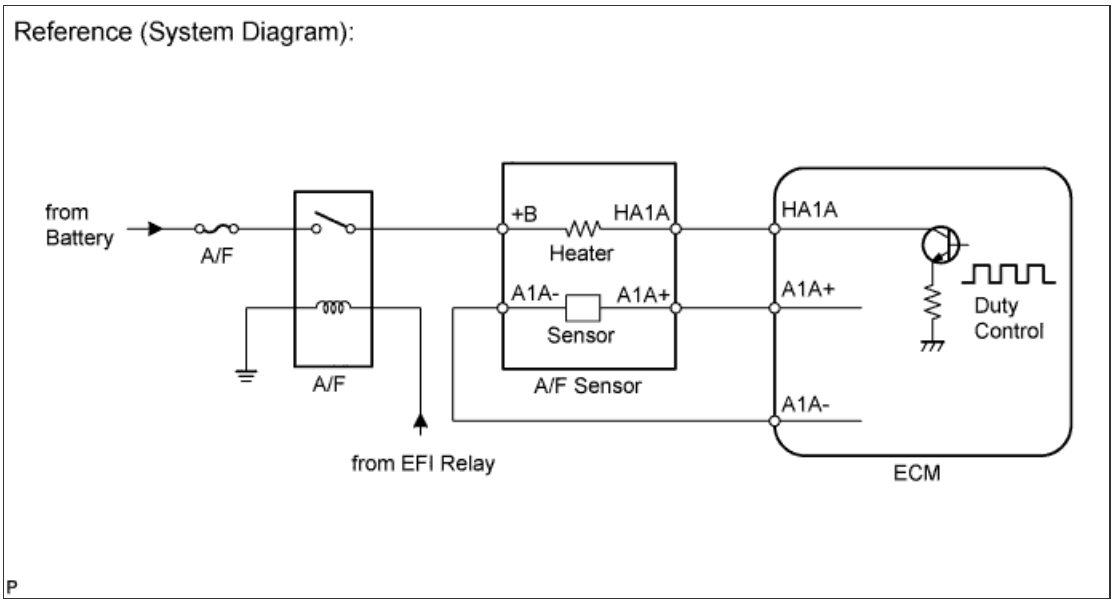
The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate airfuel ratio detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.



HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the EC enters fail-safe mode. The EC turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The EC provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

Reference (System Diagram):

P

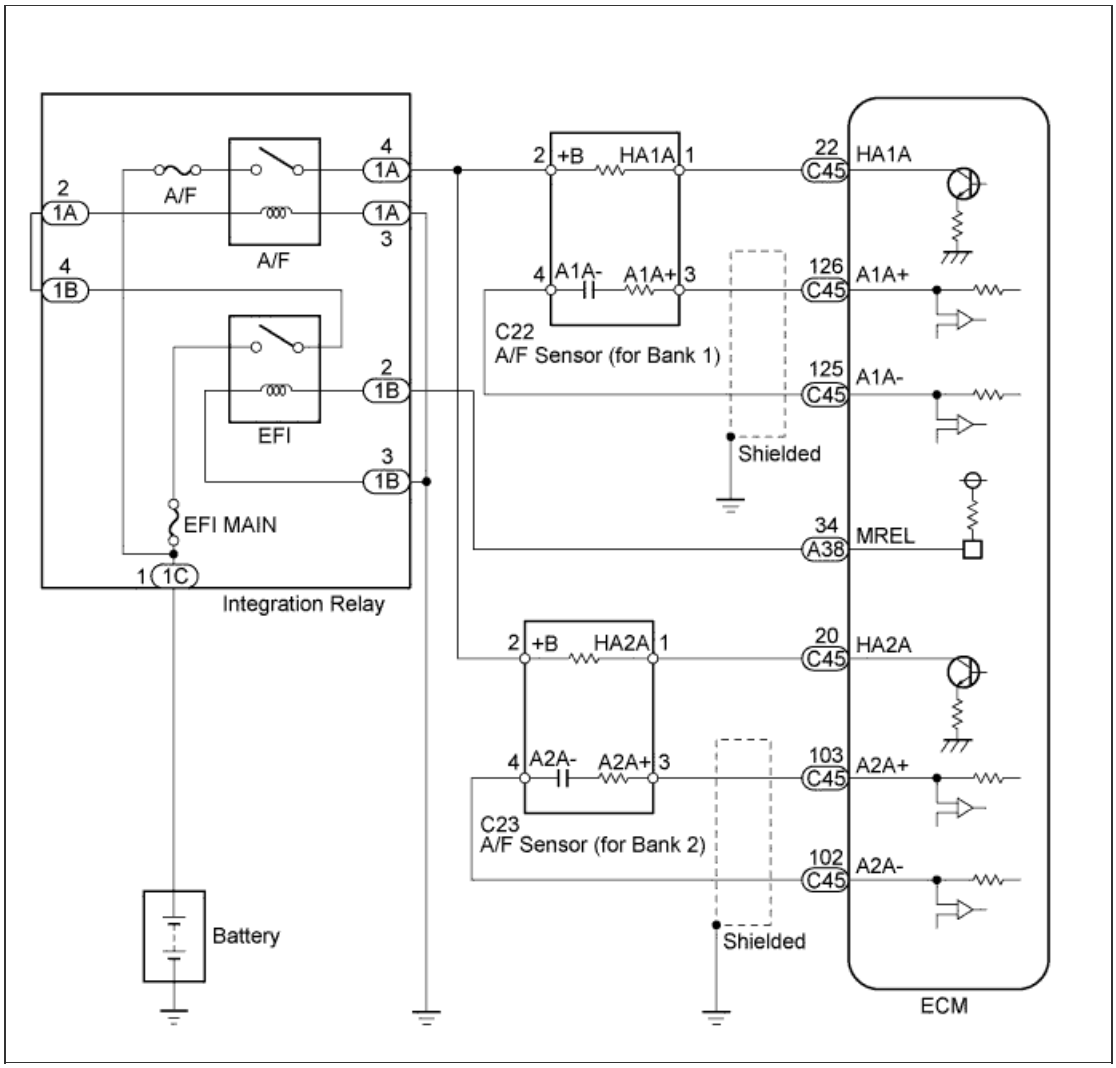
DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

ONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.

The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.



The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.

When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).

Example:

The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

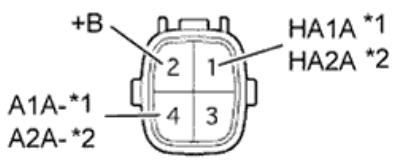
WIRING DIAGRA

INSPECTION PROCEDURE

HINT:

- **Read free e frame data using the intelligent tester. Free e frame data records the engine condition when malfunctions are detected. When troubleshooting, free e frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

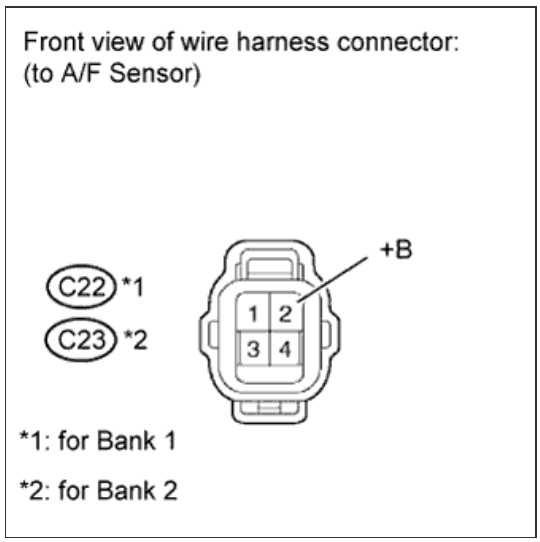
*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

2.CHECK TER INAL VOLTAGE (+B OF A/F SENSOR)

a. Disconnect the C22 or C23 A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

Result

Result	Proceed to
NG	A
OK	B

B → Go to step 5

A

3.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

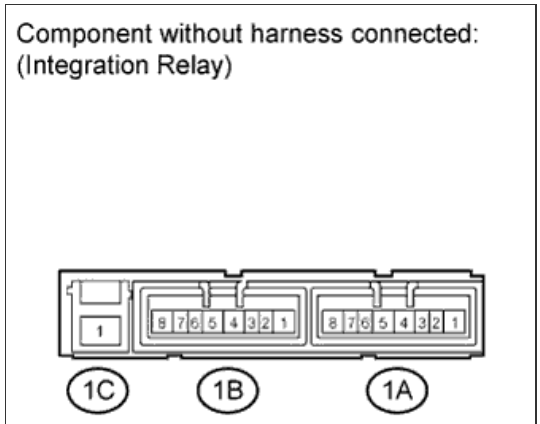
b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω



iii. Reinstall the A/F fuse.

c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

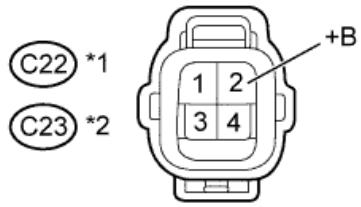
Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

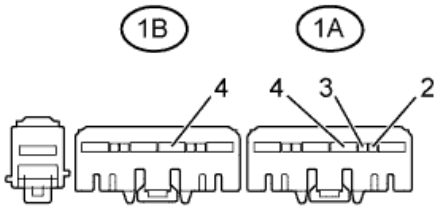
4.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - A/F SENSOR AND BODY GROUND)

a. Disconnect the C22 or C23 A/F sensor connector.



b. Remove the integration relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C22-2 (+B) - 1A-4	Always	Below 1 Ω
C23-2 (+B) - 1A-4	Always	Below 1 Ω
1A-2 - 1B-4	Always	Below 1 Ω
1A-3 - Body ground	Always	Below 1 Ω
C22-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C23-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
1A-2 or 1B-4 - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:

Front view of wire harness connector:

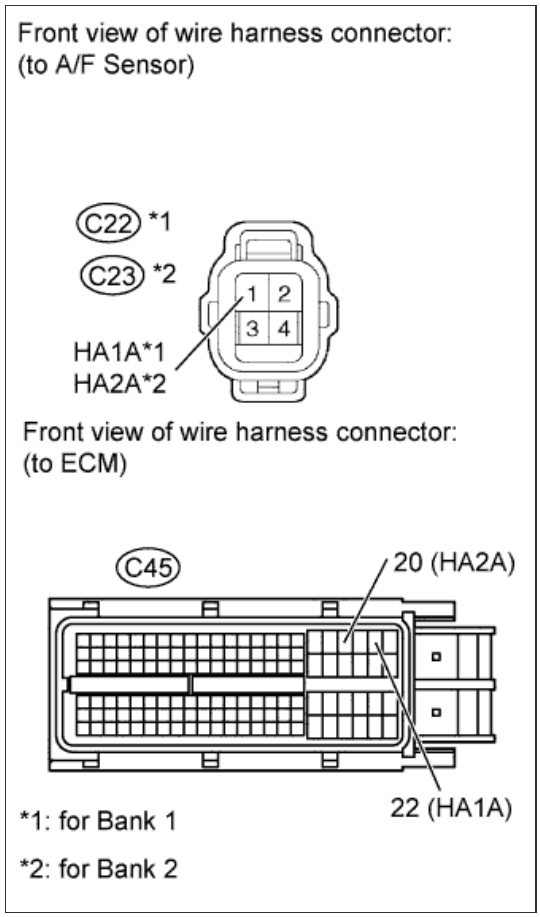
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

CHECK EC POWER SOURCE CIRCUIT (Click here)

5.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)



a. Disconnect the C22 or C23 A/F sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Allow the engine to idle for 1 minute or more.

g. Enter the following menus: Powertrain / Engine and ECT / DTC.

h. Read DTCs.

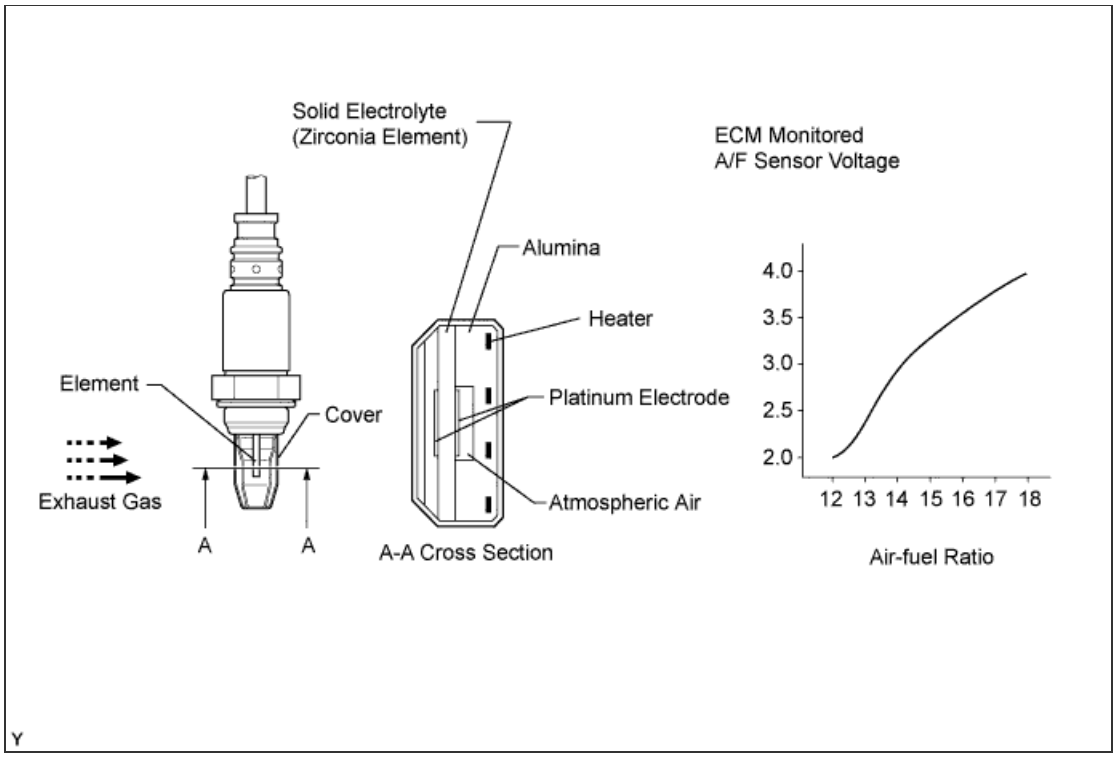
DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here



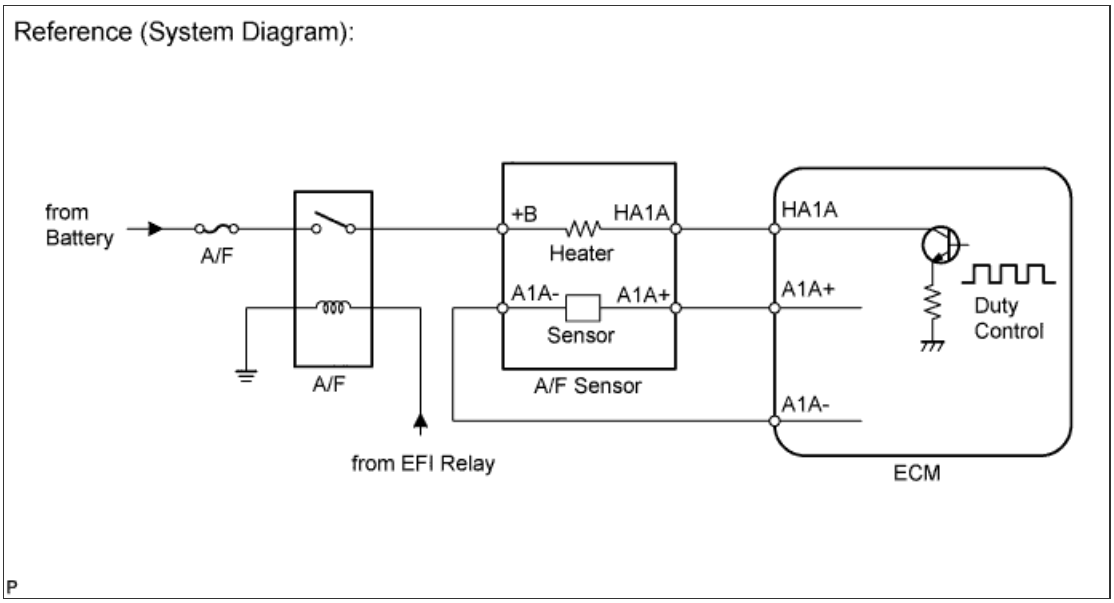
DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate airfuel ratio detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: Value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.



HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

Reference (System Diagram):

P

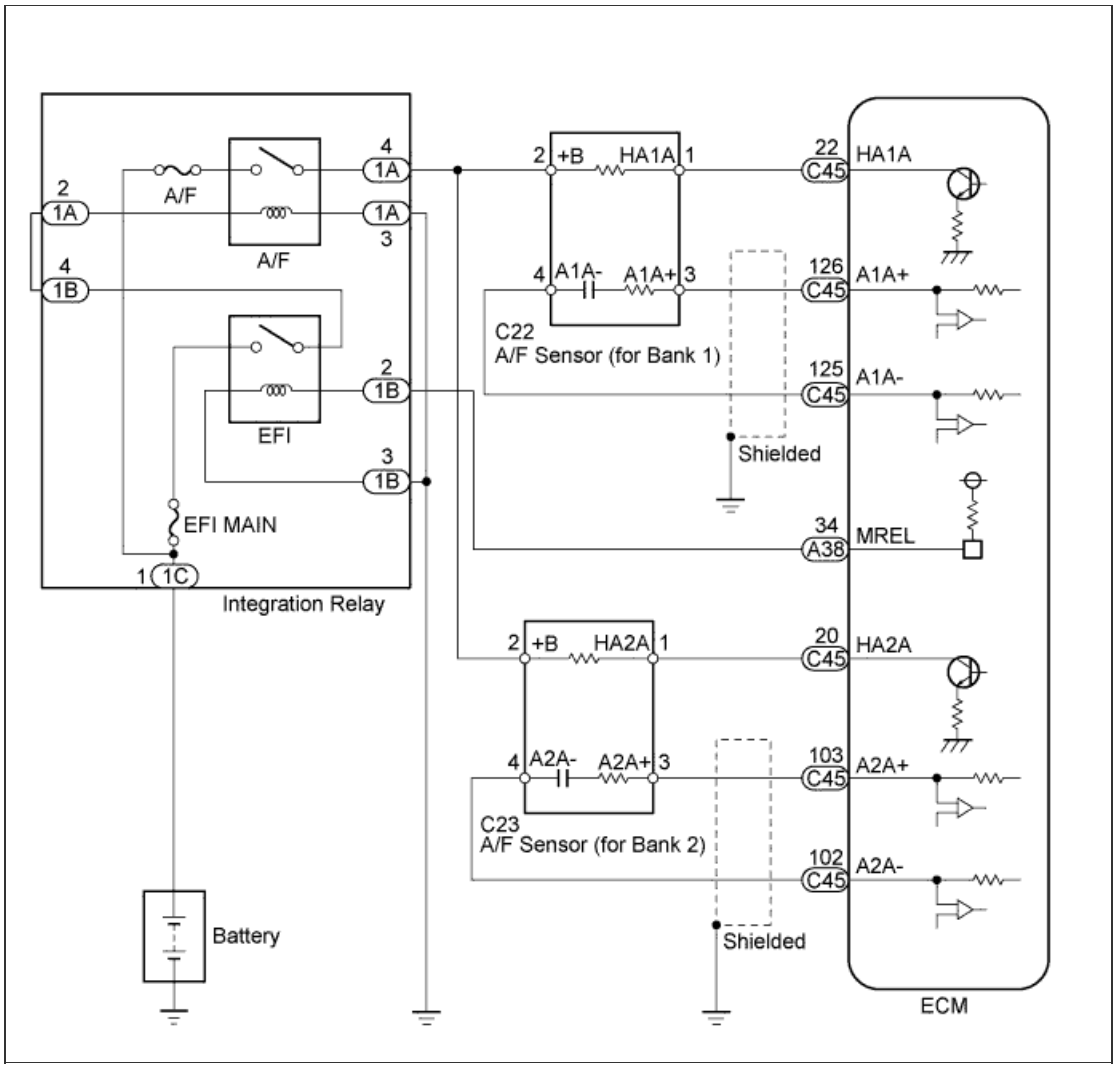
DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Sensor 1) • Integration relay • ECM

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.

The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.



The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate the air-fuel ratio properly.

When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores DTC(s).

Example:

The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is more than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

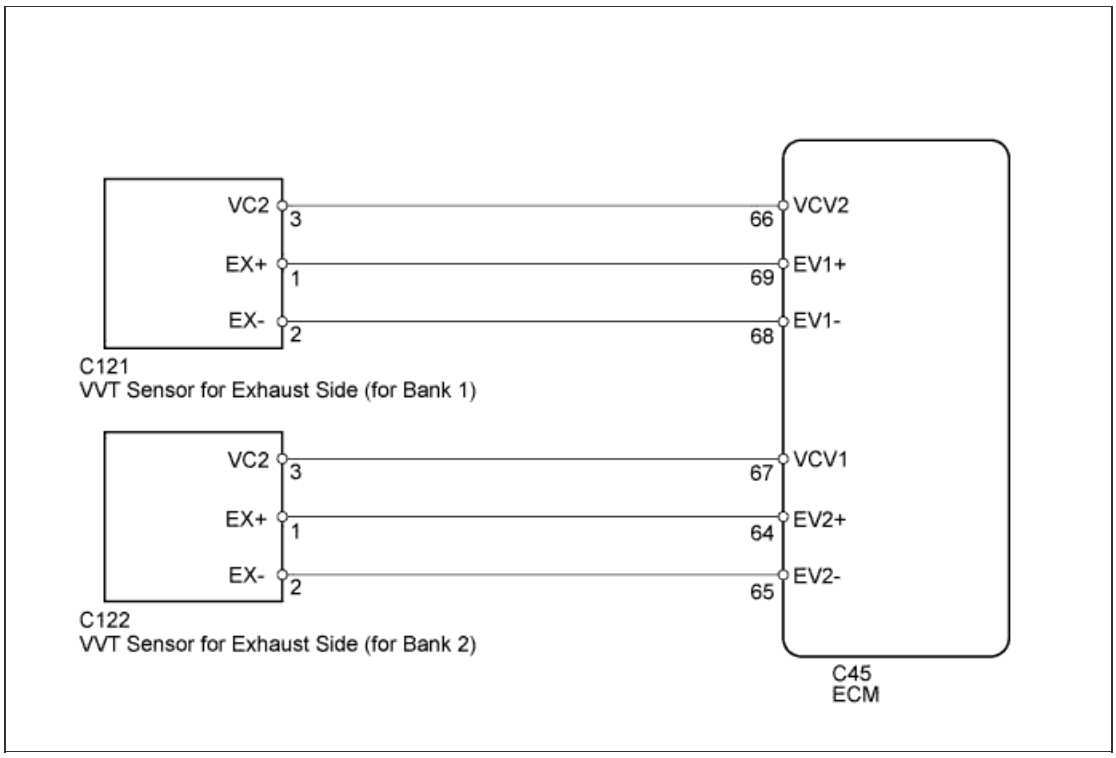
DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition

C45 110 (NE+) - C45-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-69 (EV1+) - C45-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-64 (EV2+) - C45-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown



HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

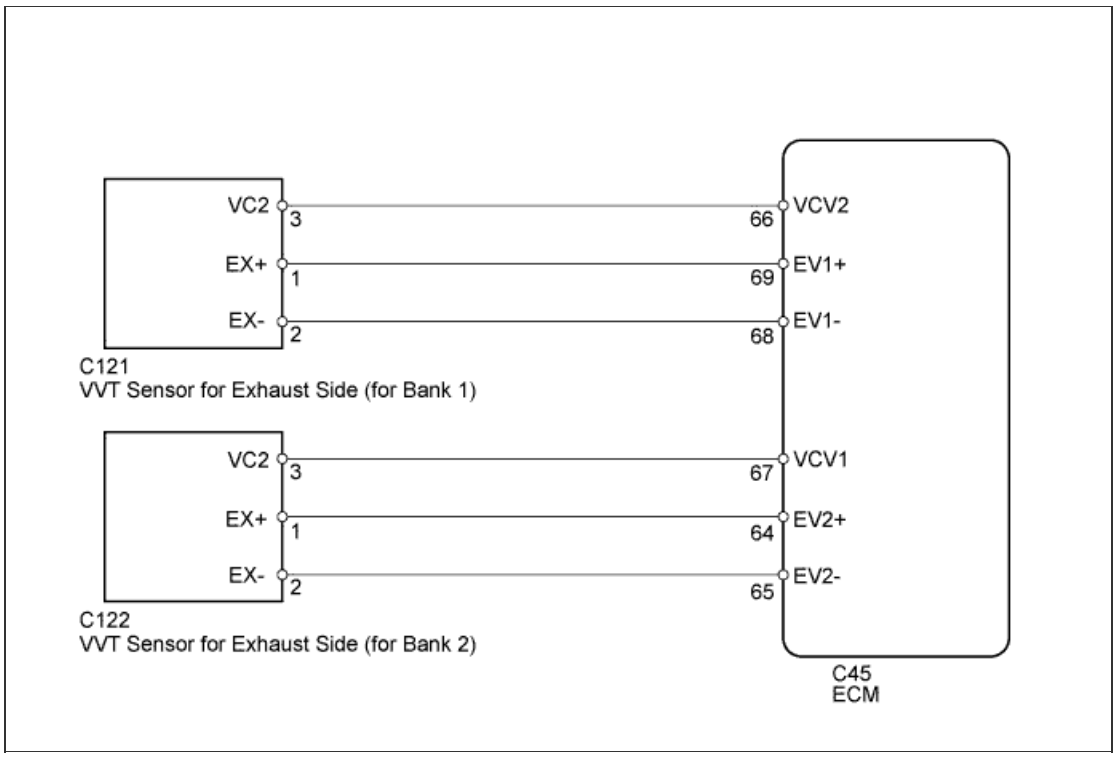
DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition

C45 110 (NE+) - C45-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-69 (EV1+) - C45-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-64 (EV2+) - C45-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown



HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

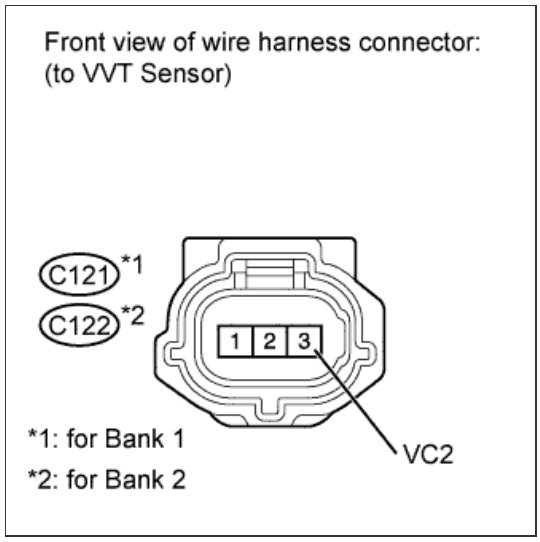
If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C121 or C122 VVT sensor (for exhaust side) connector.

b. Measure the voltage according to the value(s) in the table below.

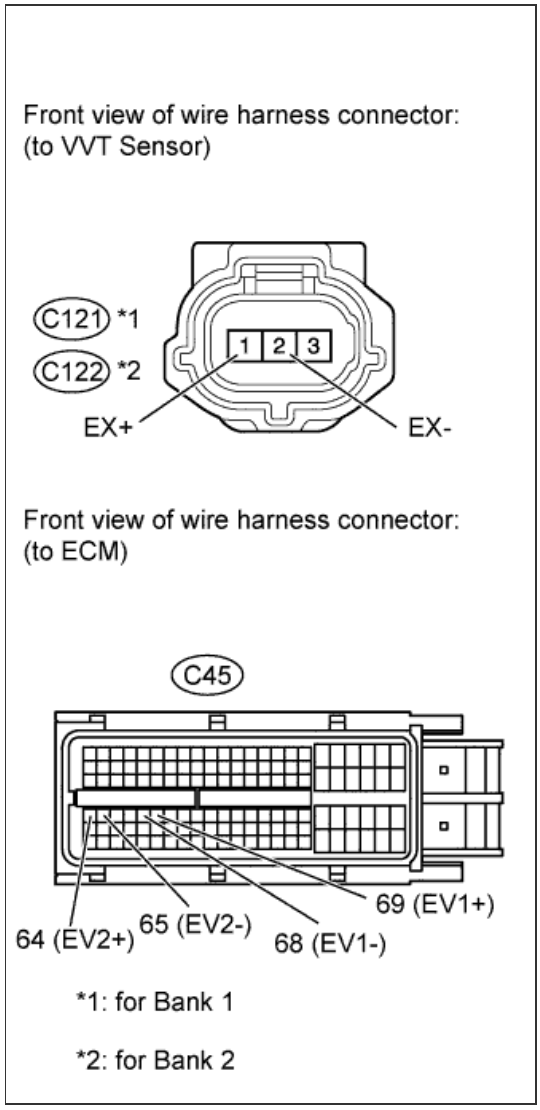
Standard Voltage:

Tester Connection	Condition	Specified Condition
C121-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C122-3 (VC2) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR (for Exhaust Side) - ECM)



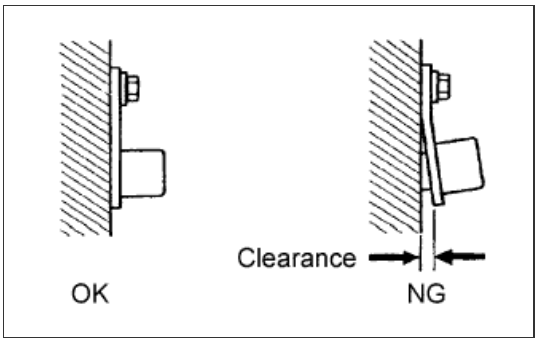
a. Disconnect the C121 or C122 VVT (for exhaust side) sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C121-1 (EX+) - C45-69 (EV1+)	Always	Below 1 Ω
C121-2 (EX-) - C45-68 (EV1-)	Always	Below 1 Ω
C122-1 (EX+) - C45-64 (EV2+)	Always	Below 1 Ω
C122-2 (EX-) - C45-65 (EV2-)	Always	Below 1 Ω
C121-1 (EX+) or C45-69 (EV1+) - Body ground	Always	10 kΩ or higher
C121-2 (EX-) or C45-68 (EV1-) - Body ground	Always	10 kΩ or higher
C122-1 (EX+) or C45-64 (EV2+) - Body ground	Always	10 kΩ or higher
C122-2 (EX-) or C45-65 (EV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Chec the VVT sensor (for exhaust side) installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK EXHAUST CAMSHAFT

a. Check the teeth of the camshaft.

OK:
Teeth do not have any cracks or deformation.

NG → REPLACE EXHAUST CAMSHAFT (Click here)

OK

5.REPLACE VVT SENSOR (for Exhaust Side)

a. Replace the VVT sensor (for exhaust side) (Click here).

NEXT

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No output	A
P0365, P0367, P0368, P0390, P0392 or P0393	B

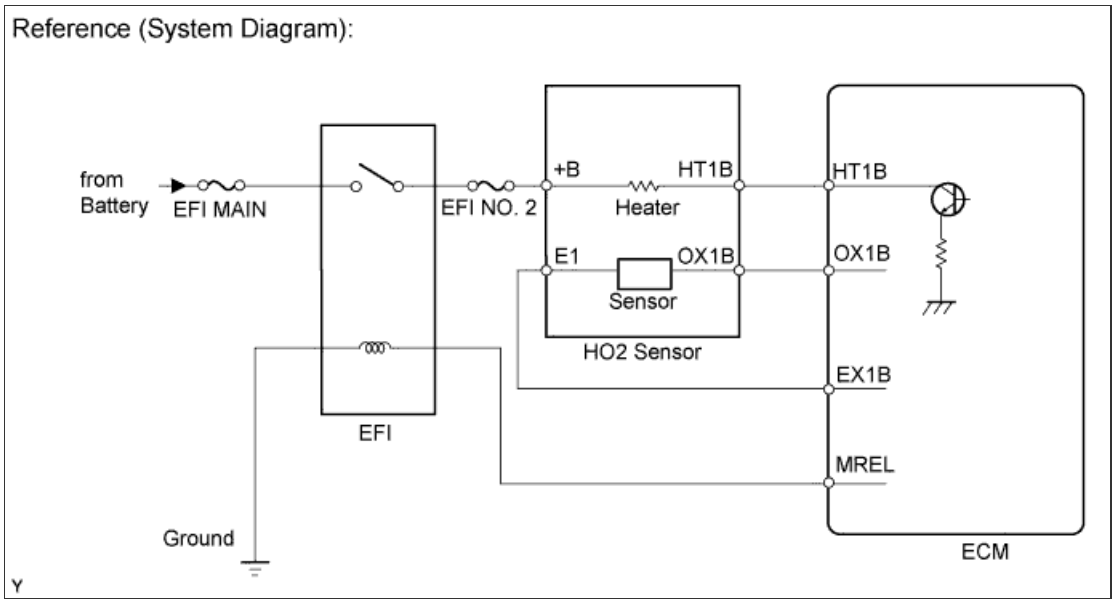
DTC P0037 Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)

DTC P0038 Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in Heated Oxygen (HO2) sensor heater circuit • HO2 sensor heater (for Sensor 2) • ntegration relay • CM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for Sensor 2) • ntegration relay • CM

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. f the zirconia element is at the appropriate temperature and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large the zirconia element generates oltage signals. n order to increase the oxygen concentration detecting capacity of the zirconia element the CM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037 P0038 P0057 and P0058):

The CM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. f the current is below the threshold alue the CM determines that there is an open circuit in the heater. f the current is higher than the threshold alue the CM determines that there is a short circuit in the heater.

The CM constantly monitors the current applied to the heater. f the CM detects an open or short circuit the CM turns the M on and stores a DTC.

f a malfunction is detected the CM cuts off the current applied to the heater.
 xample:
The CM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Con esely when the heater current is below 0.3 A DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

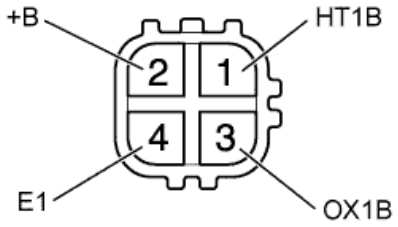
These DTCs are stored when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:

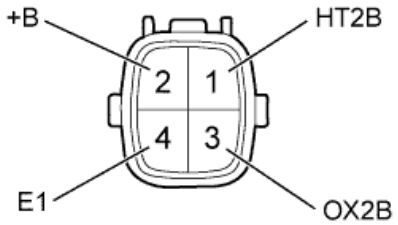
- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C20 or C56 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the alue(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1) - 2 (+)	20 C (68)	11 to 16 Ω
1 (HT1) - 4 (1)	Always	10 kΩ or higher
1 (HT2) - 2 (+)	20 C (68)	11 to 16 Ω
1 (HT2) - 4 (1)	Always	10 kΩ or higher

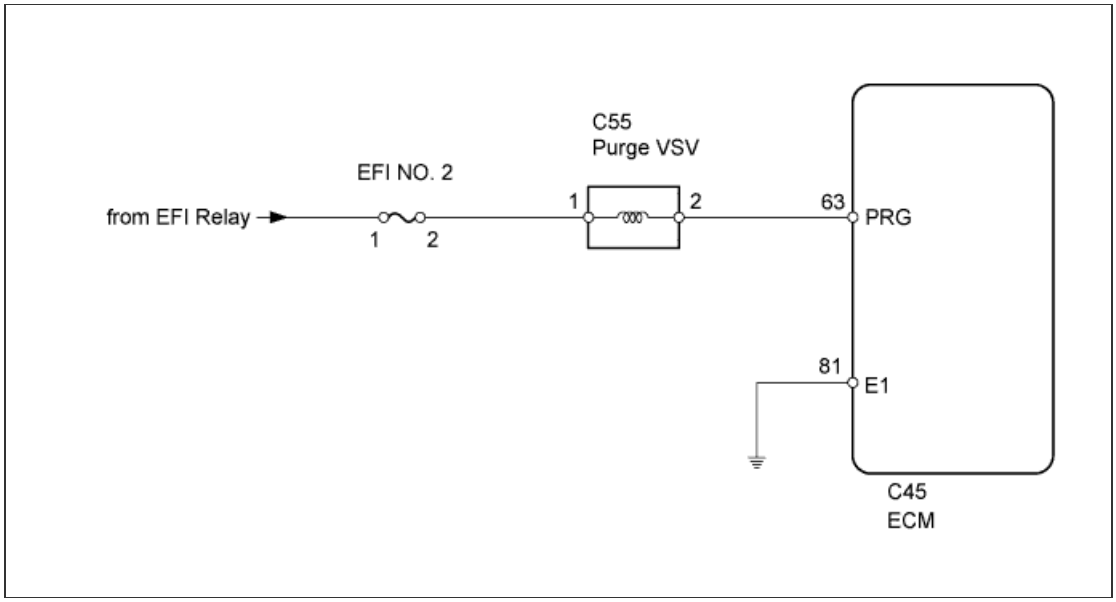
CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0443 Evaporative Emission Control System Purge Control Valve Circuit



for Preparation Click here

DESCRIPTION

To reduce HC emissions, evaporated fuel from the fuel tank is routed through a charcoal canister to the intake manifold for combustion in the cylinders. The ECM changes the duty signals to the purge VSV so that the intake amount of HC emissions is appropriate for driving conditions (engine load, engine speed, vehicle speed, etc.) after the engine is warmed up.

DTC Code	DTC Detection Condition	Trouble Area
P0443	The terminal voltage of the ECM output circuit does not correspond with the drive signals from the ECM to the purge VSV (1 trip detection logic).	• Open or short in purge VSV circuit • Purge VSV • ECM

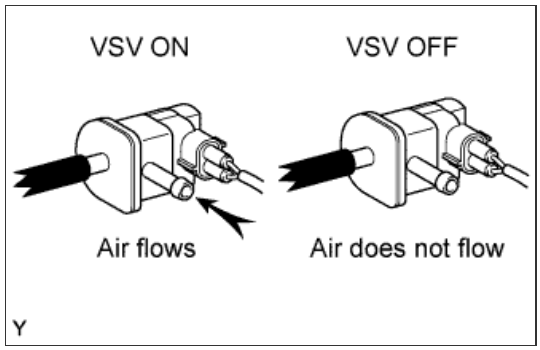
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (ACTIVATE THE VSV FOR EVAP CONTROL)



a. Connect the intelligent tester to the D C3.

b. Remove the vacuum hose of the purge VSV from the charcoal canister.

c. Start the engine and turn the tester on.

d. Enter the following menus: Powertrain Engine and ECT Active Test Activate the VSV for Evap Control.

e. When the purge VSV is operated using the tester, check whether the disconnected hose applies suction to your finger.

OK:

Tester Operation	Specified Condition
VSV is ON	Disconnected hose applies suction to finger
VSV is OFF	Disconnected hose applies no suction to finger

OK → CHECK FOR INTERMITTENT PROBLEMS (Click here)

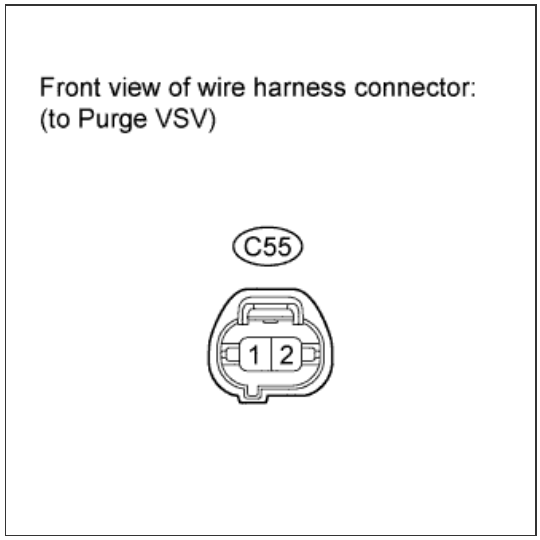
NG

2.INSPECT PURGE VSV

a. Inspect the purge VSV (Click here).

NG → REPLACE PURGE VSV (Click here)

OK



3.INSPECT PURGE VSV (POWER SOURCE VOLTAGE)

a. Disconnect the purge VSV connector.

b. Measure the voltage according to the value(s) in the table below.

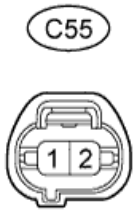
Standard Voltage:

Tester Connection	Condition	Specified Condition
C55-1 - Body ground	Engine switch on (IG)	11 to 14 V

OK → Go to step 5

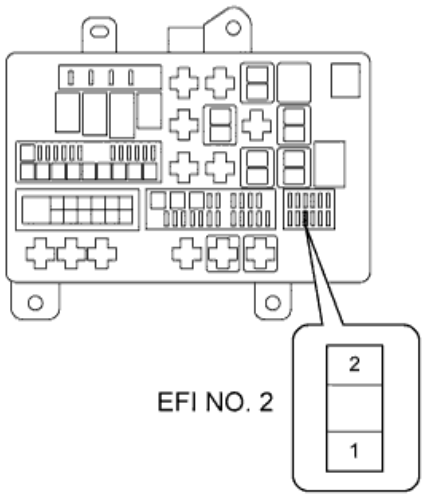
NG

4.CHECK HARNESS AND CONNECTOR (PURGE VSV - EFI NO. 2 FUSE)



a. Remove the EFI NO. fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C55-1 - EFI NO. fuse ( )	Always	Below 1 Ω
C55-1 or EFI NO. fuse ( ) - Body ground	Always	10 kΩ or higher

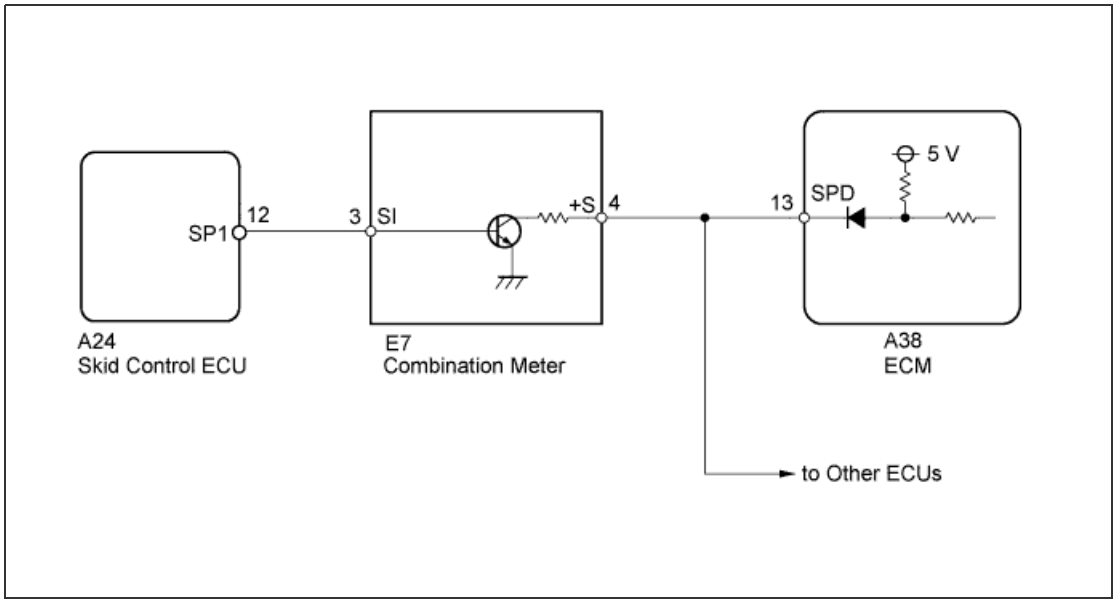
CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0500 Vehicle Speed Sensor "A"

for Preparation Click here

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.



DTC Code	DTC Detection Condition	Trouble Area
P0500	While the vehicle is being driven, no vehicle speed sensor signal is transmitted to the ECM (2 trip detection logic).	• Open or short in speed signal circuit • Combination meter • ECM

MONITOR DESCRIPTION

The ECM assumes that the vehicle is being driven when the indicated vehicle speed is more than km h (5.6 mph). If there is no speed signal from the combination meter despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and stores the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When

troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK OPERATION OF SPEEDOMETER

a. Drive the vehicle and check whether the operation of the speedometer in the combination meter is normal.

HINT:

- **The vehicle speed sensor is operating normally if the speedometer reading is normal.**
- **If the speedometer does not operate, check it by following the procedure described in Speedometer Malfunction (Click here).**

NG → **GO TO MALFUNCTION IN SPEEDOMETER (Click here)**

OK

2.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPD)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Vehicle Speed.

e. Drive the vehicle.

f. Read the value displayed on the tester.

OK:
Vehicle speeds displayed on tester and speedometer display are equal.

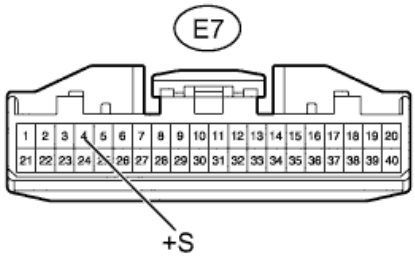
NG → **Go to step 3**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

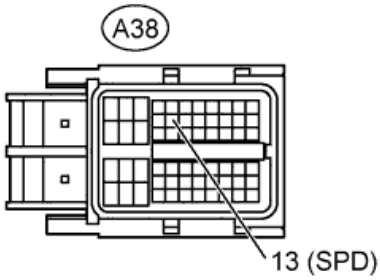
3.CHECK HARNESS AND CONNECTOR (COMBINATION METER - ECM)

a. Disconnect the E combination meter connector.



b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
E -4 (+S) - A38-(SPD)	Always	Below Ω
E -4 (+S) or A38-(SPD) - Body ground	Always	0 kΩ or higher

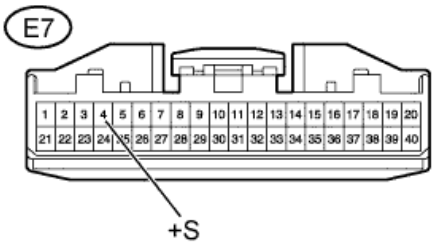
Front view of wire harness connector:
(to Combination Meter)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK COMBINATION METER ASSEMBLY (+S VOLTAGE)



a. Disconnect the E combination meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
E -4 (+S) - Body ground	Engine switch on (IG)	4.5 to 5.5 V

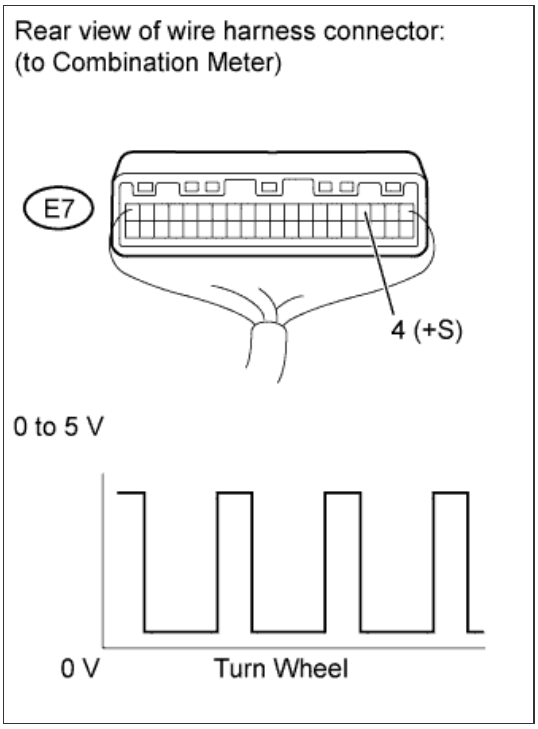
Front view of wire harness connector:
(to Combination Meter)

T

NG → REPLACE ECM (Click here)

OK

5.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL OUTPUT WAVEFORM)



a. Move the shift lever to .

b. ack up the vehicle.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
E -4 (+S) - Body ground	• Engine switch on (IG) • Wheel turned slowly	Voltage generated intermittently

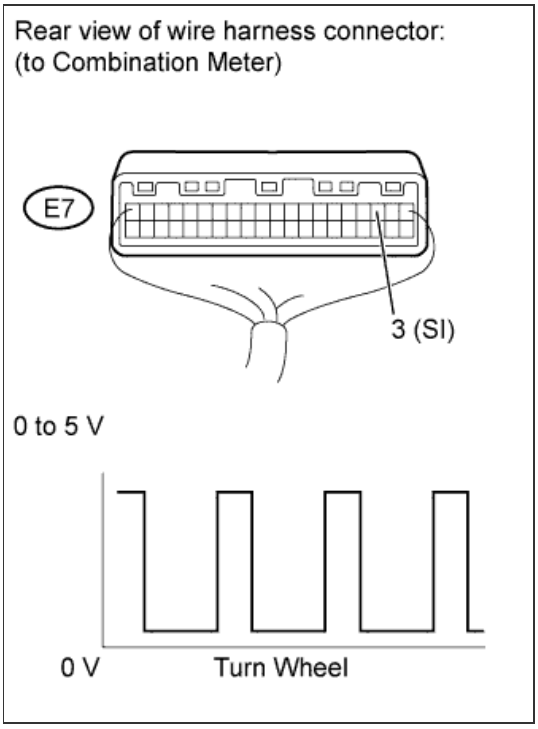
HINT:

The output voltage should fluctuate up and down, similarly to the diagram, when the wheel is turned slowly.

NG → CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL INPUT WAVEFORM)

OK

6.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL INPUT WAVEFORM)



a. Move the shift lever to .

b. ack up the vehicle.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
E -3 (SI) - Body ground	• Engine switch on (IG) • Wheel turned slowly	Voltage generated intermittently

HINT:

The output voltage should fluctuate up and down, similarly to the diagram, when the wheel is turned slowly.

NG → Go to step 7

OK

REPLACE COMBINATION METER ASSEMBLY

7.CHECK HARNESS AND CONNECTOR (COMBINATION METER - SKID CONTROL ECU)

a. Disconnect the combination meter connector.

b. Disconnect the skid control ECU connector.

c. Measure the resistance according the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
E -5 (SI) - A24- 2 (SP	Always	Below Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
E -5 (SI) or A24- 2 (SP - Body ground	Always	0 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

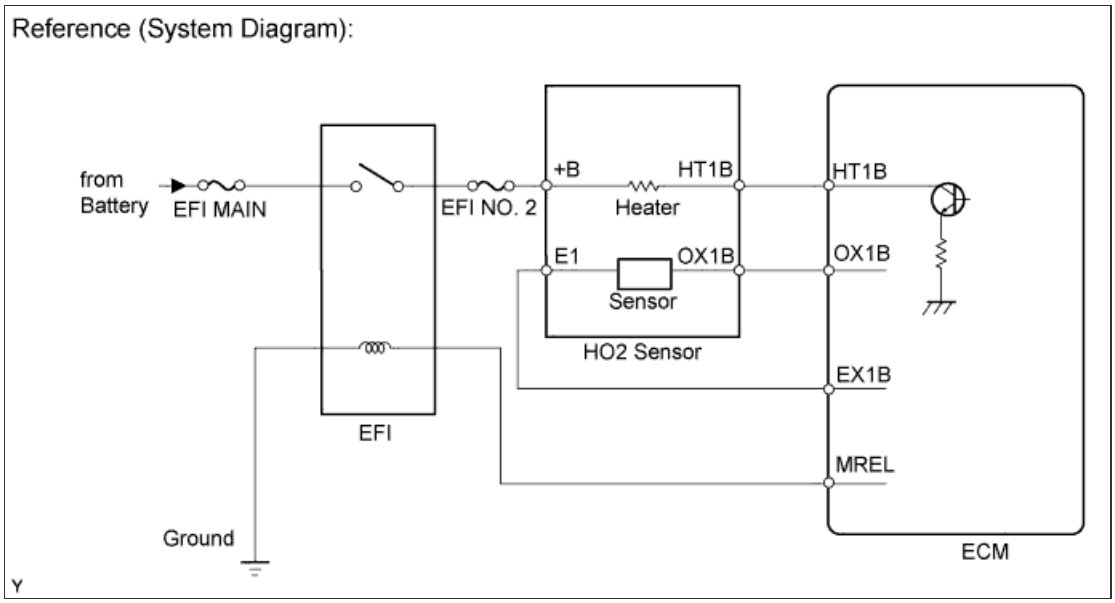
REPLACE MASTER CYLINDER SOLENOID

DTC P0037 Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)

DTC P0038 Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) Sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in Heated Oxygen (HO2) sensor heater circuit • HO2 sensor heater (for Sensor 2) • ntegration relay • CM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for Sensor 2) • ntegration relay • CM

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. f the zirconia element is at the appropriate temperature and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large the zirconia element generates oltage signals. n order to increase the oxygen concentration detecting capacity of the zirconia element the CM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037 P0038 P0057 and P0058):

The CM monitors the current applied to the O2 sensor heater to check the heater for malfunctions. f the current is below the threshold alue the CM determines that there is an open circuit in the heater. f the current is higher than the threshold alue the CM determines that there is a short circuit in the heater.

The CM constantly monitors the current applied to the heater. f the CM detects an open or short circuit the CM turns the M on and stores a DTC.

f a malfunction is detected the CM cuts off the current applied to the heater.
 xample:
The CM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Con esely when the heater current is below 0.3 A DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

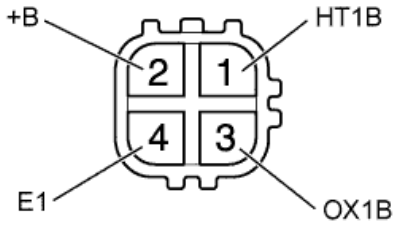
These DTCs are stored when the engine idles for 110 seconds or more.

INSPECTION PROCEDURE

HINT:

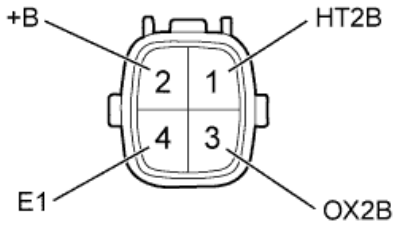
- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C20 or C56 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the alue(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1) - 2 (+)	20 C (68)	11 to 16 Ω
1 (HT1) - 4 (1)	Always	10 kΩ or higher
1 (HT2) - 2 (+)	20 C (68)	11 to 16 Ω
1 (HT2) - 4 (1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Disconnect the C20 or C56 HO2 sensor connector.

b. Measure the oltage according to the alue(s) in the table below.

Standard Voltage:

		Specified

Tester Connection	Switch Condition	Condition
C20-2 (+) - ody ground	ngine switch on ( )	11 to 14 V
C56-2 (+) - ody ground	ngine switch on ( )	11 to 14 V

3.INSPECT INTEGRATION NO.1 RELAY (EFI)

a. Re o e the integration relay from the engine room relay block.

b. nspect the MA fuse.

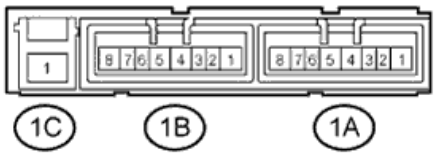
i. Remo e the MA fuse from the integration relay.

ii. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
MA fuse	Always	e low 1 Ω

iii. Reinstall the MA fuse.



c. nspect the relay.

i. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1	o battery oltage applied to terminals 1 2 and 1 3	10 kΩ or higher
	attery oltage applied to terminals 1 2 and 1 3	e low 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (EFI)

OK

4.CHECK HARNESS AND CONNECTOR (HO2 SENSOR - INTEGRATION RELAY)

a. Check the O. 2 fuse.

i. Remo the O. 2 fuse from the engine room relay block.

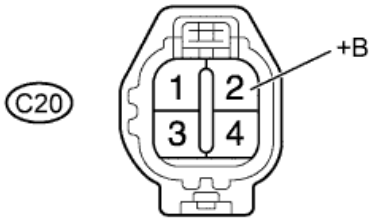
ii. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
O. 2 fuse	Always	dw 1 Ω

iii. Reinstall the O. 2 fuse.

b. Disconnect the C20 or C56 HO2 sensor connector.



c. Remo the integration relay from the engine room relay block.

d. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C20-2 (+) - 1	Always	dw 1 Ω
C56-2 (+) - 1	Always	dw 1 Ω
C20-2 (+) or 1 ody ground	Always	10 kΩ or higher

CHECK FOR INTERMITTENT PROBLEMS (Click here)

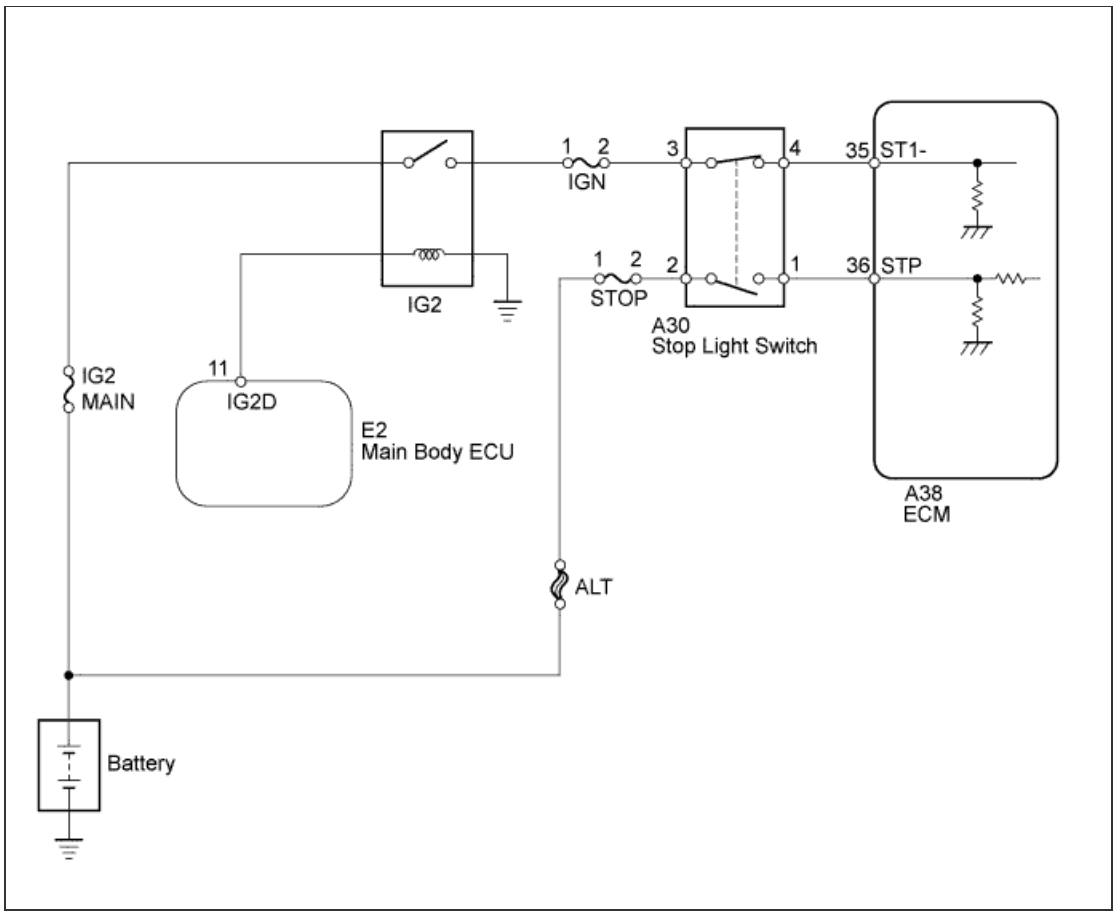
DTC P0504 Brake Switch "A" / "B" Correlation

for Preparation Click here

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and stores the DTC.

HINT:



The normal signal conditions are as shown in the table below.

Signal (ECM Terminal)	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

- **[OFF] denotes ground potential.**
- **[ON] denotes battery potential (+B).**
- **On the intelligent tester, both the Data List items Stop Light Switch and ST1 are ON when the brake pedal is depressed because the ST1 indication characteristic is opposite to the Stop Light Switch indication.**

DTC Code	DTC Detection Condition	Trouble Area
P0	Conditions (a), (b) and (c) continue for 0. seconds or more (1 trip detection logic): (a) The engine switch is on (IG). (b) The brake pedal is released. (c) The STP signal is OFF when the ST1- signal is OFF.	• Short in stop light switch signal circuit • STOP fuse • IGN fuse • Stop light switch • ECM

WIRING DIAGRAM

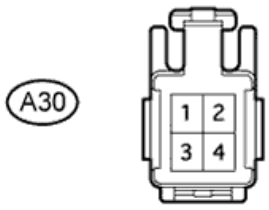
INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **STP signal conditions can be checked using the intelligent tester.**
  1. **Connect the tester to the DLC3.**
  2. **Turn the engine switch on (IG).**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Stop Light Switch and ST1.**
  5. **Check the Data List indication when the brake pedal is depressed and released.**

Brake Pedal Operation	Stop ght Switch	ST1
Depressed	ON	ON
Released	OFF	OFF

1.CHECK STOP LIGHT SWITCH ASSEMBLY (B+ VOLTAGE)



a. Disconnect the A stop light switch connector.

b. Measure the oltage according to the alue(s) in the table below.

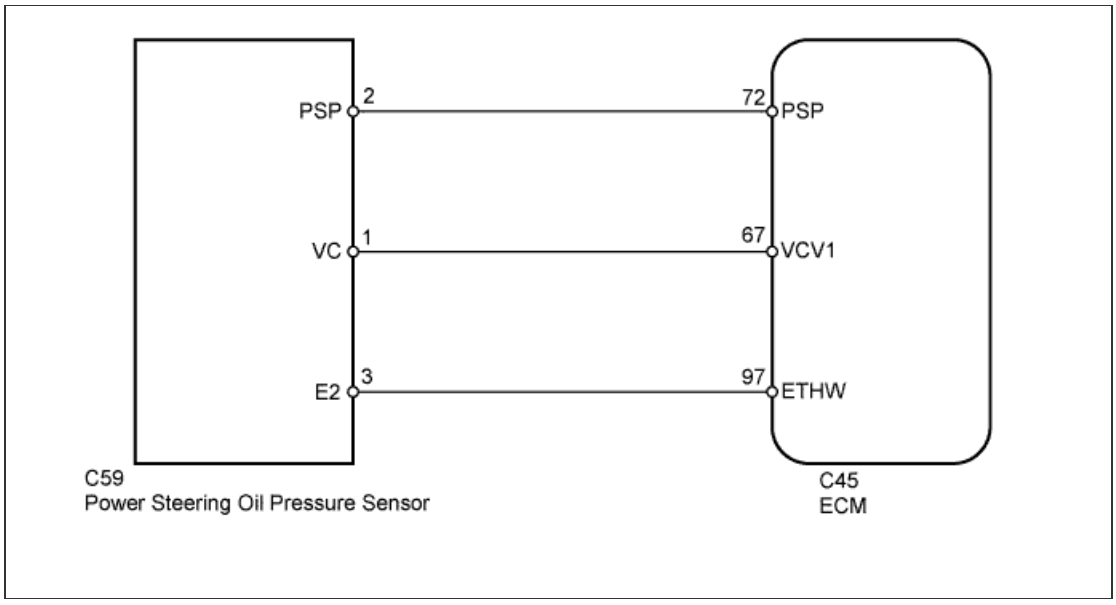
CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0550 Power Steering Pressure Sensor Circuit Malfunction

DTC P0552 Power Steering Pressure Sensor Circuit Low Input

DTC P0553 Power Steering Pressure Sensor Circuit High Input



for Preparation Click here

DESCRIPTION

The power steering oil pressure sensor is turned on when a power steering wheel load occurs by turning the steering wheel. The ECM regulates the engine idling RPM according to the voltage output of the sensor.

DTC Code	DTC Detection Condition	Trouble Area
P0550	Power steering oil pressure sensor voltage less than 0.28 V, or more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0552	Power steering oil pressure sensor voltage less than 0.28 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0553	Power steering oil pressure sensor voltage more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM

WIRING DIAGRAM

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to regulate the engine idling speed. When the sensor output voltage deviates from the normal operating range, the ECM determines that there is a malfunction in the power steering oil pressure sensor and stores DTC(s).

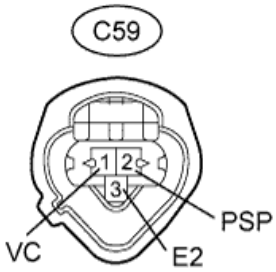
INSPECTION PROCEDURE

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

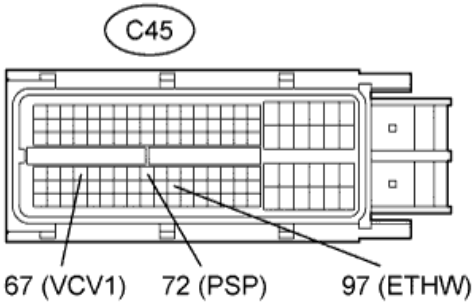
1.CHECK HARNESS AND CONNECTOR (ECM - POWER STEERING OIL PRESSURE SENSOR)

a. Disconnect the C45 ECM connector.



b. Disconnect the C59 power steering oil pressure sensor connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C59-2 (PSP) - C45-72 (PSP)	Always	Below 1 Ω
C59-1 (VC) - C45-67 (VCV1)	Always	Below 1 Ω
C59-3 (E2) - C45-97 (ETHW)	Always	Below 1 Ω
C59-2 (PSP) or C45-72 (PSP) - Body ground	Always	10 kΩ or higher

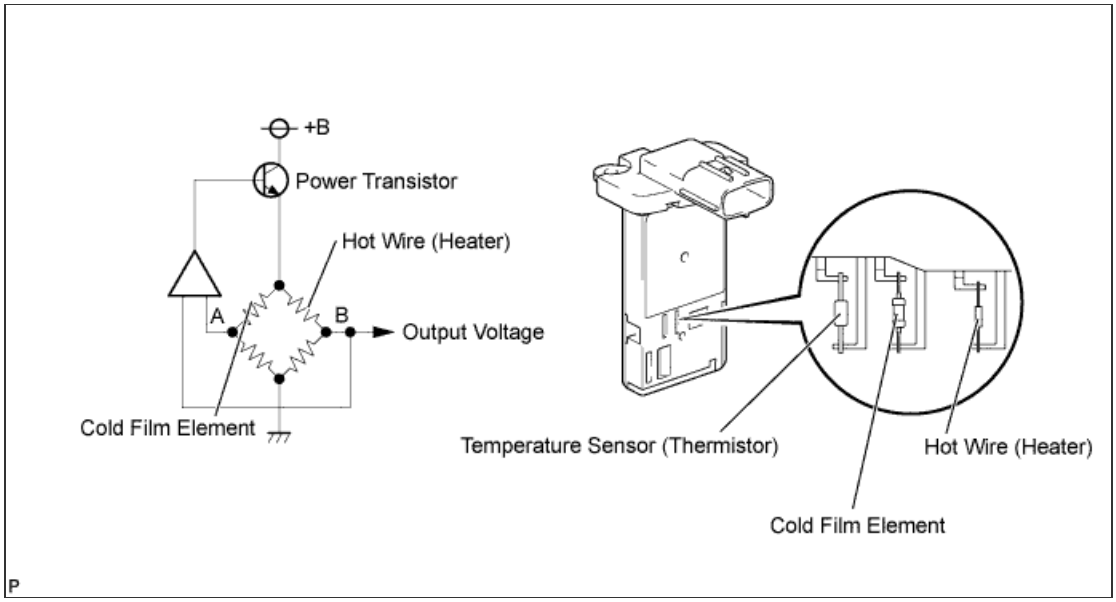
A

REPLACE ECM (Click here)

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.
The ECM uses this information to determine the fuel injection time and to provide the appropriate air-fuel ratio.
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.
By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter.
The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The circuit is constructed so that the platinum hot wire and the cold film element create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

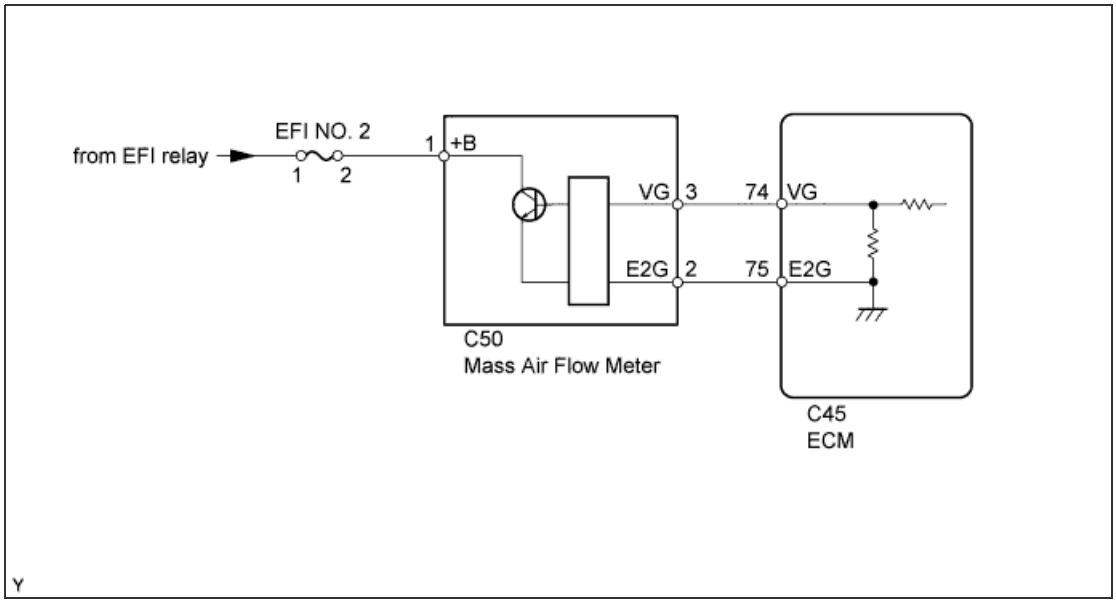
HINT:

When any of these DTCs are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine speed and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0102	The Mass Air Flow (MAF) meter voltage is below 0.2 V for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • MAF meter • ECM
P0103	The MAF meter voltage is higher than 4.9 V for 3 seconds (1 trip detection logic).	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:

When any of these DTCs is output, check the air-flow rate by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.



Mass Air Flow Rate (gm/s)	Malfunction
Approximately 0.0	• **Open in Mass Air Flow (MAF) meter power source circuit** • **Open or short in VG circuit**
271.0 or more	Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this

deviation as a malfunction in the MAF meter and stores DTC(s).
Example:
When the sensor output voltage remains at below 0.2 V, or higher than 4.9 V for more than 3 seconds, the ECM stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 3 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MASS AIR FLOW RATE)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.

e. Read the values displayed on the tester.

Result

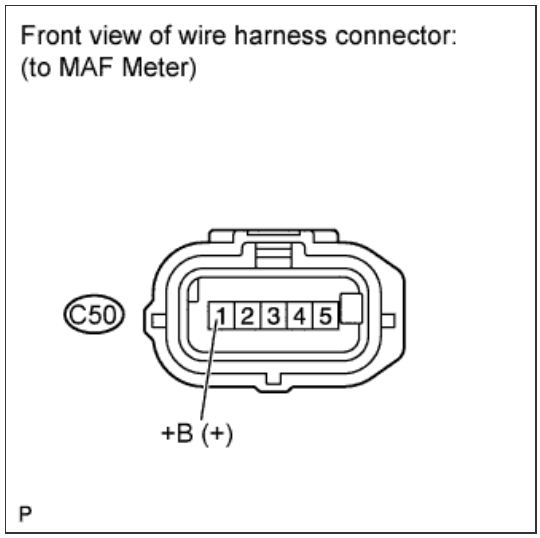
Mass Air Flow Rate (gm/s)	Proceed to
0.0	A
271.0 or more	B
Between 1.0 and 270.0*	C

HINT:

*: The value must change when the throttle valve is open or closed with the engine running.

B	Go to step 6
C	CHECK FOR INTERMITTENT PROBLEMS (Click here)

A



2.INSPECT MASS AIR FLOW METER (POWER SOURCE VOLTAGE)

a. Disconnect the C50 Mass Air Flow (MAF) meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition

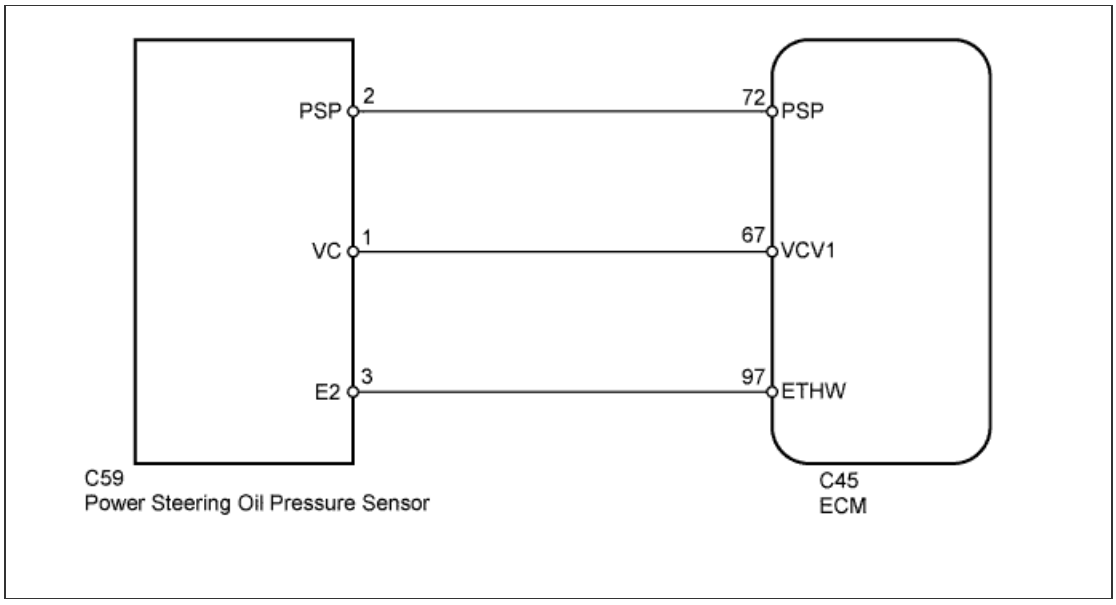
DTC P0550 Power Steering Pressure Sensor Circuit Malfunction

DTC P0552 Power Steering Pressure Sensor Circuit Low Input

DTC P0553 Power Steering Pressure Sensor Circuit High Input



for Preparation Click here

DESCRIPTION

The power steering oil pressure sensor is turned on when a power steering wheel load occurs by turning the steering wheel. The ECM regulates the engine idling RPM according to the voltage output of the sensor.

DTC Code	DTC Detection Condition	Trouble Area
P0550	Power steering oil pressure sensor voltage less than 0.28 V, or more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0552	Power steering oil pressure sensor voltage less than 0.28 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0553	Power steering oil pressure sensor voltage more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM

WIRING DIAGRAM

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to regulate the engine idling speed. When the sensor output voltage deviates from the normal operating range, the ECM determines that there is a malfunction in the power steering oil pressure sensor and stores DTC(s).

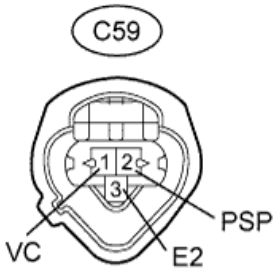
INSPECTION PROCEDURE

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

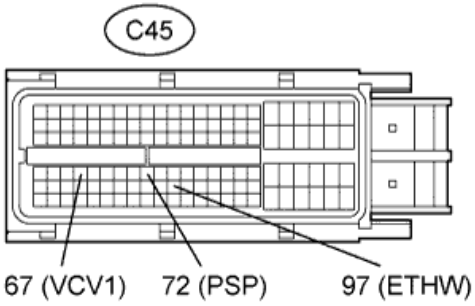
1.CHECK HARNESS AND CONNECTOR (ECM - POWER STEERING OIL PRESSURE SENSOR)

a. Disconnect the C45 ECM connector.



b. Disconnect the C59 power steering oil pressure sensor connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C59-2 (PSP) - C45-72 (PSP)	Always	Below 1 Ω
C59-1 (VC) - C45-67 (VCV1)	Always	Below 1 Ω
C59-3 (E2) - C45-97 (ETHW)	Always	Below 1 Ω
C59-2 (PSP) or C45-72 (PSP) - Body ground	Always	10 kΩ or higher
C59-1 (VC) or C45-67 (VCV1) - Body ground	Always	10 kΩ or higher

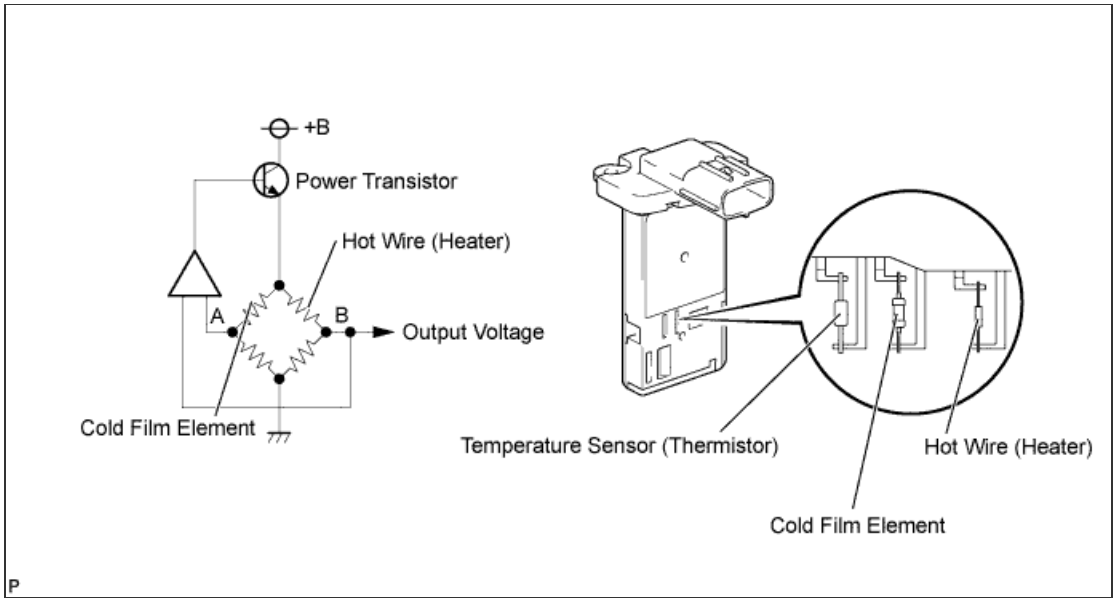
A

REPLACE ECM (Click here)

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.
The ECM uses this information to determine the fuel injection time and to provide the appropriate air-fuel ratio.
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.
By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter.
The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The circuit is constructed so that the platinum hot wire and the cold film element create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

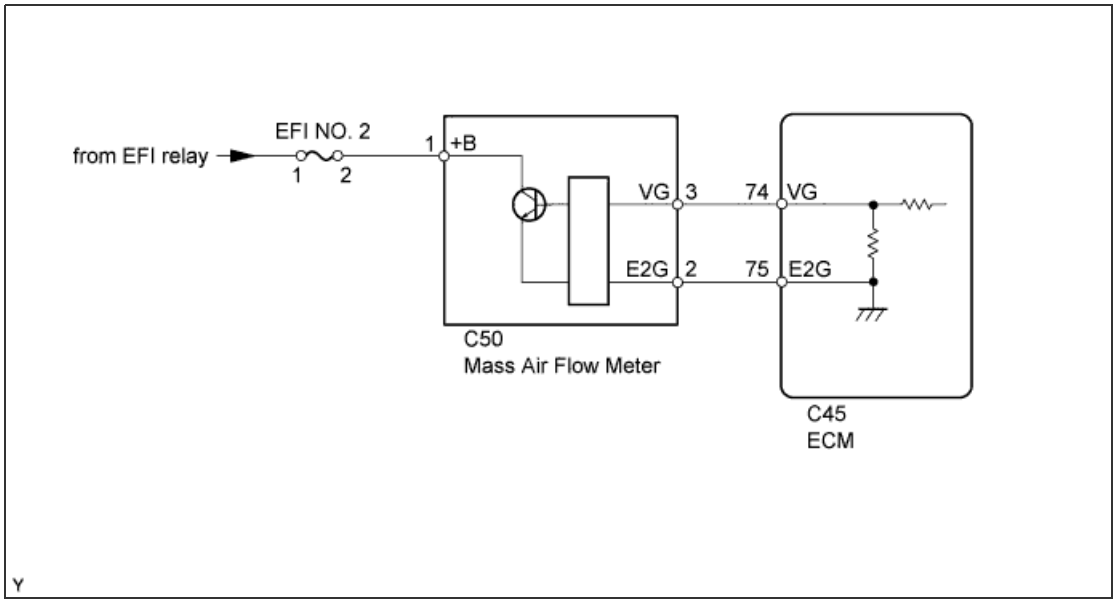
HINT:

When any of these DTCs are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine speed and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0102	The Mass Air Flow (MAF) meter voltage is below 0.2 V for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • MAF meter • ECM
P0103	The MAF meter voltage is higher than 4.9 V for 3 seconds (1 trip detection logic).	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:

When any of these DTCs is output, check the air-flow rate by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.



Mass Air Flow Rate (gm/s)	Malfunction
Approximately 0.0	• **Open in Mass Air Flow (MAF) meter power source circuit** • **Open or short in VG circuit**
271.0 or more	Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this

deviation as a malfunction in the MAF meter and stores DTC(s).
Example:
When the sensor output voltage remains at below 0.2 V, or higher than 4.9 V for more than 3 seconds, the ECM stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 3 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MASS AIR FLOW RATE)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.

e. Read the values displayed on the tester.

Result

Mass Air Flow Rate (gm/s)	Proceed to
0.0	A
271.0 or more	B
Between 1.0 and 270.0*	C

REPLACE ECM (Click here)

DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

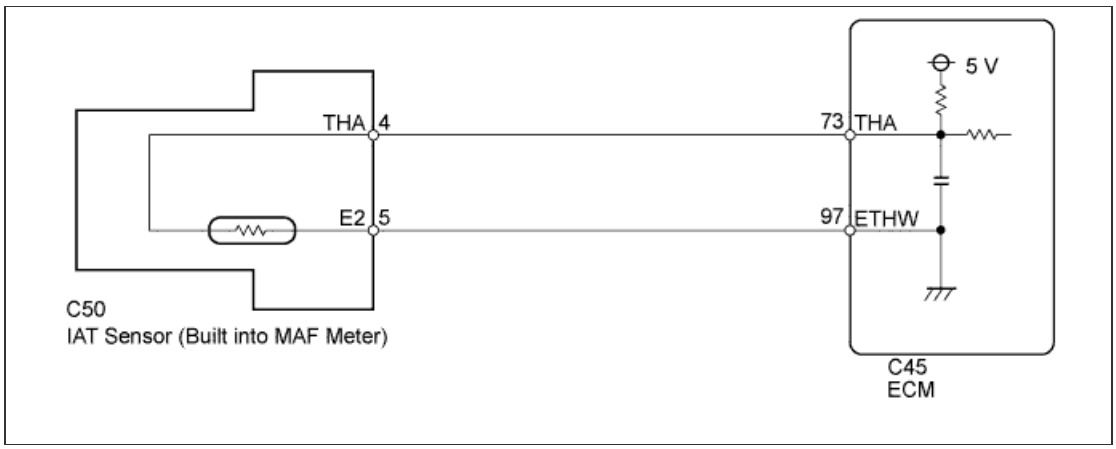
The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 is stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow [MAF] meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:



When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

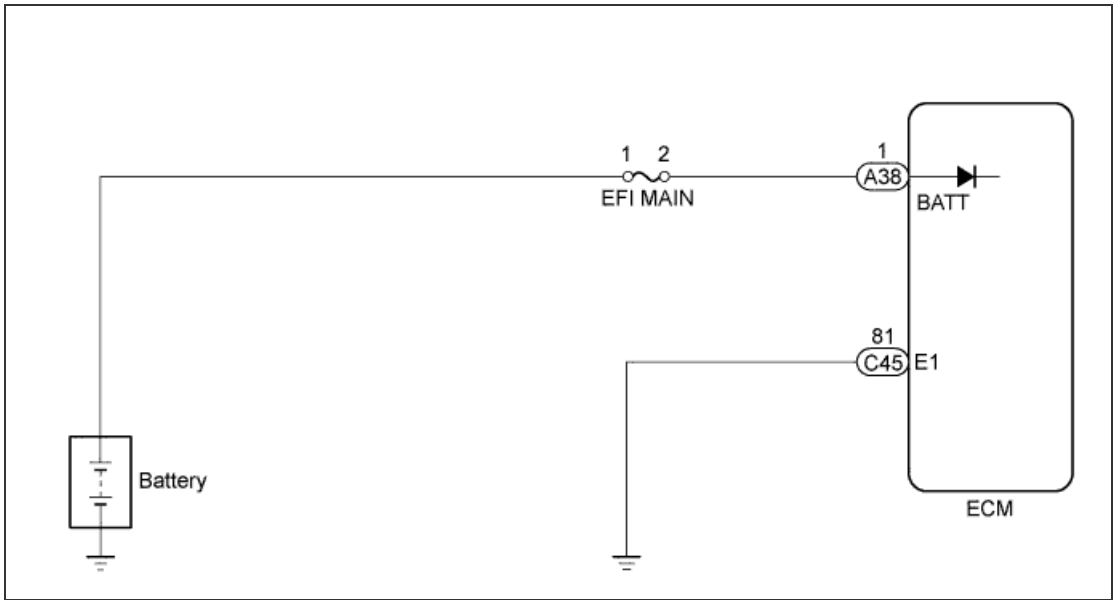
REPLACE ECM (Click here)

DTC P0560 System Voltage

for Preparation Click here

DESCRIPTION



The battery supplies electricity to the ECM even when the engine switch is off. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and stores the DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0560	An open in the ECM back up power source circuit (1 trip detection logic).	• Open in back up power source circuit • Battery • Battery terminals • EFI MAIN fuse • ECM

HINT:

If DTC P0560 is stored, the ECM does not store other DTCs or the data stored in the ECM is partly cleared.

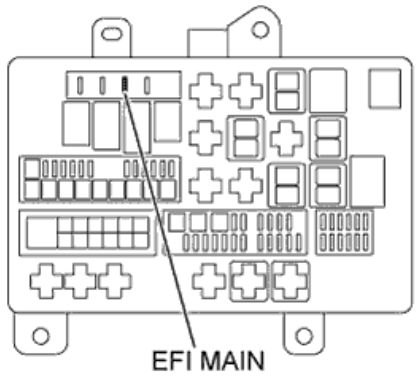
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT FUSE (EFI MAIN)



a. Remove the EFI MAIN fuse from the engine room relay block.

DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

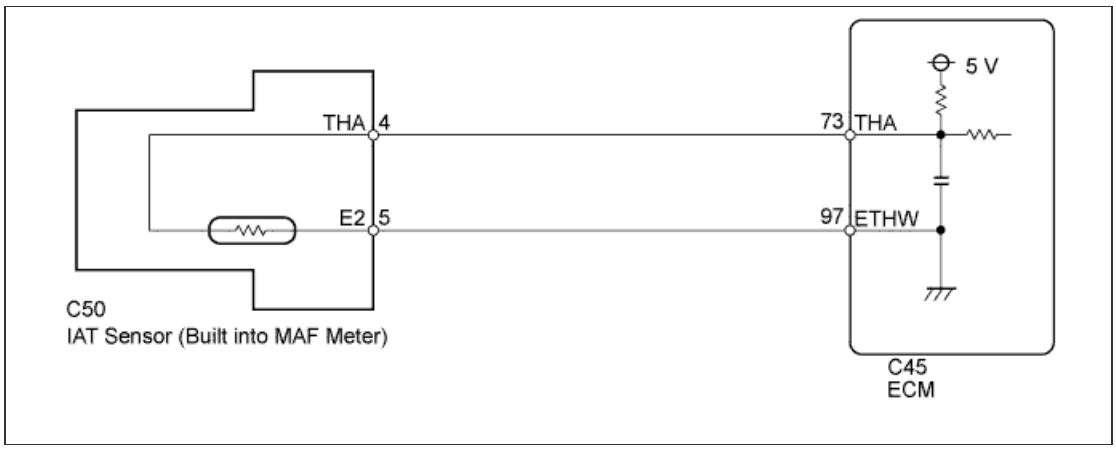
The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 is stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow [MAF] meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:



When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (INTAKE AIR TEMPERATURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

e. Read the value displayed on the tester.

Standard:
Same as actual Intake Air Temperature (IAT).

Result

Temperature Displayed	Proceed to
-40°C (-40°F)	A
140°C (284°F) or higher	B
Same as actual IAT	C

HINT:

- **If there is an open circuit, the tester indicates -40°C (-40°F).**
- **If there is a short circuit, the tester indicates 140°C (284°F) or higher.**

B	Go to step 4
C	CHECK FOR INTERMITTENT PROBLEMS (Click here)

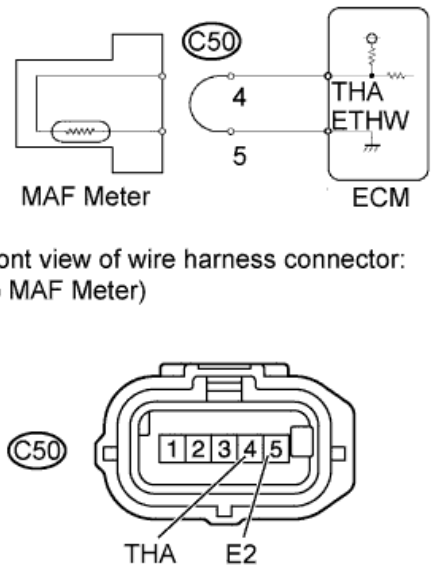
A

2.READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)

a. Disconnect the C50 Mass Air Flow (MAF) meter connector.

b. Connect terminals 4 (THA) and 5 (E2) of the MAF meter wire harness side connector.

c. Connect the intelligent tester to the DLC3.



d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

g. Read the value displayed on the tester.

Standard value:
140°C (284°F) or higher

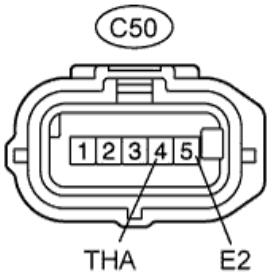
NG → Go to step 3

OK

CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE MASS AIR FLOW METER (Click here)

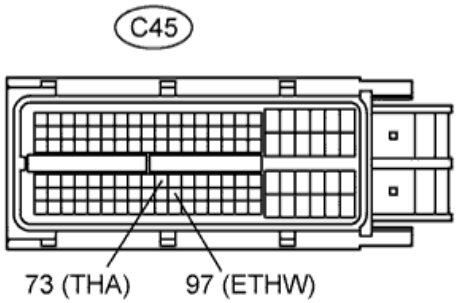
3.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the C50 MAF meter connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C50-4 (THA) - C45-73 (THA)	Always	Below 1 Ω
C50-5 (E2) - C45-97 (ETHW)	Always	Below 1 Ω

Front view of wire harness connector:
(to Mass Air Flow Meter)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

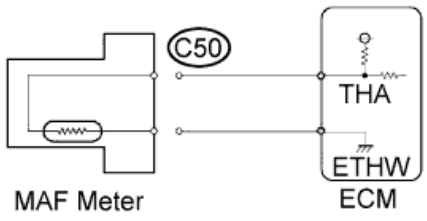
OK

CONFIRM GOOD CONNECTION TO ECM. IF OK, REPLACE ECM (Click here)

4.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (CHECK FOR SHORT IN WIRE HARNESS)

a. Disconnect the C50 MAF meter connector.

b. Connect the intelligent tester to the DLC3.



c. Turn the engine switch on (IG).

d. Turn the tester on.

e. Enter the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

f. Read the value displayed on the tester.

Standard value:
-40°C (-40°F)

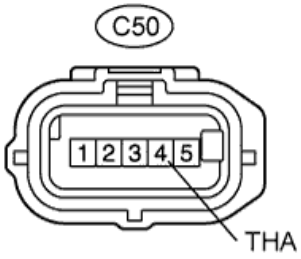
NG → Go to step 5

OK

REPLACE MASS AIR FLOW METER (Click here)

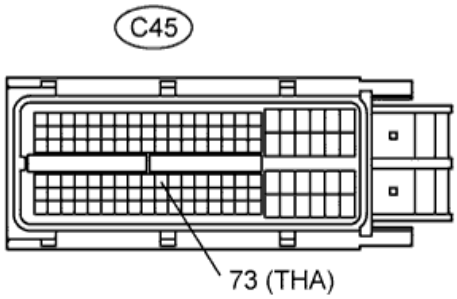
5.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the C50 MAF meter connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C50-4 (THA) or C45-73 (THA) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to MAF Meter)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

DTC P0604 Random Access Memory (RAM)

for Preparation Click here

DESCRIPTION

The ECM continuously monitors its internal memory status. This self-check ensures that the ECM is functioning properly. This is diagnosed by internal "mirroring" of the main CPU and sub CPU to detect Random Access Memory (RAM) errors. If outputs from these CPUs are different and deviate from the standard, the ECM will illuminate the MIL and store DTC(s) immediately.

DTC Code	DTC Detection Condition	Trouble Area
P0604	ECM RAM errors.	ECM

INSPECTION PROCEDURE

1.CHECK DTC

a. Clear DTC (Click here).

b. Turn the engine switch off.

c. Disconnect the cable from the negative (-) battery terminal and wait for 1 minute.

d. Connect the cable to the negative (-) battery terminal.

e. Turn the engine switch on (I .

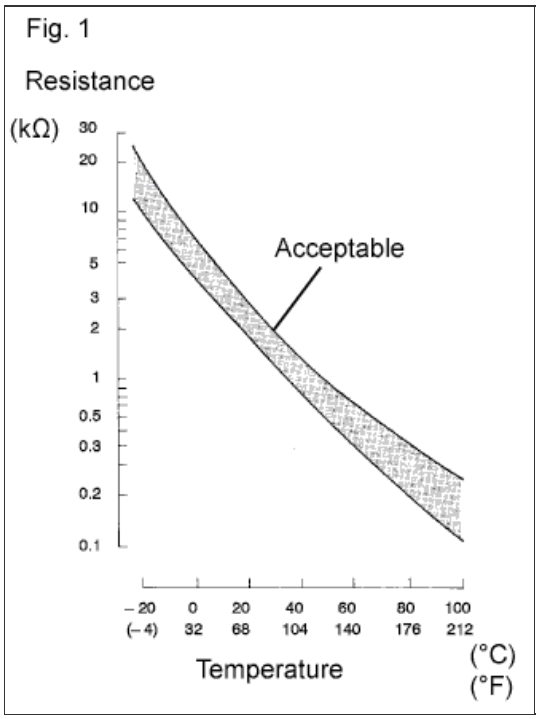
f. Check DTC.

OK:
P0604 is not output.

NG → **REPLACE ECM (Click here)**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)



DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

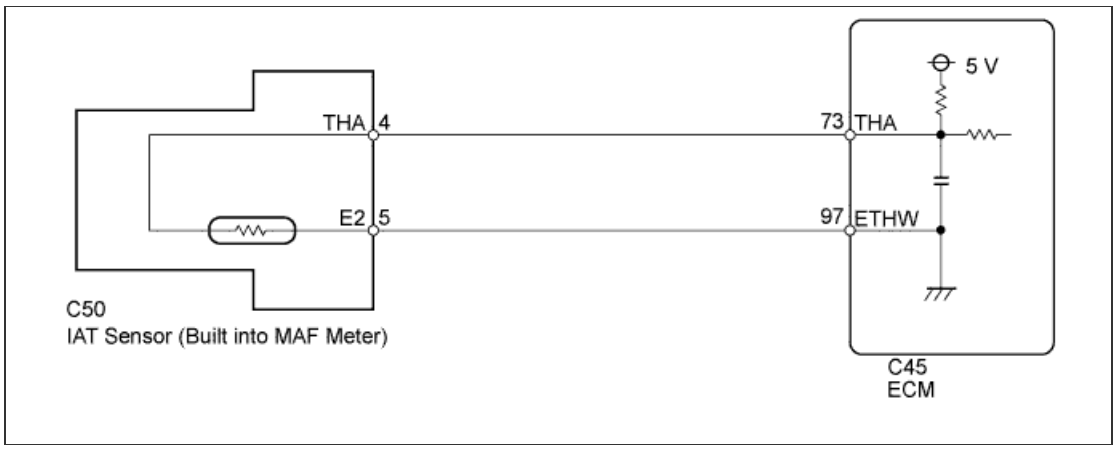
The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (See Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 is stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow [MAF] meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:



When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / All Data / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

DTC P0115 Engine Coolant Temperature Circuit Malfunction

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

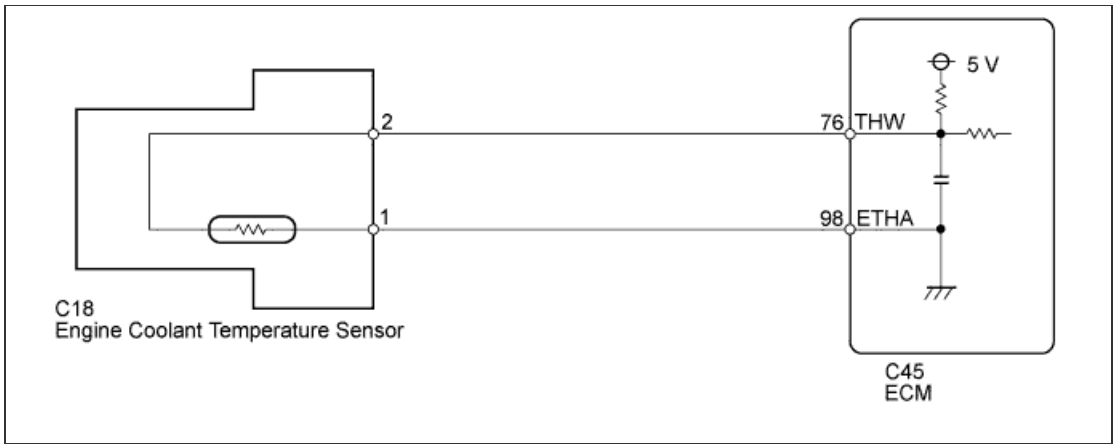
A thermistor, whose resistance value varies according to the ECT, is built into the Engine Coolant Temperature (ECT) sensor.
The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0115	An open or short in the Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Engine Coolant Temperature (ECT) sensor circuit • ECT sensor • ECM
P0117	A short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor • ECT sensor • ECM
P0118	An open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:



When any of these DTCs is output, check the ECT by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and stores DTC(s).
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and stores DTC P0118. Conversely, if the voltage output is below 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0117.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

REPLACE ECM (Click here)

DTC P060D Internal Control Module Accelerator Pedal Position Performance

for Preparation Click here

DESCRIPTION

The ECM monitors the input signals of the A elerator Pedal Position (APP) sensor o. 1. When the input signals and ontrol signals are deviated, a DTC is stored.

DTC Code	DTC Dete tion Condition	Trouble Area
P060D	When either ondition below is met: • An ECM main CPU error. • An ECM sub CPU error.	ECM

INSPECTION PROCEDURE

1.CHECK DTC

a. Clear DTC (Cli here).

b. Turn the engine swit h off.

c. Dis onne t the able from the negative (-) battery terminal and wait for 1 minute.

d. Conne t the able to the negative (-) battery terminal.

e. Turn the engine swit h on (IG).

f. Che DTC.

OK:
P060D is not output.

NG → **REPLACE ECM (Click here)**

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0116 Engine Coolant Temperature Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0115 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0116	The Engine Coolant Temperature (ECT) is between 35°C and 60°C (95°F and 140°F) when the engine is started, and conditions (a) and (b) are met (2 trip detection logic): (a) The vehicle is driven at varying speeds (accelerated and decelerated). (b) The ECT remains within 3°C (5.4°F) of the initial ECT.	• Water inlet sub-assembly with thermostat • ECT sensor

MONITOR DESCRIPTION

The ECT sensor is used to monitor the ECT. The ECT sensor has a built-in thermistor with a resistance that varies according to the temperature of the engine coolant. When the ECT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in the resistance are reflected in the output voltage from the ECT sensor.
The ECM monitors the sensor voltage and uses this value to calculate the ECT. If the sensor output voltage deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the ECT sensor and stores the DTC.
Example:
Upon starting the engine, the ECT is between 35°C and 60°C (95°F and 140°F). If after driving for 250 seconds, the ECT remains within 3°C (5.4°F) of the starting temperature, the DTC is stored (2 trip detection logic).

INSPECTION PROCEDURE

HINT:

- **If any of DTCs P0115, P0117, P0118 or P0125 is output simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTC.

Result

Result	Proceed to
P0116 is output	A
P0116 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

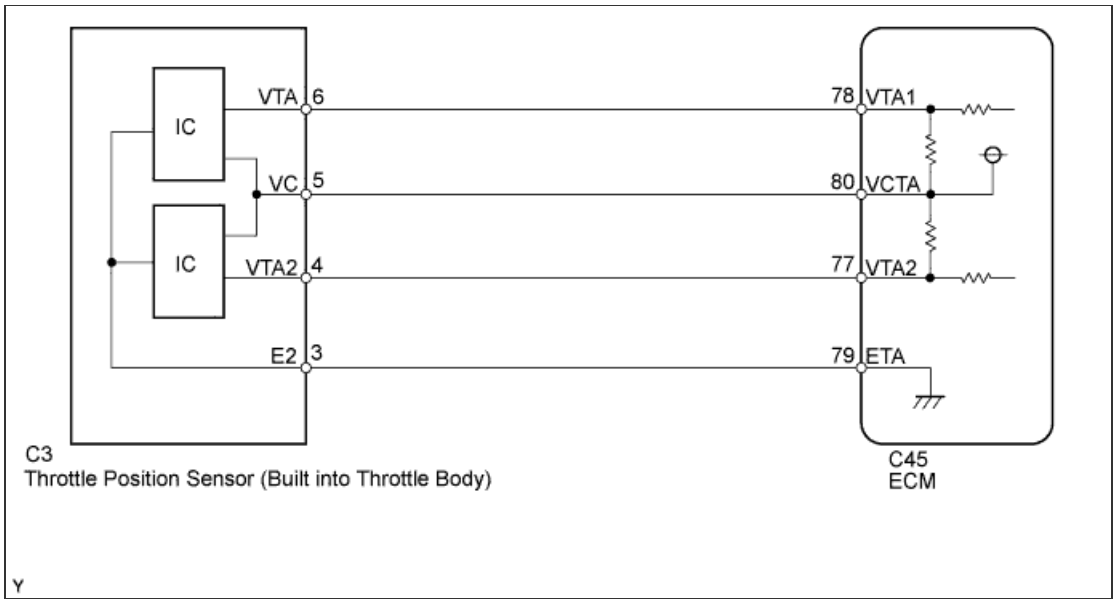
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

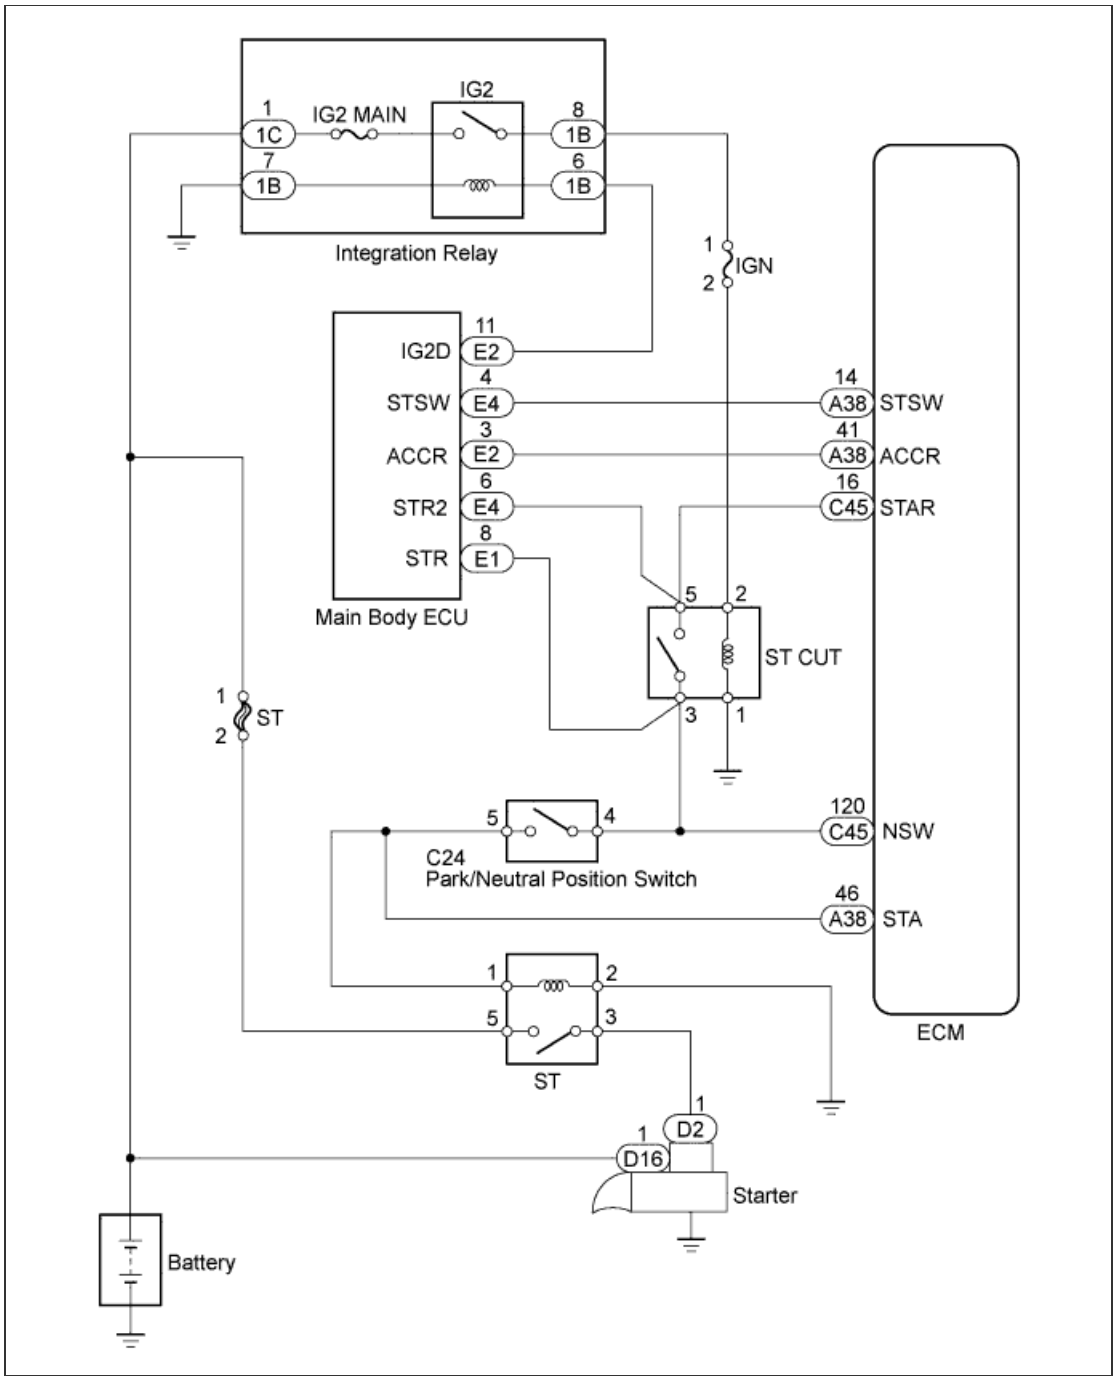
DTC P0617 Starter Relay Circuit High



for Preparation Click here

DESCRIPTION

While the engine is being cranked, the positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the Starter Control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and stores the DTC.
This monitor runs when the vehicle is driven at 20 km/h (12.4 mph) for over 20 seconds.

DTC Code	DTC Detection Condition	Trouble Area
P0617	When conditions (a), (b) and (c) are met, and a positive (+B) battery voltage of 10.5 V or higher is applied to the ECM for 20 seconds (1 trip detection logic). (a) The vehicle speed is 20 km/h (12.4 mph) or more. (b) The engine speed is 1000 rpm or more. (c) The STA signal is ON.	• Park/Neutral Position (PNP) switch • Starter relay circuit • Engine switch • ECM

(b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

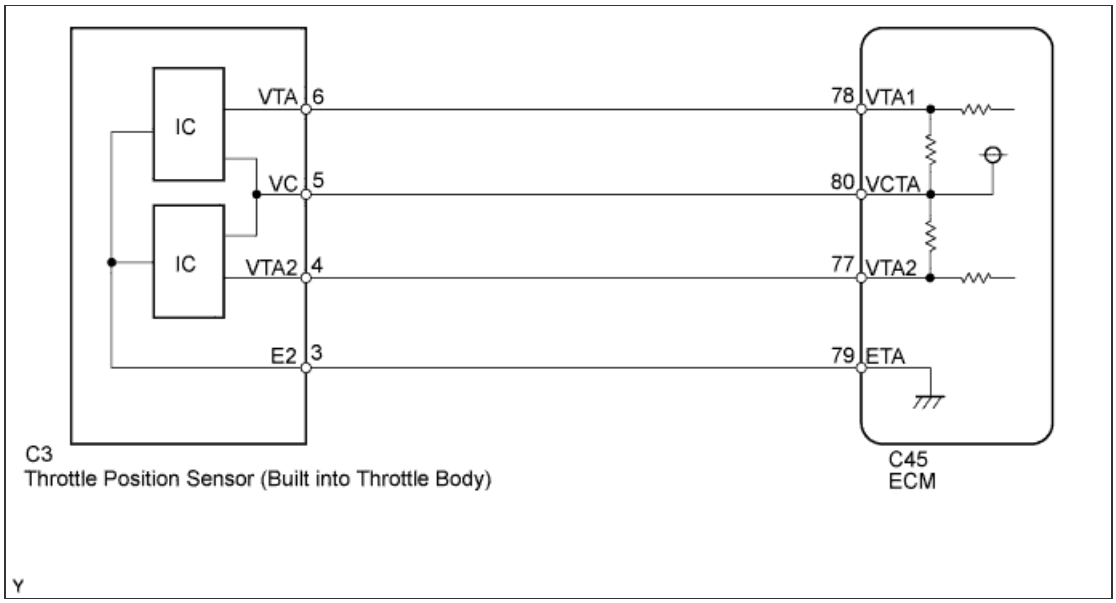
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

DTC P0657 Actuator Supply Voltage Circuit / Open

for Preparation Click here

DESCRIPTION

The ECM monitors the output voltage to the throttle actuator. This self-check ensures that the ECM is functioning properly. The output voltage usually is 0 V when the engine switch is turned off. If the output voltage is higher than 7 V when the engine switch is turned off, the ECM will illuminate the MIL and store DTC(s) when the engine switch is turned on (IG).

DTC Code	DTC Detection Condition	Trouble Area

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

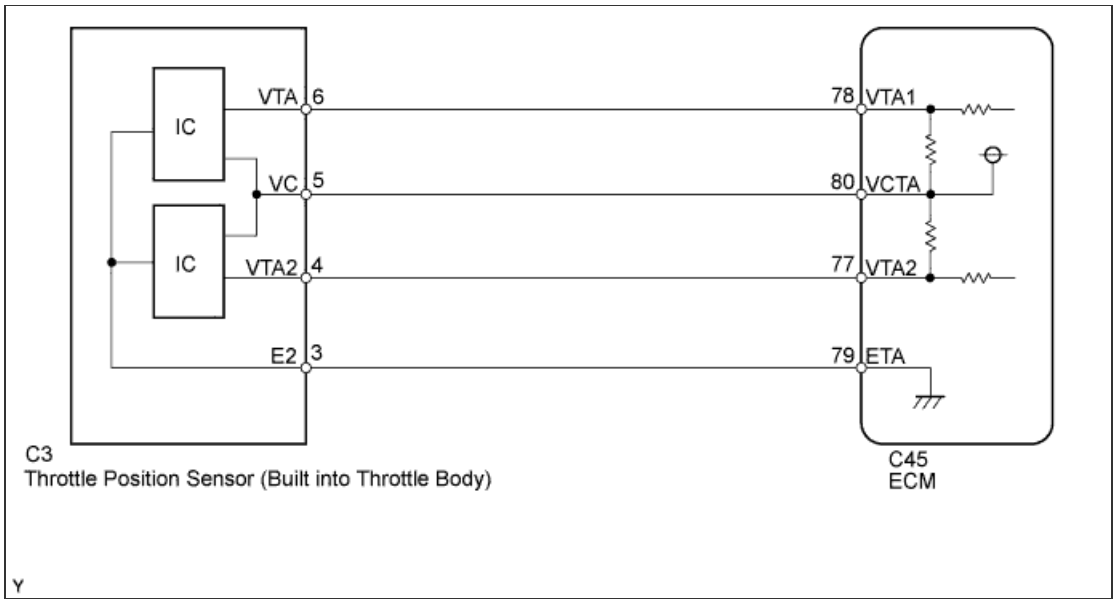
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain Engine and ECT Data List ETCS Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

DTC P0724 Brake Switch "B" Circuit High

for Preparation Click here

DESCRIPTION

The purpose of this circuit is to prevent the engine from stalling while driving in the lock-up condition when the brakes are suddenly applied.
When the brake pedal is depressed, this switch sends a signal to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

DTC No.	DTC Detection Condition	Trouble Area
P0724	Stop light switch remains ON even when vehicle is driven in GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) pattern 5 times (2 trip detection logic)	• Short in stop light switch signal circuit • Stop light switch • ECM

MONITOR DESCRIPTION

This DTC indicates that the stop light switch remains ON. When the stop light switch remains ON during GO and STOP driving, the ECM interprets this as a fault in the stop light switch. Then the MIL illuminates and the ECM stores the DTC. The vehicle must GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) 5 times for 2 driving cycles in order for the DTC to be output.

