sender gauge.

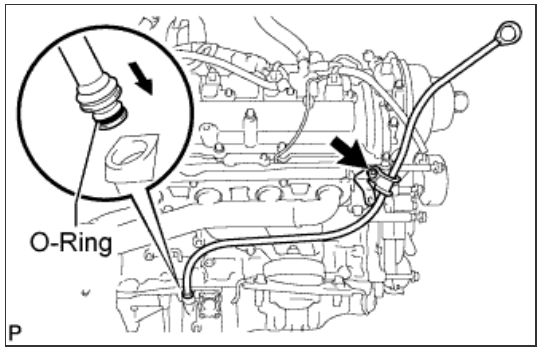
Torque:
15 N*m{ 153 kgf*cm , 11 ft.*lbf }

NOTICE:

Do not start the engine within 1 hour of installation.

c. Connect the sender gauge connector.

9. INSTALL ENGINE OIL LEVEL DIPSTICK GUIDE



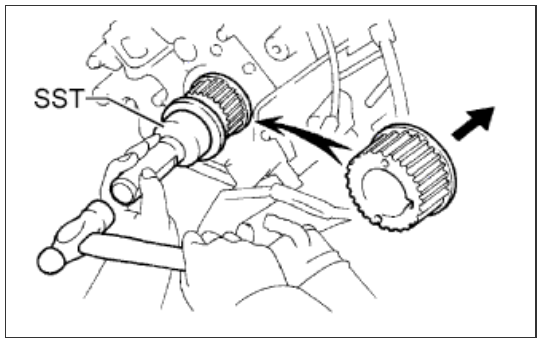
a. Apply a light coat of engine oil to a new O-ring.

b. Install a new O-ring to the guide.

c. Install the dipstick guide with the bolt.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

d. Install the dipstick.

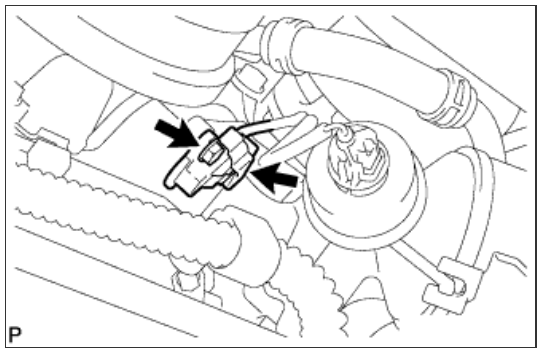


10. INSTALL CRANKSHAFT TIMING PULLEY

a. Align the timing pulley set key with the key groove of the pulley.

b. Using SST and a hammer, tap in the timing pulley with the flange side facing inward.

SST
09223-46011



11. INSTALL CRANKSHAFT POSITION SENSOR

a. Install the sensor with the bolt.

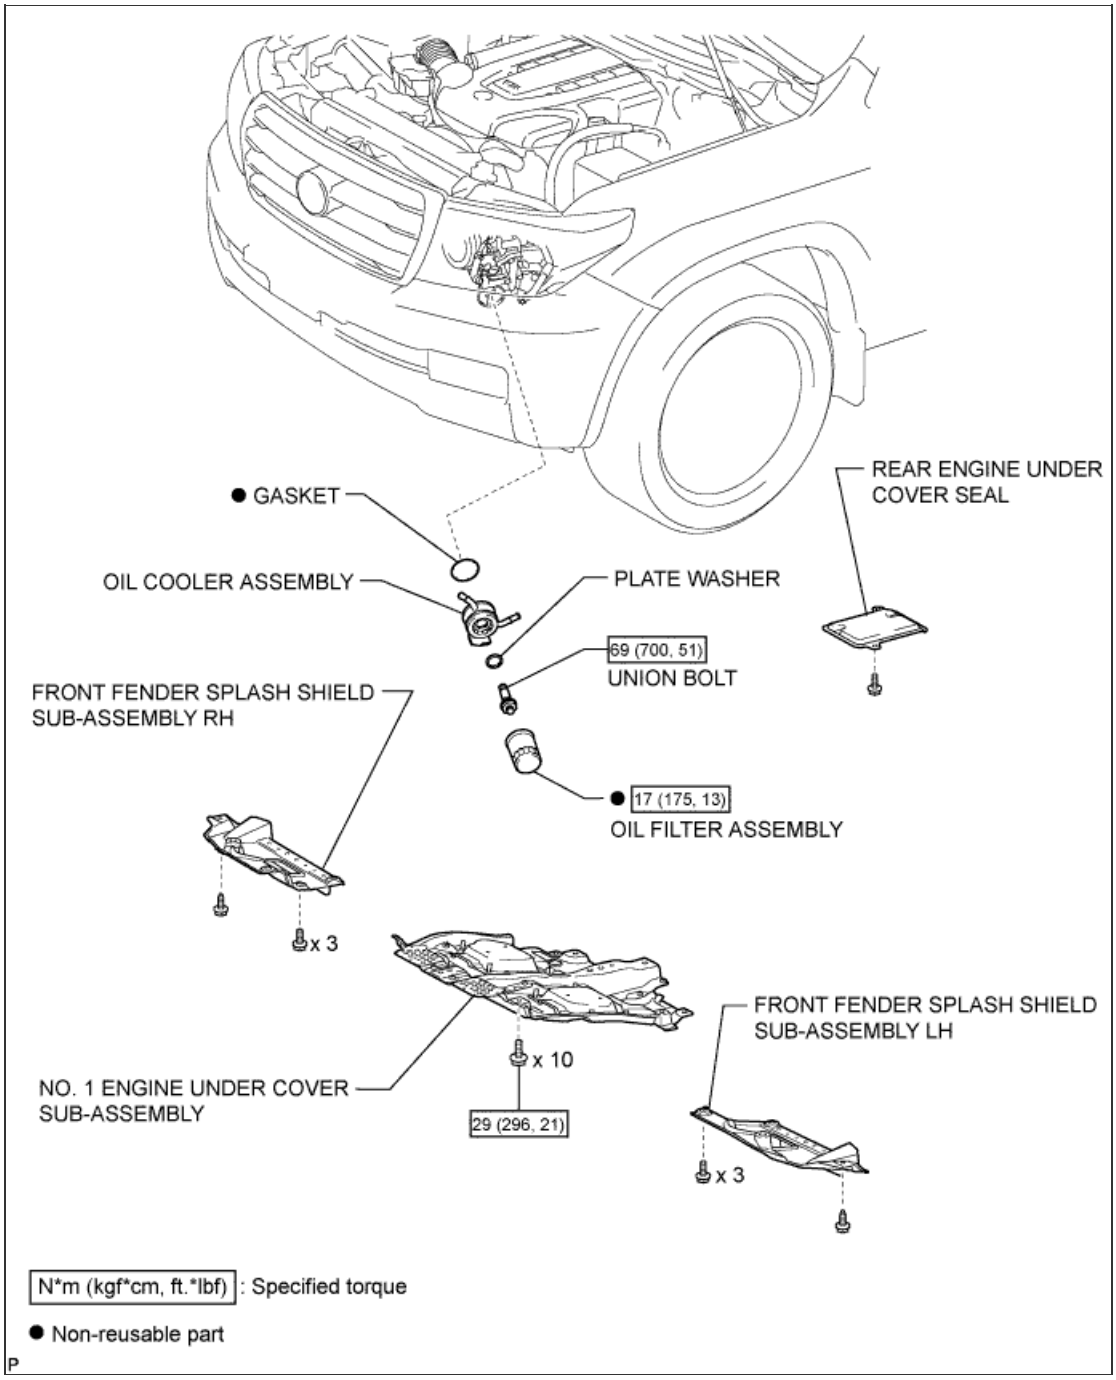
Torque:
6.5 N*m{ 66 kgf*cm , 58 in.*lbf }

b. Connect the sensor connector.

12. INSTALL TIMING BELT

a. Install the timing belt (Click here).

13. INSTALL ENGINE ASSEMBLY



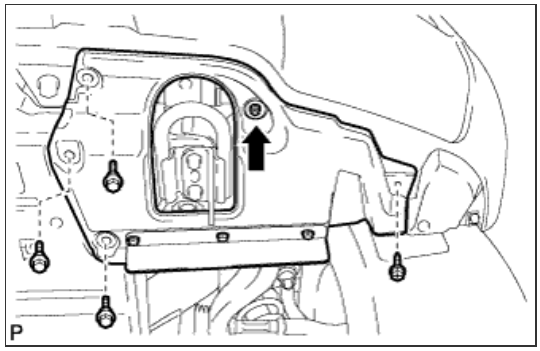
a. Install the engine to the vehicle (Click here).

14. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

for Preparation Click here

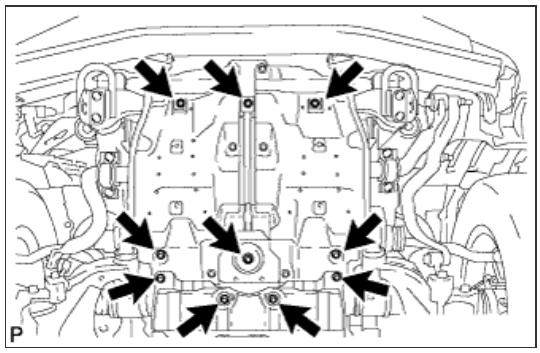


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

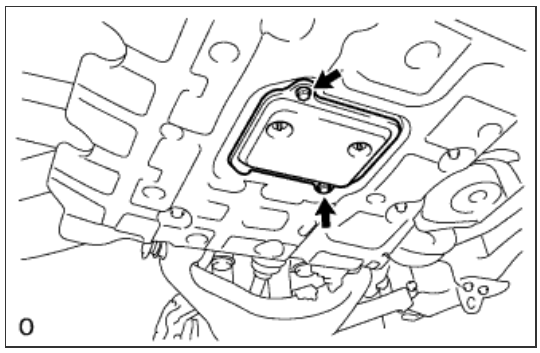
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

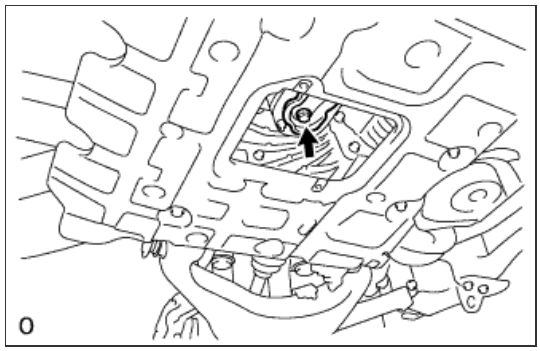
Use the same procedures described for the LH side.



3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

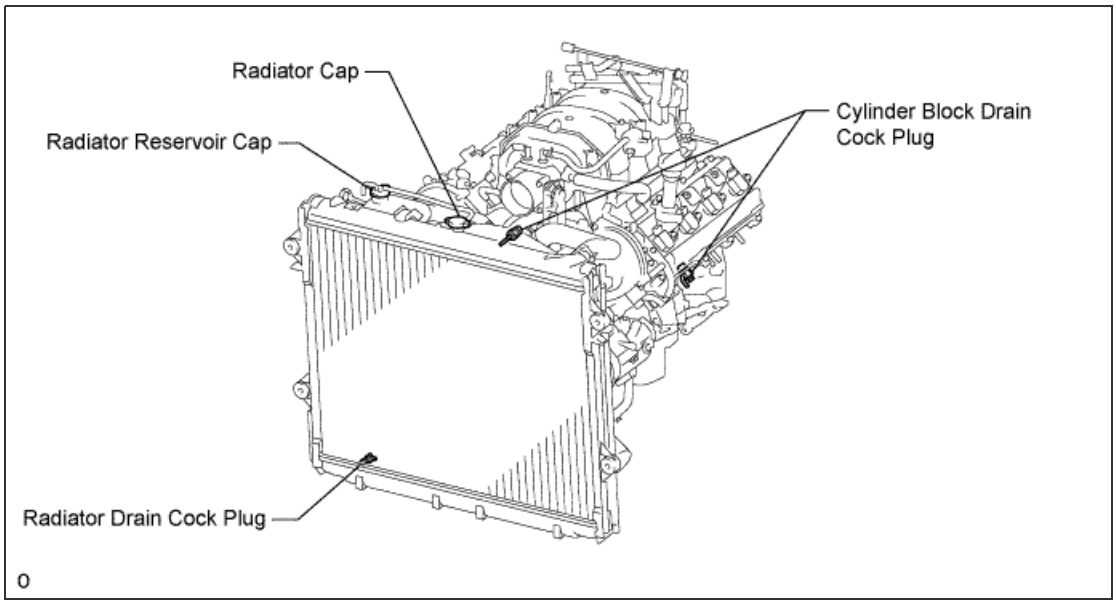
4. REMOVE REAR ENGINE UNDER COVER SEAL



a. Remove the 2 bolts and cover seal.

5. REMOVE OIL FILLER CAP SUB-ASSEMBLY

6. DRAIN ENGINE OIL



a. Remove the oil drain plug and gasket, and drain the engine oil into a container.

7. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

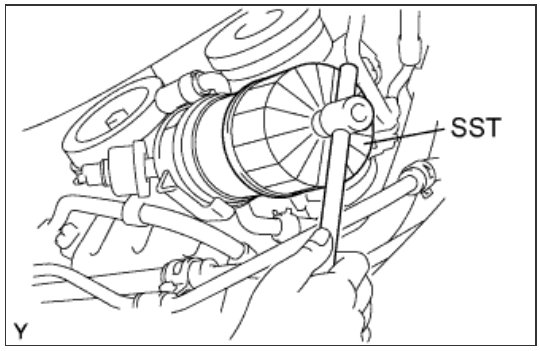
b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

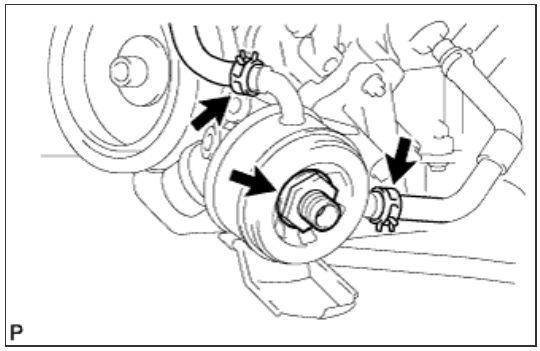


Torque:
13 N*m{ 130 kgf*cm , 9 ft.*lbf }

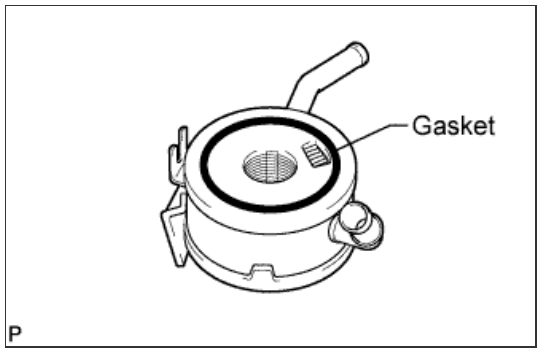
e. Tighten the radiator drain cock plug by hand.

8. REMOVE OIL FILTER ASSEMBLY

a. Using SST, remove the oil filter.



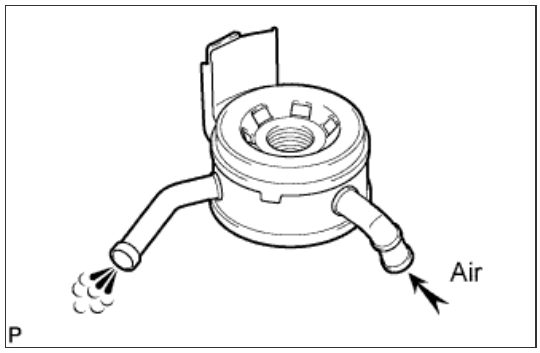
SST
09228-07501



9. REMOVE OIL COOLER ASSEMBLY

a. Disconnect the 2 oil cooler hoses from the oil cooler.

b. Remove the union bolt, plate washer and oil cooler.

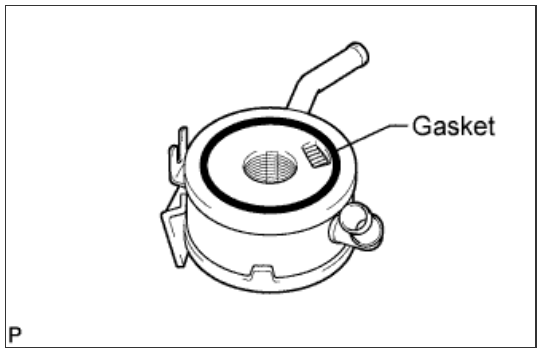


c. Remove the gasket from the oil cooler.

for Preparation Click here

1. INSPECT OIL COOLER ASSEMBLY

a. Check the oil cooler for damage or clogging.
If necessary, replace the oil cooler.



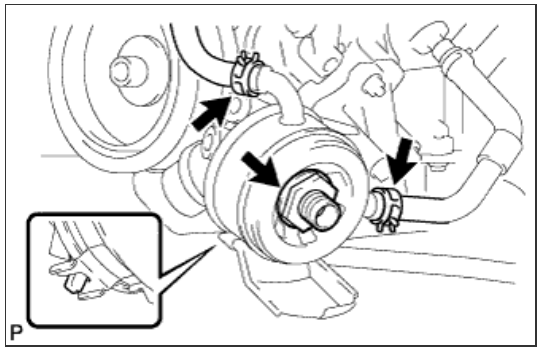
for Preparation Click here

1. INSTALL OIL COOLER ASSEMBLY

a. Clean the oil cooler contact surface on the cooler mounting.

b. Apply a light coat of engine oil to a new gasket and install it to the oil cooler.

c. Apply a light coat of engine oil on the threads and under the head of the union bolt.



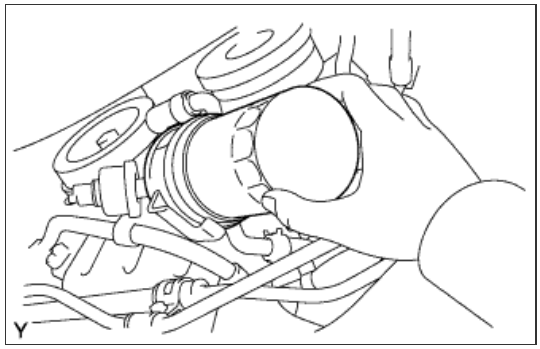
d. Install the oil cooler and plate washer with the union bolt.

Torque:
69 N*m{ 700 kgf*cm , 51 ft.*lbf }

HINT:

Fit the fork part of the oil cooler onto the rib of the oil cooler bracket.

e. Connect the 2 oil cooler hoses to the oil cooler.

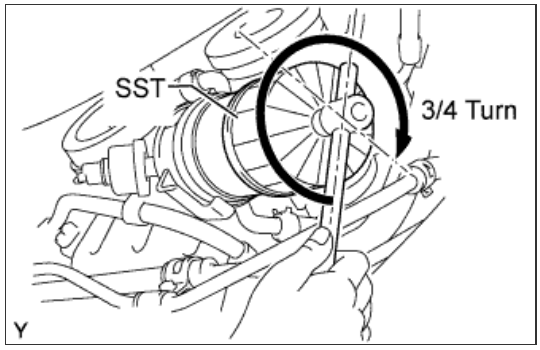


2. INSTALL OIL FILTER ASSEMBLY

a. Clean and check the oil filter installation surface.

b. Apply clean engine oil to the gasket of a new oil filter.

c. Lightly screw the oil filter into place by hand. Tighten it until the gasket contacts the seat.



d. Using SST, tighten the oil filter. Choose from the following to tighten the oil filter.

SST
09228-07501

i. Using a torque wrench, tighten the oil filter.

Torque:
17 N*m{ 175 kgf*cm , 13 ft.*lbf }

ii. Tighten the oil filter a 3/4 turn by hand or with a common wrench.

3. ADD ENGINE OIL

a. Install a new gasket and the drain plug.

Torque:
39 N*m{ 398 kgf*cm , 29 ft.*lbf }

b. Add new engine oil.

Standard Engine Oil:

Oil Grade	Oil Viscosity (SAE)
API grade SL "Energy-Conserving", SM "Energy-Conserving" or ILSAC multigrade engine oil	10W-30 (10W-30 is best choice for fuel economy and good starting in cold weather).
API grade SL or SM multigrade engine oil	10W-30

Standard Oil Capacity:

Item	Specified Condition
Drain and refill with oil filter change	6.2 liters (6.6 US qts, 5.5 Imp. qts)
Drain and refill without oil filter change	5.7 liters (6.0 US qts, 5.0 Imp. qts)
Dry fill	7.1 liters (7.5 US qts, 6.2 Imp. qts)

4. INSTALL OIL FILLER CAP SUB-ASSEMBLY

5. ADD ENGINE COOLANT

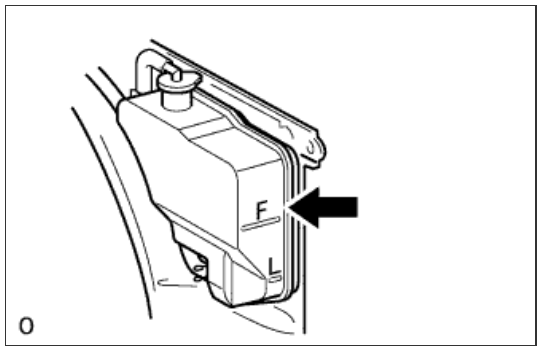
a. Add engine coolant.

Standard Capacity:

Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	16.3 liters (17.2 US qts, 14.3 Imp. qts)
w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	16.9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).



b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the radiator reservoir cap.

d. Press the inlet and outlet radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

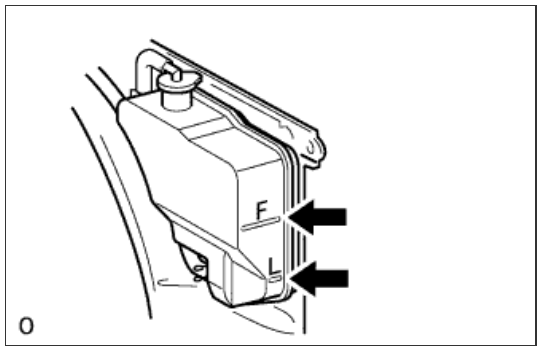
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabili ed.**

h. Press the inlet and outlet radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

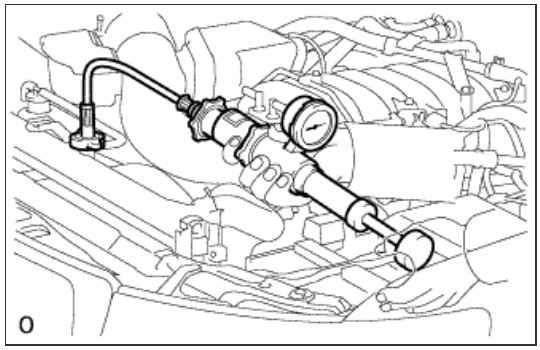
i. Stop the engine, and wait until the engine coolant cools down to the ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines. If the coolant level is below the L line, repeat all of the procedures above. If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

6. INSPECT FOR OIL LEAK



a. Start the engine. Make sure that there are no oil leaks from the area that was worked on.

7. INSPECT FOR COOLANT LEAK

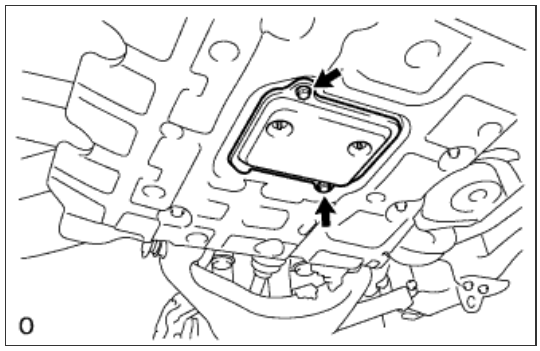
a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

8. CHECK ENGINE OIL LEVEL

a. Warm up the engine, then stop the engine and wait for 5 minutes.

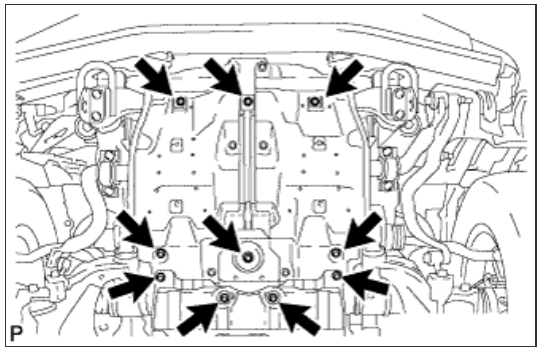


b. Check that the engine oil level is between the low level and full level marks on the dipstick.
If low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill engine oil above the full level mark.

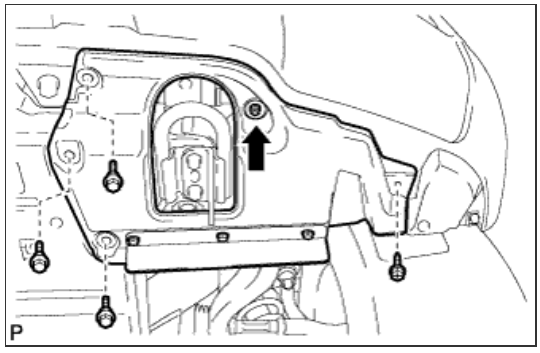
9. INSTALL REAR ENGINE UNDER COVER SEAL



a. Install the cover seal with the 2 bolts.

10. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.



Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

11. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

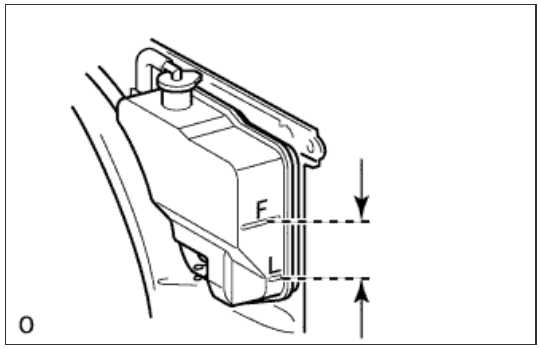
a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

12. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.



13. INSPECT ENGINE COOLANT LEVEL

a. Check that the engine coolant level is between the L and F lines when the engine is cold.
If the engine coolant is low, check for leaks and add "TOYOTA Super Long Life Coolant" or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite and non-borate coolant with long-life hybrid organic acid technology to the F line.

NOTICE:

Do not substitute plain water for engine coolant.

b. Remove the radiator cap, and check that the coolant level is up to the radiator filler hole.

for Preparation Click here

1. CHECK OIL QUALITY

a. Check the engine oil for deterioration, water contamination, discoloring or thinning.
If the quality is visibly poor, replace the engine oil and oil filter element (Click here).

2. CHECK ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The engine oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

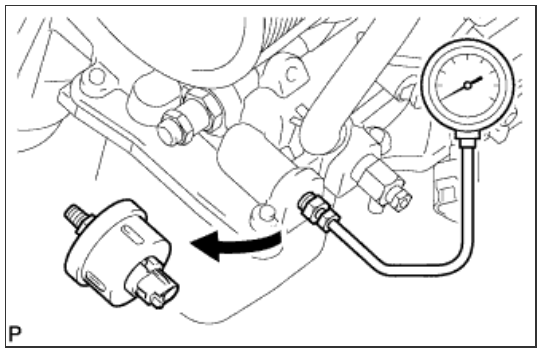
NOTICE:

Do not fill engine oil above the full level mark.

3. CHECK ENGINE OIL PRESSURE

a. Remove the oil pressure sender gauge (Click here).

b. Install an oil pressure sender gauge with an adapter.

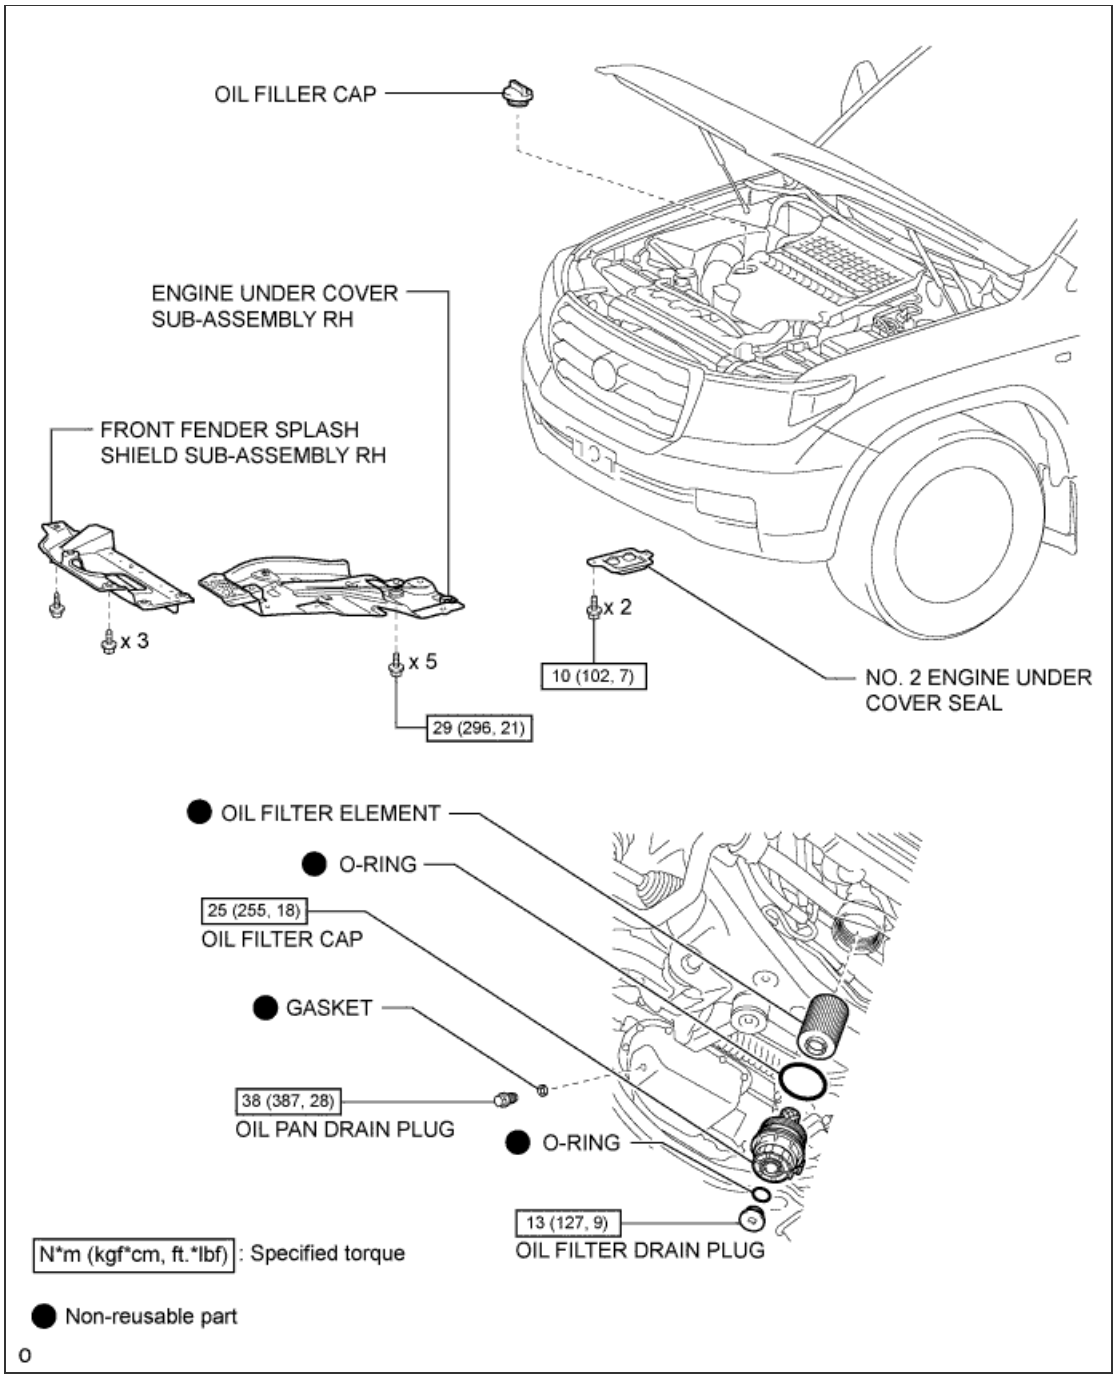


c. Warm up the engine.

d. Measure the engine oil pressure.

Standard Oil Pressure:

Condition	Specified Condition
Idle	50 kPa (0.5 kgf/cm^2, 7.3 psi) or more
2500 rpm	230 kPa (2.3 kgf/cm^2, 33 psi) or more



If the pressure is not as specified, check the oil pump.

e. Remove the oil pressure gauge and adapter.

f. Install the oil pressure sender gauge (Click here).

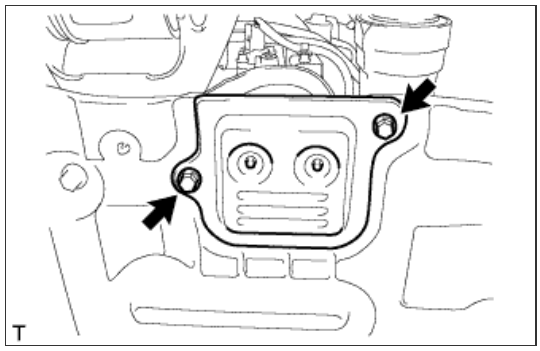
for Preparation Click here

for Preparation Click here

CAUTION:

- **Prolonged and repeated contact with engine oil will result in the removal of natural oils from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer.**
- **Precautions should be taken when replacing engine oil to minimize the risk of your skin making contact with used engine oil. Protective clothing and gloves that cannot be penetrated by oil should be worn. The skin should be washed with soap and water, or use waterless hand cleaner, to remove any used engine oil thoroughly. Do not use gasoline, thinners, or solvents.**
- **In order to protect the environment, used oil and used oil filters must be disposed of at designated disposal sites.**

1. DRAIN ENGINE OIL



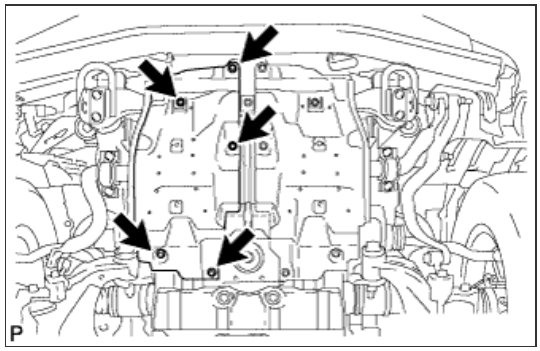
a. Remove the 2 bolts and No. 2 engine under cover seal from the No. 2 engine under cover.

b. Remove the oil filler cap.

c. Remove the oil pan drain plug and gasket, and then drain the engine oil into a container.

d. Install a new gasket and the oil pan drain plug.

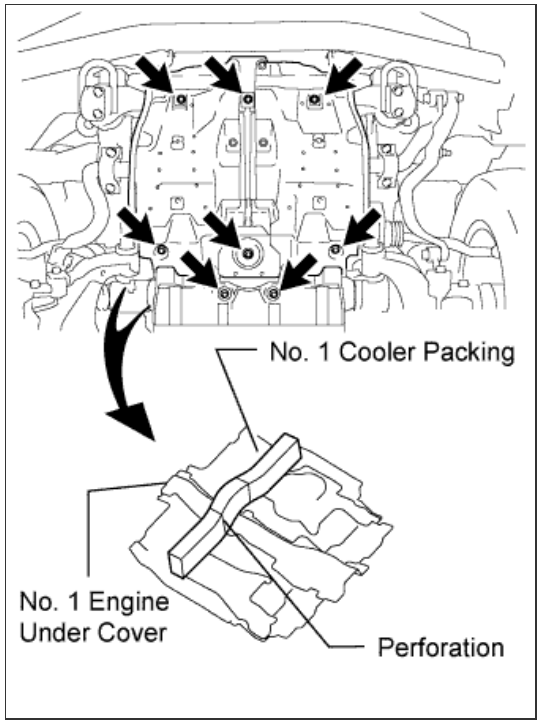
Torque:
38 N*m{ 387 kgf*cm , 28 ft.*lbf }



2. REMOVE FRONT FENDER PLA IELD UB-A EMBLY RH

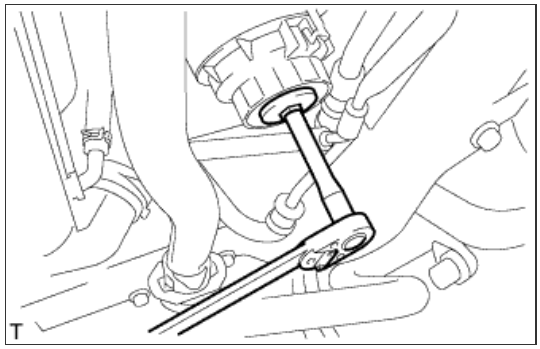
HINT:

Use the same procedures described for the LH side.



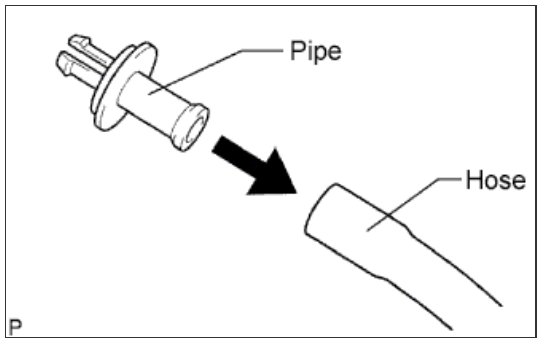
3. REMOVE ENGINE UNDER COVER UB-A EMBLY RH

a. Remove the 5 bolts and engine under cover sub-assembly RH.



HINT:

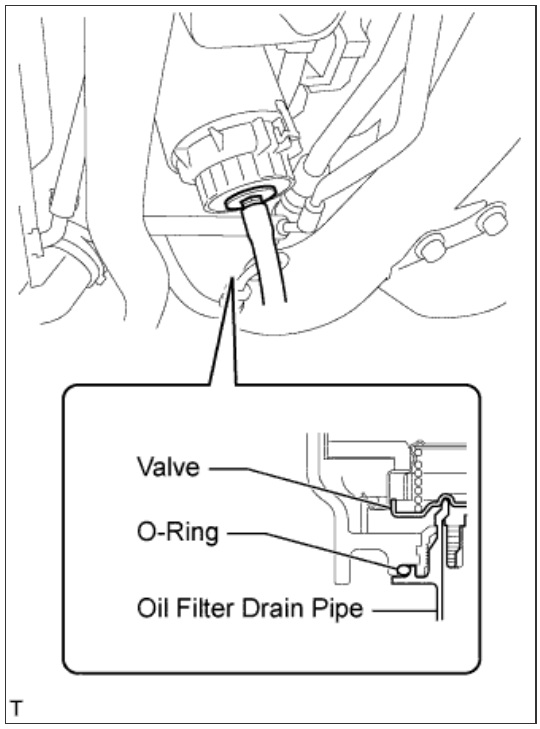
If the No. 1 cooler packing is not divided, remove both sides of the engine under cover assembly and cut the packing at the perforation indicated in the illustration.



4. REMOVE OIL FILTER ELEMENT

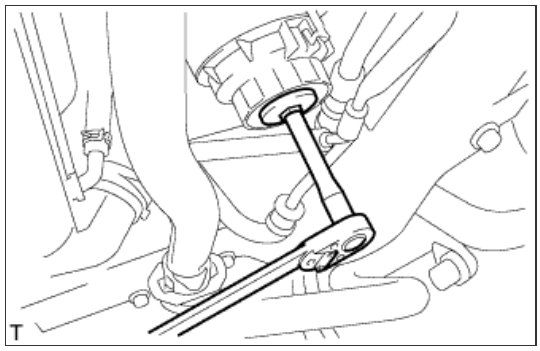
a. Remove the oil filter drain plug.

b. Connect a hose with an inside diameter of 15 mm (0.591 in.) to the pipe.



c. Remove the O-ring from the oil filter drain plug and install it to the drain pipe.

d. Install the oil filter drain pipe to the oil filter cap and drain the engine oil.

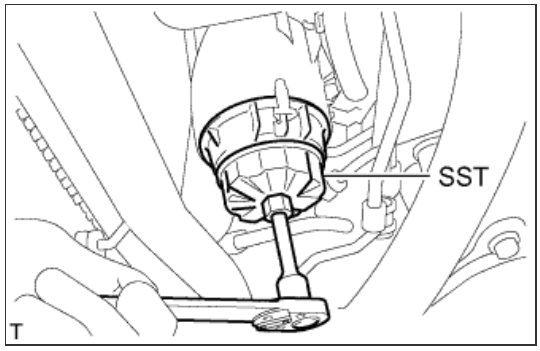


e. Remove the oil filter drain pipe.

f. Apply a light coat of engine oil to a new O-ring, and install it to the oil filter drain plug.

g. Install the oil filter drain plug to the oil filter cap.

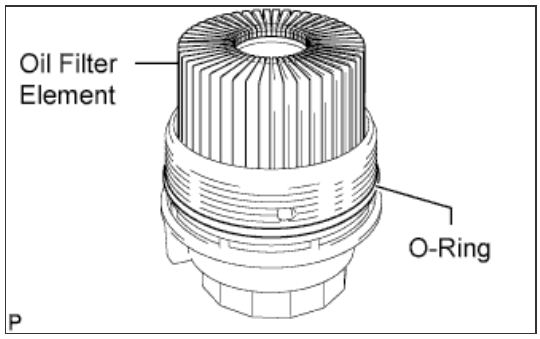
Torque:
13 N*m{ 127 kgf*cm , 9 ft.*lbf }



h. Using SST, remove the oil filter cap.

SST
09228-06501

HINT:



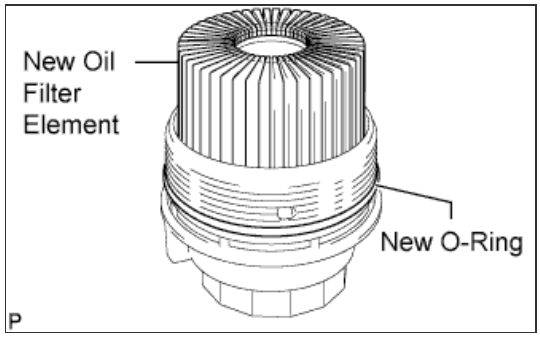
Use a container to catch the draining oil. After the oil filter cap is loosened approximately 4 turns and the cap ribs are vertical, engine oil drains from the gap between the oil filter cap and oil pan.

i. Remove the oil filter element and O-ring from the oil filter cap.

NOTICE:

Be sure to remove the cap O-ring by hand, without using any tools, to prevent damage to the cap O-ring groove.

5. IN TALL OIL FILTER ELEMENT



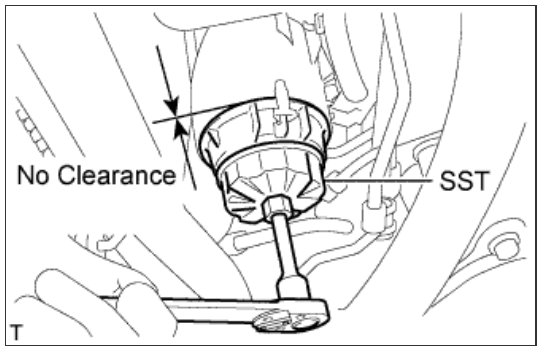
a. Clean the inside of the oil filter cap, its threads and its O-ring groove.

b. Apply a small amount of engine oil to a new O-ring and install it to the oil filter cap.

c. Set a new oil filter element in the oil filter cap.

d. Remove any dirt or foreign matter from the installation surface of the engine.

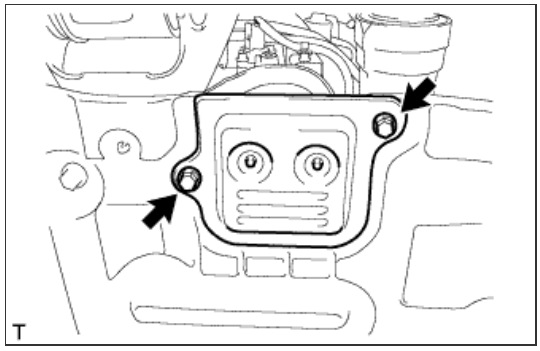
e. Apply a small amount of engine oil to the O-ring again and temporarily install the oil filter cap by hand.



f. Using SST, tighten the oil filter cap.

SST
09228-06501

Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }



NOTICE:

- **Make sure that the oil filter is installed securely as shown in the illustration.**
- **Be careful that the O-ring does not get caught between any surrounding parts.**

g. Install the No. 2 engine under cover seal to the No. 2 engine under cover with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

6. ADD ENGINE OIL

a. Add fresh oil.

tandard Engine Oil:

Oil Grade	Oil Viscosity (SAE)
G-DLD-1, API CF-4, API CF or ACEA B1 (You may also use API CE or CD)	- 5W-30 - 10W-30 - 15W-40 - 20W-50 (5W-30 is best choice for fuel economy and good starting in cold weather).

tandard Capacity:

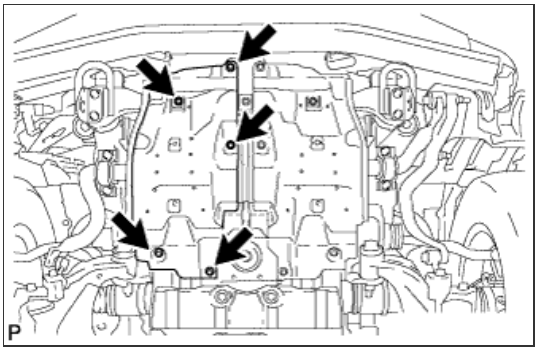
Item	Specified Condition
Drain and refill with oil filter change	9.2 liters (9.7 US qts, 8.1 Imp. qts)
Drain and refill without oil filter change	8.2 liters (8.7 US qts, 7.2 Imp. qts)
Dry fill	9.9 liters (10.5 US qts, 8.7 Imp. qts)

b. Install the oil filler cap.

7. IN PECT FOR ENGINE OIL LEAK

a. Warm up the engine and check for an engine oil leak.

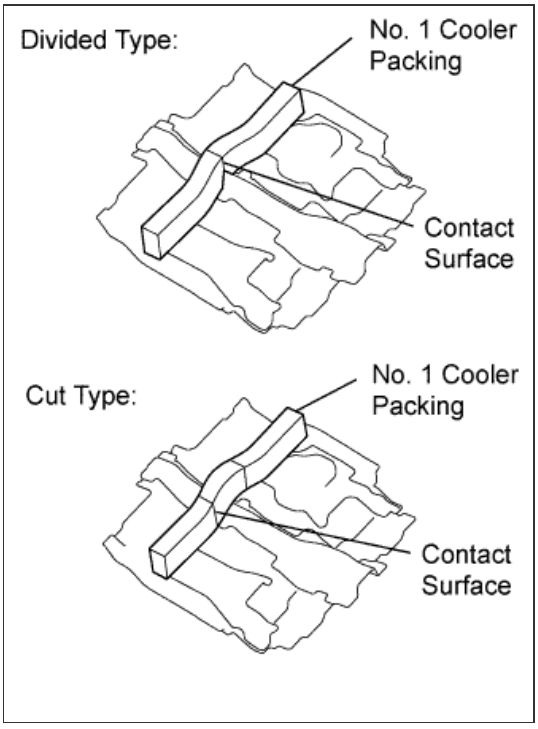
8. CHECK ENGINE OIL LEVEL



a. Warm up the engine, stop the engine and wait 5 minutes. The engine oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

NOTICE:

Do not fill engine oil above the full level mark.

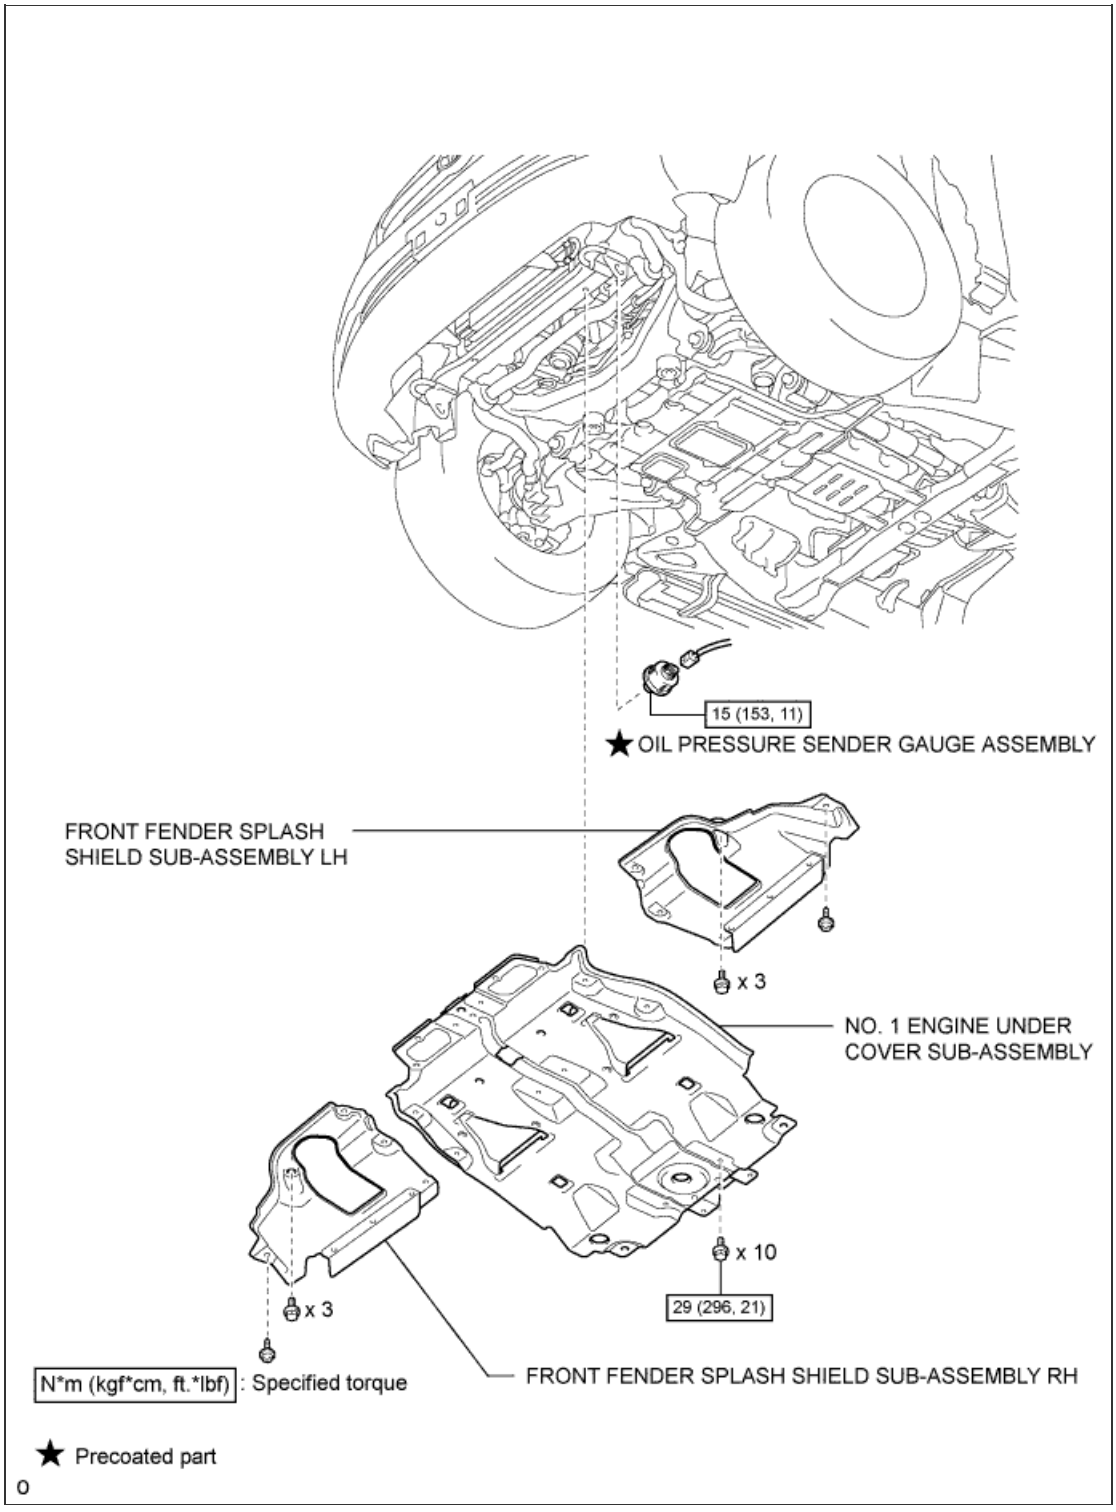


9. IN TALL ENGINE UNDER COVER UB-A EMBLY RH

a. Install the engine under cover sub-assembly RH with the 5 bolts.

HINT:

Make sure there is no gap between the ends of the No. 1 cooler packing.



10. IN TALL FRONT FENDER PLA IELD UB-A EMBLY RH

HINT:

Use the same procedures described for the LH side.

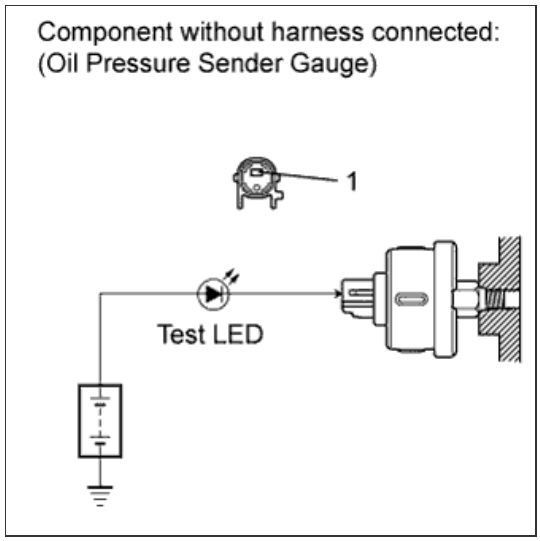
for Preparation Click here

for Preparation Click here

1. INSPECT OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Disconnect the oil pressure sender gauge connector.

b. Apply battery positive (ltage to the oil pressure sender gauge terminal through a test LED.



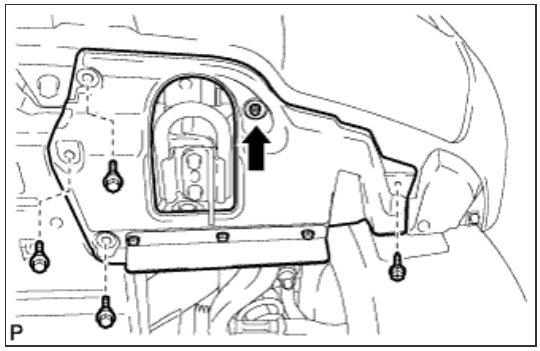
c. Check that the LED does not illuminate when the engine is stopped.

d. Check that the oil pressure sender gauge operation.

OK:

Condition	Specified Condition
Engine stopped	LED does not illuminate
Engine is running	Number of flashes varies with engine speed

If the result is not as specified, replace the oil pressure sender gauge assembly.

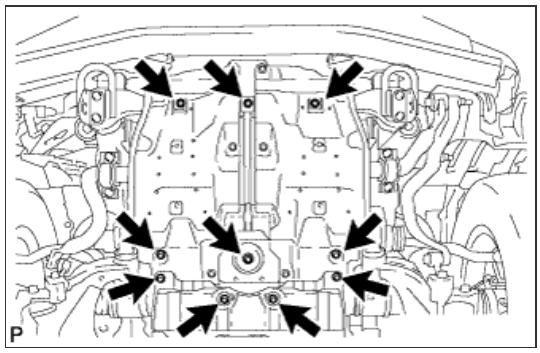


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

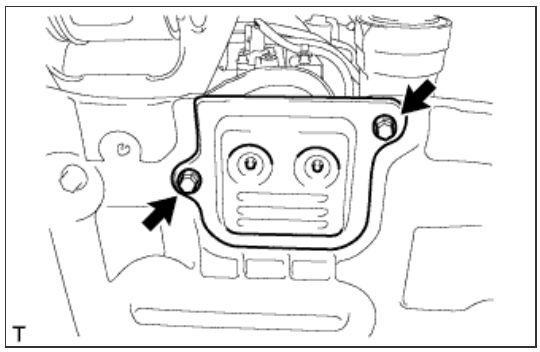
HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. DRAIN ENGINE OIL

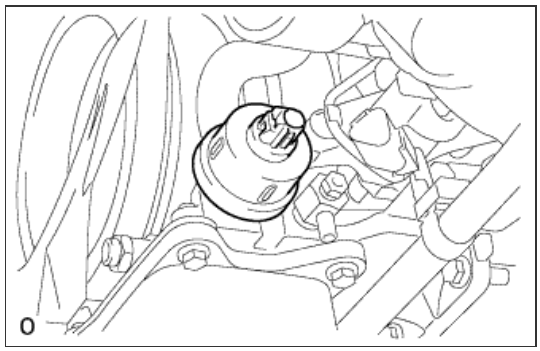


a. Remove the 2 bolts and No. 2 engine under cover seal from the No. 2 engine under cover.

b. Remove the oil filler cap.

c. Remove the oil pan drain plug and gasket, and then drain the engine oil into a container.

d. Install a new gasket and the oil pan drain plug.

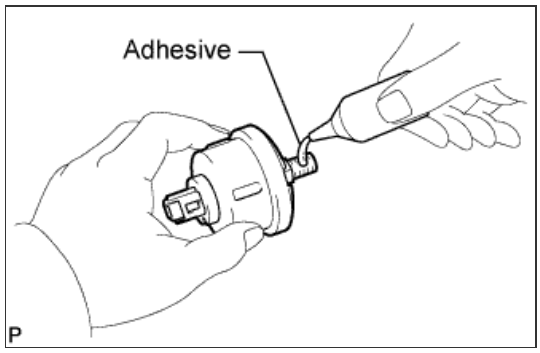


Torque:
38 N*m{ 387 kgf*cm , 28 ft.*lbf }

5. REMOVE OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Disconnect the oil pressure sender gauge connector.

b. Remove the oil pressure sender gauge.

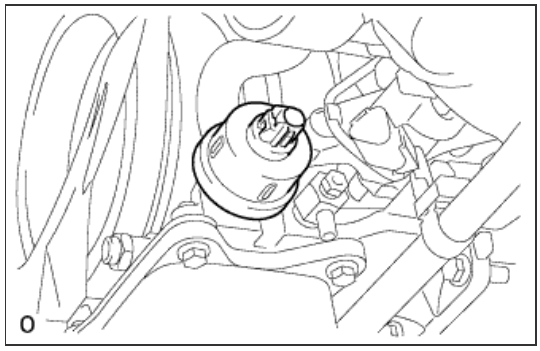


for Preparation Click here

1. INSTALL OIL PRESSURE SENDER GAUGE ASSEMBLY

a. Remove the adhesive from the threads of the oil pressure sender gauge and the bolt hole of the oil filter bracket.

b. Apply adhesive to 2 or 3 threads of the oil pressure sender gauge.



Adhesive:
Toyota Genuine Adhesive 1344, Three Bond 1344 or equivalent

NOTICE:

Do not apply adhesive to the oil inlet port of the sensor.

c. Install the oil pressure sender gauge.

Torque:
15 N*m{ 153 kgf*cm , 11 ft.*lbf }

NOTICE:

Do not start the engine within 1 hour after installation.

d. Connect the oil pressure sender gauge connector.

2. ADD ENGINE OIL

a. Add fresh oil.

Standard Engine Oil:

Oil Grade	Oil Viscosity (SAE)
G-DLD-1, API CF-4, API CF or ACEA B1 (You may also use API CE or CD)	- 5W-30 - 10W-30 - 15W-40 - 20W-50 (5W-30 is best choice for fuel economy and good starting in cold weather).

Standard Capacity:

Item	Specified Condition
Drain and refill with oil filter change	9.2 liters (9.7 US qts, 8.1 Imp. qts)
Drain and refill without oil filter change	8.2 liters (8.7 US qts, 7.2 Imp. qts)
Dry fill	9.9 liters (10.5 US qts, 8.7 Imp. qts)

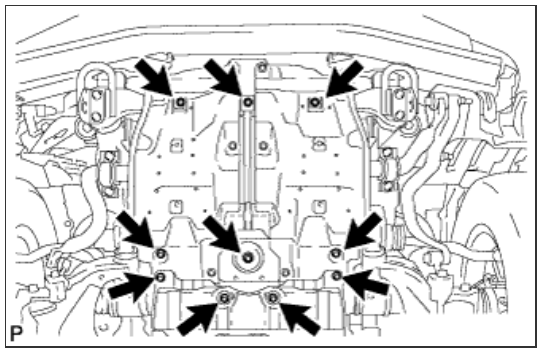
b. Install the oil filler cap.

3. INSPECT FOR ENGINE OIL LEAK

a. Warm up the engine and check for an engine oil leak.

4. CHECK ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The engine oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.



NOTICE:

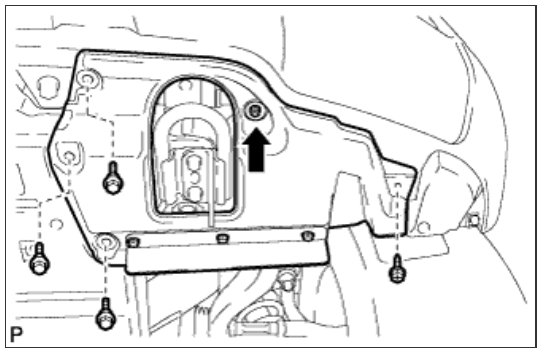
Do not fill engine oil above the full level mark.

5. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the engine under cover with the 10 bolts.

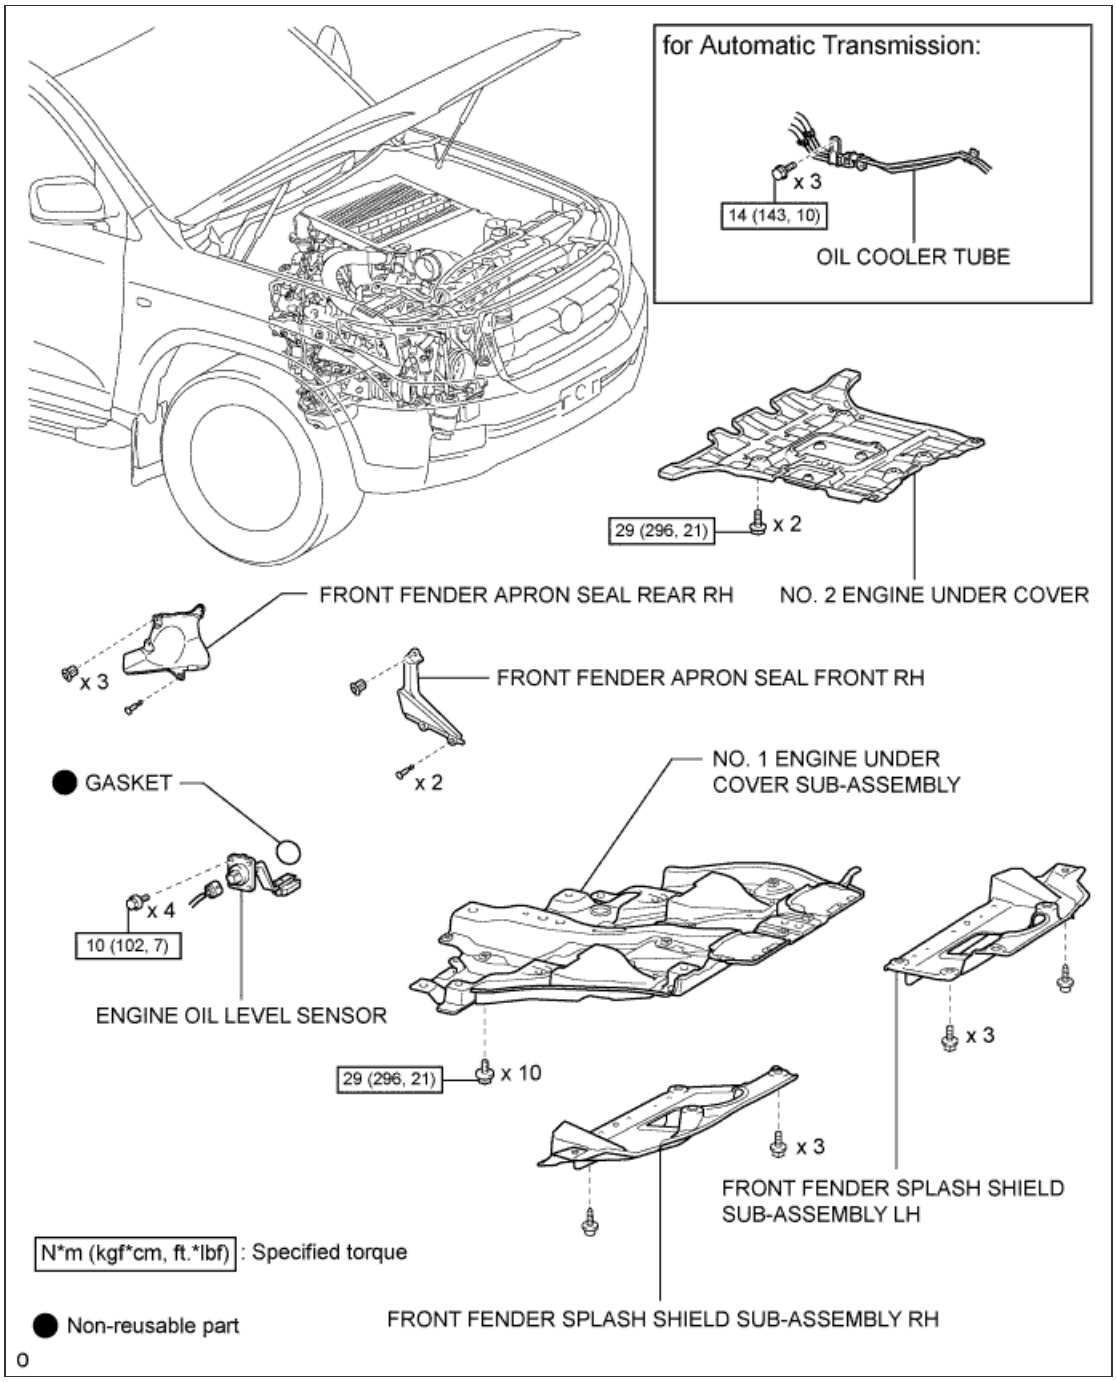
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

6. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

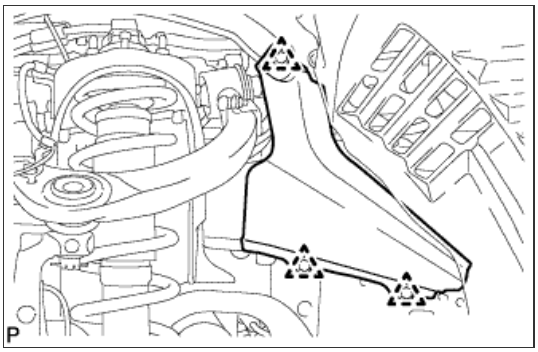


7. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

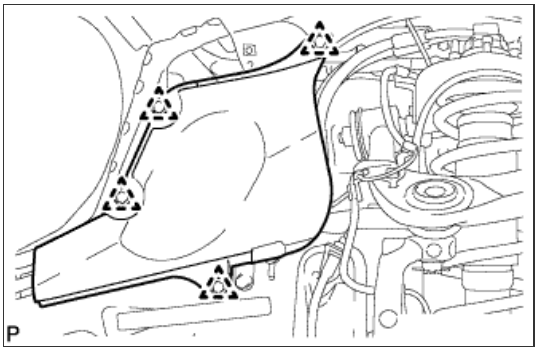
b. Install the 3 bolts and screw.

for Preparation Click here



for Preparation Click here

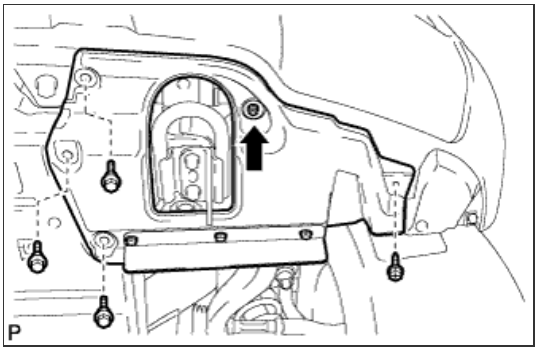
1. REMOVE FRONT WHEEL RH



2. REMOVE FRONT FENDER APRON SEAL FRONT RH

a. Remove the 3 clips and front fender apron seal front RH.

3. REMOVE FRONT FENDER APRON SEAL REAR RH

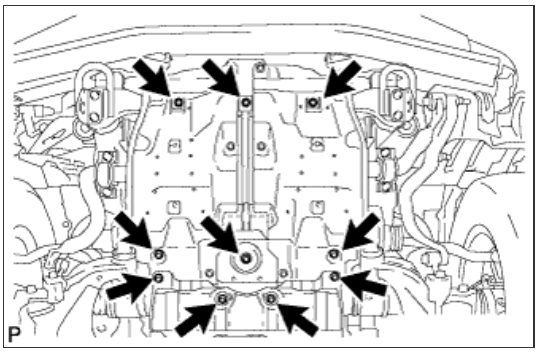


a. Remove the 4 clips and front fender apron seal rear RH.

4. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



5. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

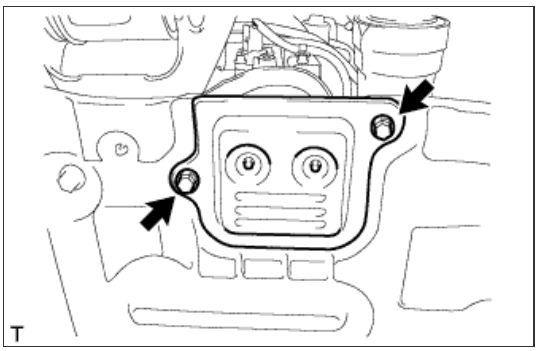
HINT:

Use the same procedures described for the LH side.

6. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

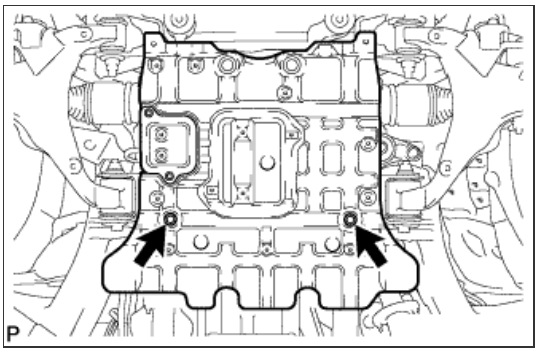
7. DRAIN ENGINE OIL



a. Remove the 2 bolts and No. 2 engine under cover seal from the No. 2 engine under cover.

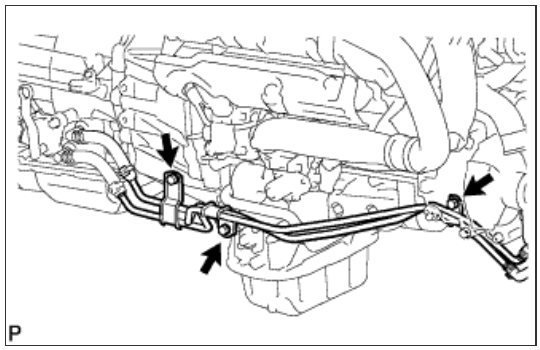
b. Remove the oil filler cap.

c. Remove the oil pan drain plug and gasket, and then drain the engine oil into a container.



d. nstall a new gasket and the oil pan drain plug.

Torque:
38 N*m{ 387 kgf*cm , 28 ft.*lbf }

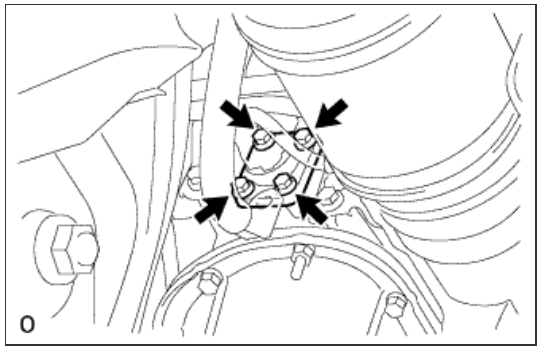


8. REMOVE NO. 2 ENGINE UNDER COVER

a. Remove the 2 bolts and under cover.

9. DISCONNECT OIL COOLER TUBE (for Automatic Transmission)

a. Remove the 3 bolts and disconnect the oil cooler tube from the engine.



10. REMOVE ENGINE OIL LEVEL SENSOR

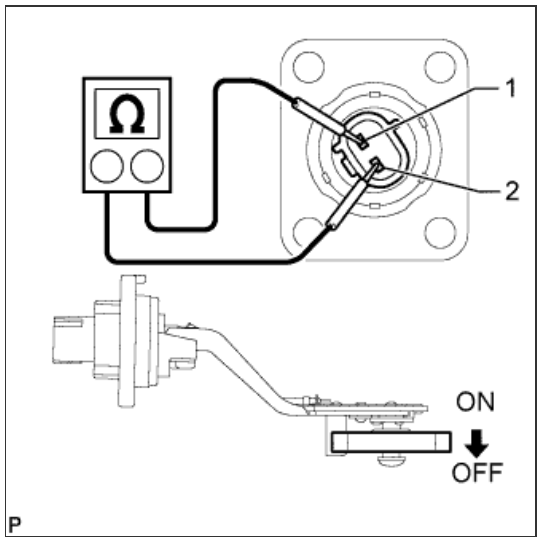
a. Disconnect the sensor connector.

b. Remove the 4 bolts and sensor.

c. Remove the gasket from the sensor.

for Preparation Click here

1. INSPECT ENGINE OIL LEVEL SENSOR



a. Heat the switch to higher than 60°C (140°F) in an oil bath.

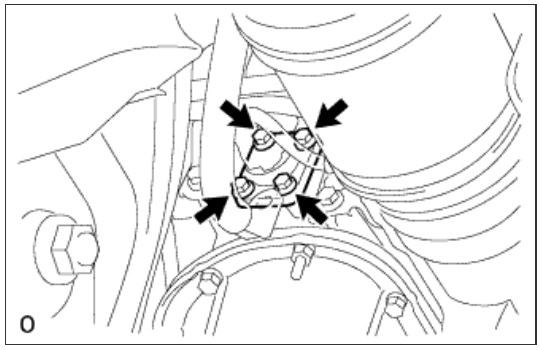
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	ON at 20°C (68°F)	Below 1 Ω
	OFF at 20°C (68°F)	Below 1 Ω
	ON at 60°C (140°F)	Below 1 Ω
	OFF at 60°C (140°F)	10 kΩ or higher

If the result is not as specified, replace the engine oil level sensor.

for Preparation Click here



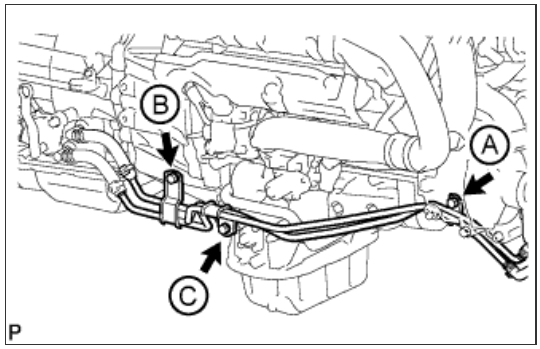
1. INSTALL ENGINE OIL LEVEL SENSOR

a. Install a new gasket to the sensor.

b. Install the sensor with the 4 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

c. Connect the sensor connector.



2. CONNECT OIL COOLER TUBE (for Automatic Transmission)

a. Temporarily install the oil cooler tube to the engine with the 2 bolts A and B.

b. Install the bolt C and tighten it to the specified torque. Then tighten the bolt A and B to the specified torque.

Torque:
14 N*m{ 143 kgf*cm , 10 ft.*lbf }

3. ADD ENGINE OIL

a. Add fresh oil.

Standard Engine Oil:

Oil Grade	Oil Viscosity (SAE)
G-DLD-1, API CF-4, API CF or ACEA B1 (You may also use API CE or CD)	- 5W-30 - 10W-30 - 15W-40 - 20W-50 (5W-30 is best choice for fuel economy and good starting in cold weather).

Standard Capacity:

Item	Specified Condition
Drain and refill with oil filter change	9.2 liters (9.7 US qts, 8.1 Imp. qts)
Drain and refill without oil filter change	8.2 liters (8.7 US qts, 7.2 Imp. qts)
Dry fill	9.9 liters (10.5 US qts, 8.7 Imp. qts)

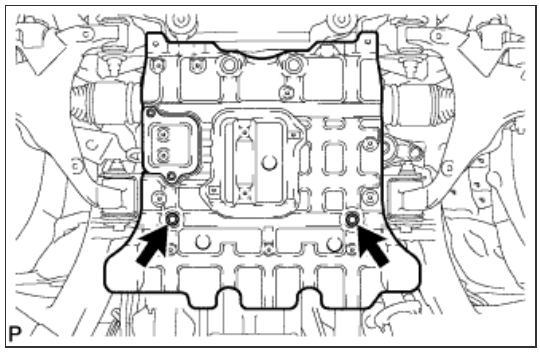
b. Install the oil filler cap.

4. INSPECT FOR ENGINE OIL LEAK

a. Warm up the engine and check for an engine oil leak.

5. CHECK ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The engine oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

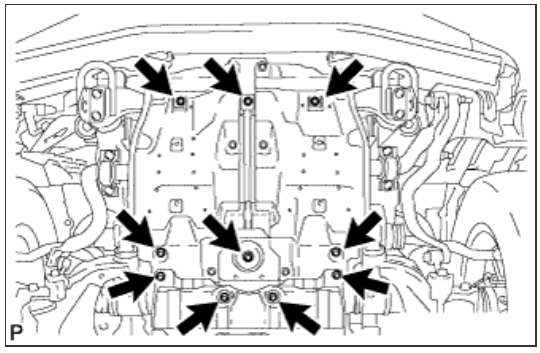


NOTICE:

Do not fill engine oil above the full level mark.

6. INSTALL NO. 2 ENGINE UNDER COVER

a. Install the engine under cover with the 2 bolts.



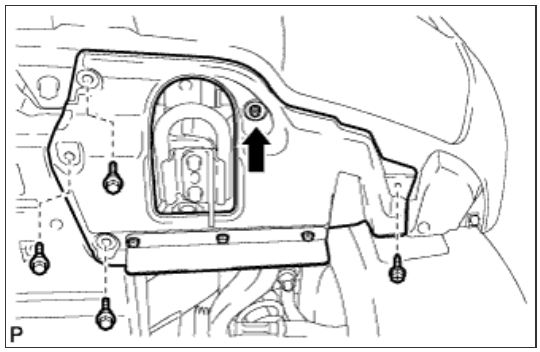
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

7. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

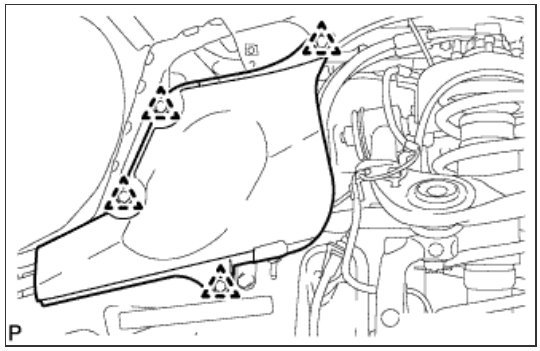
8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

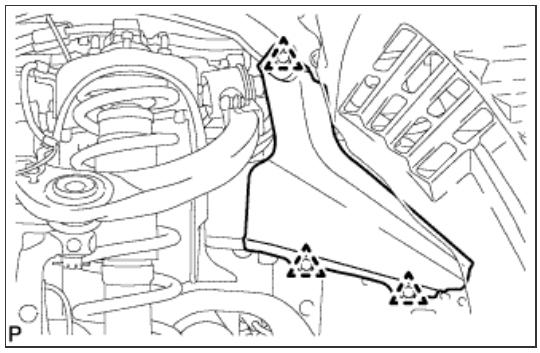
Use the same procedures described for the LH side.

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

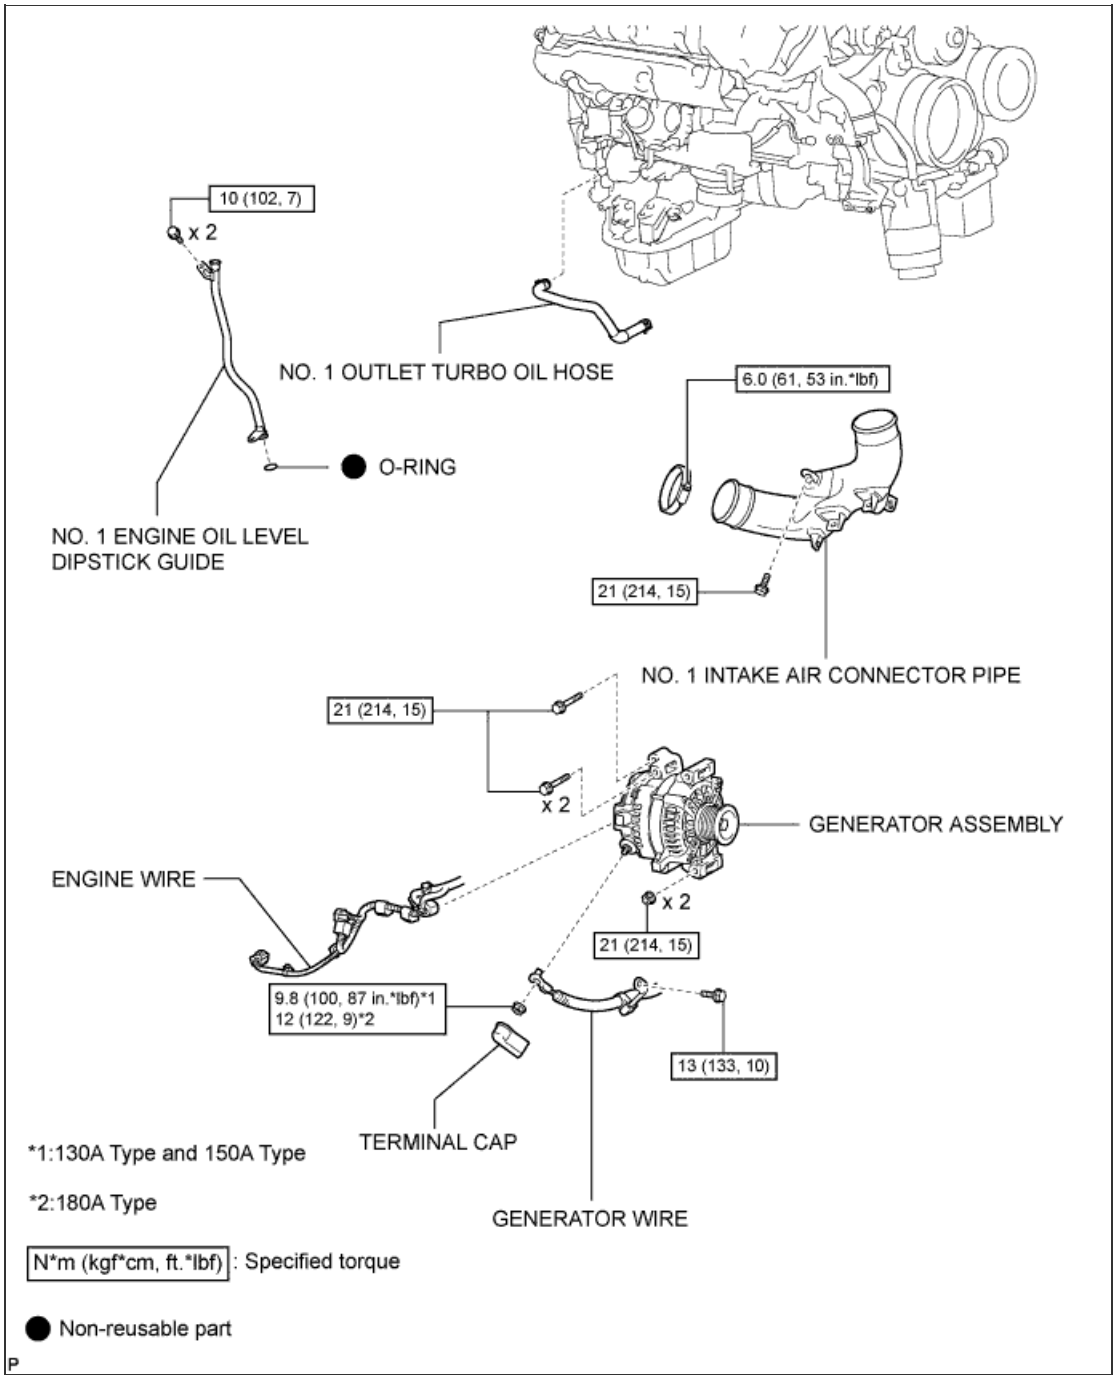
b. Install the 3 bolts and screw.



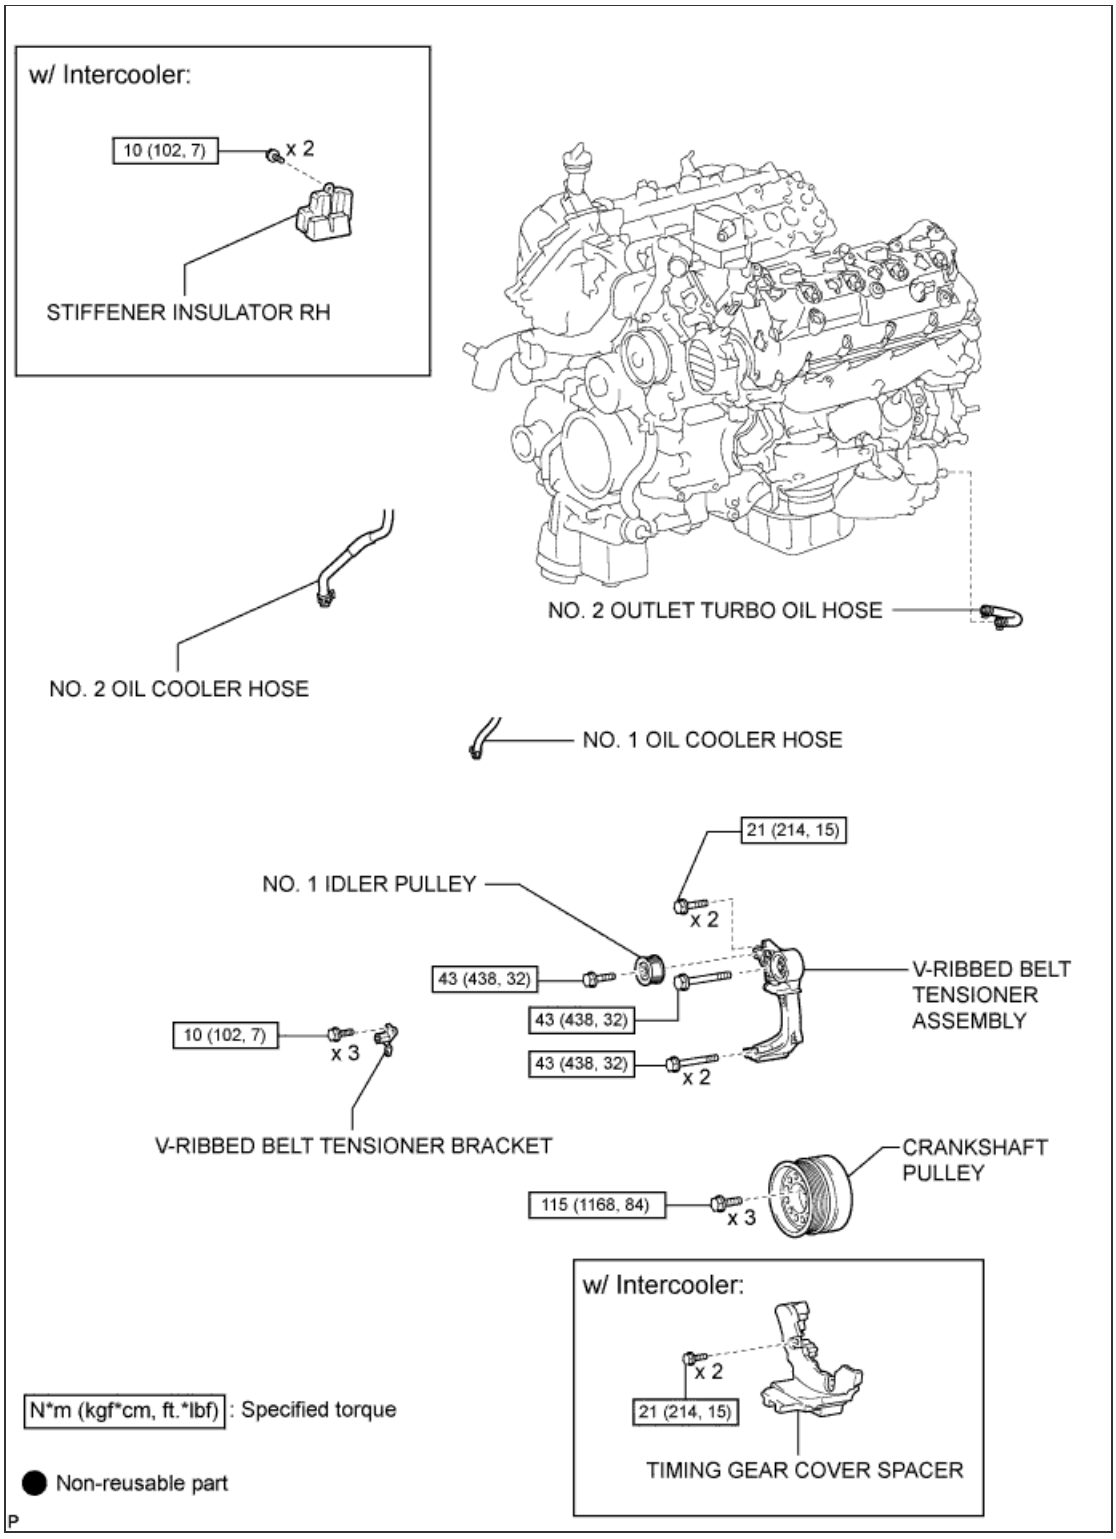
10. INSTALL FRONT FENDER APRON SEAL REAR RH

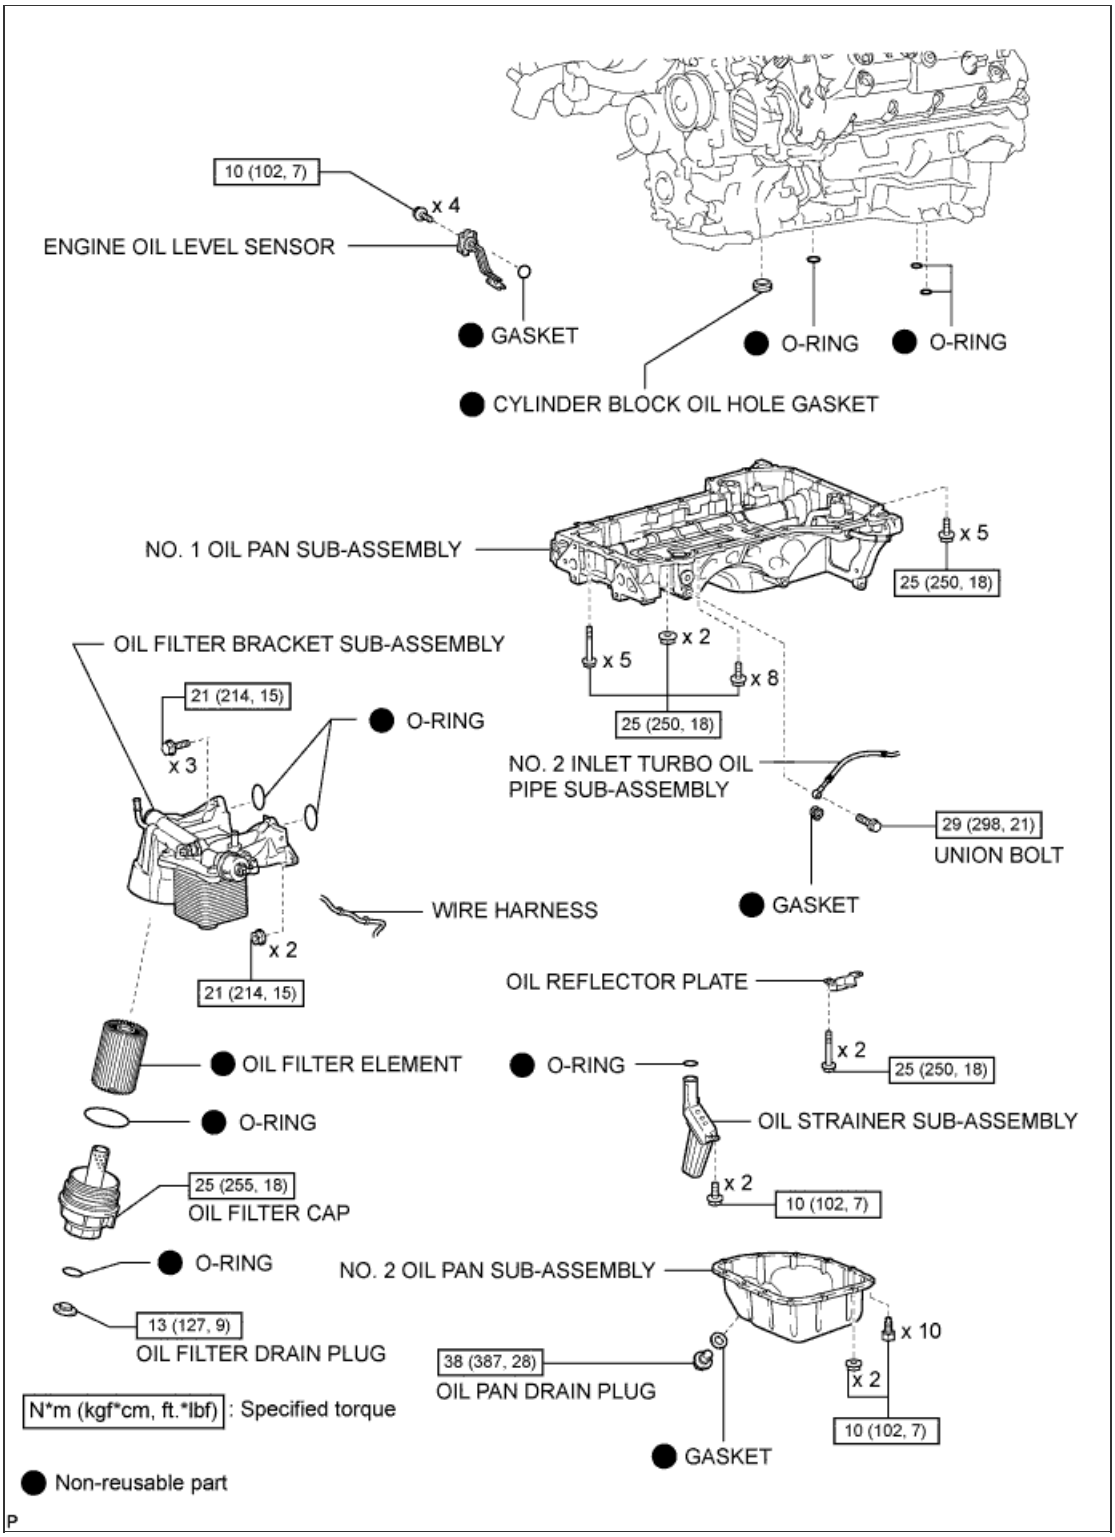
a. Install the front fender apron seal rear RH with the 4 clips.

11. INSTALL FRONT FENDER APRON SEAL FRONT RH

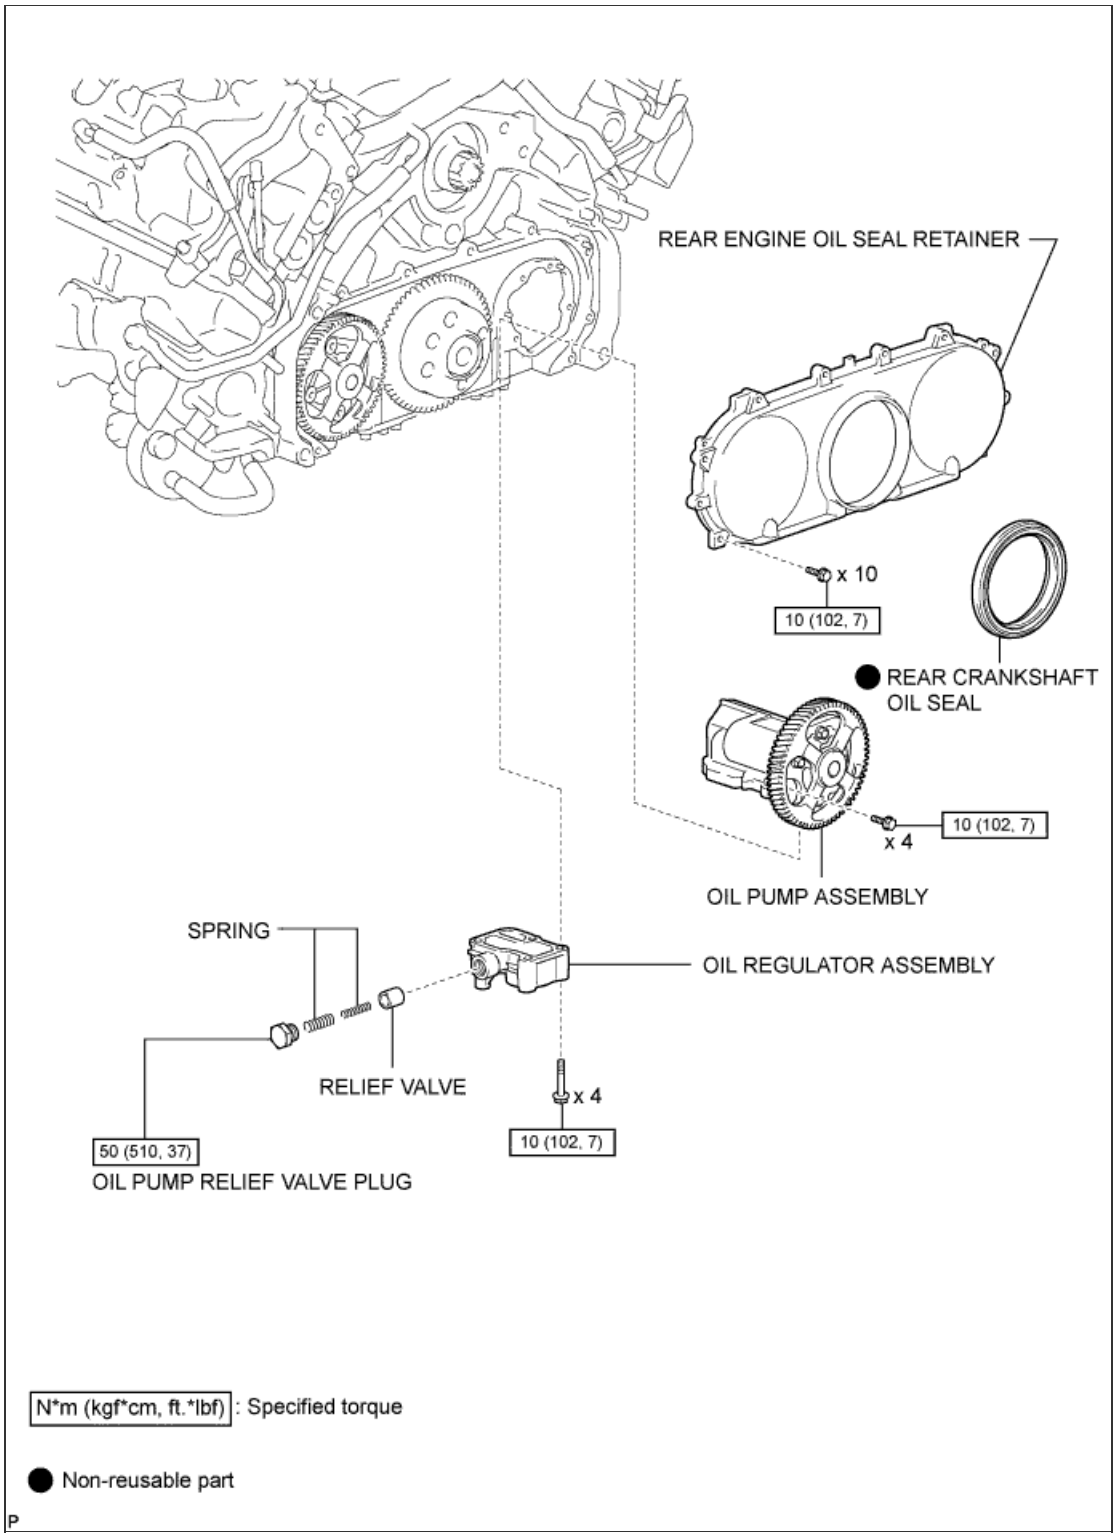


a. Install the front fender apron seal front RH with the 3 clips.





12. INSTALL FRONT WHEEL RH



Torque:
for Aluminum Wheel:
131 N*m{ 1336 kgf*cm , 97 ft.*lbf }
for Steel Wheel:
209 N*m{ 2131 kgf*cm , 154 ft.*lbf }

for Preparation Click here

1. PRECAUTION

NOTICE:

After turning the ignition switch off, waiting time may be required before disconnecting the cable from the battery terminal. Therefore, make sure to read the disconnecting the cable from the battery terminal notice before proceeding with work (Click here).

2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

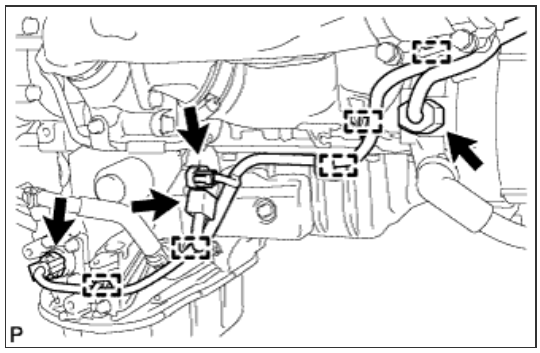
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

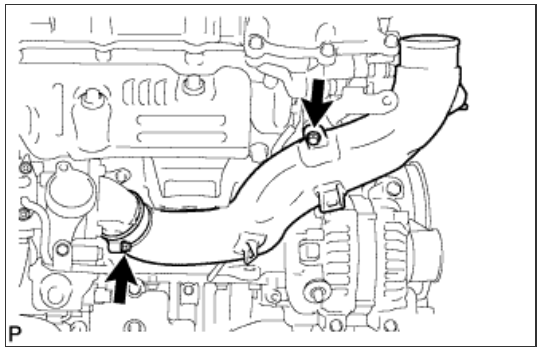
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.



3. REMOVE ENGINE ASSEMBLY

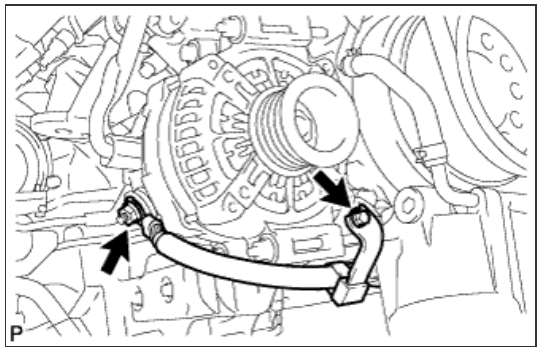
a. Remove the engine assembly from the vehicle (Click here).



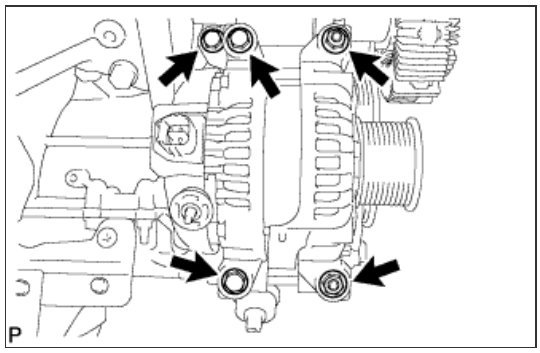
4. REMOVE NO. 1 INTAKE AIR CONNECTOR PIPE

a. Remove the 4 connectors.

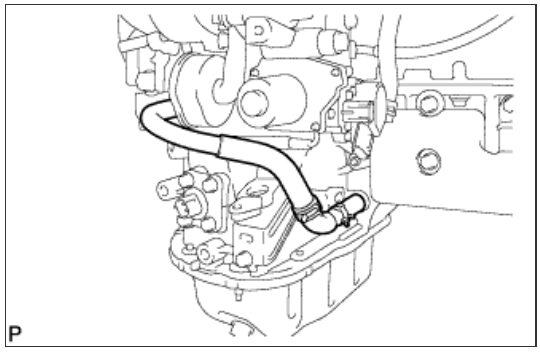
b. Using a clip remover, detach the 5 wire harness clamps.



c. Loosen the hose clamp, and remove the bolt and No. 1 intake air connector pipe.

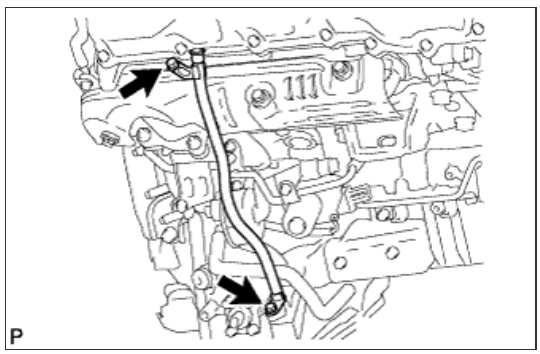


5. REMOVE GENERATOR ASSEMBLY

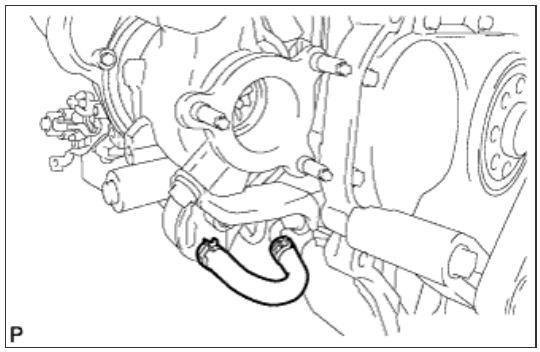


a. Remove the nut and bolt, and disconnect the generator positive ( ) cable.

b. Remove the 3 bolts, 2 nuts and generator.

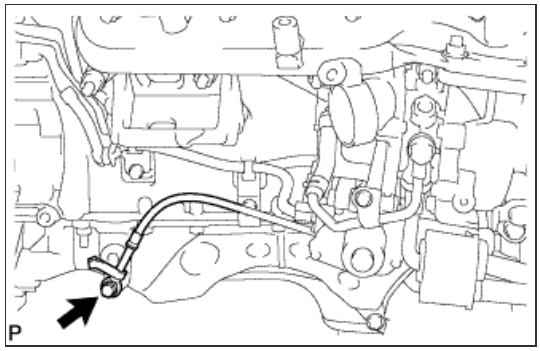


6. DISCONNECT NO. 1 OUTLET TURBO OIL HOSE

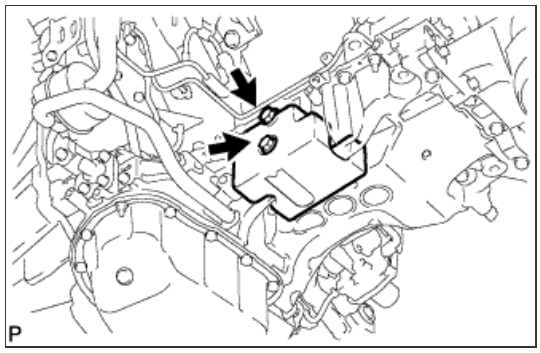


7. REMOVE NO. 1 ENGINE OIL LEVEL DIPSTICK GUIDE

a. Remove the 2 bolts and No. 1 engine oil level dipstick guide.

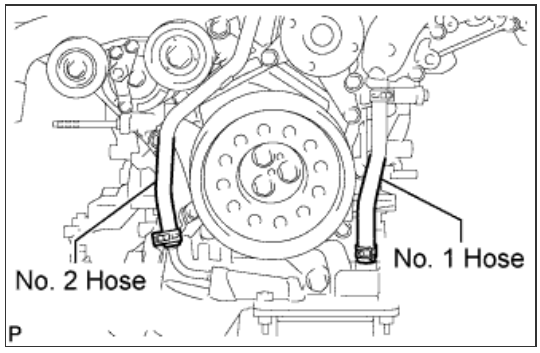


8. DISCONNECT NO. 2 OUTLET TURBO OIL HOSE



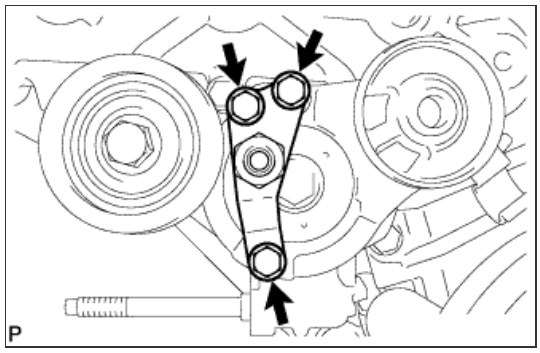
9. DISCONNECT NO. 2 INLET TURBO OIL PIPE SUB-ASSEMBLY

a. Remove the union bolt and gasket, and disconnect the No. 2 inlet turbo oil pipe.

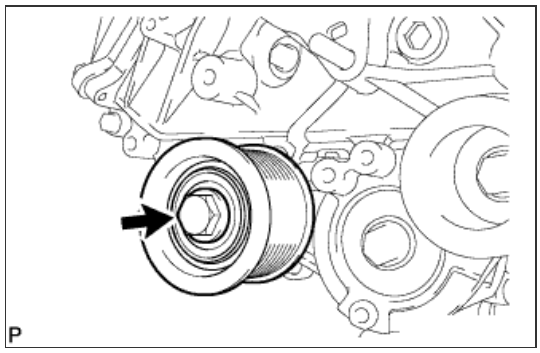


10. REMOVE STIFFENER INSULATOR RH (w/ Intercooler)

a. Remove the 2 bolts and stiffener insulator RH.

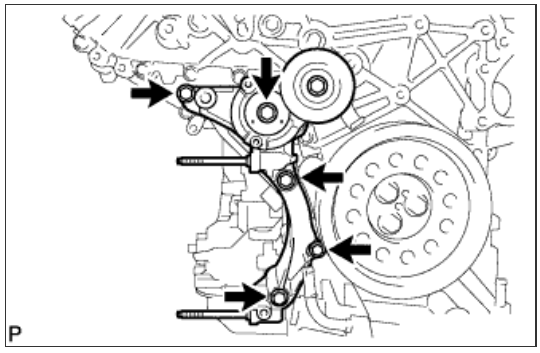


11. DISCONNECT NO. 1 OIL COOLER HOSE



12. DISCONNECT NO. 2 OIL COOLER HOSE

13. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY



a. Remove the 3 bolts and ribbed belt tensioner bracket.

b. Remove the bolt and No. 1 idler pulley.

c. Remove the 5 bolts and ribbed belt tensioner.

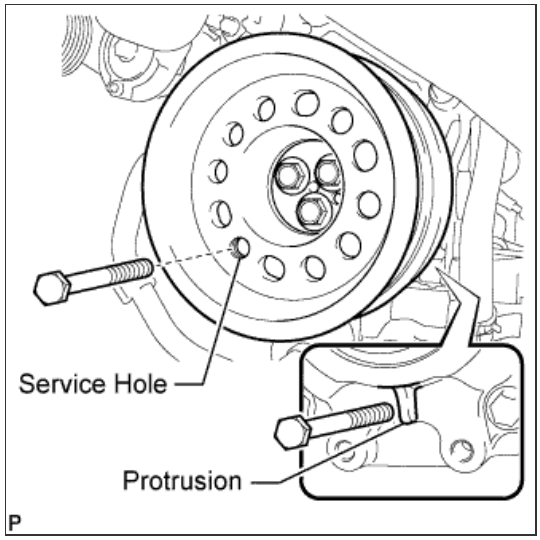
14. REMOVE CRANKSHAFT PULLEY

NOTICE:

This procedure is intended for removal/installation of the crankshaft pulley only. Do not use this procedure for removal/installation of the flywheel or the drive plate and ring gear.

a. nstall the 2 bolts to the bolt holes of the crankshaft rear side.

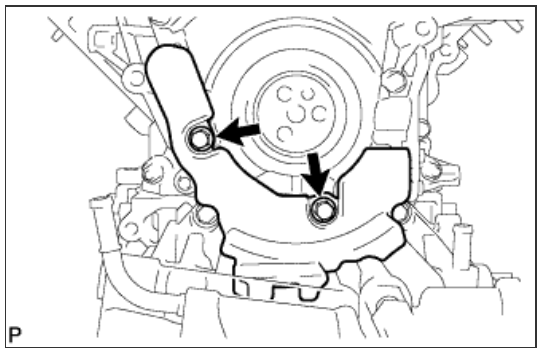
b. Using a bar, turn the crankshaft until the crankshaft pulley service hole is a little to the left of bottom dead center.



c. nstall a 14 mm 1.5 pitch service bolt with a length of 70 mm or more to the crankshaft pulley service hole, and hold the crankshaft using the timing chain cover protrusion.

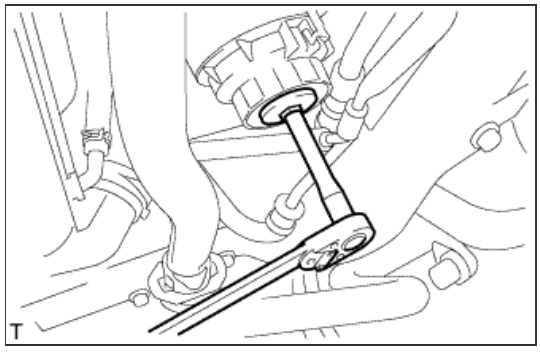
d. Remove the 3 bolts and crankshaft pulley.

NOTICE:



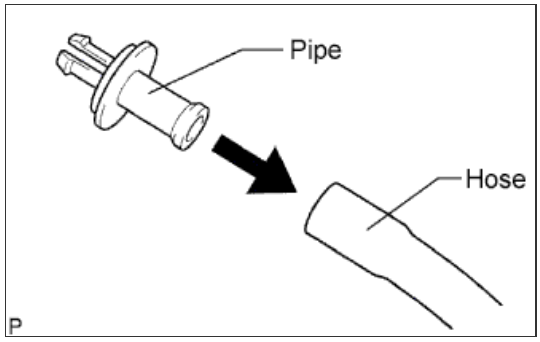
f the crankshaft pulley cannot be removed, temporarily install a bolt to the crankshaft so that the pulley does not fall, and lightly tap the outer edge of the mass damper with a plastic-faced hammer to remove the pulley. Do not tap the pulley ribbed belt ribs, as the crankshaft may

be damaged.



15. REMOVE TIMING GEAR COVER SPACER (w/ Intercooler)

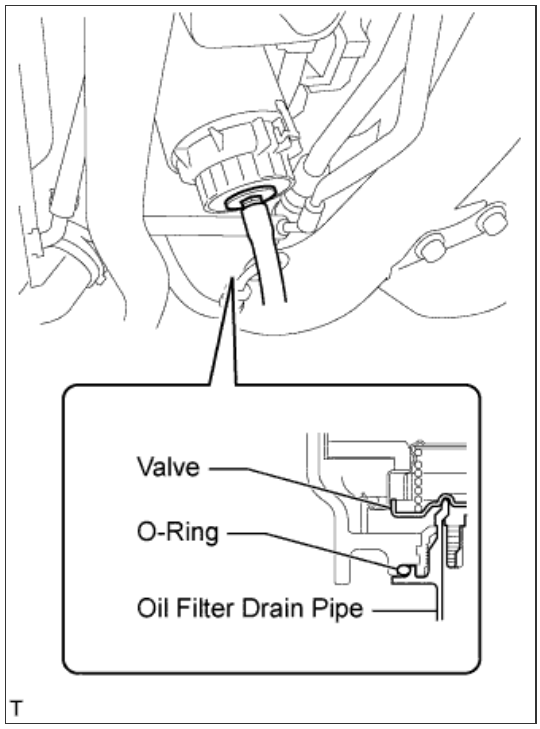
a. Remove the 2 bolts and timing gear cover spacer.



16. REMOVE OIL FILTER ELEMENT

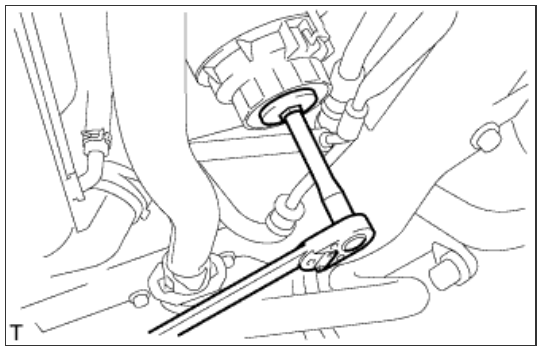
a. Remove the oil filter drain plug.

b. Connect a hose with an inside diameter of 15 mm (0.591 in.) to the pipe.



c. Remove the O-ring from the oil filter drain plug and install it to the drain pipe.

d. nstall the oil filter drain pipe to the oil filter cap and drain the engine oil.

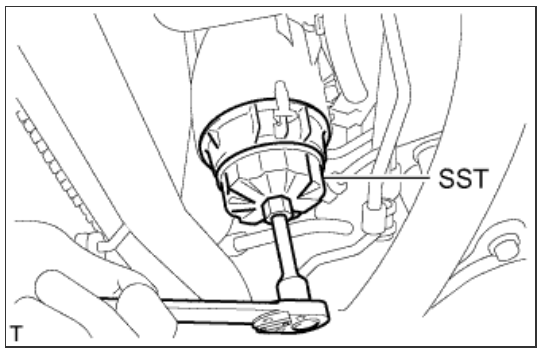


e. Remove the oil filter drain pipe.

f. Apply a light coat of engine oil to a new O-ring, and install it to the oil filter drain plug.

g. nstall the oil filter drain plug to the oil filter cap.

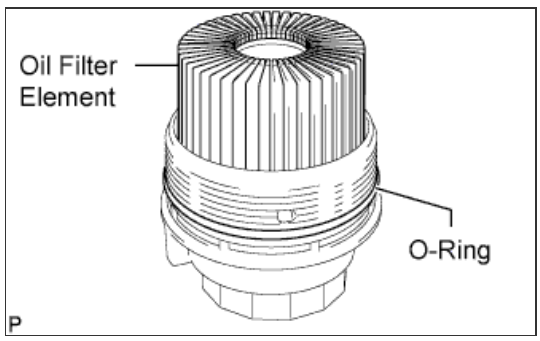
Tor e:
13 N*m{ 127 kgf*cm , 9 ft.*lbf }



h. Using SST, remove the oil filter cap.

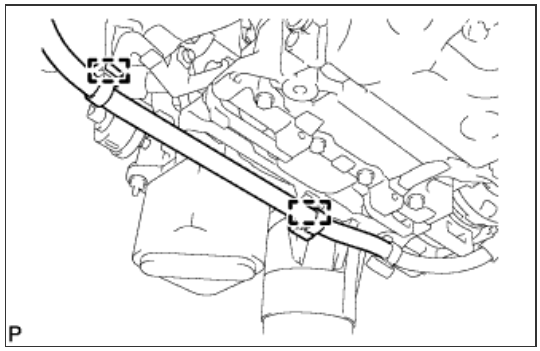
SST
09228-06501

HINT:



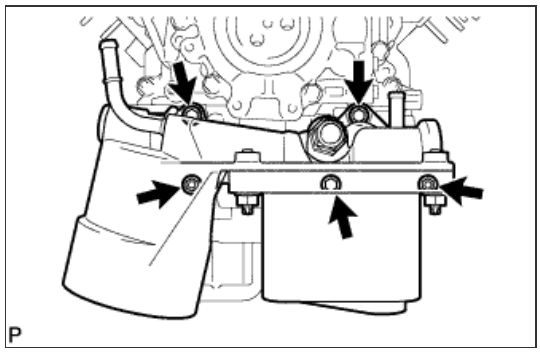
Use a container to catch the draining oil. After the oil filter cap is loosened appro mately 4 turns and the cap ribs are vertical, engine oil drains from the gap between the oil filter cap and oil pan.

i. Remove the oil filter element and O-ring from the oil filter cap.

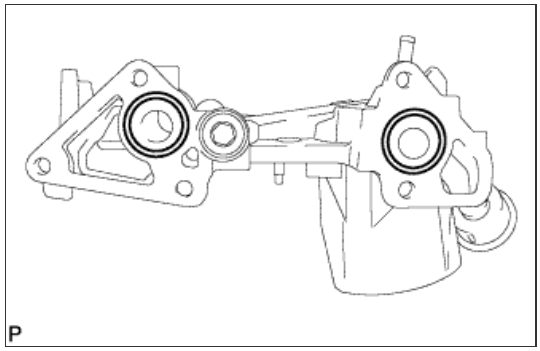


NOTICE:

Be sure to remove the cap O-ring by hand, without using any tools, to prevent damage to the cap O-ring groove.

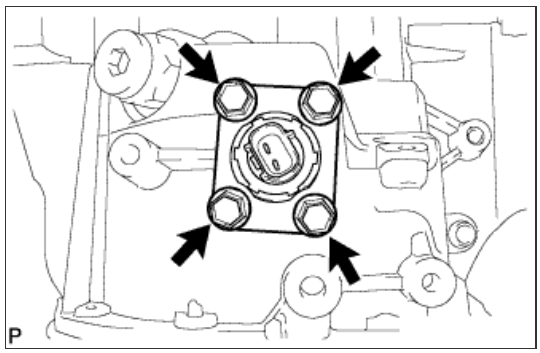


17. REMOVE OIL FILTER BRACKET SUB-ASSEMBLY



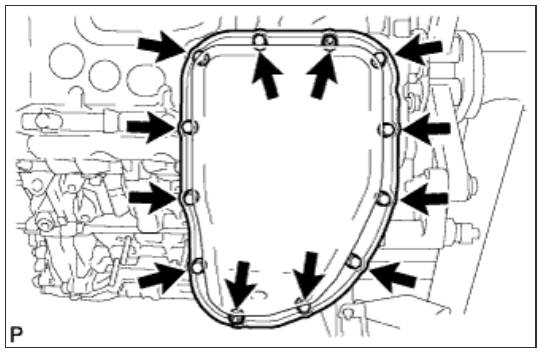
a. Disconnect the 2 wire harness clamps.

b. Remove the 3 bolts, 2 nuts and oil filter bracket.



c. Remove the 2 O-rings.

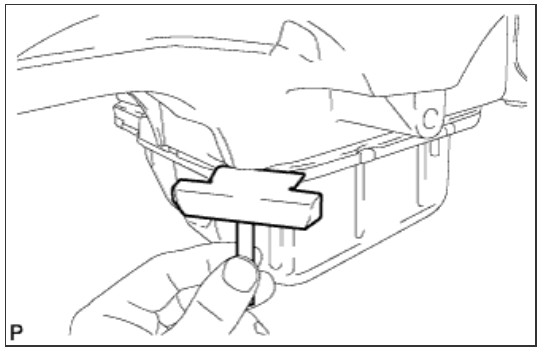
18. REMOVE ENGINE OIL LEVEL SENSOR



a. Remove the 4 bolts and engine oil level sensor.

b. Remove the gasket.

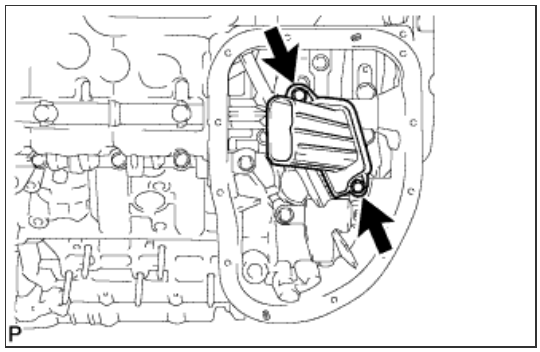
19. REMOVE NO. 2 OIL PAN SUB-ASSEMBLY



a. Remove the 10 bolts and 2 nuts.

b. nsert the blade of an oil pan seal cutter between the oil pans. Cut through the applied sealer and remove the No. 2 oil pan.

NOTICE:



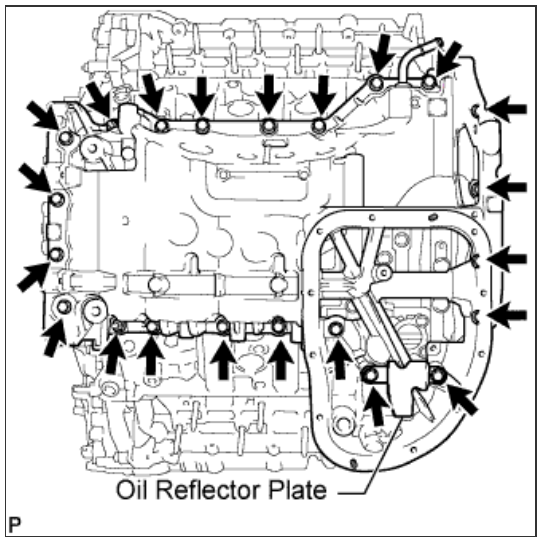
Be careful not to damage the contact surfaces of the No. 1 and No. 2 oil pans.

20. REMOVE OIL STRAINER SUB-ASSEMBLY

a. Remove the 2 bolts and oil strainer.

b. Remove the O-ring from the oil strainer.

21. REMOVE NO. 1 OIL PAN SUB-ASSEMBLY



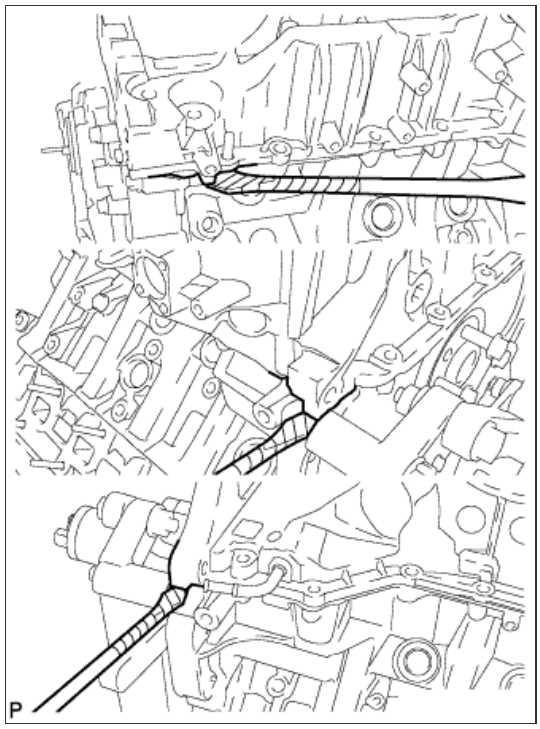
a. Remove the 20 bolts, 2 nuts and oil reflector plate.

NOTICE:

f the oil reflector plate is deformed, replace it.

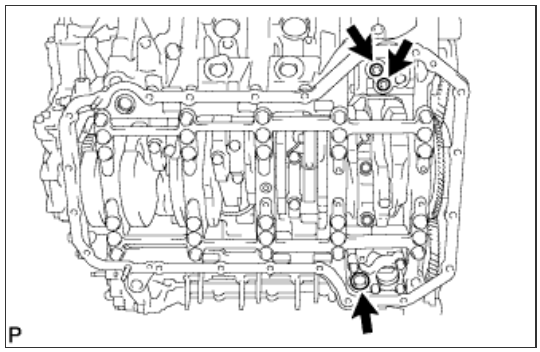
HINT:

Be sure to clean the bolts and stud bolts, and check the threads for cracks or other damage.



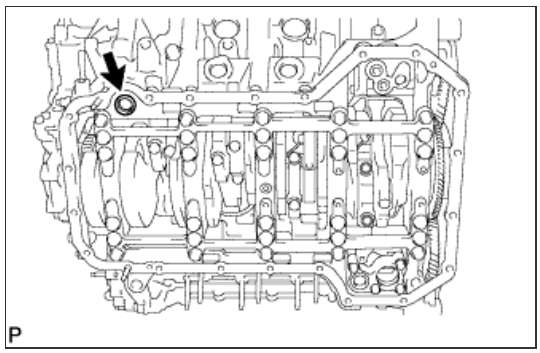
b. Remove the No. 1 oil pan by prying between the No. 1 oil pan and cylinder block with a screwdriver.

NOTICE:



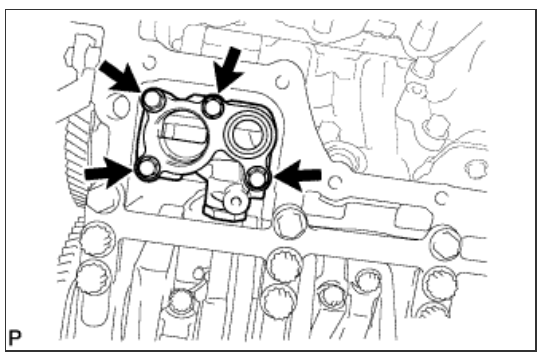
Be careful not to damage the contact surfaces of the cylinder block and oil pan.

HINT:



Tape the screwdriver tip before use.

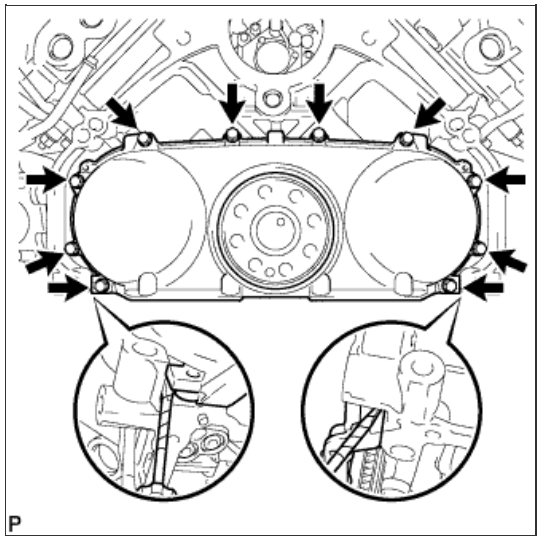
c. Remove the 3 O-rings.



d. Remove the cylinder block oil hole gasket.

22. REMOVE OIL REGULATOR ASSEMBLY

a. Remove the 4 bolts and oil regulator.



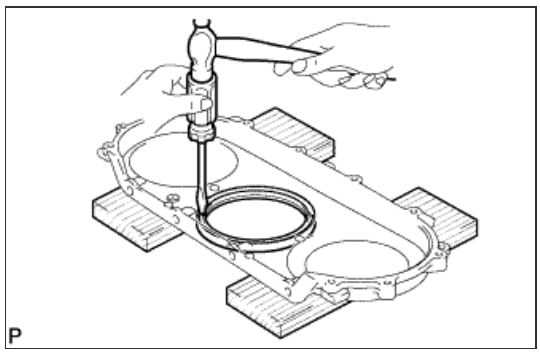
23. REMOVE REAR ENGINE OIL SEAL RETAINER

a. Remove the 10 bolts.

b. Remove the oil seal retainer by prying between the oil seal retainer and cylinder block with a screwdriver.

HINT:

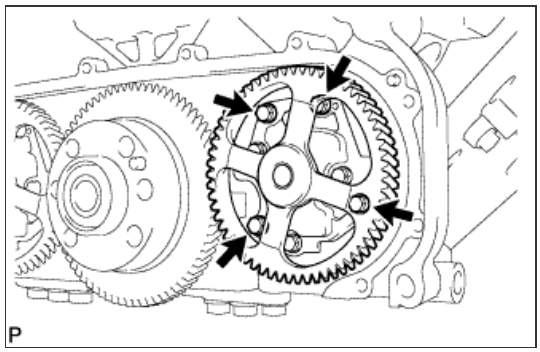
Tape the screwdriver tip before use.



24. REMOVE REAR CRANKSHAFT OIL SEAL

a. Place the oil seal retainer on wooden blocks.

b. Using a screwdriver and hammer, tap out the oil seal.

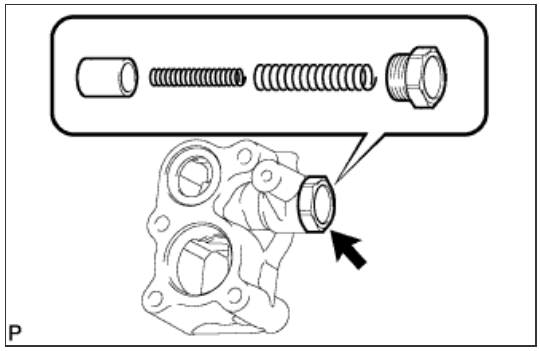


HINT:

Tape the screwdriver tip before use.

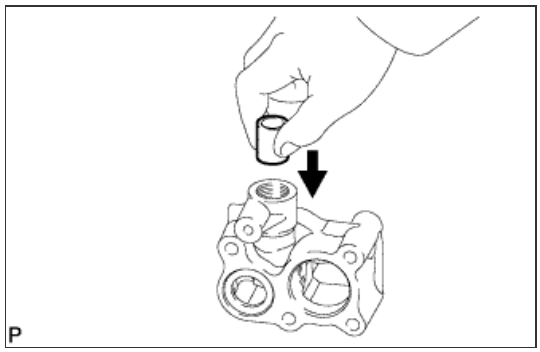
25. REMOVE OIL PUMP ASSEMBLY

a. Remove the 4 bolts and oil pump.



for Preparation Click here

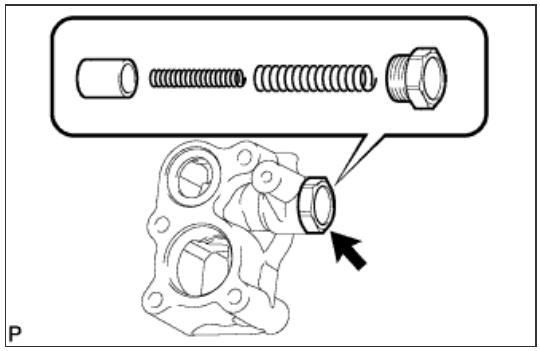
1. INSPECT OIL REGULATOR ASSEMBLY



a. Remove the oil pump relief valve plug.

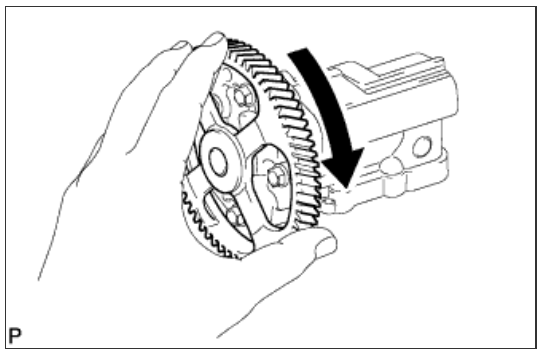
b. Remove the 2 valve springs and relief valve.

c. Check that the valve falls smoothly into the valve hole by its own weight.
If it does not, replace the relief valve. If necessary, replace the oil regulator assembly.



d. Coat the relief valve with engine oil.

e. Install the relief valve and 2 relief valve springs into the oil regulator body hole.



f. Install the oil pump relief valve plug.

Torque:
50 N*m{ 510 kgf*cm , 37 ft.*lbf }

2. INSPECT OIL PUMP ASSEMBLY

a. Turn the gear and check that the oil pump bearing moves smoothly and quietly.
If necessary, replace the oil pump assembly.

for Preparation Click here

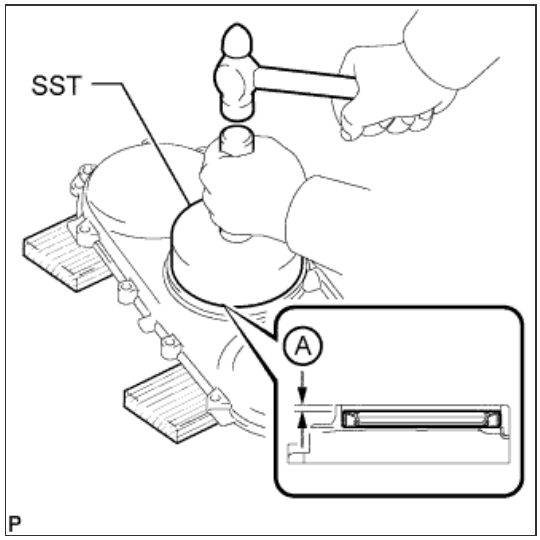
1. INSTALL OIL PUMP ASSEMBLY

a. Install the oil pump with the 4 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

2. INSTALL REAR CRANKSHAFT OIL SEAL

a. Place the oil seal retainer on wooden blocks.



b. Using SST and a hammer, tap in a new oil seal as shown in the illustration.

SST
09223-56010

Standard depth A:
2.7 to 3.7 mm (0.106 to 0.147 in.)

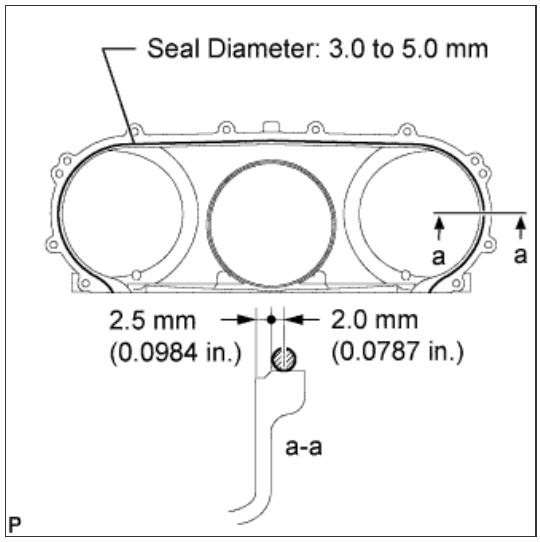
NOTICE:

- **Keep the lip free from foreign matter.**
- **Do not tap on the seal at an angle.**

3. INSTALL REAR ENGINE OIL SEAL RETAINER

a. Apply seal packing in a continuous line as shown in the illustration.

Seal diameter:
3.0 to 5.0 mm (0.118 to 0.197 in.)



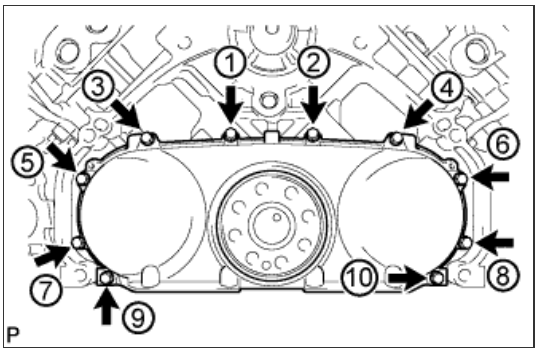
Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the rear engine oil seal retainer within 3 minutes and tighten the bolts within 15 minutes after applying seal packing.**

b. Apply engine oil to the oil seal lip.

c. Make sure that the lip of the oil seal is properly installed.



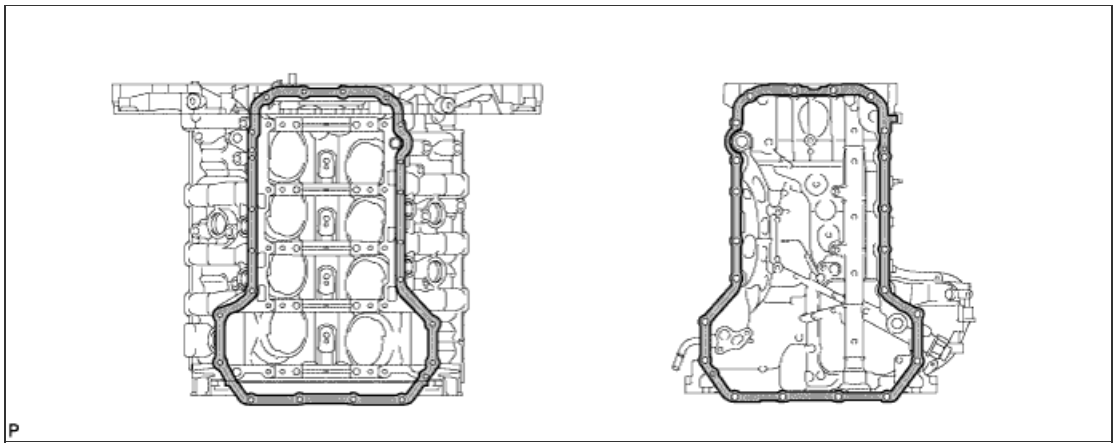
d. Install and uniformly tighten the 10 bolts in the order shown in the illustration.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

- When installing the oil seal retainer, make sure the lip of the oil seal is not damaged.
- When installing the oil seal retainer, make sure the lip of the oil seal is not folded incorrectly.

4. INSTALL OIL REGULATOR ASSEMBLY



a. Install the oil regulator with the 4 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

5. INSTALL NO. 1 OIL PAN SUB-ASSEMBLY

NOTICE:

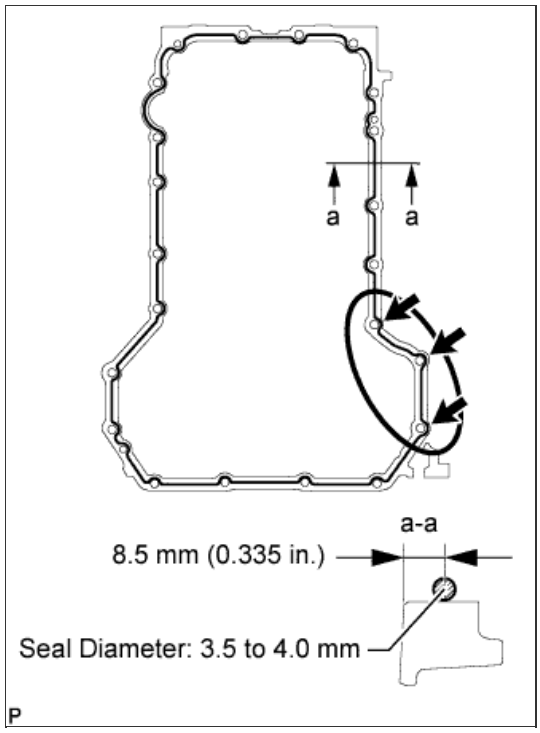
When the contact surfaces shown below are wet, wipe them with an oil-free cloth before applying seal packing.

a. Install the cylinder block oil hole gasket.

b. Apply a light coat of engine oil to 3 new O-rings and set the 3 O-rings to the oil regulator and scavenging pump.

c. Apply seal packing to the No. 1 oil pan as shown in the illustration.

Standard seal diameter:
3.5 to 4.0 mm (0.134 to 0.157 in.)



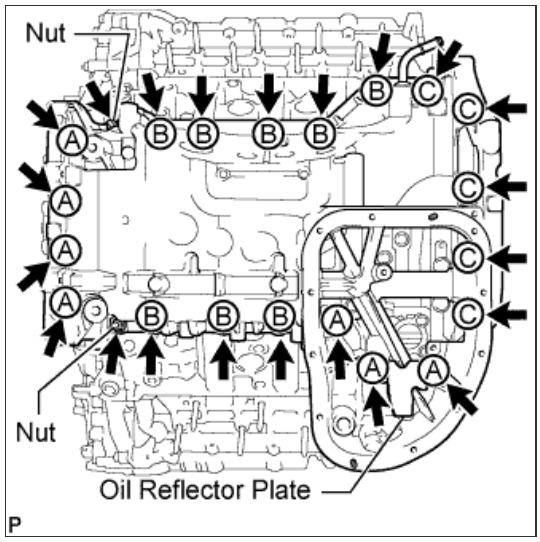
Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

- For the 3 bolt holes labeled with arrows, apply the seal packing on the outer edges. For the other bolt holes, apply the seal packing on the inner edges.
- Make sure to apply a continuous bead of seal packing as shown in the illustration. If the bead breaks, overlap 3 mm (0.118 in.) of seal packing and continue the bead.
- Remove any oil and old seal packing from the contact surface.
- Install the No. 1 oil pan within 3 minutes and tighten the bolts

and nuts within 15 minutes after applying seal packing.

- Do not start the engine for at least 2 hours after installing.



d. Install the No. 1 oil pan and oil reflector plate with the 20 bolts and 2 nuts.

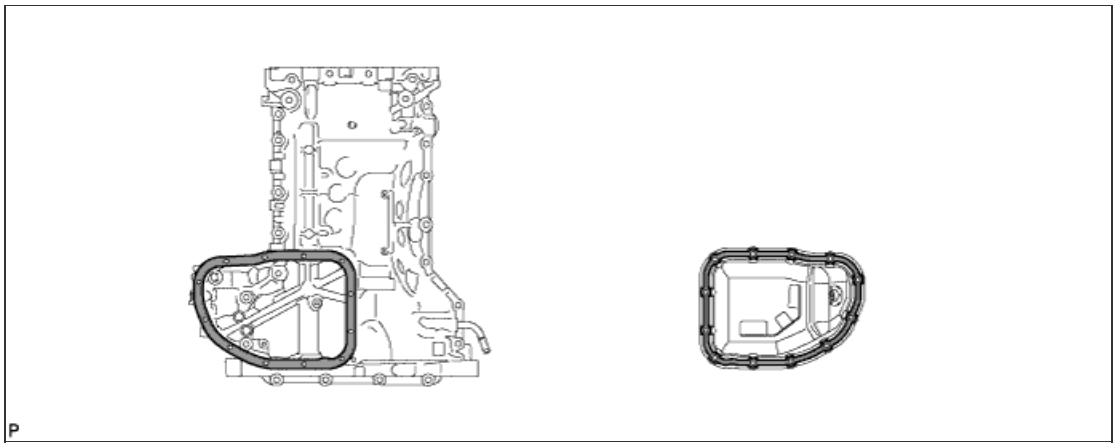
Torque:
25 N*m{ 250 kgf*cm , 18 ft.*lbf }

Bolt Length

Item	Quantity	Length
Bolt A	7	70 mm (2.76 in.)
Bolt B	8	20 mm (0.787 in.)
Bolt		30 mm (1.18 in.)

6. INSTALL OIL STRAINER SUB-ASSEMBLY

a. Apply a light coat of engine oil to a new O-ring, and install it to the oil strainer.



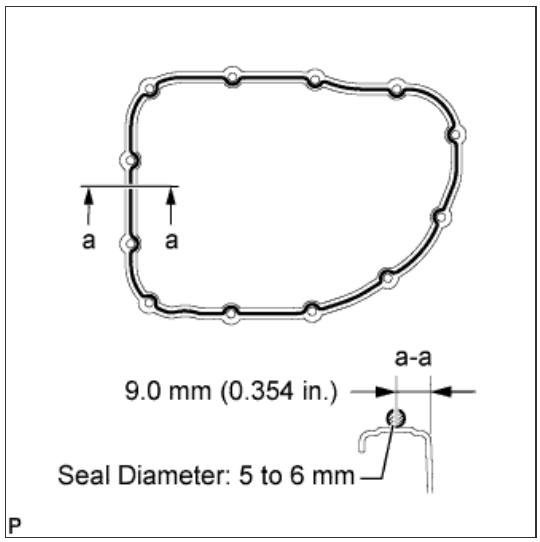
b. Install the oil strainer with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

7. INSTALL NO. 2 OIL PAN SUB-ASSEMBLY

NOTICE:

When the contact surfaces shown below are wet, wipe them with an oil-free cloth before applying seal packing.



a. Apply seal packing to the No. 2 oil pan as shown in the illustration.

Standard seal diameter:
5.0 to 6.0 mm (0.197 to 0.236 in.)

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

- **For the bolt and pin holes, make sure to apply seal packing to the inner sides.**
- **Make sure to apply a continuous bead of seal packing as shown in the illustration. If the bead breaks, overlap 3.0 mm (0.118 in.) of seal packing and continue the bead.**
- **Remove any oil from the contact surface.**
- **Install the No. 2 oil pan within 3 minutes and tighten the bolts and nuts within 10 minutes after applying seal packing.**
- **Do not start the engine for at least 2 hours after installing.**

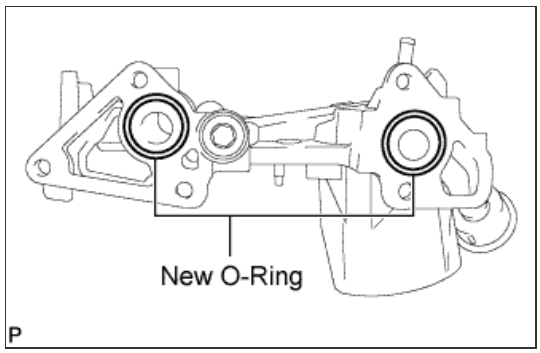
b. Install the No. 2 oil pan with the 10 bolts and 2 nuts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

8. INSTALL ENGINE OIL LEVEL SENSOR

a. Install a new gasket and the sensor with the 4 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }



9. INSTALL OIL FILTER BRACKET SUB-ASSEMBLY

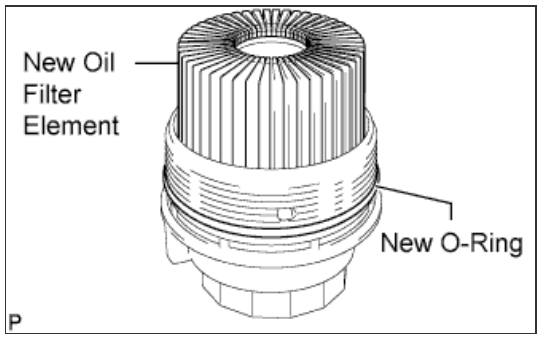
a. Apply a light coat of engine oil to 2 new O-rings, and set them to the oil filter bracket.

b. Install the oil filter bracket with the 3 bolts and 2 nuts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Connect the 2 wire harness clamps.

10. INSTALL OIL FILTER ELEMENT



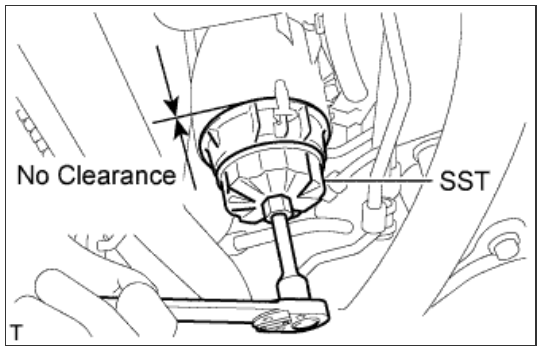
a. lean the inside of the oil filter cap, its threads and its O-ring groove.

b. Apply a small amount of engine oil to a new O-ring and install it to the oil filter cap.

c. Set a new oil filter element in the oil filter cap.

d. emove any dirt or foreign matter from the installation surface of the engine.

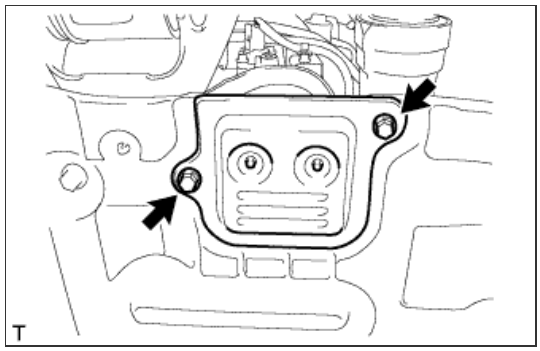
e. Apply a small amount of engine oil to the O-ring again and temporarily install the oil filter cap by hand.



f. Using SST, tighten the oil filter cap.

SST
09228-06501

Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }



NOTICE:

- **Make sure that the oil filter is installed securely as shown in the illustration.**
- **Be careful that the O-ring does not get caught between any surrounding parts.**

g. Install the No. 2 engine under cover seal to the No. 2 engine under cover with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

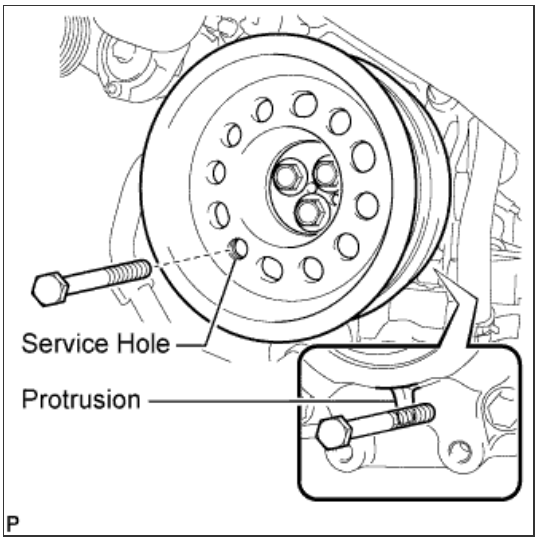
11. INSTALL TIMING GEAR COVER SPACER (w/ Intercooler)

a. Install the timing gear cover spacer with the 2 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

12. INSTALL CRANKSHAFT PULLEY

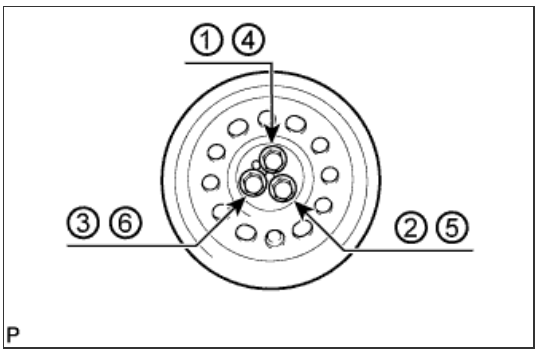
NOTICE:



This procedure is intended for removal/installation of the crankshaft pulley only. Do not use this procedure for removal/installation of the flywheel or the drive plate and ring gear.

a. Align the crankshaft pulley and the crankshaft knock pin, and temporarily install the crankshaft pulley with the 3 bolts.

b. Install the 2 bolts to the bolt holes of the crankshaft rear side.

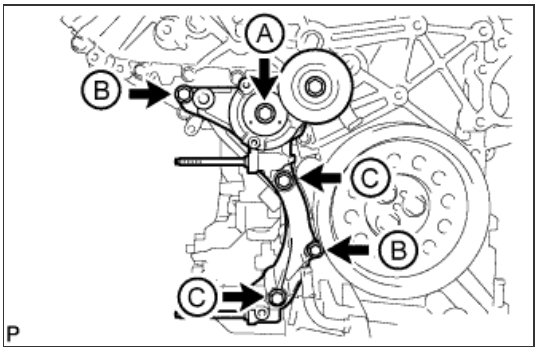


c. Using a bar, turn the crankshaft until the crankshaft pulley service hole is a little to the right of bottom dead center.

d. Install a 14 mm x 1.5 pitch service bolt with a length of 70 mm or more to the crankshaft pulley service hole, and hold the crankshaft using the timing chain cover protrusion.

e. Uniformly tighten the 3 bolts in 2 passes in the order shown in the illustration.

Torque:
115 N*m{ 1168 kgf*cm , 84 ft.*lbf }



f. Remove the service bolt.

13. INSTALL V-RIBBED BELT TENSIONER ASSEMBLY

a. Install the V-ribbed belt tensioner with the 5 bolts.

Torque:
for bolt A and C:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }
for bolt B:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

Bolt Length

Item	Quantity	Length
Bolt A	1	116 mm (4.57 in.)
Bolt B	2	40 mm (1.58 in.)
Bolt C	2	95 mm (3.74 in.)

b. Install the No. 1 idler pulley with the bolt.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

c. Install the V-ribbed belt tensioner bracket with the 3 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

14. CONNECT NO. 2 OIL COOLER HOSE

a. Align the white paint marks on the oil cooler hose and oil filter bracket and connect the hose.

NOTICE:

Make sure to maintain a space between the oil cooler hose and crankshaft pulley and the oil cooler hose and V-ribbed belt idler pulley.

15. CONNECT NO. 1 OIL COOLER HOSE

a. Face the pink paint mark on the oil cooler hose toward the front side of the engine and connect the hose to the oil filter bracket.

NOTICE:

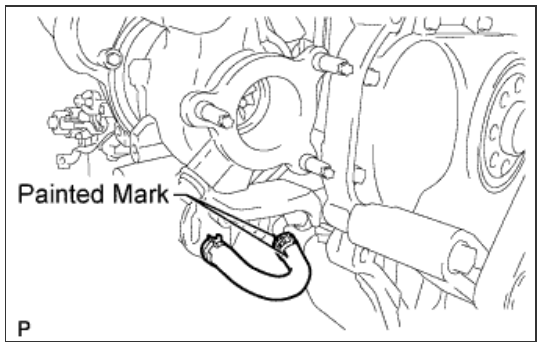
Make sure to maintain a space between the oil cooler hose and crankshaft pulley.

16. INSTALL STIFFENER INSULATOR RH (w/ Intercooler)

a. Install the stiffener insulator with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

17. INSTALL NO. 2 INLET TURBO OIL PIPE SUB-ASSEMBLY



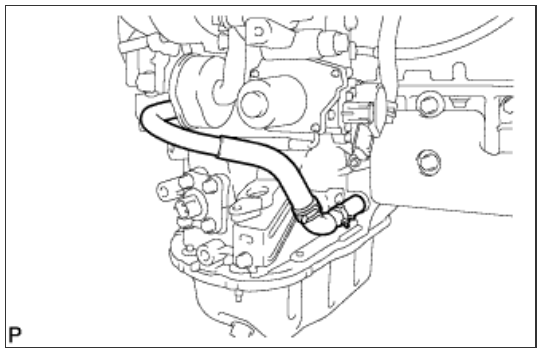
a. Install a new gasket and connect the No. 2 inlet turbo oil pipe with the union bolt.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

18. CONNECT NO. 2 OUTLET TURBO OIL HOSE

HINT:

Align the white paint marks on the oil hose and pipe, and connect the hose.



19. INSTALL NO. 1 ENGINE OIL LEVEL DIPSTICK GUIDE

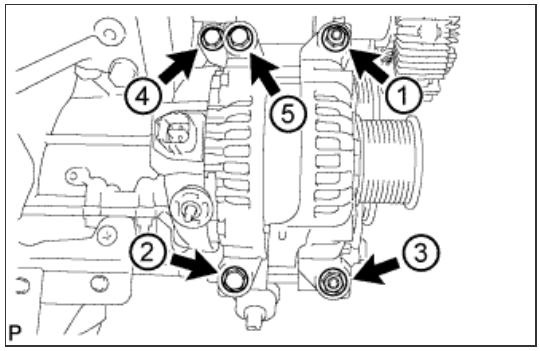
a. Apply a light coat of engine oil to a new O-ring, and install it to the No. 1 engine oil level dipstick guide.

b. Install the No. 1 engine oil level dipstick guide with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

20. CONNECT NO. 1 OUTLET TURBO OIL HOSE

21. INSTALL GENERATOR ASSEMBLY

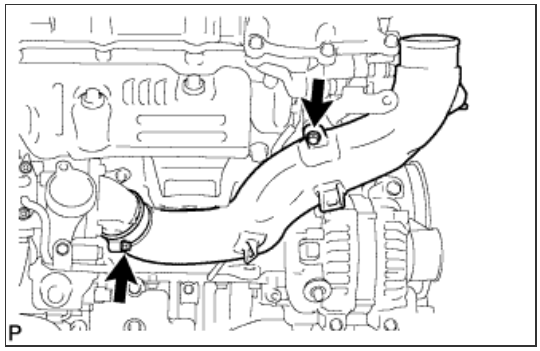


a. Temporarily install the generator with the 3 bolts and 2 nuts.

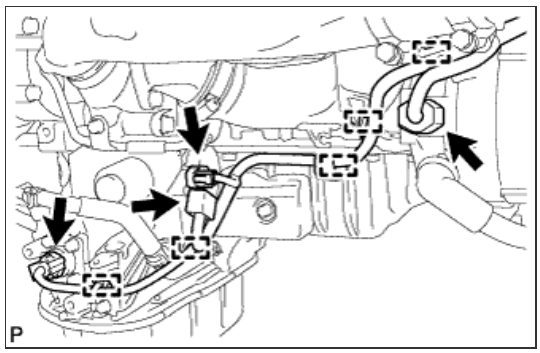
b. Uniformly tighten the 3 bolts and 2 nuts in the order shown in the illustration.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. onnect the generator cable and install the nut and bolt.



Torque:
for bolt:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }
for nut (130A Type and 150A Type:):
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }
for nut (180A Type:):
12 N*m{ 122 kgf*cm , 9 ft.*lbf }



22. INSTALL NO. 1 INTAKE AIR CONNECTOR PIPE

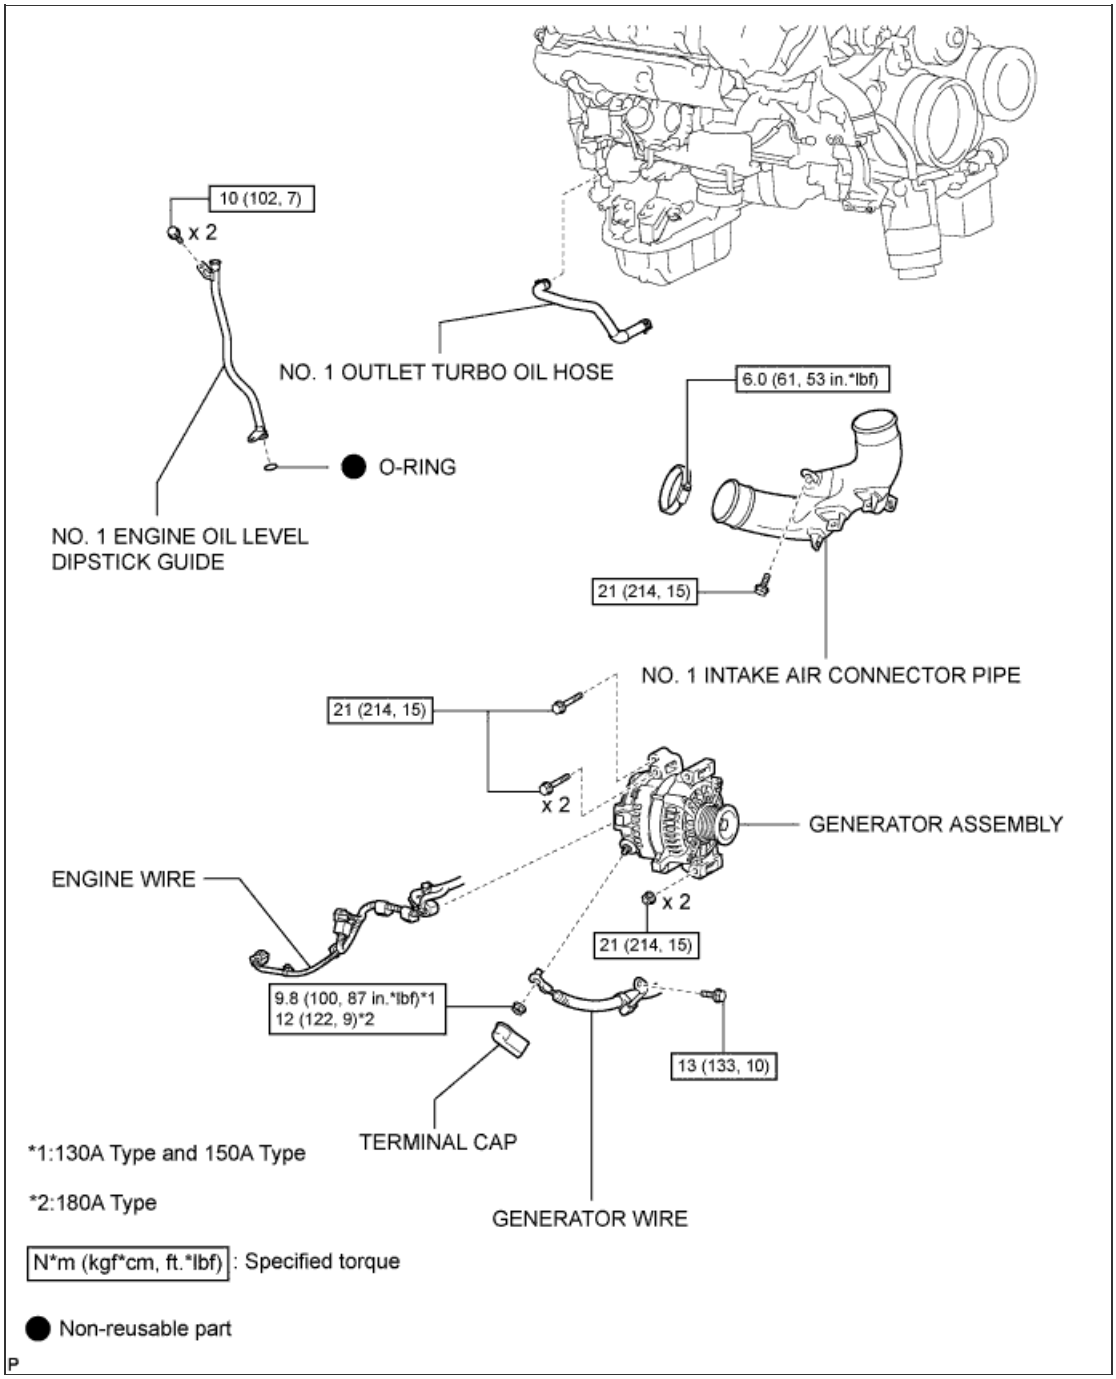
a. Install the No. 1 intake air connector pipe with the bolt. Then tighten the hose clamp.

Torque:
for bolt:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for clamp:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }

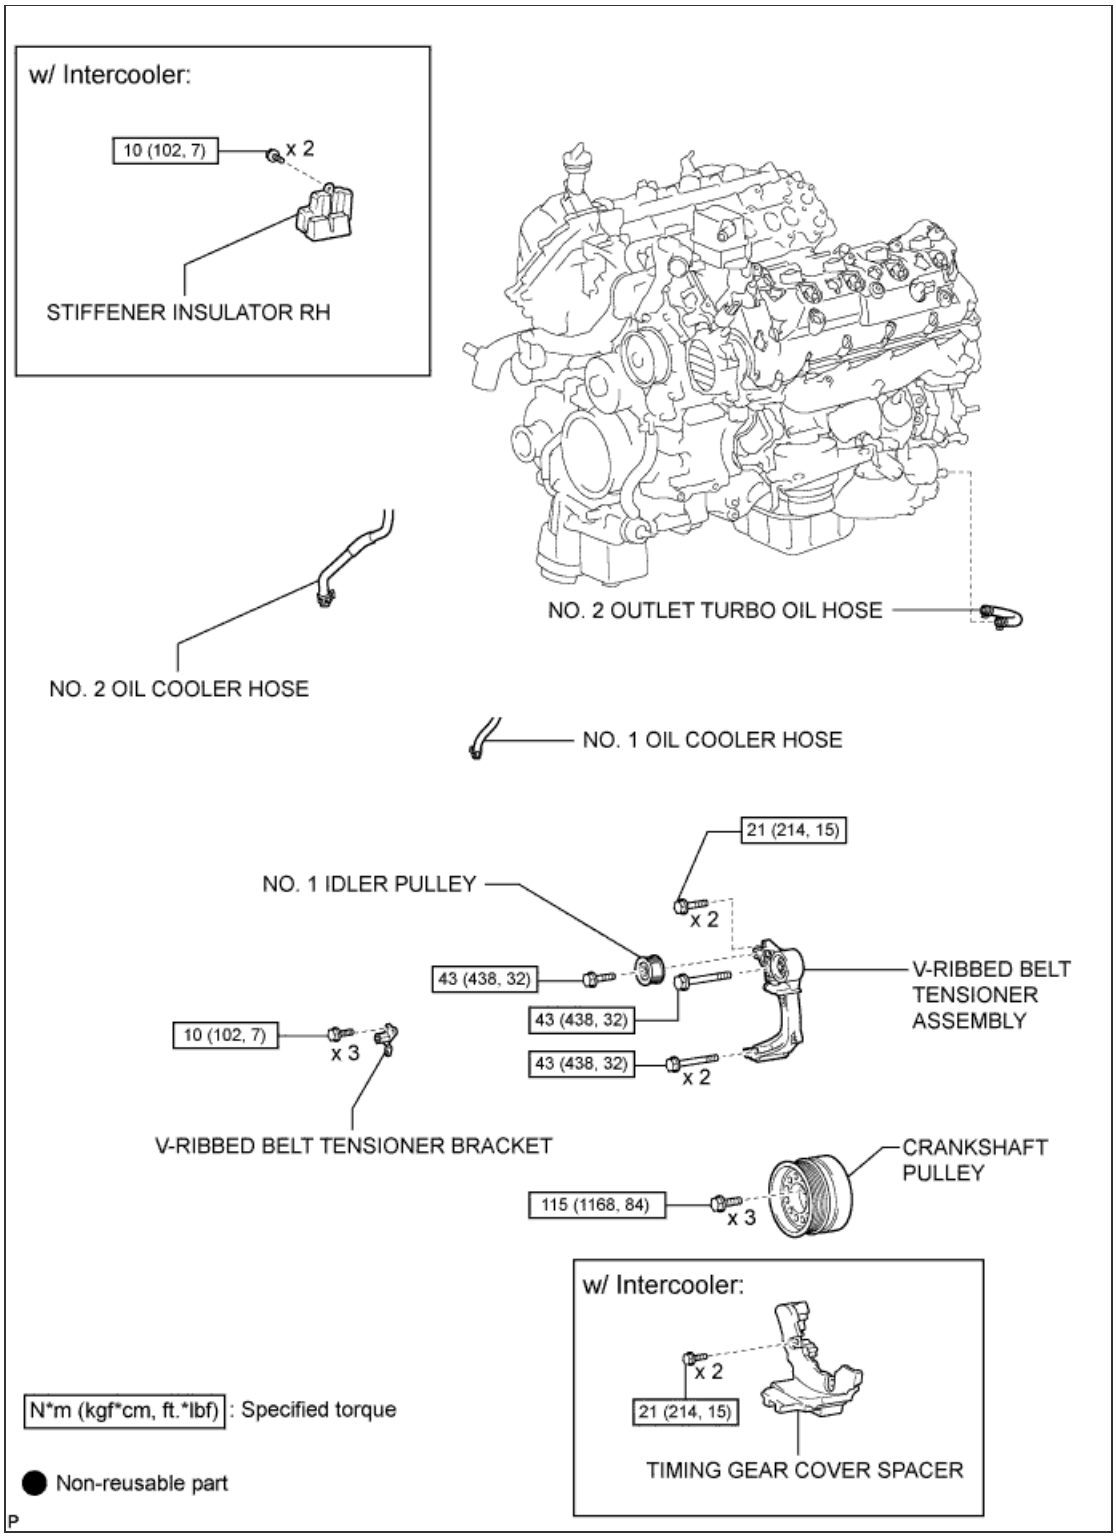
b. onnect the 4 connectors and attach the 5 wire harness clamps.

23. INSTALL ENGINE ASSEMBLY

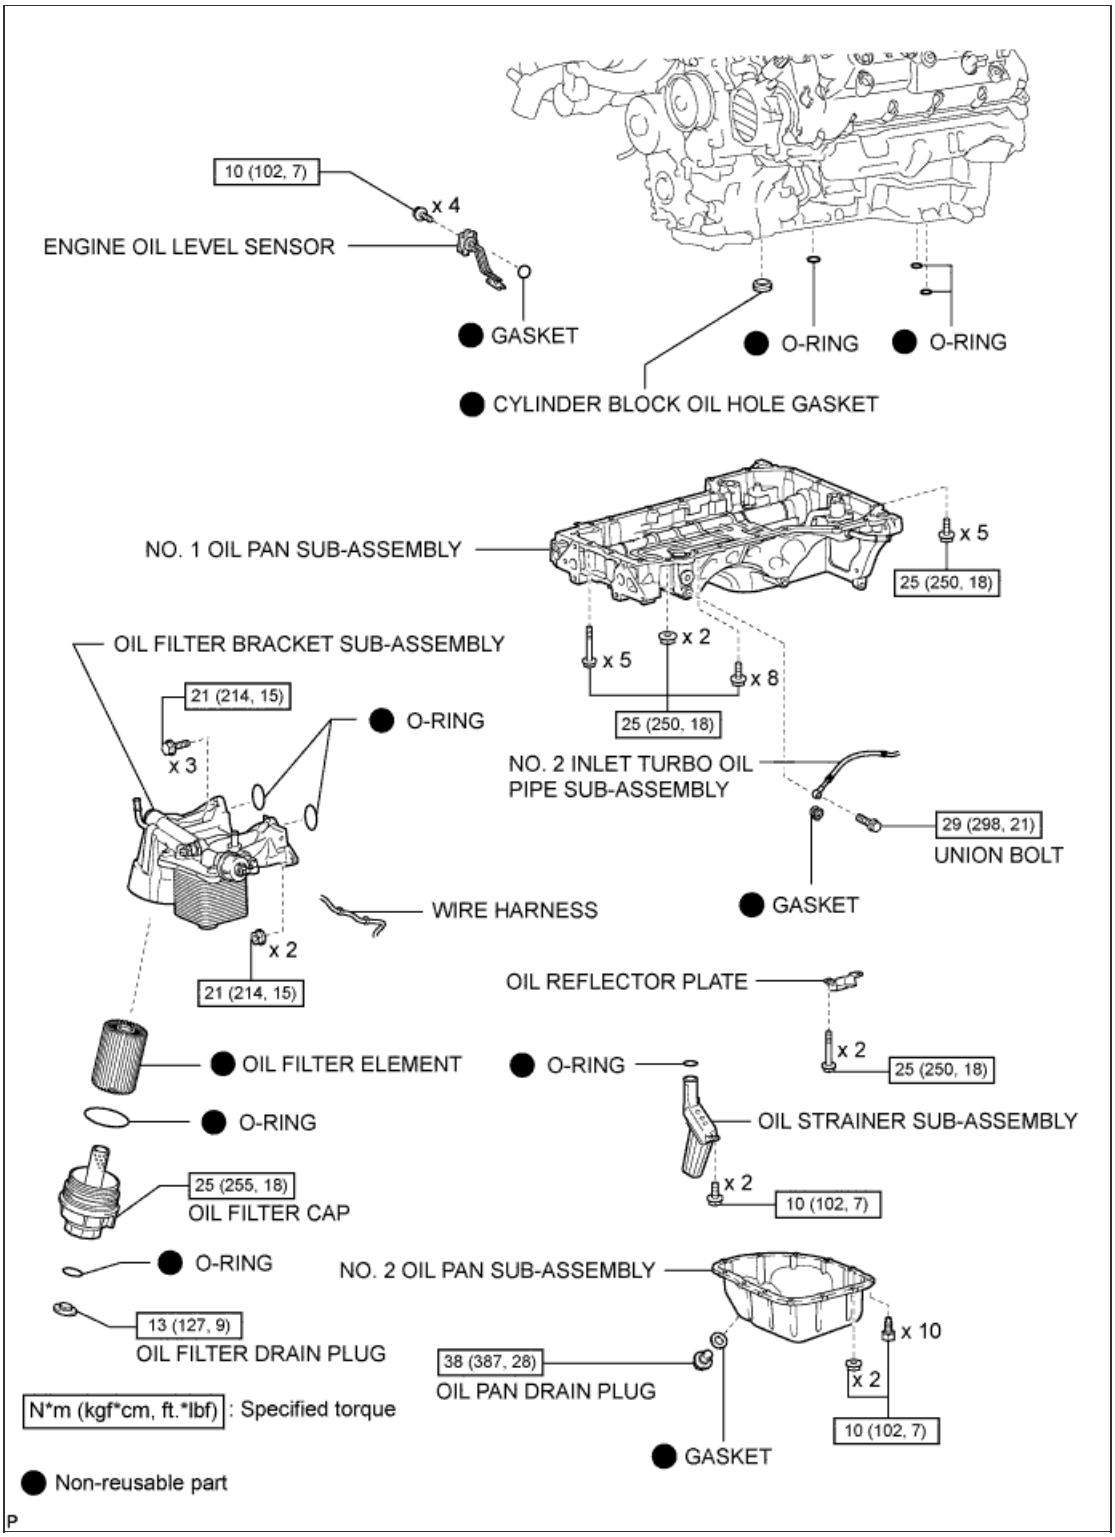
a. Install the engine assembly to the vehicle (Click here).



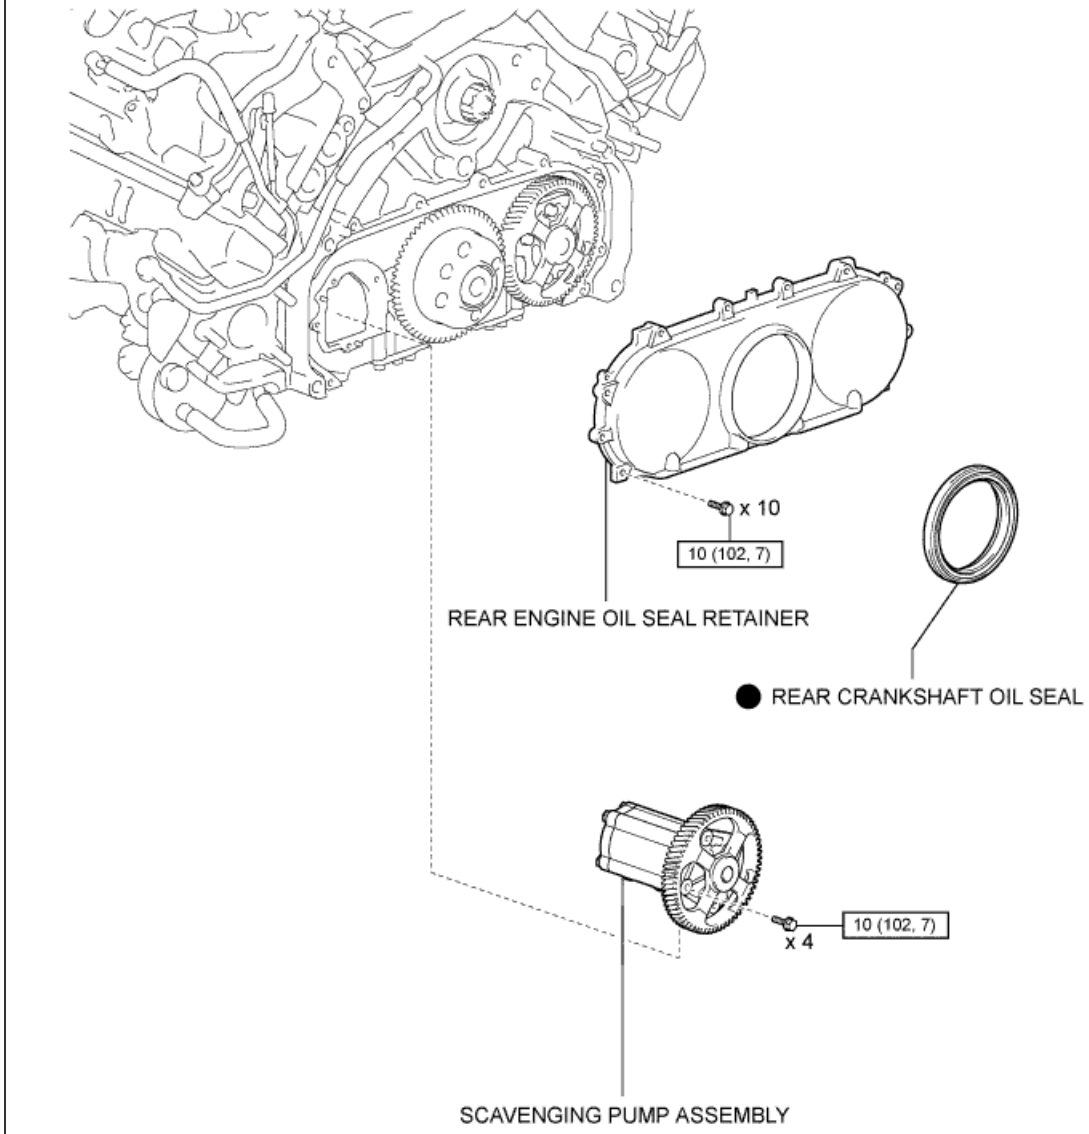
24. CONNECT TO NEGATIVE BATTERY TERMINAL



NOTICE:



When disconnecting the cable, some systems need to be initialized after the cable is reconnected (lick here).



a. onnect the cables to negative (-) main battery and sub-battery terminals.

for Preparation Click here

1. PRECAUTION

NOTICE:

After turning the ignition switch off, waiting time may be required before disconnecting the cable from the battery terminal. Therefore, make sure to read the disconnecting the cable from the battery terminal notice before proceeding with work (Click here).

2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

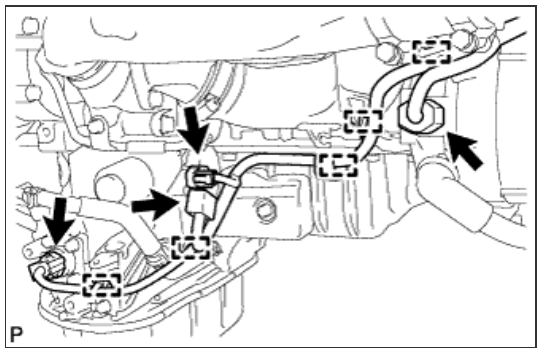
CAUTION:

Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

NOTICE:

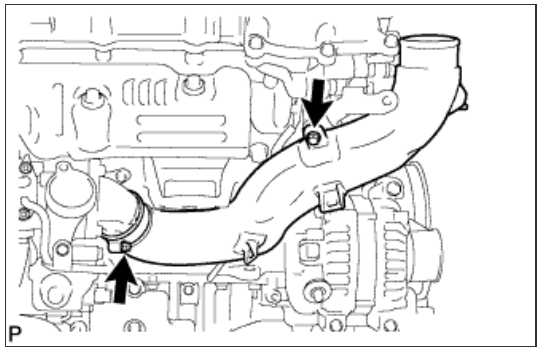
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Disconnect the cables from the negative (-) main battery and sub-battery terminals.



3. REMOVE ENGINE ASSEMBLY

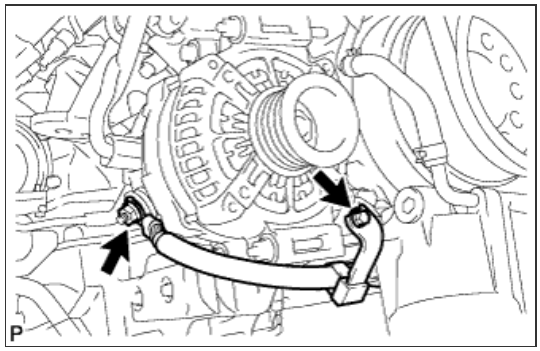
a. Remove the engine assembly from the vehicle (Click here).



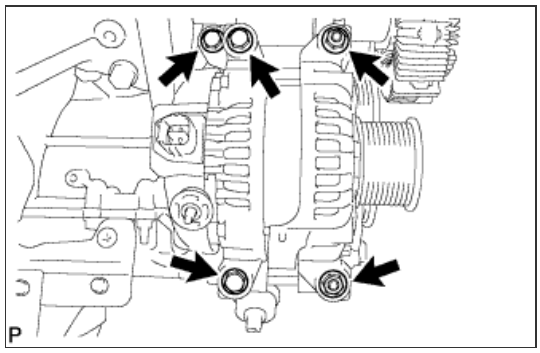
4. REMOVE NO. 1 INTAKE AIR CONNECTOR PIPE

a. Remove the 4 connectors.

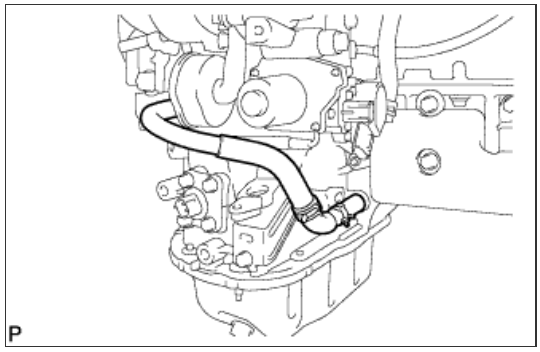
b. Using a clip remover, detach the 5 wire harness clamps.



c. Loosen the hose clamp, and remove the bolt and No. 1 intake air connector pipe.

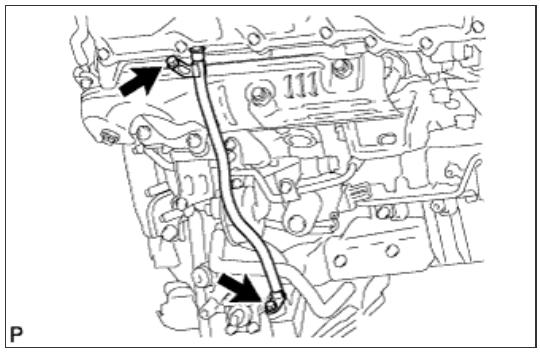


5. REMOVE GENERATOR ASSEMBLY

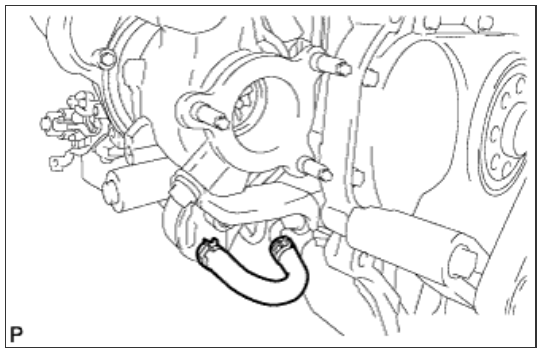


a. Remove the nut and bolt, and disconnect the generator positive ( ) cable.

b. Remove the 3 bolts, 2 nuts and generator.

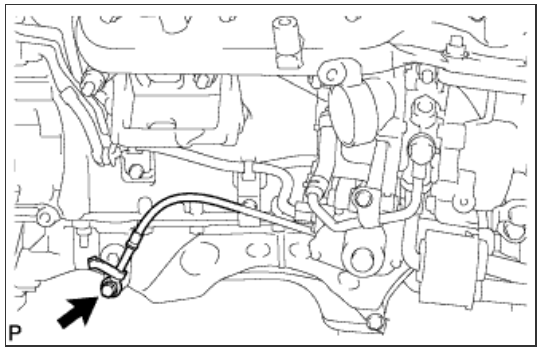


6. DISCONNECT NO. 1 OUTLET TURBO OIL HOSE

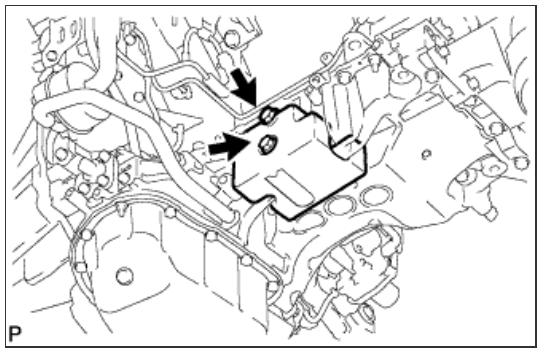


7. REMOVE NO. 1 ENGINE OIL LEVEL DIPSTICK GUIDE

a. Remove the 2 bolts and No. 1 engine oil level dipstick guide.

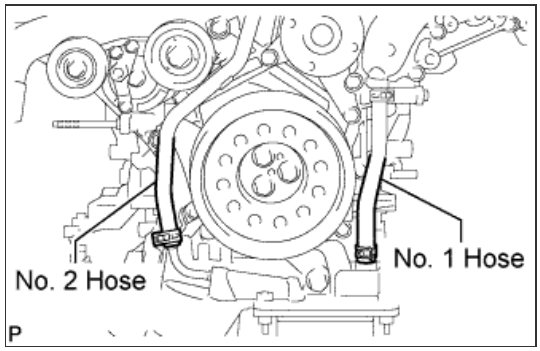


8. DISCONNECT NO. 2 OUTLET TURBO OIL HOSE



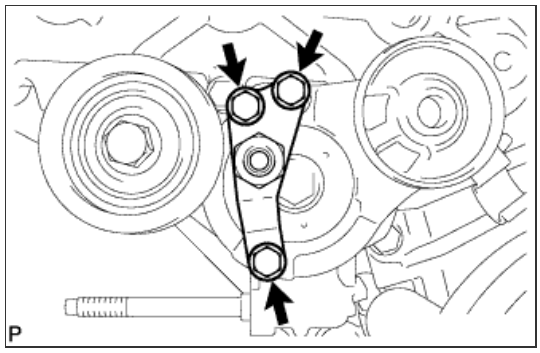
9. DISCONNECT NO. 2 INLET TURBO OIL PIPE SUB-ASSEMBLY

a. Remove the union bolt and gasket, and disconnect the No. 2 inlet turbo oil pipe.

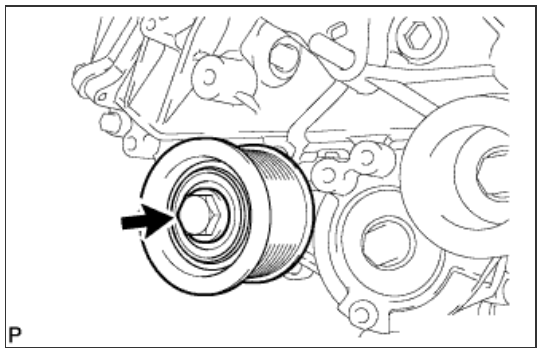


10. REMOVE STIFFENER INSULATOR RH (w/ Intercooler)

a. Remove the 2 bolts and stiffener insulator RH.

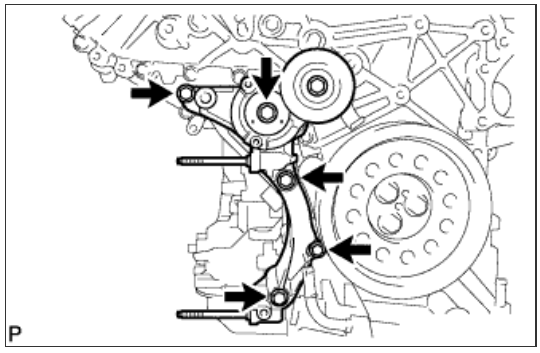


11. DISCONNECT NO. 1 OIL COOLER HOSE



12. DISCONNECT NO. 2 OIL COOLER HOSE

13. REMOVE V-RIBBED BELT TENSIONER ASSEMBLY



a. Remove the 3 bolts and ribbed belt tensioner bracket.

b. Remove the bolt and No. 1 idler pulley.

c. Remove the 5 bolts and ribbed belt tensioner.

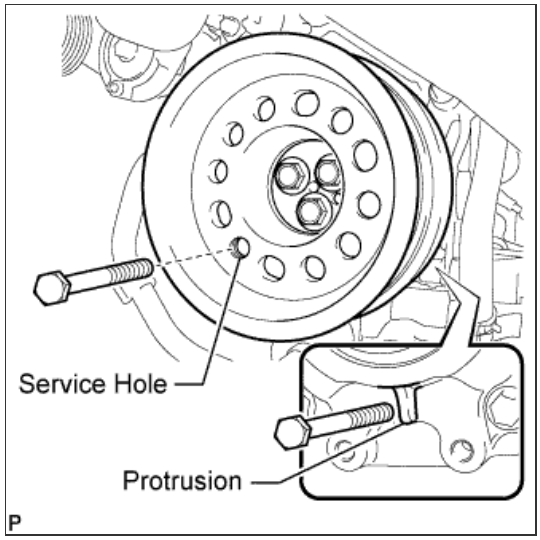
14. REMOVE CRANKSHAFT PULLEY

NOTICE:

This procedure is intended for removal/installation of the crankshaft pulley only. Do not use this procedure for removal/installation of the flywheel or the drive plate and ring gear.

a. nstall the 2 bolts to the bolt holes of the crankshaft rear side.

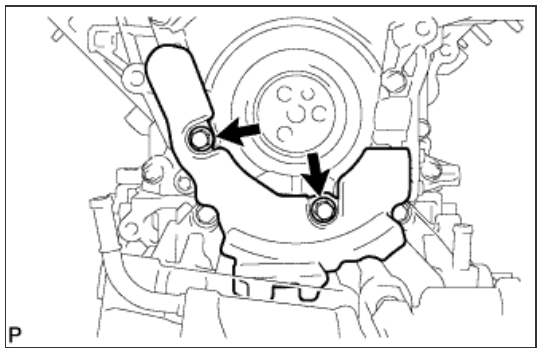
b. Using a bar, turn the crankshaft until the crankshaft pulley service hole is a little to the left of bottom dead center.



c. nstall a 14 mm 1.5 pitch service bolt with a length of 70 mm or more to the crankshaft pulley service hole, and hold the crankshaft using the timing chain cover protrusion.

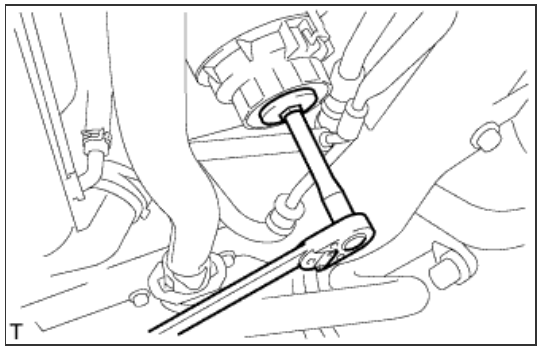
d. Remove the 3 bolts and crankshaft pulley.

NOTICE:



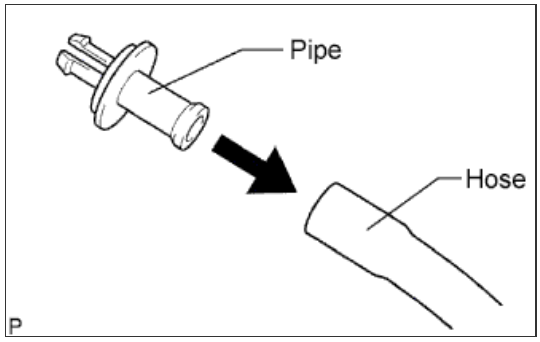
f the crankshaft pulley cannot be removed, temporarily install a bolt to the crankshaft so that the pulley does not fall, and lightly tap the outer edge of the mass damper with a plastic-faced hammer to remove the pulley. Do not tap the pulley ribbed belt ribs, as the crankshaft may

be damaged.



15. REMOVE TIMING GEAR COVER SPACER (w/ Intercooler)

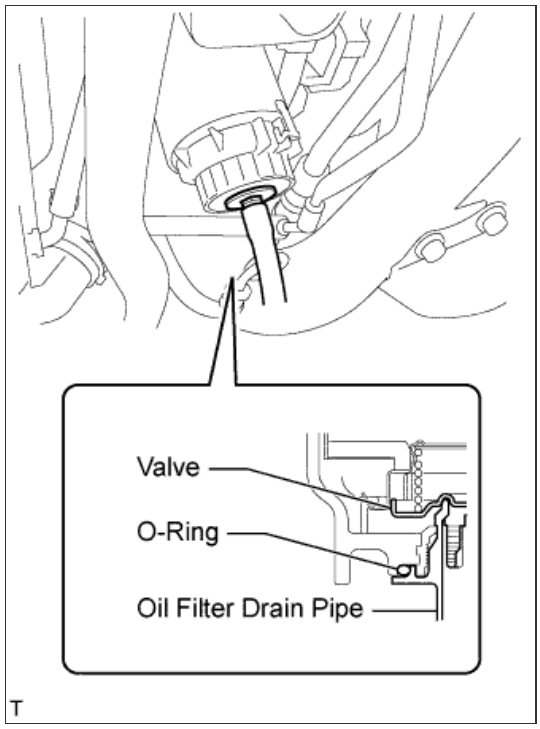
a. Remove the 2 bolts and timing gear cover spacer.



16. REMOVE OIL FILTER ELEMENT

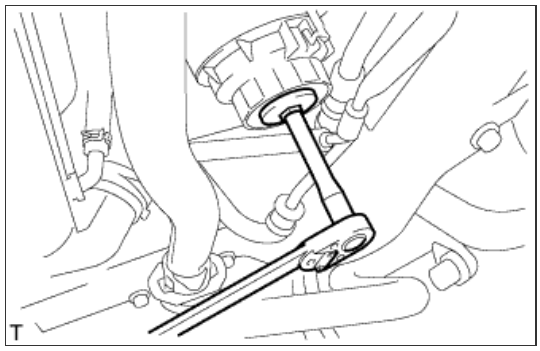
a. Remove the oil filter drain plug.

b. Connect a hose with an inside diameter of 15 mm (0.591 in.) to the pipe.



c. Remove the O-ring from the oil filter drain plug and install it to the drain pipe.

d. nstall the oil filter drain pipe to the oil filter cap and drain the engine oil.

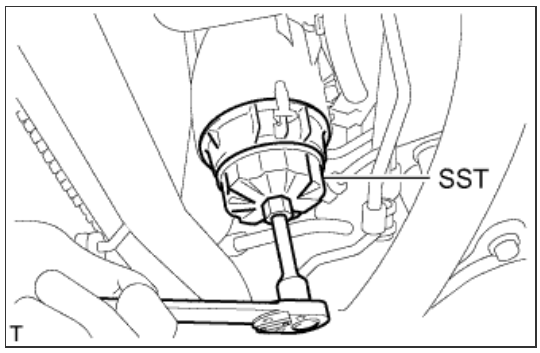


e. Remove the oil filter drain pipe.

f. Apply a light coat of engine oil to a new O-ring, and install it to the oil filter drain plug.

g. nstall the oil filter drain plug to the oil filter cap.

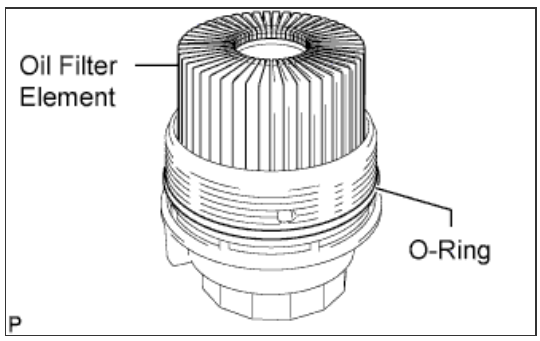
Tor e:
13 N*m{ 127 kgf*cm , 9 ft.*lbf }



h. Using SST, remove the oil filter cap.

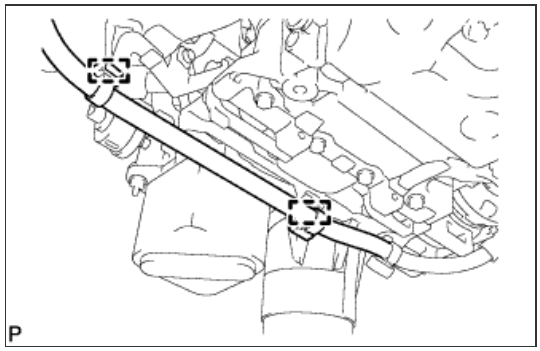
SST
09228-06501

HINT:



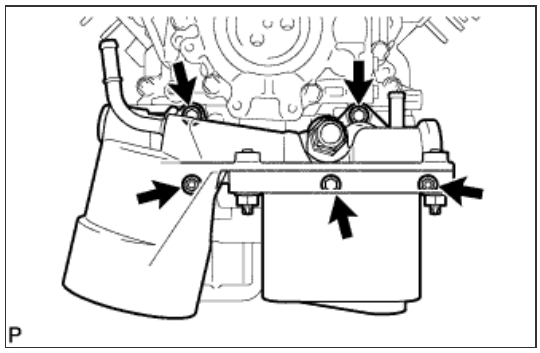
Use a container to catch the draining oil. After the oil filter cap is loosened appro mately 4 turns and the cap ribs are vertical, engine oil drains from the gap between the oil filter cap and oil pan.

i. Remove the oil filter element and O-ring from the oil filter cap.

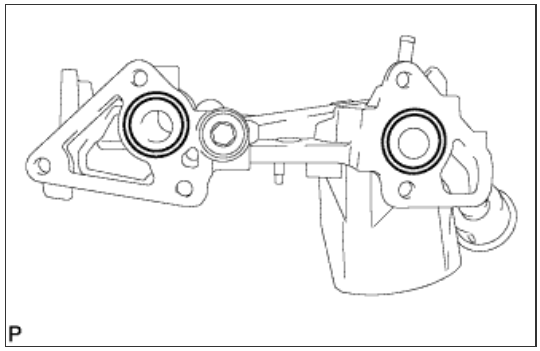


NOTICE:

Be sure to remove the cap O-ring by hand, without using any tools, to prevent damage to the cap O-ring groove.

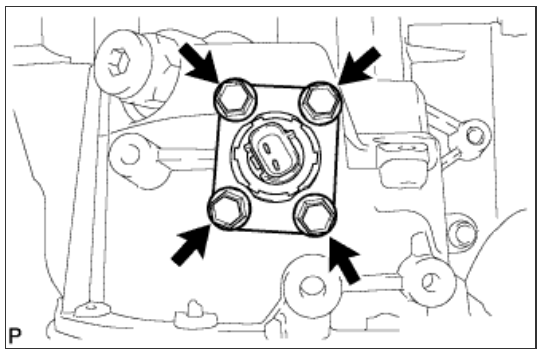


17. REMOVE OIL FILTER BRACKET SUB-ASSEMBLY



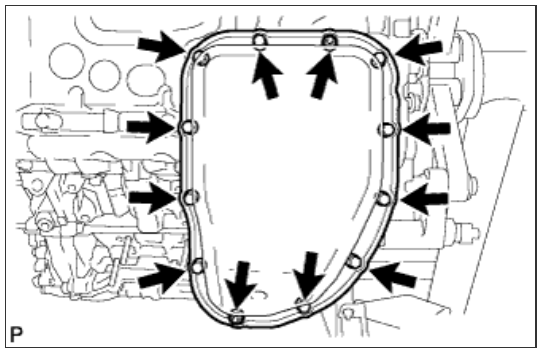
a. Disconnect the 2 wire harness clamps.

b. Remove the 3 bolts, 2 nuts and oil filter bracket.



c. Remove the 2 O-rings.

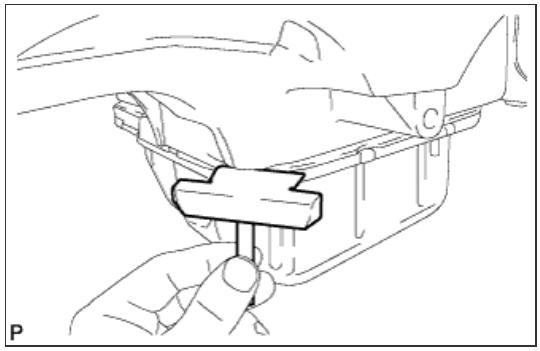
18. REMOVE ENGINE OIL LEVEL SENSOR



a. Remove the 4 bolts and engine oil level sensor.

b. Remove the gasket.

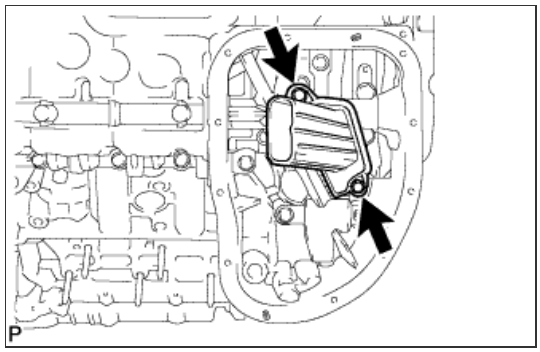
19. REMOVE NO. 2 OIL PAN SUB-ASSEMBLY



a. Remove the 10 bolts and 2 nuts.

b. nsert the blade of an oil pan seal cutter between the oil pans. Cut through the applied sealer and remove the No. 2 oil pan.

NOTICE:



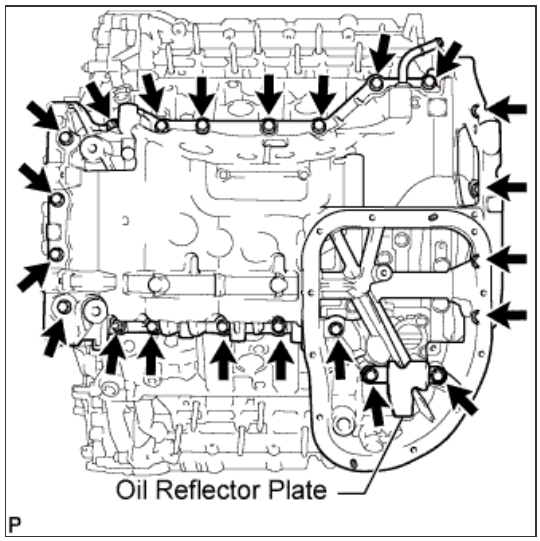
Be careful not to damage the contact surfaces of the No. 1 and No. 2 oil pans.

20. REMOVE OIL STRAINER SUB-ASSEMBLY

a. Remove the 2 bolts and oil strainer.

b. Remove the O-ring from the oil strainer.

21. REMOVE NO. 1 OIL PAN SUB-ASSEMBLY



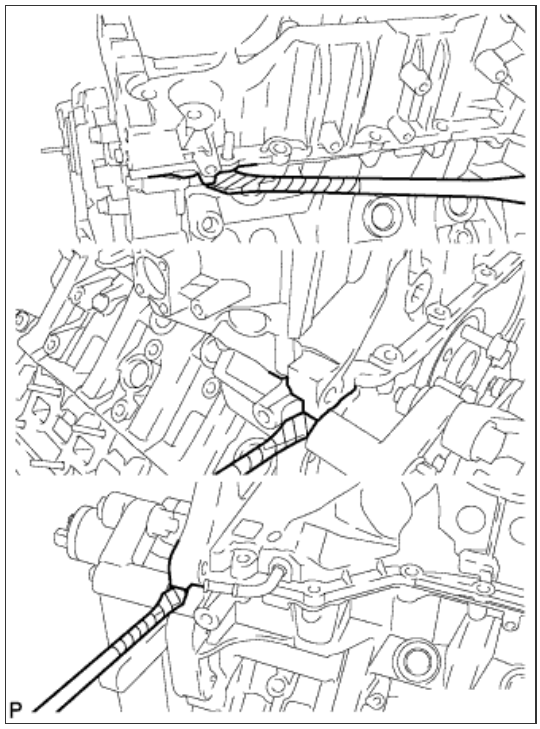
a. Remove the 20 bolts, 2 nuts and oil reflector plate.

NOTICE:

f the oil reflector plate is deformed, replace it.

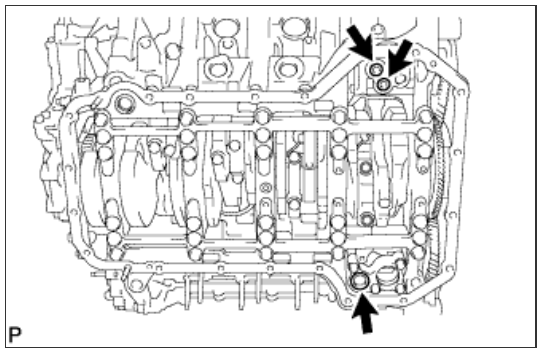
HINT:

Be sure to clean the bolts and stud bolts, and check the threads for cracks or other damage.



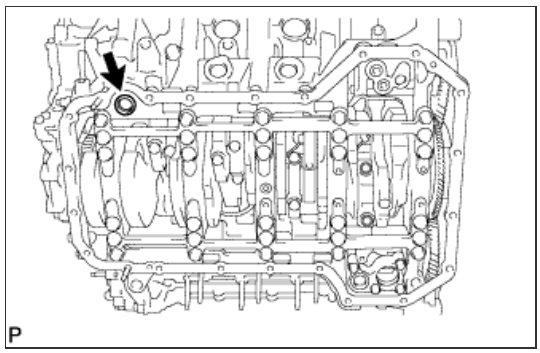
b. Remove the No. 1 oil pan by prying between the No. 1 oil pan and cylinder block with a screwdriver.

NOTICE:



Be careful not to damage the contact surfaces of the cylinder block and oil pan.

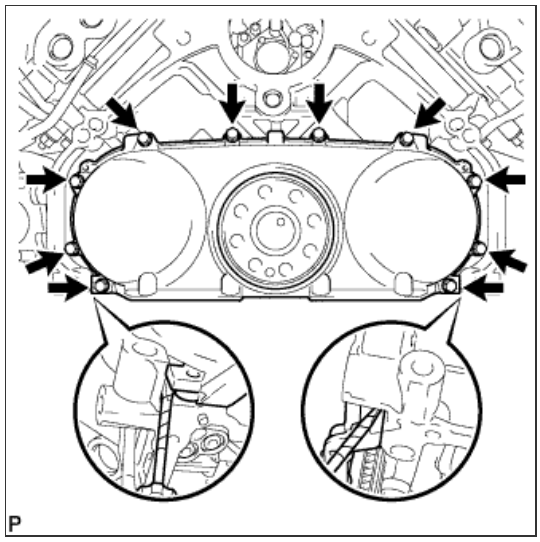
HINT:



Tape the screwdriver tip before use.

c. Remove the 3 O-rings.

d. Remove the cylinder block oil hole gasket.



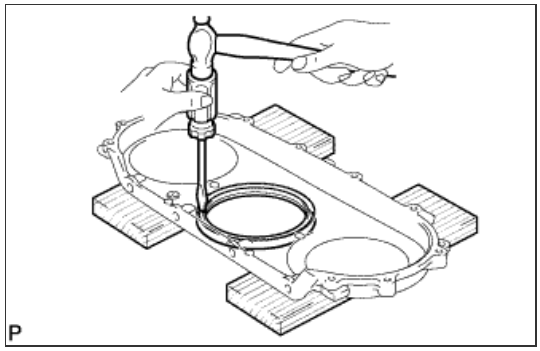
22. REMOVE REAR ENGINE OIL SEAL RETAINER

a. Remove the 10 bolts.

b. Remove the oil seal retainer by prying between the oil seal retainer and cylinder block with a screwdriver.

HINT:

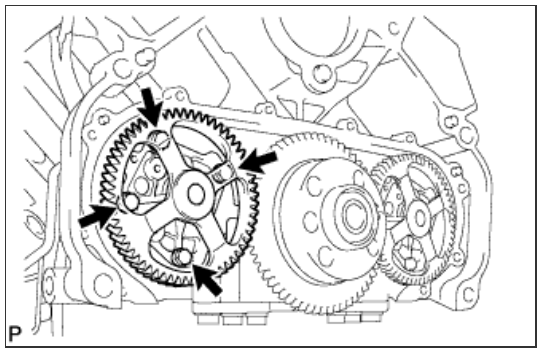
Tape the screwdriver tip before use.



23. REMOVE REAR CRANKSHAFT OIL SEAL

a. Place the oil seal retainer on wooden blocks.

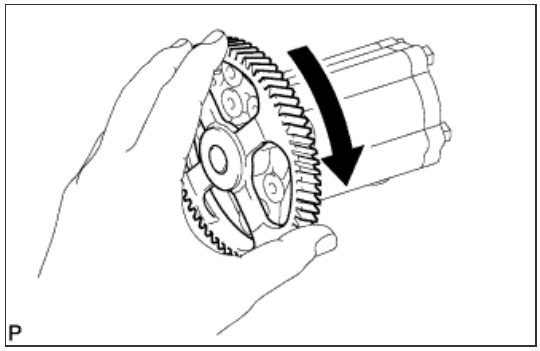
b. Using a screwdriver and hammer, tap out the oil seal.



HINT:

Tape the screwdriver tip before use.

24. REMOVE SCAVENGING PUMP ASSEMBLY



a. Remove the 4 bolts and scavenging pump.

for Preparation Click here

1. INSPECT SCAVENGING PUMP ASSEMBLY

a. Turn the gear and check that the scavenging pump bearing moves smoothly and quietly.
If necessary, replace the scavenging pump assembly.

for Preparation Click here

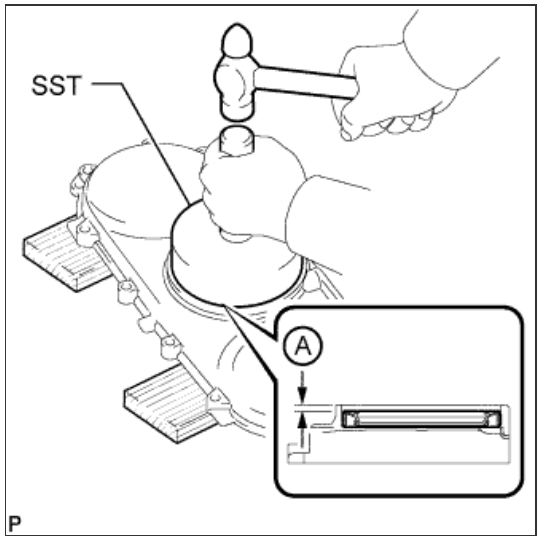
1. INSTALL SCAVENGING PUMP ASSEMBLY

a. Install the scavenging pump with the 4 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

2. INSTALL REAR CRANKSHAFT OIL SEAL

a. Place the oil seal retainer on wooden blocks.



b. Using SST and a hammer, tap in a new oil seal as shown in the illustration.

SST
09223-56010

Standard depth A:
2.7 to 3.7 mm (0.106 to 0.147 in.)

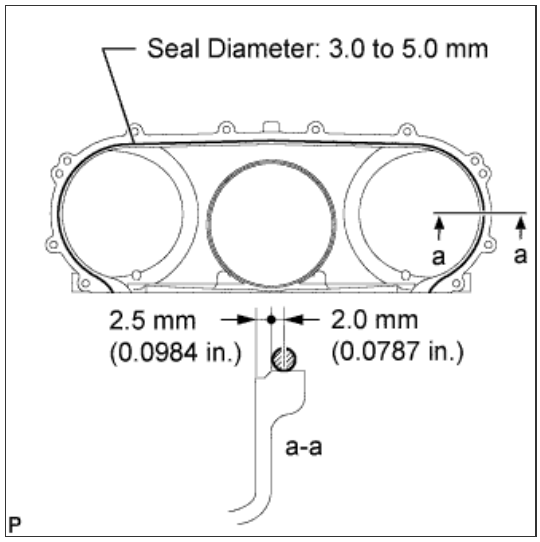
NOTICE:

- **Keep the lip free from foreign matter.**
- **Do not tap on the seal at an angle.**

3. INSTALL REAR ENGINE OIL SEAL RETAINER

a. Apply seal packing in a continuous line as shown in the illustration.