WIRING DIAGRAM

Refer to DTC P0504 (Click here).

INSPECTION PROCEDURE

HINT:

Using the intelligent tester to read the Data List allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the Data List early in troubleshooting is one way to save time.

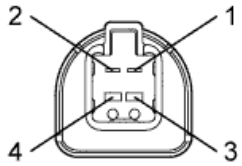
NOTICE:

In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

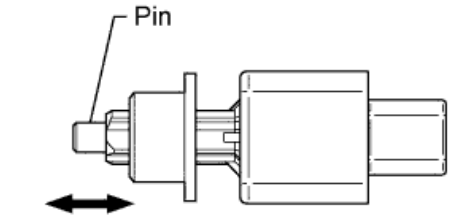
1. Warm up the engine.
2. Turn the ignition switch off.
3. Connect the intelligent tester to the DLC3.
4. Turn the ignition switch to ON.
5. Turn the intelligent tester on.
6. Enter the following menus: Powertrain / Engine and ECT / Data List.
7. Follow the instructions on the intelligent tester and read the Data List.

Item	Measurement Item/ Range (Display)	Normal Condition	Diagnostic Note
STOP LIGHT SW (Stop Light Switch)	Stop light switch status/ ON or OFF	• Brake pedal is depressed: ON • Brake pedal is released: OFF	-

1.INSPECT STOP LIGHT SWITCH



a. Remove the stop light switch.



b. Measure the resistance according to the value(s) in the table below.

Standard Re i tance:

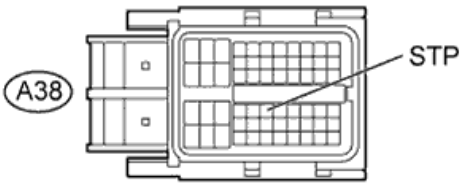
Tester Connection	Switch Condition	Specified Condition
1 - 2	Pin not pushed	Below 1 Ω
	Pin pushed	10 kΩ or higher
3 - 4	Pin not pushed	10 kΩ or higher
	Pin pushed	Below 1 Ω

Component without harness connected:
(Stop Light Switch)

NG → REPLACE STOP LIGHT SWITCH (Click here)

OK

2.CHECK HARNESS AND CONNECTOR (ECM - BATTERY)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
A38-36 (STP) - Body ground	Brake pedal is depressed	11 to 14 V
A38-36 (STP) - Body ground	Brake pedal is released	Below 1 V

Front view of wire harness connector:
(to ECM)

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

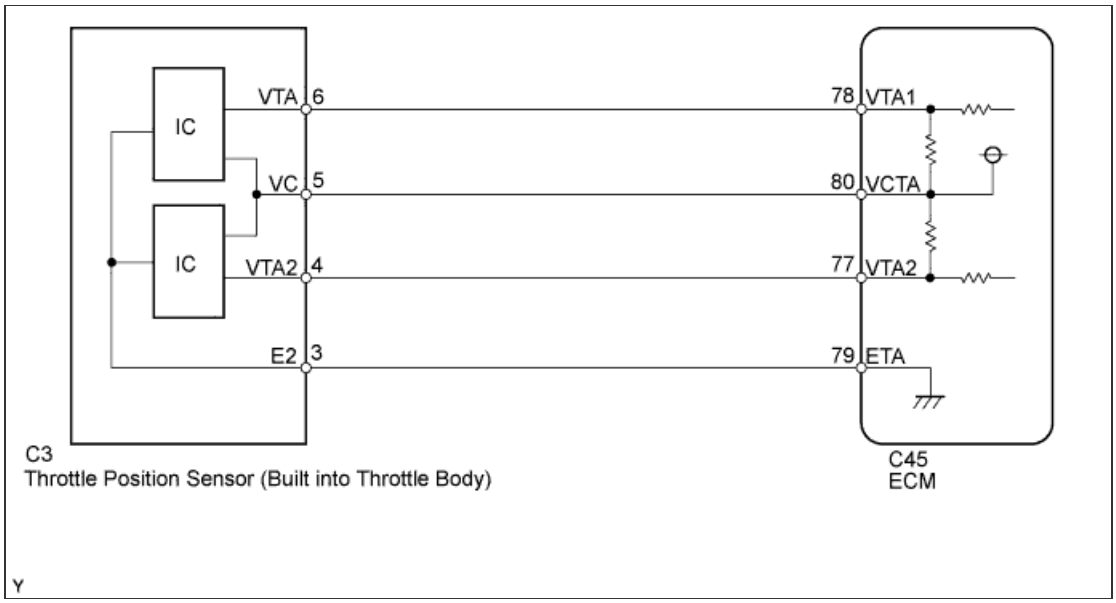
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain Engine and ECT Data List ETCS Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

TP#1 (VTA1) When Accelerator Pedal Released	TP#2 (VTA2) When Accelerator Pedal Released	TP#1 (VTA1) When Accelerator Pedal Depressed	TP#2 (VTA2) When Accelerator Pedal Depressed	Trouble Area	Proceed to

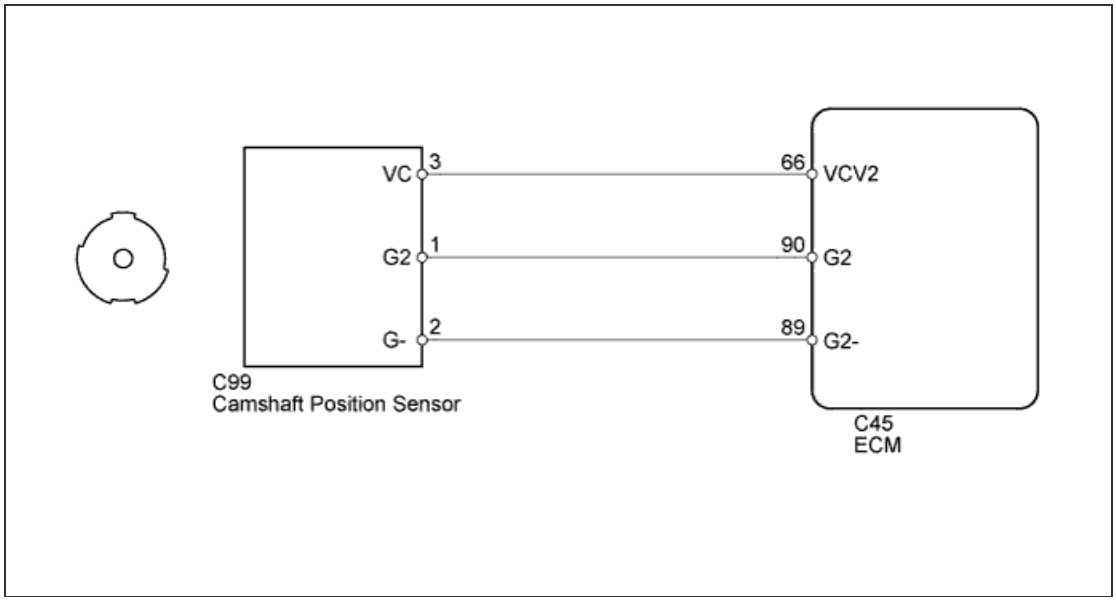
DESCRIPTION



The camshaft position sensor (G signal) consists of a magnet and MRE (Magnetic Resistance Element).
The camshaft drive gear (LH) has 3 teeth on its inner circumference. When the camshaft gear rotates, air gap changes between the protrusion on the teeth and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE.
The crankshaft position sensor plate has 34 teeth and is installed to the rear end of the crankshaft. The crankshaft position sensor generates 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No camshaft position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing plate LH • ECM
	No camshaft position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

DTC P0223 Throttle / Pedal Position Sensor / Switch "B" Circuit High Input

DTC P2135 Throttle / Pedal Position Sensor / Switch "A" / "B" Voltage Correlation

for Preparation Click here

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

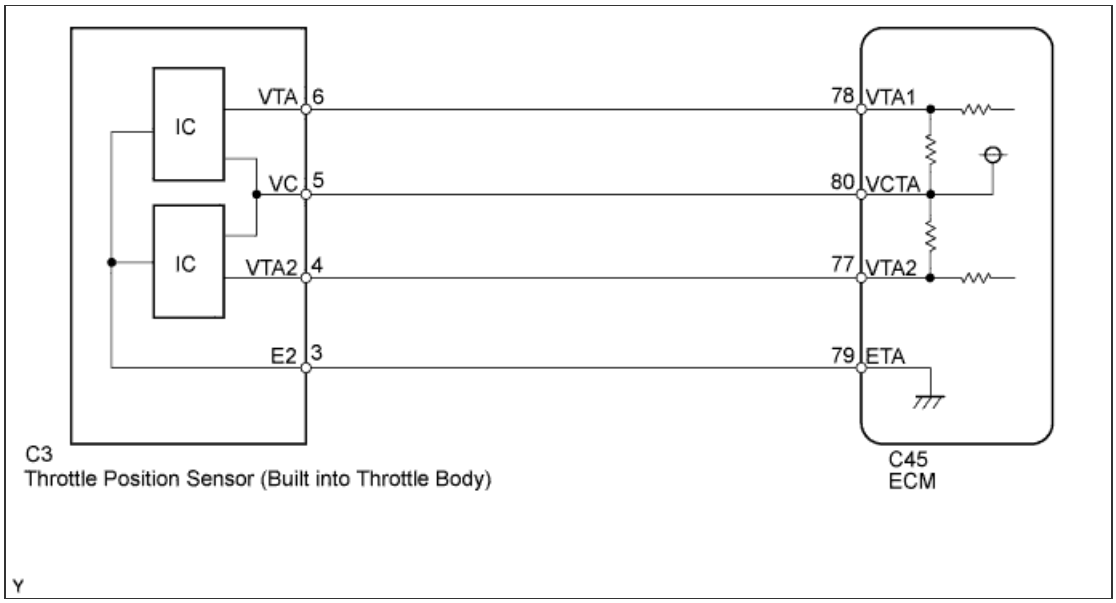
- **When any of these DTCs is output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition):

Display Item	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores DTC(s).
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores DTC(s).

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain Engine and ECT Data List ETCS Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

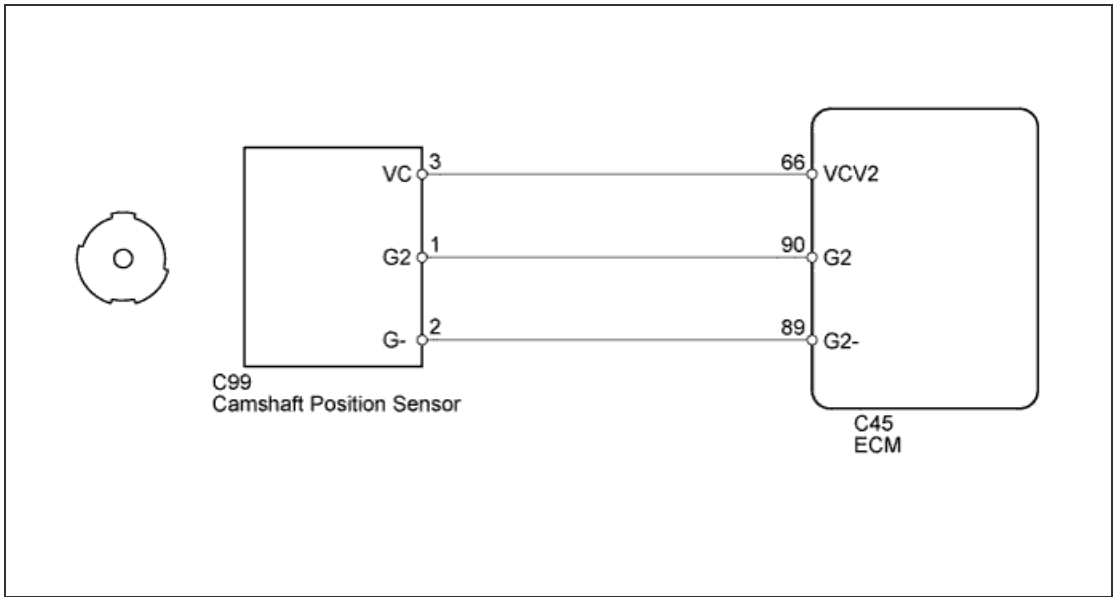
DTC P1340 Camshaft Position Sensor "A" (Bank 1 Sensor 2)

DTC P1342 Camshaft Position Sensor "A" Low Input (MRE)

DTC P1343 Camshaft Position Sensor "A" High Input (MRE)

for Preparation Click here

DESCRIPTION



The camshaft position sensor (G signal) consists of a magnet and MRE (Magnetic Resistance Element).
The camshaft drive gear (LH) has 3 teeth on its inner circumference. When the camshaft gear rotates, air gap changes between the protrusion on the teeth and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE.
The crankshaft position sensor plate has 34 teeth and is installed to the rear end of the crankshaft. The crankshaft position sensor generates 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No camshaft position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in camshaft position sensor circuit • Camshaft position sensor • Camshaft timing plate LH • ECM
	No camshaft position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

The camshaft position sensor (G signal) consists of a magnet and MRE.
The camshaft drive gear has 3 teeth on its inner circumference. When the camshaft gear rotates, air gap changes between the protrusion on the gear and the MRE. The change affects the magnetic field and results in changes in the resistance of the MRE. The crankshaft position sensor plate has 34 teeth and outputs 34 signals with every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC P0121 Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0120 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0121	The difference between the VTA1 and VTA2 voltages is below 0.8 V, or higher than 1.6 V for 2 seconds (1 trip detection logic).	Throttle Position (TP) sensor (built into throttle body)

MONITOR DESCRIPTION

The ECM uses the TP sensor to monitor the throttle valve opening angle.
This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1.
The ECM performs several checks to confirm the proper operation of the TP sensor and VTA1.
For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the output voltage difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction of the TP sensor. The ECM illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

INSPECTION PROCEDURE

HINT:

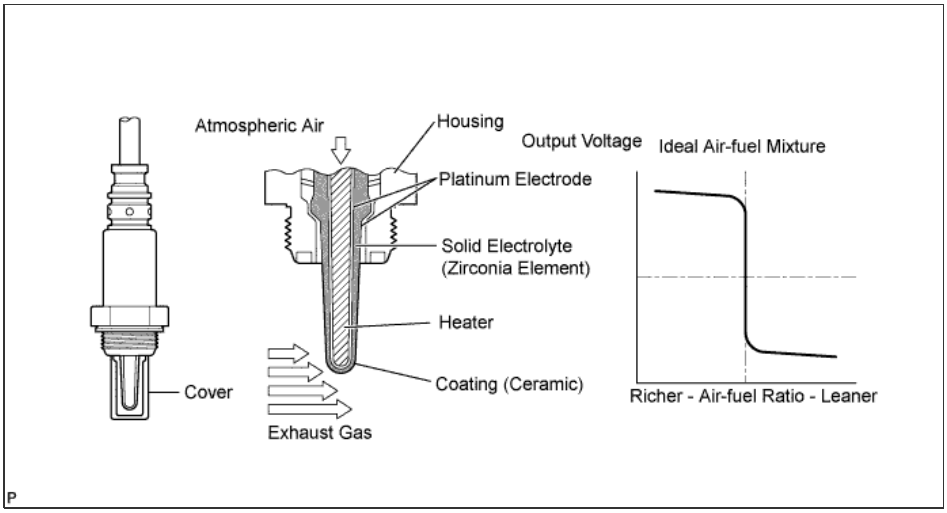
CHECK FOR INTERMITTENT PROBLEMS (Click here)



DTC P0137 Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)

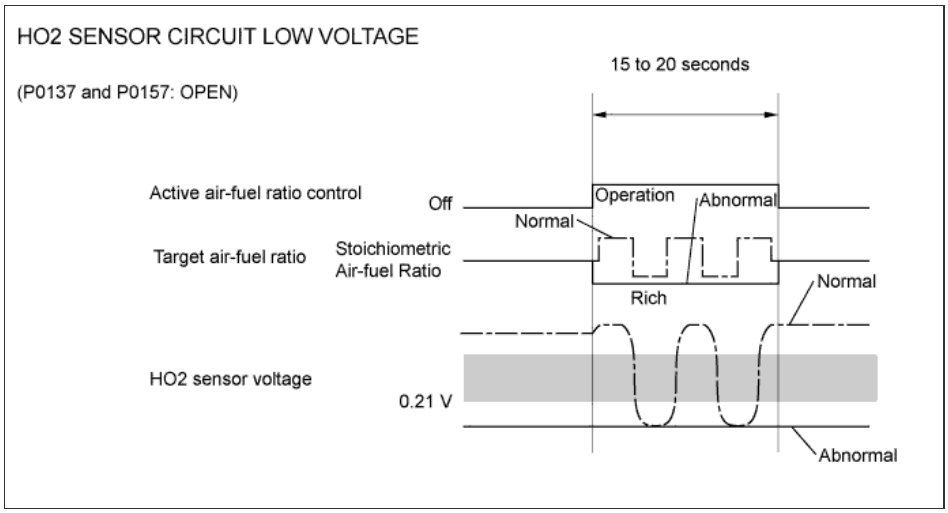
DTC P0157 Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)

for Preparation Click here

DESCRIPTION

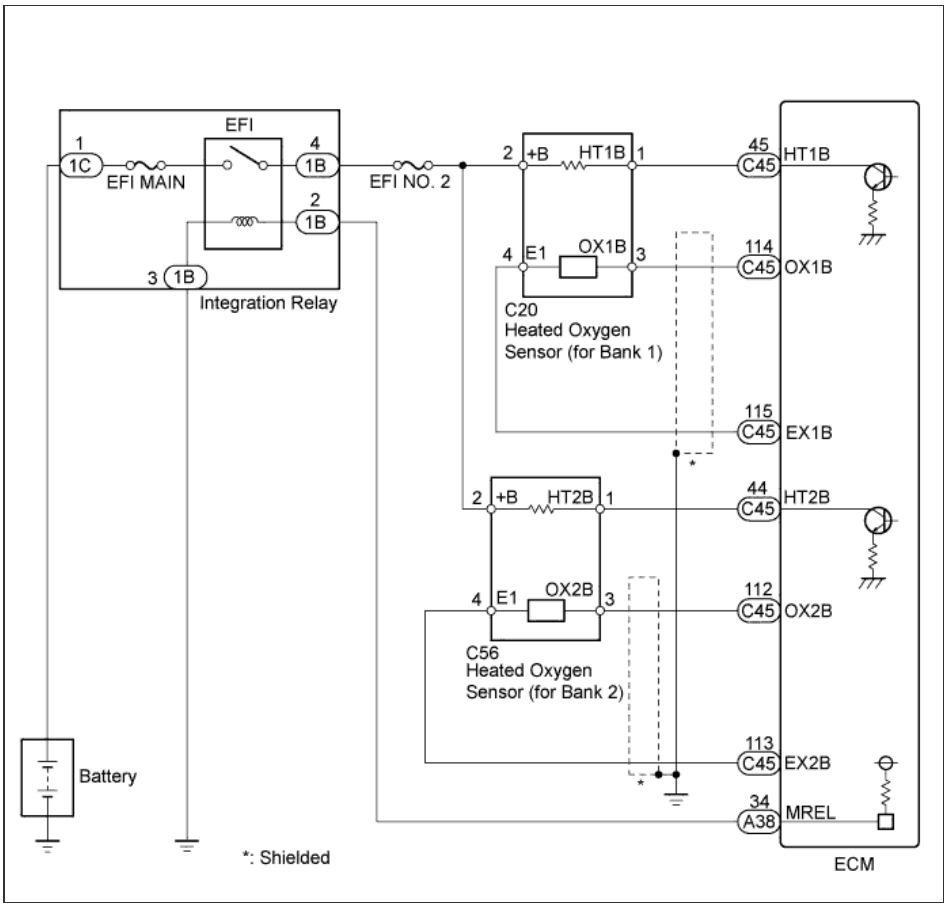
In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.
The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system



MONITOR DESCRIPTION

Active Air-Fuel Ratio Control

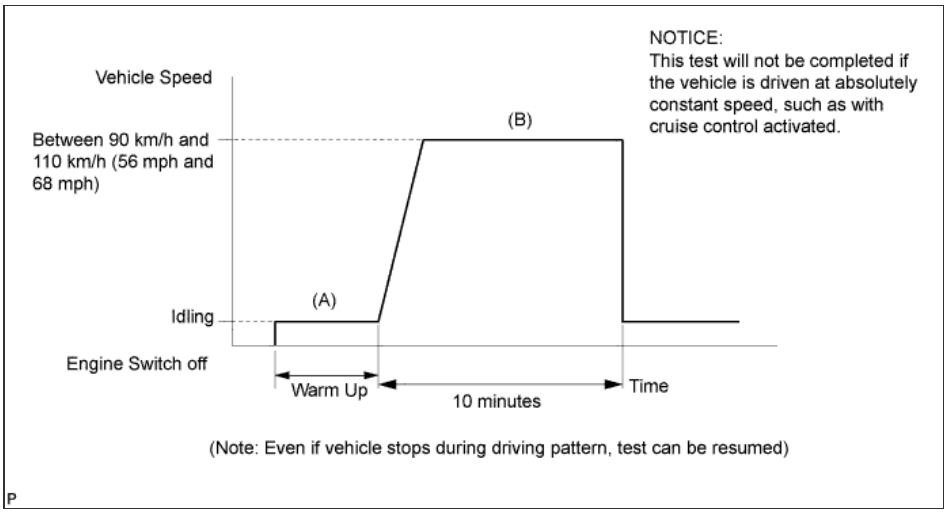


The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).
Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157)

During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.
While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157.
*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value.

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

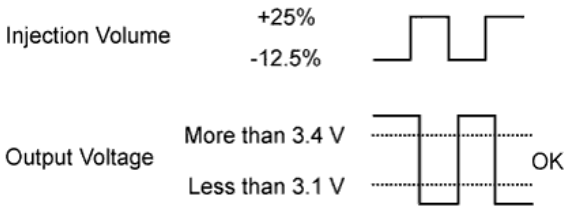
INSPECTION PROCEDURE

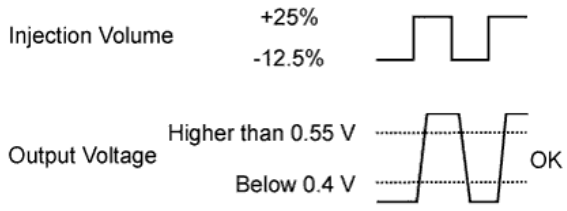
HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

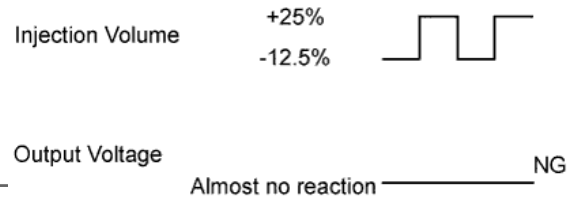
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

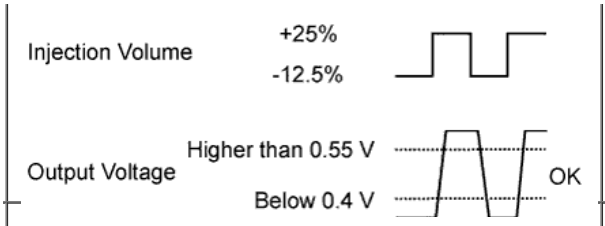
1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

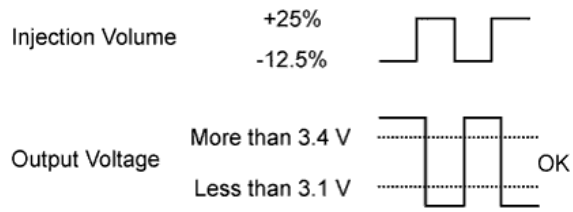


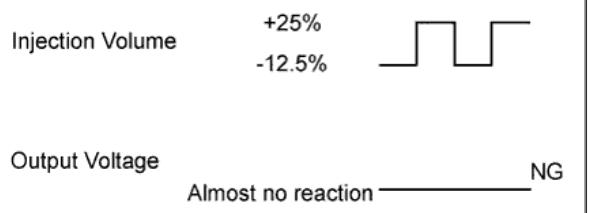


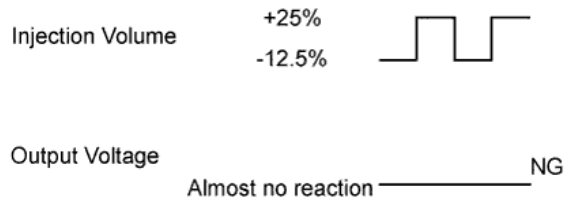
HINT:

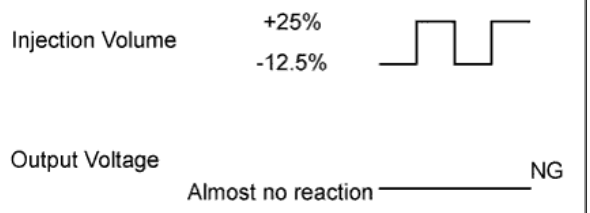












- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.1 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.4 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
			• A/F

2			sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume / All Data / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0137 or P0157 is output	A

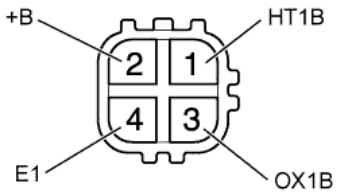
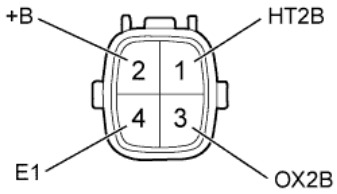
3.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C20 or C56 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

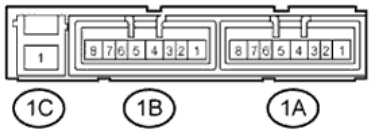
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

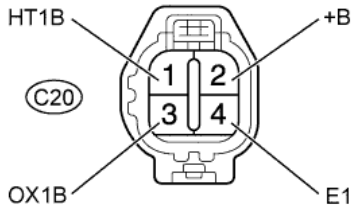
Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

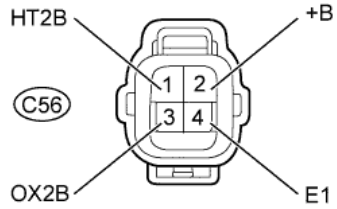
NG → REPLACE INTEGRATION NO.1 RELAY

OK



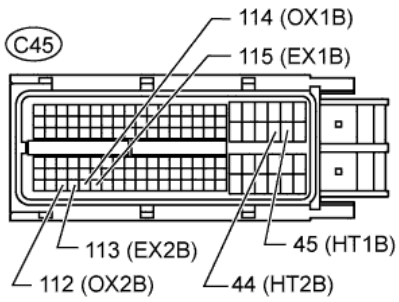
5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C20 or C56 HO2 sensor connector.

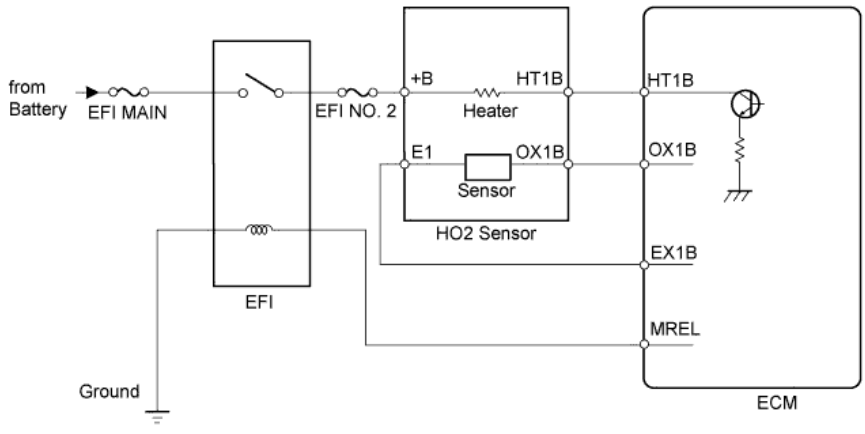


b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)



Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

Reference (System Diagram):

Y

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

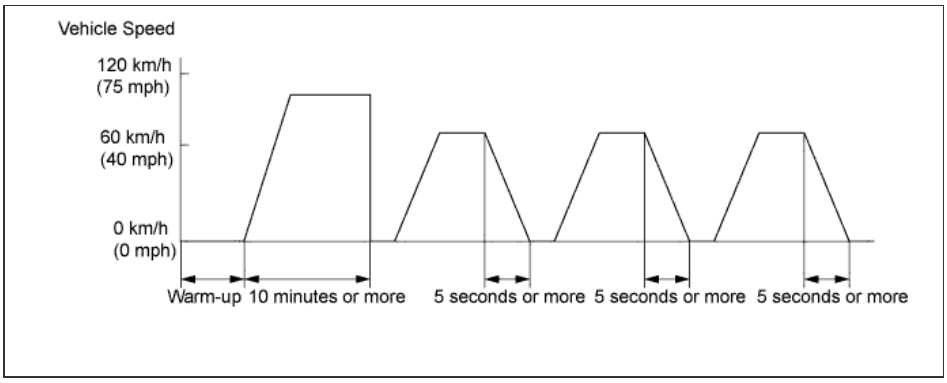
d. Disconnect the C45 ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

6.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

7.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for at least 10 minutes.

e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0137 and P0157.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern adding the vehicle speed and using the second gear to decelerate the vehicle.

OK:
No DTC is output.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → REPAIR COMPLETE

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

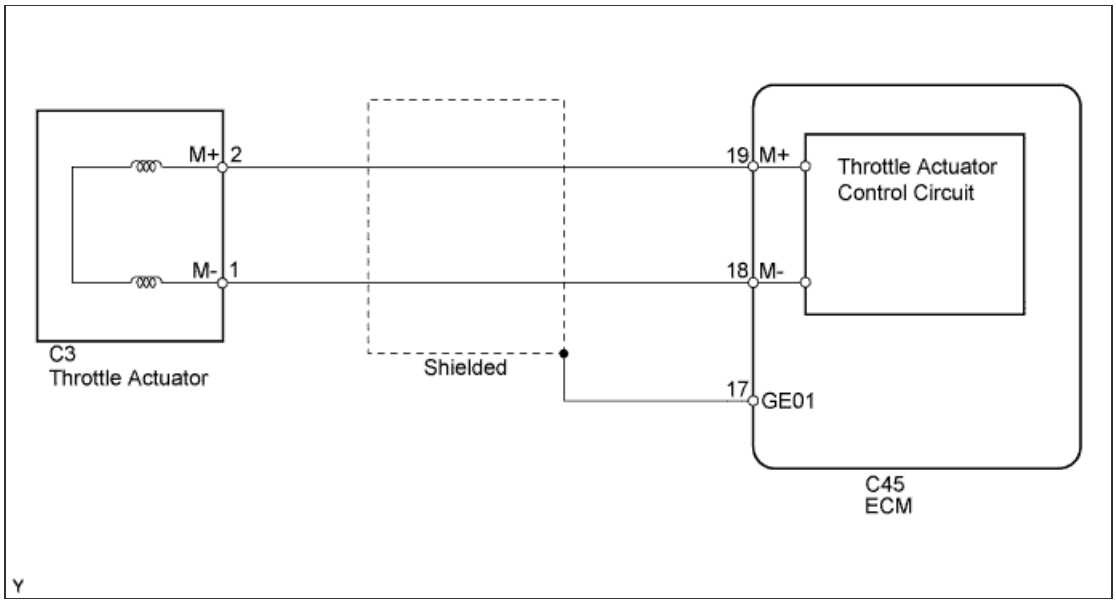
DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is below 0.5 A.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions is met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**



MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the electrical current is below 0.5 A and the throttle actuator duty ratio exceeds 80%, the ECM interprets this as the current being outside the standard range, illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine is started and has idled for 5 seconds.

FAIL-SAFE

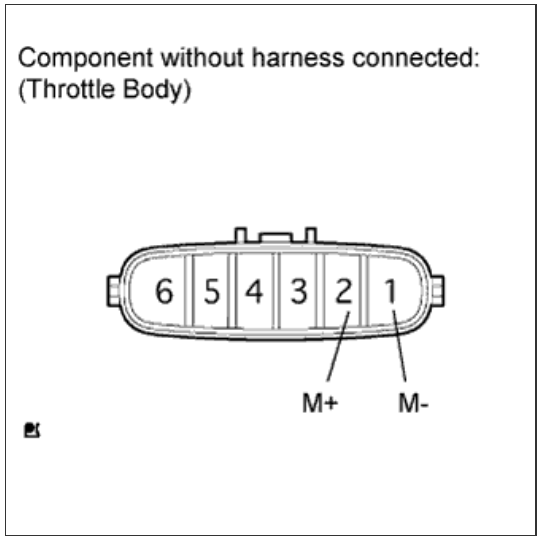
When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **The throttle actuator current (Throttle Motor Current) and the throttle actuator duty ratio (Throttle Motor Open Duty / Throttle Motor Close Duty) can be read using the intelligent tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.**



1.INSPECT THROTTLE BODY ASSEMBLY (RESISTANCE OF THROTTLE ACTUATOR)

a. Disconnect the C3 throttle body connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (M+) - 1 (M-)	20°C (68°F)	0.3 to 100 Ω

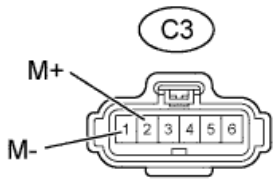
NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

2.CHECK HARNESS AND CONNECTOR (THROTTLE ACTUATOR - ECM)

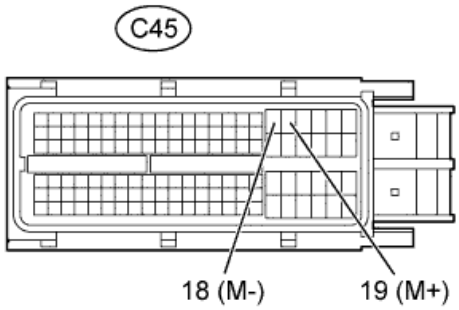
a. Disconnect the C3 throttle body connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C3-2 (M+) - C45-19 (M+)	Always	Below 1 Ω

C3-1 (M-) - C45-18 (M-)	Always	Below 1 Ω
C3-2 (M+) or C45-19 (M+) - Body ground	Always	10 kΩ or higher
C3-1 (M-) or C45-18 (M-) - Body ground	Always	10 kΩ or higher

(to Throttle Body)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.INSPECT THROTTLE BODY ASSEMBLY

a. Check for foreign objects between the throttle valve and the housing.

OK:
No foreign objects between throttle valve and housing.

NG → REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY

OK

4.INSPECT THROTTLE VALVE

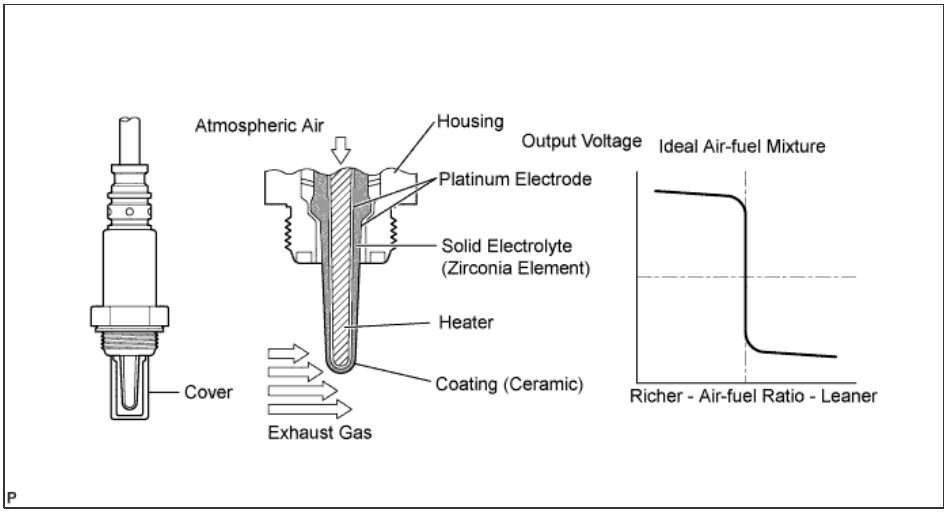
a. Check if the throttle valve opens and closes smoothly.

OK:
Throttle valve opens and closes smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

REPLACE ECM (Click here)



DTC P0137 Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)

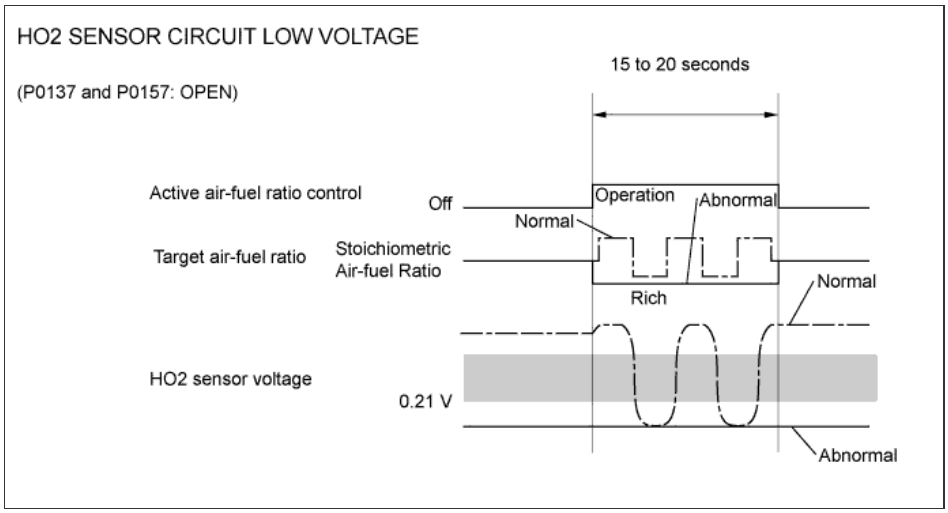
DTC P0157 Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)

for Preparation Click here

DESCRIPTION

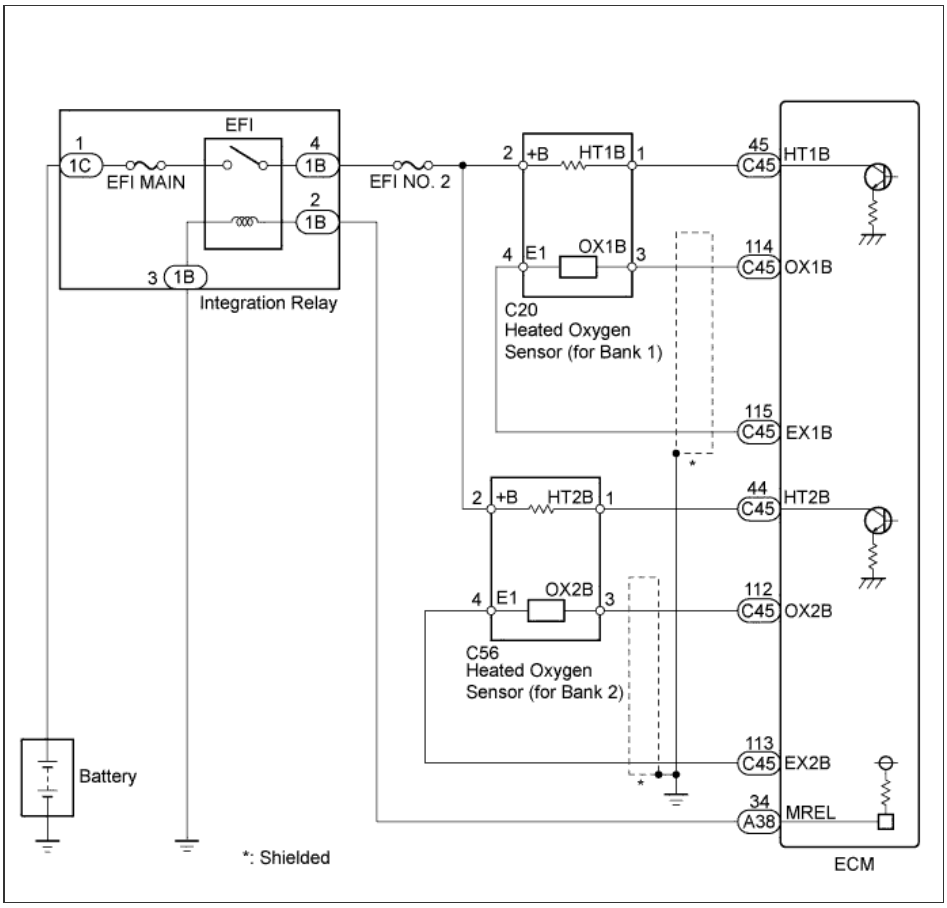
In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel ratio. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.
The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel ratio, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0137 P0157	Low voltage (open): During active air-fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The HO2 sensor voltage output is below 0.21 V. 2. The target air-fuel ratio is rich.	• Open in HO2 sensor (for Bank 1, 2) circuit • HO2 sensor (for Bank 1, 2) • HO2 sensor heater (for Bank 1, 2) • Integration relay • Gas leakage from exhaust system



MONITOR DESCRIPTION

Active Air-Fuel Ratio Control

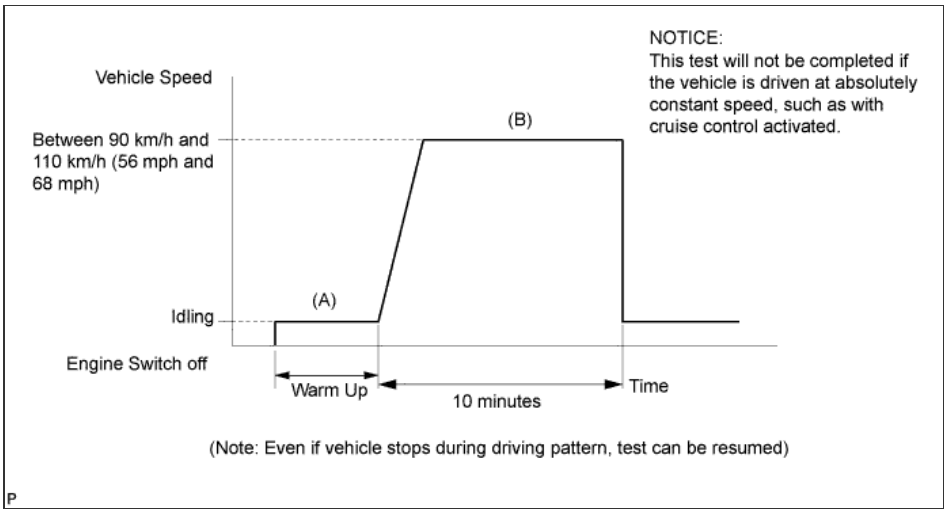


The ECM usually performs air-fuel ratio feedback control so that the Air Fuel ratio (A/F) sensor output indicates a near stoichiometric air-fuel ratio. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).
Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157)

During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.
While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157.
*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value.

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN

HINT:

- **This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.**
- **Performing this confirmation driving pattern will activate the Heated Oxygen (HO2) sensor monitor (the catalyst monitor is performed simultaneously). This is very useful for verifying the completion of a repair.**

NOTICE:

This test will not be completed if the vehicle is driven under absolutely constant speed conditions such as with cruise control activated.

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.
5. Clear DTCs.
6. Switch the ECM from normal mode to check mode
7. Enter the following menus: Powertrain / Engine and ECT / Data List / O2S (A/FS) Monitor.
8. Check that the item O2S (A/FS) Monitor displays Incmpl (Incomplete).
9. Start the engine and warm it up. (Proceed to "A")
10. Drive the vehicle at between 90 km/h and 110 km/h (56 mph and 68 mph) for at least 10 minutes. (Proceed to "B")
11. Note the state of the Data List items. Those items will change to Compl (Complete) as the O2 Sensor monitor operates.
12. On the tester, enter the following menus: Powertrain / Engine and ECT / DTC / Pending and check if any DTCs (any pending DTCs) are output.

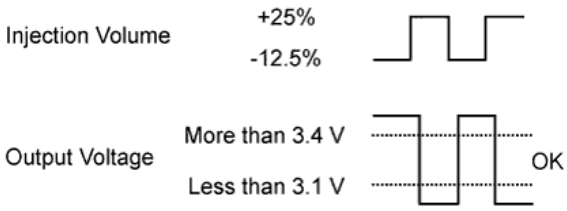
INSPECTION PROCEDURE

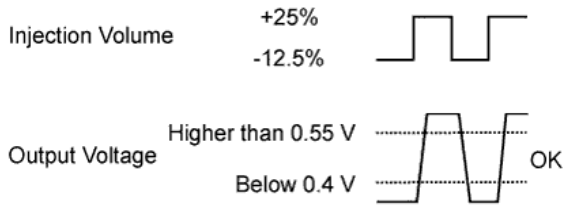
HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

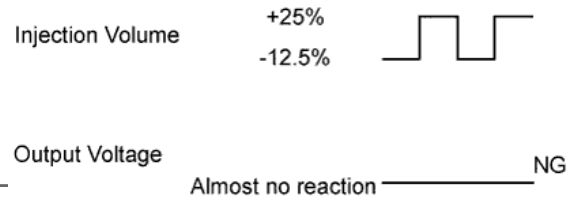
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

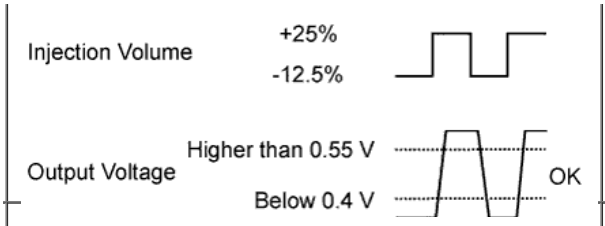
1. **Connect the tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

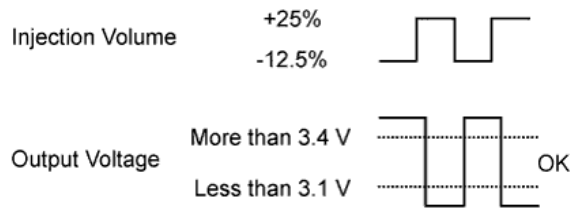


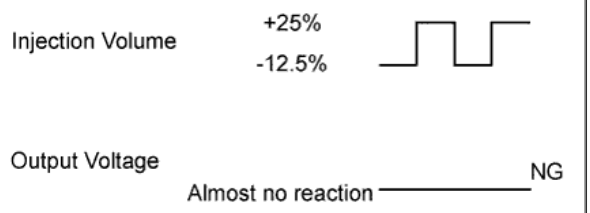


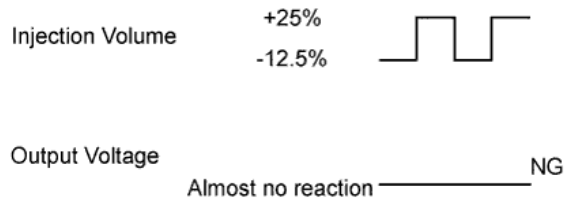
HINT:

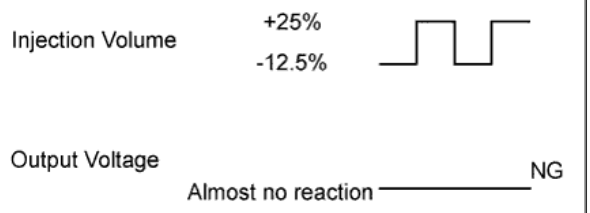












- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.1 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.4 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
			• A/F

2			sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume / All Data / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0137 or P0157 is output	A
P0137 or P0157 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.CHECK FOR EXHAUST GAS LEAKAGE

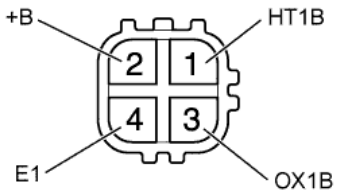
OK:

No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

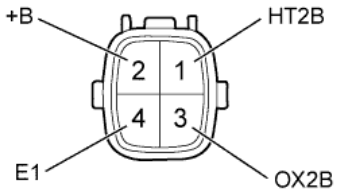
OK

3.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the C20 or C56 heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected
(HO2 Sensor for Bank 1)

Component without harness connected
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.INSPECT INTEGRATION NO.1 RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

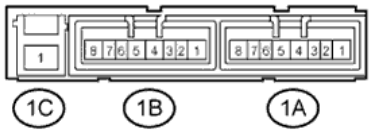
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

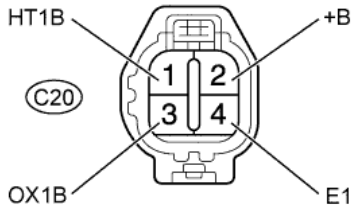
Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	No battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

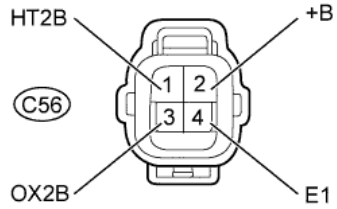
NG → REPLACE INTEGRATION NO.1 RELAY

OK



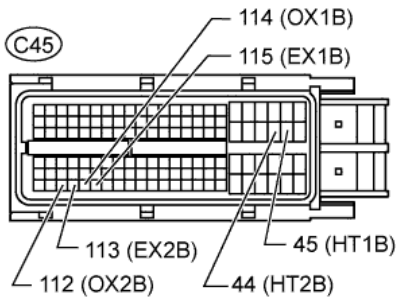
5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the C20 or C56 HO2 sensor connector.

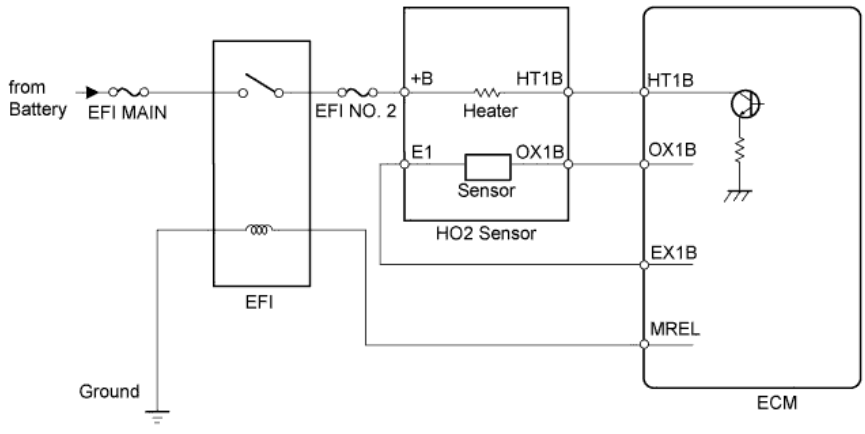


b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Front view of wire harness connector:
(to HO2 Sensor for Bank 1)



Front view of wire harness connector:
(to HO2 Sensor for Bank 2)

Front view of wire harness connector:
(to ECM)

Reference (System Diagram):

Y

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C56-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

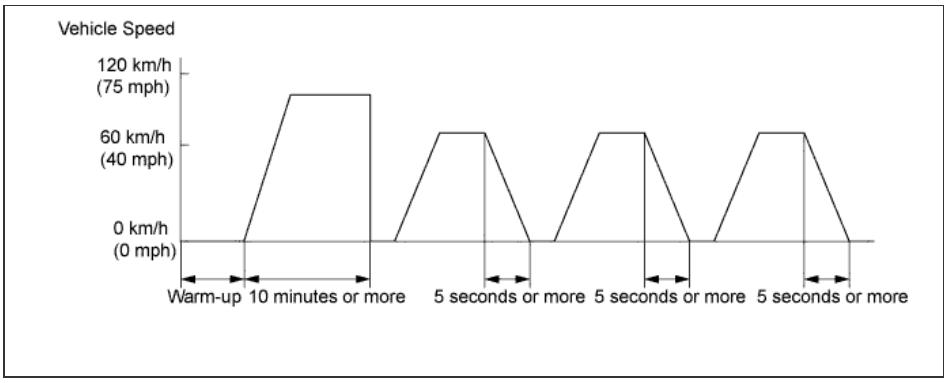
d. Disconnect the C45 ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

6.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

7.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for at least 10 minutes.

e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0137 and P0157.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern adding the vehicle speed and using the second gear to decelerate the vehicle.

OK:
No DTC is output.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → REPAIR COMPLETE

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

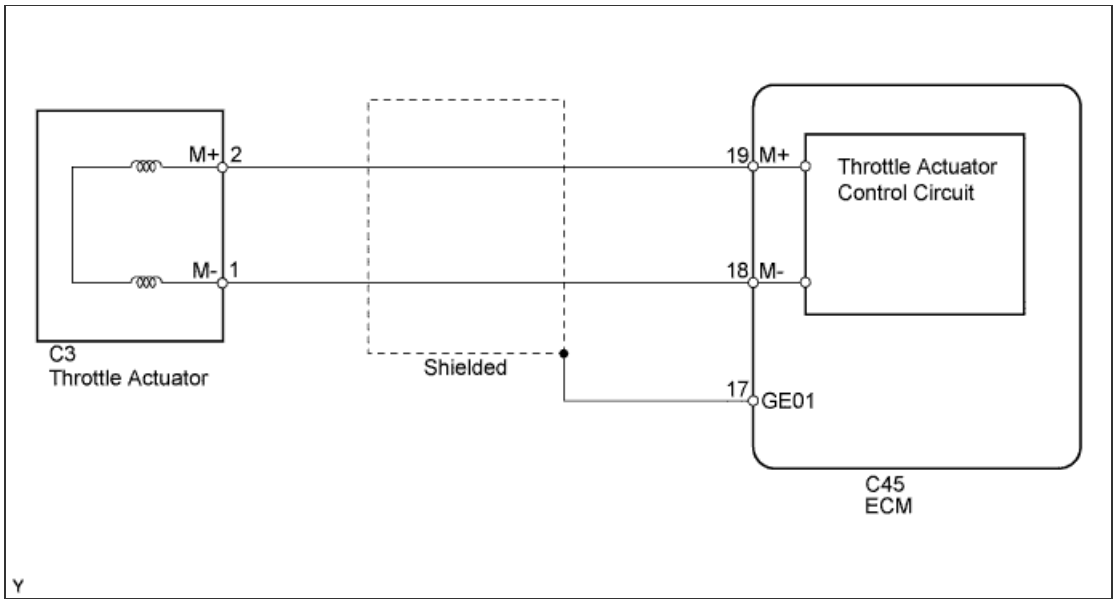
DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is below 0.5 A.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions is met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**



MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the electrical current is below 0.5 A and the throttle actuator duty ratio exceeds 80%, the ECM interprets this as the current being outside the standard range, illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine is started and has idled for 5 seconds.

FAIL-SAFE

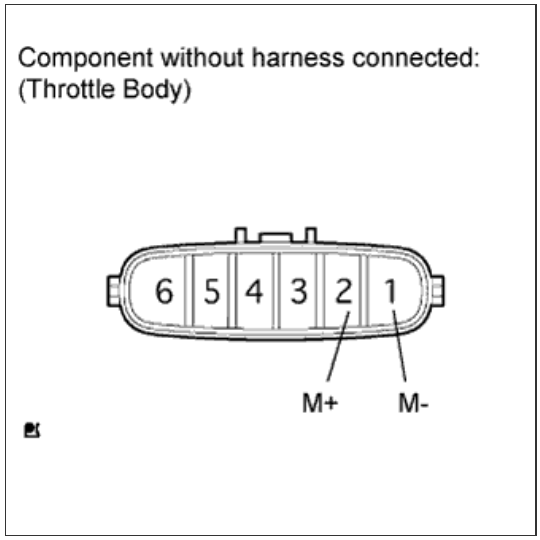
When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **The throttle actuator current (Throttle Motor Current) and the throttle actuator duty ratio (Throttle Motor Open Duty / Throttle Motor Close Duty) can be read using the intelligent tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.**



1.INSPECT THROTTLE BODY ASSEMBLY (RESISTANCE OF THROTTLE ACTUATOR)

a. Disconnect the C3 throttle body connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (M+) - 1 (M-)	20°C (68°F)	0.3 to 100 Ω

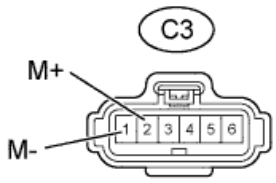
NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

2.CHECK HARNESS AND CONNECTOR (THROTTLE ACTUATOR - ECM)

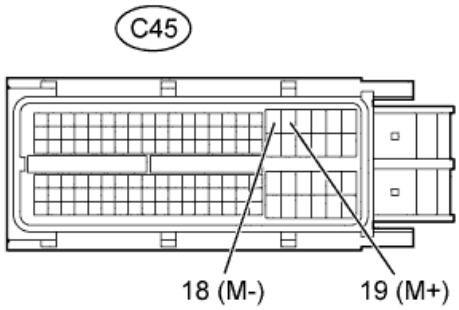
a. Disconnect the C3 throttle body connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C3-2 (M+) - C45-19 (M+)	Always	Below 1 Ω

C3-1 (M-) - C45-18 (M-)	Always	Below 1 Ω
C3-2 (M+) or C45-19 (M+) - Body ground	Always	10 kΩ or higher
C3-1 (M-) or C45-18 (M-) - Body ground	Always	10 kΩ or higher

3.INSPECT THROTTLE BODY ASSEMBLY

a. Check for foreign objects between the throttle valve and the housing.

OK:
No foreign objects between throttle valve and housing.

NG → REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY

OK

4.INSPECT THROTTLE VALVE

a. Check if the throttle valve opens and closes smoothly.

OK:
Throttle valve opens and closes smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

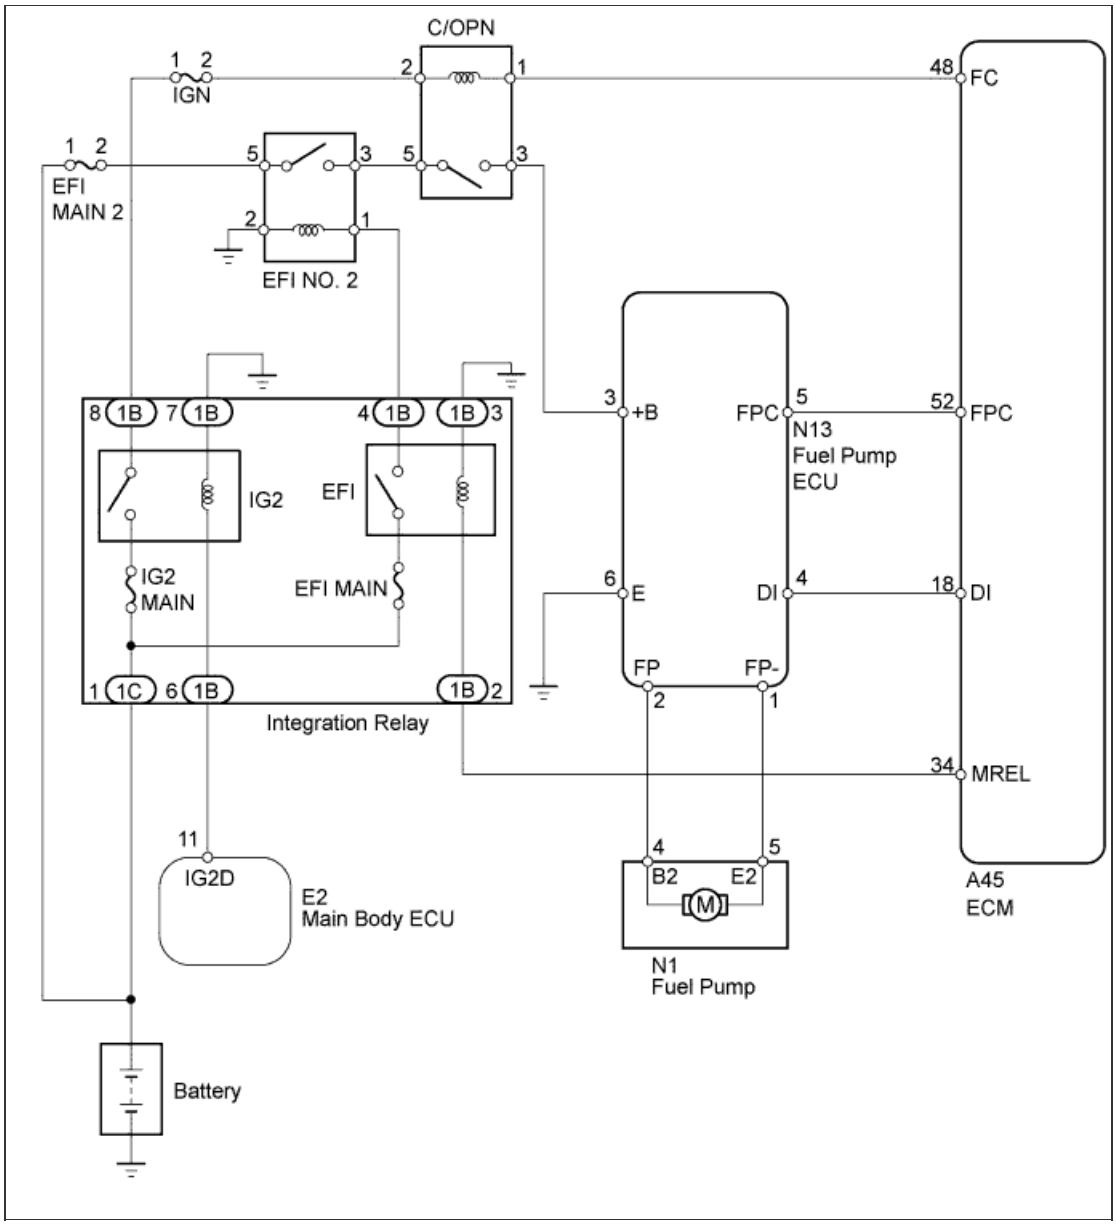
REPLACE ECM (Click here)

DTC P0230 Fuel Pump Primary Circuit

for Preparation Click here

DESCRIPTION

When a malfunction in the fuel pump circuit is detected, DTC P0230 is stored.
The fuel pump circuit consists of the ECM, fuel pump and fuel pump ECU (which operates the fuel pump). Based on the engine output, the ECM determines the fuel pump speed. The speed is then converted to a duty signal and sent to the fuel pump ECU. Based on the signal sent from the ECM, the fuel pump ECU adjusts the fuel pump operation speed between 3 settings. The fuel pump ECU also has a self-diagnosis function. Based on the fuel pump circuit condition, the fuel pump ECU outputs a diagnostic signal (DI) to the ECM, and the ECM determines if there is a malfunction in the fuel pump circuit.



DTC Code	DTC Detection Condition	Trouble Area

P0230	When either condition below is met (1 trip detection logic):
	• When the fuel pump is operating:
	  ◦ The remaining fuel is 17 liters or more.
	  ◦ The DI terminal output is low.
	• When the fuel pump is not operating:
	  ◦ The DI terminal output is high.
		• Open or short in fuel pump circuit
		• Fuel pump
		• Fuel pump ECU
		• ECM

MONITOR DESCRIPTION

To monitor the fuel pump circuit, the ECM checks the fuel pump control signal (FPC) and diagnostic signal (DI). The FPC voltage varies between approximately 0 V to approximately 12 V (duty signal). Based on the condition of the fuel pump ECU malfunction, the DI voltage varies between approximately 0 V and approximately 12 V. The ECM then compares the variance of the FPC voltage and DI voltage, and determines if the fuel pump circuit is malfunctioning. When the ECM determines that the fuel pump circuit is malfunctioning, a DTC is stored immediately.

WIRING DIAGRAM

INSPECTION PROCEDURE

This troubleshooting procedure is based on the premise that the engine is started. If the engine is not started, proceed to the Problem Symptoms Table (Click here).

1.CHECK FOR DTC (B1500)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Body Electrical / Combination Meter / DTC.

e. Read the DTC.

Result

Result	Proceed to
DTC B1500 is not output	A
DTC B1500 is output	B

B → GO TO DTC B1500 (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PUMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump / Speed.

d. Check whether operating sounds can be heard while operating the fuel pump using the tester.

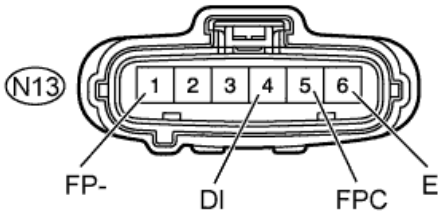
OK:
Operating sounds can be heard from fuel pump.

NG → Go to step 6

OK

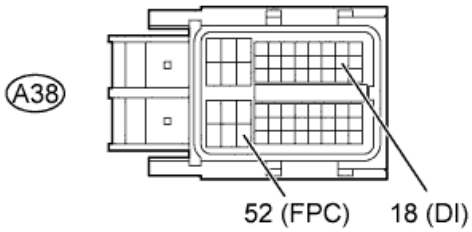
3.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM, BODY GROUND)

a. Disconnect the N3 fuel pump ECU connector.



b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
N13-5 (FPC) - A38-52 (FPC)	Always	Below 1 Ω
N13-4 (DI) - A38-18 (DI)	Always	Below 1 Ω
N13-6 (E) - Body ground	Always	Below 1 Ω
N13-1 (FP-) - Body ground	Always	10 kΩ or higher
N13-5 (FPC) or A38-52 (FPC) - Body ground	Always	10 kΩ or higher
N13-4 (DI) or A38-18 (DI) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector: (to Fuel Pump ECU)

Front view of wire harness connector: (to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.REPLACE FUEL PUMP ECU

a. Replace the fuel pump ECU (Click here).

NEXT

5.CONFIRM WHETHER DTC OUTPUT RECURS

a. Check that there are 17 liters or more of fuel remaining.

b. Connect the intelligent tester to the DLC3.

c. Turn the engine switch on (IG).

d. Turn the tester on.

e. Clear DTCs (Click here).

f. Crank the engine for 15 seconds.

g. Idle the engine for 1 minute.

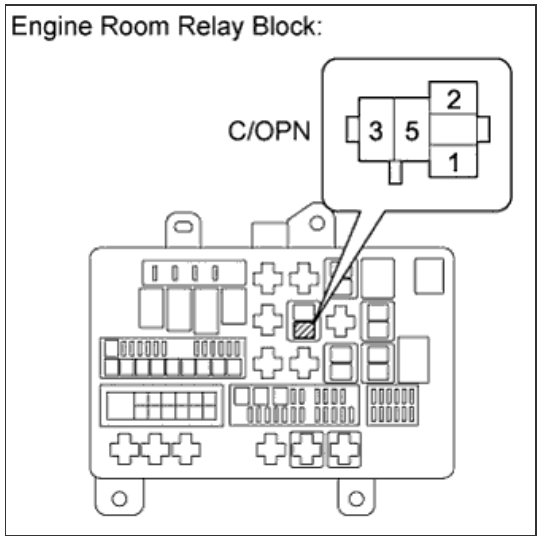
6.INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Inspect the circuit opening relay (C/OPN) (Click here).

NG → REPLACE CIRCUIT OPENING RELAY (C/OPN)

OK →

7.INSPECT CIRCUIT OPENING RELAY (POWER SOURCE VOLTAGE)



a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Turn the engine switch on (IG).

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C/OPN relay (2) - Body ground	Engine switch on (IG)	11 to 14 V
C/OPN relay (5) - Body ground	Engine switch on (IG)	11 to 14 V

NG → Go to step 14

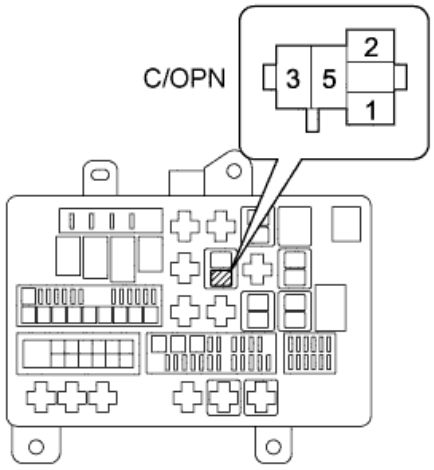
OK →

8.CHECK HARNESS AND CONNECTOR (CIRCUIT OPENING RELAY (C/OPN) - ECM, FUEL PUMP ECU)

a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

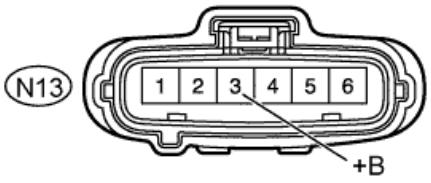
b. Disconnect the A38 ECM connector.

c. Disconnect the N13 fuel pump ECU connector.



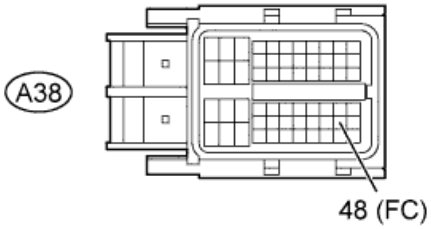
d. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C/OPN relay (1) - A38-48 (FC)	Always	Below 1 Ω
C/OPN relay (3) -		

N13-3 (+B)	Always	Below 1 Ω
C/OPN relay (1) or A38-48 (FC) - Body ground	Always	10 kΩ or higher
C/OPN relay (3) or N13-3 (+B) - Body ground	Always	10 kΩ or higher



Engine Room Relay Block:

Front view of wire harness connector:

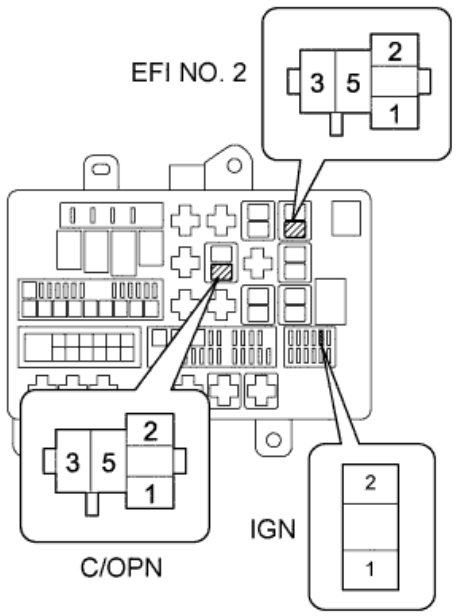
14.CHECK HARNESS AND CONNECTOR (C/OPN RELAY - EFI NO. 2 RELAY, IGN FUSE)

a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Remove the EFI NO. 2 relay (EFI NO. 2) from the engine room relay block.



c. Remove the IGN fuse from the engine room relay block.

d. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C/OPN relay (2) - IGN fuse (2)	Always	Below 1 Ω
C/OPN relay (5) - EFI NO. 2 relay (3)	Always	Below 1 Ω
C/OPN relay (2) or IGN fuse (2) - Body ground	Always	10 kΩ or higher
C/OPN relay (5) or EFI NO. 2 relay (3) - Body ground	Always	10 kΩ or higher

Engine Room Relay Block:

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

15.INSPECT EFI NO. 2 RELAY (EFI NO. 2)

a. Inspect the EFI NO. 2 relay (EFI NO. 2) (Click here).

NG → REPLACE EFI NO. 2 RELAY (EFI NO. 2)

OK

16.CHECK HARNESS AND CONNECTOR (EFI NO. 2 RELAY - INTEGRATION RELAY, BATTERY, BODY GROUND)

a. Remove the EFI MAIN 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

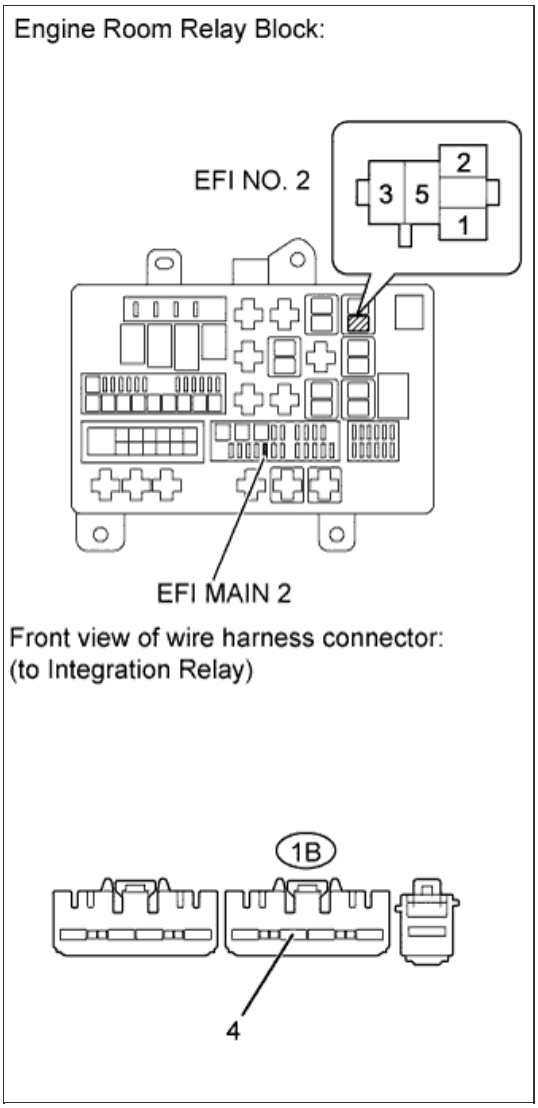
Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN 2 fuse	Always	Below 1 Ω

c. Reinstall the EFI MAIN 2 fuse.

d. Remove the EFI NO. 2 relay (EFI NO. 2) from the engine room relay block.

e. Remove the integration relay from the engine room relay block.



f. Disconnect the 1B integration relay connector.

g. Disconnect the cable from the battery positive (+) terminal.

h. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 relay (1) - 1B-4	Always	Below 1 Ω
EFI NO. 2 relay (5) - Positive (+) battery cable	Always	Below 1 Ω
EFI NO. 2 relay (2) - Body ground	Always	Below 1 Ω
EFI NO. 2 relay (1) or 1B-4 - Body ground	Always	10 kΩ or higher
EFI NO. 2 relay (5) or Positive (+) battery cable - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

GO TO ECM POWER SOURCE CIRCUIT (Click here)

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The throttle actuator does not close when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**
P2112	The throttle actuator does not open when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Refer to Data List Active Test Throttle Position Command, Throttle Position No. 1, Throttle Motor Current, Throttle Motor Duty (Open Throttle Motor Duty (Close Click here .**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

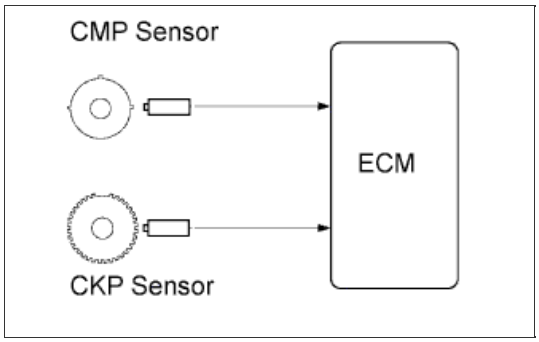
DTC P0305 Cylinder 5 Misfire Detected



DTC P0306 Cylinder 6 Misfire Detected

DTC P0307 Cylinder 7 Misfire Detected

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

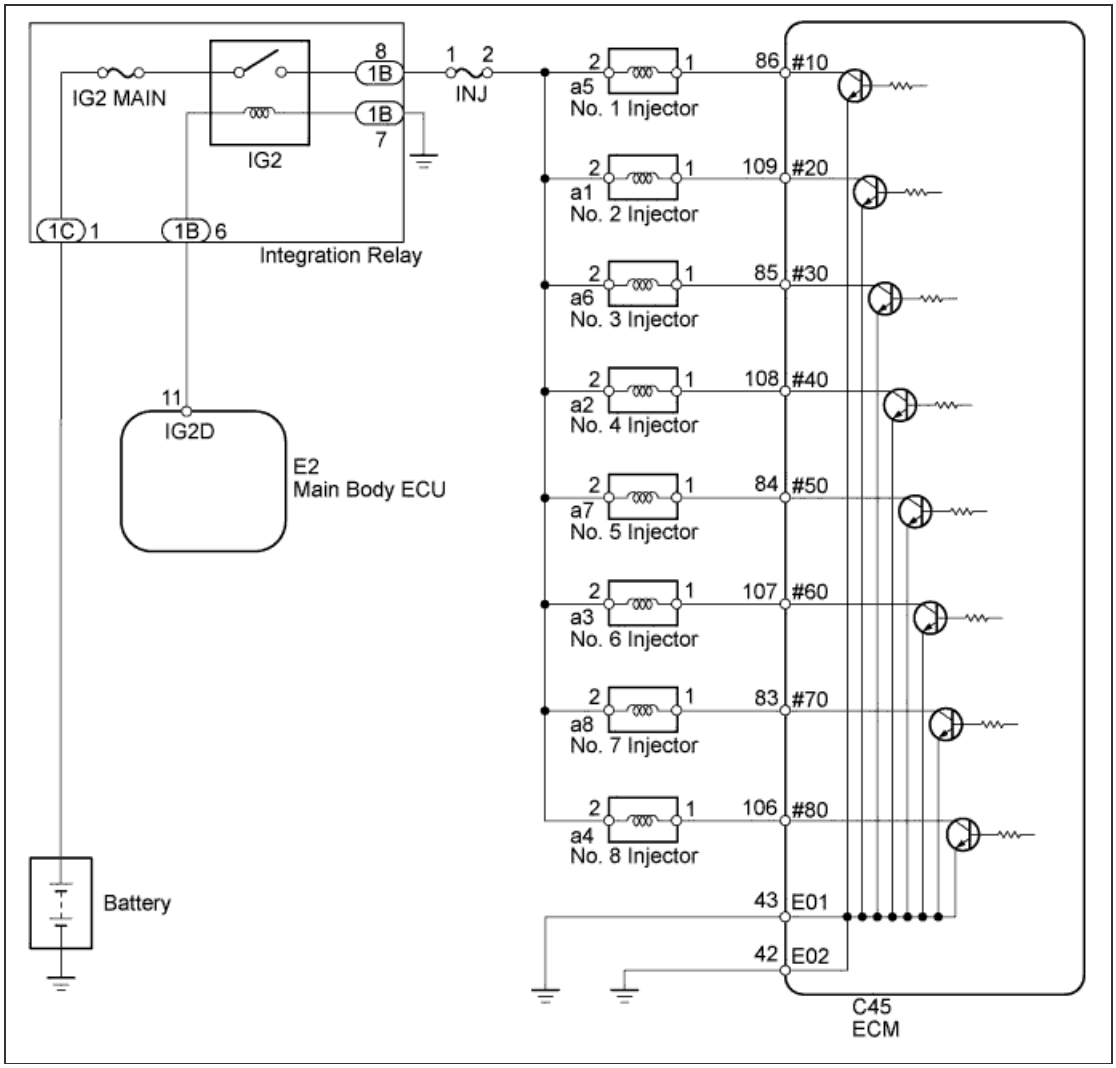
HINT:

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

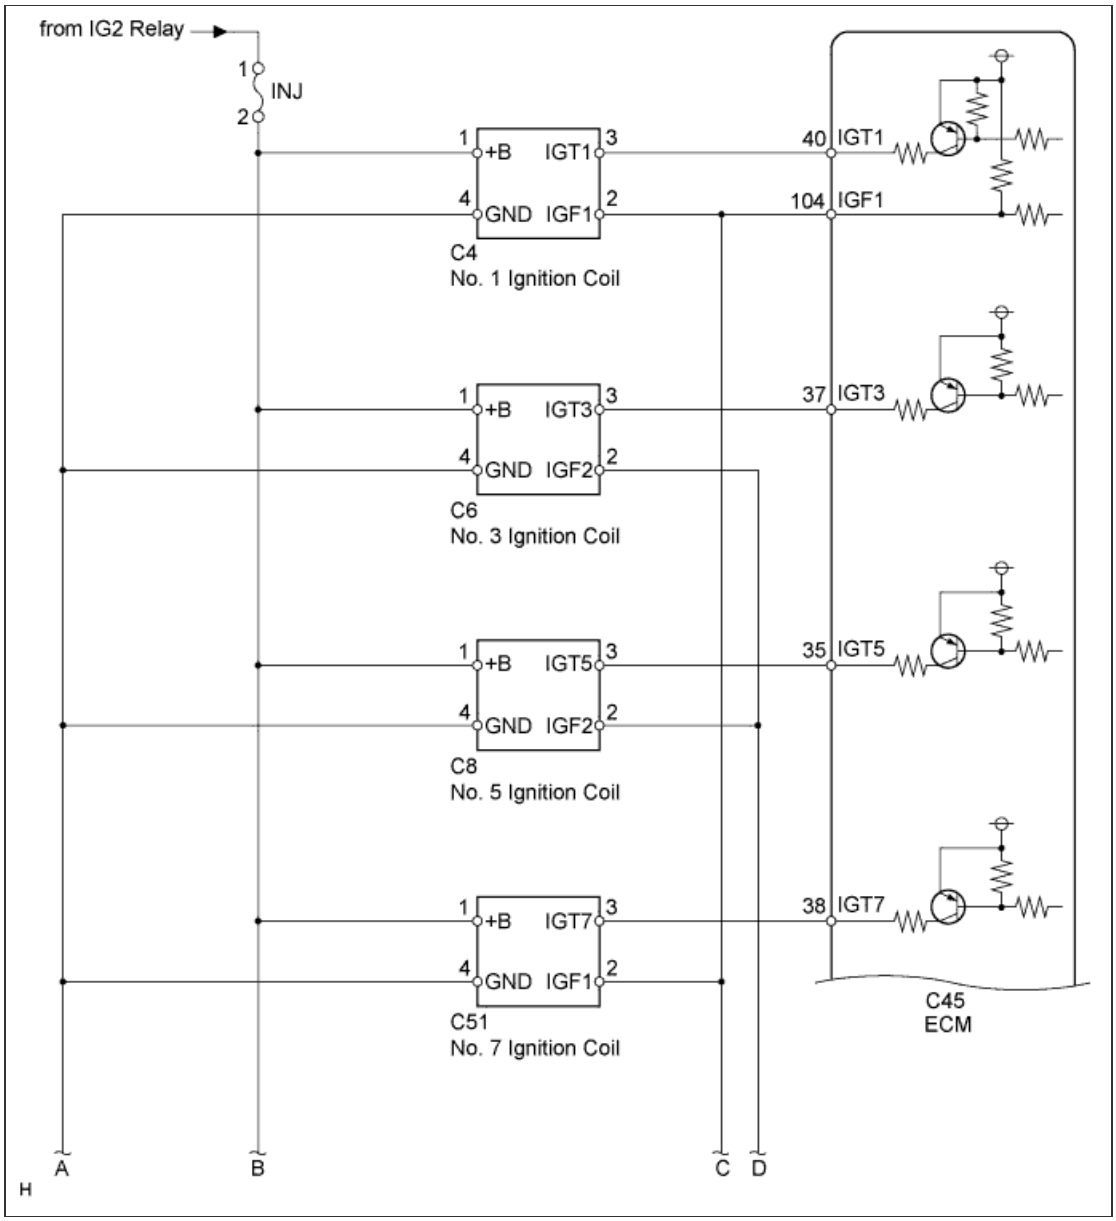
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

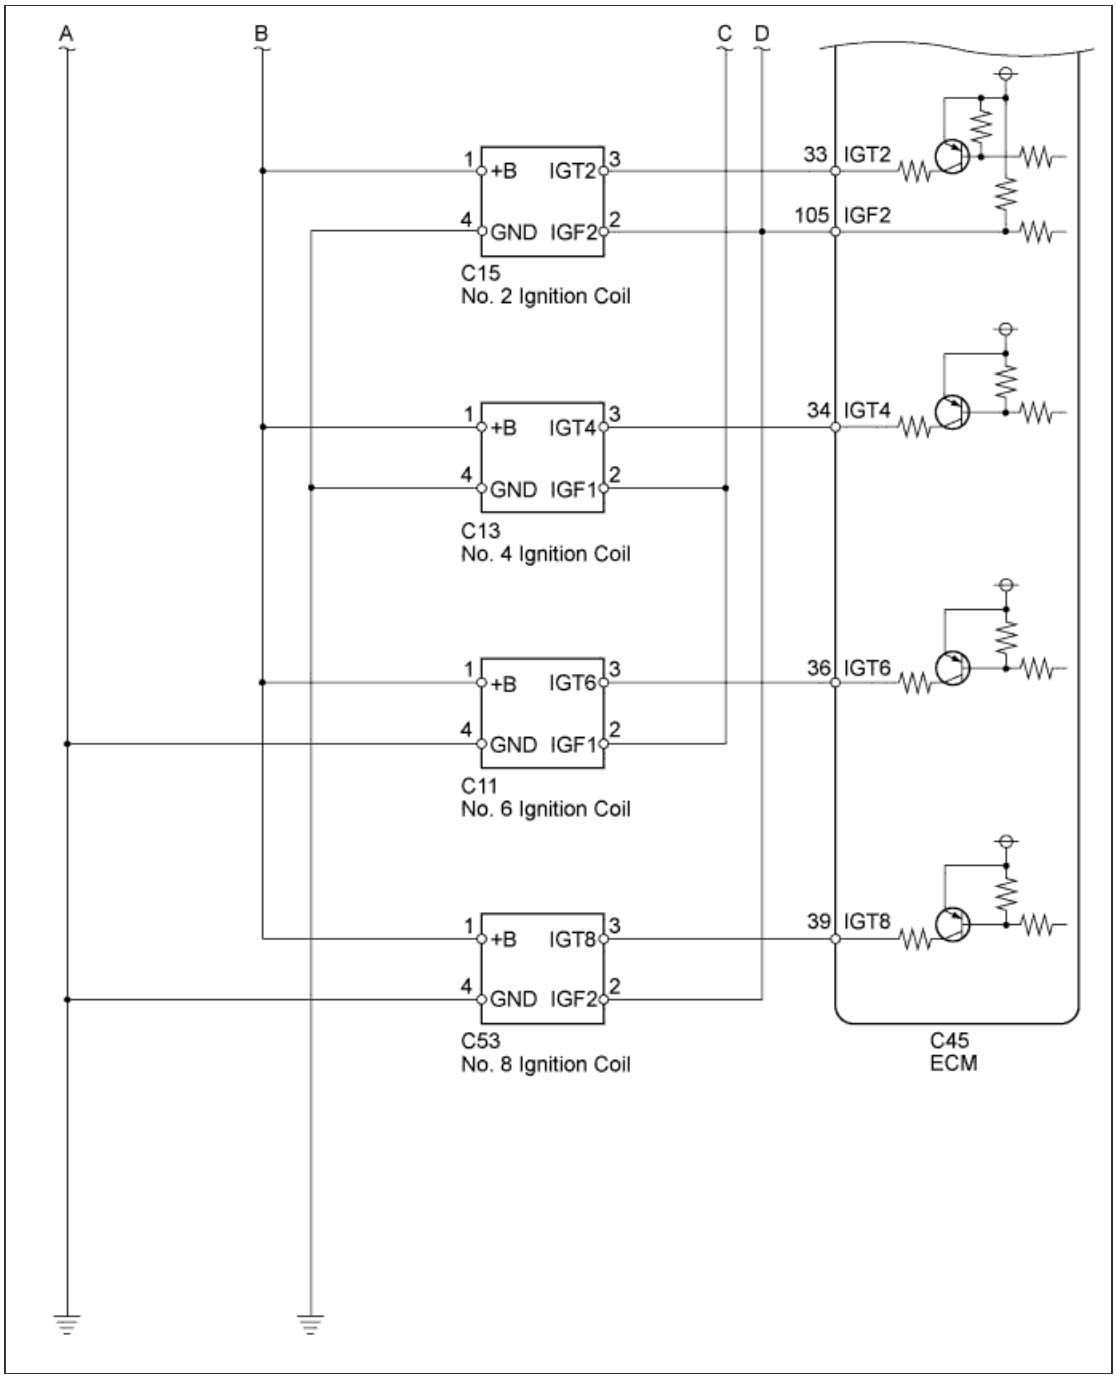
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

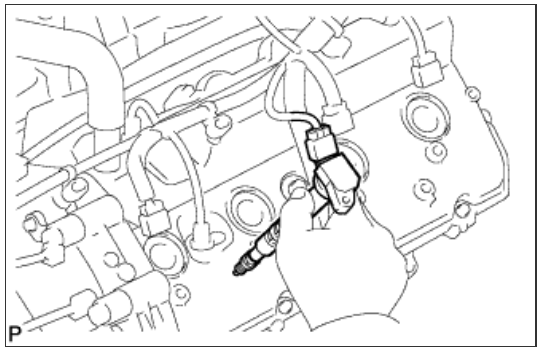
HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

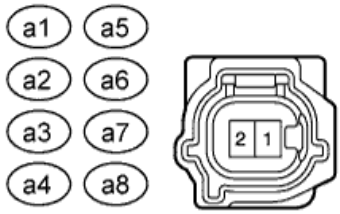
a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

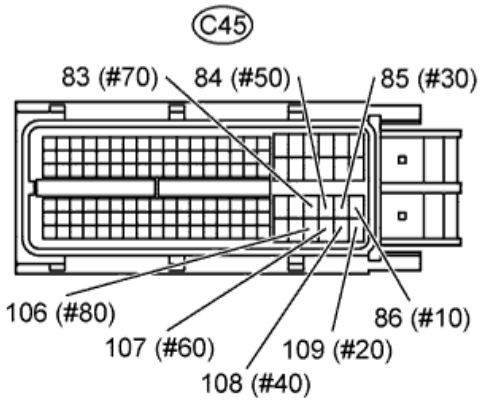
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

Front view of wire harness connector:
(to Injector)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

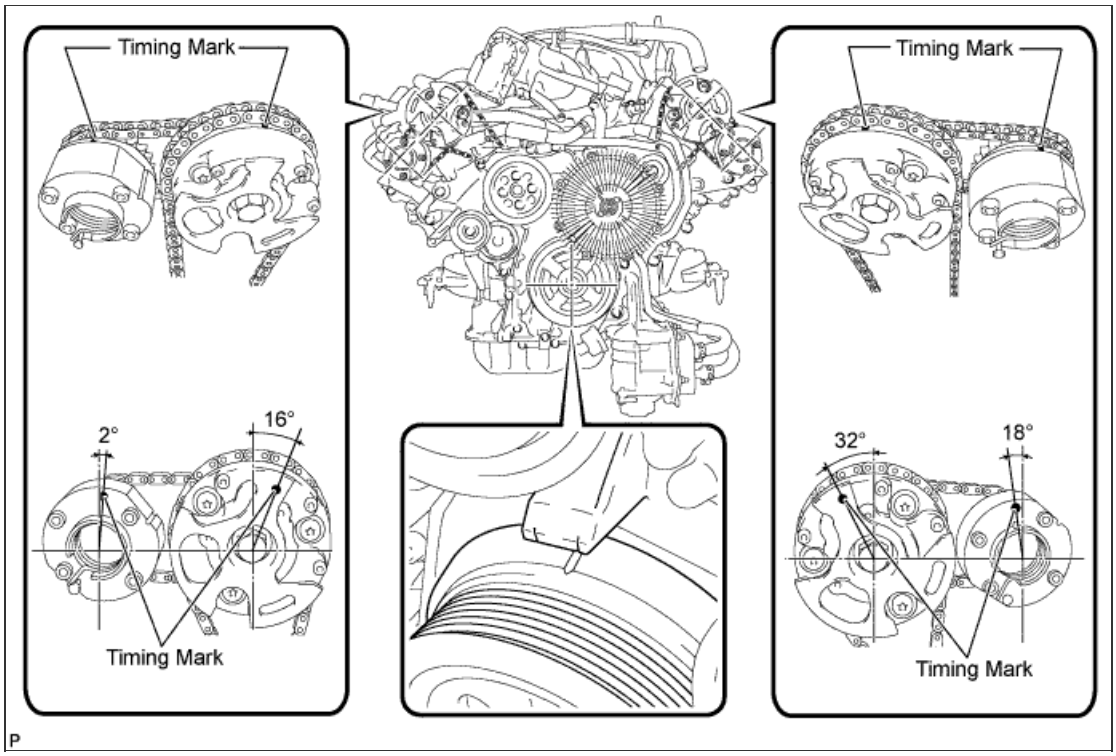
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

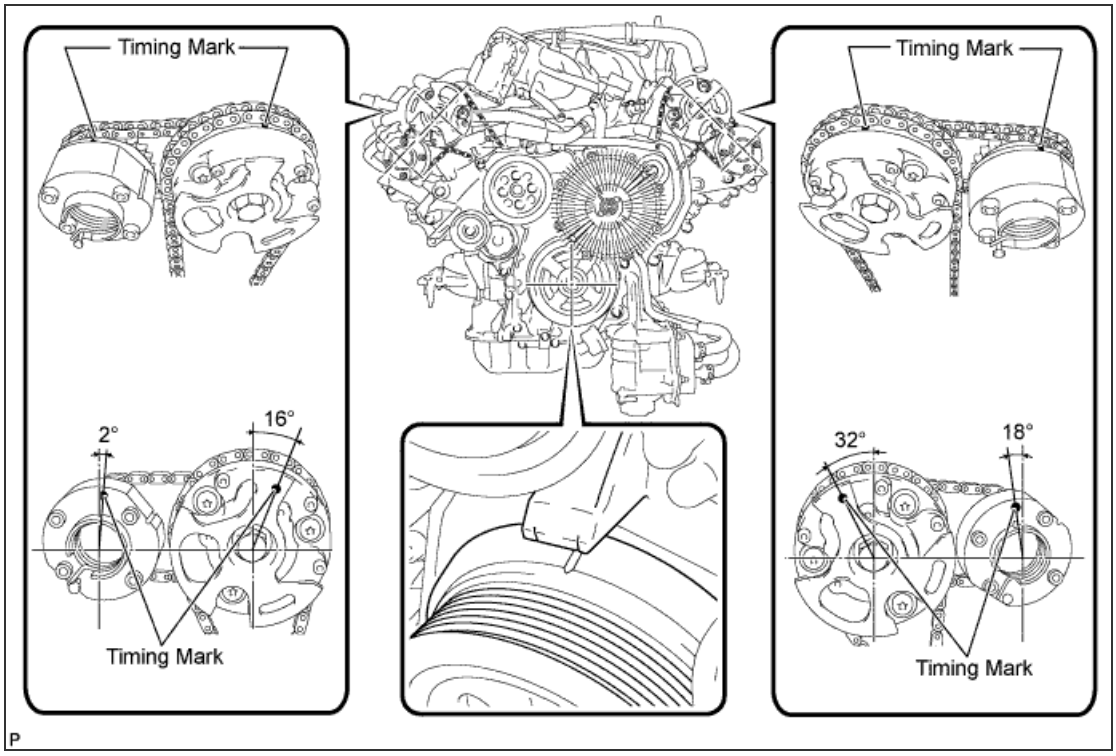
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

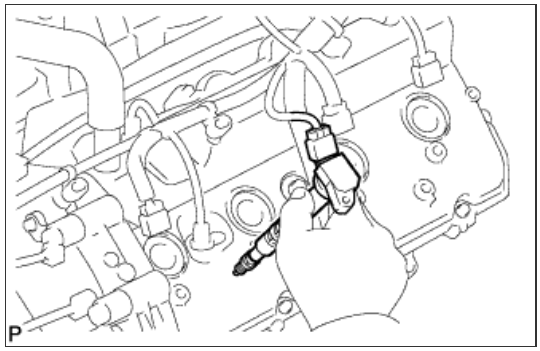
OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

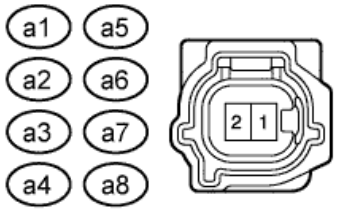
a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

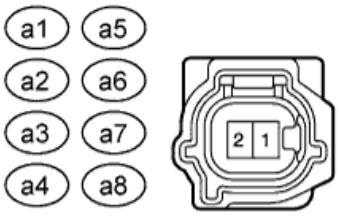
Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

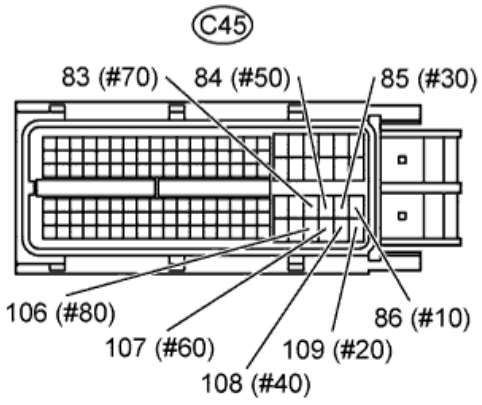
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

(to Injector)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.CHECK FUEL INJECTOR ASSEMBLY OF MISFIRING CYLINDER

Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

27.CHECK HARNESS AND CONNECTOR

a. Check the connection and terminal contact pressure of connectors and wire harnesses between the mass air flow meter and ECM (Click here).

HINT:

Repair any problems.

NEXT

28.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
ABNORMAL (P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308 output)	A
NORMAL (No DTC output)	B

B → END

A

29.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

		Specified

Tester Connection	Condition	Condition
C50-3 (VG) - C45-74 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C45-75 (E2G)	Always	Below 1 Ω
C50-3 (VG) or C45-74 (VG) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

30.REPLACE MASS AIR FLOW METER

Replace the mass air flow meter assembly (Click here).

HINT:

If the results of the inspections performed in steps 14 and 21 indicated no problem, proceed to the next step without replacing the mass air flow meter assembly.

NEXT

31.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
NORMAL (No DTC output)	A

END

32.CHANGE TO CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the installed spark plug to a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 33

OK ↓

REPLACE SPARK PLUG (Click here)

33.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the ignition coil to an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK ↓

REPLACE IGNITION COIL (Click here)

a. Check the fuel lines for leaks or blockage.

NG → REPAIR OR REPLACE FUEL LINE

OK ↓

REPLACE FUEL PUMP ASSEMBLY (Click here)

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The throttle actuator does not close when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**
P2112	The throttle actuator does not open when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Refer to Data List Active Test Throttle Position Command, Throttle Position No. 1, Throttle Motor Current, Throttle Motor Duty (Open Throttle Motor Duty (Close Click here .**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

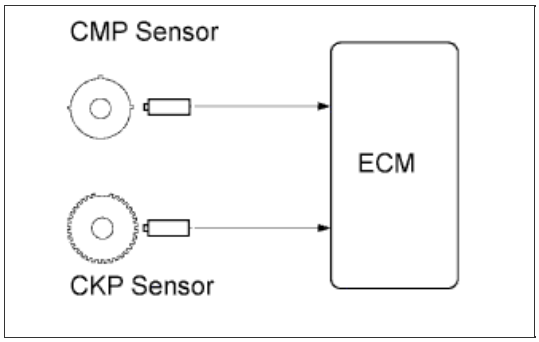
DTC P0305 Cylinder 5 Misfire Detected



DTC P0306 Cylinder 6 Misfire Detected

DTC P0307 Cylinder 7 Misfire Detected

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

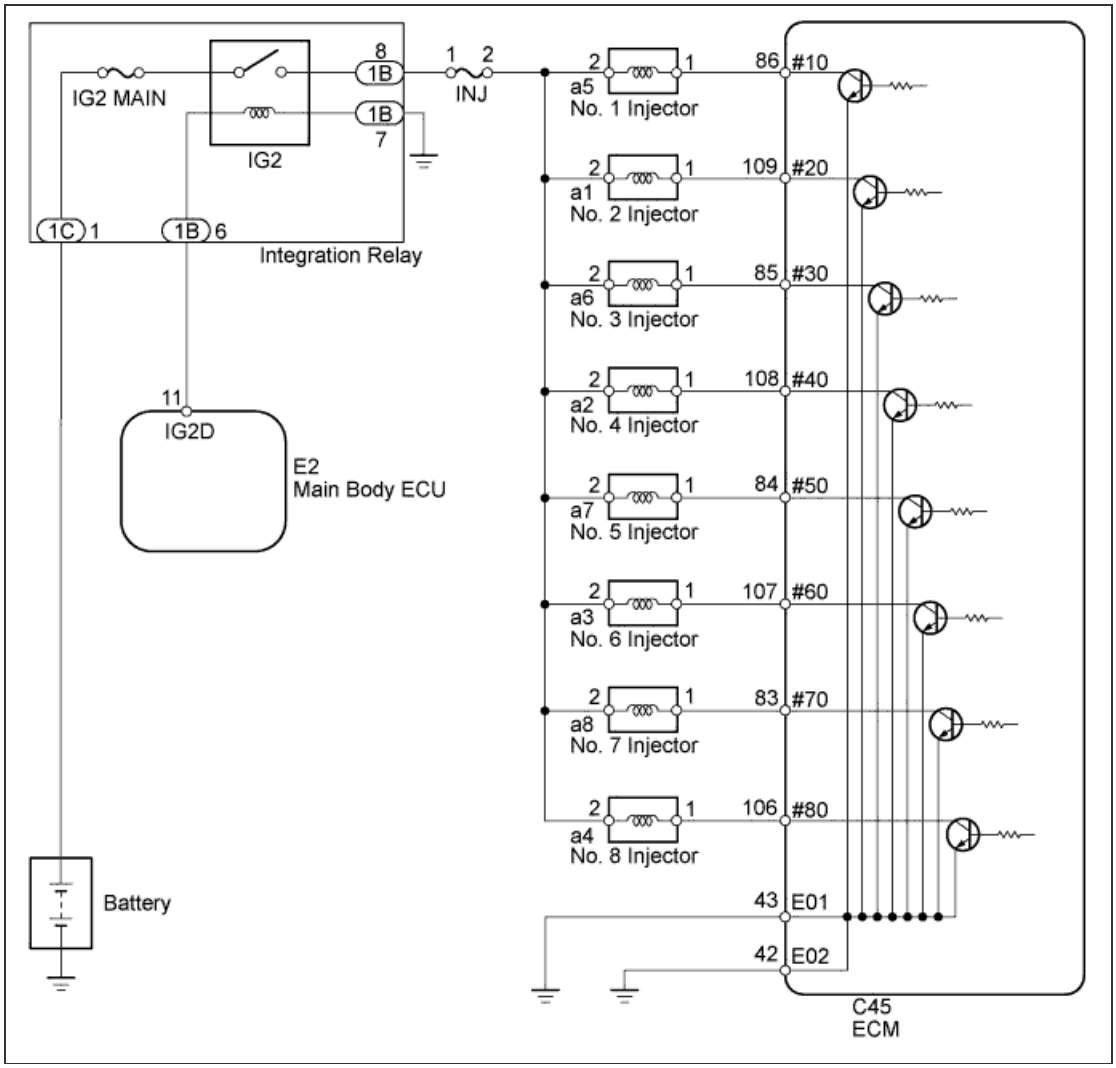
HINT:

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

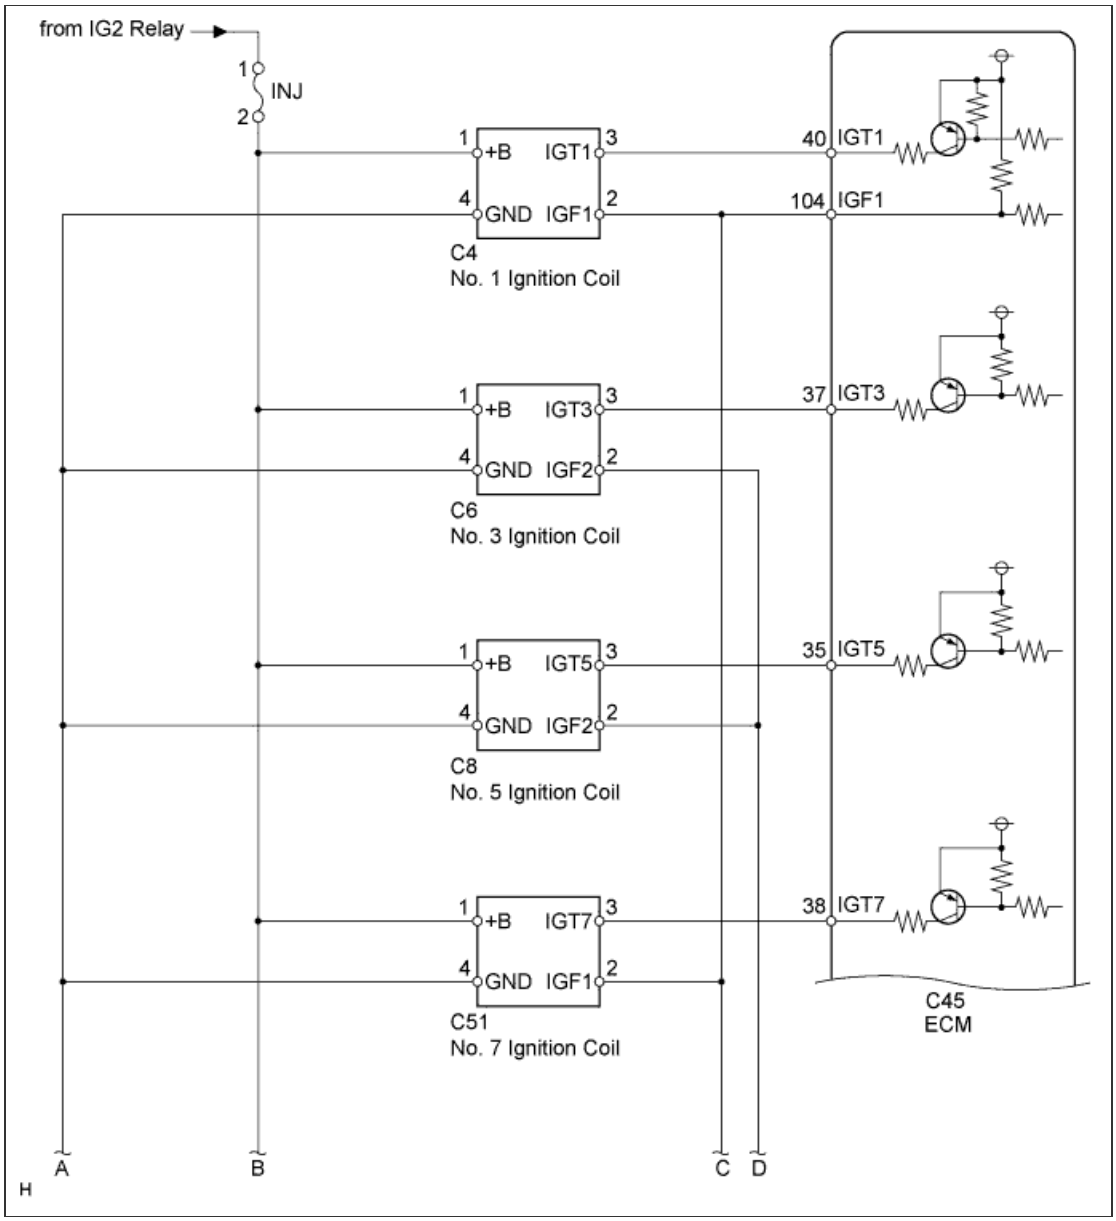
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

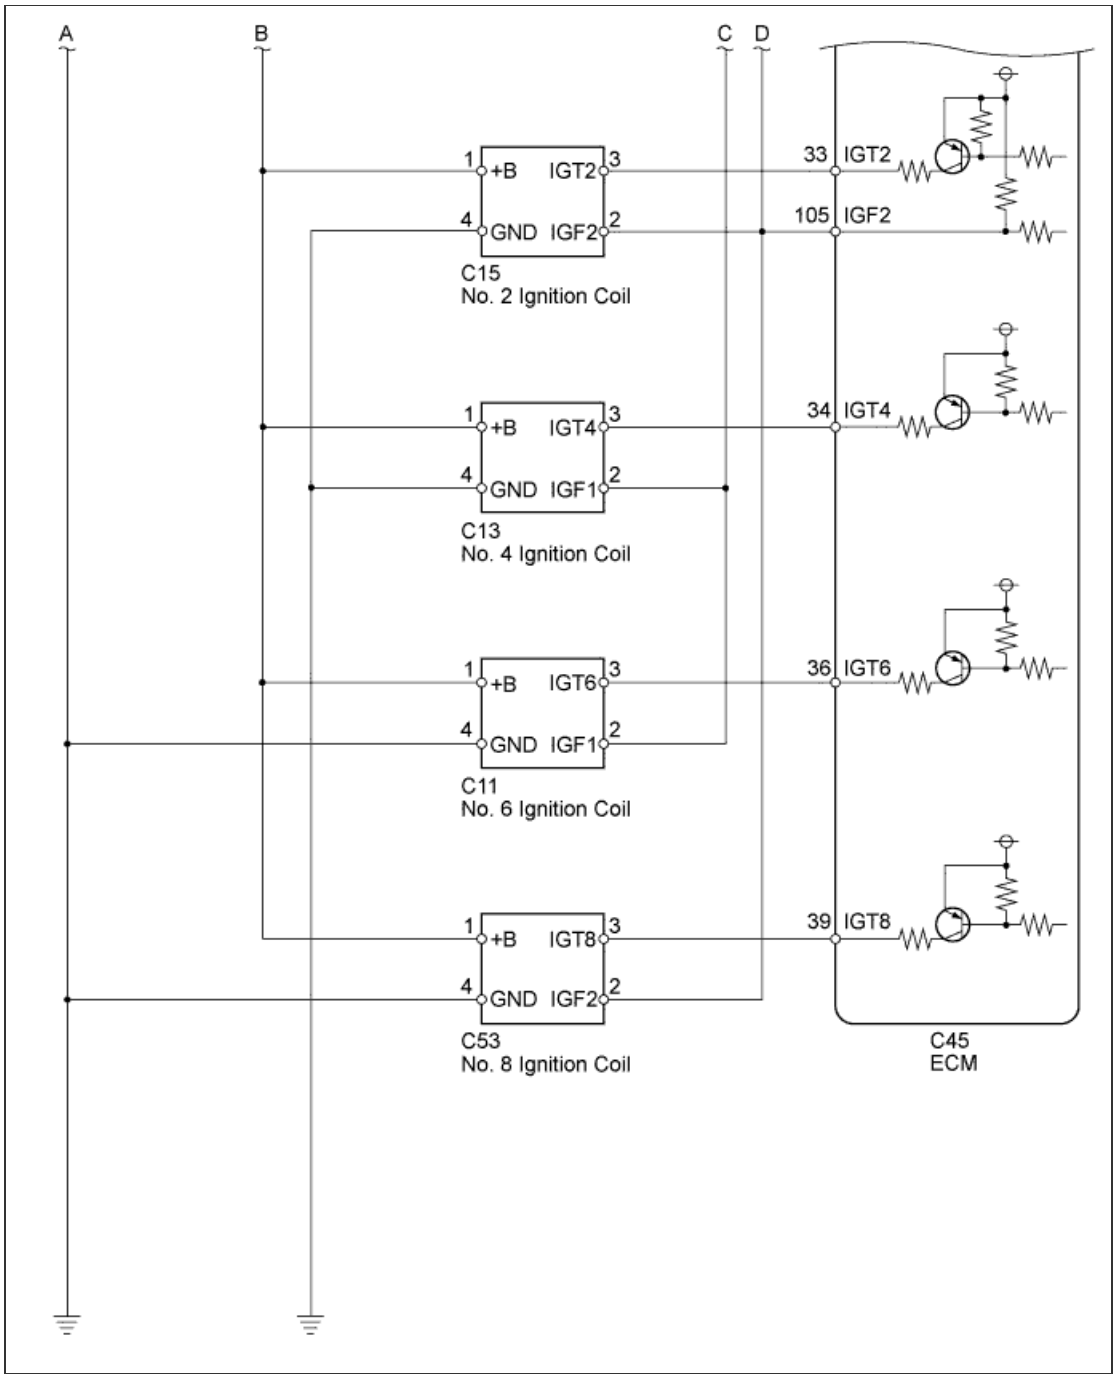
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

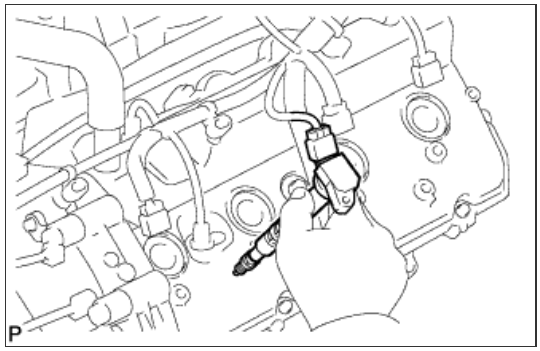
HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

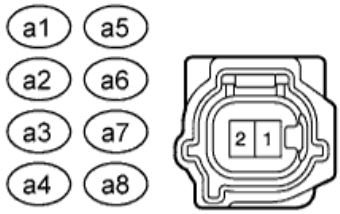
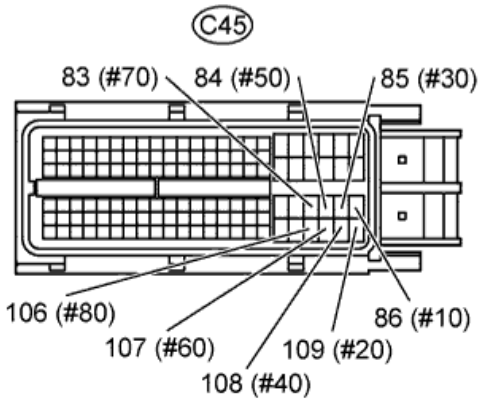
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

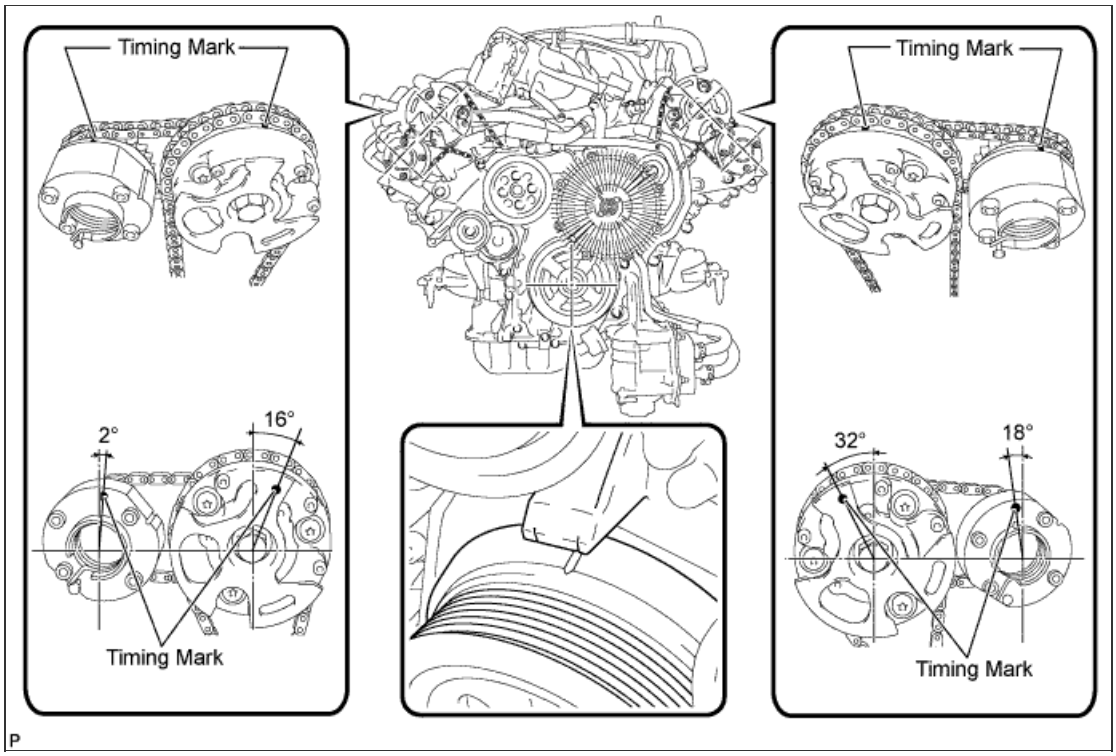
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

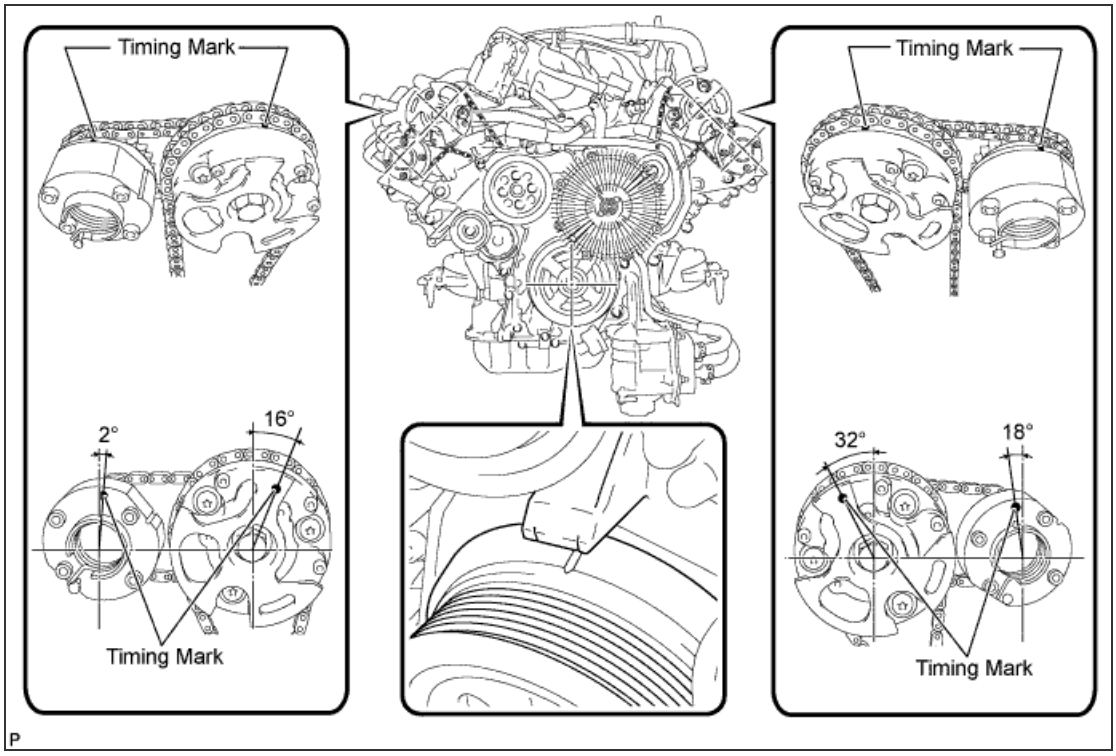
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

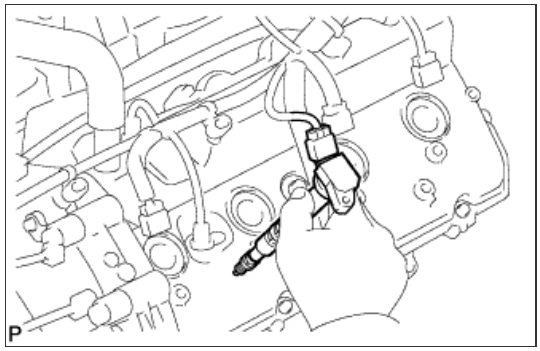
OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

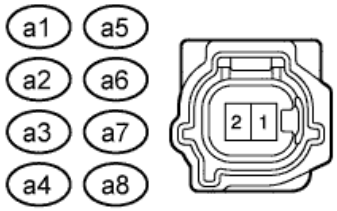
a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

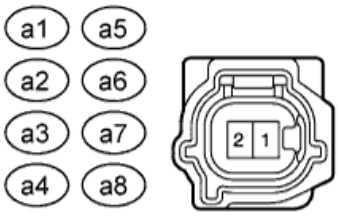
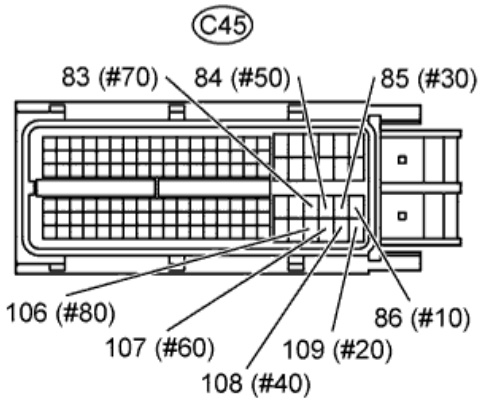
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

Front view of wire harness connector:
(to Injector)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.CHECK FUEL INJECTOR ASSEMBLY OF MISFIRING CYLINDER

Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

27.CHECK HARNESS AND CONNECTOR

a. Check the connection and terminal contact pressure of connectors and wire harnesses between the mass air flow meter and ECM (Click here).