Seal diameter:
3.0 to 5.0 mm (0.118 to 0.197 in.)



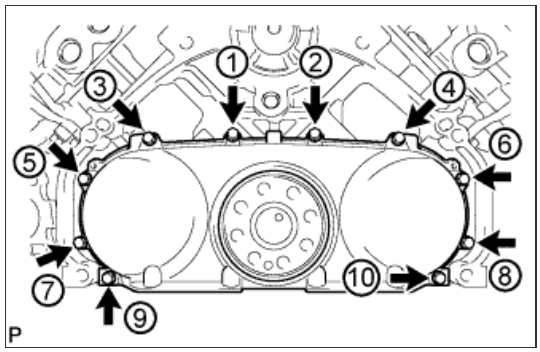
Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

- **Remove any oil from the contact surface.**
- **Install the rear engine oil seal retainer within 3 minutes and tighten the bolts within 15 minutes after applying seal packing.**

b. Apply engine oil to the oil seal lip.

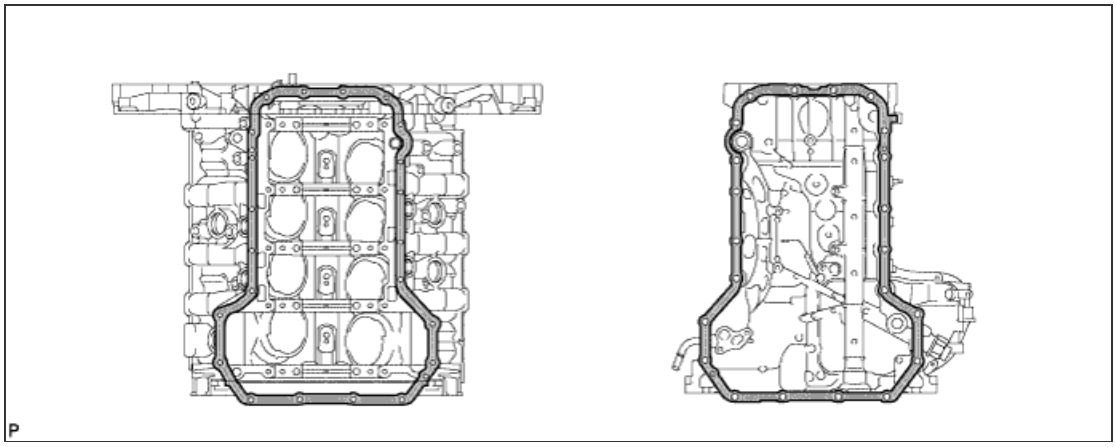
c. Make sure that the lip of the oil seal is properly installed.



d. Install and uniformly tighten the 10 bolts in the order shown in the illustration.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:



- When installing the oil seal retainer, make sure the lip of the oil seal is not damaged.
- When installing the oil seal retainer, make sure the lip of the oil seal is not folded incorrectly.

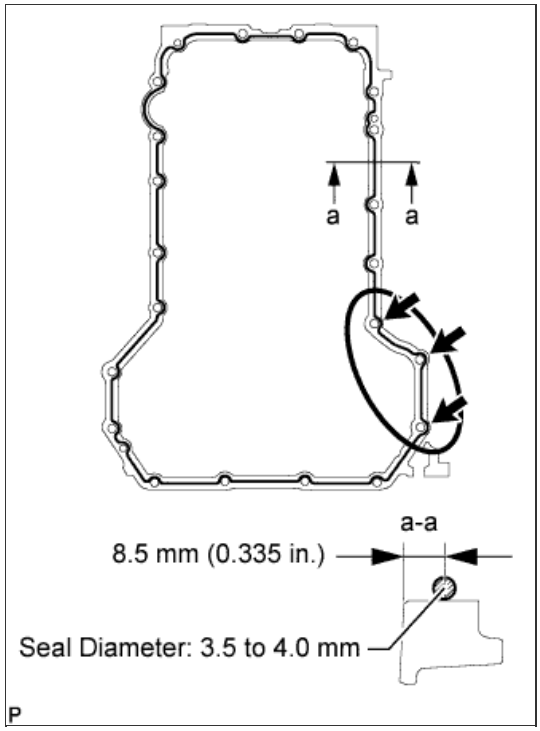
4. INSTALL NO. 1 OIL PAN SUB-ASSEMBLY

NOTICE:

When the contact surfaces shown below are wet, wipe them with an oil-free cloth before applying seal packing.

a. Install the cylinder block oil hole gasket.

b. Apply a light coat of engine oil to 3 new O-rings and set the 3 O-rings to the oil regulator and scavenging pump.



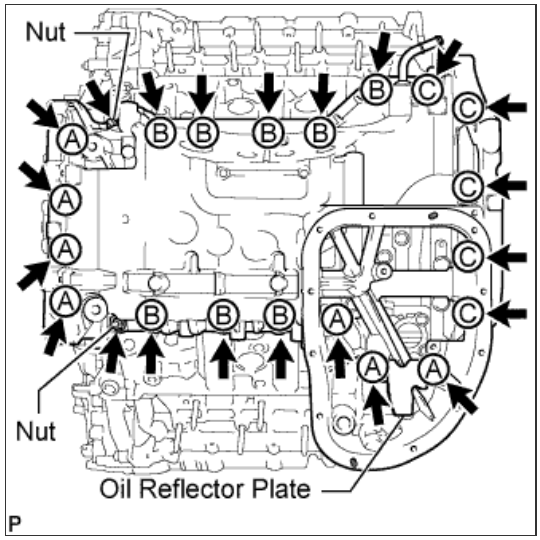
c. Apply seal packing to the No. 1 oil pan as shown in the illustration.

Standard seal diameter:
3.5 to 4.0 mm (0.134 to 0.157 in.)

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:

- For the 3 bolt holes labeled with arrows, apply the seal packing on the outer edges. For the other bolt holes, apply the seal packing on the inner edges.
- Make sure to apply a continuous bead of seal packing as shown in the illustration. If the bead breaks, overlap 3 mm (0.118 in.) of seal packing and continue the bead.
- Remove any oil and old seal packing from the contact surface.
- Install the No. 1 oil pan within 3 minutes and tighten the bolts and nuts within 15 minutes after applying seal packing.
- Do not start the engine for at least 2 hours after installing.



d. Install the No. 1 oil pan and oil reflector plate with the 20 bolts and 2 nuts.

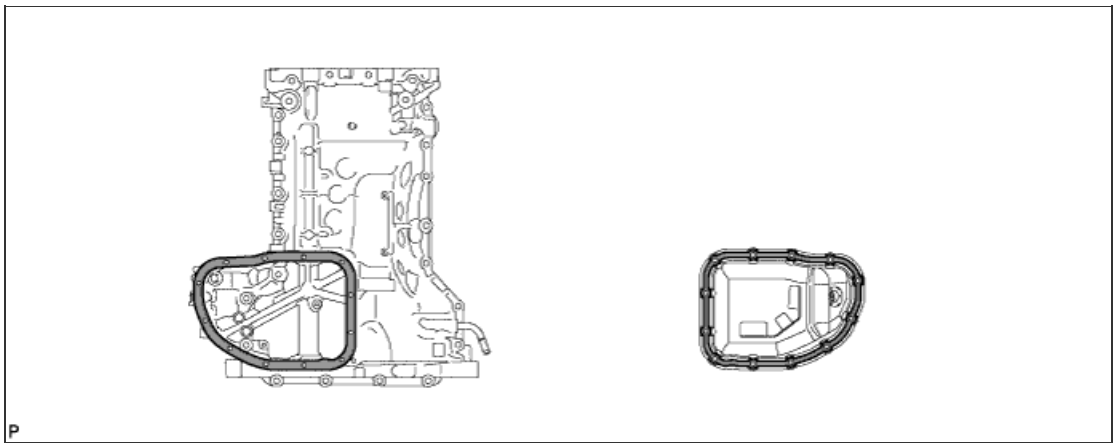
Torque:
25 N*m{ 250 kgf*cm , 18 ft.*lbf }

Bolt Length

Item	Quantity	Length
Bolt A	7	70 mm (2.76 in.)
Bolt B	8	20 mm (0.787 in.)
Bolt C	5	30 mm (1.18 in.)

5. INSTALL OIL STRAINER SUB-ASSEMBLY

a. Apply a light coat of engine oil to a new O-ring, and install it to the oil strainer.



b. Install the oil strainer with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

6. INSTALL NO. 2 OIL PAN SUB-ASSEMBLY

NOTICE:

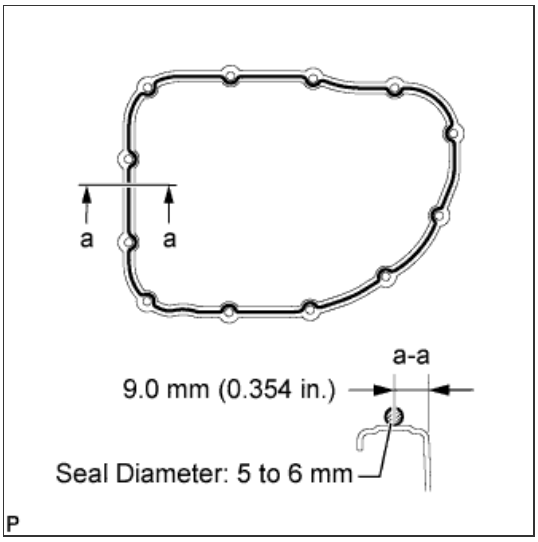
When the contact surfaces shown below are wet, wipe them with an oil-free cloth before applying seal packing.

a. Apply seal packing to the No. 2 oil pan as shown in the illustration.

Standard seal diameter:
5.0 to 6.0 mm (0.197 to 0.236 in.)

Seal packing:
Toyota Genuine Seal Packing Black, Three Bond 1207B or equivalent

NOTICE:



- **For the bolt and pin holes, make sure to apply seal packing to**

the inner sides.

- Make sure to apply a continuous bead of seal packing as shown in the illustration. If the bead breaks, overlap 3.0 mm (0.118 in.) of seal packing and continue the bead.
- Remove any oil from the contact surface.
- Install the No. 2 oil pan within 3 minutes and tighten the bolts and nuts within 10 minutes after applying seal packing.
- Do not start the engine for at least 2 hours after installing.

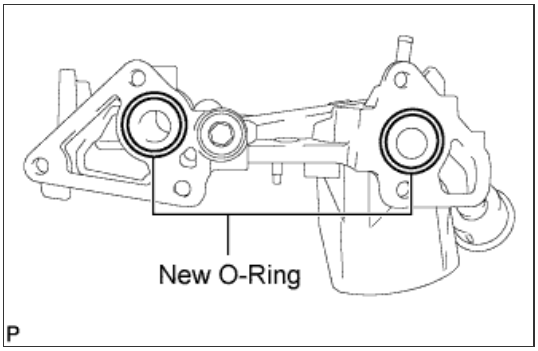
b. Install the No. 2 oil pan with the 10 bolts and 2 nuts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

7. INSTALL ENGINE OIL LEVEL SENSOR

a. Install a new gasket and the sensor with the 4 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }



8. INSTALL OIL FILTER BRACKET SUB-ASSEMBLY

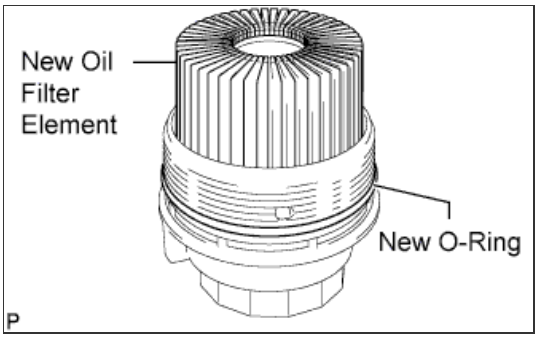
a. Apply a light coat of engine oil to 2 new O-rings, and set them to the oil filter bracket.

b. Install the oil filter bracket with the 3 bolts and 2 nuts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Connect the 2 wire harness clamps.

9. INSTALL OIL FILTER ELEMENT



a. Clean the inside of the oil filter cap, its threads and its O-ring groove.

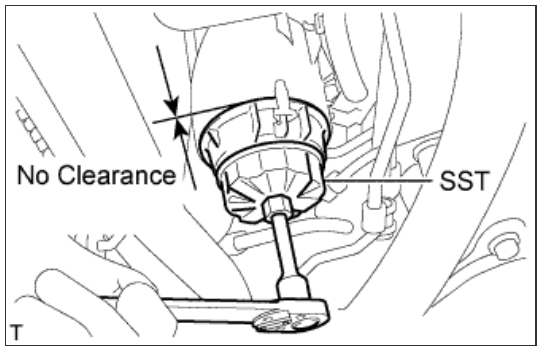
b. Apply a small amount of engine oil to a new O-ring and install it to the oil filter cap.

c. Set a new oil filter element in the oil filter cap.

d. Remove any dirt or foreign matter from the installation surface of the engine.

e. Apply a small amount of engine oil to the O-ring again and temporarily install the oil filter cap by hand.

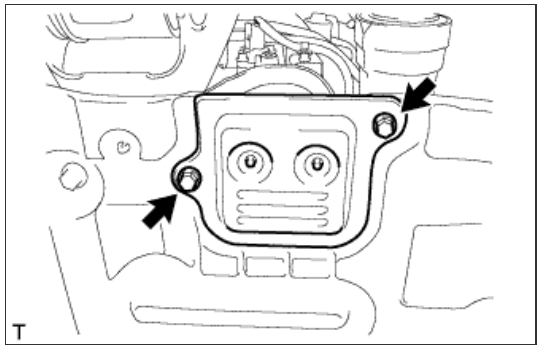
f. Using SST, tighten the oil filter cap.



SST
09228-06501

Torque:

25 N*m{ 255 kgf*cm , 18 ft.*lbf }



NOTICE:

- **Make sure that the oil filter is installed securely as shown in the illustration.**
- **Be careful that the O-ring does not get caught between any surrounding parts.**

g. Install the No. 2 engine under cover seal to the No. 2 engine under cover with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

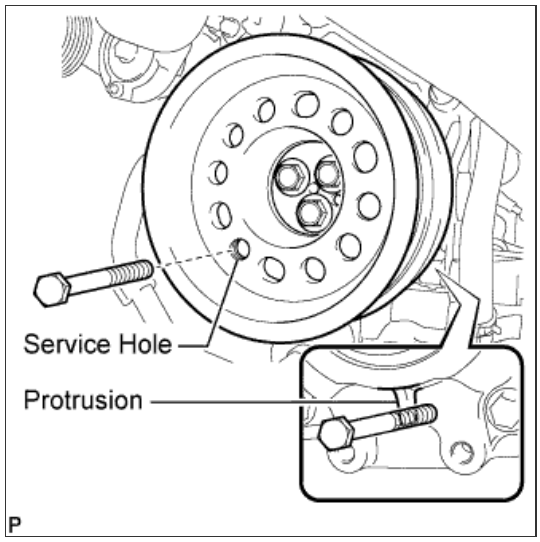
10. INSTALL TIMING GEAR COVER SPACER (w/ Intercooler)

a. Install the timing gear cover spacer with the 2 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

11. INSTALL CRANKSHAFT PULLEY

NOTICE:

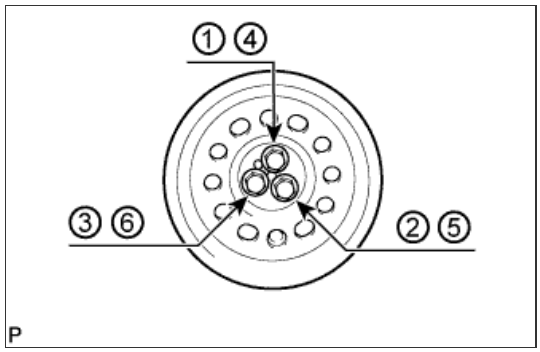


This procedure is intended for removal/installation of the crankshaft pulley only. Do not use this procedure for removal/installation of the flywheel or the drive plate and ring gear.

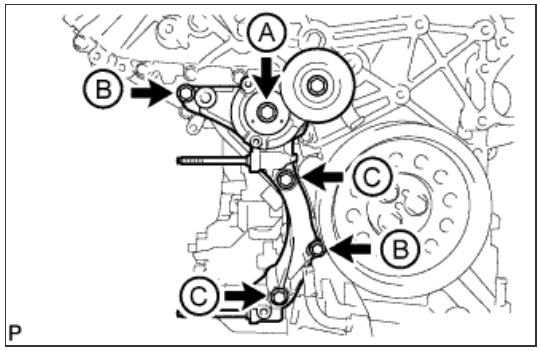
a. Align the crankshaft pulley and the crankshaft knock pin, and temporarily install the crankshaft pulley with the 3 bolts.

b. Install the 2 bolts to the bolt holes of the crankshaft rear side.

c. Using a bar, turn the crankshaft until the crankshaft pulley service hole is a little to the right of bottom dead center.



d. Install a 14 mm x 1.5 pitch service bolt with a length of 70 mm or more to the crankshaft pulley service hole, and hold the crankshaft using the timing chain cover protrusion.



e. Uniformly tighten the 3 bolts in 2 passes in the order shown in the illustration.

Torque:
115 N*m{ 1168 kgf*cm , 84 ft.*lbf }

f. Remove the service bolt.

12. INSTALL V-RIBBED BELT TENSIONER ASSEMBLY

a. Install the V-ribbed belt tensioner with the 5 bolts.

Torque:
for bolt A and C:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }
for bolt B:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

Bolt Length

Item	Quantity	Length
Bolt A	1	116 mm (4.57 in.)
Bolt B	2	40 mm (1.58 in.)
Bolt C	2	95 mm (3.74 in.)

b. Install the No. 1 idler pulley with the bolt.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

c. Install the V-ribbed belt tensioner bracket with the 3 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

13. CONNECT NO. 2 OIL COOLER HOSE

a. Align the white paint marks on the oil cooler hose and oil filter bracket and connect the hose.

NOTICE:

Make sure to maintain a space between the oil cooler hose and crankshaft pulley and the oil cooler hose and V-ribbed belt idler pulley.

14. CONNECT NO. 1 OIL COOLER HOSE

a. Face the pink paint mark on the oil cooler hose toward the front side of the engine and connect the hose to the oil filter bracket.

NOTICE:

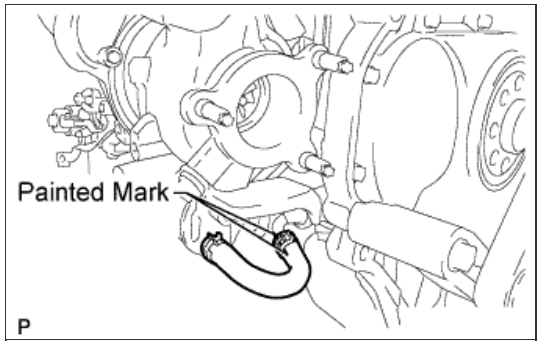
Make sure to maintain a space between the oil cooler hose and crankshaft pulley.

15. INSTALL STIFFENER INSULATOR RH (w/ Intercooler)

a. Install the stiffener insulator RH with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

16. INSTALL NO. 2 INLET TURBO OIL PIPE SUB-ASSEMBLY



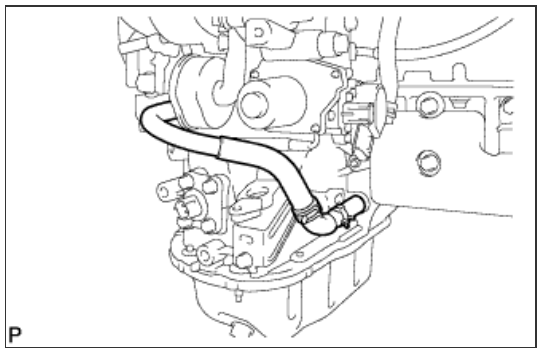
a. Install a new gasket and connect the No. 2 inlet turbo oil pipe with the union bolt.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

17. CONNECT NO. 2 OUTLET TURBO OIL HOSE

HINT:

Align the white paint marks on the oil hose and pipe, and connect the hose.



18. INSTALL NO. 1 ENGINE OIL LEVEL DIPSTICK GUIDE

a. Apply a light coat of engine oil to a new O-ring, and install it to the No. 1 engine oil level dipstick guide.

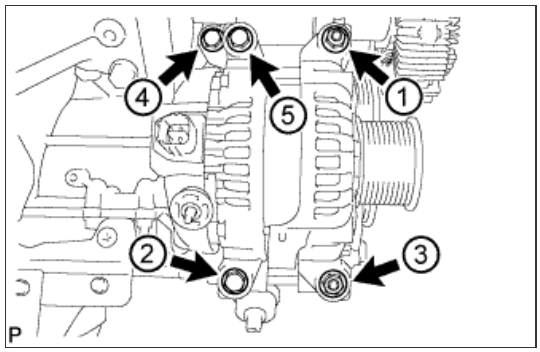
b. Install the No. 1 engine oil level dipstick guide with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

19. CONNECT NO. 1 OUTLET TURBO OIL HOSE

20. INSTALL GENERATOR ASSEMBLY

a. Temporarily install the generator with the 3 bolts and 2 nuts.

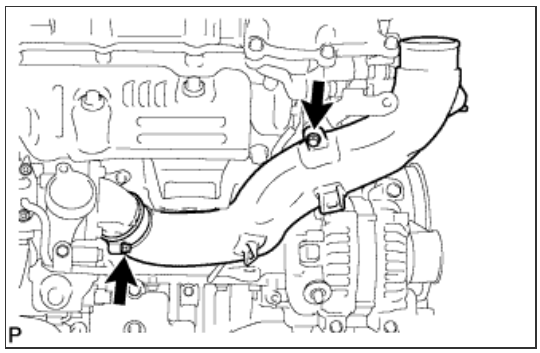


b. Uniformly tighten the 3 bolts and 2 nuts in the order shown in the illustration.

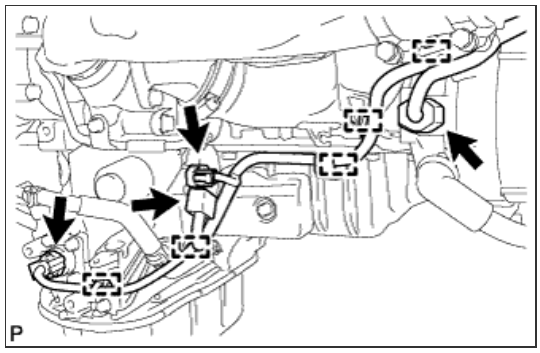
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Connect the generator cable and install the nut and bolt.

Torque:
for bolt:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }



for nut (130A Type and 150A Type:):
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }
for nut (180A Type:):
12 N*m{ 122 kgf*cm , 9 ft.*lbf }



21. INSTALL NO. 1 INTAKE AIR CONNECTOR PIPE

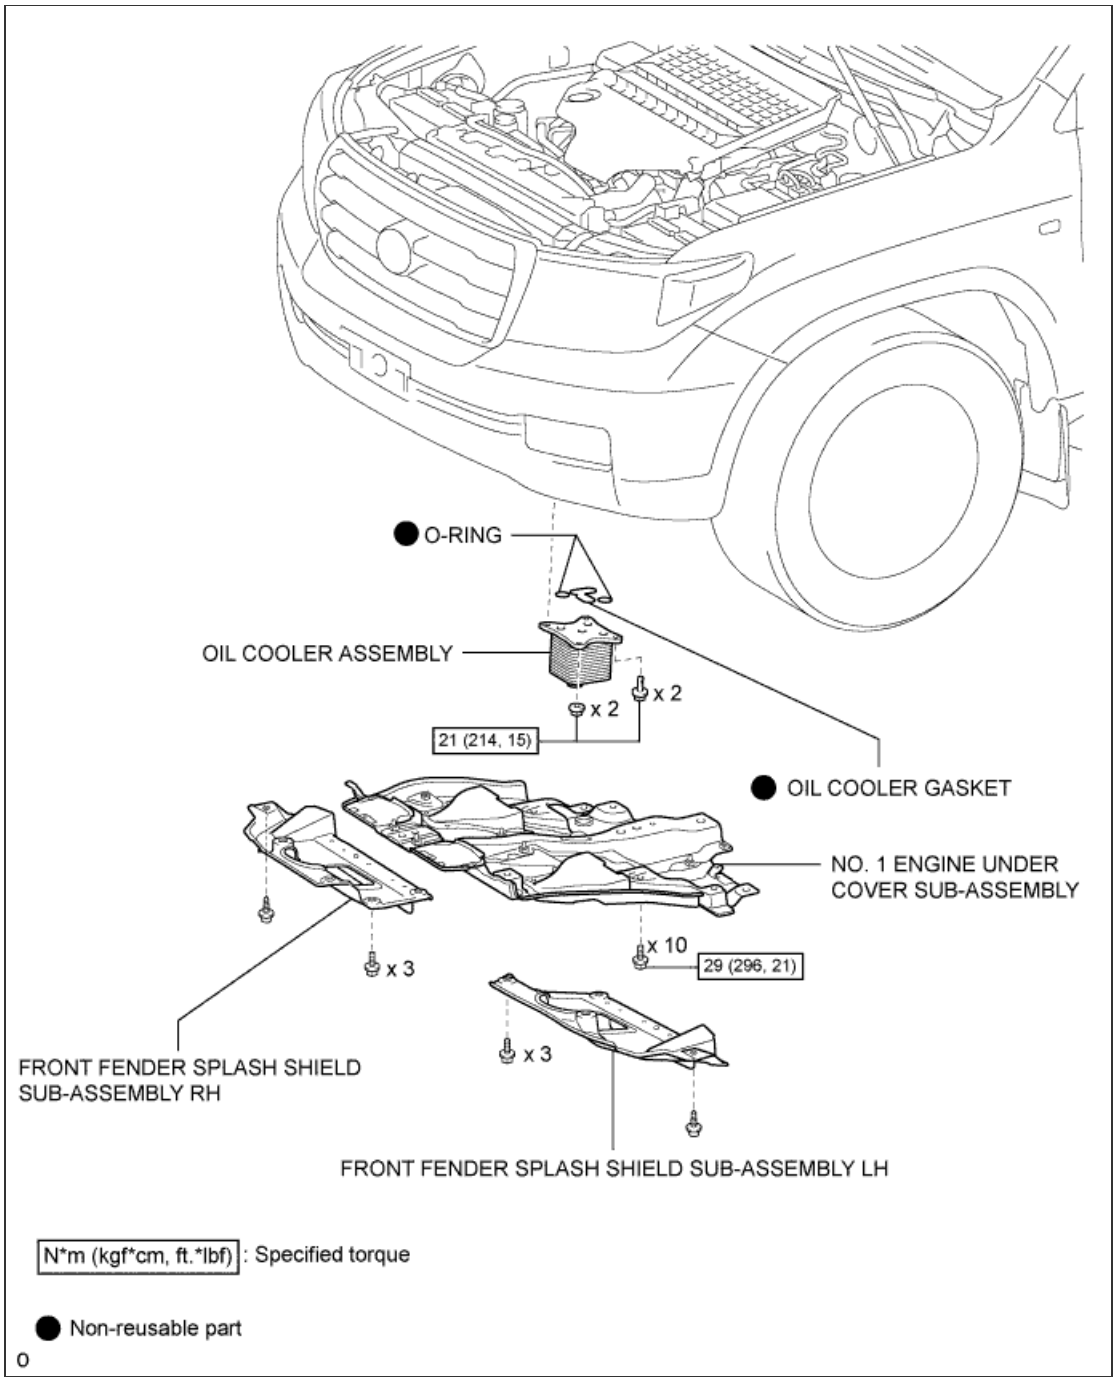
a. Install the No. 1 intake air connector pipe with the bolt. Then tighten the hose clamp.

Torque:
for bolt:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }
for clamp:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }

b. Connect the 4 connectors and attach the 5 wire harness clamps.

22. INSTALL ENGINE ASSEMBLY

a. Install the engine assembly to the vehicle (Click here).



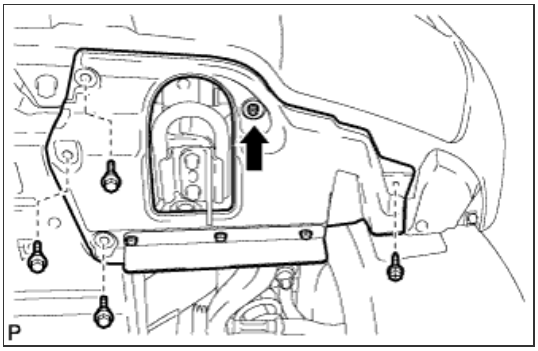
23. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

a. Connect the cables to negative (-) main battery and sub-battery terminals.

for Preparation Click here

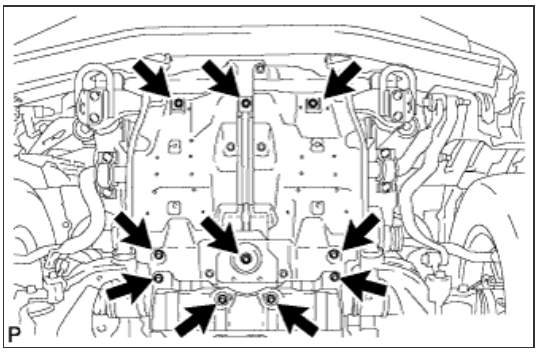


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

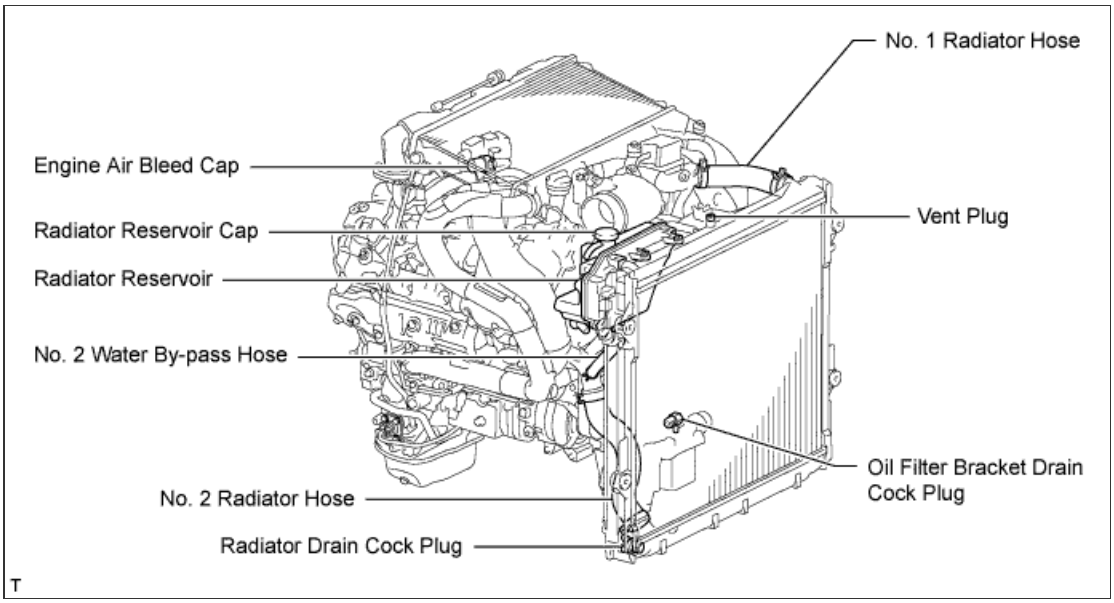
3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.

4. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

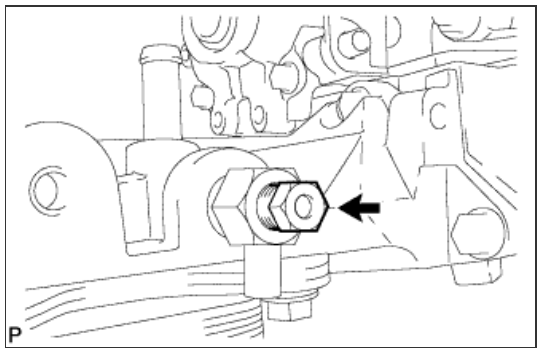


HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

a. Loosen the radiator drain cock plug.

b. Remove the radiator reservoir cap to drain the coolant in the radiator.



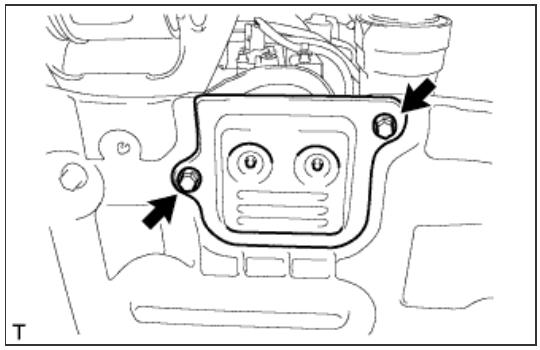
c. Loosen the oil filter bracket drain cock plug to drain the coolant in the engine.

d. Tighten the radiator drain cock plug by hand.

e. Tighten the oil filter bracket drain cock plug.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

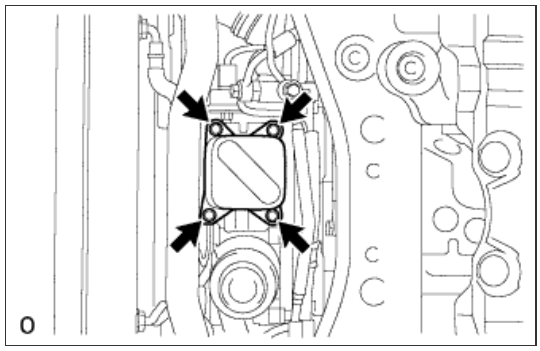
5. DRAIN ENGINE OIL



a. Remove the 2 bolts and No. 2 engine under cover seal from the No. 2 engine under cover.

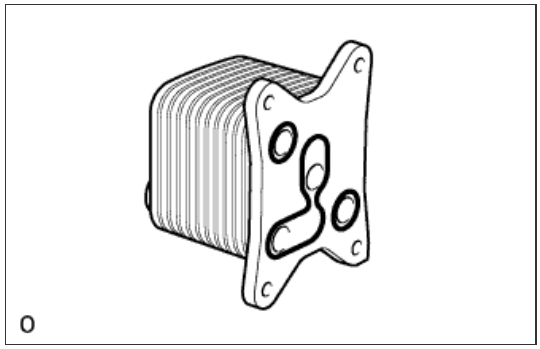
b. Remove the oil filler cap.

c. Remove the oil pan drain plug and gasket, and then drain the engine oil into a container.



d. Install a new gasket and the oil pan drain plug.

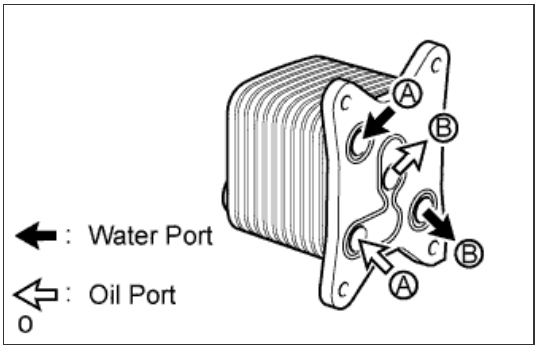
Torque:
38 N*m{ 387 kgf*cm , 28 ft.*lbf }



6. REMOVE OIL COOLER ASSEMBLY

a. Remove the 2 bolts, 2 nuts and oil cooler.

b. Remove the 2 O-rings and oil cooler gasket.

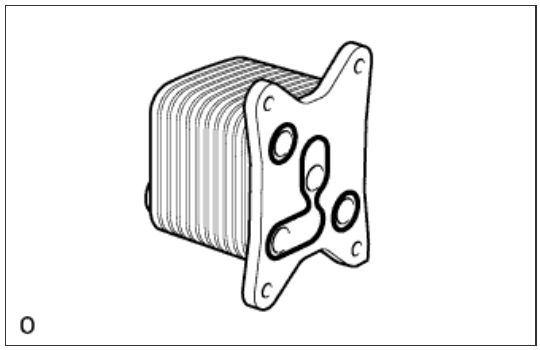


for Preparation Click here

1. INSPECT OIL COOLER ASSEMBLY

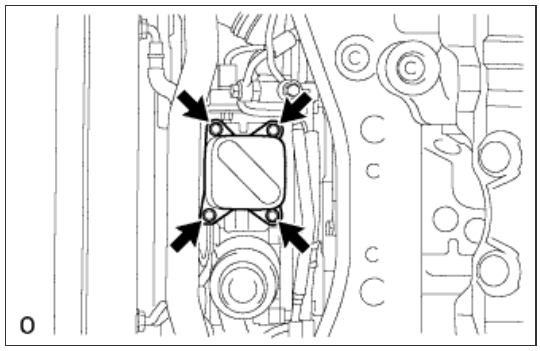
a. Visual check that the oil cooler for damage.
If necessary, replace the oil cooler assembly.

b. Check the oil cooler for clogging.



i. Apply air into A, and check that air flows from B for the water and oil ports.
If air does not flow as specified, clean or replace the oil cooler assembly.

for Preparation Click here



1. INSTALL OIL COOLER ASSEMBLY

a. Apply a light coat of engine oil to 2 new O-rings and a new oil cooler gasket, and set them to the oil cooler.

b. Install the oil cooler with the 2 bolts and 2 nuts.

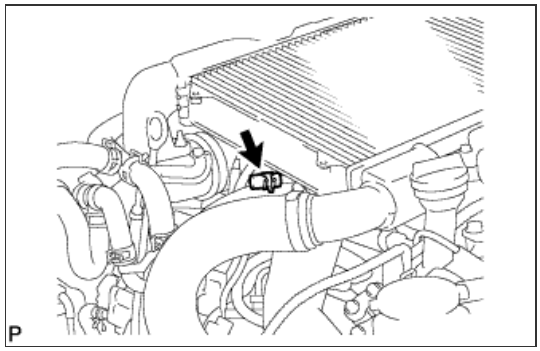
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

2. ADD ENGINE OIL

a. Add fresh oil.

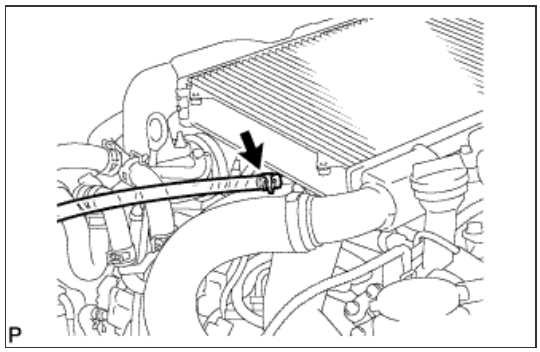
Standard Engine Oil:

Oil Grade	Oil Viscosity (SAE)
G-DLD-1, API CF-4, API CF or ACEA B1 (ou may also use API CE or CD)	- -30 - 10W-30 - 1 -40 - 2 W- (-30 is best choice for fuel economy and good starting in cold weather).



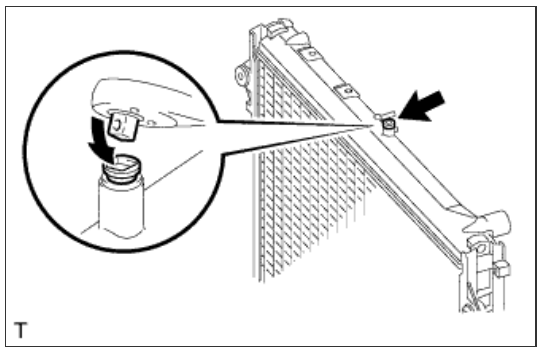
Standard Capacity:

Item	Specified Condition
Drain and refill with oil filter change	9.2 liters (9.7 US qts, 8.1 Imp. qts)
Drain and refill without oil filter change	8.2 liters (8.7 US qts, 7.2 Imp. qts)
Dry fill	9.9 liters (10. S qts, 8.7 Imp. qts)

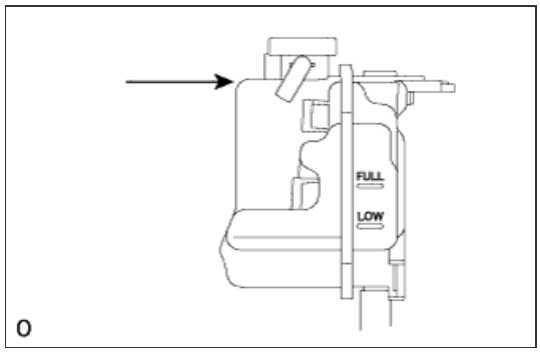


b. Install the oil filler cap.

3. ADD ENGINE COOLANT



a. Remove the engine air bleed cap.



b. Connect a clear hose to the engine air bleed pipe.

c. Using a wrench, remove the vent plug.

d. Fill the radiator with O O ÆSLLC to the radiator reservoir filler neck.

HINT:

Pour TOYOTA SLLC until it spills out of the engine air bleed pipe.

Standard Capacity (for Automatic Transmission):

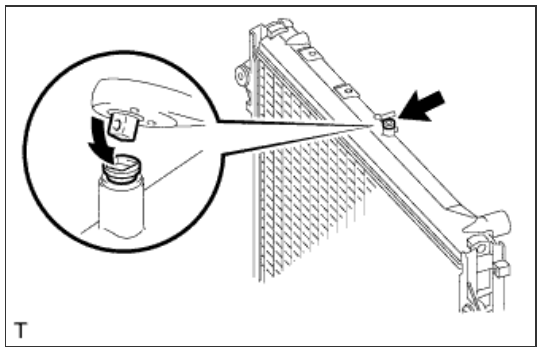
Item	Specified Condition
Front heater only	14.8 liters (15.6 US qts, 13.0 Imp. qts)
Front heater and rear heater	17.6 liters (18.6 US qts, 15.5 Imp. qts)
Front heater with viscous heater	15.2 liters (16.1 US qts, 13.4 Imp. qts)
Front heater and rear heater with viscous heater	18.0 liters (19.0 US qts, 15.4 Imp. qts)

Standard capacity (for Manual Transmission):
15.4 liters (16.3 US qts, 13.6 Imp. qts)

NOTICE:

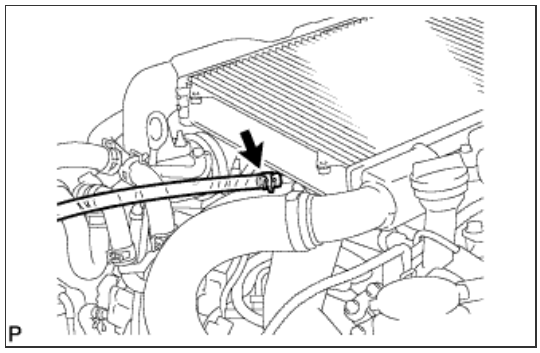
Do not substitute plain water for engine coolant.

HINT:



TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

e. Install the vent plug.

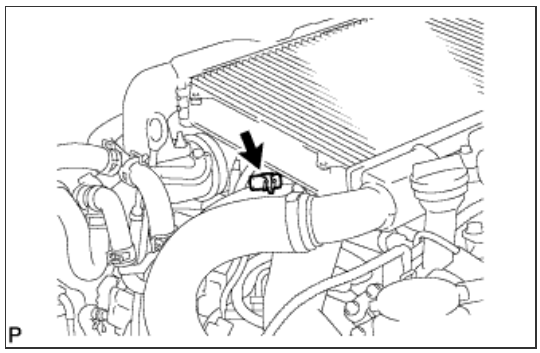


Torque:
2.0 N*m{ 20 kgf*cm , 18 in.*lbf }

NOTICE:

Do not tighten the plug to 5.0 N*m (51 kgf*cm, 44 in.*lbf) or more, as the plug will be damaged.

f. Disconnect the clear hose from the engine air bleed pipe.



g. Install the engine air bleed cap when coolant comes out.

h. Install the radiator reservoir cap.

i. Start the engine.

NOTICE:

Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the FULL line.

j. Maintain an engine speed of 3000 rpm for approximately 10 minutes so that the thermostat opens and air bleeding is performed.

CAUTION:

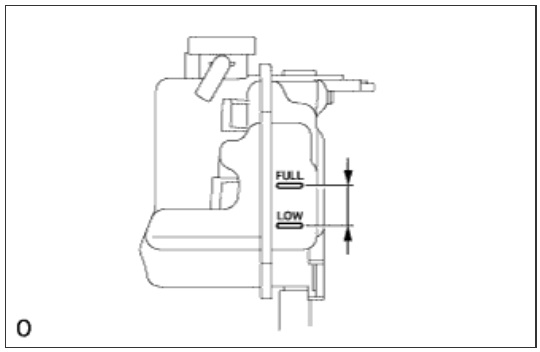
When pressing the radiator hoses:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the radiator fan**

NOTICE:

- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**

HINT:



The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

k. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

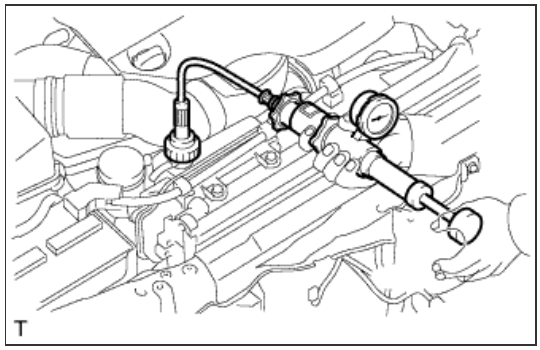
Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

l. Check that the coolant level is between the FULL and LOW lines.
If the coolant level is above the FULL line, drain coolant so that the coolant level is between the FULL and LOW lines.

4. INSPECT FOR ENGINE OIL LEAK

a. Warm up the engine and check for an engine oil leak.

5. INSPECT FOR COOLANT LEAK

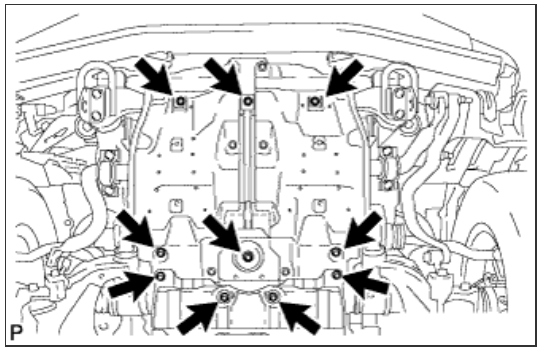


CAUTION:

Do not remove the radiator reservoir cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester to the radiator reservoir.

b. Warm up the engine.



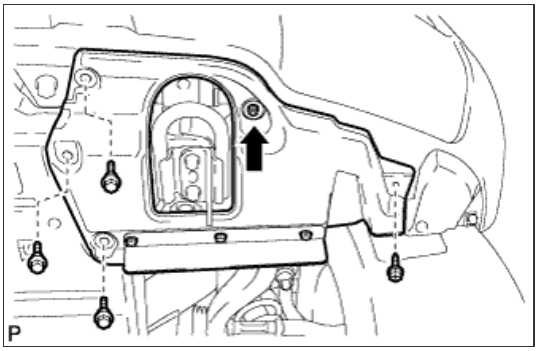
c. Using the radiator cap tester, increase the pressure inside the radiator to 12 kPa (1.3 kgf/cm^2, 17.8 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks.
If no external leaks are found, check the cylinder block and cylinder head.

6. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

7. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

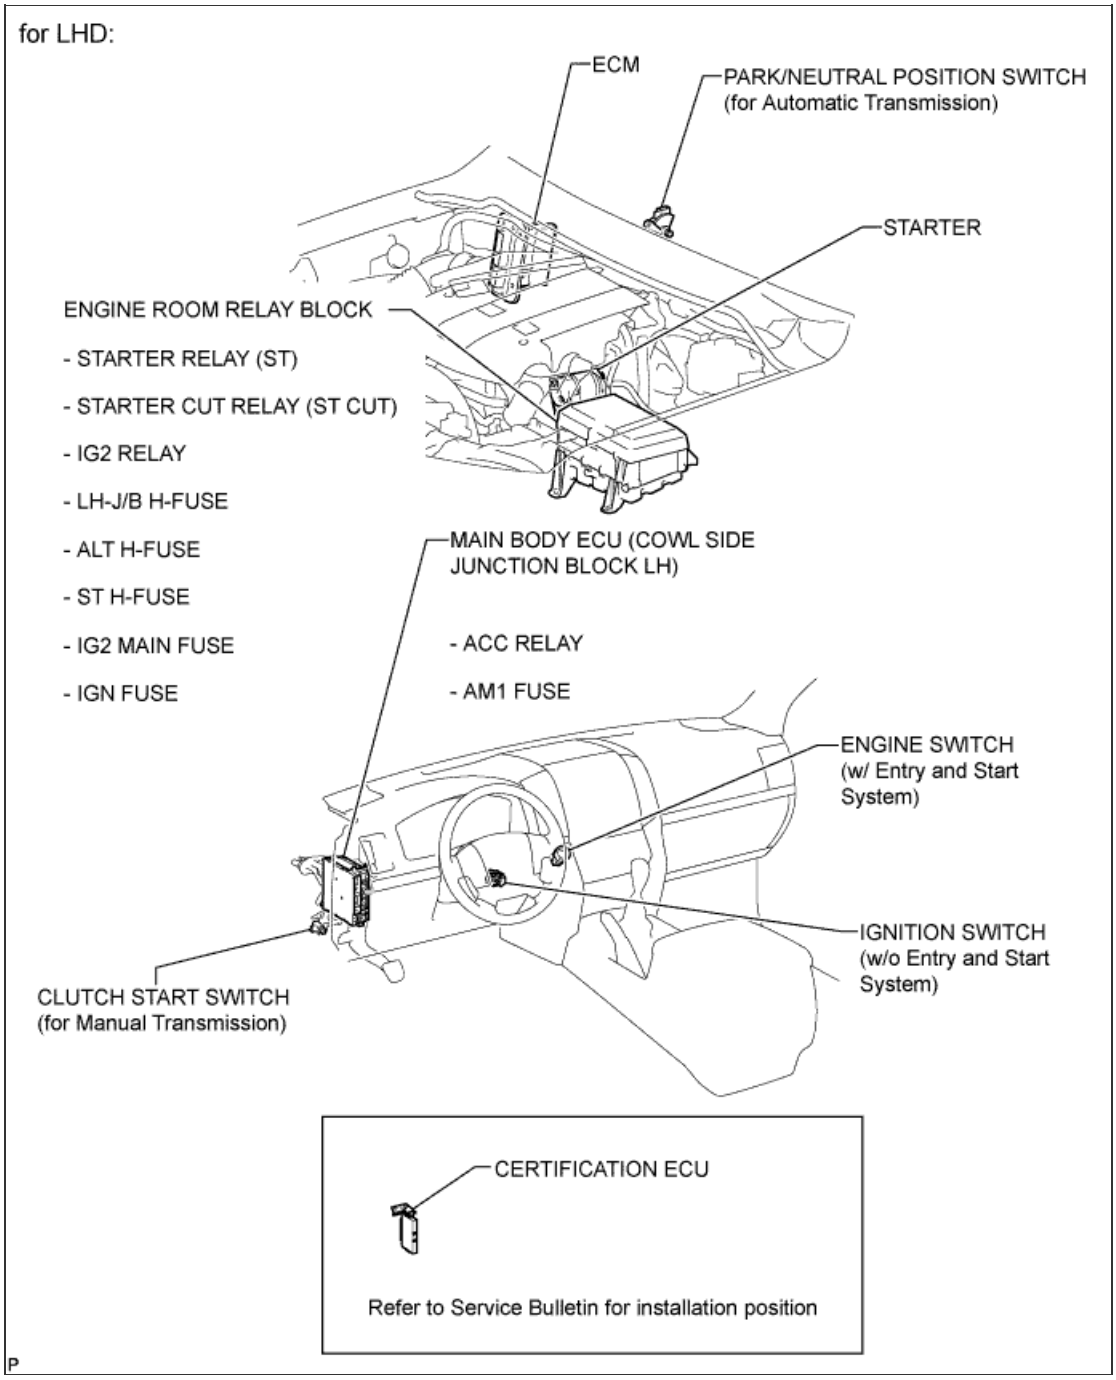
9. CHECK ENGINE OIL LEVEL

a. Warm up the engine, stop the engine and wait 5 minutes. The engine oil level should be between the dipstick low level mark and full level mark.
If low, check for leakage and add oil up to the full level mark.

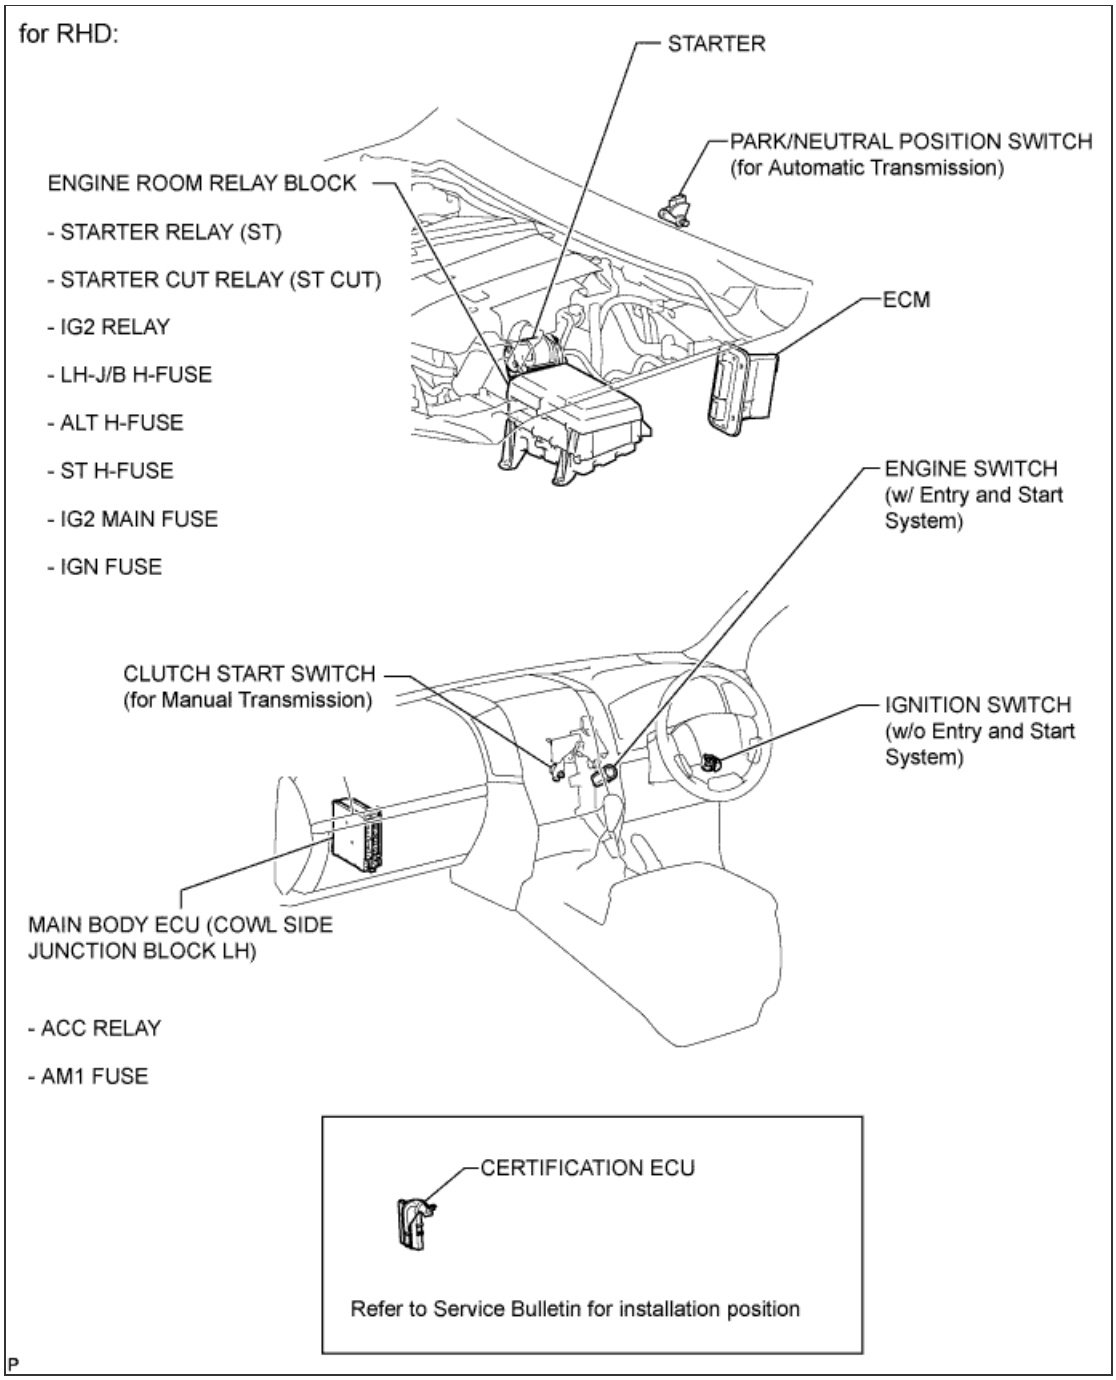
NOTICE:

Do not fill engine oil above the full level mark.

for Preparation Click here

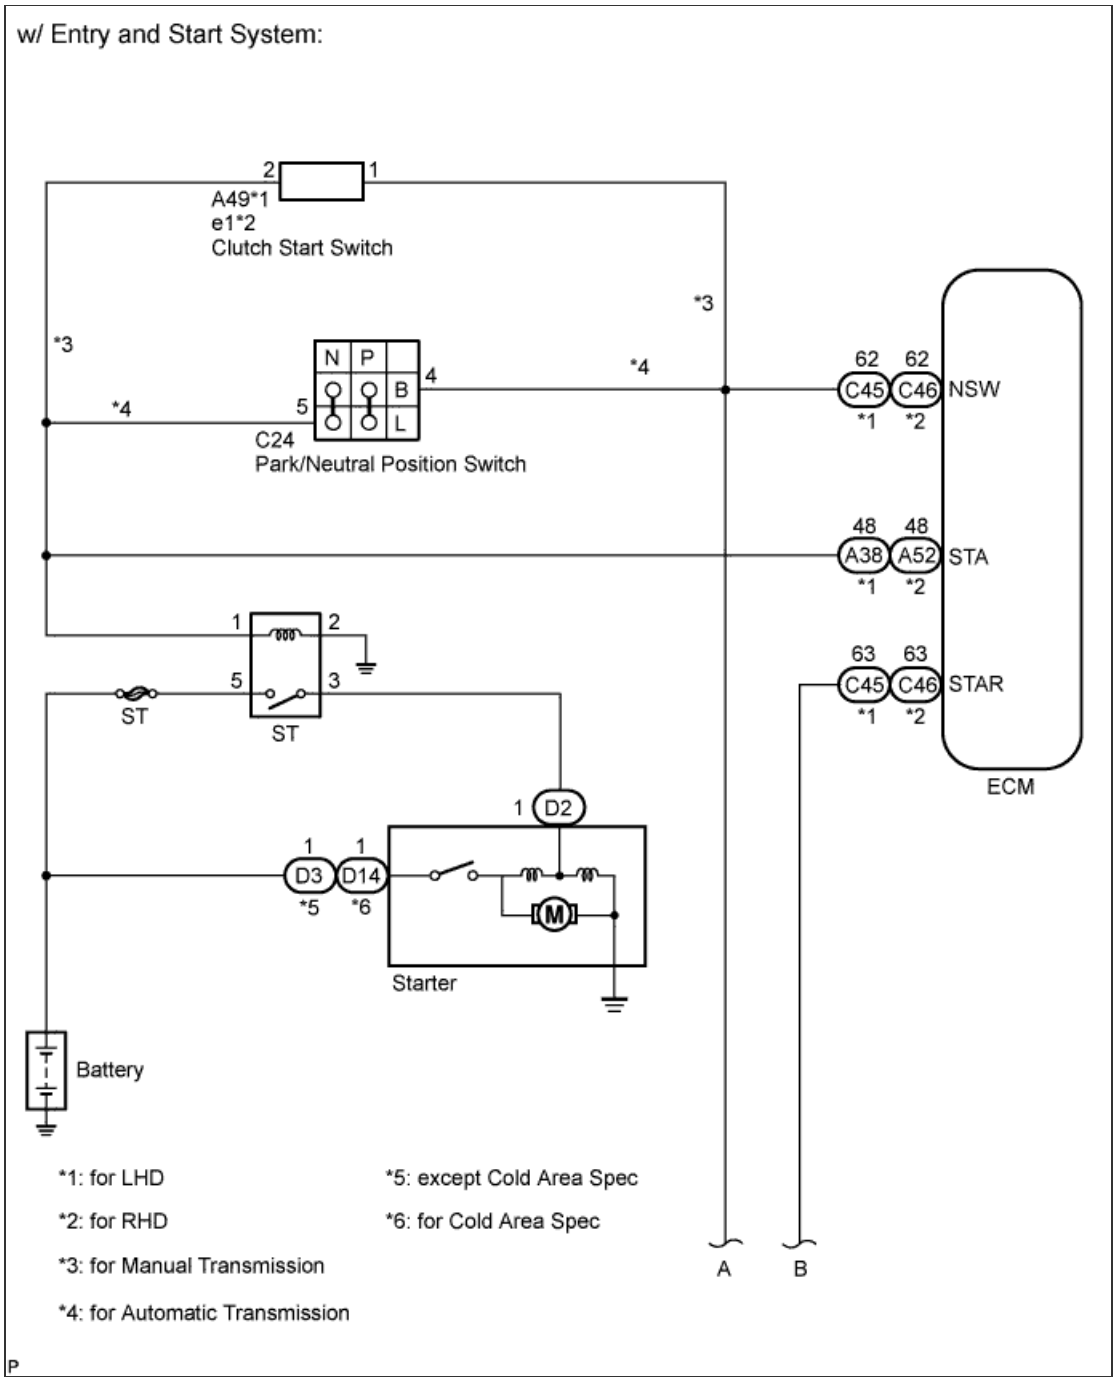


1.IGNITION SWITCH EXPRESSION



HINT:

The type of ignition switch used on this model differs depending on the specifications of the vehicle. The e pressions listed in the table below are used in this section.



E pression	Ignition Switch (Position)	Engine Switch (ondition)
Ignition Switch off	LO	ff
Ignition Switch A		n (A
gnition Switch ON	ON	On (IG)
Engine Start	START	Start

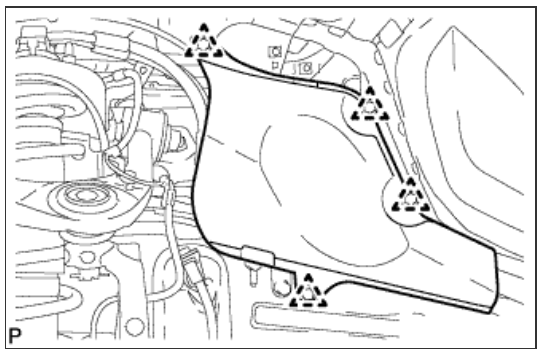
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

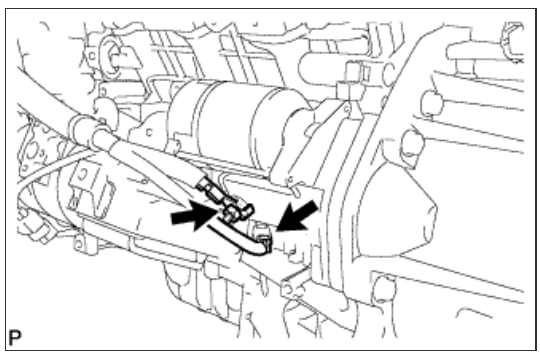


2. REMOVE FRONT FENDER APRON SEAL LH

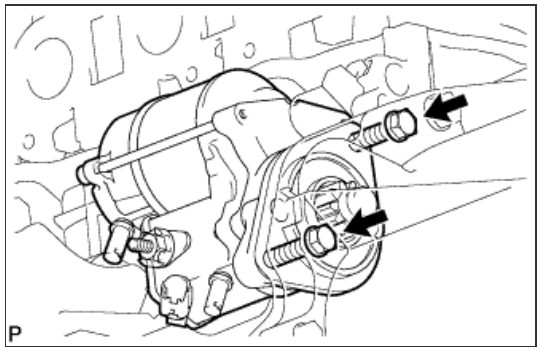
a. Using a clip remover, remove the 4 clips and fender apron seal.

3. REMOVE FRONT FENDER APRON SEAL REAR LH

a. Using a clip remover, remove the 4 clips and fender apron seal.



4. REMOVE STARTER ASSEMBLY



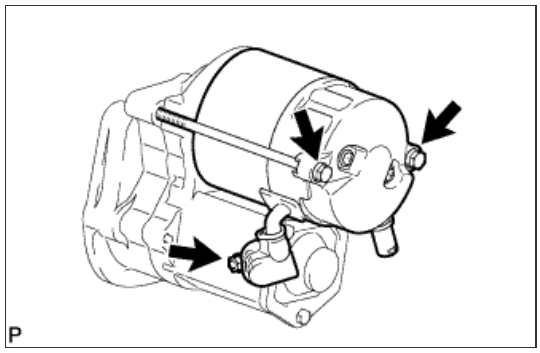
a. Disconnect the terminal cap.

b. Remove the nut and disconnect the starter wire.

c. Disconnect the starter connector.

d. Remove the 2 bolts and starter.

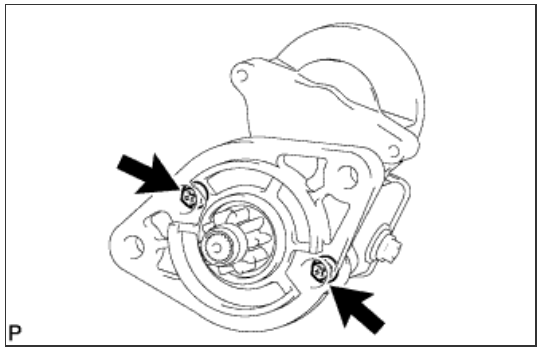
for Preparation Click here



1. REMOVE STARTER YOKE ASSEMBLY

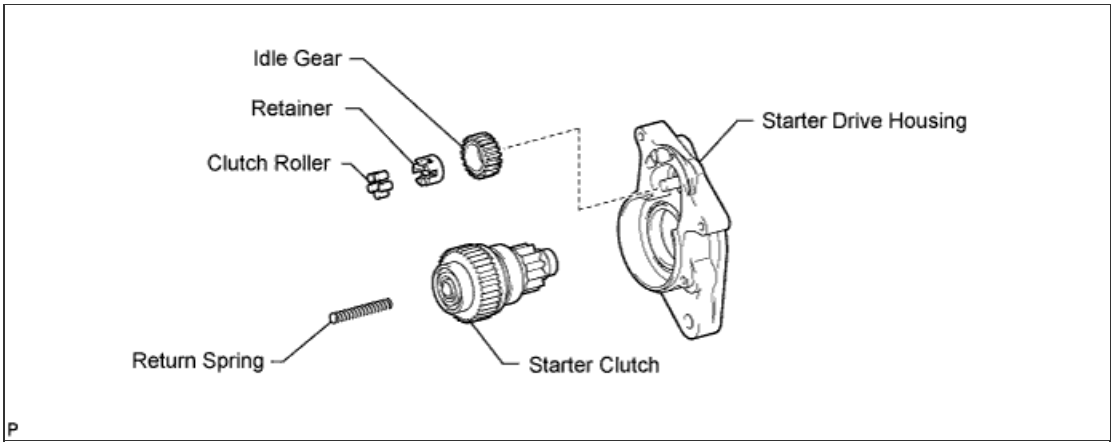
a. Remove the nut and disconnect the lead wire from terminal C.

b. Remove the 2 bolts.

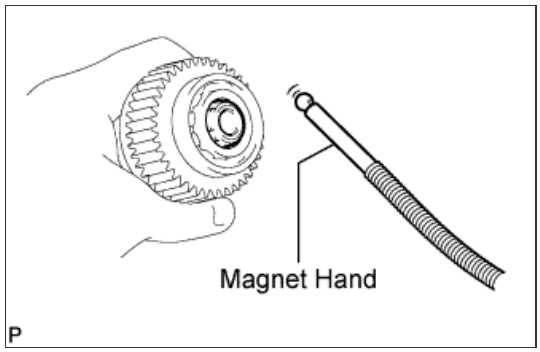


c. Pull out the starter yoke and starter commutator end frame together with the starter armature.

d. Remove the O-ring from the starter yoke.



2. REMOVE MAGNET STARTER SWITCH ASSEMBLY

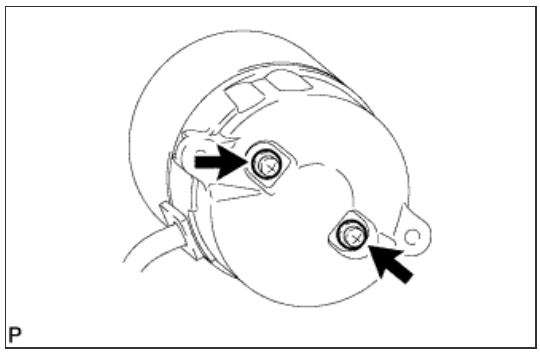


a. Remove the 2 screws and magnet starter switch.

b. Remove the idle gear, retainer, clutch roller, return spring and starter clutch from the starter drive housing.

c. Using a magnet hand, remove the steel ball from the starter clutch hole.

3. REMOVE STARTER BRUSH HOLDER ASSEMBLY



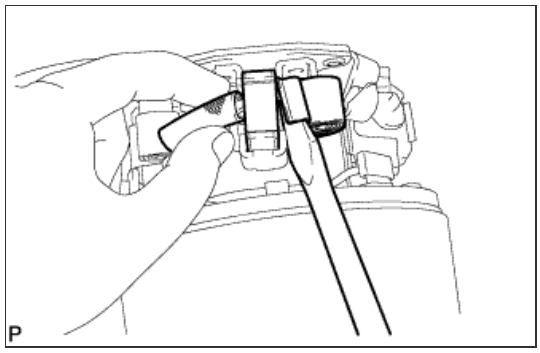
a. Remove the 2 screws and commutator end frame from the starter yoke.

NOTICE:

While holding down the lead wire, remove the starter commutator end frame.

b. Remove the dust protector from the commutator end frame.

c. Remove the O-ring from the starter yoke.



d. Disconnect the 4 brushes from the starter brush holder.

i. Using a screwdriver, hold back the spring.

ii. Disconnect the brush from the brush holder.

e. Remove the brush holder.

4. REMOVE STARTER ARMATURE ASSEMBLY

a. Remove the starter armature from the starter yoke.

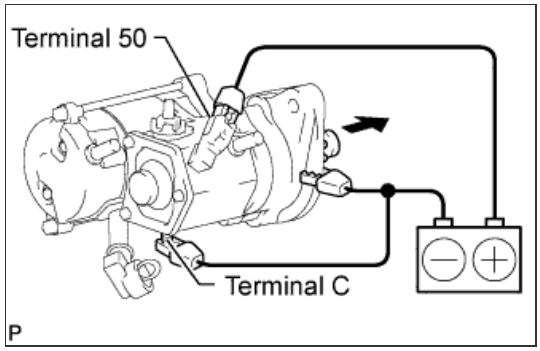
for Preparation Click here

1. INSPECT STARTER ASSEMBLY

CAUTION:

As a large electric current passes through the cable during this inspection, a thick cable must be used. If not, the cable may became hot and cause injury.

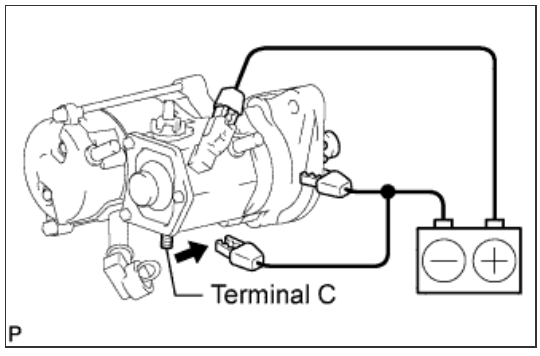
NOTICE:



The following tests must each be performed within 3 to 5 seconds to prevent the coil from burning out.

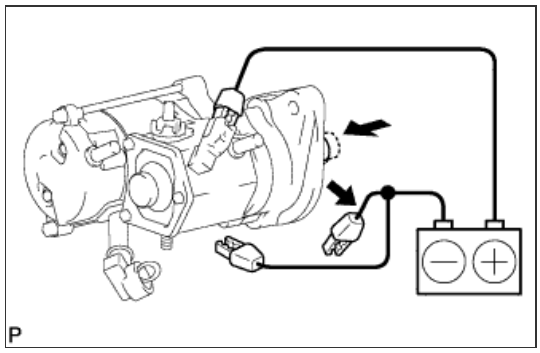
a. Mount the starter in a vise between aluminum plates.

b. Perform a pull-in test.



i. Remove the nut, then disconnect the lead wire from terminal C.

ii. Connect the battery to the magnet starter switch as shown in the illustration. Then check that the clutch pinion gear extends.
If the clutch pinion gear does not move, inspect the magnet starter switch assembly. If the magnet starter switch assembly is not as specified, replace it.



c. Perform a holding test.

i. Disconnect the negative (-) terminal lead from terminal C with the condition specified in the pull-in test above being maintained. Check that the pinion gear remains out.
If the clutch pinion gear returns inward, inspect the magnet starter switch assembly. If the magnet starter switch assembly is not as specified, replace it.

d. Inspect the clutch pinion gear return.

i. Disconnect the negative (-) terminal lead from the starter body. Check that the clutch pinion gear returns inward.
If the clutch pinion gear does not return inward, inspect the magnet starter switch assembly. If the magnet starter switch assembly is not as specified, replace it.

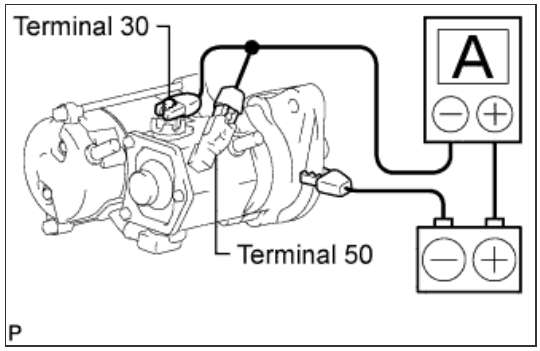
e. Perform an operation test without load.

.

i. Connect the lead wire to terminal C with the nut.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

ii. Connect the battery and an ammeter to the starter as shown in the illustration.



iii. Check that the starter rotates smoothly and steadily while the pinion gear is extended. Then measure the current.

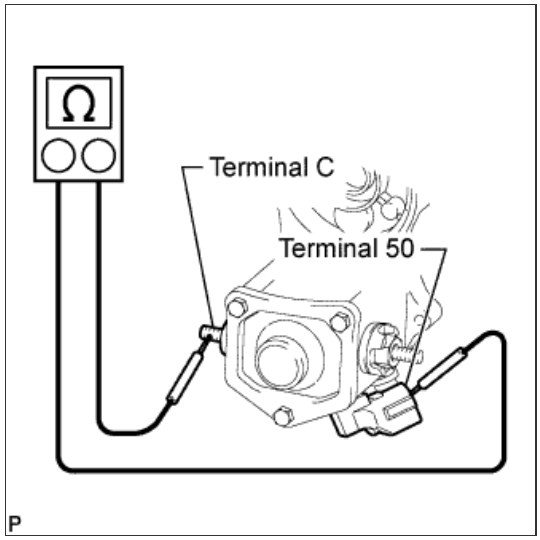
Specified current:
90 A or less at 11.5 V

If the result is not as specified, inspect the starter assembly.

HINT:

Inspect the starter brush holder assembly, starter yoke assembly and starter armature assembly. If there is a malfunction, replace the part and perform this test again.

2. INSPECT MAGNET STARTER SWITCH ASSEMBLY



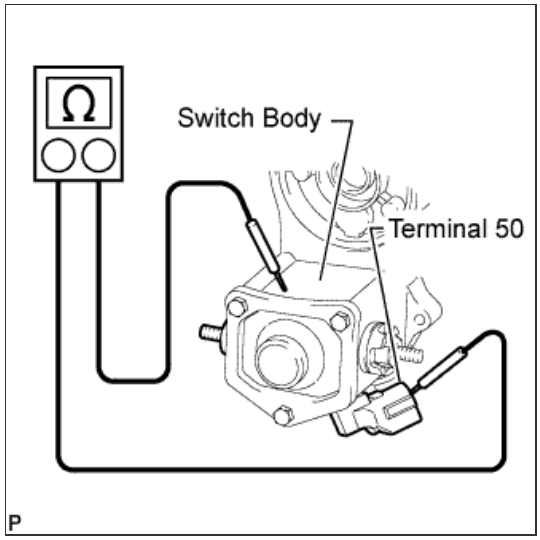
a. Inspect the pull-in coil.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Terminal C	Always	Below 1 Ω

If the result is not as specified, replace the magnet starter switch assembly.



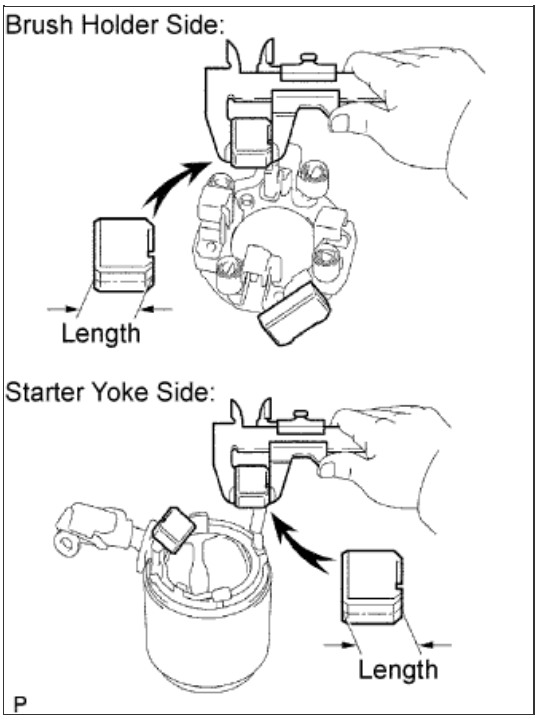
b. Inspect the holding coil.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Switch Body	Always	Below 2 Ω

If the result is not as specified, replace the magnet starter switch assembly.



3. INSPECT BRUSH

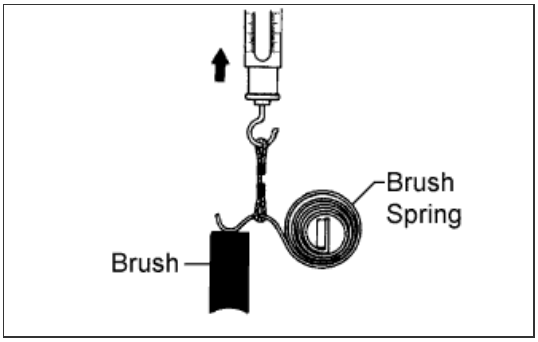
a. Using a vernier caliper, measure the brush length.

Standard length:
15.5 mm (0.610 in.)

Minimum length:
8.5 mm (0.335 in.)

If the length is less than the minimum, replace the starter brush holder assembly and starter yoke assembly.

4. INSPECT STARTER BRUSH HOLDER ASSEMBLY



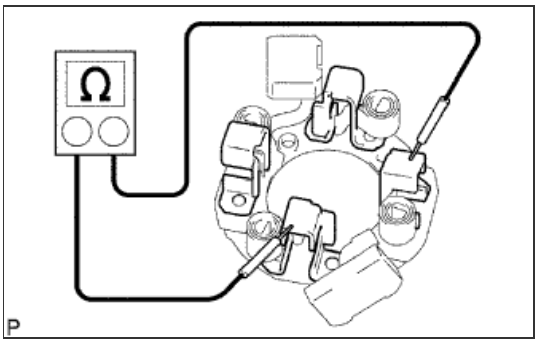
a. Check the brush spring load.

i. Take a pull scale reading immediately after the brush spring separates from the brush.

Standard spring load:
18 to 24 N (1.8 to 2.4 kgf, 4.0 to 5.3 lbf)

Minimum spring load:
12 N (1 kgf, 2.7 lbf)

If the spring load is less than the minimum, replace the starter brush holder assembly.

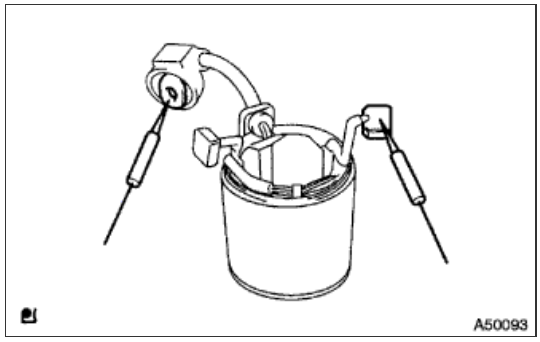


b. Inspect the insulation.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive (+) Brush Holder - Negative (-) Brush Holder	Always	10 KΩ or higher

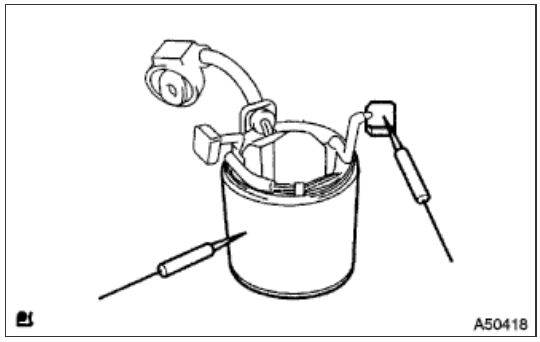


If the result is not as specified, replace the starter brush holder assembly.

5. INSPECT STARTER YOKE ASSEMBLY

a. Inspect the field coil for an open circuit.

i. Measure the resistance according to the value(s) in the table below.



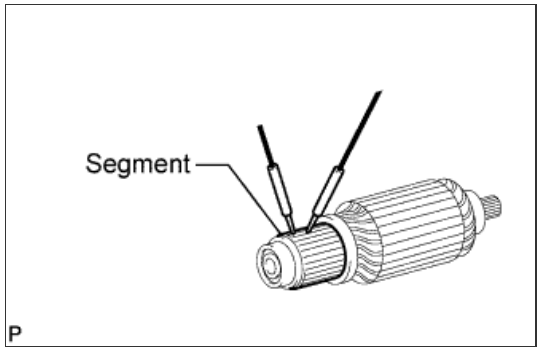
Standard Resistance:

Tester Connection	Condition	Specified Condition
Lead Wire - Brush	Always	Below 1 Ω

If the result is not as specified, replace the starter yoke assembly.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
Starter Yoke Body - Brush	Always	10 kΩ or higher

If the result is not as specified, replace the starter yoke assembly.

6. INSPECT STARTER ARMATURE ASSEMBLY

a. Check the commutator for dirt and/or burns on the surface.
If the surface is dirty or burnt, correct it with sandpaper (No. 400) or a lathe.

b. Inspect the commutator for an open circuit.

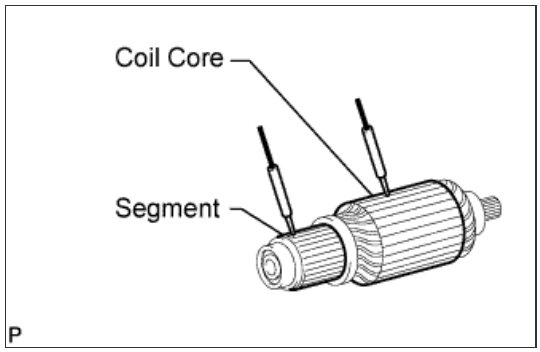
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Segment - Segment	Always	Below 1 Ω

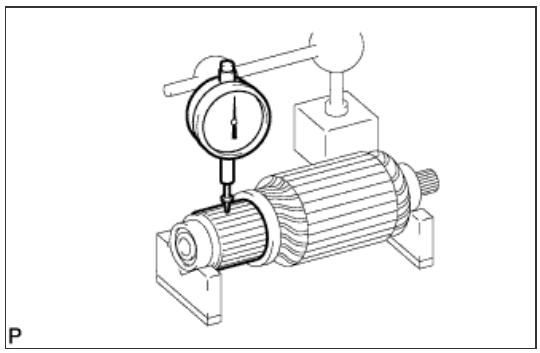
If the result is not as specified, replace the starter armature assembly.

c. Inspect the commutator for a short circuit.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
Segment - Coil	Always	10 kΩ or higher

Core

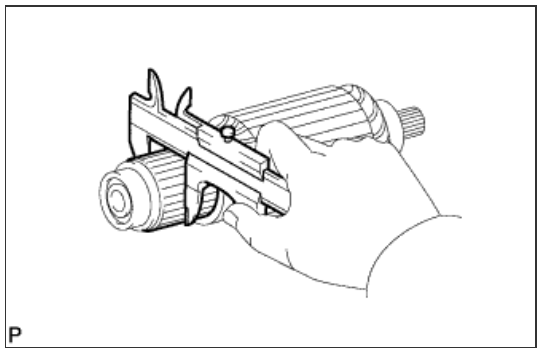
If the result is not as specified, replace the starter armature assembly.

d. Check the commutator circle runout.

i. Place the commutator on V-blocks.

ii. Using a dial indicator, measure the circle runout.

Maximum runout:
0.05 mm (0.00197 in.)



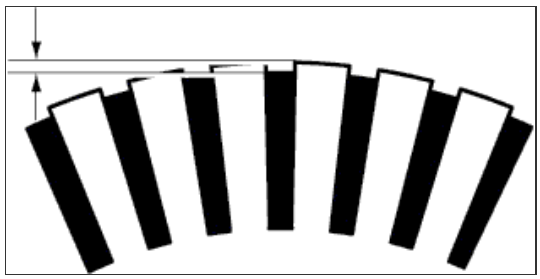
If the circle runout is more than the maximum, replace the starter armature assembly.

e. Using a vernier caliper, measure the commutator diameter.

Standard diameter:
30.0 mm (1.18 in.)

Minimum diameter:
29.0 mm (1.14 in.)

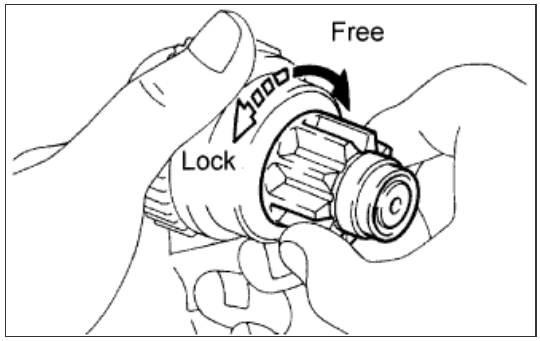
If the diameter is less than the minimum, replace the starter armature assembly.



f. Using a vernier caliper, measure the undercut depth of the commutator.

Standard undercut depth:
0.6 mm (0.0236 in.)

Minimum undercut depth:
0.2 mm (0.00787 in.)



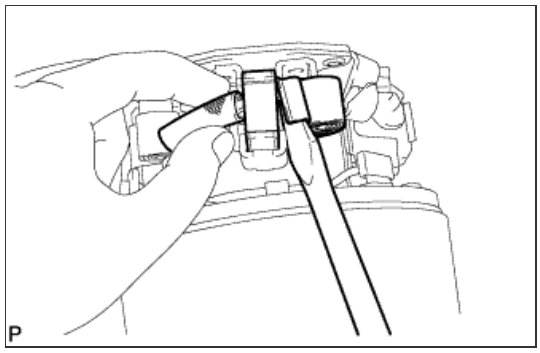
If the undercut depth is less than the minimum, replace the starter armature assembly.

7. INSPECT STARTER CLUTCH SUB-ASSEMBLY

a. Rotate the pinion gear clockwise and check that it turns freely. Try to rotate the pinion gear counterclockwise and check that it locks.
If the result is not as specified, replace the starter clutch sub-assembly.

b. Turn the pinion gear by hand while applying inward force and check the movement of the bearing.
If resistance is felt or the bearing sticks, replace the starter clutch sub-assembly.

for Preparation Click here



1. INSTALL STARTER ARMATURE ASSEMBLY

a. Install the starter armature to the starter yoke.

2. INSTALL STARTER BRUSH HOLDER ASSEMBLY

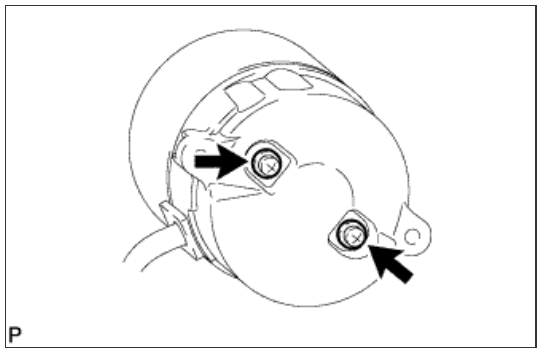
a. Install the brush holder.

b. Connect the 4 brushes to the starter brush holder.

i. Using a screwdriver, hold back the spring.

ii. Connect the brush to the brush holder.

NOTICE:



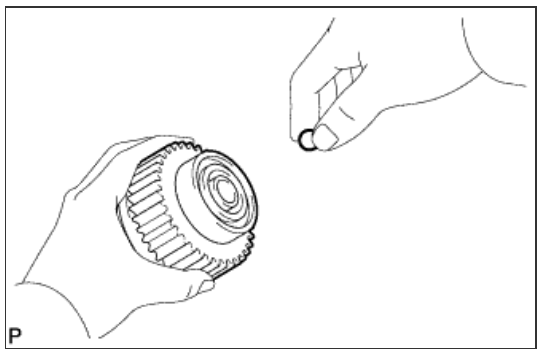
Check that the positive (lead wire are not grounded.

c. Place a new O-ring in position on the commutator end rame.

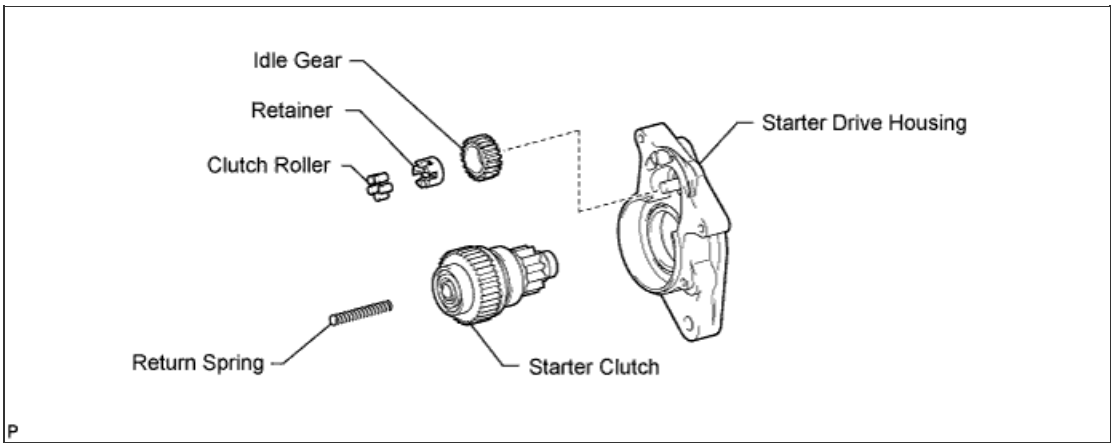
d. Install a new dust protector to the commutator end rame.

e. Install the commutator end rame with the 2 screws.

Torque:
1.5 N*m{ 15 kgf*cm , 13 in.*lbf }



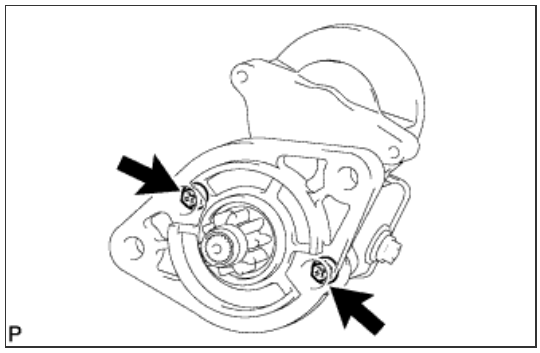
3. INSTALL MAGNET STARTER SWITCH ASSEMBLY



a. Apply high temperature grease to the idle gear, steel ball, return spring, clutch roller and retainer.

b. Insert the steel ball into the starter clutch sha t hole.

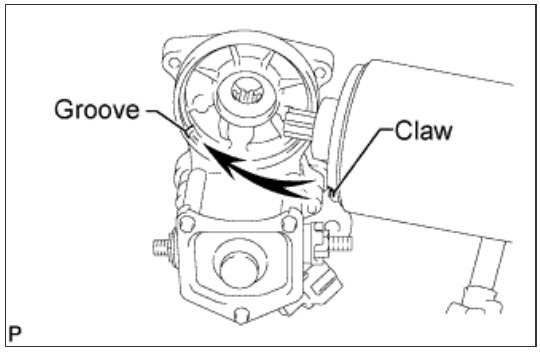
c. Insert the return spring into the starter clutch sha t hole.



d. Install the starter clutch, idle gear, retainer and clutch roller to the starter drive housing.

e. Install the starter drive housing to the magnet starter switch with the 2 screws.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

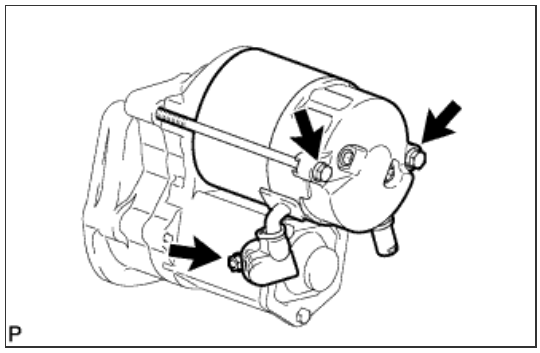


4. INSTALL STARTER YOKE ASSEMBLY

a. Install a new O-ring to the groove o the starter yoke.

b. Align the claw o the starter yoke with the groove o the starter switch.

c. Install the starter yoke to the starter switch.

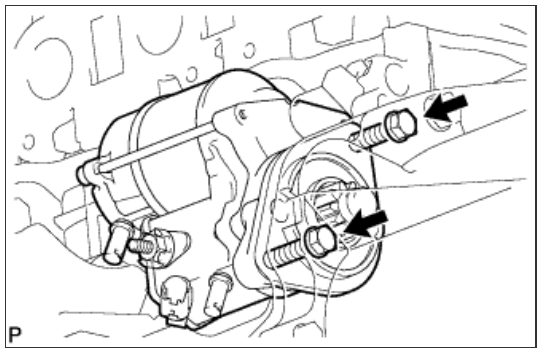


d. Install the 2 bolts.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

e. Connect the lead wire to terminal C with the nut.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

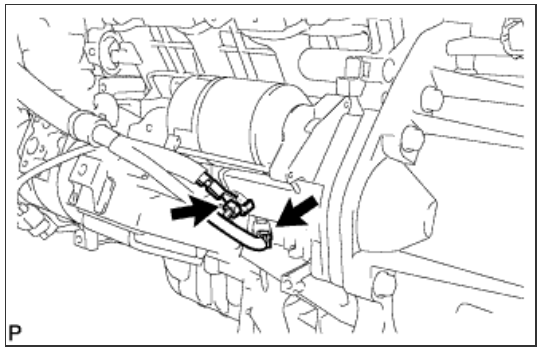


for Preparation Click here

1. INSTALL STARTER ASSEMBLY

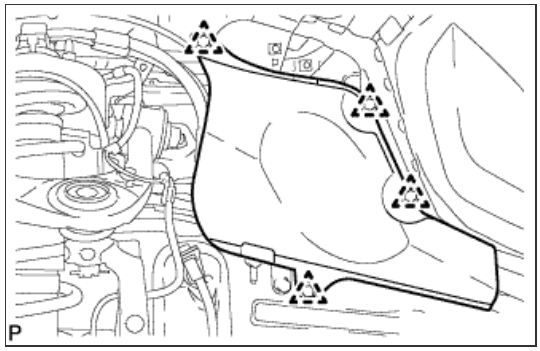
a. Install the starter with the 2 bolts.

Torque:
58 N*m{ 591 kgf*cm , 43 ft.*lbf }



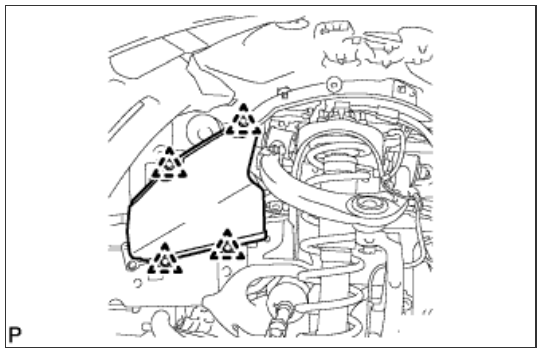
b. Connect the starter connector.

c. Connect the starter wire with the nut.



Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

d. Connect the terminal cap.

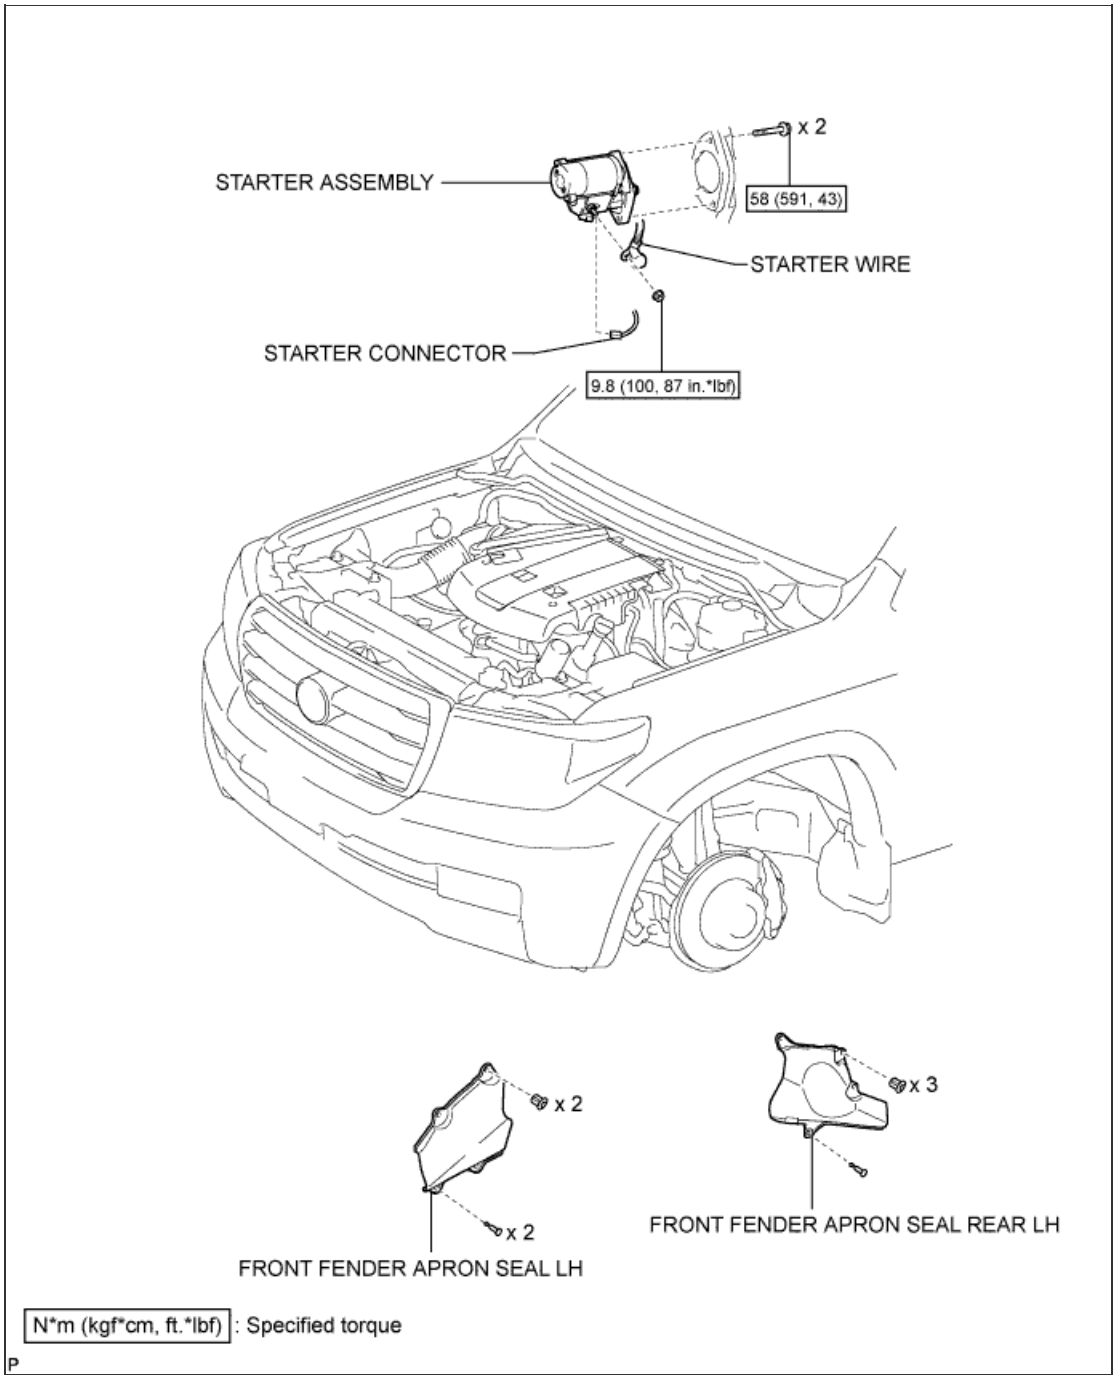


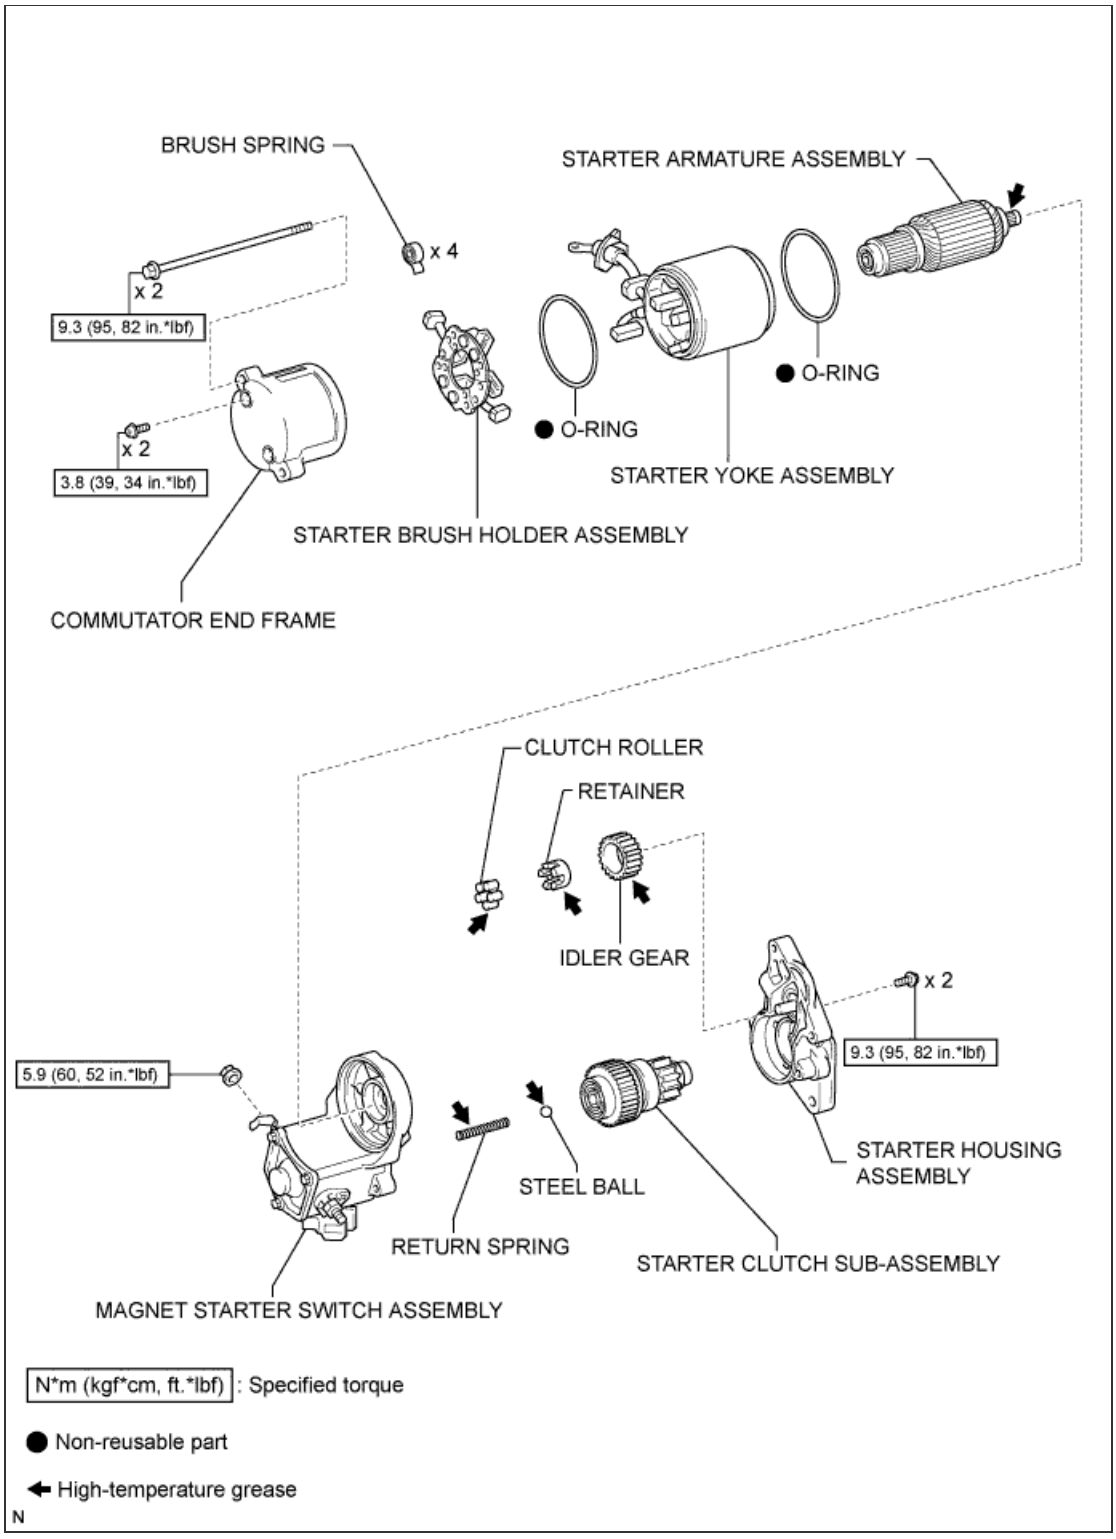
2. INSTALL FRONT FENDER APRON SEAL REAR LH

a. Install the fender apron seal with the 4 clips.

3. INSTALL FRONT FENDER APRON SEAL LH

a. Install the fender apron seal with the 4 clips.