HINT:

Repair any problems.

NEXT

28.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
ABNORMAL (P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308 output)	A
NORMAL (No DTC output)	B

B → END

A

29.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

		Specified

Tester Connection	Condition	Condition
C50-3 (VG) - C45-74 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C45-75 (E2G)	Always	Below 1 Ω
C50-3 (VG) or C45-74 (VG) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

30.REPLACE MASS AIR FLOW METER

Replace the mass air flow meter assembly (Click here).

HINT:

If the results of the inspections performed in steps 14 and 21 indicated no problem, proceed to the next step without replacing the mass air flow meter assembly.

NEXT

31.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
NORMAL (No DTC output)	A
ABNORMAL (P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308 output)	B

B → REPLACE ECM (**Click here**)

A

END

32.CHANGE TO CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the installed spark plug to a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 33

OK ↓

REPLACE SPARK PLUG (Click here)

33.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the ignition coil to an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK ↓

REPLACE IGNITION COIL (Click here)

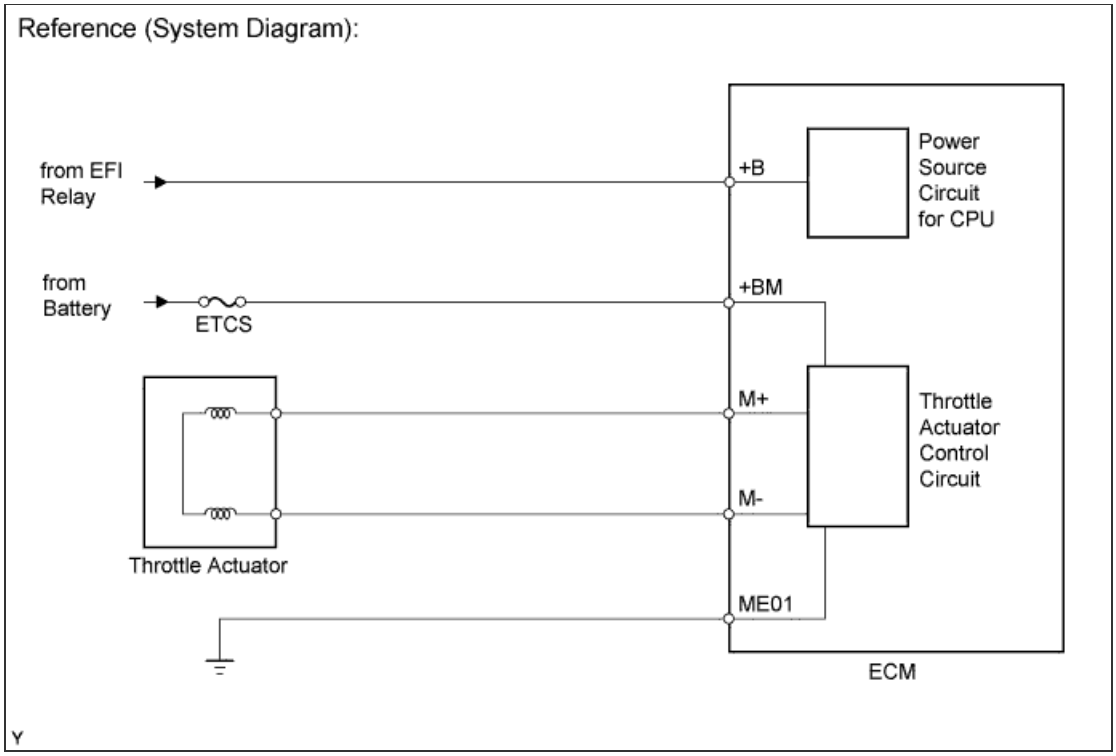
34.CHECK FUEL LINE

a. Check the fuel lines for leaks or blockage.

NG → REPAIR OR REPLACE FUEL LINE

OK ↓

REPLACE FUEL PUMP ASSEMBLY (Click here)



for Preparation Click here

DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (below 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the engine switch off. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.

HINT:

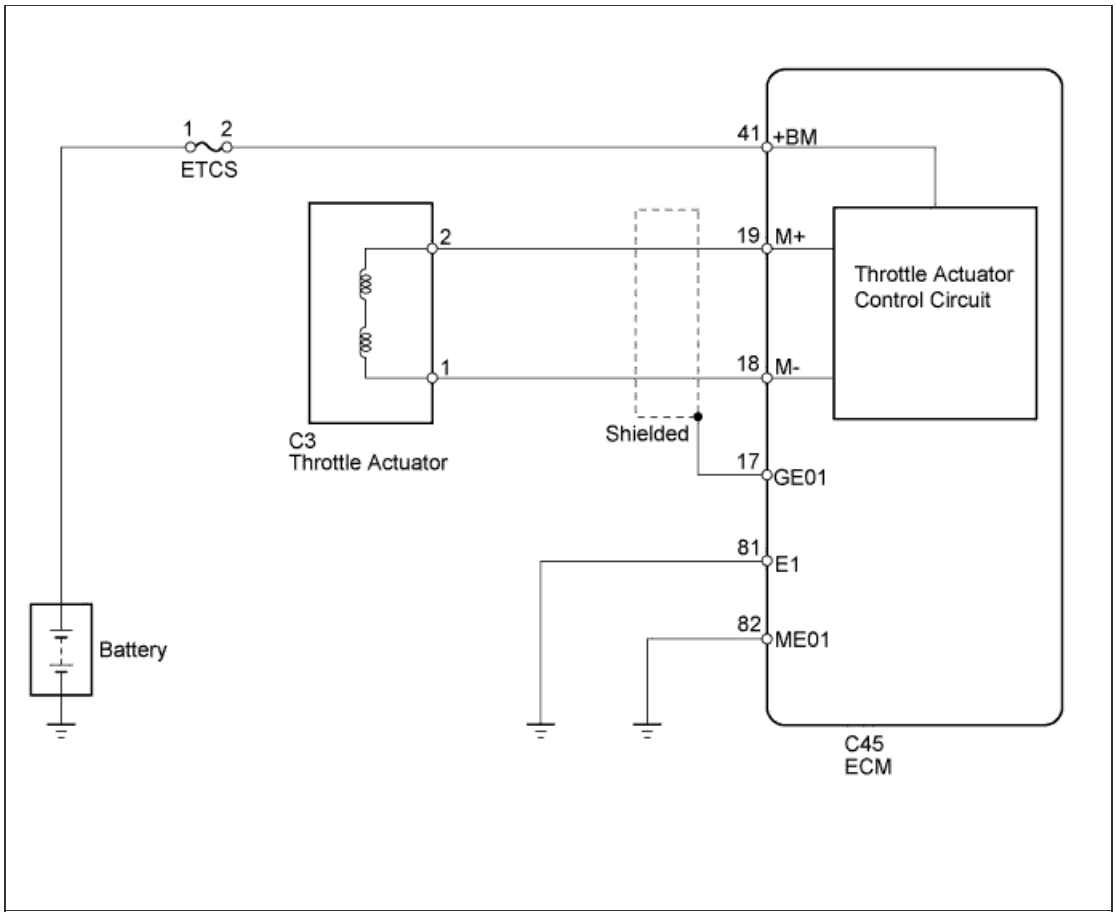
The ETCS does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2118	An open in the ETCS power source (+BM) circuit (1 trip detection logic).	• Open in ETCS power source circuit • ETCS fuse • ECM



MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored 5 seconds after the engine is next started.

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

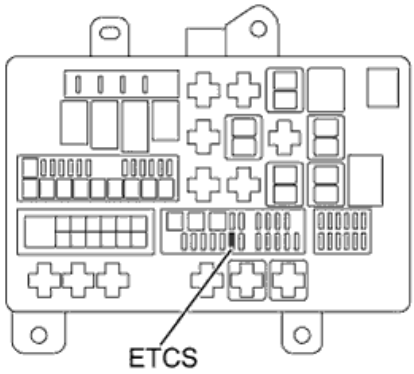
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT FUSE (ETCS)



a. Remove the ETCS fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
ETCS fuse	Always	Below 1 Ω

Engine Room Relay Block:

NG → CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

2.CHECK HARNESS AND CONNECTOR (ECM - ETCS FUSE, ETCS FUSE - BATTERY)

a. Check the harness and connector between the ETCS fuse and ECM.

i. Remove the ETCS fuse from the engine room relay block.

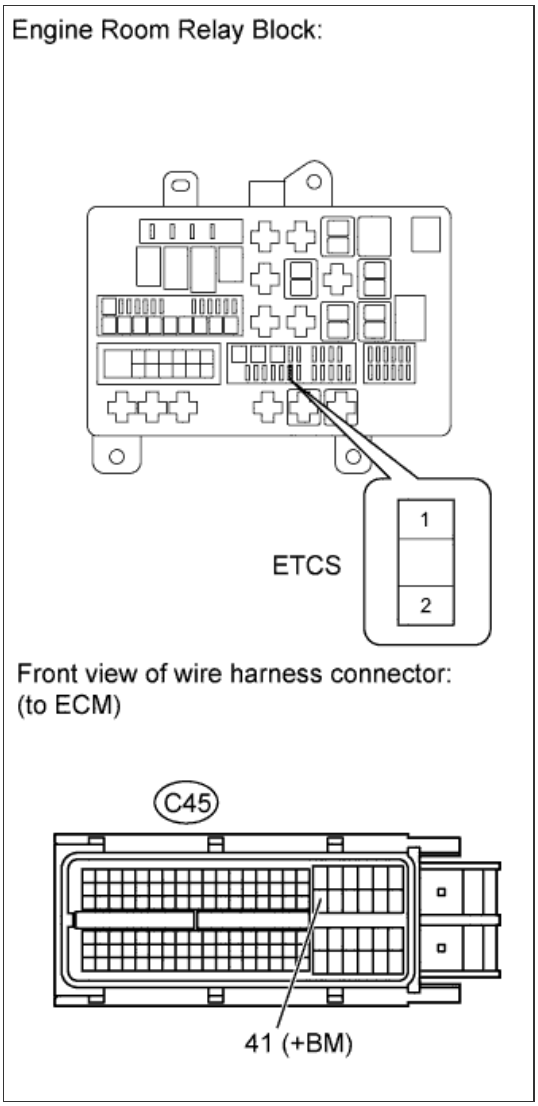
ii. Disconnect the C45 ECM connector.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
ETCS fuse terminal 2 - C45-41 (+BM)	Always	Below 1 Ω
ETCS fuse terminal 2 or C45-41 (+BM) - Body ground	Always	10 kΩ or higher

b. Check the harness and connector between the ETCS fuse and positive battery cable.



i. Remove the ETCS fuse from the engine room relay block.

ii. Disconnect the cable from the positive (+) battery terminal.

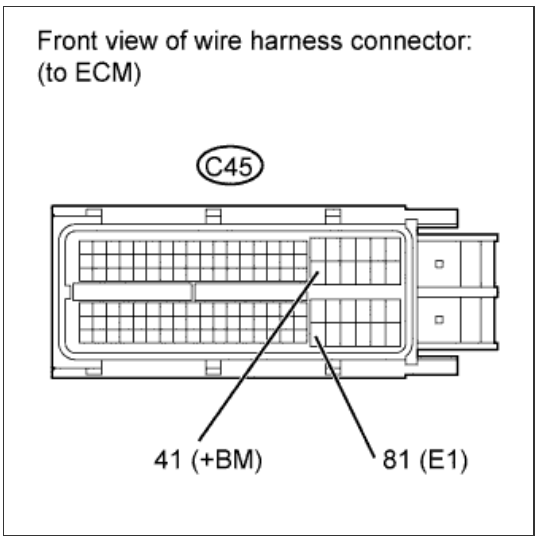
iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive battery cable - ETCS fuse terminal 1	Always	Below 1 Ω
Positive battery cable or ETCS fuse terminal 1 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



3.INSPECT ECM (+BM VOLTAGE)

a. Disconnect the C45 ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C45-41 (+BM) - C45-81 (E1)	Always	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (TERMINAL E1 - BODY GROUND)

OK

REPLACE ECM (Click here)

DTC P0307 Cylinder 7 Misfire Detected

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

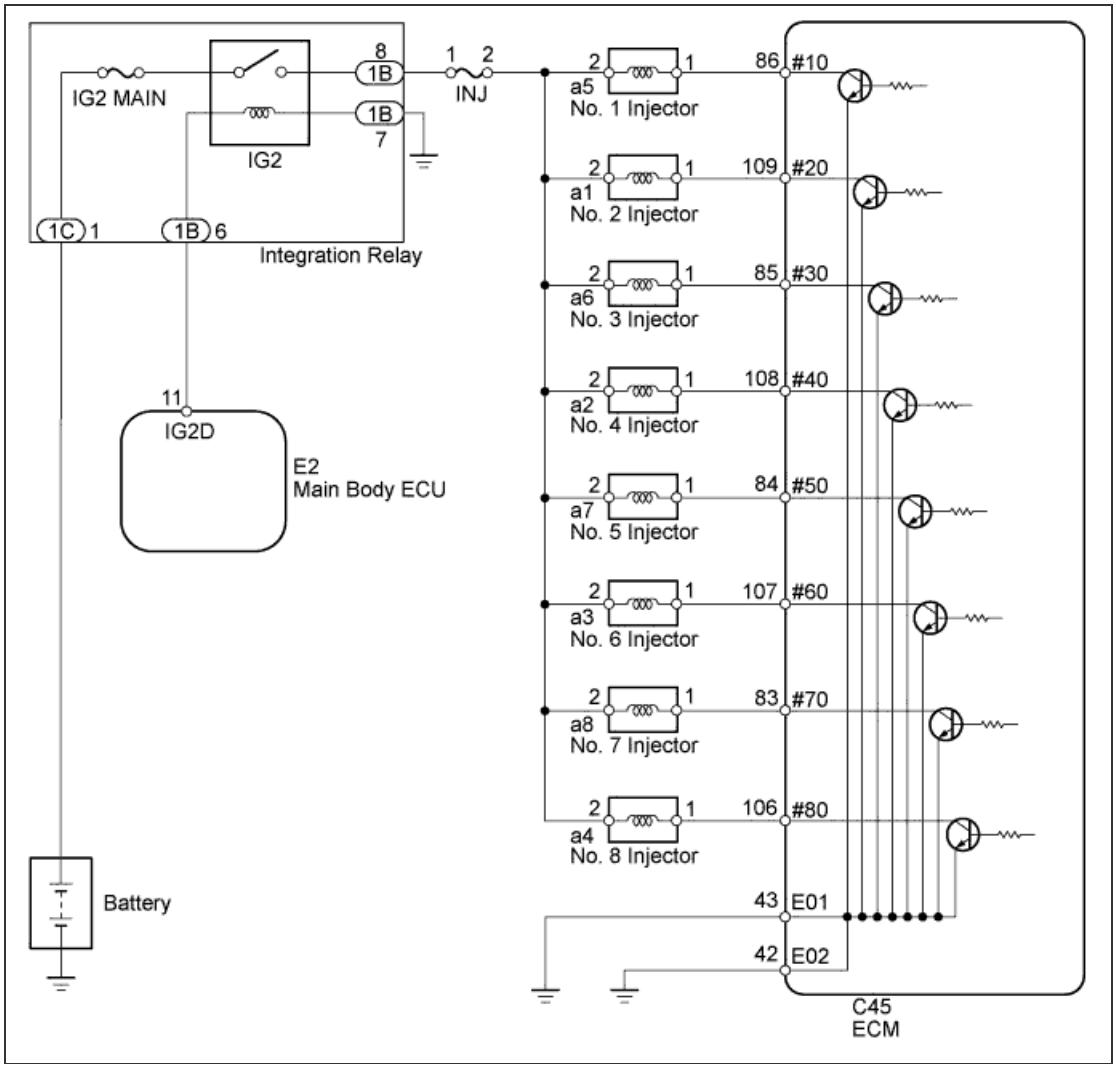
HINT:

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

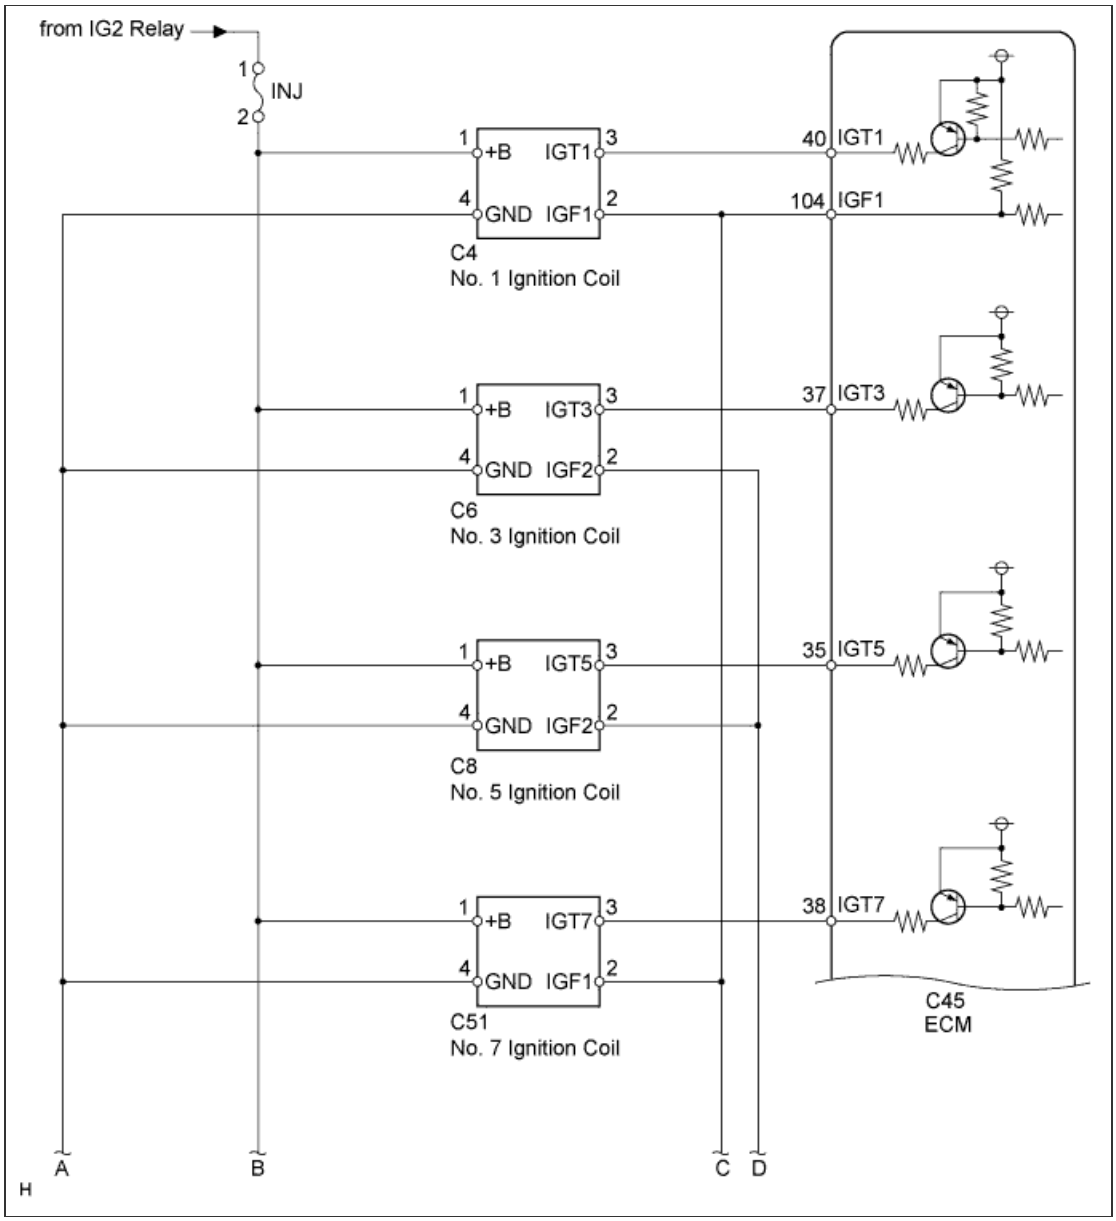
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

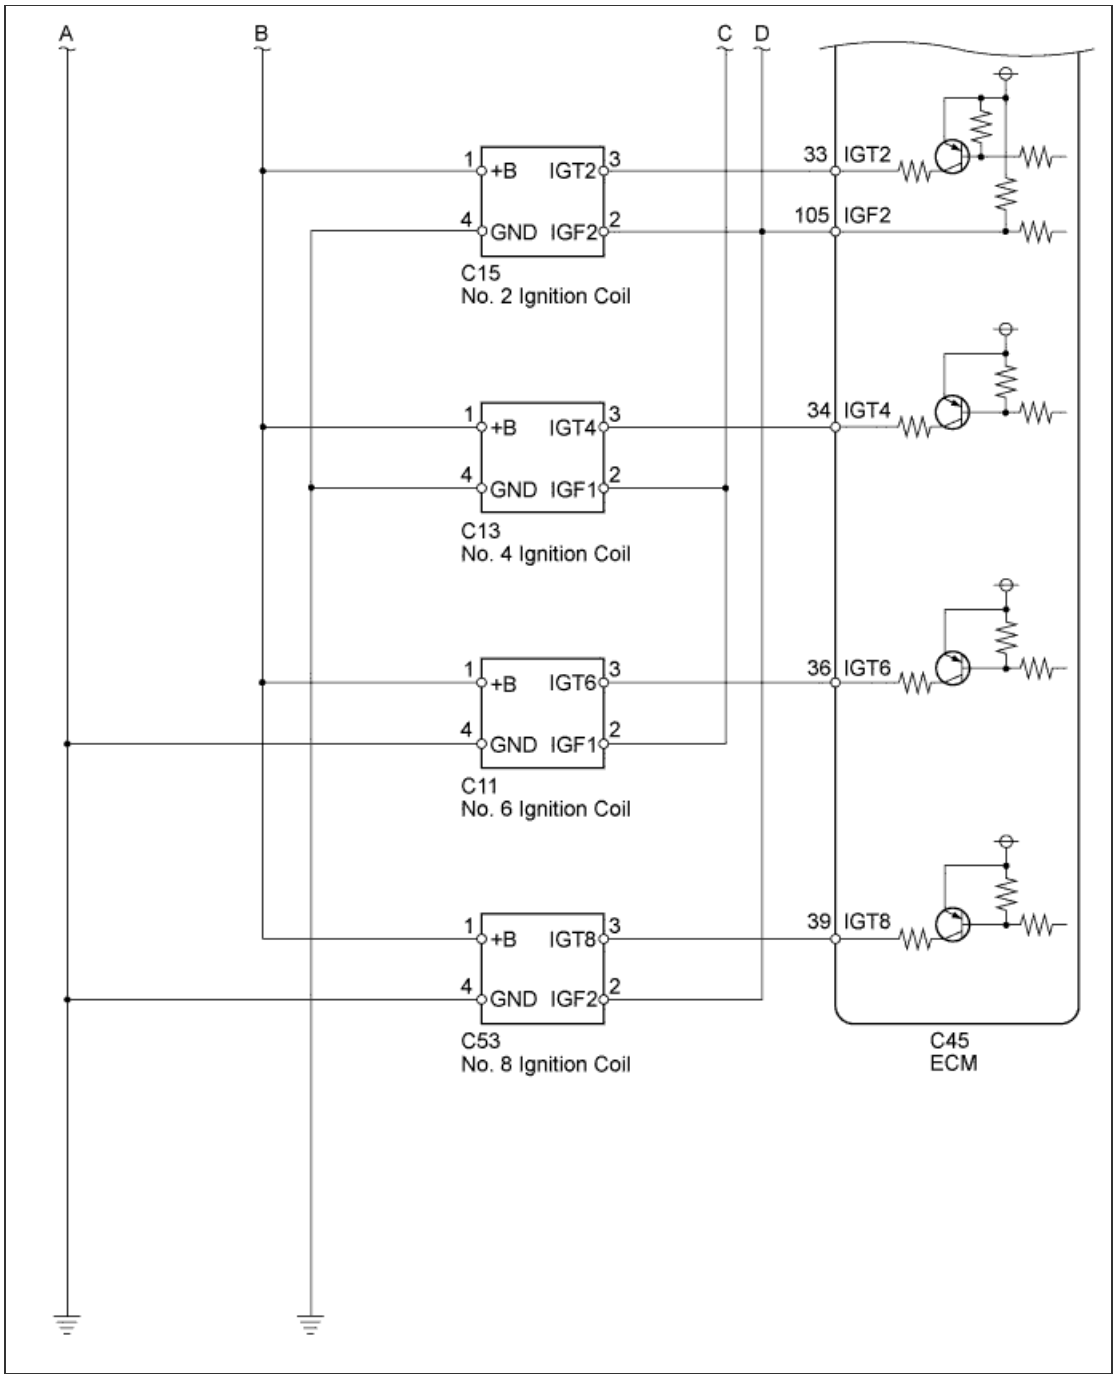
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

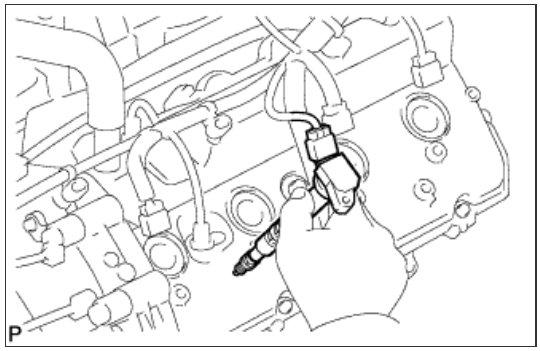
HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

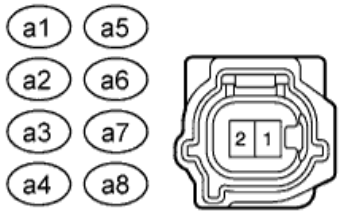
a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

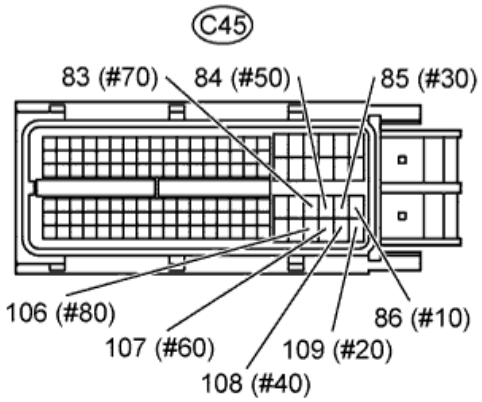
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

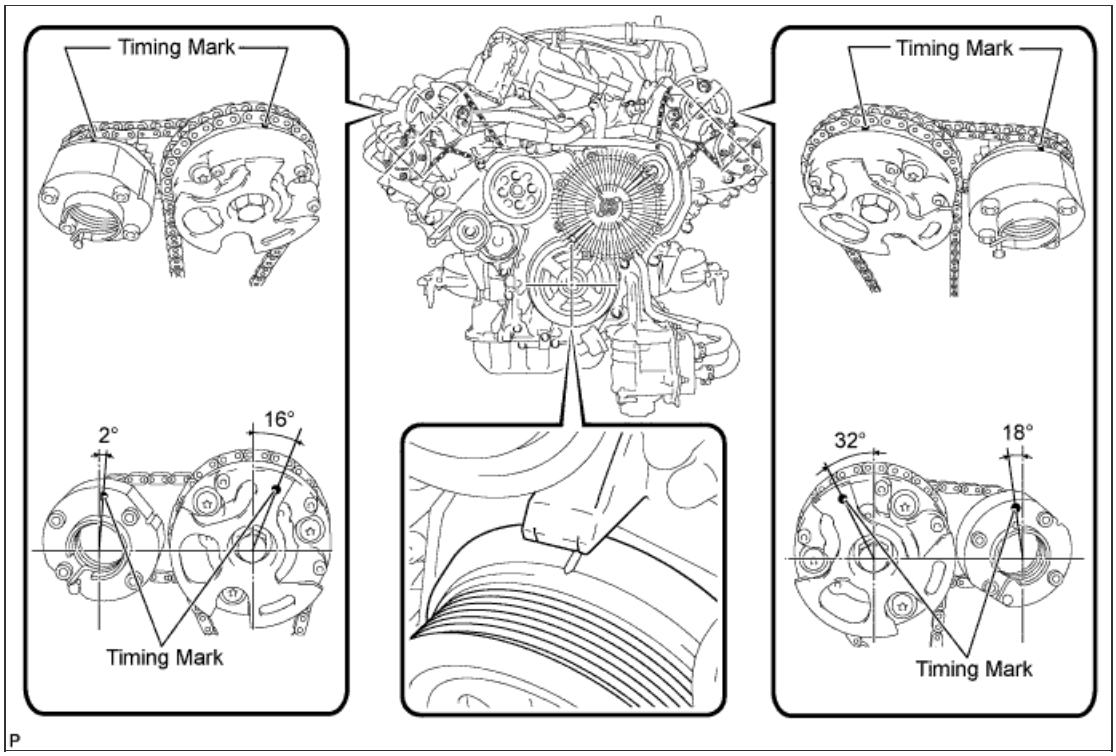
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

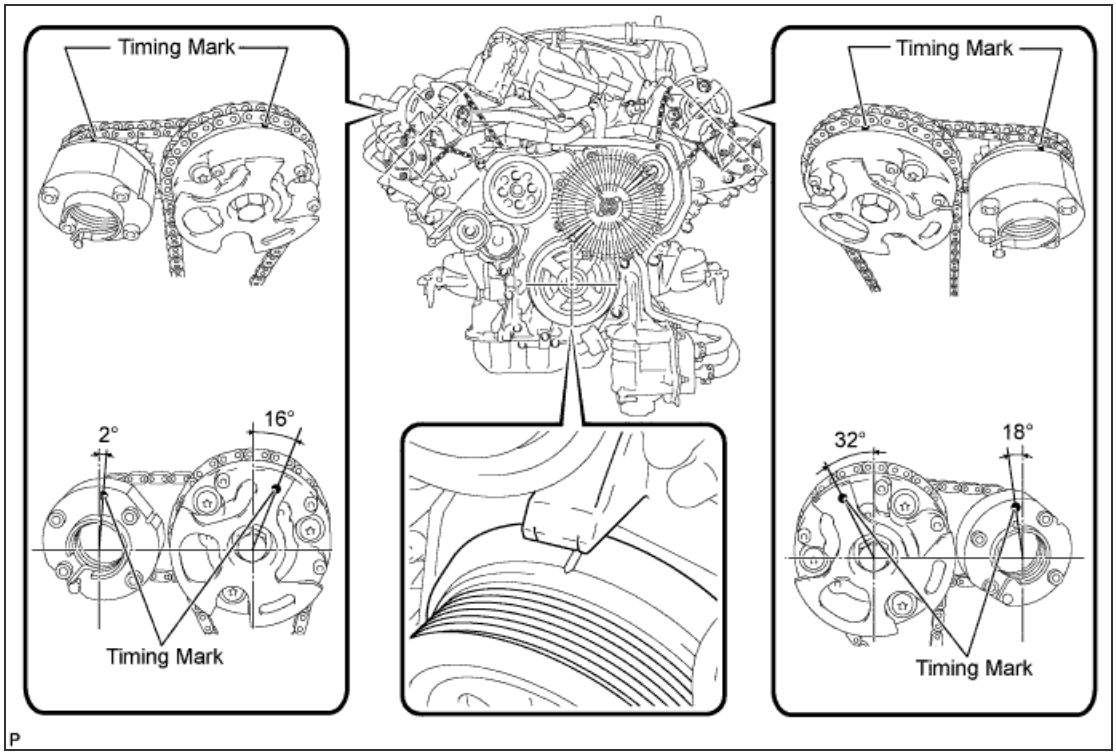
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

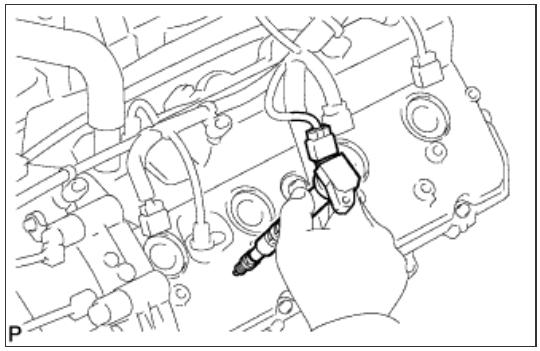
OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

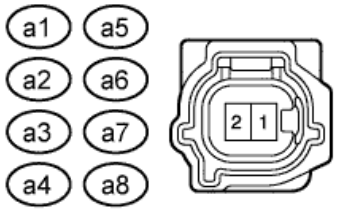
a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:

REPLACE FUEL PUMP ASSEMBLY (Click here)

DTC P2119 Throttle Actuator Control Throttle Body Range / Performance

for Preparation Click here

DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P2119	The throttle valve opening angle continues to vary greatly from the target opening angle (1 trip detection logic).	• ETCS • ECM

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

- **Refer to "Data List / Active Test" [Throttle Position Commanded, Throttle Position No. 1, Throttle Motor Current, Throttle Motor Duty (Open) and Throttle Motor Duty (Close)] (Click here).**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2119 is output	A
P2119 and other DTCs are output	B

HINT:

If any DTCs other than P2119 are output, troubleshoot those DTCs first.

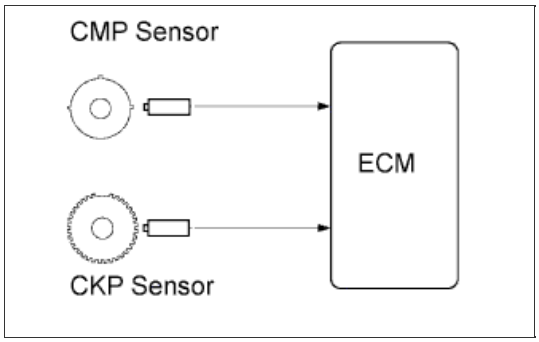
DTC P0304 Cylinder 4 Misfire Detected

DTC P0305 Cylinder 5 Misfire Detected



DTC P0306 Cylinder 6 Misfire Detected

DTC P0307 Cylinder 7 Misfire Detected

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

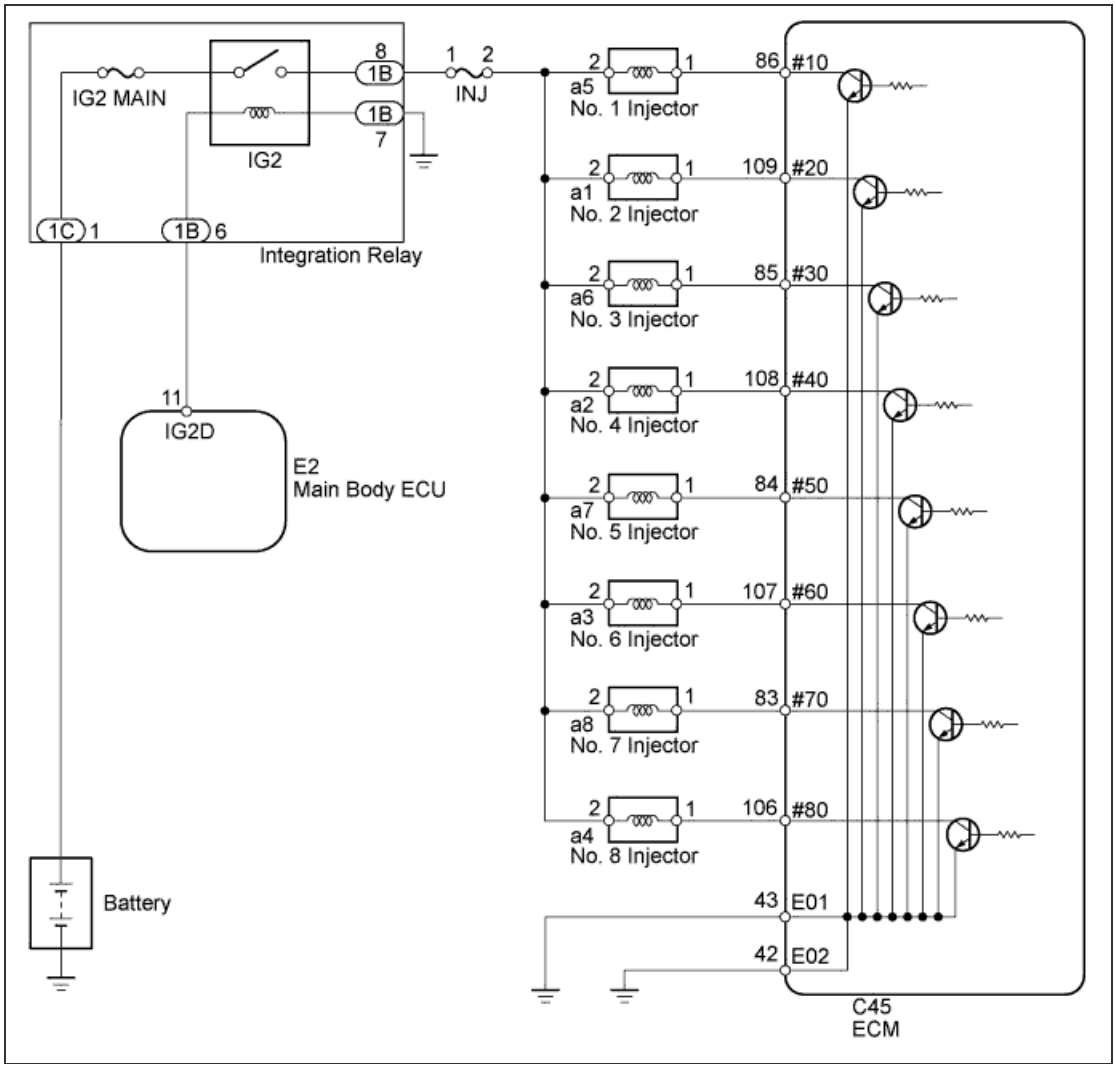
HINT:

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

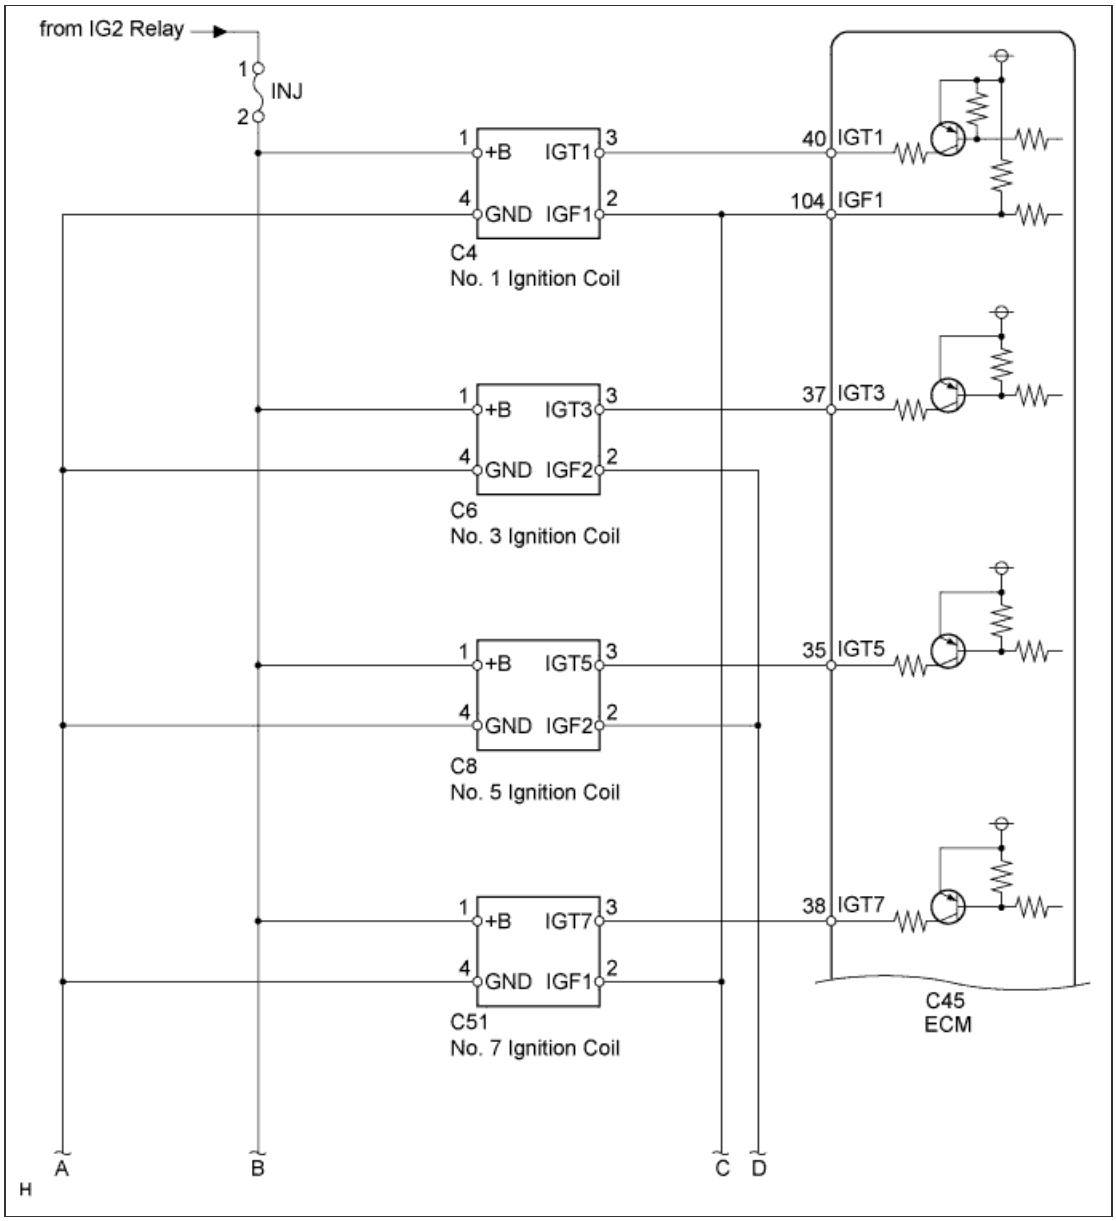
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

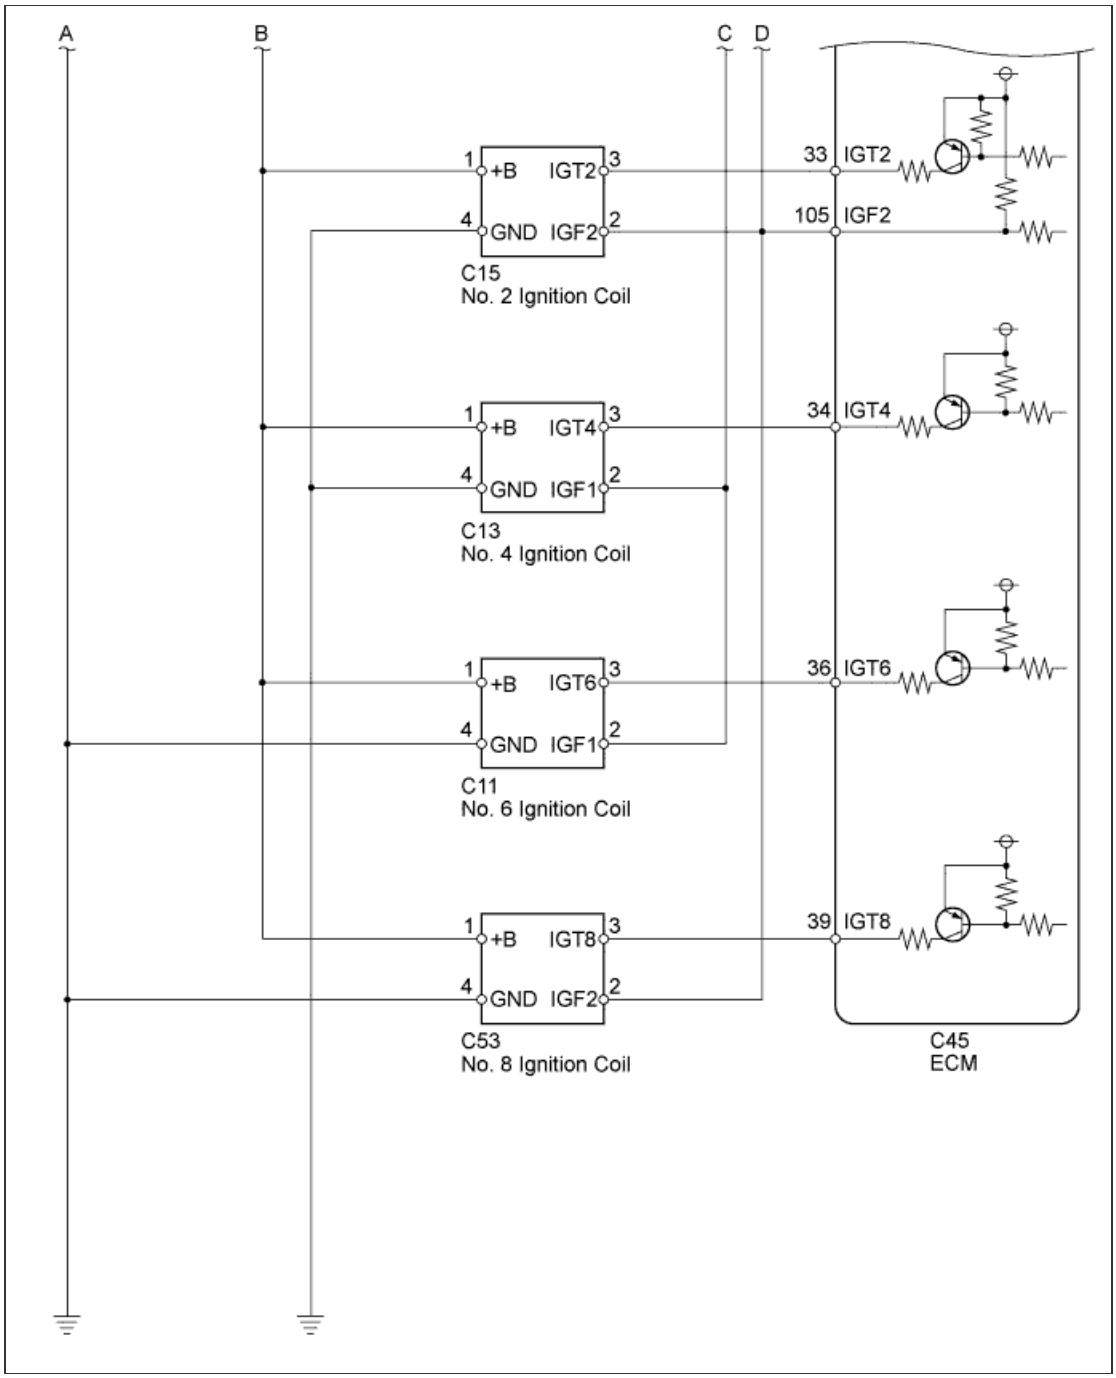
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

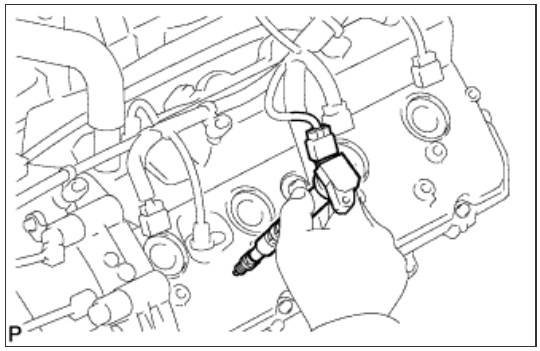
HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

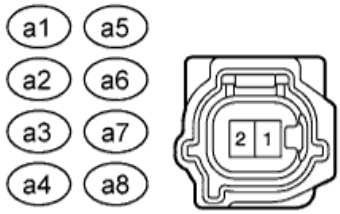
a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

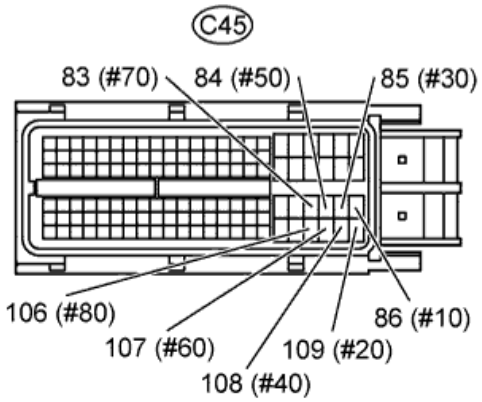
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

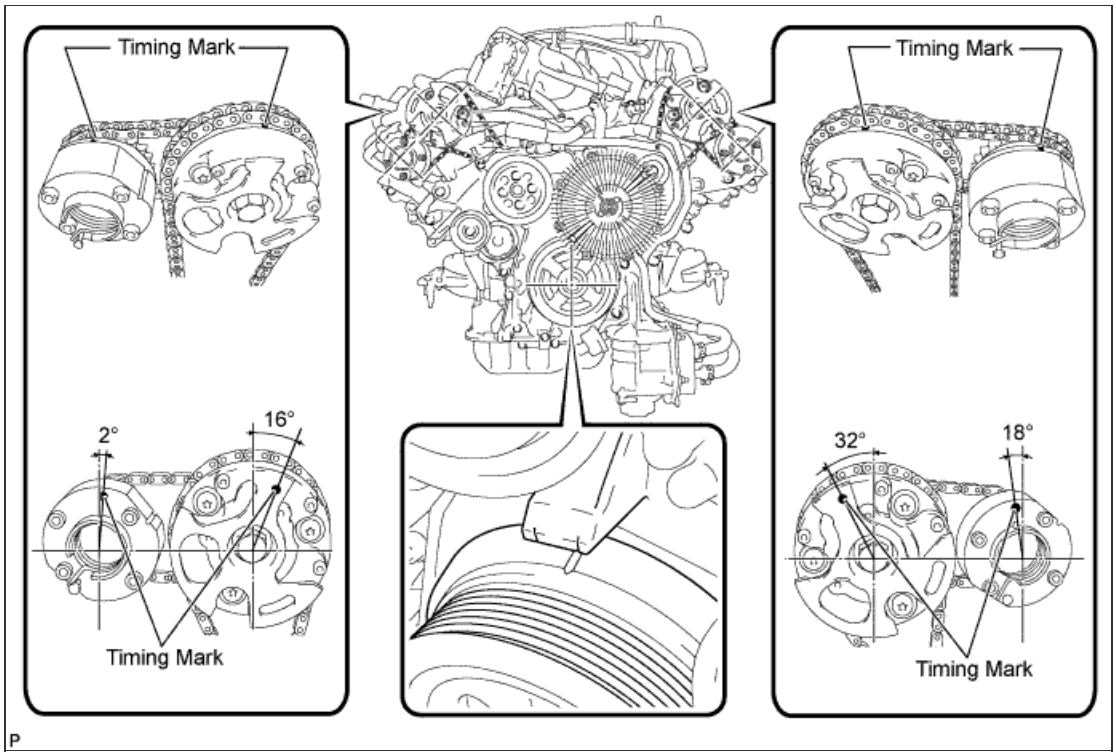
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

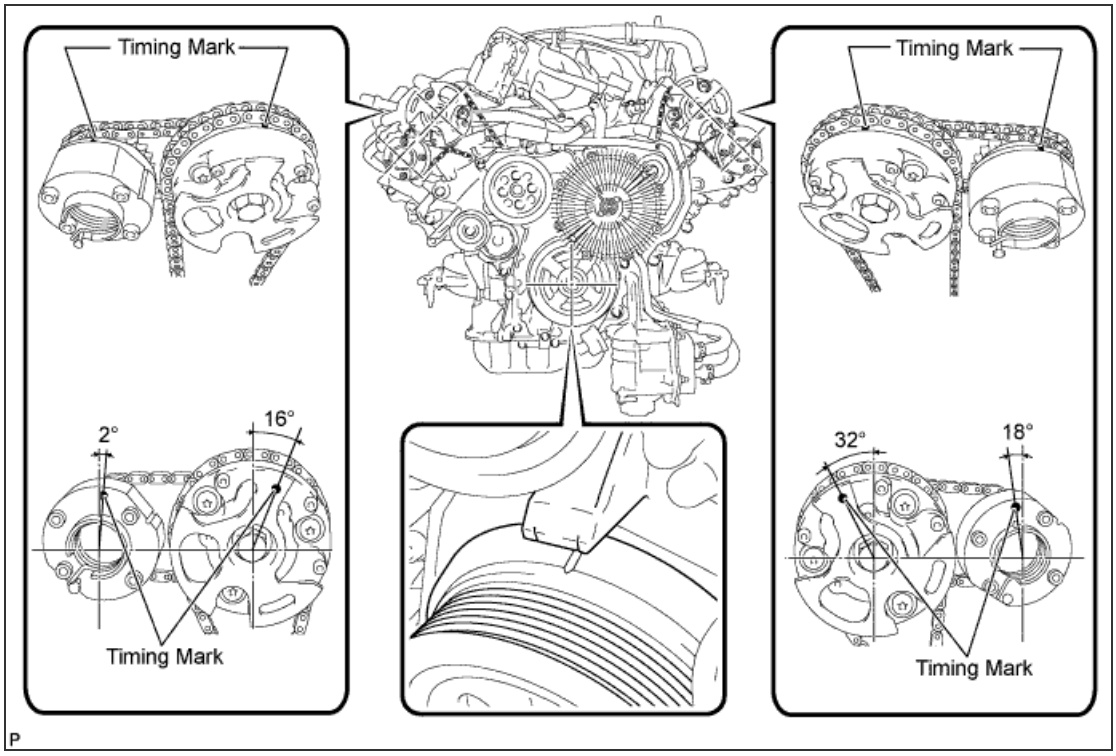
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

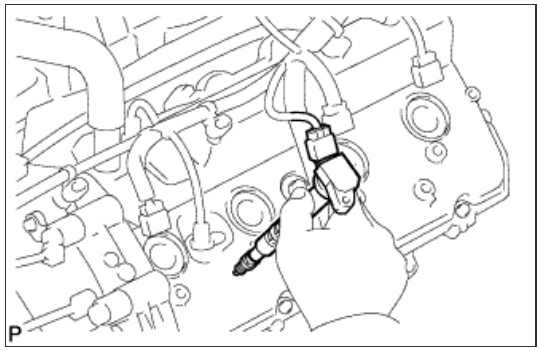
OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

23.CHECK CYLINDER COMPRESSION PRESSURE

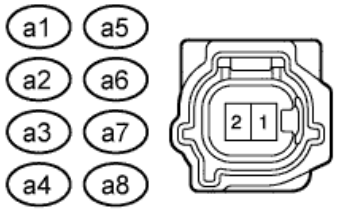
a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

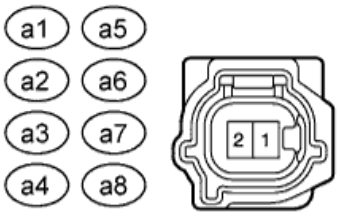
Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

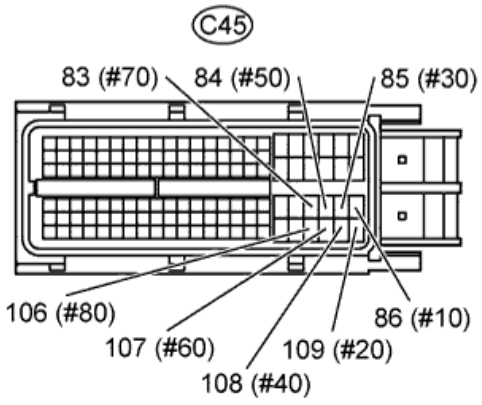
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

OK

26.CHECK FUEL INJECTOR ASSEMBLY OF MISFIRING CYLINDER

Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

27.CHECK HARNESS AND CONNECTOR

a. Check the connection and terminal contact pressure of connectors and wire harnesses between the mass air flow meter and ECM (Click here).

HINT:

Repair any problems.

NEXT

28.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
ABNORMAL (P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308 output)	A

32.CHANGE TO CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the installed spark plug to a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 33

OK ↓

REPLACE SPARK PLUG (Click here)

33.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the ignition coil to an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

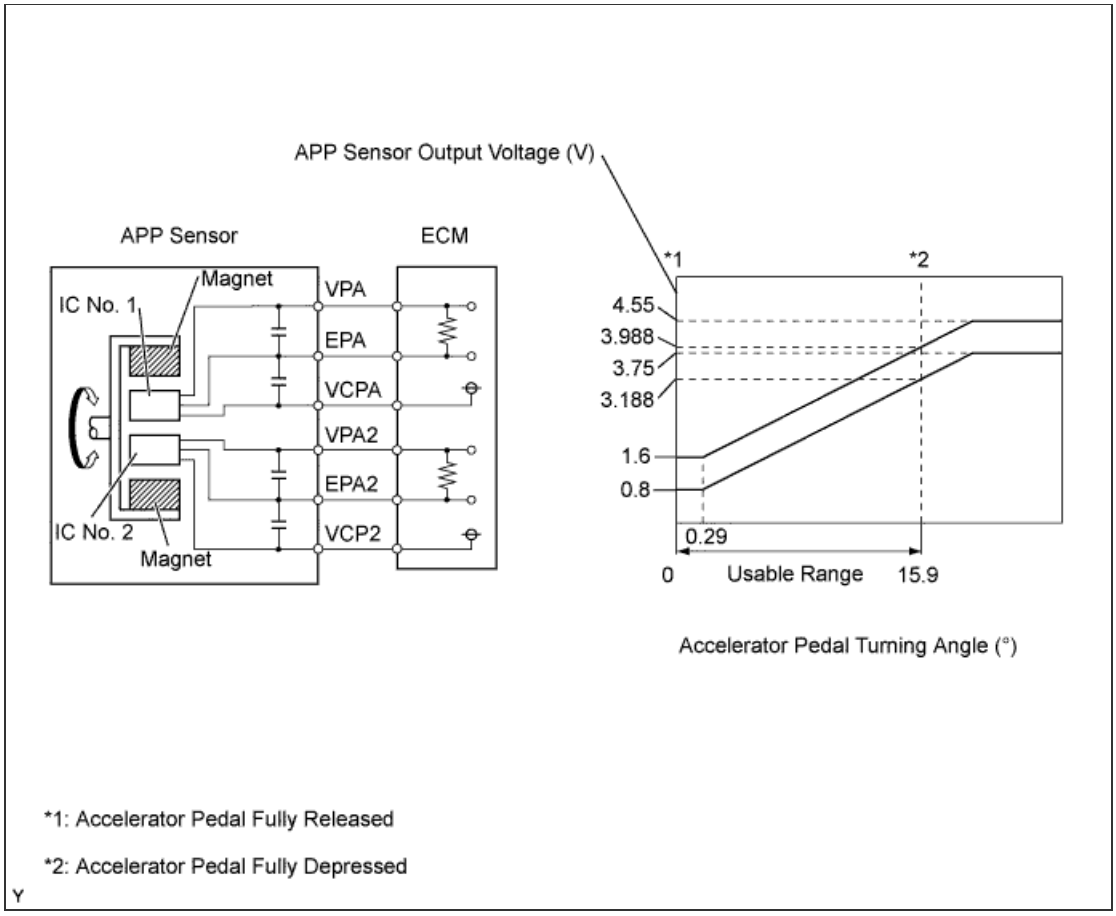
DTC P2138 Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation

for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

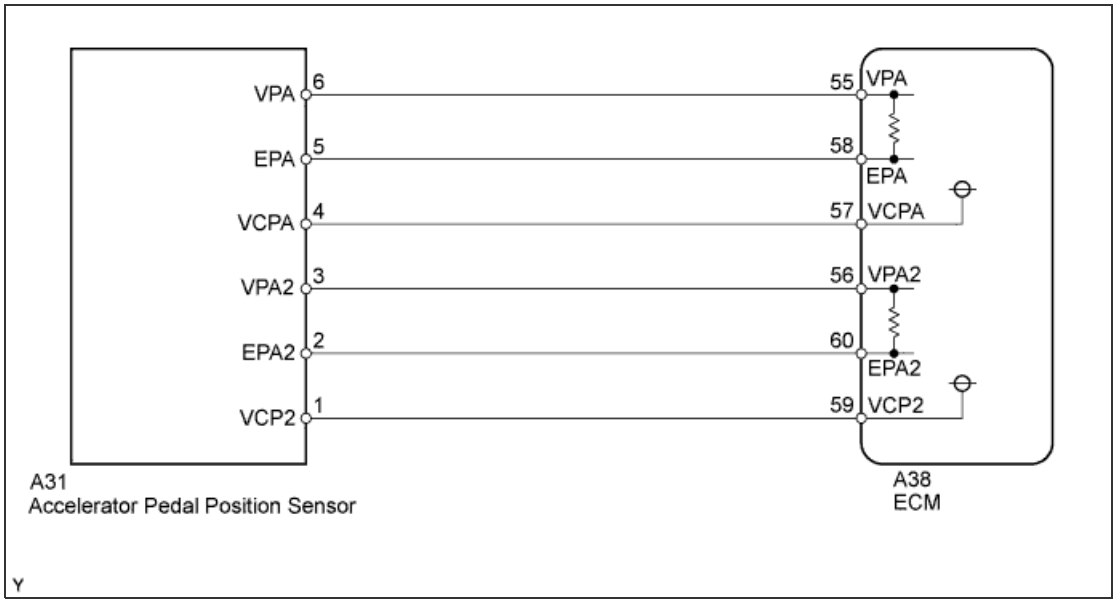
HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

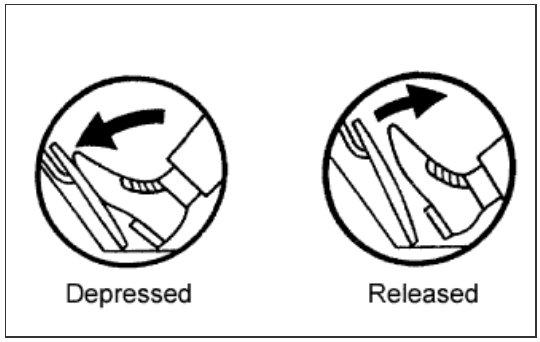
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 5.0 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

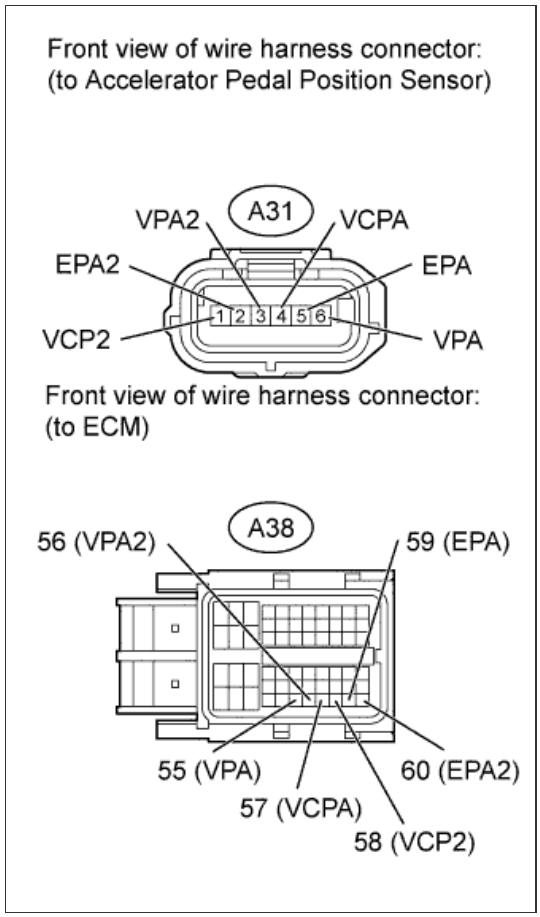
Result

Result	Proceed to
N	A
OK	B

B → Go to step 5

A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 ECM connector.

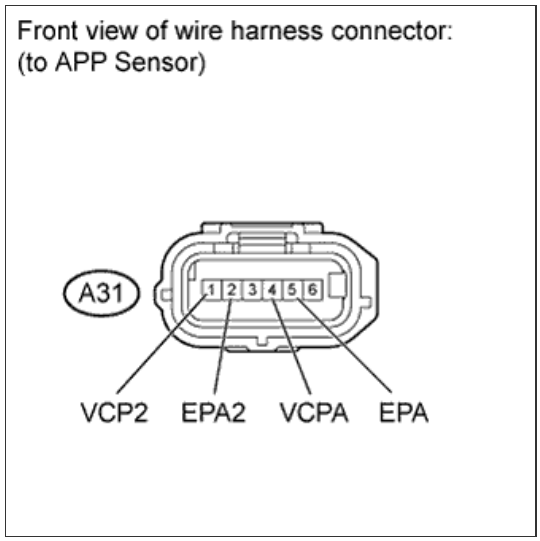
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



3.CHECK ECM (VCPA AND VCP2 VOLTAGE)

a. Disconnect the A31 APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

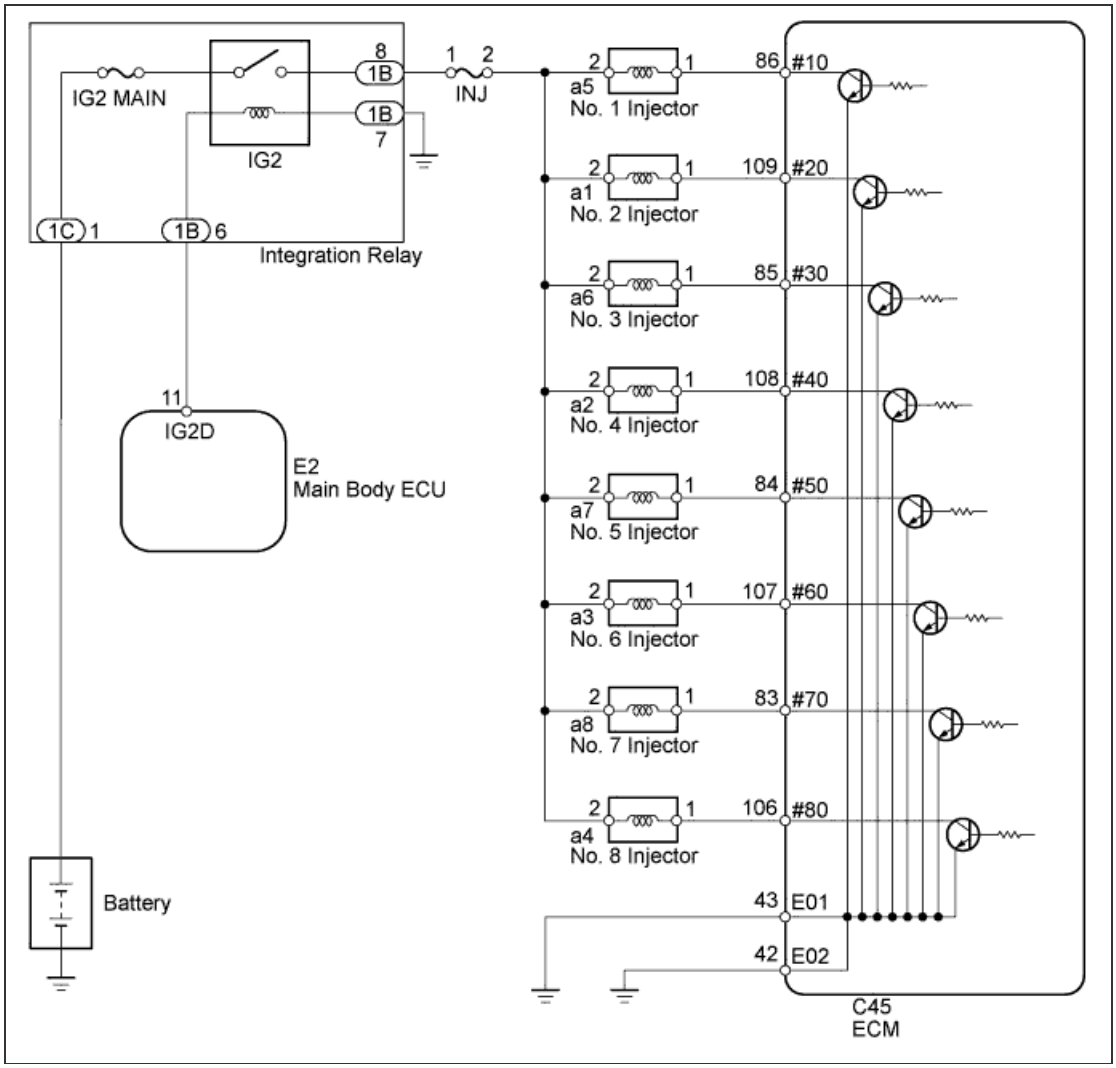
HINT:

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

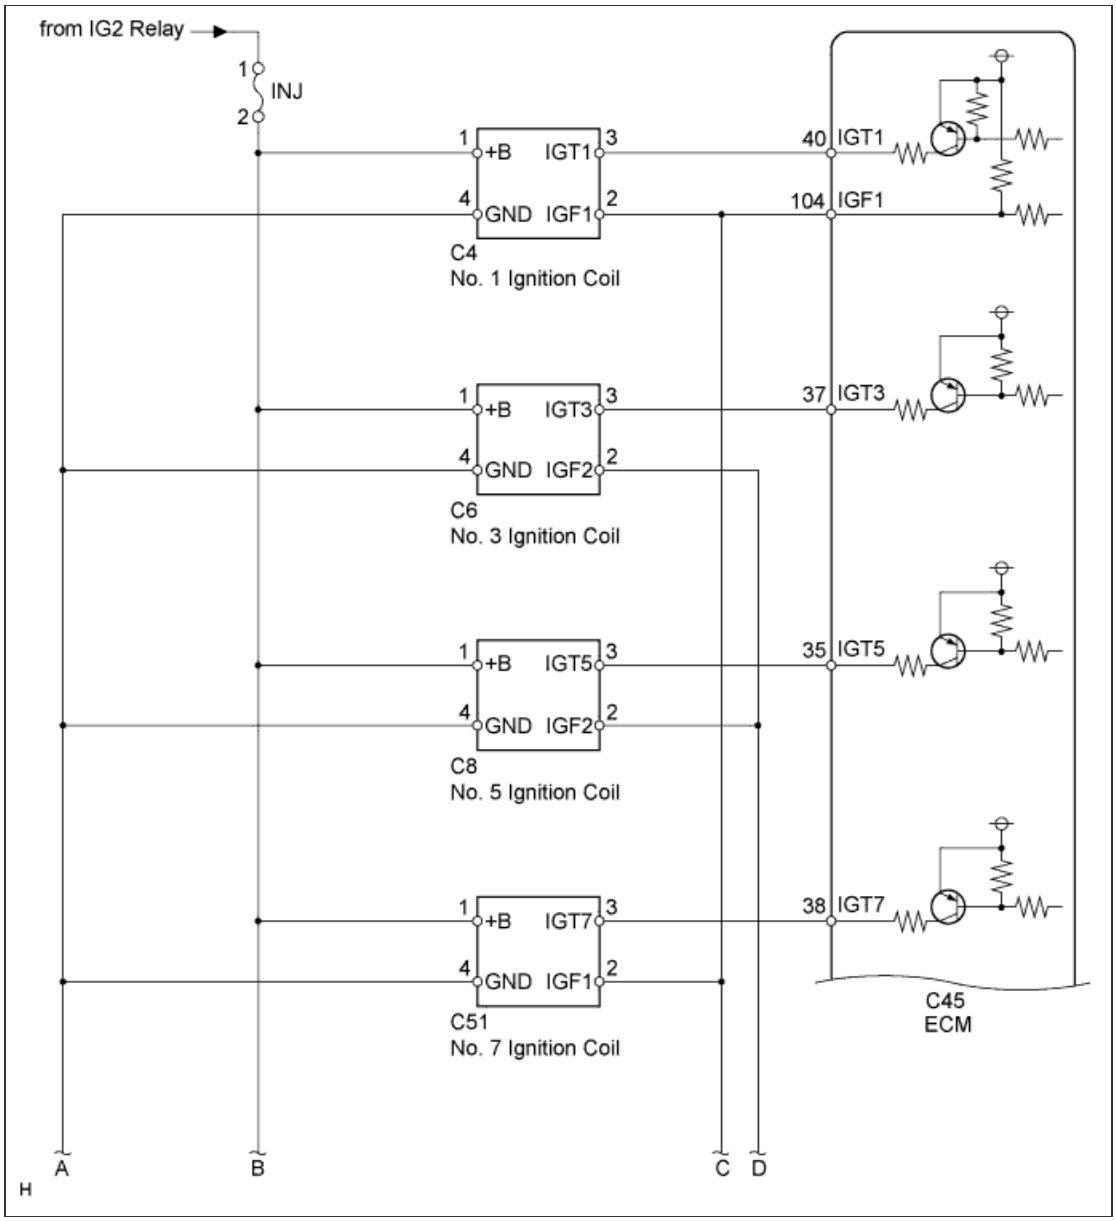
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

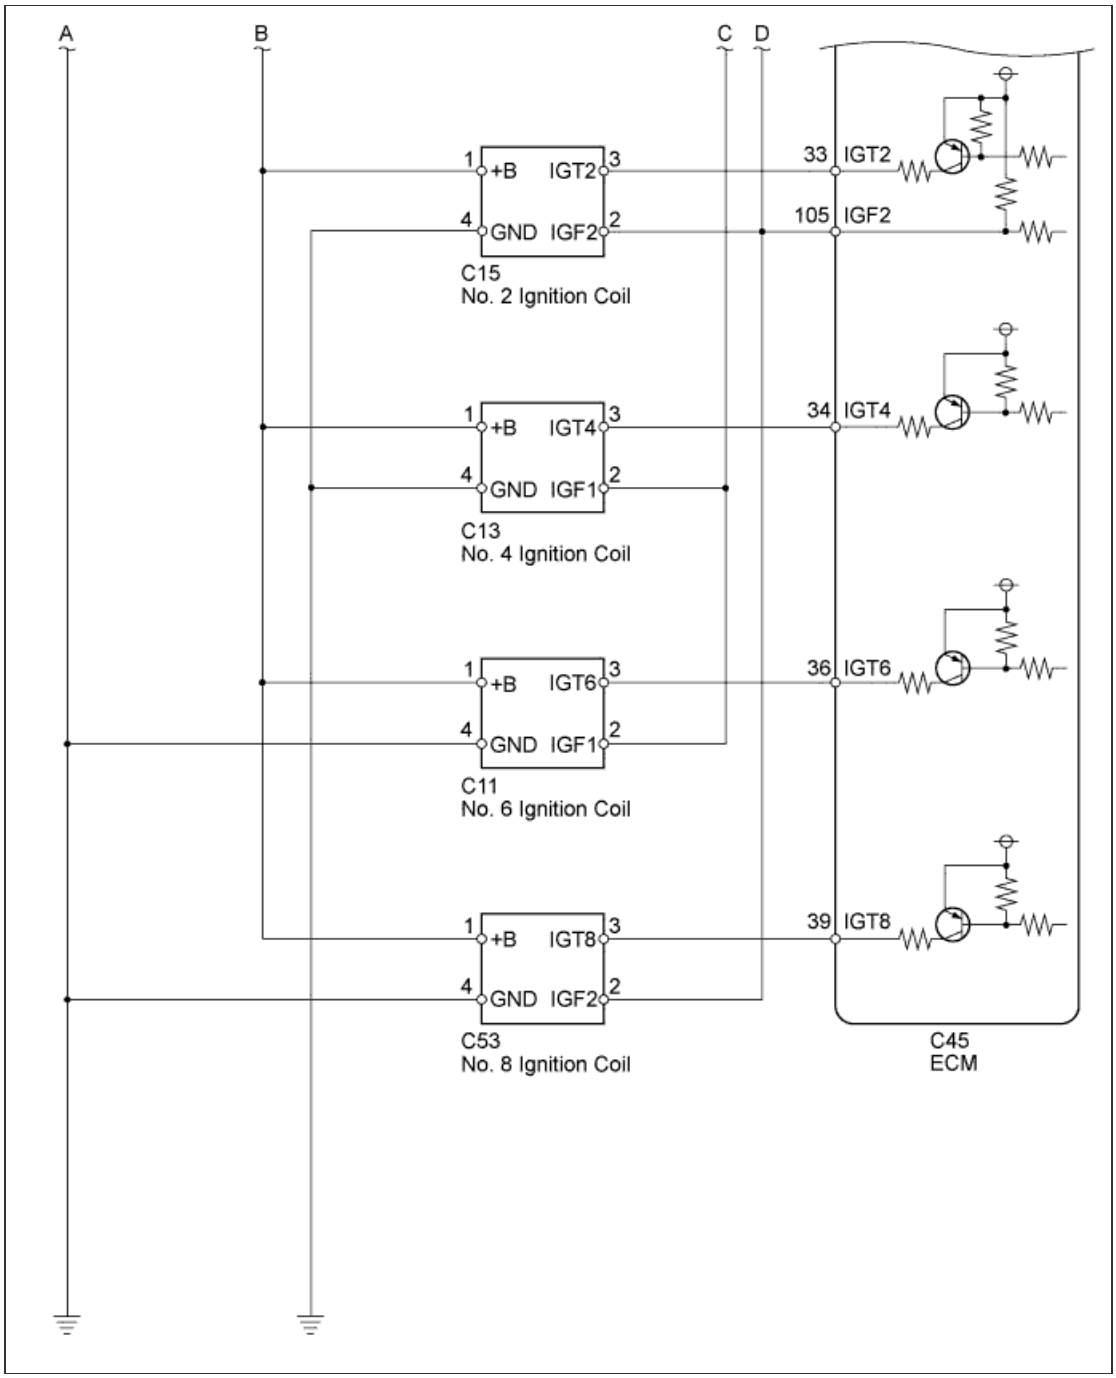
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

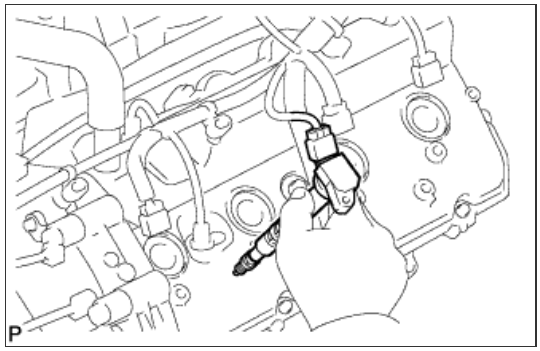
HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

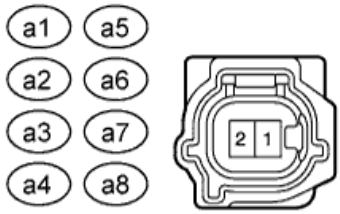
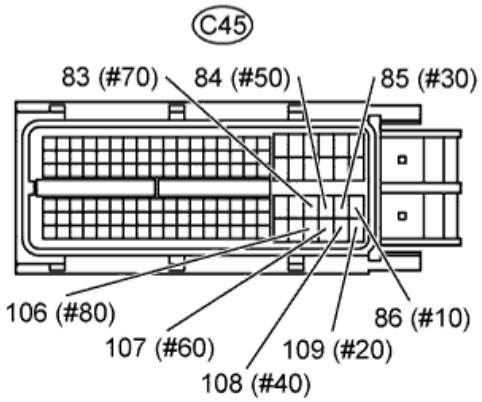
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

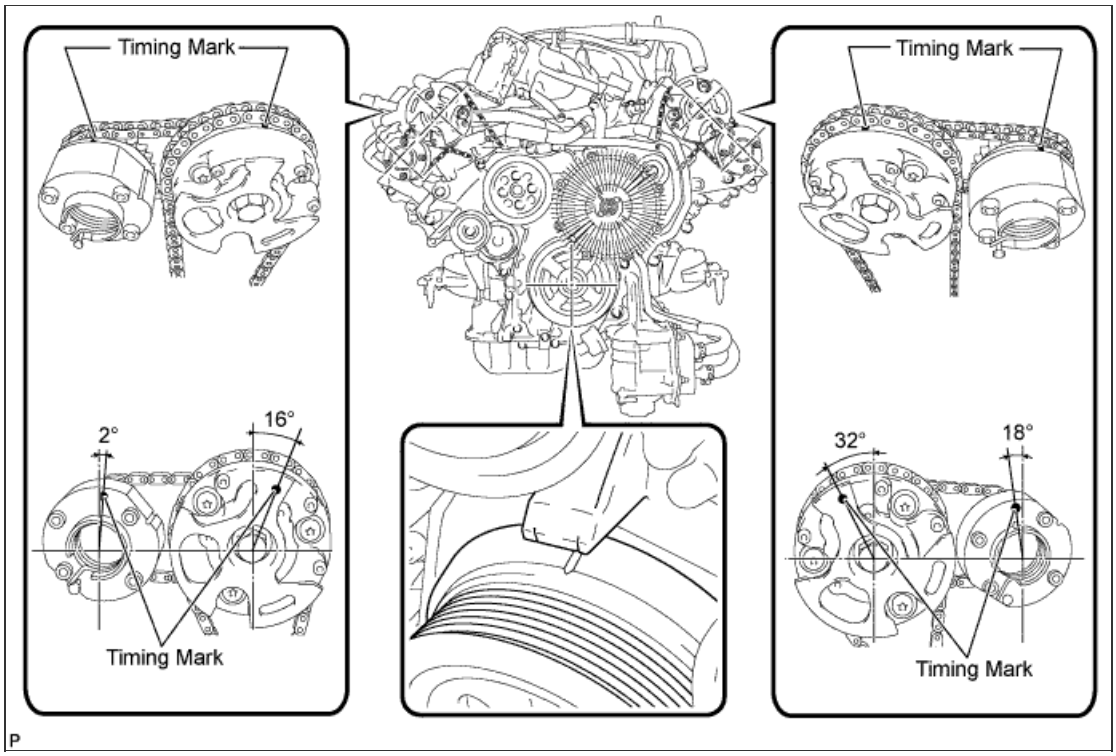
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

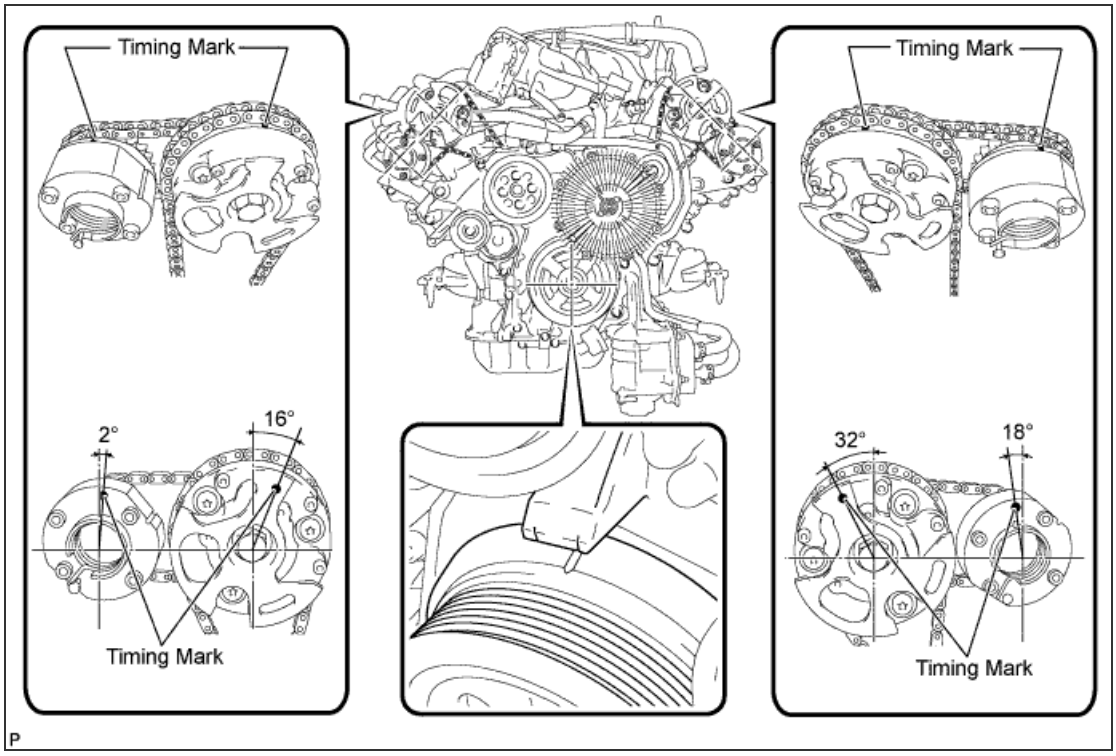
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

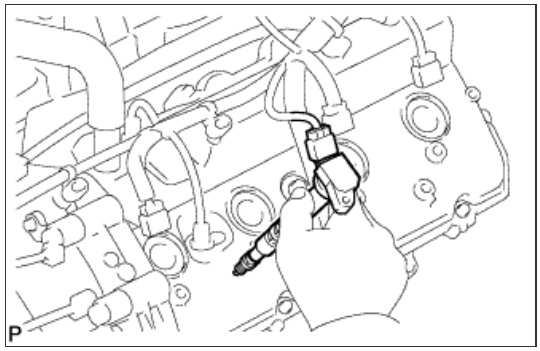
OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

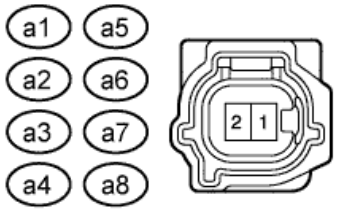
a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

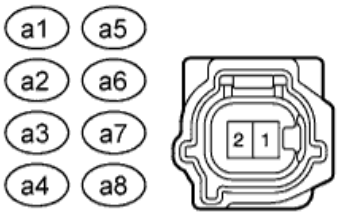
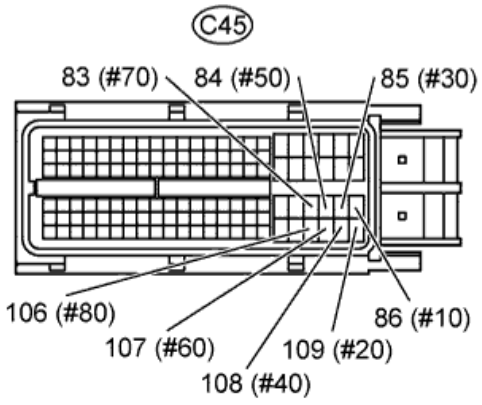
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.CHECK FUEL INJECTOR ASSEMBLY OF MISFIRING CYLINDER

Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

27.CHECK HARNESS AND CONNECTOR

a. Check the connection and terminal contact pressure of connectors and wire harnesses between the mass air flow meter and ECM (Click here).

HINT:

Repair any problems.

NEXT

28.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
ABNORMAL (P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308 output)	A
NORMAL (No DTC output)	B

B → END

A

29.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

		Specified

Tester Connection	Condition	Condition
C50-3 (VG) - C45-74 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C45-75 (E2G)	Always	Below 1 Ω
C50-3 (VG) or C45-74 (VG) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

30.REPLACE MASS AIR FLOW METER

Replace the mass air flow meter assembly (Click here).

HINT:

If the results of the inspections performed in steps 14 and 21 indicated no problem, proceed to the next step without replacing the mass air flow meter assembly.

NEXT

31.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

32.CHANGE TO CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the installed spark plug to a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 33

OK ↓

REPLACE SPARK PLUG (Click here)

33.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Change the ignition coil to an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

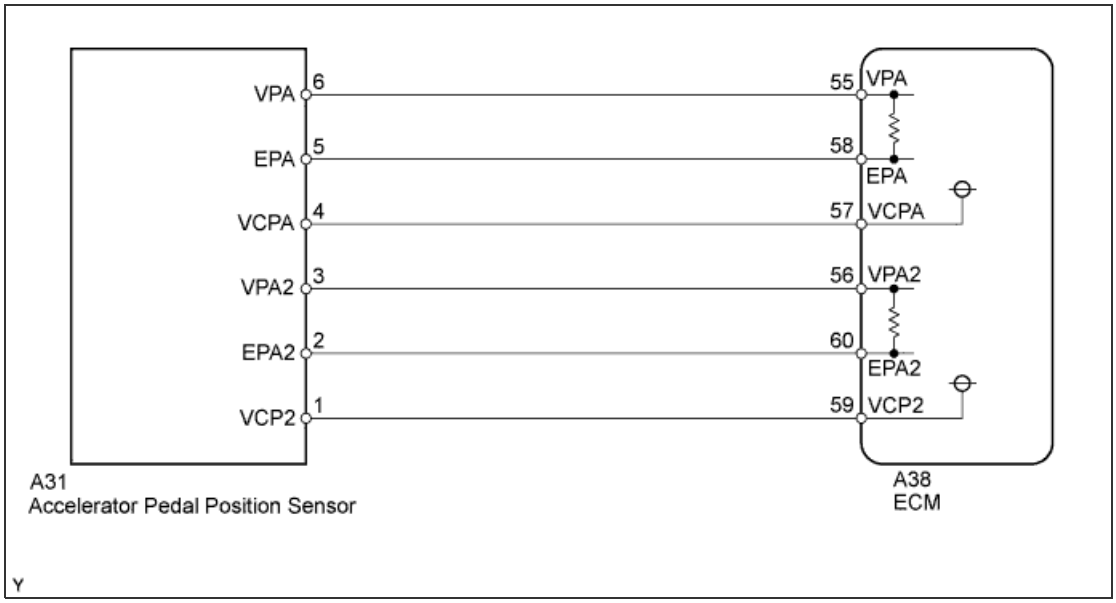
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

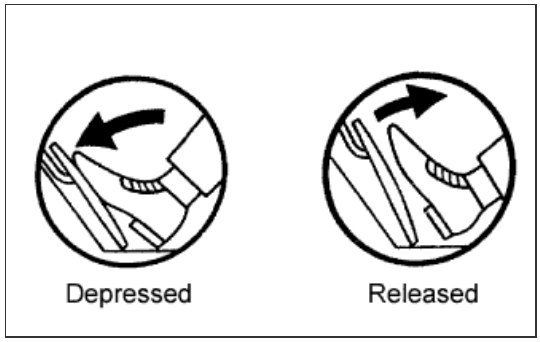
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 5.0 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

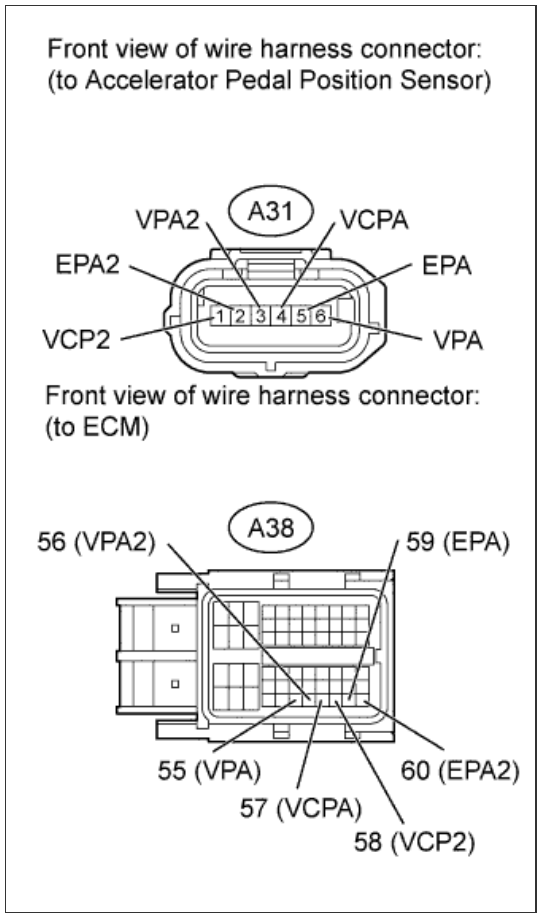
Result

Result	Proceed to
N	A
OK	B

B → Go to step 5

A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)

a. Disconnect the A31 APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
P2120, P2122, P2123, P2125, P2127, P2128, and/or P2138 are output	A

DTC P0307 Cylinder 7 Misfire Detected

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

HINT:

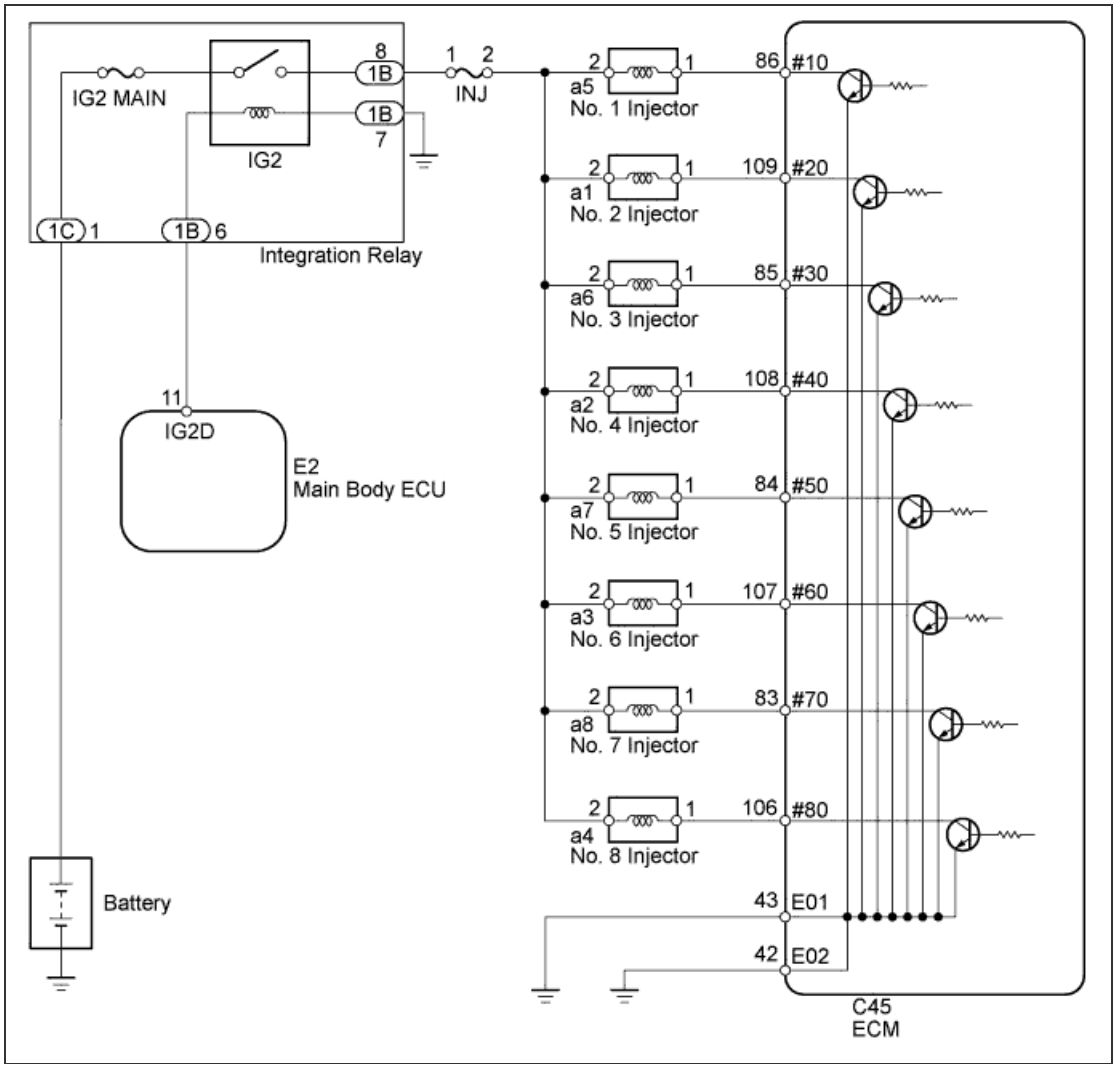
When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

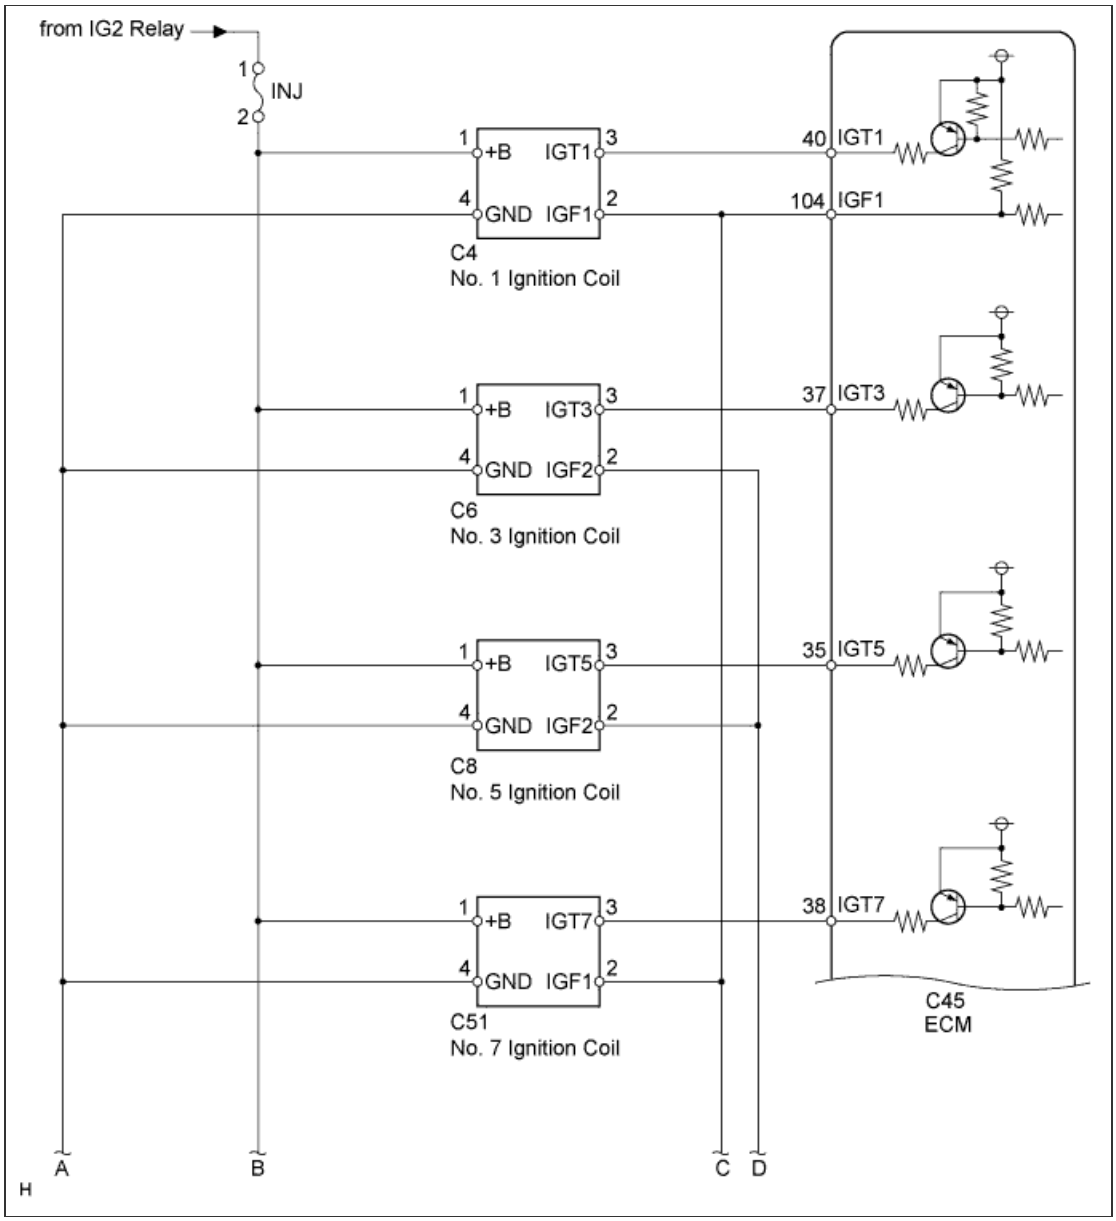
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

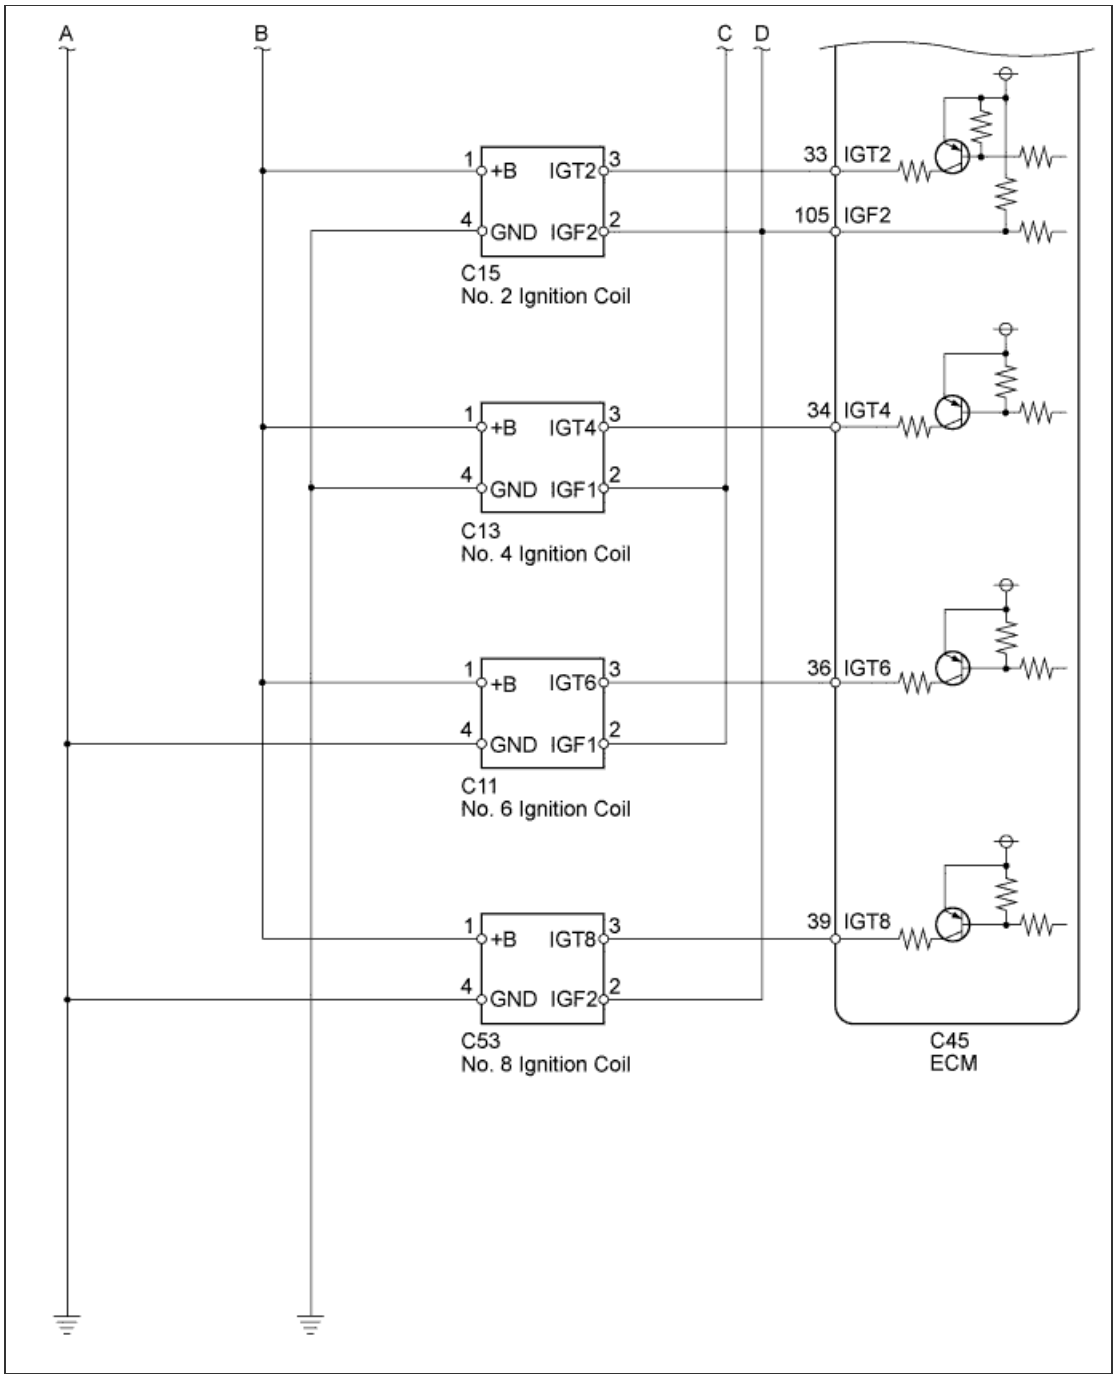
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

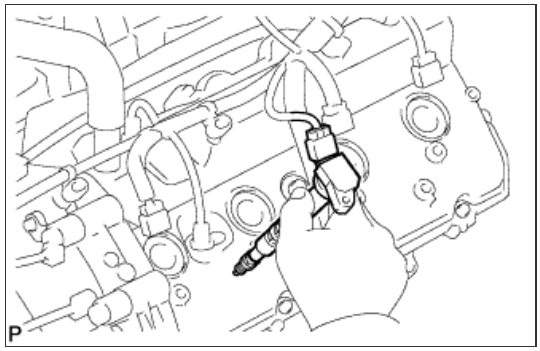
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

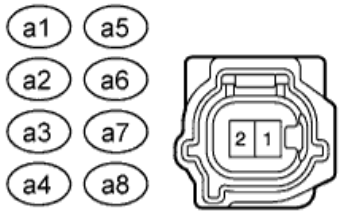
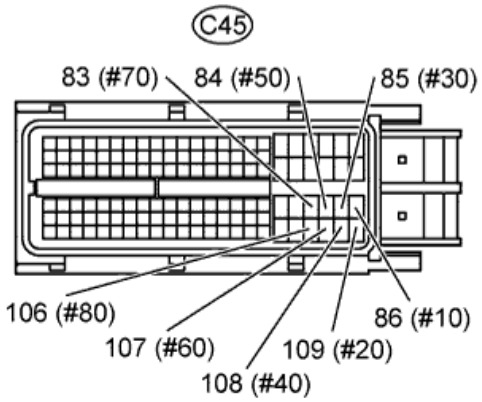
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

Front view of wire harness connector:
(to Injector)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

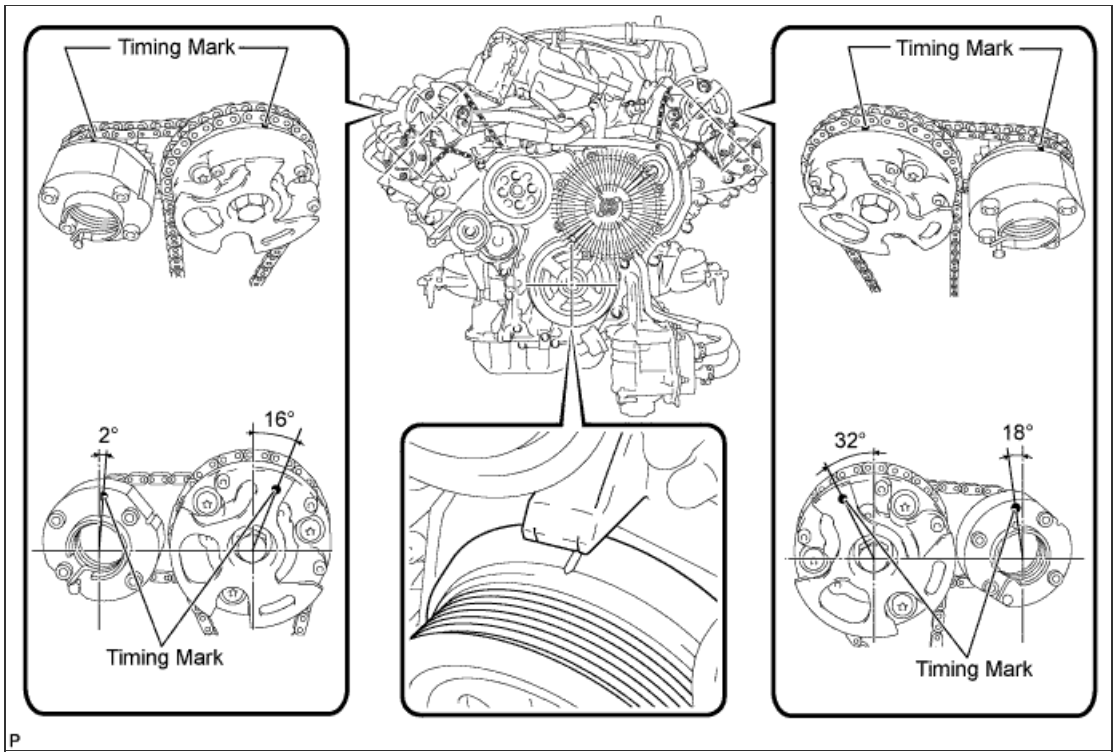
b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

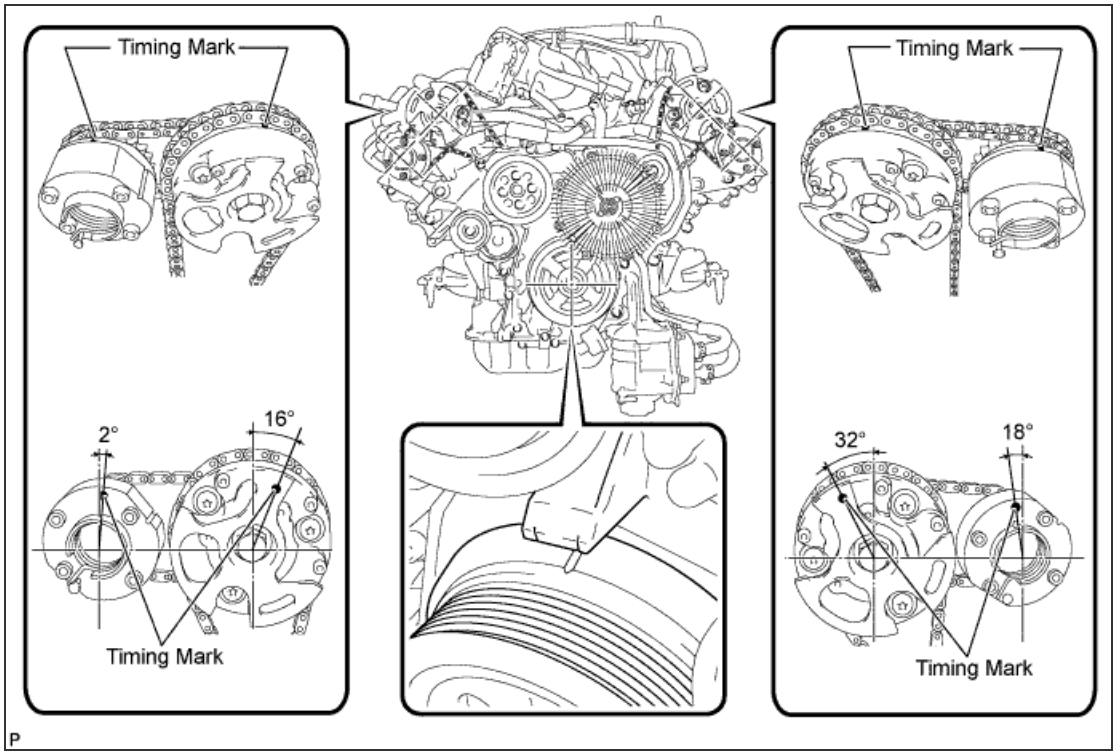
b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

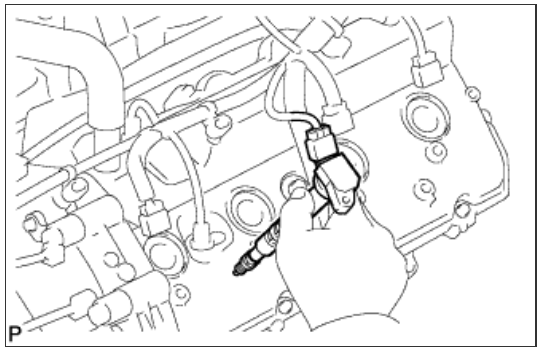
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

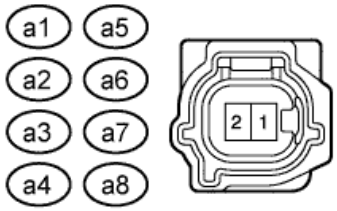
a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

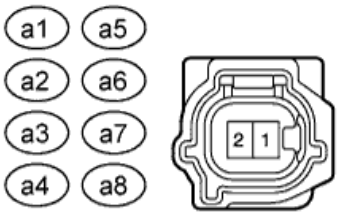
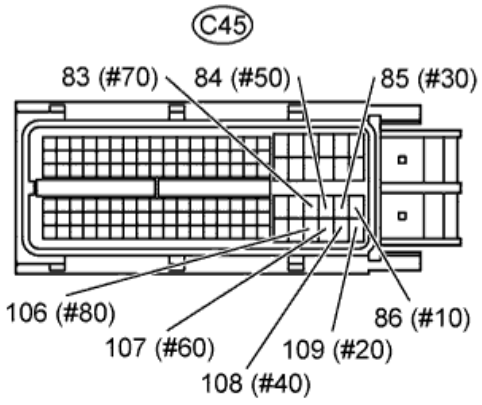
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω

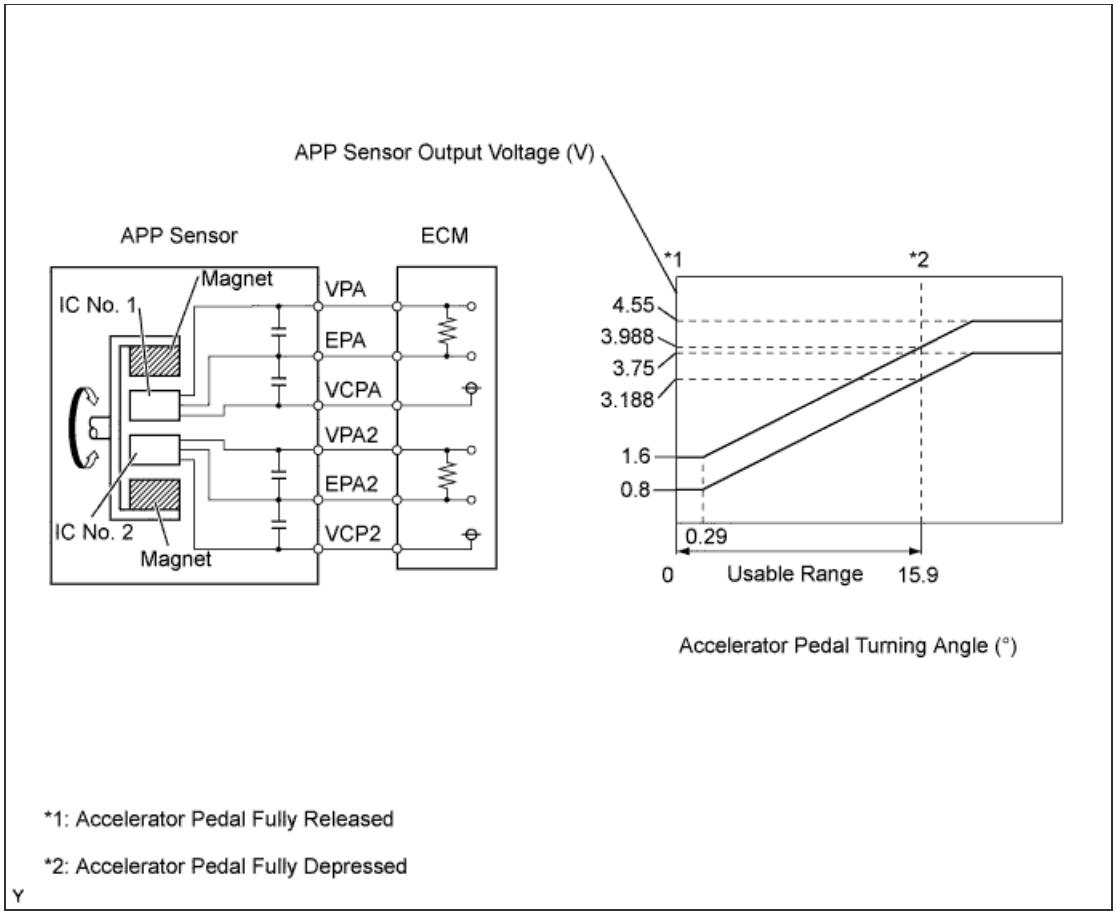
DTC P2138 Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation

for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

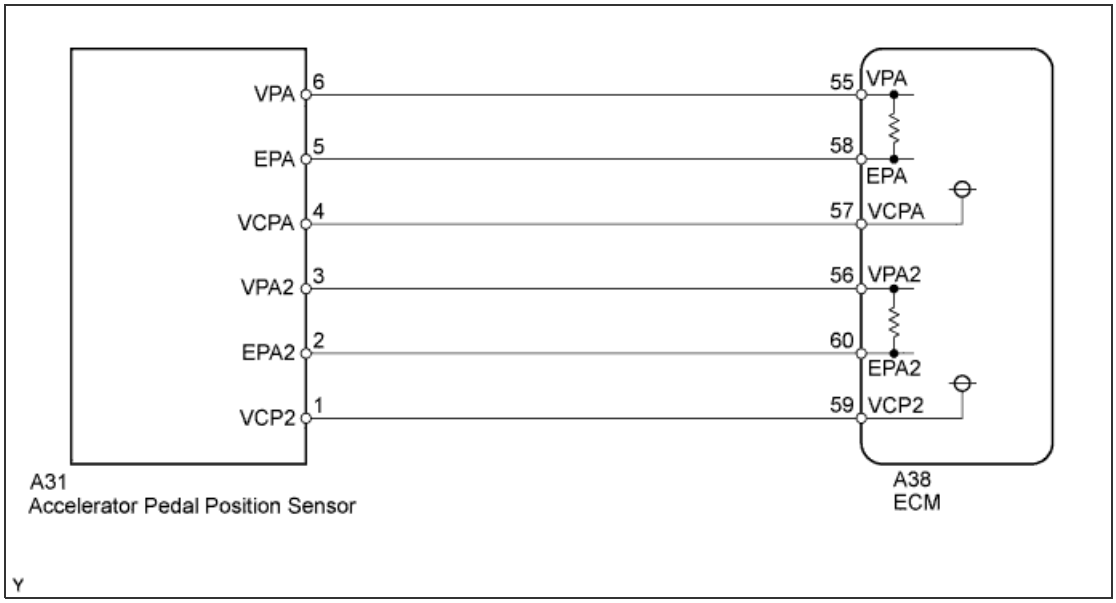
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

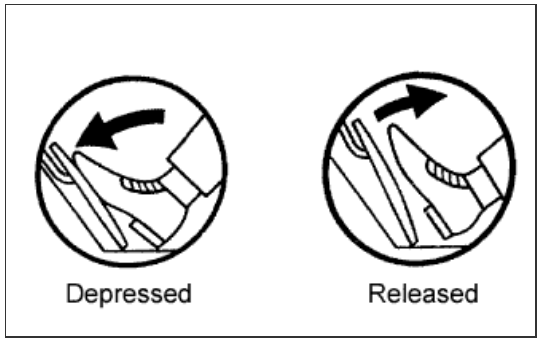
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 5.0 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

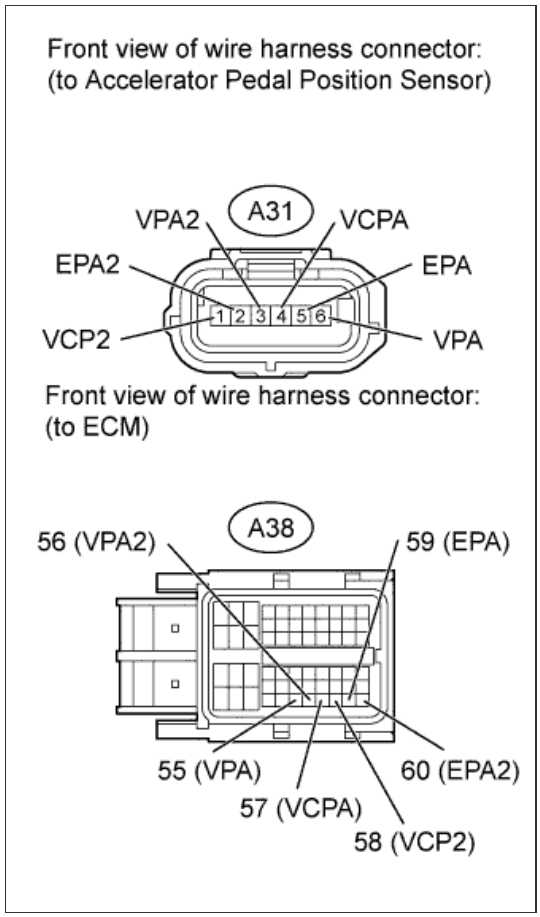
OK	B

B → Go to step 5

A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)

a. Disconnect the A31 APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

HINT:

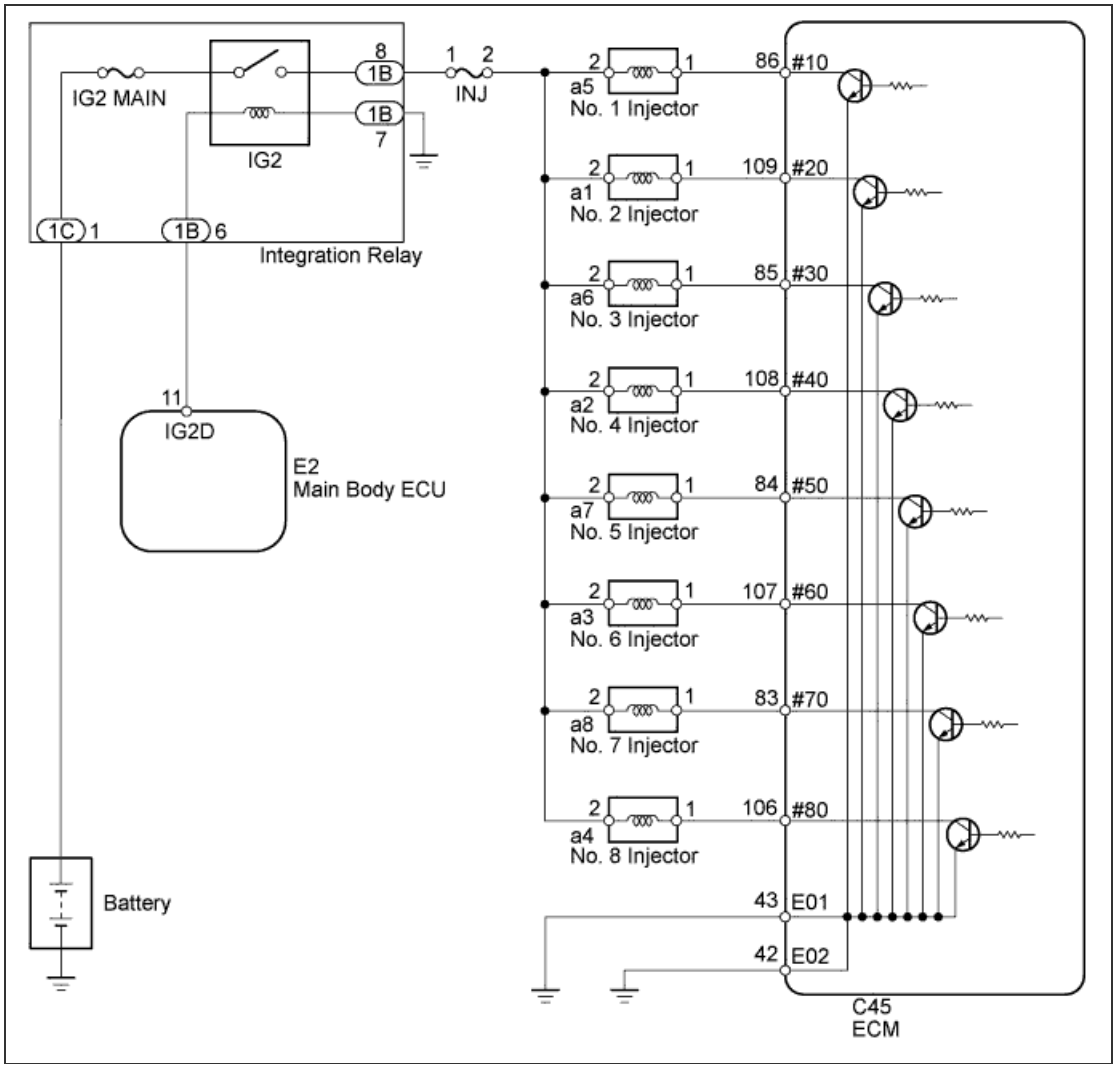
When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

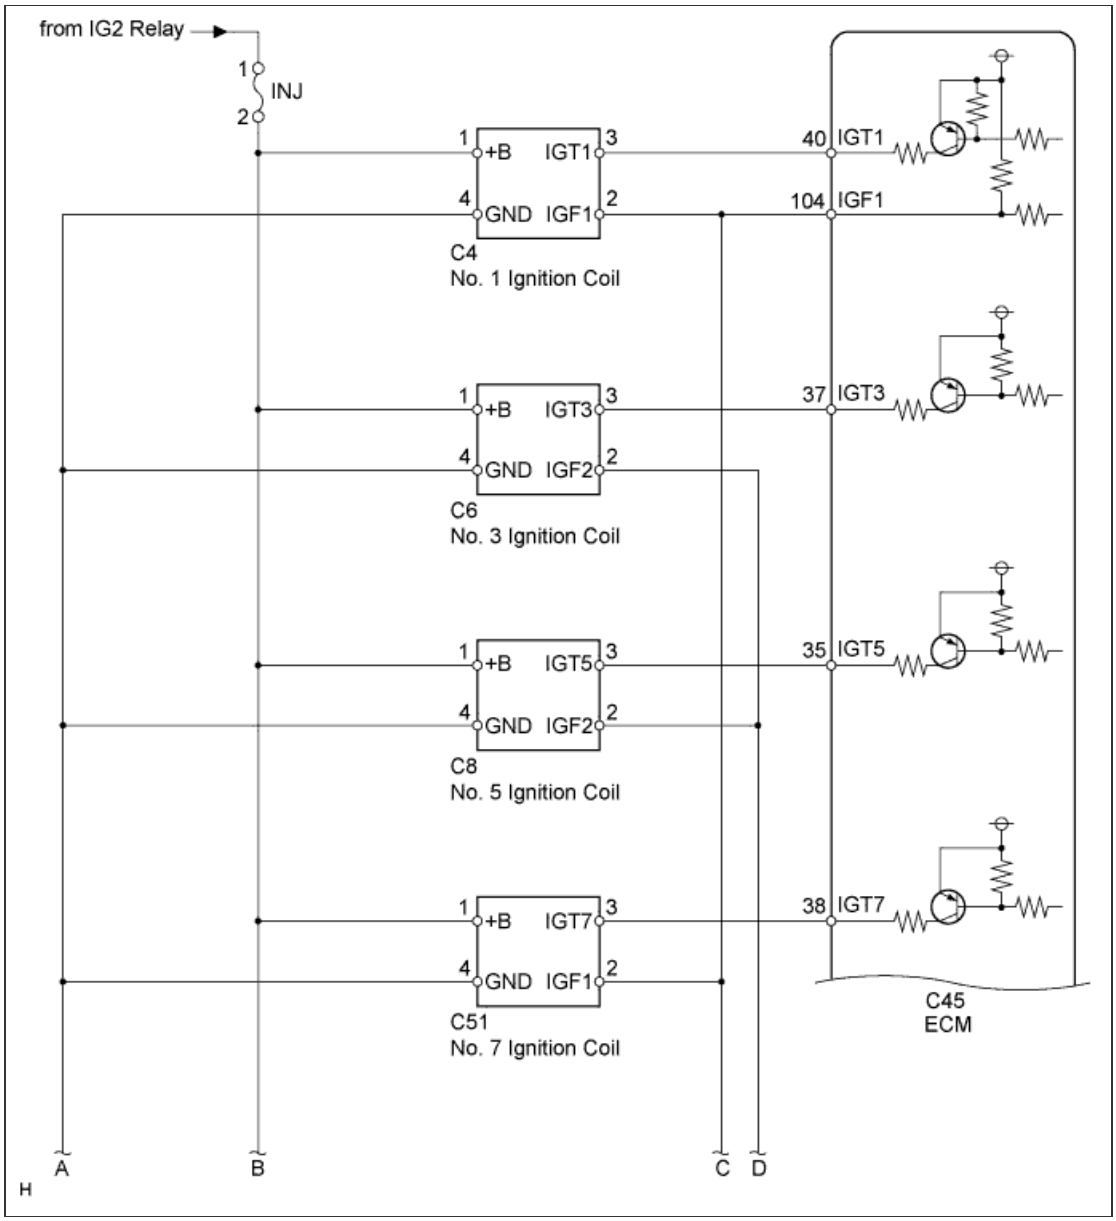
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

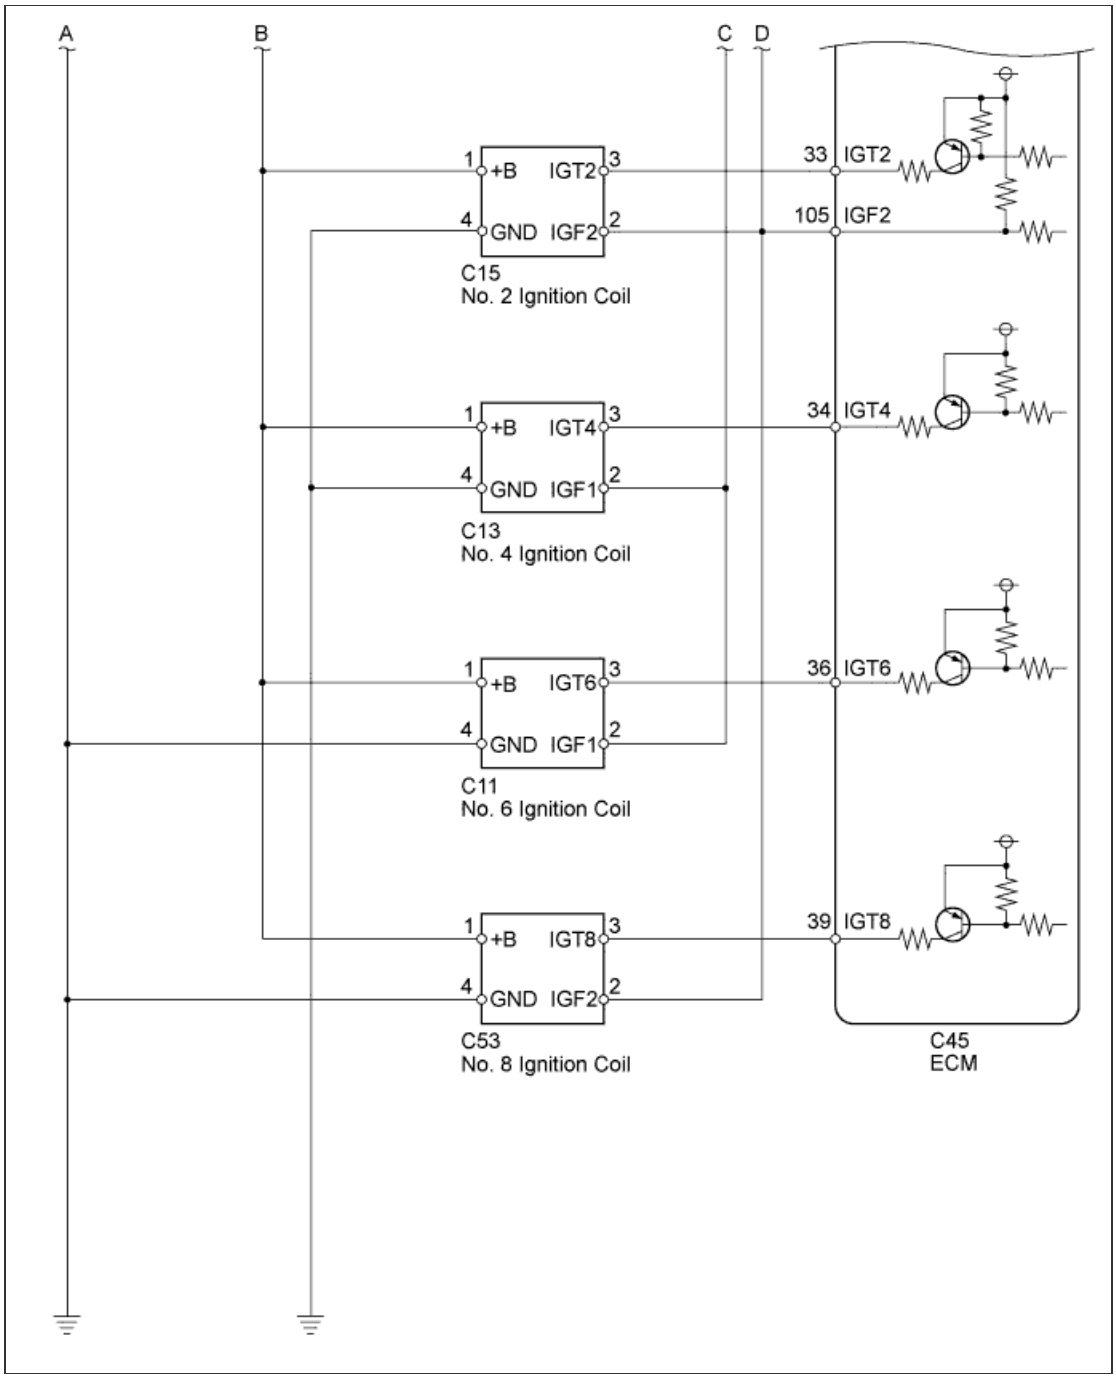
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

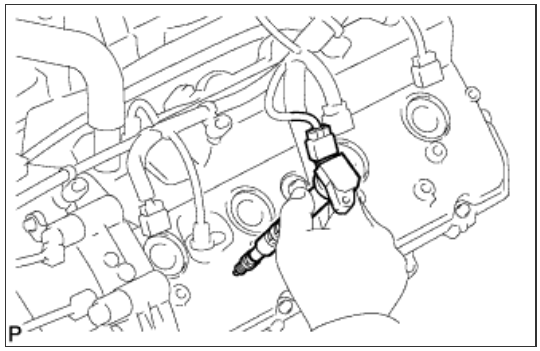
5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

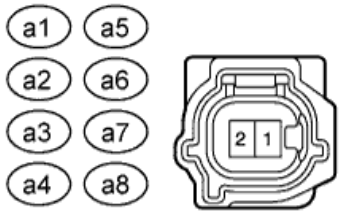
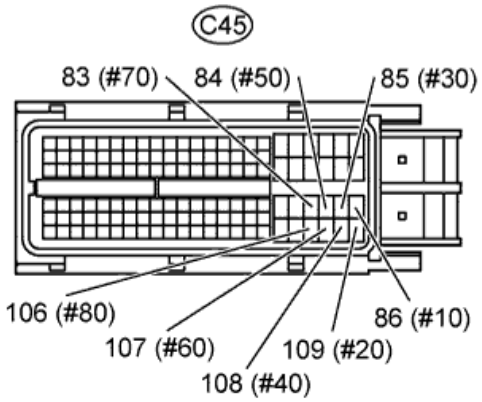
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

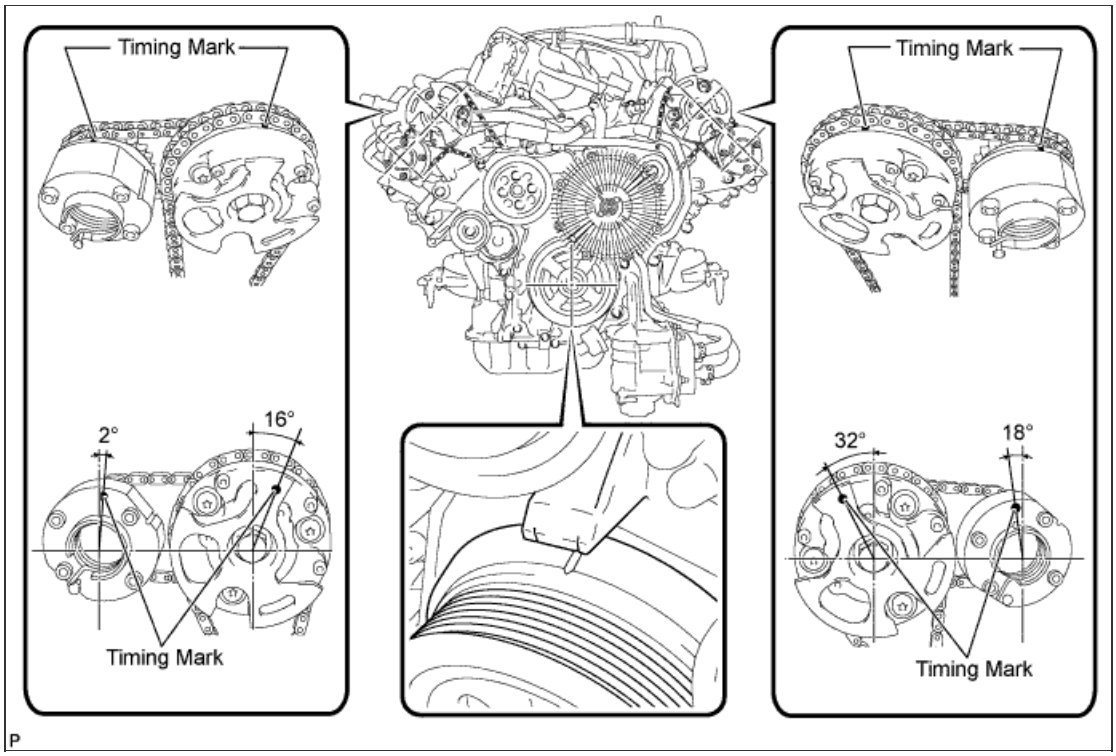
d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

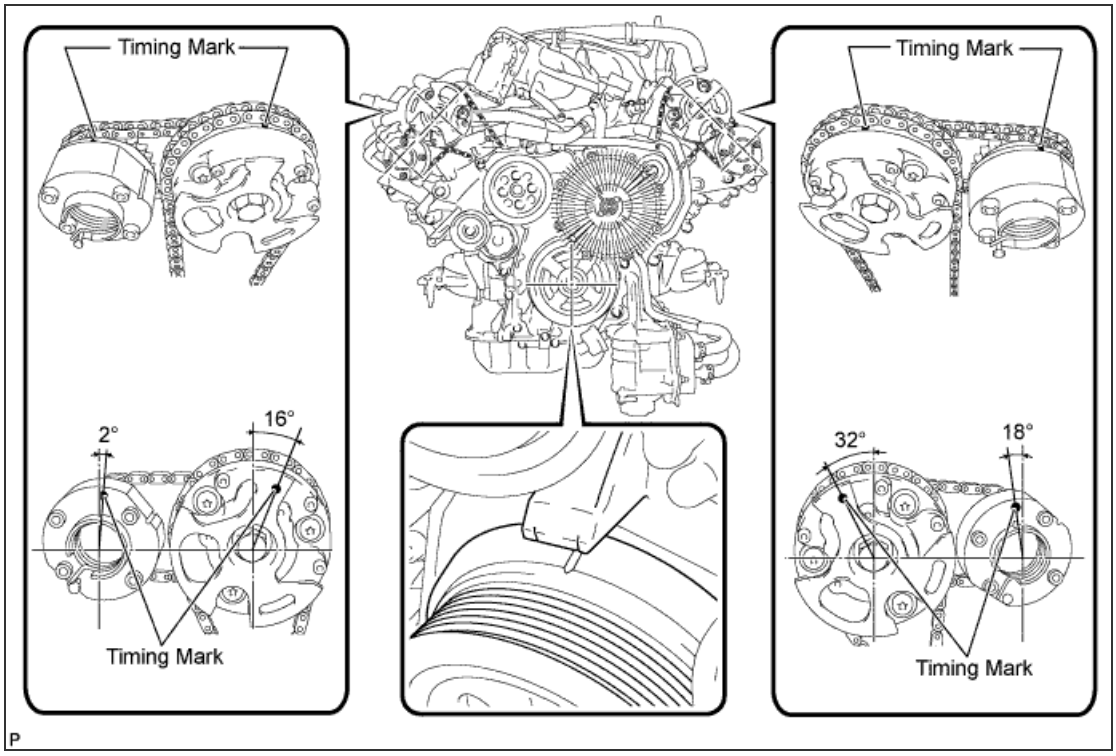
d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

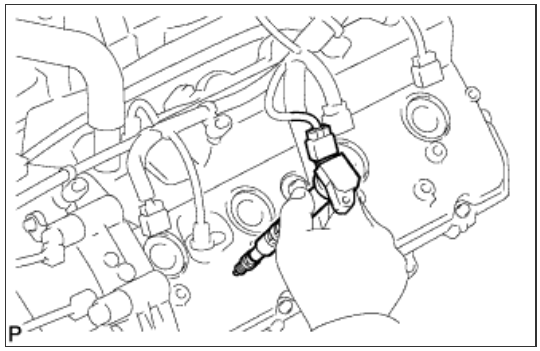
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

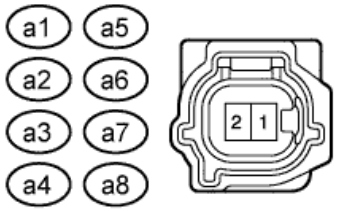
24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

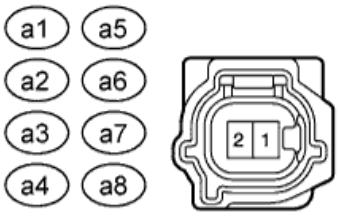
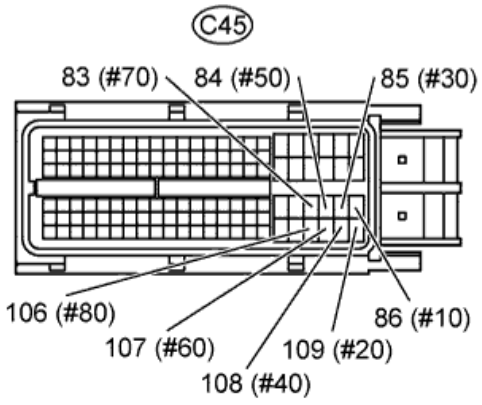
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.CHECK FUEL INJECTOR ASSEMBLY OF MISFIRING CYLINDER

Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

27.CHECK HARNESS AND CONNECTOR

a. Check the connection and terminal contact pressure of connectors and wire harnesses between the mass air flow meter and ECM (Click here).

HINT:

Repair any problems.

NEXT

28.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
ABNORMAL (P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308 output)	A
NORMAL (No DTC output)	B

B → END

A

29.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

		Specified

Tester Connection	Condition	Condition
C50-3 (VG) - C45-74 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C45-75 (E2G)	Always	Below 1 Ω
C50-3 (VG) or C45-74 (VG) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

30.REPLACE MASS AIR FLOW METER

Replace the mass air flow meter assembly (Click here).

HINT:

If the results of the inspections performed in steps 14 and 21 indicated no problem, proceed to the next step without replacing the mass air flow meter assembly.

NEXT

31.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

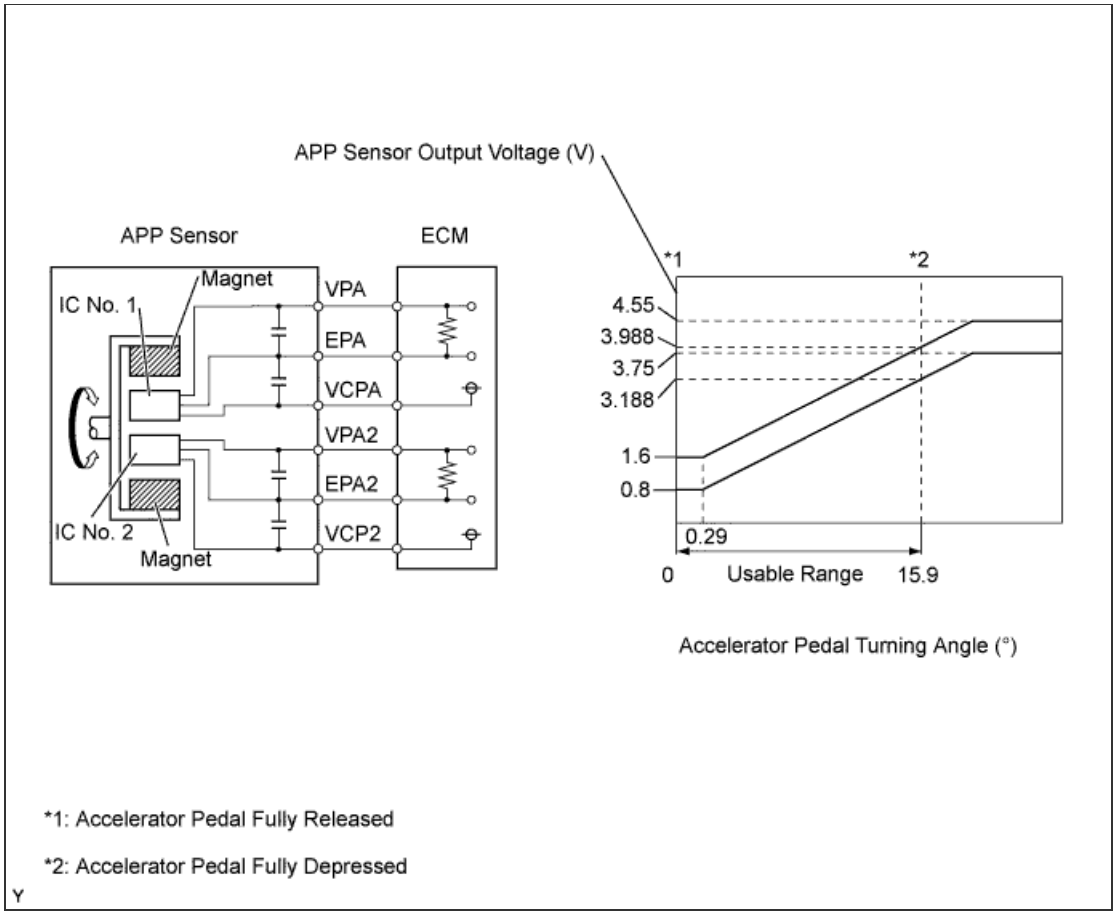
for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

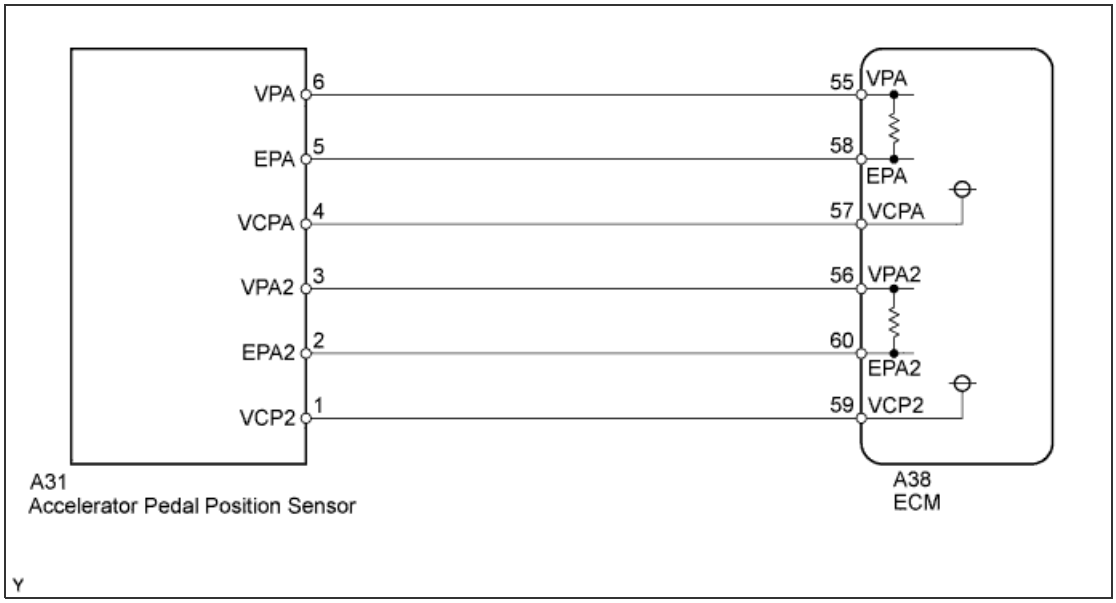
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

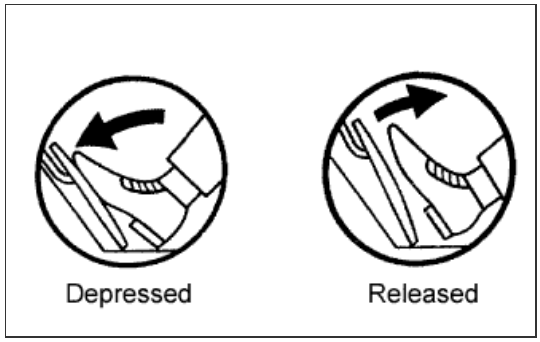
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 5.0 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

Result

Result	Proceed to
N	A
OK	B

B → Go to step 5

A

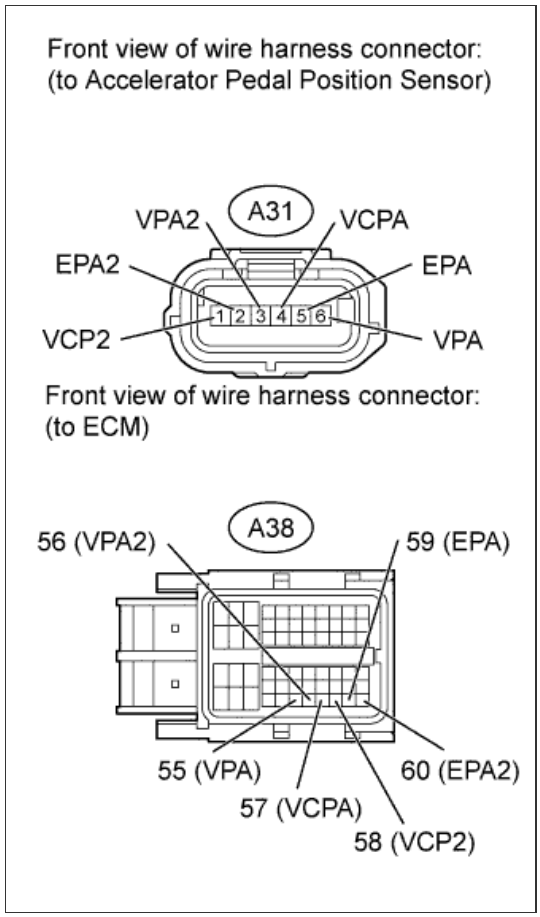
2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)

a. Disconnect the A31 APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
P2120, P2122, P2123, P2125, P2127, P2128, and/or P2138 are output	A

DTC P0307 Cylinder 7 Misfire Detected

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

HINT:

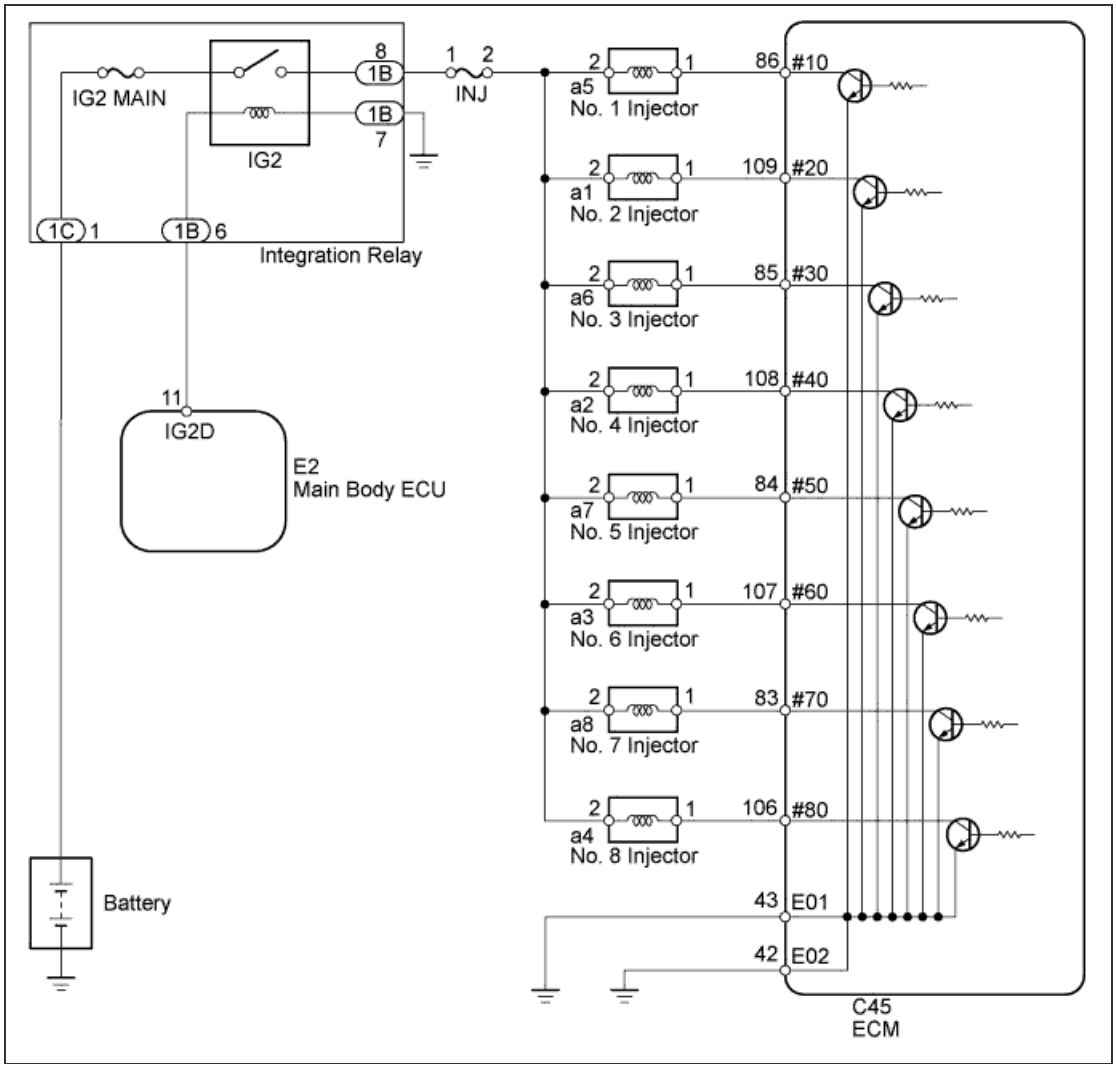
When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

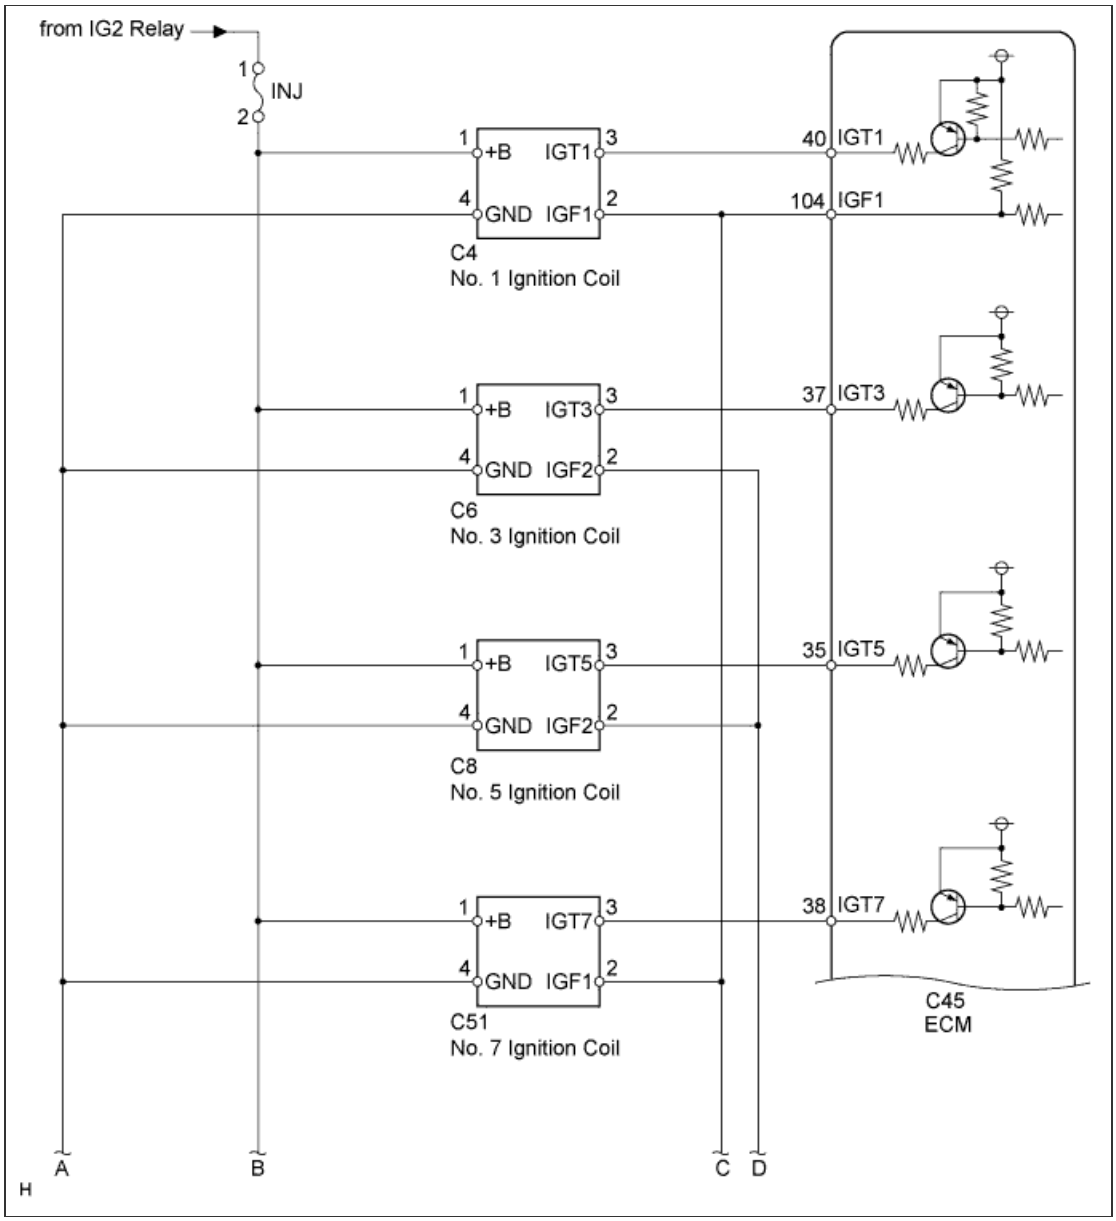
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

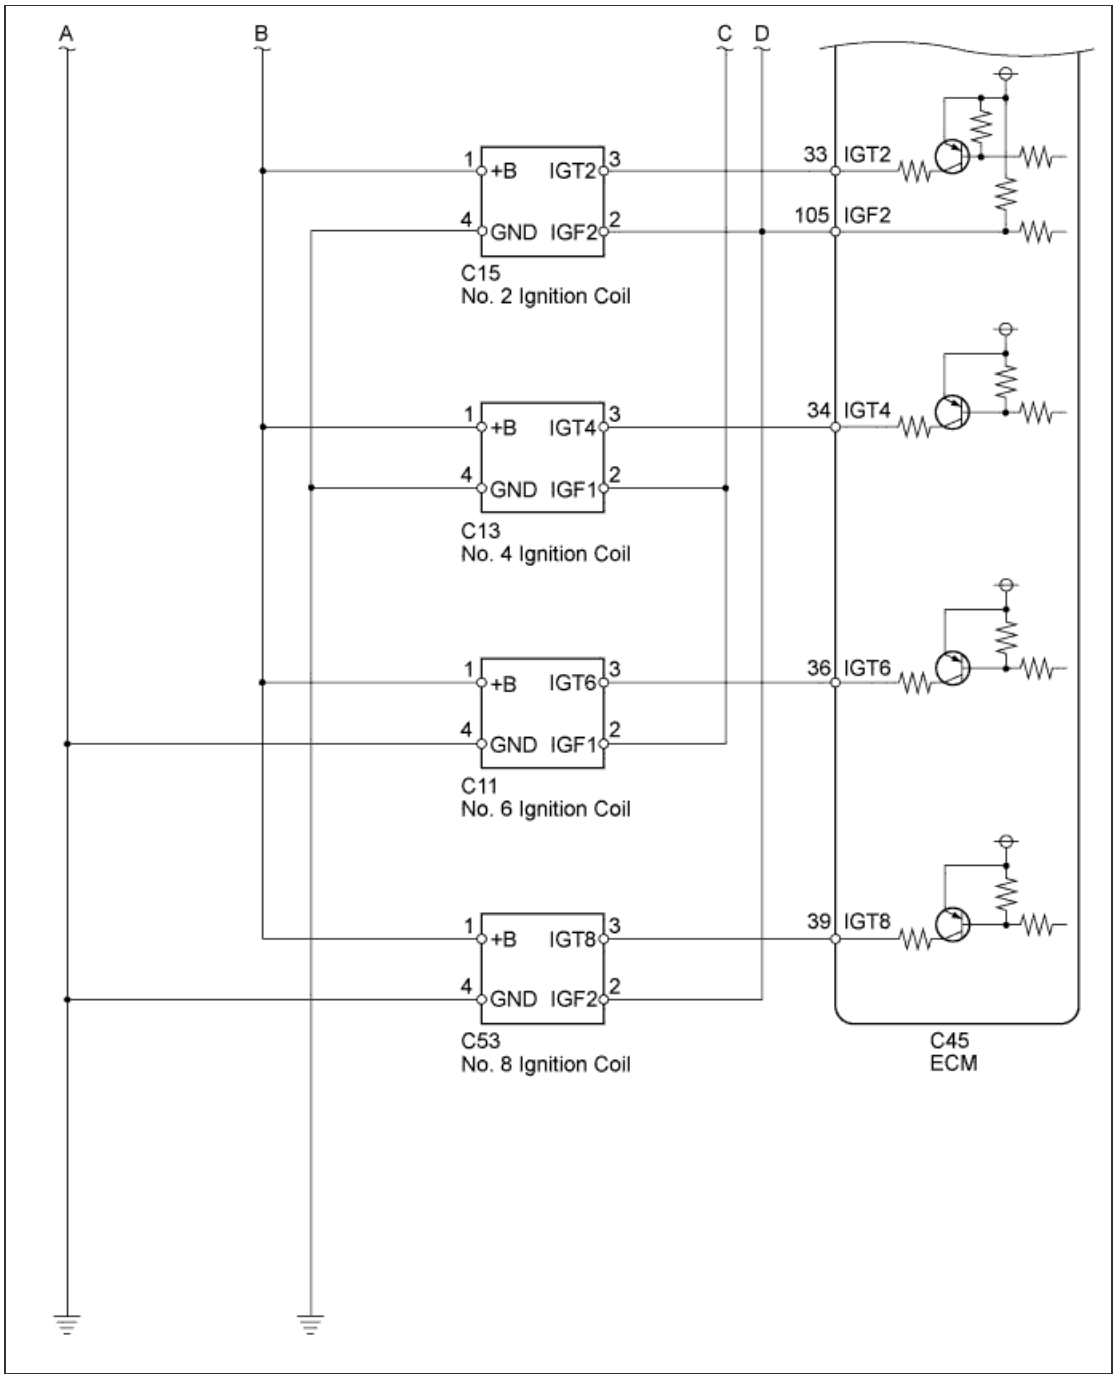
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

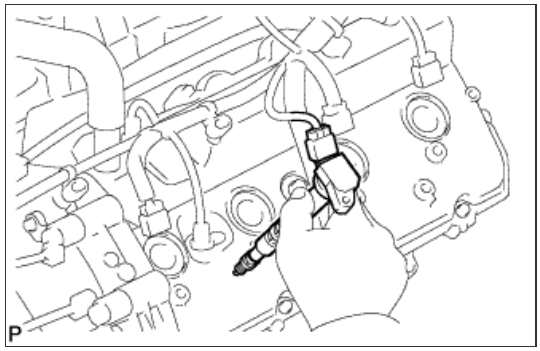
5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

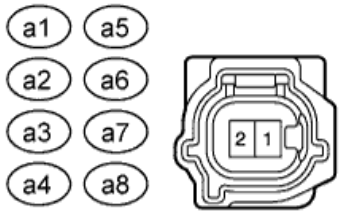
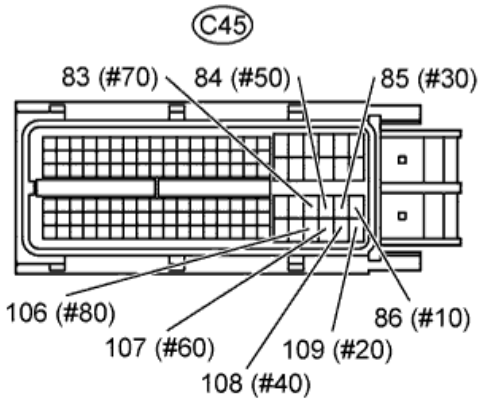
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

Front view of wire harness connector:
(to Injector)

Front view of wire harness connector:

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

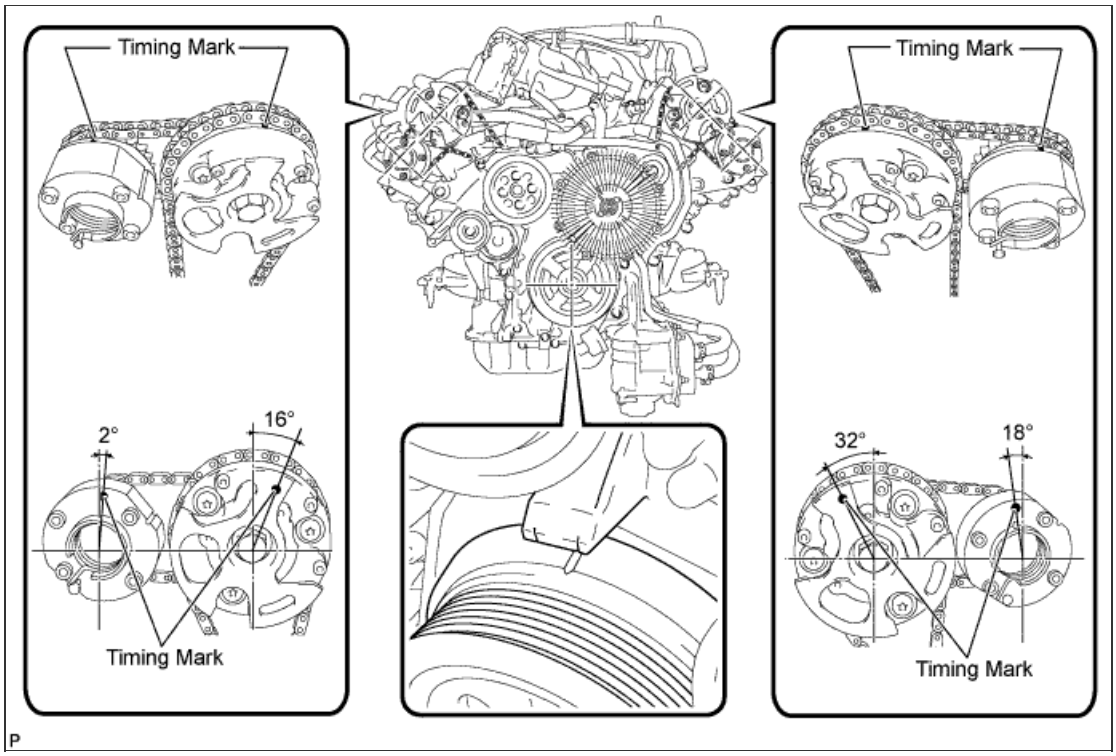
d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

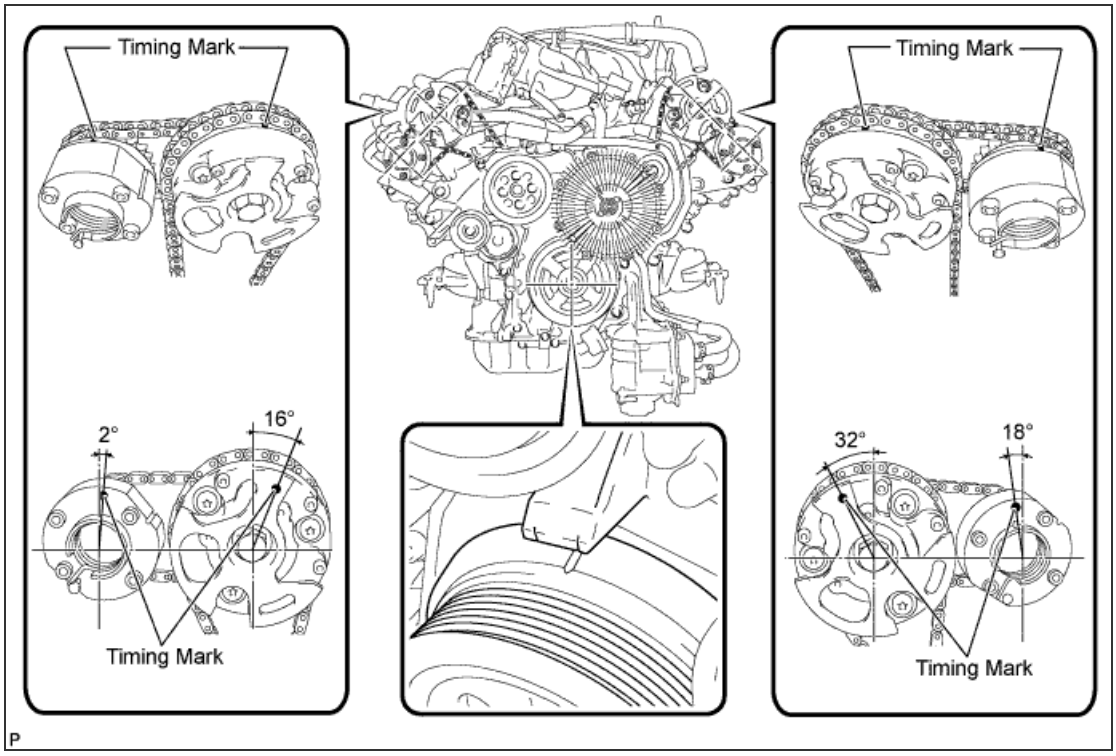
d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

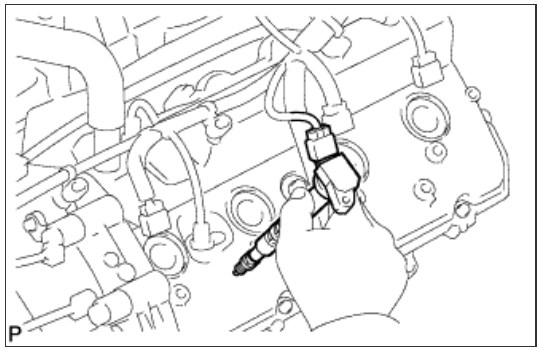
21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

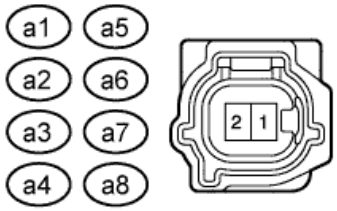
24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

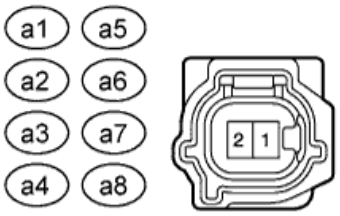
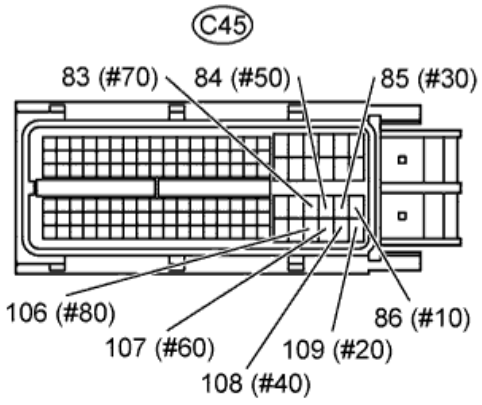
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.CHECK FUEL INJECTOR ASSEMBLY OF MISFIRING CYLINDER

Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

27.CHECK HARNESS AND CONNECTOR

a. Check the connection and terminal contact pressure of connectors and wire harnesses between the mass air flow meter and ECM (Click here).

HINT:

Repair any problems.

NEXT

28.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

Display (DTC Output)	Proceed to
ABNORMAL (P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308 output)	A
NORMAL (No DTC output)	B

B → END

A

29.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

		Specified

Tester Connection	Condition	Condition
C50-3 (VG) - C45-74 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C45-75 (E2G)	Always	Below 1 Ω
C50-3 (VG) or C45-74 (VG) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

30.REPLACE MASS AIR FLOW METER

Replace the mass air flow meter assembly (Click here).

HINT:

If the results of the inspections performed in steps 14 and 21 indicated no problem, proceed to the next step without replacing the mass air flow meter assembly.

NEXT

31.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Turn the engine switch off.

f. Turn the engine switch on (IG) and turn the tester on.

g. Start the engine and warm it up.

h. Drive the vehicle in accordance with the driving pattern described in Confirmation Driving Pattern.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input the DTC: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 or P0308.

k. Check the DTC judgment result.

Result

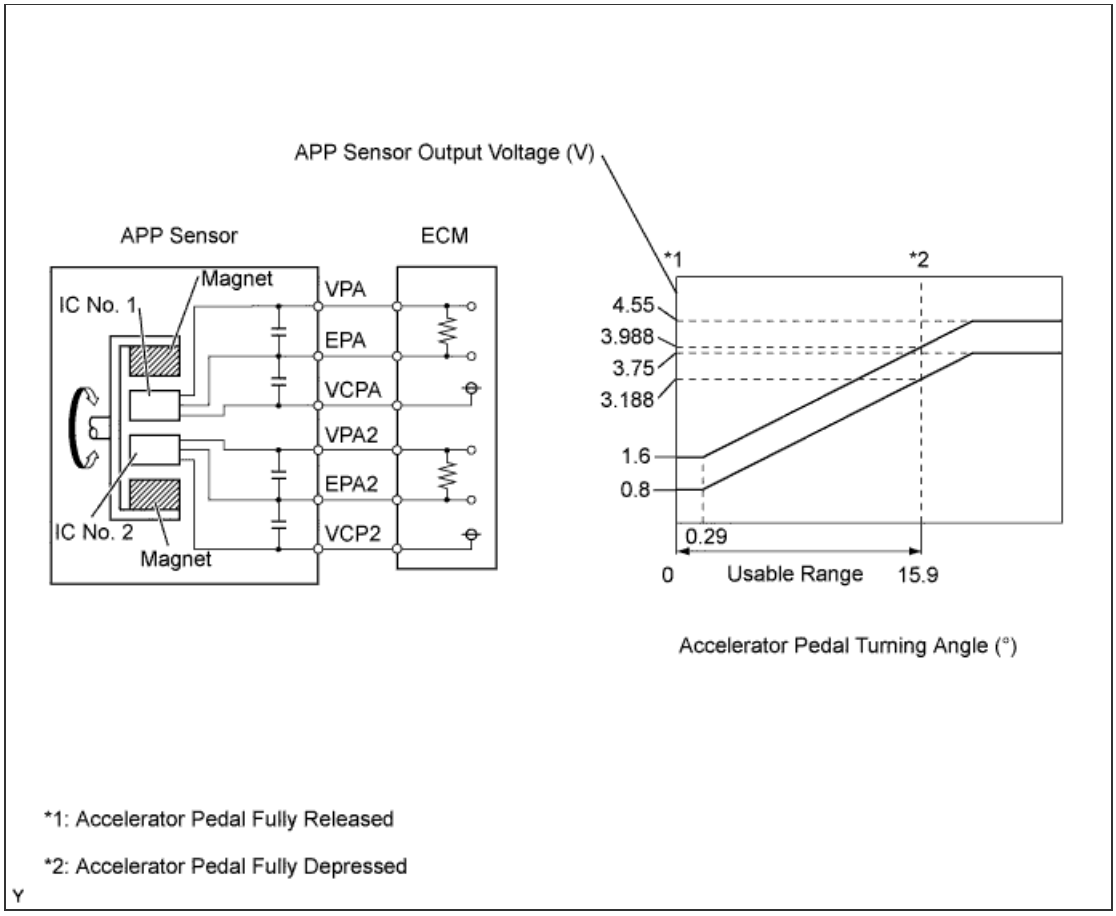
DTC P2138 Throttle / Pedal Position Sensor / Switch "D" / "E" Voltage Correlation

for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

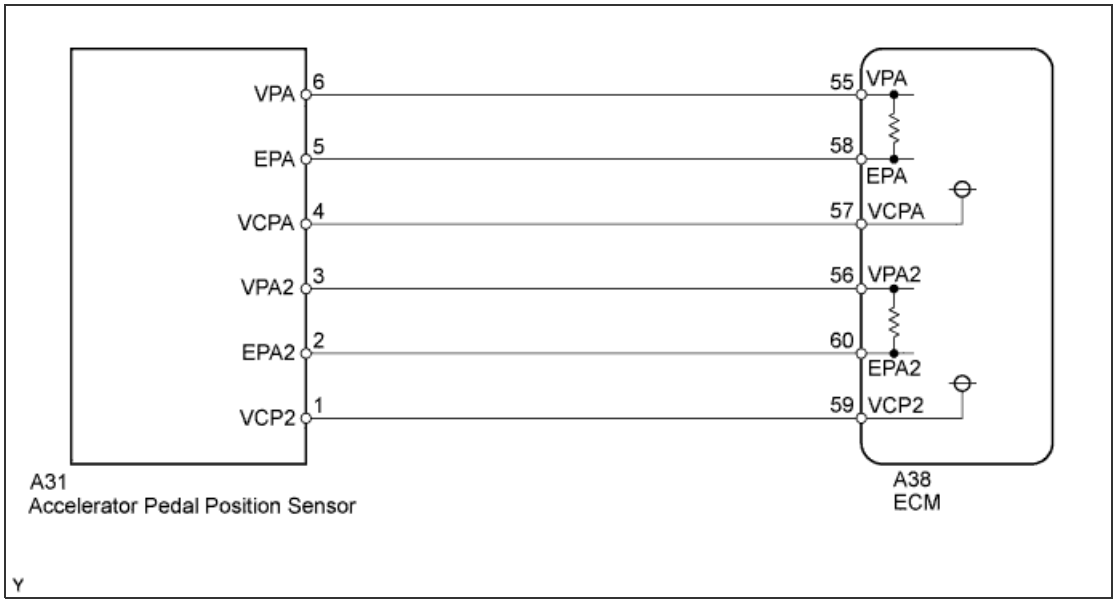
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

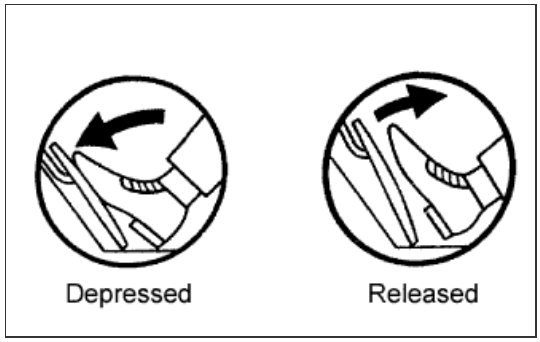
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 5.0 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

Result

Result	Proceed to
N	A
OK	B

B → Go to step 5

A

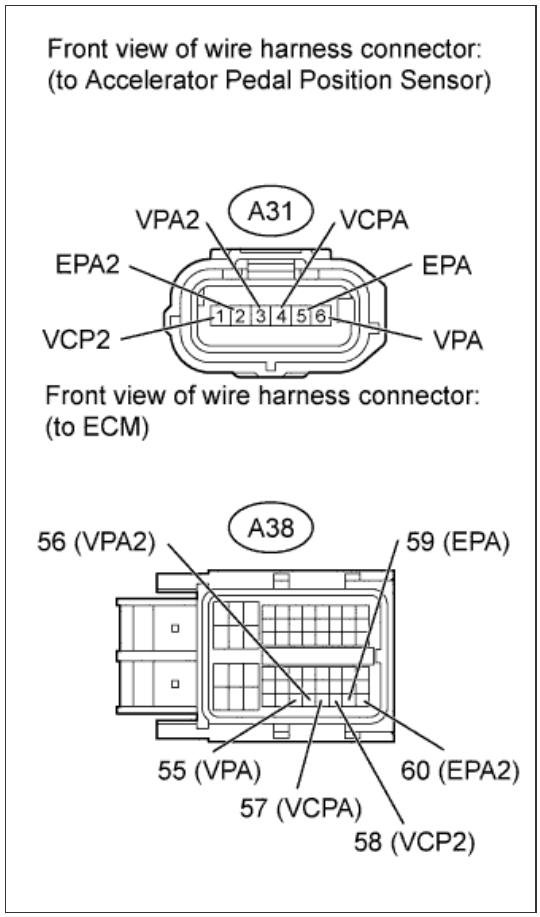
2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)

a. Disconnect the A31 APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the MIL blinks. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC). • An emission deterioration misfire occurs.	

HINT:

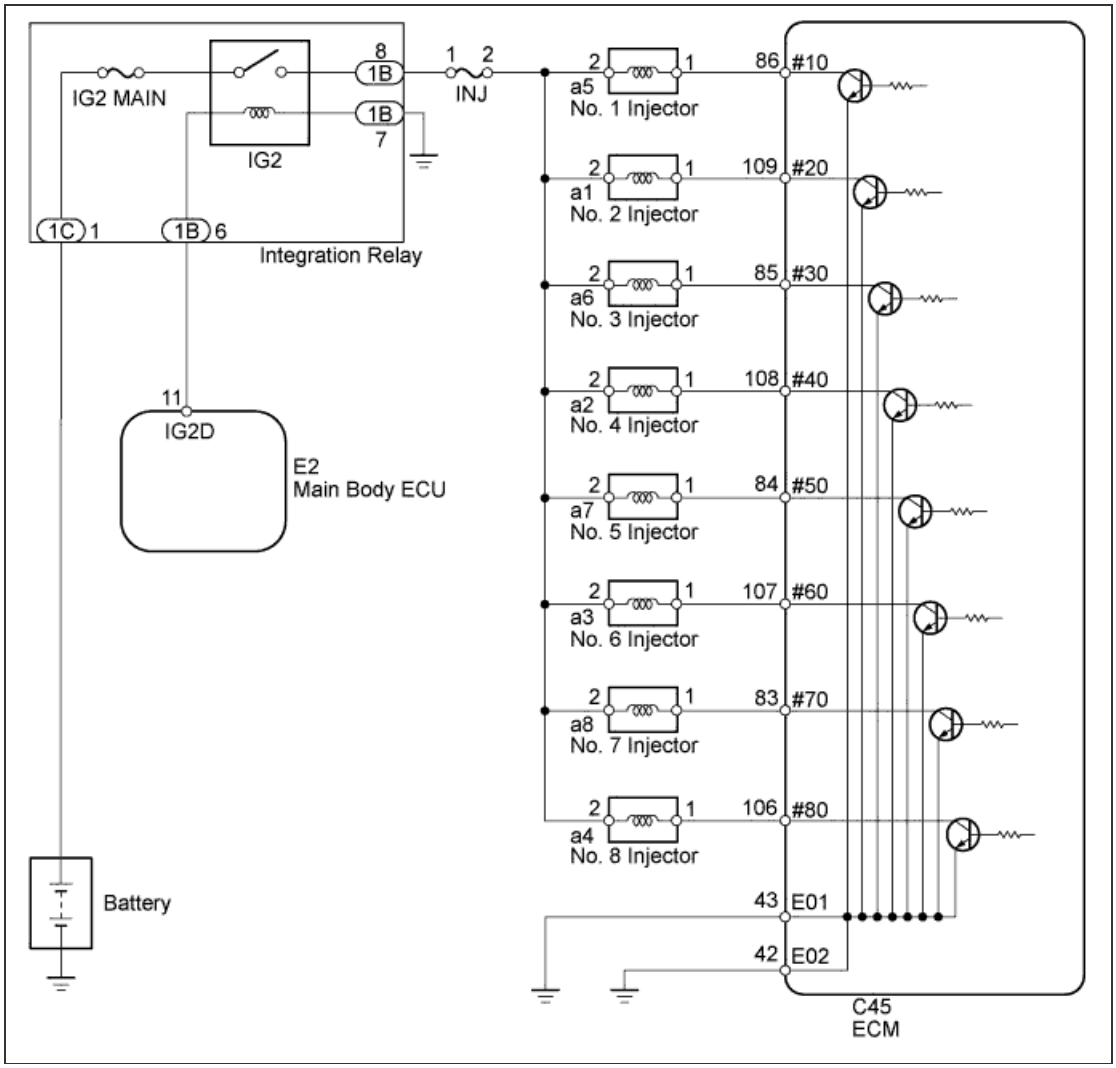
When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

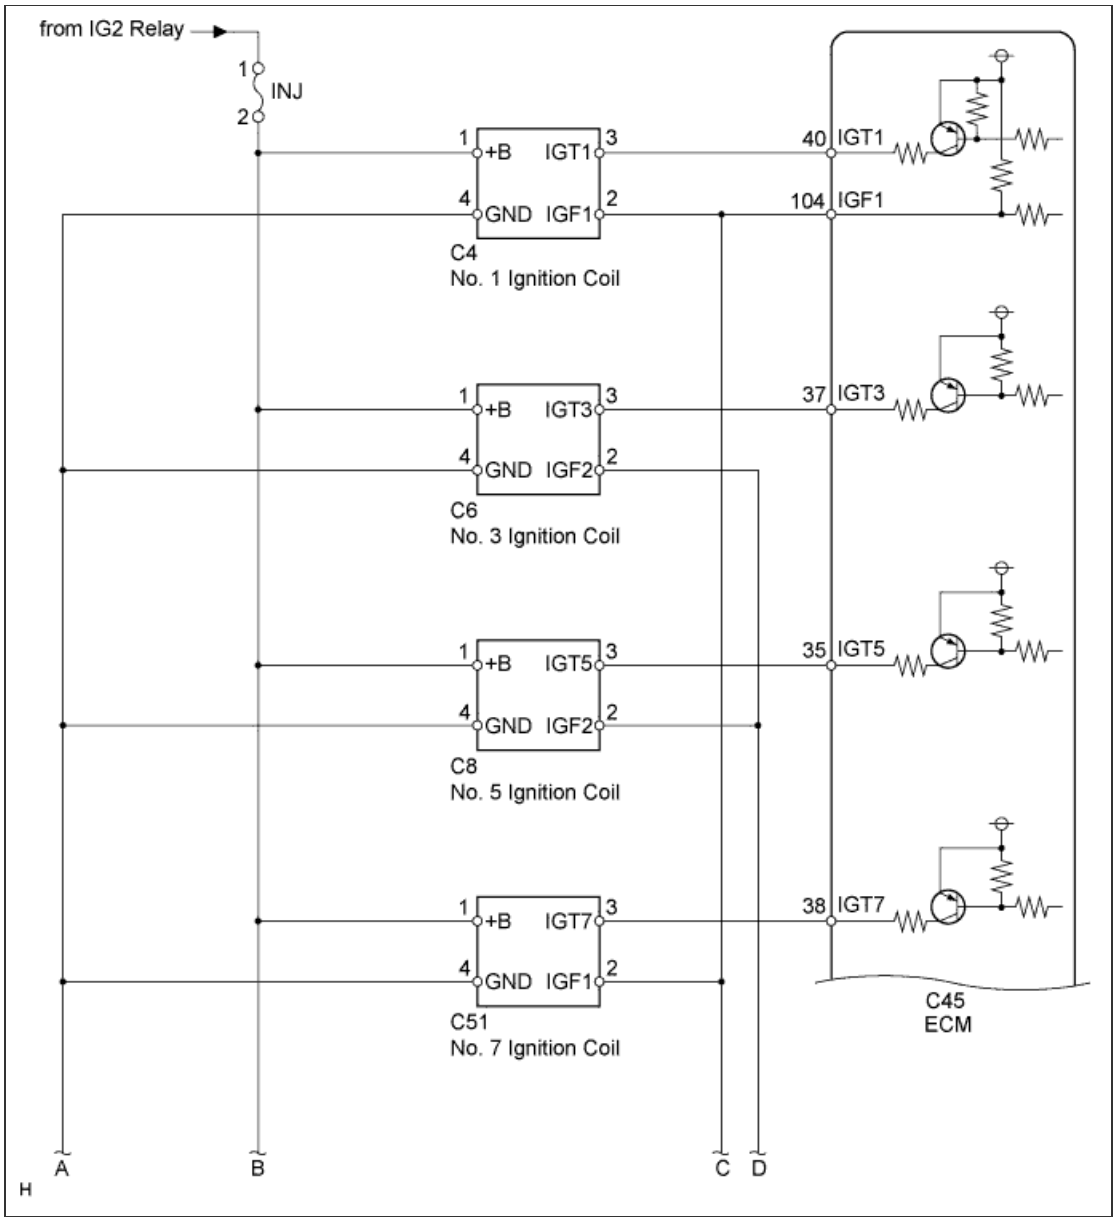
MONITOR DESCRIPTION

The ECM stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

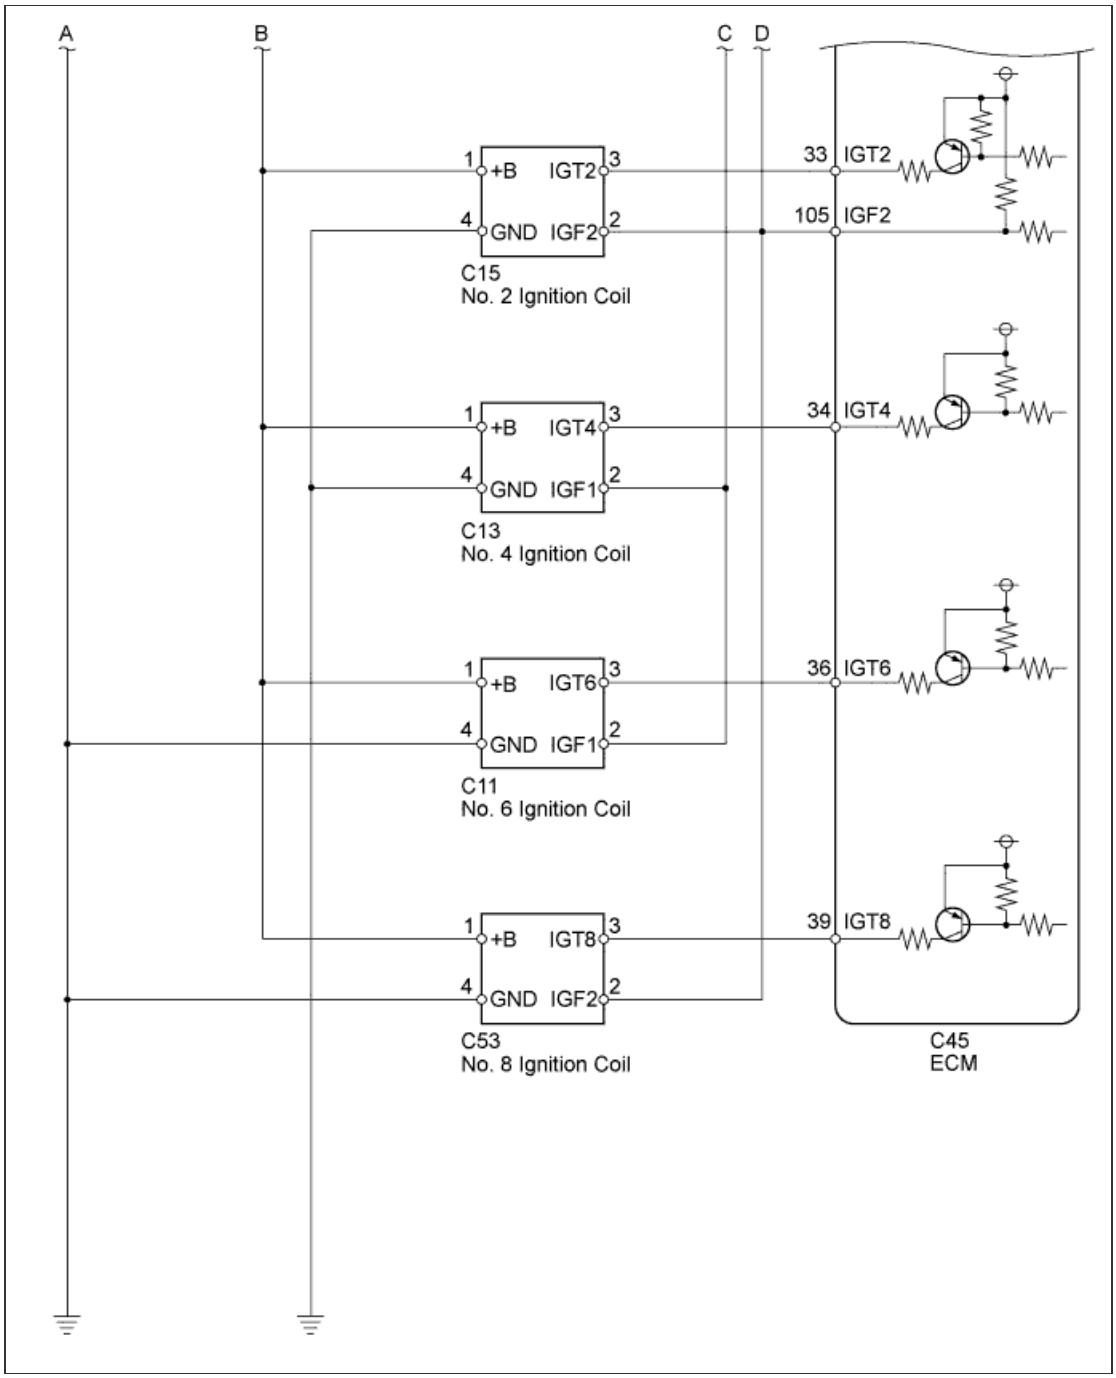
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 30 to 110 misfires per 1000



crankshaft revolutions) occurs once.



- An excessive misfiring rate (approximately 30 to 110 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM stores DTC(s) when either one of the following conditions, which could cause the Three-Way Catalytic Converter (TWC) damage, is detected (2 trip detection logic).

- At a high engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which monitored every 200 crankshaft revolutions, occurs 3 times.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	7 minutes or more
1000	4 minutes or more
2000	2 minutes or more
3000	1.5 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **DTC P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are for Euro-OBD only.**
- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel which causes body vibration may cause misfire DTCs to be detected.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 are output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → **REPAIR OR REPLACE PCV HOSE (Click here)**

OK

3.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the ad Value Using tester (Misfire RPM and Misfire Load) procedures above (Procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (Procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → **Go to step 16**

A

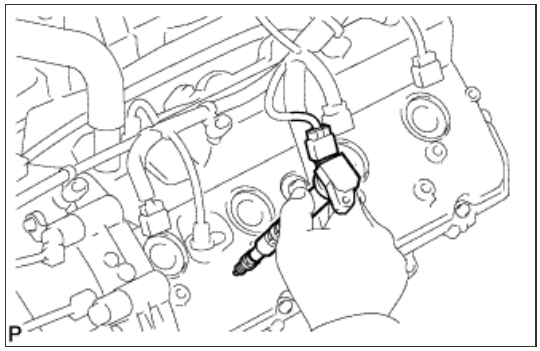
5.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (**Click here**)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → **Go to step 32**

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → GO TO FUEL INJECTOR CIRCUIT (**Click here**)

OK

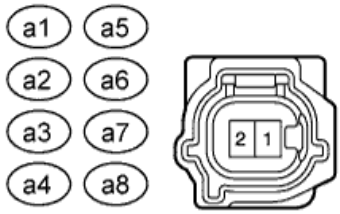
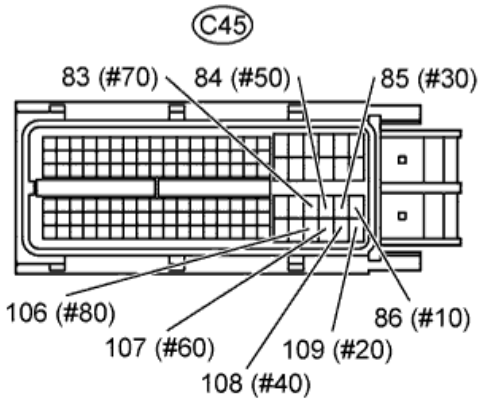
9.CHECK HARNESS AND CONNECTOR

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

12.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → Go to step 34

OK

13.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

e. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

14.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

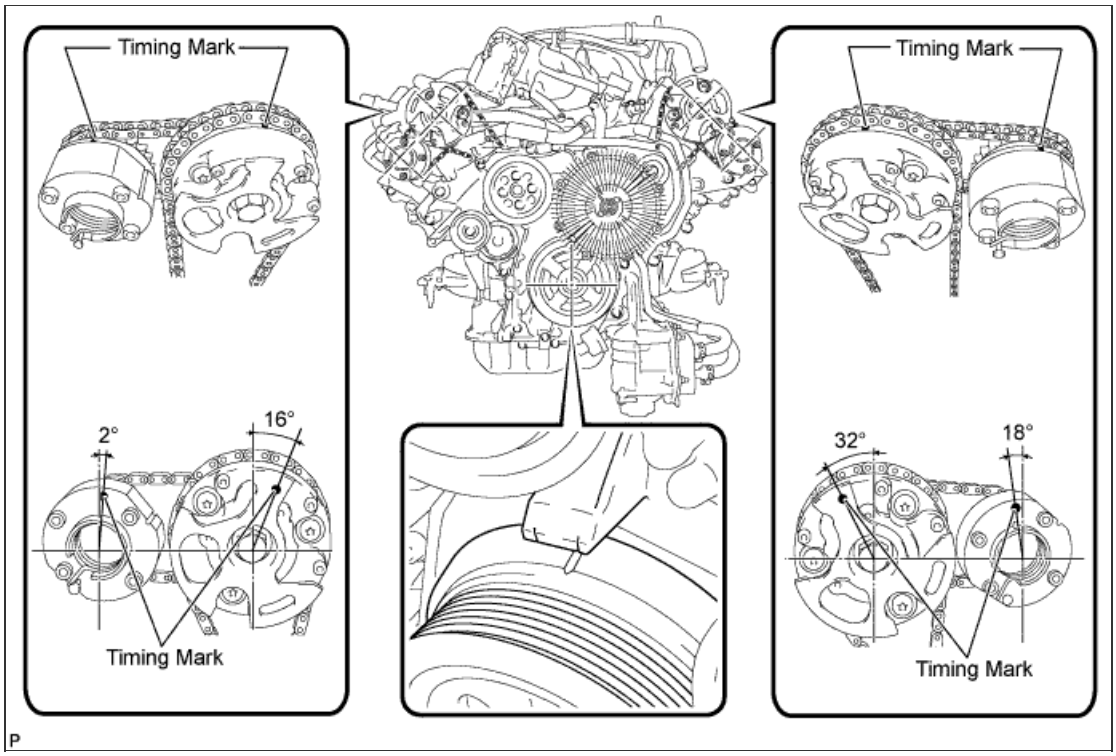
d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

15.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

OK	Go to step 27
NG	ADJUST VALVE TIMING (Click here)

16.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG	REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

17.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG	Go to step 34

OK

18.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine:
Same as ambient air temperature.
With warm engine:
Between 75°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

19.INSPECT MASS AIR FLOW METER

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

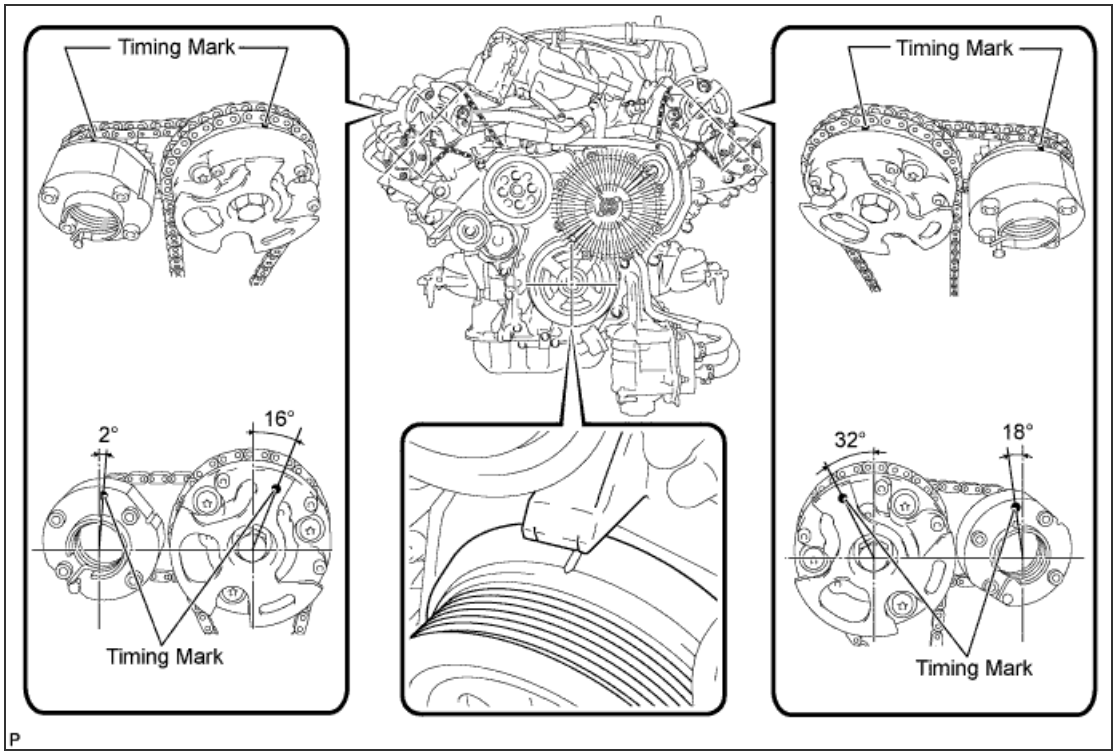
d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF and Coolant Temp.

e. Allow the engine to idle until Coolant Temp reaches 75 C (167 F) or higher.



f. Read MAF with the engine speed at 3000 rpm.

Standard:
Between 25.2 gm/s and 35.2 gm/s (shift lever: N; A/C: Off).

NG → Go to step 27

OK

20.CHECK VALVE TIMING

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark 0 of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

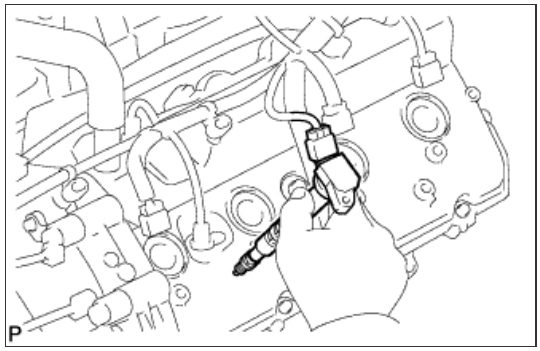
21.INSPECT SPARK PLUG



a. Inspect the spark plug of the misfiring cylinder (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK ↓

22.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 32

OK ↓

23.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK ↓

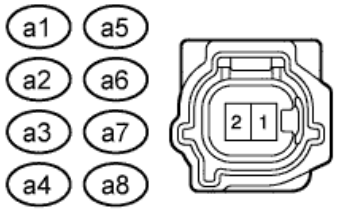
24.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)

a. Disconnect the fuel injector connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch	11 to 14 V

		on (IG)	
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Injector)

NG → GO TO FUEL INJECTOR CIRCUIT (Click here)

OK

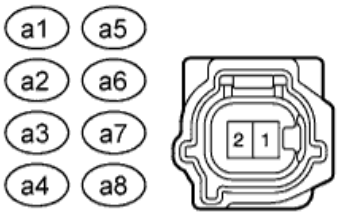
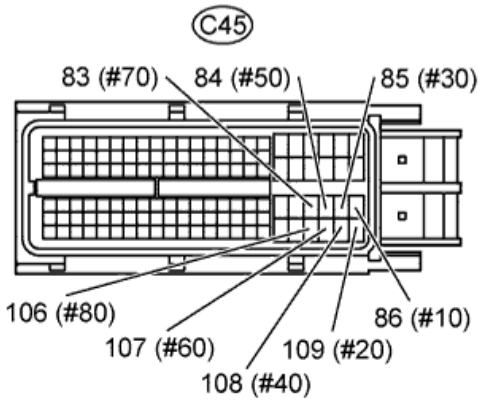
25.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86 (#10)	Always	Below 1 Ω
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

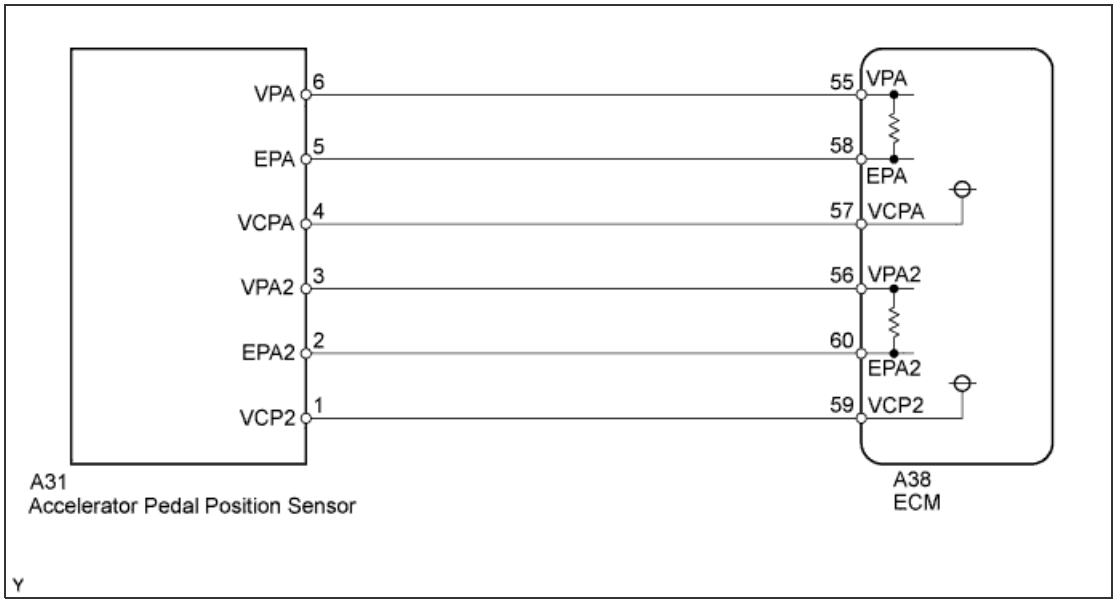
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

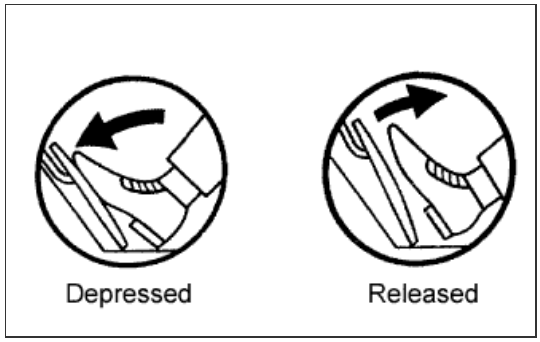
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 5.0 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

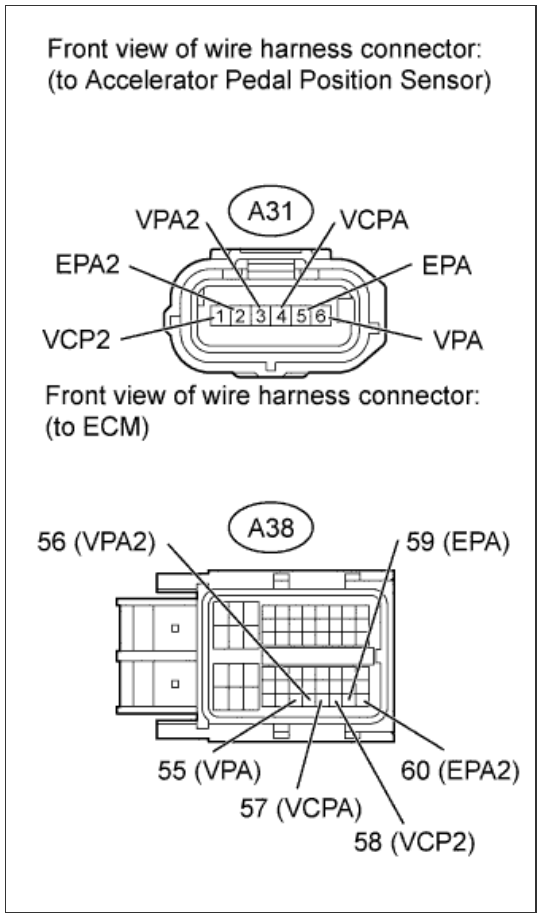
2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)



a. Disconnect the A31 accelerator pedal position (APP) sensor connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)

a. Disconnect the A31 APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

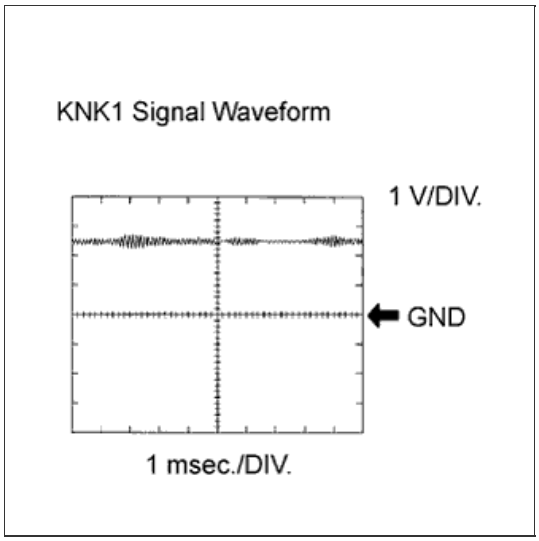
DESCRIPTION

A flat type knock sensor (non-resonant type) has a structure that can detect vibrations between approximately 6 kHz and 15 kHz.
Knock sensors are fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.



DTC Code	DTC Detection Condition	Trouble Area
P0327	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0328	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0332	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P0333	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P032C	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P032D	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P033C	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2)

		• ECM
P033D	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2) • ECM

HINT:

When any of DTCs P0327, P0328, P0332, P0333, P032C, P032D, P033C and P033D is stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-94 (KNK1) - C45-93 (EKNK)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

C45-96 (KNK3) - C45-95 (EKN3)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-119 (KNK4) - C45-118 (EKN4)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

MONITOR DESCRIPTION

The knock sensor, located on the cylinder block, detects spark knock. When spark knock occurs, the piezoelectric element of the sensor vibrates. When the ECM detects a voltage in this frequency range, it retards the ignition timing to suppress the spark knock.
The ECM also senses background engine noise with the knock sensor and uses this noise to check for faults in the sensor. If the knock sensor signal level is too low for more than 10 seconds, or if the knock sensor output voltage is outside the normal range, the ECM interprets this as a fault in the knock sensor and stores DTC(s).

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs is output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

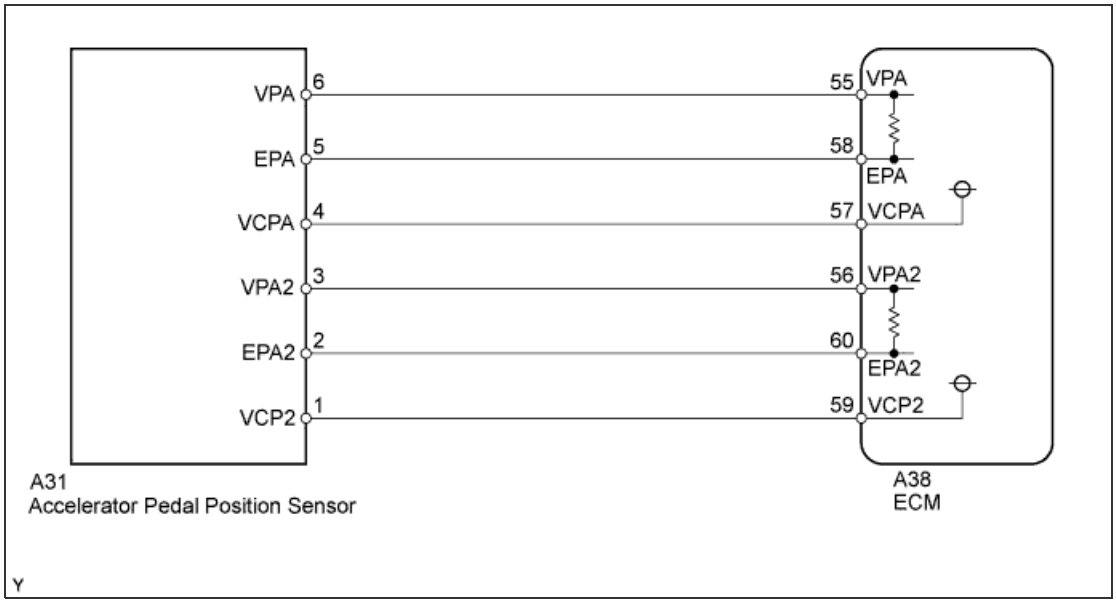
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores DTC(s).
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 is stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

C45-96 (KNK3) - C45-95 (EKN3)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-119 (KNK4) - C45-118 (EKN4)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

MONITOR DESCRIPTION

The knock sensor, located on the cylinder block, detects spark knock. When spark knock occurs, the piezoelectric element of the sensor vibrates. When the ECM detects a voltage in this frequency range, it retards the ignition timing to suppress the spark knock.
The ECM also senses background engine noise with the knock sensor and uses this noise to check for faults in the sensor. If the knock sensor signal level is too low for more than 10 seconds, or if the knock sensor output voltage is outside the normal range, the ECM interprets this as a fault in the knock sensor and stores DTC(s).

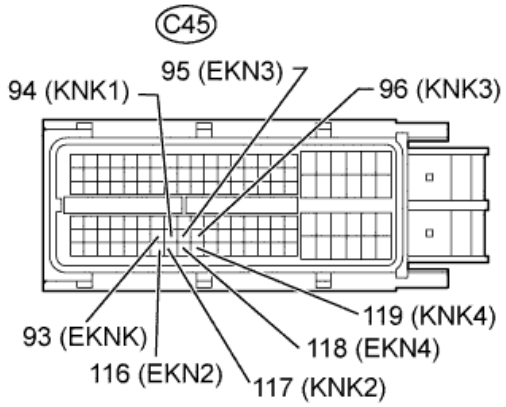
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**

1.INSPECT KNOCK SENSOR

a. Disconnect the C45 ECM connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition

C45-94 (KNK1) - C45-93 (EKNK)	20°C (68°F)	120 to 280 kΩ
C45-117 (KNK2) - C45-116 (EKN2)	20°C (68°F)	120 to 280 kΩ
C45-96 (KNK3) - C45-95 (EKN3)	20°C (68°F)	120 to 280 kΩ
C45-119 (KNK4) - C45-118 (EKN4)	20°C (68°F)	120 to 280 kΩ

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P2121 Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance

for Preparation Click here

DESCRIPTION

HINT:

Refer to DTC P2120 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2121	The difference between VPA and VPA2 is below 0.4 V, or higher than 1.2 V for 0.5 seconds (1 trip detection logic).	• **Accelerator Pedal Position (APP) sensor** • **ECM**

MONITOR DESCRIPTION

When the difference between the output voltages of VPA and VPA2 deviates from the standard, the ECM determines that the Accelerator Pedal Position (APP) sensor is malfunctioning. The ECM turns on the MIL and the DTC is stored.

FAIL-SAFE

The Accelerator Pedal Position (APP) sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the functioning circuit is used to calculate the accelerator pedal opening angle to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal as being fully closed. In this case, the throttle valve remains closed as if the engine is idling.
If a pass condition is detected and then the engine switch is turned off, the fail-safe operation stops and the system returns to a normal condition.

WIRING DIAGRAM

Refer to DTC P2120 (Click here).

INSPECTION PROCEDURE

HINT:

- **This DTC relates to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2121)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

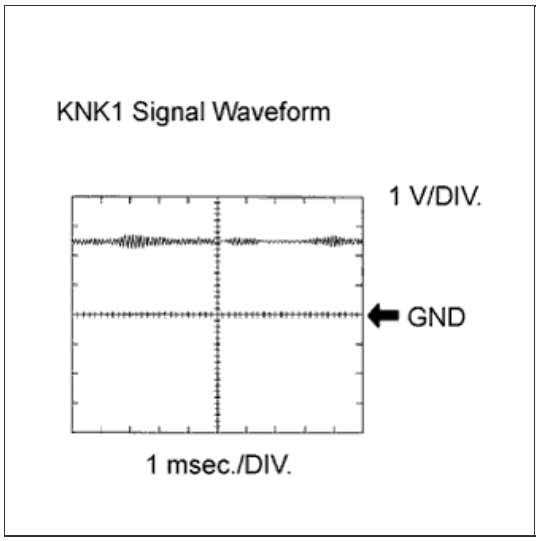
DESCRIPTION

A flat type knock sensor (non-resonant type) has a structure that can detect vibrations between approximately 6 kHz and 15 kHz.
Knock sensors are fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.