4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

- hø disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

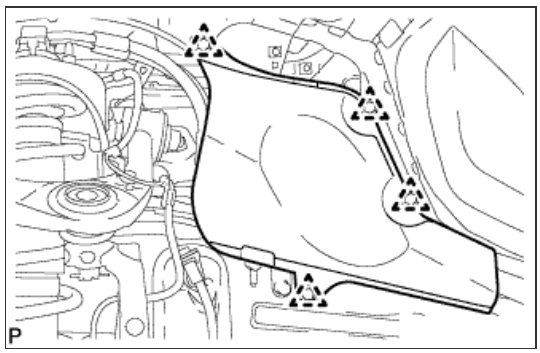
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

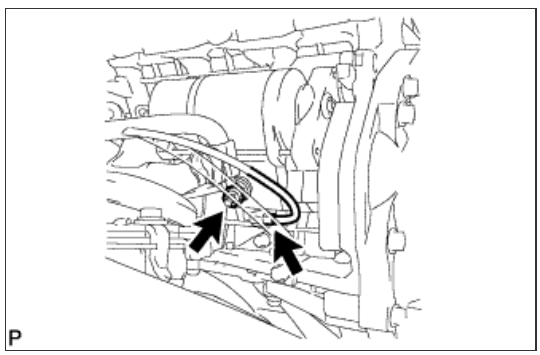


2. REMOVE FRONT FENDER APRON SEAL LH

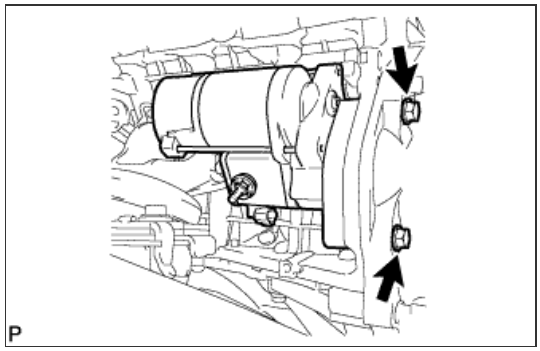
a. Using a clip remover, remove the 4 clips and fender apron seal.

3. REMOVE FRONT FENDER APRON SEAL REAR LH

a. Using a clip remover, remove the 4 clips and fender apron seal.



4. REMOVE STARTER ASSEMBLY



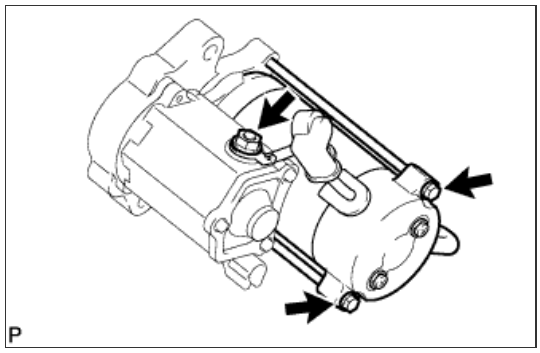
a. Disconnect the terminal cap.

b. Remove the nut and disconnect the starter wire.

c. Disconnect the starter connector.

d. Remove the 2 bolts and starter.

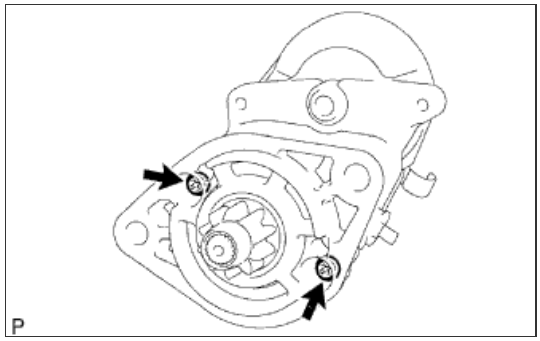
for Preparation Click here



1. REMOVE STARTER YOKE ASSEMBLY

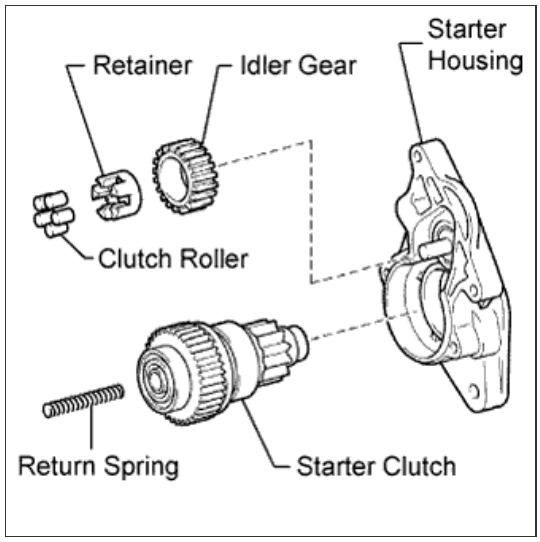
a. Remove the nut and disconnect the lead wire from terminal C.

b. Remove the 2 through bolts.

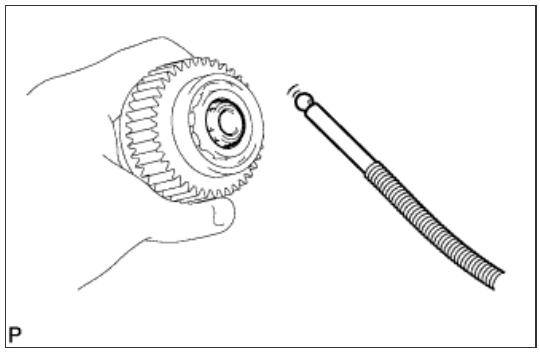


c. Pull out the starter yoke and the armature together.

d. Remove the O-ring from the starter yoke.

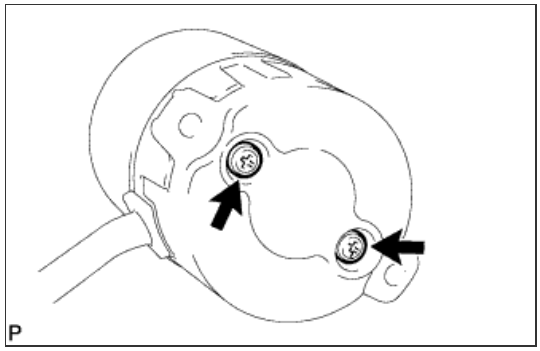


2. REMOVE MAGNET STARTER SWITCH ASSEMBLY



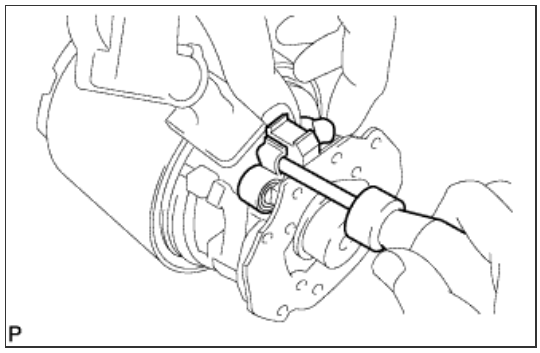
a. Remove the 2 screws and magnet starter switch.

b. Remove the return spring, idler gear, clutch roller, retainer and starter clutch from the starter housing.



c. Using a magnetic finger, remove the steel ball from the clutch shaft hole.

3. REMOVE STARTER BRUSH HOLDER ASSEMBLY



a. Remove the 2 screws and end frame from the starter yoke.

b. Remove the O-ring from the starter yoke.

c. Using a screwdriver, hold the spring back and disconnect the 4 brushes from the brush holder.

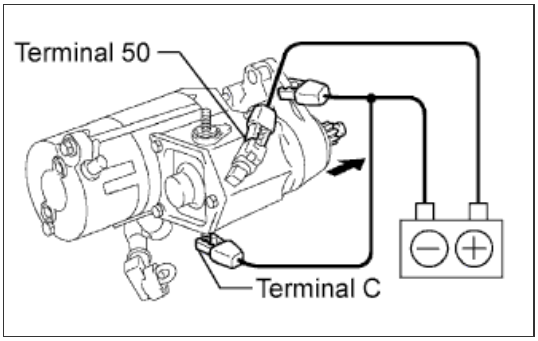
d. Remove the brush holder from the armature.

4. REMOVE STARTER ARMATURE ASSEMBLY

a. Remove the starter armature from the starter yoke.

for Preparation Click here

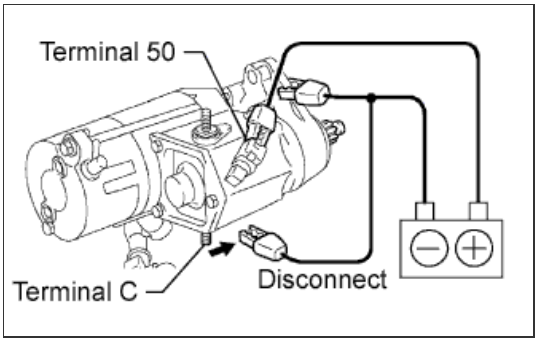
NOTICE:



The following tests must be done within 3 to 5 seconds to prevent the coil from burning out.

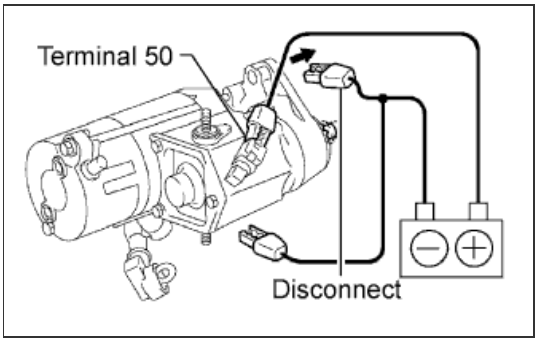
1. INSPECT STARTER ASSEMBLY

a. Perform pull-in test.



i. Remove the nut, then disconnect the lead wire from terminal C.

ii. Connect the battery to the starter as shown in the illustration. Check that the clutch pinion gear moves outward.
If the clutch pinion gear does not move, replace the magnet starter switch assembly.



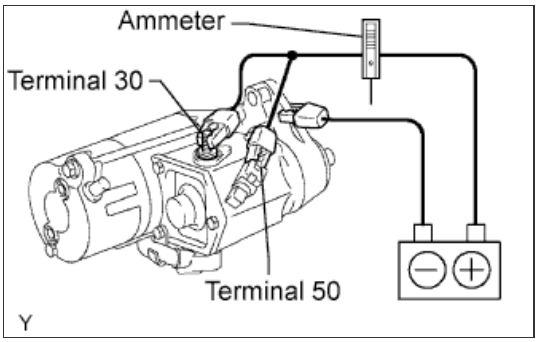
b. Perform holding test.

i. When the battery is connected as above with the clutch pinion gear out, disconnect the negative (-) lead from terminal C. Check that the pinion gear remains out.
If the clutch pinion gear returns inward, replace the magnet starter switch assembly.

c. Inspect clutch pinion gear return.

i. Disconnect the negative (-) lead from the starter body. Check that the clutch pinion gear returns inward.
If the clutch pinion gear does not return inward, replace the magnet starter switch assembly.

d. Perform the operation test without load.



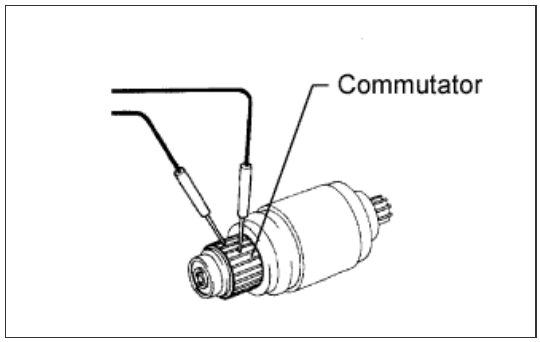
i. Connect the lead wire to terminal C with the nut.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

ii. Grip the starter in a vise.

iii. Connect the battery and an ammeter to the starter as shown.

iv. Check that the starter rotates smoothly and steadily with the clutch pinion gear extended.



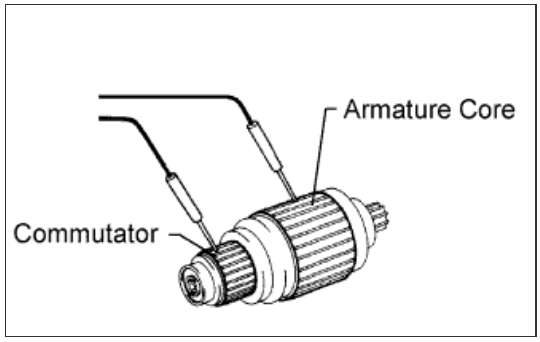
v. Check that the ammeter reads the specified current.

Standard current:
100 A or less at 11.5 V

If the result is not as specified, replace the starter assembly.

2. INSPECT STARTER ARMATURE ASSEMBLY

a. Inspect the commutator for an open circuit.



i. Measure the resistance according to the value(s) in the table below.

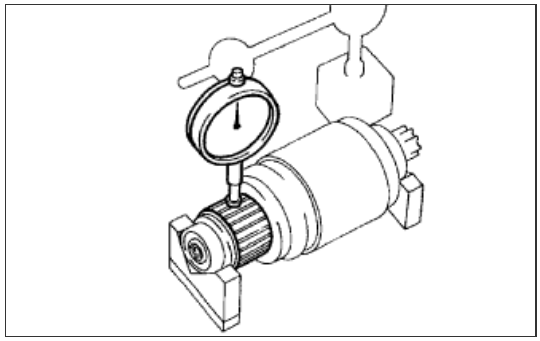
Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator	Always	Below 1 Ω

If the result is not as specified, replace the starter armature assembly.

b. Inspect the commutator for a short circuit.

i. Measure the resistance according to the value(s) in the table below.



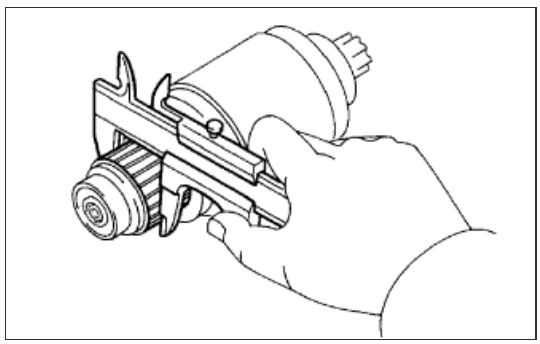
Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator - Armature	Always	10 kΩ or higher

If the result is not as specified, replace the starter armature assembly.

c. Check the commutator surface for dirt and burns.
If the surface is dirty or burnt, correct it with sandpaper (#400) or a lathe.

d. Inspect the commutator circle runout.



i. Place the commutator on V-blocks.

ii. Using a dial indicator, measure the circle runout.

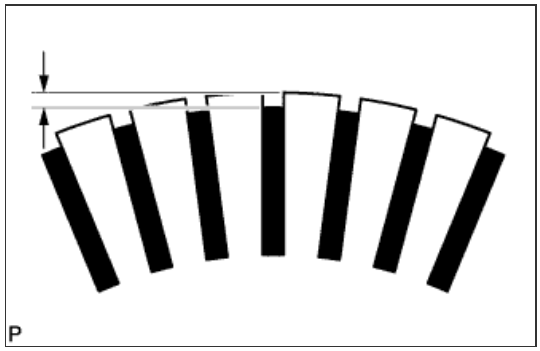
Maximum circle runout:
0.05 mm (0.00197 in.)

If the runout is more than the maximum, correct it with sandpaper (#400) or replace the starter armature assembly.

e. Using a vernier caliper, measure the commutator diameter.

Standard diameter:
35.0 mm (1.38 in.)

Minimum diameter:
34.0 mm (1.34 in.)



If the diameter is less than the minimum, replace the starter armature assembly.

f. Measure the undercut depth of the commutator.

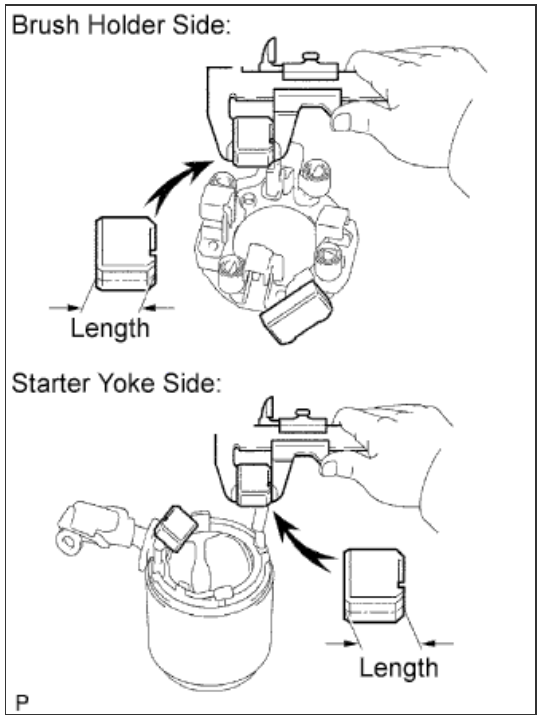
Standard undercut depth:
0.7 mm (0.0276 in.)

Minimum undercut depth:
0.2 mm (0.00787 in.)

If the undercut depth is less than the minimum, increase the depth using a hacksaw blade.

g. Inspect the bearings.

i. Check that the bearing rotates smoothly.



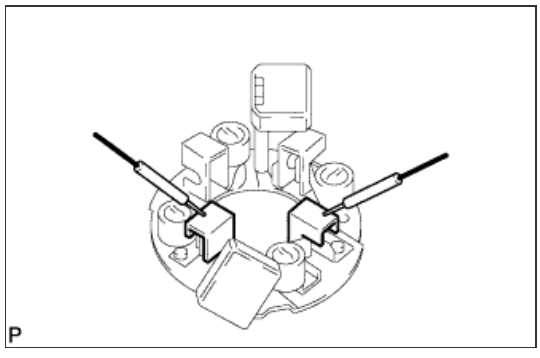
3. INSPECT BRUSH

a. Using a vernier caliper, measure the brush length.

Standard brush length:
15.0 mm (0.591 in.)

Minimum brush length:
9.0 mm (0.354 in.)

If the length is less than the minimum, replace the starter brush holder assembly and starter yoke assembly.



4. INSPECT STARTER BRUSH HOL ER ASSEMBLY

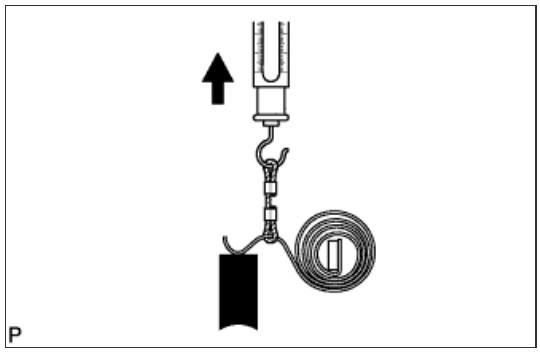
a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive brush holder - Negative brush holder	Always	10 kΩ or higher

If the result is not as specified, replace the starter brush holder assembly.

b. Inspect the load of the brush spring.



i. Take the pull scale reading immediately after the brush spring

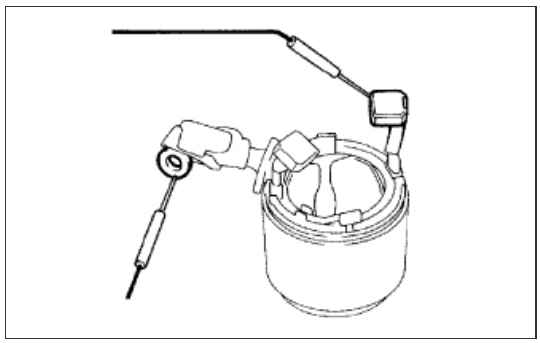
separates from the brush.

Standard spring installed load:
21.5 to 27.5 N (2.2 to 2.8 kgf, 4.8 to 6.2 lbf)

Minimum spring installed load:
12.7 N (1.3 kgf, 2.9 lbf)

If the spring load is less than the minimum, replace the starter brush holder assembly.

5. INSPECT STARTER YOKE ASSEMBLY



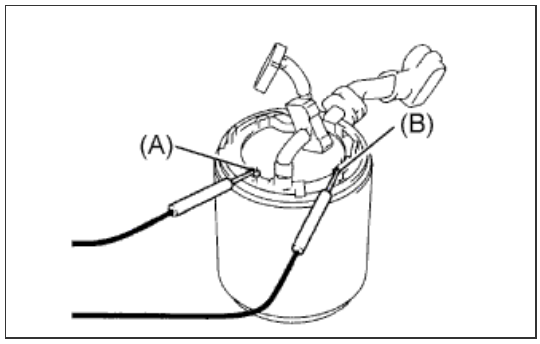
a. Inspect for an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

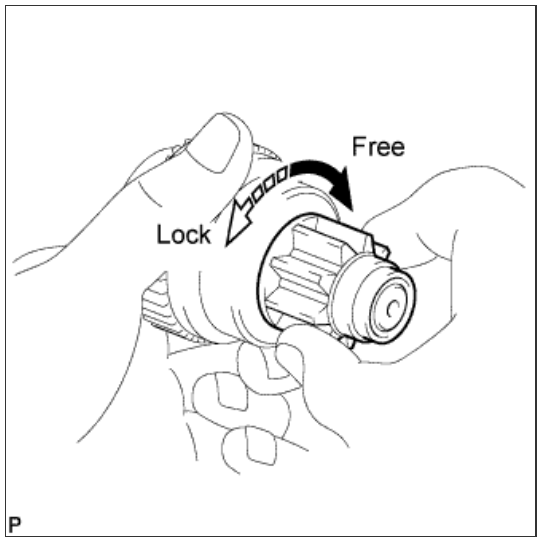
Tester Connection	Condition	Specified Condition
Terminal C wire - Brush	Always	Below 1 Ω

If the result is not as specified, replace the starter yoke assembly.



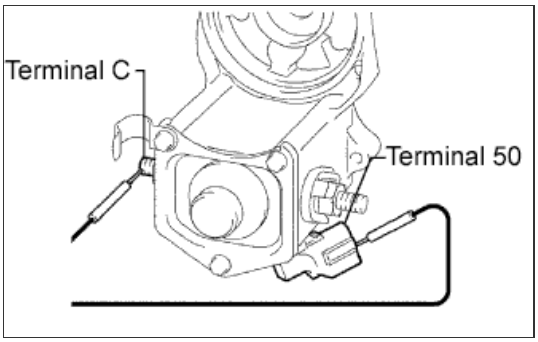
ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester connection	Condition	Specified Condition
Shunt coil terminal (A) - Shunt coil terminal (B)	20°C (68°F)	1.5 to 1.9 Ω

If the result is not as specified, replace the starter yoke assembly.

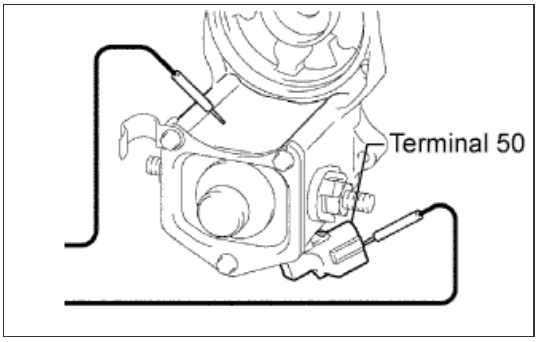


6. INSPECT STARTER CLUTCH SUB-ASSEMBLY

a. Check that the starter clutch cannot be rotated counterclockwise, and can be rotated clockwise.
If the starter clutch is not as specified, replace the starter clutch sub-assembly.

7. INSPECT MA NET STARTER SWITCH ASSEMBLY

a. Inspect the pull-in coil.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminals 50 - Terminal C	Always	Below 1 Ω

If the result is not as specified, replace the magnet starter switch assembly.

b. Inspect the holding coil.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Switch body	Always	Below 2 Ω

If the result is not as specified, replace the magnet starter switch assembly.

for Preparation Click here

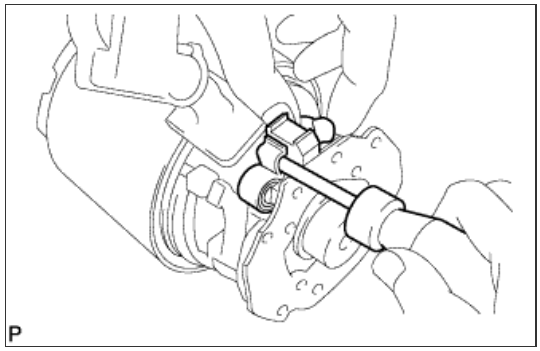
HINT:

Use high temperature-resistant grease to lubricate the bearings and sliding parts when assembling the starter.

1. INSTALL STARTER ARMATURE ASSEMBLY

a. Apply high-temperature grease to the bearings, and install it to the starter yoke.

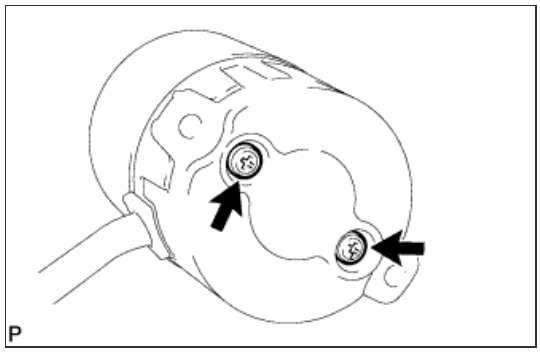
2. INSTALL STARTER BRUSH HOLDER ASSEMBLY



a. Place the brush holder on the armature.

b. Using a screwdriver, connect the brushes.

NOTICE:

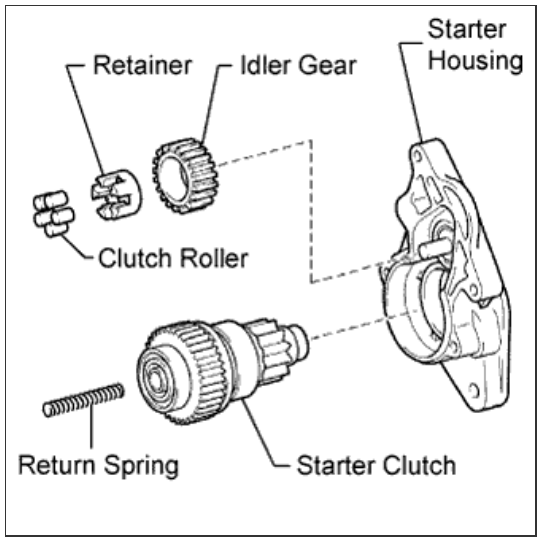


Check that the positive (lead wires are not grounded.

c. Install a new O-ring to the groove o the starter yoke.

d. Install the end rame with the 2 screws.

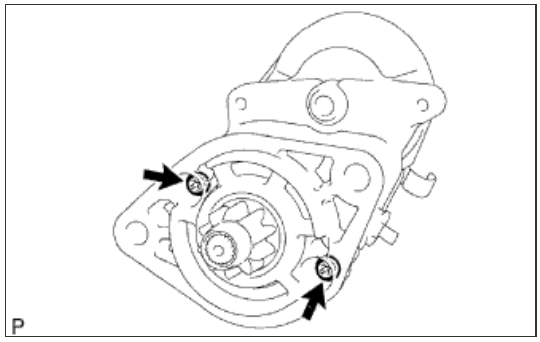
Torque:
3.8 N*m{ 39 kgf*cm , 34 in.*lbf }



3. INSTALL MAGNET STARTER SWITCH ASSEMBLY

a. Apply high-temperature grease to the steel ball and install it to the clutch sha t hole.

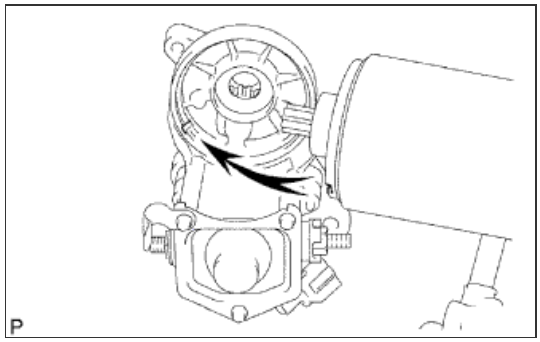
b. Apply high-temperature grease to the return spring, clutch roller, retainer and idler gear.



c. Insert the return spring into the magnet starter switch hole.

d. Install the starter clutch, idler gear, retainer and clutch roller to the starter housing.

e. Install the starter housing to the magnet starter switch with the 2 screws.

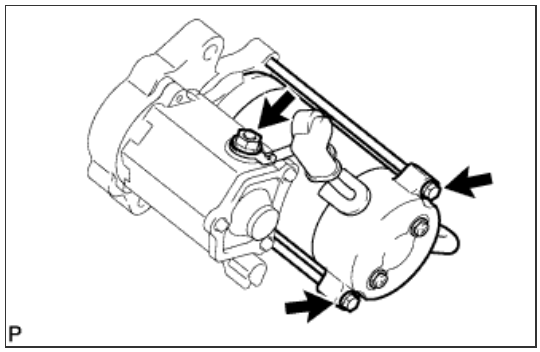


Torque:
9.3 N*m{ 95 kgf*cm , 82 in.*lbf }

4. INSTALL STARTER YOKE ASSEMBLY

a. Install a new O-ring to the groove o the starter yoke.

b. Align the key o the starter yoke with the groove o the magnet starter switch.

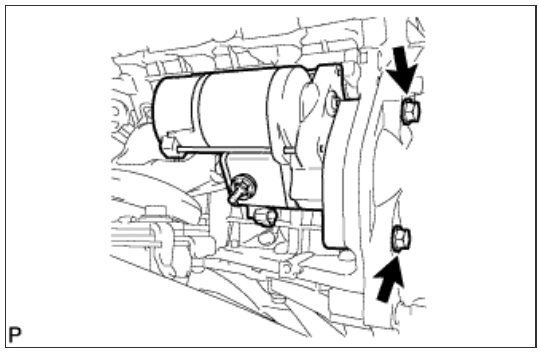


c. Install the starter yoke and armature with the 2 bolts.

Torque:
9.3 N*m{ 95 kgf*cm , 82 in.*lbf }

d. Connect the lead wire to the magnet switch terminal with the nut.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

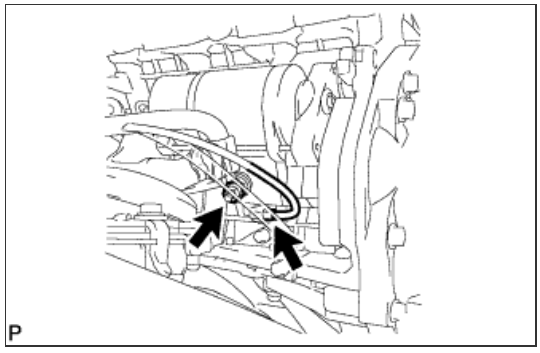


for Preparation Click here

1. INSTALL STARTER ASSEMBLY

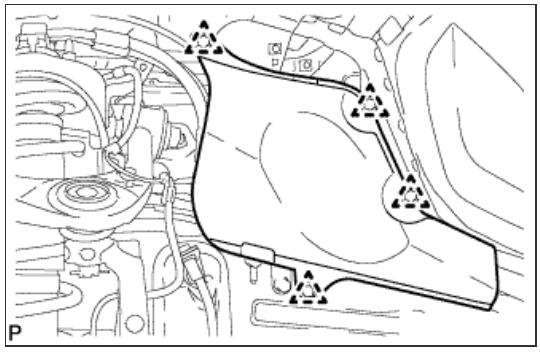
a. Install the starter with the 2 bolts.

Torque:
58 N*m{ 591 kgf*cm , 43 ft.*lbf }



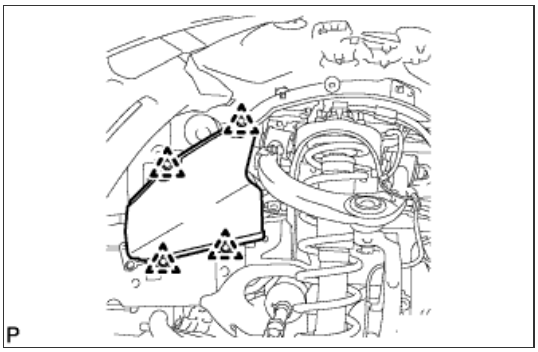
b. Connect the starter connector.

c. Connect the starter wire with the nut.



Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

d. Connect the terminal cap.

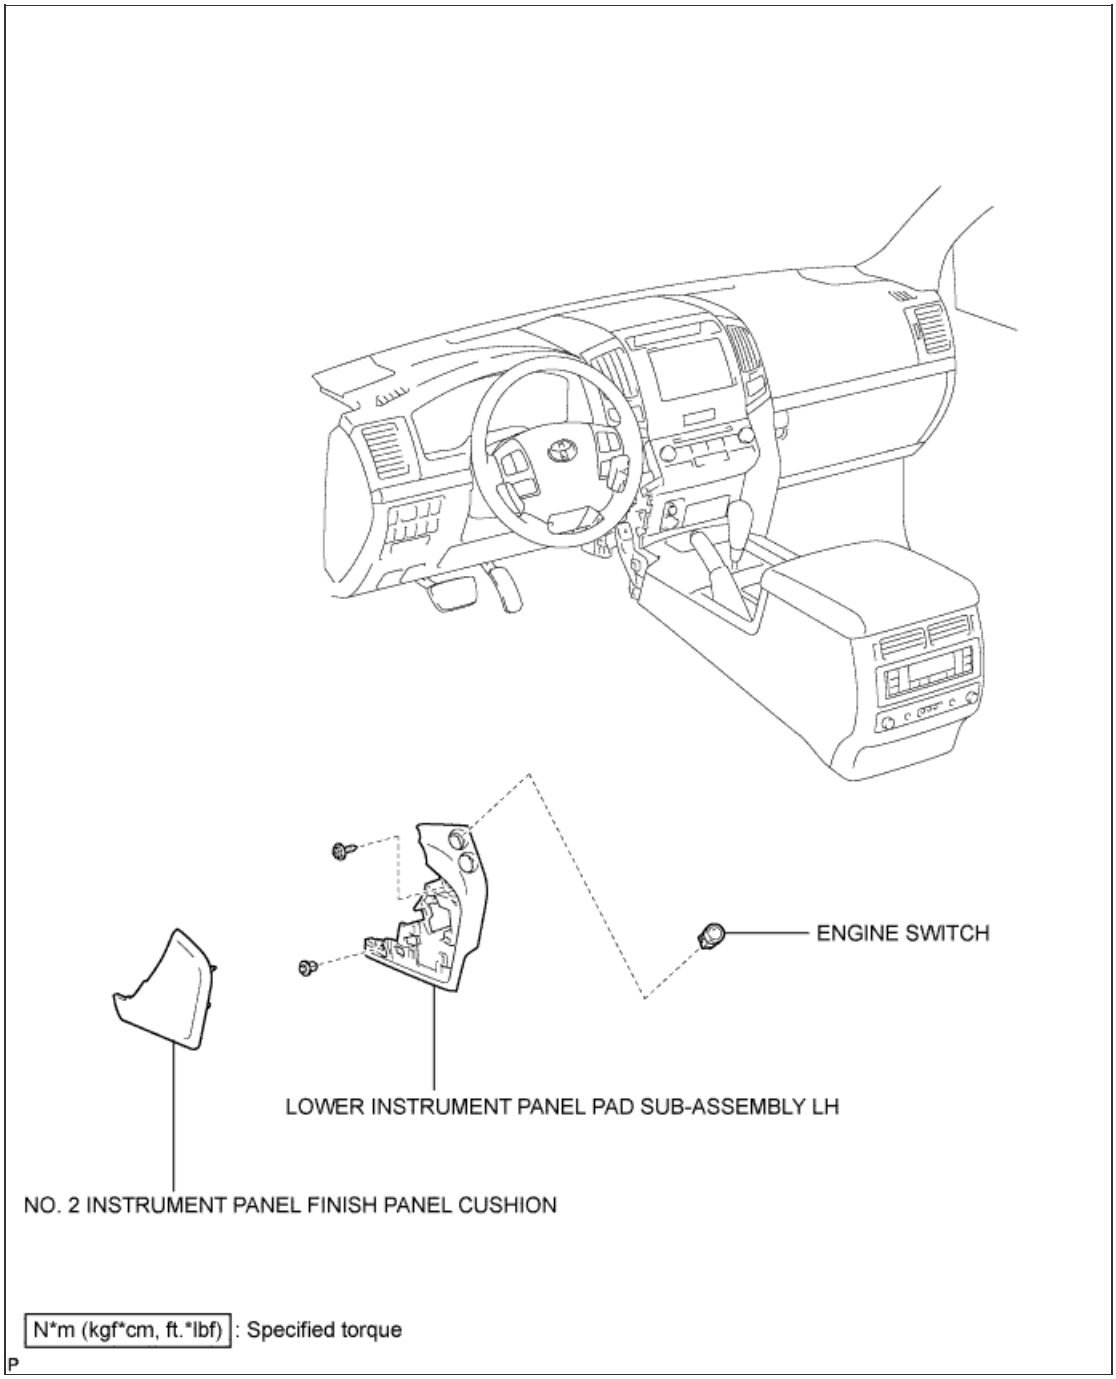


2. INSTALL FRONT FENDER APRON SEAL REAR LH

a. Install the fender apron seal with the 4 clips.

3. INSTALL FRONT FENDER APRON SEAL LH

a. Install the fender apron seal with the 4 clips.



4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

- hen disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

for Preparation Click here

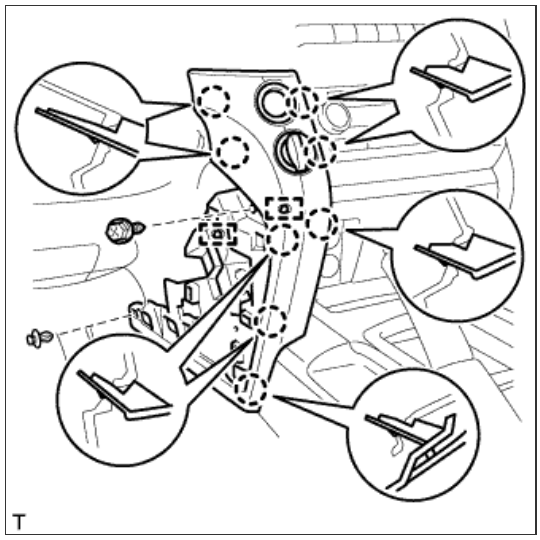
1. REMOVE NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Place protective tape as shown in the illustration.

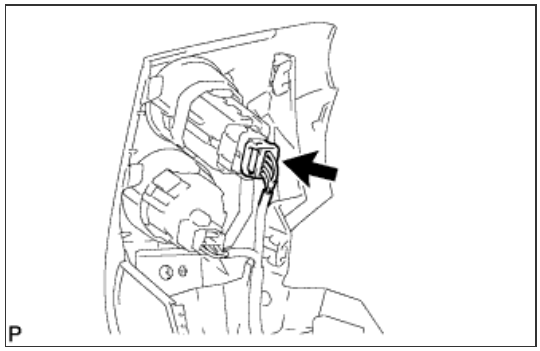
b. Using a moulding remover, detach the 7 claws and remove the panel cushion.



2. REMOVE LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

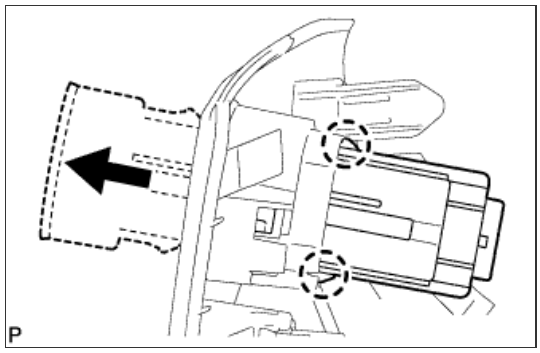
a. Remove the clip.

b. Remove the screw.



c. Detach the 8 claws.

d. Remove the panel pad and disconnect the connectors and 2 clamps.

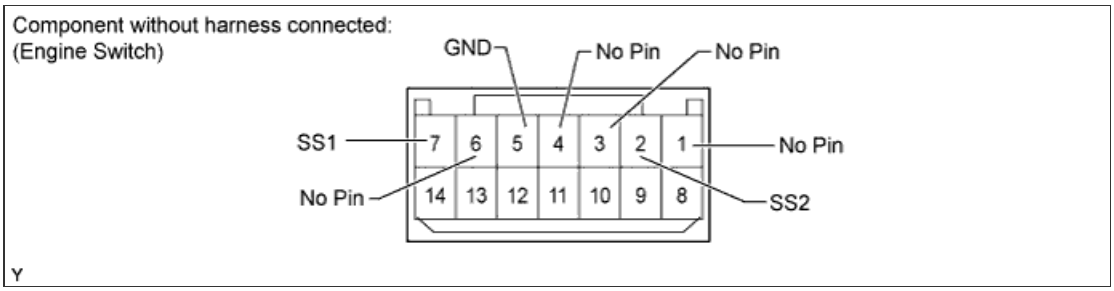


3. REMOVE ENGINE SWITCH

a. Disconnect the switch connector.

b. Detach the 2 claws and remove the switch.

P



for Preparation Click here

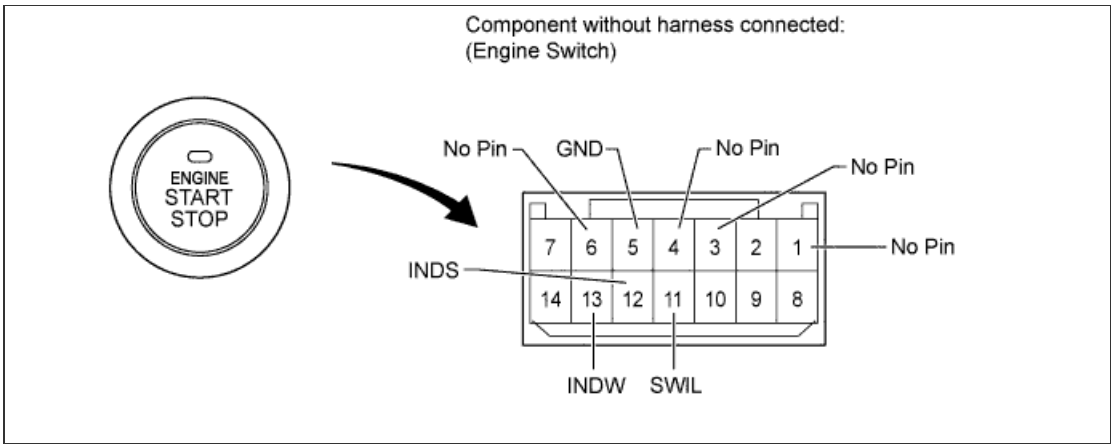
1. INSPECT ENGINE SWITCH

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
7 (SS1) - 5 (GND)	Not pushed	10 kΩ or higher
2 (SS2) - 5 (GND)	Not pushed	10 kΩ or higher
7 (SS1) - 5 (GND)	Pushed	Below 1 Ω
2 (SS2) - 5 (GND)	Pushed	Below 1 Ω

If the result is not as specified, replace the engine switch.



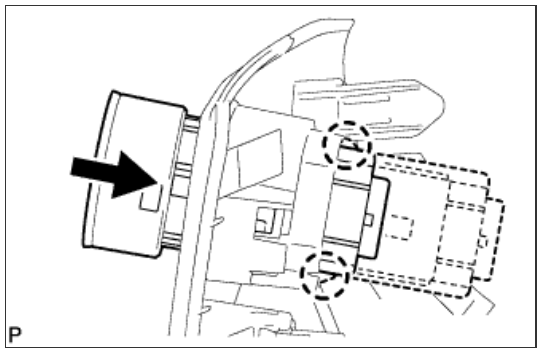
b. Apply battery voltage between the terminals of the switch, and check the illumination condition of the switch.

HINT:

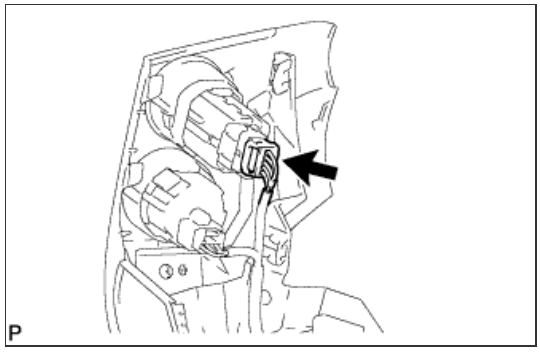
- **If the positive (+) lead and the negative (-) lead are incorrectly connected, the engine switch indicator will not illuminate.**
- **If the voltage is too low, the indicator will not illuminate.**

OK:

Measurement Condition	Specified Condition
Battery positive (+) → Terminal 11 (SWIL) Battery negative (-) → Terminal 5 (GND)	Illuminates (illumination of lettering)
Battery positive (+) → Terminal 12 (INDS) Battery negative (-) → Terminal 5 (GND)	Illuminates (green)
Battery positive (+) → Terminal 13 (INDW) Battery negative (-) → Terminal 5 (GND)	Illuminates (amber)



If the result is not as specified, replace the engine switch.

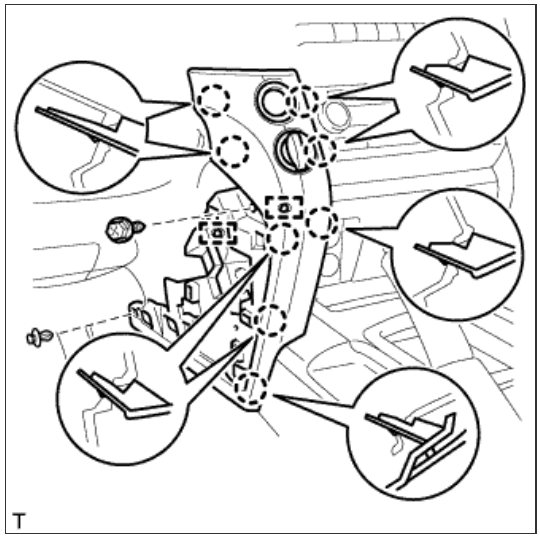


for Preparation Click here

1. INSTALL ENGINE SWITCH

a. Attach the 2 claws to install the switch.

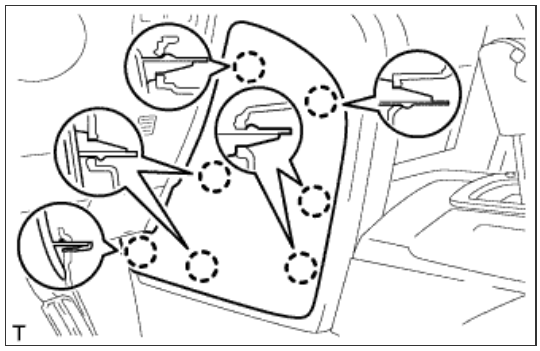
b. Connect the switch connector.



2. INSTALL LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

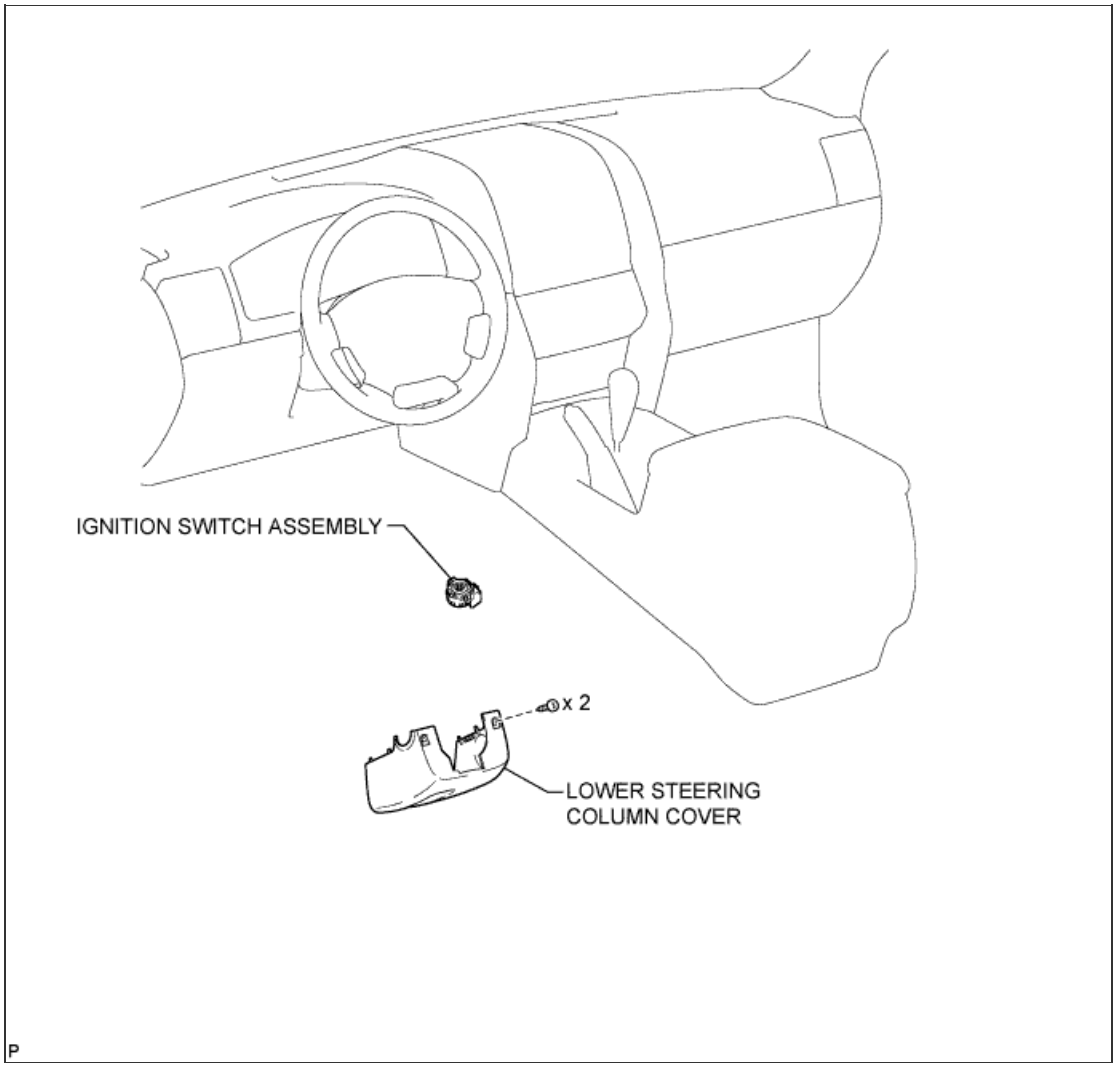
a. Connect the connectors and 2 clamps.

b. Attach the 8 claws to install the panel pad.



c. Install the screw.

d. Install the clip.



3. INSTALL NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Attach the 7 claws to install the panel cushion.

1. INSTALL IGNITION SWITCH ASSEMBLY

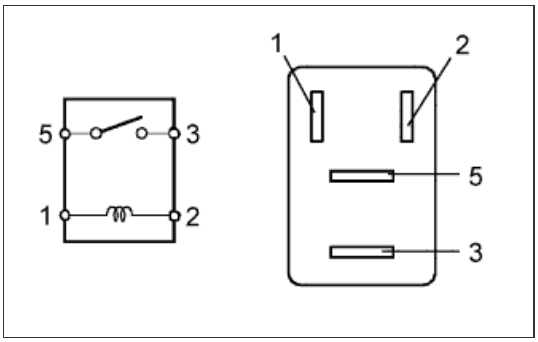
a. Attach the 2 claws to install the ignition switch.

b. Connect the ignition switch connector.

2. INSTALL LOWER STEERING COLUMN COVER

a. Attach the 2 claws to install the lower steering column cover.

b. Install the 2 screws.



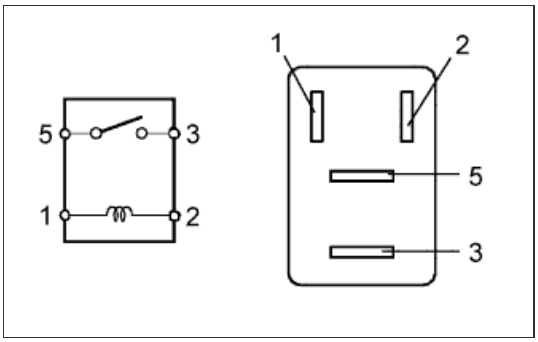
HINT:

Turn the steering wheel to the right and left as necessary to install the 2 screws.

for Preparation Click here

1. INSPECT STARTER RELAY (ST)

a. Measure the resistance according to the value(s) in the table below.



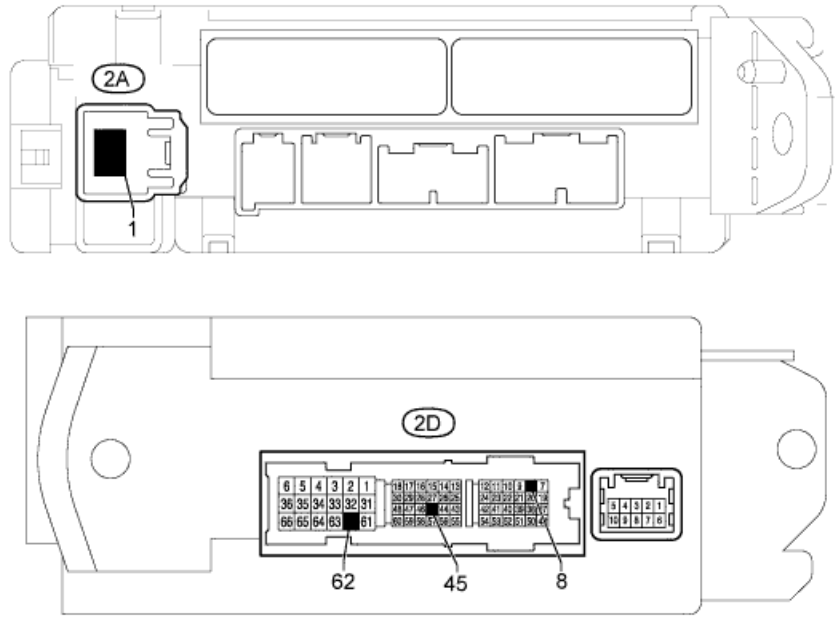
Standard Resistance:

Tester Connection	Condition	Specified Condition
3 -	tttery voltage not applied to ter inals 1 and 2	10 kΩ or higher
	Battery voltage applied to ter inals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

2. INSPECT STARTER CUT RELAY (ST CUT)

a. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
3 -	tttery voltage not applied to ter inals 1 and 2	10 kΩ or higher
	Battery voltage applied to ter inals 1 and 2	Below 1 Ω

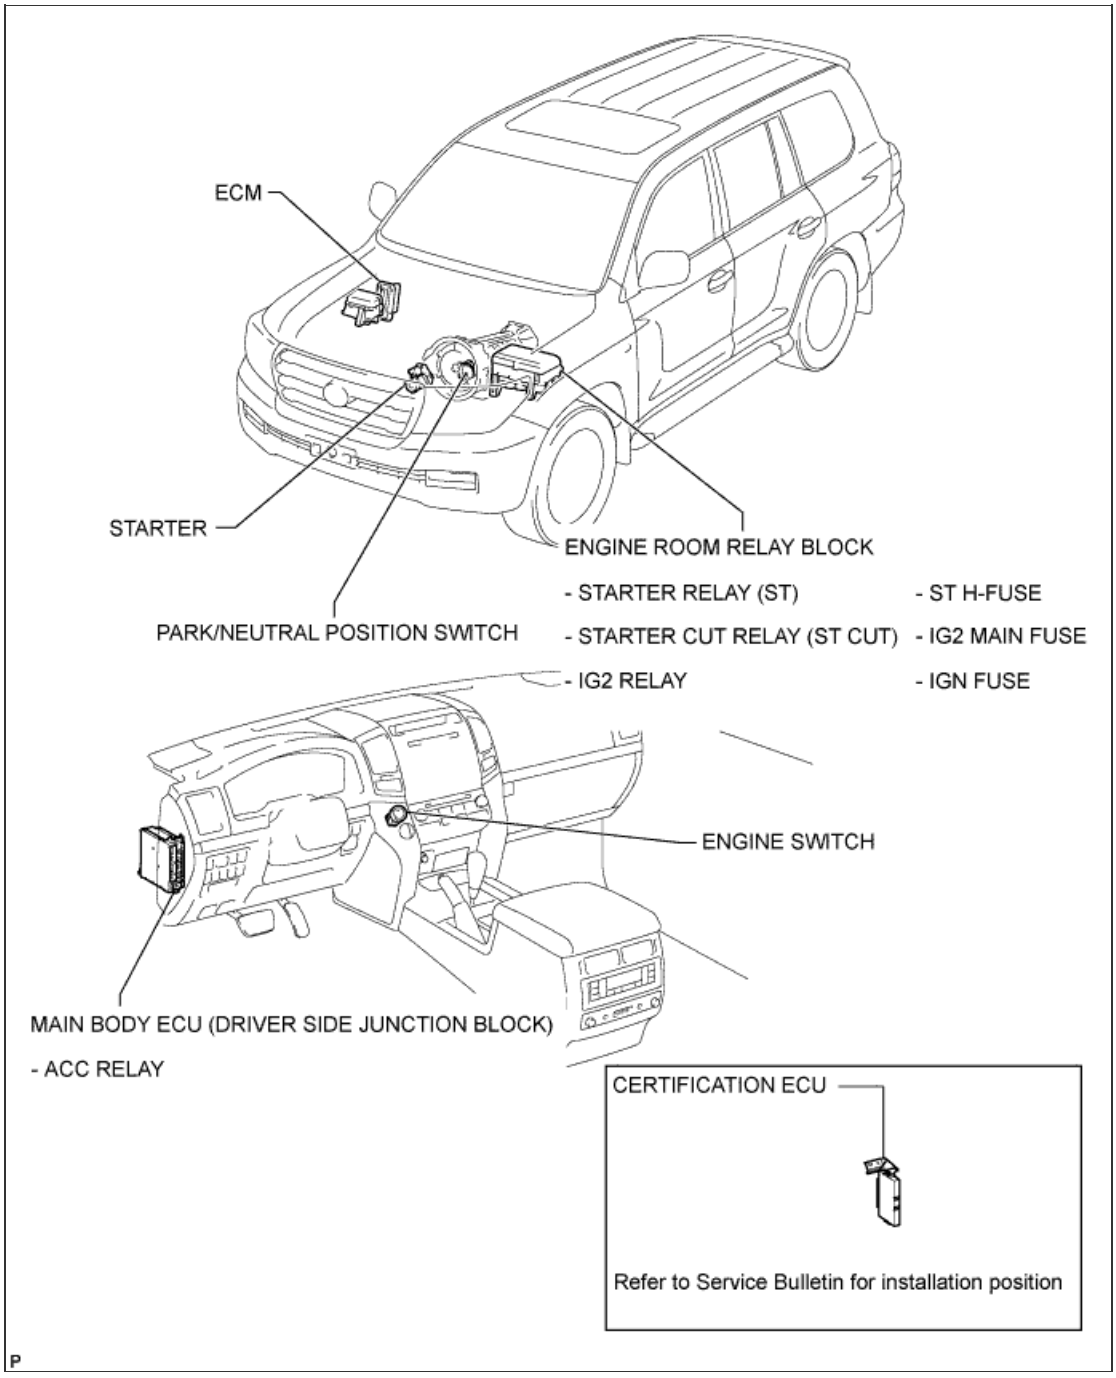
If the result is not as specified, replace the relay.

3. INSPECT MAIN BODY ECU (ACC RELAY)

Component without harness connected: (Main Body ECU)

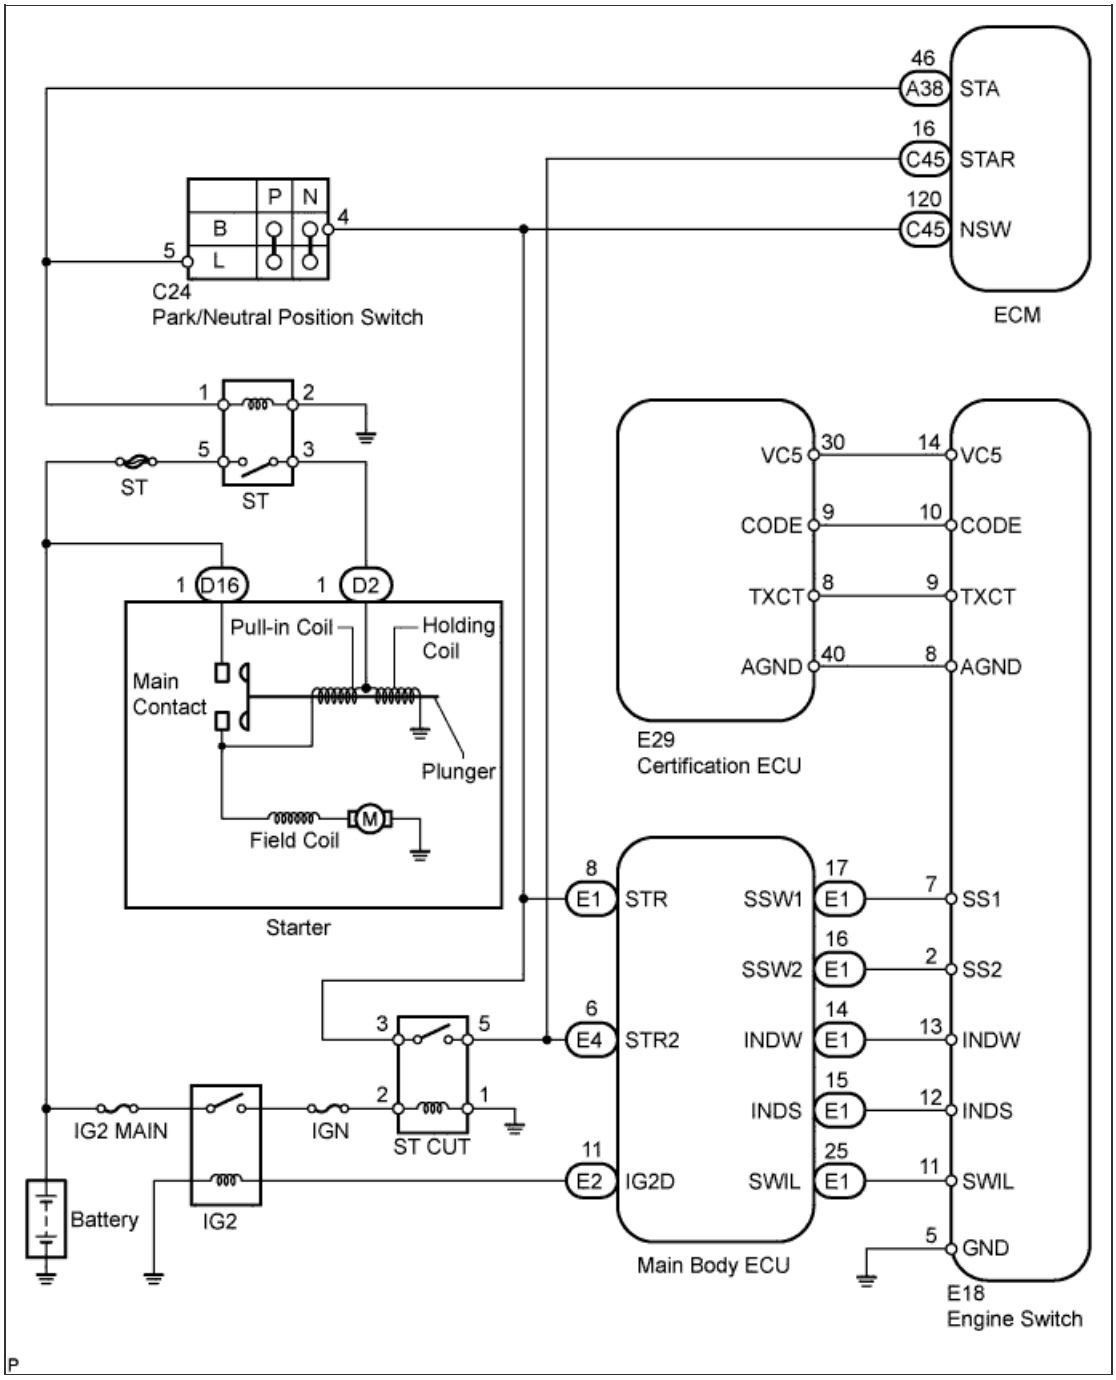
P

a. Measure the resistance of the CC relay circuit.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
2 - 2D-	ttery voltage not applied between 2D-4 and 2D-62	10 kΩ or higher
	Battery voltage applied between 2D-4 and 2D-62	Below 1 Ω

If the result is not as specified, replace the in body EC .

d. Remove the starter pinion drive lever and rubber seal from the starter center bearing clutch.

for Preparation Click here

1. INSPECT STARTER ASSEMBLY

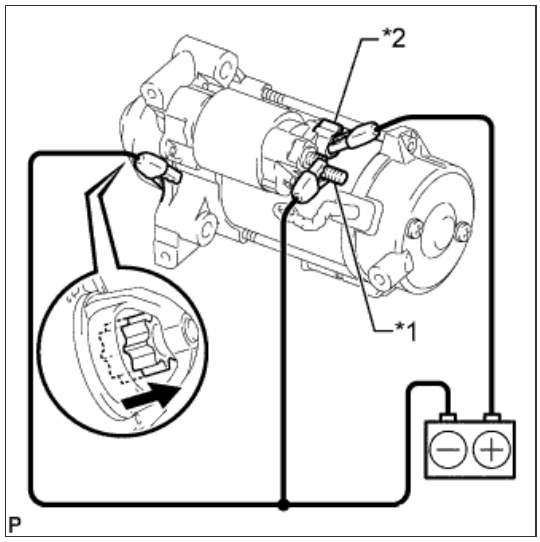
CAUTION:

As a large electric current passes through the cable during this inspection, a thick cable must be used. Otherwise, the cable may become hot and cause injury.

NOTICE:

These tests must be performed within 3 to 5 seconds to avoid burning out the coil.

a. Perform a pull-in test.



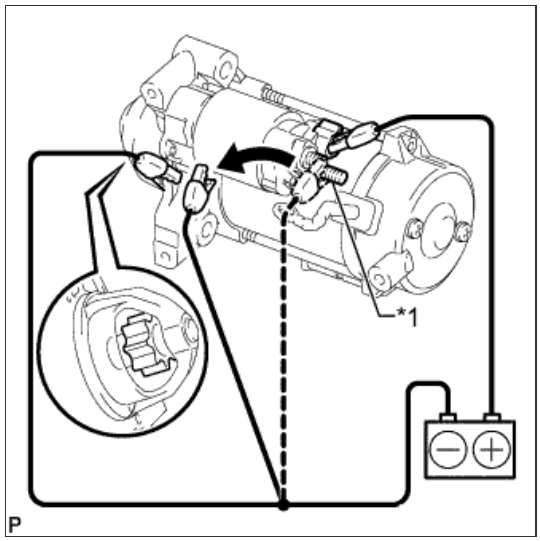
i. Remove the nut, and then disconnect the field coil lead wire from terminal C.

ii. Connect the battery to the magnet starter switch as shown in the illustration. Then check that the clutch pinion gear moves outward.

Text in Illustration

*1	Terminal C
*2	Terminal 50

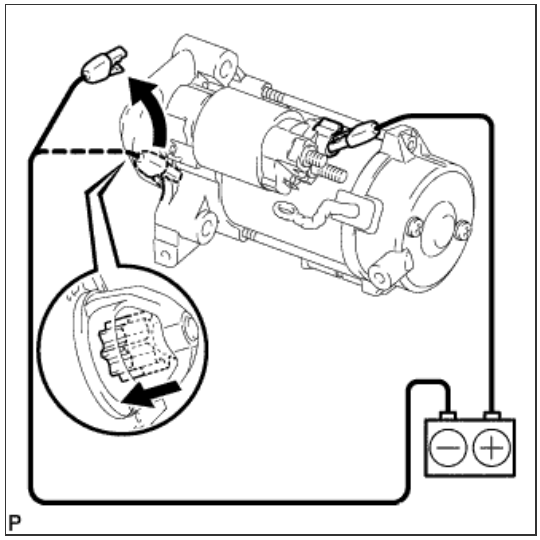
If the clutch pinion gear does not move outward, replace the magnet starter switch assembly.



b. Perform a holding test.

i. When the battery is connected as above with the clutch pinion gear out, disconnect the negative (-) terminal lead from terminal C. Check that the pinion gear remains out.

Text in Illustration



*1	Terminal C

If the clutch pinion gear moves inward, replace the magnet starter switch assembly.

c. Inspect the clutch pinion gear return.

i. Disconnect the negative (-) lead from the starter body. Check that the clutch pinion gear returns inward.
If the clutch pinion gear does not return inward, replace the magnet starter switch assembly.

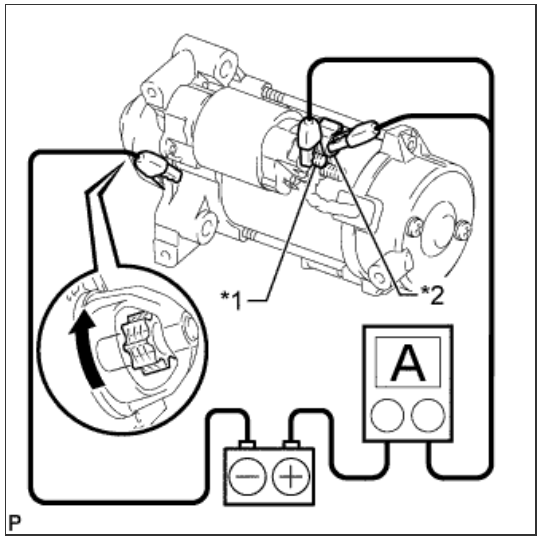
d. Perform an operation test without load.

i. Connect the field coil lead wire to terminal C with the nut.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

ii. Mount the starter in a vise between aluminum plates.

iii. Connect the battery and an ammeter to the starter as shown in the illustration.



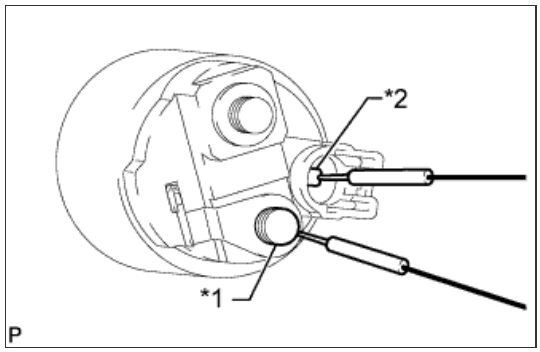
Text in Illustration

*1	Terminal 30
*2	Terminal 50

iv. Check that the starter rotates smoothly and steadily while the pinion gear is moving outward. Then measure the current.

Standard current:
150 A or less at 11.5 V

If the result is not as specified, replace the starter assembly.



2. INSPECT MAGNET STARTER SWITCH ASSEMBLY

a. Check if the pull-in coil has an open circuit.

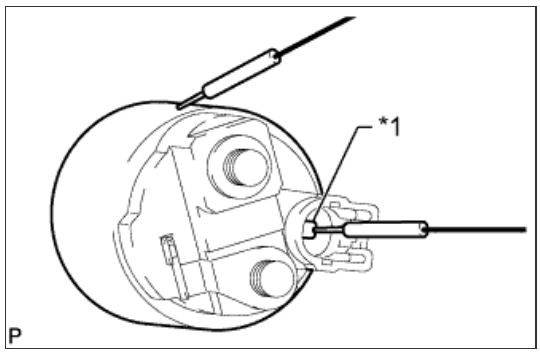
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Terminal C	Always	Below 1 Ω

Text in Illustration

*1	Terminal C
*2	Terminal 50



If the result is not as specified, replace the magnet starter switch assembly.

b. Check if the holding coil has an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

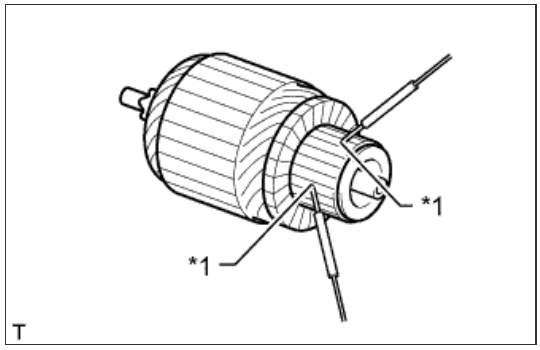
Tester Connection	Condition	Specified Condition
Terminal 50 - Switch body	Always	Below 2 Ω

Text in Illustration

*1	Terminal 50

If the result is not as specified, replace the magnet starter switch assembly.

3. INSPECT STARTER ARMATURE ASSEMBLY



a. Check the surface of the commutator for dirt and burns.
If the surface is dirty or burnt, correct it with sandpaper (No. 400) or a lathe.
If necessary, replace the starter armature assembly.

b. Inspect the commutator for an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Segment - Segment	Always	Below 1 Ω

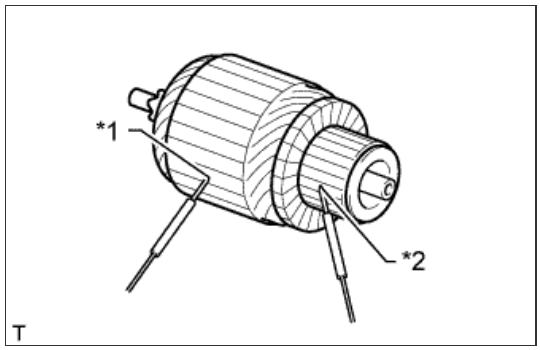
Text in Illustration

*1	Segment

If the result is not as specified, replace the starter armature assembly.

c. Inspect the commutator for a short circuit.

i. Measure the resistance according to the value(s) in the table below.



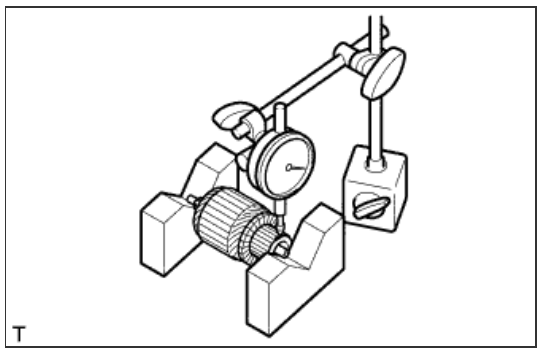
Standard Resistance:

Tester Connection	Condition	Specified Condition
Segment - Armature coil core	Always	10 kΩ or higher

Text in Illustration

*1	Armature Coil Core
*2	Commutator

If the result is not as specified, replace the starter armature assembly.



d. Check the commutator circle runout.

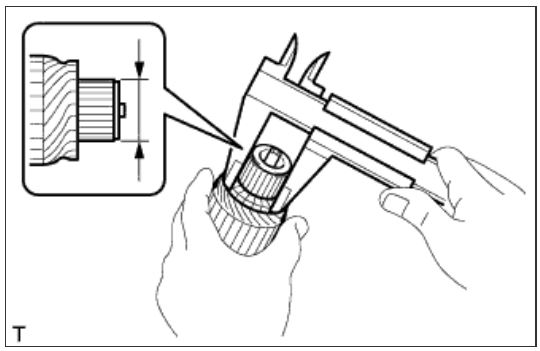
i. Place the armature shaft on V-blocks.

ii. Using a dial indicator, measure the circle runout.

Maximum runout:
0.05 mm (0.00197 in.)

If the circle runout is more than the maximum, replace the starter armature assembly.

e. Using a vernier caliper, measure the commutator diameter.



Standard diameter:
29.0 mm (1.14 in.)

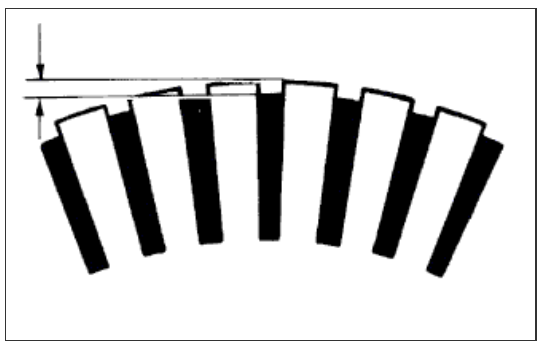
Minimum diameter:
28.0 mm (1.10 in.)

HINT:

Be sure to measure the commutator diameter at the ridges.

If the diameter is less than the minimum, replace the starter armature assembly.

f. Check that the undercut portion is clean and free of foreign matter. Smooth out the edge.



Standard undercut depth:
0.4 mm (0.0157 in.)

Minimum undercut depth:
0.2 mm (0.00787 in.)

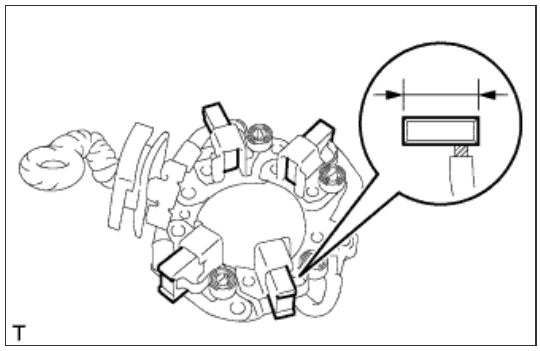
HINT:

Be sure to measure the commutator undercut depth at a cutout.

If the undercut depth is less than the minimum, increase the depth using a hacksaw blade.

4. INSPECT STARTER BRUSH HOLDER ASSEMBLY

a. Using a vernier caliper, measure the brush length.



Standard length:
14.4 mm (0.567 in.)

Minimum length:
9.0 mm (0.354 in.)

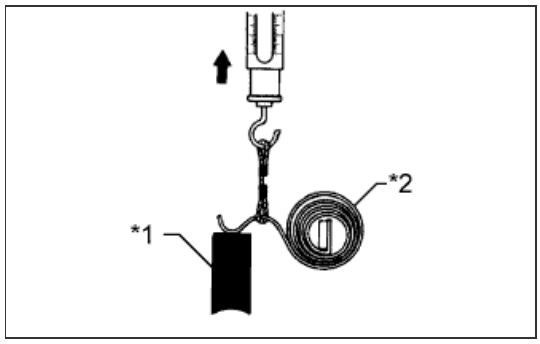
HINT:

Be sure to measure the brush lengths at the protrusions.

If the length is less than the minimum, replace the starter brush holder assembly.

b. Inspect the load of the brush spring.

i. Take a pull scale reading immediately after the brush spring separates from the brush.



Standard spring load:
22 to 27 N (2 to 3 kgf, 5.0 to 6.1 lbf)

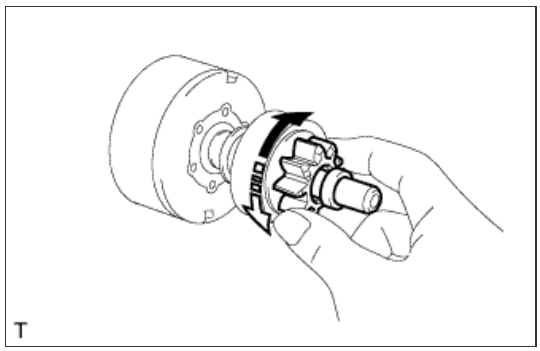
Minimum spring load:
14 N (1 kgf, 3.1 lbf)

Text in Illustration

*1	Brush
*2	Brush Spring

If the load is less than the minimum, replace the starter brush holder assembly.

5. INSPECT STARTER CENTER BEARING CLUTCH SUB-ASSEMBLY



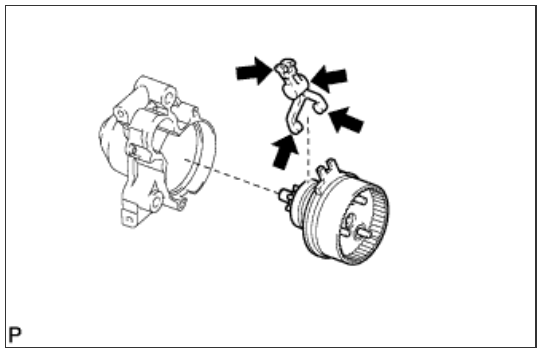
a. Check the gear teeth on the planetary gears, and the internal gear and pinion gear of the starter center bearing clutch for wear or damage. If any of the gears is damaged, replace the gear or starter center bearing clutch sub-assembly.

b. Hold the starter clutch, rotate the pinion gear clockwise and check that it turns freely. Try to rotate the pinion gear counterclockwise and check that it locks.

Text in Illustration

➡	Free
⇨	Lock

If the result is not as specified, replace the starter center bearing clutch sub-assembly.



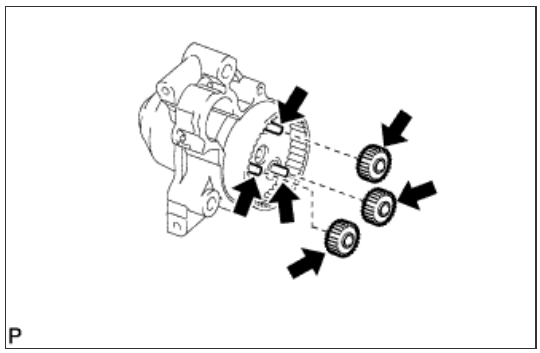
for Preparation Click here

1. INSTALL STARTER CENTER BEARING CLUTCH SUB-ASSEMBLY

a. Apply high-temperature grease to the areas of the starter pinion drive lever indicated in the illustration.

Text in Illustration

➡	High-temperature grease



b. Install the starter pinion drive lever and rubber seal to the starter center bearing clutch.

c. Install the starter center bearing clutch together with the starter pinion drive lever and rubber seal to the starter drive housing.

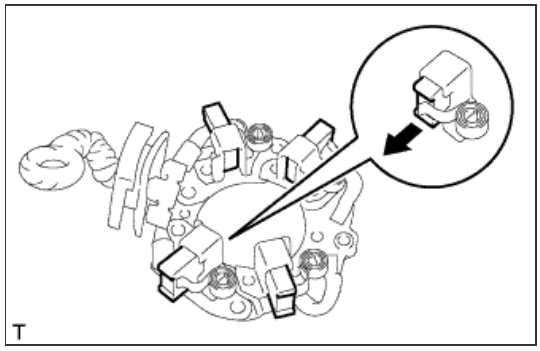
d. Apply high-temperature grease to the planetary gears and pins of the starter center bearing clutch.

Text in Illustration

➡	High-temperature grease

e. Install the 3 planetary gears.

2. INSTALL STARTER ARMATURE ASSEMBLY

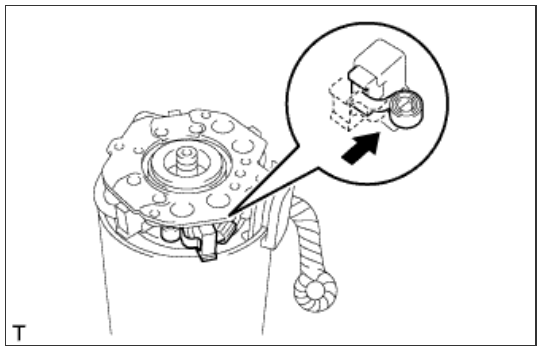


a. Install the starter armature to the starter yoke.

NOTICE:

The magnet of the starter yoke may attract the starter armature when the starter commutator end frame is installed, causing the magnet to break.

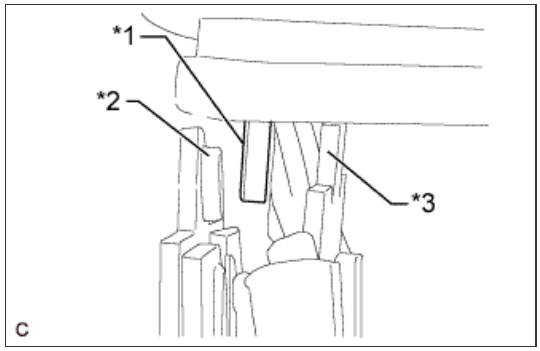
3. INSTALL STARTER BRUSH HOLDER ASSEMBLY



a. Push out the 4 brushes from the brush holder so that they are held in place by the springs as shown in the illustration.

b. Install the brush holder to the starter armature and push in the 4 brushes.

NOTICE:



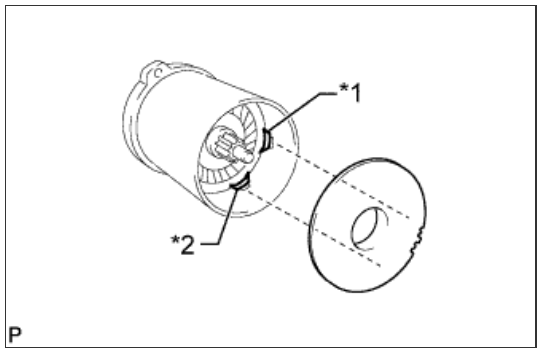
Check that the positive (+) lead wires are not grounded.

c. Insert the grommet between the positive side and negative side.

Text in Illustration

*1	Grommet
*2	Negative Side
*3	Positive Side

4. INSTALL STARTER YOKE ASSEMBLY



a. Install the starter armature plate to the starter yoke.

Text in Illustration

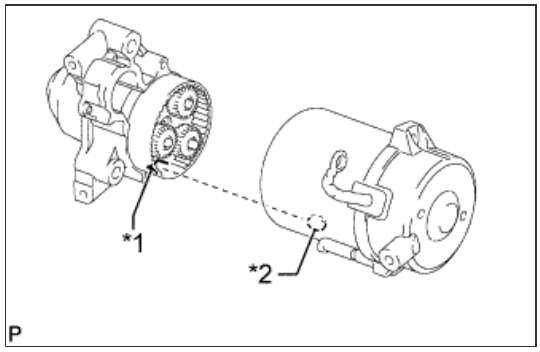
*1	Key A
*2	Key B

NOTICE:

Install the starter armature plate so that the keyway is positioned between key A and key B.

b. Install the commutator end frame with the 2 screws.

Torque:
1.5 N*m{ 15 kgf*cm , 13 in.*lbf }



c. Align the key of the starter yoke with the keyway located on the starter drive housing.

Text in Illustration

*1	Keyway
*2	Key

d. Using a T25 "TOR socket wrench, install the 2 bolts.

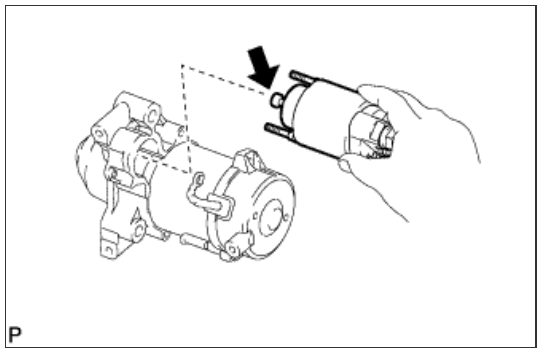
Torque:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }

5. INSTALL MAGNET STARTER SWITCH ASSEMBLY

a. Apply high-temperature grease to the plunger hook.

Text in Illustration

➡	High-temperature grease



b. Hang the plunger of the magnet starter switch onto the drive lever from the upper side.

c. Install the magnet starter switch with the 2 nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

d. Connect the lead wire to the magnet starter switch with the nut.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

for Preparation Click here

1. INSTALL STARTER ASSEMBLY

a. Install the flywheel housing side cover.

b. Install the starter with the 2 bolts.

Torque:
37 N*m{ 377 kgf*cm , 27 ft.*lbf }

c. Install the starter wire with the nut.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

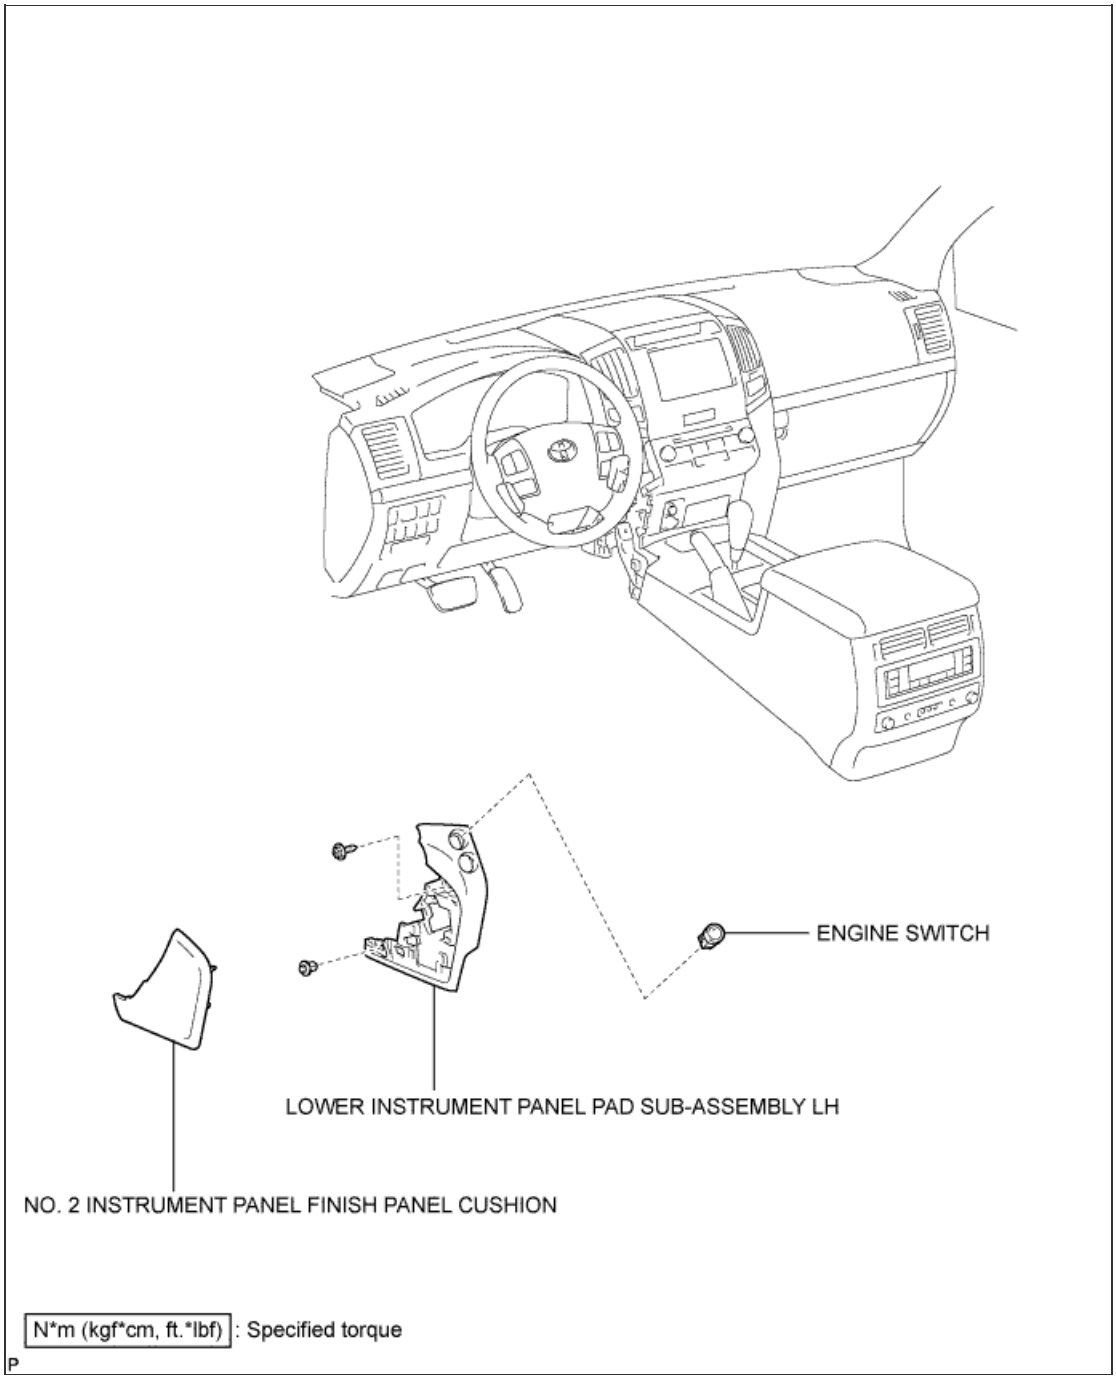
d. Connect the starter connector.

2. INSTALL STARTER COVER

a. Install the starter cover with the bolts.

Torque:
12 N*m{ 122 kgf*cm , 9 ft.*lbf }

3. INSTALL EXHAUST MANIFOLD SUB-ASSEMBLY RH



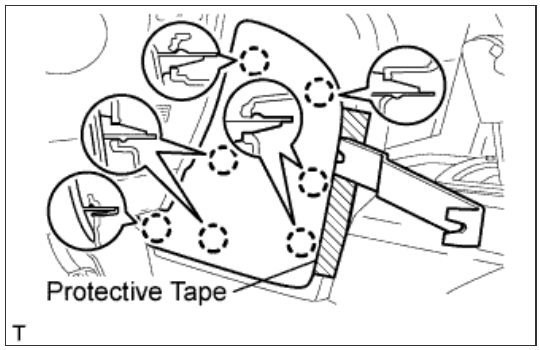
(Click here)

4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

for Preparation Click here

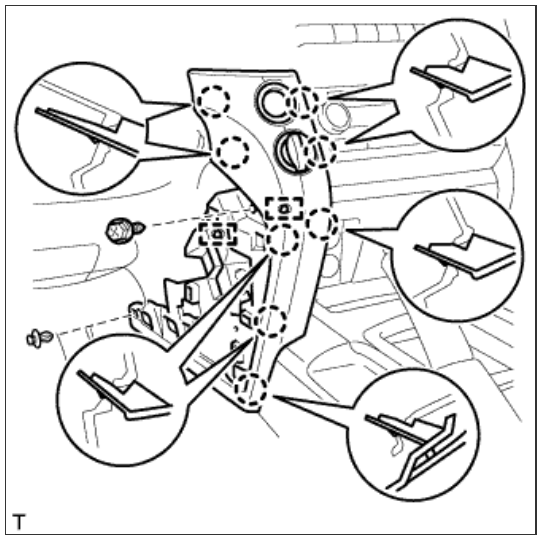


for Preparation Click here

1. REMOVE NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Place protective tape as shown in the illustration.

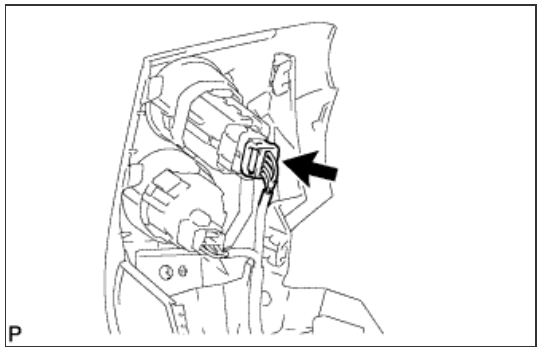
b. Using a moulding remover, detach the 7 claws and remove the panel cushion.



2. REMOVE LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

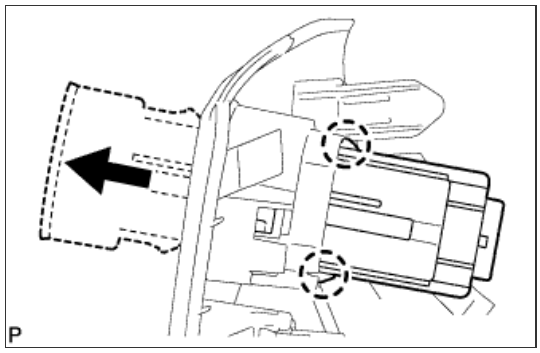
a. Remove the clip.

b. Remove the screw.



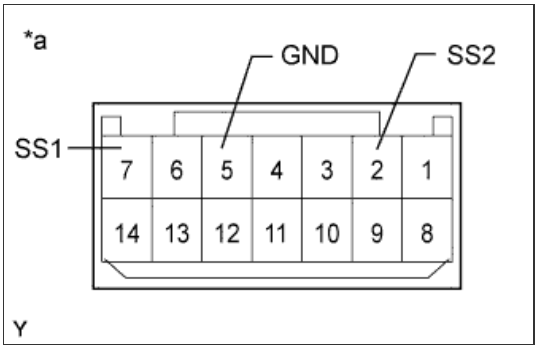
c. Detach the 8 claws.

d. Remove the panel pad and disconnect the connectors and 2 clamps.



3. REMOVE ENGINE SWITCH

a. Disconnect the switch connector.



b. Detach the 2 claws and remove the switch.

P

for Preparation Click here

1. INSPECT ENGINE SWITCH

a. Measure the resistance according to the value(s) in the table below.

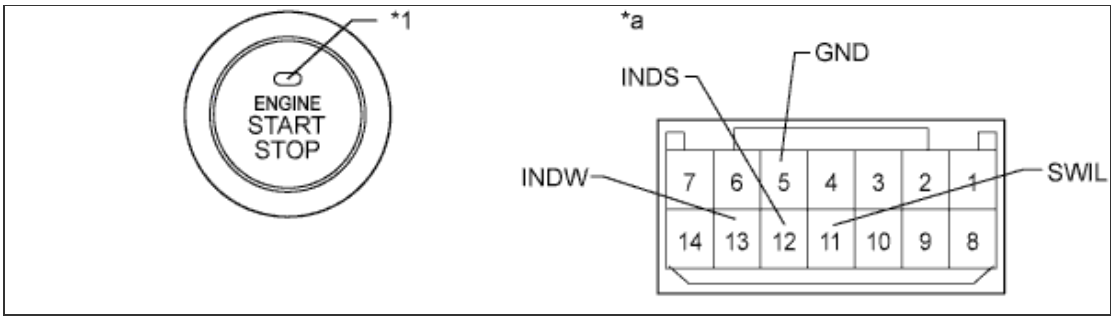
Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
7 (SS1) - 5 (GND)	Not pushed	10 kΩ or higher
2 (SS2) - 5 (GND)	Not pushed	10 kΩ or higher
7 (SS1) - 5 (GND)	Pushed	Below 1 Ω
2 (SS2) - 5 (GND)	Pushed	Below 1 Ω

Text in Illustration

*a	Component without harness connected (Engine Switch)

If the result is not as specified, replace the engine switch.



b. Apply battery voltage between the terminals of the switch, and check the illumination condition of the switch.

HINT:

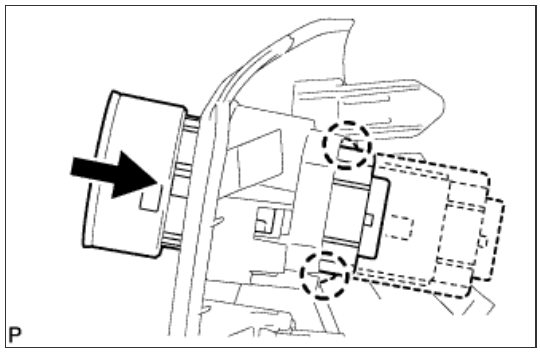
- **If the positive (lead and the negative (-) lead are incorrectly connected, the engine switch indicator will not illuminate.**
- **If the voltage is too low, the indicator will not illuminate.**

OK:

Measurement Condition	Specified Condition
Battery positive (+) → Terminal 11 (SWIL) Battery negative (-) → Terminal 5 (GND)	Illuminates (illumination of lettering)
Battery positive (+) → Terminal 12 (INDS) Battery negative (-) → Terminal 5 (GND)	Illuminates (green)
Battery positive (+) → Terminal 13 (INDW) Battery negative (-) → Terminal 5 (GND)	Illuminates (amber)

Text in Illustration

*a	Component without harness connected (Engine Switch)	-	-



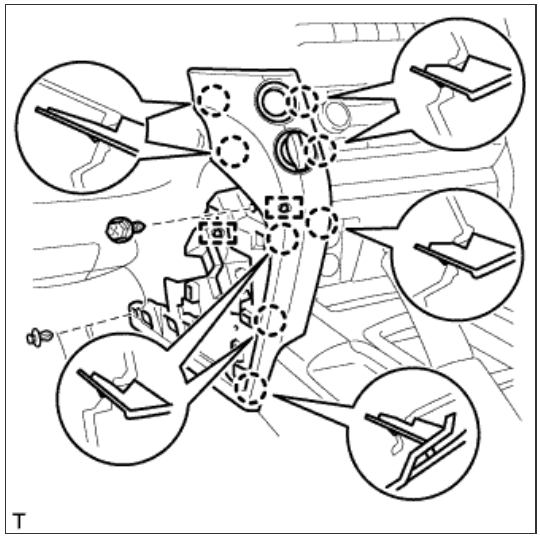
If the result is not as specified, replace the engine switch.

for Preparation Click here

1. INSTALL ENGINE SWITCH

a. Attach the 2 claws to install the switch.

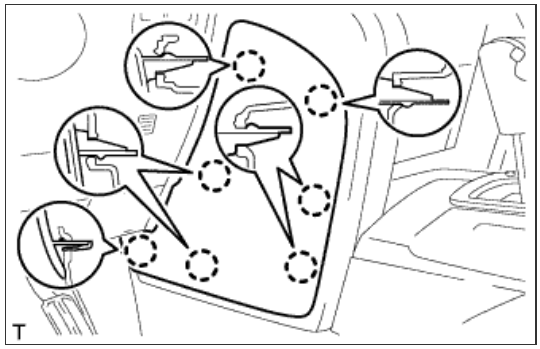
b. Connect the switch connector.



2. INSTALL LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

a. Connect the connectors and 2 clamps.

b. Attach the 8 claws to install the panel pad.

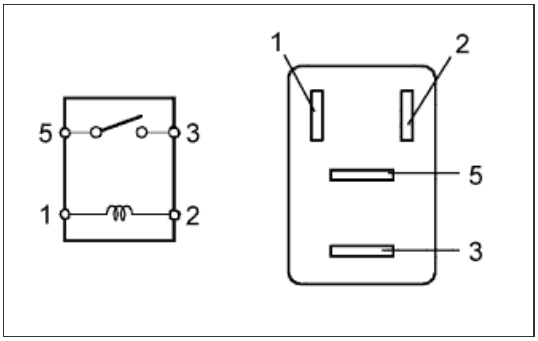


c. Install the screw.

d. Install the clip.

3. INSTALL NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Attach the 7 claws to install the panel cushion.



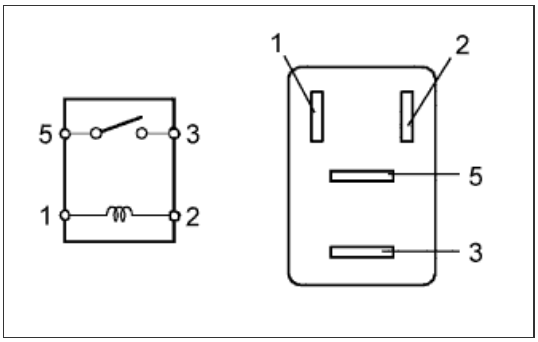
for Preparation Click here

1. INSPECT STARTER RELAY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

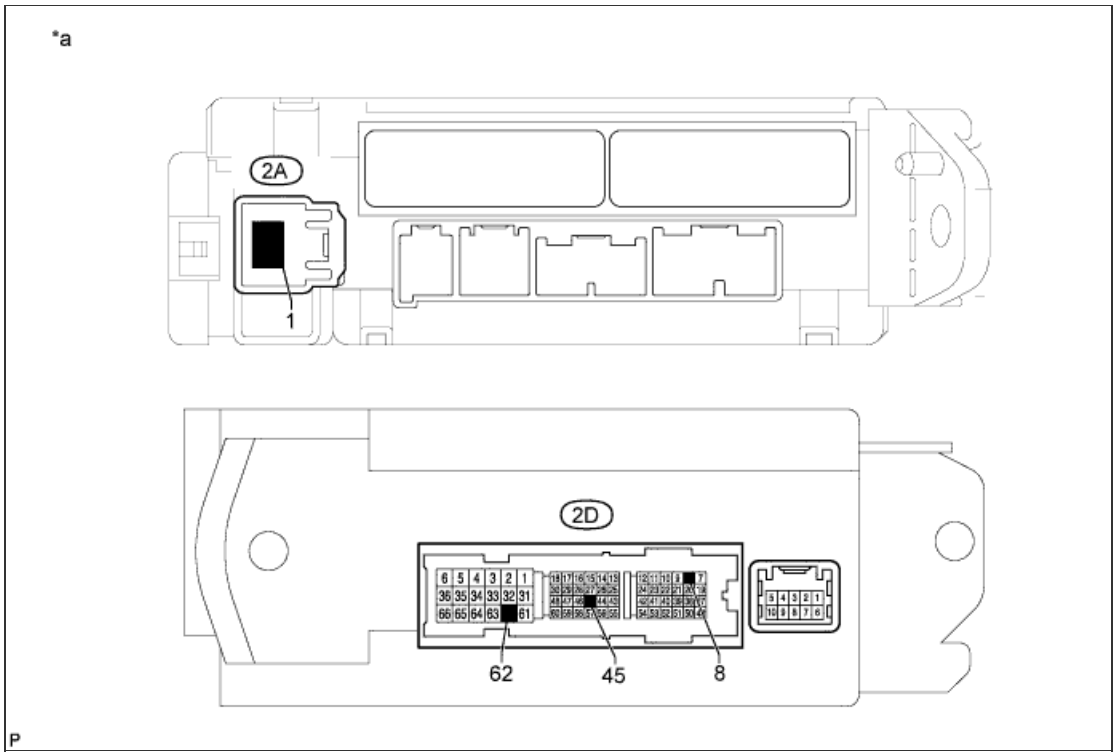
Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω



If the result is not as specified, replace the starter relay.

2. INSPECT STARTER CUT RELAY

a. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

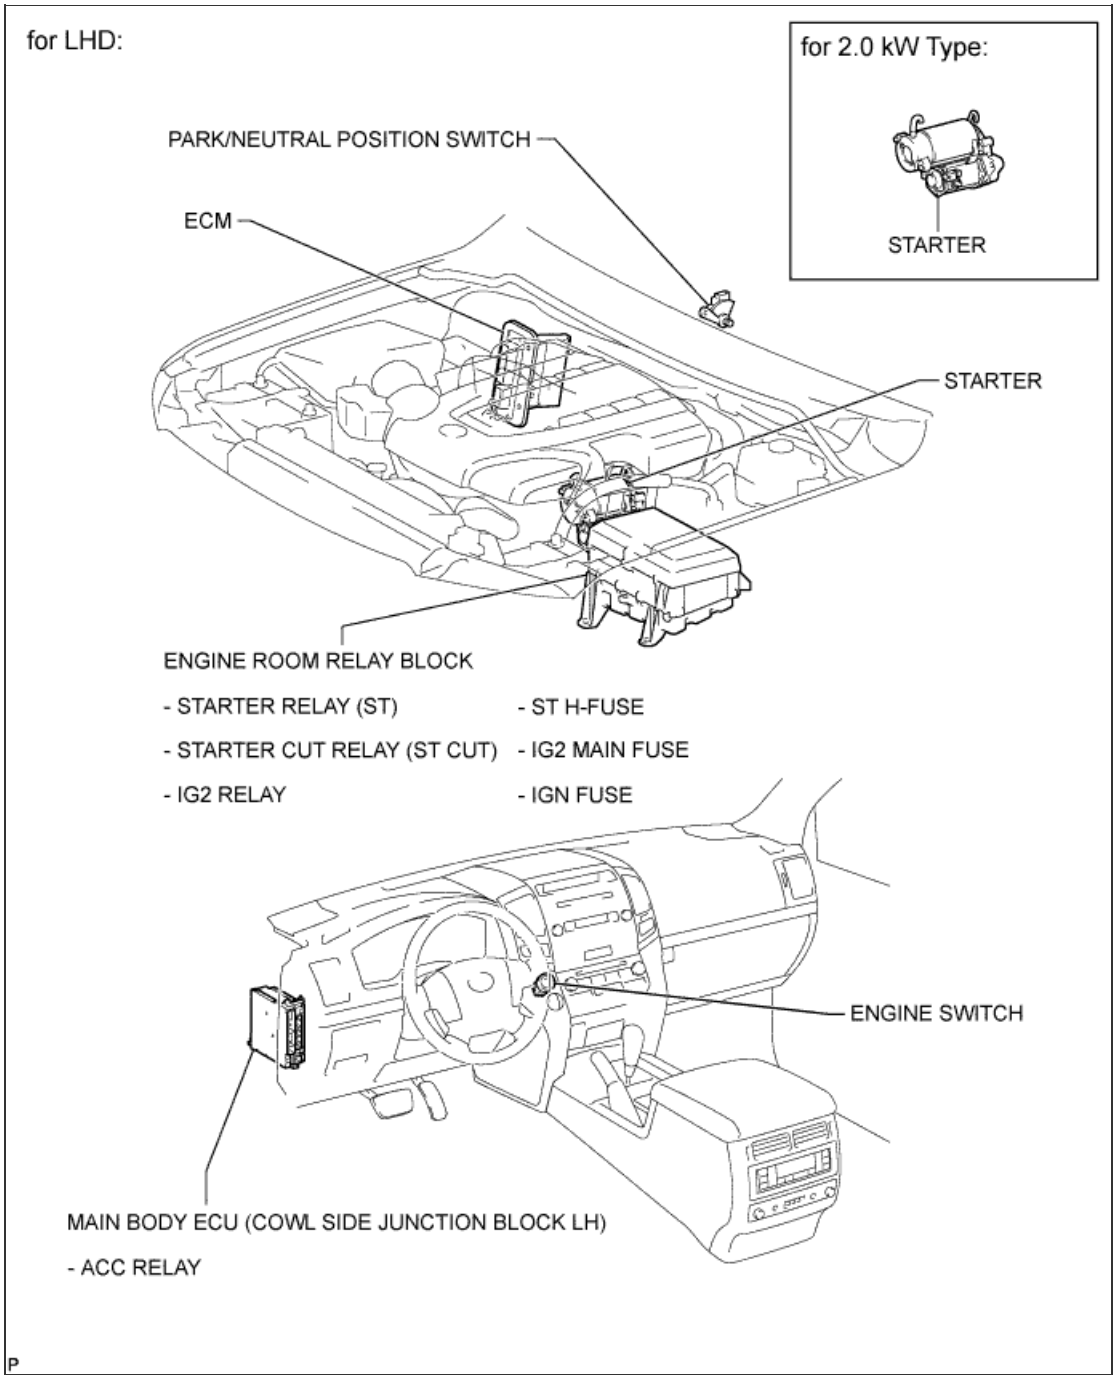
If the result is not as specified, replace the starter relay.

3. INSPECT MAIN BODY ECU (ACC RELAY)

Text in Illustration

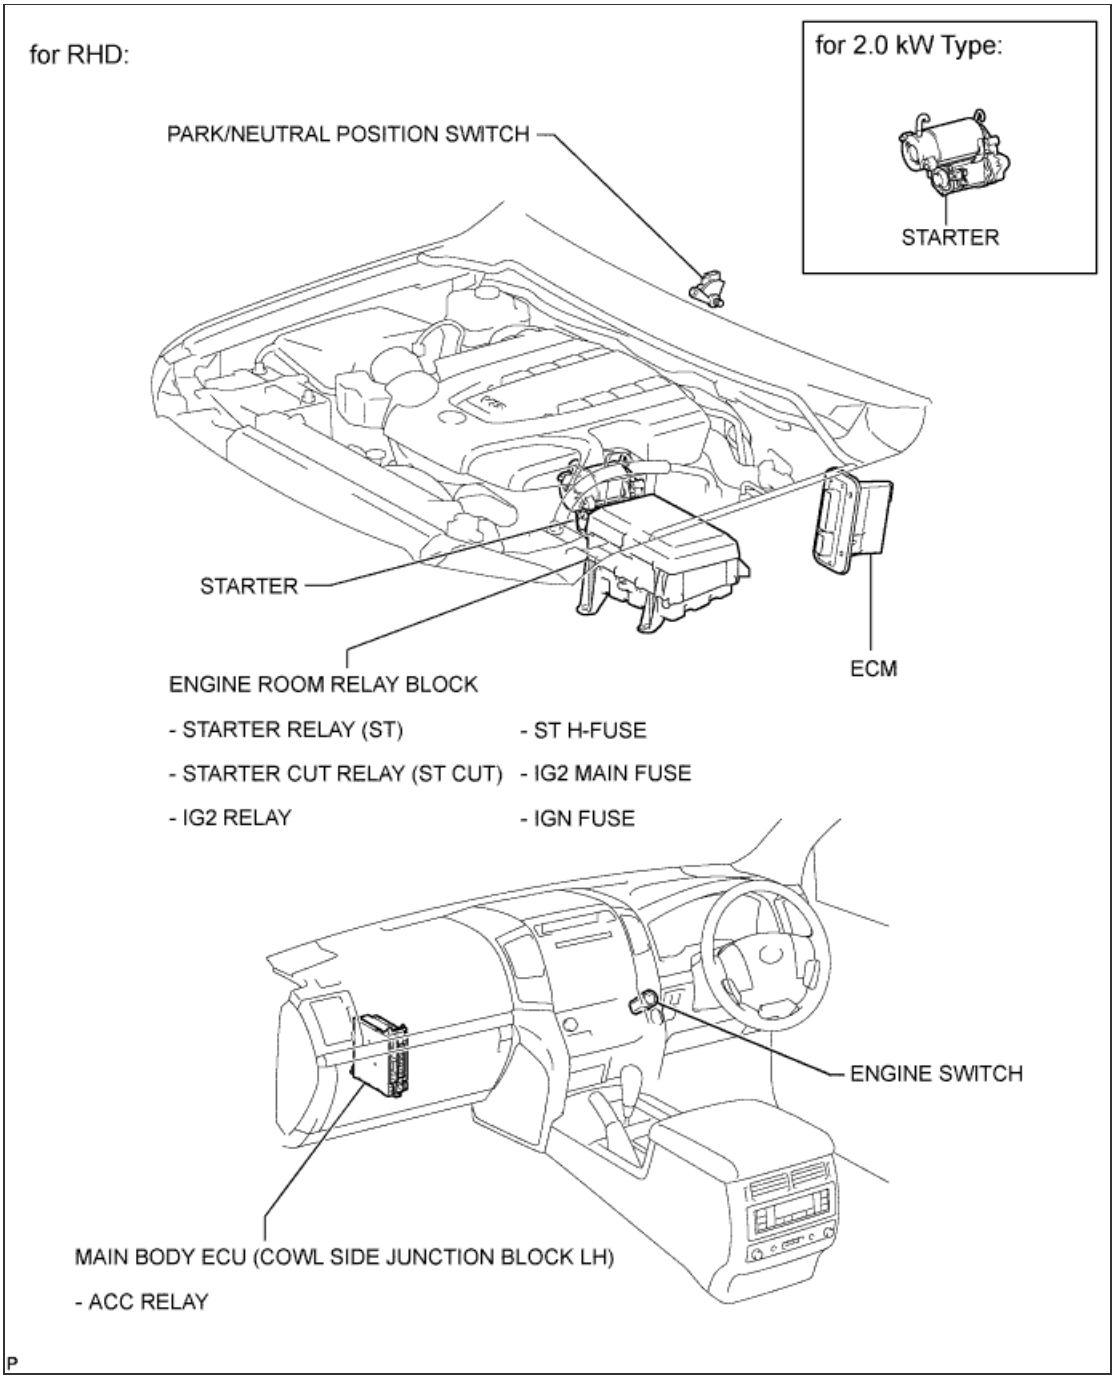
*a	Component without harness connected (Main Body ECU)	-	-

a. Measure the resistance of the ACC relay circuit.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
2A-1 - 2D-8	Battery voltage not applied between 2D-45 and 2D-62	10 kΩ or higher
	Battery voltage applied between 2D-45 and 2D-62	Below 1 Ω

If the result is not as specified, replace the main body ECU.

for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

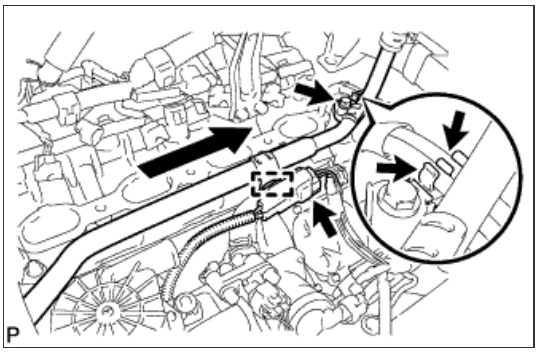
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

2. REMOVE INTAKE MANIFOLD

a. Remove the intake manifold (Click here).

3. REMOVE WATER BY-PASS PIPE SUB-ASSEMBLY

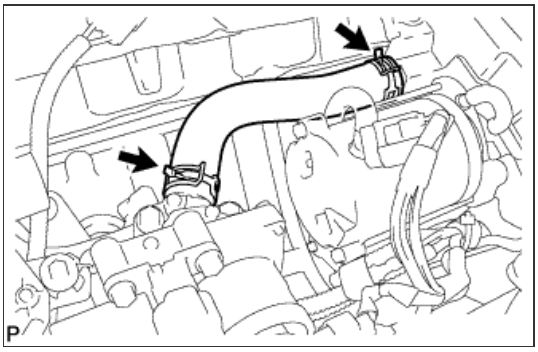
a. Disconnect the connector.



b. Disconnect the wire harness clamp from the water by-pass pipe.

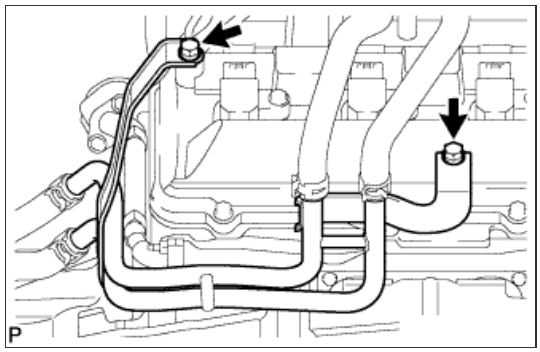
c. Disconnect the 2 vacuum switching valve hoses from the water by-pass pipe clamp.

d. Remove the bolt.



e. Pull out the water by-pass pipe.

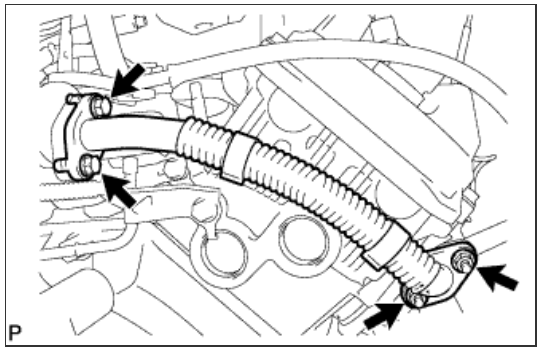
f. Remove the O-ring from the water by-pass pipe.



4. REMOVE NO. 2 AIR INJECTION SYSTEM HOSE (w Secondary Air Injection System)

a. Remove the No. 2 air injection system hose from the rear water by-pass joint and air switching valve.

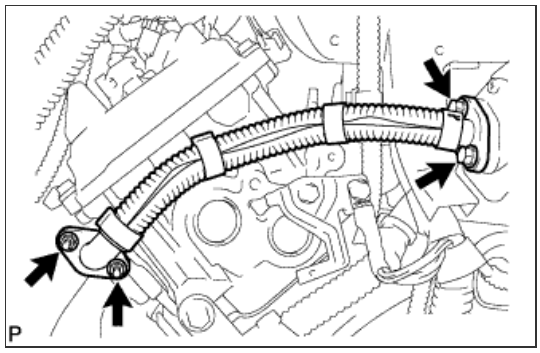
5. DISCONNECT NO. 1 WATER BY-PASS PIPE (w o Air Cooled Transmission Oil Cooler)



a. Remove the 2 bolts and disconnect the water by-pass pipe from the cylinder head cover RH.

6. REMOVE AIR TUBE SUB-ASSEMBLY RH (w Secondary Air Injection System)

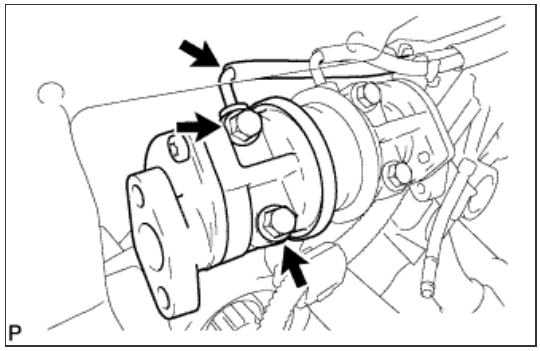
a. Remove the 2 bolts, 2 nuts and air tube sub-assembly.



b. Remove the 2 gaskets.

7. REMOVE NO. 3 AIR TUBE (w Secondary Air Injection System)

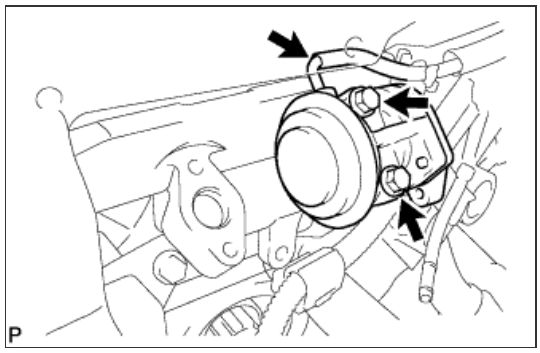
a. Remove the 2 bolts, 2 nuts and No. 3 air tube.



b. Remove the 2 gaskets.

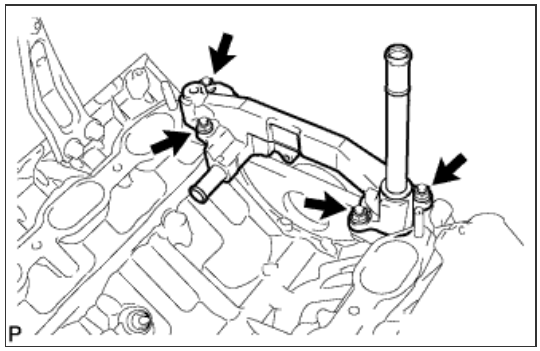
8. REMOVE NO. 2 AIR SWITCHING VALVE ASSEMBLY (w Secondary Air Injection System)

a. Remove the vacuum switching valve hose from the No. 2 air switching valve.



b. Remove the 2 bolts, gasket and No. 2 air switching valve from the rear water by-pass joint.

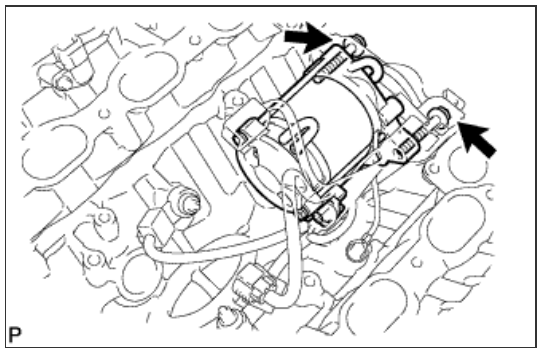
9. REMOVE NO. 1 AIR SWITCHING VALVE ASSEMBLY (w Secondary Air Injection System)



a. Remove the vacuum switching valve hose from the No. 1 air switching valve.

b. Remove the 2 bolts, gasket and No. 1 air switching valve from the rear water by-pass joint.

10. REMOVE REAR WATER BY-PASS JOINT

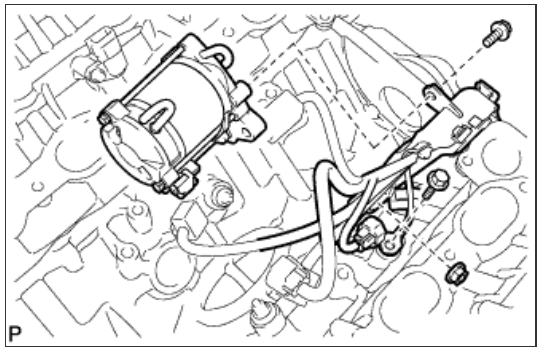


a. Remove the 4 nuts, water by-pass joint and 2 gaskets.

11. REMOVE STARTER ASSEMBLY

a. Remove the 2 bolts holding the starter to the cylinder block.

b. Disconnect the starter from the cylinder block.



c. Remove the bolt and disconnect the engine wire protector from the starter.

d. Remove the bolt and disconnect the ground wire.

e. Disconnect the starter connector.

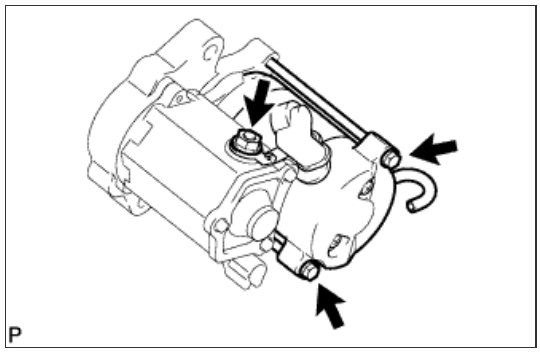
f. Remove the nut and disconnect the starter wire.

. Remove the starter.

for Preparation Click here

1. REMOVE STARTER DUST PROTECTOR

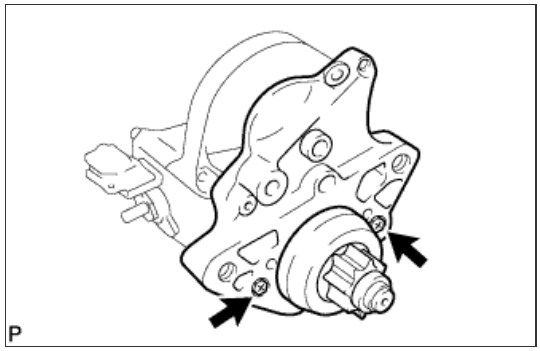
a. Remove the 2 dust protectors.



2. REMOVE STARTER YOKE ASSEMBLY

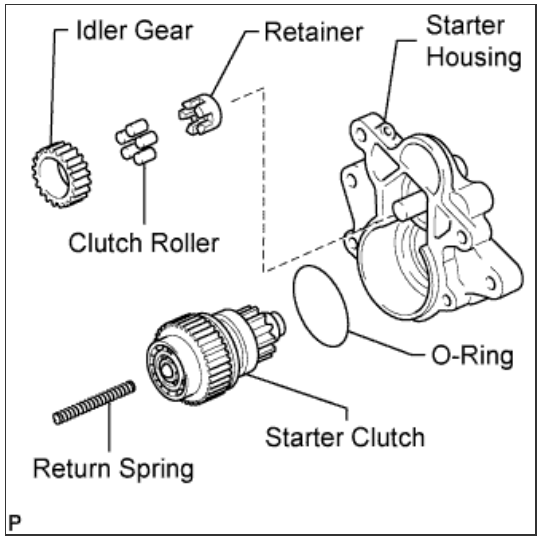
a. Remove the nut and disconnect the lead wire from terminal C.

b. Remove the 2 through bolts.



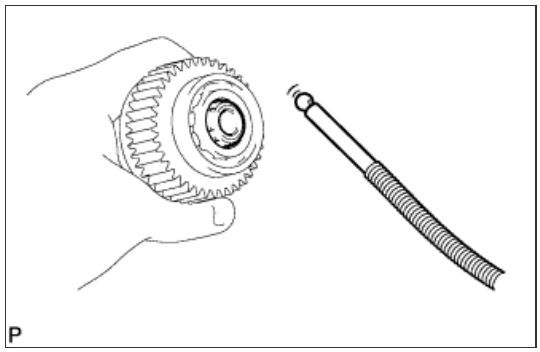
c. Pull out the starter yoke with the armature from the magnet starter switch.

d. Remove the O-ring from the starter yoke.



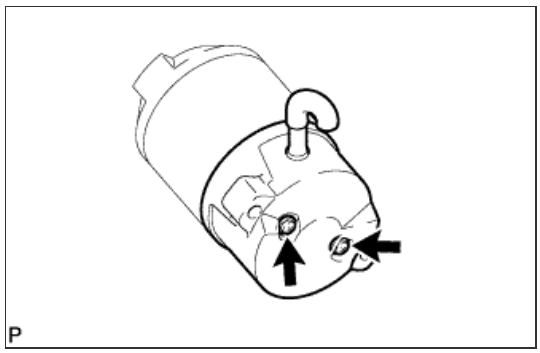
3. REMOVE STARTER CLUTCH SUB-ASSEMBLY

a. Remove the 2 bolts.



b. Remove the return spring, idler gear, clutch roller, retainer, O-ring and starter clutch from the starter housing.

c. Using a magnetic finger, remove the steel ball from the clutch shaft hole.

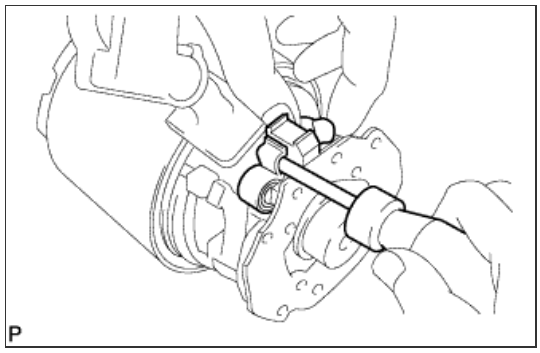


c. Using a magnetic finger, remove the steel ball from the clutch shaft hole.

4. REMOVE STARTER BRUSH HOLDER ASSEMBLY

a. Remove the 2 screws, 2 O-rings and starter commutator end frame from the starter yoke.

b. Remove the O-ring from the starter yoke.



c. Using a screwdriver, hold the spring back and disconnect the brush from the brush holder.

d. Disconnect the 4 brushes and remove the brush holder.

OTICE:

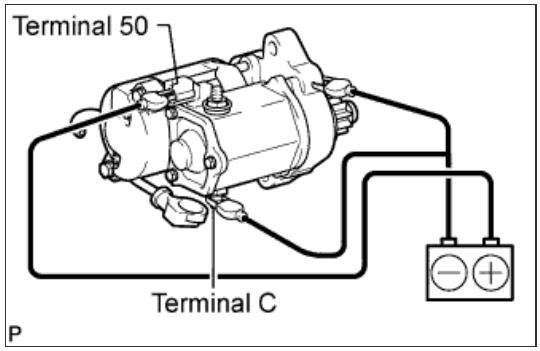
Check that the positive (+) lead wires are not grounded.

5. REMOVE STARTER ARMATURE ASSEMBLY

a. Remove the starter armature from the starter yoke.

for Preparation Click here

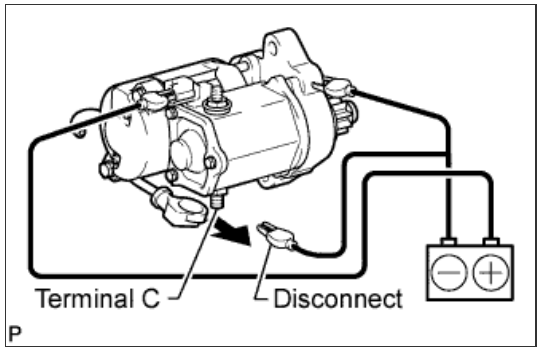
1. INSPECT STARTER ASSEMBLY



NOTICE:

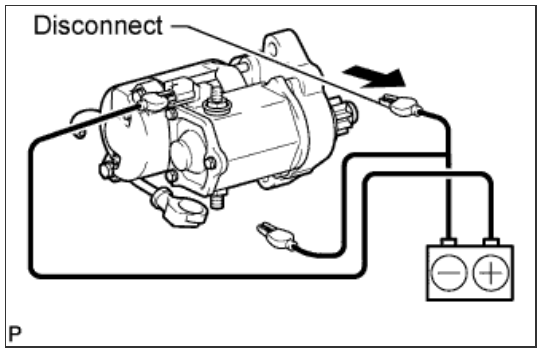
The following tests must be done within 3 to 5 seconds to prevent the coil from burning out.

a. Perform the pull-in test.



i. Remove the nut, then disconnect the lead wire from terminal C.

ii. Connect the battery to the starter as shown in the illustration. Check that the clutch pinion gear moves outward.
If the clutch pinion gear does not move, replace the magnet starter switch assembly.



b. Perform the holding test.

i. With the battery connected as above with the clutch pinion gear out, disconnect the negative (-) lead from terminal C. Check that the pinion gear remains out.
If the clutch pinion gear returns inward, replace the magnet starter switch assembly.

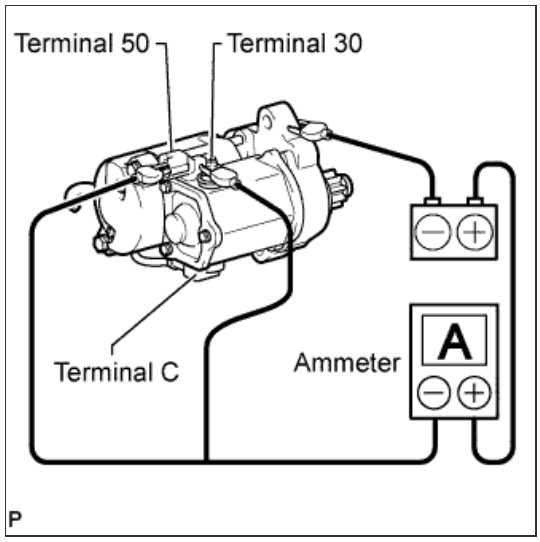
c. Inspect the clutch pinion gear return.

i. Disconnect the negative (-) lead from the starter housing. Check that the clutch pinion gear returns inward.
If the clutch pinion gear does not return inward, replace the magnet starter switch assembly.

d. Perform the operation test without load.

i. Connect the lead wire to terminal C.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }



ii. Grip the starter in a vise.

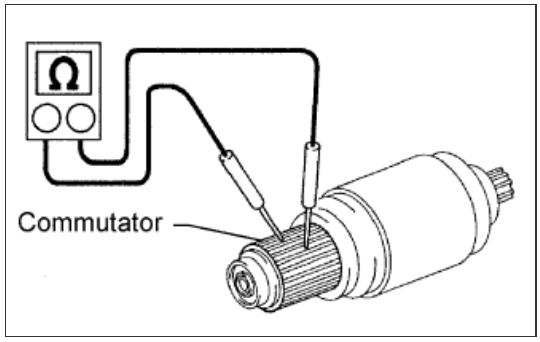
iii. Connect the battery and an ammeter to the starter as shown in the illustration.

iv. Check that the starter rotates smoothly and steadily while the pinion gear is moving out. Then measure the current.

Specified current:
90 A or less at 11.5 V

If the result is not as specified, replace the starter assembly.

2. INSPECT STARTER ARMATURE ASSEMBLY



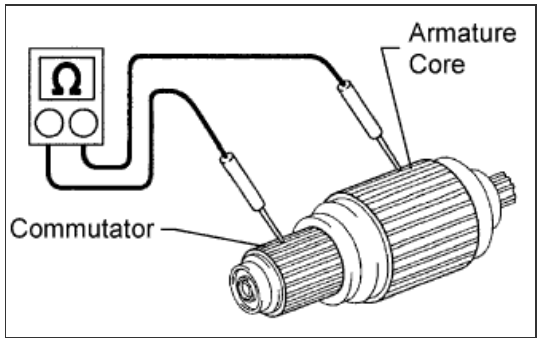
a. Inspect the commutator for an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator	Always	Below 1 Ω

If the result is not as specified, replace the armature assembly.



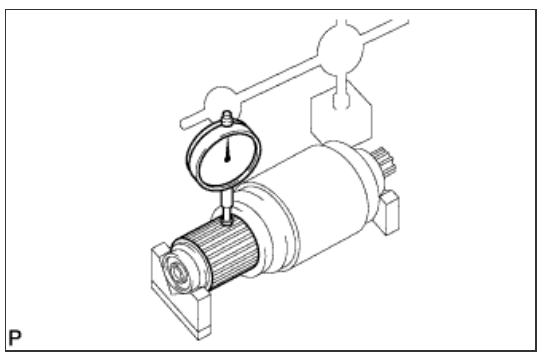
b. Inspect the commutator for a short circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator - Armature core	Always	10 kΩ or higher

If the result is not as specified, replace the armature assembly.



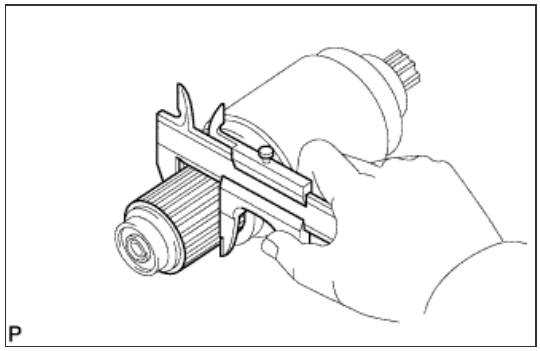
c. Inspect the commutator circle runout.

i. Place the commutator on V-blocks.

ii. Using a dial indicator, measure the circle runout.

Maximum circle runout:
0.05 mm (0.00197 in.)

If the runout is more than the maximum, correct it with sandpaper (#400) or replace the armature assembly.

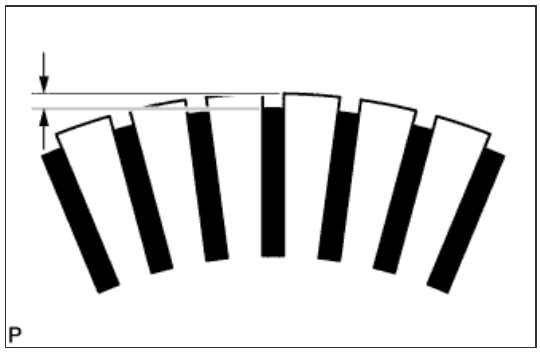


d. Using a vernier caliper, measure the commutator diameter.

Standard diameter:
30.0 mm (1.18 in.)

Minimum diameter:
29.0 mm (1.14 in.)

If the diameter is less than the minimum, replace the armature assembly.



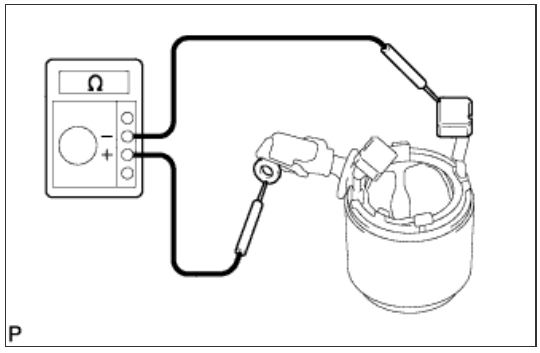
e. Measure the undercut depth of the commutator.

Standard undercut depth:
0.6 mm (0.0236 in.)

Minimum undercut depth:
0.2 mm (0.00787 in.)

If the undercut depth is less than the minimum, increase the depth using a hacksaw blade.

3. INSPECT STARTER YOKE ASSEMBLY



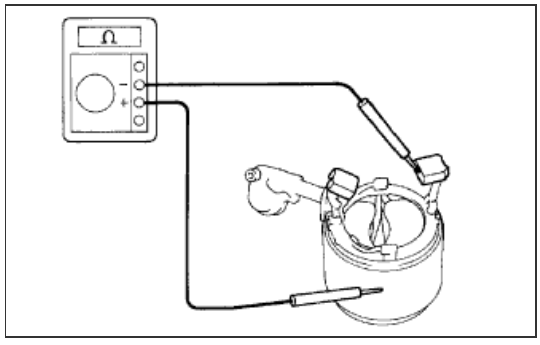
a. Inspect for an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal C wire - Brushes	Always	Below 1 Ω

If the result is not as specified, replace the starter yoke assembly.



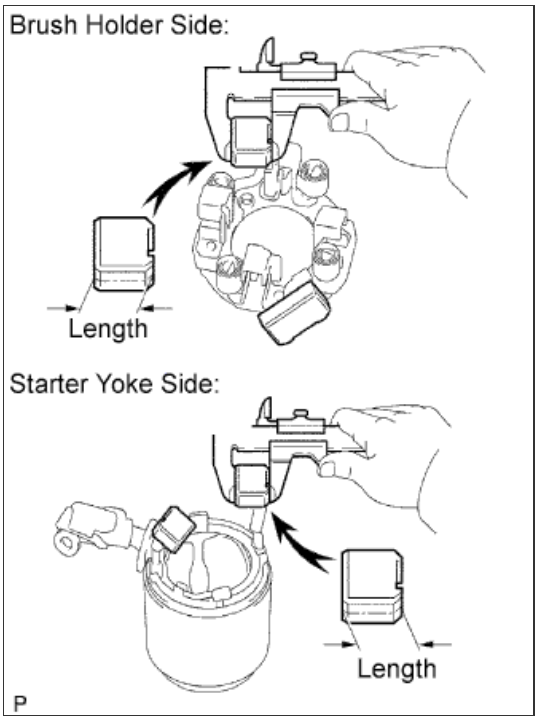
b. Inspect for a short circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Brushes - Starter yoke body	Always	10 kΩ or higher

If the result is not as specified, replace the starter yoke assembly.



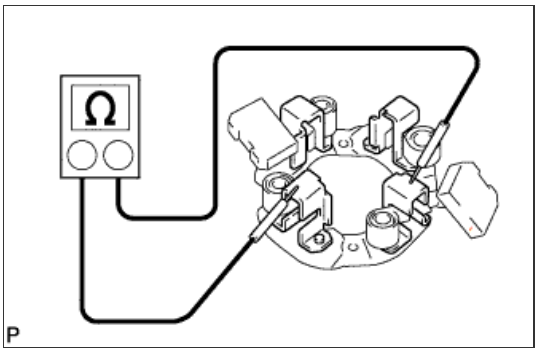
4. INSPECT BRUSH

a. Using a vernier caliper, measure the brush length.

Standard length:
15.5 mm (0.610 in.)

Minimum length:
8.5 mm (0.335 in.)

If the length is less than the minimum, replace the brush holder and starter yoke assembly.



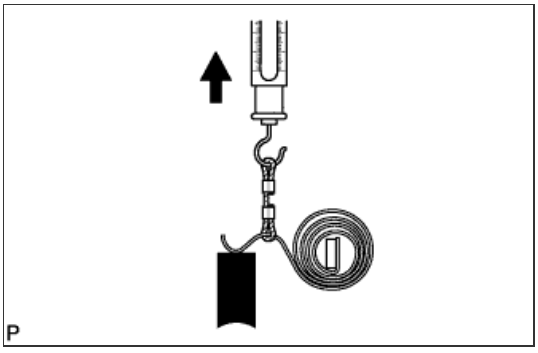
5. INSPECT STARTER BRUSH HOLDER ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive brush holder - Negative brush holder	Always	10 kΩ or higher

If the result is not as specified, replace the brush holder assembly.

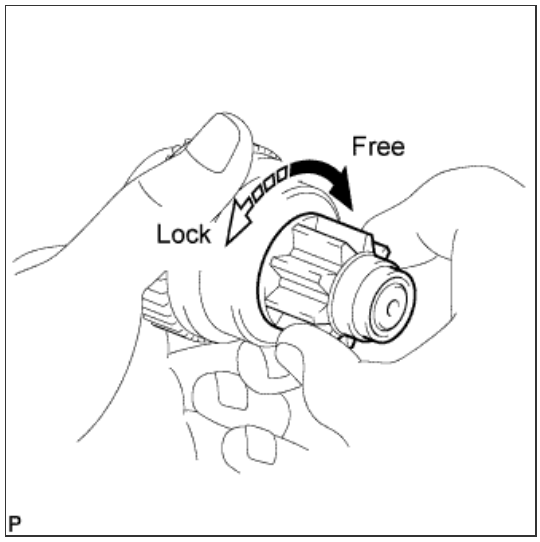


b. Inspect the load of the brush spring.

i. Take a pull scale reading immediately after the brush spring separates from the brush.

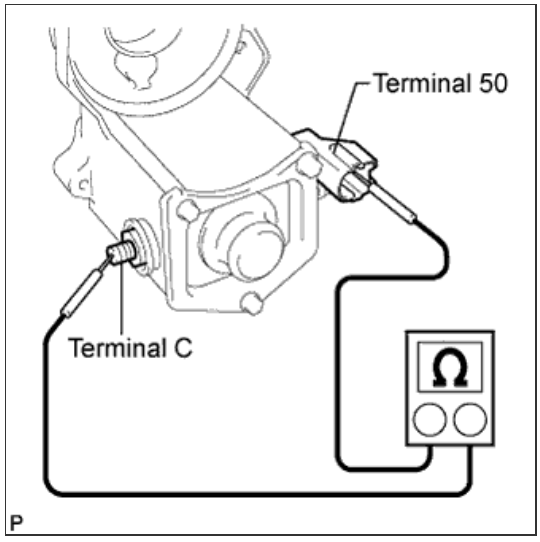
Standard spring installed load:
18 to 24 N (1.8 to 2.4 kgf, 4.0 to 5.3 lbf)

Minimum spring installed load:
12 N (1 kgf, 2.7 lbf)



If the installed load is less than the minimum, replace the brush holder assembly.

6. INSPECT STARTER CLUTCH SUB-ASSEMBLY

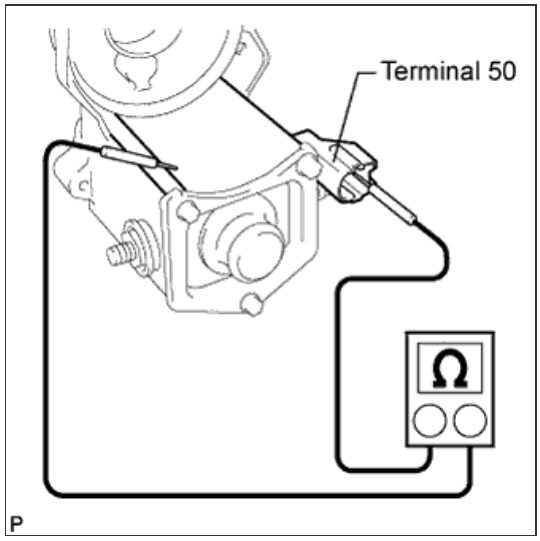


a. Check that the starter clutch cannot be rotated counterclockwise, and can be rotated clockwise.
If the starter clutch is not as specified, replace the starter clutch sub-assembly.

b. Turn the bearing by hand while applying inward force.
If resistance is felt or the bearing sticks, replace the starter clutch sub-assembly.

7. INSPECT MA NET STARTER SWITCH ASSEMBLY

a. Inspect the pull-in coil.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Terminal C	Always	Below 1 Ω

If the result is not as specified, replace the magnet starter switch assembly.

b. Inspect the holding coil.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Switch body	Always	Below 2 Ω

If the result is not as specified, replace the magnet starter switch assembly.

for Preparation Click here

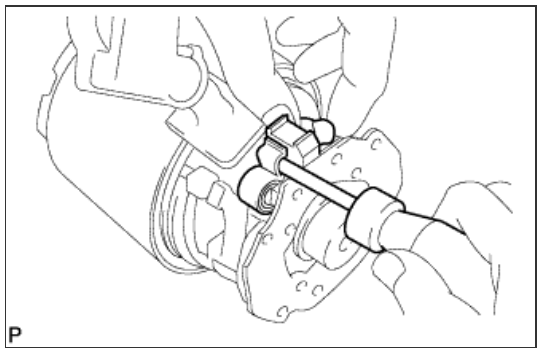
1. INSTALL STARTER ARMATURE ASSEMBLY

a. Install the starter armature to the starter yoke.

2. INSTALL STARTER BRUSH HOLDER ASSEMBLY

a. Install a new O-ring to the groove of the starter yoke.

b. Place the brush holder on the starter yoke.

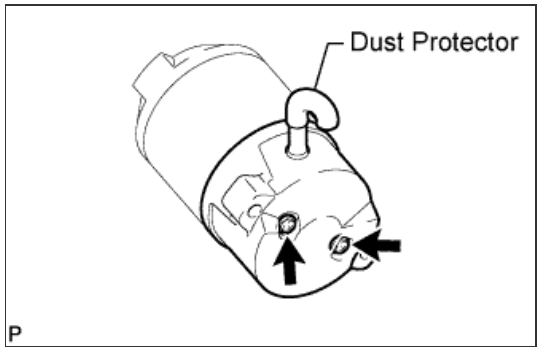


c. Using a screwdriver, hold the brush spring back.

d. Connect the brush to the brush holder.

e. Connect the 4 brushes.

NOTICE:



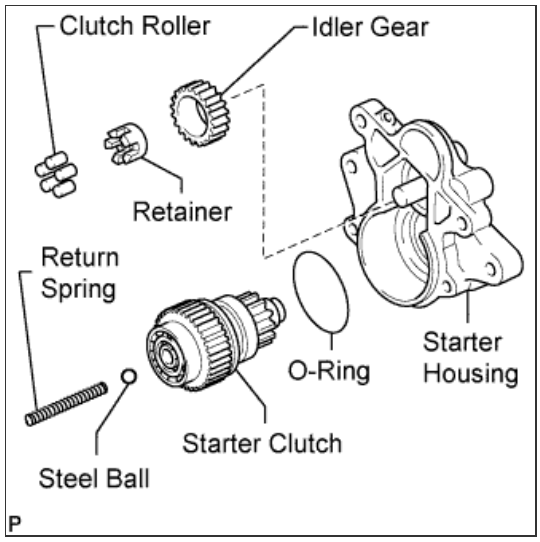
Check that the positive (+ lead wires are not grounded.

f. Install 2 new O-rings and the end cover with the 2 screws.

Torque:
1.5 N*m{ 15 kgf*cm , 13 in.*lbf }

g. Install the dust protector as shown in the illustration.

3. INSTALL STARTER CLUTCH SUB-ASSEMBLY

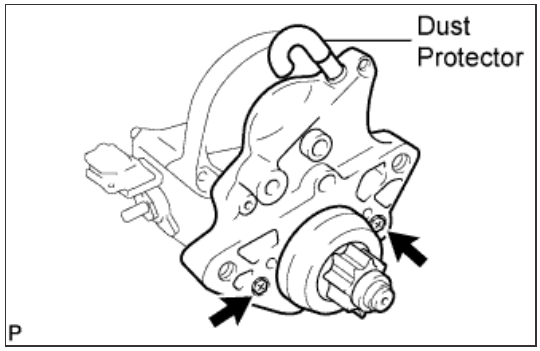


a. Apply grease to the steel ball, return spring, clutch roller, retainer and idler gear.

b. Install the steel ball.

c. Install a new O-ring to the starter housing.

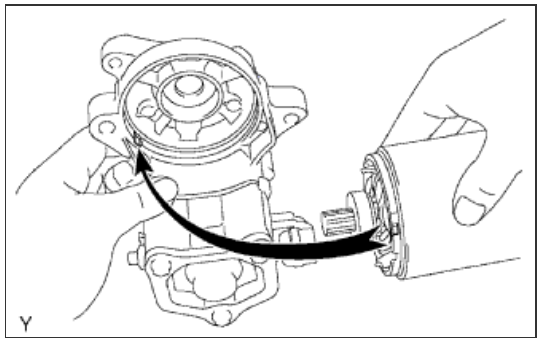
d. Insert the return spring into the magnet starter switch hole.



e. Install the starter clutch, idler gear, retainer and clutch roller.

f. Install the starter housing to the magnet starter switch with the 2 bolts.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

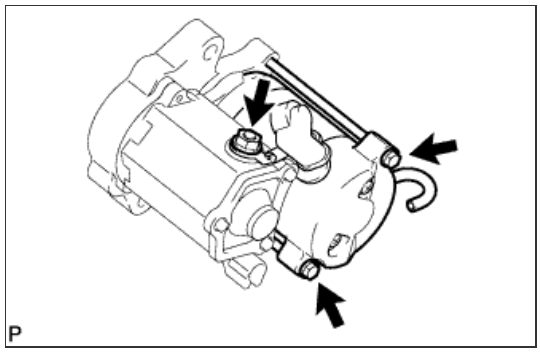


g. Install the dust protector as shown in the illustration.

4. INSTALL STARTER YOKE ASSEMBLY

a. Install a new O-ring to the groove of the starter yoke.

b. Align the protrusion of the starter yoke with the groove of the magnet starter switch.



c. Install the starter yoke with the 2 through bolts.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

d. Connect the lead wire to terminal C with the nut.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

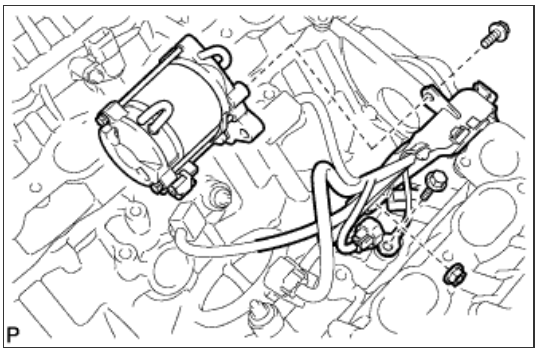
for Preparation Click here

1. INSTALL STARTER ASSEMBLY

a. Connect the starter wire with the nut.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

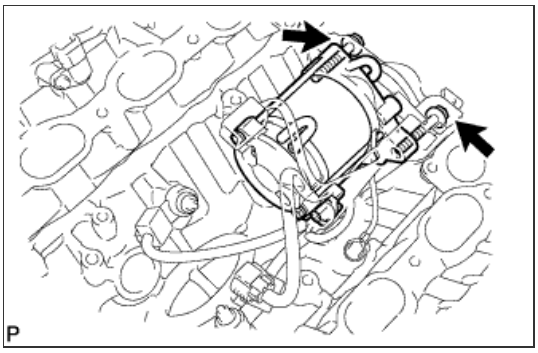
b. Connect the starter connector.



c. Connect the starter to the cylinder block.

d. Connect the ground wire with the bolt.

Torque:
17 N*m{ 173 kgf*cm , 13 ft.*lbf }

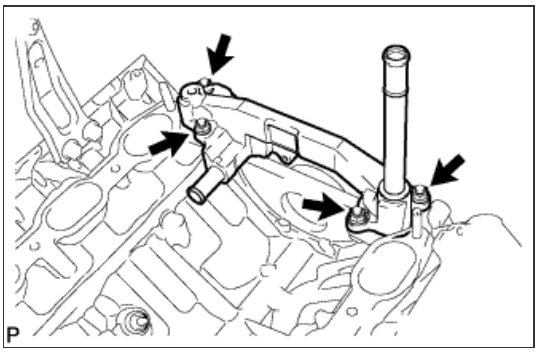


e. Connect the engine wire protector to the starter with the bolt.

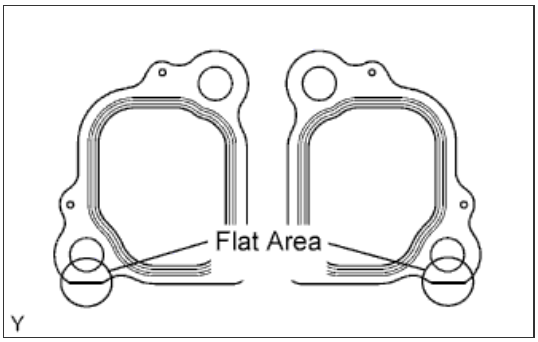
Torque:
17 N*m{ 173 kgf*cm , 13 ft.*lbf }

f. Install the starter with the 2 bolts.

Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }



2. INSTALL REAR WATER BY-PASS JOINT

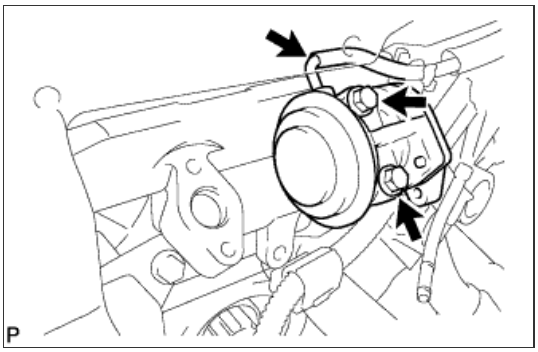


a. Install 2 new gaskets and the water by-pass joint with the 4 nuts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

HINT:

With the flat-bottom of each new gasket facing downward as shown in the illustration, install the 2 gaskets to the engine rear side.

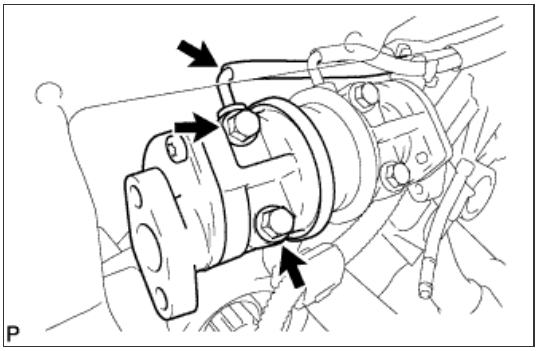


3. INSTALL NO. 1 AIR SWITCHING VALVE ASSEMBLY (eSondary Air Injection System)

a. Install a new gasket and the No. 1 air switching valve to the rear water by-pass joint with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Connect the vacuum switching valve hose to the No. 1 air switching valve.

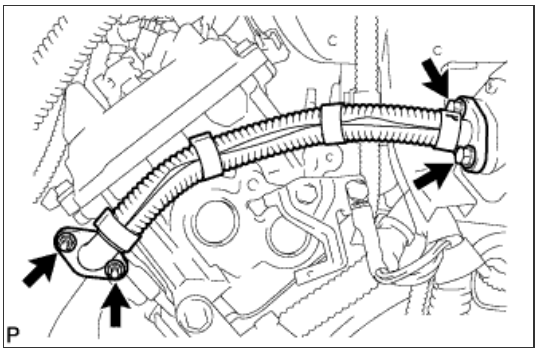


4. INSTALL NO. 2 AIR SWITCHING VALVE ASSEMBLY (eSondary Air Injection System)

a. Install a new gasket and the No. 2 air switching valve to the rear water by-pass joint with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Connect the vacuum switching valve hose to the No. 2 air switching valve.



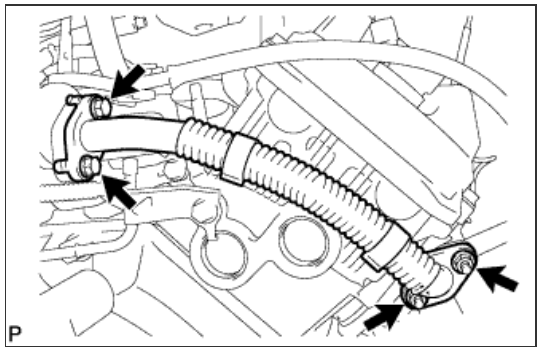
5. INSTALL NO. 3 AIR TUBE (eSondary Air Injection System)

a. Install a new gasket and connect the No. 3 air tube to the exhaust manifold with the 2 nuts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install a new gasket and connect the No. 3 air tube to the No. 2 air switching valve with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

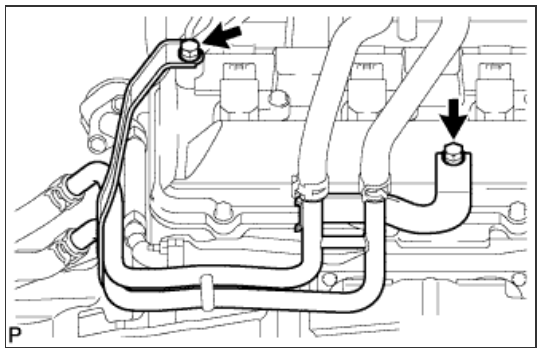


. INSTALL AIR TUBE SUB-ASSEMBLY RH (eSondary Air Injection System)

a. Install a new gasket and connect the air tube to the exhaust manifold with the 2 nuts.

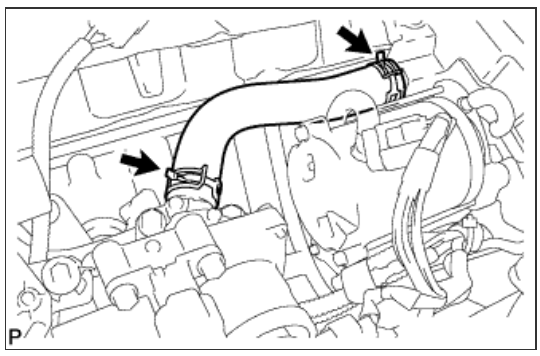
Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install a new gasket and connect the air tube to the No. 1 air switching valve with the 2 bolts.



Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

7. CONNECT NO. 1 WATER BY-PASS PIPE (o Air Cooled Transmission Oil Cooler)



a. Connect the water by-pass pipe to the cylinder head cover RH with the 2 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

8. INSTALL NO. 2 AIR INJECTION SYSTEM HOSE (econdary Air Injection System)

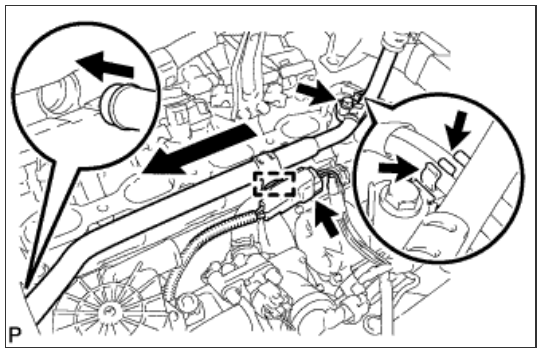
a. Install the hose.

9. INSTALL WATER BY-PASS PIPE SUB-ASSEMBLY

a. Apply soapy water to the O-ring.

b. Install a new O-ring to the water by-pass pipe.

c. Push in the water by-pass pipe.



d. Install the water by-pass pipe with the bolt.

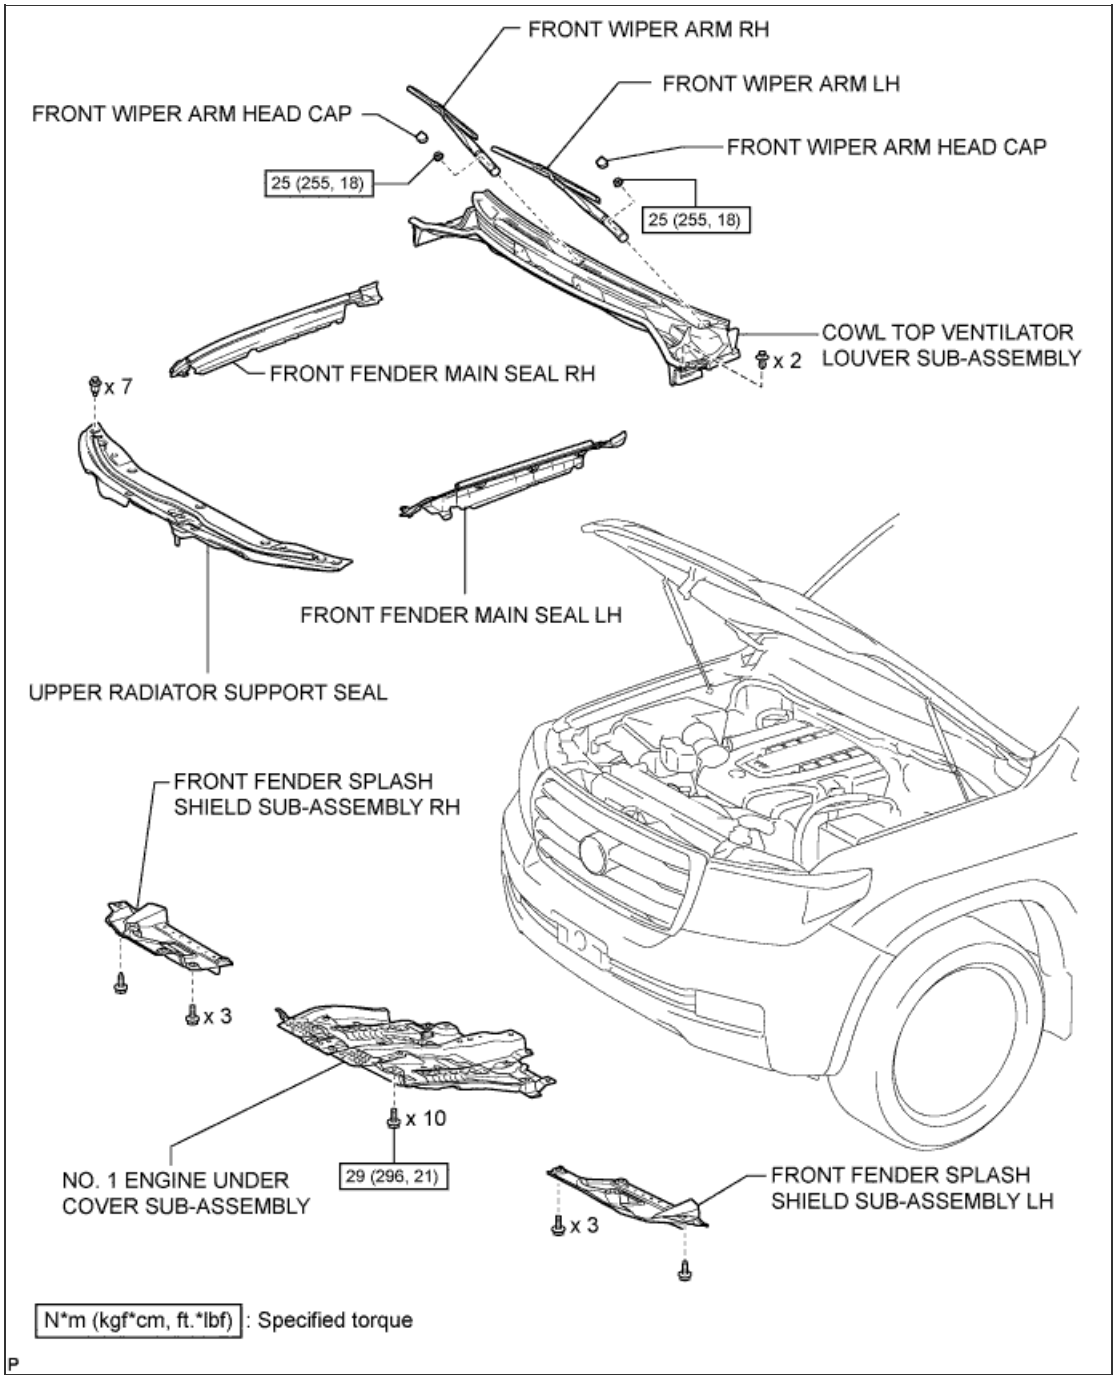
Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

e. Connect the 2 vacuum switching valve hoses to the water by-pass pipe clamp.

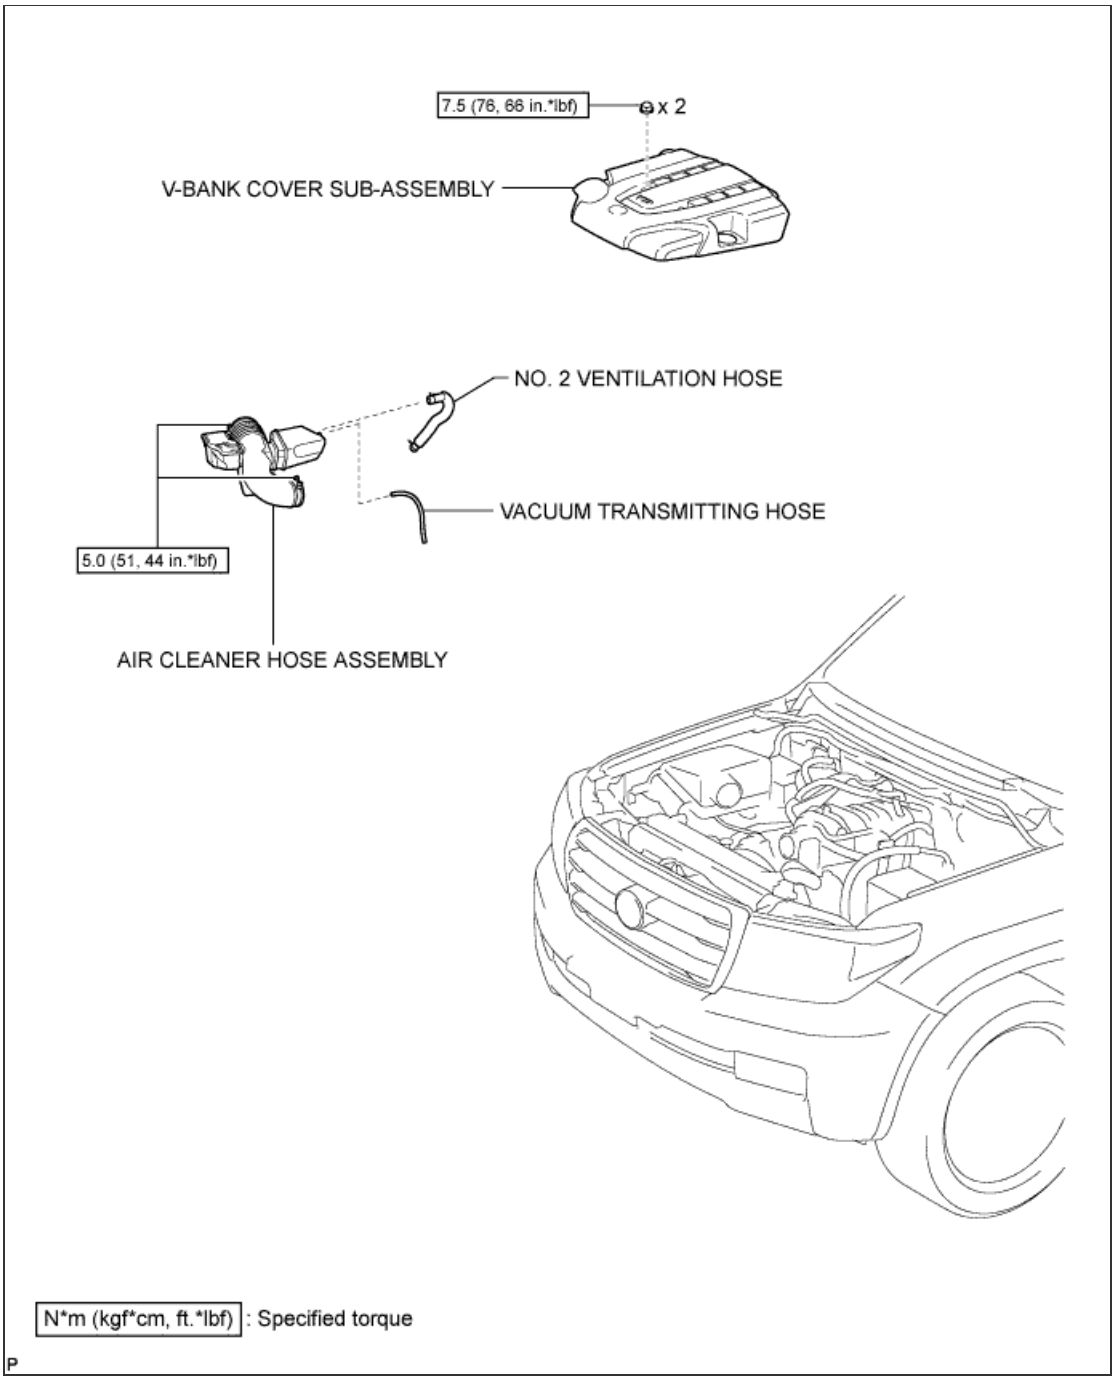
f. Connect the wire harness clamp.

g. Connect the connector.

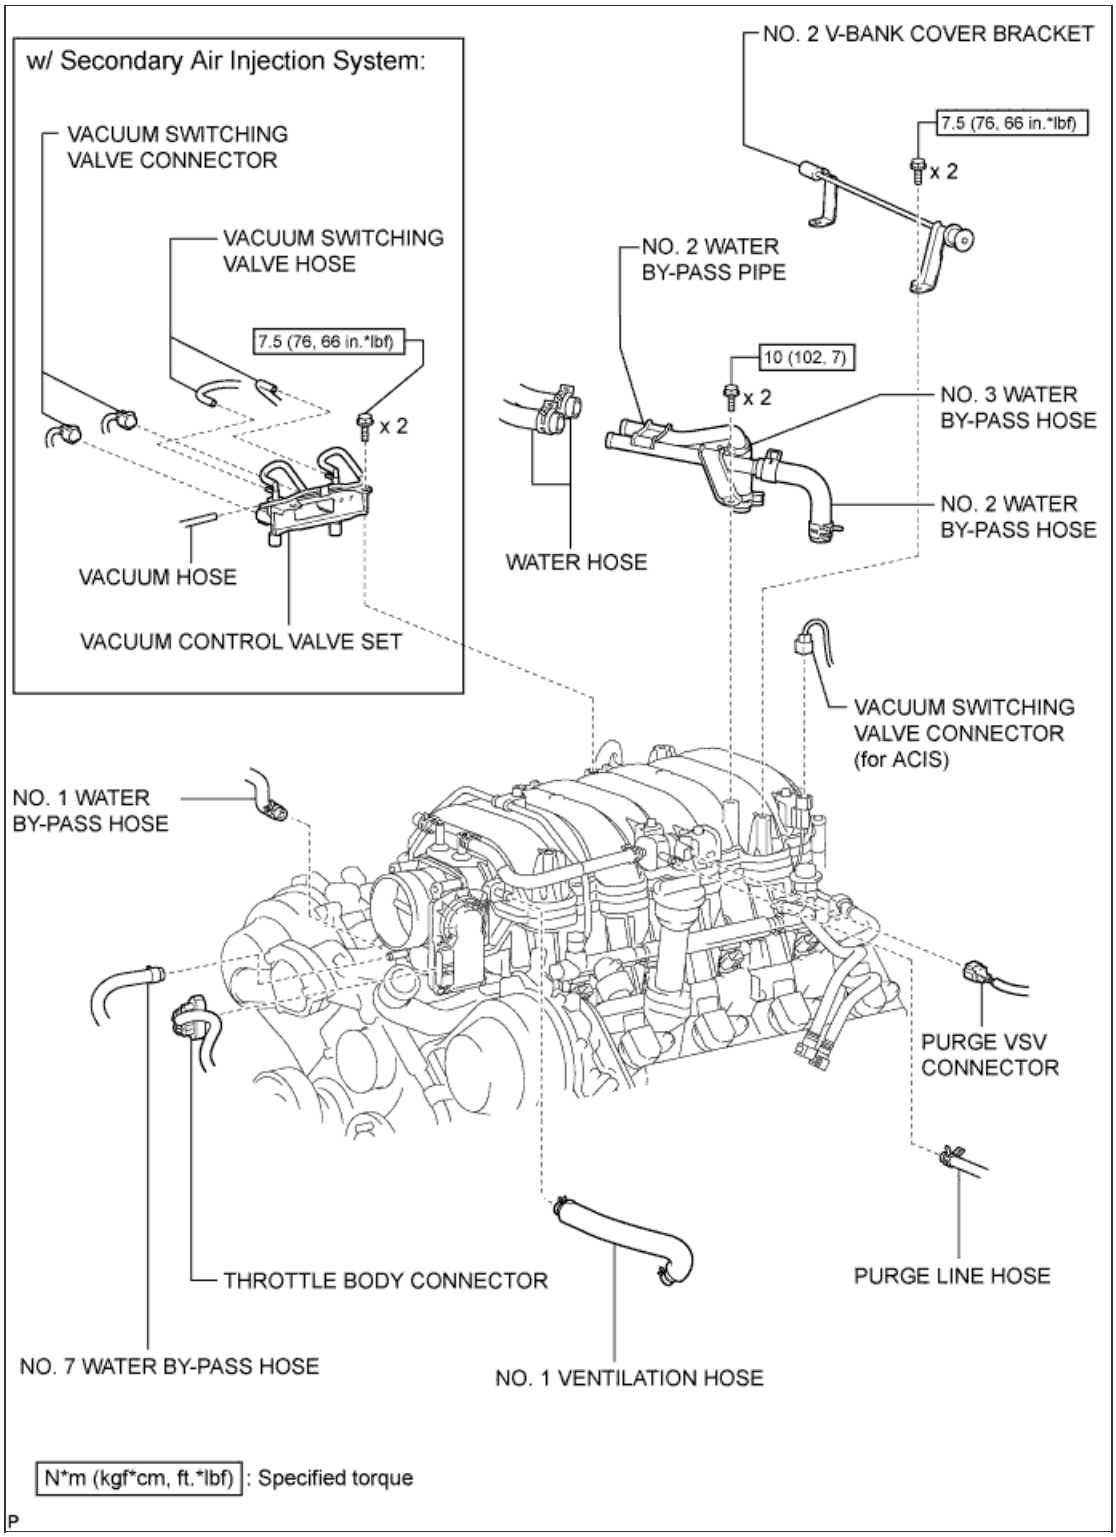
10. INSTALL INTAKE MANIFOLD



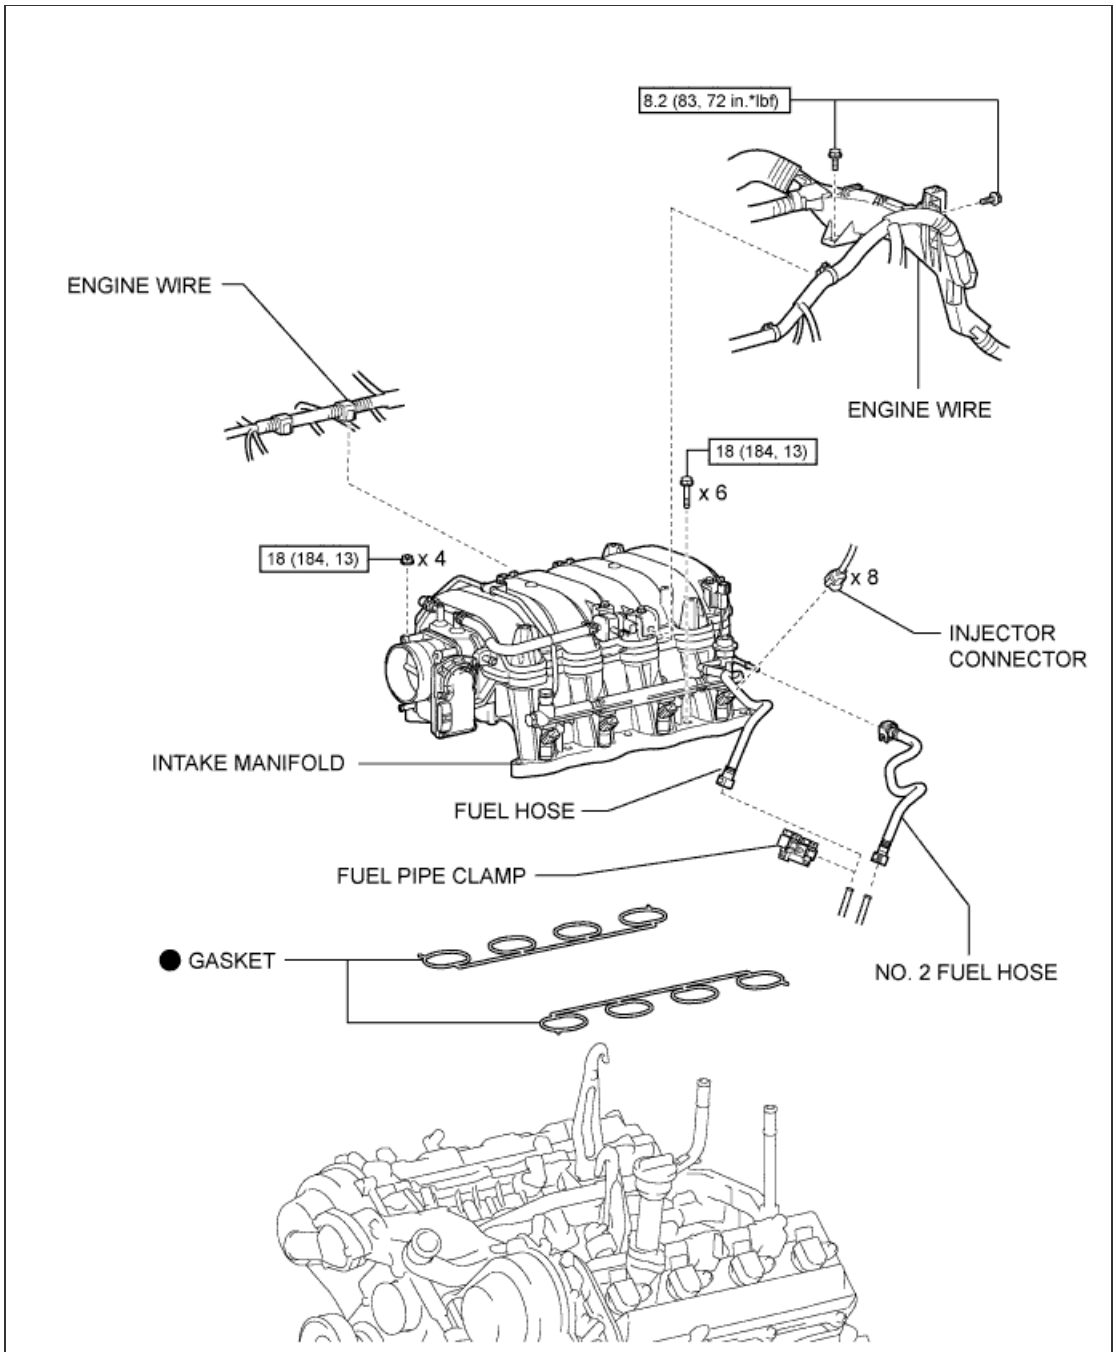
a. Install the intake manifold (Click here).



11. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



NOTICE:



When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

P

for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

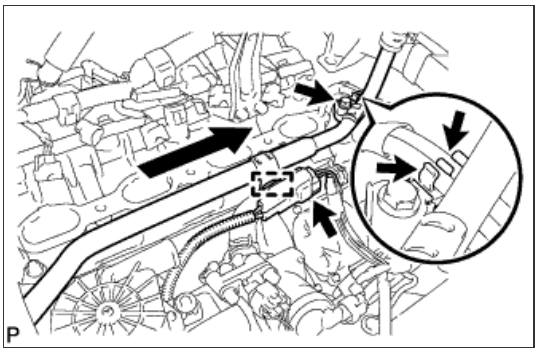
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

2. REMOVE INTAKE MANIFOLD

a. Remove the intake manifold (Click here).

3. REMOVE WATER BY-PASS PIPE SUB-ASSEMBLY

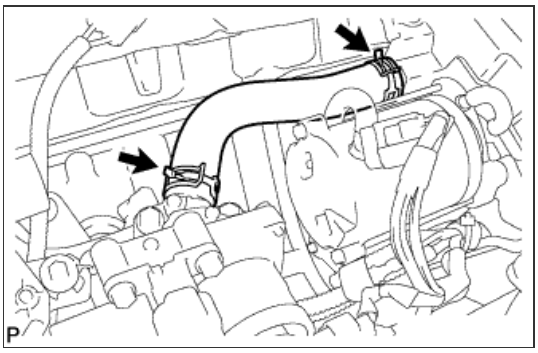
a. Disconnect the connector.



b. Disconnect the wire harness clamp from the water by-pass pipe.

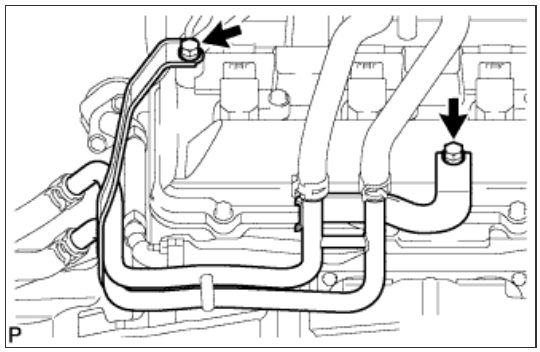
c. Disconnect the 2 vacuum switching valve hoses from the water by-pass pipe clamp.

d. Remove the bolt.



e. Pull out the water by-pass pipe.

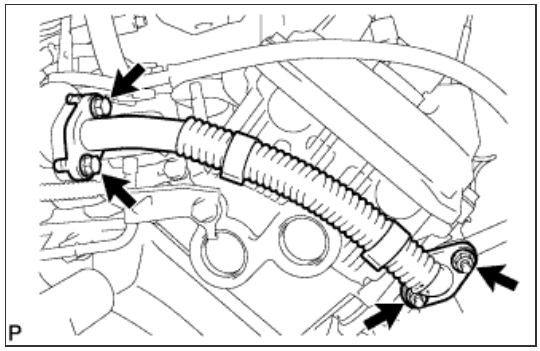
f. Remove the O-ring from the water by-pass pipe.



4. REMOVE NO. 2 AIR INJECTION SYSTEM HOSE (w/ Secondary Air Injection System)

a. Remove the No. 2 air injection system hose from the rear water by-pass joint and air switching valve.

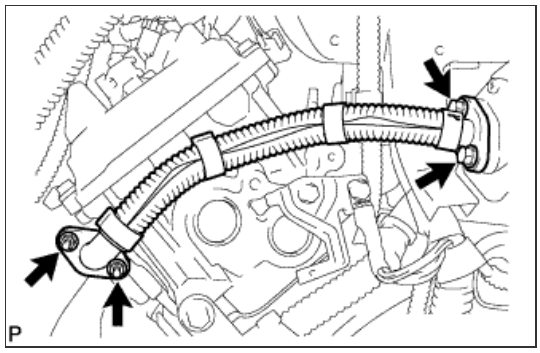
5. DISCONNECT NO. 1 WATER BY-PASS PIPE (w/o Air Cooled Transmission Oil Cooler)



a. Remove the 2 bolts and disconnect the water by-pass pipe from the cylinder head cover RH.

6. REMOVE AIR TUBE SUB-ASSEMBLY RH (w/ Secondary Air Injection System)

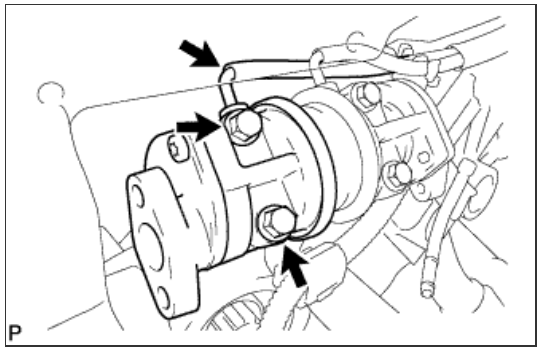
a. Remove the 2 bolts, 2 nuts and air tube sub-assembly.



b. Remove the 2 gaskets.

7. REMOVE NO. 3 AIR TUBE (w/ Secondary Air Injection System)

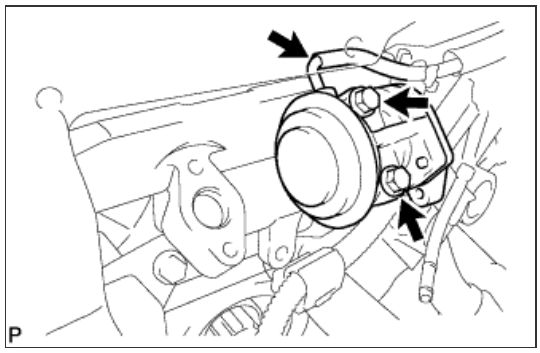
a. Remove the 2 bolts, 2 nuts and No. 3 air tube.



b. Remove the 2 gaskets.

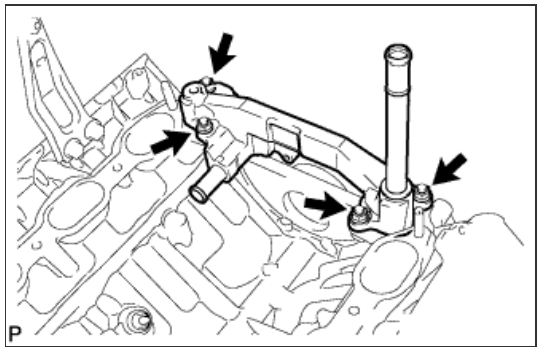
8. REMOVE NO. 2 AIR SWITCHING VALVE ASSEMBLY (w/ Secondary Air Injection System)

a. Remove the vacuum switching valve hose from the No. 2 air switching valve.



b. Remove the 2 bolts, gasket and No. 2 air switching valve from the rear water by-pass joint.

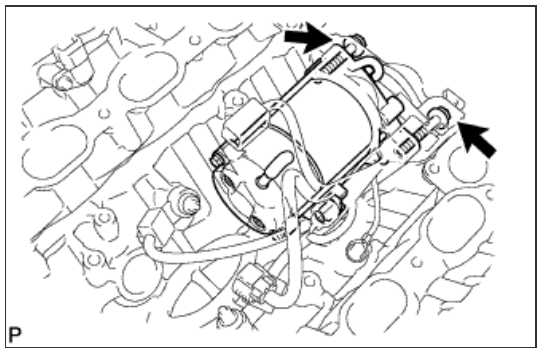
9. REMOVE NO. 1 AIR SWITCHING VALVE ASSEMBLY (w/ Secondary Air Injection System)



a. Remove the vacuum switching valve hose from the No. 1 air switching valve.

b. Remove the 2 bolts, gasket and No. 1 air switching valve from the rear water by-pass joint.

10. REMOVE REAR WATER BY-PASS JOINT

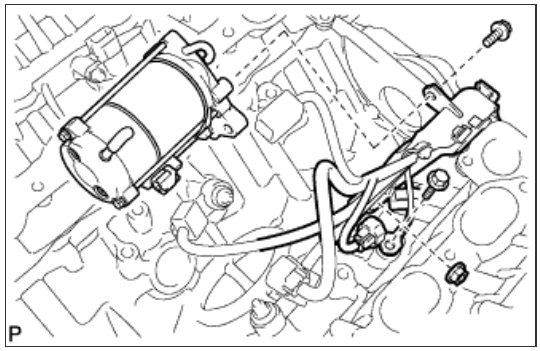


a. Remove the 4 nuts, water by-pass joint and 2 gaskets.

11. REMOVE STARTER ASSEMBLY

a. Remove the 2 bolts holding the starter to the cylinder block.

b. Disconnect the starter from the cylinder block.



c. Remove the bolt and disconnect the engine wire protector from the starter.

d. Remove the bolt and disconnect the ground wire.

e. Disconnect the starter connector.

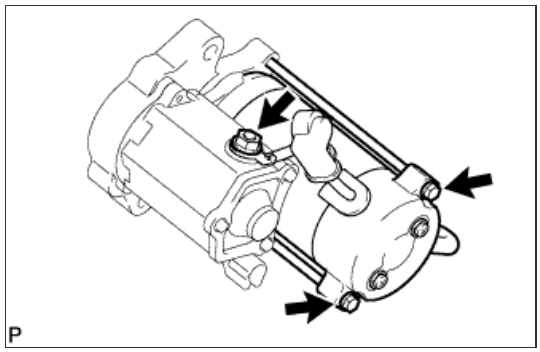
f. Remove the nut and disconnect the starter wire.

. Remove the starter.

for Preparation Click here

1. REMOVE STARTER DUST PROTECTOR

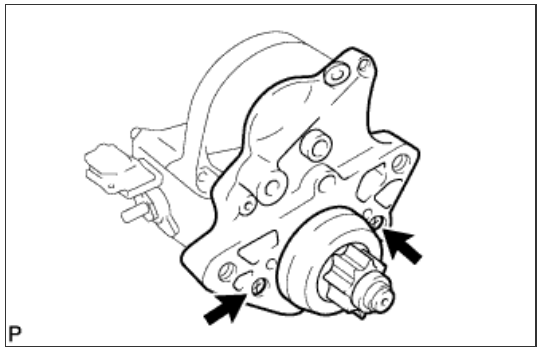
a. Remove the 2 dust protectors.



2. REMOVE STARTER YOKE ASSEMBLY

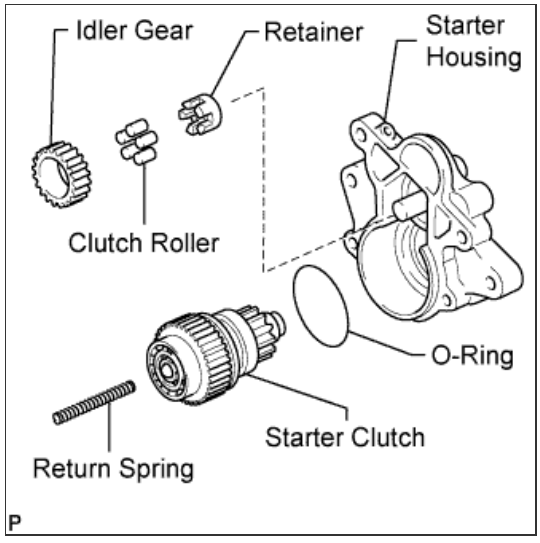
a. Remove the nut and disconnect the lead wire from terminal C.

b. Remove the 2 through bolts.



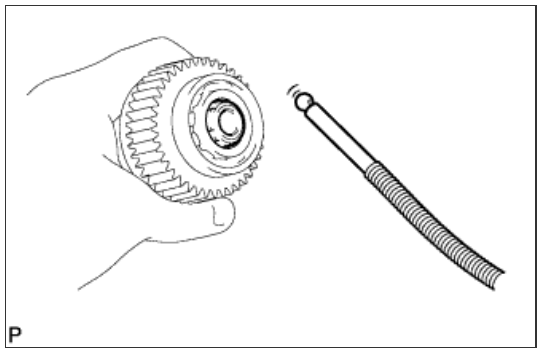
c. Pull out the starter yoke with the armature from the magnet starter switch.

d. Remove the O-ring from the starter yoke.



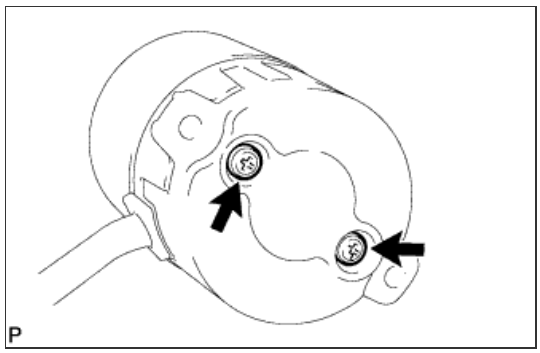
3. REMOVE STARTER CLUTCH SUB-ASSEMBLY

a. Remove the 2 screws.



b. Remove the return spring, idler gear, clutch roller, retainer, O-ring and starter clutch from the starter housing.

c. Using a magnetic finger, remove the steel ball from the clutch shaft hole.

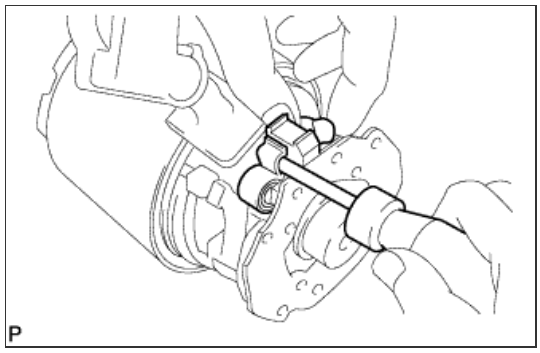


c. Using a magnetic finger, remove the steel ball from the clutch shaft hole.

4. REMOVE STARTER BRUSH HOLDER ASSEMBLY

a. Remove the 2 screws, 2 O-rings and starter commutator end frame from the starter yoke.

b. Remove the O-ring from the starter yoke.



c. Using a screwdriver, hold the spring back and disconnect the brush from the brush holder.

d. Disconnect the 4 brushes and remove the brush holder.

OTICE:

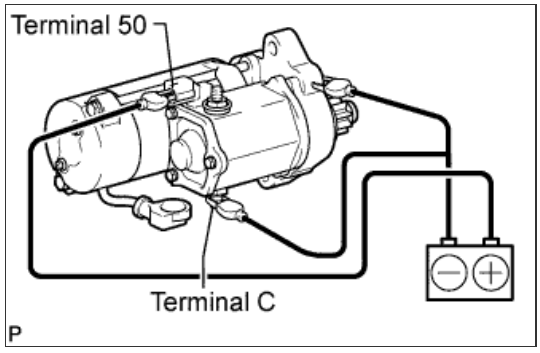
Check that the positive (+) lead wires are not grounded.

5. REMOVE STARTER ARMATURE ASSEMBLY

a. Remove the starter armature from the starter yoke.

for Preparation Click here

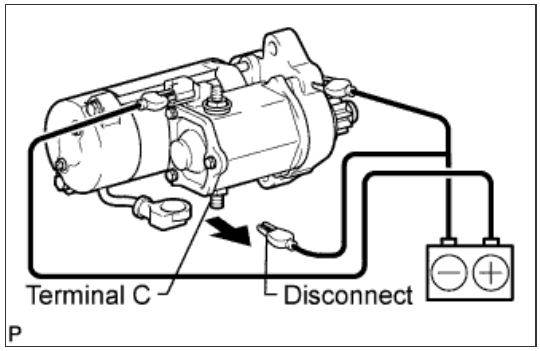
1. INSPECT STARTER ASSEMBLY



NOTICE:

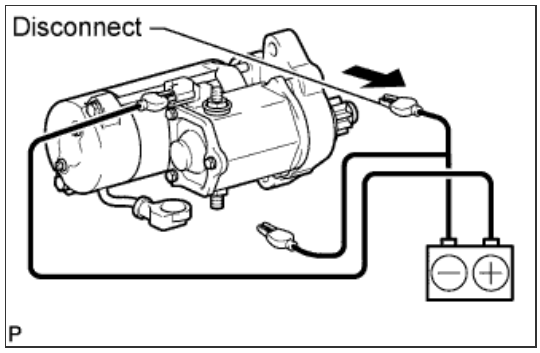
The following tests must be done within 3 to 5 seconds to prevent the coil from burning out.

a. Perform the pull-in test.



i. Remove the nut, then disconnect the lead wire from terminal C.

ii. Connect the battery to the magnet starter switch as shown in the illustration. Check that the clutch pinion gear moves outward.
If the clutch pinion gear does not move, replace the magnet starter switch assembly.



b. Perform the holding test.

i. With the battery connected as above with the clutch pinion gear out, disconnect the negative (-) lead from terminal C. Check that the pinion gear remains out.
If the clutch pinion gear returns inward, replace the magnet starter switch assembly.

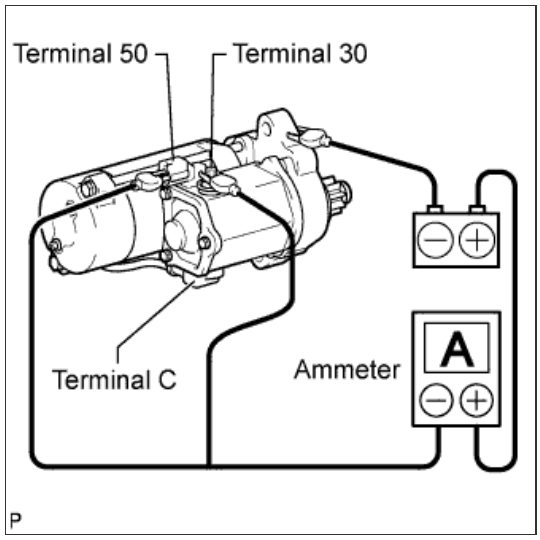
c. Inspect the clutch pinion gear return.

i. Disconnect the negative (-) lead from the starter housing. Check that the clutch pinion gear returns inward.
If the clutch pinion gear does not return inward, replace the magnet starter switch assembly.

d. Perform the operation test without load.

i. Connect the field coil lead wire to terminal C.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }



ii. Grip the starter in a vise.

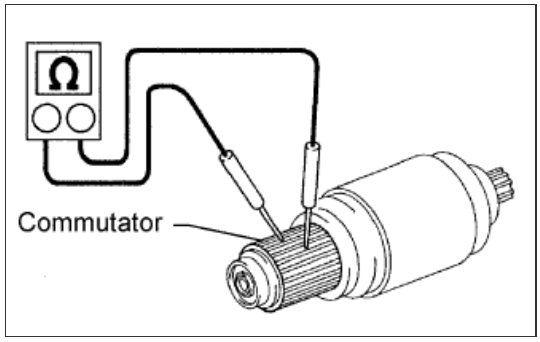
iii. Connect the battery and an ammeter to the starter as shown.

iv. Check that the starter rotates smoothly and steadily while the pinion gear is moving out. Then measure the current.

Standard current:
100 A or less at 11.5 V

If the result is not as specified, replace the starter assembly.

2. INSPECT STARTER ARMATURE ASSEMBLY



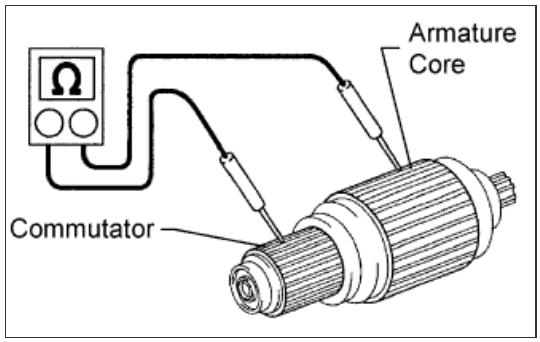
a. Inspect the commutator for an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator	Always	Below 1 Ω

If the result is not as specified, replace the armature assembly.



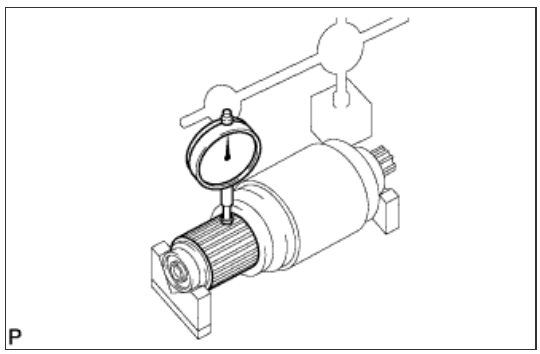
b. Inspect the commutator for a short circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator - Armature core	Always	10 kΩ or higher

If the result is not as specified, replace the armature assembly.



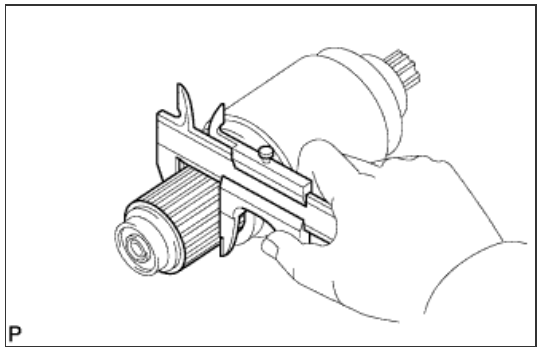
c. Inspect the commutator circle runout.

i. Place the commutator on V-blocks.

ii. Using a dial indicator, measure the circle runout.

Maximum circle runout:
0.05 mm (0.00197 in.)

If the runout is more than the maximum, correct it with sandpaper (#400) or replace the armature assembly.

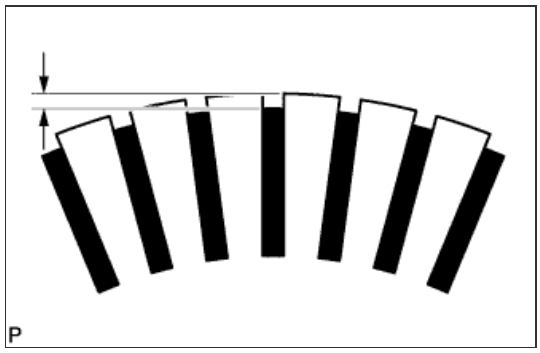


d. Using a vernier caliper, measure the commutator diameter.

Standard diameter:
35.0 mm (1.38 in.)

Minimum diameter:
34.0 mm (1.34 in.)

If the diameter is less than the minimum, replace the armature assembly.



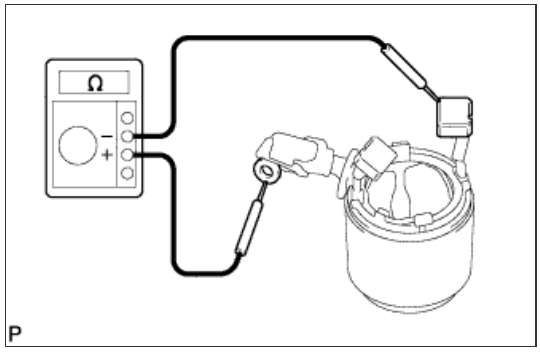
e. Measure the undercut depth of the commutator.

Standard undercut depth:
0.7 mm (0.0276 in.)

Minimum undercut depth:
0.2 mm (0.00787 in.)

If the undercut depth is less than the minimum, increase the depth using a hacksaw blade.

3. INSPECT STARTER YOKE ASSEMBLY



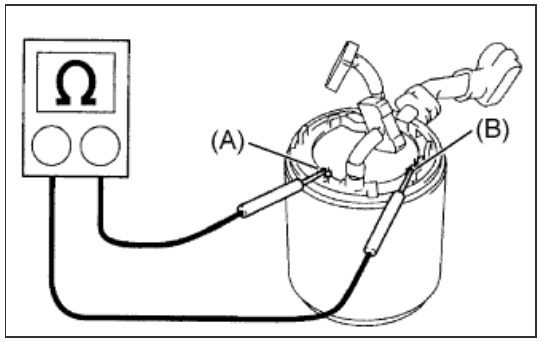
a. Inspect for an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal C wire - Brushes	Always	Below 1 Ω

If the result is not as specified, replace the starter yoke assembly.



b. Inspect the shunt coil for an open circuit.

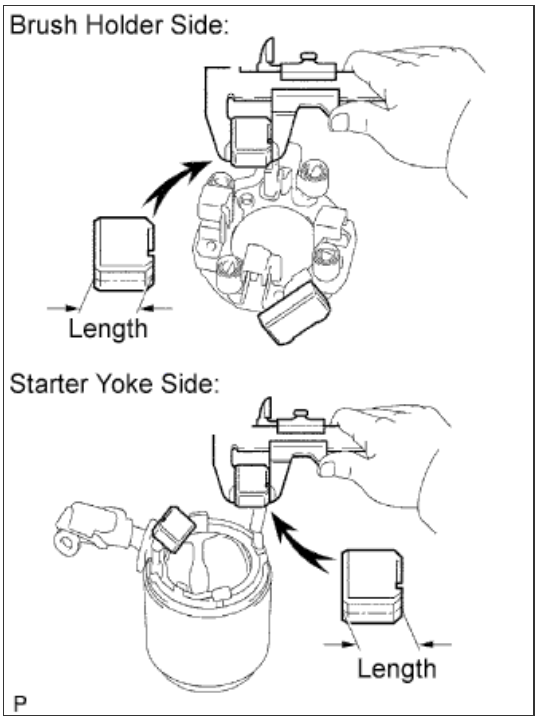
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal (A) - Terminal (B)	20°C (68°F)	1.5 to 1.9 Ω

If the result is not as specified, replace the starter yoke assembly.

4. INSPECT BRUSH



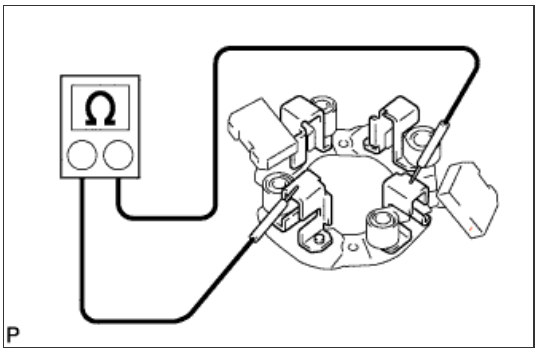
a. Using a vernier caliper, measure the brush length.

Standard length:

15.0 mm (0.591 in.)

Minimum length:
9.0 mm (0.354 in.)

If the length is less than the minimum, replace the brush holder and starter yoke assembly.



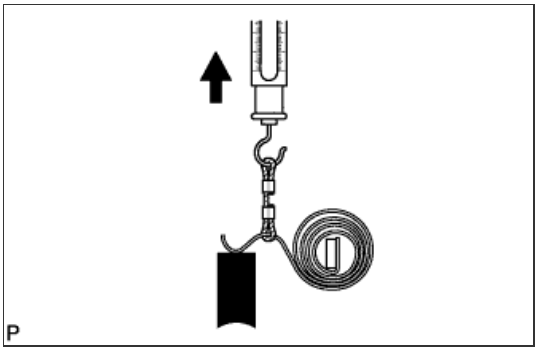
5. INSPECT STARTER BRUSH HOLDER ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive brush holder - Negative brush holder	Always	10 kΩ or higher

If the result is not as specified, replace the brush holder assembly.

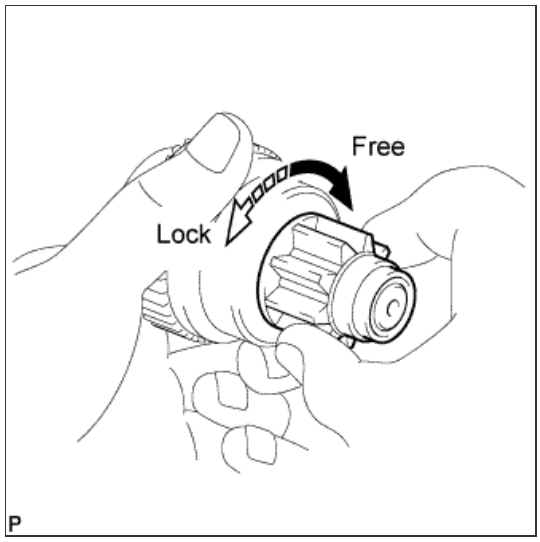


b. Inspect the load of the brush spring.

i. Take a pull scale reading immediately after the brush spring separates from the brush.

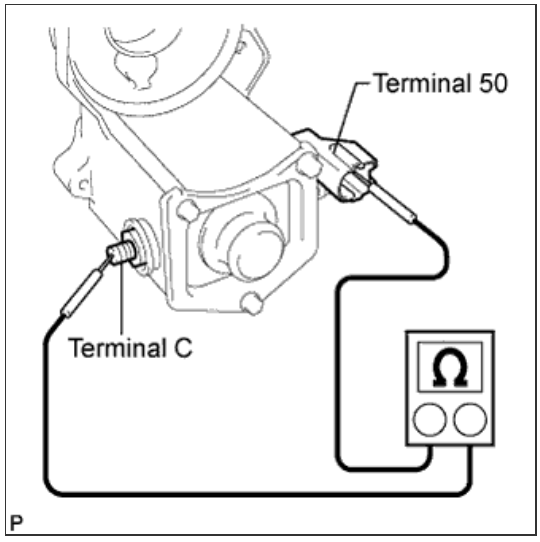
Standard spring installed load:
22 to 28 N (2 to 3 kgf, 4.9 to 6.3 lbf)

Minimum spring installed load:
13 N (1 kgf, 2.9 lbf)



If the spring load is less than the minimum, replace the brush holder assembly.

6. INSPECT STARTER CLUTCH SUB-ASSEMBLY

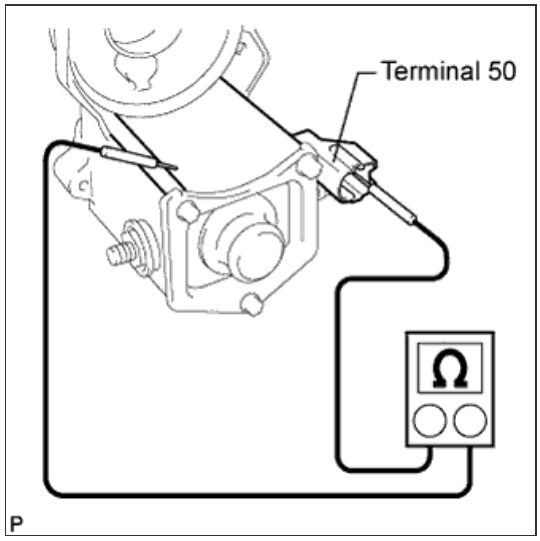


a. Check that the starter clutch cannot be rotated counterclockwise, and can be rotated clockwise.
If the starter clutch is not as specified, replace the starter clutch sub-assembly.

b. Turn the bearing by hand while applying inward force.
If resistance is felt or the bearing sticks, replace the starter clutch sub-assembly.

7. INSPECT MA NET STARTER SWITCH ASSEMBLY

a. Inspect the pull-in coil.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Terminal C	Always	Below 1 Ω

If the result is not as specified, replace the magnet starter switch assembly.

b. Inspect the holding coil.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal 50 - Switch body	Always	Below 2 Ω

If the result is not as specified, replace the magnet starter switch assembly.

for Preparation Click here

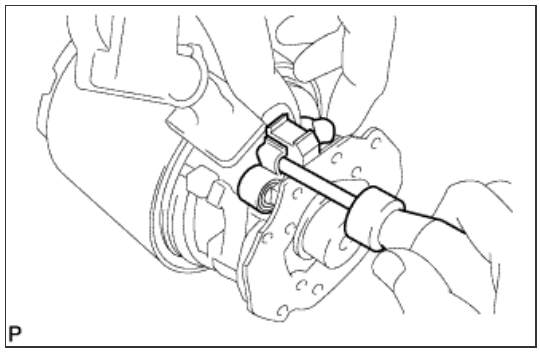
1. INSTALL STARTER ARMATURE ASSEMBLY

a. Install the starter armature to the starter yoke.

2. INSTALL STARTER BRUSH HOLDER ASSEMBLY

a. Install a new O-ring to the groove of the starter yoke.

b. Place the brush holder on the starter yoke.

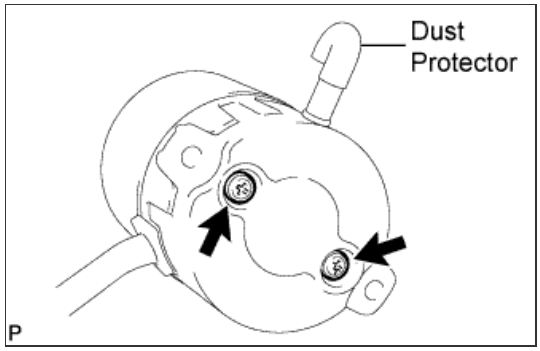


c. Using a screwdriver, hold the brush spring back.

d. Connect the brush to the brush holder.

e. Connect the 4 brushes.

NOTICE:



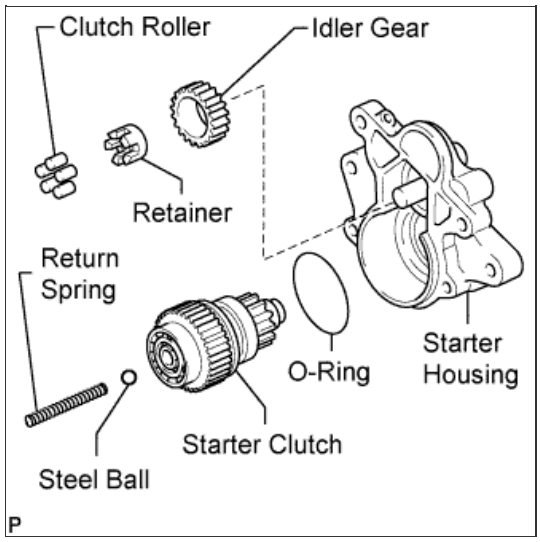
Check that the positive (+ lead wires are not grounded.

f. Install 2 new O-rings and the starter commutator end cover with the 2 screws.