DTC Code	DTC Detection Condition	Trouble Area
P0327	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM

DESCRIPTION

Refer to DTC P0031 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

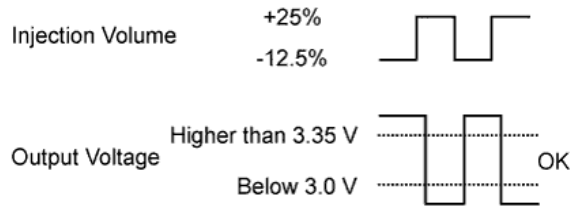
HINT:

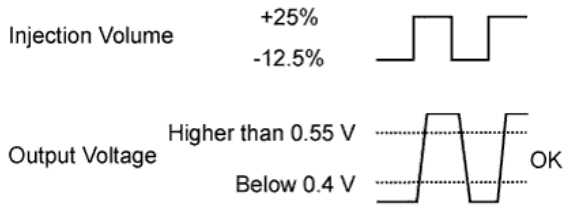
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

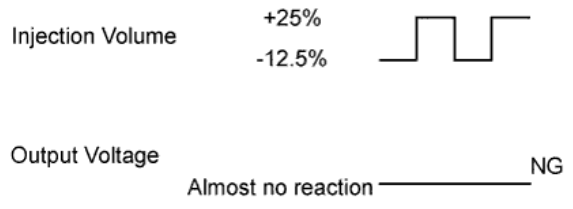
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

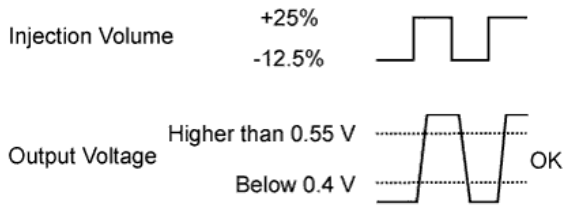
(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

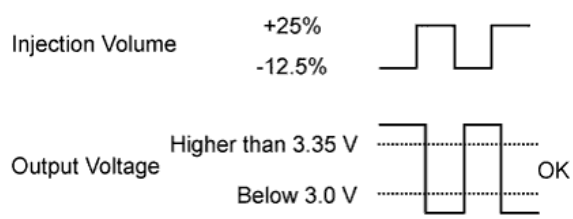
HINT:

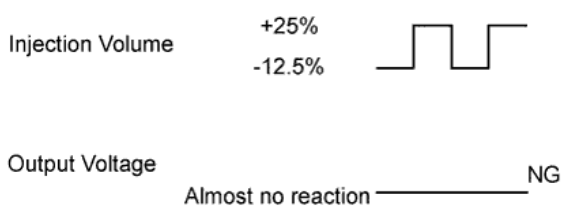


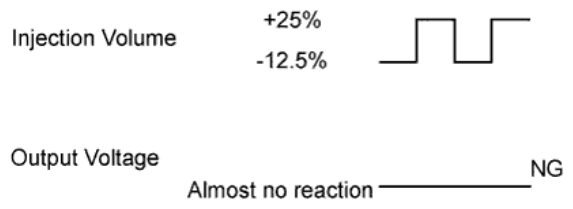


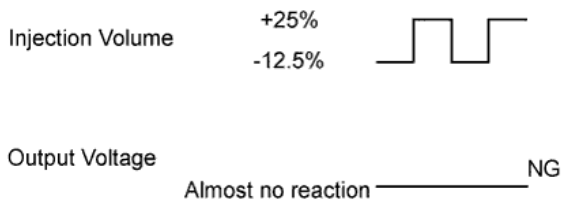












- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

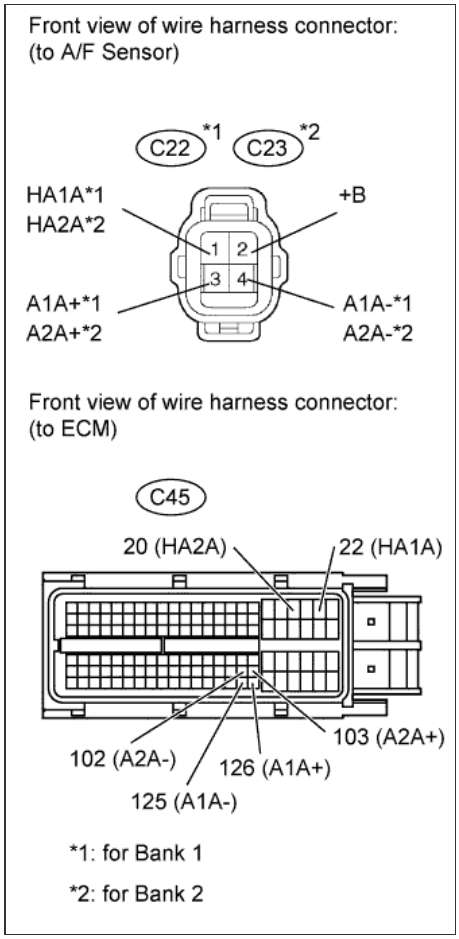
To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



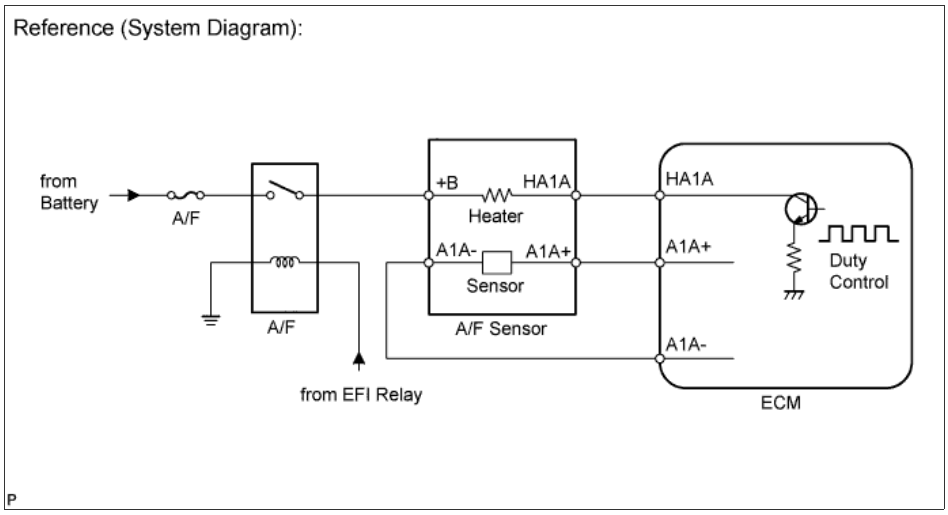
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

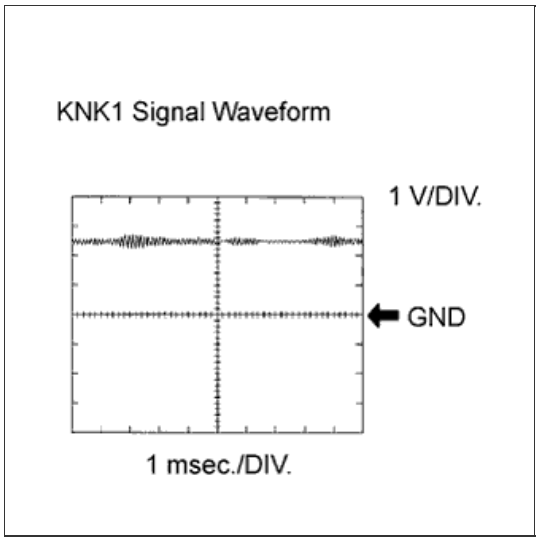
DESCRIPTION

A flat type knock sensor (non-resonant type) has a structure that can detect vibrations between approximately 6 kHz and 15 kHz.
Knock sensors are fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.



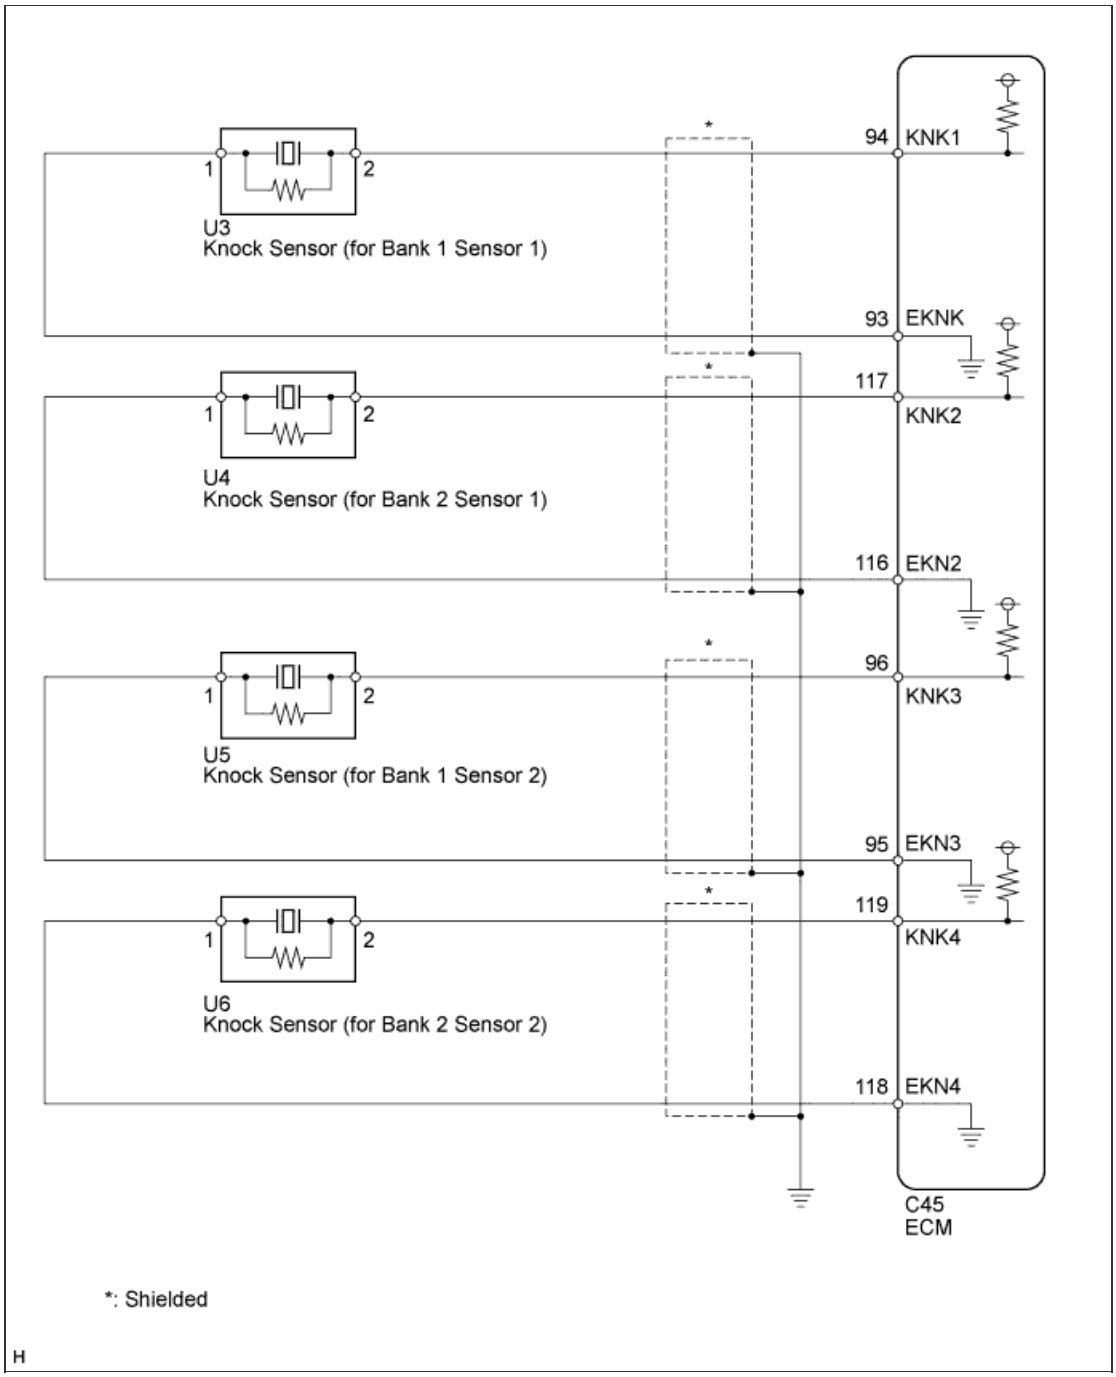
DTC Code	DTC Detection Condition	Trouble Area
P0327	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0328	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0332	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P0333	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P032C	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P032D	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P033C	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2)

		• ECM
P033D	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2) • ECM

HINT:

When any of DTCs P0327, P0328, P0332, P0333, P032C, P032D, P033C and P033D is stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-94 (KNK1) - C45-93 (EKNK)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

C45-119 (KNK4) - C45-118 (EKN4)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

MONITOR DESCRIPTION

The knock sensor, located on the cylinder block, detects spark knock. When spark knock occurs, the piezoelectric element of the sensor vibrates. When the ECM detects a voltage in this frequency range, it retards the ignition timing to suppress the spark knock.
The ECM also senses background engine noise with the knock sensor and uses this noise to check for faults in the sensor. If the knock sensor signal level is too low for more than 10 seconds, or if the knock sensor output voltage is outside the normal range, the ECM interprets this as a fault in the knock sensor and stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

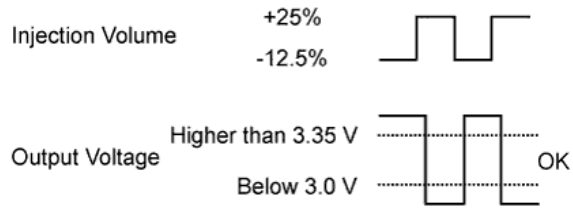
HINT:

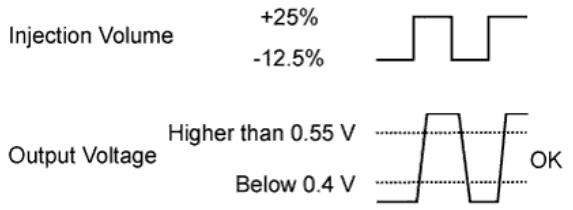
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

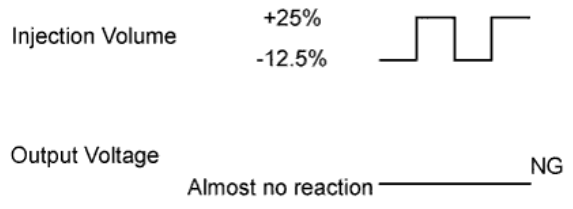
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

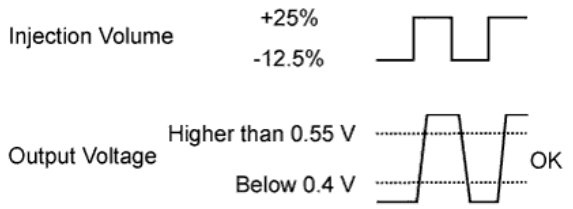
(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

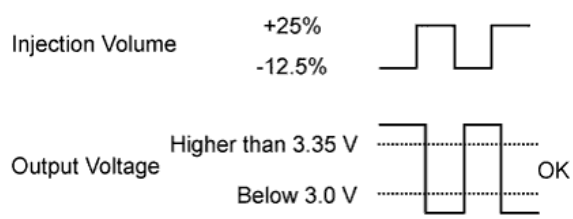
HINT:

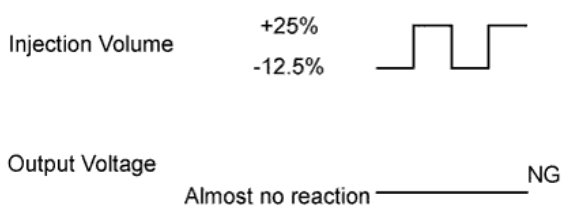


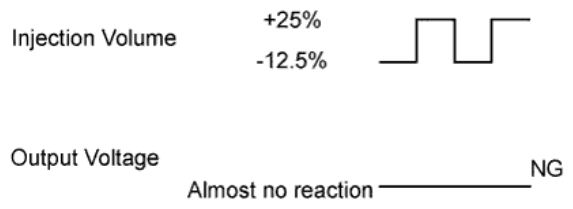


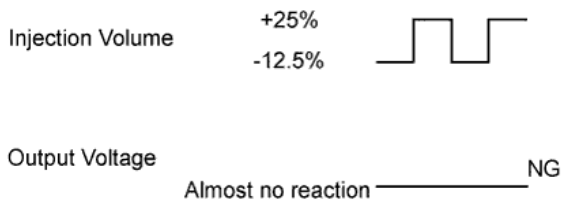












- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

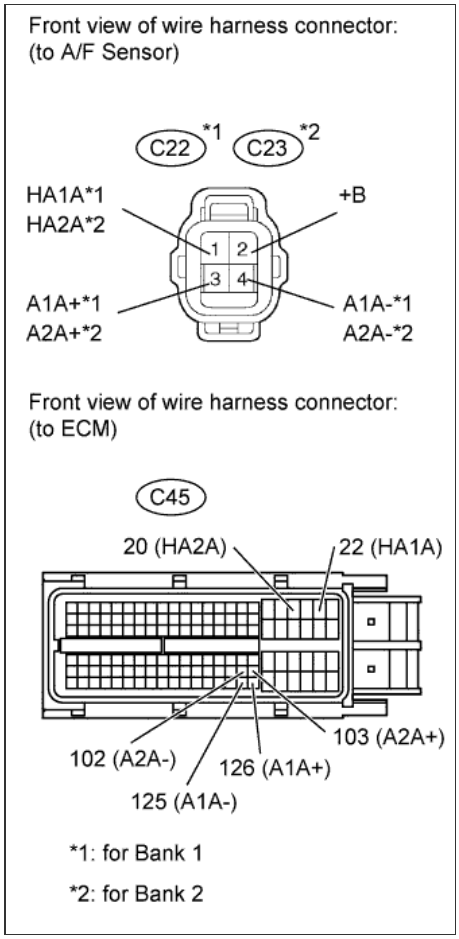
To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



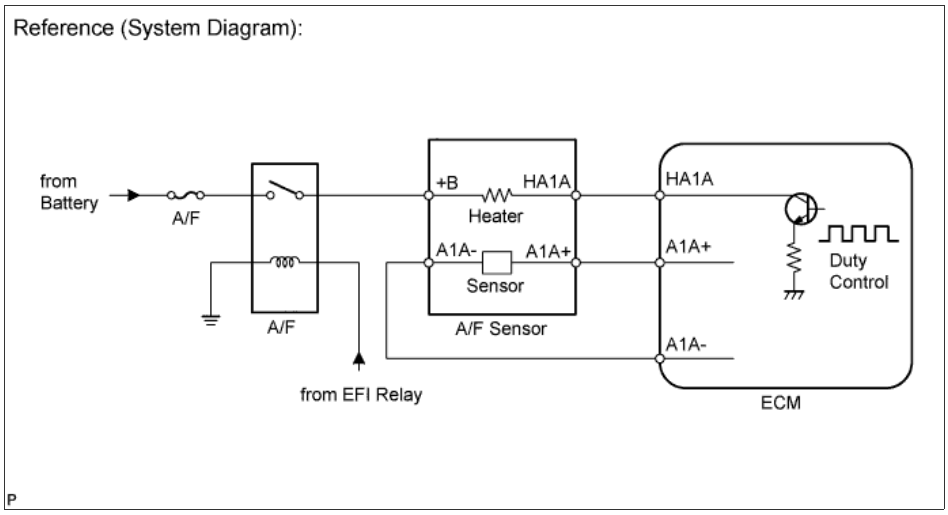
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

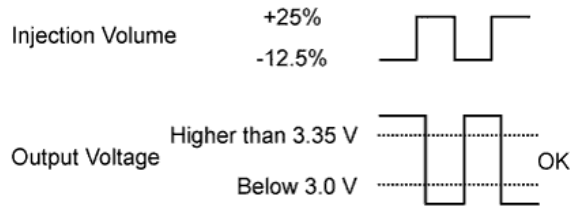
HINT:

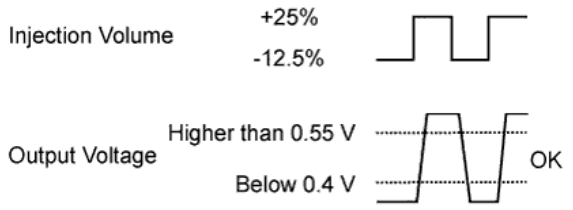
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

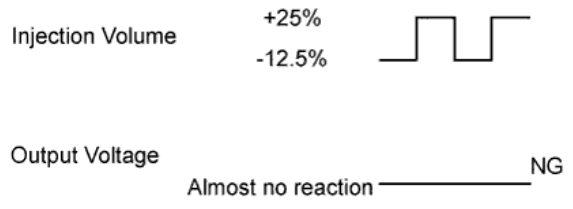
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

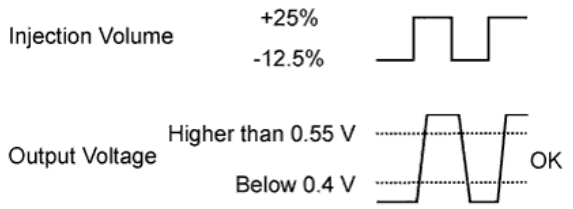
(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

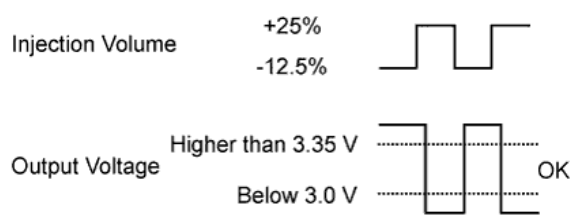
HINT:

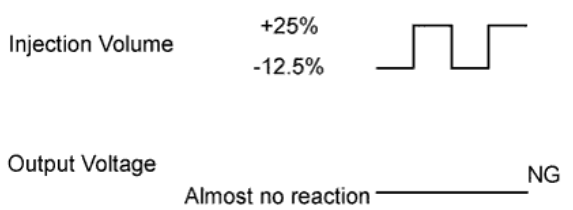


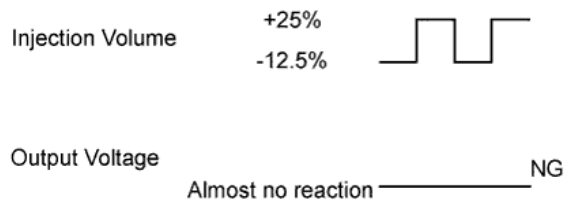


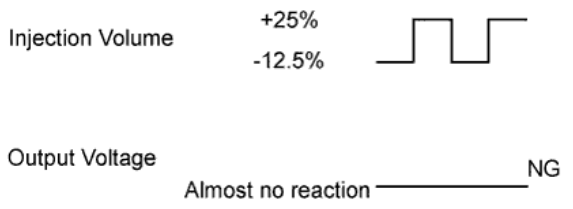












- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

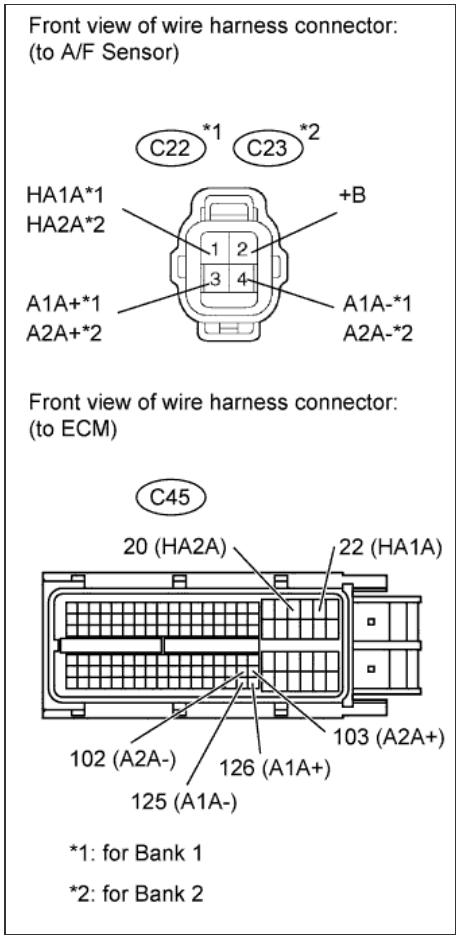
To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



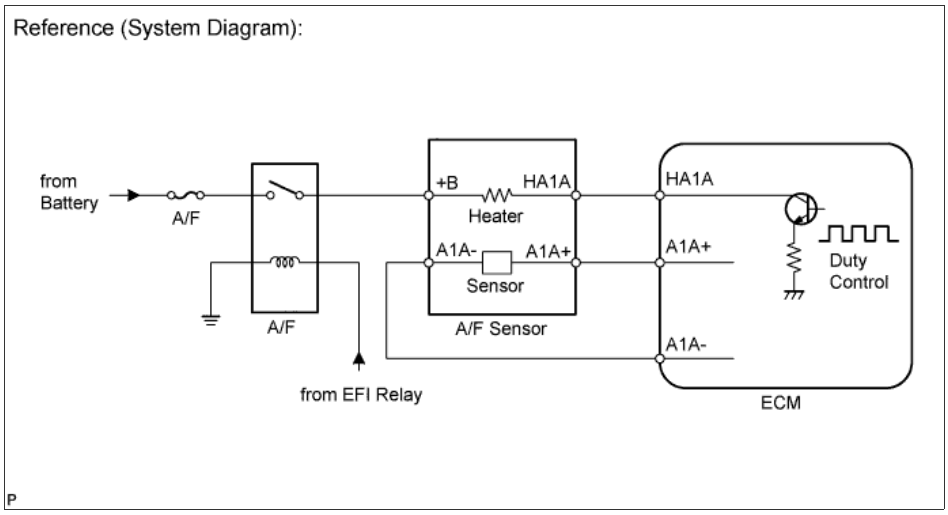
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

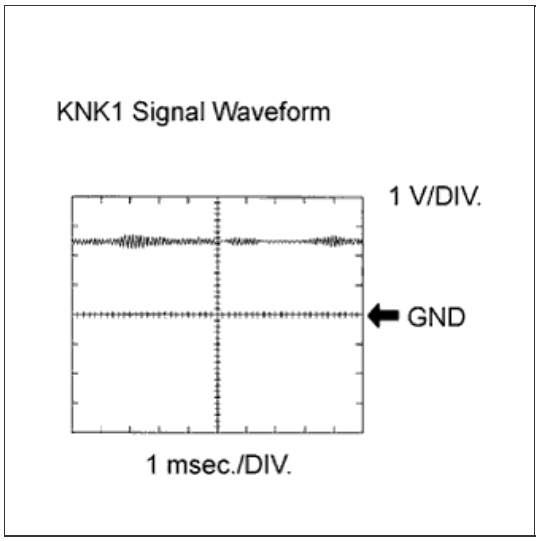
DESCRIPTION

A flat type knock sensor (non-resonant type) has a structure that can detect vibrations between approximately 6 kHz and 15 kHz.
Knock sensors are fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.



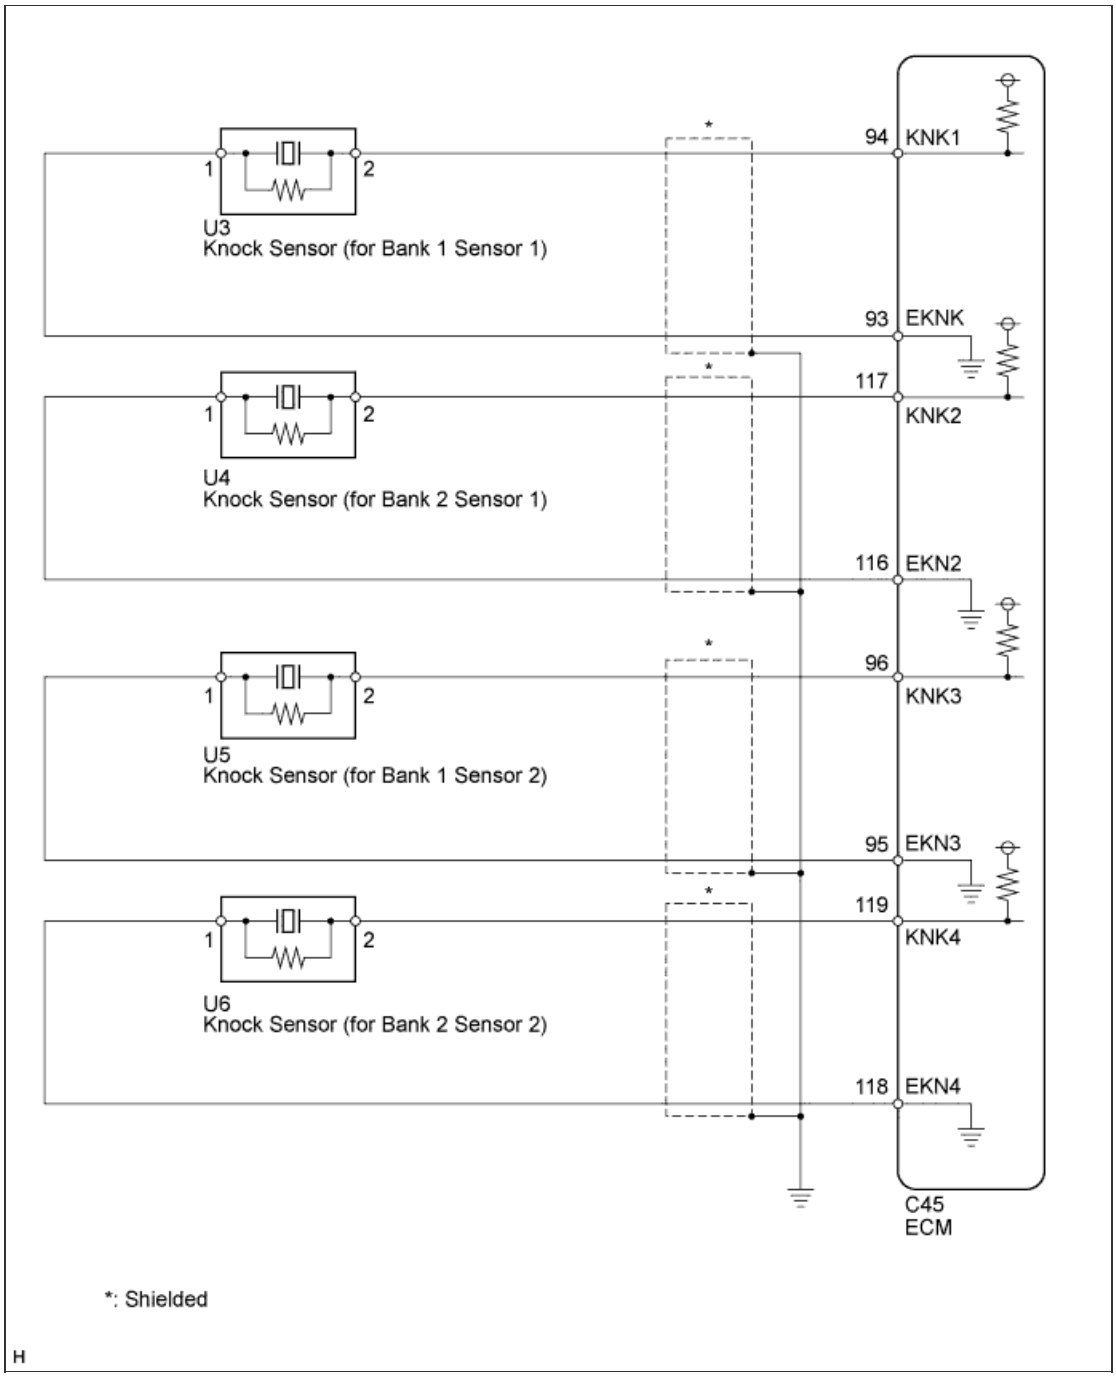
DTC Code	DTC Detection Condition	Trouble Area
P0327	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0328	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0332	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P0333	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P032C	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P032D	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P033C	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2)

		• ECM
P033D	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2) • ECM

HINT:

When any of DTCs P0327, P0328, P0332, P0333, P032C, P032D, P033C and P033D is stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-94 (KNK1) - C45-93 (EKNK)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-117 (KNK2) - C45-116 (EKN2)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-96 (KNK3) - C45-95 (EKN3)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-119 (KNK4) - C45-118 (EKN4)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

MONITOR DESCRIPTION

The knock sensor, located on the cylinder block, detects spark knock. When spark knock occurs, the piezoelectric element of the sensor vibrates. When the ECM detects a voltage in this frequency range, it retards the ignition timing to suppress the spark knock.
The ECM also senses background engine noise with the knock sensor and uses this noise to check for faults in the sensor. If the knock sensor signal level is too low for more than 10 seconds, or if the knock sensor output voltage is outside the normal range, the ECM interprets this as a fault in the knock sensor and stores DTC(s).

INSPECTION PROCEDURE

HINT:

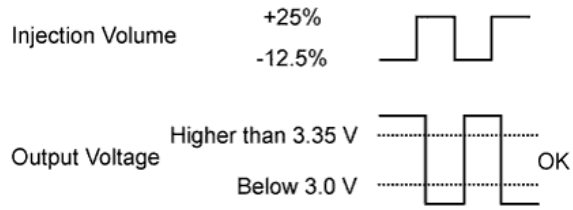
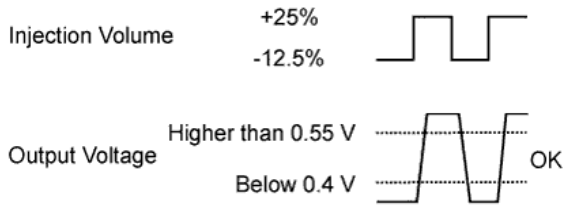
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

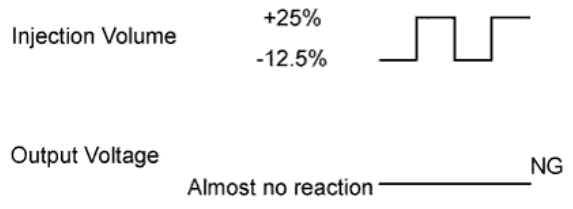
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

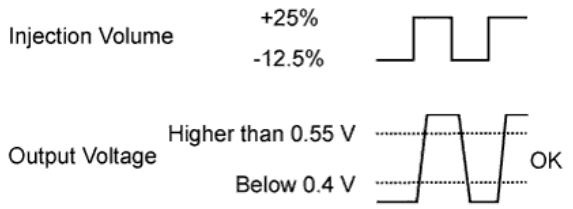
(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

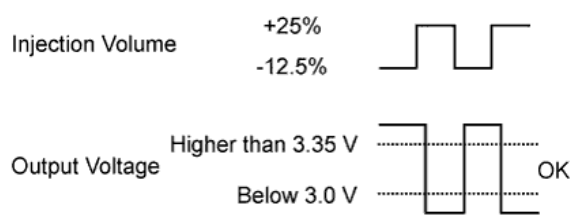
HINT:

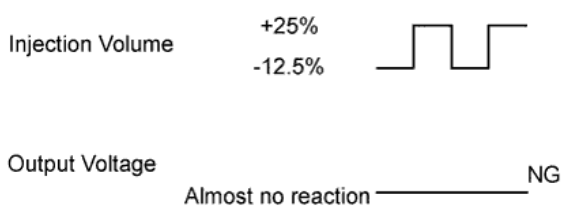


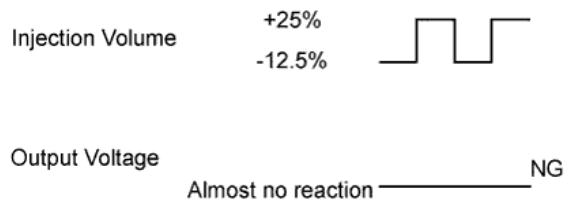


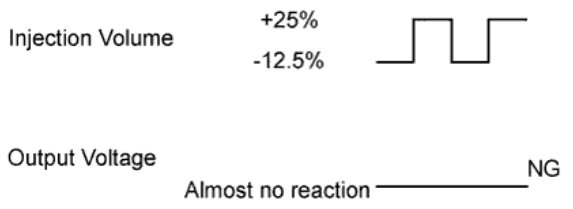












- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

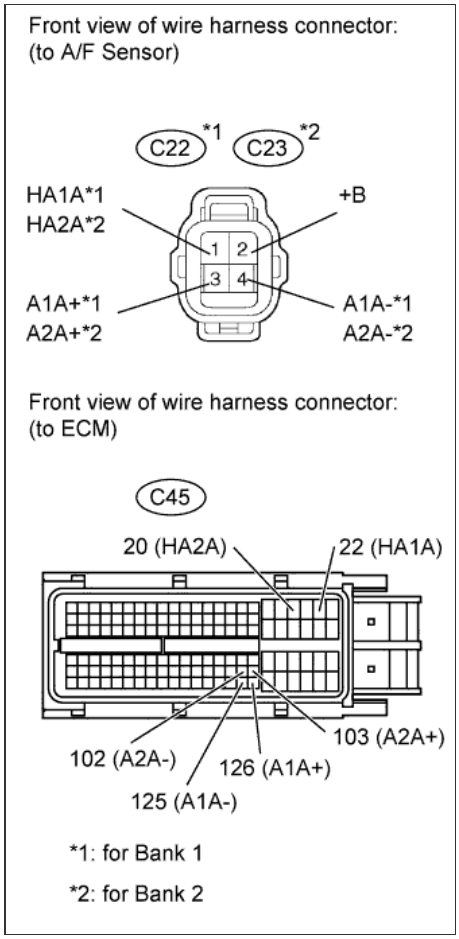
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



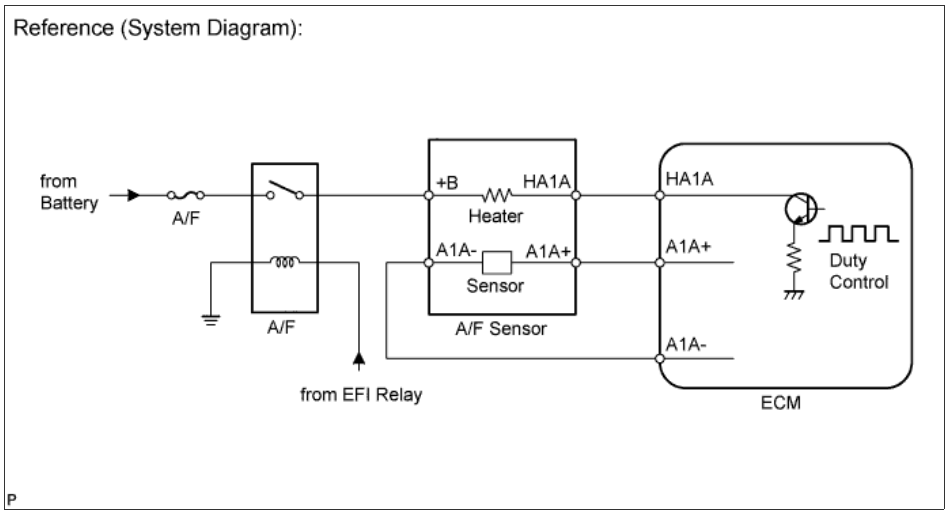
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

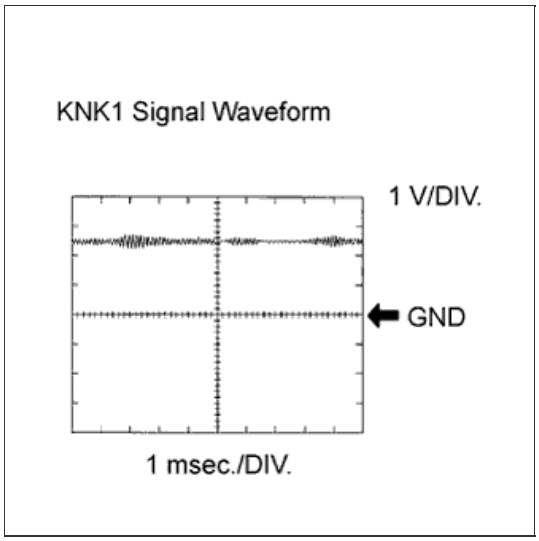
DESCRIPTION

A flat type knock sensor (non-resonant type) has a structure that can detect vibrations between approximately 6 kHz and 15 kHz.
Knock sensors are fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.



DTC Code	DTC Detection Condition	Trouble Area
P0327	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0328	The output voltage of the knock sensor (for Bank 1 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 1) circuit • Knock sensor (for Bank 1 Sensor 1) • ECM
P0332	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P0333	The output voltage of the knock sensor (for Bank 2 Sensor 1) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor1) circuit • Knock sensor (for Bank 2 Sensor 1) • ECM
P032C	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P032D	The output voltage of the knock sensor (for Bank 1 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 1 Sensor 2) circuit • Knock sensor (for Bank 1 Sensor 2) • ECM
P033C	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 0.5 V or less (1 trip detection logic).	• Short in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2)

		• ECM
P033D	The output voltage of the knock sensor (for Bank 2 Sensor 2) is 4.5 V or higher (1 trip detection logic).	• Open in knock sensor (for Bank 2 Sensor 2) circuit • Knock sensor (for Bank 2 Sensor 2) • ECM

HINT:

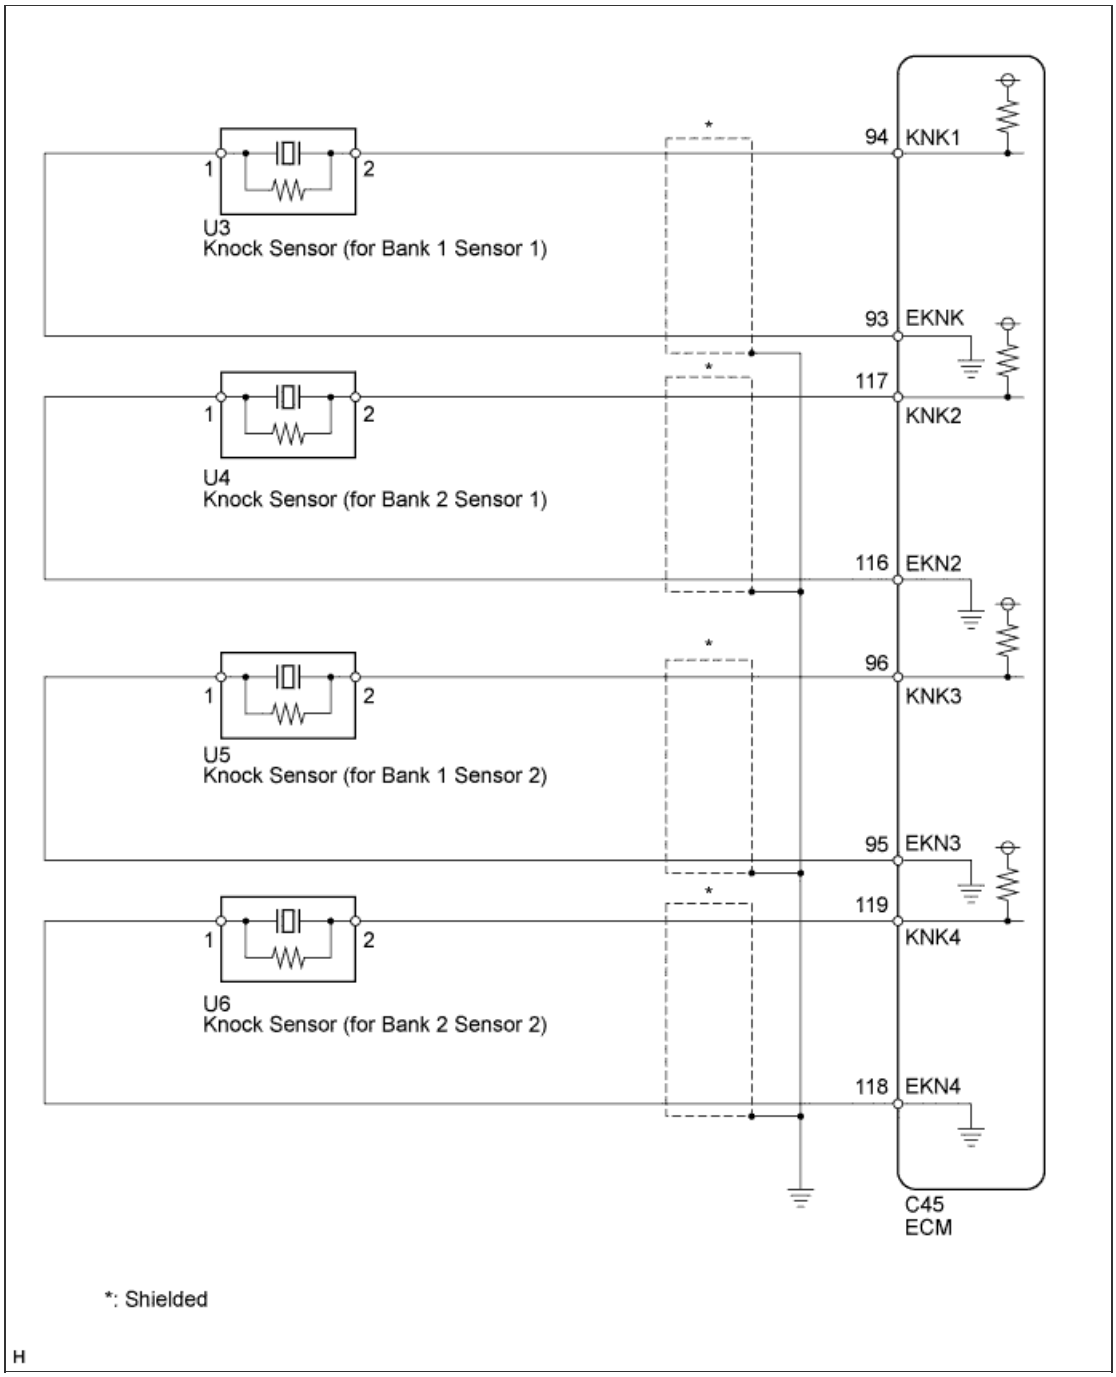
When any of DTCs P0327, P0328, P0332, P0333, P032C, P032D, P033C and P033D is stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-94 (KNK1) - C45-93 (EKNK)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-117 (KNK2) - C45-116 (EKN2)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-96 (KNK3) - C45-95 (EKN3)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-119 (KNK4) - C45-118 (EKN4)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

MONITOR DESCRIPTION

The knock sensor, located on the cylinder block, detects spark knock. When spark knock occurs, the piezoelectric element of the sensor vibrates. When the ECM detects a voltage in this frequency range, it retards the ignition timing to suppress the spark knock.
The ECM also senses background engine noise with the knock sensor and uses this noise to check for faults in the sensor. If the knock sensor signal level is too low for more than 10 seconds, or if the knock sensor output voltage is outside the normal range, the ECM interprets this as a fault in the knock sensor and stores DTC(s).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

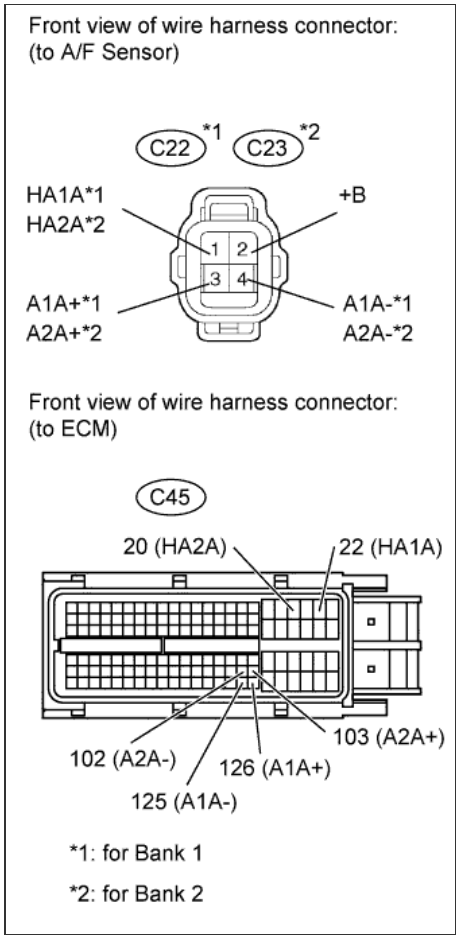
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



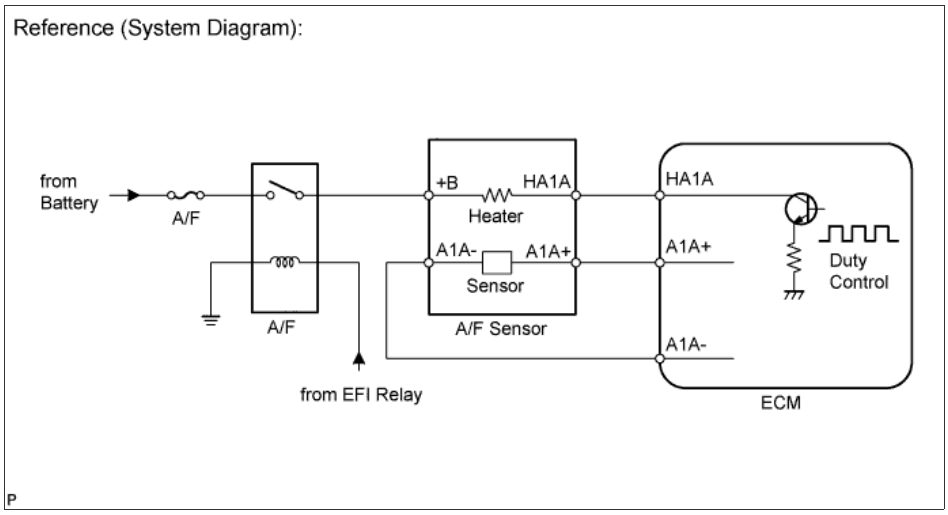
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

C45-94 (KNK1) - C45-93 (EKNK)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-117 (KNK2) - C45-116 (EKN2)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-96 (KNK3) - C45-95 (EKN3)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown
C45-119 (KNK4) - C45-118 (EKN4)	0.01 to 10 V/DIV. 0.01 to 10 msec./DIV.	Keep engine speed at 4000 rpm with warm engine	The correct waveform is as shown

MONITOR DESCRIPTION

The knock sensor, located on the cylinder block, detects spark knock. When spark knock occurs, the piezoelectric element of the sensor vibrates. When the ECM detects a voltage in this frequency range, it retards the ignition timing to suppress the spark knock.
The ECM also senses background engine noise with the knock sensor and uses this noise to check for faults in the sensor. If the knock sensor signal level is too low for more than 10 seconds, or if the knock sensor output voltage is outside the normal range, the ECM interprets this as a fault in the knock sensor and stores DTC(s).

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

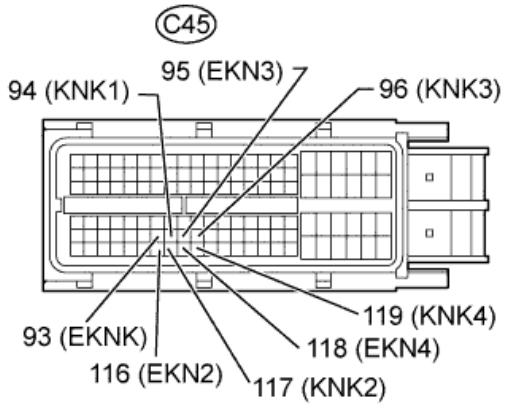
- **DTCs P0327 and P0328 are for the bank 1 sensor 1 knock sensor circuit.**
- **DTCs P032C and P032D are for the bank 1 sensor 2 knock sensor circuit.**
- **DTCs P0332 and P0333 are for the bank 2 sensor 1 knock sensor circuit.**
- **DTCs P033C and P033D are for the bank 2 sensor 2 knock sensor circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**

1.INSPECT KNOCK SENSOR

a. Disconnect the C45 ECM connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition

C45-94 (KNK1) - C45-93 (EKNK)	20°C (68°F)	120 to 280 kΩ
C45-117 (KNK2) - C45-116 (EKN2)	20°C (68°F)	120 to 280 kΩ
C45-96 (KNK3) - C45-95 (EKN3)	20°C (68°F)	120 to 280 kΩ
C45-119 (KNK4) - C45-118 (EKN4)	20°C (68°F)	120 to 280 kΩ

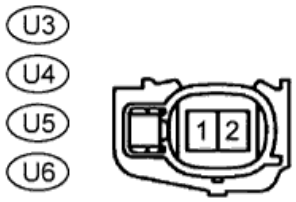
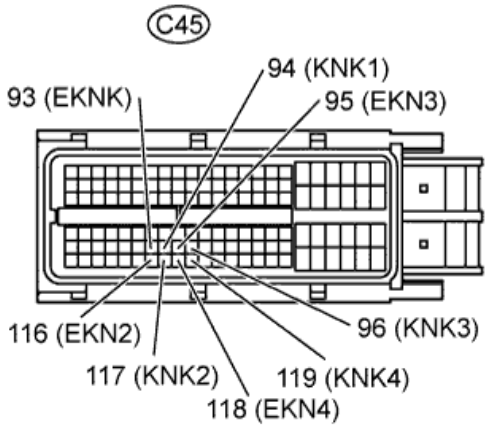
2.CHECK HARNESS AND CONNECTOR (ECM - KNOCK SENSOR)

a. Disconnect the C45 ECM connector.



b. Disconnect the U3, U4, U5 or U6 knock sensor connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
U3-2 - C45-94 (KNK1)	Always	Below 1 Ω
U3-1 - C45-93 (EKNK)	Always	Below 1 Ω
U4-2 - C45-117 (KNK2)	Always	Below 1 Ω
U4-1 - C45-116 (EKN2)	Always	Below 1 Ω
U5-2 - C45-96 (KNK3)	Always	Below 1 Ω
U5-1 - C45-95 (EKN3)	Always	Below 1 Ω
U6-2 - C45-119 (KNK4)	Always	Below 1 Ω
U6-1 - C45-118 (EKN4)	Always	Below 1 Ω
U3-2 or C45-94 (KNK1) - Body ground	Always	10 kΩ or higher
U3-1 or C45-93 (EKNK) - Body ground	Always	10 kΩ or higher
U4-2 or C45-117 (KNK2) - Body ground	Always	10 kΩ or higher
U4-1 or C45-116 (EKN2) - Body ground	Always	10 kΩ or higher
U5-2 or C45-96		

Front view of wire harness connector:
(to Knock Sensor)

Front view of wire harness connector:
(to ECM)

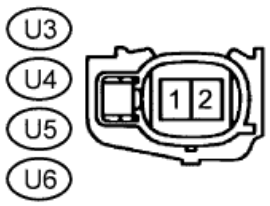
(KNK3) - Body ground	Always	10 kΩ or higher
U5-1 or C45-95 (EKN3) - Body ground	Always	10 kΩ or higher
U6-2 or C45-119 (KNK4) - Body ground	Always	10 kΩ or higher
U6-1 or C45-118 (EKN4) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE KNOCK SENSOR (Click here)

3.INSPECT ECM



a. Disconnect the U3, U4, U5 or U6 knock sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Engine switch on (IG)	4.5 to 5.5 V

Front view of wire harness connector:
(to Knock Sensor)

NG → REPLACE ECM (Click here)

DESCRIPTION

Refer to DTC P0031 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

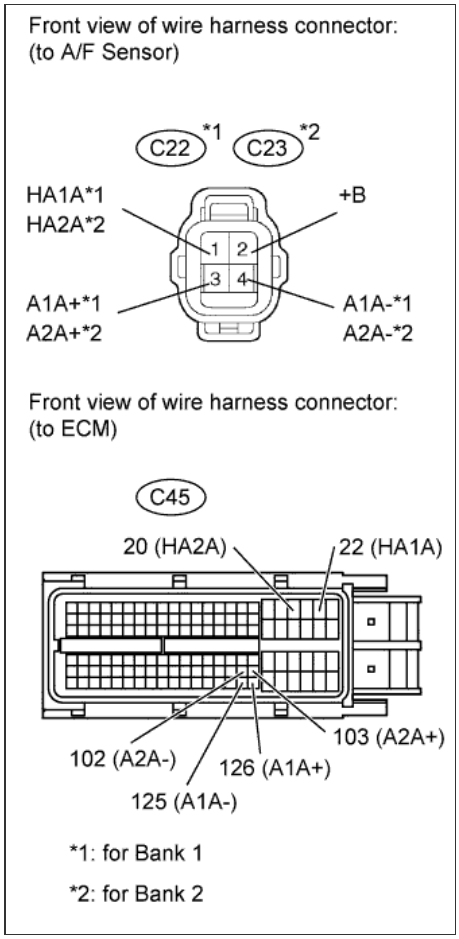
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



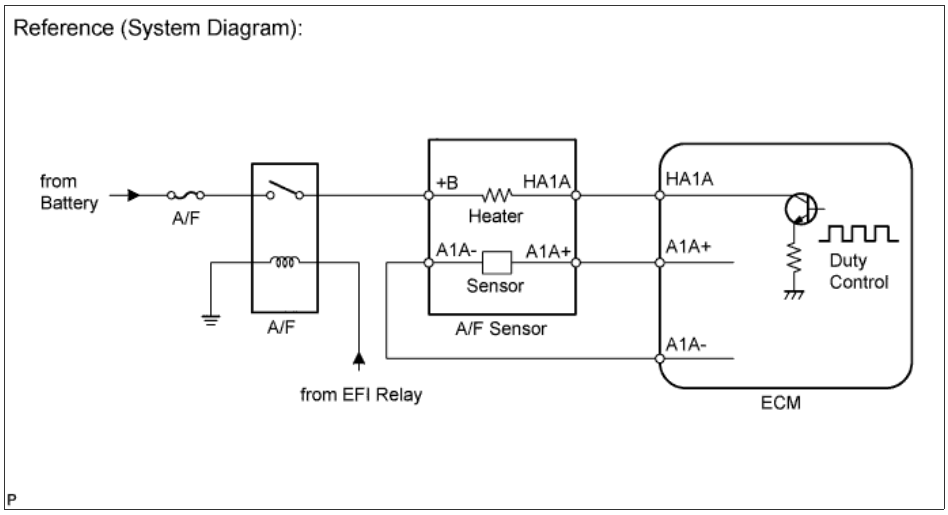
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

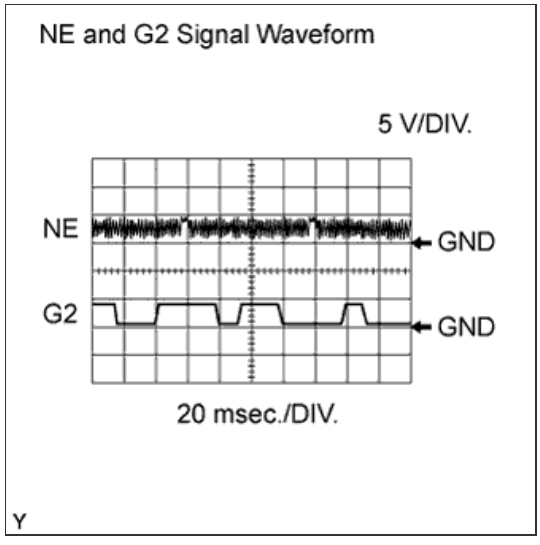
DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0337 Crankshaft Position Sensor "A" Circuit Low Input

DTC P0338 Crankshaft Position Sensor "A" Circuit High Input

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent



for Preparation Click here

DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a crankshaft position sensor plate and Magnetic Resistance Element (MRE) type sensor. The crankshaft position sensor plate has 34 teeth at 10° intervals (2 teeth are missing for detecting top dead center), and is installed to the rear end of the crankshaft. The crankshaft position sensor outputs 34 rotation signals per crankshaft revolution. The ECM uses the G2 signal to distinguish between the cylinders, and uses the NE signal to detect the crankshaft position and engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0335	• No Crankshaft Position (CKP) sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in Crankshaft Position (CKP) sensor circuit • CKP sensor • CKP sensor plate • ECM
P0337	The output voltage of the CKP sensor is 0.3 V or less for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0338	The output voltage of the CKP sensor is 4.7 V or higher for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) The engine speed is 1000 rpm or more. (b) The starter signal is OFF. (c) 3 seconds or more have elapsed since the starter signal was switched from ON to OFF.	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

C45-90 (G2) - C45-89 (G2-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

G2 stands for the camshaft position sensor signal, and NE stands for the crankshaft position sensor signal.

MONITOR DESCRIPTION

If there is no signal from the crankshaft position sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor. When the sensor output voltage remains at below 0.3 V, or higher than 4.7 V for more than 4 seconds, the ECM stores DTC(s).

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If no problem is found by this diagnostic troubleshooting procedure, check for problems by referring to the engine mechanical section.**
- **The engine speed can be checked by using the intelligent tester. To check, follow the procedures below:**
  1. **Connect the tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.**
     The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as less than the actual engine speed, if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.

d. Start the engine.

e. Read the values displayed on the tester while the engine is running.

Standard:
Correct values are displayed.

HINT:

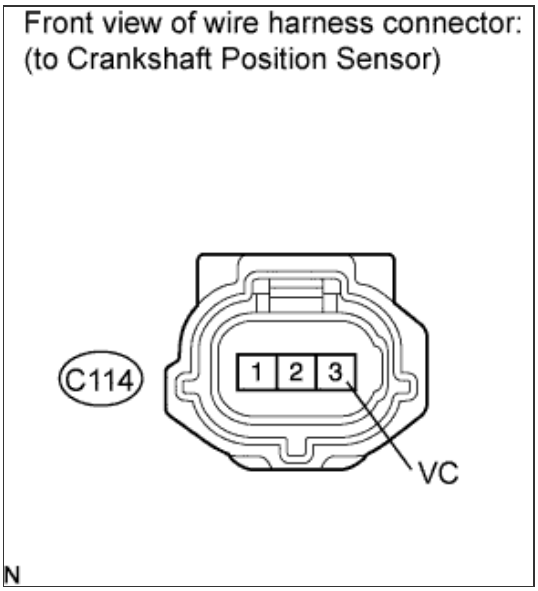
- **To check the engine speed change, display the graph on the intelligent tester.**
- **If the engine does not start, check the engine speed while cranking.**
- **If the engine speed indicated on the intelligent tester remains zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.**

NG → Go to step 2

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)



2.INSPECT CRANKSHAFT POSITION SENSOR (SENSOR POWER SOURCE)

a. Disconnect the C114 crankshaft position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

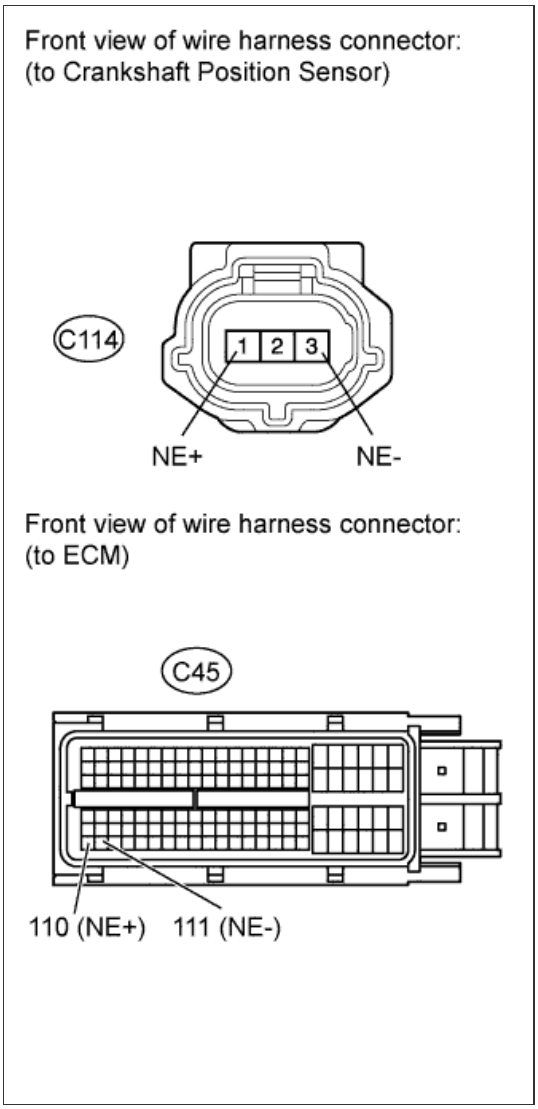
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C114-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → Go to step 8

OK

3.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)



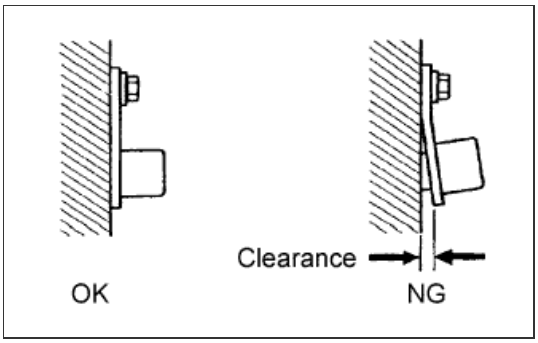
a. Disconnect the C114 crankshaft position sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C114-1 (NE+) - C45-110 (NE+)	Always	Below 1 Ω
C114-2 (NE-) - C45-111 (NE-)	Always	Below 1 Ω
C114-1 (NE+) or C45-110 (NE+) - Body ground	Always	10 kΩ or higher
C114-2 (NE-) or C45-111 (NE-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

a. Check the crankshaft position sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

5.CHECK CRANKSHAFT POSITION SENSOR PLATE (TEETH OF SENSOR PLATE)

a. Check the teeth of the sensor plate.

OK:
Sensor plate does not have any cracks or deformation.

NG → REPLACE CRANKSHAFT POSITION SENSOR PLATE (Click here)

OK

6.REPLACE CRANKSHAFT POSITION SENSOR

a. Replace the crankshaft position sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS (DTC P0335, P0337, P0338 AND/OR P0339)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

DESCRIPTION

Refer to DTC P0031 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

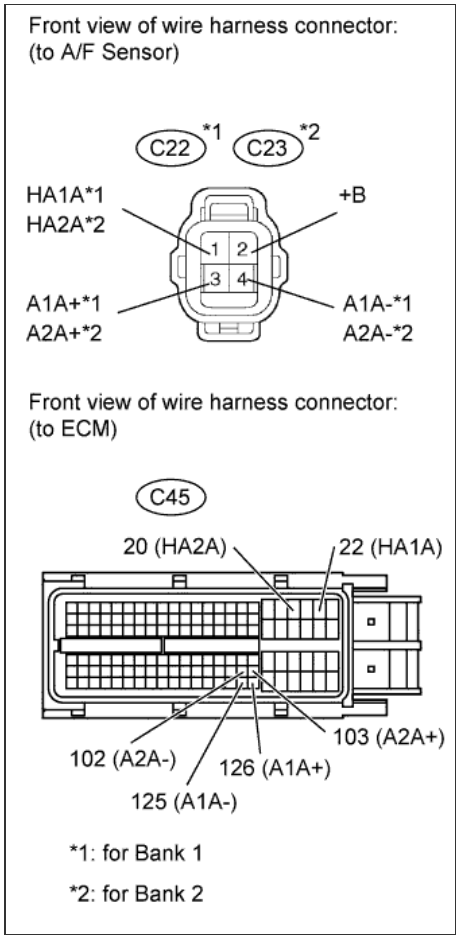
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



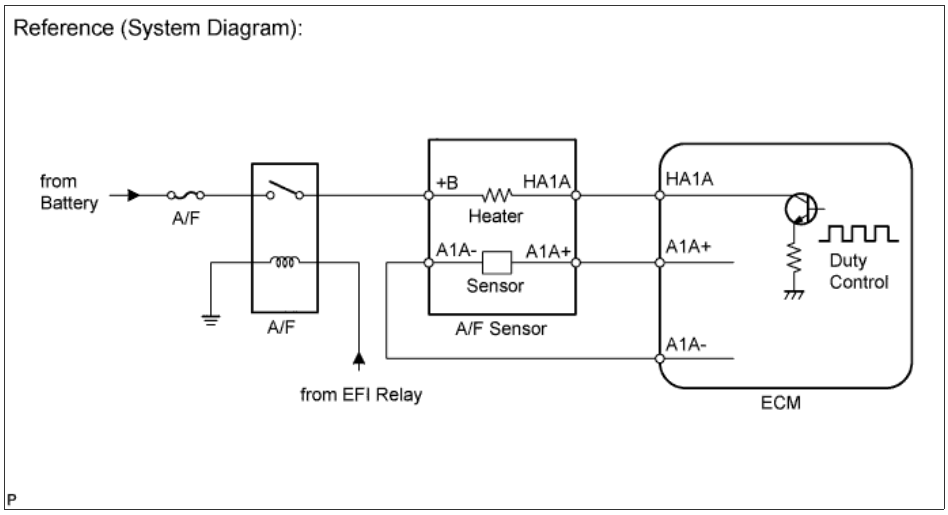
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

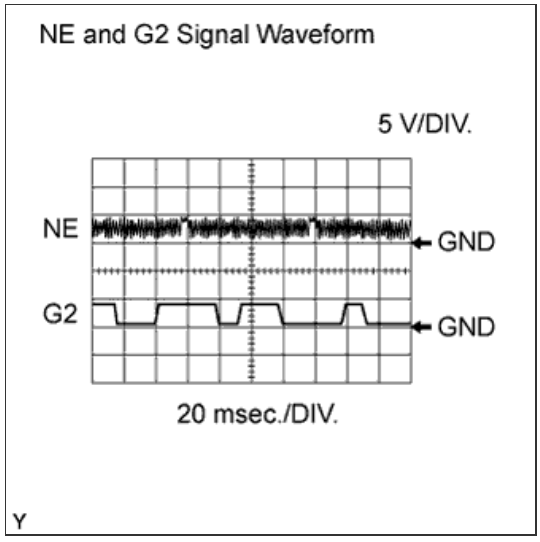
DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent



for Preparation Click here

DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a crankshaft position sensor plate and Magnetic Resistance Element (MRE) type sensor. The crankshaft position sensor plate has 34 teeth at 10° intervals (2 teeth are missing for detecting top dead center), and is installed to the rear end of the crankshaft. The crankshaft position sensor outputs 34 rotation signals per crankshaft revolution. The ECM uses the G2 signal to distinguish between the cylinders, and uses the NE signal to detect the crankshaft position and engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0335	• No Crankshaft Position (CKP) sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in Crankshaft Position (CKP) sensor circuit • CKP sensor • CKP sensor plate • ECM
P0337	The output voltage of the CKP sensor is 0.3 V or less for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0338	The output voltage of the CKP sensor is 4.7 V or higher for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) The engine speed is 1000 rpm or more. (b) The starter signal is OFF. (c) 3 seconds or more have elapsed since the starter signal was switched from ON to OFF.	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

C45-90 (G2) - C45-89 (G2-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

G2 stands for the camshaft position sensor signal, and NE stands for the crankshaft position sensor signal.

MONITOR DESCRIPTION

If there is no signal from the crankshaft position sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor. When the sensor output voltage remains at below 0.3 V, or higher than 4.7 V for more than 4 seconds, the ECM stores DTC(s).

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If no problem is found by this diagnostic troubleshooting procedure, check for problems by referring to the engine mechanical section.**
- **The engine speed can be checked by using the intelligent tester. To check, follow the procedures below:**
  1. **Connect the tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.**
     The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as less than the actual engine speed, if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.

d. Start the engine.

e. Read the values displayed on the tester while the engine is running.

Standard:
Correct values are displayed.

HINT:

- **To check the engine speed change, display the graph on the intelligent tester.**
- **If the engine does not start, check the engine speed while cranking.**
- **If the engine speed indicated on the intelligent tester remains zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.**

NG → Go to step 2

OK

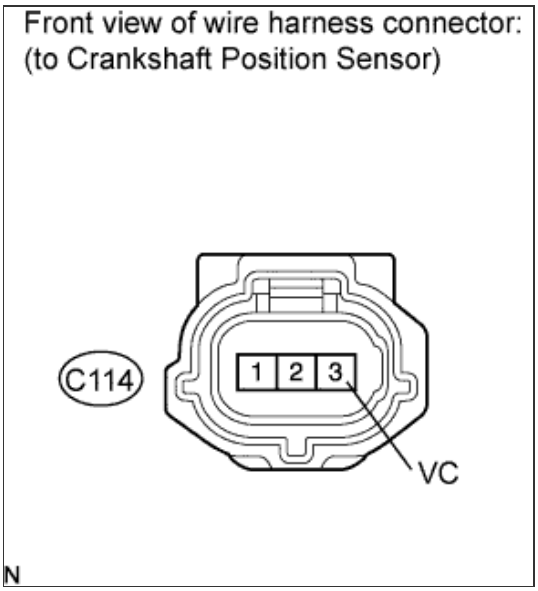
CHECK FOR INTERMITTENT PROBLEMS (Click here)



2.INSPECT CRANKSHAFT POSITION SENSOR (SENSOR POWER SOURCE)

a. Disconnect the C114 crankshaft position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C114-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → Go to step 8

OK

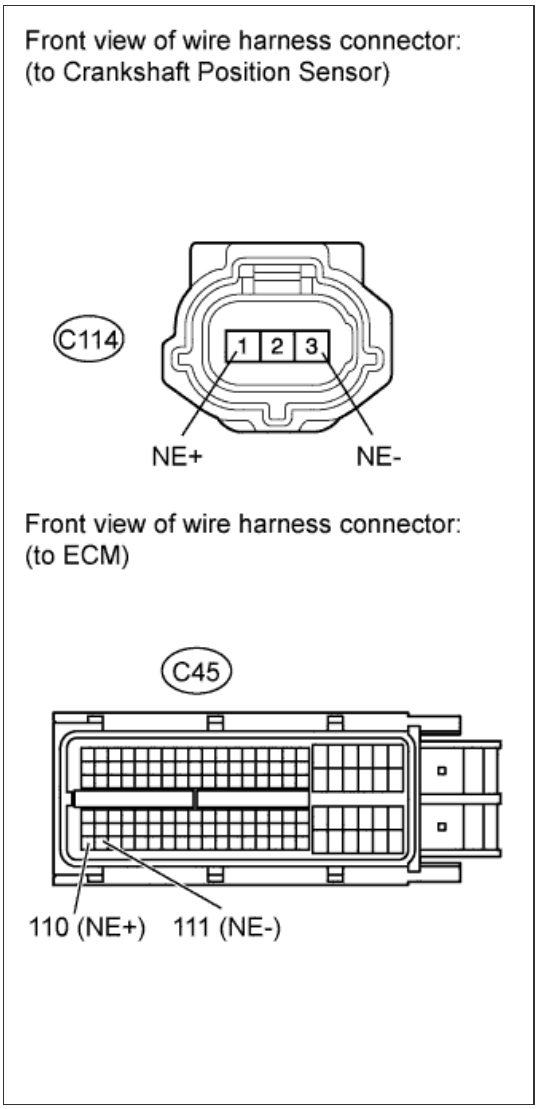
3.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)



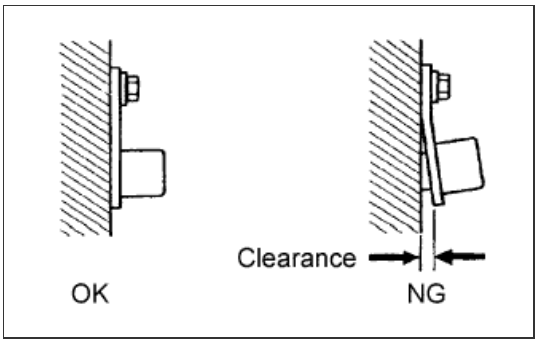
a. Disconnect the C114 crankshaft position sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C114-1 (NE+) - C45-110 (NE+)	Always	Below 1 Ω
C114-2 (NE-) - C45-111 (NE-)	Always	Below 1 Ω
C114-1 (NE+) or C45-110 (NE+) - Body ground	Always	10 kΩ or higher
C114-2 (NE-) or C45-111 (NE-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

a. Check the crankshaft position sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

5.CHECK CRANKSHAFT POSITION SENSOR PLATE (TEETH OF SENSOR PLATE)

a. Check the teeth of the sensor plate.

OK:
Sensor plate does not have any cracks or deformation.

NG → REPLACE CRANKSHAFT POSITION SENSOR PLATE (Click here)

OK

6.REPLACE CRANKSHAFT POSITION SENSOR

a. Replace the crankshaft position sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS (DTC P0335, P0337, P0338 AND/OR P0339)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No output	A
P0335, P0337, P0338 and/or P0339	B

HINT:

If the engine does not start, replace the ECM.

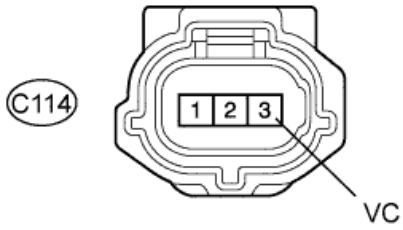
B → REPLACE ECM (Click here)

A

END

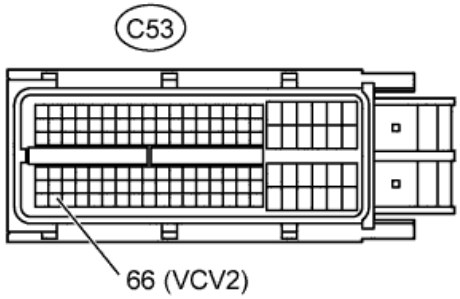
8.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)

a. Disconnect the C114 crankshaft position sensor connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C114-3 (VC) - C45-66 (VCV2)	Always	Below 1 Ω
C114-3 (VC) or C45-66 (VCV2) - Body ground	Always	10 kΩ or higher

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

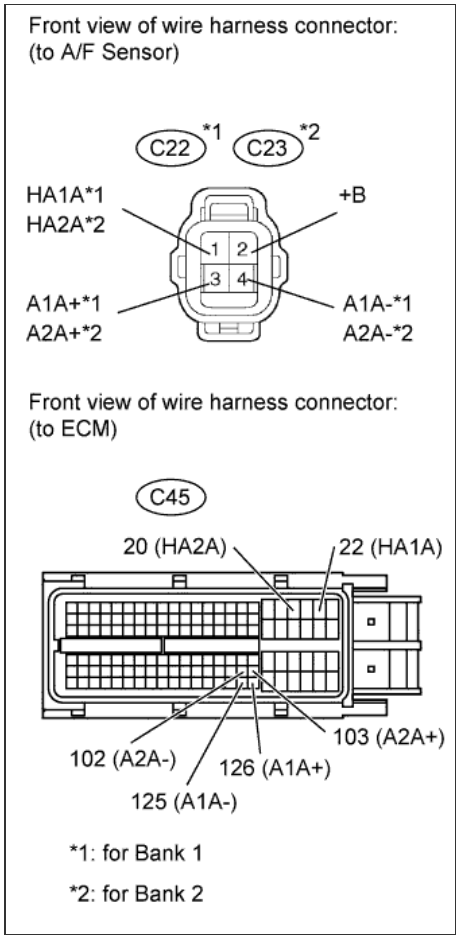
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



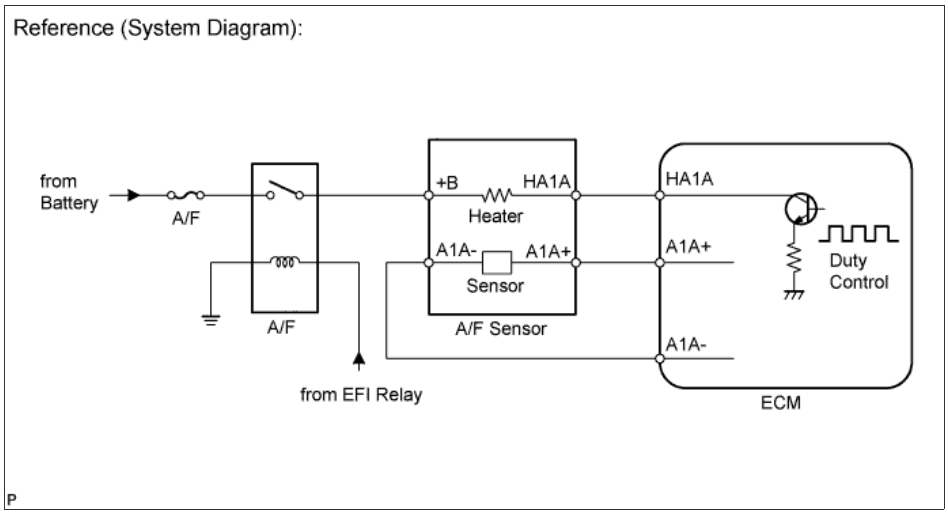
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

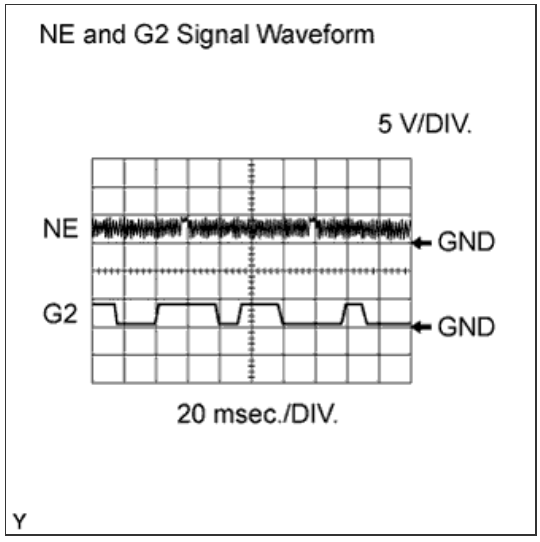
DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0337 Crankshaft Position Sensor "A" Circuit Low Input

DTC P0338 Crankshaft Position Sensor "A" Circuit High Input

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent



for Preparation Click here

DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a crankshaft position sensor plate and Magnetic Resistance Element (MRE) type sensor. The crankshaft position sensor plate has 34 teeth at 10° intervals (2 teeth are missing for detecting top dead center), and is installed to the rear end of the crankshaft. The crankshaft position sensor outputs 34 rotation signals per crankshaft revolution. The ECM uses the G2 signal to distinguish between the cylinders, and uses the NE signal to detect the crankshaft position and engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0335	• No Crankshaft Position (CKP) sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in Crankshaft Position (CKP) sensor circuit • CKP sensor • CKP sensor plate • ECM
P0337	The output voltage of the CKP sensor is 0.3 V or less for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0338	The output voltage of the CKP sensor is 4.7 V or higher for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) The engine speed is 1000 rpm or more. (b) The starter signal is OFF. (c) 3 seconds or more have elapsed since the starter signal was switched from ON to OFF.	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

C45-90 (G2) - C45-89 (G2-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

G2 stands for the camshaft position sensor signal, and NE stands for the crankshaft position sensor signal.

MONITOR DESCRIPTION

If there is no signal from the crankshaft position sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor. When the sensor output voltage remains at below 0.3 V, or higher than 4.7 V for more than 4 seconds, the ECM stores DTC(s).

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If no problem is found by this diagnostic troubleshooting procedure, check for problems by referring to the engine mechanical section.**
- **The engine speed can be checked by using the intelligent tester. To check, follow the procedures below:**
  1. **Connect the tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.**
     The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as less than the actual engine speed, if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.

d. Start the engine.

e. Read the values displayed on the tester while the engine is running.

Standard:
Correct values are displayed.

HINT:

- **To check the engine speed change, display the graph on the intelligent tester.**
- **If the engine does not start, check the engine speed while cranking.**
- **If the engine speed indicated on the intelligent tester remains zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.**

NG → Go to step 2

OK

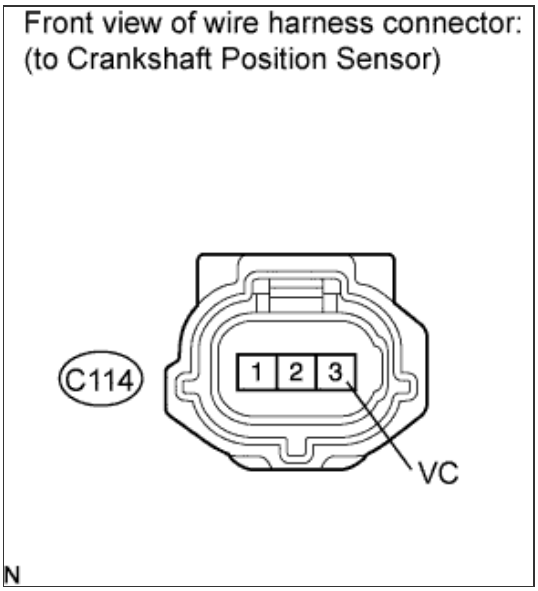
CHECK FOR INTERMITTENT PROBLEMS (Click here)



2.INSPECT CRANKSHAFT POSITION SENSOR (SENSOR POWER SOURCE)

a. Disconnect the C114 crankshaft position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C114-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → Go to step 8

OK

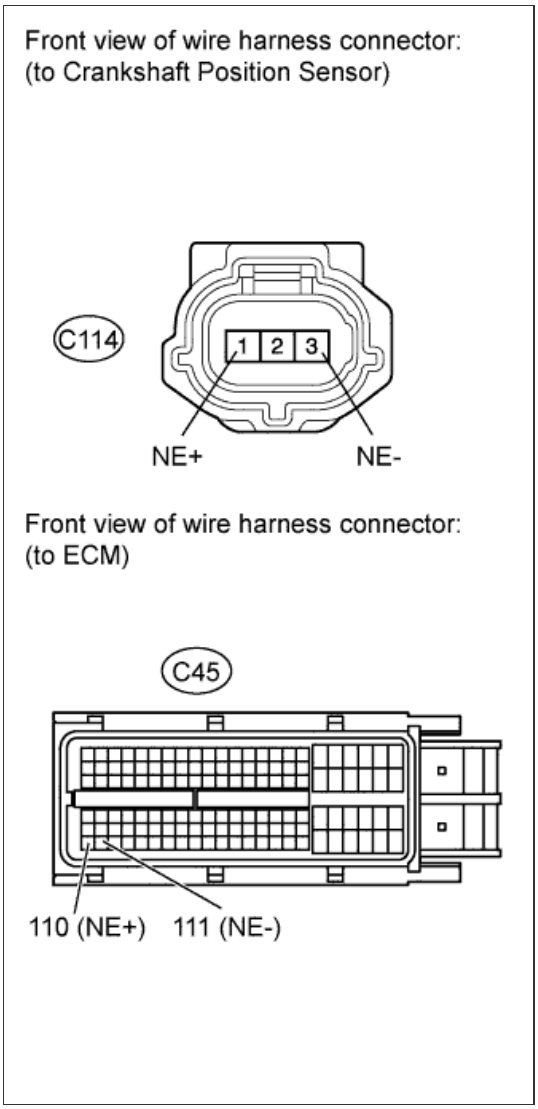
3.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)



a. Disconnect the C114 crankshaft position sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
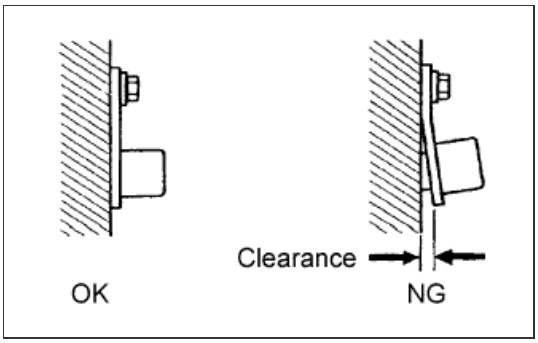
C114-1 (NE+) - C45-110 (NE+)	Always	Below 1 Ω
C114-2 (NE-) - C45-111 (NE-)	Always	Below 1 Ω
C114-1 (NE+) or C45-110 (NE+) - Body ground	Always	10 kΩ or higher
C114-2 (NE-) or C45-111 (NE-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

a. Check the crankshaft position sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

5.CHECK CRANKSHAFT POSITION SENSOR PLATE (TEETH OF SENSOR PLATE)

a. Check the teeth of the sensor plate.

OK:
Sensor plate does not have any cracks or deformation.

NG → REPLACE CRANKSHAFT POSITION SENSOR PLATE (Click here)

OK

6.REPLACE CRANKSHAFT POSITION SENSOR

a. Replace the crankshaft position sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS (DTC P0335, P0337, P0338 AND/OR P0339)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No output	A
P0335, P0337, P0338 and/or P0339	B

HINT:

If the engine does not start, replace the ECM.

DESCRIPTION

Refer to DTC P0031 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

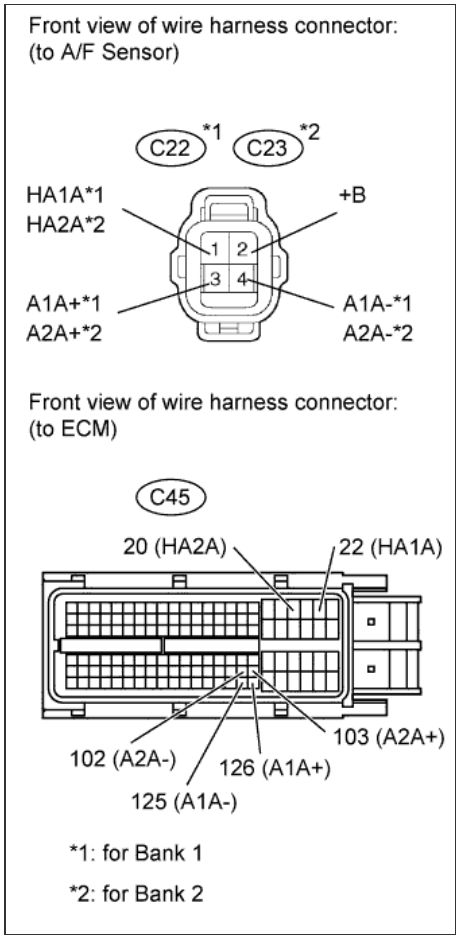
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



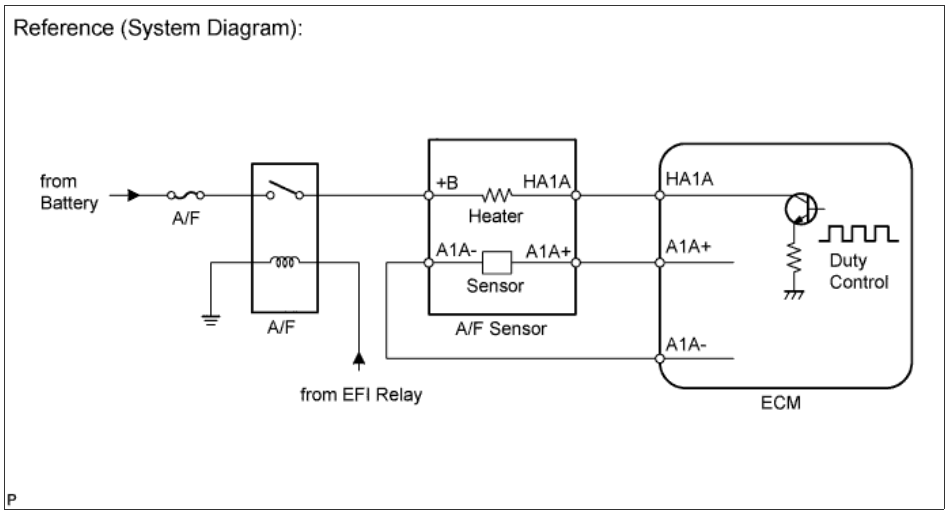
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

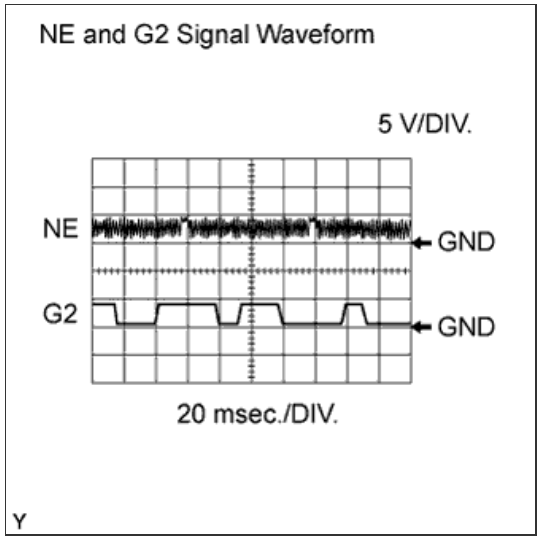
DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0337 Crankshaft Position Sensor "A" Circuit Low Input

DTC P0338 Crankshaft Position Sensor "A" Circuit High Input

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent



for Preparation Click here

DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a crankshaft position sensor plate and Magnetic Resistance Element (MRE) type sensor. The crankshaft position sensor plate has 34 teeth at 10° intervals (2 teeth are missing for detecting top dead center), and is installed to the rear end of the crankshaft. The crankshaft position sensor outputs 34 rotation signals per crankshaft revolution. The ECM uses the G2 signal to distinguish between the cylinders, and uses the NE signal to detect the crankshaft position and engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0335	• No Crankshaft Position (CKP) sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in Crankshaft Position (CKP) sensor circuit • CKP sensor • CKP sensor plate • ECM
P0337	The output voltage of the CKP sensor is 0.3 V or less for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0338	The output voltage of the CKP sensor is 4.7 V or higher for 4 seconds (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) The engine speed is 1000 rpm or more. (b) The starter signal is OFF. (c) 3 seconds or more have elapsed since the starter signal was switched from ON to OFF.	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

C45-90 (G2) - C45-89 (G2-)	5 V/DIV., 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

G2 stands for the camshaft position sensor signal, and NE stands for the crankshaft position sensor signal.

MONITOR DESCRIPTION

If there is no signal from the crankshaft position sensor despite the engine revolving, the ECM interprets this as a malfunction of the sensor. When the sensor output voltage remains at below 0.3 V, or higher than 4.7 V for more than 4 seconds, the ECM stores DTC(s).

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If no problem is found by this diagnostic troubleshooting procedure, check for problems by referring to the engine mechanical section.**
- **The engine speed can be checked by using the intelligent tester. To check, follow the procedures below:**
  1. **Connect the tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.**
     The engine speed may be indicated as zero despite the engine revolving normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as less than the actual engine speed, if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.

d. Start the engine.

e. Read the values displayed on the tester while the engine is running.

Standard:
Correct values are displayed.

HINT:

- **To check the engine speed change, display the graph on the intelligent tester.**
- **If the engine does not start, check the engine speed while cranking.**
- **If the engine speed indicated on the intelligent tester remains zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.**

NG → Go to step 2

OK

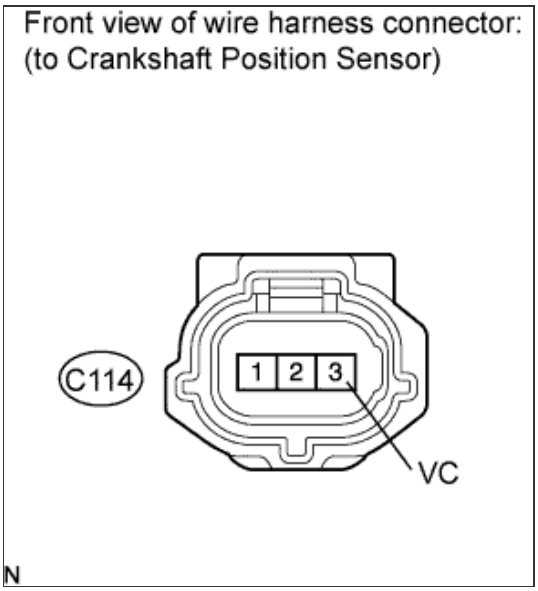
CHECK FOR INTERMITTENT PROBLEMS (Click here)



2.INSPECT CRANKSHAFT POSITION SENSOR (SENSOR POWER SOURCE)

a. Disconnect the C114 crankshaft position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C114-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → Go to step 8

OK

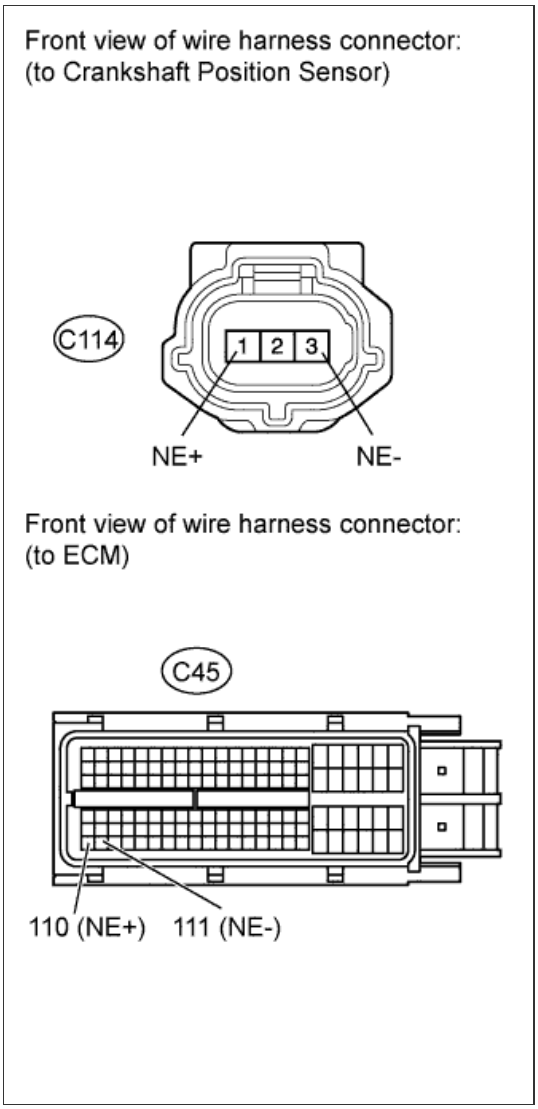
3.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)



a. Disconnect the C114 crankshaft position sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
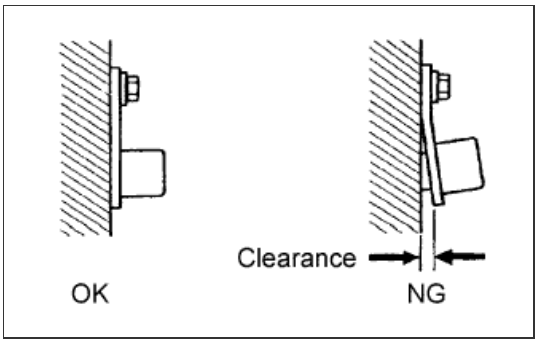
C114-1 (NE+) - C45-110 (NE+)	Always	Below 1 Ω
C114-2 (NE-) - C45-111 (NE-)	Always	Below 1 Ω
C114-1 (NE+) or C45-110 (NE+) - Body ground	Always	10 kΩ or higher
C114-2 (NE-) or C45-111 (NE-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

a. Check the crankshaft position sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

5.CHECK CRANKSHAFT POSITION SENSOR PLATE (TEETH OF SENSOR PLATE)

a. Check the teeth of the sensor plate.

OK:
Sensor plate does not have any cracks or deformation.

NG → REPLACE CRANKSHAFT POSITION SENSOR PLATE (Click here)

OK

6.REPLACE CRANKSHAFT POSITION SENSOR

a. Replace the crankshaft position sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS (DTC P0335, P0337, P0338 AND/OR P0339)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No output	A

DESCRIPTION

Refer to DTC P0031 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+ and A1A-/A2A+ and A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) circuit • Air Fuel ratio (A/F) sensor (for Bank 1, 2 Sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The A1A+/A2A+ voltage is 0.5 V or less. (b) (A1A+/A2A+) - (A1A-/A2A-) = 0.1 V or less. • Case 2: The A/F sensor admittance is below 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for Bank 1, 2 Sensor 1) circuit • A/F sensor (for Bank 1, 2 Sensor 1) • ECM

HINT:

- **DTCs P2237, P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2240, P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air Fuel ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P0031 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Display Item (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

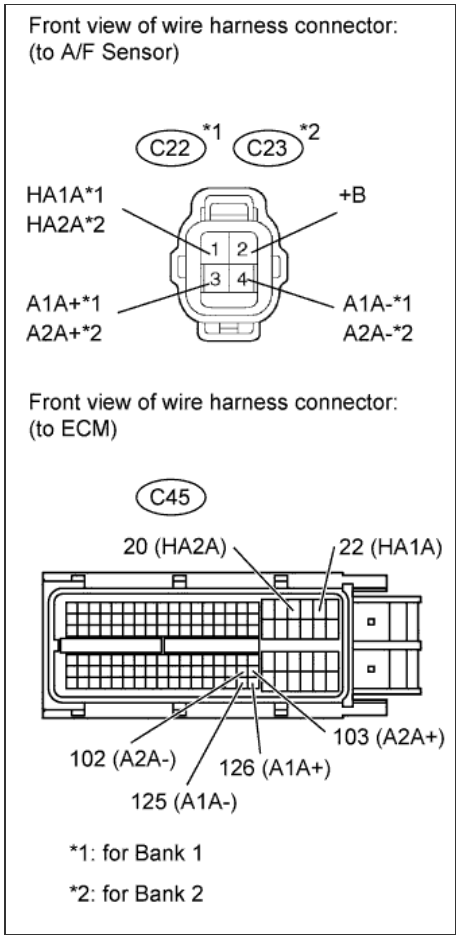
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the C22 or C23 Air Fuel ratio (A/F) sensor connector.



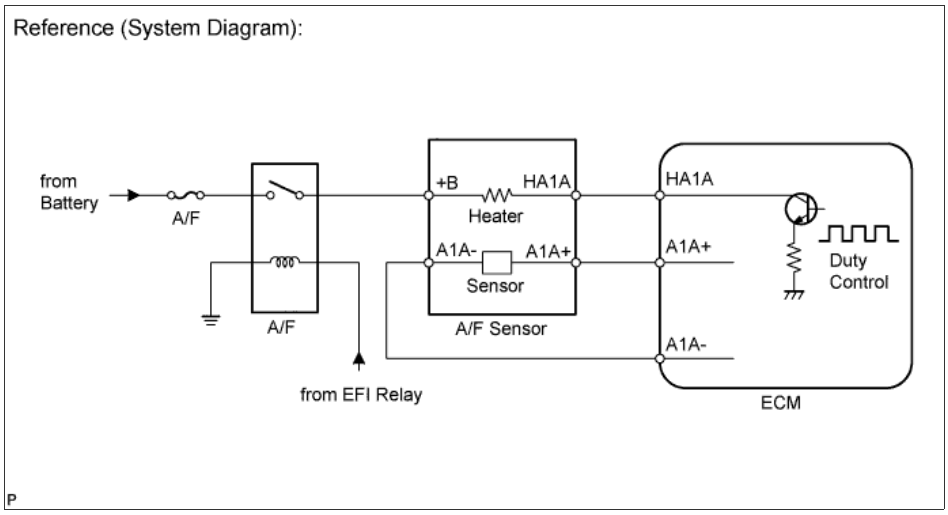
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the C45 ECM connector.



e. Measure the resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45- 126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45- 103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Reference (System Diagram):

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

3.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 5 minutes or more.

f. Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.

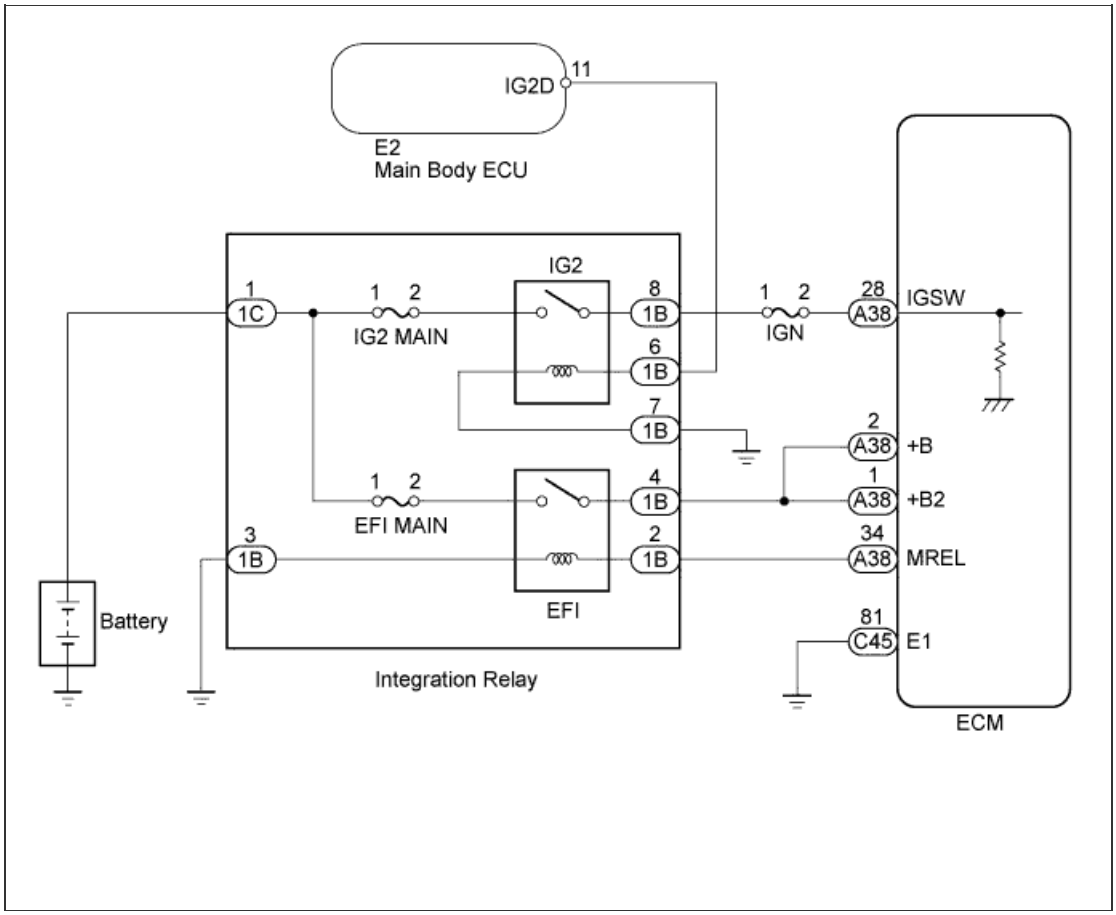
g. Read pending DTCs.

Result

Result	Proceed to
No DTC is output	A
P2237, P2238, P2239, P2240, P2241, P2242, P2252, P2253, P2255 or P2256 is output	B

B → REPLACE ECM (**Click here**)

A



END

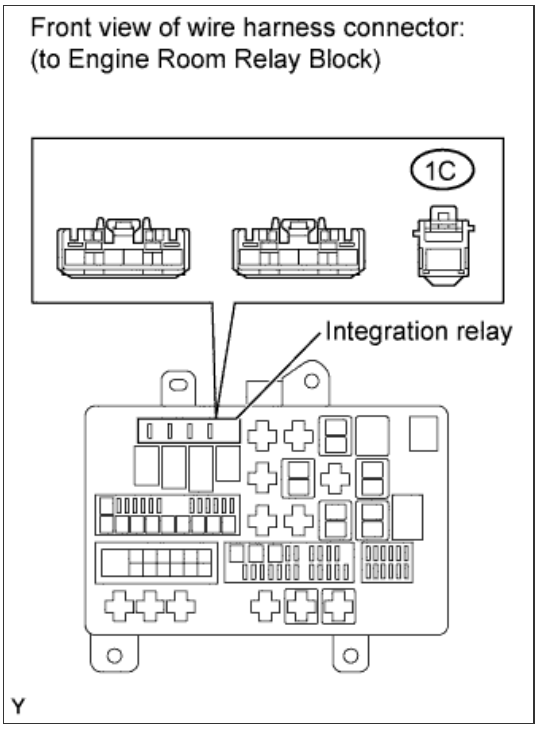
for Preparation Click here

DESCRIPTION

When the engine switch is turned on (IG), battery voltage is applied to the IGSW of the ECM. The output signal from the MREL terminal of the ECM causes a current to flow to the coil, closing the contacts of the integration relay (EFI relay) and supplying power to either terminal +B or +B2 of the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE



1.INSPECT INTEGRATION NO.1 RELAY (INTEGRATION RELAY - BODY GROUND)

a. Remove the integration relay from the engine room relay block.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
1C-1 - Body ground	Always	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.INSPECT INTEGRATION NO.1 RELAY (EFI AND IG2 RELAY)

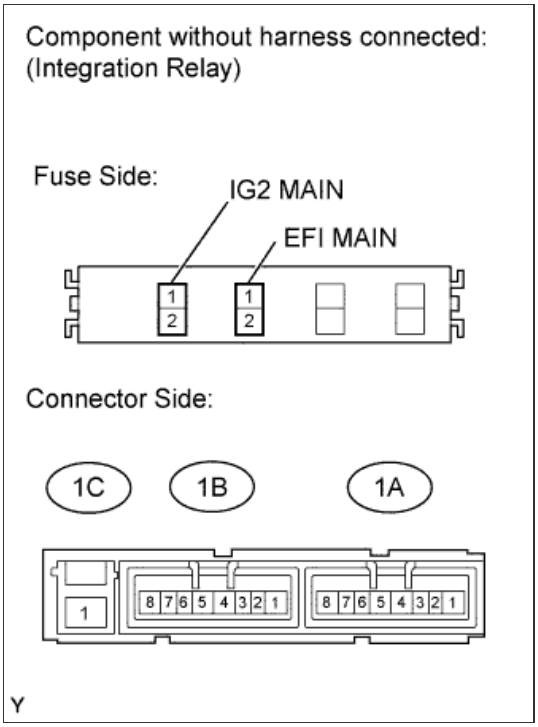
a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse and the IG2 MAIN fuse.

i. Remove the EFI MAIN fuse and IG2 MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω
IG2 MAIN fuse	Always	Below 1 Ω

c. Inspect the EFI relay and the IG2 relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	Battery voltage is not applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage is applied to terminals 1B-2 and 1B-3	Below 1 Ω
1C-1 - 1B-8	Battery voltage is not applied to terminals 1B-7 and 1B-6	10 kΩ or higher
	Battery voltage is applied to terminals 1B-7 and 1B-6	Below 1 Ω

NG → REPLACE INTEGRATION NO.1 RELAY

OK

3.CHECK HARNESS AND CONNECTOR (+B, +B2 AND MREL CIRCUIT)

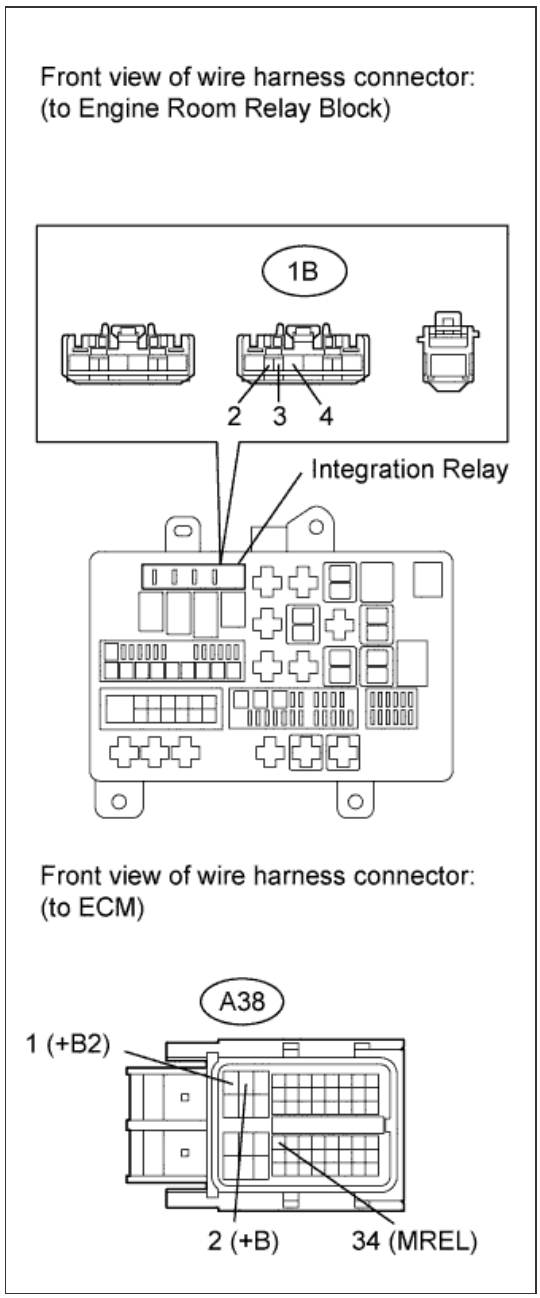
a. Check the harness and the connectors between the integration relay and the ECM.

i. Remove the integration relay from the engine room relay block.

ii. Disconnect the ECM connector.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
A38-34 (MREL) - 1B-2	Always	Below 1 Ω
A38-2 (+B) - 1B-4	Always	Below 1 Ω
A38-1 (+B2) - 1B-4	Always	Below 1 Ω
A38-34 (MREL) or 1B-2 - Body ground	Always	10 kΩ or higher
A38-2 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher
A38-1 (+B2) or 1B-4 - Body ground	Always	10 kΩ or higher

b. Check the harness and connectors between the integration relay and body ground.

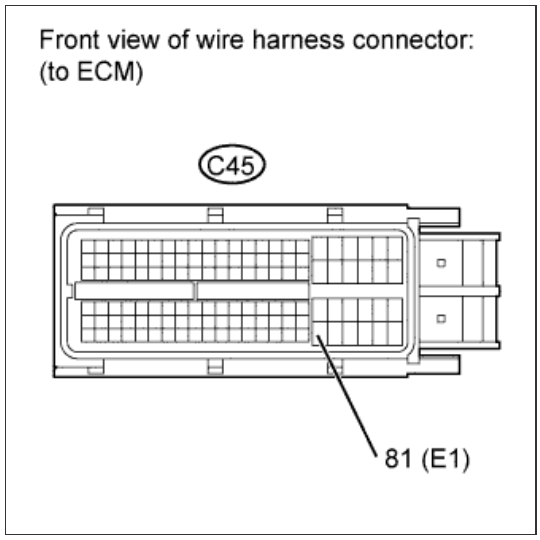
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1B-3 - Body ground	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



4.CHECK HARNESS AND CONNECTOR (ECM - BODY GROUND)

a. Disconnect the ECM connector.

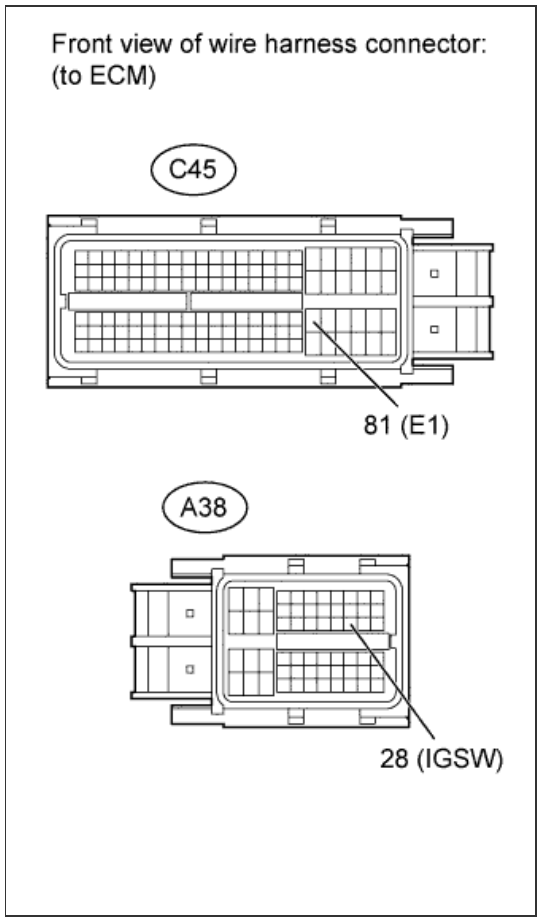
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C45-81 (E1) - Body ground	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



5.INSPECT ECM (IGSW VOLTAGE)

a. Disconnect the ECM connectors.

b. Measure the voltage according to the value(s) in the table below.

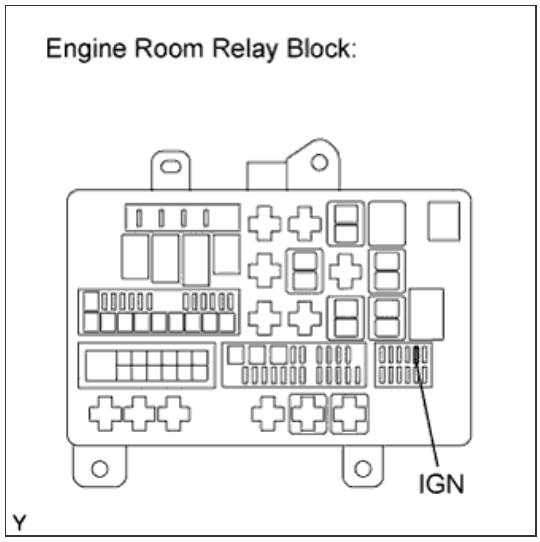
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A38-28 (IGSW) - C45-81 (E1)	Engine switch on (IG)	11 to 14 V

NG → Go to step 6

OK

REPLACE ECM (Click here)



6.INSPECT FUSE (IGN)

a. Remove the IGN fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

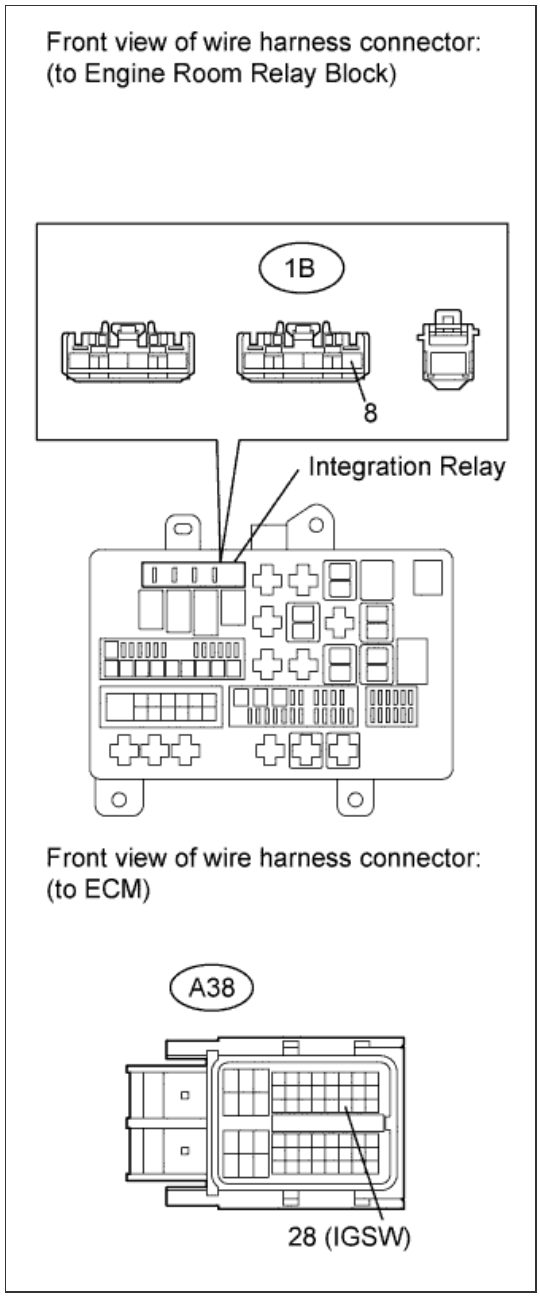
Standard Resistance:

Tester Connection	Condition	Specified Condition
IGN fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

7.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - ECM, INTEGRATION RELAY - BODY GROUND)



a. Remove the integration relay from the engine room relay block.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

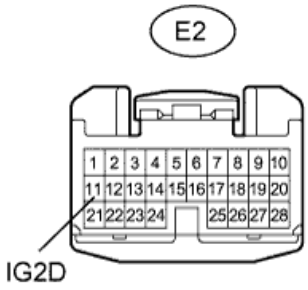
Tester Connection	Condition	Specified Condition
1B-8 - A38-28 (IGSW)	Always	Below 1 Ω
1B-8 or A38-28 (IGSW) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

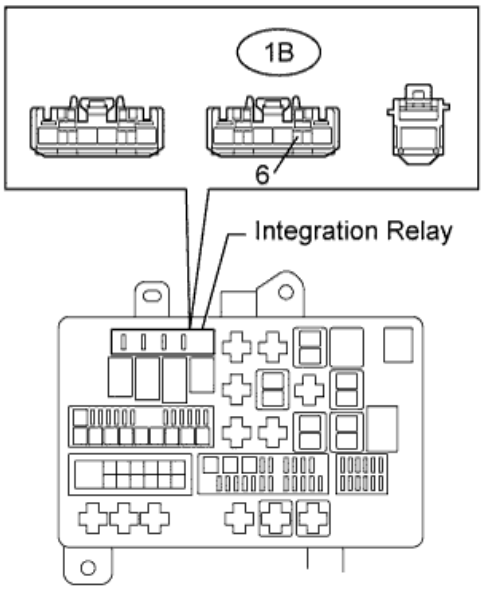
8.CHECK HARNESS AND CONNECTOR (MAIN BODY ECU - ENGINE ROOM RELAY BLOCK)

a. Remove the integration relay from the engine room relay block.



b. Disconnect the E2 main body ECU connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
E2-11 (IG2D) - 1B-6	Always	Below 1 Ω
E2-11 (IG2D) or 1B-6 - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to Main Body ECU)

Front view of wire harness connector:
(to Engine Room Relay Block)

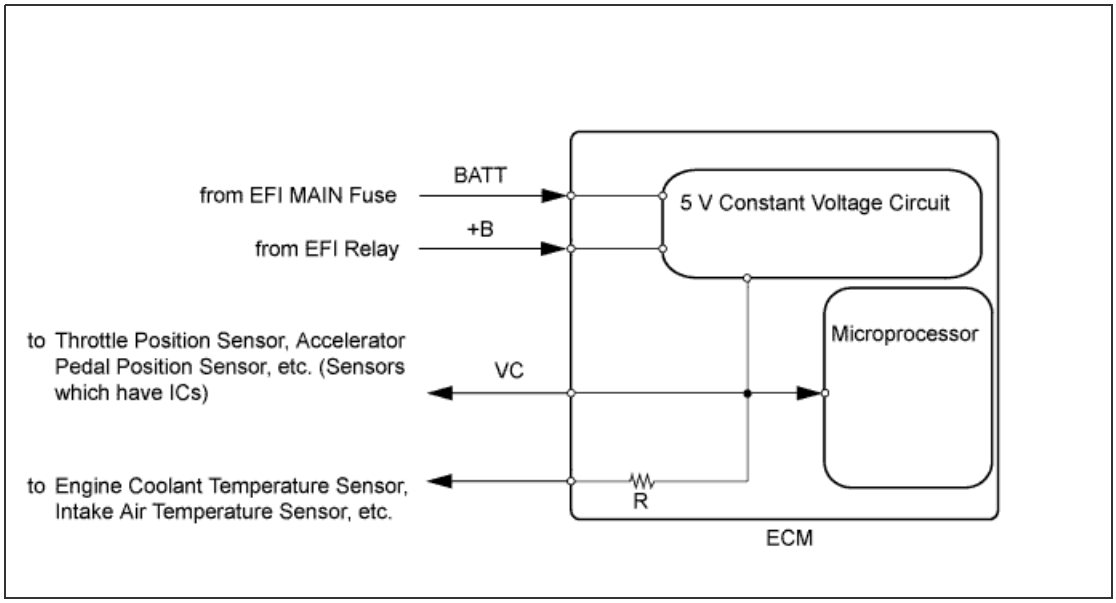
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.CHECK ENTRY AND START SYSTEM (POWER SOURCE MODE DOES NOT CHANGE)

a. Check the entry and start system (Click here).

NG → REPAIR ENTRY AND START SYSTEM



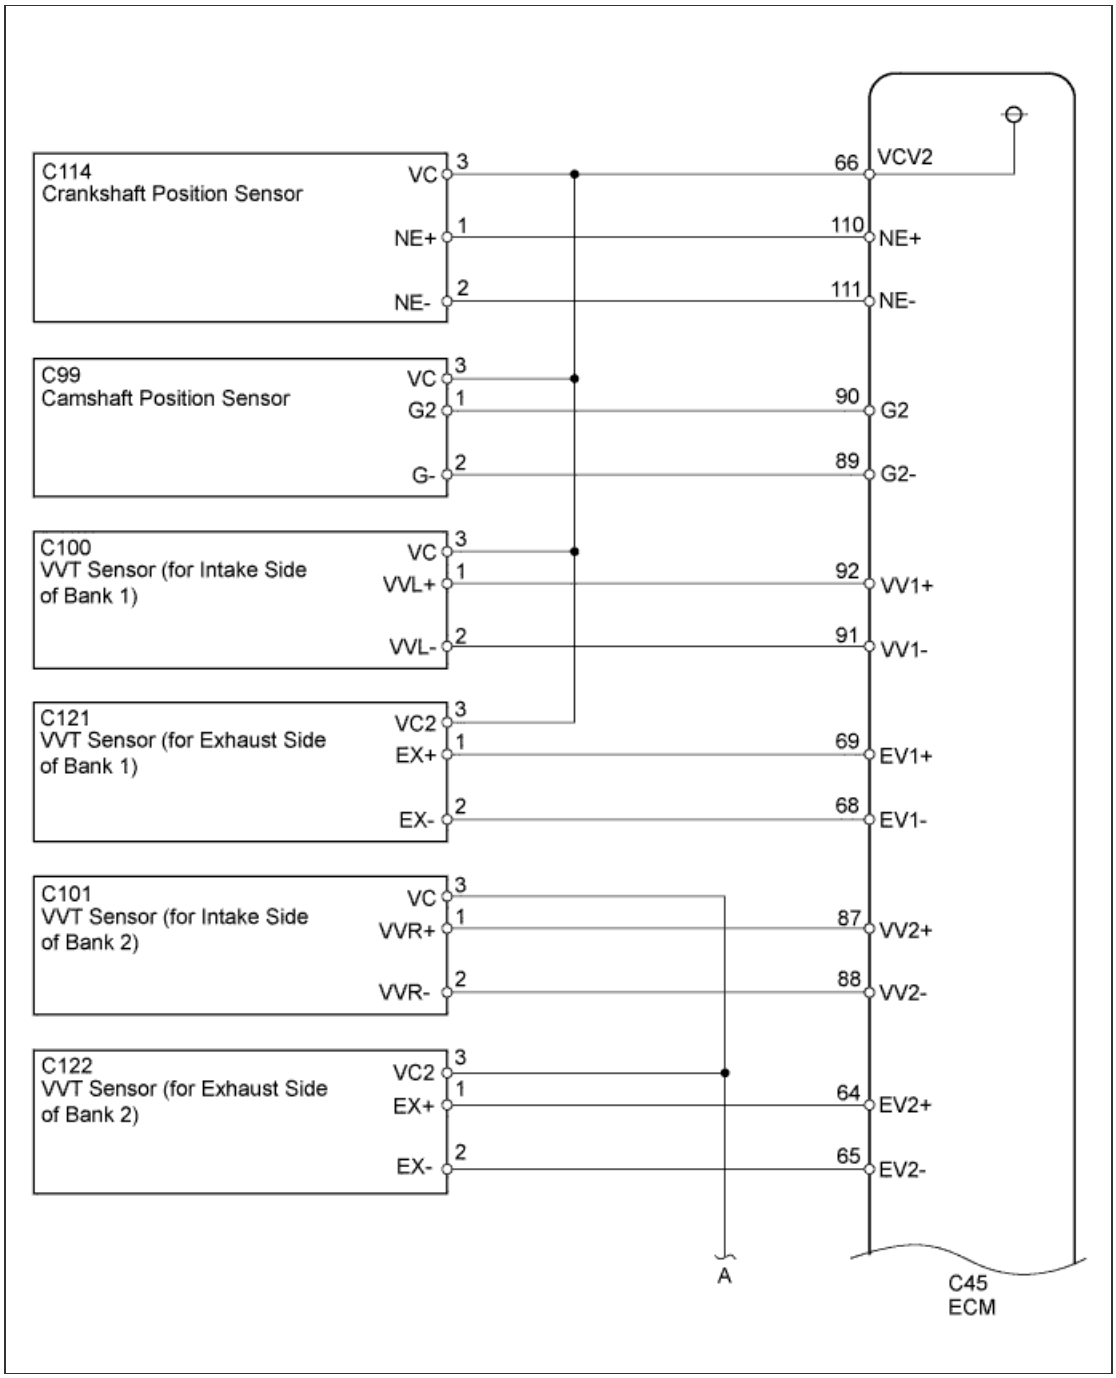
OK

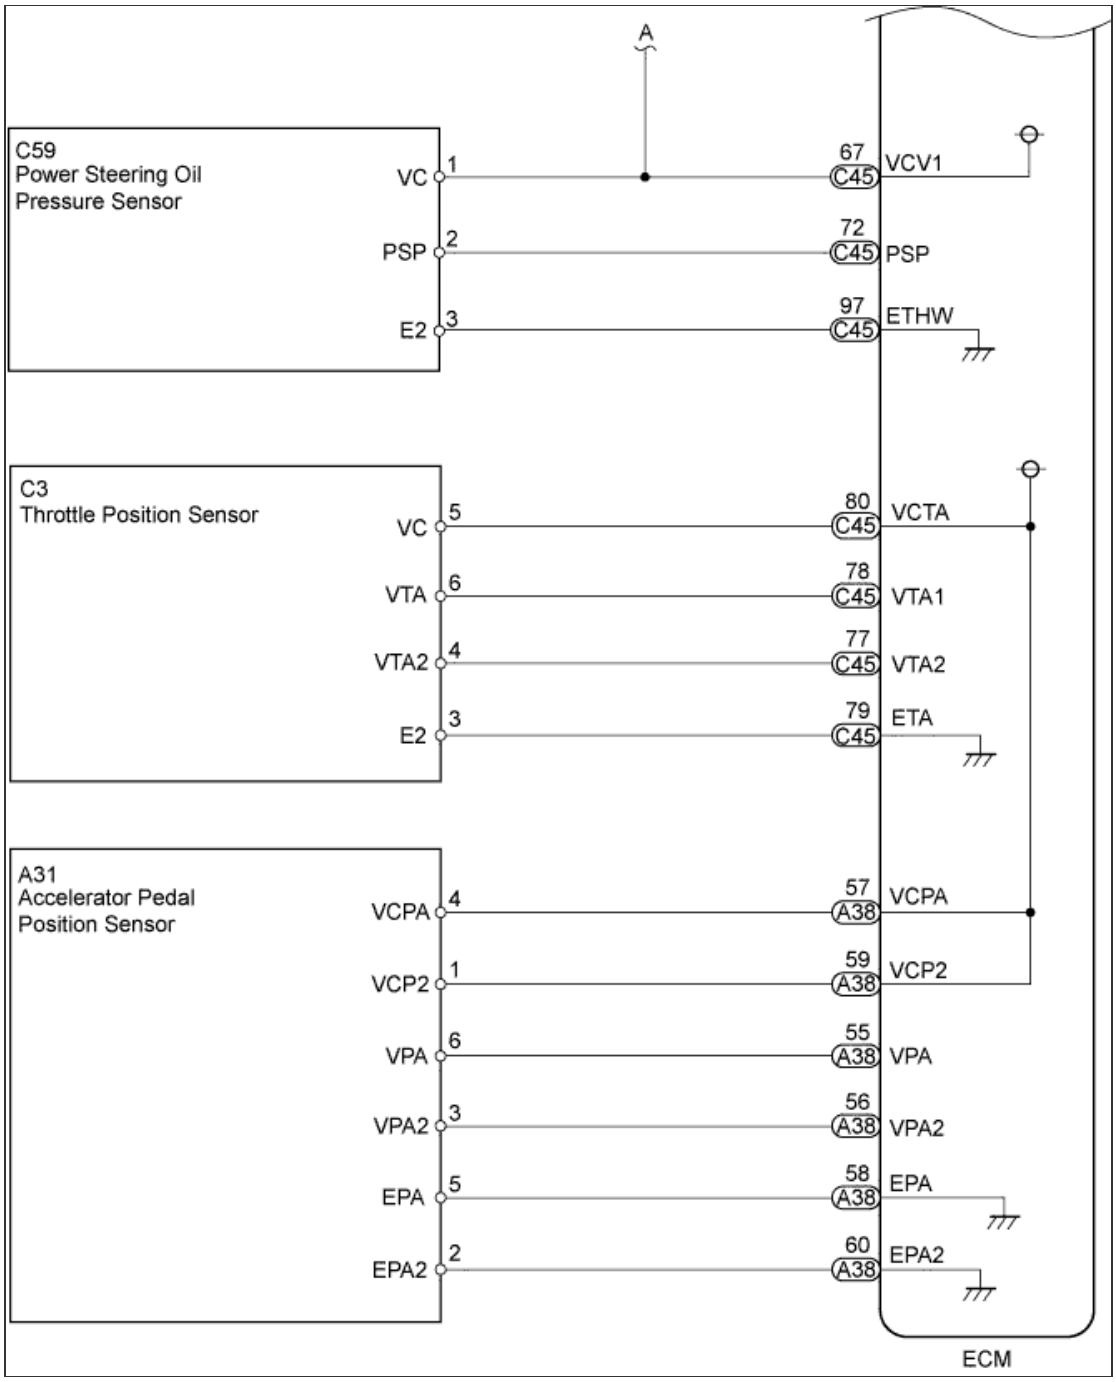
REPLACE ECM (**Click here**)

for Preparation Click here

DESCRIPTION

The ECM constantly generates 5 V power from the battery voltages supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.





When the VC circuit is short-circuited, the microprocessor in the ECM and sensors that are supplied with power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.

HINT:

Under normal conditions, the MIL is illuminated for several seconds when the engine switch is first turned on (IG). The MIL goes off when the engine is started.

5.CHECK MIL (POWER STEERING OIL PRESSURE SENSOR)

a. Disconnect the C59 power steering oil pressure sensor connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → REPLACE POWER STEERING OIL PRESSURE SENSOR (Click here)

B

6.CHECK MIL (CAMSHAFT POSITION SENSOR)

a. Disconnect the C99 camshaft position sensor connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → REPLACE CAMSHAFT POSITION SENSOR (Click here)

B

7.CHECK MIL (CRANKSHAFT POSITION SENSOR)

a. Disconnect the C114 crankshaft position sensor connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → REPLACE CRANKSHAFT POSITION SENSOR (Click here)

B

8.CHECK MIL (VVT SENSOR for Intake Side of Bank 1)

a. Disconnect the C100 VVT sensor (for Intake Side of Bank 1) connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → REPLACE VVT SENSOR (for Intake Side of Bank 1) (Click here)

B

9.CHECK MIL (VVT SENSOR for Exhaust Side of Bank 1)

a. Disconnect the C121T sensor (for Exhaust Side of Bank 1) connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → REPLACE VVT SENSOR (for Exhaust Side of Bank 1) (Click here)

B

10.CHECK MIL (VVT SENSOR for Intake Side of Bank 2)

a. Disconnect the C101 VVT sensor (for Intake Side of Bank 2) connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → REPLACE VVT SENSOR (for Intake Side of Bank 2) (Click here)

B

11.CHECK MIL (VVT SENSOR for Exhaust Side of Bank 2)

a. Disconnect the C122T sensor (for Exhaust Side of Bank 2) connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → REPLACE VVT SENSOR (for Exhaust Side of Bank 2) (Click here)

B

12.CHECK HARNESS AND CONNECTOR

a. Disconnect the C3throttle body connector.

b. Disconnect the A31 accelerator pedal position sensor connector.

c. Disconnect the C59 power steering oil pressure sensor connector.

d. Disconnect the C99 camshaft position sensor connector.

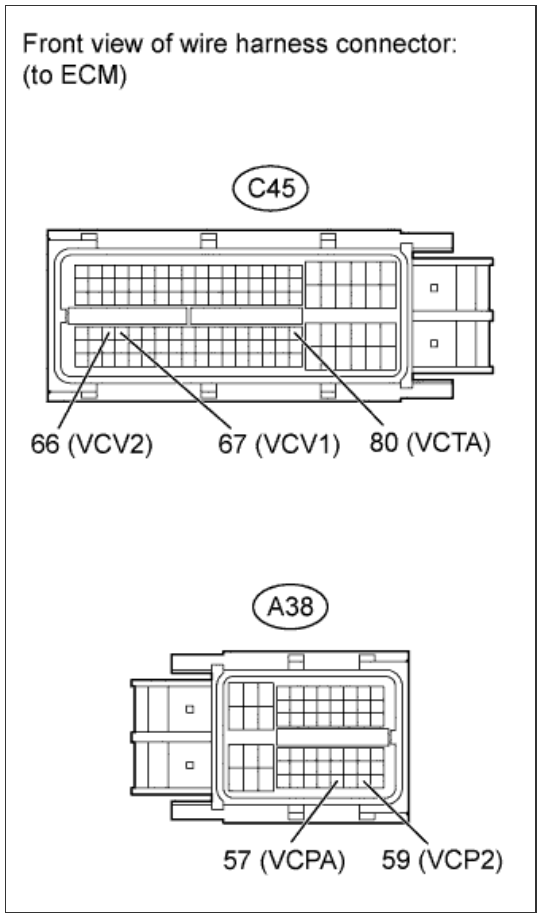
e. Disconnect the C114 crankshaft position sensor connector.

f. Disconnect the C100 VVT sensor (for Intake Side of Bank 1) connector.

g. Disconnect the C121 VVT sensor (for Exhaust Side of Bank 1) connector.

h. Disconnect the C101 VVT sensor (for Intake Side of Bank 2) connector.

i. Disconnect the C122 VVT sensor (for Exhaust Side of Bank 2) connector.



j. Disconnect the ECM connectors.

k. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C45-80 (VCTA) - Body ground	Always	10 kΩ or higher

A38-57 (VCPA) - Body ground	Always	10 kΩ or higher
A38-59 (VCP2) - Body ground	Always	10 kΩ or higher
C45-66 (VCV2) - Body ground	Always	10 kΩ or higher
C45-67 (VCV1) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

for Preparation Click here

DESCRIPTION

The fuel pump circuit consists of the ECM, fuel pump and fuel pump ECU (which operates the fuel pump). Based on the engine output, the ECM determines the fuel pump speed. The speed is then converted to a duty signal and sent to the fuel pump ECU. Based on the signal sent from the ECM, the fuel pump ECU adjusts the fuel pump operation speed between 3 settings.

WIRING DIAGRAM

Refer to DTC P0230 (Click here).

INSPECTION PROCEDURE

This troubleshooting procedure is based on the premise that the engine is started. If the engine is not started, proceed to the Problem Symptoms Table (Click here).

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PUMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump / Speed.

d. Check whether operating sounds can be heard while operating the fuel pump using the tester.

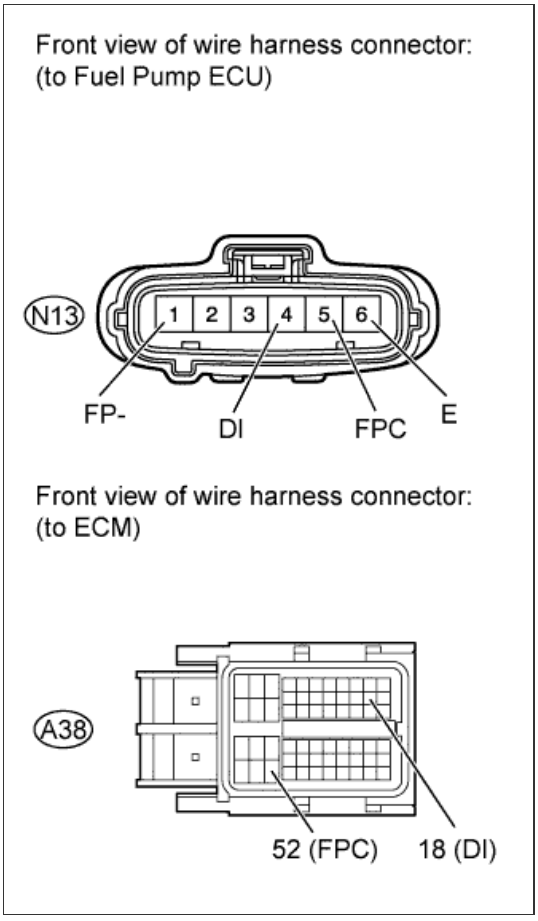
OK:

Operating sounds can be heard from fuel pump.

NG → Go to step 5

OK ↓

2.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM, BODY GROUND)



a. Disconnect the N3 fuel pump ECU connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
N13-5 (FPC) - A38-52 (FPC)	Always	Below 1 Ω
N13-4 (DI) - A38-18 (DI)	Always	Below 1 Ω
N13-6 (E) - Body ground	Always	Below 1 Ω
N13-1 (FP-) - Body ground	Always	10 kΩ or higher
N13-5 (FPC) or A38-52 (FPC) - Body ground	Always	10 kΩ or higher
N13-4 (DI) or A38-18 (DI) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.REPLACE FUEL PUMP ECU

a. Replace the fuel pump ECU (Click here).

NEXT

4.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check the fuel pump operation.

OK:
Malfunction has been repaired successfully.

NG → REPLACE ECM (Click here)

OK

END

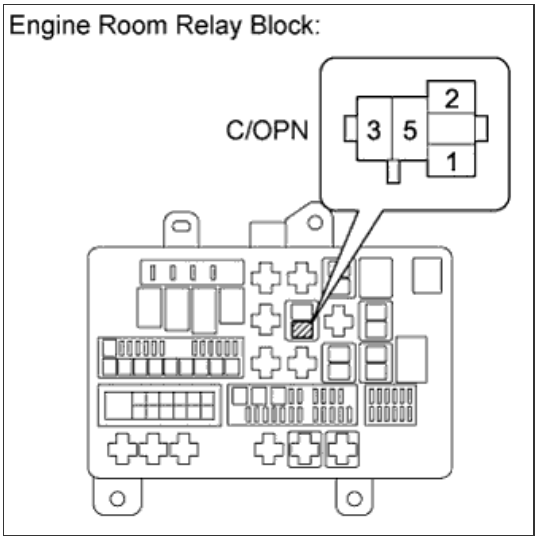
5.INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Inspect the circuit opening relay (C/OPN) (Click here).

NG → REPLACE CIRCUIT OPENING RELAY (C/OPN)

OK

6.INSPECT CIRCUIT OPENING RELAY (POWER SOURCE VOLTAGE)



a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Turn the engine switch on (IG).

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C/OPN relay (2) - Body ground	Engine switch on (IG)	11 to 14 V
C/OPN relay (5) - Body ground	Engine switch on (IG)	11 to 14 V

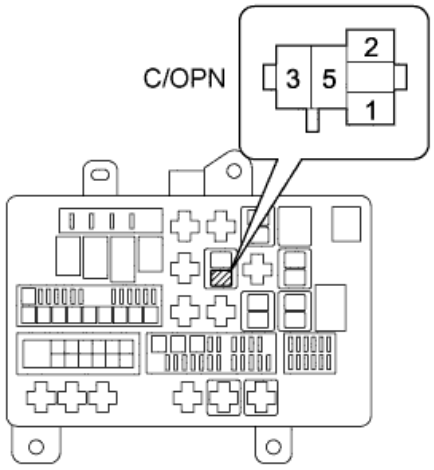
NG → Go to step 13

OK

7.CHECK HARNESS AND CONNECTOR (CIRCUIT OPENING RELAY - ECU, FUEL PUMP ECU)

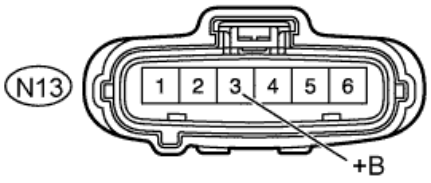
a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Disconnect the A38 ECM connector.



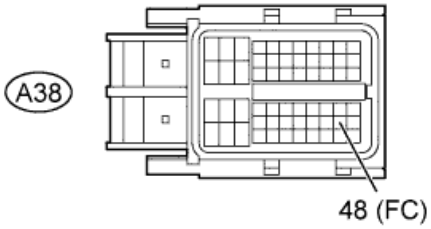
c. Disconnect the N13 fuel pump ECU connector.

d. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C/OPN relay (1) - A38-48 (FC)	Always	Below 1 Ω
C/OPN relay (3) - N13-3 (+B)	Always	Below 1 Ω
C/OPN relay (1) or A38-48 (FC) - Body ground	Always	10 kΩ or higher
C/OPN relay (3) or N13-3 (+B) - Body ground	Always	10 kΩ or higher



Engine Room Relay Block:

Front view of wire harness connector:
(to Fuel Pump ECU)

Front view of wire harness connector:

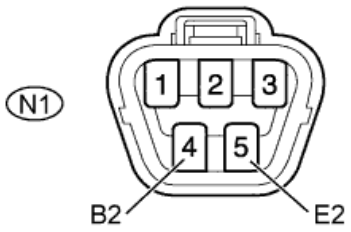
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

.CHECK HARNESS AND CONNECTOR (FUEL PUMP - FUEL PUMP ECU)

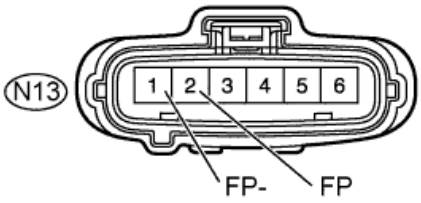
a. Disconnect the N1 fuel pump connector.

b. Disconnect the N13 fuel pump ECU connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
N1-4 (B2) - N13-2 (FP)	Always	Below 1 Ω
N1-5 (E2) - N13-1 (FP-)	Always	Below 1 Ω

N1-4 (B2) or N13-2 (FP) - Body ground	Always	10 kΩ or higher
N1-5 (E2) or N13-1 (FP-) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to Fuel Pump)

Front view of wire harness connector:
(to Fuel Pump ECU)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

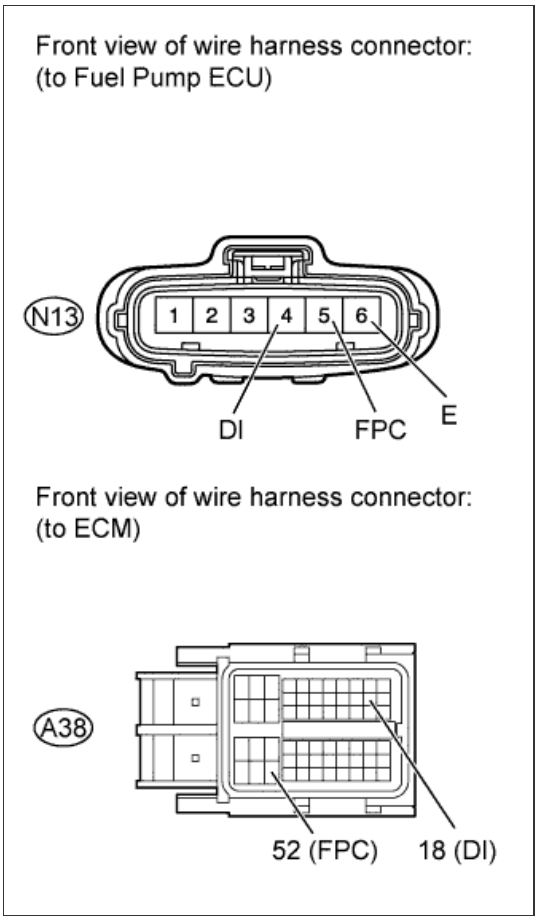
.INSPECT FUEL PUMP

a. Inspect the fuel pump (Click here).

NG → REPLACE FUEL PUMP (Click here)

OK

1 .CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM, BODY GROUND)



a. Disconnect the N13 fuel pump ECU connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
N13-5 (FPC) - A38-52 (FPC)	Always	Below 1 Ω
N13-4 (DI) - A38-18 (DI)	Always	Below 1 Ω
N13-6 (E) - Body ground	Always	Below 1 Ω
N13-5 (FPC) or A38-52 (FPC) - Body ground	Always	10 kΩ or higher
N13-4 (DI) or A38-18 (DI) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

11.REPLACE FUEL PUMP ECU

a. Replace the fuel pump ECU (Click here).

NEXT

12.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check the fuel pump operation.

OK:
Malfunction has been repaired successfully.

NG → REPLACE ECM (**Click here**)

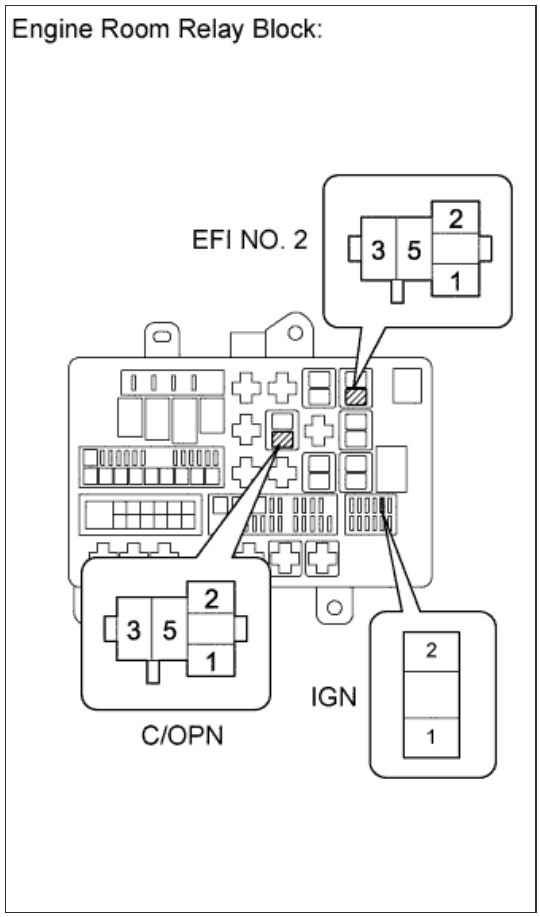
OK

END

13.CHECK HARNESS AND CONNECTOR (CIRCUIT OPENING RELAY - EFI NO. 2 RELAY, IGN FUSE)

a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Remove the EFI NO. 2 relay (EFI NO. 2) from the engine room relay block.



c. Remove the IGN fuse from the engine room relay block.

d. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition

C/OPN relay (2) - IGN fuse (2)	Always	Below 1 Ω
C/OPN relay (5) - EFI NO. 2 relay (3)	Always	Below 1 Ω
C/OPN relay (2) or IGN fuse (2) - Body ground	Always	10 kΩ or higher
C/OPN relay (5) or EFI NO. 2 relay (3) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

14.INSPECT EFI NO. 2 RELAY (EFI NO. 2)

a. Inspect the EFI NO. 2 relay (EFI NO. 2) (Click here).

NG → REPLACE EFI NO. 2 RELAY (EFI NO. 2)

OK

15.CHECK HARNESS AND CONNECTOR (EFI NO. 2 RELAY - INTEGRATION RELAY, BATTERY AND BODY GROUND)

a. Remove the EFI MAIN 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN 2 fuse	Always	Below 1 Ω

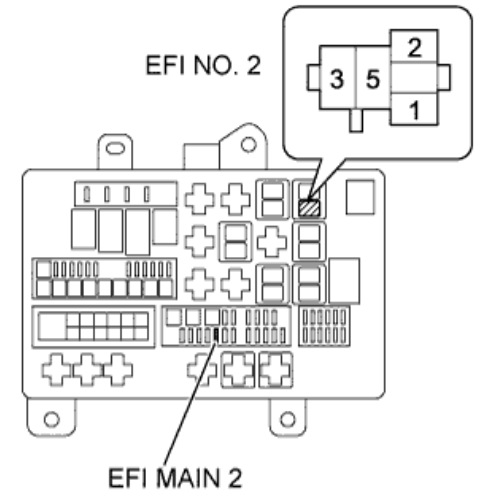
c. Reinstall the EFI MAIN 2 fuse.

d. Remove the EFI NO. 2 relay (EFI NO. 2) from the engine room relay block.

e. Remove the integration relay from the engine room relay block.

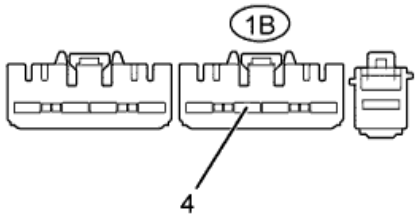
f. Disconnect the 1B integration relay connector.

g. Disconnect the cable from the battery positive (+) terminal.



h. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition

EFI NO. 2 relay (1) - 1B-4	Always	Below 1 Ω
EFI NO. 2 relay (5) - Positive (+) battery cable	Always	Below 1 Ω
EFI NO. 2 relay (2) - Body ground	Always	Below 1 Ω
EFI NO. 2 relay (1) or 1B-4 - Body ground	Always	10 kΩ or higher
EFI NO. 2 relay (5) or Positive (+) battery cable - Body ground	Always	10 kΩ or higher

Engine Room Relay Block:

Front view of wire harness connector:

for Preparation Click here

DESCRIPTION

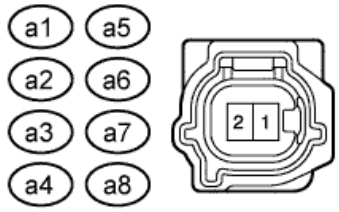
The fuel injectors are located on the intake manifold. They inject fuel into the cylinders based on the signals from the ECM.

WIRING DIAGRAM

Refer to DTC P0300 (Click here).

INSPECTION PROCEDURE

1.CHECK INJECTOR ASSEMBLY (POWER SOURCE)



a. Disconnect the fuel injector connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	a5-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	a1-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	a6-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	a2-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	a7-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	a3-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	a8-2 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	a4-2 - Ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Injector)

NG → Go to step 4

OK

2.INSPECT FUEL INJECTOR ASSEMBLY

a. Inspect the fuel injector (Click here).

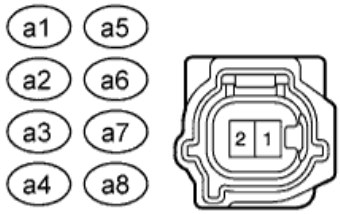
NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

3.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR ASSEMBLY - ECM)

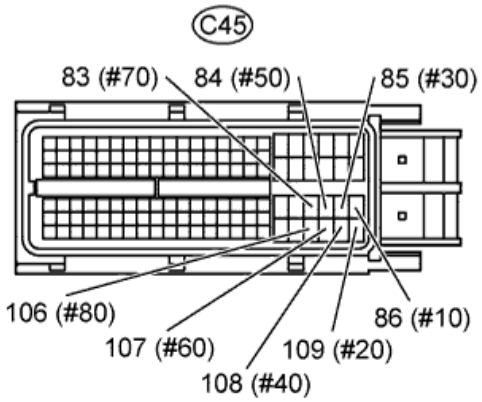
a. Disconnect the fuel injector connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Cylinder	Tester Connection	Condition	Specified Condition
No. 1	a5-1 - Body ground	Always	10 kΩ or higher
	a5-1 - C45-86	Always	Below 1 Ω

	(#10)		
No. 2	a1-1 - Body ground	Always	10 kΩ or higher
	a1-1 - C45-109 (#20)	Always	Below 1 Ω
No. 3	a6-1 - Body ground	Always	10 kΩ or higher
	a6-1 - C45-85 (#30)	Always	Below 1 Ω
No. 4	a2-1 - Body ground	Always	10 kΩ or higher
	a2-1 - C45-108 (#40)	Always	Below 1 Ω
No. 5	a7-1 - Body ground	Always	10 kΩ or higher
	a7-1 - C45-84 (#50)	Always	Below 1 Ω
No. 6	a3-1 - Body ground	Always	10 kΩ or higher
	a3-1 - C45-107 (#60)	Always	Below 1 Ω
No. 7	a8-1 - Body ground	Always	10 kΩ or higher
	a8-1 - C45-83 (#70)	Always	Below 1 Ω
No. 8	a4-1 - Body ground	Always	10 kΩ or higher
	a4-1 - C45-106 (#80)	Always	Below 1 Ω

Front view of wire harness connector:
(to Injector)

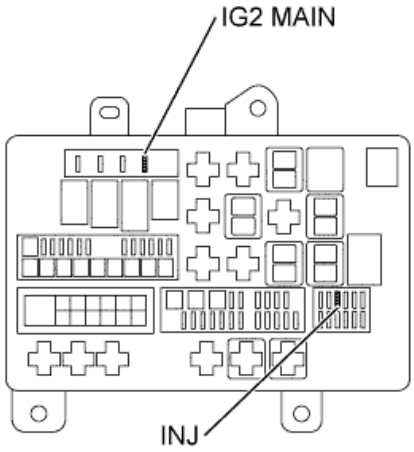
Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

4.INSPECT FUSE (INJ, IG2 MAIN)



a. Remove the INJ fuse and IG2 MAIN fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
INJ fuse	Always	Below 1 Ω
IG2 MAIN fuse	Always	Below 1 Ω

Engine Room Relay Block:

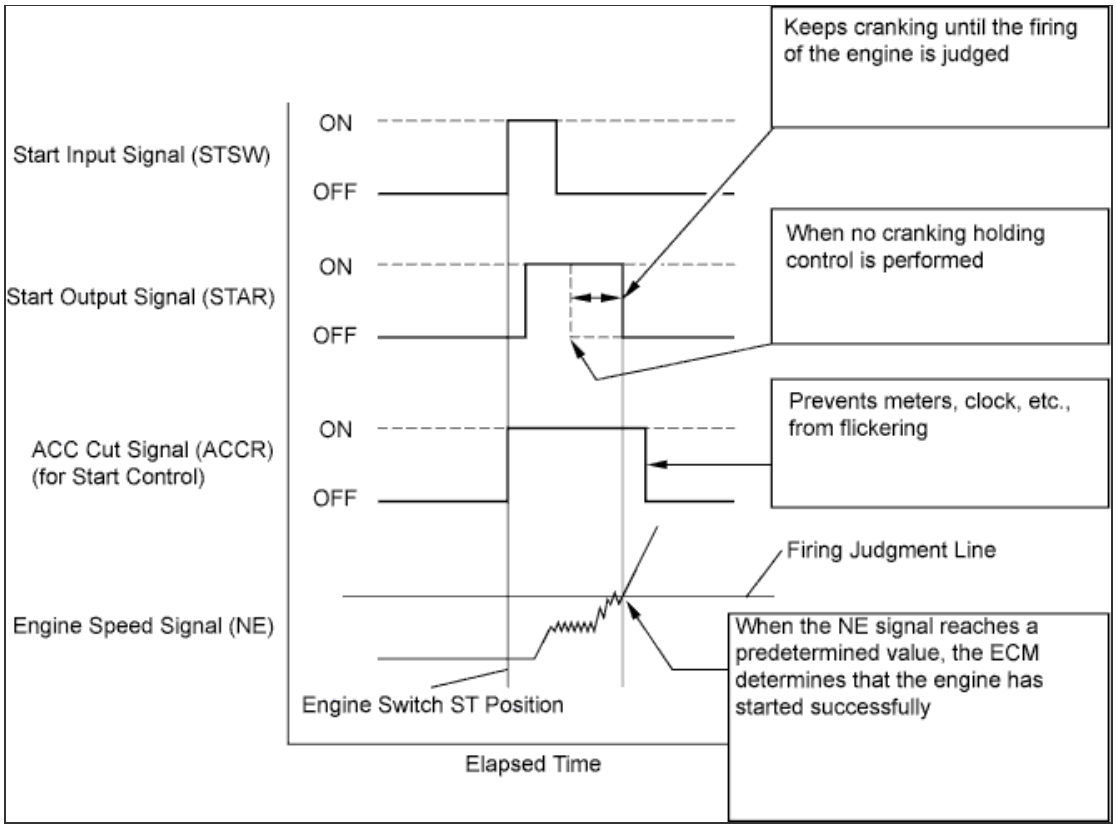
NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.INSPECT INTEGRATION NO.1 RELAY (IG2)

a. Inspect the integration relay (IG2) (Click here).

NG → REPLACE INTEGRATION NO.1 RELAY



OK

REPAIR OR REPLACE HARNESS OR CONNECTOR (INTEGRATION RELAY - FUEL INJECTOR ASSEMBLY)

for Preparation Click here

DESCRIPTION

The cranking holding control system provides current to the starter when the ECM detects the engine switch start signal (STSW). When the ECM performs a firing judgment, the system cuts current to the starter. When an ECM receives the STSW signal, it turns on the ACC cut, which prevents flickering of the combination meter, clock, audio system, etc. Also, the ECM sends a signal to the ECM STAR terminal. Then the STAR output signal travels through the Park/Neutral Position (PNP) switch to the starter relay, causing the starter to activate.
When the engine is cranking, the starter operation signal is sent to the ECM STA terminal.

WIRING DIAGRAM

Refer to DTC P0617 (Click here).

INSPECTION PROCEDURE

1.CHECK CRANKING

a. Check the cranking of the engine.

Result

Result	Proceed to
Cranking possible and holding control operates	A
Does not crank	B
Cranking possible but holding control does not operate	C

B → Go to step 2

C → Go to step 11

A

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (Click here)

2.READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / Starter Signal.

e. Check the value displayed on the tester when the engine switch is turned to the START.

Standard:

Engine Switch Position	Display (Starter Signal)
On (IG)	OFF
START	ON

NG → Go to step 7

OK ↓

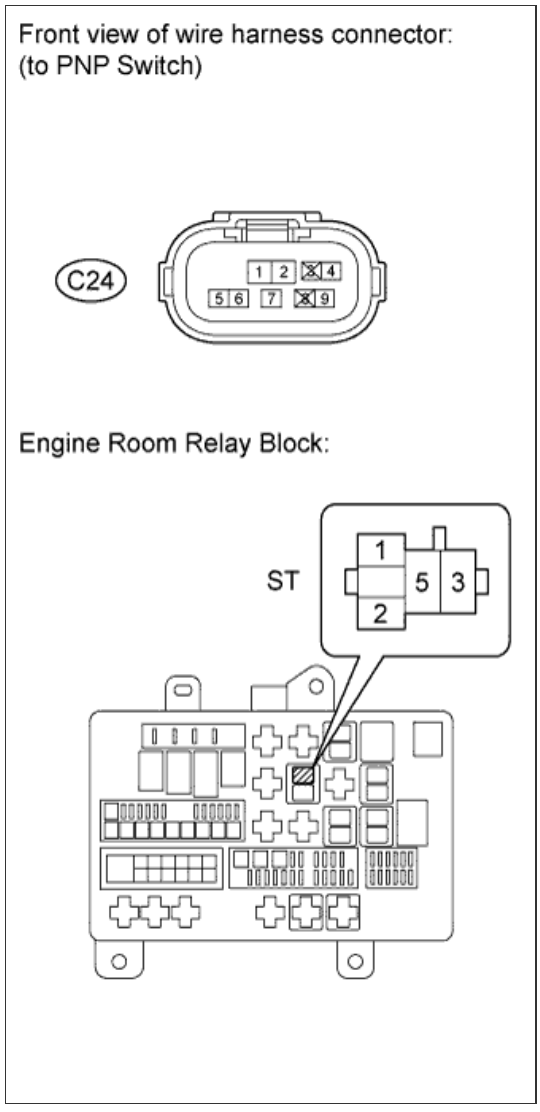
3.INSPECT STARTER RELAY (ST)

a. Inspect the starter relay (ST) (Click here).

NG → REPLACE STARTER RELAY

OK ↓

4.CHECK HARNESS AND CONNECTOR (STARTER RELAY - PNP SWITCH)



a. Remove the starter relay (ST) from the engine room relay block.

b. Disconnect the C24 PNP switch.

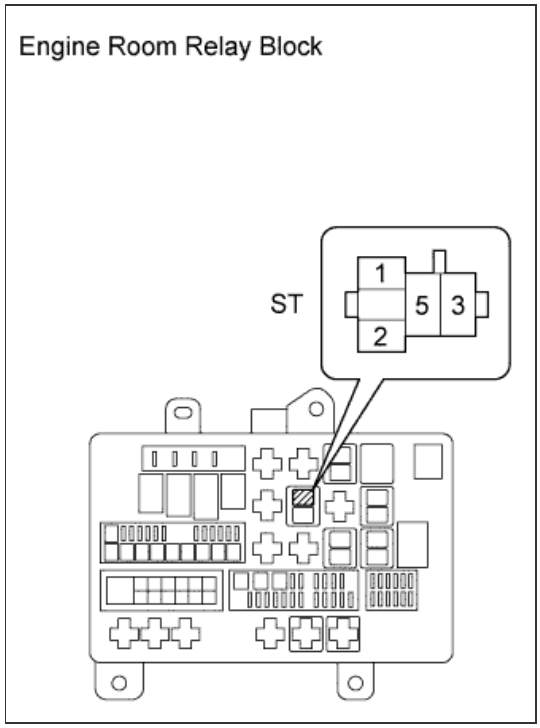
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
ST relay (1) - C24-5	Always	Below 1 Ω
ST relay (1) or C24-5 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



5.CHECK STARTER RELAY (POWER SOURCE)

a. Remove the ST relay from the engine room relay block.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
ST relay (2) - ST relay (5)	Always	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (STARTER RELAY (ST) - BATTERY, BODY GROUND)

OK

6.INSPECT STARTER

a. Inspect the starter (Click here).

NG → REPAIR OR REPLACE STARTER (Click here)

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR (STARTER - STARTER RELAY (ST), BATTERY)

7.INSPECT STARTER CUT RELAY (ST CUT)

a. Inspect the starter cut relay (ST CUT) (Click here).

NG → REPLACE STARTER CUT RELAY

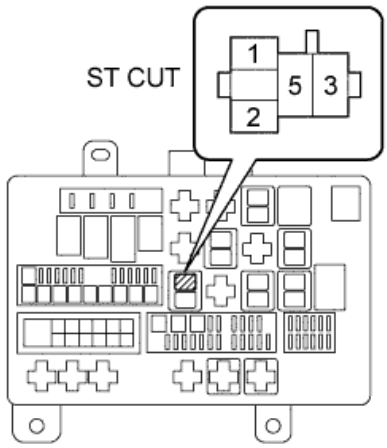
OK

8.CHECK HARNESS AND CONNECTOR (ST CUT RELAY - PNP SWITCH, ECM)

a. Remove the starter cut relay (ST CUT) from the engine room relay block.

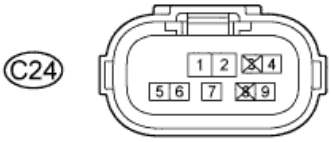
b. Disconnect the C24 PNP switch connector.

c. Disconnect the C45 ECM connector.



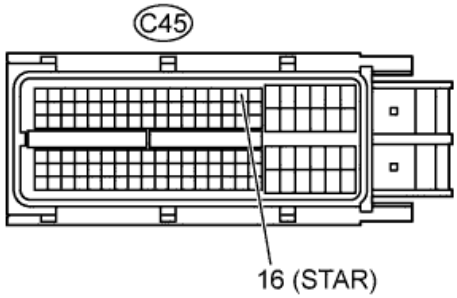
d. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified

		Condition
ST CUT relay (5) - C45-16 (STAR)	Always	Below 1 Ω
ST CUT relay (3) - C24-4	Always	Below 1 Ω
ST CUT relay (5) or C45-16 (STAR) - Body ground	Always	10 kΩ or higher
ST CUT relay (3) or C24-4 - Body ground	Always	10 kΩ or higher



Engine Room Relay Block

Front view of wire harness connector:
(to PNP Switch)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT PARK/NEUTRAL POSITION SWITCH

a. Inspect the park/neutral position switch (Click here).

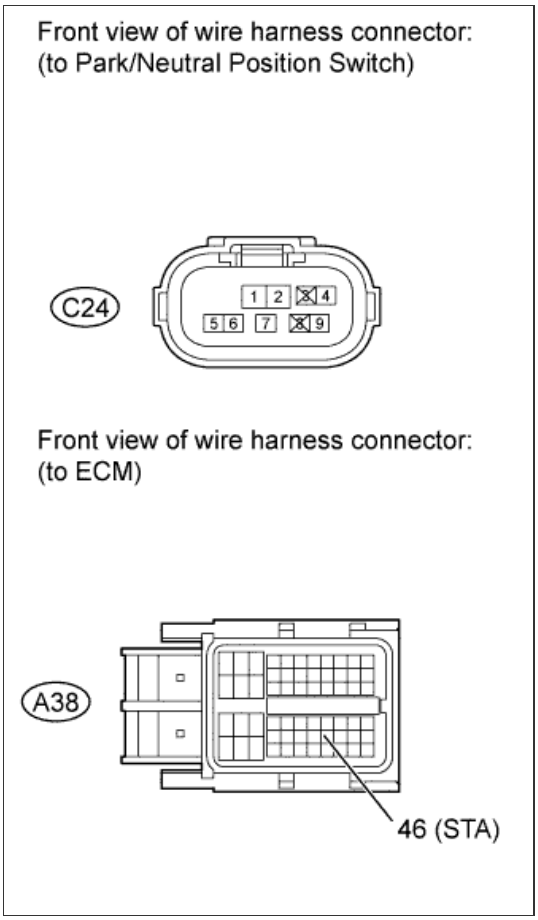
NG → REPLACE PARK/NEUTRAL POSITION SWITCH (Click here)

OK

10.CHECK HARNESS AND CONNECTOR (PNP SWITCH - ECM)

a. Disconnect the C24 PNP switch connector.

b. Disconnect the A38 ECM connector.



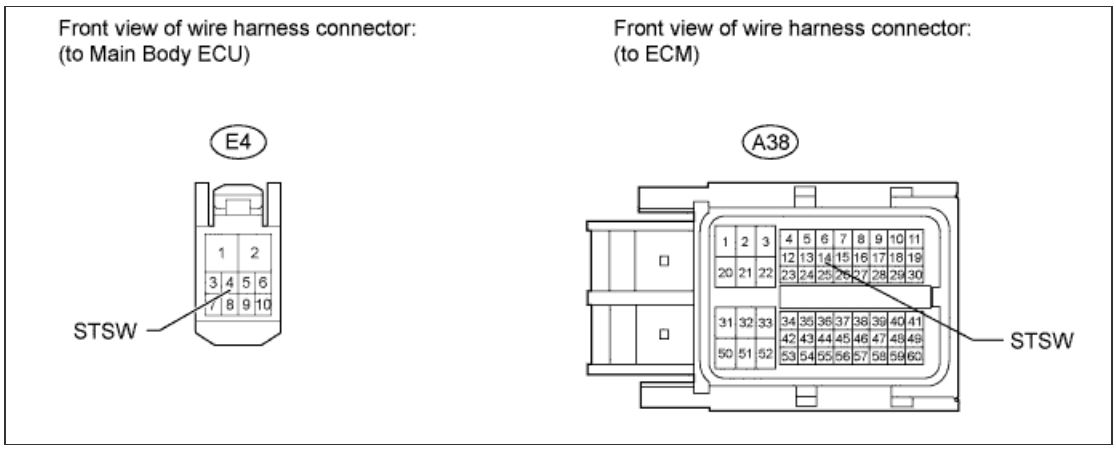
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C24-5 - A38-46 (STA)	Always	Below 1 Ω
C24-5 or A38-46 (STA) - Body ground	Always	10 kΩ or higher

Result

Result	Proceed to
NG	A
OK	B



B → Go to step 13

A

REPAIR OR REPLACE HARNESS OR CONNECTOR

11.CHECK HARNESS AND CONNECTOR (MAIN BODY ECU - ECM)

a. Disconnect the E4 main body ECU connector.

b. Disconnect the A38 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
E4-4 (STSW) - A38-14 (STSW)	Always	Below 1 Ω
E4-4 (STSW) or A38-14 (STSW) - Body ground	Always	10 kΩ or higher

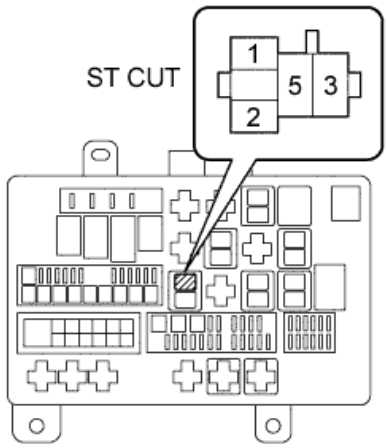
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

12.CHECK HARNESS AND CONNECTOR (STARTER CUT RELAY - PNP SWITCH, ECM)

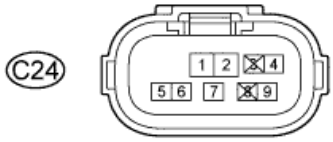
a. Remove the starter cut relay (ST CUT) from the engine room relay block.

b. Disconnect the C24 PNP switch connector.



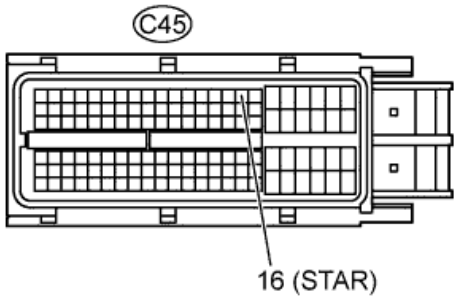
c. Disconnect the C45 ECM connector.

d. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
ST CUT relay (5) - C45-16 (STAR)	Always	Below 1 Ω
ST CUT relay (3) - C24-4	Always	Below 1 Ω
ST CUT relay (5) or C45-16 (STAR) - Body ground	Always	10 kΩ or higher
ST CUT relay (3) or C24-4 - Body ground	Always	10 kΩ or higher



Engine Room Relay Block

Front view of wire harness connector: (to PNP Switch)

Front view of wire harness connector: (to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (**Click here**)

13.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

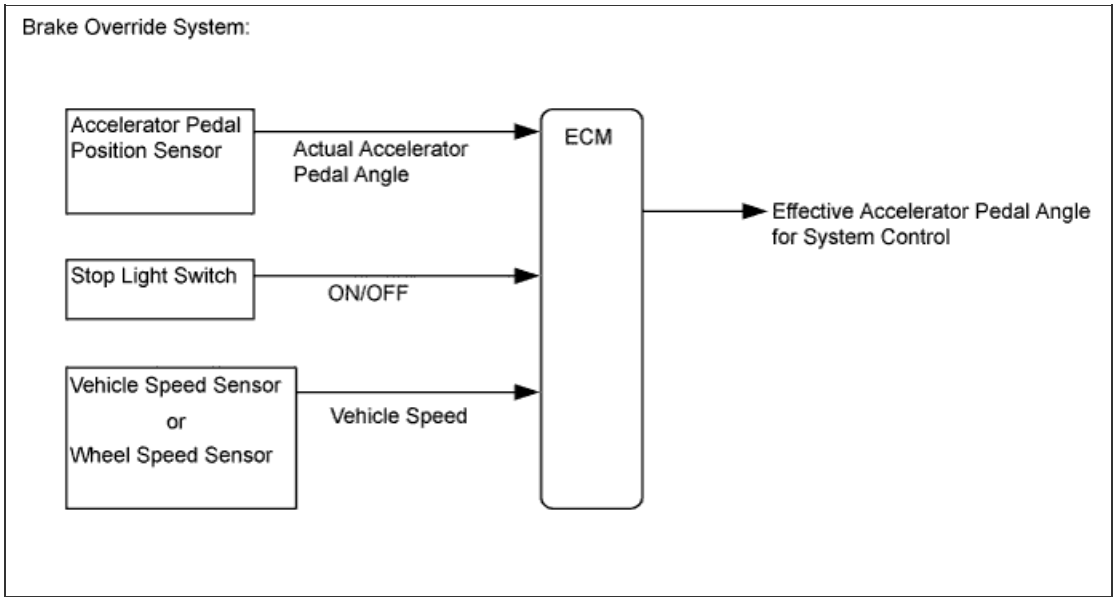
14.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check the starter operation.

OK:

Malfunction has been repaired successfully.

NG → GO TO ENTRY AND START SYSTEM (ENGINE DOES NOT START) (Click here)



OK

END

for Preparation Click here

DESCRIPTION

When the vehicle is being driven with the accelerator pedal depressed, depressing the brake pedal without releasing the accelerator pedal will activate the brake override system to restrict driving torque. The conditions for activating the brake override system as well as the items that are controlled are explained below.

Activation Conditions:

- Vehicle is running at or above the specified speed.
- The accelerator pedal is depressed beyond a specified level, and then the brake pedal is depressed.

NOTICE:

The vehicle may not enter the brake override system control due to the relation of the accelerator pedal angle and the vehicle's speed.

Items Controlled:

- Driving torque is restricted.

HINT:

During brake override system control, the value for the accelerator pedal angle (which is used for engine control) is forcibly reduced to a specified value. For this reason, the Data List value for Accelerator Position (applied to electronic throttle control) will be replaced with a specified value regardless of the actual accelerator pedal angle (Accel Sens. No. 1 Volt %, Accel Sens. No. 2 Volt %)

Deactivation Conditions:

- When the Stop Light Switch turns OFF or the actual accelerator pedal angle increases or decreases beyond the specified range.

INSPECTION PROCEDURE

Inspection Method

Drive at 10 km/h (6.25 mph), depress the accelerator pedal by 1/2 to 3/4 and keep it in that position. Under these conditions, if the engine speed decreases to 1000 rpm when the brake pedal is depressed, then the brake override system has been activated.

CAUTION:

When carrying out the inspection, use a place where you are able to carry it out safely and also pay close attention to your surroundings.

Also, when driving make absolutely sure that all road traffic laws, such as speed limits, are observed.

HINT:

- **Under normal conditions, the Accelerator Position value changes in response to the Accel Sens. No. 1 Volt % value. For more information on the numerical values, refer to the Data List (Click here).**
- **If the Data List values of Accelerator Position and Accel Sens. No. 1 Volt % do not match, and the value of Accelerator Position changes but the value of Accel Sens. No. 1 Volt % is constant, this confirms that the brake override system has activated. (Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the driving test.)**

NOTICE:

The brake override system restricts driving torque if the brake pedal is depressed when driving with the accelerator pedal depressed. If a customer reports experiencing loss of torque after the accelerator and brake pedals have both been intentionally depressed, explain to the customer that this is not a malfunction, and that the customer should avoid depressing both the accelerator and brake pedals at the same time.

Example: While operating the accelerator pedal, the customer uses their left foot to operate the brake pedal.

1.CHECK DTC OUTPUT

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: System Select / Health Check.

d. Check DTCs.

Result

Result	Proceed to
No DTC output	A
DTC output	B

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (STOP LIGHT SWITCH AND ST1)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Stop Light Switch and ST1.

d. Check the Data List indication when the brake pedal is depressed and released.

OK:

intelligent tester Display	Condition	Specified Condition
Stop Light Switch	Brake pedal released	OFF
	Brake pedal depressed	ON
ST1	Brake pedal released	OFF
	Brake pedal depressed	ON

NG → INSPECT STOP LIGHT SWITCH ASSEMBLY (Click here)

OK

3.INSPECT BRAKE PEDAL

a. Inspect and adjust the brake pedal (Click here).

HINT:

If the stop light switch turns ON too late, the start of brake override system control may be delayed; if it turns ON too soon, brake override system control may begin too early, so conduct inspection of the brake pedal and stop light switch assembly.

NG → REPAIR OR REPLACE BRAKE PEDAL (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR PEDAL POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Accel Sens. No. 1 Volt % and Accel Sens. No. 2 Volt %.

d. Read the value displayed on the intelligent tester.

OK:

intelligent tester Display	Condition	Specified Condition
Accel Sens. No. 1 Volt %	Accelerator Pedal Released → Depressed → Released	Values smoothly change following accelerator pedal operation
Accel Sens. No. 2 Volt %		

HINT:

For numerical values of Accel Sens. No. 1 Volt % and Accel Sens. No. 2 Volt %, refer to the Data List (Click here).

NG → REPLACE ACCELERATOR PEDAL SENSOR ASSEMBLY (Click here)

OK

5.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine / Data List / Vehicle Speed.

e. Read the value displayed on the intelligent tester.

Standard:

intelligent tester Display	Condition	Specified Condition
Vehicle Speed	Vehicle stopped, engine running	0 km/h (0 mph)
	Vehicle running at constant speed between 16.1 to 64.4 km/h (10 to 40 mph)	No large fluctuations when driving at a constant speed

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.

NG → GO TO METER / GAUGE SYSTEM (SPEED SIGNAL CIRCUIT) (Click here)

OK

6.READ VALUE USING INTELLIGENT TESTER (FR, FL, RR, RL WHEEL SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine.

d. Enter the following menus: Chassis / ABS/VSC/TRAC / Data List / FR Wheel Speed, FL Wheel Speed, RR Wheel Speed and RL Wheel Speed.

e. Read the value displayed on the intelligent tester.

Standard:

intelligent tester Display	Condition	Specified Condition

FR Wheel Speed FL Wheel Speed RR Wheel Speed RL Wheel Speed	Vehicle stopped, engine running	0 km/h (0 mph)
	Vehicle running at constant speed between 16.1 to 64.4 km/h (10 to 40 mph)	No large fluctuations when driving at a constant speed

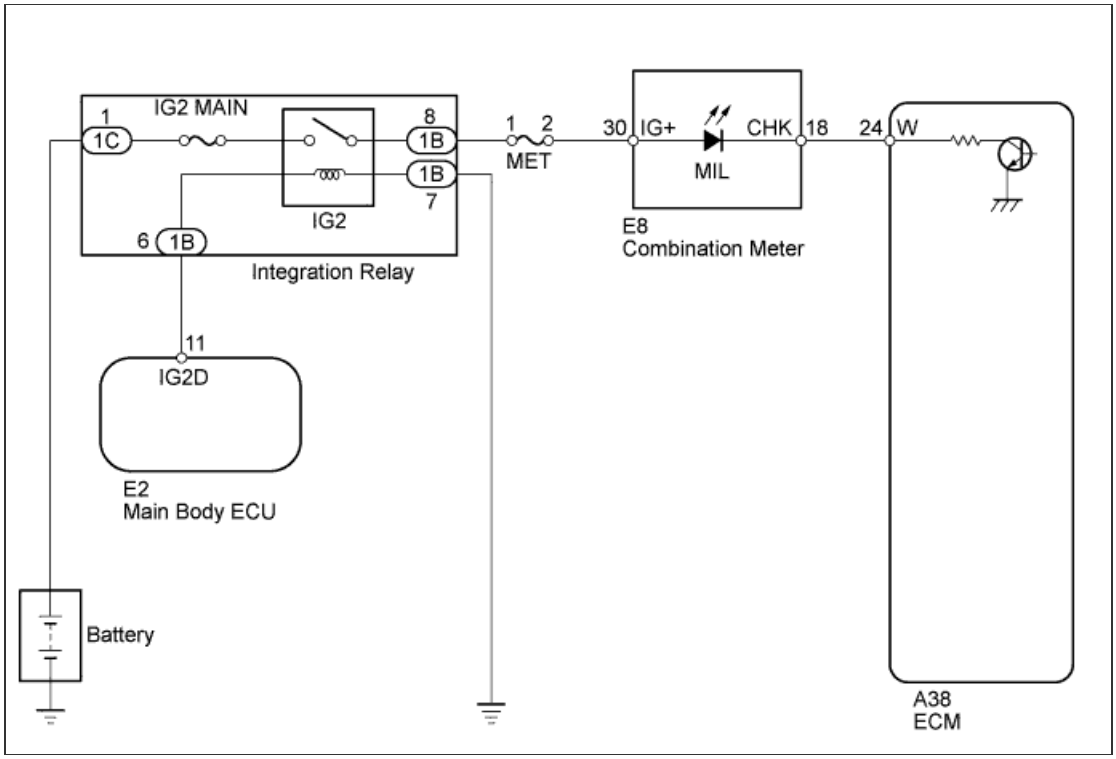
CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.

NG → INSPECT FRONT OR REAR SPEED SENSOR



OK → END

for Preparation Click here

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detections by the ECM. When the engine switch is turned on (IG), power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.
The MIL operation can be checked visually: When the engine switch is first turned on (IG), the MIL should be illuminated and should then turn off when the engine is started. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using the intelligent tester.

WIRING DIAGRAM

INSPECTION PROCEDURE

1.CHECK THAT MIL IS ILLUMINATED

a. Perform troubleshooting in accordance with the table below.

Result

Result	Proceed to
MIL remains ON	A
MIL does not illuminate	B

B → Go to step 5

A

2.CHECK WHETHER MIL TURNS OFF

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Check if any DTCs are output. Note down any DTCs.

e. Clear DTCs (Click here).

f. Check if the MIL goes off.

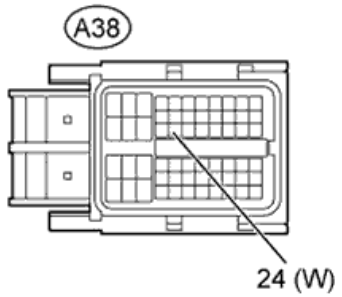
Standard:
MIL goes off

NG → Go to step 3

OK

REPAIR CIRCUITS INDICATED BY OUTPUT DTCS (Click here)

3.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT IN WIRE HARNESS)



a. Disconnect the A38 ECM connector.

b. Turn the engine switch on (IG).

c. Check that the MIL is not illuminated.

OK:
MIL is not illuminated.

Front view of wire harness connector:
(to ECM)

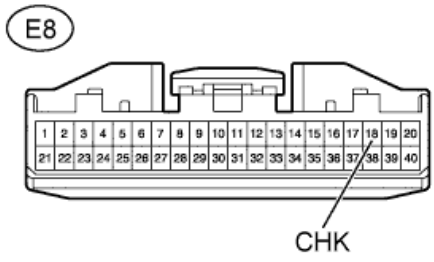
NG → Go to step 4

OK

REPLACE ECM (Click here)

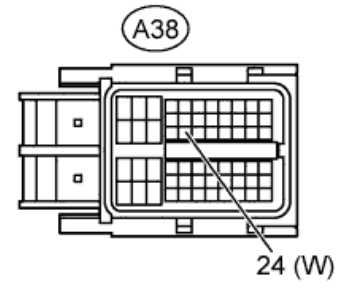
4.CHECK HARNESS AND CONNECTOR (COMBINATION METER ECM)

a. Disconnect the A38 ECM connector.



b. Disconnect the E8 combination meter connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
A38-24 (W) or E8-18 (CHK) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to Combination Meter)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE COMBINATION METER ASSEMBLY (Click here)

5.CHECK THAT MIL IS ILLUMINATED

a. Check if the MIL is illuminated when the engine switch is turned on (IG).

OK:
MIL is illuminated.

NG → Go to step 6

OK

SYSTEM OK

6.CHECK THAT ENGINE STARTS

a. Turn the engine switch on (IG).

b. Start the engine.

Result

Result	Proceed to
Engine starts	A
Engine does not start*	B

HINT:

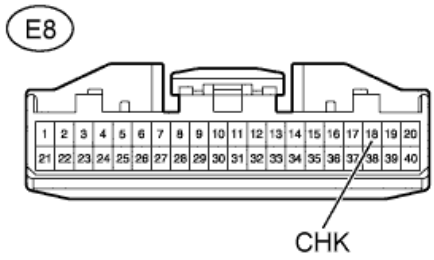
*: The intelligent tester cannot communicate with the ECM.

B → GO TO VC OUTPUT CIRCUIT (Click here)

A

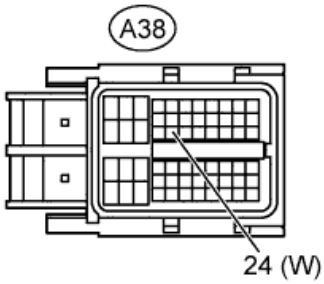
7.CHECK HARNESS AND CONNECTOR (COMBINATION METER ECM)

a. Disconnect the A38 ECM connector.



b. Disconnect the E8 combination meter connector.

c. Measure the resistance according to the value(s) in the table below.

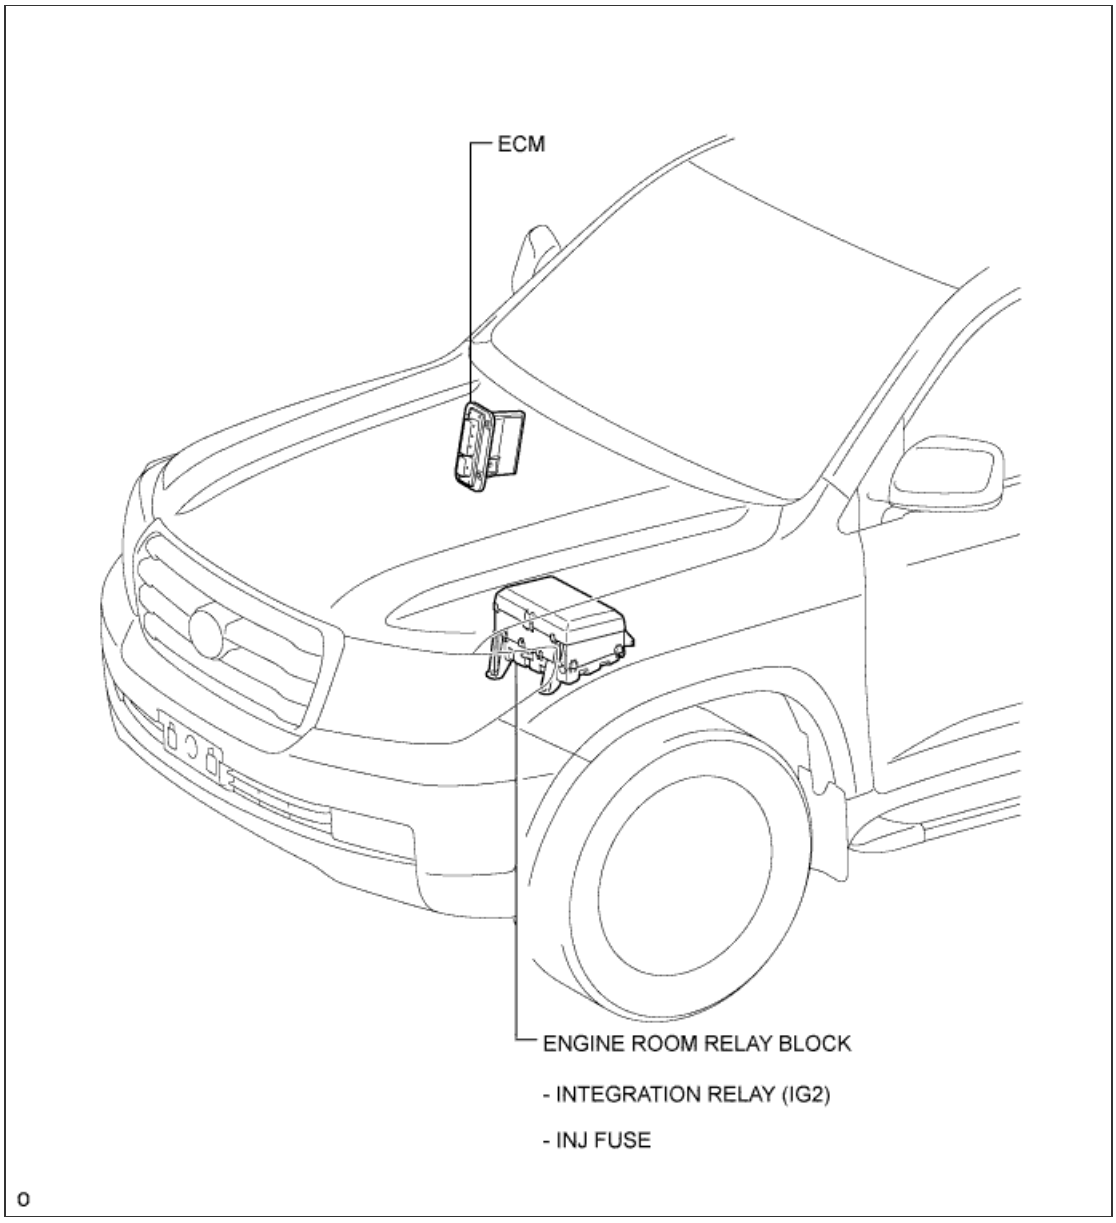


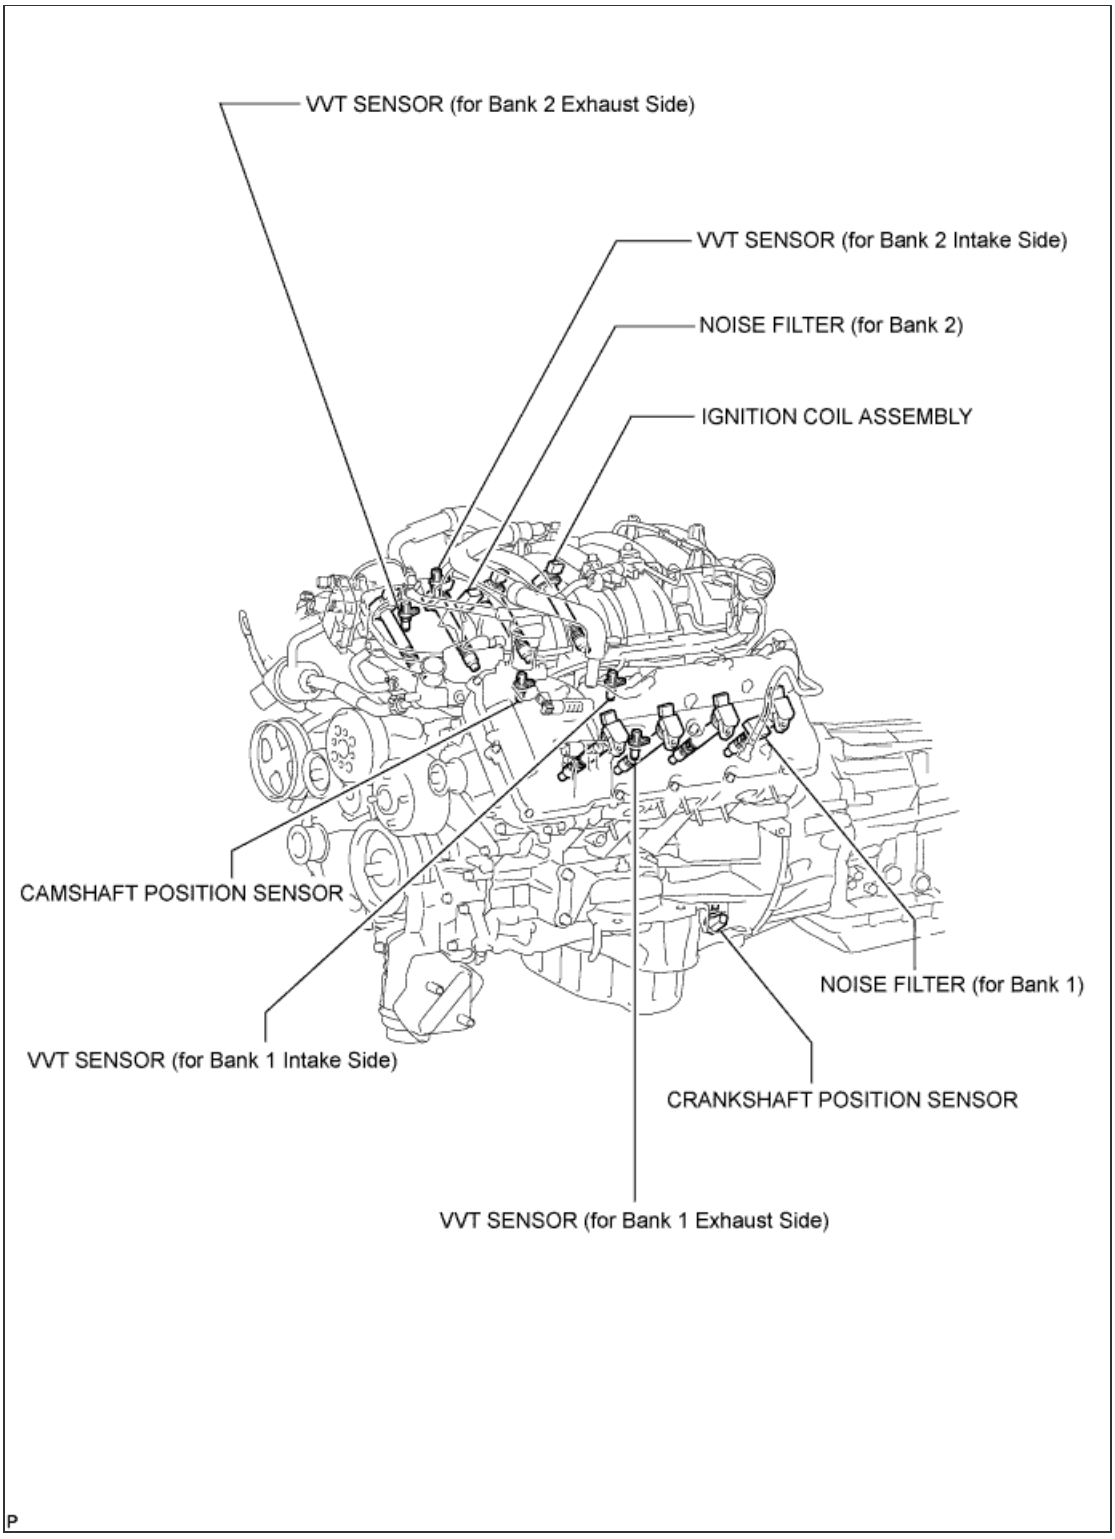
Standard Resistance:

Tester Connection	Condition	Specified Condition
A38-24 (W) - E8-18 (CHK)	Always	Below 1 Ω

Front view of wire harness connector:
(to Combination Meter)

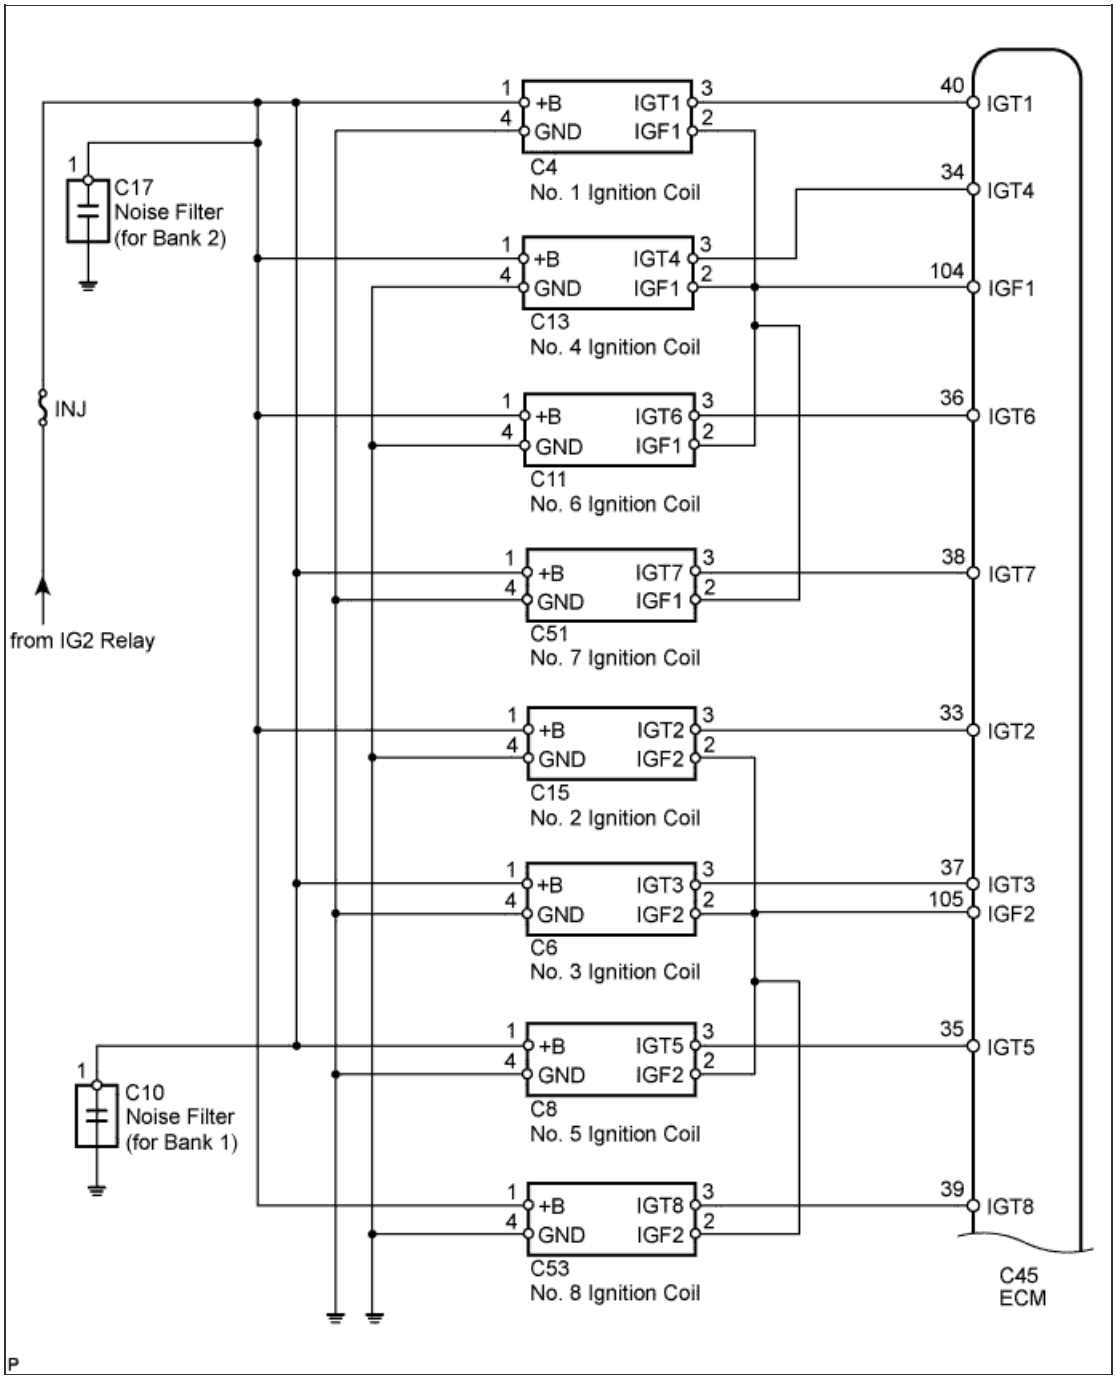
Front view of wire harness connector:
(to ECM)





NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



REPLACE COMBINATION METER ASSEMBLY (Click here)

1. PERFORM SPARK TEST

a. Check for DTCs (Click here).

NOTICE:

If any DTC is output, perform troubleshooting procedures for that DTC.

b. Check if sparks occur.

i. Remove the ignition coils and spark plugs (Click here).

ii. Install the spark plug to the ignition coil and connect the ignition coil connector.

iii. Disconnect the 8 injector connectors.

iv. Ground the spark plug.

v. Visually check that sparks occur while the engine is being cranked.

NOTICE:

- **Be sure to ground the spark plug when checking.**
- **If the ignition coil has been struck or dropped, replace it.**
- **Do not crank the engine for more than 2 seconds.**

c. Check that the wire harness side connector of the ignition coil with igniter is securely connected.

Result

Result	Proceed to
NG	Connect securely
OK	Go to next step

d. Perform a spark test on each ignition coil with igniter.

i. If there is a cylinder where sparks do not occur, replace its ignition coil with the ignition coil of a cylinder where sparks occur normally.

ii. Crank the engine and visually check that sparks occur at the cylinder with the normally operating ignition coil.

Result

Result	Proceed to
OK	Replace ignition coil with igniter
NG	Go to next step

e. Check spark plug.

Result

Result	Proceed to
NG	Replace spark plug
OK	Go to next step

f. Check the power supply to the ignition coil with igniter.

i. Turn the engine switch on (IG).

ii. Check that there is battery voltage at the ignition coil positive (+) terminal.

Result

Result	Proceed to
NG	Check wiring between engine switch and ignition coil with igniter
OK	Go to next step

g. Check the VVT sensor for intake side (Click here).

h. Check the VVT sensor for exhaust side (Click here).

i. Check the camshaft position sensor (Click here).

j. Check the crankshaft position sensor (Click here).

k. Check the IGT signal circuit (Click here).

l. Connect the 8 injector connectors.

m. Install the ignition coils and spark plugs (Click here).

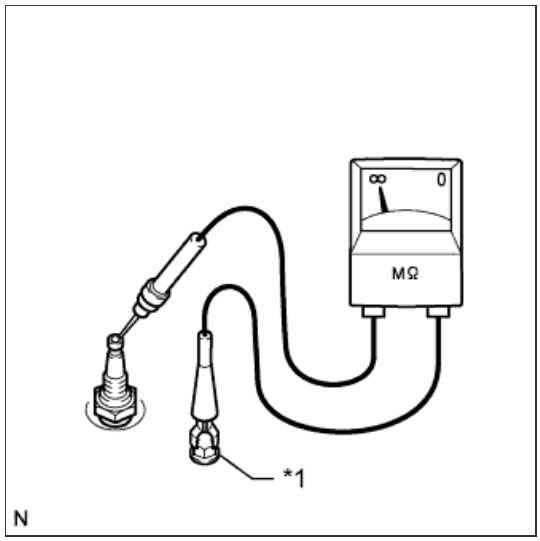
2. INSPECT SPARK PLUG

NOTICE:

- **Do not use a wire brush for cleaning.**
- **Do not attempt to adjust the electrode gap of a used spark plug.**

a. Check the electrode.

i. Using a megohmmeter, measure the insulation resistance.



Standard Insulation Resistance:

Tester Connection	Condition	Specified Condition
Spark plug (terminal part) - Body ground	Always	10 MΩ or higher

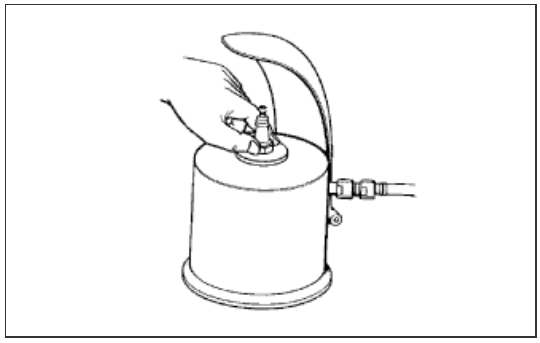
Text in Illustration

*1	Ground

If the insulation resistance is below the specified range, replace the spark plug.

HINT:

If a megohmmeter is not available, perform the following simple inspection instead.



b. Alternative inspection method:

i. Quickly accelerate the engine to 4000 rpm 5 times.

ii. Remove the spark plug.

iii. Visually check the spark plug.
If the electrode is dry, the spark plug is functioning properly. If the electrode is damp, proceed to the next step.

c. Check the spark plug for any damage to its threads and insulator.
If there is any damage, replace the spark plug.

Recommended Spark Plug:

Manufacturer	Type
DENSO made	SK20HR11

HINT:

Maximum electrode gap for a used spark plug: 1.3 mm (0.0512 in.).

If the gap is more than the maximum, replace the spark plug.

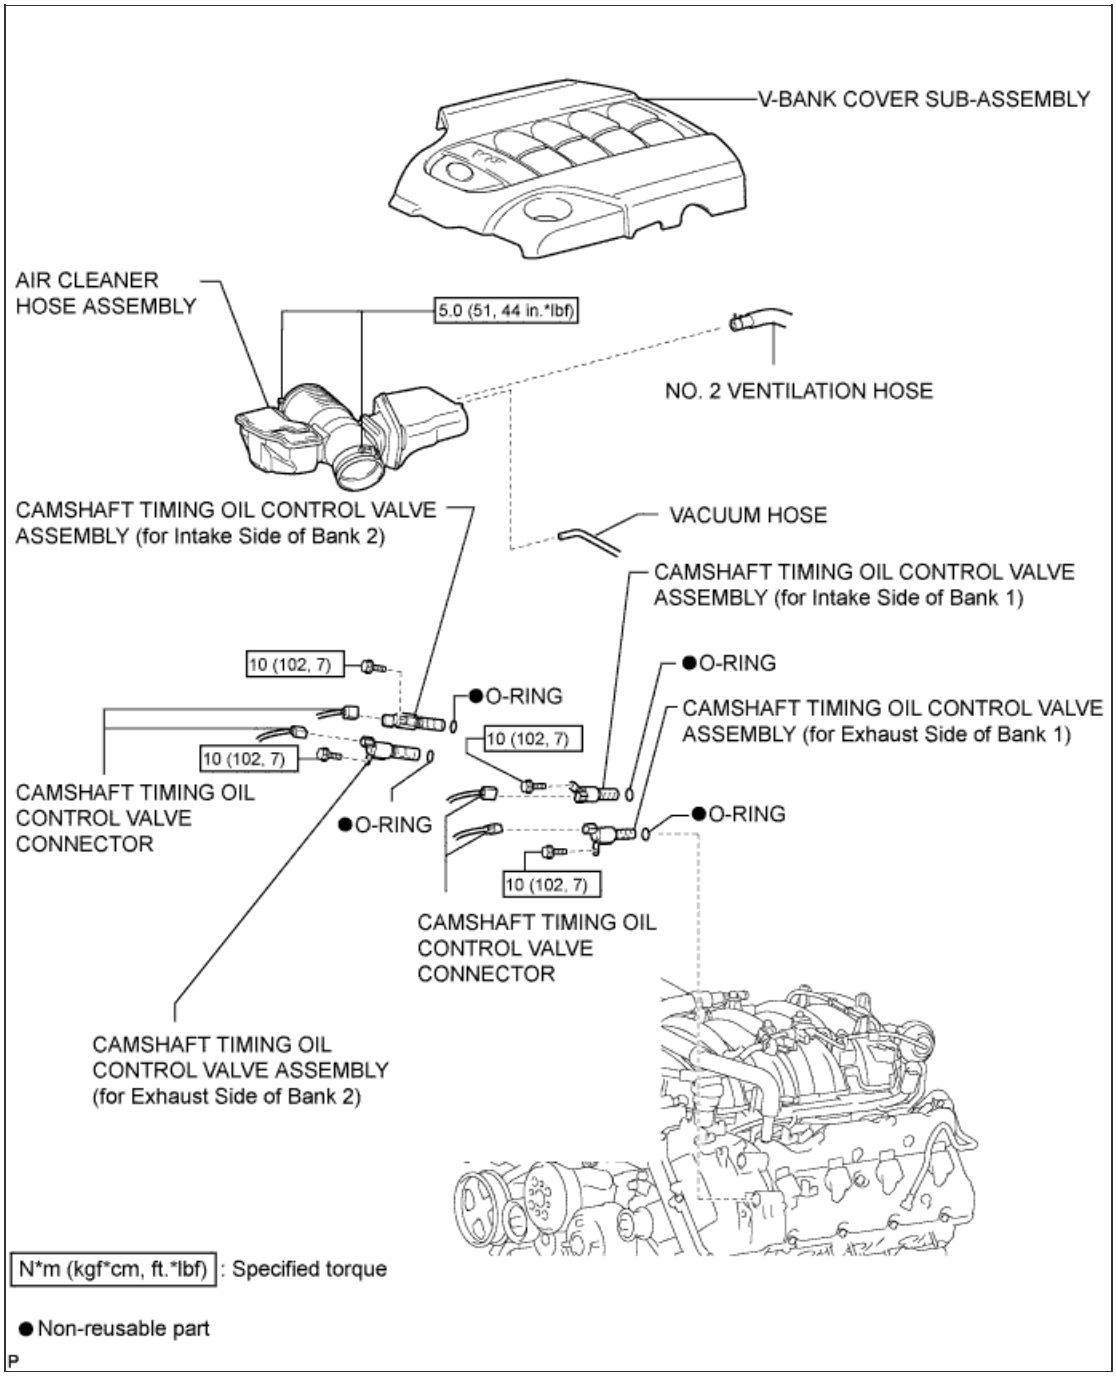
Electrode gap for a new spark plug: 1.0 to 1.1 mm (0.0394 to 0.0433 in.).

NOTICE:

If adjusting the gap of a new spark plug, bend only the base of the ground electrode. Do not touch the tip. Never attempt to adjust the gap

of a used plug.

If the electrode has traces of wet carbon, allow it to dry and then clean it with a spark plug cleaner.



Standard air pressure:
588 kPa (6.0 kgf/cm^2, 85 psi)

Standard duration:
20 seconds or less

HINT:

Only use the spark plug cleaner when the electrode is free of oil. If the electrode has traces of oil, use gasoline to clean off the oil before using the spark plug cleaner.

for Preparation Click here

1. INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Linear (Bank 1) or Control the VVT Linear (Bank 2) or Control the VVT System (Bank 1) or Control the VVT System (Bank 2) or Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the intelligent tester.

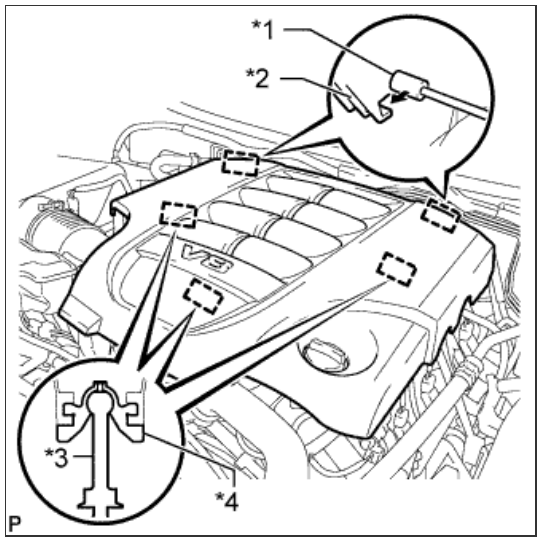
OK:

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

If the result is not as specified, check the oil control valve, wiring and camshaft timing gear.

HINT:

- **Control the VVT Linear (Bank 1): Command to activate exhaust and intake side oil control valves of bank 1 (Control range: Between -128 to 127%).**
- **Control the VVT Linear (Bank 2): Command to activate exhaust and intake side oil control valves of bank 2 (Control range: Between -128 to 127%).**
- **Control VVT System (Bank 1): Command to activate oil control valve of bank 1 (Control range: ON/OFF).**
- **Control VVT System (Bank 2): Command to activate oil control valve of bank 2 (Control range: ON/OFF).**
- **Control the VVT Exhaust Linear (Bank 1): Command to activate exhaust side oil control valve of bank 1 (Control range: Between -128 to 127%).**
- **Control the VVT Exhaust Linear (Bank 2): Command to activate exhaust side oil control valve of bank 2 (Control range: Between -128 to 127%).**



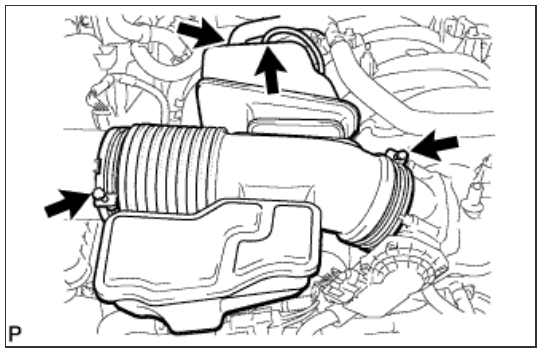
for Preparation Click here

1. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Raise the front of the V-bank cover to detach the 3 pins. Then remove the 2 V-bank cover hooks from the bracket, and remove the V-bank cover.

Text in Illustration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

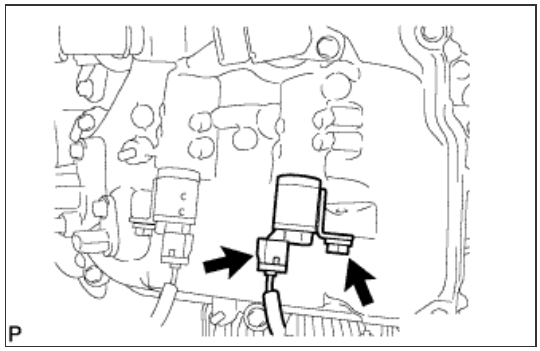


2. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum hose and No. 2 ventilation hose.

b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

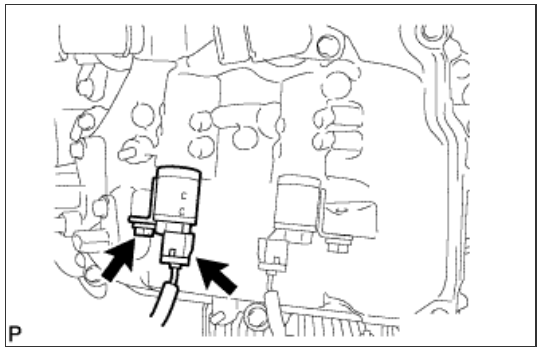


3. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Exhaust Side of Bank 1)

a. Disconnect the oil control valve connector.

b. Remove the bolt and oil control valve.

c. Remove the O-ring from the oil control valve.

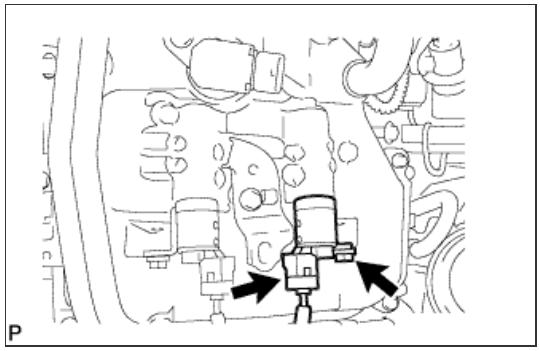


4. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Intake Side of Bank 1)

a. Disconnect the oil control valve connector.

b. Remove the bolt and oil control valve.

c. Remove the O-ring from the oil control valve.

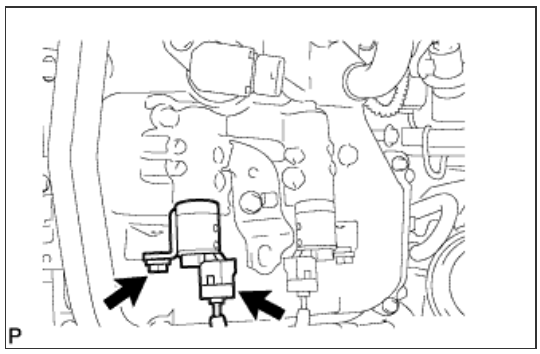


5. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Intake Side of Bank 2)

a. Disconnect the oil control valve connector.

b. Remove the bolt and oil control valve.

c. Remove the O-ring from the oil control valve.



6. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Exhaust Side of Bank 2)

a. Disconnect the oil control valve connector.

b. Remove the bolt and oil control valve.

c. Remove the O-ring from the oil control valve.

for Preparation Click here

1. INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

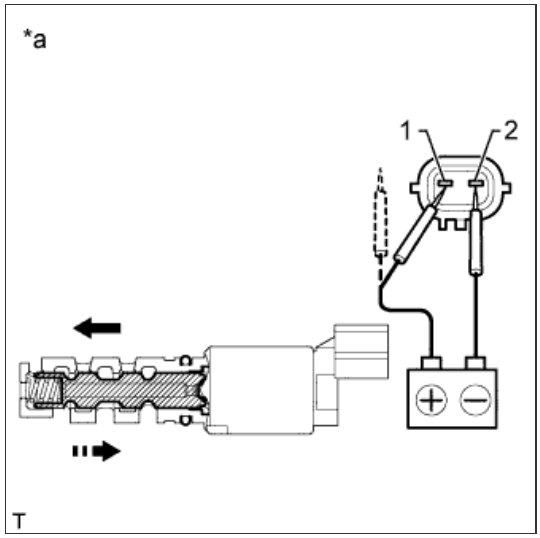
a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

If the result is not as specified, replace the oil control valve assembly.

b. Connect the battery positive (+) lead to terminal 1 and the negative (-) lead to terminal 2, and check the movement of the valve.



OK:

Condition	Specified Condition
Battery positive (+) voltage is applied	Valve moves in left arrow direction shown in the illustration
Battery positive (+) voltage is cut off	Valve moves in right arrow direction shown in the illustration

Te t in lll stcani

*a	Component without harness connected (Oil Control Valve)

If the result is not as specified, replace the oil control valve assembly. If the valve cannot return properly because of foreign matter, a small pressure leak in the advanced direction may occur and a DTC may be output.

for Preparation Click here

1. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Exhaust Side of Bank 1)

a. Install a new O-ring to the oil control valve.

b. Apply a light coat of engine oil to the O-ring.

c. Install the oil control valve with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head cover).**
- **Be careful that the O-ring is not cracked or moved out of place when installing the oil control valve.**

d. Connect the oil control valve connector.

2. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Intake Side of Bank 1)

a. Install a new O-ring to the oil control valve.

b. Apply a light coat of engine oil to the O-ring.

c. Install the oil control valve with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head cover).**
- **Be careful that the O-ring is not cracked or moved out of place when installing the oil control valve.**

d. Connect the oil control valve connector.

3. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Intake Side of Bank 2)

a. Install a new O-ring to the oil control valve.

b. Apply a light coat of engine oil to the O-ring.

c. Install the oil control valve with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head cover).**
- **Be careful that the O-ring is not cracked or moved out of place when installing the oil control valve.**

d. Connect the oil control valve connector.

4. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Exhaust Side of Bank 2)

a. Install a new O-ring to the oil control valve.

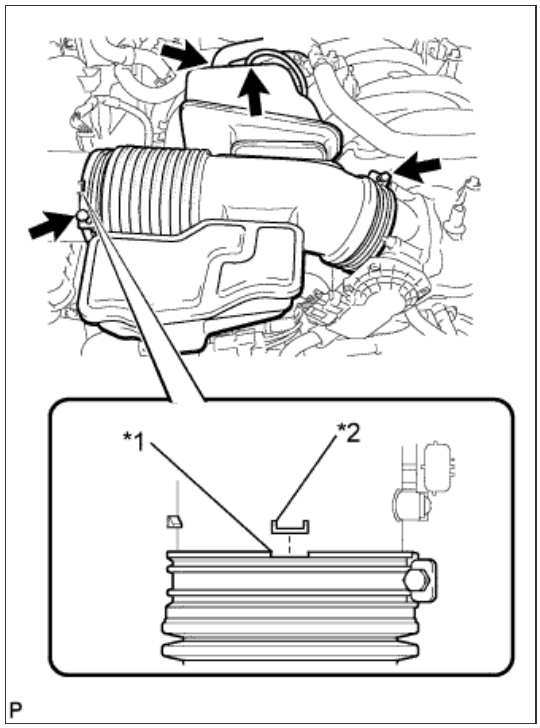
b. Apply a light coat of engine oil to the O-ring.

c. Install the oil control valve with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head cover).**
- **Be careful that the O-ring is not cracked or moved out of place when installing the oil control valve.**



d. Connect the oil control valve connector.

5. INSTALL AIR CLEANER HOSE ASSEMBLY

a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

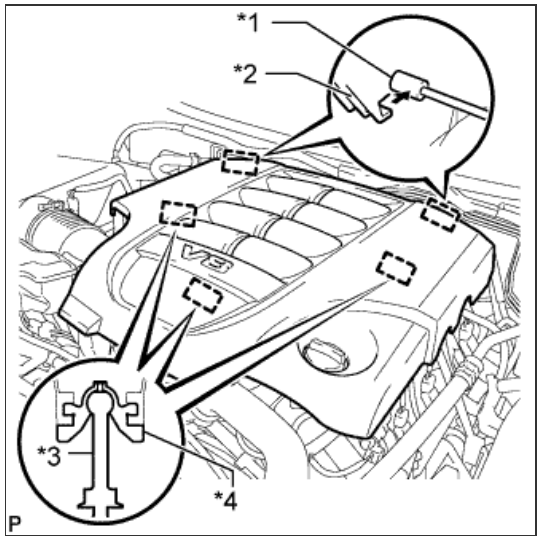
Text in Illustration

*1	Groove
*2	Protrusion

b. Tighten the 2 clamps.

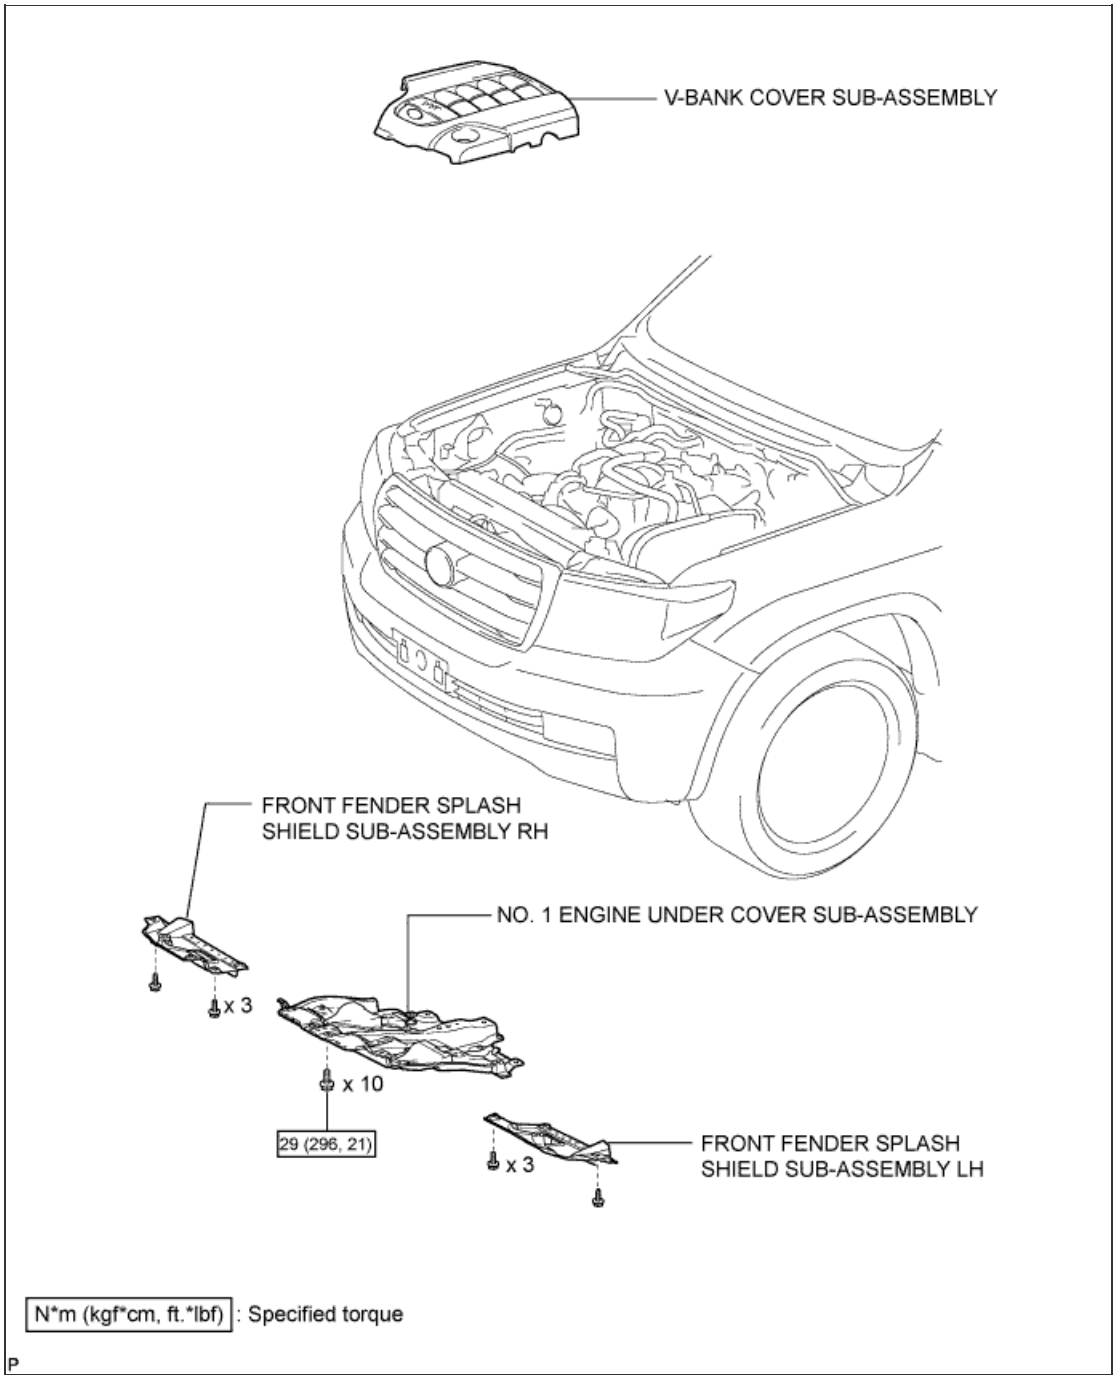
Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum hose.