Torque:
3.8 N*m{ 39 kgf*cm , 34 in.*lbf }

g. Install the dust protector as shown in the illustration.

3. INSTALL STARTER CLUTCH SUB-ASSEMBLY

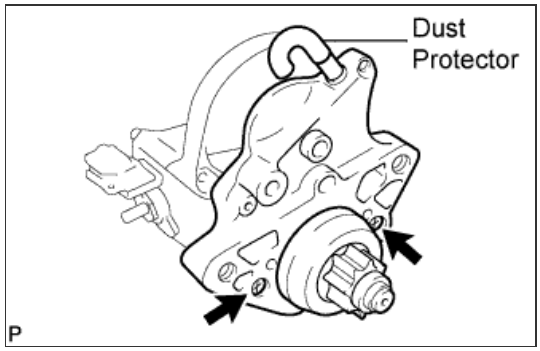


a. Apply grease to the steel ball, return spring, clutch roller, retainer and idler gear.

b. Install the steel ball.

c. Install a new O-ring to the starter housing.

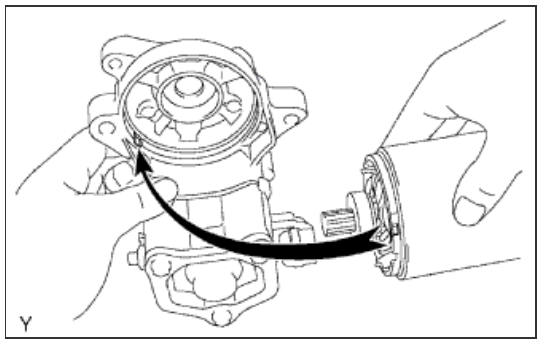
d. Insert the return spring into the magnet starter switch hole.



e. Install the starter clutch, idler gear, retainer and clutch roller.

f. Install the starter housing to the magnet starter switch with the 2 screws.

Torque:
9.3 N*m{ 95 kgf*cm , 82 in.*lbf }

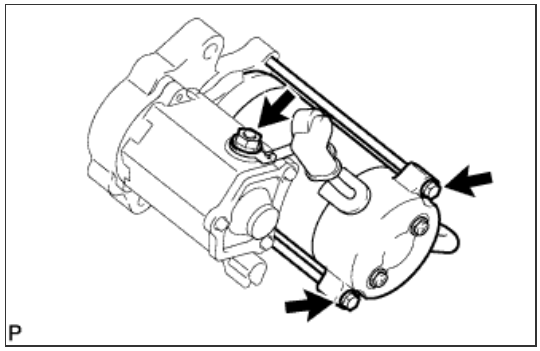


g. Install the dust protector as shown in the illustration.

4. INSTALL STARTER YOKE ASSEMBLY

a. Install a new O-ring to the groove of the starter yoke.

b. Align the protrusion of the starter yoke with the groove of the magnet starter switch.



c. Install the starter yoke with the 2 through bolts.

Torque:
9.3 N*m{ 95 kgf*cm , 82 in.*lbf }

d. Connect the lead wire to the magnet starter switch terminal with the nut.

Torque:
5.9 N*m{ 60 kgf*cm , 52 in.*lbf }

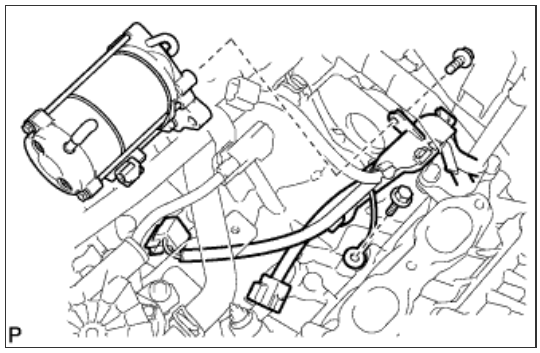
for Preparation Click here

1. INSTALL STARTER ASSEMBLY

a. Connect the starter wire with the nut.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }

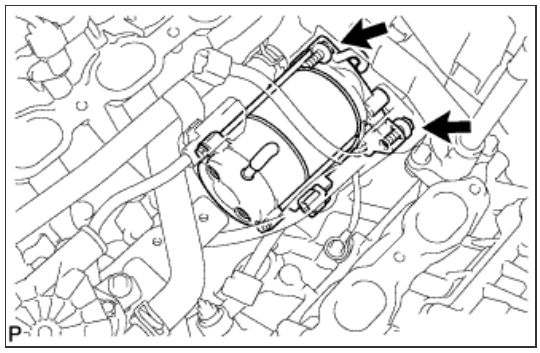
b. Connect the starter connector.



c. Connect the starter to the cylinder block.

d. Connect the ground wire with the bolt.

Torque:
17 N*m{ 173 kgf*cm , 13 ft.*lbf }

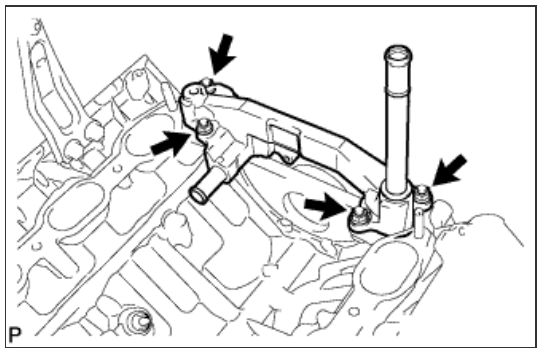


e. Connect the engine wire protector to the starter with the bolt.

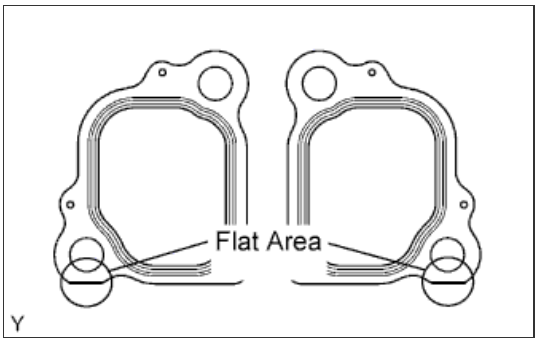
Torque:
17 N*m{ 173 kgf*cm , 13 ft.*lbf }

f. Install the starter with the 2 bolts.

Torque:
25 N*m{ 255 kgf*cm , 18 ft.*lbf }



2. INSTALL REAR WATER BY-PASS JOINT

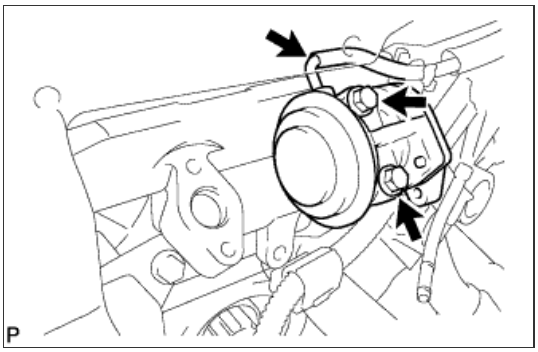


a. Install 2 new gaskets and the water by-pass joint with the 4 nuts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

HINT:

With the flat-bottom of each new gasket facing downward as shown in the illustration, install the 2 gaskets to the engine rear side.

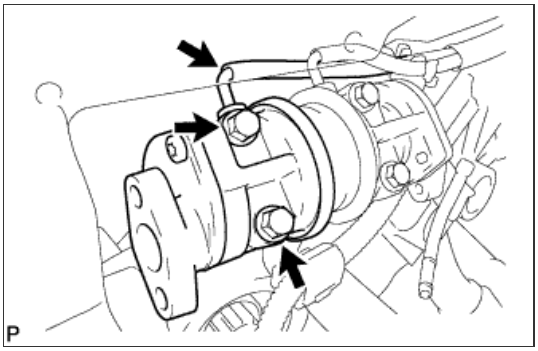


3. INSTALL NO. 1 AIR SWITCHING VALVE ASSEMBLY (eSondary Air Injection System)

a. Install a new gasket and the No. 1 air switching valve to the rear water by-pass joint with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Connect the vacuum switching valve hose to the No. 1 air switching valve.

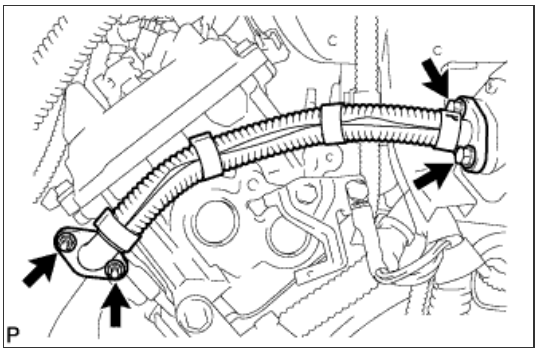


4. INSTALL NO. 2 AIR SWITCHING VALVE ASSEMBLY (eSondary Air Injection System)

a. Install a new gasket and the No. 2 air switching valve to the rear water by-pass joint with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Connect the vacuum switching valve hose to the No. 2 air switching valve.



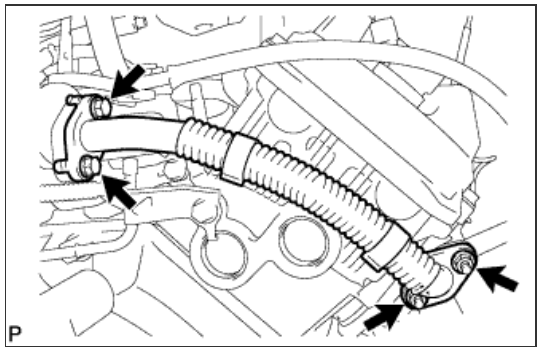
5. INSTALL NO. 3 AIR TUBE (eSondary Air Injection System)

a. Install a new gasket and connect the No. 3 air tube to the exhaust manifold with the 2 nuts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install a new gasket and connect the No. 3 air tube to the No. 2 air switching valve with the 2 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

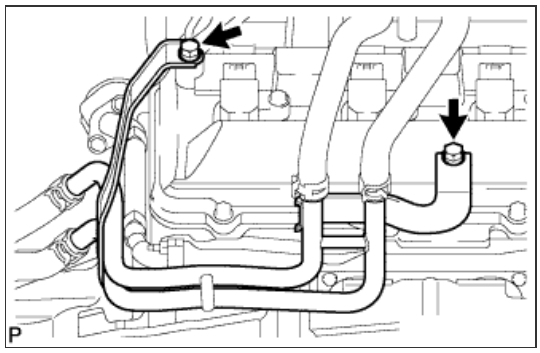


. INSTALL AIR TUBE SUB-ASSEMBLY RH (eSondary Air Injection System)

a. Install a new gasket and connect the air tube to the exhaust manifold with the 2 nuts.

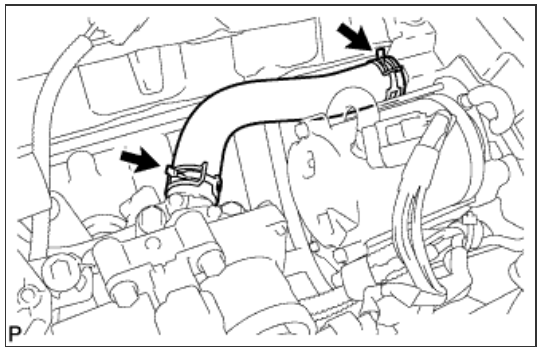
Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install a new gasket and connect the air tube to the No. 1 air switching valve with the 2 bolts.



Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

7. CONNECT NO. 1 WATER BY-PASS PIPE (eSondary Air Injection System)



a. Connect the water by-pass pipe to the cylinder head cover RH with the 2 bolts.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

8. INSTALL NO. 2 AIR INJECTION SYSTEM HOSE (eSondary Air Injection System)

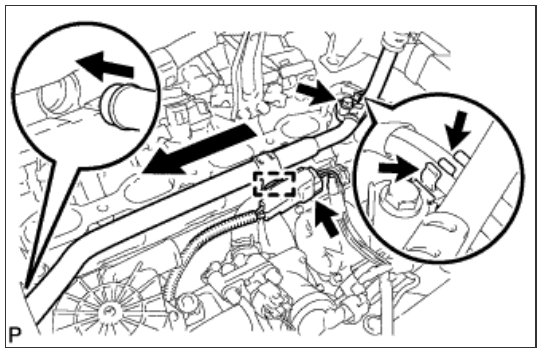
a. Install the hose.

9. INSTALL WATER BY-PASS PIPE SUB-ASSEMBLY

a. Apply soapy water to the O-ring.

b. Install a new O-ring to the water by-pass pipe.

c. Push in the water by-pass pipe.



d. Install the water by-pass pipe with the bolt.

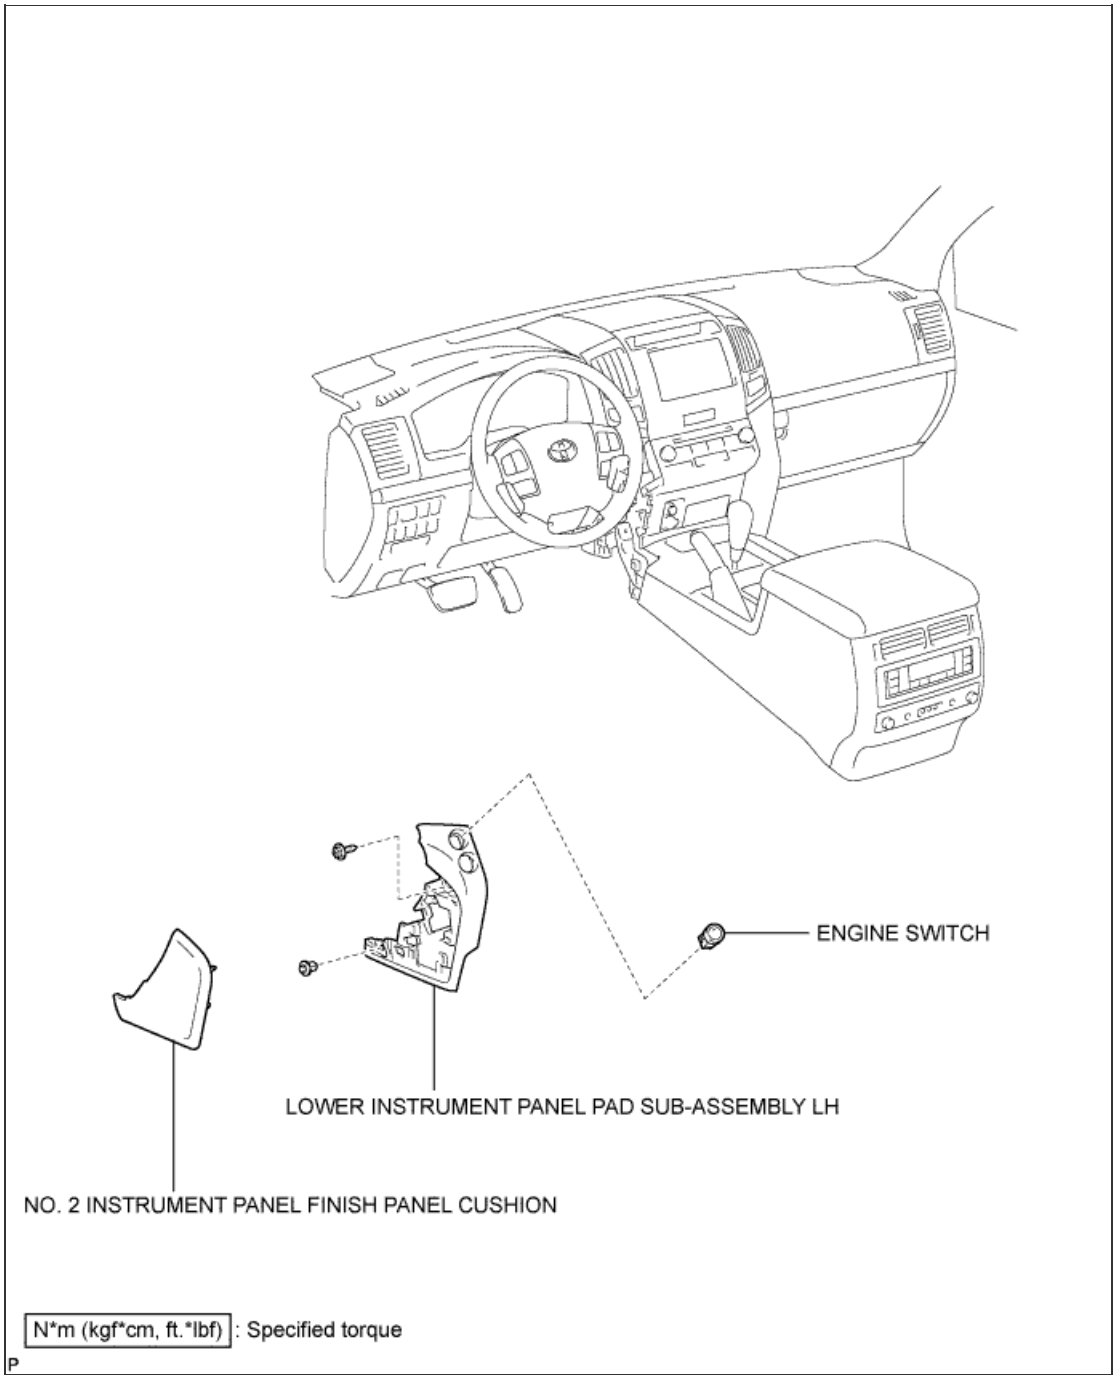
Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

e. Connect the 2 vacuum switching valve hoses to the water by-pass pipe clamp.

f. Connect the wire harness clamp.

g. Connect the connector.

10. INSTALL INTAKE MANIFOLD



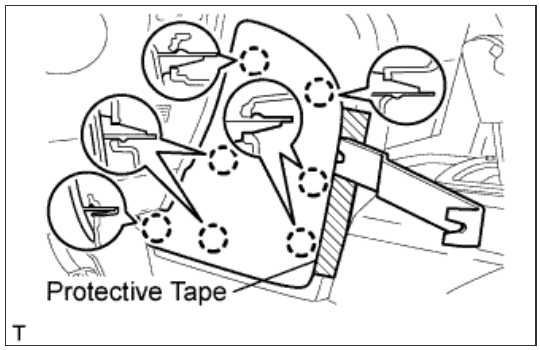
a. Install the intake manifold (Click here).

11. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

for Preparation Click here

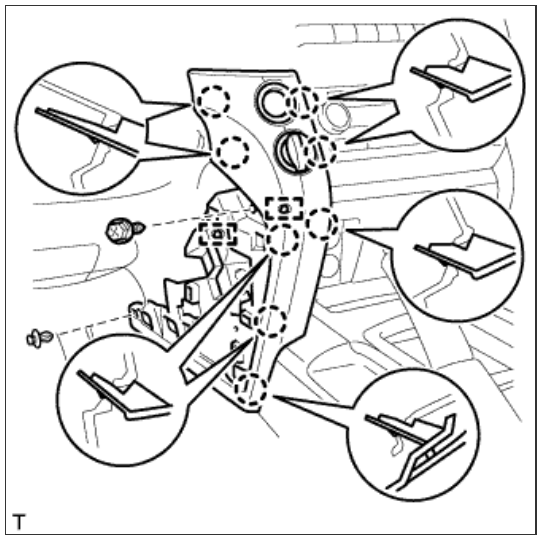


for Preparation Click here

1. REMOVE NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Place protective tape as shown in the illustration.

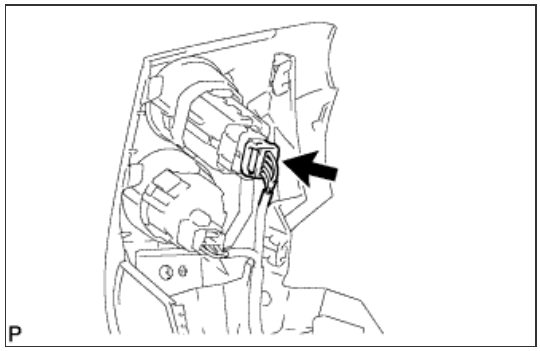
b. Using a moulding remover, detach the 7 claws and remove the panel cushion.



2. REMOVE LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

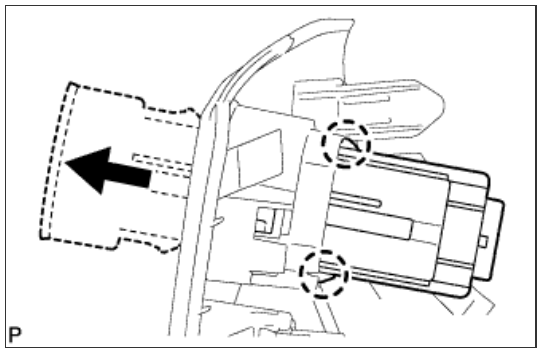
a. Remove the clip.

b. Remove the screw.



c. Detach the 8 claws.

d. Remove the panel pad and disconnect the connectors and 2 clamps.

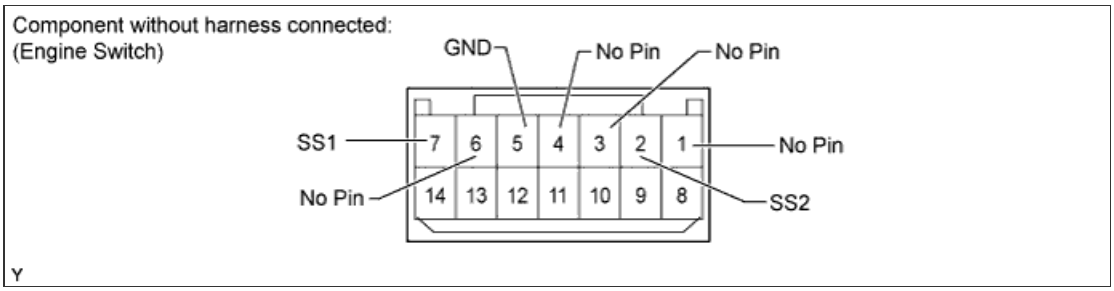


3. REMOVE ENGINE SWITCH

a. Disconnect the switch connector.

b. Detach the 2 claws and remove the switch.

P



for Preparation Click here

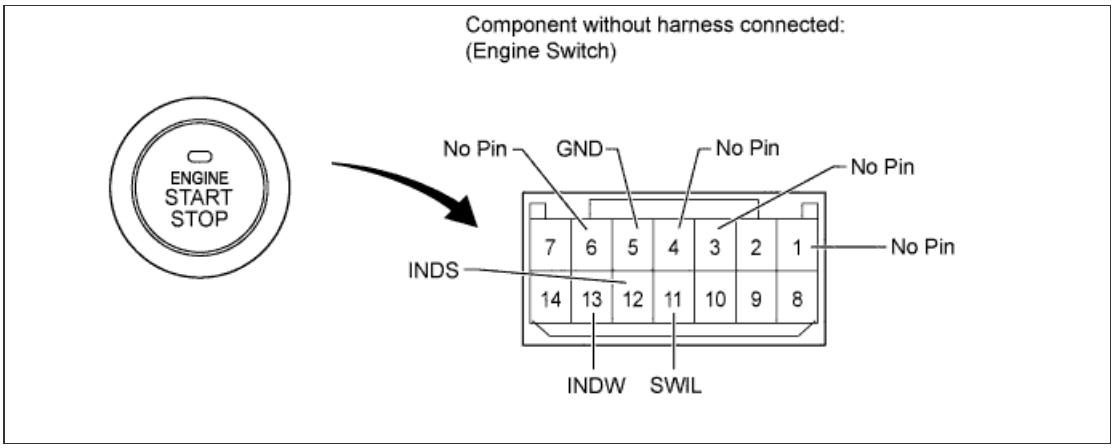
1. INSPECT ENGINE SWITCH

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
7 (SS1) - 5 (GND)	Not pushed	10 kΩ or higher
2 (SS2) - 5 (GND)	Not pushed	10 kΩ or higher
7 (SS1) - 5 (GND)	Pushed	Below 1 Ω
2 (SS2) - 5 (GND)	Pushed	Below 1 Ω

If the result is not as specified, replace the engine switch.



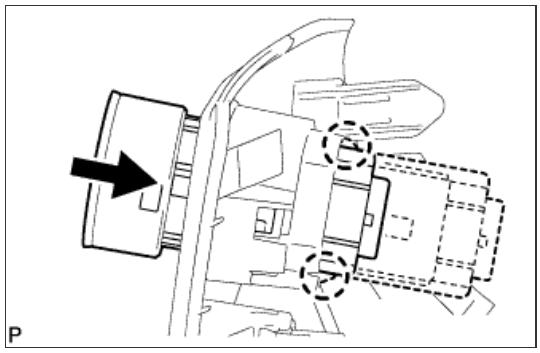
b. Apply battery voltage between the terminals of the switch, and check the illumination condition of the switch.

HINT:

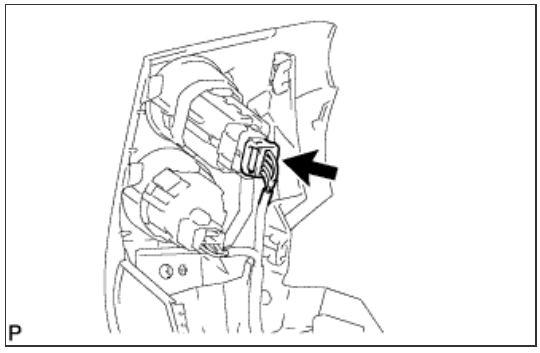
- **If the positive (+) lead and the negative (-) lead are incorrectly connected, the engine switch indicator will not illuminate.**
- **If the voltage is too low, the indicator will not illuminate.**

OK:

Measurement Condition	Specified Condition
Battery positive (+) → Terminal 11 (SWIL) Battery negative (-) → Terminal 5 (GND)	Illuminates (illumination of lettering)
Battery positive (+) → Terminal 12 (INDS) Battery negative (-) → Terminal 5 (GND)	Illuminates (green)
Battery positive (+) → Terminal 13 (INDW) Battery negative (-) → Terminal 5 (GND)	Illuminates (amber)



If the result is not as specified, replace the engine switch.

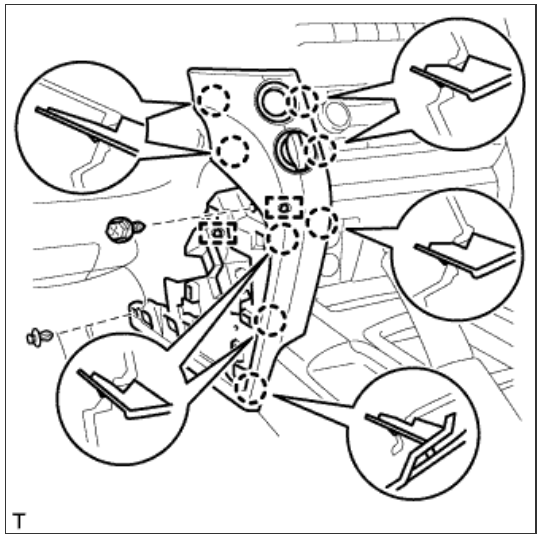


for Preparation Click here

1. INSTALL ENGINE SWITCH

a. Attach the 2 claws to install the switch.

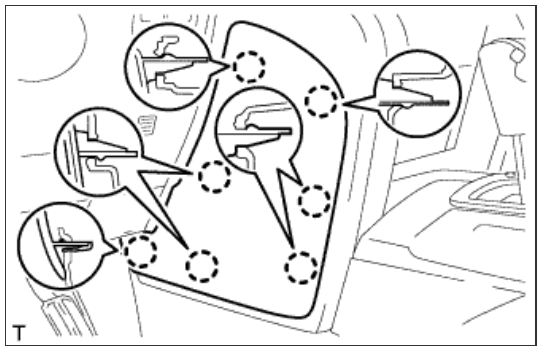
b. Connect the switch connector.



2. INSTALL LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

a. Connect the connectors and 2 clamps.

b. Attach the 8 claws to install the panel pad.



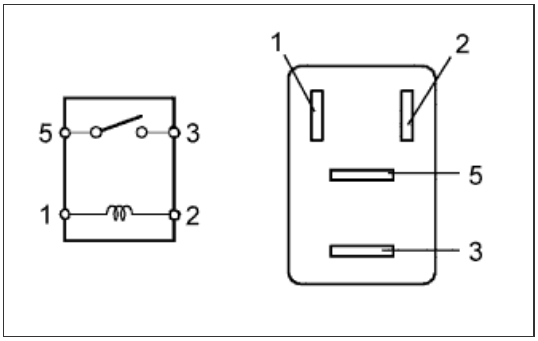
c. Install the screw.

d. Install the clip.

3. INSTALL NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Attach the 7 claws to install the panel cushion.

T



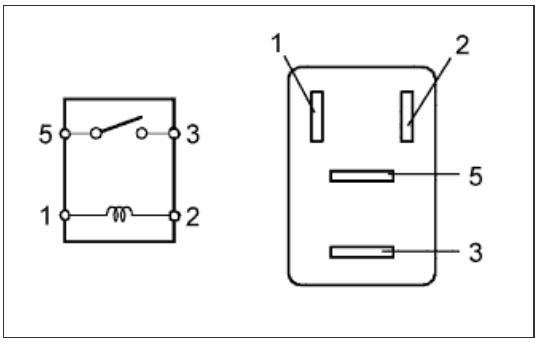
for Preparation Click here

1. INSPECT STARTER RELAY (ST)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

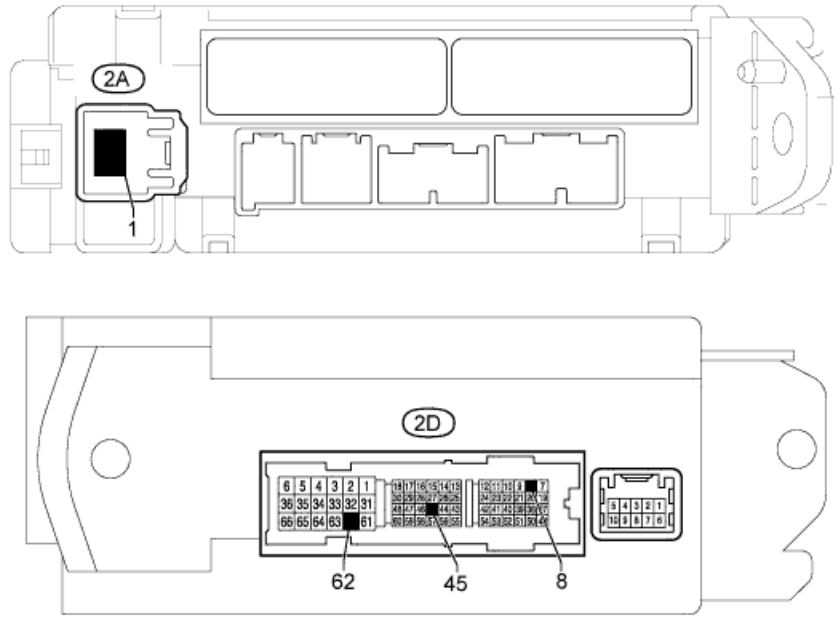


If the result is not as specified, replace the relay.

2. INSPECT STARTER CUT RELAY (ST CUT)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

3. INSPECT MAIN BODY ECU (ACC RELAY)

Component without harness connected: (Main Body ECU)

P

a. Measure the resistance of the ACC relay circuit.

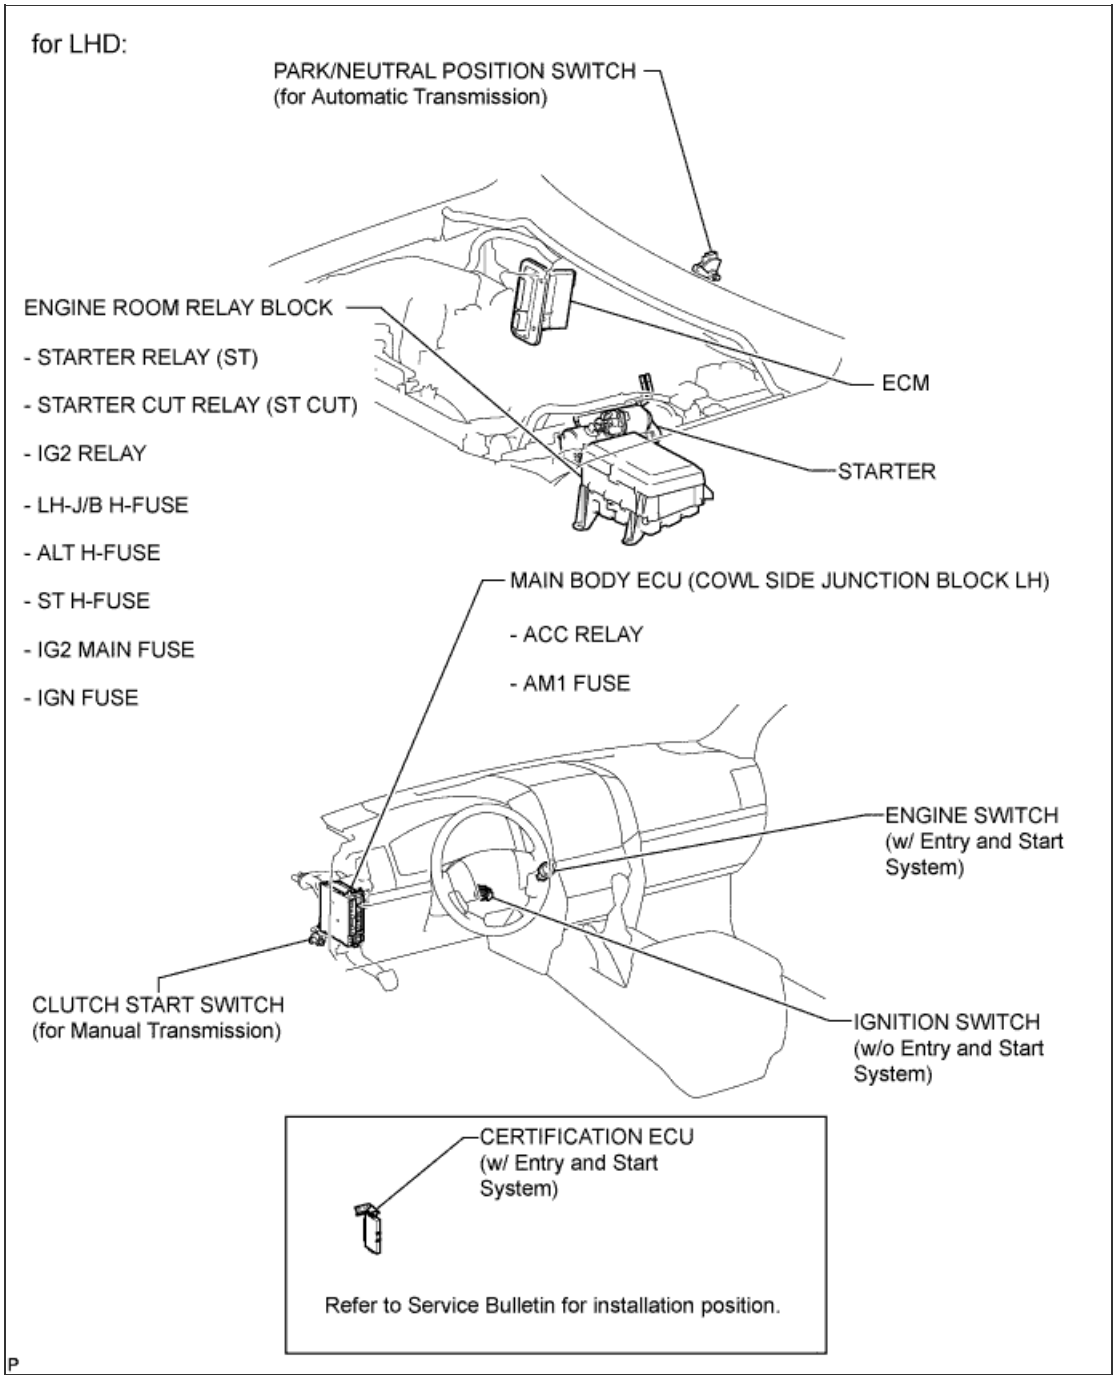
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

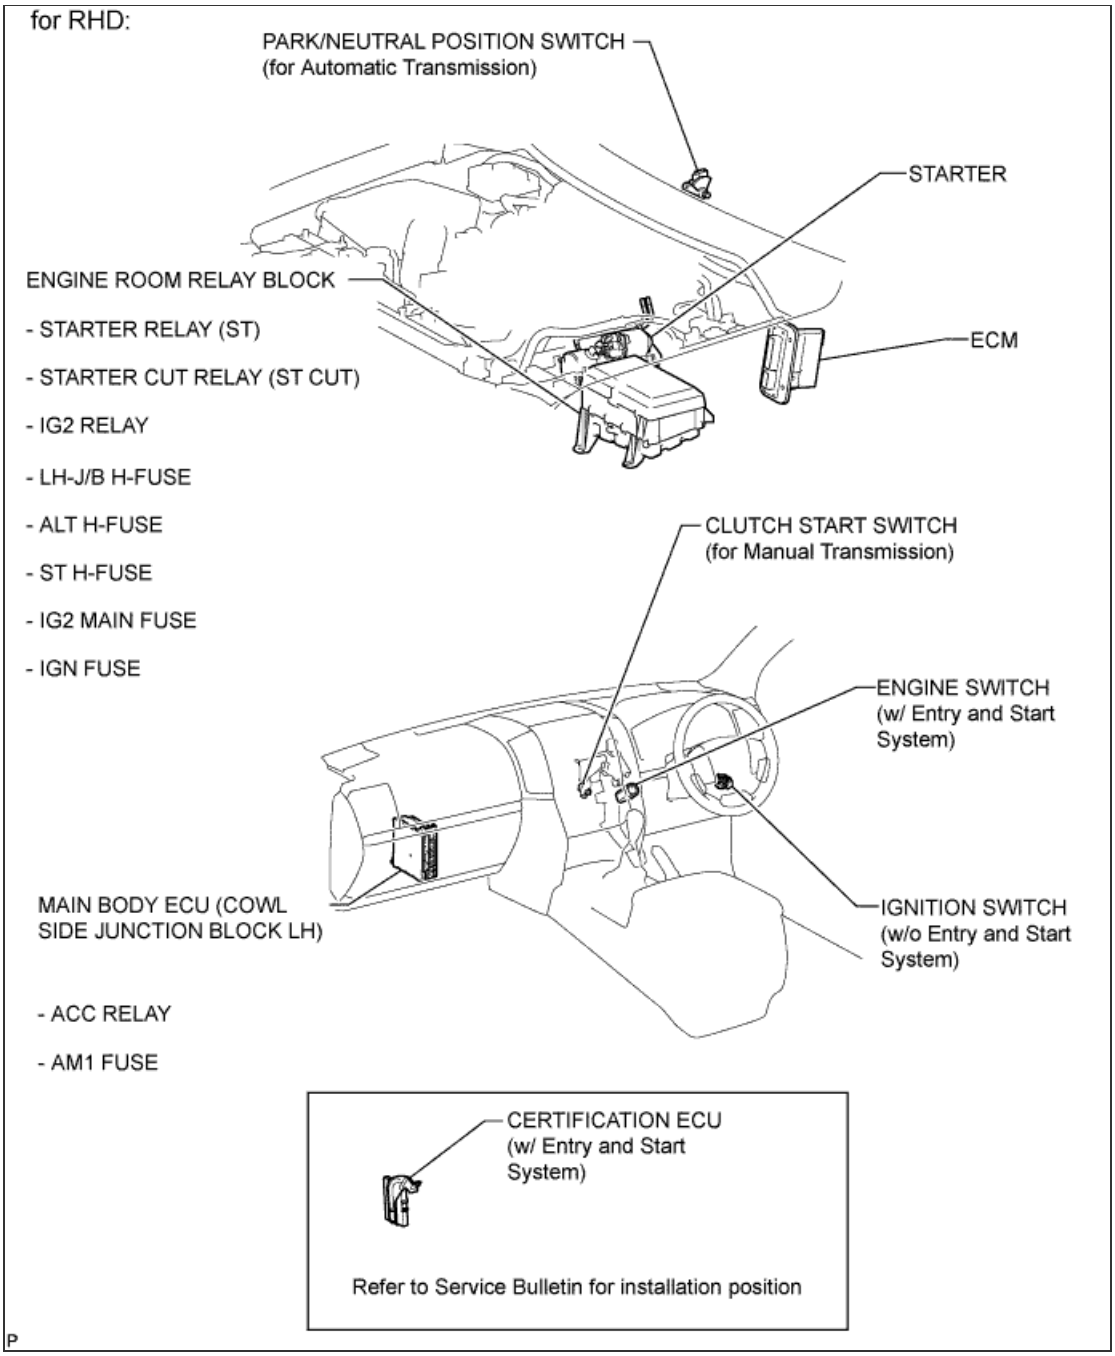
Tester Connection	Condition	Specified Condition
2A-1 - 2D-8	Battery voltage not applied between 2D-45 and 2D-62	10 kΩ or higher
	Battery voltage applied between 2D-45 and 2D-62	Below 1 Ω

If the result is not as specified, replace the main body ECU.

for Preparation Click here

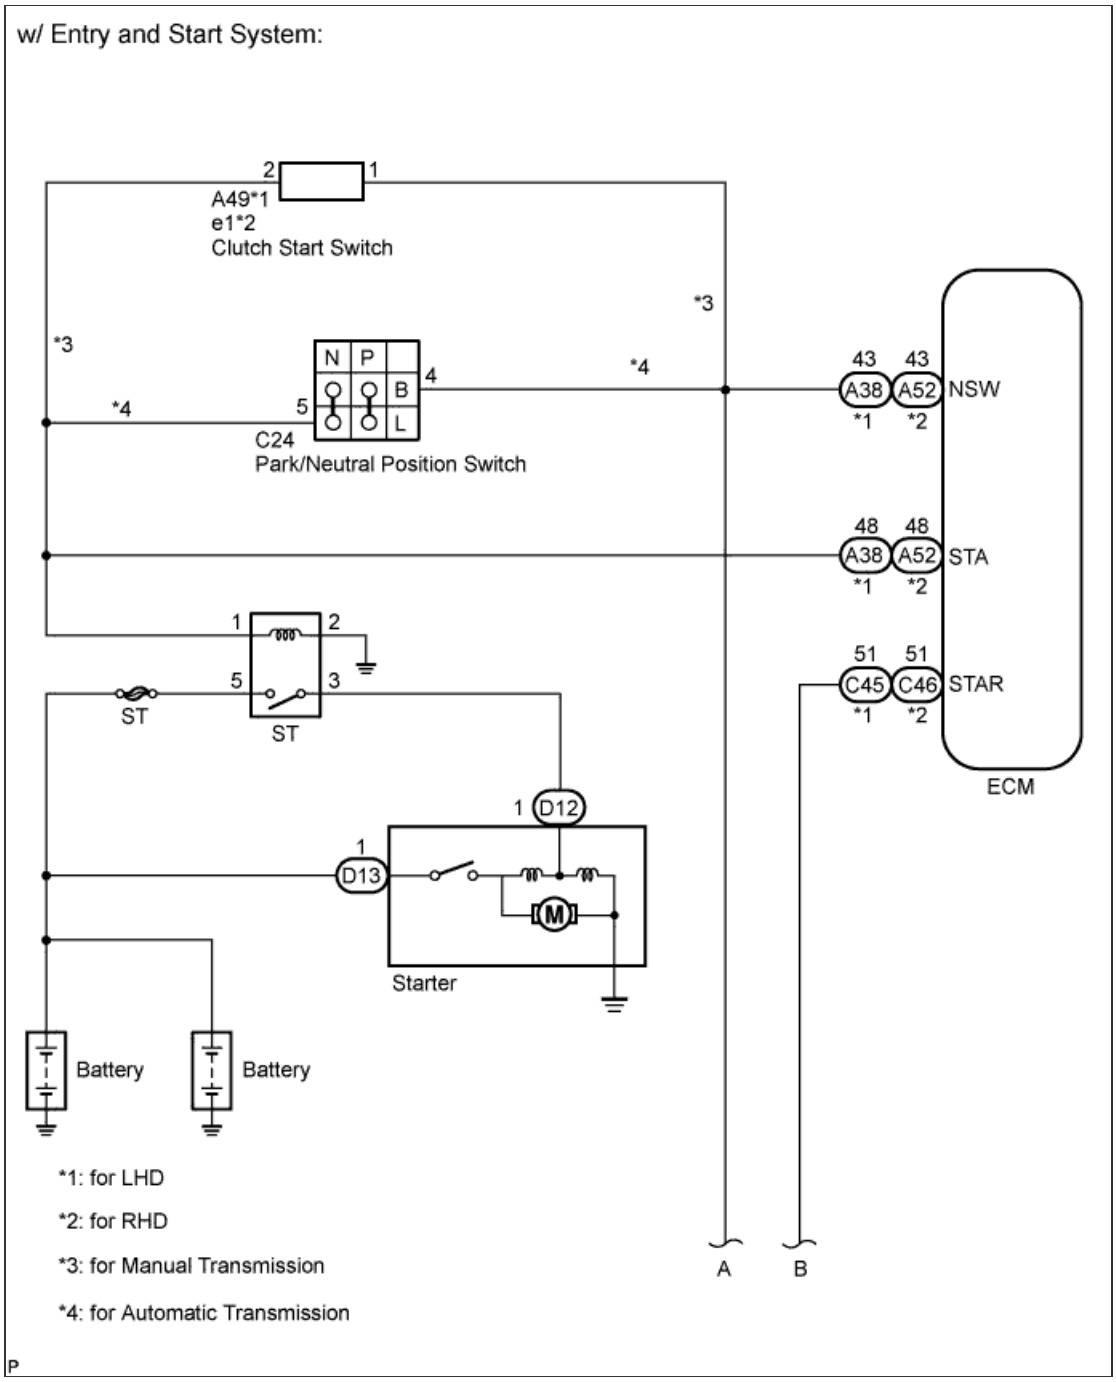


1.IGNITION SWITCH E PRESSION



HINT:

The type of ignition switch used on this model differs depending on the specifications of the vehicle. The e pressions listed in the table below are used in this section.



E pression	Ignition Switch (Position)	Engine Switch (ondition)
Ignition Switch off	LO	ff
Ignition Switch A		n (A
gnition Switch ON	ON	On (IG)
Engine Start	START	Start

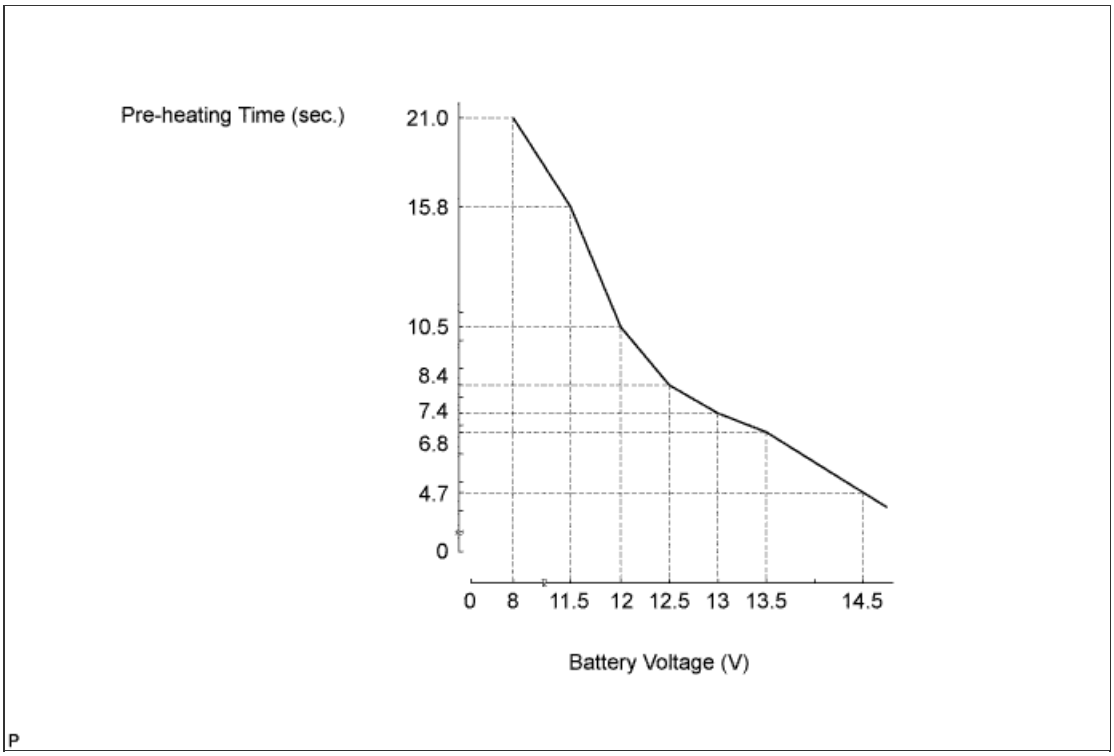
1. CHECK ILLUMINATION DURATION OF GLOW INDICATOR LIGHT

a. Check the light illumination duration.

i. Turn the ignition switch to ON and measure the light illumination duration.

Light illumination duration:
See graph.

If the result is not as specified, check the ECM, engine coolant temperature sensor, glow plug assembly and glow relay.



HINT:

Actual light illumination duration may vary slightly from the graph.

ii. Turn the ignition switch off.

2. CHECK PRE-HEATING

a. Inspect the pre-heating time.

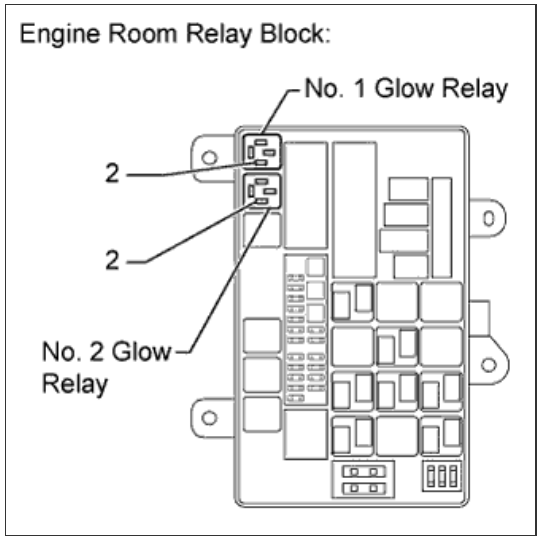
i. Turn the ignition switch to ON. Measure how long it takes for the battery voltage to be applied to the glow plugs.

Standard Pre-Heating Time:

Engine Coolant Temperature	Specified Condition
40°C (104°F) or higher	1 second
Below 40°C (104°F)	See graph* (Maximum: 21 seconds)

HINT:

*: The pre-heating time changes depending on the battery voltage.



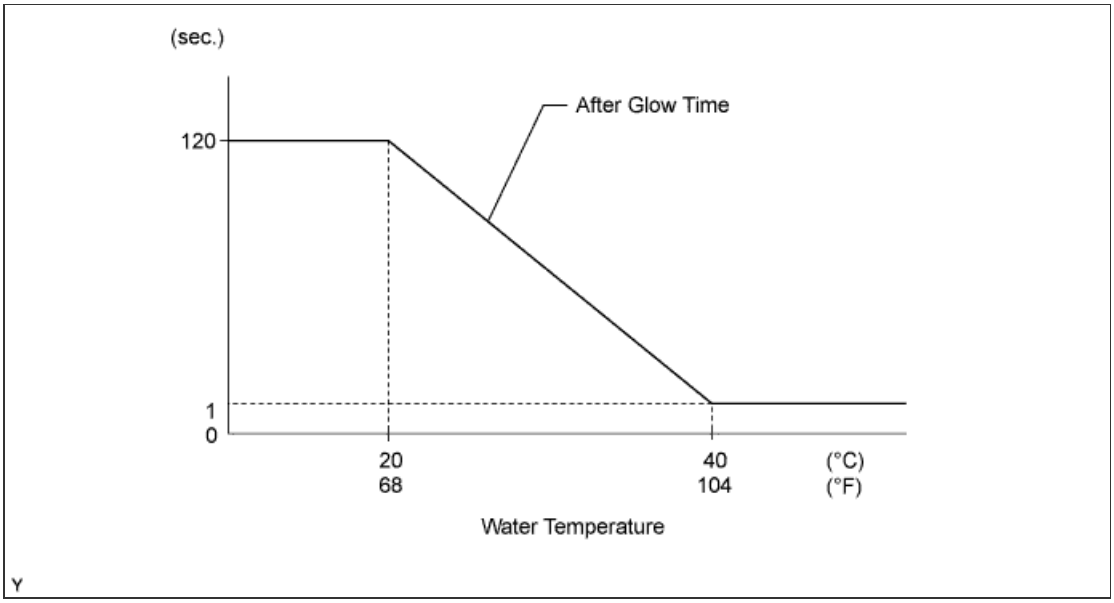
If the result is not as specified, check the ECM, engine coolant temperature sensor, glow plug assembly and glow relay.

ii. Turn the ignition switch off.

3. CHECK AFTER GLOW TIME

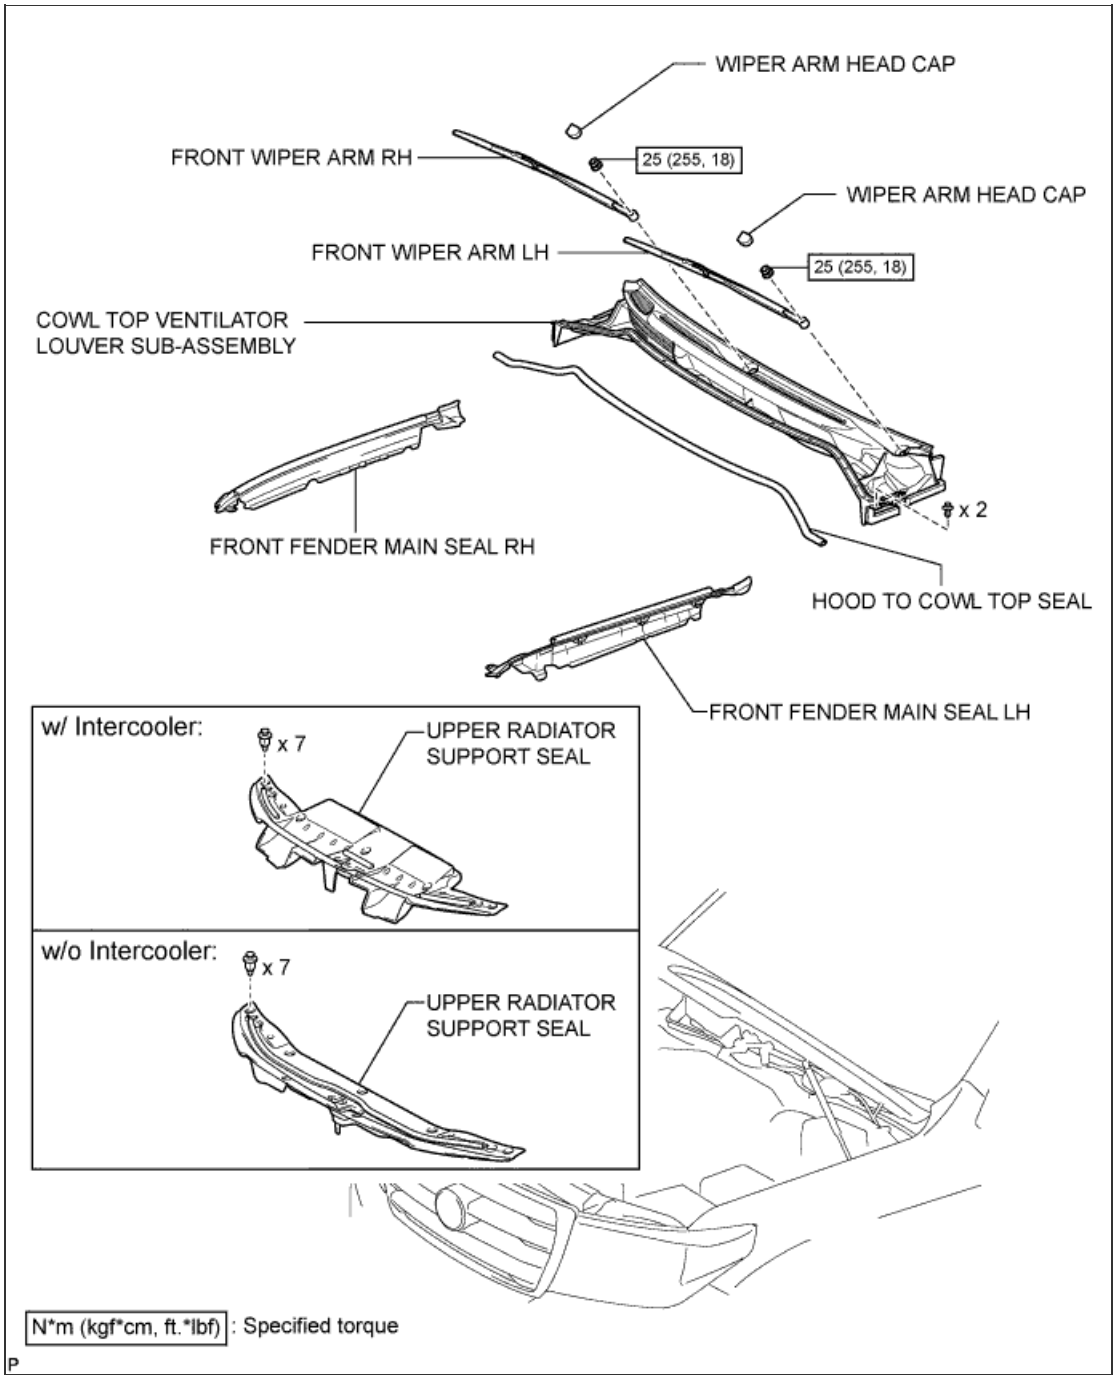
a. Remove the No. 1 glow relay (GLOW 1) from the engine room relay block.

b. Remove the No. 2 glow relay (GLOW 2) from the engine room relay block.

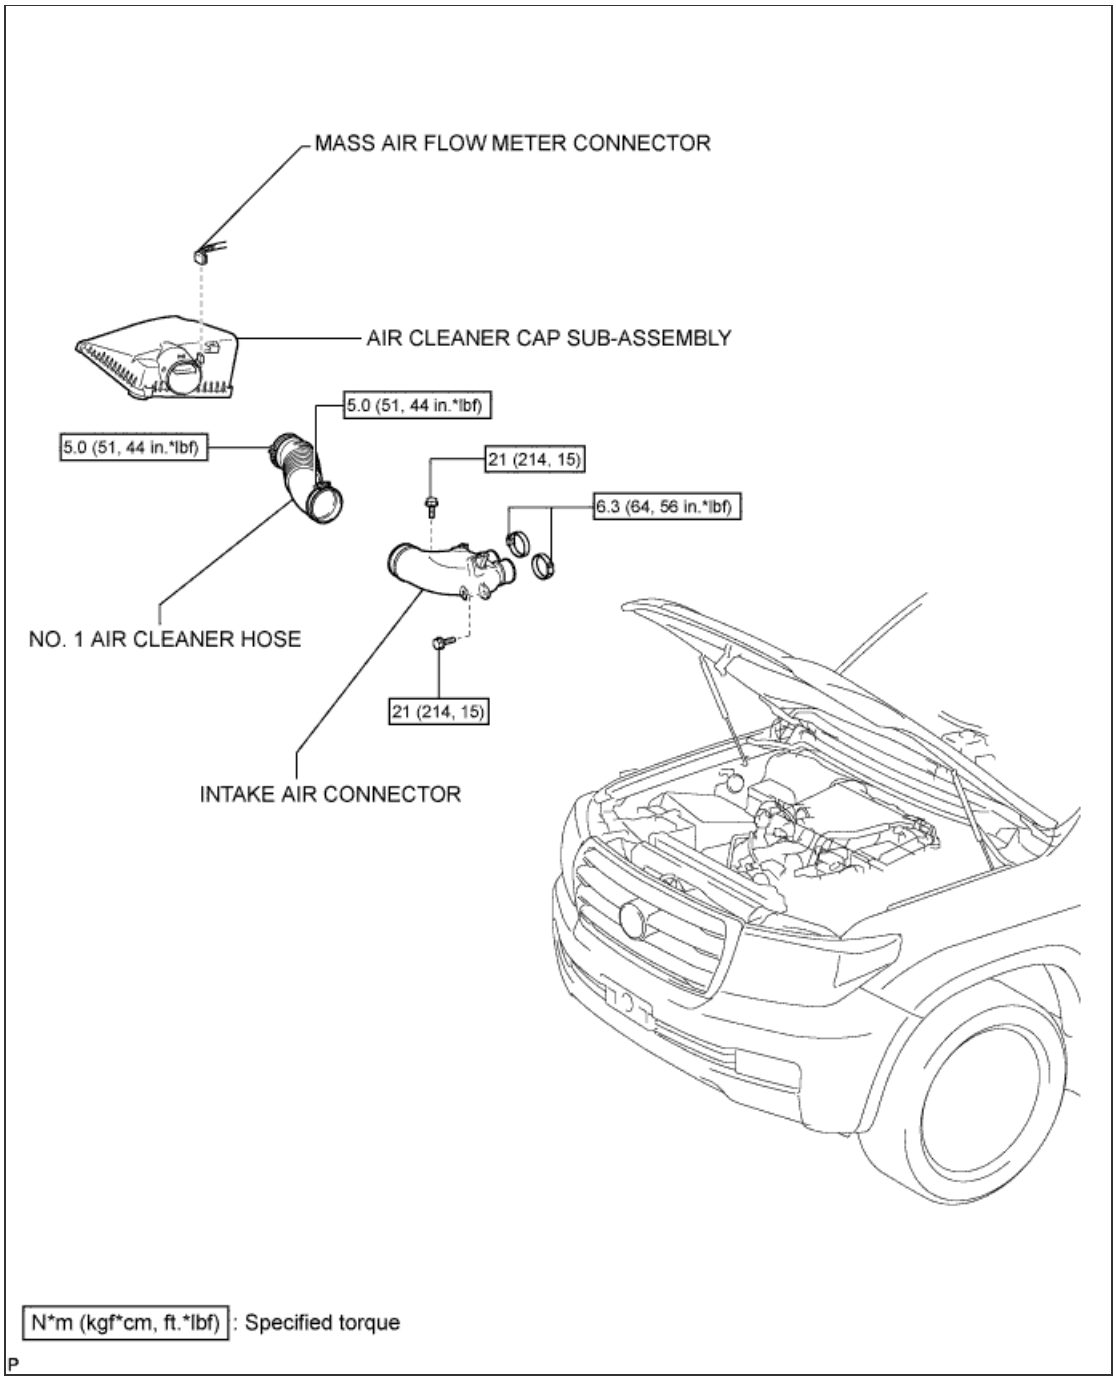


c. After the engine starts, measure the time duration that battery voltage remains present.

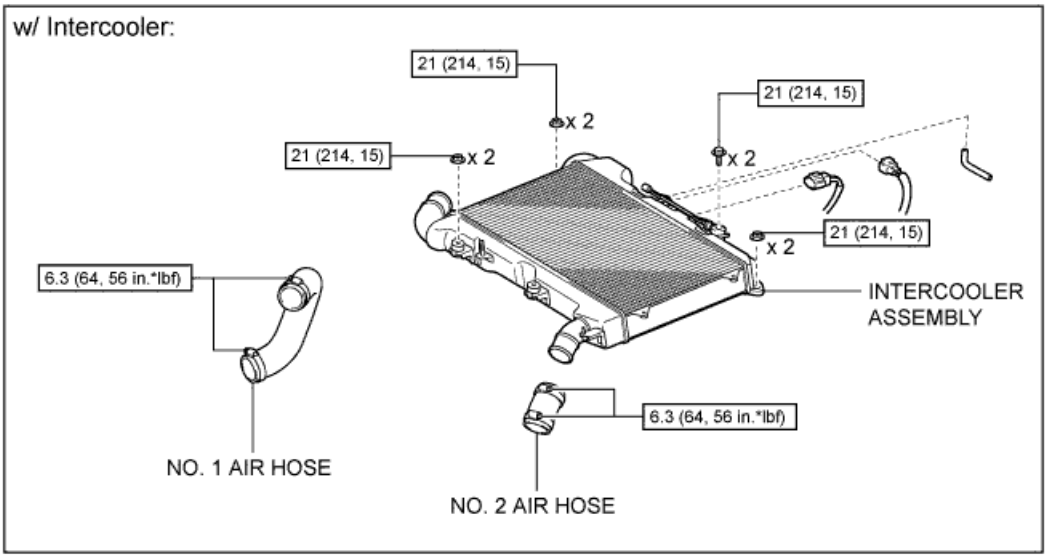
c. After the engine starts, measure the time duration that battery voltage remains present.

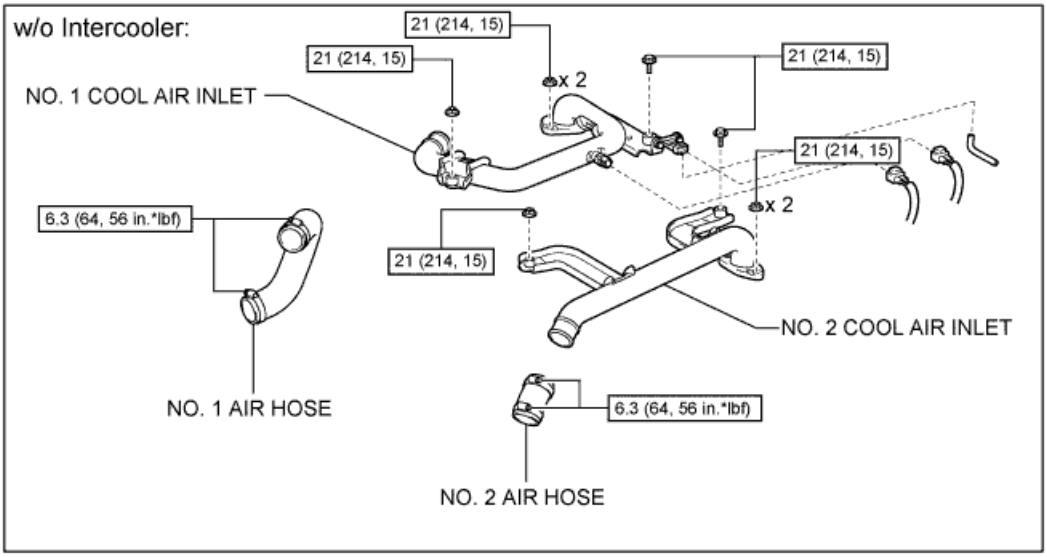


Standard After Glow Time:



Tester Connection	Condition	Specified Condition
2 - Body ground	After engine starts	Refer to graph below
2 - Body ground		





If the result is not as specified, check the ECM, engine coolant temperature sensor, glow plug assembly and glow relay.

for Preparation Click here

1. CHECK GLOW PLUG ASSEMBLY

a. Remove the screw grommet.

b. Remove the glow plug connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

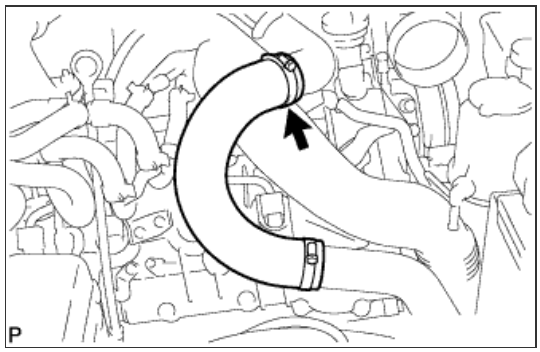
Tester Connection	Condition	Specified Condition
Glow plug terminal - Body ground	20°C (68°F)	Approximately 1 Ω

If the result is not as specified, replace the glow plug assembly.

NOTICE:

- **Be careful not to damage the glow plug, as this may cause an open circuit or shorten the life of the glow plugs.**
- **Do not allow oil or gasoline to contact the glow plug when cleaning it.**
- **Clean any oil on the terminal and bakelite washer with a dry cloth.**
- **Do not apply more than 11 V to the glow plug, as this may cause an open circuit.**

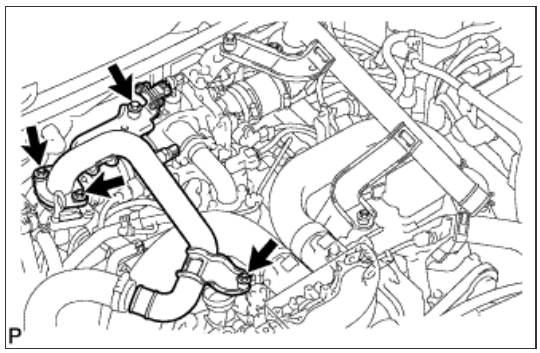
for Preparation Click here



1. REMOVE INTERCOOLER ASSEMBLY (w/ Intercooler)

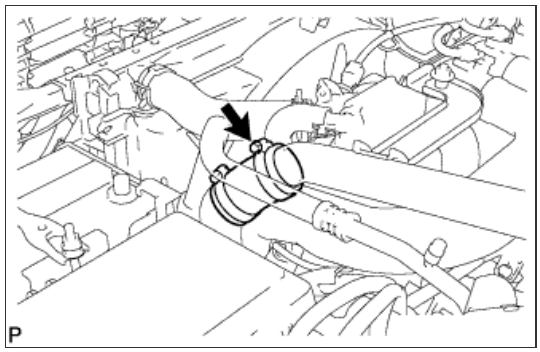
(Click here)

2. REMOVE NO. 1 COOL AIR INLET (w/o Intercooler)



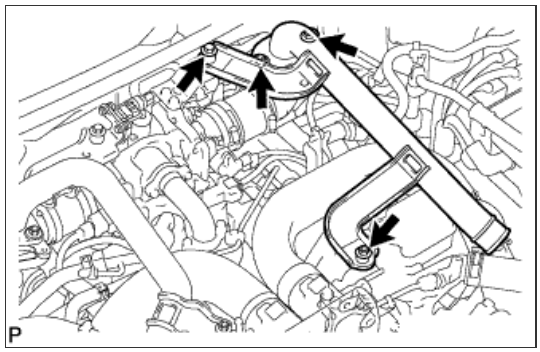
a. Loosen the No. 1 air hose clamp.

b. Disconnect the turbo pressure sensor connector, intake air temperature sensor connector and vacuum hose.



c. Remove the 3 nuts, bolt and No. 1 cool air inlet.

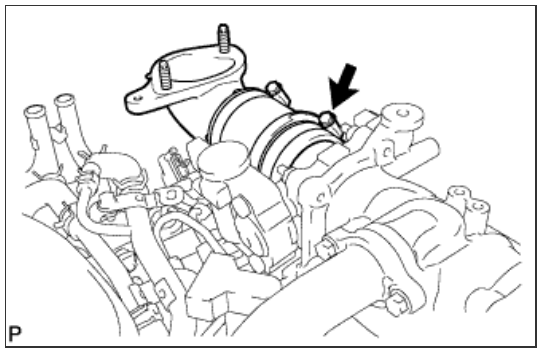
d. Remove the gasket from the air tube RH.



3. REMOVE NO. 2 COOL AIR INLET (w/o Intercooler)

a. Loosen the No. 2 air hose clamp.

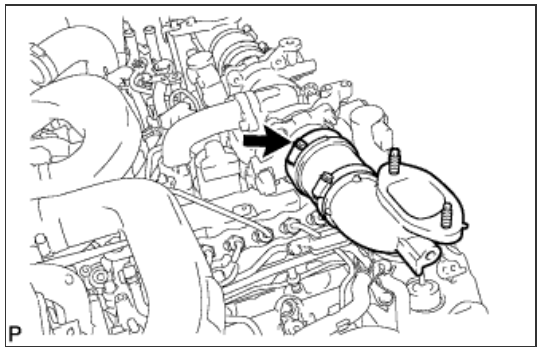
b. Remove the 3 nuts, bolt and No. 2 cool air inlet.



c. Remove the gasket from the air tube LH.

4. REMOVE AIR TUBE SUB-ASSEMBLY RH

a. Loosen the hose clamp.

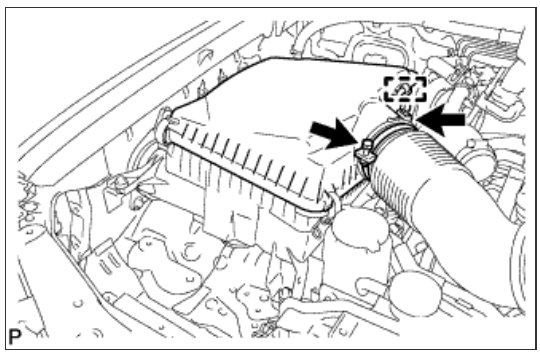


b. Remove the air tube from the throttle body.

5. REMOVE AIR TUBE SUB-ASSEMBLY LH

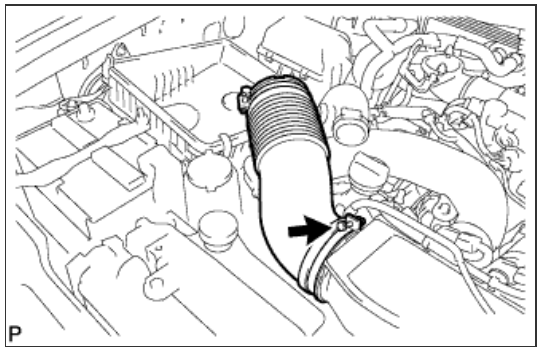
a. Loosen the hose clamp.

b. Remove the air tube from the throttle body.



6. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

a. Loosen the hose clamp.



b. Disconnect the mass air flow meter connector and using a clip remover, detach the wire harness clamp from the air cleaner cap.

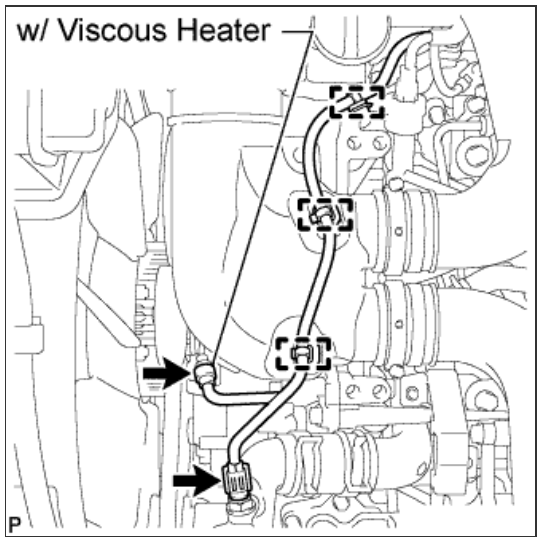
c. Detach the 4 clamps and remove the air cleaner cap.

7. REMOVE NO. 1 AIR CLEANER HOSE

a. Loosen the hose clamp and remove the No. 1 air cleaner hose.

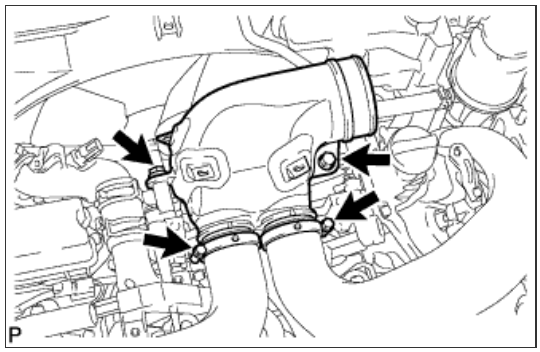
8. REMOVE INTAKE AIR CONNECTOR

a. w/o Viscous Heater:



i. Disconnect the connector from the water temperature sensor.

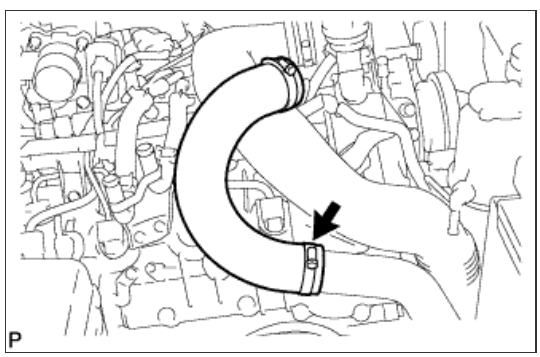
ii. Using a clip remover, detach the 3 wire harness clamps.



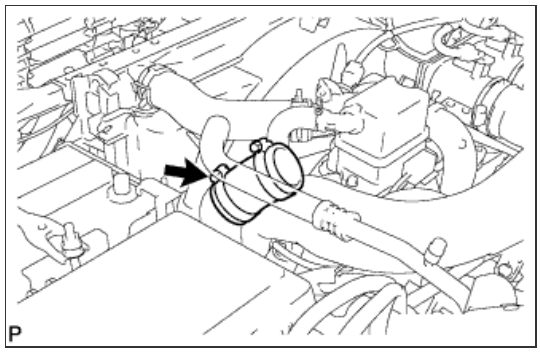
b. w/ Viscous Heater:

i. Disconnect the 2 connectors from the viscous with magnet clutch heater and water temperature sensor.

ii. Using a clip remover, detach the 3 wire harness clamps.



c. Loosen the 2 hose clamps and remove the 2 bolts and intake air connector.

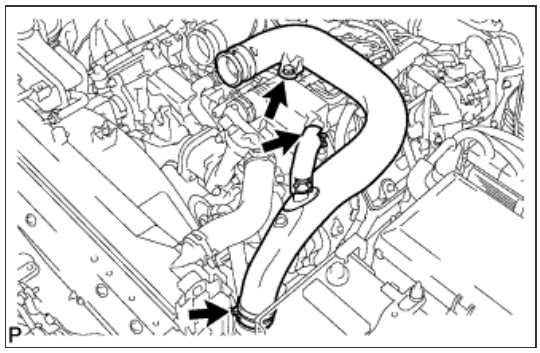


9. REMOVE NO. 1 AIR HOSE

a. Loosen the hose clamp and remove the No. 1 air hose.

10. REMOVE NO. 2 AIR HOSE

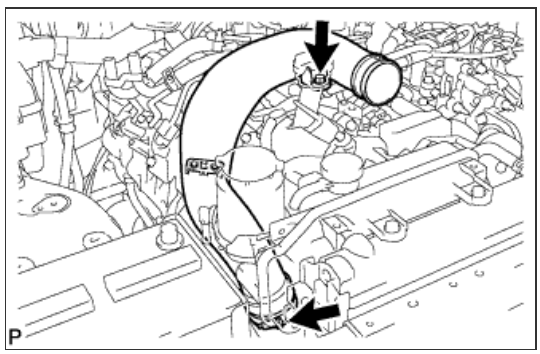
a. Loosen the hose clamp and remove the No. 2 air hose.



11. REMOVE NO. 2 AIR CLEANER PIPE SUB-ASSEMBLY

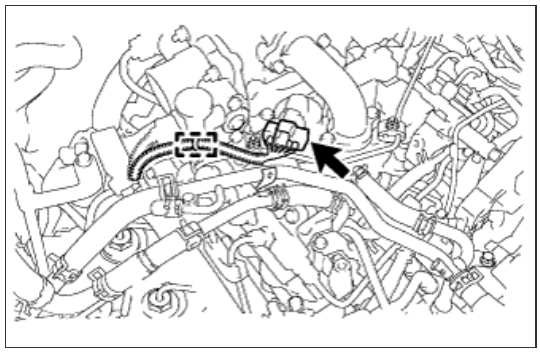
a. Disconnect the ventilation hose from the oil separator.

b. Loosen the hose clamp.



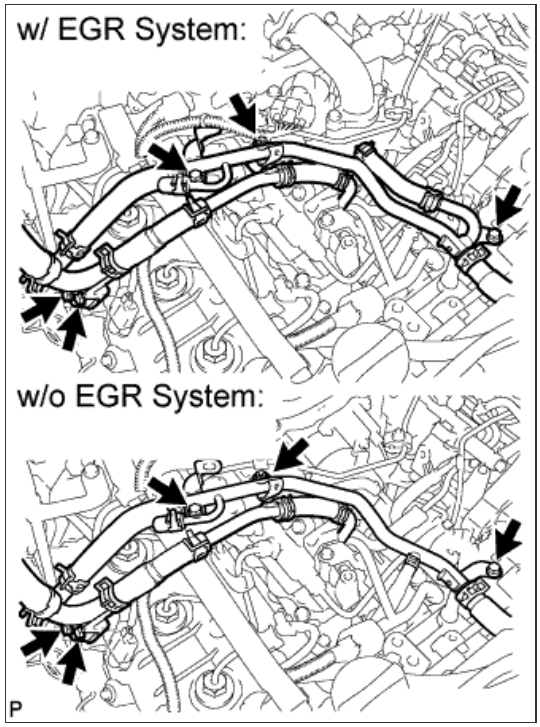
c. Remove the bolt and No. 2 air cleaner pipe.

12. REMOVE NO. 1 AIR CLEANER PIPE SUB-ASSEMBLY



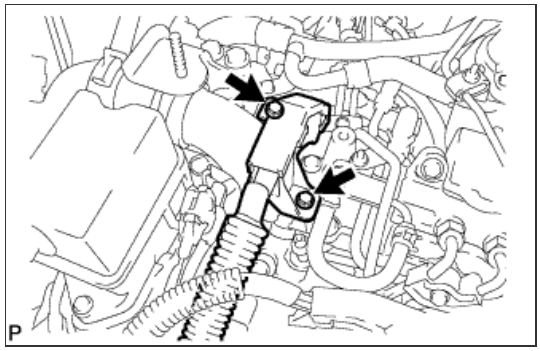
a. Loosen the hose clamp.

b. Remove the bolt and No. 1 air cleaner pipe.

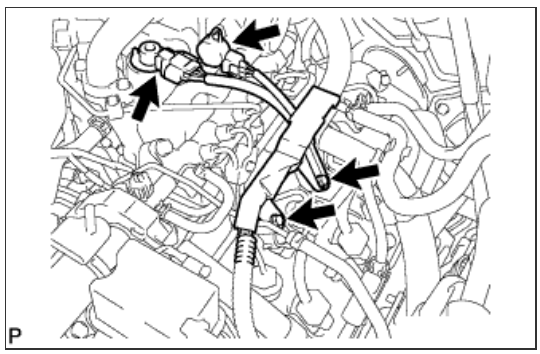


13. DISCONNECT NO. 4 WATER BY-PASS PIPE

a. w/ EGR System:
Detach the clamp and disconnect the connector.

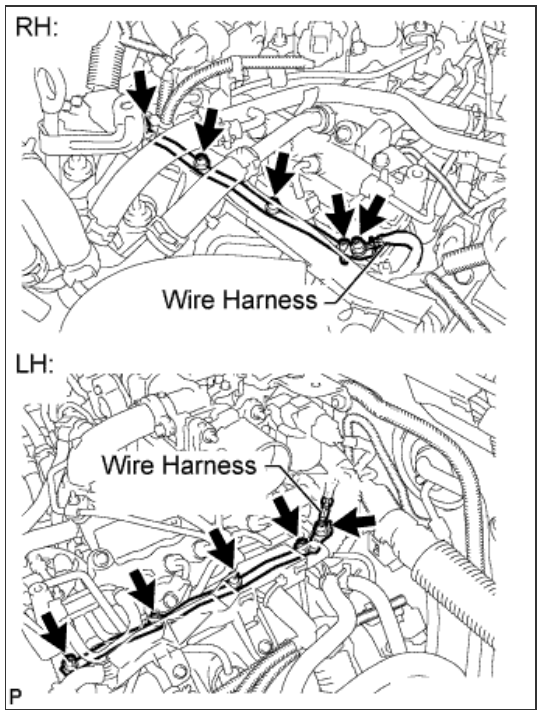


b. Remove the nut, 4 bolts and water by-pass pipe so that the glow plug can be removed in a step below.



14. DISCONNECT ENGINE WIRE

a. Remove the 2 bolts and engine wire so that the glow plug can be removed in a step below.

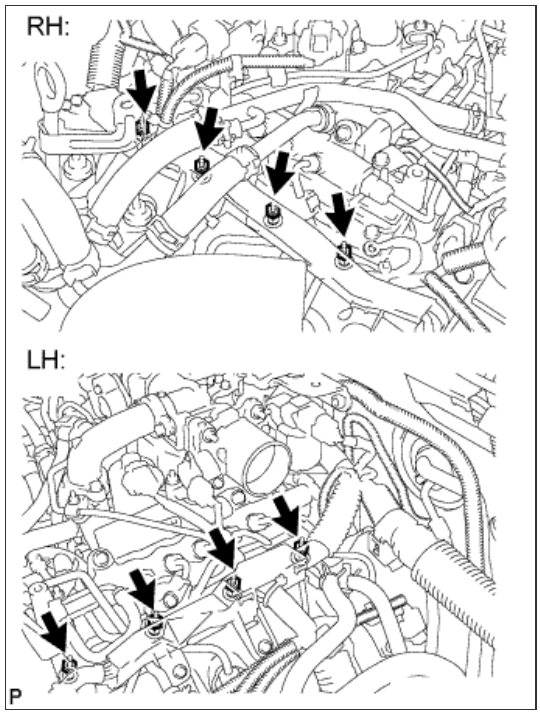


b. Disconnect the 2 connectors and remove the 2 bolts and engine wire so that the glow plug can be removed in a step below.

15. REMOVE NO. 1 GLOW PLUG CONNECTOR

a. Remove the 2 screw grommets and 2 nuts, and disconnect the 2 wire harnesses.

b. Remove the 8 screw grommets, 8 nuts and 2 glow plug connectors.

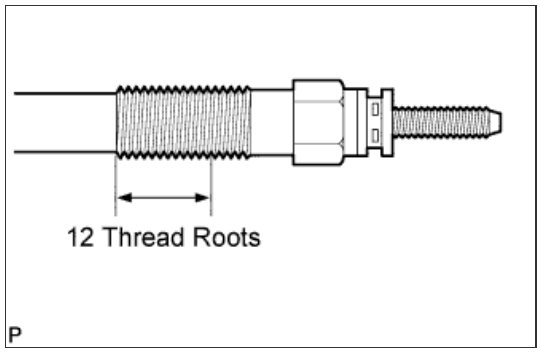


16. REMOVE GLOW PLUG ASSEMBLY

a. Using a 10 mm deep socket wrench, remove the 8 glow plugs.

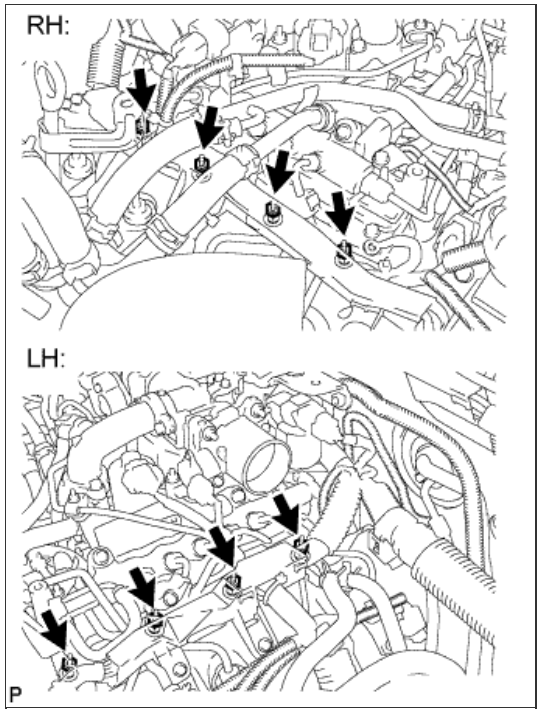
HINT:

Before removing the glow plugs, thoroughly clean off all dirt, sand, etc.



for Preparation Click here

1. INSTALL GLOW PLUG ASSEMBLY



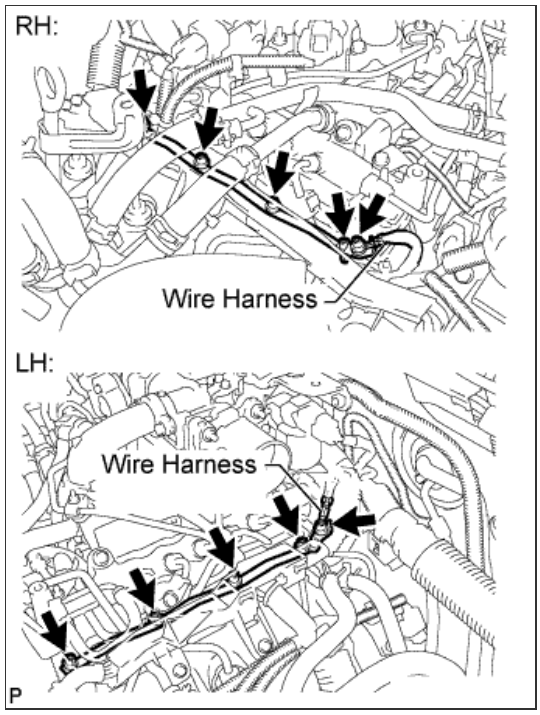
a. Apply adhesive to 3 or more thread roots in the area shown in the illustration.

Adhesive:
Toyota Genuine Adhesive 1324, Three Bond 1324 or equivalent

b. Using a 10 mm deep socket wrench, install the 8 glow plugs.

Torque:
12 N*m{ 125 kgf*cm , 9 ft.*lbf }

2. INSTALL NO. 1 GLOW PLUG CONNECTOR



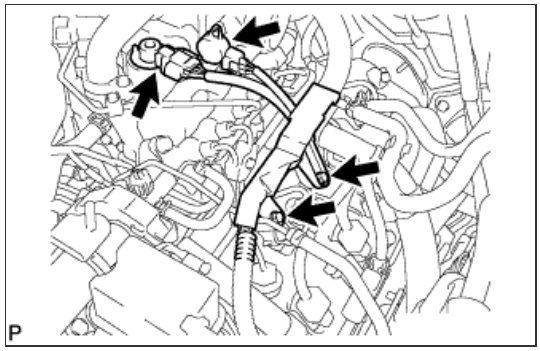
a. Install the 2 glow plug connectors by uniformly tightening the 8 nuts.

Torque:
2.2 N*m{ 22 kgf*cm , 19 in.*lbf }

b. Install the 8 screw grommets.

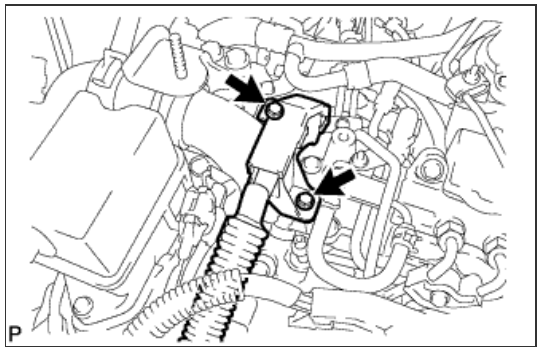
c. Connect the 2 wire harnesses with the 2 nuts and 2 screw grommets.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }



3. CONNECT ENGINE WIRE

a. Connect the 2 connectors.

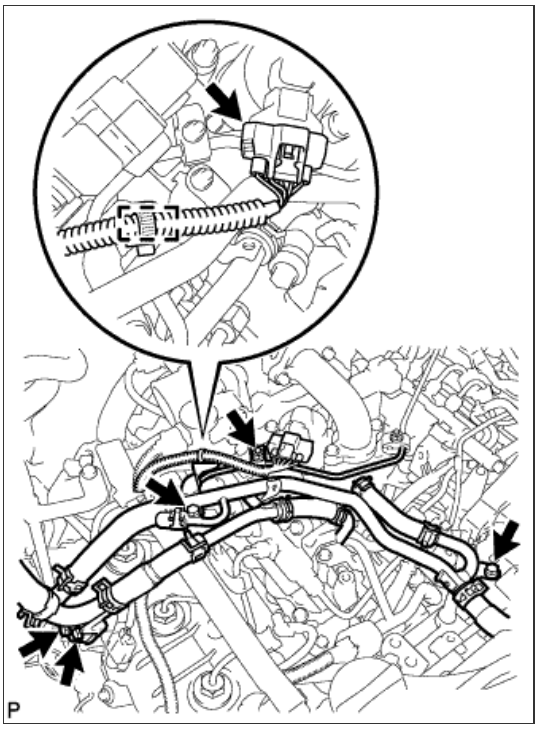


b. Connect the engine wire with the 2 bolts.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

c. Connect the engine wire with the 2 bolts.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }



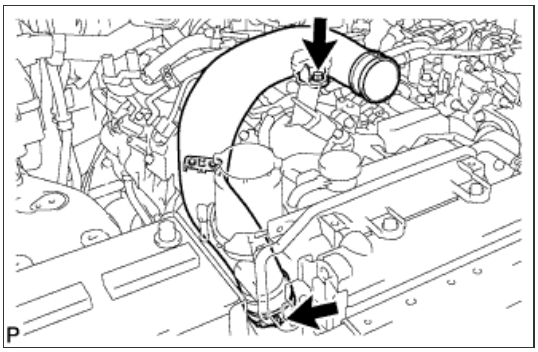
4. CONNECT NO. 4 WATER BY-PASS PIPE

a. Connect the water by-pass pipe with the 4 bolts and nut.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Attach the clamp and connect the connector.

5. INSTALL NO. 1 AIR CLEANER PIPE SUB-ASSEMBLY



a. Connect the No. 1 air cleaner pipe to the No. 1 intake air connector pipe.

b. Install the pipe with the bolt.

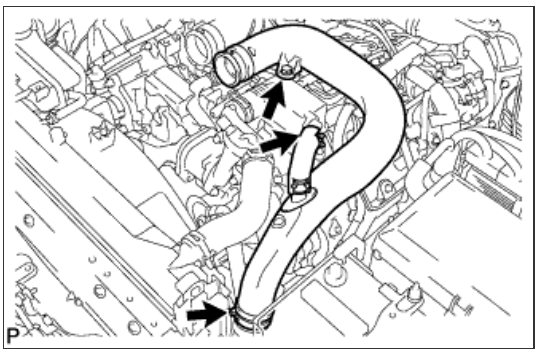
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Tighten the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

6. INSTALL NO. 2 AIR CLEANER PIPE SUB-ASSEMBLY

a. Connect the No. 2 air cleaner pipe to the No. 2 intake air connector pipe.



b. Connect the ventilation hose to the oil separator.

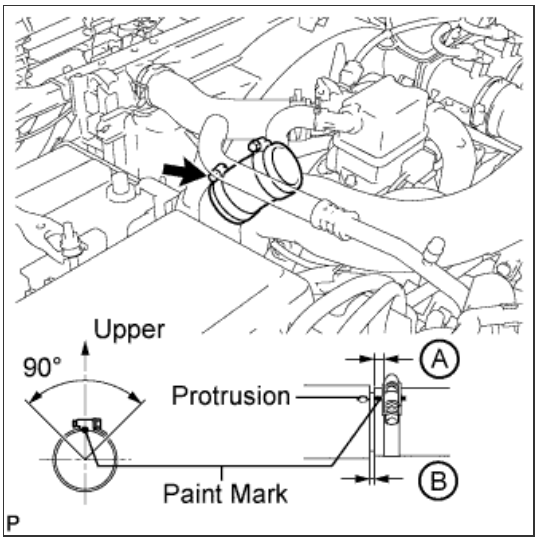
c. Install the pipe with the bolt.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

d. Tighten the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

7. INSTALL NO. 2 AIR HOSE



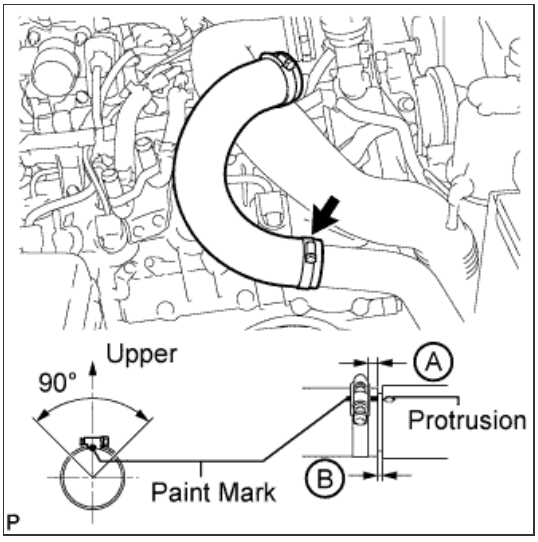
a. Connect the No. 2 air hose with the hose clamp.

Torque:

6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

- **Align the paint mark of the air hose with the protrusion and push in the air hose so that distance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that distance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the direction of the hose clamp is as shown in the illustration.**



8. INSTALL NO. 1 AIR HOSE

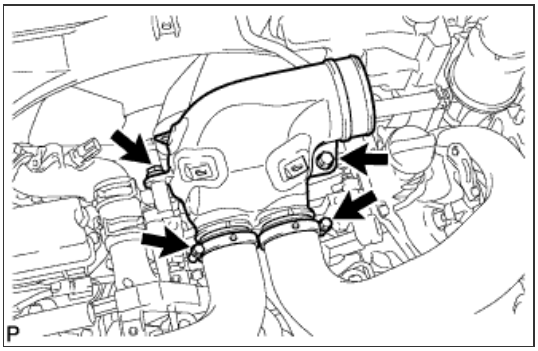
a. Connect the No. 1 air hose with the hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

- **Align the paint mark of the air hose with the protrusion and push in the air hose so that distance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that distance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the direction of the hose clamp is as shown in the illustration.**

9. INSTALL INTAKE AIR CONNECTOR

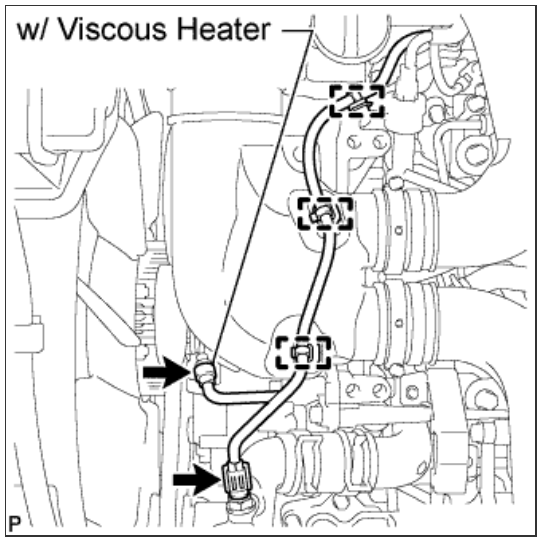


a. Connect the intake air connector to the No. 1 and No. 2 air cleaner pipes.

b. Install the connector with the 2 bolts.

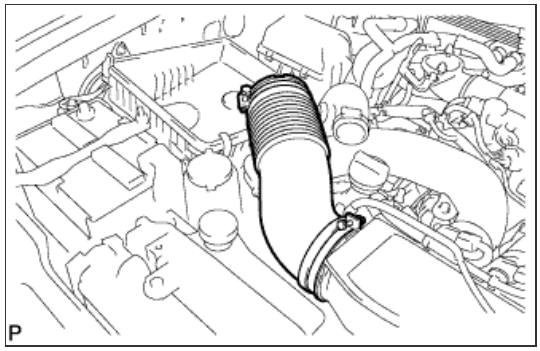
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Tighten the 2 hose clamps.



Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

d. Attach the 3 wire harness clamps.

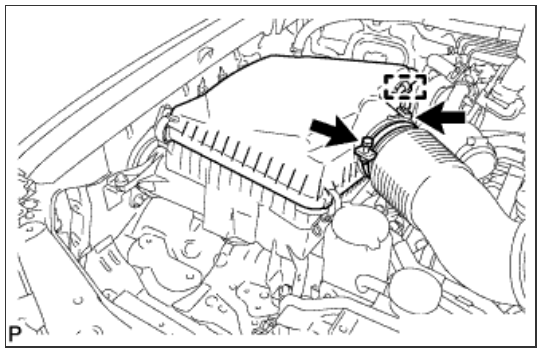


e. w/o Viscous Heater:
Connect the connector to the water temperature sensor.

f. w/ Viscous Heater:
Connect the 2 connectors to the water temperature sensor and viscous with magnet clutch heater.

10. TEMPORARILY INSTALL NO. 1 AIR CLEANER HOSE

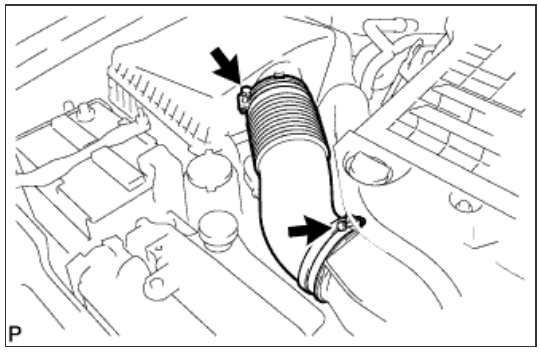
a. Temporarily install the air cleaner hose to the intake air connector.



11. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

a. Connect the air cleaner cap to the air cleaner hose, and install the air cleaner cap with the 4 clamps.

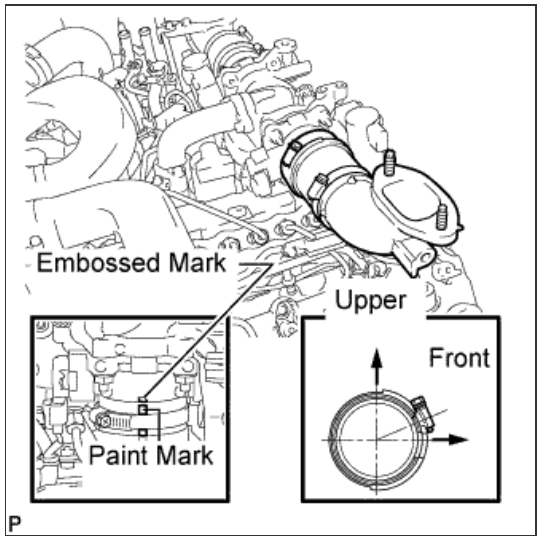
b. Connect the mass air flow meter connector and attach the wire harness clamp to the air cleaner cap.



c. Attach the wire harness clamp.

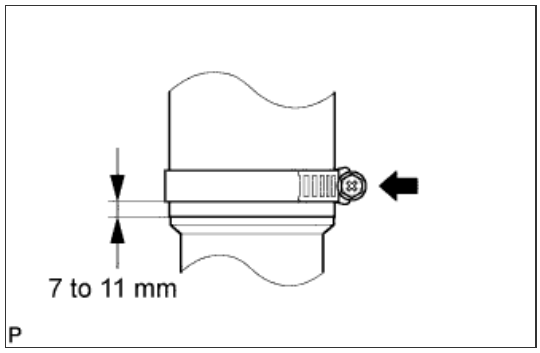
d. Align the protrusion of air cleaner cap and concave portion of air cleaner hose.

e. Tighten the 2 hose clamps.



Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

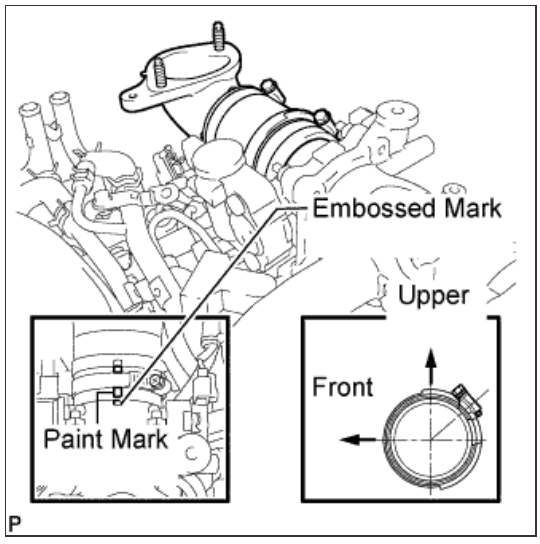
12. INSTALL AIR TUBE SUB-ASSEMBLY LH



a. Install the air tube to the throttle body.

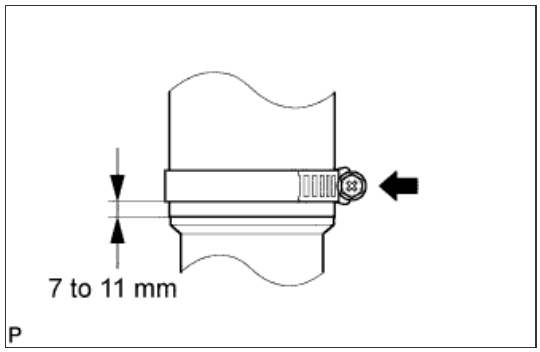
b. Align the embossed mark of the throttle body with the paint mark of the No. 4 air hose.

c. Tighten the hose clamp so that it is 7 to 11 mm (0.276 to 0.433 in.) from the end of the hose as shown in the illustration.



Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

13. INSTALL AIR TUBE SUB-ASSEMBLY RH

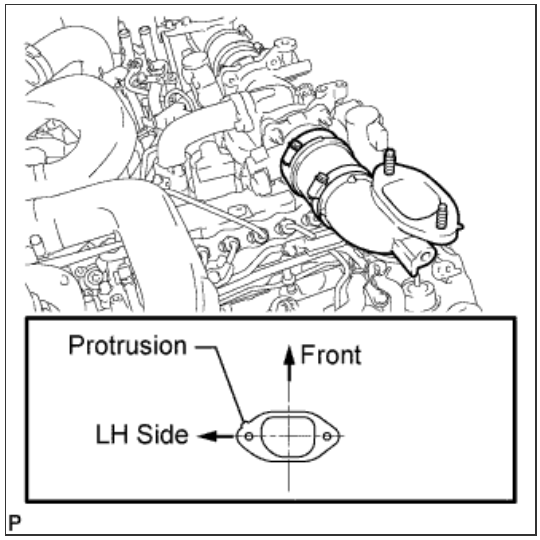


a. Install the air tube to the throttle body.

b. Align the embossed mark of the throttle body with the paint mark of the No. 4 air hose.

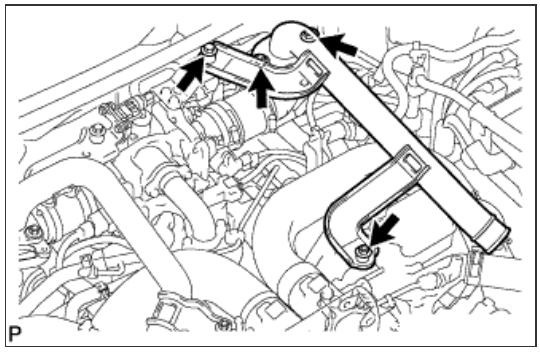
c. Tighten the hose clamp so that it is 7 to 11 mm (0.276 to 0.433 in.) from the end of the hose as shown in the illustration.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }



14. INSTALL NO. 2 COOL AIR INLET (w/o Intercooler)

a. Install a new gasket to the air tube LH.