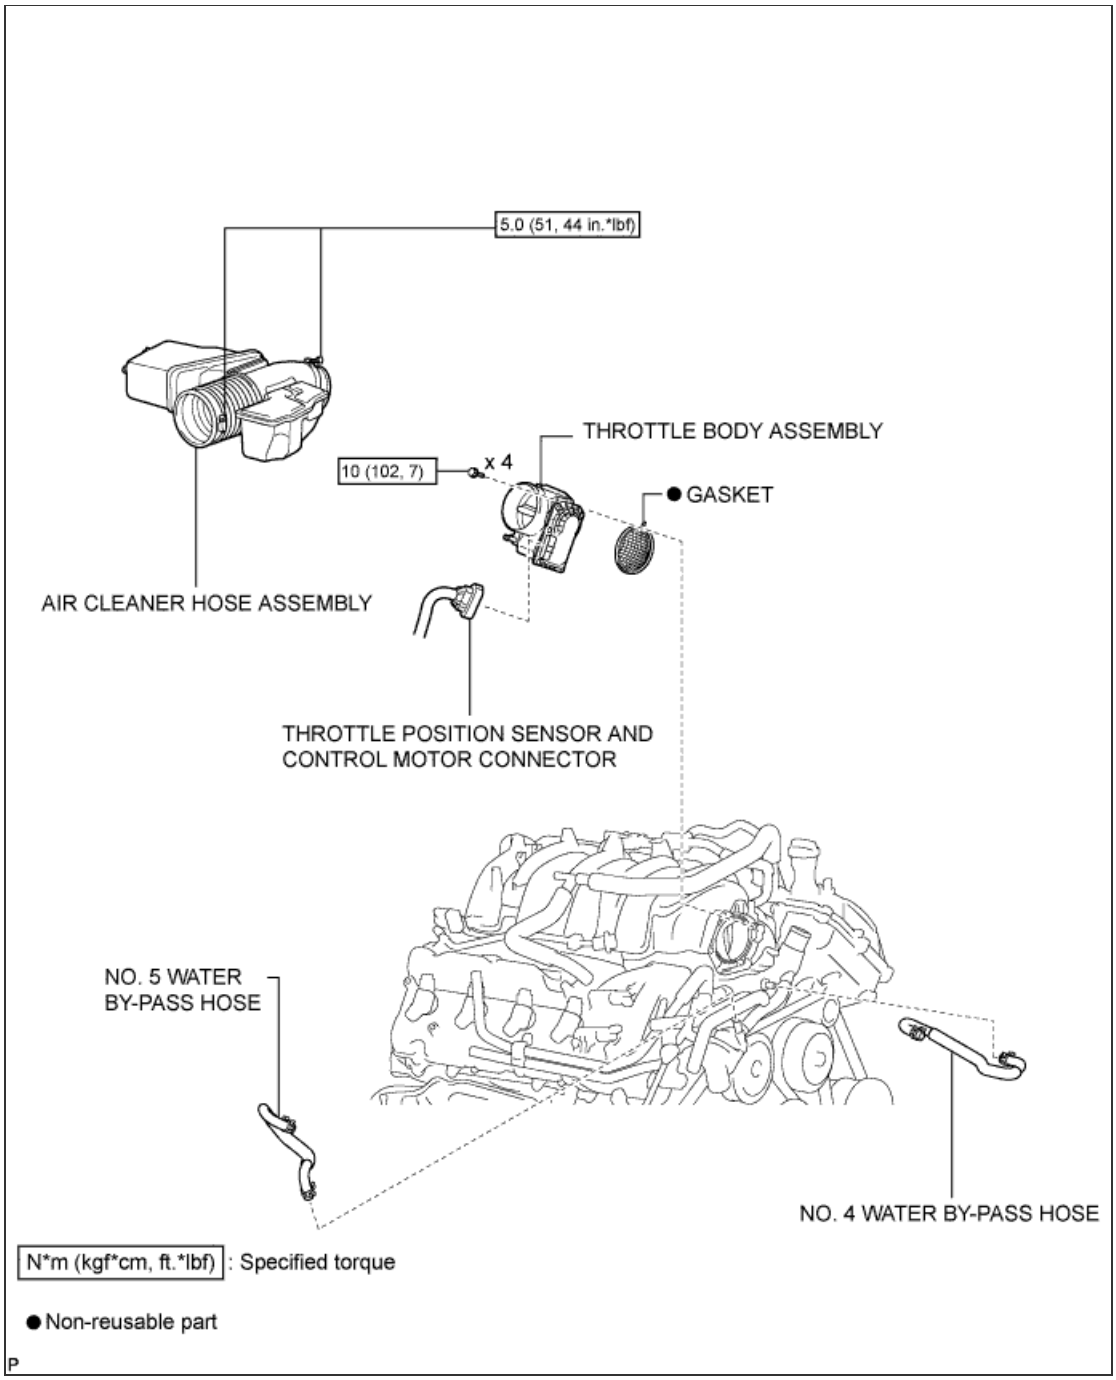


d. Connect the No. 2 ventilation hose.

6. INSTALL V-BANK COVER SUB-ASSEMBLY



a. Attach the 2 V-bank cover hooks to the bracket. Then align the 3 V-bank cover grommets with the 3 pins, and press down on the V-bank cover to attach the pins.



Text in Illustration

*1	Bracket
*2	Hook
*3	Pin

for Preparation Click here

1. CHECK THROTTLE BODY ASSEMBLY

a. Check the throttle control motor operating sounds.

i. Turn the engine switch on (IG).

ii. When depressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises are emitted from the motor. If friction noise exists, replace the throttle body.

b. Check the throttle position sensor.

i. Connect the intelligent tester to the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester main switch on.

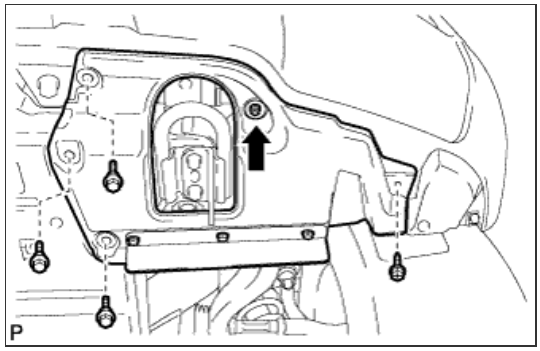
iv. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Throttle Sensor Volt %.

v. Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of "Throttle Sensor Volt %" is within the specification.

Standard throttle valve opening percentage:
60% or more

HINT:

When checking the standard throttle valve opening percentage, the shift lever should be in N.



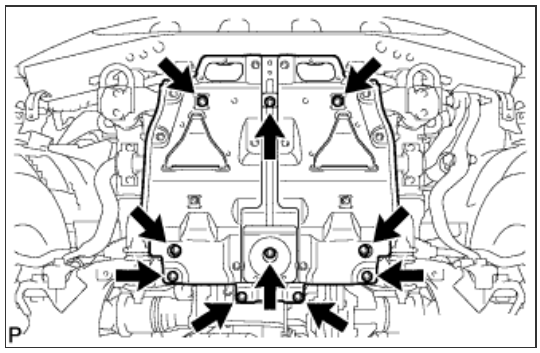
If the percentage is less than 60%, replace the throttle body.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE COOLANT

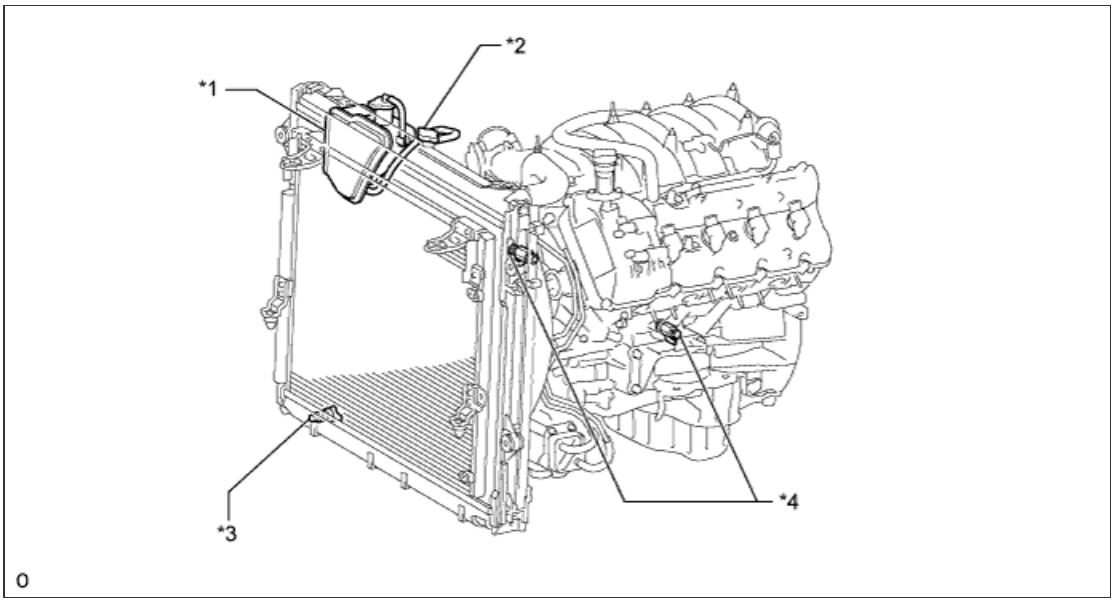
CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.



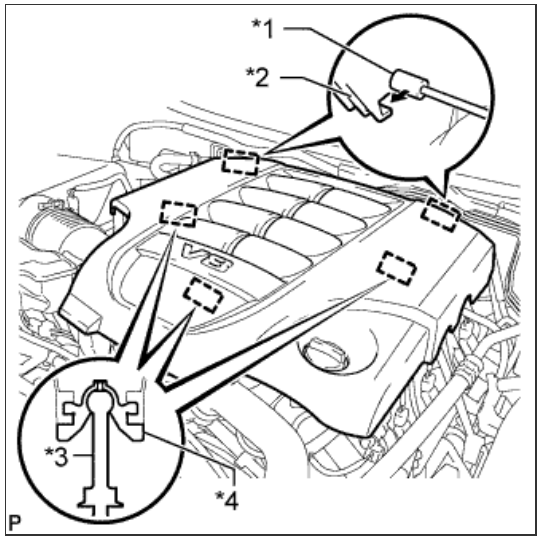
b. Remove the radiator cap. Then drain the coolant from the radiator.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.

d. Tighten the 2 cylinder block drain cock plugs.

Torque:

13 N 33 kgf cm , 1 ft. lbf }



Text in Illustration

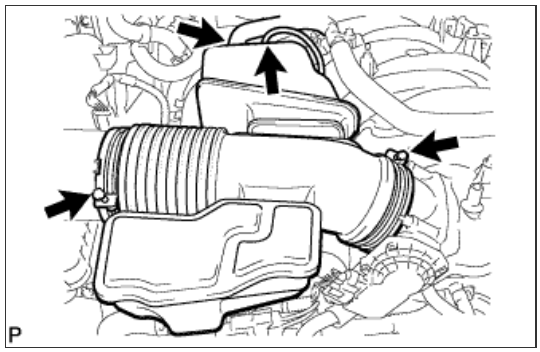
*1	Radiator Reservoir	*2	Radiator Cap
*3	Radiator Drain Cock Plug	*4	Cylinder Block Drain Cock Plug

e. Tighten the radiator drain cock plug by hand.

5. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Raise the front of the V bank cover to detach the 3 pins. Then remove the 2 V bank cover hooks from the bracket, and remove the V bank cover.

Text in Illustration

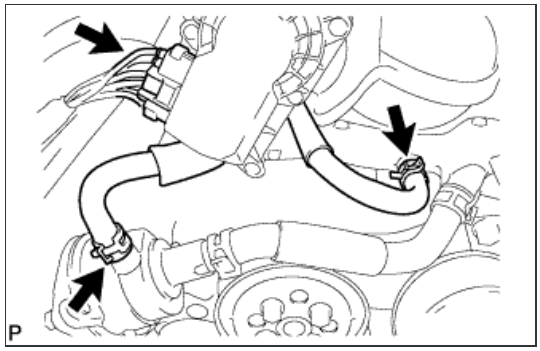


*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

6. REMOVE AIR CLEANER HOSE ASSEMBLY

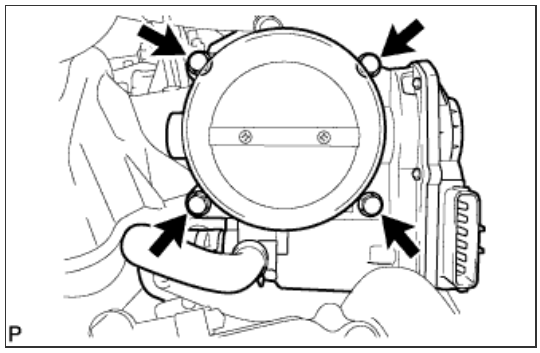
a. Disconnect the vacuum hose and No. 2 ventilation hose.

b. Loosen the 2 hose clamps.



c. Remove the air cleaner hose.

7. REMOVE THROTTLE BODY ASSEMBLY



a. Disconnect the 2 water by pass hoses.

b. Disconnect the throttle position sensor and control motor connector.

c. Remove the 4 bolts, throttle body and gasket.

d. Remove the 2 water by pass hoses from the throttle body.

for Preparation Click here

1. INSPECT THROTTLE BODY ASSEMBLY

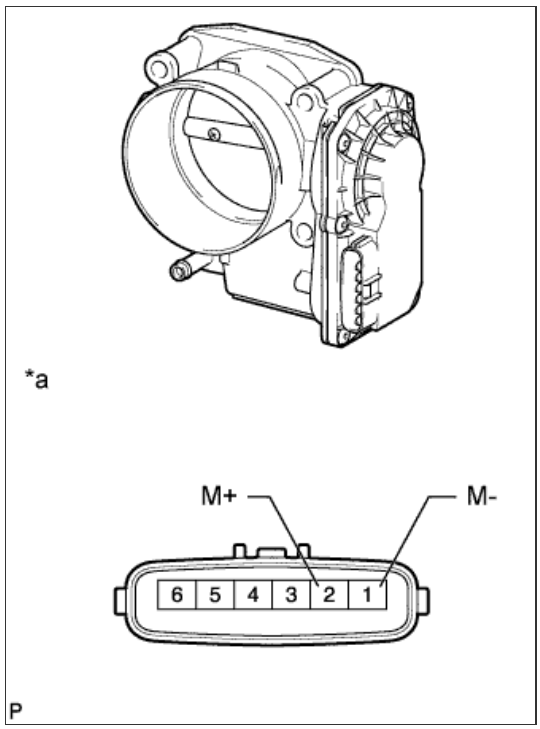
a. Check the throttle valve.

i. Check that the throttle valve opens and closes smoothly.

ii. Check that there is no sludge accumulating around the throttle body.

. Check the throttle control motor.

i. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

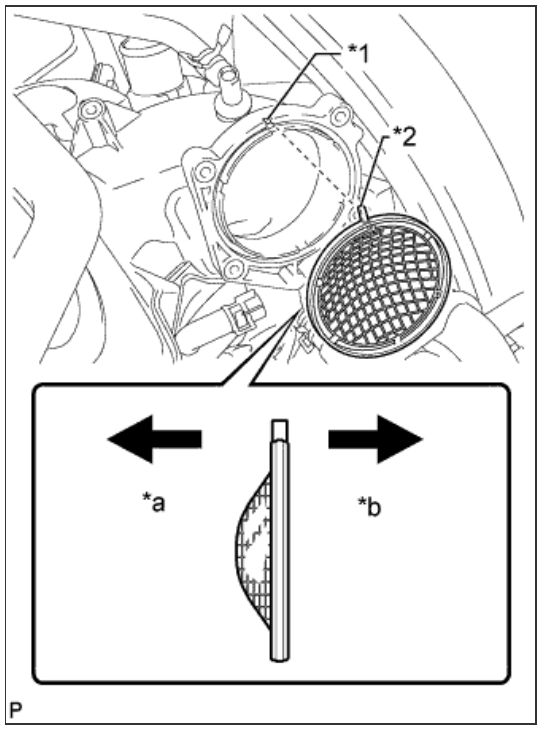
Tester Connection	Condition	Specified Condition
1 (M-) - 2 (M+)	20°C (68°F)	0.3 to 100 Ω

Text in Illustration

*a	Component without harness connected (Throttle Body)

If the result is not as specified, replace the throttle body.

for Preparation Click here



1. INSTALL THROTTLE BODY ASSEMBLY

a. Install the 2 water by-pass hoses to the throttle body.

b. Install a new gasket to the intake air surge tank.

Text in Illustration

*1	Groove
*2	Protrusion
*a	Surge Tank Side
*b	Throttle Body Side

HINT:

Align the protrusion of the gasket with the groove of the intake air surge tank.

c. Install the throttle body with the 4 bolts.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

d. Connect the throttle position sensor and control motor connector.

e. Connect the 2 water by-pass hoses.

2. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item	Specified Condition
with rear heater	16.2 liters (17.1 US qts, 14.3 Imp. qts)
without rear heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the radiator inlet hose by hand, and checking when the engine coolant starts

to flow inside the hose.

g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

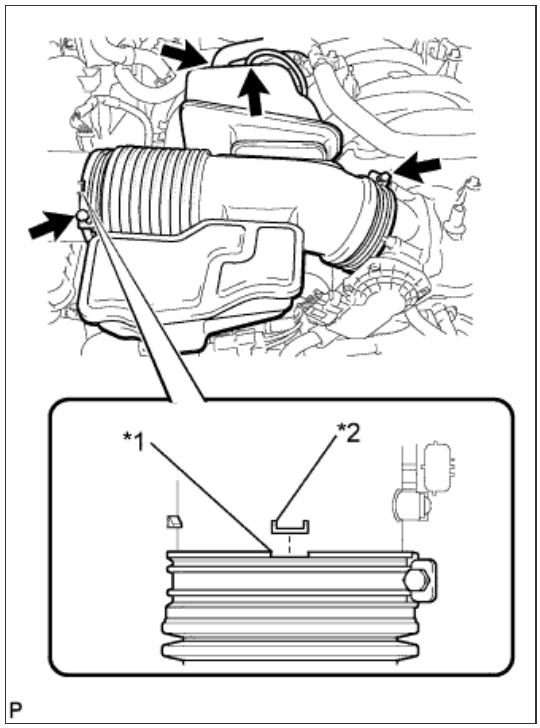
CAUTION:

- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

i. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.



j. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

3. INSTALL AIR CLEANER HOSE ASSEMBLY

a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

Text in Illustration

*1	Groove
*2	Protrusion

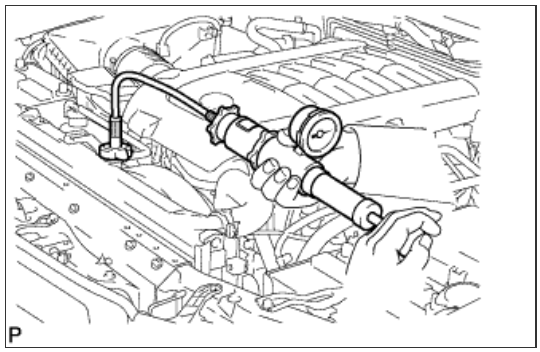
b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum hose.

d. Connect the No. 2 ventilation hose.

4. INSPECT FOR COOLANT LEAK



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. ill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

5. CHECK THROTTLE BODY ASSEMBLY

a. Check the throttle control motor operating sounds.

i. Turn the engine switch on (IG).

ii. When depressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises are emitted from the motor. If friction noise exists, replace the throttle body.

b. Check the throttle position sensor.

i. Connect the intelligent tester to the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester main switch on.

iv. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Throttle Sensor Volt %.

v. Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of "Throttle Sensor Volt %" is within the specification.

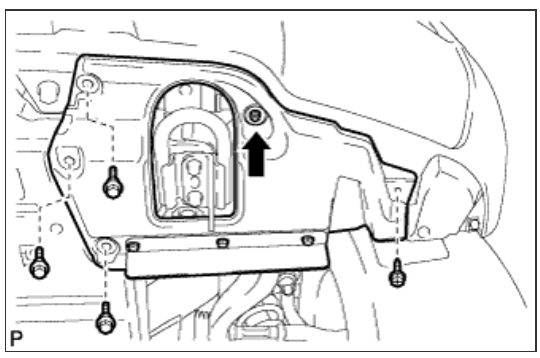
Standard throttle valve opening percentage:
60% or more

HINT:

When checking the standard throttle valve opening percentage, the shift lever should be in N.

If the percentage is less than 60%, replace the throttle body.

6. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the No. 1 engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

7. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

9. PERFORM INITIALIZATION

NOTICE:

Perform the following procedure after replacing the ECM, throttle body assembly or any throttle body components. The following procedure should also be performed if the throttle body is cleaned.

a. Disconnect the cable from the negative (-) battery terminal. Wait at least 60 seconds and reconnect the cable.

b. Turn the engine switch on (IG) without operating the accelerator pedal.

NOTICE:

If the accelerator pedal is operated, perform the above steps again.

c. Connect the intelligent tester to the DLC3 and clear the DTCs (Click here).

d. Start the engine and check that the MIL is not illuminated and that the idle speed is within the specified range when the A/C is switched off after the engine is warmed up.

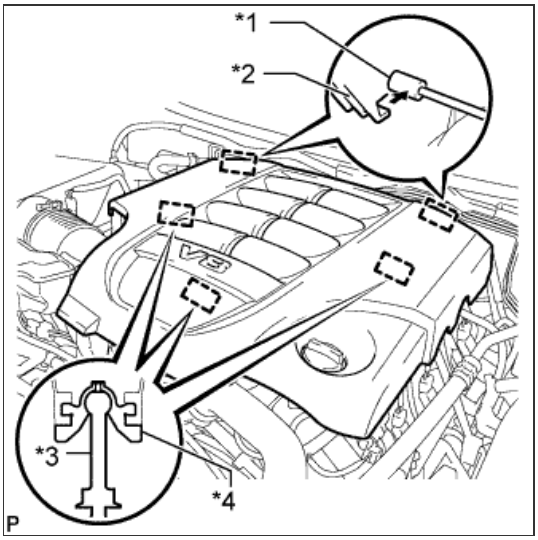
Standard:

Condition	Engine Idle Speed
A/C switched off	650 to 750 rpm

NOTICE:

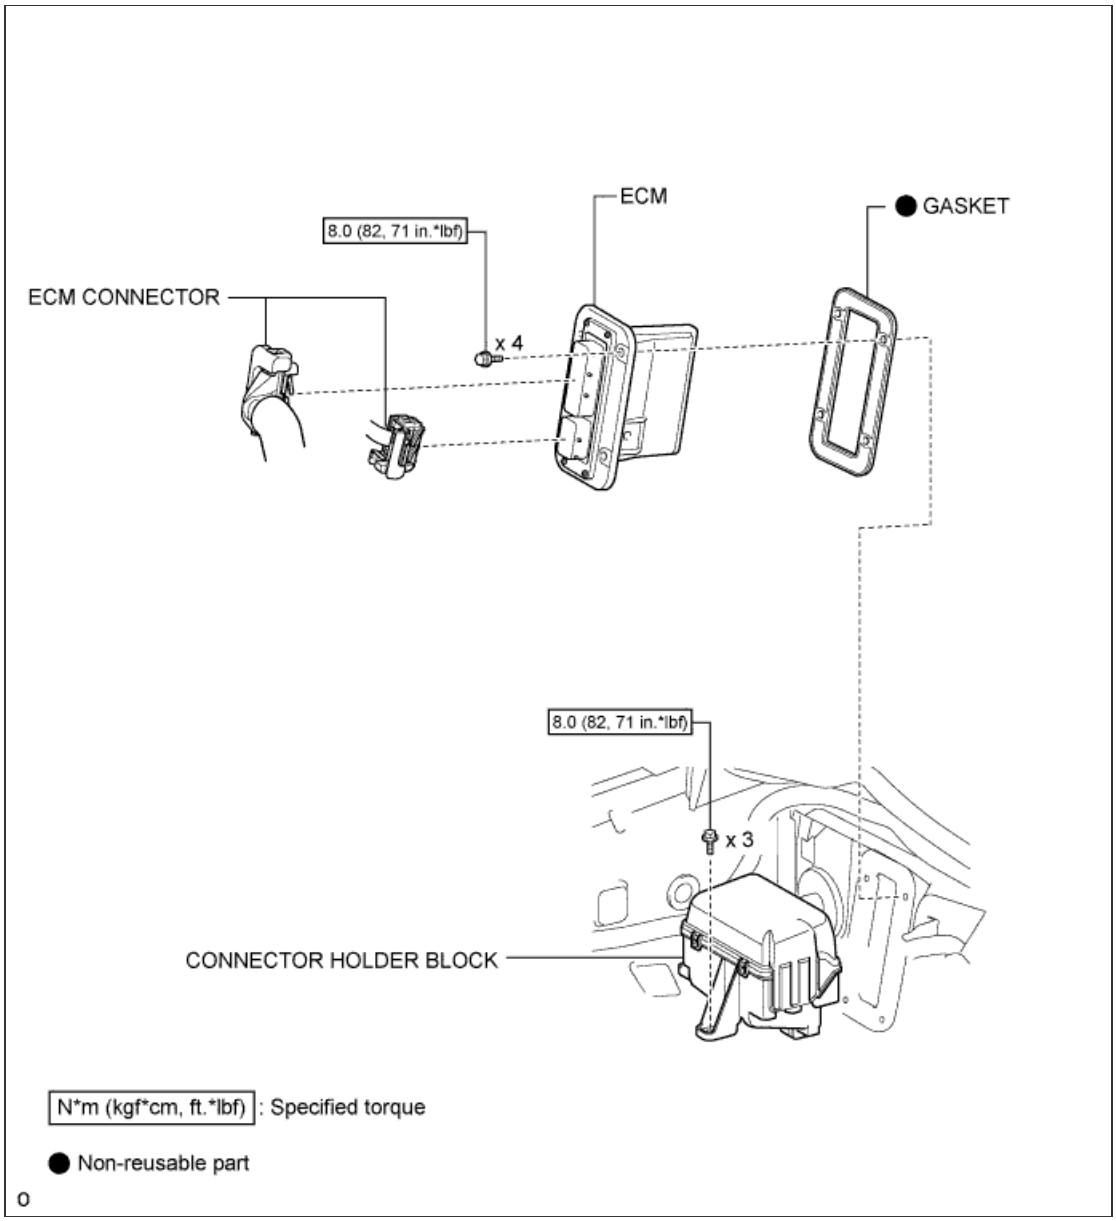
- **Be sure to perform this step with all accessories off.**
- **Make sure that the shift lever is in N or P.**

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Throttle Sensor Volt %. Fully depress the accelerator pedal and check that the value is 60% or more.



f. Perform a road test and confirm that there are no abnormalities.

10. INSTALL V-BANK COVER SUB-ASSEMBLY



a. Attach the 2 V-bank cover hooks to the bracket. Then align the 3 V-bank cover grommets with the 3 pins, and press down on the V-bank cover to attach the pins.

Text in Illustration

*1	Bracket
*2	Hook
*3	Pin

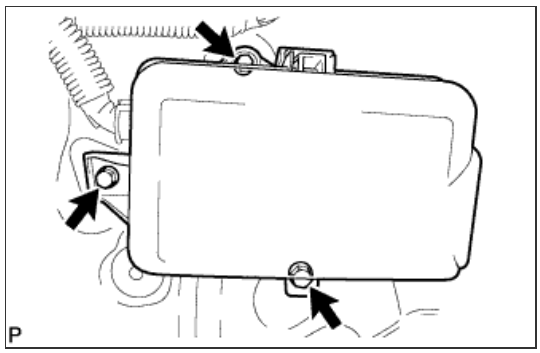
for Preparation [Click here]

for Preparation Click here



1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

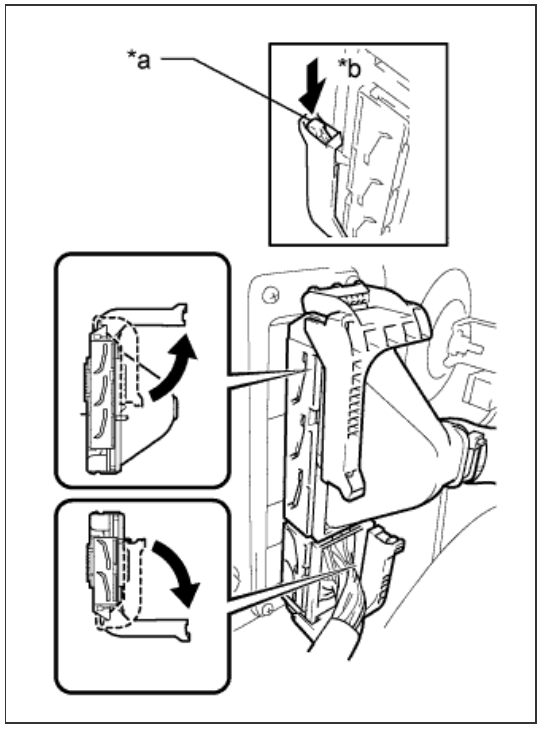
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

2. DISCONNECT CONNECTOR HOLDER BLOCK

a. Remove the 3 bolts and move the connector holder block so that the ECM can be removed in the next step.

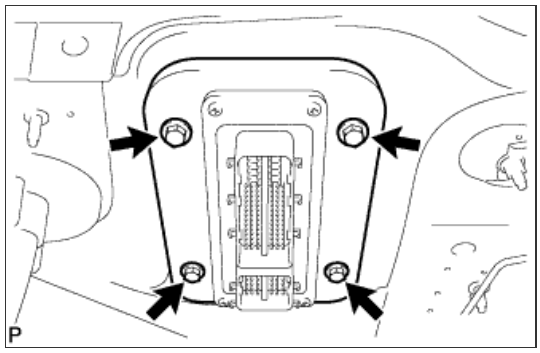
3. REMOVE ECM

a. Raise the 2 levers while pushing the locks on the 2 levers.



Text in Illustration

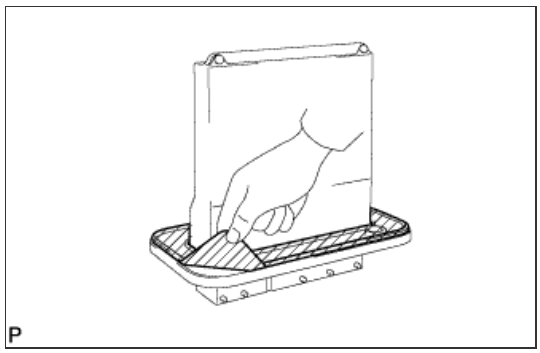
*a	Lock
*b	Push



NOTICE:

Make sure that the lock levers are raised 90° as shown in the illustration before disconnecting the connectors. Failure to do this may cause the connectors to break.

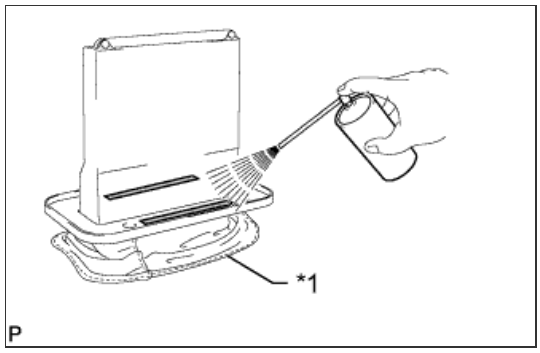
b. Disconnect the 2 connectors.



c. Remove the 4 bolts and ECM.

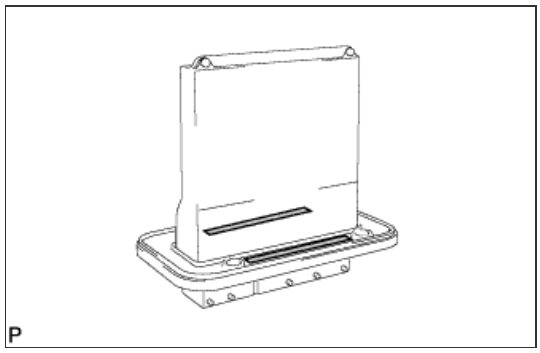
4. REMOVE GASKET

a. Peel off the gasket.



b. Spray gasket remover or e uivalent on the remaining tape of the gasket.

NOTICE:



When using gasket remover or e uivalent, cover the ECM connectors with a cloth.

Text in Illustration

*	Cloth

c. Remove the tape of the gasket without using bladed ob ects.

for Preparation Click here

1. INSTALL GASKET

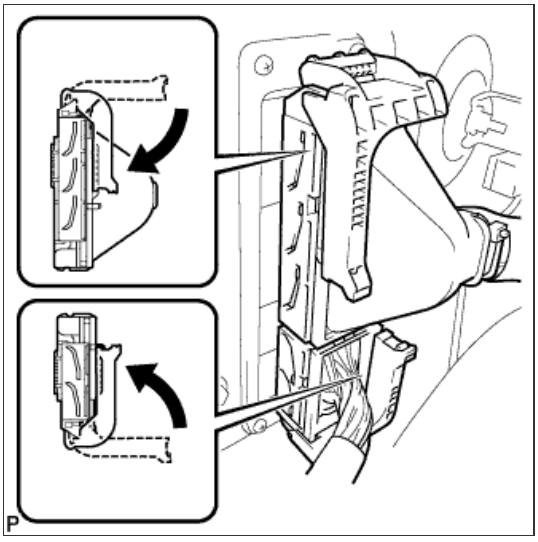
a. Clean the ECM seal surface with non-residue solvent.

b. Attach a new gasket to the ECM.

2. INSTALL ECM

a. Install the ECM with the 4 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



NOTICE:

- **Make sure the gasket is not folded or caught on any area of the surrounding part.**
- **Make sure there is no foreign matter caught between the gasket and surrounding part.**
- **Do not damage the gasket.**

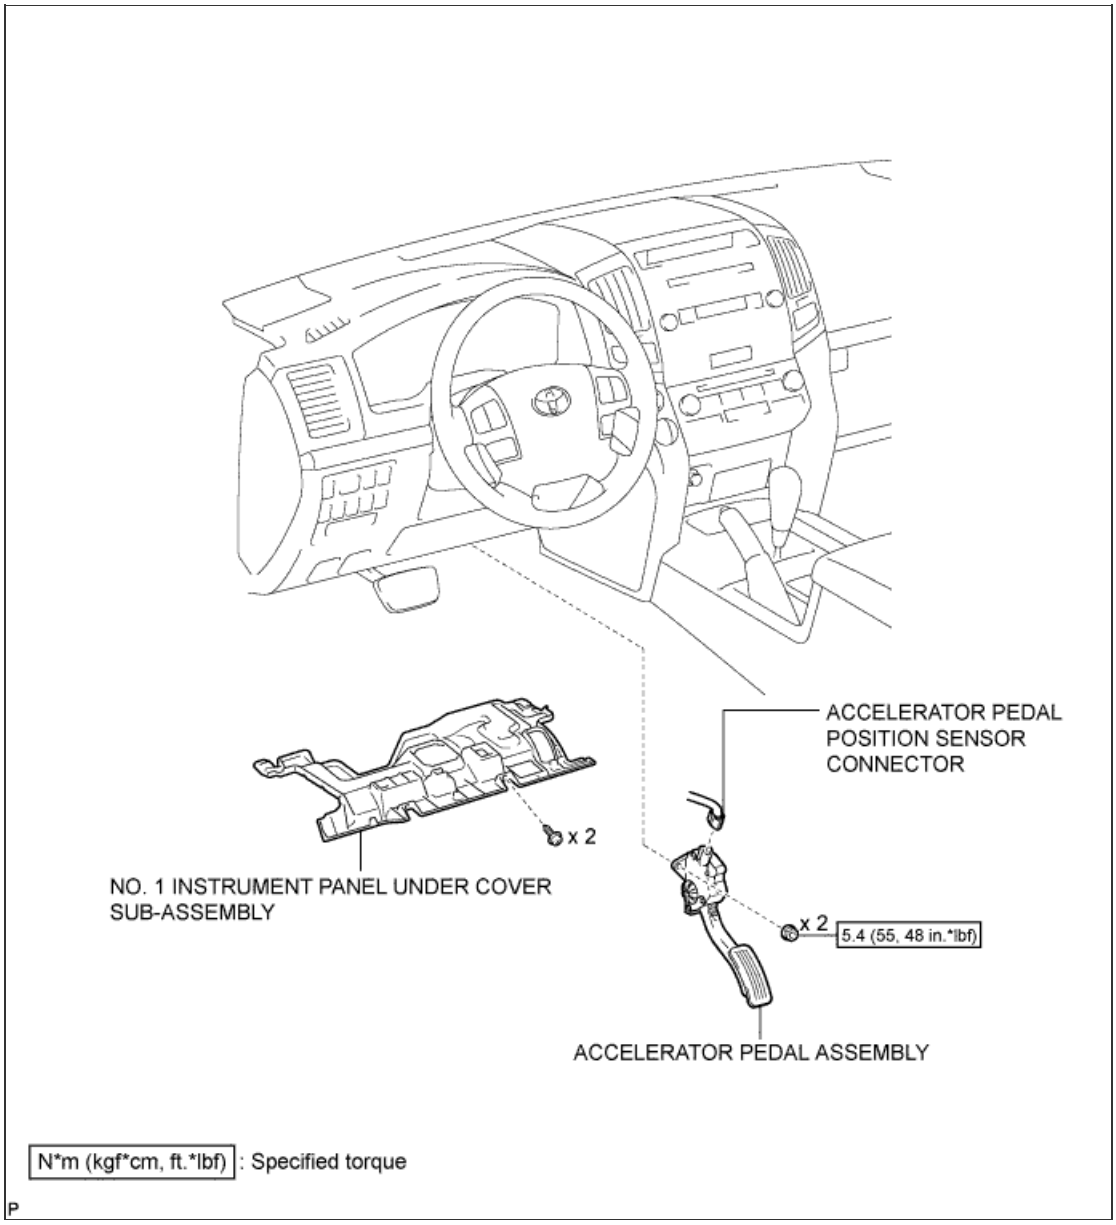
b. Connect the 2 ECM connectors and push each lock lever down to lock the ECM connectors.

NOTICE:

- **Be careful not to allow dirt, water, or other foreign matter to adhere to the connecting parts when connecting the connectors.**
- **Do not twist the wire harness when connecting the ECM connectors.**
- **Make sure that the lock levers are raised 90° before connecting the ECM connectors. Failure to do this may cause the lock lever and terminals to break.**
- **Make sure that the levers are securely locked.**

3. INSTALL CONNECTOR HOLDER BLOCK

a. Install the connector holder block with the 3 bolts.



Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

for Preparation Click here

for Preparation Click here

1. INSPECT ACCELERATOR PEDAL ASSEMBLY

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the intelligent tester main switch on.

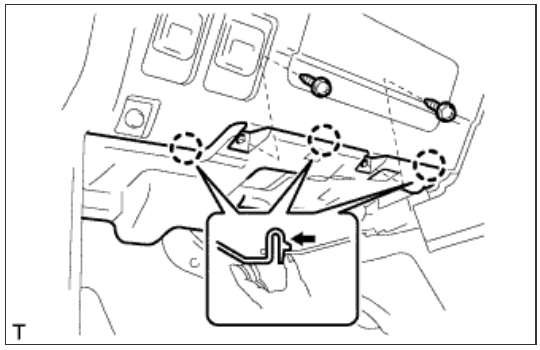
d. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accel Sensor Out No. 1 and Accel Sensor Out No. 2.

e. Read the lue displayed on the intelligent tester.

Standard Voltage:

Accelerator Pedal Operations	Accel Sensor Out No. 1	Accel Sensor Out No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

If the result is not as specified chec the accelerator pedal wire harness and EC .

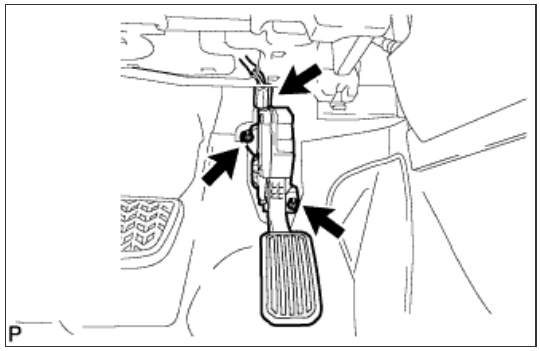


for Preparation Click here

1. REMOVE NO. 1 INSTRUMENT PANEL UNDER COVER SUB ASSEMBLY

a. Remove the 2 screws.

b. Detach the 3 claws.



c. Disconnect the connectors and remove the No. 1 instrument panel under cover.

2. REMOVE ACCELERATOR PEDAL ASSEMBLY

a. Disconnect the accelerator pedal position sensor connector.

b. Remove the 2 nuts and accelerator pedal.

for Preparation Click here

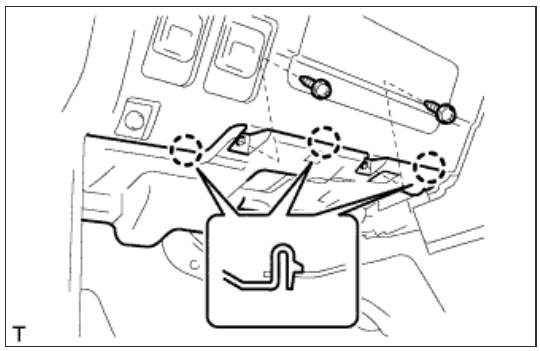
1. INSTALL ACCELERATOR PEDAL ASSEMBLY

NOTICE:

- **Avoid physical shocks to the accelerator pedal.**
- **Do not disassemble the accelerator pedal.**

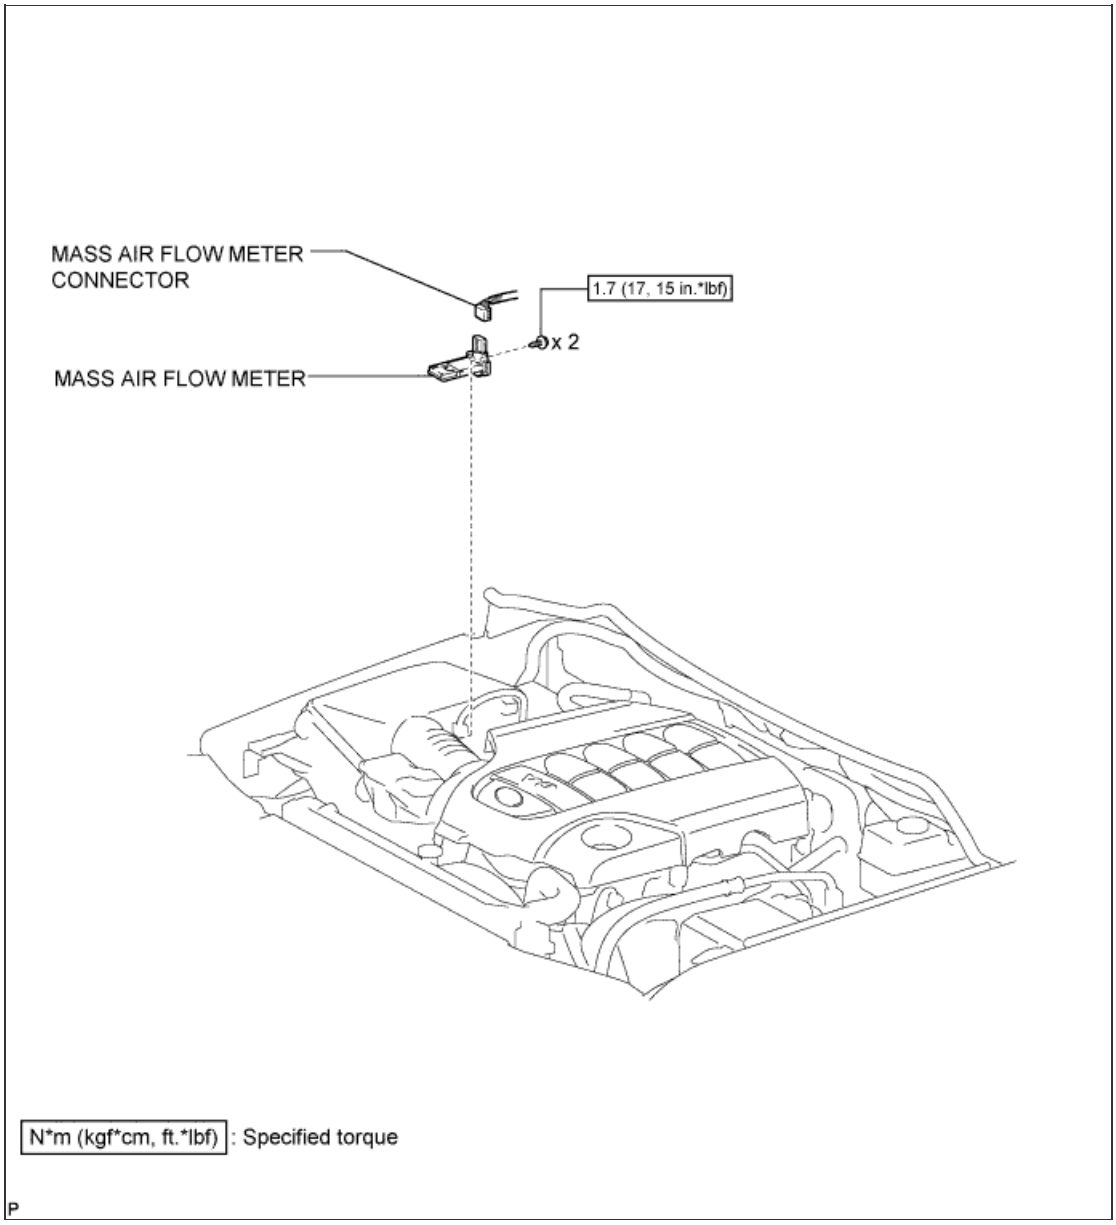
a. Install the accelerator pedal with the 2 nuts.

Torque:
5.4 N*m{ 55 kgf*cm , 48 in.*lbf }



b. Connect the accelerator pedal position sensor connector.

2. INSTALL NO. 1 INSTRUMENT PANEL UNDER CO B SUB-ASSEMBLY



a. Connect the connectors.

b. Attach the 3 claws to install the o. instrument panel under cover.

c. Install the 2 screws.

for Preparation Click here

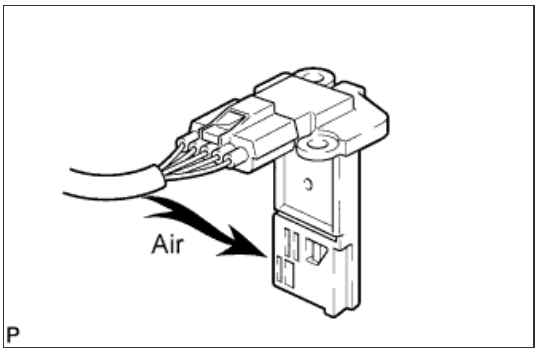
1. CHECK MASS AIR FLOW METER

a. Check the mass air flow value.



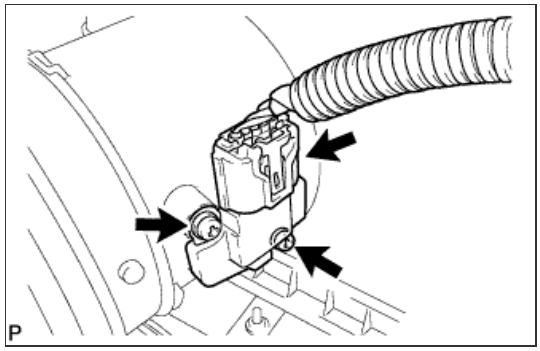
i. Connect the intelligent tester to the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester main switch on.

i Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / mass air flow meter.

Blow air into the mass air flow meter, and check that the mass air flow meter value fluctuates.
If the result is not as specified, check the mass air flow meter (Click here), or wiring and ECM (Click here).

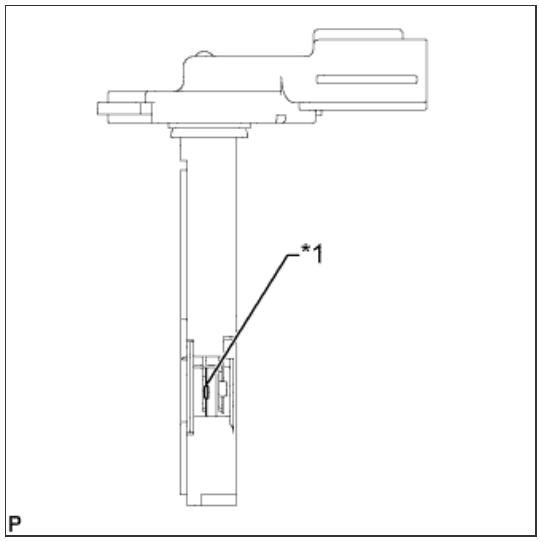


for Preparation Click here

1. REMOVE MASS AIR FLOW METER

a. Disconnect the mass air flow meter connector.

b. Remove the 2 screws and mass air flow meter.

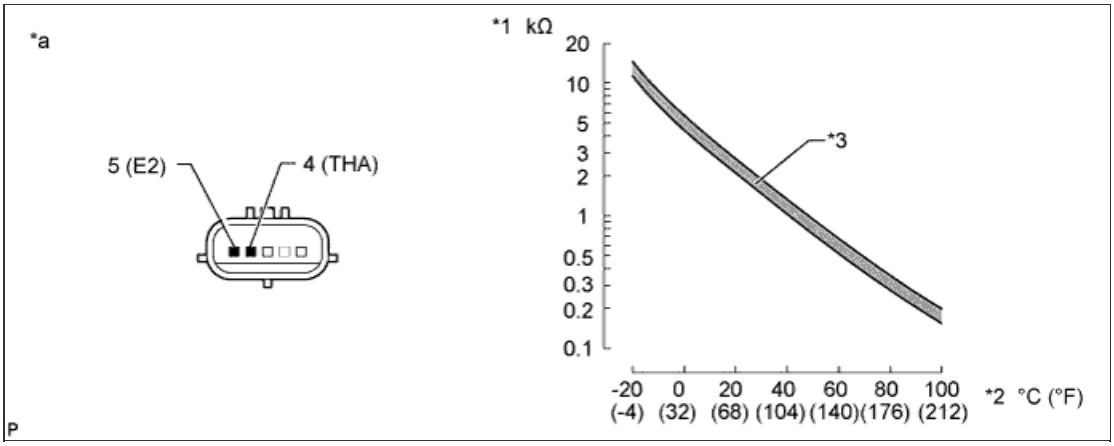


for Preparation Click here

1. INSPECT MASS AIR FLOW METER

a. Perform a visual check for any foreign matter on the platinum hot wire (heater) of the mass air flow meter shown in the illustration.

OK:
There is no foreign matter.



Text in Illustration

*1	Platinum Hot Wire (Heater)

If the result is not as specified, replace the mass air flow meter.

b. Check the intake air temperature sensor.

Text in Illustration

*1	Resistance kΩ	*2	Temperature °C (°F)
*3	Acceptable Range	-	-
*a	Component without harness connected (Mass air flow meter)	-	-

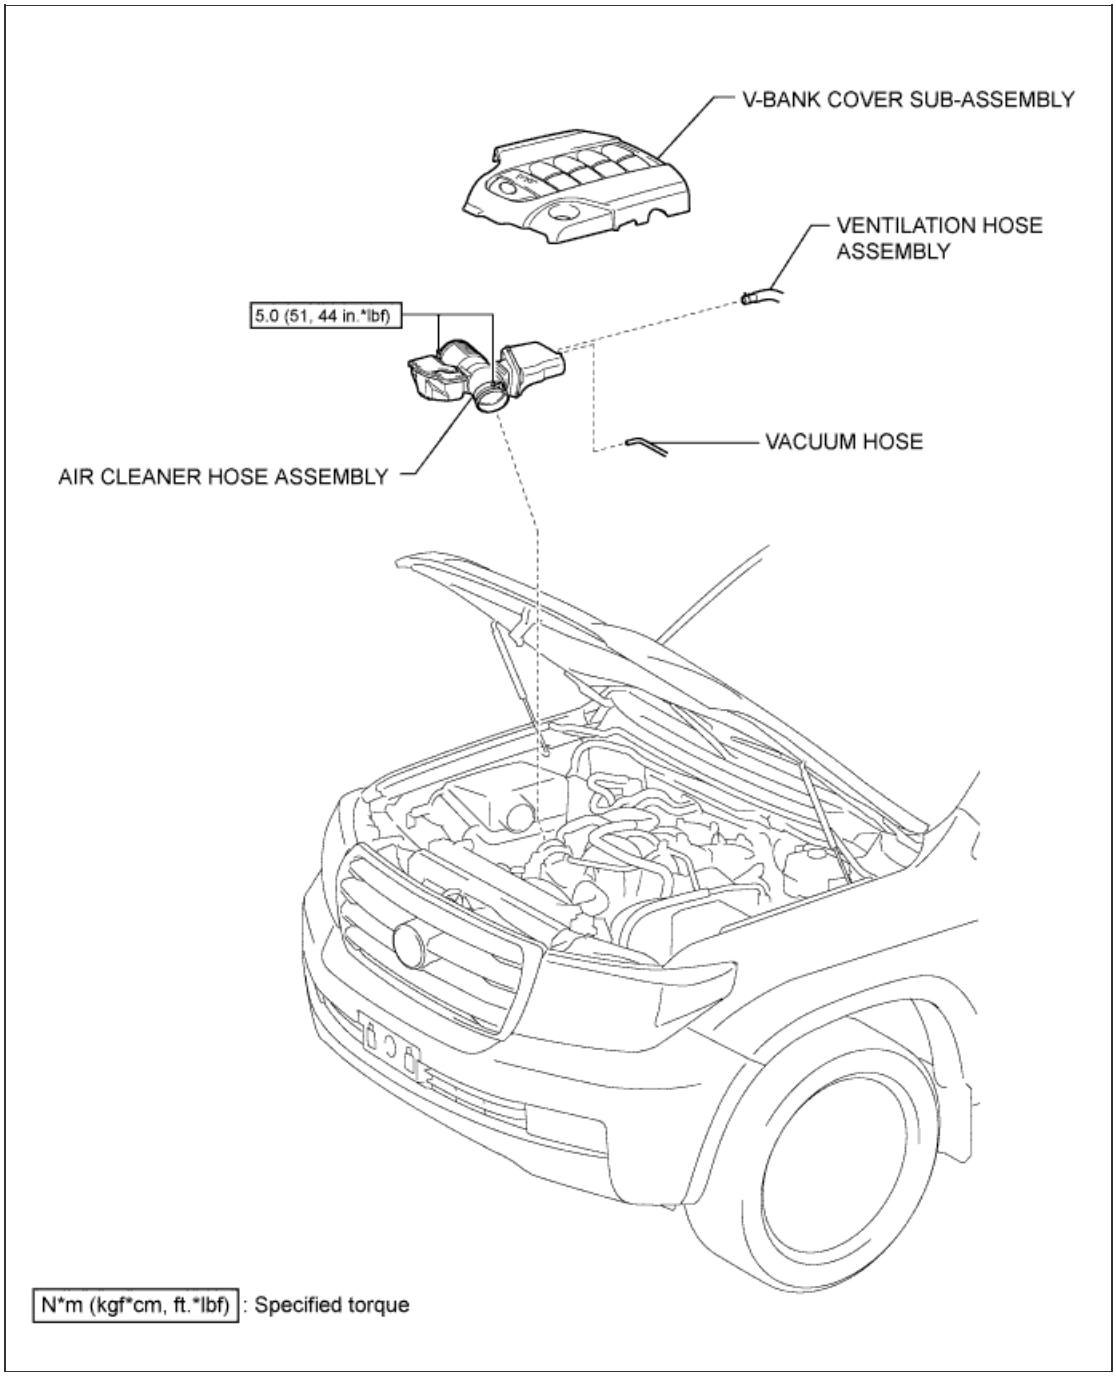
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

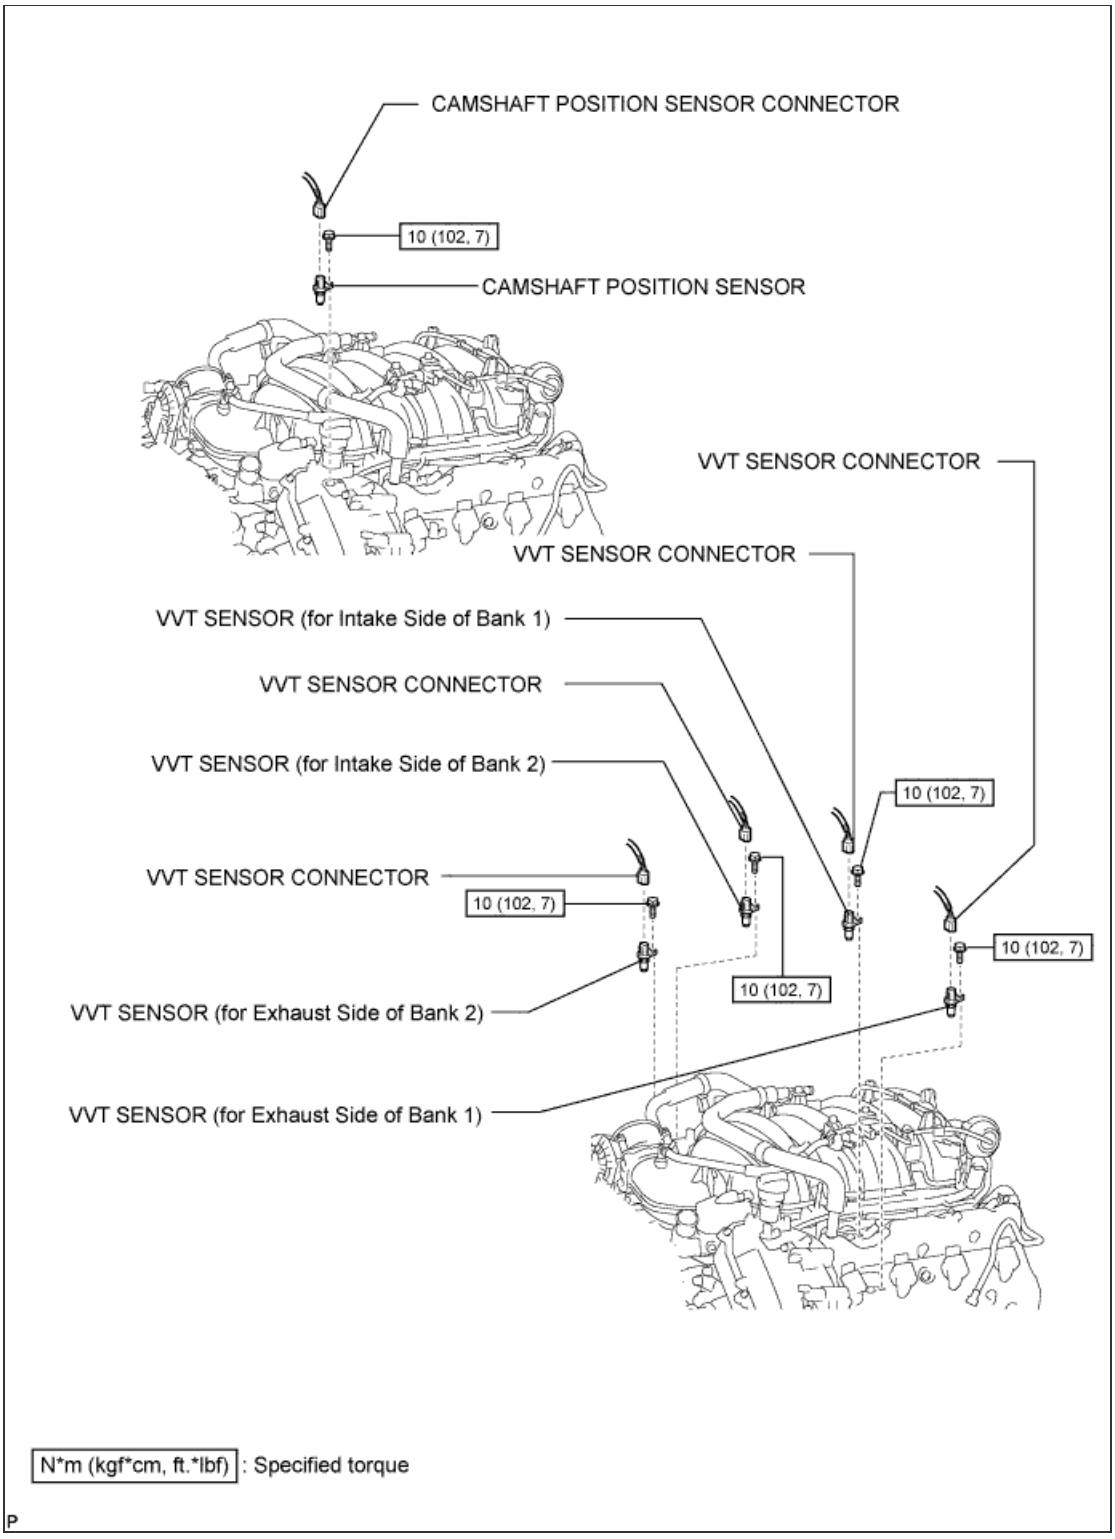
Tester Connection	Condition	Specified Condition
4 (THA) - 5 (E2)	-20°C (-4°F)	12.5 to 16.9 kΩ
	20°C (68°F)	2.19 to 2.67 kΩ
	60°C (140°F)	0.50 to 0.68 kΩ

If the result is not as specified, replace the mass air flow meter.

for Preparation Click here



1. INSTALL MASS AIR FLOW METER



a. Install the mass air flow meter with the 2 screws.

Torque:
1.7 N*m{ 17 kgf*cm , 15 in.*lbf }

b. Connect the mass air flow meter connector.

*4	Grommet

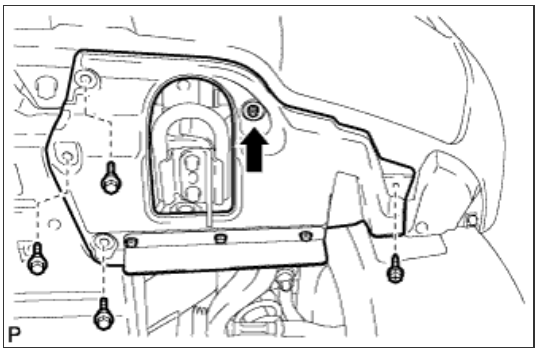
5. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



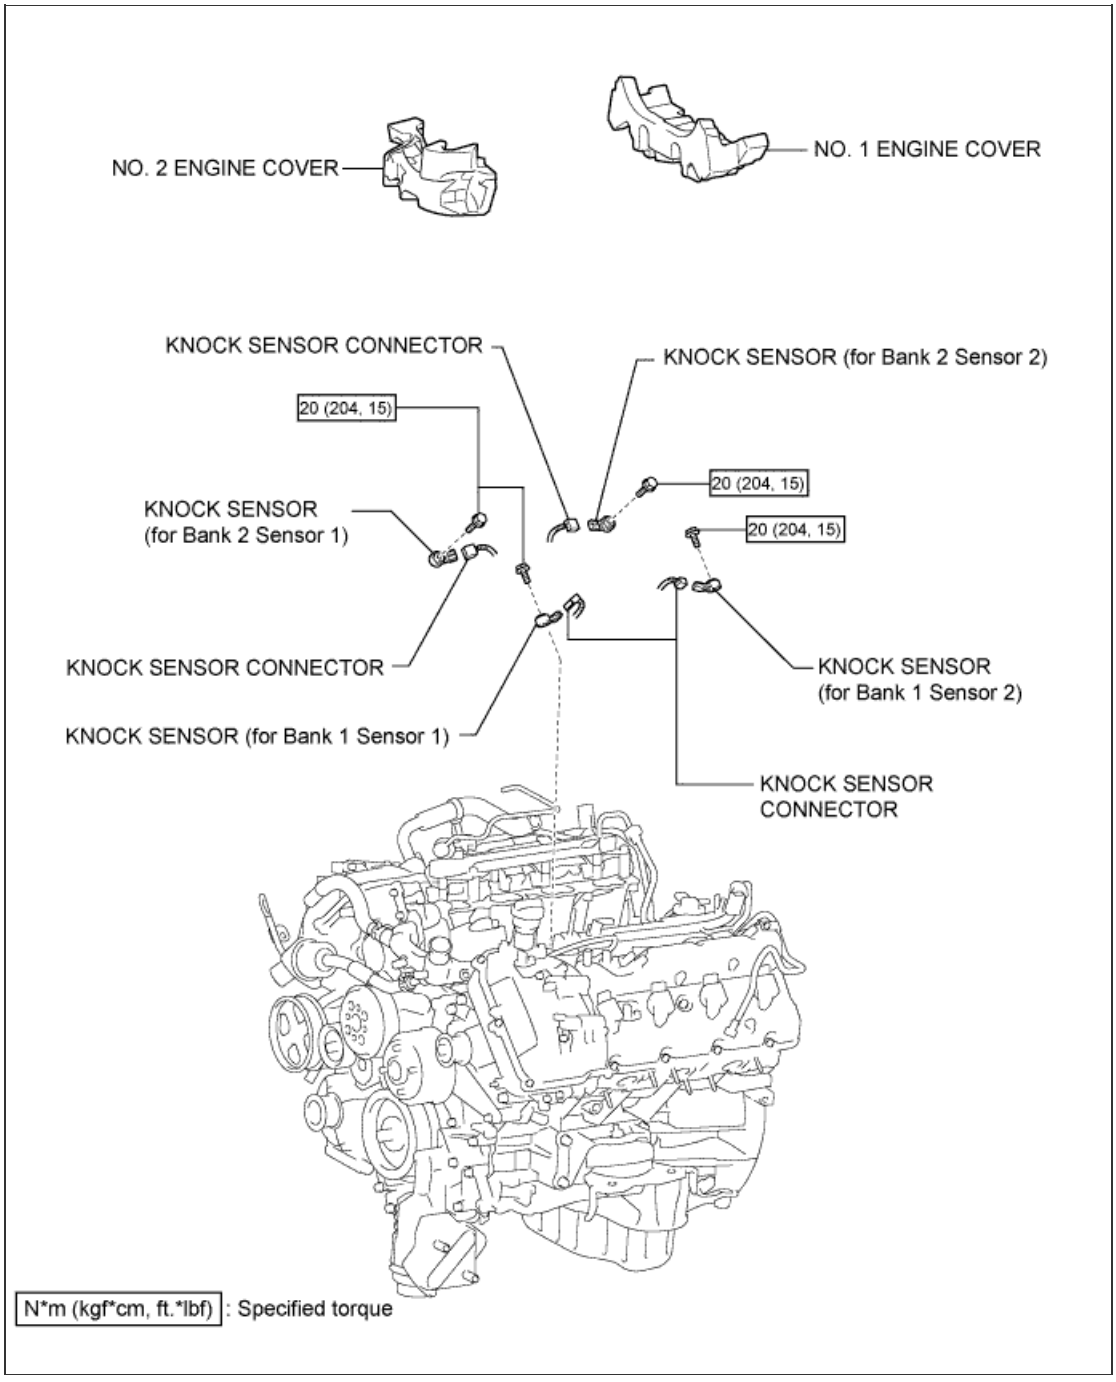
a. Install the No. 1 engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

6. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

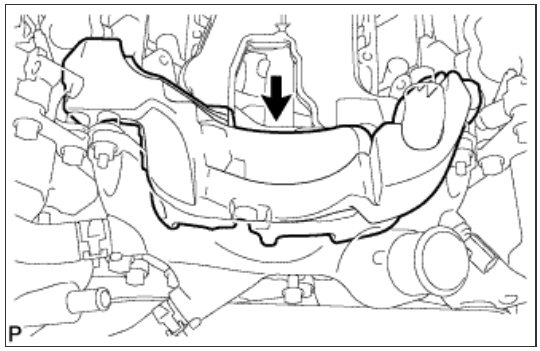


. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

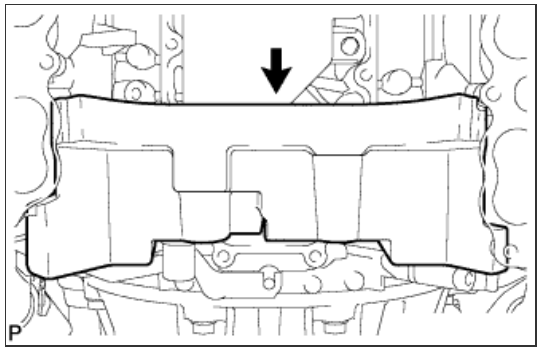
HINT:

Use the same procedures described for the LH side.

for Preparation Click here



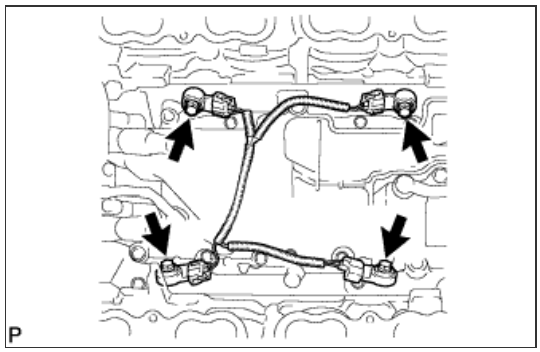
for Preparation Click here



1. REMOVE INTAKE MANIFOLD

(Click here)

2. REMOVE NO. 2 ENGINE COVER



3. REMOVE NO. 1 ENGINE COVER

4. REMOVE KNOCK SENSOR

a. Disconnect the 4 knock sensor connectors.

b. Remove the 4 bolts and 4 knock sensors.

for Preparation Click here

1. INSPECT KNOCK SENSOR

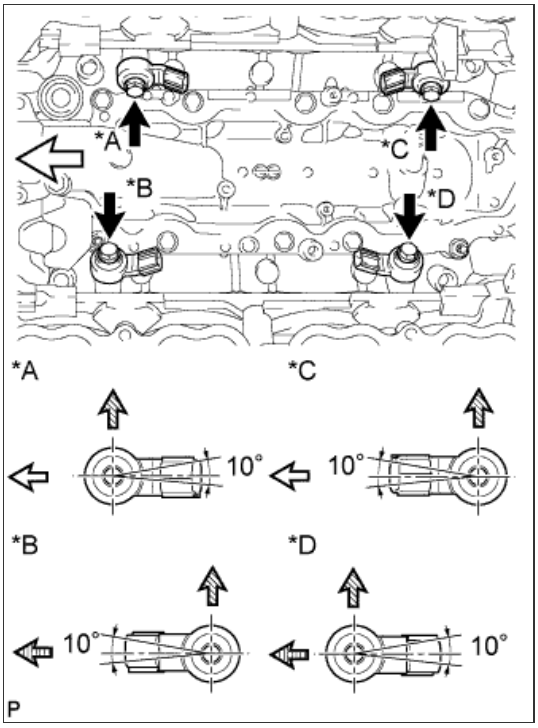
a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	120 to 280 kΩ

If the result is not as specified, replace the sensor.

for Preparation Click here



1. INSTALL KNOCK SENSOR

a. Install the 4 sensors with the 4 bolts so that the sensors are angled as shown in the illustration.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

NOTICE:

The acceptable installation angle of the sensor is between 10° upward and downward from the horizontal position.

	ulcrum Length

HINT:

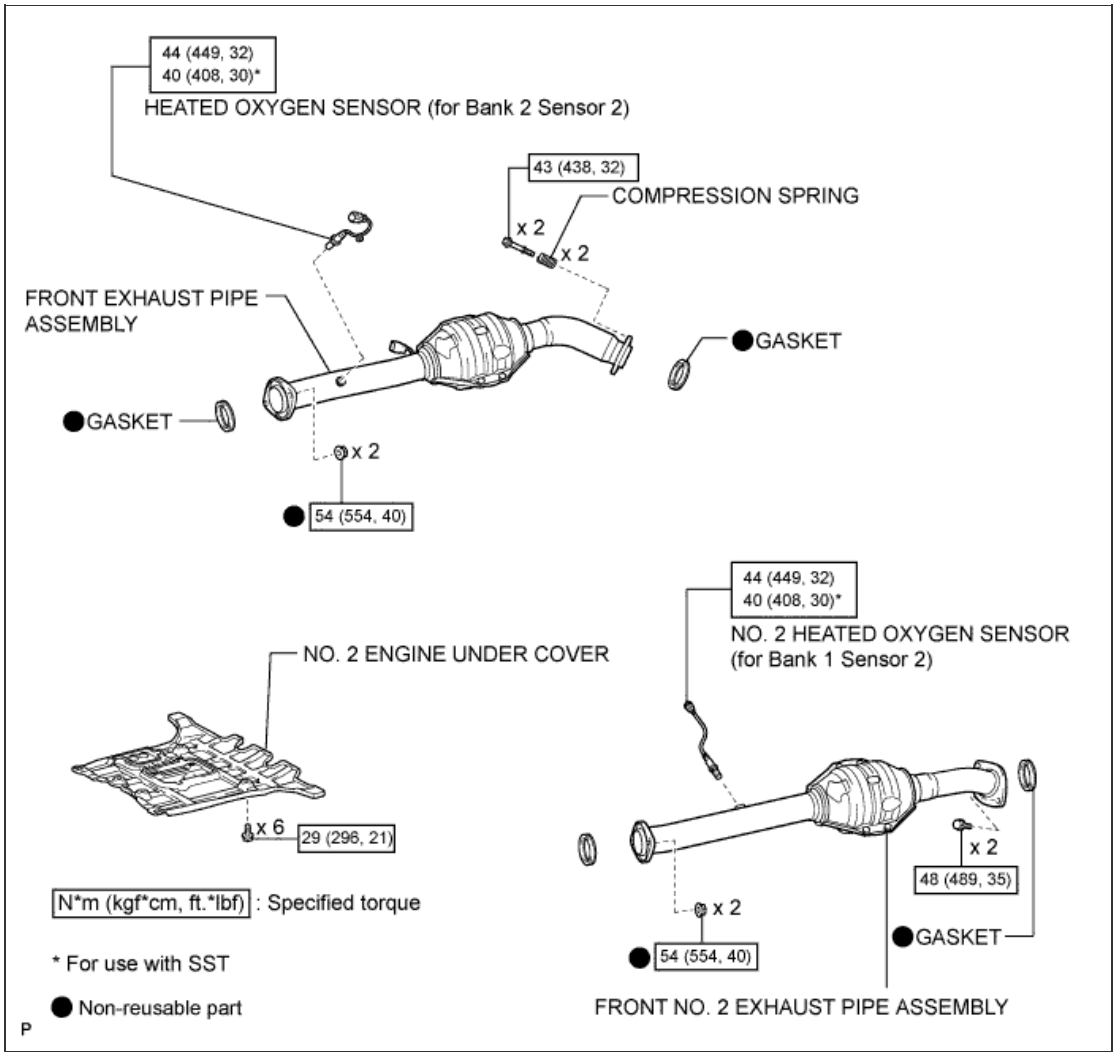
- **Use a torque wrench with a fulcrum length of 300 mm (11.8 in.).**

If using a torque wrench with a length that is not 300 mm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the without SST torque specification (Click here).

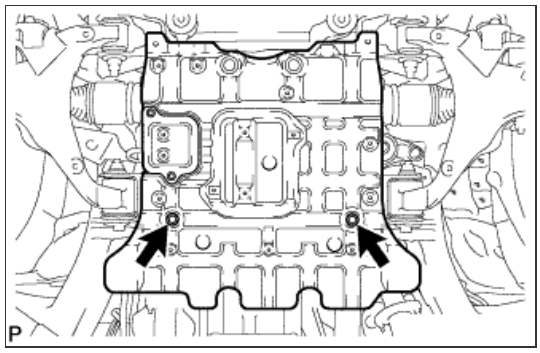


- ake sure SST and the wrench are connected in a straight line.

3. INSTALL E AUST ANIFOL SUB-ASSE BLY

(Click here)

for Preparation Click here



for Preparation Click here

CAUTION:

- **The procedures should be performed by at least 2 people.**
- **Wear protective gloves when removing the exhaust pipe.**
- **The exhaust pipe is extremely hot immediately after the engine has stopped.**
- **Confirm that the exhaust pipe has cooled down before removing it.**

1. REMOVE NO. 2 ENGINE UNDER COVER

a. Remove the 2 bolts and No. 2 engine under cover.

2. REMOVE FRONT NO. 2 EXHAUST PIPE ASSEMBLY

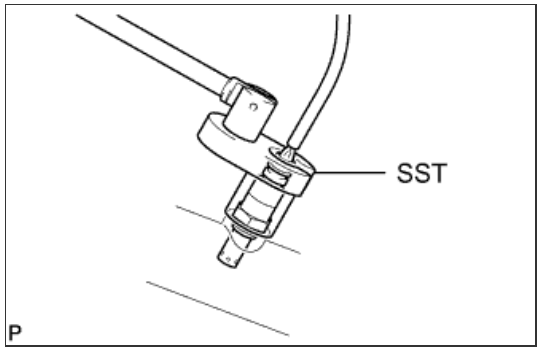
a. Disconnect the heated o gen sensor connector.

b. Remove the bolt and disconnect the wire harness clamp brac et of the o gen sensor from the transmission.

c. Remove the 2 nuts, front No. 2 e haust pipe and gas et from the e haust manifold LH.

3. REMOVE FRONT EXHAUST PIPE ASSEMBLY

a. Disconnect the heated o gen sensor connector.



b. Remove the bolt and disconnect the wire harness clamp brac et of the o gen sensor from the transmission.

c. Remove the 2 nuts, front e haust pipe and gas et from the e haust manifold RH.

4. REMOVE HEATED OXYGEN SENSOR (for Bank 2 Sensor 2)

a. sing remove the sensor.

SST
09224-00010

. REMOVE NO. 2 HEATED OXYGEN SENSOR (for Bank Sensor 2)

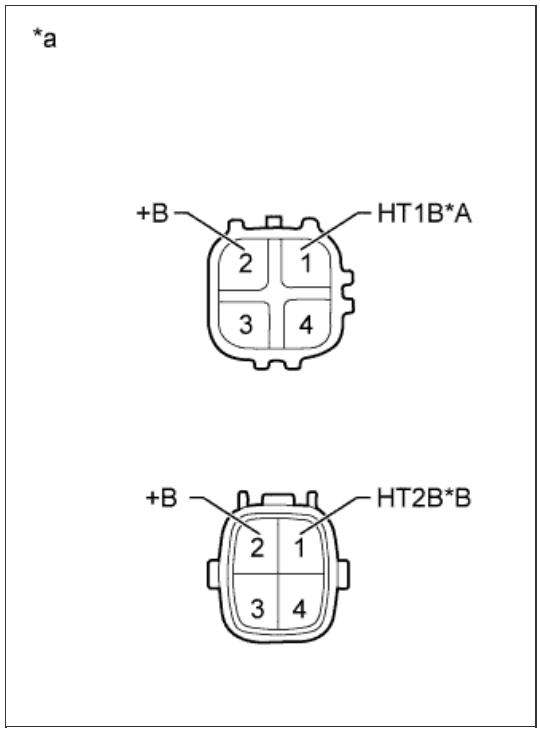
a. sing remove the sensor.

SST
224-

for Preparation Click here

1. INSPECT HEATED OXYGEN SENSOR

a. Measure the heater resistance according to the value(s) in the table below.

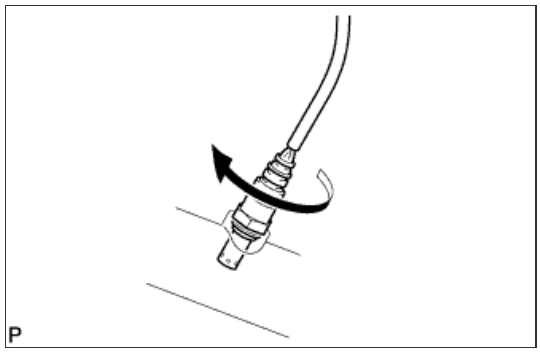


Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B) (for Bank 1)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 2 (+B) (for Bank 2)		

Te t in Ill stration

*A	for Bank 1
*B	for Bank 2
*a	Co ponent without harness connected (Heated Oxygen Sensor)



If the result is not as specified, replace the sensor.

	ulcrum Length

HINT:

- **Use a torque wrench with a fulcrum length of 300 mm (11.8 in.).**

If using a torque wrench with a length that is not 300 mm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).

- **Make sure SST and the wrench are connected in a straight line.**

3. INSTALL FRONT EXHAUST PIPE ASSEMBLY

a. Install a new gasket and the front exhaust pipe to the exhaust manifold RH with 2 new nuts.

Torque:
54 N*m{ 551 kgf*cm , 40 ft.*lbf }

b. Install the wire harness clamp bracket of the oxygen sensor to the transmission with the bolt.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

c. Connect the heated oxygen sensor connector.

4. INSTALL FRONT NO. 2 EXHAUST PIPE ASSEMBLY

a. Install a new gasket and the front No. 2 exhaust pipe to the exhaust manifold LH with 2 new nuts.

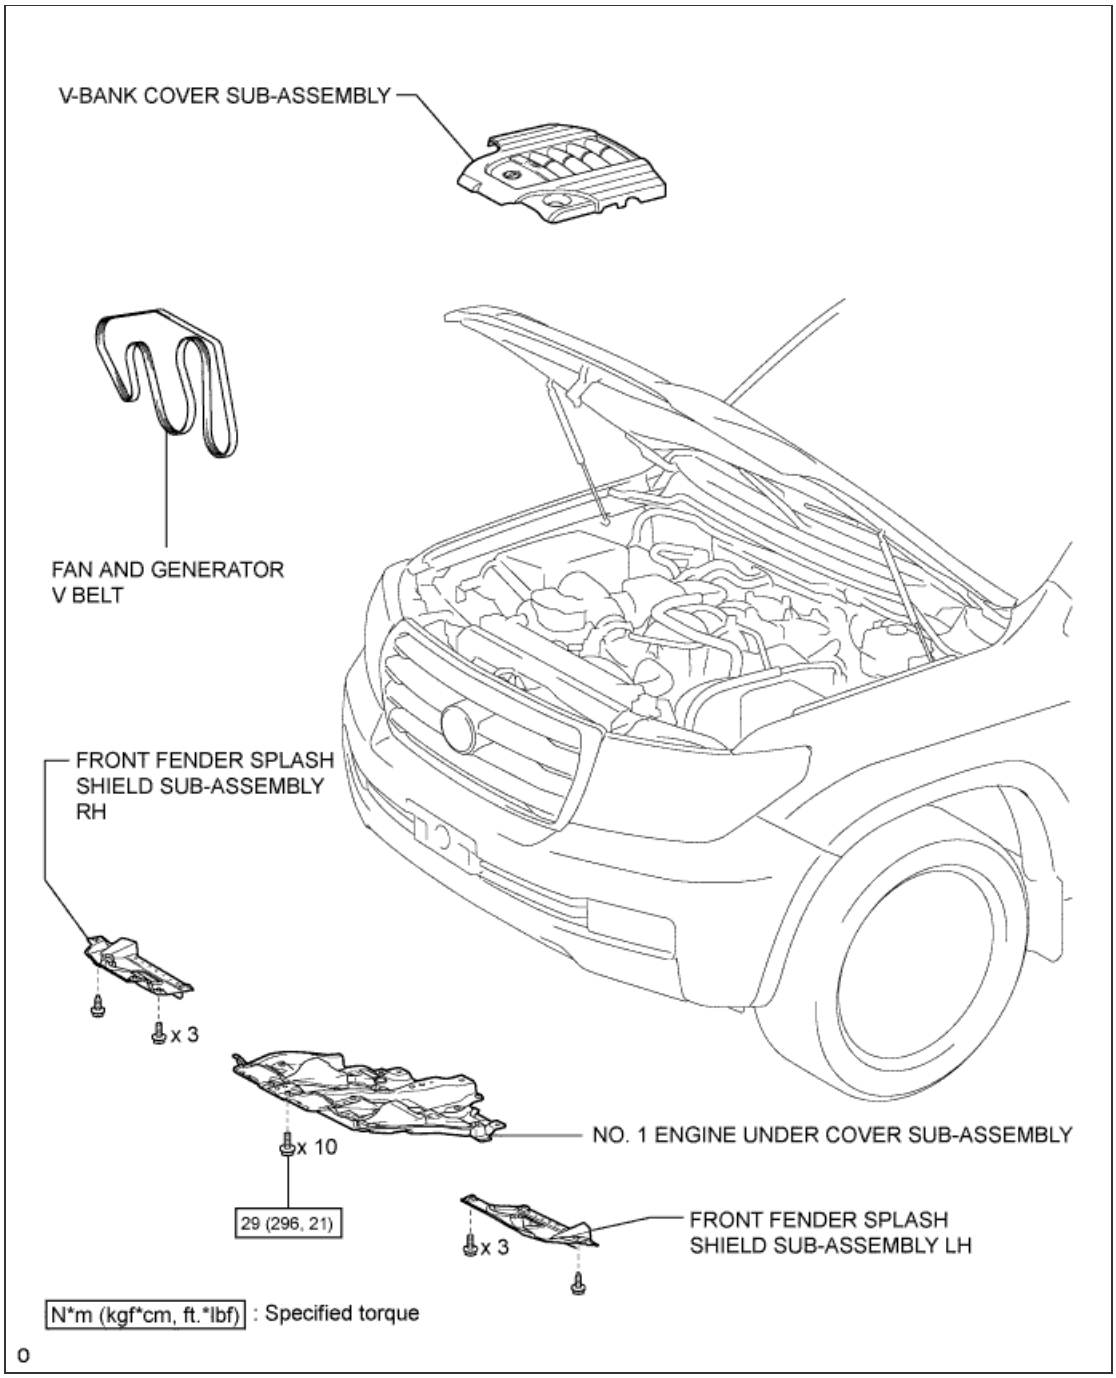
Torque:
54 N*m{ 551 kgf*cm , 40 ft.*lbf }

b. Install the wire harness clamp bracket of the oxygen sensor to the transmission with the bolt.

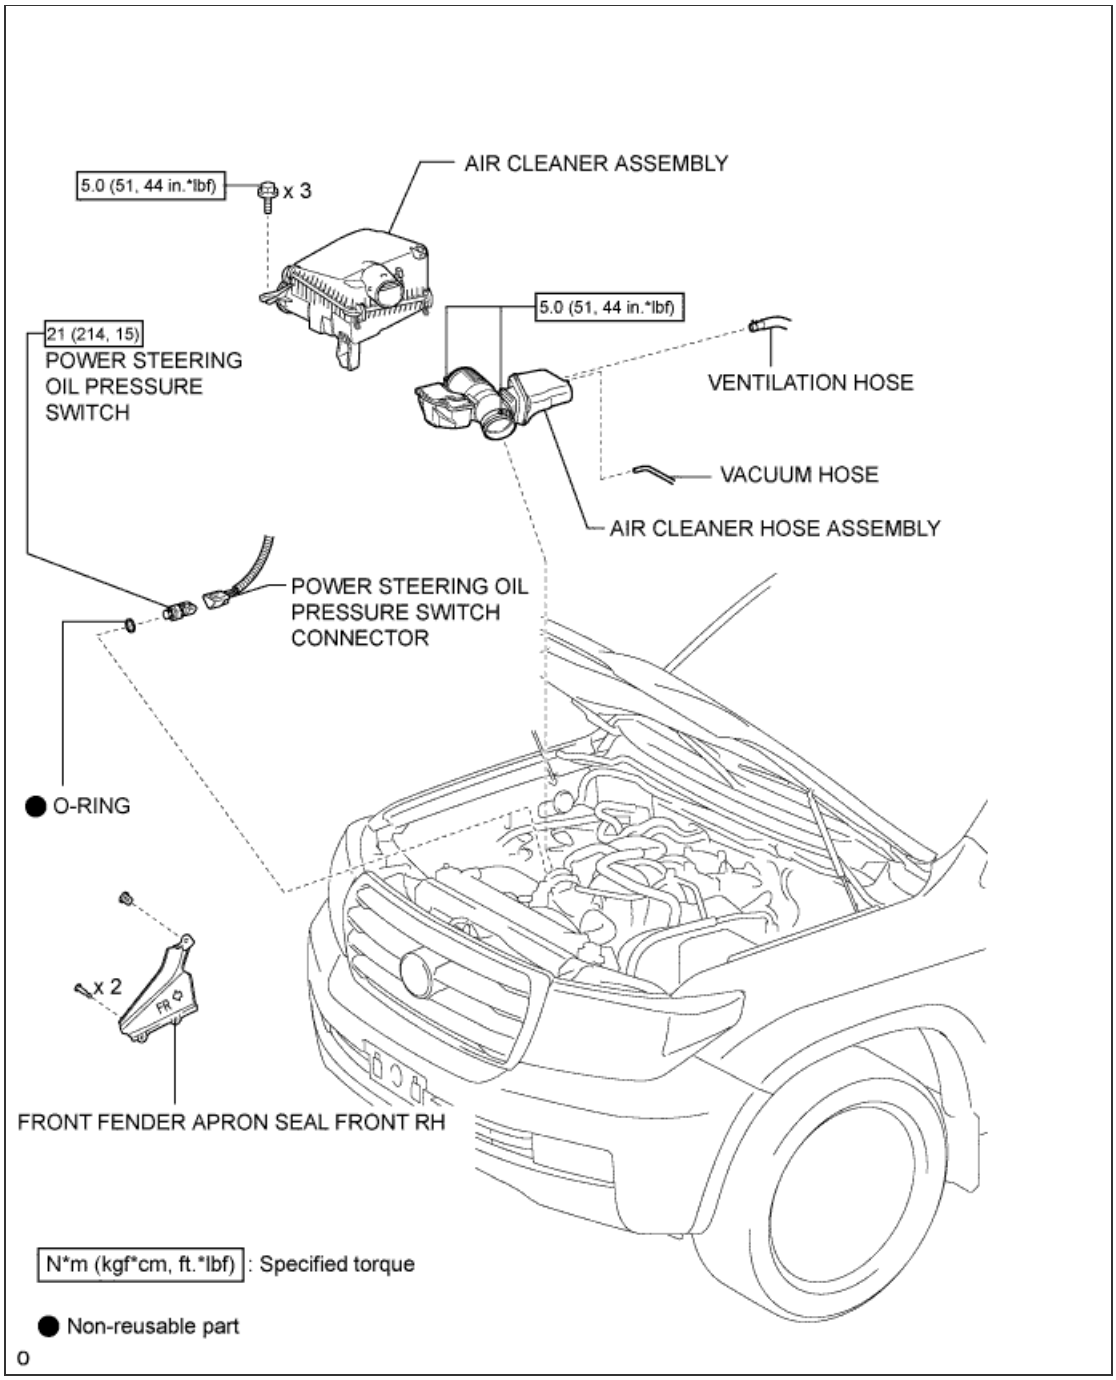
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

c. Connect the heated oxygen sensor connector.

5. INSPECT FOR EXHAUST GAS LEAK



If gas is leaking, tighten the areas necessary to stop the leak. Replace damaged parts as necessary.



6. INSTALL NO. 2 ENGINE UNDER COVER

a. Install the No. 2 engine under co er with the 2 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

for Preparation Click here

for Preparation Click here

1. INSPECT POWER STEERING OIL PRESSURE SWITCH

a. Check the oil pressure switch.

i. Connect the intelligent tester to the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester main switch on.

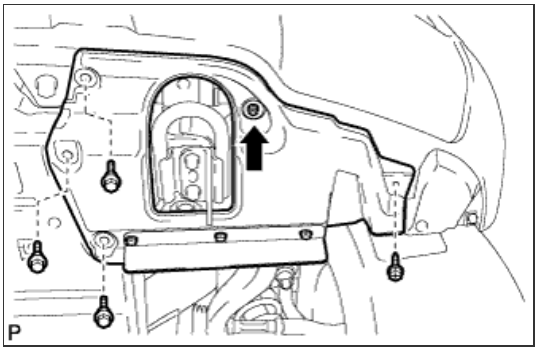
iv. Enter the following menus Powertrain / Engine and ECT / Data List / All Data / Power Steering pressure.

v. Start the engine.

vi. ead the value displa ed on the intelligent tester.

OK:

Condition	Specified Condition
Power steering operating	ON
Power steering not operating	OFF



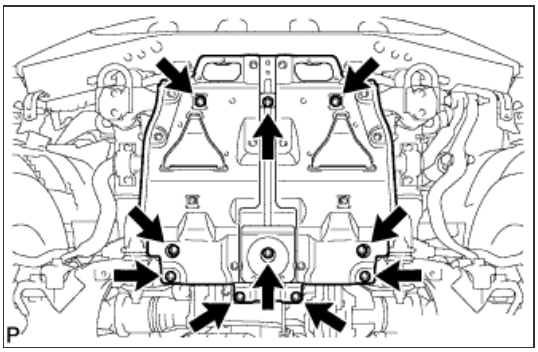
If the result is not as specified, check the wire harness and connector. If the wire harness and connector are normal, replace the power steering oil pressure switch.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



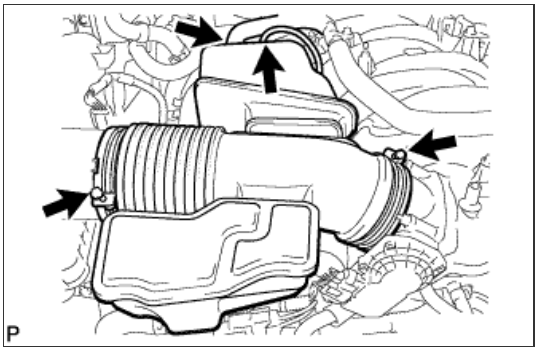
2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

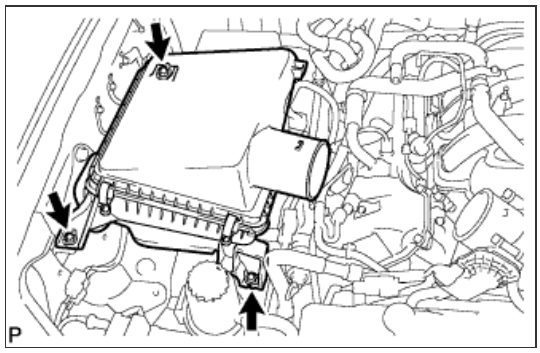
3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.



4. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum hose and No. 2 ventilation hose.

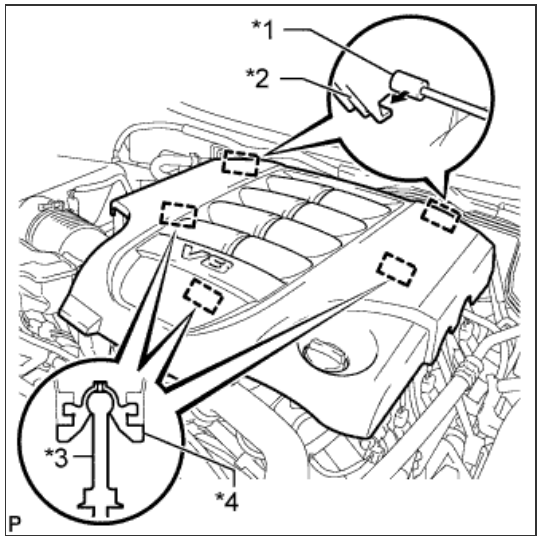


b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

5. REMOVE AIR CLEANER ASSEMBLY

a. Remove the 3 bolts and air cleaner.



6. REMOVE V-BANK COVER SUB-ASSEMBLY

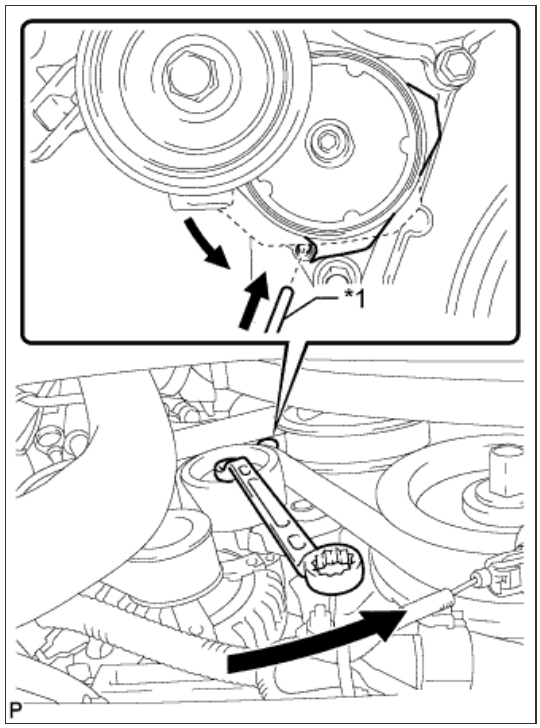
a. Raise the front of the V-bank cover to detach the 3 pins. Then remove the 2 V-bank cover hooks from the bracket, and remove the V-bank cover.

Text in Illustration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

7. REMOVE FAN AND GENERATOR V BELT

a. hile turning the belt tensioner counterclockwise, align the service hole for the belt tensioner and the belt tensioner fixing position, and then insert a bar of 5 mm 0.1 in.) into the service hole to fix the belt tensioner in place.



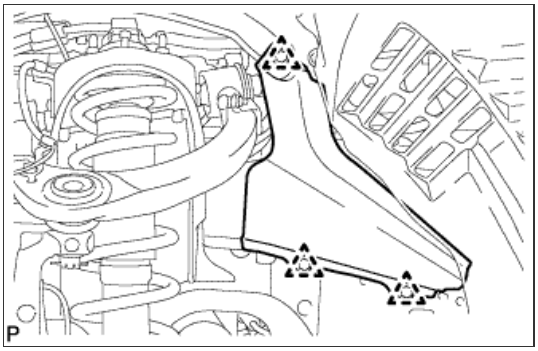
Text in Illustration

*1	Bar

HINT:

The pulley bolt for the belt tensioner has a left-hand thread.

b. Remove the V belt.

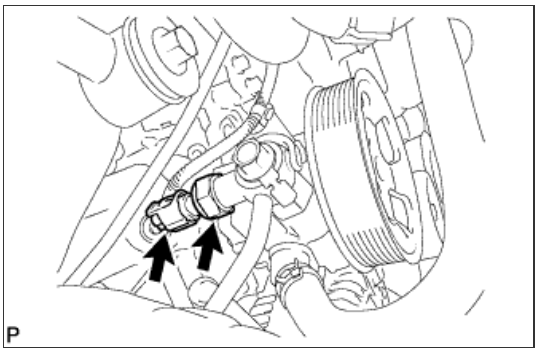


8. DRAIN POWER STEERING FLUID

9. REMOVE FRONT WHEEL

1 . REMOVE FRONT FENDER APRON SEAL FRONT RH

a. Using a clip remover, remove the 3 clips and fender apron seal.



11. REMOVE POWER STEERING OIL PRESSURE SWITCH

a. Disconnect the switch connector.

b. Using a 24 mm deep socket wrench, remove the oil pressure switch.

c. Remove the O-ring.

for Preparation Click here

1. INSTALL POWER STEERING OIL PRESSURE SWITCH

a. Install a new O-ring to the oil pressure switch.

b. Apply a light coat of engine oil to the O-ring of the oil pressure switch.

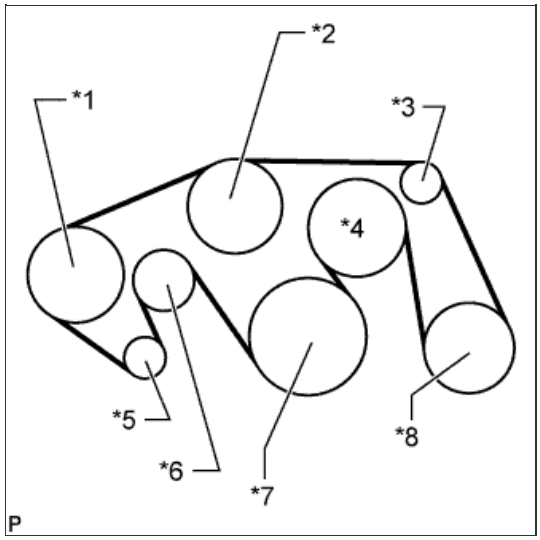
NOTICE:

- **When reusing the oil pressure switch, inspect the O-ring.**
- **If the O-ring has scratches or cuts, replace the new O-ring.**

c. Using a 24 mm deep socket wrench, install the oil pressure switch.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

d. Connect the oil pressure switch connector.



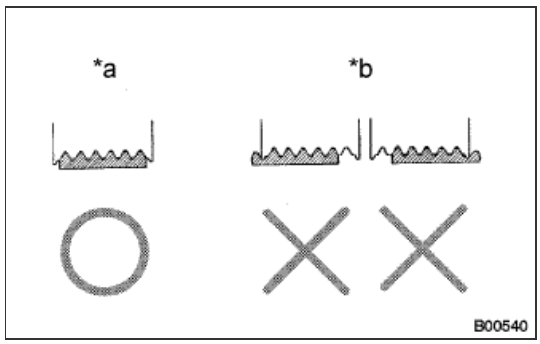
2. INSTALL FAN AND GENERATOR V BELT

a. Set the V belt onto every part.

b. While turning the belt tensioner counterclockwise, remove the bar.

Text in Illustration

*1	Vane Pump
*2	Water Pump
*3	No. 1 Idler
*4	Fan
*5	Generator
*6	Belt Tensioner
*7	Crankshaft
*8	Cooler Compressor



NOTICE:

Make sure that the V belt is properly set to each pulley.

c. After installing the belt, check that it fits properly in the ribbed grooves.

Text in Illustration

*a	CORRECT
*b	INCORRECT

HINT:

Make sure to check by hand that the belt has not slipped out of the grooves on the bottom of the pulley.

3. INSTALL AIR CLEANER ASSEMBLY

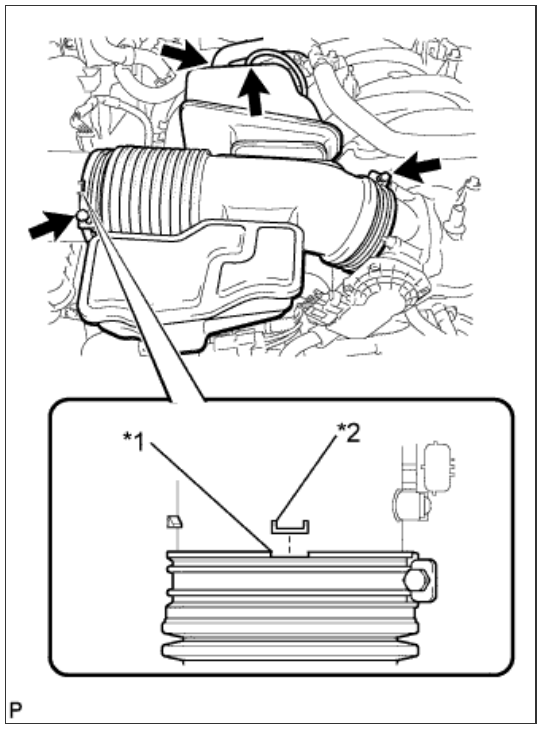
a. Install the air cleaner with the 3 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

4. INSTALL AIR CLEANER HOSE ASSEMBLY

a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

Text in Illustration



*1	Groove
*2	Protrusion

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum hose.

d. Connect the No. 2 ventilation hose.

5. ADD POWER STEERING FLUID

6. BLEED POWER STEERING FLUID

a. Check the fluid level.

b. Jack up the front of the vehicle and support it with stands.

c. Turn the steering wheel.

i. With the engine stopped, turn the wheel slowly from lock to lock several times.

d. Lower the vehicle.

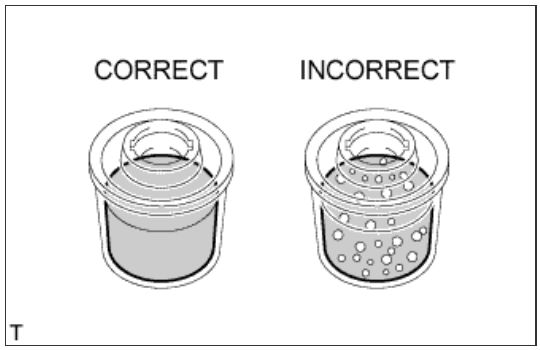
e. Start the engine.

f. Idle the engine for a few minutes.

g. Turn the steering wheel.

i. With the engine idling, turn the wheel left or right to the full lock position and keep it there for 2 to 3 seconds, then turn the wheel to the opposite full lock position and keep it there for 2 to 3 seconds. *1

ii. Repeat *1 several times.



NOTICE:

For vehicles with VGRS, if the steering wheel is turned from lock to lock repeatedly, the system may stop operating and the amount of rotation before the steering wheel locks may increase due to operation of the overheating prevention function. When the system temperature drops, the system operation automatically returns to normal.

h. Stop the engine.

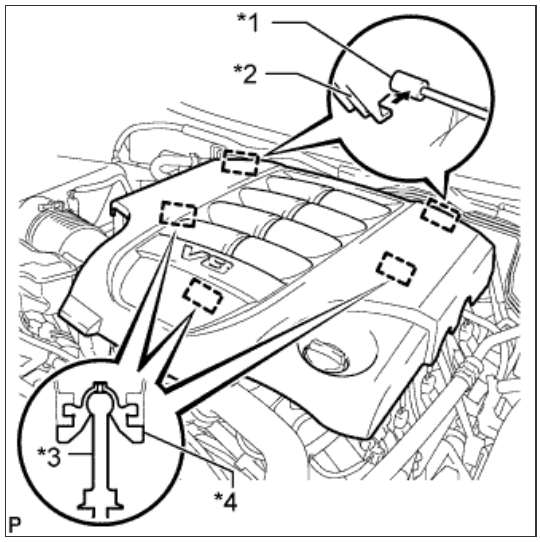
i. Check for foaming or emulsification.
If the system has to be bled twice because of foaming or emulsification, check for fluid leaks in the system.

j. Check the fluid level.

7. INSPECT FOR POWER STEERING FLUID LEAK

8. INSTALL FRONT FENDER APRON SEAL FRONT RH

a. Install the fender apron seal with the 3 clips.



9. INSTALL FRONT WHEEL

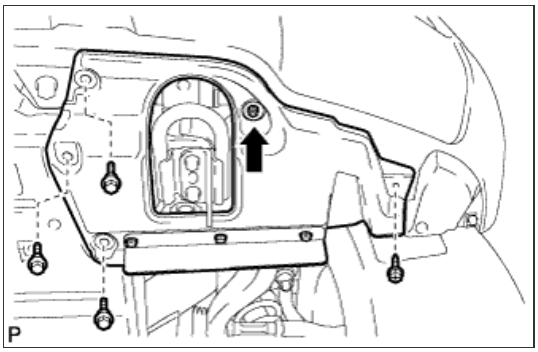
10. INSTALL V-BANK COVER SUB-ASSEMBLY

a. Attach the 2 V-bank cover hooks to the bracket. Then align the 3 V-bank cover grommets with the 3 pins, and press down on the V-bank cover to attach the pins.

Text in Illustration

*1	Bracket
*2	Hook
*3	Pin
*4	Grommet

11. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the No. 1 engine under cover with the 10 bolts.

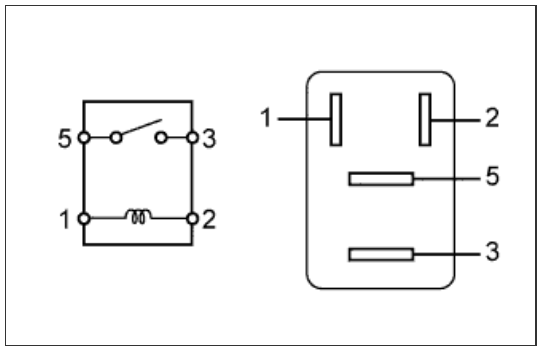
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

12. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

13. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

for Preparation Click here

1. INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage is not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage is applied to terminals 1 and 2	Below 1 Ω

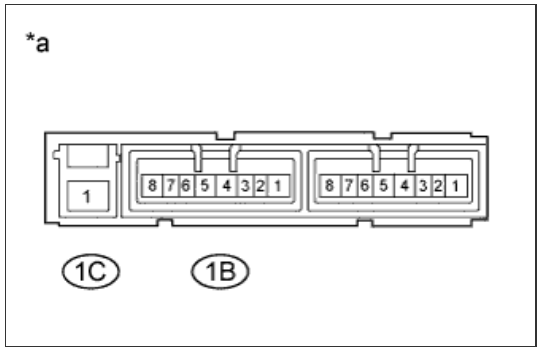
If the result is not as specified, replace the relay.

2. INSPECT INTEGRATION RELAY (IG2)

a. Measure the resistance of the IG2 MAIN fuse.

i. Remove the IG2 MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
IG2 MAIN fuse	Always	Below 1 Ω

If the result is not as specified, replace the IG2 MAIN fuse.

iii. Install the IG2 MAIN fuse to the integration relay.

b. Measure the resistance of the ignition relay No. 2 (IG2) circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-6	Battery voltage is not applied to terminals 1B-6 and 1B-7	10 kΩ or higher
	Battery voltage is applied to terminals 1B-6 and 1B-7	Below 1 Ω

Text in Illustration

a	Component without harness connected (Integration Relay)

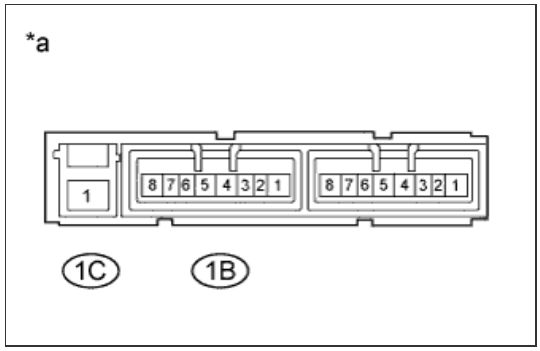
If the result is not as specified, replace the integration relay.

3. INSPECT INTEGRATION RELAY (EFI)

a. Measure the resistance of the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay

ii. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

If the result is not as specified, replace the EFI MAIN fuse.

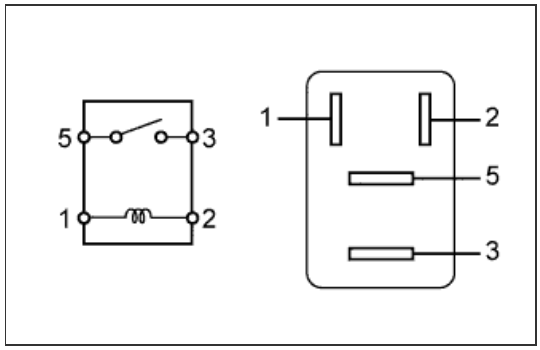
iii. Install the EFI MAIN fuse to the integration relay.

b. Measure the resistance of the EFI relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	Battery voltage is not applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage is applied to terminals 1B-2 and 1B-3	Below 1 Ω



Text in Illustration

a	Component without harness connected (Integration Relay)

If the result is not as specified, replace the integration relay.

4. INSPECT EFI NO. 2 RELAY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage is not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage is applied to terminals 1 and 2	Below 1 Ω

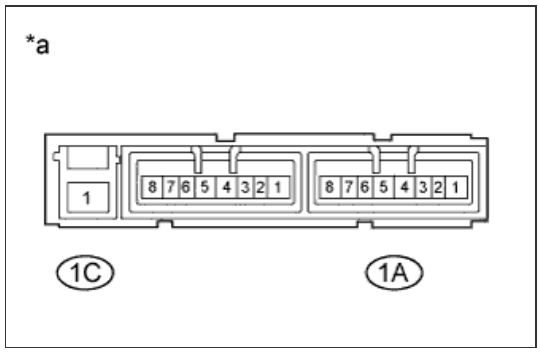
If the result is not as specified, replace the relay.

5. INSPECT INTEGRATION RELAY (A/F)

a. Measure the resistance of the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

If the result is not as specified, replace the A/F fuse.