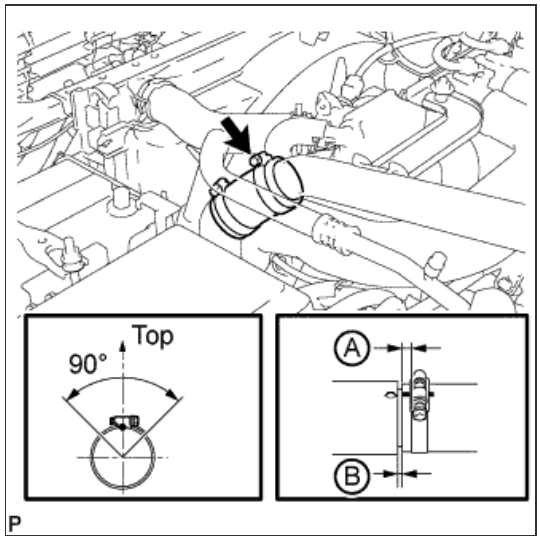


HINT:

Install the gasket with the protrusion facing as shown in the illustration.

b. Install the No. 2 cool air inlet with the 3 nuts and bolt.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



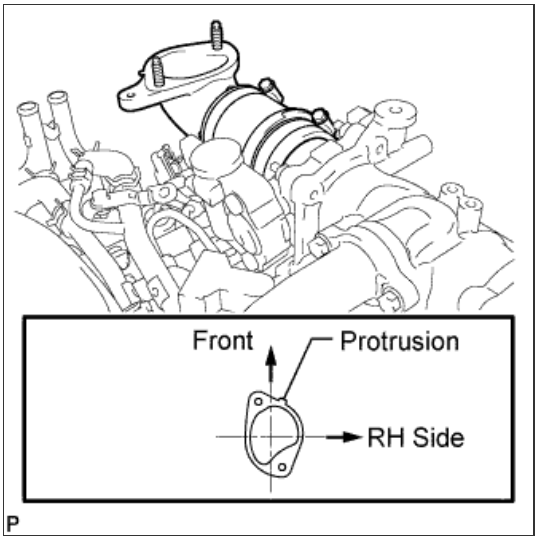
c. Connect the No. 2 air hose to the No. 2 cool air inlet.

d. Tighten the No. 2 air hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:

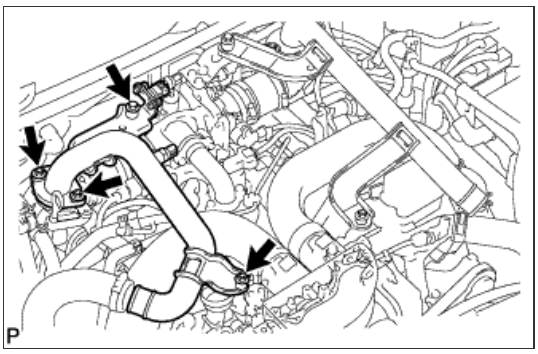
- **Align the paint mark of the air hose with the protrusion and push on the air hose so that distance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that distance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the direction of the hose clamp is as shown in the illustration.**



15. INSTALL NO. 1 COOL AIR INLET (w/o Intercooler)

a. Install a new gasket to the air tube RH.

HINT:

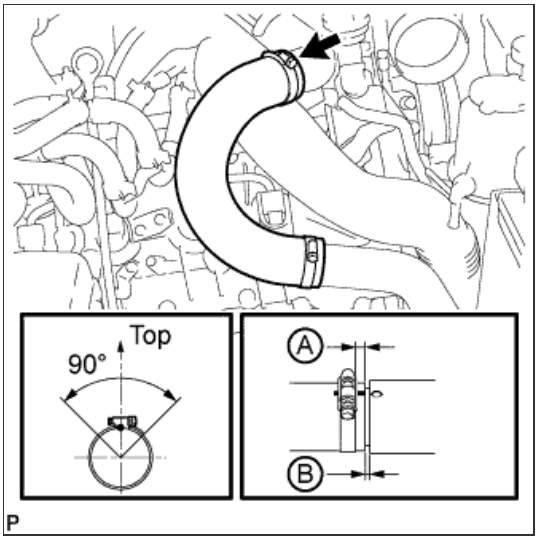


Install the gasket with the protrusion facing as shown in the illustration.

b. Install the No. 1 cool air inlet with the 3 nuts and bolt.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

c. Connect the vacuum hose, intake air temperature sensor connector and turbo pressure sensor connector.

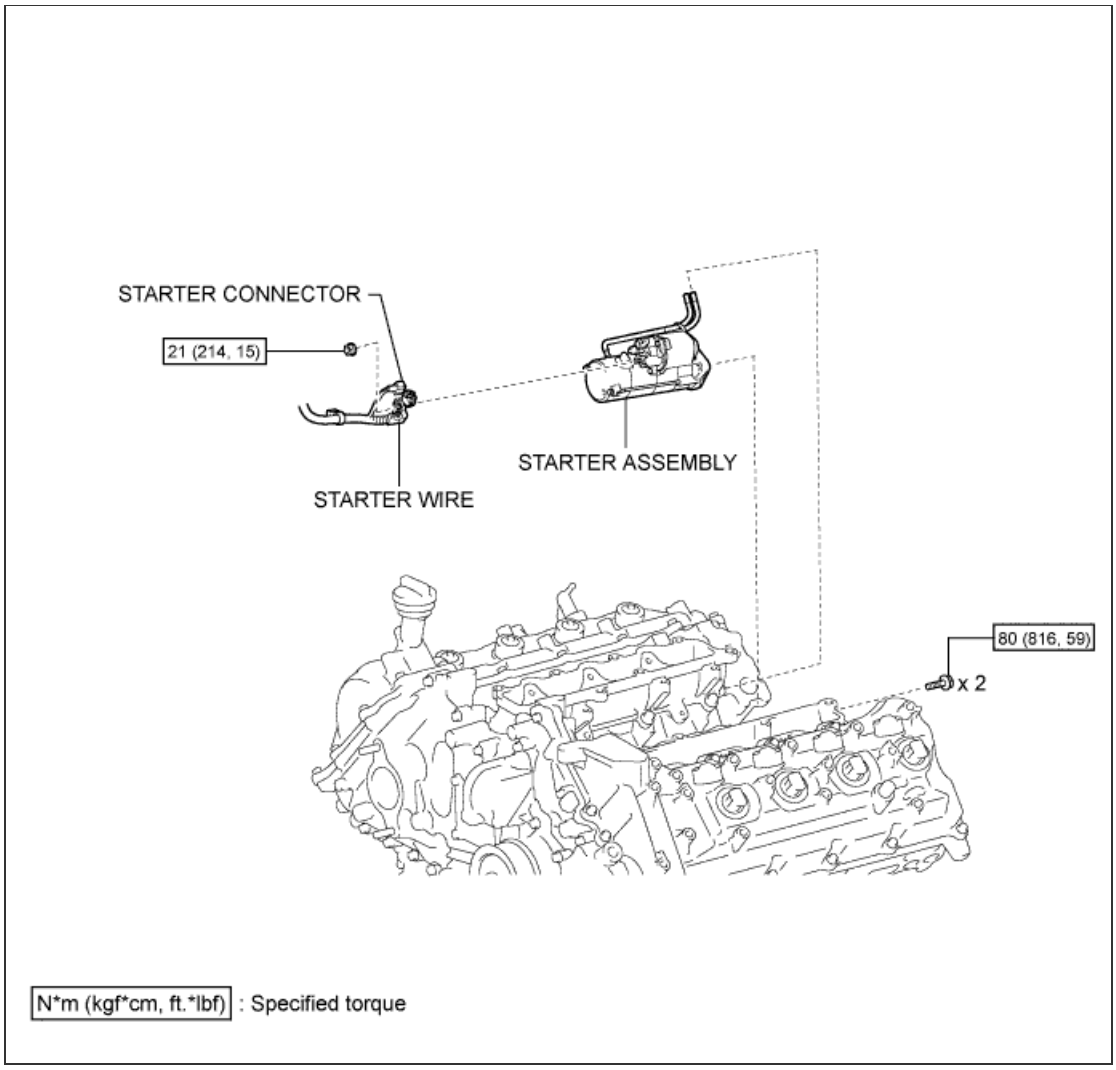


d. Connect the No. 1 air hose to the No. 1 cool air inlet.

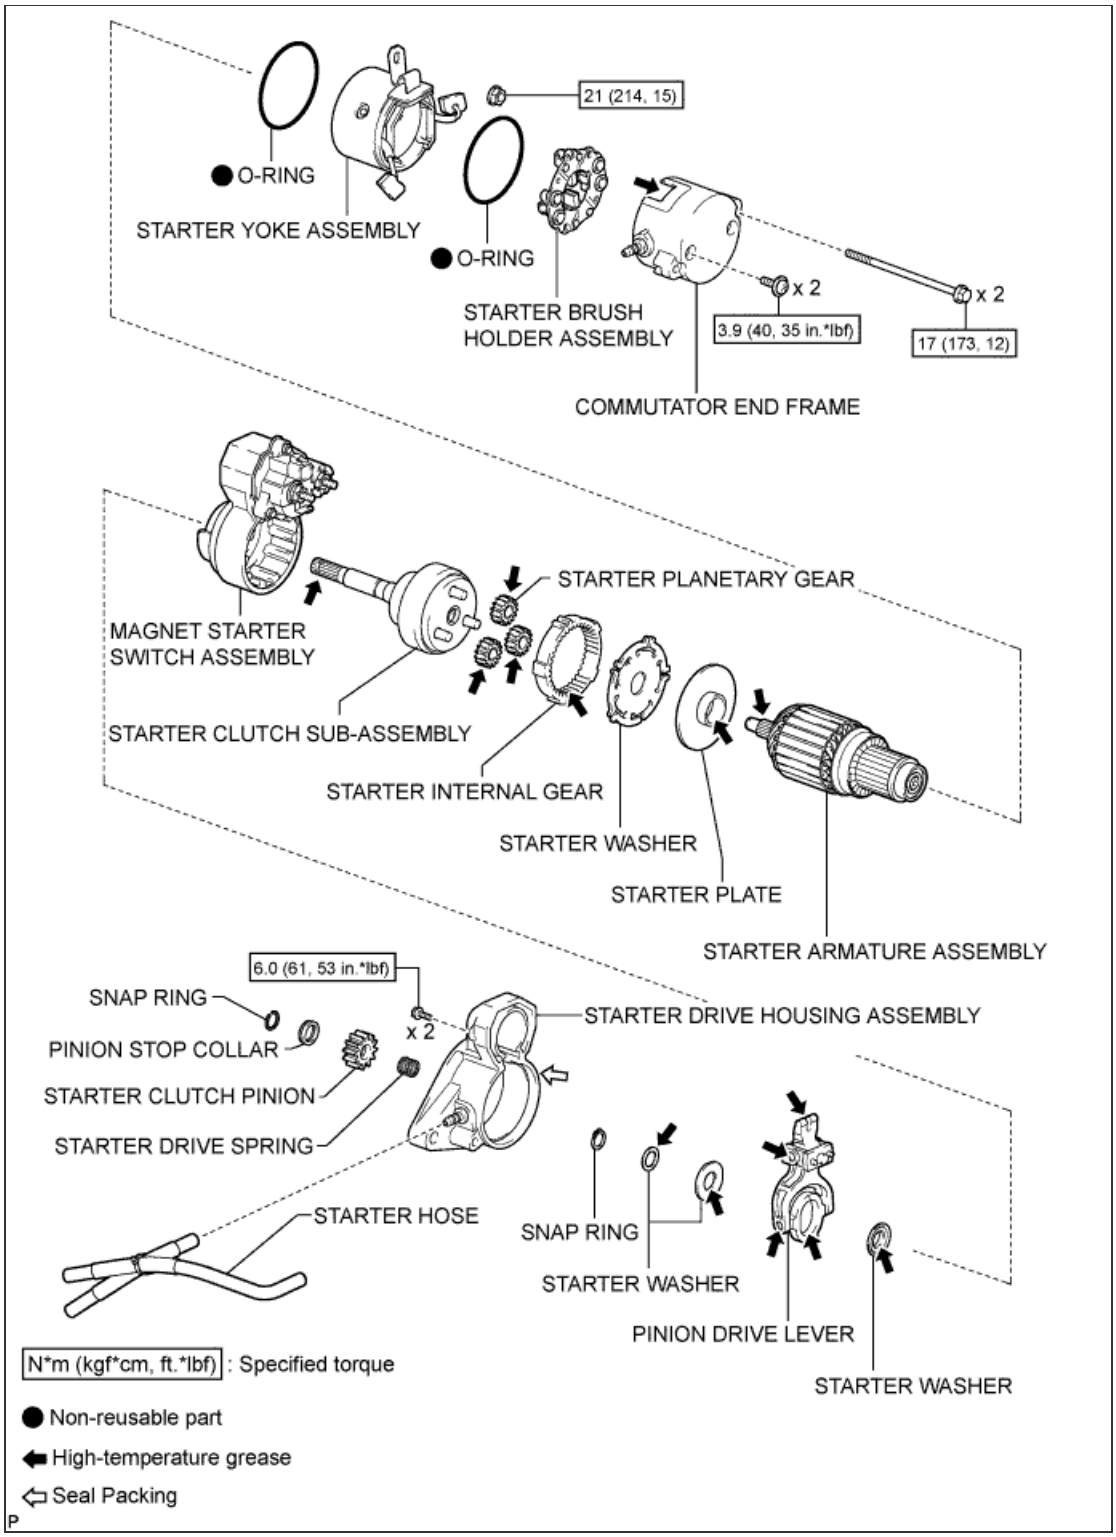
e. Tighten the No. 1 air hose clamp.

Torque:
6.3 N*m{ 64 kgf*cm , 56 in.*lbf }

HINT:



- **Align the paint mark of the air hose with the protrusion and push on the air hose so that distance B is 0 to 3 mm (0 to 0.118 in.).**
- **Position the clamp so that distance A is 2 to 6 mm (0.0787 to 0.236 in.).**
- **Make sure the direction of the hose clamp is as shown in the illustration.**



16. INSTALL INTERCOOLER ASSEMBLY (w/ Intercooler)

a. Install the intercooler (Click here).

for Preparation Click here

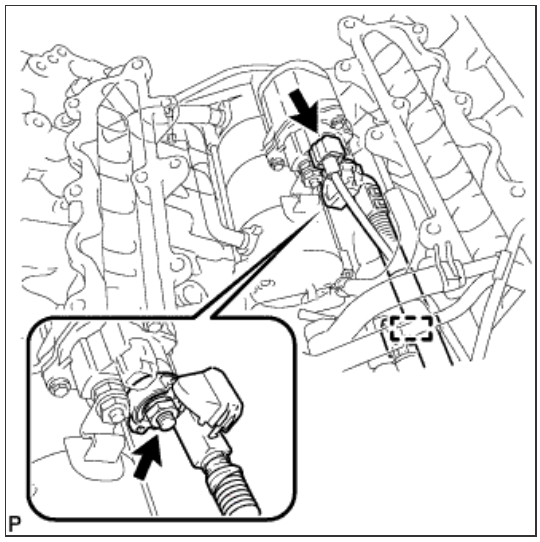
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

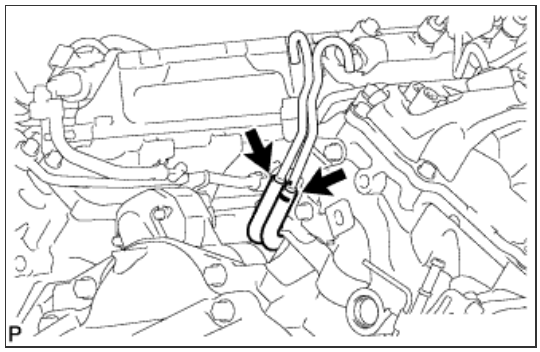
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

2. REMOVE FUEL COOLER ASSEMBLY



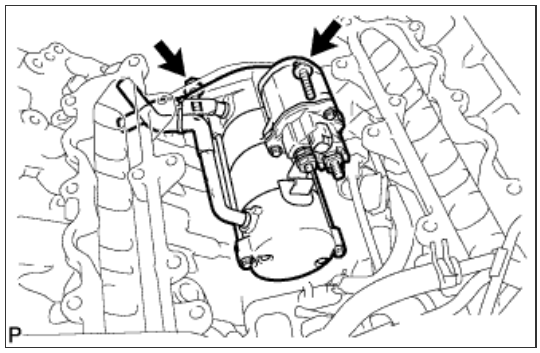
a. Remove the fuel cooler assembly (Click here).

3. REMOVE STARTER ASSEMBLY



a. Detach the harness clamp and disconnect the wire harness.

b. Disconnect the starter connector.



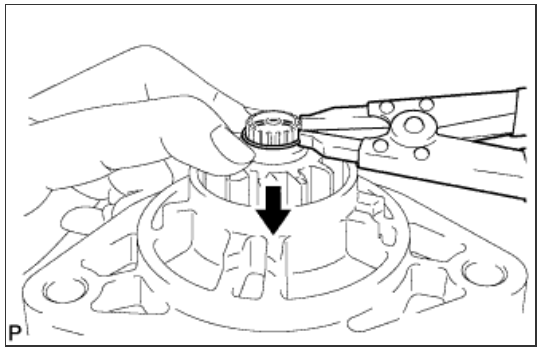
c. Remove the nut and disconnect the starter wire.

d. Disconnect the 2 starter hoses.

e. Remove the 2 bolts and starter.

P

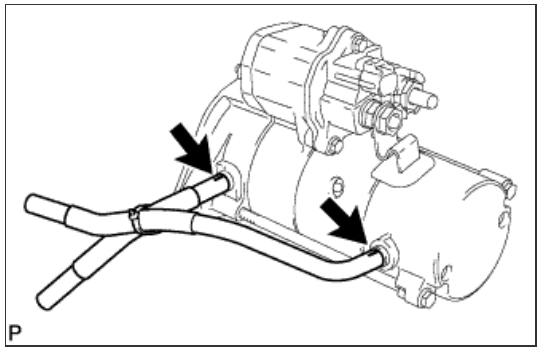
for Preparation Click here



1. REMOVE STARTER CLUTCH PINION

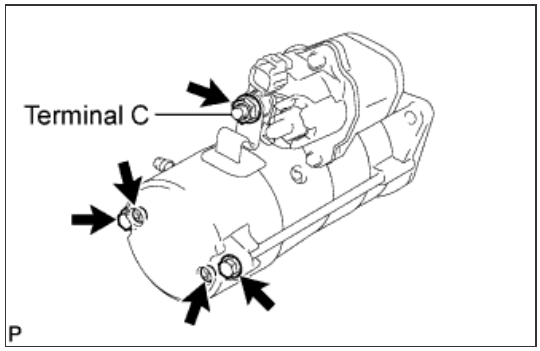
a. Using snap ring pliers, remove the snap ring.

HINT:



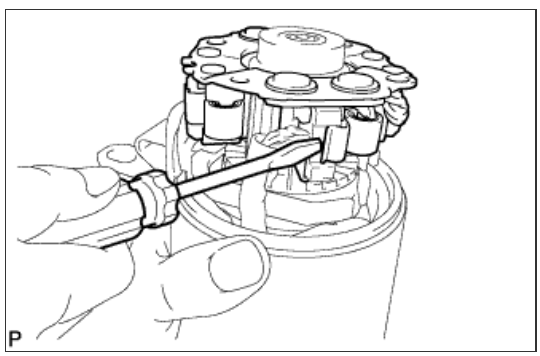
While pushing down the starter clutch pinion, remove the snap ring.

b. Remove the pinion stop collar, starter clutch pinion and starter drive spring.



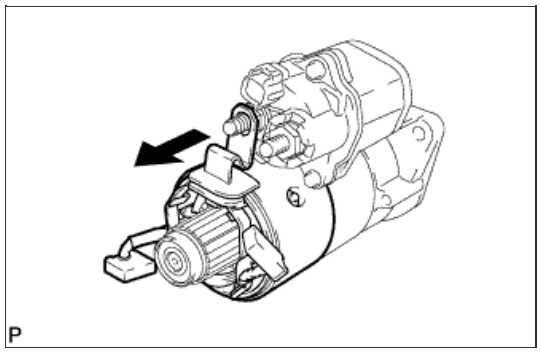
2. REMOVE STARTER BRUSH HOLDER ASSEMBLY

a. Remove the 2 starter hoses from the starter.



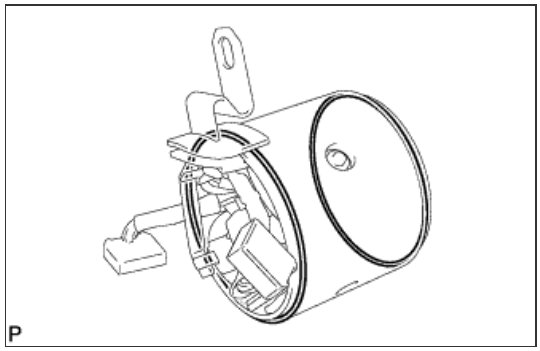
b. Remove the nut from terminal C.

c. Remove the 2 through bolts and 2 screws, then remove the commutator end frame from the starter yoke.



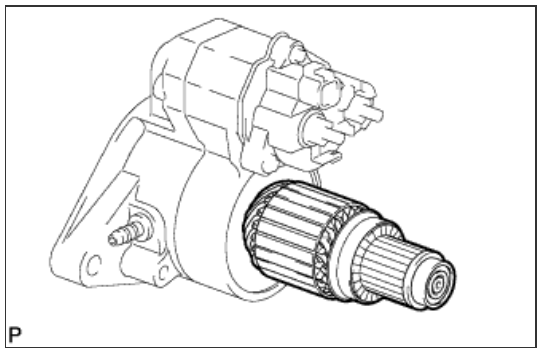
d. Using a screwdriver, hold the starter brush spring back and disconnect the 4 starter brushes from the brush holder.

e. Remove the starter brush holder from the starter armature.

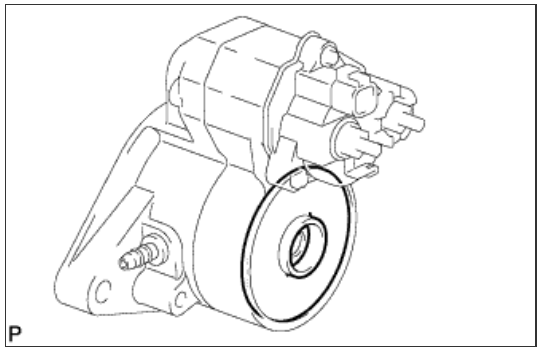


3. REMOVE STARTER YOKE ASSEMBLY

a. Remove the starter yoke.

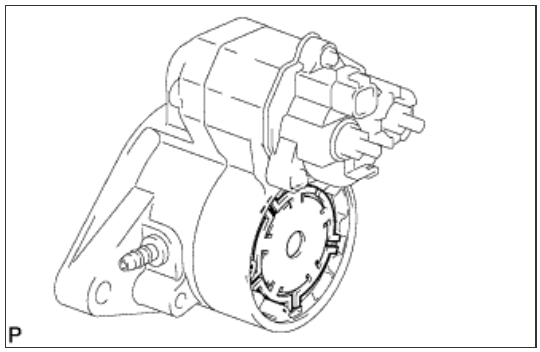


b. Remove the 2 O-rings from the starter yoke.

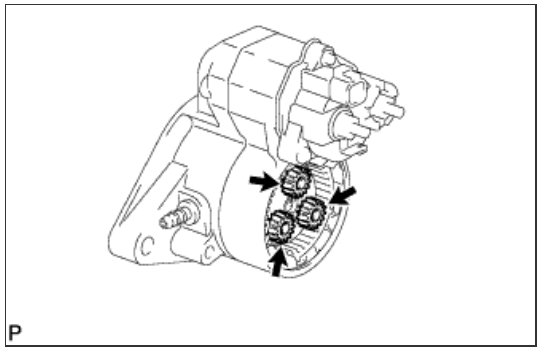


4. REMOVE STARTER ARMATURE ASSEMBLY

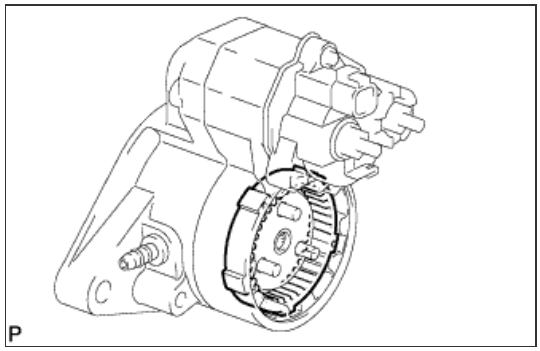
a. Remove the starter armature from the starter plate.



5. REMOVE STARTER INTERNAL GEAR

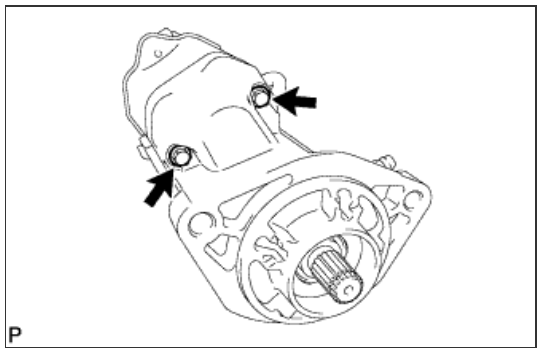


a. Remove the starter plate.



b. Remove the starter washer.

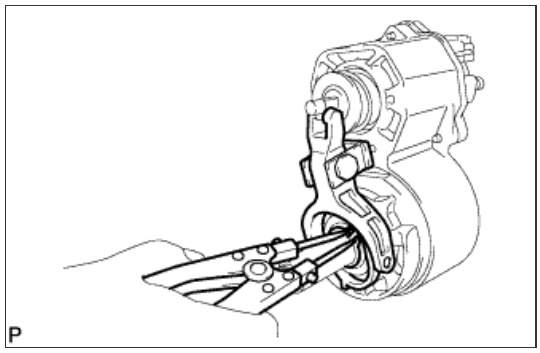
c. Remove the 3 starter planetary gears.



d. Remove the starter internal gear.

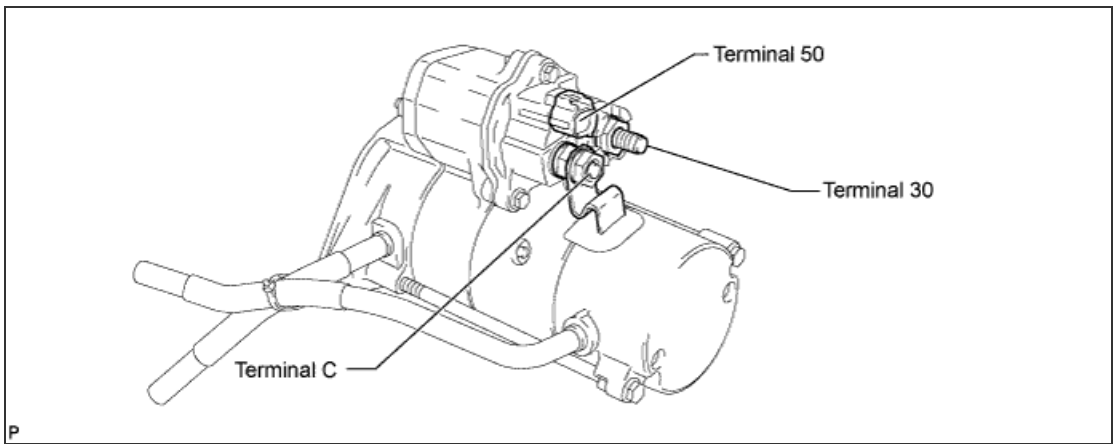
6. REMOVE STARTER DRIVE HOUSING ASSEMBLY

a. Remove the 2 bolts and starter drive housing from the magnet starter switch.



7. REMOVE STARTER CLUTCH SUB-ASSEMBLY

a. Using snap ring pliers, remove the snap ring.



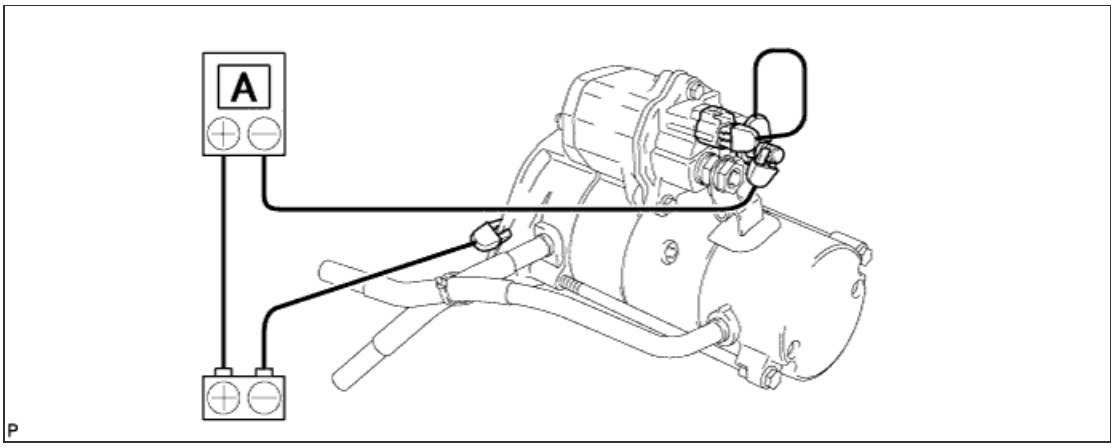
b. Remove the pinion drive lever and 3 washers.

c. Remove the starter clutch from the magnet starter switch.

P

for Preparation Click here

1. INSPECT STARTER ASSEMBLY



CAUTION:

As a large electric current passes through the cable during this inspection, a thick cable must be used. If not, the cable may become hot and cause injury.

NOTICE:

The following tests must be done within 3 to 5 seconds to prevent the coil from burning out.

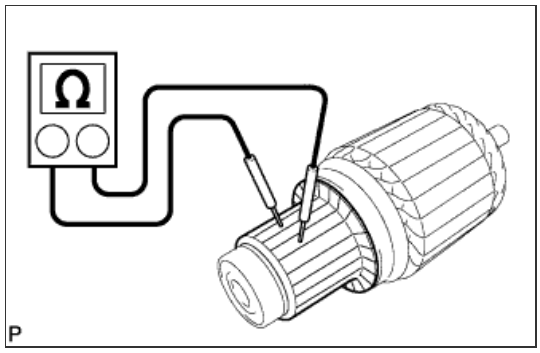
a. Perform the operation test without load.

i. Grip the starter in a vise.

ii. Connect the battery and an ammeter to the starter with terminal 30 disconnected.

NOTICE:

Do not connect terminal 30 to the battery in this step.



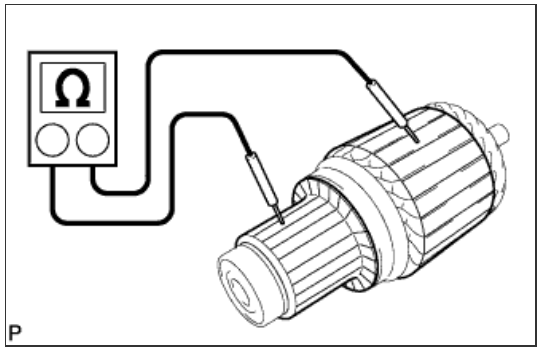
iii. Connect terminal 30 to the battery and check that the starter rotates smoothly and steadily while the pinion gear is moving outward. Then measure the current.

Standard current:
200 A or less at 11 V

If the result is not as specified, repair or replace the starter assembly.

2. INSPECT STARTER ARMATURE ASSEMBLY

a. Inspect the commutator for an open circuit.



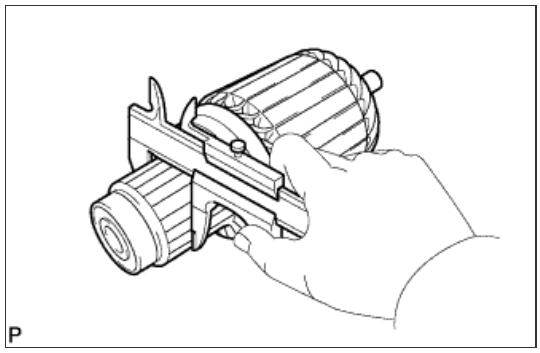
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator	Always	Below 1 Ω

If the result is not as specified, replace the armature assembly.

b. Inspect the commutator for a short circuit.



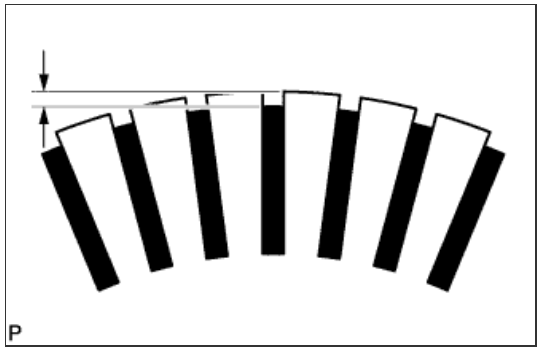
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Commutator - Armature coil core	Always	10 kΩ or higher

If the result is not as specified, replace the armature assembly.

c. Using a vernier caliper, measure the commutator diameter.

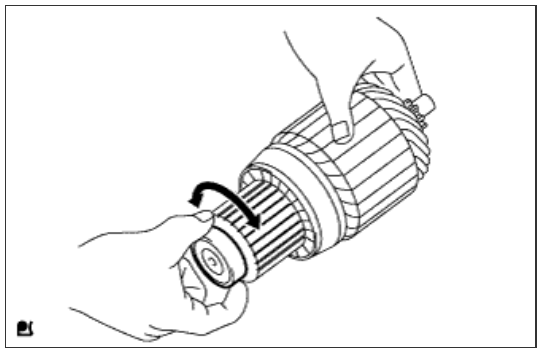


Standard diameter:
36.0 mm (1.42 in.)

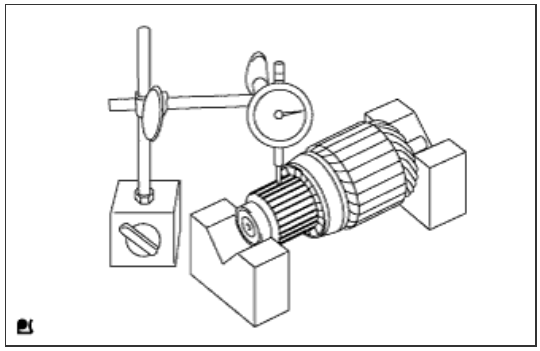
Minimum diameter:
35.0 mm (1.38 in.)

If the diameter is less than the minimum, replace the armature assembly.

d. Measure the undercut depth of the commutator.



Standard undercut depth:
0.7 mm (0.0276 in.)



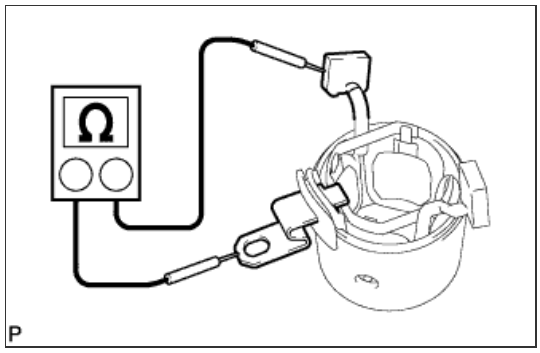
Minimum undercut depth:
0.2 mm (0.00787 in.)

If the undercut depth is less than the minimum, increase the depth using a hacksaw blade.

e. Check that the bearing rotates smoothly.
If necessary, replace the starter armature assembly.

f. Inspect the commutator circle runout.

i. Place the commutator on V-blocks.



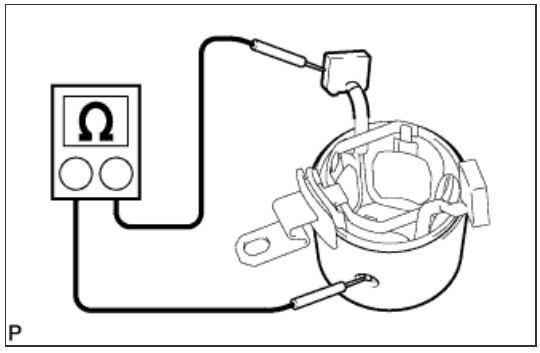
ii. Using a dial indicator, measure the circle runout.

Maximum circle runout:
0.05 mm (0.00197 in.)

If the runout is more than the maximum, correct it with sandpaper (#400) or replace the armature assembly.

3. INSPECT STARTER YOKE ASSEMBLY

a. Inspect the field coil for an open circuit.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Terminal C plate - Brushes	Always	Below 1 Ω

If the result is not as specified, replace the starter yoke assembly.

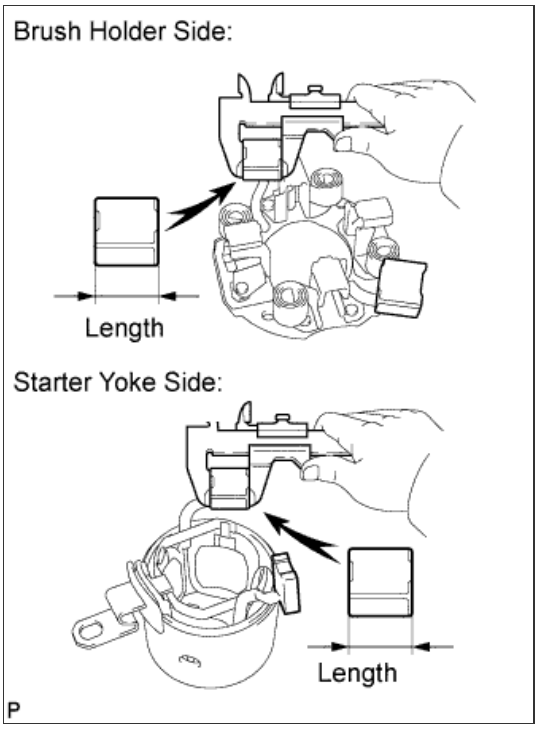
b. Inspect if the field coil is grounded.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Brushes - Starter yoke body	Always	10 kΩ or higher

If the result is not as specified, replace the starter yoke assembly.



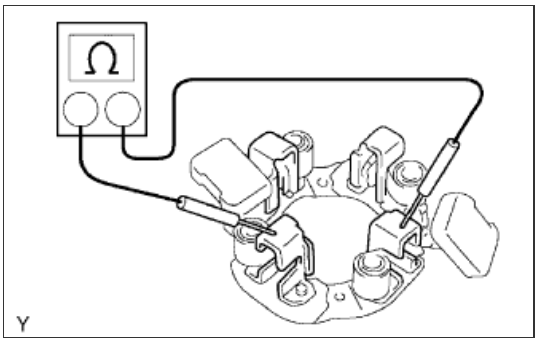
4. INSPECT STARTER BRUSH

a. Using a vernier caliper, measure the brush length.

Standard length:
21.0 mm (0.827 in.)

Minimum length:
12.0 mm (0.472 in.)

If the length is less than the minimum, replace the brush holder and starter yoke assembly.



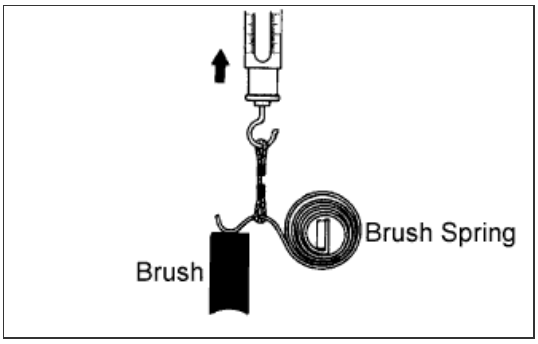
5. INSPECT STARTER BRUSH HOLDER ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive ( ) brush holder - Negative (-) brush holder	Always	10 kΩ or higher

If the result is not as specified, replace the brush holder assembly.



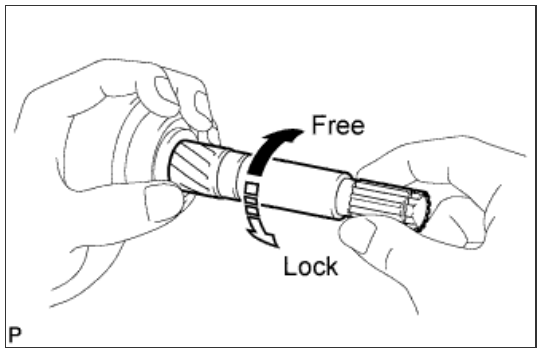
b. Inspect the load of the brush spring.

i. Take a pull scale reading immediately after the brush spring separates from the brush.

Standard spring installed load:
36 N (3.6 kgf, 8.0 lbf)

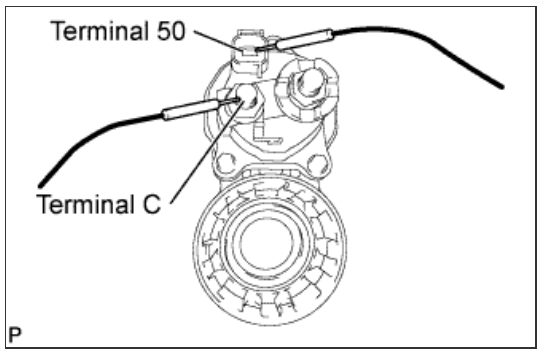
Minimum spring installed load:
12 N (1.2 kgf, 2.7 lbf)

If the spring installed load is less than the minimum, replace the brush holder assembly.



6. INSPECT STARTER CLUTCH SUB-ASSEMBLY

a. Check the starter clutch operation.

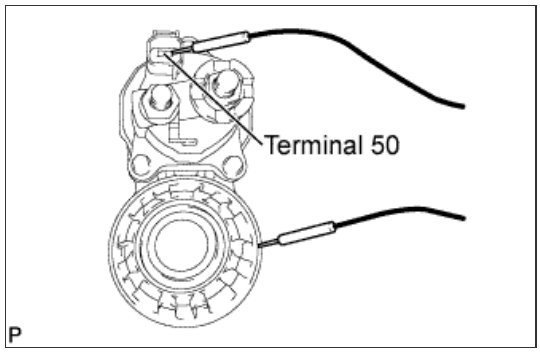


i. Hold the clutch and bearing with one hand and turn the shaft with the other. Check that the inner sleeve turns easily in the "free" direction but cannot turn in the "lock" direction as shown in the illustration.
If the starter clutch sub-assembly does not operate as specified,

replace the starter clutch sub-assembly.

7. INSPECT MAGNET STARTER SWITCH ASSEMBLY

a. Check the pull-in coil for an open circuit.



i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

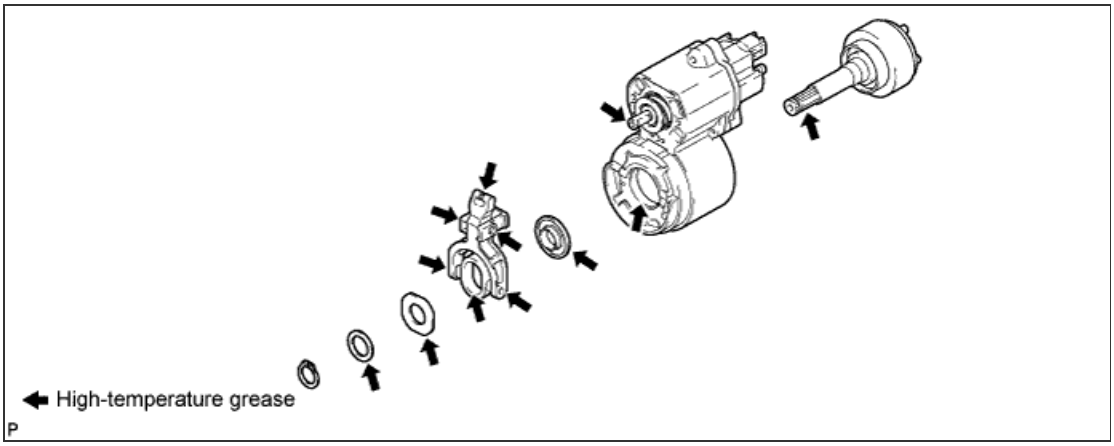
Tester Connection	Condition	Specified Condition
Terminal 50 - Terminal C	Always	Below 0.3 Ω

If the result is not as specified, replace the magnet starter switch assembly.

b. Check the hold-in coil for an open circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
Terminal 50 - Housing Body	Always	Below 0.8 Ω

If the result is not as specified, replace the magnet starter switch assembly.

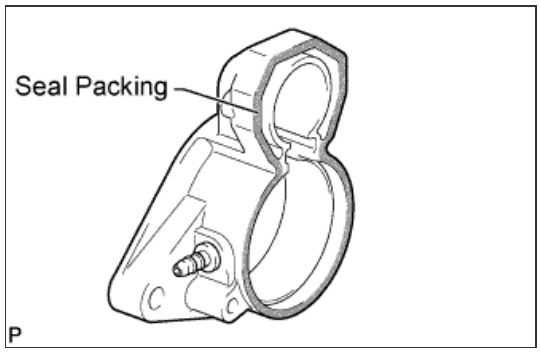
for Preparation Click here

1. INSTALL STARTER CLUTCH SUB-ASSEMBLY

a. Apply high-temperature grease to the parts indicated by the arrows in the illustration.

b. Install the starter clutch into the magnet starter switch.

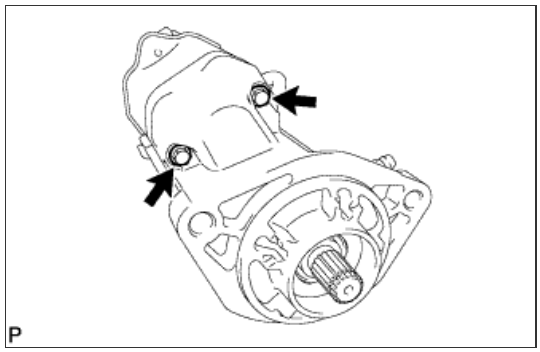
NOTICE:



Make sure that the bearing does not disengage from the starter clutch.

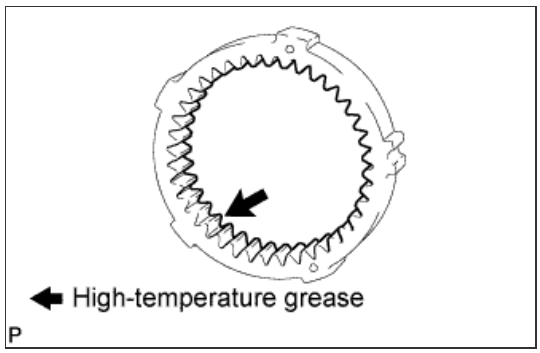
c. Install the 3 starter washers and pinion drive lever with the snap ring.

2. INSTALL STARTER DRIVE HOUSING ASSEMBLY



a. Apply a light coat of seal packing to the surface of the starter drive housing that contacts the starter magnet switch.

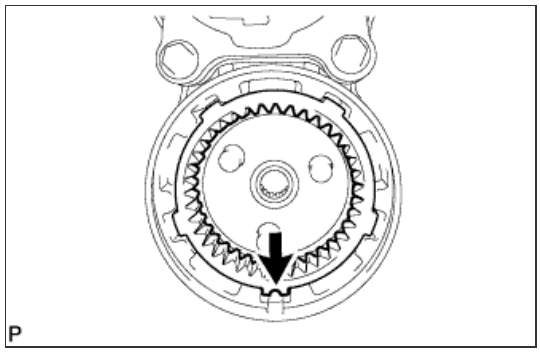
Seal packing:
Toyota Genuine Seal Packing 1121C, Three Bond 1121C or equivalent



b. Install the starter drive housing with the 2 bolts.

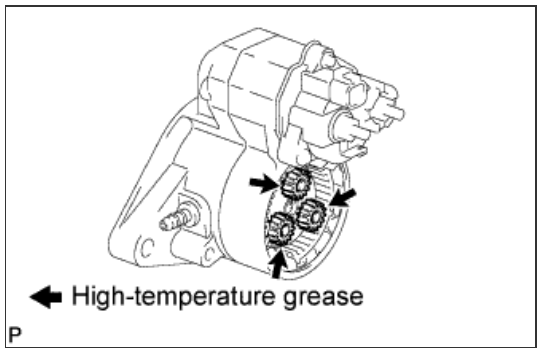
Torque:
6.0 N*m{ 61 kgf*cm , 53 in.*lbf }

3. INSTALL STARTER INTERNAL GEAR



a. Apply high-temperature grease to the portion indicated by the arrow in the illustration.

b. Install the starter internal gear.

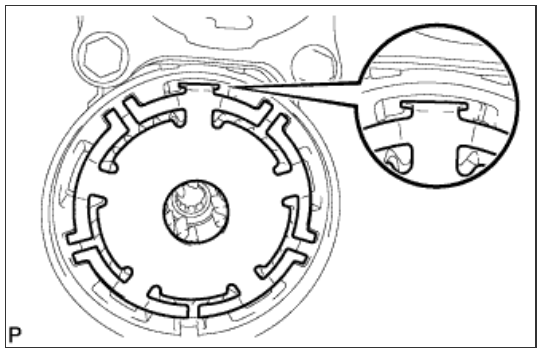


NOTICE:

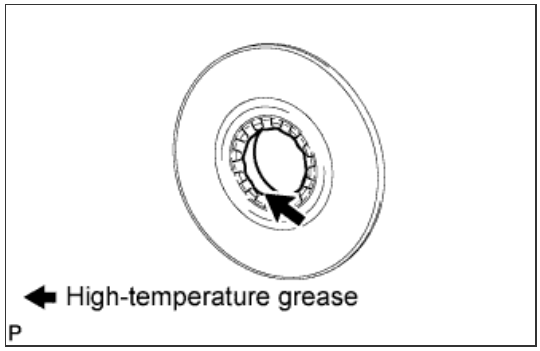
Make sure the internal gear protrusion indicated by the arrow in the illustration is aligned with the groove on the bottom side of the magnet starter switch.

c. Apply high-temperature grease to the planetary gears.

d. Install the 3 starter planetary gears.

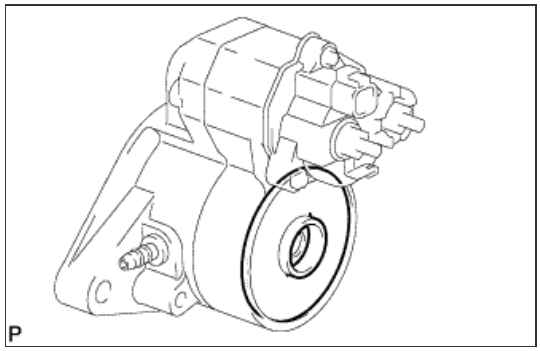


4. INSTALL STARTER ARMATURE ASSEMBLY

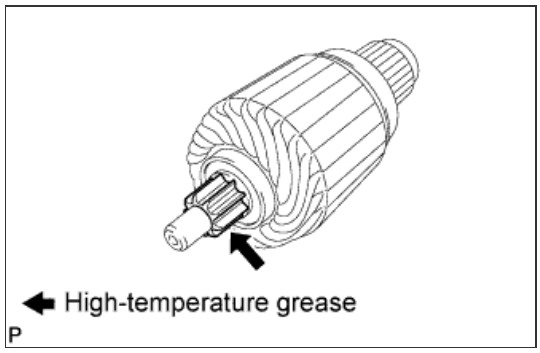


a. Install the starter washer.

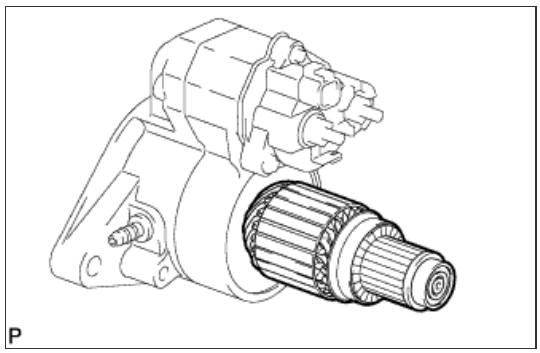
NOTICE:



Make sure that the washer is securely seated in the groove.

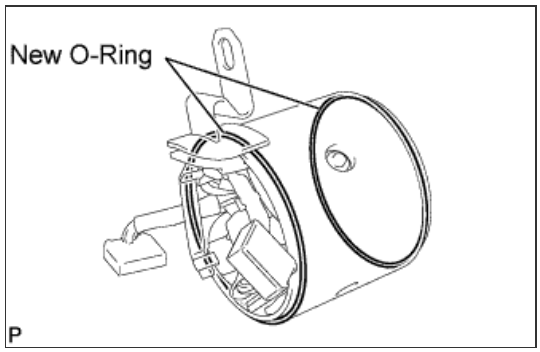


b. Apply high-temperature grease to the portion indicated by the arrow in the illustration.

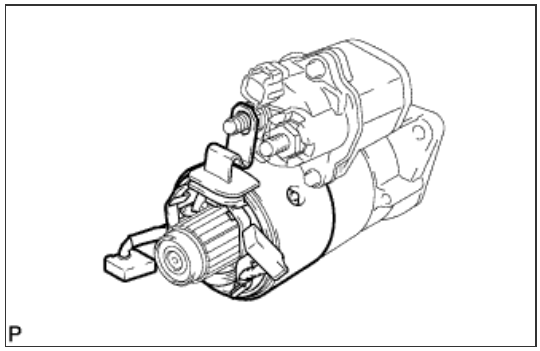


c. Install the starter plate.

d. Apply high-temperature grease to the portion indicated by the arrow in the illustration.



e. Install the starter armature to the starter plate.

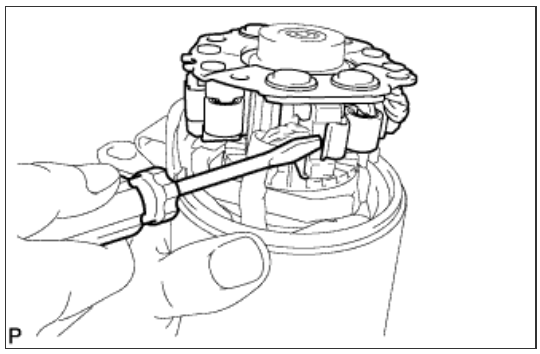


5. INSTALL STARTER YOKE ASSEMBLY

a. Install 2 new O-rings to the starter yoke.

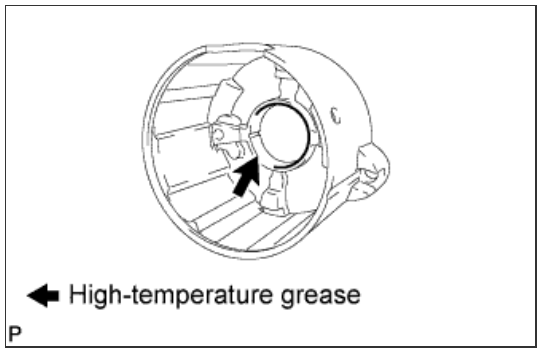
b. Install the starter yoke to the magnet starter switch.

6. INSTALL STARTER BRUSH HOLDER ASSEMBLY



a. Place the brush holder on the starter armature.

b. Using a screwdriver, hold the starter brush spring back and connect the 4 starter brushes to the starter brush holder.



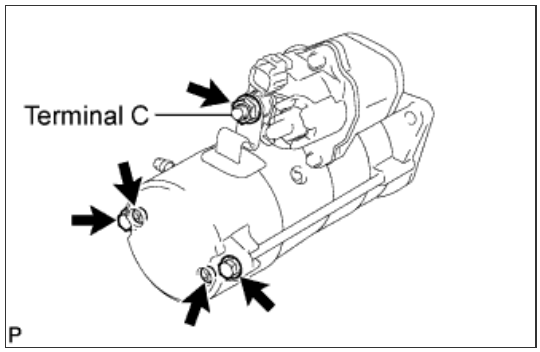
NOTICE:

Check that the positive (+) lead wires are not grounded.

c. Install the starter brush holder into the starter armature.

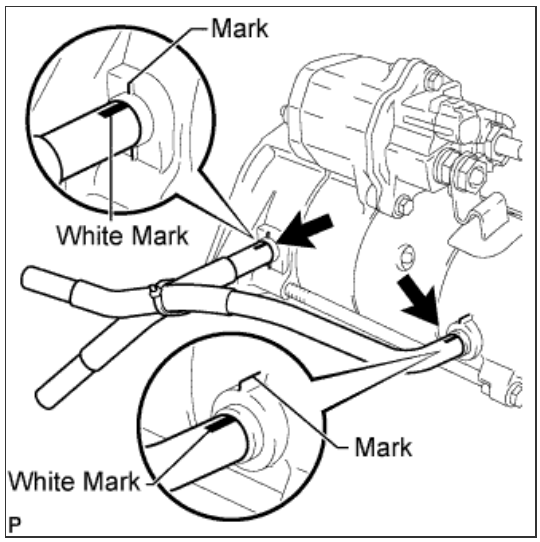
d. Apply high-temperature grease to the portion indicated by the arrow in the illustration.

e. Install the commutator end frame with the 2 screws.



Torque:
3.9 N*m{ 40 kgf*cm , 35 in.*lbf }

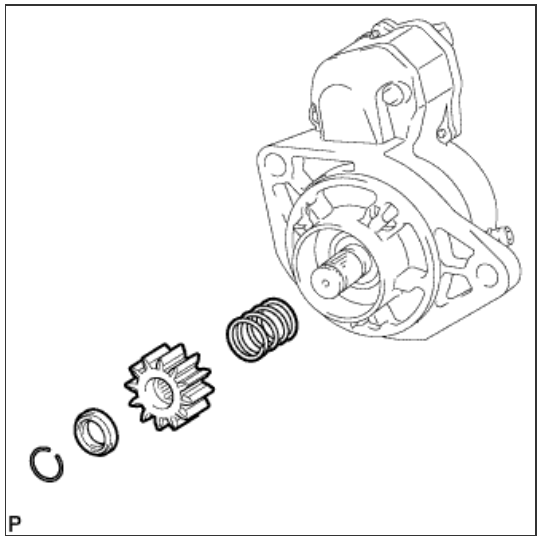
f. Install the 2 through bolts.



Torque:
17 N*m{ 173 kgf*cm , 12 ft.*lbf }

g. Install the nut to terminal C.

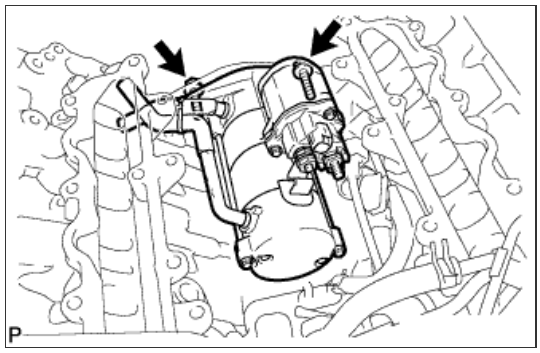
Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



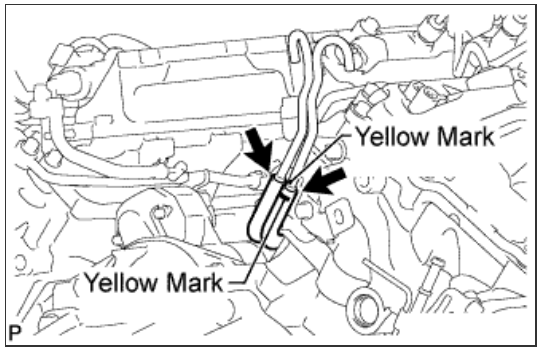
h. Install the 2 starter hoses to the starter.

7. INSTALL STARTER CLUTCH PINION

a. Install the spring, starter clutch pinion and pinion stop collar with the snap ring.



for Preparation Click here

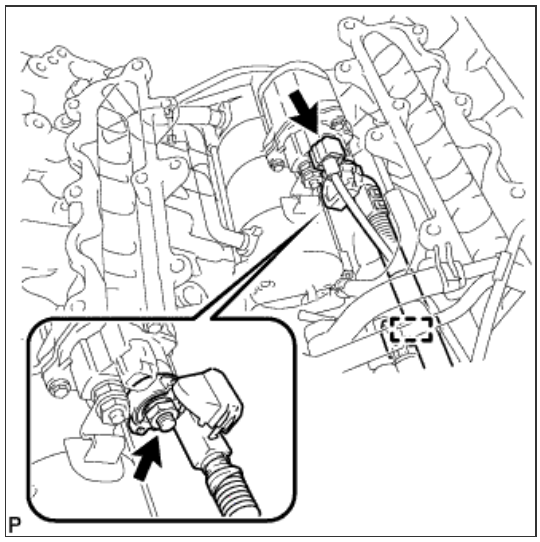


1. INSTALL STARTER ASSEMBLY

a. Install the starter with the 2 bolts.

Torque:
80 N*m{ 816 kgf*cm , 59 ft.*lbf }

b. Connect the 2 starter hoses.



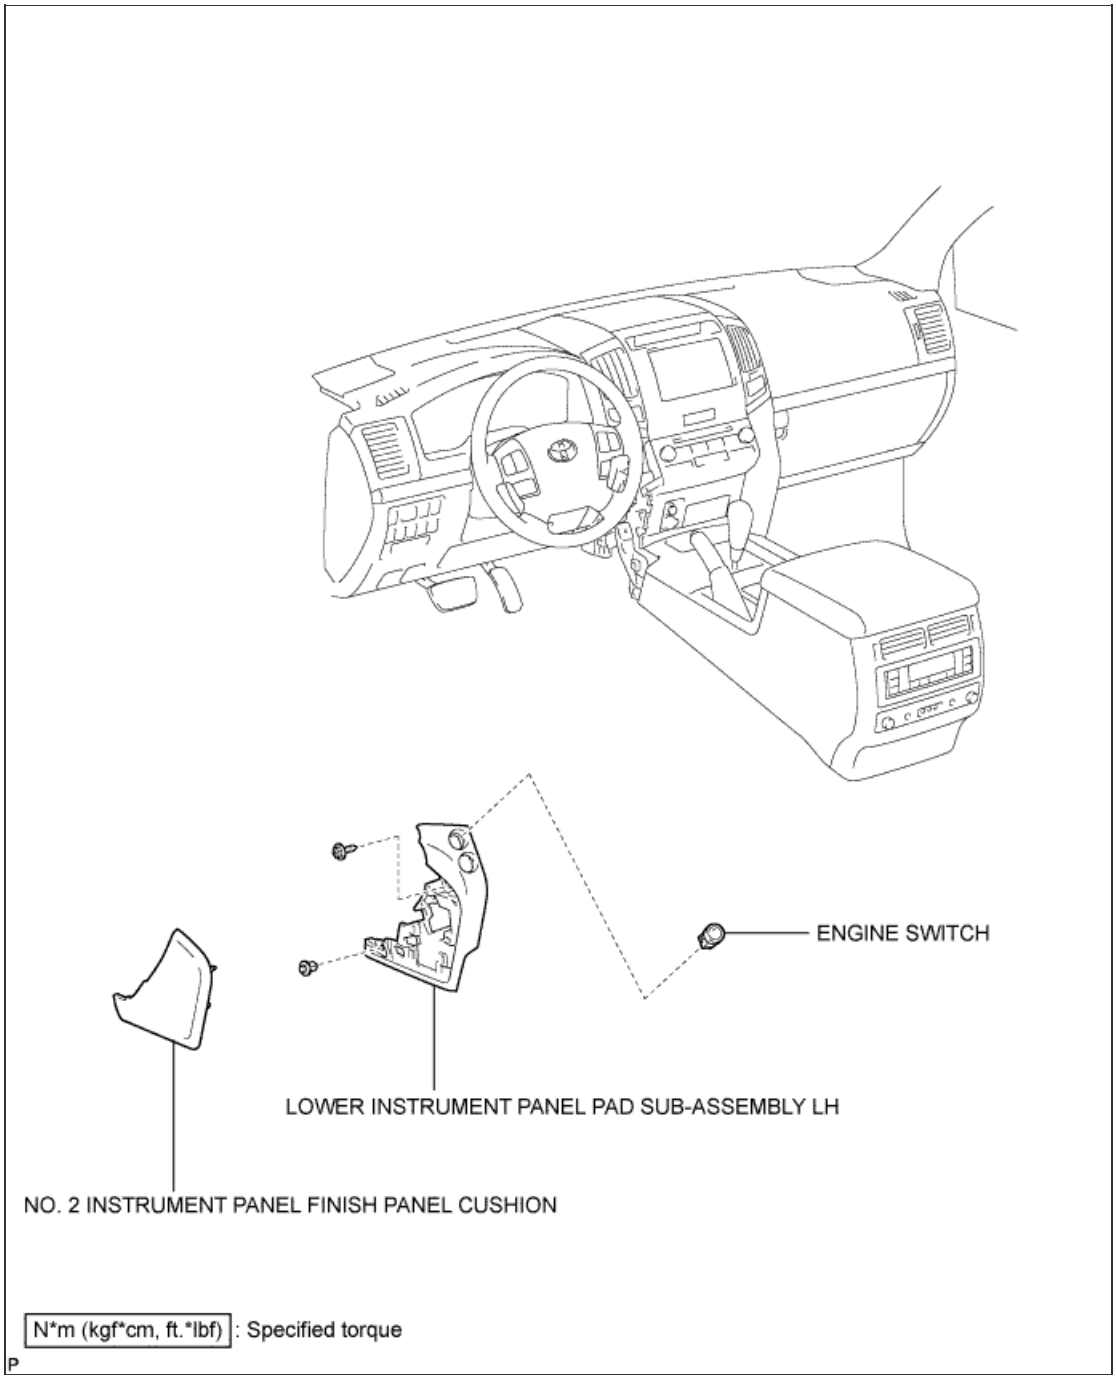
c. Attach the harness clamp and connect the wire harness.

d. Connectl the starter wire with the nut.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

e. Connect the starter connector.

2. INSTALL FUEL COOLER ASSEMBLY



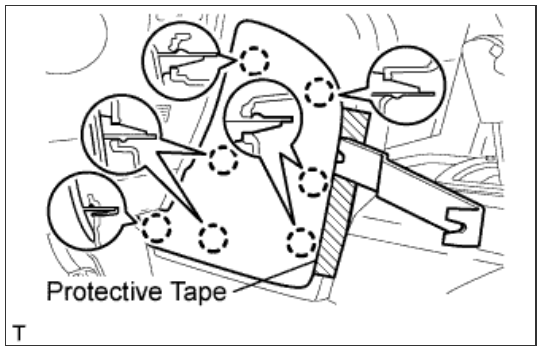
a. Install the fuel cooler assembly (Click here).

3. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

for Preparation Click here

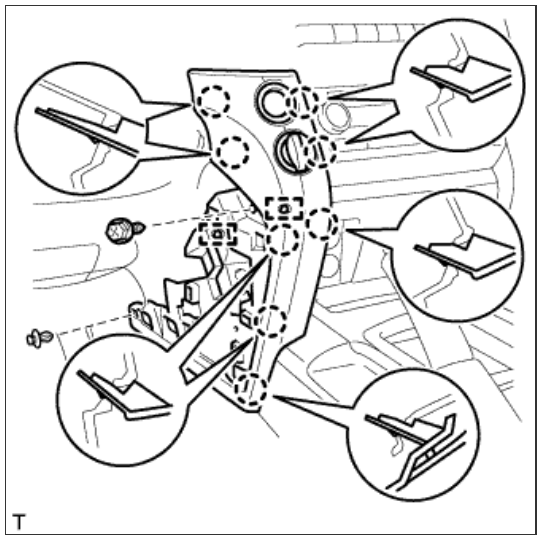


for Preparation Click here

1. REMOVE NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Place protective tape as shown in the illustration.

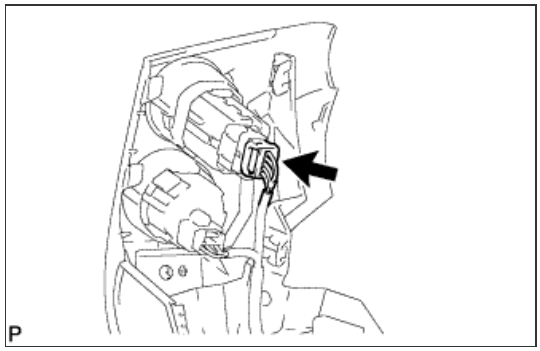
b. Using a moulding remover, detach the 7 claws and remove the panel cushion.



2. REMOVE LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

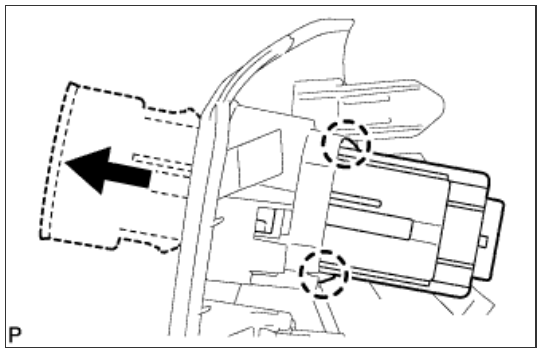
a. Remove the clip.

b. Remove the screw.



c. Detach the 8 claws.

d. Remove the panel pad and disconnect the connectors and 2 clamps.

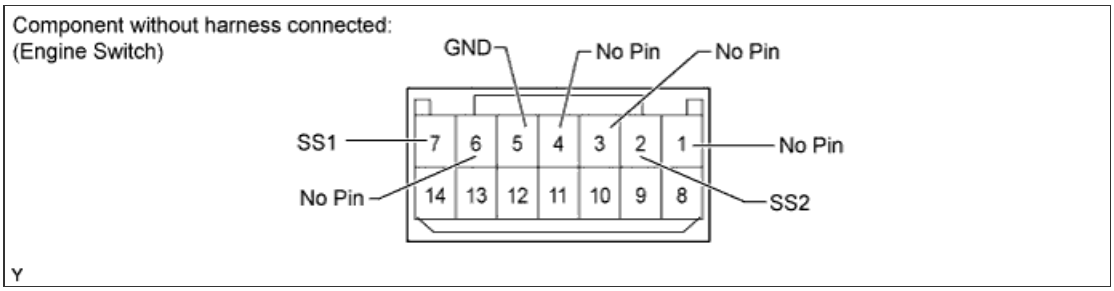


3. REMOVE ENGINE SWITCH

a. Disconnect the switch connector.

b. Detach the 2 claws and remove the switch.

P



for Preparation Click here

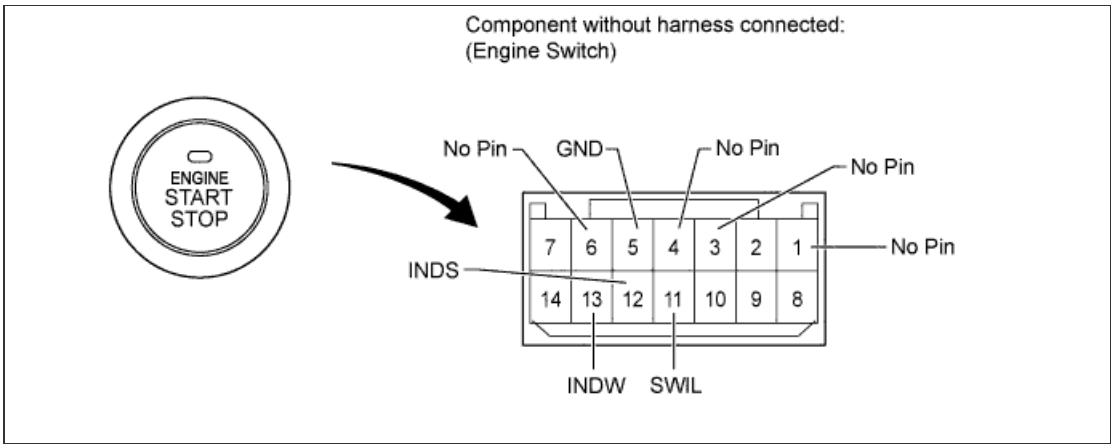
1. INSPECT ENGINE SWITCH

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
7 (SS1) - 5 (GND)	Not pushed	10 kΩ or higher
2 (SS2) - 5 (GND)	Not pushed	10 kΩ or higher
7 (SS1) - 5 (GND)	Pushed	Below 1 Ω
2 (SS2) - 5 (GND)	Pushed	Below 1 Ω

If the result is not as specified, replace the engine switch.



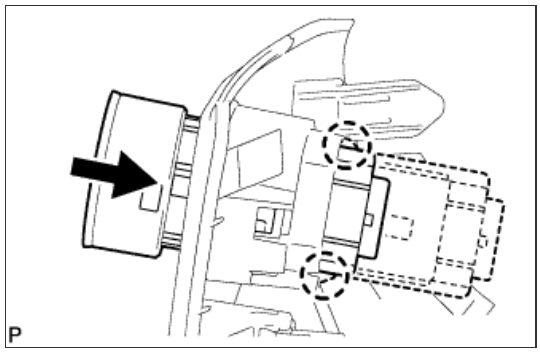
b. Apply battery voltage between the terminals of the switch, and check the illumination condition of the switch.

HINT:

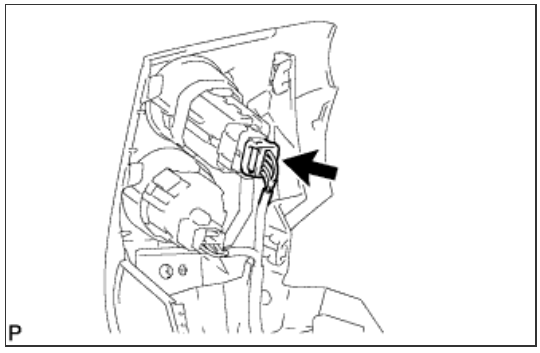
- **If the positive (+) lead and the negative (-) lead are incorrectly connected, the engine switch indicator will not illuminate.**
- **If the voltage is too low, the indicator will not illuminate.**

OK:

Measurement Condition	Specified Condition
Battery positive (+) → Terminal 11 (SWIL) Battery negative (-) → Terminal 5 (GND)	Illuminates (illumination of lettering)
Battery positive (+) → Terminal 12 (INDS) Battery negative (-) → Terminal 5 (GND)	Illuminates (green)
Battery positive (+) → Terminal 13 (INDW) Battery negative (-) → Terminal 5 (GND)	Illuminates (amber)



If the result is not as specified, replace the engine switch.

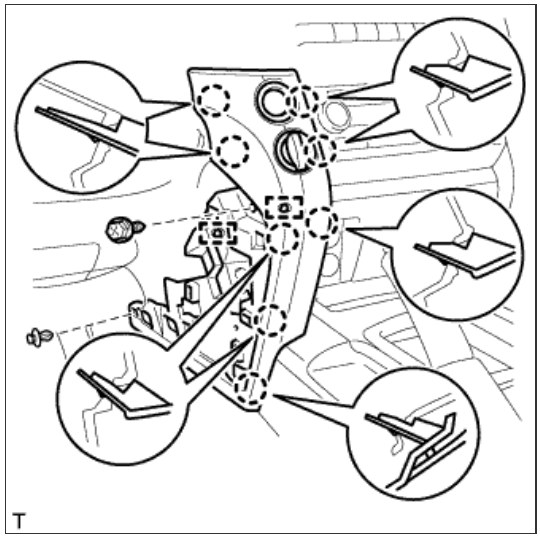


for Preparation Click here

1. INSTALL ENGINE SWITCH

a. Attach the 2 claws to install the switch.

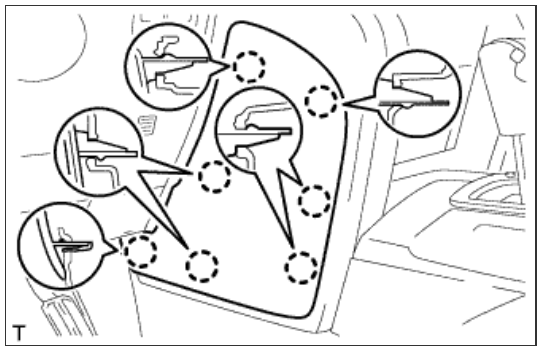
b. Connect the switch connector.



2. INSTALL LOWER INSTRUMENT PANEL PAD SUB-ASSEMBLY LH

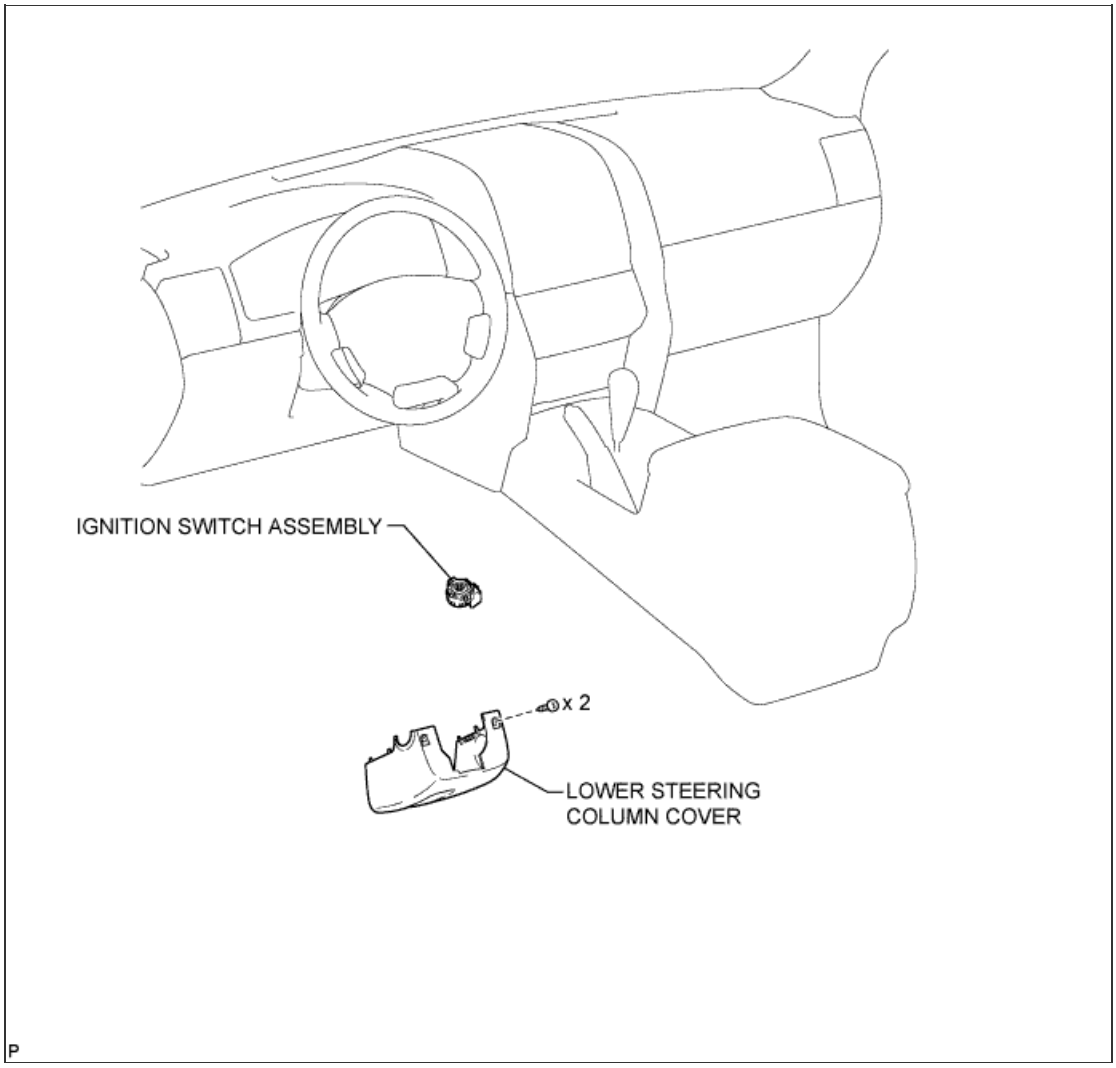
a. Connect the connectors and 2 clamps.

b. Attach the 8 claws to install the panel pad.



c. Install the screw.

d. Install the clip.



3. INSTALL NO. 2 INSTRUMENT PANEL FINISH PANEL CUSHION

a. Attach the 7 claws to install the panel cushion.

T

for Preparation Click here

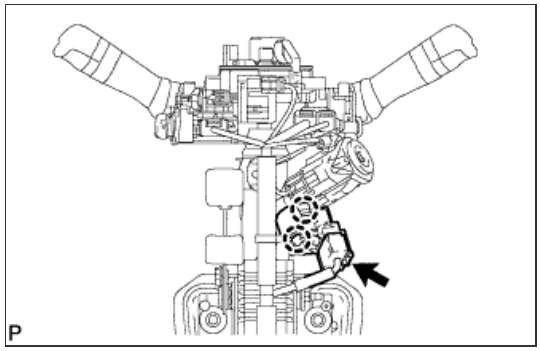
1. REMOVE LOWER STEERING COLUMN COVER

a. Remove the 2screws.

HINT:

Turn the steering wheel to the right and left as necessary to remove the 2 screws.



b. Detach the 2 claws and remove the lower steering column cover.

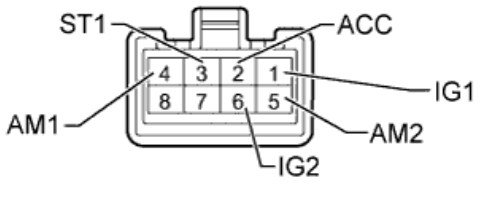
2. REMOVE IGNITION SWITCH ASSEMBLY

a. Disconnect the ignition switch connector.

b. Detach the 2 claws and remove the ignition switch.

for Preparation Click here

1. INSPECT IGNITION SWITCH ASSEMBLY



a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
All combinations of all terminals	LOCK	10 kΩ or higher
4 (AM1) - 2 (ACC)	ACC	Below 1 Ω
4 (AM1) - 2 (ACC) 4 (AM1) - 1 (IG1) 5 (AM2) - 6 (IG2)	ON	
4 (AM1) - 1 (IG1) 4 (AM1) - 3 (ST1) 5 (AM2) - 6 (IG2)	START	

If the result is not as specified, replace the switch assembly.

Component without harness connected:
(Ignition Switch)

for Preparation Click here

1. INSTALL IGNITION SWITCH ASSEMBLY

a. Attach the 2 claws to install the ignition switch.

b. Connect the ignition switch connector.

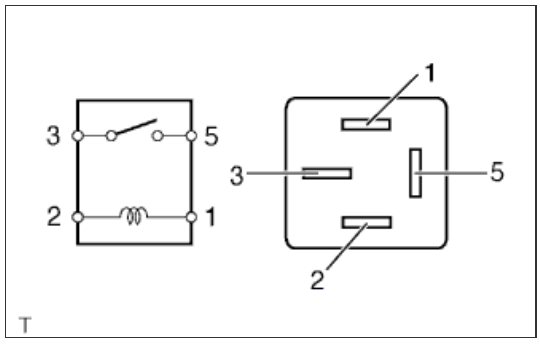
2. INSTALL LOWER STEERING COLUMN COVER

a. Attach the 2 claws to install the lower steering column cover.

b. Install the 2 screws.

HINT:

Turn the steering wheel to the right and left as necessary to install the 2 screws.



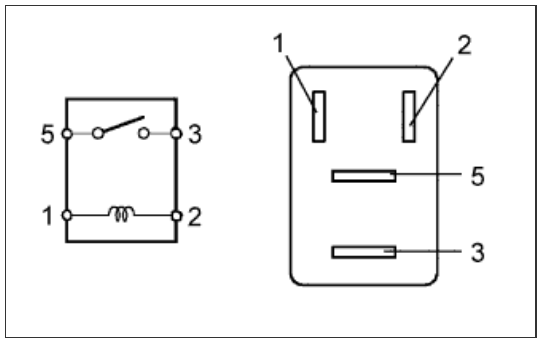
for Preparation Click here

1. INSPECT STARTER RELAY (ST)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω



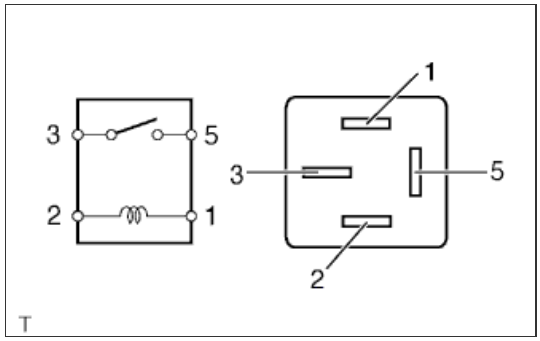
If the result is not as specified, replace the relay.

2. INSPECT STARTER CUT RELAY (ST CUT)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω



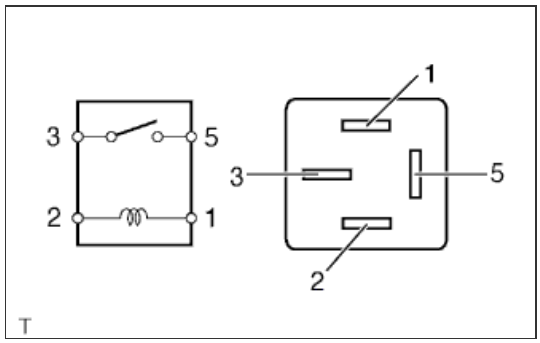
If the result is not as specified, replace the relay.

3. INSPECT NO. 1 GLOW RELAY (GLOW 1)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

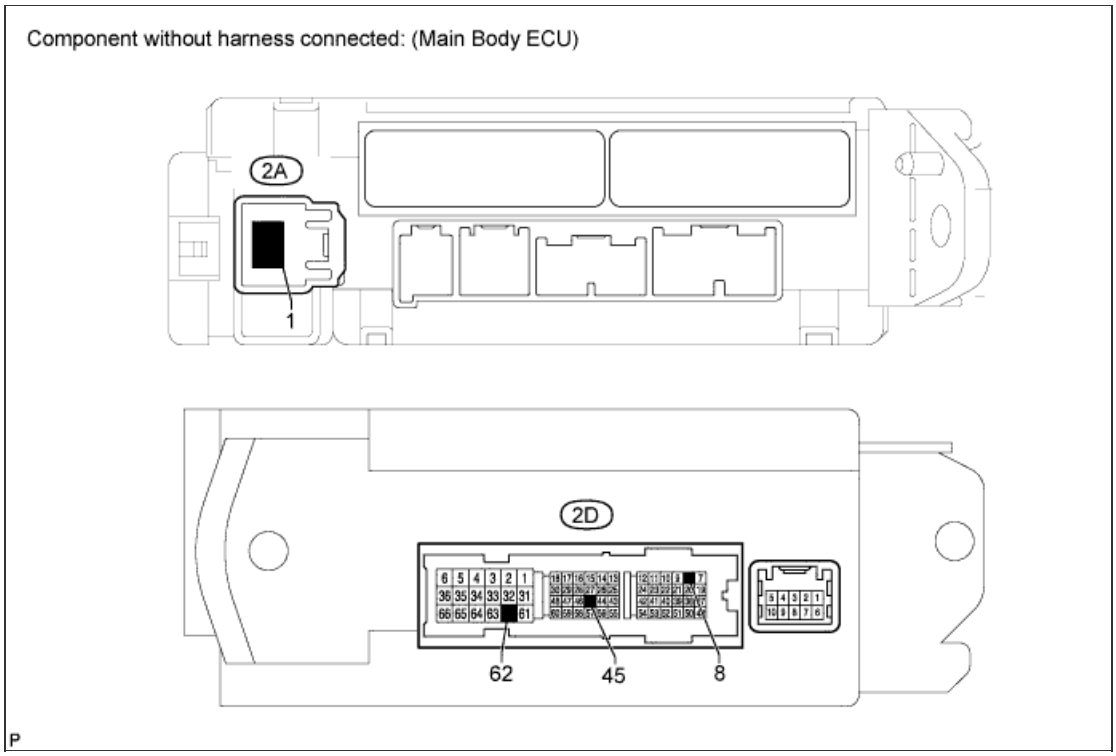
Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω



If the result is not as specified, replace the relay.

4. INSPECT NO. 2 GLOW RELAY (GLOW 2)

a. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

5. INSPECT MAIN BODY ECU (ACC RELAY)

a. Measure the resistance of the ACC relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2A-1 - 2D-8	Battery voltage not applied between 2D-45 and 2D-62	10 kΩ or higher
	Battery voltage applied between 2D-45 and 2D-62	Below 1 Ω

If the result is not as specified, replace the main body ECU.

for Preparation Click here

1.IGNITION SWITCH EXPRESSION

HINT:

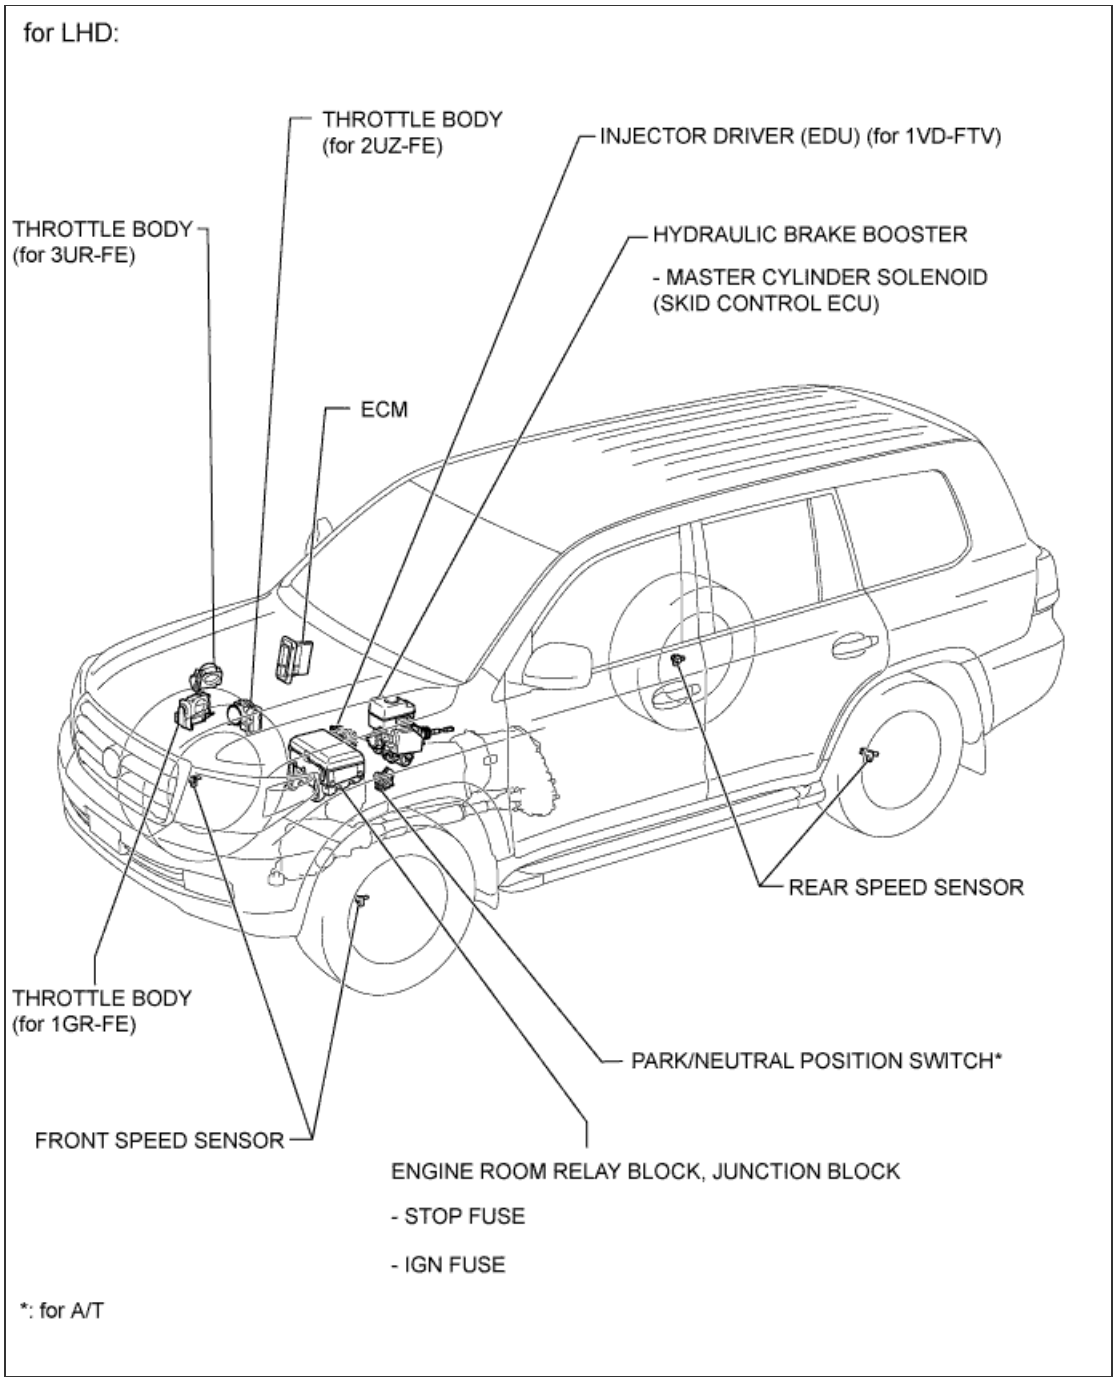
The type of ignition switch used on this model differs according to the specifications of the vehicle. The expressions listed in the table below are used in this section.

Expression	Ignition Switch (position)	Engine Switch (condition)
Ignition Switch off	LOCK	Off
Ignition Switch ACC	ACC	On (ACC)
Ignition Switch ON	ON	On (IG)
Engine Start	START	Start

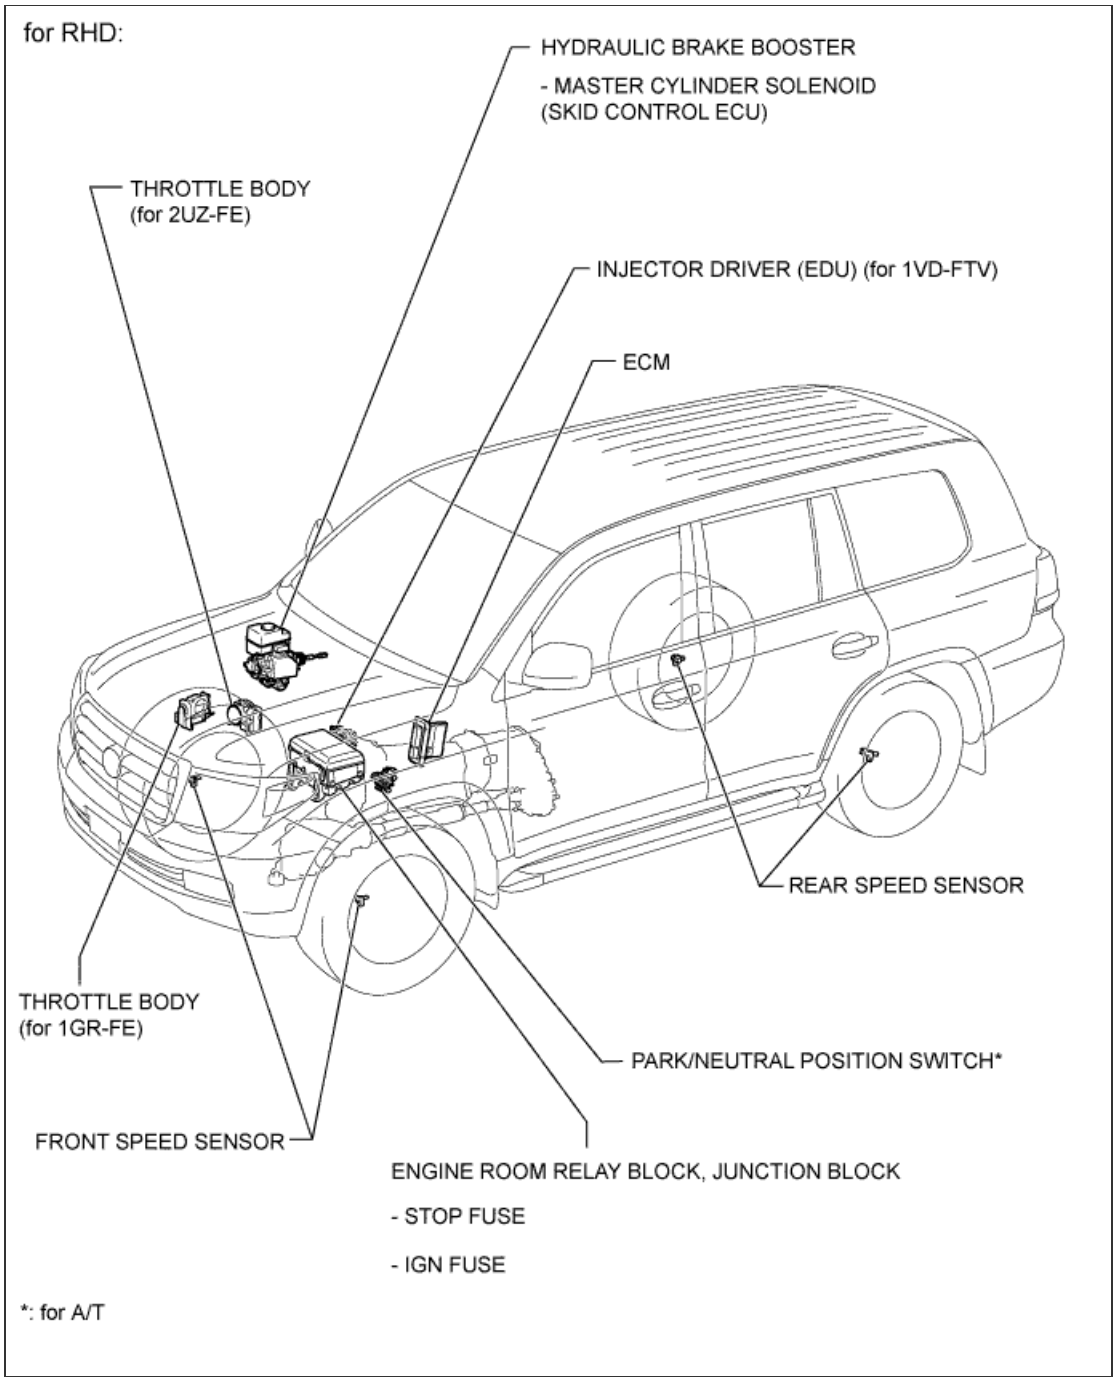
2.HANDLING PRECAUTION FOR CRUISE CONTROL SYSTEM

a. Turn the cruise control main switch off when not using the cruise control system.

b. Be careful as the vehicle speed increases when driving downhill with the cruise control system on.

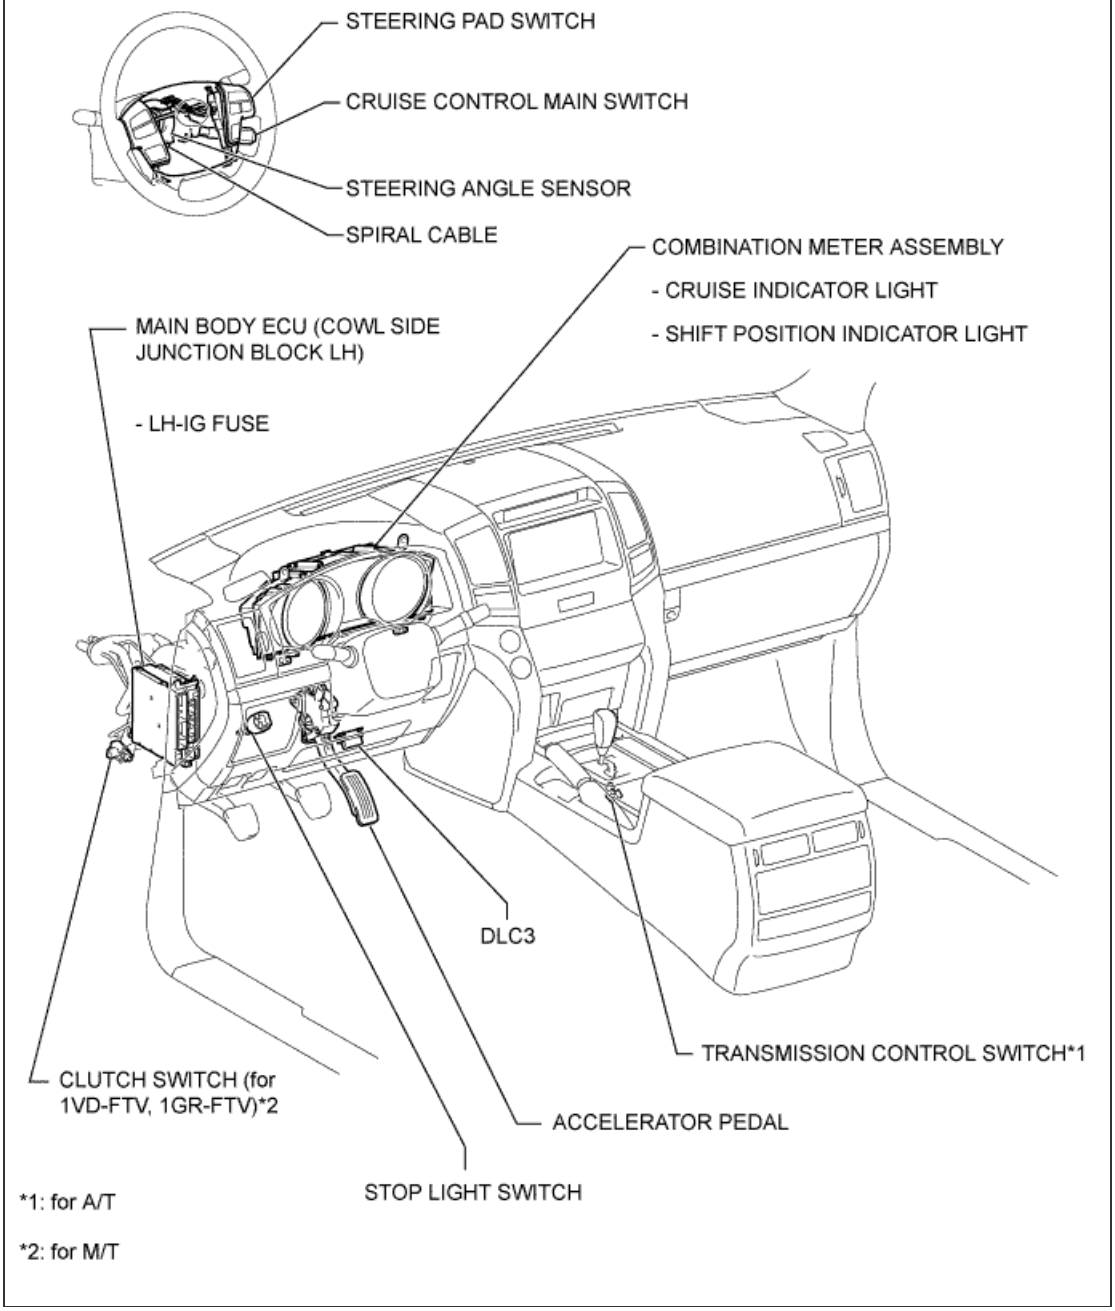


c. The +RES (ACCELERATION/RESUME) operation changes according to the cruise control system status. When the cruise control system is operating, + (ACCELERATION) operates. When the cruise control system is not operating, RES (RESUME) operates.



d. When the cruise control system is operating and the CRUISE main indicator light blinks, turn the cruise control main switch off to reset the cruise control system. After the reset, if the cruise control main switch cannot be turned on, or the cruise control system is canceled immediately after turning the cruise control main switch on, the system may have a malfunction.

e. Do not use the cruise control system where the road conditions are as follows:



- Heavy traffic
- Steep decline
- Roads with sharp turns
- Icy or snowy roads
- Slippery roads

CRUISE CONTROL SYSTEM (for 2UZ-FE, 1GR-FE, 3UR-FE)

This system is controlled by the ECM, and is activated by the throttle position sensor and motor. The ECM controls the following functions: , -SET (C ET), ES (ACCELE T ESUME), CANCEL, vehicle speed operation, motor output control, and shift down control.

- The ECM compares the driving vehicle speed from the vehicle speed sensor with the stored vehicle speed set through the cruise control main switch. The ECM controls the throttle valve motor of the throttle position sensor and motor to open the valve when the driving speed is less than the stored speed.
- The ECM receives signals such as , -SET (C ET), ES (ACCELE T ESUME), and CANCEL from the cruise control main switch and e ecutes the corresponding function.
- The ECM illuminates the C E main indicator light on the combination meter when it receives the cruise control main switch on signal.
- The ECM cancels the cruise control system when the bra e pedal is depressed and the ECM receives the stop light switch signal.
- The ECM cancels the cruise control system when the S3, S2, or S range is selected with the shift lever in S, or when the shift lever is moved from D to N, based on the (ar eutral osition) switch signal (for A/T).
- The ECM cancels the cruise control system when the clutch pedal is depressed and the ECM receives a clutch switch signal (for M/T).

CRUISE CONTROL SYSTEM (for 1VD-FTV)

This system controls the vehicle speed by using the ECM to change the fuel injection uantity. The ECM controls the following functions: , -SET (C ET), ES (ACCELE T ESUME), CANCEL, vehicle speed operation, motor output control, and shift down control.

- The ECM compares the driving vehicle speed from the vehicle speed sensor with the stored vehicle speed set through the cruise control main switch. When the actual vehicle speed e ceeds the stored vehicle speed, the ECM decreases the fuel injection uantity. When the actual vehicle speed is less than the stored vehicle speed, the ECM increases the fuel injection uantity.
- The ECM receives signals such as , -SET (C ET), ES (ACCELE T ESUME), and CANCEL from the cruise control main switch and e ecutes the corresponding function.
- The ECM illuminates the C E main indicator light on the combination meter when it receives the cruise control main switch on signal.
- The ECM cancels the cruise control system when the bra e pedal is depressed and the ECM receives the stop light switch signal.
- The ECM cancels the cruise control system when the S3, S2, or S range is selected with the shift lever in S, or when the shift lever is moved from D to N, based on the (ar eutral osition) switch signal (for A/T).
- The ECM cancels the cruise control system when the clutch pedal is depressed and the ECM receives a clutch switch signal (for M/T).

LIMIT CONTROL

a. Low speed limit
The lowest possible limit of the speed setting range is set at appro imately 40 m/h (25 mph). The cruise control system cannot be set when the driving vehicle speed is below the low speed limit. The cruise control operation will be automatically canceled but the stored vehicle speed will be retained when the vehicle speed decreases below the low speed limit of 40 m/h (25 mph) while the cruise control is in operation.

b. High speed limit
The highest possible limit of the speed setting range is set at appro imately 200 m/h (mph). The cruise control system cannot be set when the driving vehicle speed is over the high speed limit. Also, ES (ACCELE T ESUME) cannot be used to increase speed beyond the high speed limit.

OPERATION OF CRUISE CONTROL (for 2UZ-FE, 1GR-FE, 3UR-FE)

The cruise control main switch is used to operate 7 functions: SET, - (C , TA , ES (ESUME), (ACCELE T , TA , and CANCEL. The SET, TA and - (C functions, and the ES (ESUME), TA and (ACCELE T functions are operated with the same switch. The cruise control main switch is an automatic return type switch which turns on only while operating it in each arrow direction and turns off after releasing it.

a. SET C T
ehicle speed is stored and constant speed control is maintained when pushing the switch to -SET while driving with the cruise control main switch on (the C E main indicator light is on), and the vehicle speed is within the set speed range (between the low and high speed limits).

b. - (C CT T
hen the cruise control main switch is pushed to -SET and held in that position while the cruise control system is operating, the ECM sends a "throttle valve opening angle 0°" demand signal to the throttle body. Then the vehicle speed is stored and maintained when the cruise control main switch is released.

HINT:

An actual throttle valve opening angle of 0° is not possible due to the idle speed control, etc.

c. TA C T
hen tapping down the cruise control main switch to -SET (for appro imately 0.6 seconds) while the cruise control system is in operation, the stored vehicle speeds decreases each time by appro imately .6 m/h (.0 mph). However, when the difference between the driving and

stored vehicle speeds is more than appro imately 5 m/h (3. mph), the stored vehicle speed is set to the actual vehicle speed at the moment the cruise control main switch is released from -SET and constant speed control is maintained.

d. (ACCELE T C T

The throttle valve motor of the throttle position sensor and motor is instructed by the ECM to open the throttle valve when ES on the cruise control main switch is pressed and held while the cruise control system is in operation. When the cruise control main switch is released from ES, the vehicle speed is stored and the vehicle is controlled at a constant speed.

e. TA C T

hen tapping up the cruise control main switch to ES (for appro imately 0.6 seconds) while the cruise control system is in operation, the stored vehicle speed increases each time by appro imately .6 m/h (.0 mph). However, when the difference between the driving and the stored vehicle speed is more than appro imately 5 m/h (3. mph), the stored vehicle speed will not be changed.

f. ES (ESUME) C T

f cruise control operation was canceled with the stop light switch or the CANCEL switch, and if the driving speed is within the limit range, pushing the cruise control main switch to ES restores the vehicle speed memori ed at the time of cancellation, and maintains constant speed control.

g. MANUAL CANCEL C T

erforming any of the following cancels the cruise control system while in operation (the stored vehicle speed in the ECM is maintained).

- Depressing the bra e pedal.
- Depressing the clutch pedal (for M/T).
- Moving the shift lever from D to N (for A/T).
- With the shift lever in S, selecting the S , S2 or S3 range (for A/T).
- ulling the cruise control main switch to CANCEL.
- Turning the cruise control main switch off (the stored vehicle speed in the ECM is not maintained).
- The system is operated.

OPERATION OF CRUISE CONTROL (for 1VD-FTV)

The cruise control main switch is used to operate 7 functions: SET, - (C , TA , ES (ESUME), (ACCELE T , TA , and CANCEL. The SET, TA and - (C functions, and the ES (ESUME), TA and (ACCELE T functions are operated with the same switch. The cruise control main switch is an automatic return type switch which turns on only while operating it in each arrow direction and turns off after releasing it.

a. SET C T

ehicle speed is stored and constant speed control is maintained when pushing the switch to -SET while driving with the cruise control main switch on (the C E main indicator light is on), and the vehicle speed is within the set speed range (between the low and high speed limits).

b. - (C CT T

hen the cruise control main switch is pushed to -SET and held in that position while the cruise control system is operating, the ECM changes the re uired fuel injection uantity to 0 and decelerates the vehicle. When the cruise control main switch is released from -SET, the vehicle speed is stored and constant speed control is maintained.

c. TA C T

hen tapping down the cruise control main switch to -SET (for appro imately 0.6 seconds) while the cruise control system is in operation, the stored vehicle speed decreases each time by appro imately .6 m/h (.0 mph). However, when the difference between the driving and stored vehicle speeds is more than appro imately 5 m/h (3. mph), the stored vehicle speed is set to the actual vehicle speed at the moment the cruise control main switch is released from -SET and constant speed control is maintained.

d. (ACCELE T C T

hile the cruise control system is in operation, if the cruise control main switch is set to ES, the EDU (Electronic Driving Unit) increases the fuel injection uantity. When the cruise control main switch is released from ES, the vehicle speed is stored and the vehicle is controlled at a constant speed.

e. TA C T

hen tapping up the cruise control main switch to ES (for appro imately 0.6 seconds) while the cruise control system is in operation, the stored vehicle speed increases each time by appro imately .6 m/h (.0 mph). However, when the difference between the driving and the stored vehicle speed is more than appro imately 5 m/h (3. mph), the stored vehicle speed will not be changed.

f. ES (ESUME) C T

f cruise control operation was canceled with the stop light switch or the CANCEL switch, and if the driving speed is within the limit range, pushing the cruise control main switch to ES restores the vehicle speed memori ed at the time of cancellation, and maintains constant speed control.

g. MANUAL CANCEL C T

erforming any of the following cancels the cruise control system while in operation (the stored vehicle speed in the ECM is maintained).

- Depressing the bra e pedal.
- Depressing the clutch pedal (for M/T).
- Moving the shift lever from D to N (for A/T).
- With the shift lever in S, selecting the S , S2 or S3 range (for A/T).
- ulling the cruise control main switch to CANCEL.
- Turning the cruise control main switch off (the stored vehicle speed in the ECM is not maintained).
- The system is operated.

AUTO CANCEL (FAIL-SAFE)

This system has an automatic cancellation function (fail-safe) (Clic here).

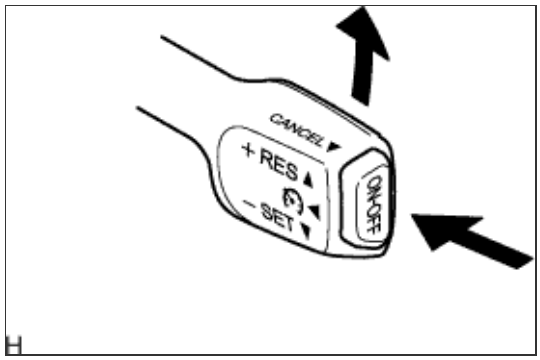
PROBLEM SYMPTOM CONFIRMATION

a. Inspect the SET function.



i. Turn the main switch on.

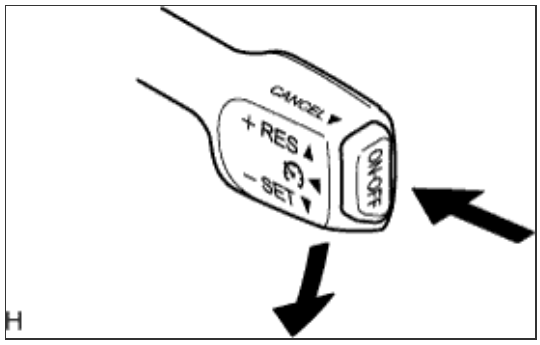
ii. Drive at the required speed (40 km/h (25 mph) or more).

iii. Push the cruise control main switch to -SET.

iv. After releasing the switch, check that the vehicle cruises at the set speed.

b. Inspect the + (ACCELERATION) function.

i. Turn the main switch on.



ii. Drive at the required speed (40 km/h (25 mph) or more).

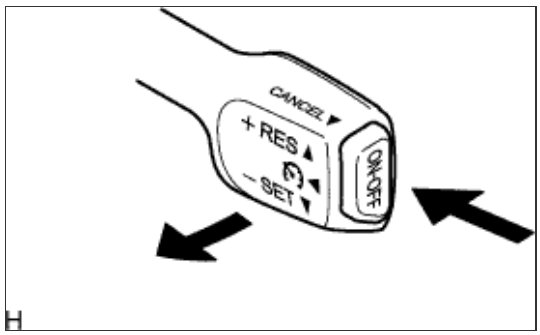
iii. Push the cruise control main switch to -SET.

iv. Check that the vehicle speed increases while the cruise control main switch is pushed to +RES, and that the vehicle cruises at the newly set speed when the switch is released.

v. Momentarily push the cruise control main switch to +RES and then immediately release it. Check that the vehicle speed increases by approximately 1.6 km/h (1.0 mph) (tap-up control).

c. Inspect the - (COAST) function.

i. Turn the main switch on.



ii. Drive at the required speed (40 km/h (25 mph) or more).

iii. Push the cruise control main switch to -SET.

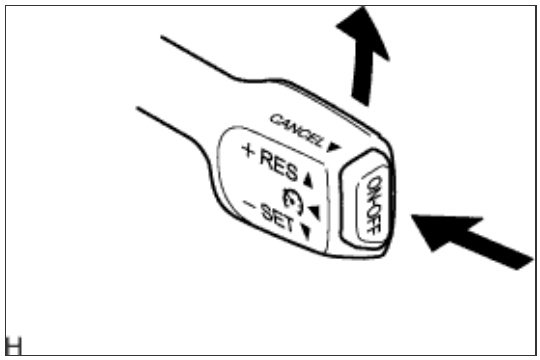
iv. Check that the vehicle speed decreases while the cruise control main switch is pushed to -SET, and that the vehicle cruises at the newly set speed when the switch is released.

v. Momentarily push the cruise control main switch to -SET, and then immediately release it. Check that vehicle speed decreases by approximately 1.6 km/h (1.0 mph) (tap-down control).

d. Inspect the CANCEL function.

i. Turn the main switch on.

ii. Drive at the required speed (40 km/h (25 mph) or more).



iii. Push the cruise control main switch to -SET.

iv. When performing one of the following, check that the cruise control system is canceled and that the normal driving mode is reset.

- Depressing the brake pedal.
- Depressing the clutch pedal (for M/T).

- oving the shift ever from D to N (for).T
- With the shift ever in S, selecting the S1, S2 or S3 range (for A/T).
- Turning the main switch off.
- Pulling the cruise control main switch to CANCEL.

e. Inspect the RES (RESUME) function.

H

i. Turn the main switch on.

ii. Drive at the required speed (40 km/h (25 mph) or more).

iii. Push the cruise control main switch to -SET.

iv. Cancel the cruise control system according to any of the above operations (other than turning the main switch off).

v. After pushing the cruise control main switch to +RES at a driving speed of more than 40 km/h (25 mph), check that the vehicle drives at the set speed.

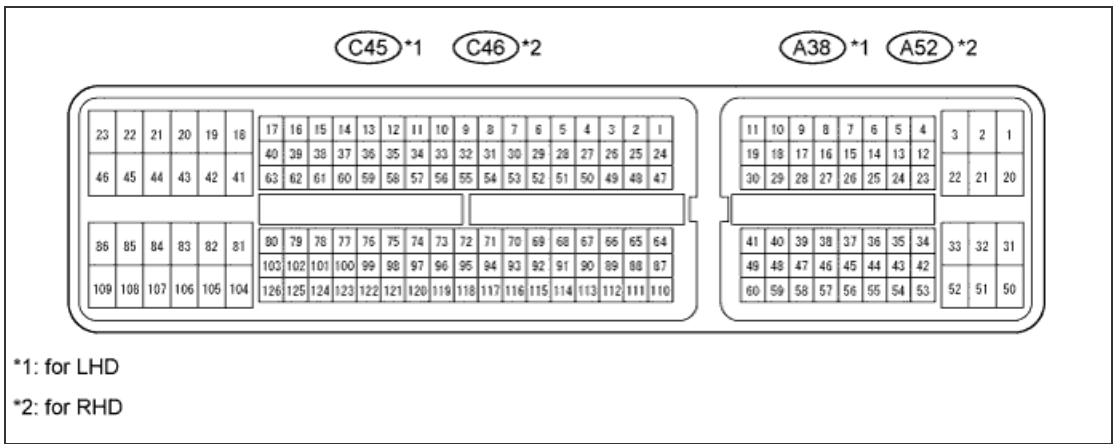
CHECK ECM (3UR-FE)

HINT:

As the ECM connector is a waterproof connector, it is not possible to check the voltage of each terminal or check the waveform with an oscilloscope while the ECM is installed in the vehicle.

a. Disconnect the A38 and C45 ECM connectors.



b. Measure the voltage and resistance according to the value(s) in the table below.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38-16 (TC) - Body ground	V-W - Body ground	Terminal TC of DLC3	Ignition switch ON	11 to 14 V
			Ignition switch off	Below 1 V
C45-81 (E1) - Body ground	W-B - Body ground	ECM ground	Always	Below 1 Ω
C45-27 (D) - Body ground	G - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in D	11 to 14 V
			Ignition switch ON Shift lever not in D	Below 1 V
A38-38 (SFTU) - Body ground	Y - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in S	Below 1 Ω
			Ignition switch ON Shift lever in +	10 kΩ or higher
A38-25 (S) - Body ground	W - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in S	11 to 14 V
			Ignition switch ON Shift lever not in S	Below 1 V
A38-27 (SFTD) - Body ground	L - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in S	10 kΩ or higher
			Ignition switch ON Shift lever in -	Below 1 Ω
A38-36 (STP) - Body ground	R - Body ground	Stop light signal	Ignition switch ON Brake pedal depressed	11 to 14 V
			Ignition switch ON Brake pedal released	Below 1 V
A38-35 (ST1-) - Body ground	R-W - Body ground	Stop light signal (opposite to STP terminal)	Ignition switch ON Brake pedal depressed	Below 1 V
			Ignition switch ON Brake pedal released	11 to 14 V
			Ignition switch ON Main switch off	1 MΩ or higher
			Ignition switch ON CANCEL switch held on	1510 to 1570 Ω

A38-45 (CCS) - Body ground	L - Body ground	Cruise control main switch signal	Ignition switch ON -SET switch held on	62 to 64 Ω
			Ignition switch ON +RES switch held on	235 to 245 Ω
			Ignition switch ON Main switch on	Below 2.5 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

CHECK ECM (2U -FE)

HINT:

As the ECM connector is a waterproof connector, it is not possible to check the voltage of each terminal or check the waveform with an oscilloscope while the ECM is installed in the vehicle.

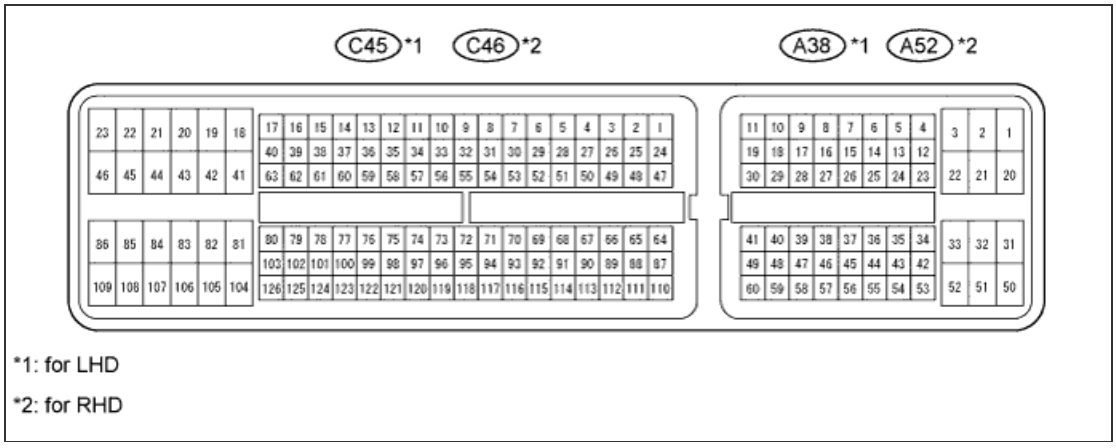
a. Disconnect the A38*1 and C45*1 or A52*2 and C46*2 ECM connectors.

HINT:

- ***1: for LHD**
- ***2: for RHD**

b. Measure the voltage and resistance according to the value(s) in the table below.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38*1-16 (TC) - Body ground A52*2-16 (TC) - Body ground	V-W - Body ground	Terminal TC of DLC3	Ignition switch ON	11 to 14 V
			Ignition switch off	Below 1 V
C45*1-81 (E1) - Body ground C46*2-81 (E1) - Body ground	BR - Body ground	ECM ground	Always	Below 1 Ω
C45*1-27 (D) - Body ground C46*2-27 (D) - Body ground	G - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in D	11 to 14 V
			Ignition switch ON Shift lever not in D	Below 1 V
A38*1-38 (SFTU) - Body ground A52*2-38 (SFTU) - Body ground	Y - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in S	Below 1 Ω
			Ignition switch ON Shift lever in "+"	10 kΩ or higher
A38*1-25 (S) - Body ground A52*2-25 (S) - Body ground	W - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in S	11 to 14 V
			Ignition switch ON Shift lever not in S	Below 1 V
A38*1-27 (SFTD) - Body ground A52*2-27 (SFTD) - Body ground	L - Body ground	Park/neutral position switch signal	Ignition switch ON Shift lever in S	10 kΩ or higher
			Ignition switch ON Shift lever in "-"	Below 1 Ω
A38*1-36 (STP) - Body ground A52*2-36 (STP) - Body ground	R - Body ground	Stop light signal	Ignition switch ON Brake pedal depressed	11 to 14 V
			Ignition switch ON Brake pedal released	Below 1 V



A38*1-35 (ST1-) - Body ground A52*2-35 (ST1-) - Body ground	R-W - Body ground	Stop light signal (opposite to ST terminal)	Ignition switch ON Brake pedal depressed	Below 1 V
			Ignition switch ON Brake pedal released	11 to 14 V
A38*1-45 (CCS) - Body ground A52*2-45 (CCS) - Body ground	L - Body ground	Cruise control main switch signal	Ignition switch ON Main switch off	10 kΩ or higher
			Ignition switch ON CANCEL switch held on	1386 to 1694 Ω
			Ignition switch ON -SET switch held on	567 to 693 Ω
			Ignition switch ON +RES switch held on	216 to 264 Ω
			Ignition switch ON Main switch on	Below 1 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

HINT:

- ***1: for LHD**
- ***2: for RHD**

CHECK ECM (1GR-FE)

HINT:

As the ECM connector is a waterproof connector, it is not possible to check the voltage of each terminal or check the waveform with an oscilloscope while the ECM is installed in the vehicle.

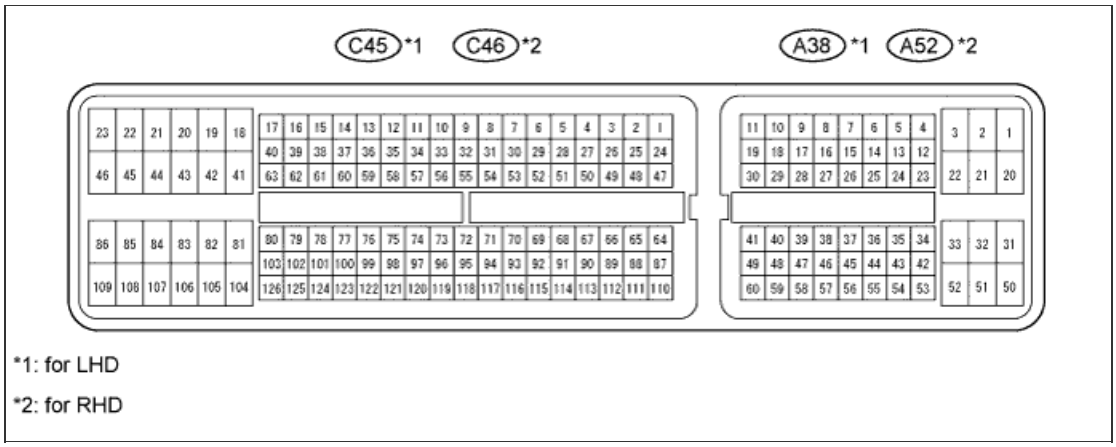
a. Disconnect the A38*1 and C45*1 or A52*2 and C46*22 ECM connectors.

HINT:

- ***1: for LHD**
- ***2: for RHD**

b. Measure the voltage and resistance according to the value(s) in the table below.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38*1-27 (TC) - Body ground A52*2-27 (TC) - Body ground	V-W - Body ground	Terminal TC of DLC3	Ignition switch ON	11 to 14 V
			Ignition switch off	Below 1 V
C45*1-81 (E1) - Body ground C46*2-81 (E1) - Body ground	BR - Body ground	ECM ground	Always	Below 1 Ω
C45*1-26 (D) - Body ground	G - Body ground	Park/neutral position switch signal (A/T)	Ignition switch ON Shift lever in D	11 to 14 V
			Ignition switch ON Shift lever not in D	Below 1 V
C45*1-26 (D) - Body ground C46*2-26 (D) - Body	G - Body ground	Clutch signal (M/T)	Ignition switch ON Clutch pedal depressed	Below 1 V
			Ignition switch ON	



ground			Clutch pedal released	11 to 14 V
A38*1-16 (SFTU) - Body ground	Y - Body ground	ark/neutral position switch signal (A/T)	Ignition switch ON Shift lever in S	Below 1 Ω
			Ignition switch ON Shift lever in "+"	1 kΩ or higher
A38*1-25 (S) - Body ground	W - Body ground	ark/neutral position switch signal (A/T)	Ignition switch ON Shift lever in S	11 to 14 V
			Ignition switch ON Shift lever not in S	Below 1 V
A38*1-51 (SFTD) - Body ground	L - Body ground	ark/neutral position switch signal (A/T)	Ignition switch ON Shift lever in S	1 kΩ or higher
			Ignition switch ON Shift lever in "-"	Below 1 Ω
A38*1-36 (ST) - Body ground A52*2-36 (ST) - Body ground	R - Body ground	Stop light signal	Ignition switch ON Brake pedal depressed	11 to 14 V
			Ignition switch ON Brake pedal released	Below 1 V
A38*1-35 (ST1-) - Body ground A52*2-35 (ST1-) - Body ground	R-W - Body ground	Stop light signal (opposite to ST terminal)	Ignition switch ON Brake pedal depressed	Below 1 V
			Ignition switch ON Brake pedal released	11 to 14 V
A38*1-4 (CCS) - Body ground A52*2-4 (CCS) - Body ground	L - Body ground	Cruise control main switch signal	Ignition switch ON Main switch off	10 kΩ or higher
			Ignition switch ON CANCEL switch held on	1386 to 1694 Ω
			Ignition switch ON -SET switch held on	567 to 693 Ω
			Ignition switch ON +RES switch held on	216 to 264 Ω
			Ignition switch ON Main switch on	Below 1 Ω

If the result is not as specified, there may be a malfunction on the wire harness side.

HINT:

- ***1: for LHD**
- ***2: for RHD**

CHECK ECM (1VD-FTV)

HINT:

As the ECM connector is a waterproof connector, it is not possible to check the voltage of each terminal or check the waveform with an oscilloscope while the ECM is installed in the vehicle.

a. Disconnect the A38*1 and C45*1 or A52*2 and C46*2 ECM connectors.

HINT:

- ***1: for LHD**
- ***2: for RHD**

b. Measure the voltage and resistance according to the value(s) in the table below.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38*1-27 (TC) - Body ground A52*2-27 (TC) - Body ground	V-W - Body ground	Terminal TC of DLC3	Ignition switch ON	11 to 14 V
			Ignition switch off	Below 1 V
C45*1-81 (E1) - Body ground C46*2-81 (E1) - Body ground	BR - Body ground	ECM ground	Always	Below 1 Ω

CHECK INDICATOR

a. Turn the ignition switch to ON.

b. Check that the CRUISE main indicator ight i uminates when the cruise contro ain switch is turned on, and that the indicator ight turns off when the main switch is turned off. If the resu ts are not as specified, inspect the CRUISE main indicator ight circuit (C ick here).

HINT:

Whi e driving with cruise contro the ECM activates AUTO CANCEL of the cruise contro system when a ma unction in one of the fo owing occurs: the vehic e speed sensors, stop ight switch or other re ated parts. When AUTO CANCEL is activated, the CRUISE main indicator ight outputs the b inking pattern shown in the i ustration. At the same time, data of the ma unction is stored as a DTC.

for Preparation Click here

CHECK DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain Cruise Control Trouble Codes.

e. Read the DTCs.

CLEAR DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain Cruise Control Trouble Codes.

e. Clear the DTCs.

for Preparation Click here

HINT:

If the following conditions are detected while the cruise control is in operation, the system clears the stored vehicle speed in the ECM and cancels the cruise control operation.

Vehicle Condition	Auto Cancel Condition	Fail-safe Deactivation Condition
CRUISE main indicator light blinks	• There is an open or short in the stop light switch circuit • There is a problem with the vehicle speed signal	Turn the cruise control main switch on again
CRUISE main indicator light goes off	• There is a problem with the throttle position sensor and the motor*1 • There is a problem with the fuel injection system*2	Turn the cruise control main switch on again
CRUISE main indicator light blinks	• There is a problem with the input circuit of the stop light switch circuit • There is a problem with the cancel circuit	• Turn the cruise control main switch on again • Turn the ignition switch off then on again
CRUISE main indicator light remains on (Cruise control is canceled)	Under the following conditions, the stored vehicle speed is maintained: • The vehicle speed is less than the low speed limit (approx. 40 km/h (25 mph)) while running with the cruise control on • The VSC system is operated	Push the cruise control main switch to RES
	• The vehicle speed is less than the stored speed by approx. 16 km/h (10 mph) or more	Push the cruise control main switch to -SET

HINT:

- **: for 2U -FE, 1GR-FE, 3UR-FE**
- **: for 1VD-FTV**

for Preparation Click here

READ DATA LIST

HINT:

Using the intelligent tester to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. This non-intrusive inspection can be very useful because intermittent conditions or signals may be discovered before parts or wiring is disturbed. Reading the Data List information early in troubleshooting is one way to save diagnostic time.

NOTICE:

In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Cruise Control / Data List.

e. According to the display on the intelligent tester, read the "Data List".

Cruise Control

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
CCS Vehicle Spd	Vehicle speed / min.: 0 km/h (0 mph), max.: 255 km/h (159 mph)	Actual vehicle speed displayed	-
CCS Mem Vehicle Spd	Vehicle speed / min.: 0 km/h (0 mph), max.: 200 km/h (125 mph)	Actual vehicle speed stored in memory	-
Cruise Operation Status	Transmission range sensor signal / ON or OFF	ON: Shift lever in D OFF: Shift lever not in D	for A/T
	Clutch switch signal / ON or OFF	ON: Clutch pedal released OFF: Clutch pedal depressed	for M/T
Cruise Control	Cruise control / ON or OFF	ON: Cruise control operating OFF: Cruise control not operating	-
CCS Indicator M-CPU	CRUISE main indicator light (Main CPU) / ON or OFF	ON: CRUISE main indicator light on OFF: CRUISE main indicator light off	-
CCS Ready M-CPU	Cruise control system standby condition (Main CPU) / ON or OFF	ON ← → OFF: Changes each time main switch pushed	-
CCS Main SW M-CPU	Cruise control main switch (Main CPU) / ON or OFF	ON: Cruise control main switch (Main CPU) on OFF: Cruise control main switch (Main CPU) off	-
CCS Main SW S-CPU	Cruise control main switch (Sub CPU) / ON or OFF	ON: Cruise control main switch (Sub CPU) on OFF: Cruise control main switch (Sub CPU) off	-
Cancel Switch	CANCEL switch / ON or OFF	ON: CANCEL switch on OFF: CANCEL switch off	-
SET/COAST Switch	-SET switch / ON or OFF	ON: -SET switch on OFF: -SET switch off	-
RES/ACC Switch	+RES switch / ON or OFF	ON: +RES switch on OFF: +RES switch off	-
Stop Light SW M-CPU	Stop light switch signal (Main CPU) / ON or OFF	ON: Brake pedal depressed OFF: Brake pedal released	-
Throttle Opening Angle	Cruise throttle opening angle / min.: 0 deg, max.: 125 deg	Actual demanded throttle angle	for 2UZ-FE, 1GR-FE
	Fuel injection quantity / min.: 0%, max.: 100%	Actual demanded fuel injection quantity	for 1VD-FTV
# Codes	Number of trouble codes / Min.: 0, Max.: 255	-	-

PERFORM ACTIVE TEST

HINT:

Using the intelligent tester to perform Active Tests allows relays, VSVs, actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing Active Tests early in troubleshooting is one way to save diagnostic time. Data List information can be displayed while performing Active Tests.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Body / Combination Meter / Active Test.

e. According to the display on the intelligent tester, perform the "Active Test".

Combination Meter

Tester Display	Test Part	Control Range	Diagnostic Note
Indicat. Lamp Cruise	CRUISE main indicator light operation	OFF or ON	-

for Preparation Click here

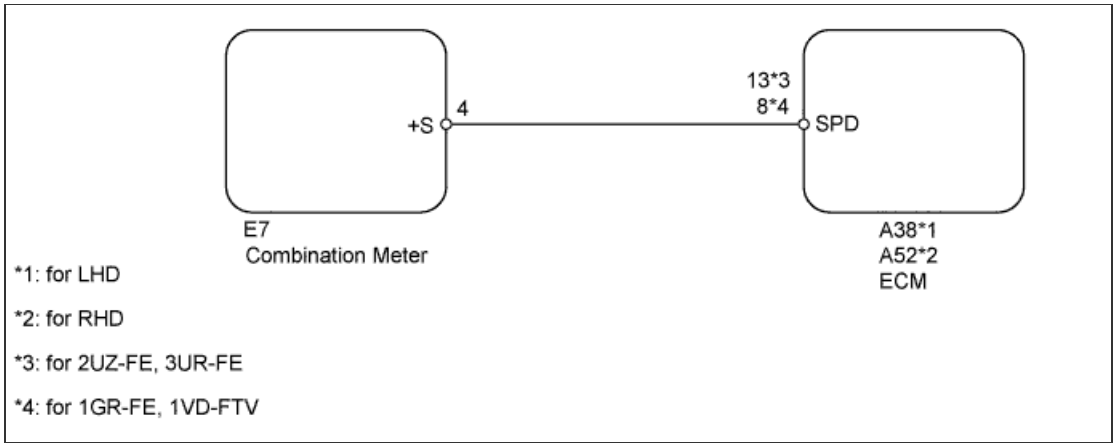
HINT:

If a trouble code is output during the DTC check, inspect the trouble areas listed for that code. For details of the code, refer to the "See page" below.

Cruise Control System

DTC Code	Detection Item	Trouble Area	See page
P0500	Vehicle Speed Sensor Malfunction	- Vehicle speed sensor signal circuit - Vehicle speed sensor - Combination meter - ECM	Click here
P0503	Vehicle Speed Sensor "A" Intermittent / Erratic / High	- Vehicle speed sensor - Vehicle speed sensor signal circuit - ECM - Combination meter	Click here
P0571	Brake Switch "A" Circuit	- Stop light switch - Stop light switch circuit - ECM	Click here
P0575	Cruise Control Input Circuit	ECM (for 2U -FE, 1 -FE, 3UR-FE)	Click here
P0607	Control Module Performance	ECM (for 1VD-FTV)	Click here

DTC P0500 Vehicle Speed Sensor Malfunction



for Preparation Click here

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the master cylinder solenoid (skid control ECU). The master cylinder solenoid (skid control ECU) converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.

DTC Code	DTC Detection Condition	Trouble Area
P0500	The vehicle speed signal from the vehicle speed sensor is cut for 0.14 sec. or more while the cruise control is in operation.	• Vehicle speed sensor signal circuit • Vehicle speed sensor • Combination meter • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

This DTC code may be output under the SFI system (for 2U -FE, 1GR-FE, 3UR-FE) or the ECD system (for 1VD-FTV) at the same time. In that case, perform troubleshooting for the SFI system first.

1.CHECK DTC (CRUISE CONTROL SYSTEM)

a. Using the intelligent tester, enter the following menus: Powertrain / Cruise Control / Trouble Code.

b. Clear the DTC (Click here).

c. Perform the following to make sure the DTC detection conditions are met.

HINT:

If the detection conditions are not met, the system cannot detect the malfunction.

i. Drive the vehicle for more than 10 seconds when the engine coolant temperature is more than 20 C (68 F).

d. Check for DTCs (Click here).

DTC P0575 Cruise Control Input Circuit

DTC P0607 Control Module Performance

for Preparation Click here

DESCRIPTION

This DTC indicates the internal abnormalities of the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0575	When either of the following conditions is met: • STP signals input to the ECM supervisory CPU and control ECU are different for 0.15 seconds or more. • 0.4 seconds have passed after cruise cancel input signal (STP input) is input to the ECM.	ECM (for 2UZ-FE, 1GR-FE, 3UR-FE)
P0607	When the cruise control main switch is turned off, the ECM recognizes that the cruise control system is operating.	ECM (for 1 D-FT)

HINT:

The ECM receives signals from each sensor to control all functions of the cruise control system. When this trouble code is stored, fail-safe remains on until the ignition switch is turned off.

INSPECTION PROCEDURE

1.CHECK DTC (CRUISE CONTROL SYSTEM)

a. Using the intelligent tester, enter the following menus: Powertrain / Cruise Control / Trouble Code.

DTC P0503 Vehicle Speed Sensor "A" Intermittent / Erratic / High

for Preparation Click here

DESCRIPTION

If a malfunction (a rapid change in vehicle speed) in the vehicle speed signal being output from the master cylinder solenoid (skid control ECU) is detected while the cruise control is in operation, the ECM determines there to be a momentary interruption and noise, and outputs a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0503	A momentary interruption and noise are detected when a rapid change of the vehicle speed occurs while the cruise control is in operation.	• Vehicle speed sensor • Vehicle speed sensor signal circuit • ECM • Combination meter

INSPECTION PROCEDURE

This DTC code may be output under the vehicle stability control system at the same time. In that case, perform troubleshooting for the vehicle stability control system first.

1.CHECK DTC (VEHICLE STABILITY CONTROL SYSTEM OR ANTI-LOCK BRAKE SYSTEM)

a. Using the intelligent tester, enter the following menus: Chassis / ABS/VSC/TRAC / Trouble Code.

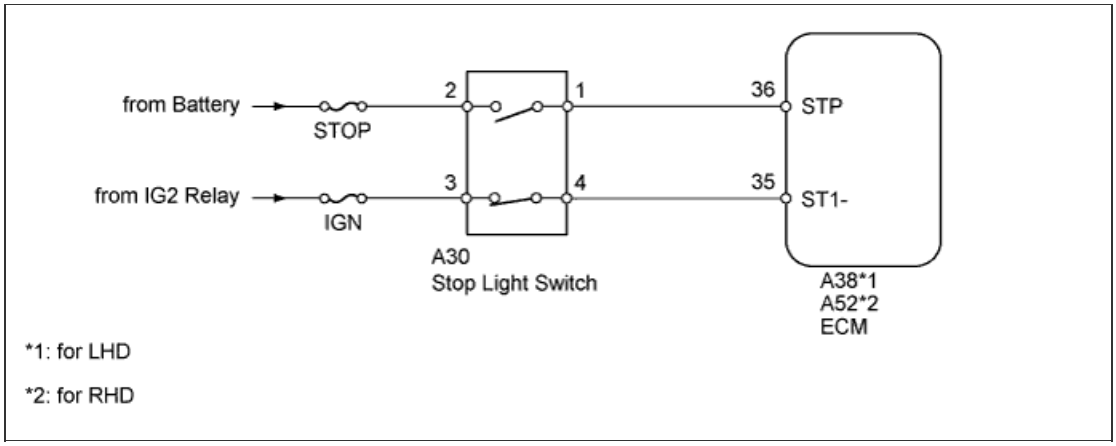
DTC P0571 Brake Switch "A" Circuit



for Preparation Click here

DESCRIPTION

When the brake pedal is depressed, the stop light switch sends a signal to the ECM. When the ECM receives this signal, it cancels the cruise control. The fail-safe function operates to enable normal driving even if there is a malfunction in the stop light signal circuit. The cancellation condition occurs when voltage is applied to terminal STP. When the brake is applied, voltage is applied to terminal STP of the ECM through the STOP fuse and the stop light switch, and the ECM turns the cruise control off.

DTC Code	DTC Detection Condition	Trouble Area
P0571	When the voltage of the STP terminal and the ST1- terminal of the ECM is below than 1 V for 0.5 sec. or more.	• Stop light switch • Stop light switch circuit • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

1.READ VALUE USING INTELLIGENT TESTER (STOP LIGHT SWITCH)

a. Using the intelligent tester, read the Data List.

Cruise Control

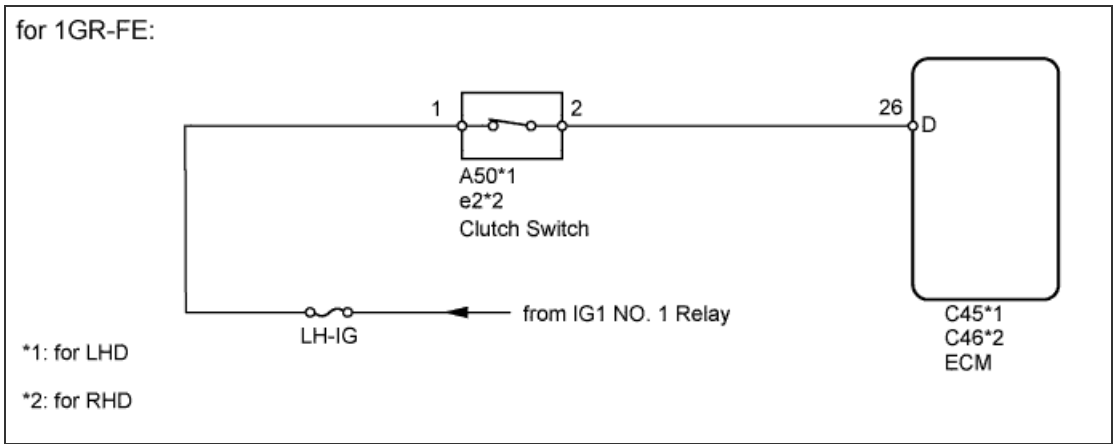
REPAIR OR REPLACE HARNESS OR CONNECTOR

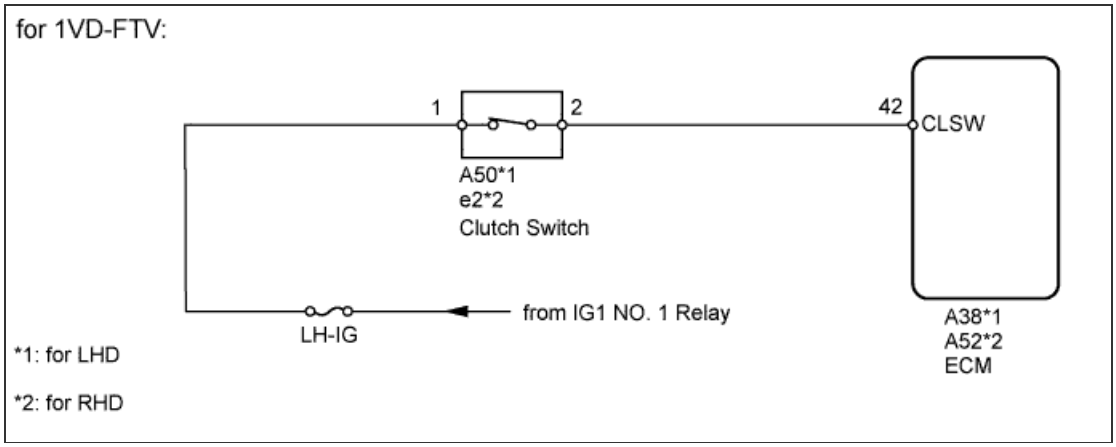
A

REPLACE ECM (Click here)

for Preparation Click here



DESCRIPTION



When the clutch pedal is released, the ECM receives positive (+) battery voltage through the LH-IG fuse. While depressing the clutch pedal, the clutch switch sends a signal to terminal D*1 or CLSW*2 of the ECM. The ECM cancels cruise control when terminal D*1 or CLSW*2 receives the signal.

HINT:

- ***1: for 1GR-FE**
- ***2: for 1VD-FTV**

WIRING DIAGRAM

INSPECTION PROCEDURE

1.INSPECT FUSE (LH-IG)

a. Remove the LH-IG fuse from the main body ECU.

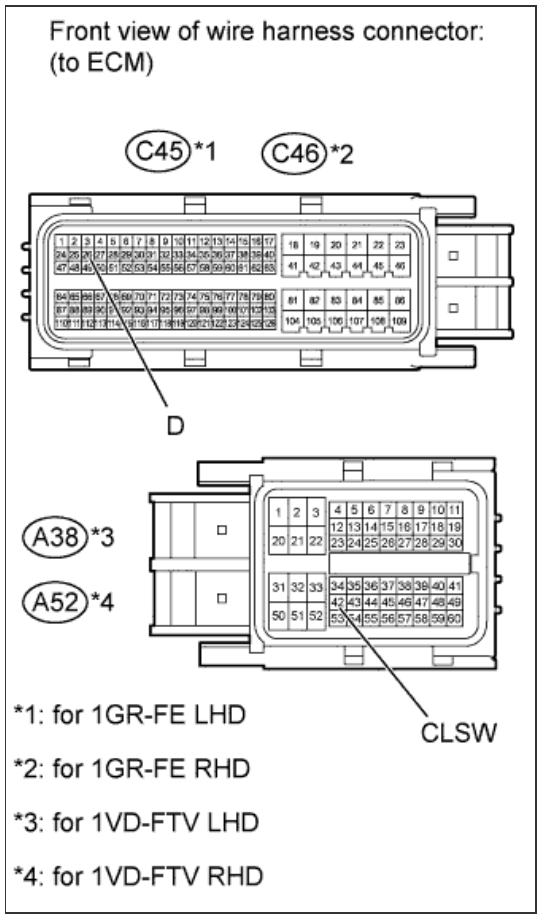
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
LH-IG fuse	Always	Below 1 Ω

NG → REPLACE FUSE

OK



2.INSPECT ECM

a. Disconnect the C45*1, C46*2, A38*3 or A52*4 ECM connector.

HINT:

- ***1: for 1GR-FE LHD**
- ***2: for 1GR-FE RHD**
- ***3: for 1VD-FTV LHD**
- ***4: for 1VD-FTV RHD**

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for 1GR-FE LHD

Tester Connection	Switch Condition	Specified Condition
C45-26 (D) - Body ground	Ignition switch ON Clutch pedal depressed	Below 1
	Ignition switch ON Clutch pedal released	11 to 14

for 1GR-FE RHD

Tester Connection	Switch Condition	Specified Condition
C46-26 (D) - Body ground	Ignition switch ON Clutch pedal depressed	Below 1
	Ignition switch ON Clutch pedal released	11 to 14

for 1VD-FTV LHD

Tester Connection	Switch Condition	Specified Condition
A38-42 (CLSW) - Body ground	Ignition switch ON Clutch pedal depressed	Below 1
	Ignition switch ON Clutch pedal released	11 to 14

for 1VD-FTV RHD

Tester Connection	Switch Condition	Specified Condition
	Ignition switch ON Clutch pedal	Below 1

A52-42 (CLSW) - Body ground	depressed	
	Ignition switch ON Clutch pedal released	11 to 14

NG → Go to step 3

OK

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (Click here)

3.INSPECT CLUTCH SWITCH ASSEMBLY

a. Turn the Ignition switch off.

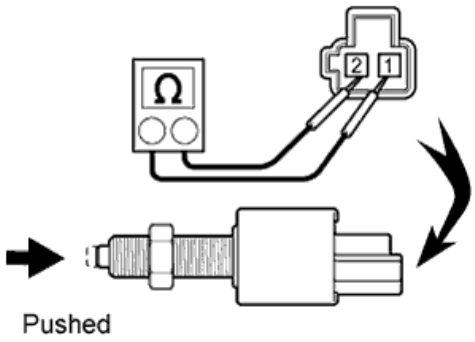
b. Disconnect the A50*1 or e2*2 clutch switch connector.

HINT:

- ***1: for LHD**
- ***2: for RHD**

c. Remove the clutch switch (Clic here for LHD, Clic here for RHD).

d. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Pushed (On)	Below 1 Ω
	Not pushed (Off)	10 Ω or higher

Result

Result	Proceed to
OK	A
NG (for LHD)	B
NG (for RHD)	C

Component without harness connected: (Clutch Switch)

e. Install the clutch switch (Clic here for LHD, Clic here for RHD).

B → REPLACE CLUTCH SWITCH ASSEMBLY (Click here)

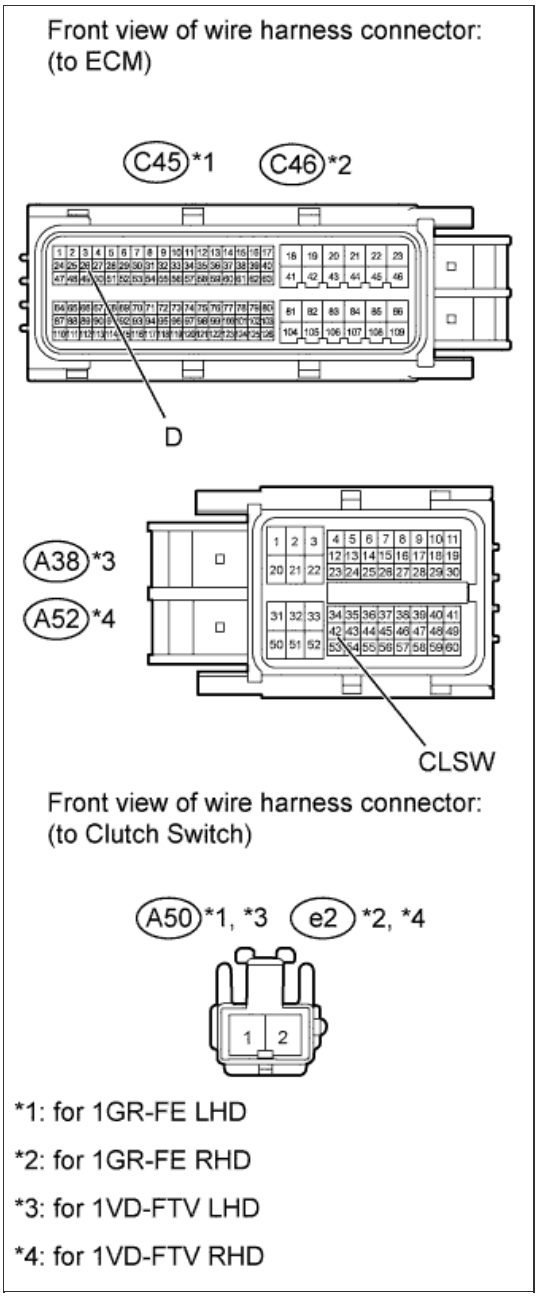
C → REPLACE CLUTCH SWITCH ASSEMBLY (Click here)

A

4.CHECK HARNESS AND CONNECTOR (ECM - CLUTCH SWITCH)

a. Disconnect the C45*1, C46*2, A38*3 or A52*4 ECM connector.

HINT:



- ***1: for 1GR-FE LHD**
- ***2: for 1GR-FE RHD**
- ***3: for 1VD-FTV LHD**
- ***4: for 1VD-FTV RHD**

b. Disconnect the A50*1 or e2*2 clutch switch connector.

HINT:

- ***1: for LHD**
- ***2: for RHD**

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for 1GR-FE LHD

Tester Connection	Condition	Specified Condition
C45-26 (D) - A50-2	Always	Below 1 Ω
C45-26 (D) - Body ground	Always	10 Ω or higher

for 1GR-FE RHD

Tester Connection	Condition	Specified Condition
C46-26 (D) - e2-2	Always	Below 1 Ω
C46-26 (D) - Body ground	Always	10 Ω or higher

for 1VD-FTV LHD

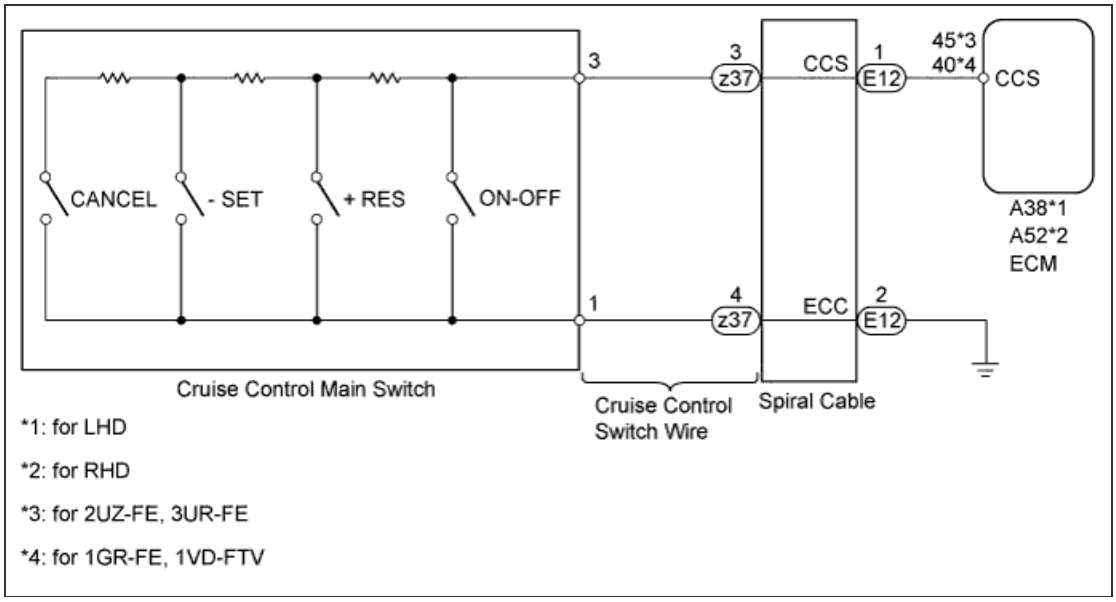
Tester Connection	Condition	Specified Condition
A38-42 (CLSW) - A50-2	Always	Below 1 Ω
A38-42 (CLSW) - Body ground	Always	10 Ω or higher

for 1VD-FTV RHD

Tester Connection	Condition	Specified Condition
A52-42 (CLSW) - e2-2	Always	Below 1 Ω
A52-42 (CLSW) - Body ground	Always	10 Ω or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - CLUTCH SWITCH)

OK

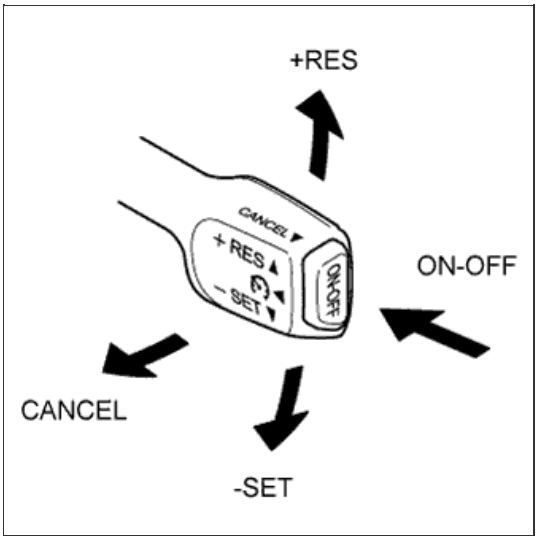


REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - CLUTCH SWITCH)

for Preparation Click here

DESCRIPTION

The cruise control main switch is used to operate 7 functions: SET, - (COAST), TAP-DOWN, RES (RESUME), + (ACCELERATION), TAP-UP, and CANCEL. The SET, TAP-DOWN and - (COAST) functions, and the RES (RESUME), TAP-UP and + (ACCELERATION) functions are operated with the same switch. The cruise control main switch is an automatic return type switch which turns on only while operating it in each arrow direction and turns off after releasing it. The internal contact point of the cruise control main switch is turned on with the switch operation. Then the ECM reads the resistance value that has been changed by the switch operation to control SET, - (COAST), RES (RESUME), + (ACCELERATION) and CANCEL.



WIRING DIAGRAM

INSPECTION PROCEDURE

1.READ VALUE USING INTELLIGENT TESTER (CRUISE CONTROL MAIN SWITCH)

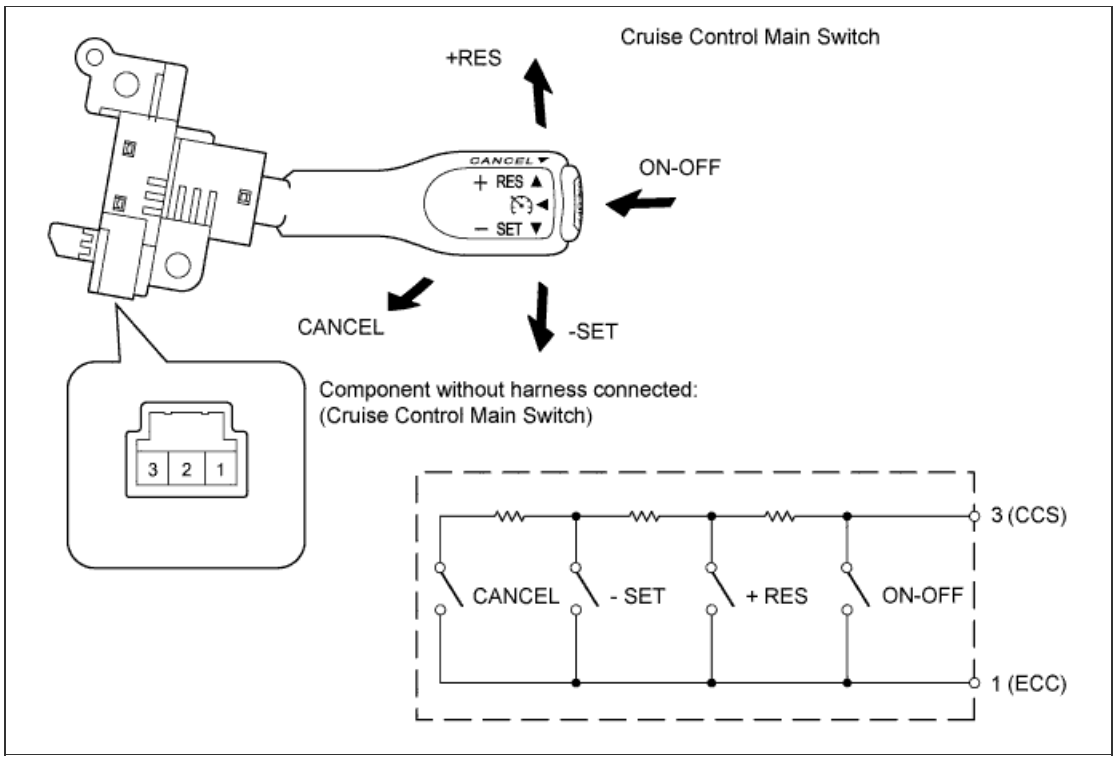
a. Using the intelligent tester, read the Data List.

Cruise Control

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
CCS Main SW M-CPU	Cruise control main switch (Main CPU) / ON or OFF	ON: Cruise control main switch (Main CPU) on OFF: Cruise control main switch (Main CPU) off	-
Cancel Switch	CANCEL switch signal / ON or OFF	ON: CANCEL switch on OFF: CANCEL switch off	-
SET/COAST Switch	-SET switch signal / ON or OFF	ON: -SET switch on OFF: -SET switch off	-

RES/ACC Switch	+RES switch signal / ON or OFF	ON: +RES switch on OFF: +RES switch off	-
CCS Main SW S-CPU	Cruise control main switch (Sub CPU) / ON or OFF	ON: Cruise control main switch (Sub CPU) on OFF: Cruise control main switch (Sub CPU) off	-

OK:



The intelligent tester display changes according to operation of cruise control main switch.

NG → Go to step 2

OK →

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (Click here)

2.INSPECT CRUISE CONTROL MAIN SWITCH

a. Remove the cruise control main switch (Clic here).

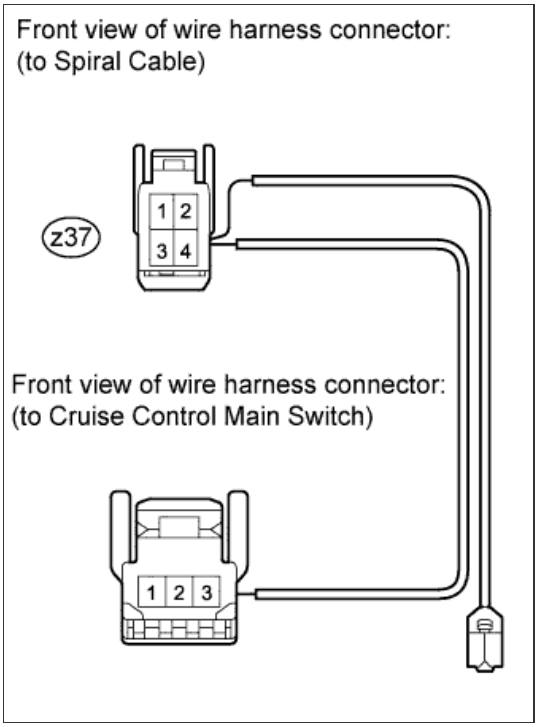
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 3	Neutral	10 Ω or higher
	Pushed to +RES	216 to 264 Ω
	Pushed to -SET	567 to 693 Ω
	Pushed to CANCEL	1386 to 1694 Ω
	Main switch pushed off	10 kΩ or higher
	Main switch pushed on	Below 1 Ω

NG → REPLACE CRUISE CONTROL MAIN SWITCH (Click here)

OK →



3.INSPECT CRUISE CONTROL SWITCH WIRE

a. Remove the cruise control switch wire.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
z37-3 - 3	Always	Below 1 Ω
z37-4 - 1		

NG → REPLACE CRUISE CONTROL SWITCH WIRE

OK

4.INSPECT SPIRAL CABLE

a. If there are any defects as follows, replace the spiral cable with a new one: scratches, cracks, dents or chips on the connector or the spiral cable.

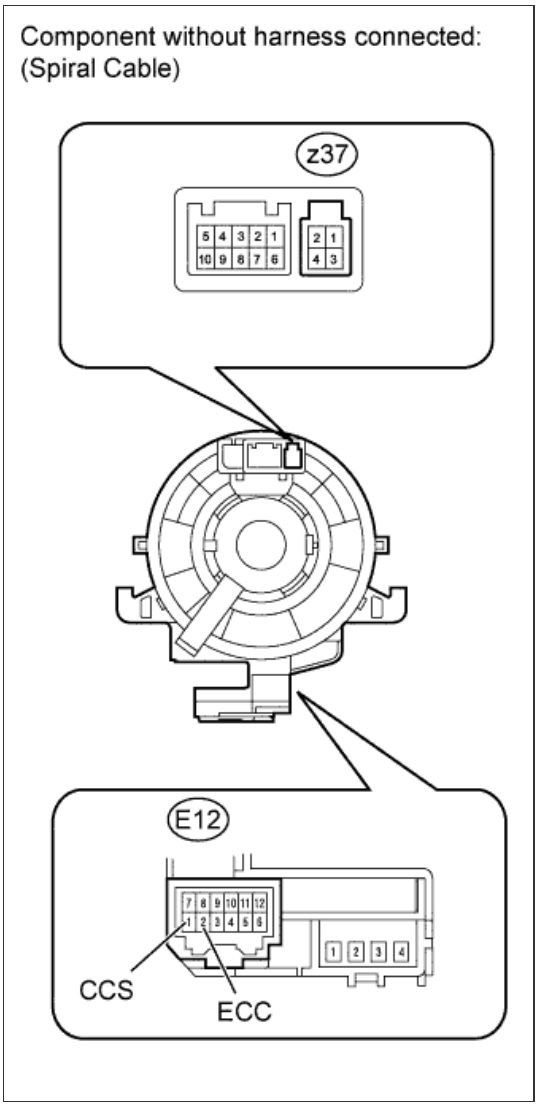
b. Check spiral cable.

i. Set the spiral cable to the center position (Click here).

ii. After setting the spiral cable to the center position, rotate the spiral cable 2.5 times clockwise, and measure the resistance according to the value(s) in the table below. Then rotate the spiral cable 5 times counterclockwise, and measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
z37-3 - E12-1 (CCS)	Always	Below 1 Ω
z37-4 - E12-2 (ECC)		



iii. After setting the spiral cable to the center position, rotate the spiral cable 2.5 times clockwise. Then while rotating the spiral cable 5 times counterclockwise, measure the resistance according to the value(s) in the table below.

NOTICE:

As the spiral cable may break, do not rotate the spiral cable more than the specified amount.

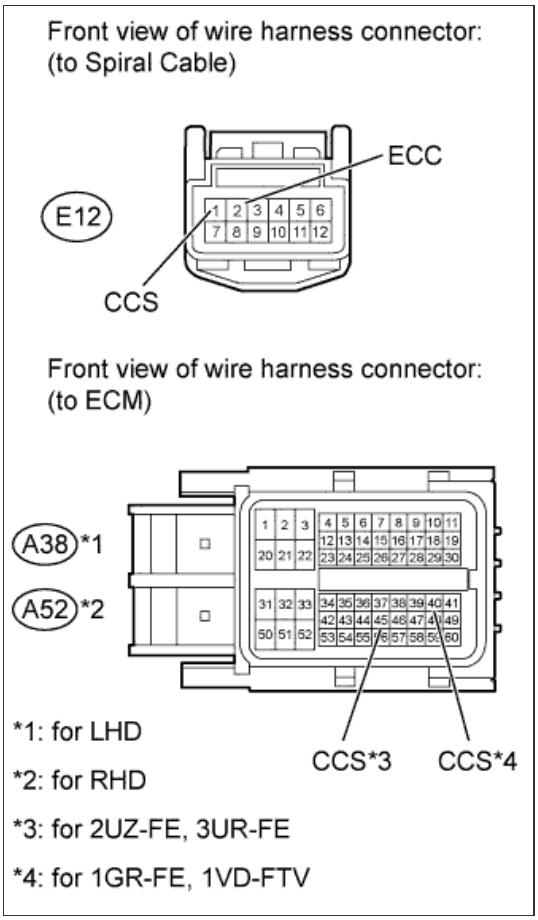
Standard Resistance:

Tester Connection	Condition	Specified Condition
z37-3 - E12-1 (CCS)	Always	Below 1 Ω
z37-4 - E12-2 (ECC)		

NG → REPLACE SPIRAL CABLE (Click here)

OK

5.CHECK HARNESS AND CONNECTOR (SPIRAL CABLE - ECM AND BODY GROUND)



a. Disconnect the E12 spiral cable connector.

b. Disconnect the A38*1 or A52*2 ECM connector.

HINT:

- ***1: for LHD**
- ***2: for RHD**

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for 2U -FE LHD, 3UR-FE LHD

Tester Connection	Condition	Specified Condition
E12-1 (CCS) - A38-45 (CCS)	Always	Below 1 Ω
E12-1 (CCS) - Body ground	Always	10 Ω or higher
E12-2 (ECC) - Body ground	Always	Below 1 Ω

for 2U -FE RHD

Tester Connection	Condition	Specified Condition
E12-1 (CCS) - A52-45 (CCS)	Always	Below 1 Ω
E12-1 (CCS) - Body ground	Always	10 Ω or higher
E12-2 (ECC) - Body ground	Always	Below 1 Ω

for 1GR-FE LHD, 1VD-FTV LHD

Tester Connection	Condition	Specified Condition
E12-1 (CCS) - A38-40 (CCS)	Always	Below 1 Ω
E12-1 (CCS) - Body ground	Always	10 Ω or higher
E12-2 (ECC) - Body ground	Always	Below 1 Ω

for 1GR-FE RHD, 1VD-FTV RHD

Tester Connection	Condition	Specified Condition
E12-1 (CCS) - A52-40 (CCS)	Always	Below 1 Ω
E12-1 (CCS) - Body ground	Always	10 Ω or higher
E12-2 (ECC) - Body ground	Always	Below 1 Ω

for Preparation Click here

DESCRIPTION

- The ECM detects a cruise control switch signal and sends it to the combination meter via the CAN communication line. Then the CRUISE main indicator light comes on.
- The CRUISE main indicator light circuit uses the CAN for communication. If there is a malfunction in this circuit, check for DTCs in the CAN communication system before troubleshooting this circuit.

WIRING DIAGRAM

INSPECTION PROCEDURE

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (CRUISE MAIN INDICATOR LIGHT)

a. Using the intelligent tester, perform the Active Test.

Combination Meter

Tester Display	Test Part	Control Range	Diagnostic Note
Indicat. Lamp Cruise	CRUISE main indicator light operation	OFF or ON	-

OK:
Indicator light comes on/goes off.

Result

Result	Proceed to
OK	A
NG (w/ Multi-information Display)	B
NG (w/o Multi-information Display)	C

B → REPLACE COMBINATION METER ASSEMBLY (Click here)

C → REPLACE COMBINATION METER ASSEMBLY (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (CRUISE MAIN INDICATOR LIGHT)

a. Using the intelligent tester, read the Data List.

Cruise Control

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
		ON: CRUISE main indicator light is on	

CCS Indicator M-CPU	CRUISE main indicator light (Main CPU) / ON or OFF	OFF: CRUISE main indicator light is off	-

OK:

The intelligent tester display changes according to condition of CRUISE main indicator light.

Result

Result	Proceed to
OK	A
NG (for 3UR-FE)	B
NG (for 2U -FE)	C
NG (for 1GR-FE)	D
NG (for 1VD-FTV)	E

B → REPLACE ECM (Click here)

C → REPLACE ECM (Click here)

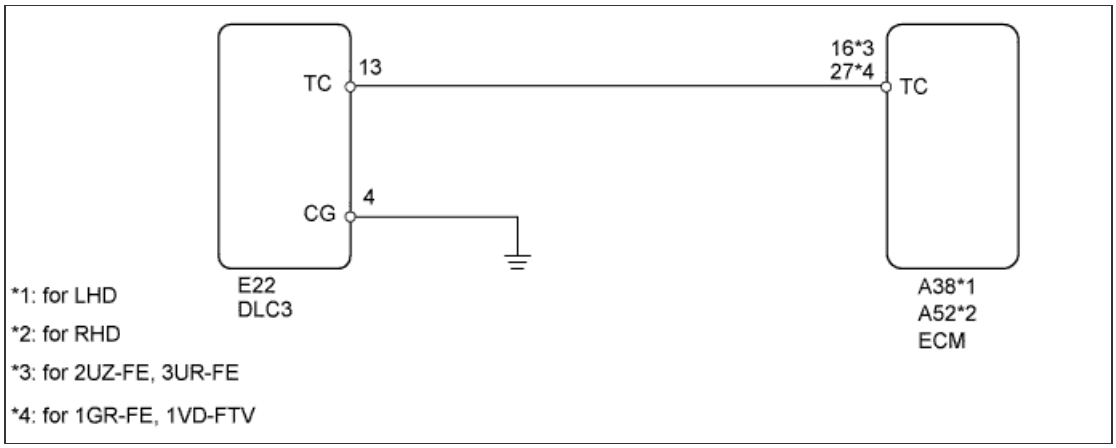
D → REPLACE ECM (Click here)

E → REPLACE ECM (Click here)

A

PROCEED TO NE T CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (Click here)

for Preparation Click here



DESCRIPTION

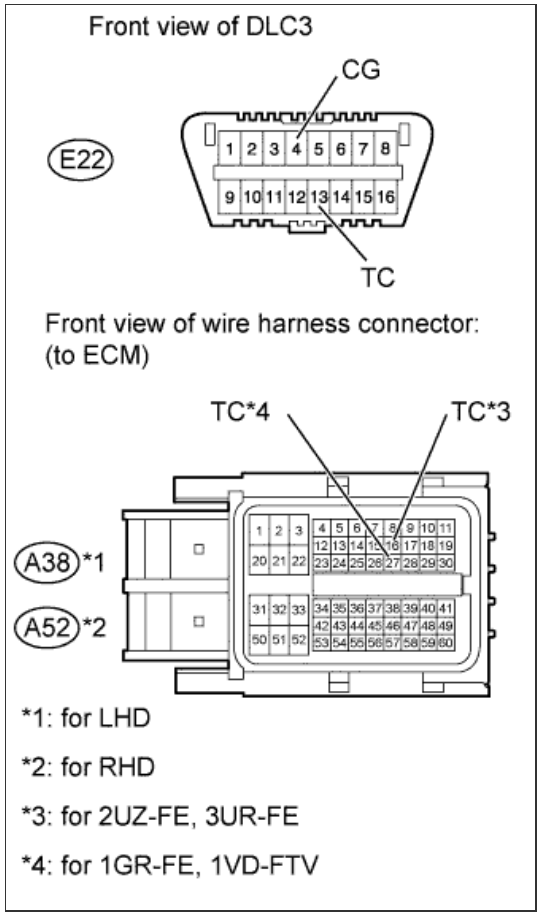
Connecting terminals TC and CG of the DLC3 causes the system to enter self-diagnostic mode. If a malfunction is present, DTCs will be output.

HINT:

When a particular warning light remains blinking, a ground short in the wiring of terminal TC of the DLC3 or an internal ground short in the relevant ECU is suspected.

WIRING DIAGRAM

INSPECTION PROCEDURE



1.CHECK HARNESS AND CONNECTOR (DLC3 - ECM AND BODY GROUND)

a. Disconnect the A38*1 or A52*2 ECM connector.

HINT:

- ***1: for LHD**
- ***2: for RHD**

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for 2UZ-FE LHD, 3UR-FE LHD

Tester Connection	Condition	Specified Condition
E22-13 (TC) - A38-16 (TC)	Always	Below 1 Ω
E22-4 (CG) - Body ground		
E22-13 (TC) - Body ground	Always	10 kΩ or higher

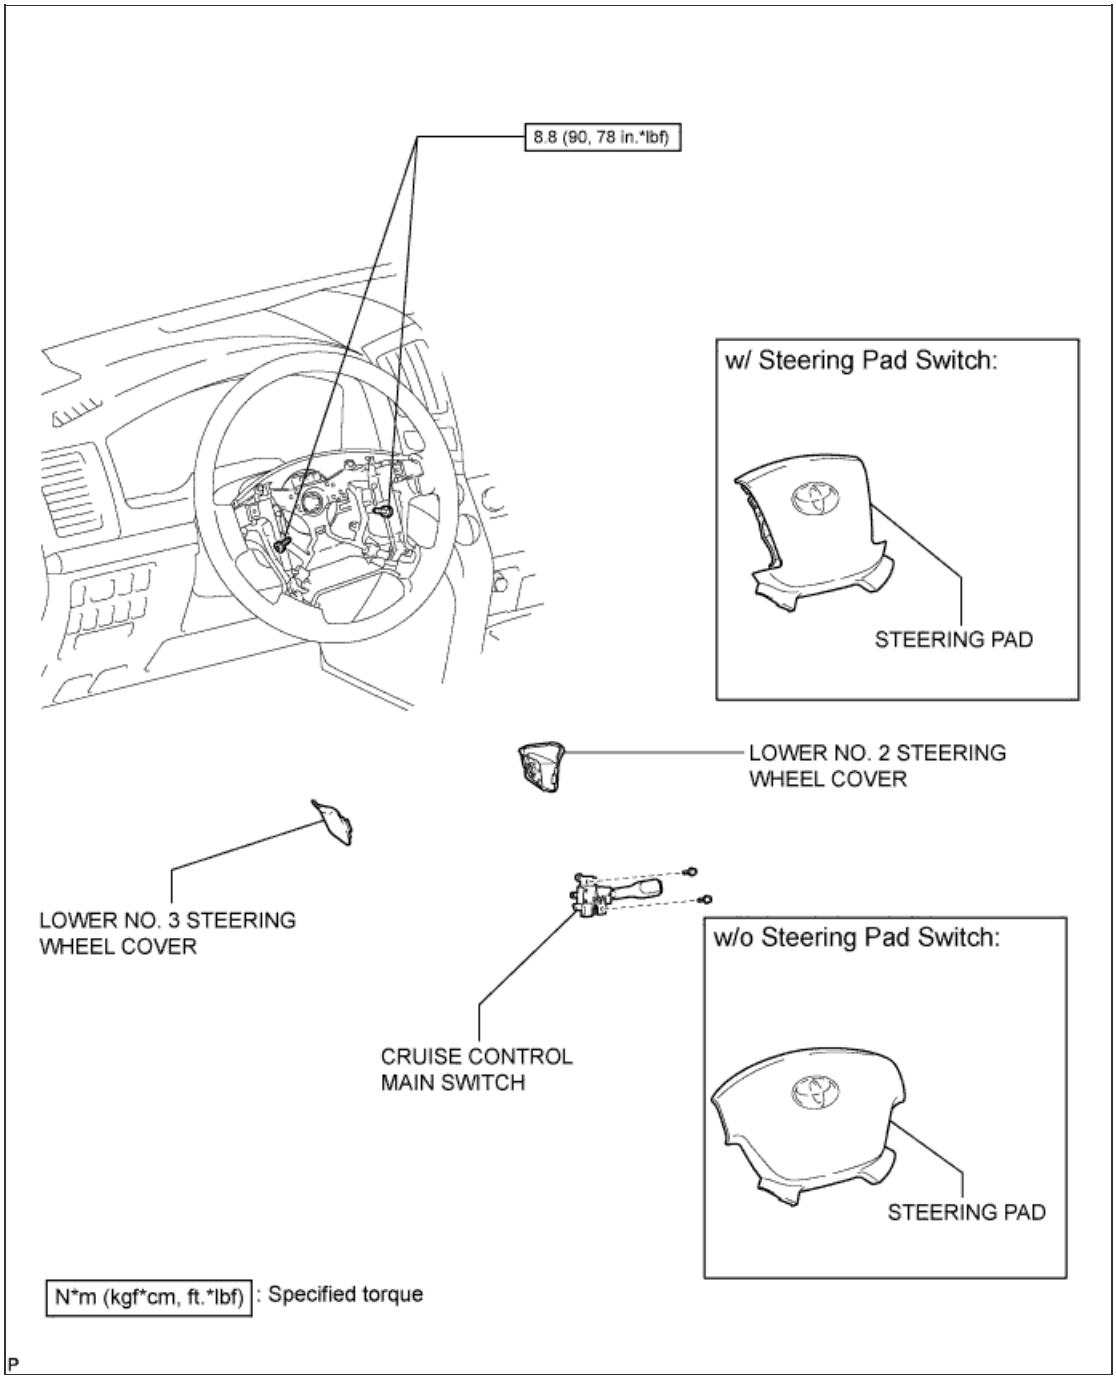
for 2UZ-FE RHD

Tester Connection	Condition	Specified Condition
E22-13 (TC) - A52-16 (TC)	Always	Below 1 Ω
E22-4 (CG) - Body ground		
E22-13 (TC) - Body ground	Always	10 kΩ or higher

for 1GR-FE LHD, 1VD-FTV LHD

Tester Connection	Condition	Specified Condition
E22-13 (TC) - A38-27 (TC)	Always	Below 1 Ω
E22-4 (CG) - Body ground		
E22-13 (TC) - Body ground	Always	10 kΩ or higher

for 1GR-FE RHD, 1VD-FTV RHD



Tester Connection	Condition	Specified Condition
E22-13 (TC) - A52-27 (TC)	Always	Below 1 Ω
E22-4 (CG) - Body ground		
E22-13 (TC) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (Click here)

for Preparation Click here

CRUISE CONTROL MAIN SWITCH > REMOVAL

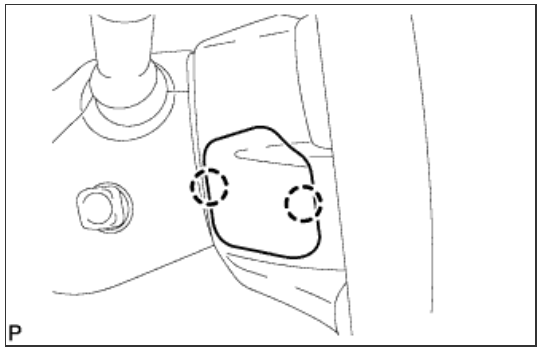
for Preparation Click here

HINT:

- **Use the same procedures for LHD and RHD vehicles.**
- **The procedures listed below are for LHD vehicles.**

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

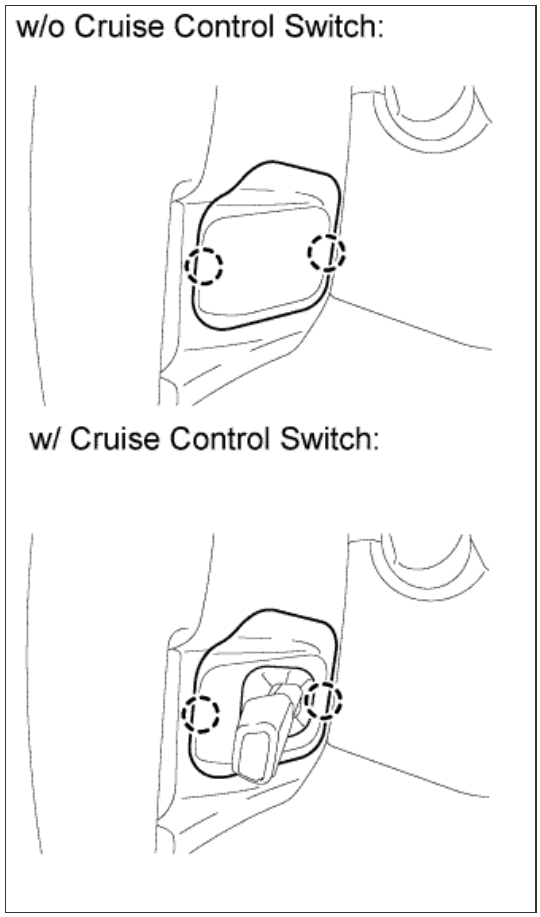
CAUTION:



Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable the SRS system.

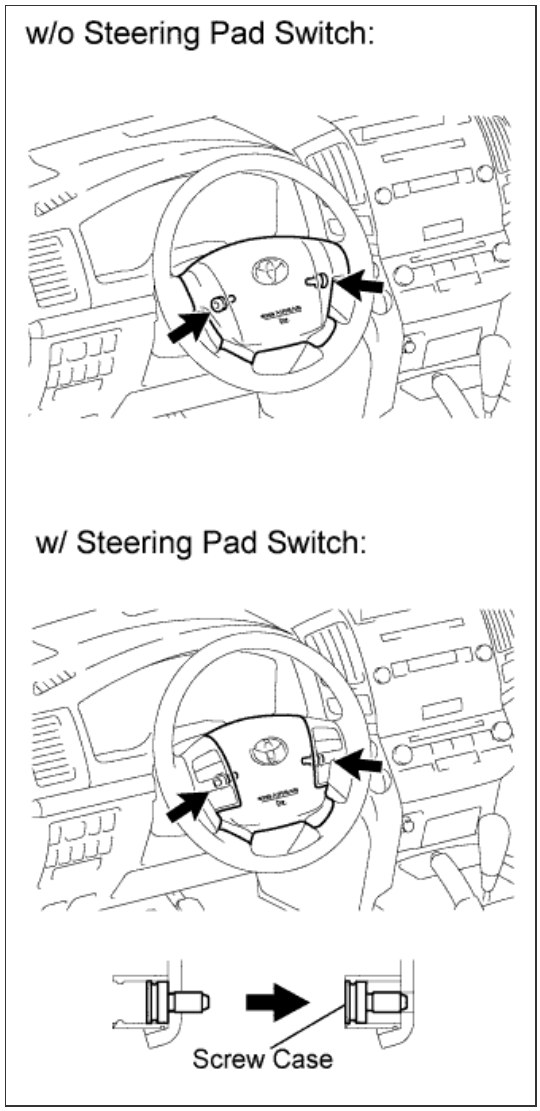
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).



2. REMOVE LOWER NO. 3 STEERING WHEEL COVER

a. Detach the 2 claws and remove the steering wheel cover.



3. REMOVE LOWER NO. 2 STEERING WHEEL COVER

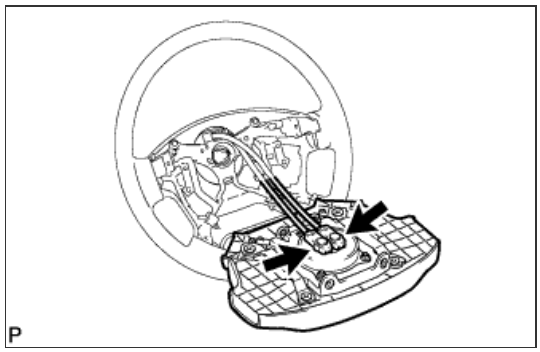
a. Detach the 2 claws and remove the steering wheel cover.

4. REMOVE STEERING PAD

a. Using a T30 R socket wrench, loosen the 2 screws ntil the groove along the screw circ mference catches on the screw case.

b. P ll o t the steering ad from the steering wheel, as shown in the ill stration. Then s ort the steering ad with one hand.

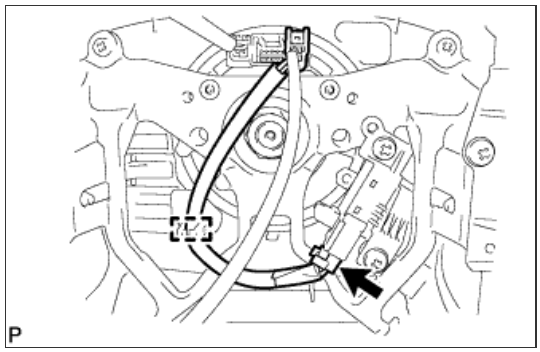
NOTICE:



When removing the steering ad, do not ll the airbag wire harness.

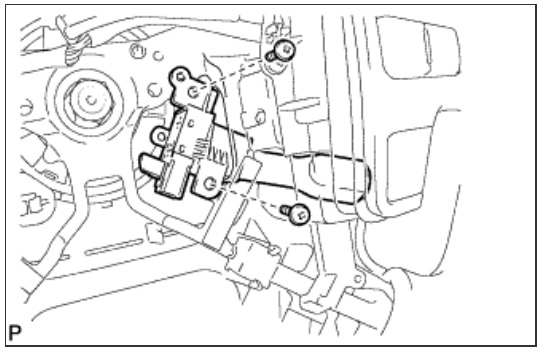
c. Disconnect the horn connector.

d. Disconnect the 2 connectors and remove the steering ad.

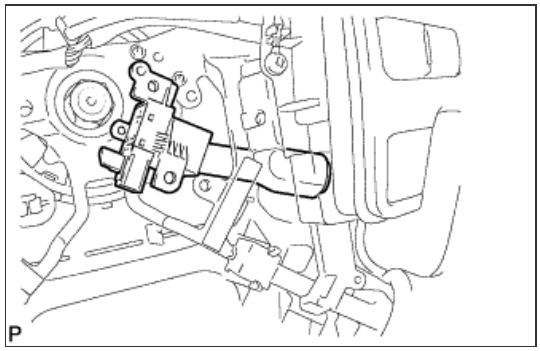


NOTICE:

When handling the airbag connector, take care not to damage the airbag wire harness.

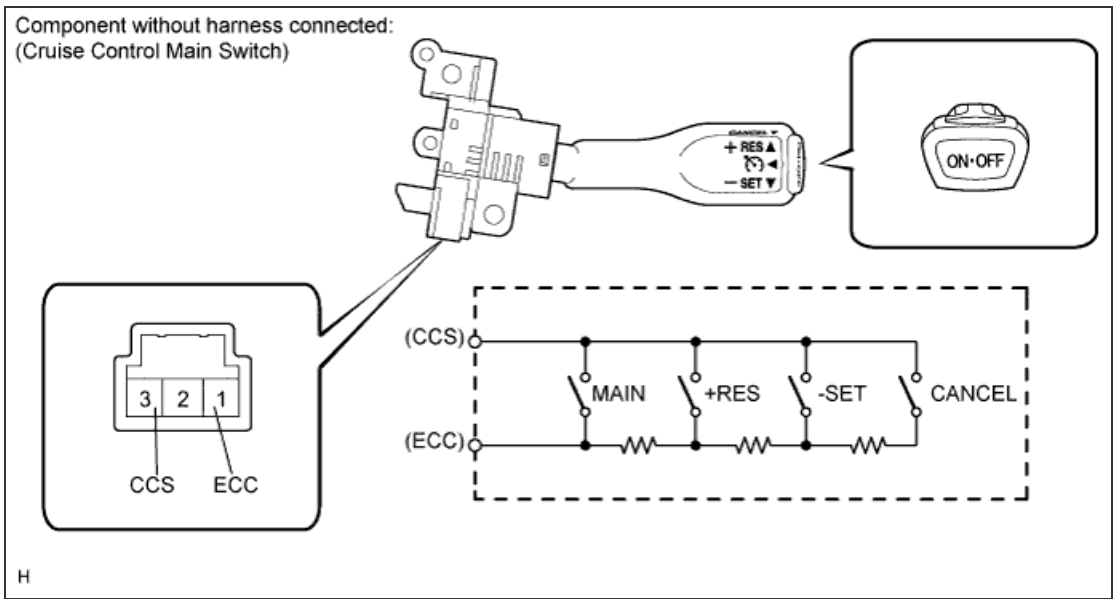


5. REMOVE CRUISE CONTROL MAIN SWITCH



a. Disconnect the connector and clam .

b. Remove the 2 screws.



c. Remove the switch.

for Preparation Click here

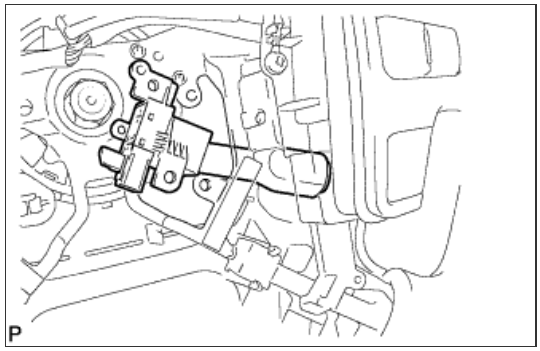
1. INSPECT CRUISE CONTROL MAIN SWITCH ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

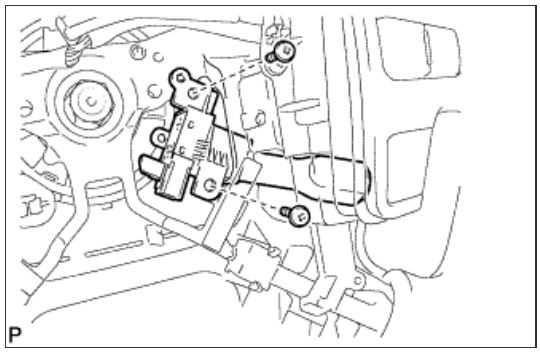
Tester Connection	Switch Condition	Specified Condition
1 (ECC) - 3 (CCS)	Neutral	10 kΩ or higher
1 (ECC) - 3 (CCS)	+RES	216 to 264 Ω
1 (ECC) - 3 (CCS)	-SET	567 to 693 Ω
1 (ECC) - 3 (CCS)	CANCEL	1386 to 1694 Ω
1 (ECC) - 3 (CCS)	Main Switch OFF	10 kΩ or higher
1 (ECC) - 3 (CCS)	Main Switch ON	Below 1 Ω

If the result is not as specified replace the cruise control ain switch asse bl .



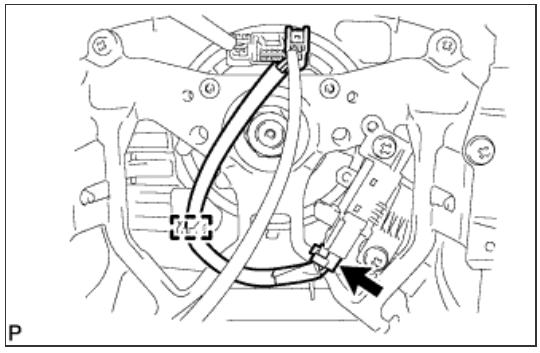
for Preparation Click here

HINT:



- **Use the same procedures for LHD and RHD vehicles.**
- **The procedures listed below are for LHD vehicles.**

1. INSTALL CRUISE CONTROL MAIN SWITCH



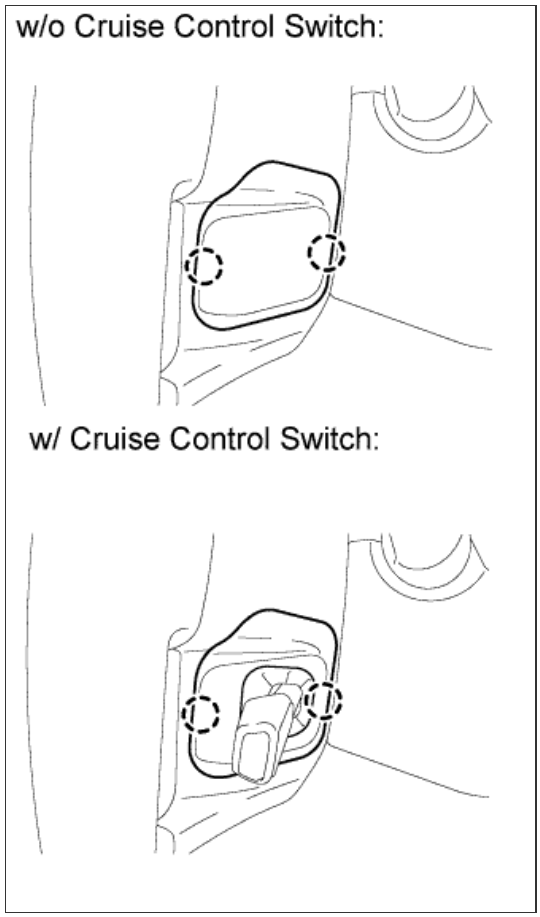
a. Install the switch.

b. Install the 2 screws.

c. Connect the connector and clamp.

2. INSTALL STEERING PAD

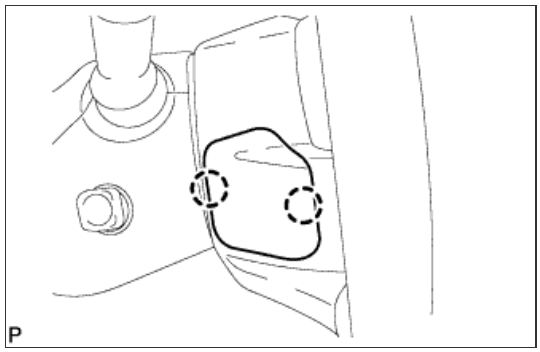
a. With the steering pad installed on the vehicle, perform a visual check. If there are any defects as mentioned below, replace the steering pad with a new one:
Cuts, minute cracks or marked discoloration on the steering pad top surface or in the grooved portion.



b. Make sure that the horn sounds.

HINT:

If the horn does not sound, inspect the horn system.



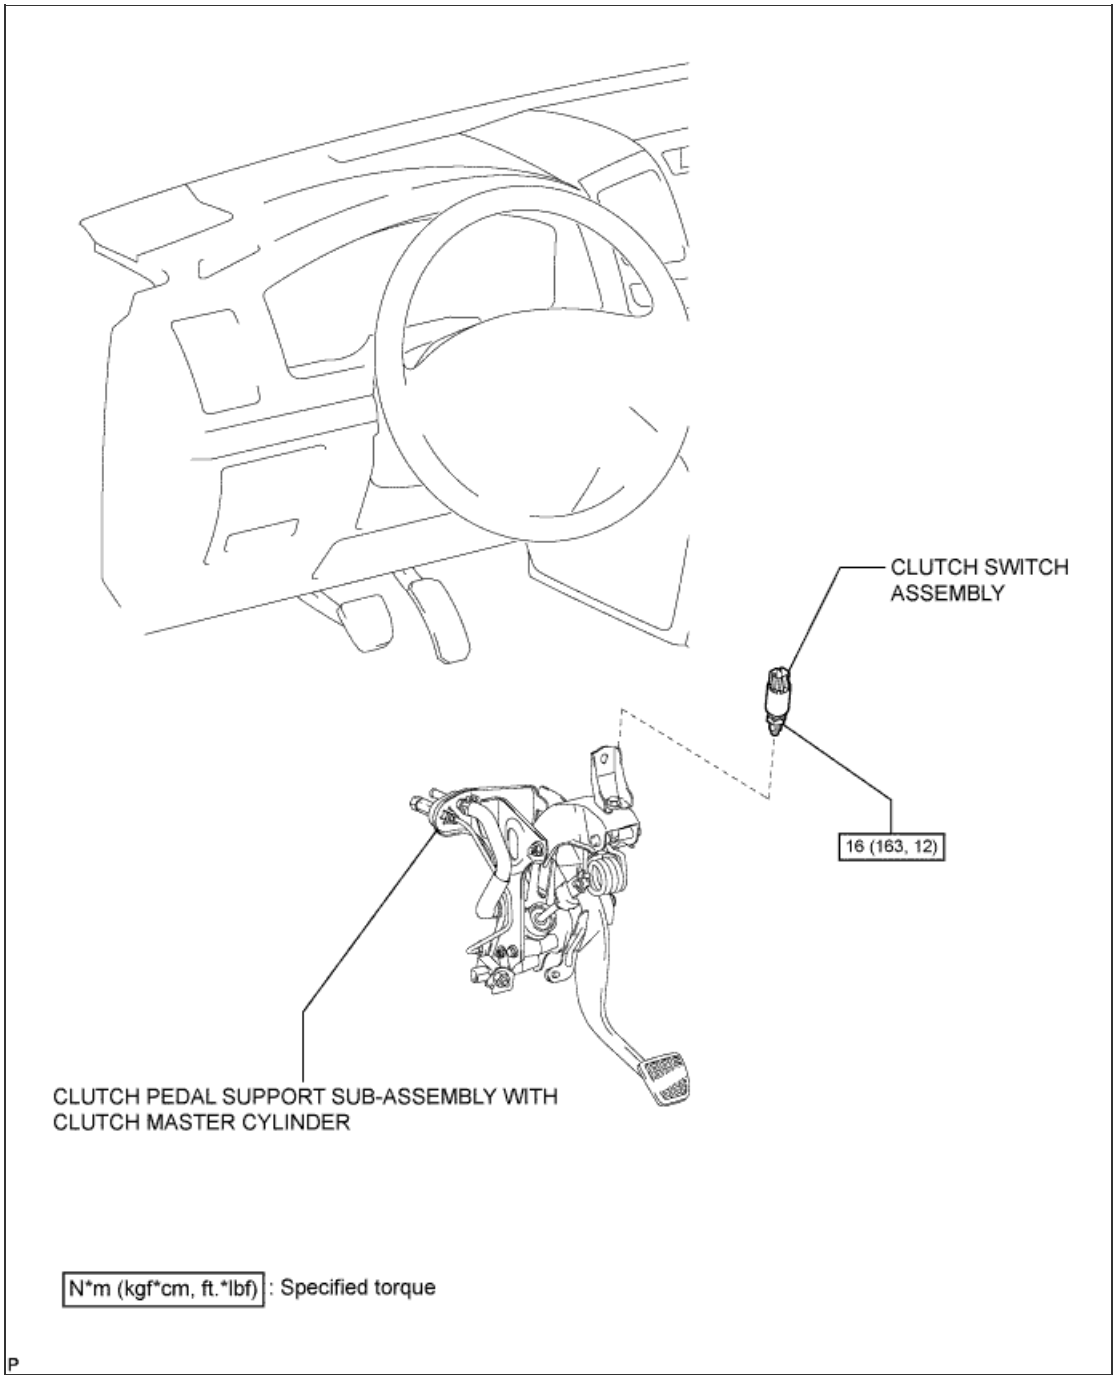
3. INSTALL LOWER NO. 2 STEERING WHEEL COVER

a. Attach the 2 claws to install the cover.

4. INSTALL LOWER NO. 3 STEERING WHEEL COVER

a. Attach the 2 claws to install the cover.

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



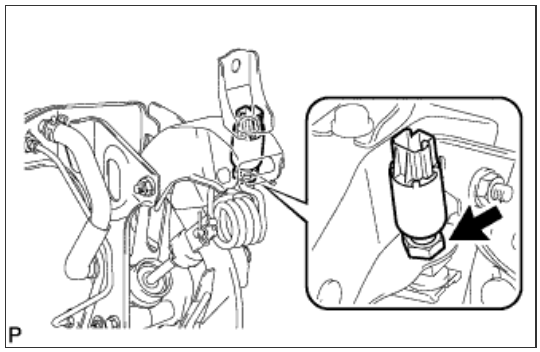
NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

6. CHECK SRS WARNING LIGHT

a. Check the SRS warning light (Click here).

for Preparation Click here



for Preparation Click here

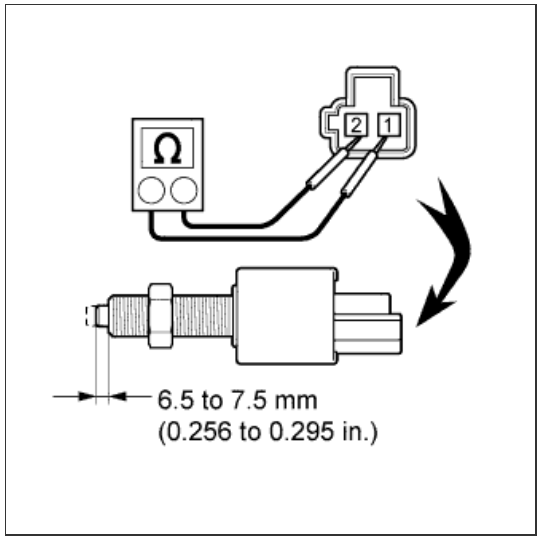
1. REMOVE CLUTCH PEDAL SUPPORT SUB-ASSEMBLY WITH CLUTCH MASTER CYLINDER

a. Remove the clutch pedal support sub-assembly with clutch master cylinder (Click here).

2. REMOVE CLUTCH SWITCH ASSEMBLY

a. Loosen the adjusting nut and remove the clutch switch assembly.

for Preparation Click here



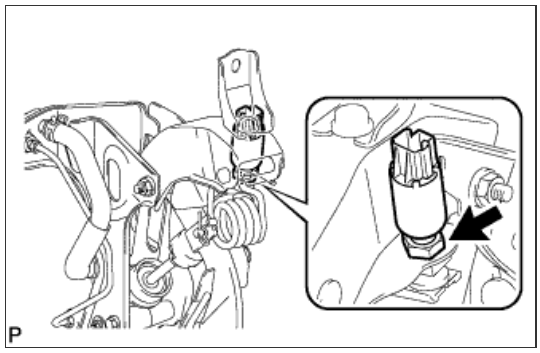
1. INSPECT CLUTCH SWITCH ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Pushed (On)	Below 1 Ω
1 - 2	Not pushed (Off)	10 kΩ or higher

If the result is not as specified, replace the clutch switch assembly.

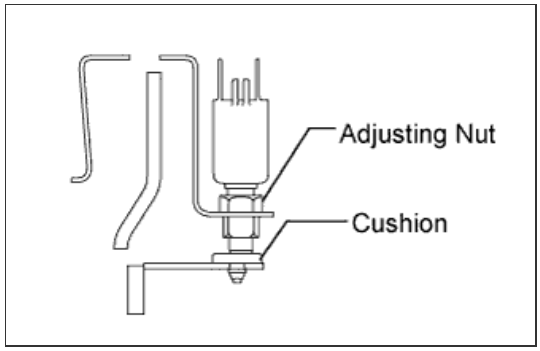


for Preparation Click here

1. INSTALL CLUTCH SWITCH ASSEMBLY

a. Install the clutch switch assembly and tighten the adjusting nut.

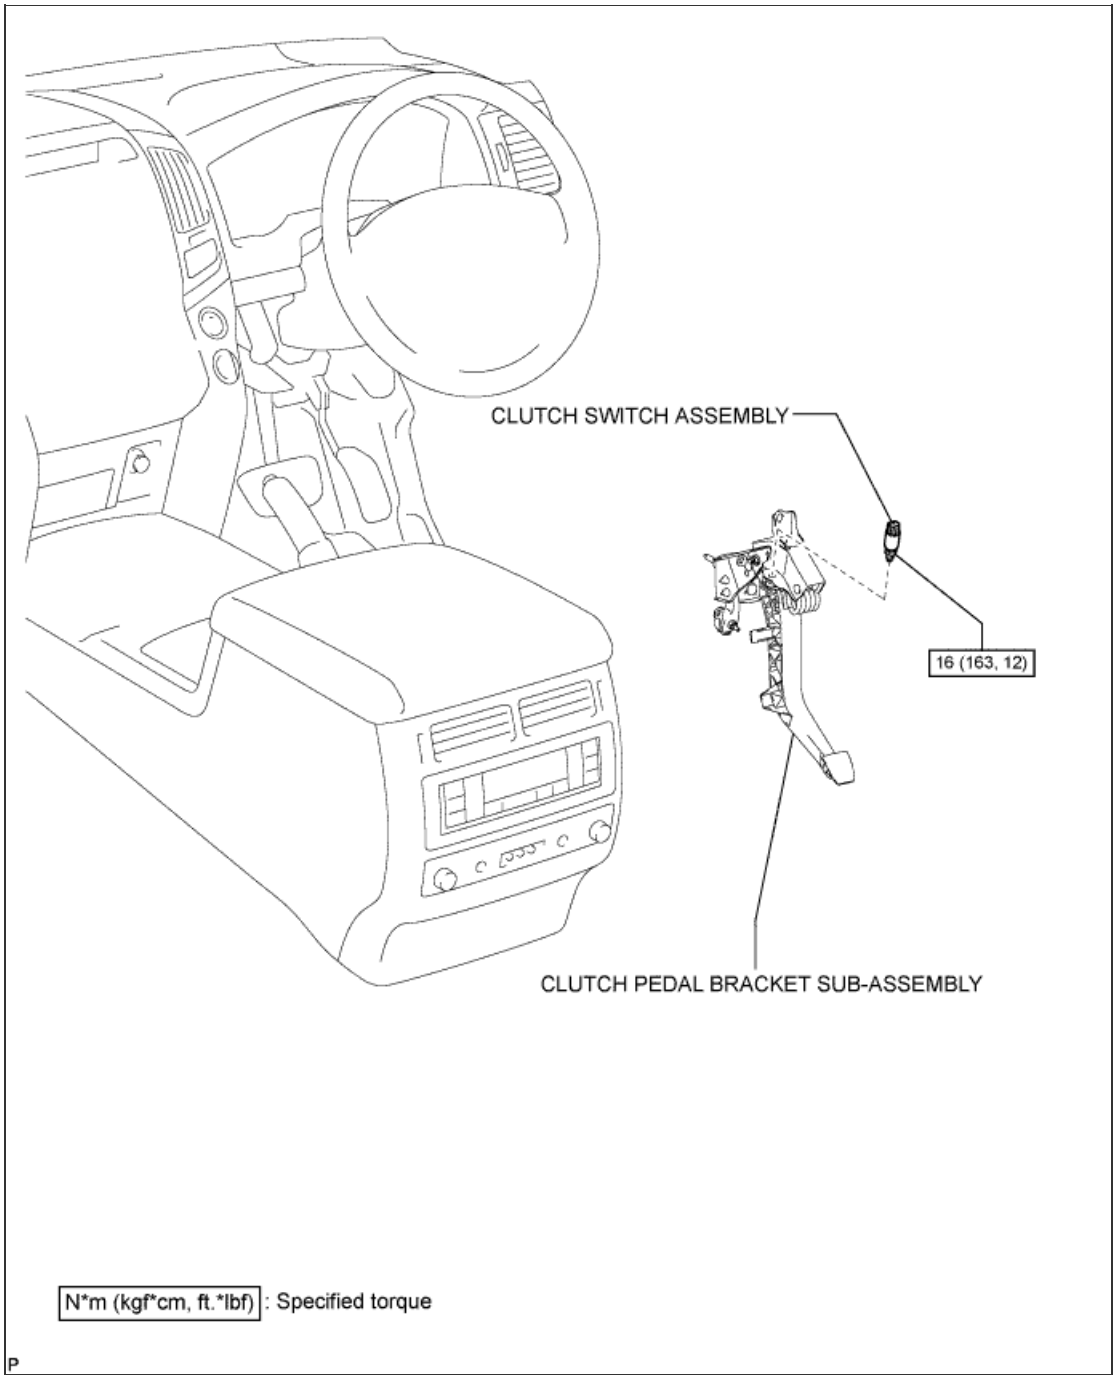
Torque:
16 N*m{ 163 kgf*cm , 12 ft.*lbf }



b. Adjust the clutch switch so that the threaded portion of the clutch switch lightly contacts the cushion. Then tighten the adjusting nut and check the contact of the cushion and switch.

Torque:
16 N*m{ 163 kgf*cm , 12 ft.*lbf }

NOTICE:

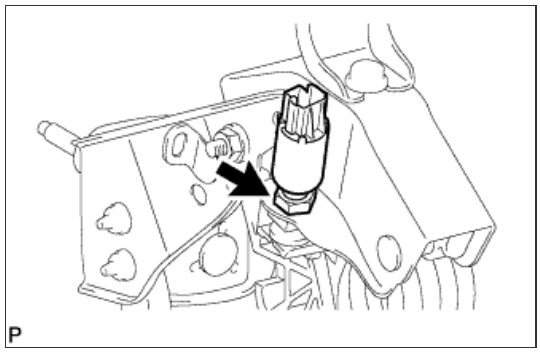


After adjusting the pedal free play, perform the clutch switch assembly adjustment (Click here).

2. INSTALL CLUTCH PEDAL SUPPORT SUB-ASSEMBLY WITH CLUTCH MASTER CYLINDER

a. Install the clutch pedal support sub-assembly with clutch master cylinder (Click here).

for Preparation Click here



for Preparation Click here

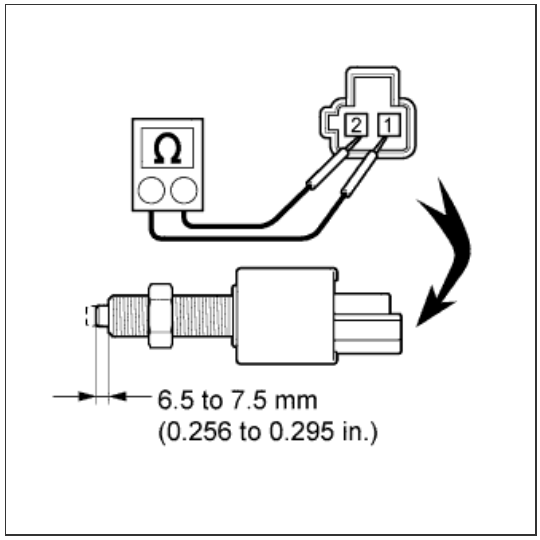
1. REMOVE CLUTCH PEDAL BRACKET SUB-ASSEMBLY

a. Remove the clutch pedal bracket sub-assembly (Click here).

2. REMOVE CLUTCH SWITCH ASSEMBLY

a. Loosen the adjusting nut and remove the clutch switch assembly.

for Preparation Click here



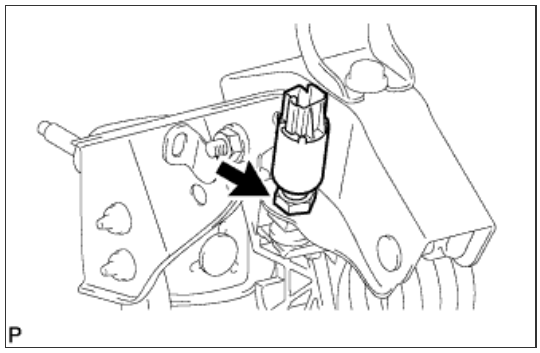
1. INSPECT CLUTCH SWITCH ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Pushed (On)	Below 1 Ω
1 - 2	Not pushed (Off)	10 kΩ or higher

If the result is not as specified, replace the clutch switch assembly.

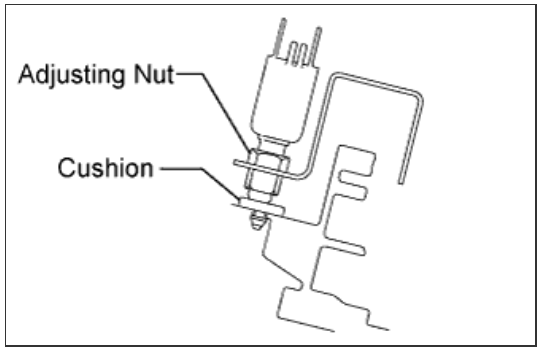


for Preparation Click here

1. INSTALL CLUTCH SWITCH ASSEMBLY

a. Install the clutch switch assembly and tighten the adjusting nut.

Torque:
16 N*m{ 163 kgf*cm , 12 ft.*lbf }



b. Adjust the clutch switch so that the threaded portion of the clutch switch lightly contacts the cushion. Then tighten the adjusting nut and check the contact of the cushion and switch.

Torque:
16 N*m{ 163 kgf*cm , 12 ft.*lbf }

NOTICE:

After adjusting the pedal free play, perform the clutch switch assembly adjustment (Click here).

2. INSTALL CLUTCH PEDAL BRACKET SUB-ASSEMBLY

a. Install the clutch pedal bracket sub-assembly (Click here).