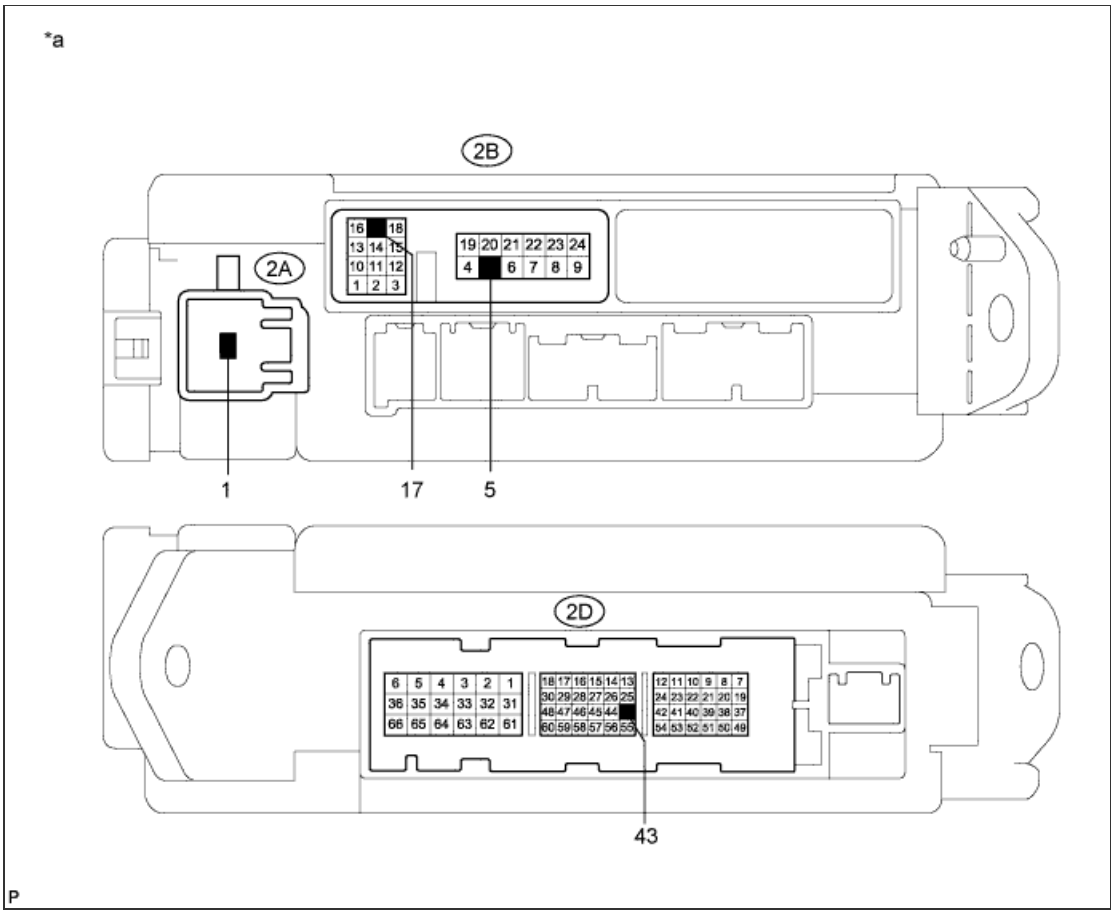
iii. Install the A/F fuse to the integration relay.

b. Measure the resistance of the A/F sensor heater relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage is not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage is applied to terminals 1 A-2 and 1A-3	Below 1 Ω



Text in Illustration

a	Component without harness connected (Integration Relay)

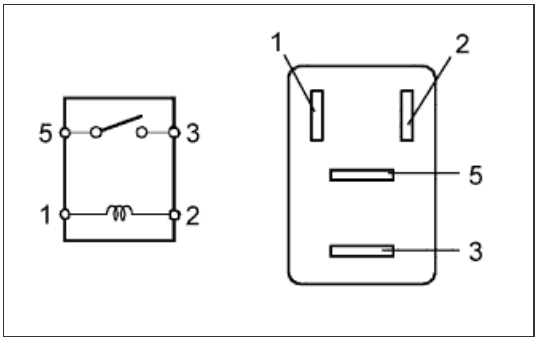
If the result is not as specified, replace the integration relay.

6. INSPECT MAIN BODY ECU (IG1 NO. 1)

a. Measure the resistance according to the value(s) in the table below.

Text in Illustration

a	Component without harness connected (Main Body EC)	-	-



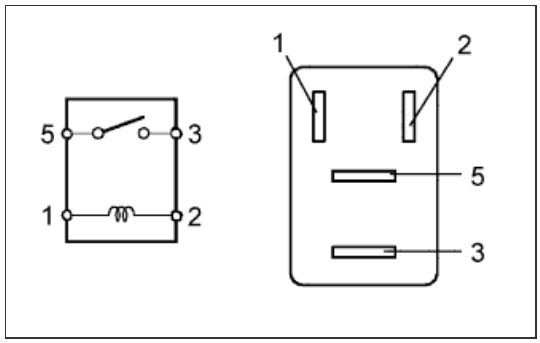
Standard Resistance:

Tester Connection	Condition	Specified Condition
2A-1 - 2B-17	Battery voltage is not applied to terminals 2B-5 and 2D-43	10 kΩ or higher
	Battery voltage is applied to terminals 2B-5 and 2D-43	Below 1 Ω

If the result is not as specified, replace the main body EC .

7. INSPECT STARTER RELAY (ST)

a. Measure the resistance according to the value(s) in the table below.



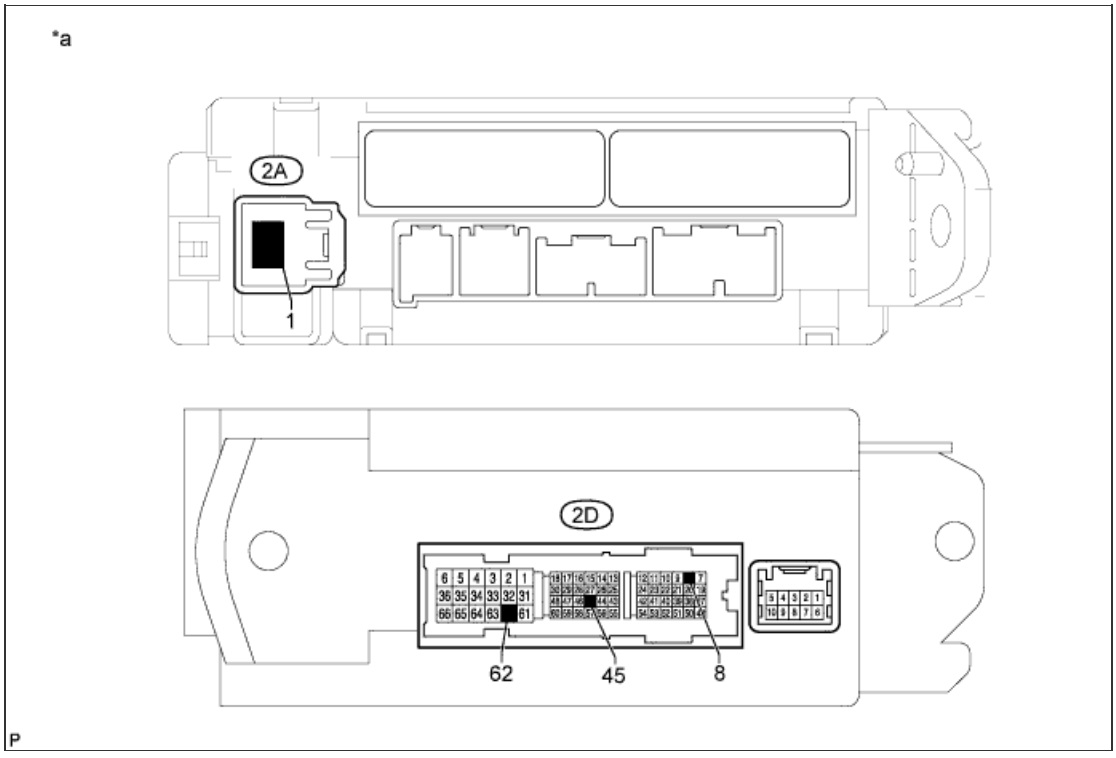
Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the starter relay.

8. INSPECT STARTER CUT RELAY (ST CUT)

a. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the starter relay.

9. INSPECT MAIN BODY ECU (ACC RELAY)

Text in Illustration

a	Component without harness connected (Main Body EC)	-	-

a. Measure the resistance of the ACC relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
	Battery voltage not applied between 2D-45 and 2D-62	10 kΩ or higher

2A-1 - 2D-	Battery voltage applied between 2D-45 and 2D-62	Below 1 Ω

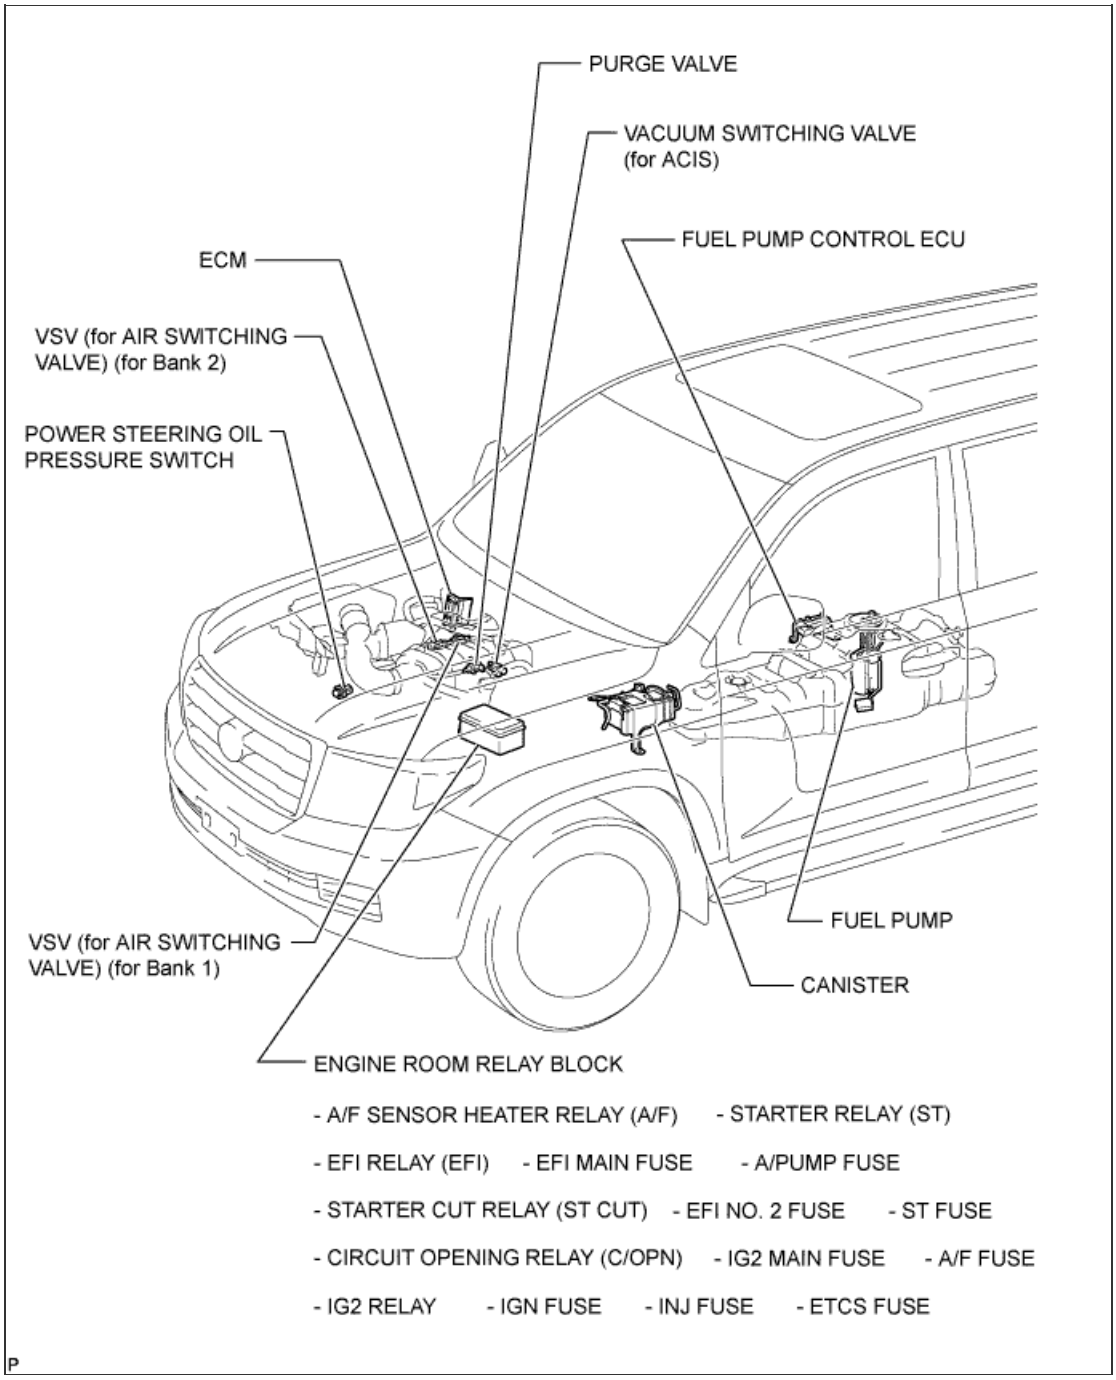
If the result is not as specified, replace the main body EC .

for Preparation Click here

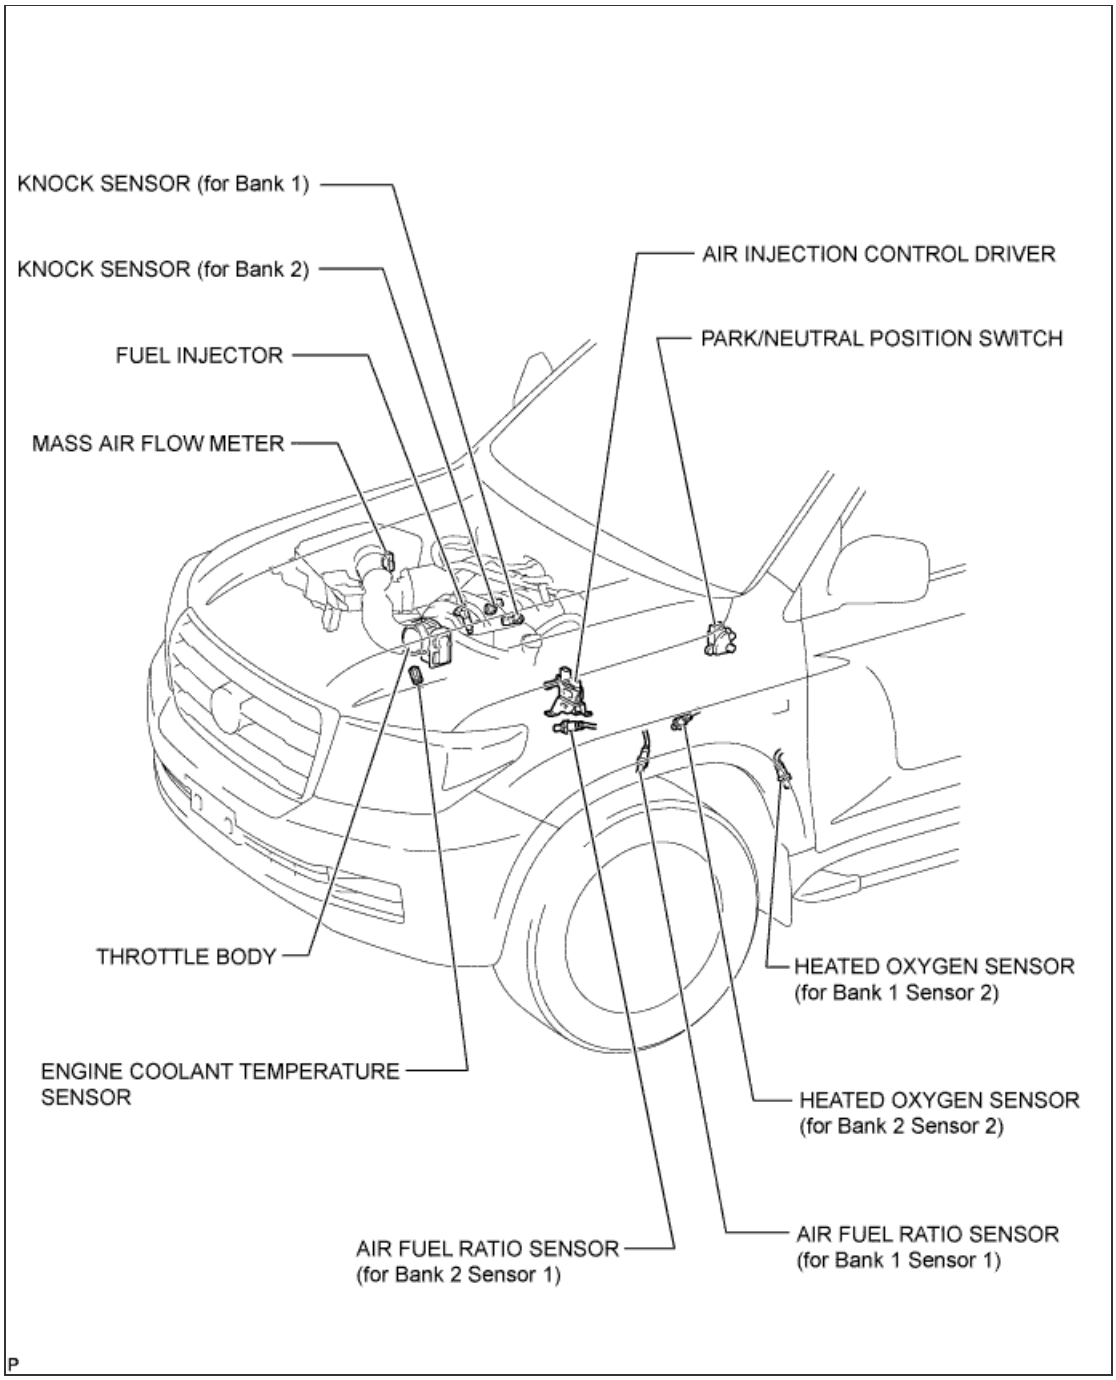
CAUTION:

When using the intelligent tester, observe the following items for safety reasons:

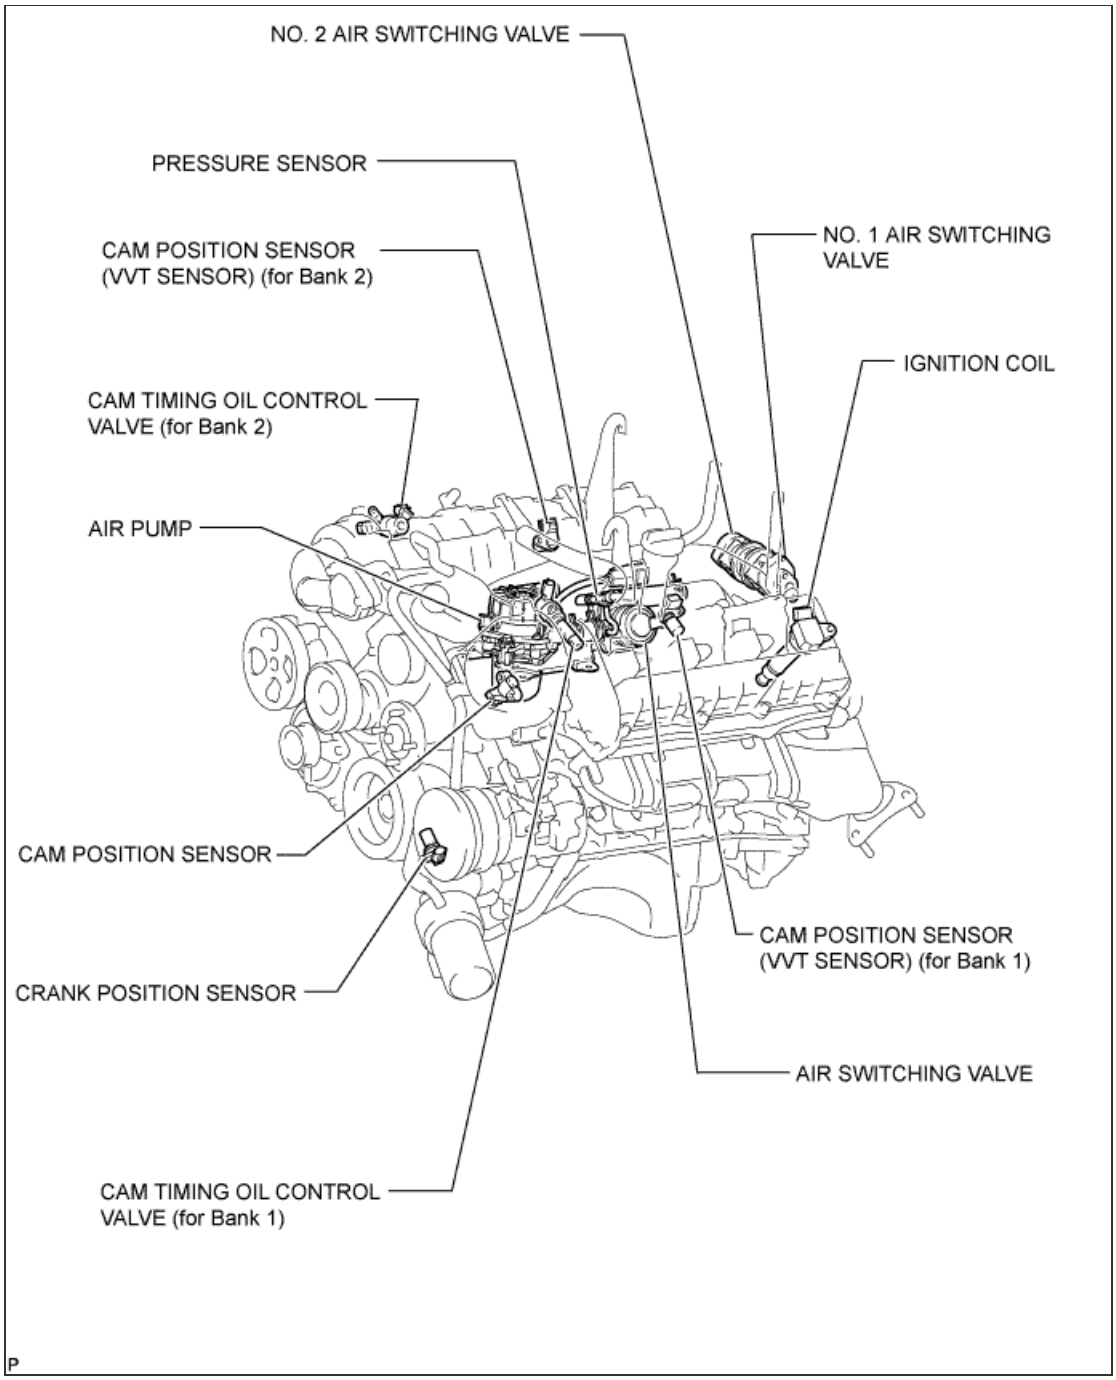
- **Read its instruction books before using the tester.**
- **Prevent the tester cable from being caught on the pedals, shift lever and steering wheel when driving with the tester connected to the vehicle.**
- **When driving the vehicle for testing purposes using the tester, 2 persons are required. One person drives the vehicle, and the other operates the tester.**



NOTICE:



Perform eset emory (AT initialization) for 4WD when repla ing the automati transmission assembly, engine assembly or EC (Cli here).



HINT:

eset emory annot be mpleted only by dis one ting the able from the negative (-) battery terminal.

8.CONFIRM PROBLEM SYMPTOMS

HINT:

If the engine does not start, first perform the "Check DTC" procedures and "Conduct Basic Inspection" procedures below.

for Preparation Click here

HINT:

Inspect the vehicle ECM using check mode. Intermittent problems are easier to detect with the intelligent tester when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. **Clear the DTCs (Click here).**
2. **Switch the ECM from normal mode to check mode using the intelligent tester (Click here).**
3. **Perform a simulation test.**
4. **Check and wiggle the harness(es), connector(s) and terminal(s).**

for Preparation Click here

When a malfunction is not confirmed by the DTC check, troubleshooting should be carried out in all circuits considered to be possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential when performing engine troubleshooting.

1.CHECK BATTERY VOLTAGE

NOTICE:

Conduct this check with the engine stopped and engine switch off.

Result

Result	Proceed to
11 V or higher	OK
Below 11 V	NG

NG. → CHARGE OR REPLACE BATTERY

OK ↓

2.CHECK WHETHER ENGINE WILL CRANK

NG. → PROCEED TO PROBLEM SYMPTOMS TABLE

OK ↓

3.CHECK WHETHER ENGINE STARTS

NG. → GO TO STEP 6

OK ↓

4.CHECK AIR FILTER

a. Visually check that the air filter is not excessively contaminated with dirt or oil.

NG. → REPLACE AIR FILTER

OK ↓

5.CHECK IDLING SPEED

NG. → TROUBLESHOOT IDLING SPEED AND PROCEED TO NEXT STEP

OK ↓

6.CHECK FUEL PRESSURE

NG. → TROUBLESHOOT FUEL PRESSURE AND PROCEED TO NEXT STEP

OK

7.CHECK FOR SPARK

NG. → TROUBLESHOOT SPARK AND PROCEED TO NEXT STEP

OK

PROCEED TO PROBLEM SYMPTOMS TABLE

for Preparation Click here

HINT:

Use the table below to help determine the cause of the problem symptom. The potential causes of the symptoms are listed in order of probability in the "Suspected Area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.

CHECK ECM

a. Measure the voltage according to the value(s) in the table below.

HINT:

The standard normal voltage between each pair of ECM terminals is shown in the table below. The appropriate conditions for checking each pair of terminals are also indicated. The result of checks should be compared with the standard normal voltage for that pair of terminals, displayed in the Specified Condition column. The illustration above can be used as a reference to identify the ECM terminal locations.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38-1 (BATT) - C45-81 (E1) A52-1 (BATT) - C46-81 (E1)		atter (for measuring battery voltage and for ECM memory)	Always	11 to 14 V
C45-41 (M) C45-81 (E1) C46-41 (M) C46-81 (E1)		ower source of throttle actuator	Always	11 to 14 V
A38-28 (IGSW) - C45-81 (E1) A52-28 (IGSW) - C46-81 (E1)		Engine switch	Engine switch on (IG)	11 to 14 V
A38-3 ( ) C45-81 (E1) A52-3 ( ) C46-81 (E1)		ower source of ECM	Engine switch on (IG)	11 to 14 V
A38-2 (O) 45-81 (E1) A52-2 (O) 46-81 (E1)		ower source of ECM	Engine switch on (IG)	11 to 14 V
C45-58 (C1) C45-57 (C1-) C46-58 (C1) C46-57 (C1-)		Cam Timing oil control valve (CV) (for Bank 1)	Engine switch on (IG)	se generation (see waveform 1)
C45-52 (C2) C45-51 (C2-) C46-52 (C2) C46-51 (C2-)		Cam Timing oil control valve (CV) (for Bank 2)	Engine switch on (IG)	se generation (see waveform 1)
A38-34 (MREL) - C45-81 (E1) A52-34 (MREL) - C46-81 (E1)		EFI relay	Engine switch on (IG)	11 to 14 V
C45-74 (VG) - C45-75 (E2G) C46-74 (VG) - C46-75	L- W	Mass air flow meter	Idling, shift lever in or N, A/C switch off	. o 8.

(E2G)				
C45-73 (THA) - C45-97 (ETHW) C46-73 (THA) - C46-97 (ETHW)		ntake air temperature sensor	Idling, intake air temperature 2 C (68°F)	. o 8.4 V
C45-76 (THW) - C45-97 (ETHW) C46-76 (THW) - C46-97 (ETHW)		Engine coolant temperature sensor	Idling, engine coolant temperature 8 C (176°F)	. o 1.
C45-8 (CTA) - C45-79 (ETA) C46-8 (CTA) - C46-79 (ETA)		ower source of throttle position sensor (specific voltage)	Engine switch on (IG)	4.5 to 5.5 V
C45-78 (VTA1) - C45-79 (ETA) C46-78 (VTA1) - C46-79 (ETA)		Throttle position sensor (for engine control)	Engine switch on (IG), throttle valve fully closed	. o 1.2 V
			Engine switch on (IG), throttle valve fully open	3.2 to 4.8 V
C45-77 (VTA2) - C45-79 (ETA) C46-77 (VTA2) - C46-79 (ETA)		Throttle position sensor (for sensor malfunction detection)	Engine switch on (IG), throttle valve fully closed	2.1 to 3.1 V
			Engine switch on (IG), throttle valve fully open	4.5 to 5.5 V
A38-55 (V A) - A38-58 (E A) A52-55 (V A) - A52-58 (E A)	W-L	Accelerator pedal position sensor (for engine control)	Engine switch on (IG), accelerator pedal released	. o 1.1 V
			Engine switch on (IG), accelerator pedal fully depressed	2.6 to 4.5 V
A38-56 (V A2) - A38-6 (E A2) A52-56 (V A2) - A52-6 (E A2)		Accelerator pedal position sensor (for sensor malfunctioning detection)	Engine switch on (IG), accelerator pedal released	1.2 to 2.
			Engine switch on (IG), accelerator pedal fully depressed	3.4 to 5.3 V
A38-57 (VC A) - A38-58 (E A) A52-57 (VC A) - A52-58 (E A)	W - W-L	ower source of accelerator pedal position sensor (for V A)	Engine switch on (IG)	4.5 to 5.5 V
A38-59 (VC)A38-6 (E A2) A52-59 (VC)A52-6 (E A2)		ower source of accelerator pedal position sensor (for V A2)	Engine switch on (IG)	4.5 to 5.5 V
C45-22 (HA1A) - C45-23 (E) C46-22 (HA1A) - C46-23 (E)	W-B	A/F sensor heater	Idling	Below 3.
			Engine switch on (IG)	11 to 14 V
C45-2 (A2A) - C45-21 (E) C46-2 (A2A) - C46-21 (E)	W-B	A/F sensor heater	Idling	Below 3.
			Engine switch on (IG)	11 to 14 V
C45-126 (A1A) C45-81 (E1) C46-126 (A1A) C46-81 (E1)		A/F sensor	Engine switch on (IG)	3.3 V
C45-125 (A1A-) - C45-81 (E1) C46-125 (A1A-) - C46-81 (E1)		A/F sensor	Engine switch on (IG)	2.9 V
C45-1 3 (A2A) C45-81 (E1) C46-1 3 (A2A) C46-81 (E1)		A/F sensor	Engine switch on (IG)	3.3 V

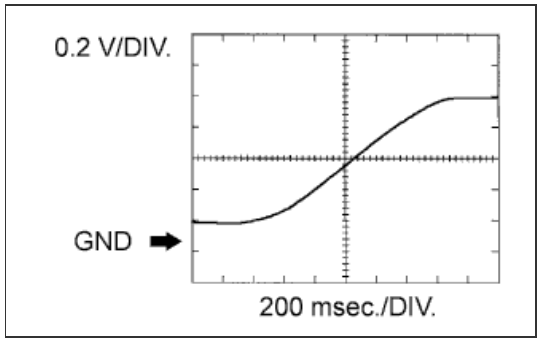
b. WAVEF M

Cam Timing Oil Control Valve (OCV)



ten	Content
Terminal No. (Symbol)	Between C1 ad C1- Between C2 ad C2-
Tool Setting	5 V/DIV., 1 msec./DIV.
Condition	Idling

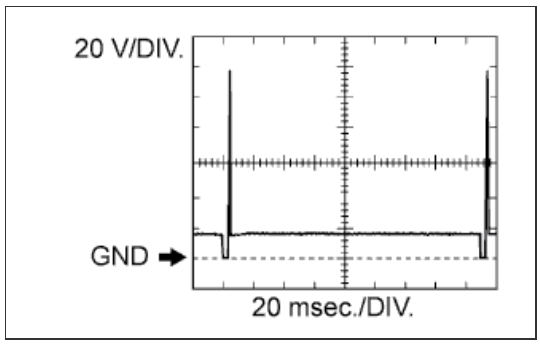
c. WAVEF M

Heated Oxygen Sensor

ten	Content
Terminal No. (Symbol)	Between nd EX1B Between nd EX2B
Tool Setting	. DIV., 2 msec./DIV.
Condition	Engine speed maintained at 25 pm for 2 minutes after warming up sensor

HINT:

In Data List, item S B1 S2 or S B2 S2 shows the ECM input values from the heated oxygen sensor.



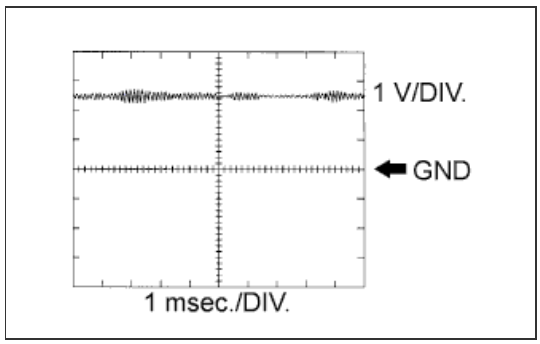
d. WAVEF M

Fuel Injector No. 1 (to No. 8) Injection Signal

Item	Content
Terminal No. (Symbol)	Between #1 (t #8) ad E
Tool Setting	2 DIV., 2 msec./DIV.
Condition	Idling

HINT:

The wavelength becomes shorter as the engine speed increases.



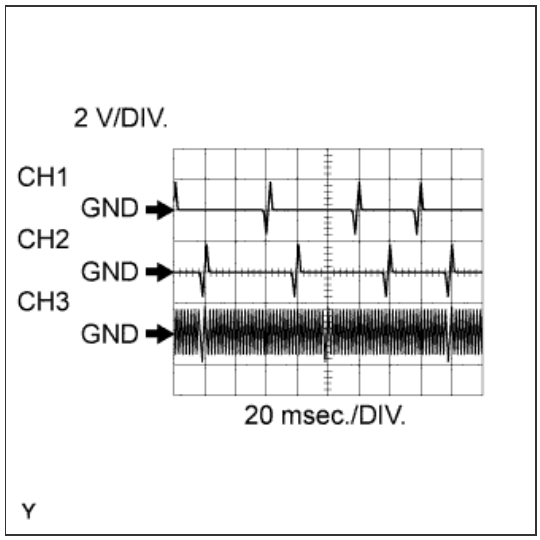
e. WAVEF M

Knock Sensor

ten	Content
Terminal No. (Symbol)	Between KNK1 and EKNK Between KNK2 and EKN2
Tool Setting	1 V/DIV., 1 msec./DIV.
Condition	Engine speed maintained at 4 pmrafter warming up engine

HINT:

- **The wavelength becomes shorter as the engine speed increases.**
- **The waveforms and amplitudes displayed differ slightly depending on the vehicle.**



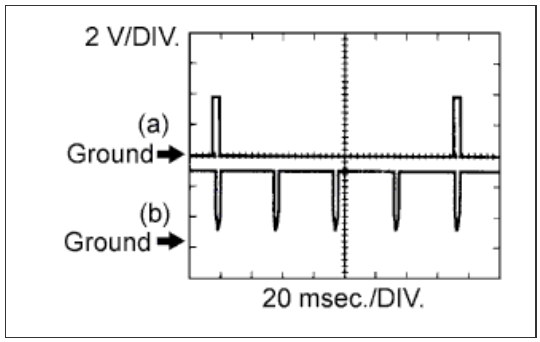
f. WAVEF M

Variable Valve Timing (VVT) Sensor (for Bank 1, 2) and Crankshaft Position Sensor

tem	Content
Terminal No. (Symbol)	CH1: Between VV1 ad VV1- CH2: Between VV2 ad VV2- CH3: Between NE ad NE-
Tool Setting	2 V/DIV., 2 msec./DIV.
Condition	Idling after engine warmed up

HINT:

The wavelength becomes shorter as engine speed increases.



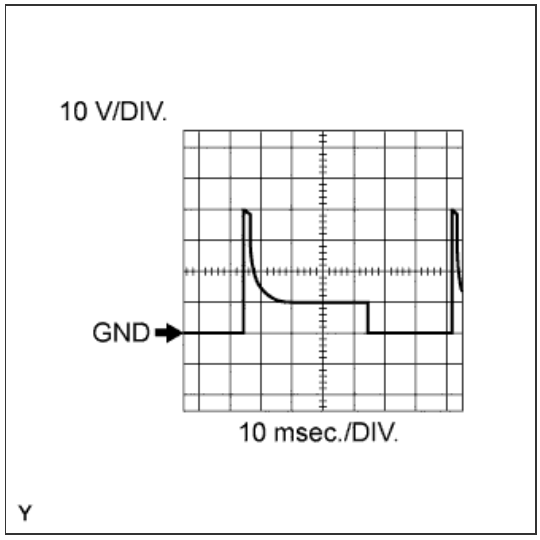
g. WAVEF M

Igniter IGT Signal (from ECM to Igniter) and Igniter IGF Signal (from Igniter to ECM)

tem	Content
Terminal No. (Symbol)	(a) Between IGT1 (to IGT8) and E1 (b) Between IGF1 (IGF2) and E1
Tool Setting	2 V/DIV., 2 msec./DIV.
Condition	Idling

HINT:

The wavelength becomes shorter as engine speed increases.



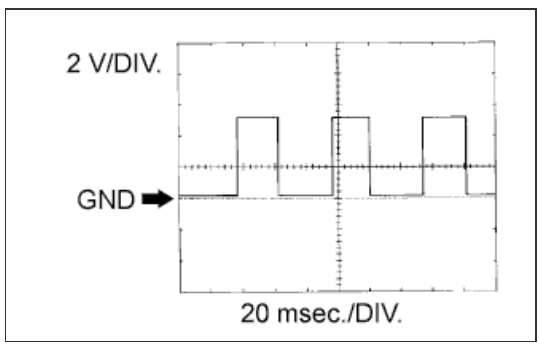
h. WAVEF M

Purge VSV

tem	Content
Terminal No. (Symbol)	Between ndÆ1
Tool Setting	1 DIV., 1 d 1 msec./DIV.
Condition	Idling

HINT:

If the waveform is not similar to the illustration, check the waveform again after idling for 1 minutes or more.



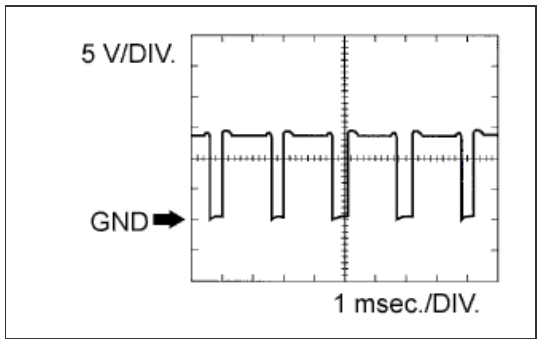
i. WAVEF M

Vehicle Speed Signal

Item	Content
Terminal No. (Symbol)	Between S D and E1
Tool Setting	2 V/DIV., 2 msec./DIV.
Condition	Driving at 2 km/h (12 mph)

HINT:

The wavelength becomes shorter as the vehicle speed increases.



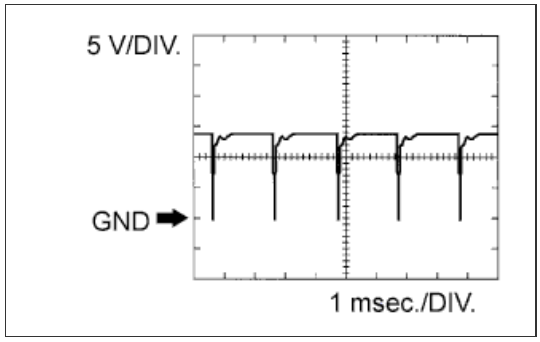
j. WAVEF M

Throttle Act ator Positive Terminal

ten	Content
Terminal No. (Symbol)	Between M ad ME
Tool Setting	5 V/DIV., 1 msec./DIV.
Condition	Idling with warm engine

HINT:

The duty ratio varies depending on the throttle actuator operation.



k. WAVEF M

Throttle Actuator Negative Terminal

ten	Content
Terminal No. (Symbol)	Between M- and ME
Tool Setting	5 V/DIV., 1 msec./DIV.
Condition	Idling with warm engine

HINT:

The duty ratio varies depending on the throttle actuator operation.

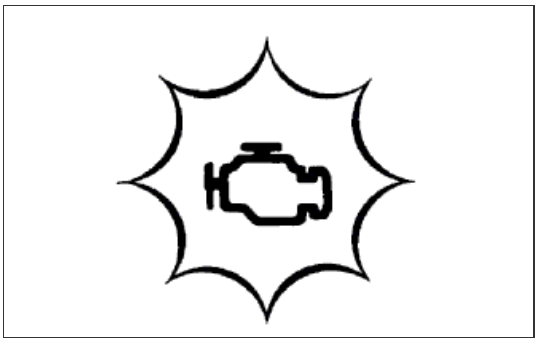
EURO-OBD (EUROPE)

When troubleshooting Europe On-Board Diagnostic (Euro-OBD) vehicles, the vehicle must be connected to an OBD scan tool (complying with ISO 15765-4). Various data output from the vehicle ECM can then be read.

Euro-OBD regulations require that the on-board computer of the vehicle illuminate the Malfunction Indicator Lamp (MIL) on the instrument panel when the computer detects a malfunction in:

1. The emission control system components
2. The powertrain control components (which affect vehicle emissions)
3. The computer itself



In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by ISO 15765-4 are stored in the ECM memory. If the malfunction does not reoccur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain stored in the ECM memory.

To check the DTCs, connect the intelligent tester to the Data Link Connector 3 (DLC3) of the vehicle. The scan tool displays DTCs, the freeze frame data and a variety of the engine data. The DTCs and freeze frame data can be cleared with the scan tool.

M-OBD (EXCEPT EUROPEAN SPEC.)

When troubleshooting Multiplex On-Board Diagnostic (M-OBD) vehicle, the vehicle must be connected to the intelligent tester. Various data output from the ECM can then be read.
OBD regulations require that the on-board computer of the vehicle illuminate the MIL on the instrument panel when the computer detects a malfunction in:

1. The emission control system components
2. The powertrain control components (which affect vehicle emissions)
3. The computer

In addition, the applicable DTCs are stored in the ECM memory. If the malfunction does not recur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain stored in the ECM memory.

NORMAL MODE AND CHECK MODE

The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic is used to ensure accurate detection of malfunctions. Check mode is also available as an option for technicians. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the ability of the system to detect malfunctions, including intermittent problems (intelligent tester only).

2 TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the next subsequent driving cycle, the MIL is illuminated (2nd trip).

FREEZE FRAME DATA

The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air-fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

BATTERY VOLTAGE

Standard voltage:
11 to 14 V

If voltage is below 11 V, replace or recharge the battery before proceeding.

MIL (Malfunction Indicator Lamp)

a. The MIL is illuminated when the engine switch is first turned on (IG) (the engine is not running).

b. The MIL should turn off when the engine is started. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.

HINT:

If the MIL is not illuminated when the engine switch is first turned on (IG), check the MIL circuit (Click here).

ALL READINESS

HINT:

- **With "All Readiness" it is possible to check whether or not the DTC judgment has been completed by using the intelligent tester.**
- **Check "All Readiness" after simulating malfunction symptoms or for validation after finishing repairs.**

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Perform the DTC judgment driving pattern to run the DTC judgment.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

g. Input the DTCs to be confirmed.

h. Check the DTC judgment result.

Result

Tester Display	Description
NORMAL	• DTC judgment completed • System normal
ABNORMAL	• DTC judgment completed • System abnormal
INCOMPLETE	• DTC judgment not completed • Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	• Unable to perform DTC judgment • Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

for Preparation Click here

NOTICE:

When the diagnosis system is changed from the normal mode to check mode or vice versa, all DTCs and freeze frame data stored in normal mode are cleared. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

- **DTCs which are stored in the ECM can be output to the intelligent tester. The intelligent tester can display the current and pending DTCs.**
- **Some DTCs are not stored if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.**

CHECK DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Check the DTC(s) and freeze frame data, and then write them down.

f. Check the details of the DTC(s) (Click here).

CLEAR DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Clear the DTCs.

CLEAR DTC (Without using the intelligent tester)

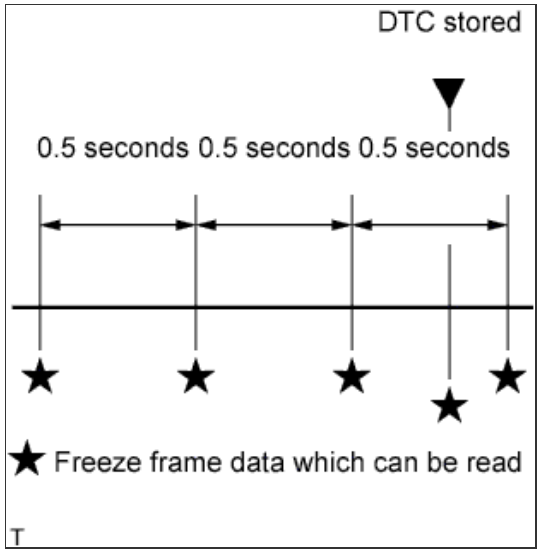
a. Perform either of the following operations:

i. Disconnect the cable from the negative (-) battery terminal for more than 1 minute.

ii. Remove the EFI MAIN fuse from the engine room relay block located inside the engine compartment for more than 1 minute.

for Preparation Click here

DESCRIPTION



Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, it can help determine if the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

HINT:

If it is impossible to duplicate the problem even though a DTC is stored, confirm the freeze frame data.

The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the intelligent tester, 5 separate sets of freeze frame data can be checked.

- 3 data sets before the DTC was stored.
- 1 data set when the DTC was stored.
- 1 data set after the DTC was stored.
  These data sets can be used to simulate the condition of the vehicle around the time of the occurrence of the malfunction. The data may assist in identifying the cause of the malfunction, and in judging whether it was temporary or not.

LIST OF FREEZE FRAME DATA

L EL (Tester Display)	Measurement Item	Diagnostic Note
Trouble Code	Trouble code	-
Injector (port)	Injection period of No. 1 cylinder	-
IGN dvance	Ignition advance	-
Calculate Load	Calculated load	The load calculated by the ECM.
Vehicle Load	Vehicle load	-
M F	Mass air flow volume	If the value is approximately 0.0 g/sec.: • The mass air flow meter power source circuit is open or shorted. • The VG circuit is open or shorted. If the value is 160.0 g/sec. or more: • The E circuit is open.
Engine peed	Engine speed	-
Vehicle peed	Vehicle speed	The speed indicated on the speedometer.
Coolant Temp	Engine coolant temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (F) or higher, the sensor circuit is shorted.
Intake ir	Intake air temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (F) or higher, the sensor circuit is shorted.
nd ir ystem tatus	econd air system status	-
ir-Fuel atio	atio compared to stoichiometric level	-
urge Density Learn Value	Learning value of purge density	-

Evap urge Flow	atio of evaporative purge flow to intake air volume	-
EV (urge) V	EV purge V duty ratio	-
Knock Correct Learn Value	Correction learning value of knocking	-
Knock Feedback Value	Feedback value of knocking	-
ccelerator osition No.1	bsolute ccelerator edal osition ( ) No. 1	-
ccelerator osition No.	bsolute No.	-
Throttle osition	Throttle position	-
Throttle ensor osition	Throttle sensor positioning	-
Throttle ensor osition #	Throttle sensor positioning #	-
Throttle Motor	Throttle motor	-
B1 B	eated oxygen sensor output	erforming the Control the Injection Volume or Control the Injection Volume for F ensor function of the ctive Test enables the technician to check the output voltage of the sensor.
F B1 F B	F sensor output	erforming the Control the Injection Volume or Control the Injection Volume for F ensor function of the ctive Test enables the technician to check the output voltage of the sensor.
F B	F sensor current	-
Total FT #1 Total FT #	Total fuel trim	-
hort FT #1	hort-term fuel trim	hort-term fuel compensation is used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #1	Long-term fuel trim	verall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
hort FT #	hort-term fuel trim	hort-term fuel compensation is used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #	ong-term fuel trim	verall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Fuel ystem tatus (Bank1)	Fuel system status (for Bank 1)	• (pen Loop): as not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • Drive: pen loop due to driving conditions (fuel enrichment). • Fault: pen loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
Fuel ystem tatus (Bank)	Fuel system status (for Bank)	• (pen Loop): as not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • Drive: pen loop due to driving conditions (fuel enrichment). • Fault: pen loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
FT B1 FT B	Fuel trim at heated oxygen sensor	-
F FT B1	Fuel trim at F sensor	-

F B1	F sensor current	-
F FT B	Fuel trim at F sensor	-
Catalyst Temp (B1) Catalyst Temp (B)	Estimated catalyst temperature (for ensor 1)	-
Catalyst Temp (B1) Catalyst Temp (B)	Estimated catalyst temperature (for ensor)	-
Initial Engine Coolant Temp	Engine coolant temperature at engine start	-
Initial Intake ir Temp	Intake air temperature at engine start	-
Injection Volum (Cylinder1)	Injection volume	-
ir pump pressure (absolute)	ir pump pressure	-
ir ump ulsation ressure	ir pump pulsation pressure	-
ower teering ressure	ower steering pressure sensor	-
CC elay	CC relay status	-
tarter elay	tarter relay status	-
tarter ignal	tarter switch (T W) signal	-
tarter Control	tarter switch status	-
ower teering witch	ower steering switch status	-
ower teering ignal	ower steering signal status	-
Closed Throttle osition W	Closed throttle position switch	-
C ignal	C signal	-
Neutral osition W ignal	ark/Neutral osition ( ) switch signal	-
Electrical Load ignal	Electrical load signal	-
top Light witch	top light switch	-
Immobiliser Communication	Immobiliser communication	-
Fuel Cut Condition	Fuel cut condition	-
Battery Voltage	Battery voltage	-
tmosphere ressure	tmospheric pressure	-
econdary ir Control V	econdary air injection system status	-
CI V	for coustic Control Induction ystem (CI)	-
CT V	C cut status for ctive Test	-
VVT Control tatus (Bank)	VVT control status	-
EV urge V	EV purge V	-
Fuel ump/ peed tatus	Fuel pump/speed status	-
VVT Control tatus (Bank1)	VVT control status	-
TC and TE1	TC and CG (TE1) terminals of DLC3	-
I Test	I test status	-
Engine peed of Cyl #1	Engine speed during No. 1 cylinder fuel cut	-
Engine peed of Cyl #	Engine speed during No. cylinder fuel cut	-
Engine peed of Cyl #3	Engine speed during No. 3 cylinder fuel cut	-
Engine peed of Cyl #4	Engine speed during No. 4 cylinder fuel cut	-
Engine peed of Cyl #5	Engine speed during No. 5 cylinder fuel cut	-
Engine peed of Cyl #6	Engine speed during No. 6 cylinder fuel cut	-
Engine peed of Cyl #	Engine speed during No. cylinder fuel cut	-
Engine peed of Cyl #8	Engine speed during No. 8 cylinder fuel cut	-
VVT im ngle (Bank1)	VVT aim angle	-
VVT Change ngle (Bank1)	VVT change angle	-
VVT CV Duty (Bank1)	VVT CV operation duty	-
VVT im ngle (Bank)	VVT aim angle	-
VVT Change ngle (Bank)	VVT change angle	-
VVT CV Duty (Bank)	VVT CV operation duty	-
Idle Fuel Cut	Fuel cut idle	when the throttle valve is fully closed and the engine speed is more than 3500 rpm.
FC T	Fuel cut during very light load	Fuel cut is being performed under a very light load to prevent the engine combustion from becoming incomplete.
Ignition	Ignition counter	-
Cylinder #1 Misfire Count	Cylinder #1 misfire	nly displayed during idling.

Cylinder # Misfire Count	Cylinder # misfire	nly displayed during idling.
Cylinder #3 Misfire Count	Cylinder #3 misfire	nly displayed during idling.
Cylinder #4 Misfire Count	Cylinder #4 misfire	nly displayed during idling.
Cylinder #5 Misfire Count	Cylinder #5 misfire	nly displayed during idling.
Cylinder #6 Misfire Count	Cylinder #6 misfire	nly displayed during idling.
Cylinder # Misfire Count	Cylinder # misfire	nly displayed during idling.
Cylinder #8 Misfire Count	Cylinder #8 misfire	nly displayed during idling.
lCylinders Misfire Count	ll cylinders misfire	ly displayed during idling.
Multi Cylinders Misfire Count	Multiple cylinder misfire	-
Misfire M	Engine speed when misfire occurred	-
Misfire Load	Engine load when misfire occurred	-
Misfire Margin	Margin to detect engine misfire	-
Engine un Time	cumulated engine running time	-
Time after DTC Cleared	Cumulative time after DTC cleared	-
Distance from DTC Cleared	cumulated distance from DTC cleared	-
Warmup Cycle Cleared DTC	Warm-up cycle after DTC cleared	-

HINT:

Intelligent tester:

Compared to the normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect the malfunctions that cannot be detected in normal mode.

NOTICE:

All the stored DTCs and freeze frame data are cleared if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the engine switch is turned from on (IG) to on (ACC) or off while in check mode. Before changing modes, always check and note any DTCs and freeze frame data.

CHECK MODE PROCEDURE

a. Check and ensure the following conditions:

   i. Battery positive voltage 11 V or more.

   ii. Throttle valve fully closed.

   iii. Transmission in the P or N position.

   iv. A/C switch off.

b. Turn the engine switch off.

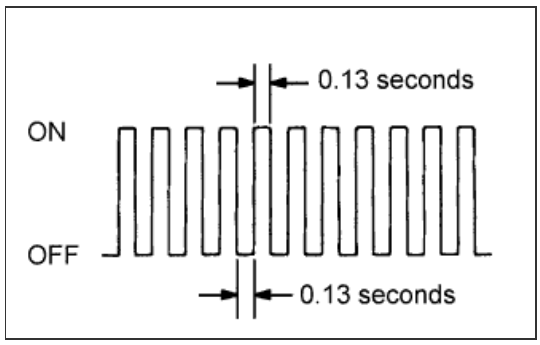
c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / Check Mode.

g. Switch the ECM from normal mode to check mode.



h. Make sure the MIL flashes as shown in the illustration.

i. Start the engine.

j. Make sure the MIL turns off.

k. Simulate the conditions of the malfunction described by the customer.

l. Check the DTCs and freeze frame data using the tester.

for Preparation Click here

If any of the following DTCs are stored, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily.

DTC	Component	Fail-Safe Operation	Fail-Safe Deactivation Condition
P0031, P0032, P0051 and P0052	Air-Fuel Ratio (A/F) Sensor Heater	The ECM turns off the A/F sensor heater.	Engine switch off
P0037, P0038, P0057 and P0058	Heated Oxygen (HO2) Sensor Heater	The ECM turns off the HO2 sensor heater.	Engine switch off
P0102 and P0103	Mass Air Flow (MAF) Meter	The ECM calculates the ignition timing according to the engine speed and throttle valve position.	Pass condition detected
P0110, P0112 and P0113	Intake Air Temperature (IAT) Sensor	The ECM estimates the IAT to be 20°C (68°F).	Pass condition detected
P0115, P0117 and P0118	Engine Coolant Temperature (ECT) Sensor	The ECM estimates the ECT to be 80°C (176°F).	Pass condition detected
P0120, P0121, P0122, P0123, P0220, P0222, P0223, P060 , P0606, P060A, P060D, P060E, P0657, P2102, P2103, P2111, P2112, P2118, P2119 and P2135	Electronic Throttle Control System (ETCS)	The ECM cuts off the throttle actuator current and the throttle valve is returned to 7° throttle position by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle to allow the vehicle to continue at minimal speed.*	Pass condition detected and then engine switch turned off
P0327, P0328, P0332 and P0333	Knock Sensor	The ECM sets the ignition timing to maximum retard.	Engine switch off
P0351 to P0358	Igniter	The ECM cuts fuel.	Pass condition detected
P050	Stop ight Switch	The accelerator pedal angle is fixed.	Pass condition detected and then engine switch turned off
P2 0 and P1 1 and/or P1	Secondary Air Injection system	The throttle is restricted (ex. 70 km/h or less).	Pass condition detected
P1 1 and P1	Secondary Air Injection system	The throttle is restricted (ex. 100 km/h or less).	Pass condition detected
P1 1 or P1	Secondary Air Injection system	The throttle is restricted (no problem under normal driving).	Pass condition detected
P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138	Accelerator Pedal Position (APP) Sensor	The APP sensor has 2 sensor circuits: Main and Sub. If either circuit malfunctions, the ECM controls the engine using the other circuit. If both circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.	Pass condition detected and then engine switch turned off
P2 31	Secondary Air Injection System	The throttle is restricted (ex. 100 km/h or less).	Pass condition detected

HINT:

*: The vehicle can be driven slowly when the accelerator pedal is depressed firmly and slowly. If the accelerator pedal is depressed quickly, the vehicle may speed up and slow down erratically.

DATA LIST

HINT:

Using the intelligent tester to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. This non-intrusive inspection can be very useful because intermittent conditions or signals may be discovered before parts or wiring is disturbed. Reading the Data List information early in troubleshooting is one way to save diagnostic time.

NOTICE:

In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

a. Warm up the engine.

b. Turn the engine switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data.

g. According to the display on the tester, read the Data List.

Engine and ECT

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
Injector (port)	Injection period of the No. 1 cylinder/ Min.: 0 ms, Max.: 32.64 ms	2.0 to 4.0 ms: idling	-
IGN Advance	Ignition timing advance for No. 1 cylinder/ Min.: -64 deg., Max.: 63.5 deg.	BTDC 5 to 15°: Idling	-
Calculate Load	Calculated load by ECM/ Min.: 0%, Max.: 100%	• 11 to 25%: Idling • 12 to 26%: Running without load (2500 rpm)	-
Vehicle Load	Vehicle load/ Min.: 0%, Max.: 25700%	Actual vehicle load	-
MAF	Air flow rate from Mass Air Flow (MAF) meter/ Min.: 0 g/sec., Max.: 655 g/sec.	4.0 to 8.0 g/sec.: Idling	If the value is approximately 0.0 g/sec.: • The mass air flow meter power source circuit is open or shorted. • The VG circuit is open or shorted. If the value is 160.0 g/sec. or more: • The E2G circuit is open.
Engine Speed	Engine speed/ Min.: 0 rpm, Max.: 16383 rpm	650 to 750 rpm: Idling	-
Vehicle Speed	Vehicle speed/ Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	The speed indicated on the speedometer.
Coolant Temp	Engine coolant temperature/ Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F), the sensor circuit is shorted.
Intake Air	Intake air temperature/ Min.: -40°C, Max.:	Equivalent to ambient air temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F), the sensor circuit is shorted.

	140°C		
2nd Air System Status	Secondary air system status/ ON or OFF	ON: Secondary air system operation	-
Air-Fuel Ratio	Air fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: During idling	-
Purge Density Learn Value	Learning value of purge density/ Min.: -50, Max.: 350	Idling: -40 to 0%	Service data.
Evap Purge Flow	Purge flow/ Min.: 0%, Max.: 102.4%	0 to 100%: Idling	-
EVAP (Purge) VSV	Purge VSV control duty/ Min.: 0%, Max.: 100%	0 to 100%: During idling	The order signal from the ECM.
Knock Correct Learn Value	Correction learning value of knocking/ Min.: -64 CA, Max.: 1984 CA	0 to 22° CA: Driving, 70 km/h (44 mph)	Service data.
Knock Feedback Value	Feedback value of knocking/ Min.: -64 CA, Max.: 1984 CA	-22 to 0° CA: Driving, 70 km/h (44 mph)	Service data.
Clutch Current	Clutch current/ Min.: 0 A, Max.: 2.49 A	-	-
Accelerator Position No.1	Absolute Accelerator Pedal Position (APP) No. 1/ Min.: 0%, Max.: 100%	10 to 22%: accelerator pedal is released 54 to 86%: accelerator pedal is fully depressed	-
Accelerator Position No.2	Absolute APP No. 2/ Min.: 0%, Max.: 100%	12 to 42%: accelerator pedal is released 66 to 98%: accelerator pedal is fully depressed	-
Accelerator Position No.1	APP sensor No. 1 voltage/ Min.: 0 V, Max.: 4.98 V	-	The ETCS freeze data.
Accelerator Position No.2	APP sensor No. 2 voltage/ Min.: 0 V, Max.: 4.98 V	-	The ETCS freeze data.
Accelerator Position No.1	APP sensor No. 1 voltage/ Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: accelerator pedal is released 2.6 to 4.5 V: accelerator pedal is fully depressed	-
Accelerator Position No.2	APP sensor No. 2 voltage/ Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: accelerator pedal is released 3.4 to 5.3 V: accelerator pedal is fully depressed	-
Accelerator Idle Position	Whether or not accelerator pedal position sensor detecting idle/ ON or OFF	ON: Idling	-
Throttle Fully Close Learn	Throttle valve fully closed (learned value)	0.4 to 0.8 V	-
Accel Fully Close #1 (AD)	Accelerator fully closed value No. 1 (AD)/ Min.: 0, Max.: 4.98 V	-	The ETCS service data.
Accel Fully Close Learn #1	Accelerator fully closed learning value No. 1/ Min.: 0, Max.: 124.512	-	The ETCS service data.
	Accelerator fully		

Accel Fully Close Learn #2	closed learning value No. 2/ Min.: 0, Max.: 124.512	-	The ETCS service data.
Fail Safe Drive	Whether or not fail-safe function executed/ ON or OFF	ON: ETCS has failed	-
Fail Safe Drive (Main CPU)	Whether or not fail-safe function executed/ ON or OFF	ON: ETCS has failed	-
ST1	Starter signal/ ON or OFF	ON: Cranking	-
System Guard	System guard/ ON or OFF	-	The ETCS service data.
Open Side Malfunction	Open side malfunction/ ON or OFF	-	The ETCS service data.
Throttle Position	Absolute throttle position sensor/ Min.: 0%, Max.: 100%	• 10 to 24%: Throttle fully closed • 64 to 96%: Throttle fully open	-
Throttle Idle Position	Whether or not throttle position sensor detecting idle/ ON or OFF	ON: Idling	-
Throttle Require Position	Throttle requirement position/ Min.: 0 V, Max.: 5 V	0.5 to 1.0 V: Idling	-
Throttle Sensor Position	Throttle sensor positioning/ Min.: 0%, Max.: 100%	10 to 18%: Idling	The calculated value based on VTA1.
Throttle Sensor Position #2	Throttle sensor positioning #2/ Min.: 0%, Max.: 100%	-	The calculated value based on VTA2.
Throttle Position No.1	Throttle position sensor No. 1 output voltage/ Min.: 0 V, Max.: 4.9 V	-	The ETCS freeze data.
Throttle Position No.2	Throttle position sensor No. 2 output voltage/ Min.: 0 V, Max.: 4.9 V	-	The ETCS freeze data.
Throttle Position No.1	Throttle position No. 1/ Min.: 0 V, Max.: 5 V	• 0.5 to 1.2 V: Throttle fully closed • 3.2 to 4.8 V: Throttle fully open	-
Throttle Position No.2	Throttle position No. 2/ Min.: 0 V, Max.: 5 V	• 2.0 to 2.9 V: Throttle fully closed • 4.6 to 5.5 V: Throttle fully open	-
Throttle Position Command	Throttle position command value/ Min.: 0 V, Max.: 4.98 V	0.5 to 4.8 V	The ETCS service data.
Throttle Sens Open Pos #1	Throttle sensor opener position No. 1/ Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	The ETCS service data.

Throttle Sens Open Pos #2	Throttle sensor opener position No. 2/ Min.: 0 V, Max.: 4.98 V	2.2 to 2.6 V	The ETCS service data.
Throttle Sens Open #1(AD)	Throttle sensor opener position No. 1 (AD)/ Min.: 0 V, Max.: 4.98 V	0.6 to 0.9 V	The ETCS service data.
Throttle Motor	Whether or not throttle actuator control permitted/ ON or OFF	ON: Idling	Read the value with the engine switch on (IG) (do not the start engine).
Throttle Motor Current	Throttle actuator current/ Min.: 0 A, Max.: 80 A	0 to 3.0 A: Idling	-
Throttle Motor	Throttle actuator/ Min.: 0%, Max.: 100%	0.5 to 40%: Idling	-
Throttle Motor Current	Throttle actuator current/ Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-
Throttle Motor Open Duty	Throttle actuator opening duty ratio/ Min.: 0%, Max.: 100%	0 to 40%: During idling	When the accelerator pedal is depressed, the duty ratio increases.
Throttle Motor Close Duty	Throttle actuator closed duty ratio/ Min.: 0%, Max.: 100%	0 to 40%: During idling	When the accelerator pedal is released quickly, the duty ratio increases.
Throttle Motor Duty (Open)	Throttle actuator duty ratio (open)/ Min.: 0%, Max.: 100%	-	The ETCS service data.
Throttle Motor Duty (Close)	Throttle actuator duty ratio (close)/ Min.: 0%, Max.: 100%	-	The ETCS service data.
O2S B1 S2	Heated oxygen sensor output voltage for bank 1 sensor 2/ Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving, 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
O2S B2 S2	Heated oxygen sensor output voltage for bank 2 sensor 2/ Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving, 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
AFS B1 S1	Air fuel ratio sensor output voltage for bank 1 sensor 1/ Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
AFS B2 S1	Air fuel ratio sensor output voltage for bank 2 sensor 1/ Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
AFS B2 S1	Air fuel ratio sensor current for bank 2 sensor 1/ Min.: 128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output current of the sensor.
	Total fuel trim of bank 1 Average value for		

Total FT #1	fuel trim system of bank 1/ Min.: -0.5 V, Max.: 1496 V	-0.2 to 0.2 V: Idling	-
Total FT #2	Total fuel trim of bank 2 Average value for fuel trim system of bank 2/ Min.: -0.5 V, Max.: 1496 V	-0.2 to 0.2 V: Idling	-
Short FT #1	Short-term fuel trim of bank 1/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the short-term fuel compensation used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #1	Long-term fuel trim of bank 1/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the overall fuel compensation carried out in long-term to compensate a continual deviation of the short-term fuel trim from the central value.
Short FT #2	Short-term fuel trim of bank 2/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the short-term fuel compensation used to maintain the air-fuel ratio at the stoichiometric air-fuel ratio.
Long FT #2	Long-term fuel trim of bank 2/ Min.: -100%, Max.: 99.2%	-20 to +20%	This item refers to the overall fuel compensation carried out in long-term to compensate a continual deviation of the short-term fuel trim from the central value.
Fuel System Status (Bank1)	Fuel system status (bank 1)/ OL, CL, OL Drive, OL Fault or CL Fault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
Fuel System Status (Bank2)	Fuel system status (bank 2)/ OL, CL, OL Drive, OL Fault or CL Fault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
O2 FT B1 S2	Short-term fuel trim associated with the bank 1 sensor 2/ Min.: -100%, Max.: 99.2%	-20 to +20%	The same as Short FT #1.
O2 FT B2 S2	Short-term fuel trim associated with the bank 2 sensor 2/ Min.: -100%, Max.: 99.2%	-20 to +20%	The same as Short FT #1.
AF FT B1 S1	Short-term fuel trim associated with the bank 1 sensor 1/ Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) = Rich • Value equal to 1 = Stoichiometric air-fuel ratio • Value more than 1 (1.001 to 1.999) = Lean	-
AFS B1 S1	Air fuel ratio sensor current bank 1 sensor 1/ Min.: 128 mA, Max.:	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output current of the sensor.

AF FT B2 S1	127.99 mA Short-term fuel trim associated with the bank 2 sensor 1/ Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) = Rich • Value equal to 1 = Stoichiometric air-fuel ratio • Value more than 1 (1.001 to 1.999) = Lean	-
Catalyst Temp (B1 S1)	Catalyst temperature (bank 1, sensor 1)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp (B2 S1)	Catalyst temperature (bank 2, sensor 1)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp (B1 S2)	Catalyst temperature (bank 1, sensor 2)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp (B2 S2)	Catalyst temperature (bank 2, sensor 2)/ Min.: -40°C, Max.: 6513.5°C	-	-
Initial Engine Coolant Temp	Initial engine coolant temperature/ Min.: -40°C, Max.: 140°C	Close to ambient air temperature	Service data.
Initial Intake Air Temp	Initial intake air temperature/ Min.: -40°C, Max.: 140°C	Close to ambient air temperature	Service data.
Injection Volum (Cylinder1)	Injection volume (cylinder 1)/ Min.: 0 ml, Max.: 2.048 ml	0 to 0.5 ml	The quantity of fuel injection volume for 10 times.
Air pump pressure (absolute)	Air pump pressure (absolute)/ Min.: 0 kPa, Max.: 320 kPa	Atmospheric pressure +1 kPa or more: Air pump on, air switching valve open Close to atmospheric pressure: Air pump off, air switching valve close	Refer to DTC P2431 (Click here).
Air Pump Pulsation Pressure	Air pump pulsation pressure/ Min.: 0 kPa, Max.: 639.9 kPa	-	The cumulative pulsation pressure calculated by the ECM.
Power Steering Pressure	Power steering oil pressure/ Min.: -1.897 MPa, Max.: 12.799 MPa	-	-
ACC Relay	Acc relay status/ ON or OFF	ON: Cranking	-
Starter Relay	Starter relay status/ ON or OFF	ON: Cranking	-
Starter Signal	Starter signal/ ON or OFF	ON: Cranking	-
Starter Control	Starter switch status/ ON or OFF	ON: Cranking	-
Power Steering Switch	Power steering switch status/ ON or OFF	ON: Power steering operation	-
Power Steering Signal	Power steering signal (history)/ ON or OFF	ON: When steering wheel first turned after battery terminals connected	This signal status is usually ON until the cables are disconnected from the battery terminals.
		• ON: Throttle	

Closed Throttle Position SW	Closed throttle position switch/ ON or OFF	fully closed • OFF: Throttle open	-
A/C Signal	A/C switch status/ ON or OFF	ON: A/C ON	-
Neutral Position SW Signal	PNP switch status/ ON or OFF	ON: P or N position	-
Electrical Load Signal	Electrical load signal/ ON or OFF	ON: Headlights or defogger turned on	-
Stop Light Switch	Stop light switch/ ON or OFF	ON: Brake pedal depressed	-
Immobiliser Communication	Immobiliser communication/ ON or OFF	ON: Normal	-
Fuel Cut Condition	Fuel cut condition/ ON or OFF	ON: Fuel cut operating	-
ETCS Actuator Power	Whether or not electric throttle control system power inputted/ ON or OFF	ON: Idling	-
+BM Voltage	+BM voltage/ Min.: 0, Max.: 19.92	10 to 15 V: Idling	The ETCS service data.
Battery Voltage	Battery voltage/ Min.: 0 V, Max.: 65535 V	11 to 14 V: Idling	-
Actuator Power Supply	Actuator power supply/ ON or OFF	ON: Idling	The ETCS service data.
Atmosphere Pressure	Atmospheric pressure/ Min.: 0 kPa, Max.: 150 kPa	Equivalent to atmospheric pressure (absolute pressure)	-
Secondary Air Control VSV	Secondary air injection system status	ON: Secondary air injection system operation	-
ACIS VSV	VSV status for ACIS control/ ON or OFF	-	The Active Test support data.
ACT VSV	A/C cut status for Active Test/ ON or OFF	-	The Active Test support data.
VVT Control Status (Bank2)	VVT control status (bank 2)/ ON or OFF	-	The Active Test support data.
EVAP Purge VSV	VSV status for EVAP control/ ON or OFF	-	The Active Test support data.
Fuel Pump/Speed Status	Fuel pump/speed status/ ON or OFF	-	The Active Test support data.
VVT Control Status (Bank1)	Variable valve timing (VVT) control status (bank 1)/ ON or OFF	-	The Active Test support data.
TC and TE1	TC and TE1 terminal of DLC3/ ON or OFF	-	The Active Test support data.
AI Test	AI Test status/ READY or NOT RDY	-	The Active Test support data.
Engine Speed of Cyl #1	Engine speed during No. 1 cylinder fuel cut/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Cylinder #1 injector fuel cut is performed using Active Test
Engine Speed	Engine speed during No. 2 cylinder fuel cut/	-	Output only when Control the Cylinder #2 fuel cut is performed

of Cyl #2	Min.: 0 rpm, Max.: 25600 rpm		using Active Test
Engine Speed of Cyl #3	Engine speed during No. 3 cylinder fuel cut/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Control the Cylinder #3 fuel cut is performed using Active Test
Engine Speed of Cyl #4	Engine speed during No. 4 cylinder fuel cut/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Control the Cylinder #4 fuel cut is performed using Active Test
Engine Speed of Cyl #5	Engine speed during No. 5 cylinder fuel cut/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Control the Cylinder #5 fuel cut is performed using Active Test
Engine Speed of Cyl #6	Engine speed during No. 6 cylinder fuel cut/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Control the Cylinder #6 fuel cut is performed using Active Test
Engine Speed of Cyl #7	Engine speed during No. 7 cylinder fuel cut/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Control the Cylinder #7 fuel cut is performed using Active Test
Engine Speed of Cyl #8	Engine speed during No. 8 cylinder fuel cut/ Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Control the Cylinder #8 fuel cut is performed using Active Test
VVT Aim Angle (Bank1)*1	VVT aim angle (bank 1)/ Min.: 0%, Max.: 100%	0%: Idling	The VVT duty signal value during the intrusive operation.
VVT Change Angle (Bank1)*1	VVT change angle (bank 1)/ Min.: 0° FR, Max.: 60° FR	0 to 5° FR: Idling	The displacement angle during the intrusive operation.
VVT OCV Duty (Bank1)*1	VVT OCV operation duty (bank 1)/ Min.: 0%, Max.: 100%	0%: Idling	The requested duty value for the intrusive operation.
VVT Aim Angle (Bank2)*1	VVT aim angle (bank 2)/ Min.: 0%, Max.: 100%	0%: Idling	The VVT duty signal value during the intrusive operation.
VVT Change Angle (Bank2)*1	VVT change angle (bank 2)/ Min.: 0° FR, Max.: 60° FR	0 to 5° FR: Idling	The displacement angle during the intrusive operation.
VVT OCV Duty (Bank2)*1	VVT OCV operation duty (bank 2)/ Min.: 0%, Max.: 100%	0%: Idling	The requested duty value for the intrusive operation.
Idle Fuel Cut	Fuel cut idle/ ON or OFF	ON: Fuel cut operation	Idle Fuel Cut is "ON" when the throttle valve is fully closed and the engine speed is more than 2800 rpm.
FC TAU	Fuel cut TAU: Fuel cut during very light load/ ON or OFF	ON: Fuel cut operation	The fuel cut being performed under a very light load to prevent the engine combustion from becoming incomplete.
Ignition	Ignition counter/ Min.: 0, Max.: 800	0 to 800	-
Cylinder #1 Misfire Count to Cylinder #8 Misfire Count	Misfire count of the cylinder 1 to 8/ Min.: 0, Max.: 255	0%	This item is displayed only when idling the engine.
All Cylinders	All cylinders misfire		

Misfire Count	count/ Min.: 0, Max.: 255	0 to 35	-
Multi Cylinders Misfire Count	Multiple cylinder misfire count/ Min.: 0 Max.:65535	0 to 65535	-
Misfire RPM	Engine speed for first misfire range/ Min.: 0 rpm, Max.: 6375 rpm	0 rpm: Misfire 0	-
Misfire Load	Engine load for first misfire range/ Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	-
Misfire Margin	Misfire monitoring/ Min.: -100%, Max.: 99.22%	-100 to 99.2%	The misfire detecting margin.
# Codes	Number of codes/ Min.: 0, Max.: 255	-	The number of stored DTCs.
Check Mode	Check mode/ ON or OFF	ON: Check mode ON	Refer to the Check Mode Procedure (Click here).
AS Test	Check mode result for secondary air injection system/ 0: Compl, 1: Incmpl	-	-
Misfire Test	Check mode result for misfire monitor/ 0: Compl, 1: Incmpl	-	-
OXS2 Test	Check mode result for heated oxygen sensor (bank 2)/ 0: Compl, 1: Incmpl	-	-
OXS1 Test	Check mode result for heated oxygen sensor (bank 1)/ 0: Compl, 1: Incmpl	-	-
A/F Test Results (Bank2)	Check mode result for air fuel ratio sensor (bank 2)/ 0: Compl, 1: Incmpl	-	-
A/F Test Results (Bank1)	Check mode result for air fuel ratio sensor (bank 1)/ 0: Compl, 1: Incmpl	-	-
MIL	MIL status/ ON or OFF	ON: MIL on	-
MIL ON Run Distance	MIL ON run distance/ Min.: 0 km, Max.: 65535 km	Distance after DTC stored	-
Running Time from MIL ON	Running time from MIL on/ Min.: 0 minute, Max.: 65535 minutes	Equivalent to running time after MIL is on	-
Engine Run Time	Engine run time/ Min.: 0 seconds, Max.: 65535 seconds	Time after engine start	Service data.
Time after DTC Cleared	Time after DTC cleared/ Min.: 0 minutes, Max.: 65535 minutes	Equivalent to time after DTCs are cleared	-
Distance from DTC Cleared	Distance after DTC cleared/ Min.: 0 km, Max.: 65535 km	Equivalent to drive distance after DTCs are cleared	-
Warmup Cycle Cleard DTC	Warm-up cycle after DTC cleared/ Min.: 0, Max.: 255	-	The number of warm-up cycles after the DTC is cleared.
OBD Requirements	OBD requirement	OBD2	-

Number of Emission DTC	Emission related DTCs	-	The number of emission related DTCs.
Complete Parts Monitor	Comprehensive component monitor/ Not Avl or Avail	-	-
Fuel System Monitor	Fuel system monitor/ Not Avl or Avail	-	-
Misfire Monitor	Misfire monitor/ Not Avl or Avail	-	-
EGR Monitor	EGR monitor/ Not Avl or Avail	-	-
EGR Monitor	EGR monitor/ Compl or Incmpl	-	-
O2S(A/FS) Heater Monitor	O2S (A/FS) heater monitor/ Not Avl or Avail	-	-
O2S(A/FS) Heater Monitor	O2S (A/FS) heater monitor/ Compl or Incmpl	-	-
O2S(A/FS) Monitor	O2S (A/FS) monitor/ Not Avl or Avail	-	-
O2S(A/FS) Monitor	O2S (A/FS) monitor/ Compl or Incmpl	-	-
2nd Air Monitor	2nd air monitor/ Not Avl or Avail	-	-
2nd AIR MON	2nd air monitor/ Compl or Incmpl	-	-
EVAP Monitor	EVAP monitor/ Not Avl or Avail	-	-
EVAP Monitor	EVAP monitor/ Compl or Incmpl	-	-
Catalyst Monitor	Catalyst monitor/ Not Avl or Avail	-	-
Catalyst Monitor	Catalyst monitor/ Compl or Incmpl	-	-
Model Code	Model code	-	Identifying the model code: UZJ2##
Engine Type	Engine type	-	Identifying the engine type: 2UZFE
Cylinder Number	Cylinder number/ Min.: 0, Max.: 255	-	Identifying the cylinder number: 8
Transmission Type	Transmission type	-	Identifying the transmission type: ECT (5AT)
Destination	Destination	-	Identifying the destination: W
Model Year	Model year/ Min.: 0, Max.: 255	-	Identifying the model year: 200#
System Identification	System identification	-	Identifying the engine system: Gasoline (gasoline engine)

HINT:

- **Normal Condition: If no conditions are specifically stated for "idling", the shift lever is in N or P, and the A/C switch is off and all accessory switches are off.**
- ***1: Data List values are only displayed when performing the following Active Tests: Control the VVT Linear ank , Control the VVT Linear ank 2 . For other Active Tests, the Data List value will be .**

ACTIVE TEST

HINT:

Using the intelligent tester to perform Active Tests allows relays, VSVs, actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing Active Tests early in troubleshooting is one way to save diagnostic time. Data List information can be displayed while performing Active Tests.

a. Warm up the engine.

b. Turn the engine switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test.

g. According to the display on the tester, perform the Active Test.

Engine and ECT

Tester Display	Test Part	Control Range	Diagnostic Note
Control the Injection Volume	Change injection volume	Between -12% and 25%	• All the injectors are tested at the same time. • Perform the test at less than 3000 rpm. • The injection volume can be changed in 1% graduations within the control range.
Control the Injection Volume for A/F Sensor	Change injection volume	Lower by -12.5% or increase 25%	• Perform the test at less than 3000 rpm. • Control the Injection Volume for A/F Sensor enables the checking and graphing of the A/F (Air-Fuel ratio) sensor voltage outputs. • To conduct the test, enter the following menus: Active Test / Control the Injection Volume for A/F Sensor / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S.
Activate the VSV for Secondary Air Control	Activate the secondary air system	ON/OFF	• Do not perform the test for 5 seconds or more. • After the test, do not perform the test again for 30 seconds.
Activate the VSV for Intake Control	Activate VSV for intake control	ON/OFF	-
Activate the VSV for Evap Control	Activate purge VSV control	ON/OFF	-
Control the A/C Cut Signal	Control A/C cut signal	ON/OFF	-
Control the Fuel Pump / Speed	Activate fuel pump	ON/OFF	-
Connect the TC and TE1	Turn on and off TC and TE1 connection	ON/OFF	• ON: TC and TE1 are connected. • OFF: TC and TE1 are disconnected.
Control the Idle Fuel Cut Prohibit	Prohibit idling fuel cut control	ON/OFF	-
Activate the Starter Relay	Activate the starter relay	ON/OFF	The engine is stopped.
Activate the ACC Cut Relay	Activate the ACC CUT relay	ON/OFF	The engine is stopped.
Control the ETCS Open/Close Slow Speed	Throttle actuator	ON: throttle valve opens slowly	This test is possible when the following conditions are met: • The engine switch is on (IG). • The engine does not start. • The accelerator pedal is fully depressed (APP: 58 degrees or more).
Control the ETCS Open/Close Fast Speed	Throttle actuator	ON: throttle valve opens fast	The same as above.
Control the VVT Linear (Bank1)	Control Variable Valve Timing (VVT) [bank 1]	-128 to 127%: This value added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• The engine stalls or idles roughly when the VVT actuator is operated by 100%. • The test is possible during idle.
Control the VVT System (Bank1)	Turn on and off Camshaft Oil Control Valve (OCV)	ON/OFF	• The engine stalls or idles roughly when the OCV is turned on. • The engine runs or idles normally when the OCV is off.
Control the VVT	Control Variable Valve Timing	-128 to 127%: This value added to present OCV control duty 100%: Maximum	• The engine stalls or idles roughly when the VVT actuator is operated by 100%.

Linear (Bank2)	(VVT) [bank 2]	advance -100%: Maximum retard	• The test is possible during idle.
Control the VVT System (Bank2)	Turn on and off Camshaft Oil Control Valve (OCV)	ON/OFF	• The engine stalls or idles roughly when the OCV is turned on. • The engine runs or idles normally when the OCV is off.
Control the Cylinder#1 Fuel Cut	Cylinder #1 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the Cylinder#2 Fuel Cut	Cylinder #2 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the Cylinder#3 Fuel Cut	Cylinder #3 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the Cylinder#4 Fuel Cut	Cylinder #4 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the Cylinder#5 Fuel Cut	Cylinder #5 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the Cylinder#6 Fuel Cut	Cylinder #6 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the Cylinder#7 Fuel Cut	Cylinder #7 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the Cylinder#8 Fuel Cut	Cylinder #8 injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Control the All Cylinders Fuel Cut	All cylinder fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.*
Check the Cylinder Compression*1	Check the cylinder compression pressure	ON/OFF	The fuel injection and ignition stop in all cylinders.

NOTICE:

*1: If the display of the Prohibit the Catalyst OT Misfire prevent F/C item of the Data List is Not Avl, perform this Active Test with the vehicle stopped and the engine idling. If the display of the Prohibit the Catalyst OT Misfire prevent F/C item of the Data List is Avail, perform this Active Test as described below.

1. **Stop the engine and turn the engine switch on I to turn Control the Cylinder Fuel Cut to Control the Cylinder Fuel Cut ON.**
2. **Start the engine.**

HINT:

*: When cranking the engine, the Active Test measures the speed of each cylinder.

In this Active Test, the fuel of all cylinders is cut, and cranking occurs for approximately 10 seconds. At this time, the speed of each cylinder is measured. If the speed of one cylinder is higher than the other cylinders, the compression pressure of that cylinder is determined to be lower than the other cylinders.

1. **Warm up the engine.**
2. **Turn the engine switch off.**
3. **Connect the intelligent tester to the DLC .**
4. **Turn the engine switch on I and turn the intelligent tester on.**
5. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Check the Cylinder Compression.**

HINT:

To display the entire Data List, press the pull down menu button next to Primary. Then select Compression.

.While the engine is not running, press the RI HT or LEFT button to change the Check the Cylinder Compression to ON.

HINT:

After performing the above procedure, the Active Test Check the Cylinder Compression will start. Fuel injection for all cylinders is prohibited, and each cylinder engine speed measurement will enter standby.

. Bly open the throttle.

8. **Crank the engine for about seconds.**

. **Monitor the engine speed Engine Speed of Cyl to displayed on the intelligent tester.**

HINT:

At first, the intelligent tester display will show each cylinder engine speed measurement to be extremely high. After approximately 10 seconds of engine cranking, each cylinder engine speed measurement will change to the actual engine speed.

NOTICE:

- **When the Check the Cylinder Compression test is OFF and the engine is cranked, the engine will start.**
- **If the Check the Cylinder Compression test needs to be performed after it is turned on and performed once, press E it to return to the Active Test menu screen. Then perform the Check the Cylinder Compression test again.**
- **se a lly charged battery.**

SYSTEM CHEC

HINT:

Performing a System Check enables the system, which consists of multiple actuators, to be operated without removing any parts. In addition, it can show whether or not any DTCs are stored, and can detect potential malfunctions in the system. The System Check can be performed with the intelligent tester.

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Utility.

e. Perform the System Check by referring to the table below.

Tester Display	Test Part	Control Range	Diagnostic Notes
Secondary Air Injection Check (Automatic Mode)	Perform secondary air injection system operation automatically	With warm engine, engine switch turned off once	• If no DTCs in Pending after performing this test, system functioning normally • Refer to inspection procedure for secondary air injection system DTCs • When performing Air Injection Check operation after battery cable has been reconnected, wait for 7 minutes with engine switch turned on (IG) or engine running • Turn engine switch off when System Check finished
Secondary Air Injection Check (Manual Mode)	Perform 8 operations in order to operate air injection system monitor manually	With warm engine, engine switch turned off once	• Used to detect malfunctioning parts • Refer to inspection procedure for secondary air injection system DTCs • When performing Air Injection Check operation after battery cable has been reconnected, wait for 7 minutes with engine switch turned on (IG) or engine running • Turn engine switch off when System

			Check finishes

for Preparation Click here

HINT:

Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.

If any DTCs are output during a check mode DTC check, check the trouble area for the DTCs listed in the table below. For details of each DTC, refer to the "See page" below.

SFI SYSTEM

DTC Code	Detection Item	Trouble Areas	MIL	Memory	See page
P0010	Camshaft Position "A" Actuator Circuit (Bank 1)	- Open or short in Camshaft Oil Control Valve (OCV) (for intake side of bank 1) circuit - OCV (for intake side of bank 1) - ECM	Comes on	DTC stored	Click here
P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)	- Valve timing - Camshaft oil control valve (OCV) for intake side - OCV filter - Intake camshaft timing tube (for Bank 1) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0012	Camshaft Position "A" - Timing Over-Retarded (Bank 1)	- Valve timing - Camshaft oil control valve (OCV) for intake side - OCV filter - Intake camshaft timing tube (for Bank 1) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0016	Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)	- Mechanical system (Timing belt has umped tooth or belt stretched) - Oil control valve - Camshaft timing tube - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0018	Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)	(Timing belt has umped tooth or belt stretched) - Oil control valve - Camshaft timing tube - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0020	Camshaft Position "A" Actuator Circuit (Bank 2)	- Open or short in Camshaft Oil Control Valve (OCV) (for intake side of bank 2) circuit - OCV (for intake side of bank 2) - ECM	Comes on	DTC stored	Click here
P0021	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)	- Valve timing - Camshaft oil control valve (OCV) for intake side - OCV filter - Intake camshaft timing tube (for Bank 2) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0022	Camshaft Position "A" - Timing Over-Retarded (Bank 2)	- Valve timing - Camshaft oil control valve (OCV) for intake side - OCV filter - Intake camshaft timing tube (for Bank 2) - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here
P0031	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)	- Open in Air-Fuel Ratio (A/F) sensor heater circuit - A/F sensor heater (for sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0032	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0037	Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for sensor 2) - Integration relay (EFI) - ECM	Comes on	DTC stored	Click here
P0038	Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for sensor 2) - Integration relay (EFI) - ECM	Comes on	DTC stored	Click here

P0051	Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)	- Open in Air-Fuel Ratio (A/F) sensor heater circuit - A/F sensor heater (for sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0052	Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)	- Short in A/F sensor heater circuit - A/F sensor heater (for sensor 1) - Integration relay - ECM	Comes on	DTC stored	Click here
P0057	Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)	- Open in HO2 sensor heater circuit - HO2 sensor heater (for sensor 2) - Integration relay (EFI) - ECM	Comes on	DTC stored	Click here
P0058	Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)	- Short in HO2 sensor heater circuit - HO2 sensor heater (for sensor 2) - Integration relay (EFI) - ECM	Comes on	DTC stored	Click here
P0102	Mass or Volume Air Flow Circuit Low Input	- Open or short in Mass Air Flow (MAF) meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0103	Mass or Volume Air Flow Circuit High Input	- Open or short in Mass Air Flow (MAF) meter circuit - MAF meter - ECM	Comes on	DTC stored	Click here
P0110	Intake Air Temperature Circuit Malfunction	- Open or short in Intake Air Temperature (IAT) sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0112	Intake Air Temperature Circuit Low Input	- Short in Intake Air Temperature (IAT) sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0113	Intake Air Temperature Circuit High Input	- Open in Intake Air Temperature (IAT) sensor circuit - IAT sensor (built into MAF meter) - ECM	Comes on	DTC stored	Click here
P0115	Engine Coolant Temperature Circuit Malfunction	- Open or short in Engine Coolant Temperature (ECT) sensor circuit - ECT sensor - ECM	Comes on	DTC stored	Click here
P0116	Engine Coolant Temperature Circuit Range / Performance Problem	- Thermostat - ECT sensor	Comes on	DTC stored	Click here
P0117	Engine Coolant Temperature Circuit Low Input	- Short in Engine Coolant Temperature (ECT) sensor circuit - ECT sensor - ECM	Comes on	DTC stored	Click here
P0118	Engine Coolant Temperature Circuit High Input	- Open in Engine Coolant Temperature (ECT) sensor circuit - ECT sensor - ECM	Comes on	DTC stored	Click here
P0120	Throttle / Pedal Position Sensor / Switch "A" Circuit Malfunction	- Throttle Position (TP) sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0121	Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem	TP sensor (built into throttle body)	Comes on	DTC stored	Click here
P0122	Throttle / Pedal Position Sensor / Switch "A" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA1 circuit - Open in VC circui - ECM	Comes on	DTC stored	Click here
P0123	Throttle / Pedal Position Sensor / Switch "A" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA1 circuit - Open in E2 circuit - Short between VC and VTA1 circuits - ECM	Comes on	DTC stored	Click here
P0136	Oxygen Sensor Circuit Malfunction (Bank 1 Sensor 2)	- Open or short in HO2 sensor (for bank 1) circuit - HO2 sensor (for bank 1) - HO2 sensor heater (for bank 1) - Air-fuel Ratio (A/F) sensor (for bank 1) - Integration relay - as leakage from exhaust system	Comes on	DTC stored	Click here

P0137	Oxygen Sensor Circuit Low Voltage (Bank 1 Sensor 2)	- Open in HO2 sensor (for bank 1) circuit - HO2 sensor (for bank 1) - HO2 sensor heater (for bank 1) - Integration relay - as leakage from exhaust system	Comes on	DTC stored	Click here
P0138	Oxygen Sensor Circuit High Voltage (Bank 1 Sensor 2)	- Short in HO2 sensor (for bank 1) circuit - HO2 sensor (for bank 1) - ECM internal circuit malfunction - Air-Fuel ratio (A/F) sensor (for bank 1)	Comes on	DTC stored	Click here
P0156	Oxygen Sensor Circuit Malfunction (Bank 2 Sensor 2)	- Open or short in HO2 sensor (for bank 2) circuit - HO2 sensor (for bank 2) - HO2 sensor heater (for bank 2) - Air-fuel Ratio (A/F) sensor (for bank 2) - Integration relay - as leakage from exhaust system	Comes on	DTC stored	Click here
P0157	Oxygen Sensor Circuit Low Voltage (Bank 2 Sensor 2)	- Open in HO2 sensor (for bank 2) circuit - HO2 sensor (for bank 2) - HO2 sensor heater (for bank 2) - Integration relay - as leakage from exhaust system	Comes on	DTC stored	Click here
P0158	Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)	- Short in HO2 sensor (for bank 2) circuit - HO2 sensor (for bank 2) - ECM internal circuit malfunction - Air-Fuel ratio (A/F) sensor (for bank 2)	Comes on	DTC stored	Click here
P0171	System Too Lean (Bank 1)	- Air induction system - In ector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - as leakage from exhaust system - Open or short in Air-Fuel Ratio (A/F) sensor (for sensor 1) circuit - A/F sensor (for sensor 1) - A/F sensor heater (for sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
P0172	System Too Rich (Bank 1)	- In ector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure - as leakage from exhaust system - Open or short in A/F sensor (for sensor 1) circuit - A/F sensor (for sensor 1) - A/F sensor heater (for sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM	Comes on	DTC stored	Click here
P0174	System Too Lean (Bank 2)	- Air induction system - In ector blockage - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Fuel pressure - as leakage from exhaust system - Open or short in Air-Fuel Ratio (A/F) sensor (for sensor 1) circuit - A/F sensor (for sensor 1) - A/F sensor heater (for sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - PCV valve and hose - PCV hose connections - ECM	Comes on	DTC stored	Click here
P0175	System Too Rich (Bank 2)	- In ector leakage or blockage - MAF meter - ECT sensor - Ignition system - Fuel pressure - as leakage from exhaust system - Open or short in A/F sensor (for sensor 1) circuit - A/F sensor (for sensor 1)	Comes on	DTC stored	Click here

		- A/F sensor heater (for sensor 1) - Integration relay - A/F sensor heater and integration relay circuits - ECM			
P0220	Throttle / Pedal Position Sensor / Switch "B" Circuit	- TP sensor (built into throttle body) - ECM	Comes on	DTC stored	Click here
P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input	- TP sensor (built into throttle body) - Short in VTA2 circuit - Open in VC circuit - ECM	Comes on	DTC stored	Click here
P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input	- TP sensor (built into throttle body) - Open in VTA2 circuit - Open in E2 circuit - Short between VC and VTA2 circuits - ECM	Comes on	DTC stored	Click here
P0230	Fuel Pump Primary Circuit	- Open or short in fuel pump circuit - Fuel pump - Fuel pump EC - ECM	-	DTC stored	Click here
P0300	Random / Multiple Cylinder Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0301	Cylinder 1 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0302	Cylinder 2 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0303	Cylinder 3 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure	Comes on/Blinks*	DTC stored	Click here

		- Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM			
P0304	Cylinder 4 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0305	Cylinder 5 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0306	Cylinder 6 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0307	Cylinder 7 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure - Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM	Comes on/Blinks*	DTC stored	Click here
P0308	Cylinder 8 Misfire Detected	- Open or short in engine wire harness - Connector connection - Vacuum hose connections - Ignition system - Fuel in ector - Fuel pressure - Mass Air Flow (MAF) meter - Engine Coolant Temperature (ECT) sensor - Compression pressure	Comes on/Blinks*	DTC stored	Click here

		- Valve clearance - Valve timing - PCV valve and hose - PCV hose connections - Air induction system - ECM			
P0327	Knock Sensor 1 Circuit Low Input (Bank 1 or Single Sensor)	- Short in knock sensor circuit - Knock sensor - ECM	Comes on	DTC stored	Click here
P0328	Knock Sensor 1 Circuit High Input (Bank 1 or Single Sensor)	- Open in knock sensor circuit - Knock sensor - ECM	Comes on	DTC stored	Click here
P0332	Knock Sensor 2 Circuit Low Input (Bank 2)	- Short in knock sensor circuit - Knock sensor - ECM	Comes on	DTC stored	Click here
P0333	Knock Sensor 2 Circuit High Input (Bank 2)	- Short in knock sensor circuit - Knock sensor - ECM	Comes on	DTC stored	Click here
P0335	Crankshaft Position Sensor "A" Circuit	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	Comes on	DTC stored	Click here
P0339	Crankshaft Position Sensor "A" Circuit Intermittent	- Open or short in CKP sensor circuit - CKP sensor - CKP sensor plate - ECM	-	DTC stored	Click here
P0340	Camshaft Position Sensor Circuit Malfunction	- Open or short in VVT sensor circuit - VVT sensor - Intake camshaft - Timing belt has a umped tooth - ECM	Comes on	DTC stored	Click here
P0345	Camshaft Position Sensor "A" Circuit (Bank 2)	- Open or short in VVT sensor circuit - VVT sensor - Intake camshaft - Timing belt has a umped tooth - ECM	Comes on	DTC stored	Click here
P0351	Ignition Coil "A" Primary / Secondary Circuit	- Ignition system - Open or short in I F1 or I T 1 circuit between ignition coil and ECM - No. 1 ignition coils - ECM	Comes on	DTC stored	Click here
P0352	Ignition Coil "B" Primary / Secondary Circuit	- Ignition system - Open or short in I F2 or I T 2 circuit between ignition coil and ECM - No. 2 ignition coils - ECM	Comes on	DTC stored	Click here
P0353	Ignition Coil "C" Primary / Secondary Circuit	- Ignition system - Open or short in I F2 or I T 3 circuit between ignition coil and ECM - No. 3 ignition coils - ECM	Comes on	DTC stored	Click here
P0354	Ignition Coil "D" Primary / Secondary Circuit	- Ignition system - Open or short in I F1 or I T 4 circuit between ignition coil and ECM - No. 4 ignition coils - ECM	Comes on	DTC stored	Click here
P0355	Ignition Coil "E" Primary / Secondary Circuit	- Ignition system - Open or short in I F2 or I T 5 circuit between ignition coil and ECM - No. 5 ignition coils - ECM	Comes on	DTC stored	Click here
P0356	Ignition Coil "F" Primary / Secondary Circuit	- Ignition system - Open or short in I F1 or I T 6 circuit between ignition coil and ECM - No. 6 ignition coils - ECM	Comes on	DTC stored	Click here
P0357	Ignition Coil " " Primary / Secondary Circuit	- Ignition system - Open or short in I F1 or I T 7 circuit between ignition coil and ECM - No. 7 ignition coils - ECM	Comes on	DTC stored	Click here

P0358	Ignition Coil "H" Primary / Secondary Circuit	- Ignition system - Open or short in I F2 or I T 8 circuit between ignition coil and ECM - No. 8 ignition coils - ECM	Comes on	DTC stored	Click here
P0412	Secondary Air In ection System Switching Valve "A" Circuit	- ASV circuit - Air in ection control driver - Air switching valve	Comes on	DTC stored	Click here
P0418	Secondary Air In ection System Control "A" Circuit	- Air pump circuit - Air pump - Air in ection control driver	Comes on	DTC stored	Click here
P0420	Catalyst System Efficiency Below Threshold (Bank 1)	- Front exhaust pipe (with TWC) - as leakage from exhaust system - Air-Fuel Ratio (A/F) sensor (for bank 1 sensor 1) - Heated Oxygen (HO2) sensor (for bank 1 sensor 2)	Comes on	DTC stored	Click here
P0430	Catalyst System Efficiency Below Threshold (Bank 2)	- Front No. 2 exhaust pipe (with TWC) - as leakage from exhaust system - Air-Fuel Ratio (A/F) sensor (for bank 2 sensor 1) - Heated Oxygen (HO2) sensor (for bank 2 sensor 2)	Comes on	DTC stored	Click here
P0443	Evaporative Emission Control System Purge Control Valve Circuit	- Open or short in purge VSV circuit - Purge VSV - ECM	Comes on	DTC stored	Click here
P0500	Vehicle Speed Sensor "A"	- Open or short in speed signal circuit - Wheel speed sensor - Combination meter - ECM - Skid control EC	Comes on	DTC stored	Click here

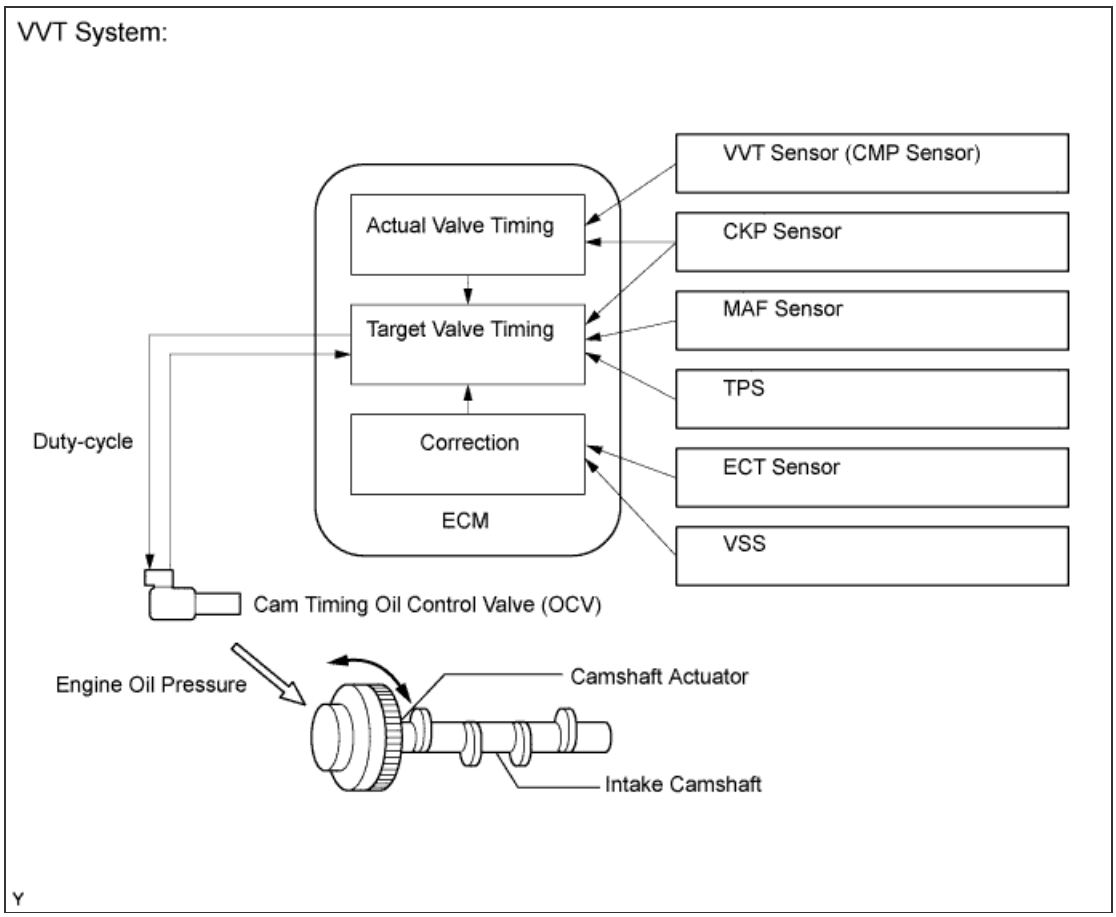
0101	Lost Communication with TCM	- Open or short in TCM and ECM circuit - TCM - ECM	Comes on	DTC stored	Click here

HINT:

* The MIL flashes when a catalyst damaged misfire is detected.



DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

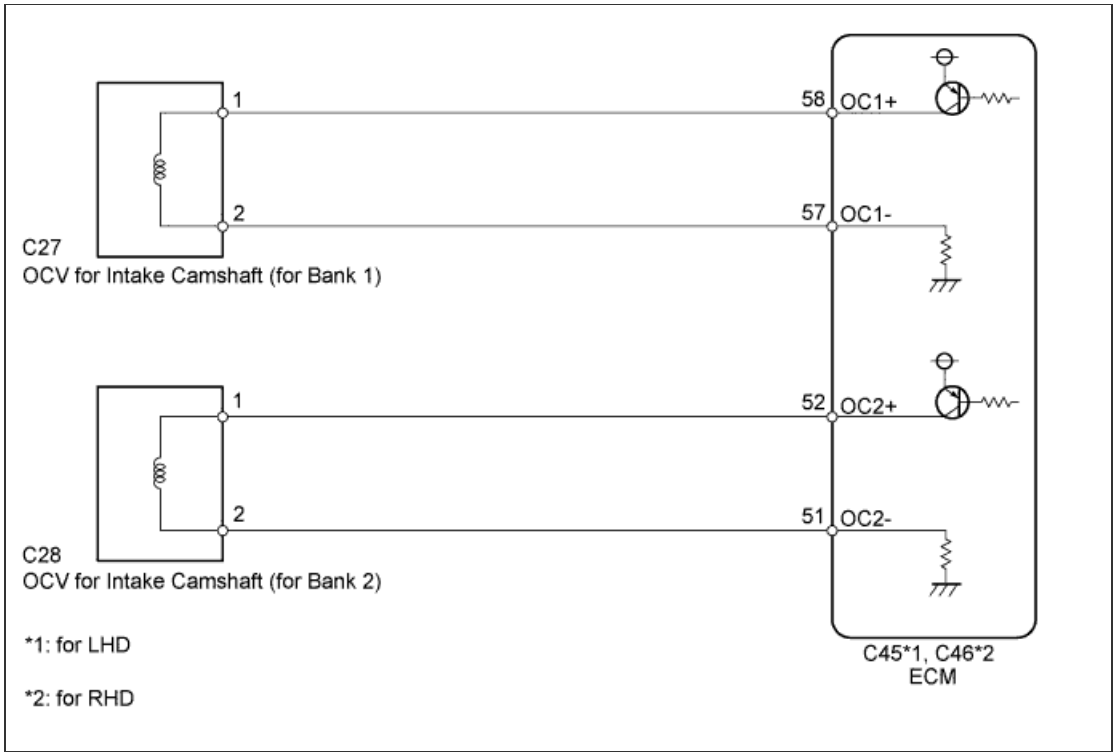
DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the cam timing oil control valve (OCV) circuit. If the duty-cycle of the OCV is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the Cam Timing Oil Control Valve (OCV) (for intake side of bank 1) circuit (1 trip detection logic).	• Open or short in Cam Timing Oil Control Valve (OCV) (for intake side of bank 1) circuit • OCV (for intake side of bank 1) • ECM
P0020	An open or short in the Cam Timing Oil Control Valve (OCV) (for intake side of bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for intake side of bank 2) circuit • OCV (for intake side of bank 2) • ECM



HINT:

This DTC relates to the Oil Control Valve (OCV).

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the cam Timing oil control valve (OCV) circuit. If the duty-cycle of the OCV is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear DTC after recording the freeze frame data and DTC (Click here).

b. Turn the engine switch off.

c. Allow the engine to idle and check for DTC.

d. Check that P0010 or P0020 is not output.

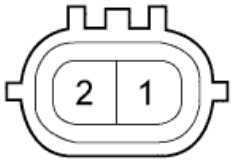
OK:
P0010 or P0020 is not output.

NG → Go to step 2

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAM TIMING OIL CONTROL VALVE ASSEMBLY



a. Disconnect the OCV connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAM TIMING OIL CONTROL VALVE ASSEMBLY (Click here)

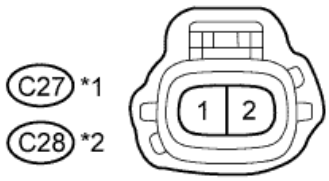
OK

3.CHECK HARNESS AND CONNECTOR (CAM TIMING OIL CONTROL VALVE ECM)

a. Disconnect the OCV connector.

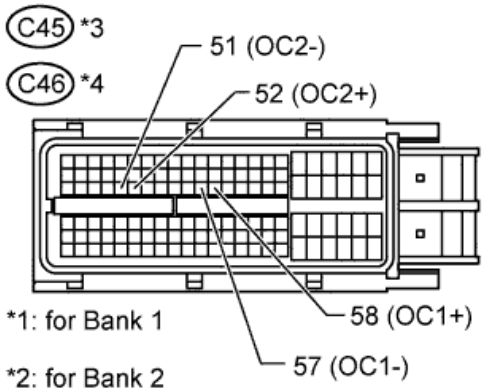
b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C27-1 - C45-58 (OC1+)	Always	Below 1 Ω
C28-1 - C45-52 (OC2+)	Always	Below 1 Ω
C27-2 - C45-57 (OC1-)	Always	Below 1 Ω
C28-2 - C45-51 (OC2-)	Always	Below 1 Ω
C27-1 or C45-58 (OC1+) - Body ground	Always	10 kΩ or higher
C28-1 or C45-52 (OC2+) - Body ground	Always	10 kΩ or higher
C27-2 or C45-57 (OC1-) - Body ground	Always	10 kΩ or higher
C28-2 or C45-51 (OC2-) - Body ground	Always	10 kΩ or higher



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C27-1 - C46-58 (OC1+)	Always	Below 1 Ω
C28-1 - C46-52 (OC2+)	Always	Below 1 Ω
C27-2 - C46-57 (OC1-)	Always	Below 1 Ω
C28-2 - C46-51		

Front view of wire harness connector:
(to Oil Control Valve)

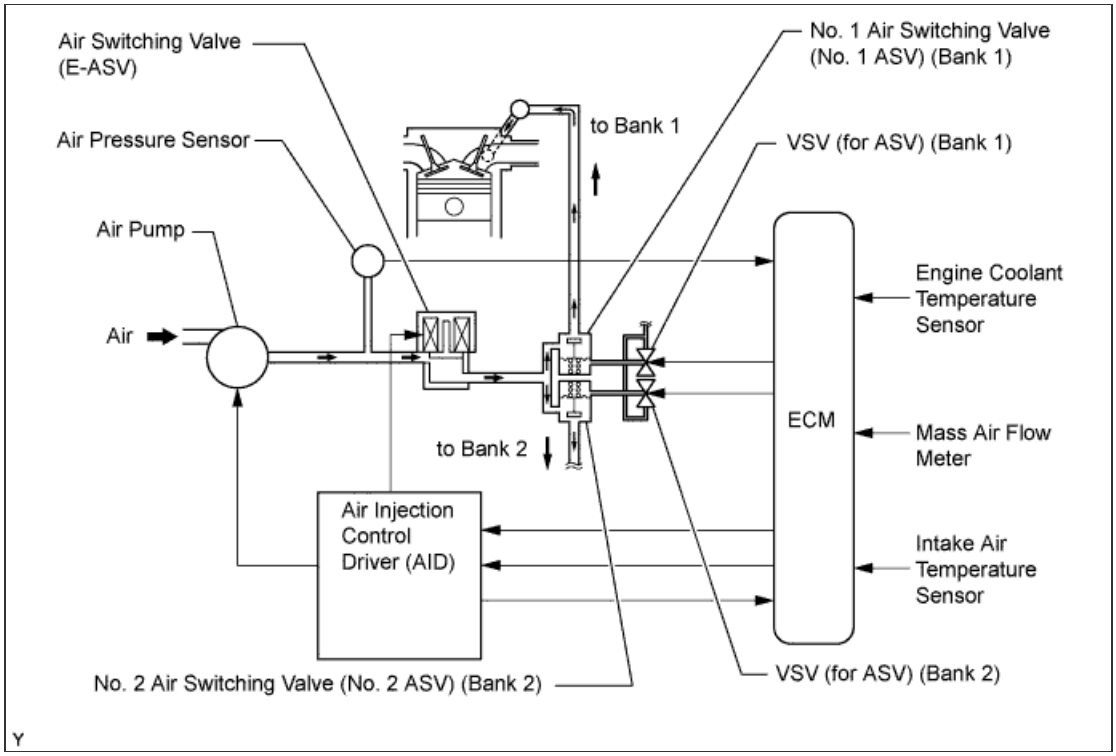
*3: for LHD

*4: for RHD

(OC2-)	Always	Below 1 Ω
C27-1 or C46-58 (OC1+) - Body ground	Always	10 kΩ or higher
C28-1 or C46-52 (OC2+) - Body ground	Always	10 kΩ or higher
C27-2 or C46-57 (OC1-) - Body ground	Always	10 kΩ or higher
C28-2 or C46-51 (OC2-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



REPLACE ECM (Click here)

DTC P0418 Secondary Air Injection System Control "A" Circuit

for Preparation Click here

DESCRIPTION

The diagnostic trouble code (DTC) indicates an open or short in the air pump circuit of the secondary air injection (AIR) system. The air injection control driver diagnoses the air pump circuit, E-ASV circuit and itself, and sends the diagnosis signal to the engine control module (ECM). If the ECM receives a malfunction signal from the air injection control driver, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.
The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after the engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

DTC Code	DTC Detection Condition	Trouble Area
P0418	The ECM receives a diagnostic signal from the driver (20% duty-cycle) (1 trip detection logic).	• Air pump circuit • Air pump • Air injection control driver

WIRING DIAGRAM

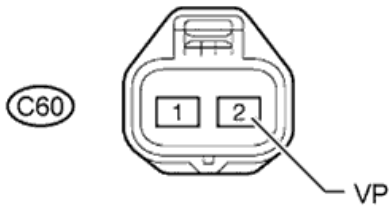
Refer to DTC P0412 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air -fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (AIR INJECTION CONTROL DRIVER - BODY GROUND)



a. Disconnect the air injection control driver connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C60-2 (VP) - Body ground	Always	0.4 to 1.0 Ω

Front view of wire harness connector:
(to Air Injection Control Driver)

NG → Go to step 2

OK

REPLACE AIR INJECTION CONTROL DRIVER (Click here)

2.INSPECT AIR PUMP

a. Remove the intake manifold (Click here).

b. Disconnect the air pump connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Always	0.4 to 1.0 Ω

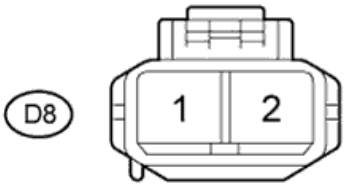
Component without harness connected:
(Air Pump)

NG → REPLACE AIR PUMP (Click here)

OK

3.CHECK HARNESS AND CONNECTOR (AIR PUMP - BODY GROUND)

a. Remove the intake manifold (Click here).



b. Disconnect the air pump connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
D8-1 - Body ground	Always	Below 1 Ω

Front view of wire harness connector:
(to Air Pump)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

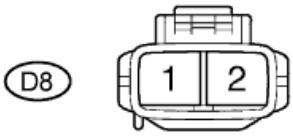
4.CHECK HARNESS AND CONNECTOR (AIR INJECTION CONTROL DRIVER - AIR PUMP)

a. Remove the intake manifold (Click here).

b. Disconnect the air injection control driver connector.

c. Disconnect the air pump connector.

d. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C60-2 (VP) - D8-2	Always	Below 1 Ω
C60-2 (VP) or D8-2 - Body ground	Always	10 kΩ higher

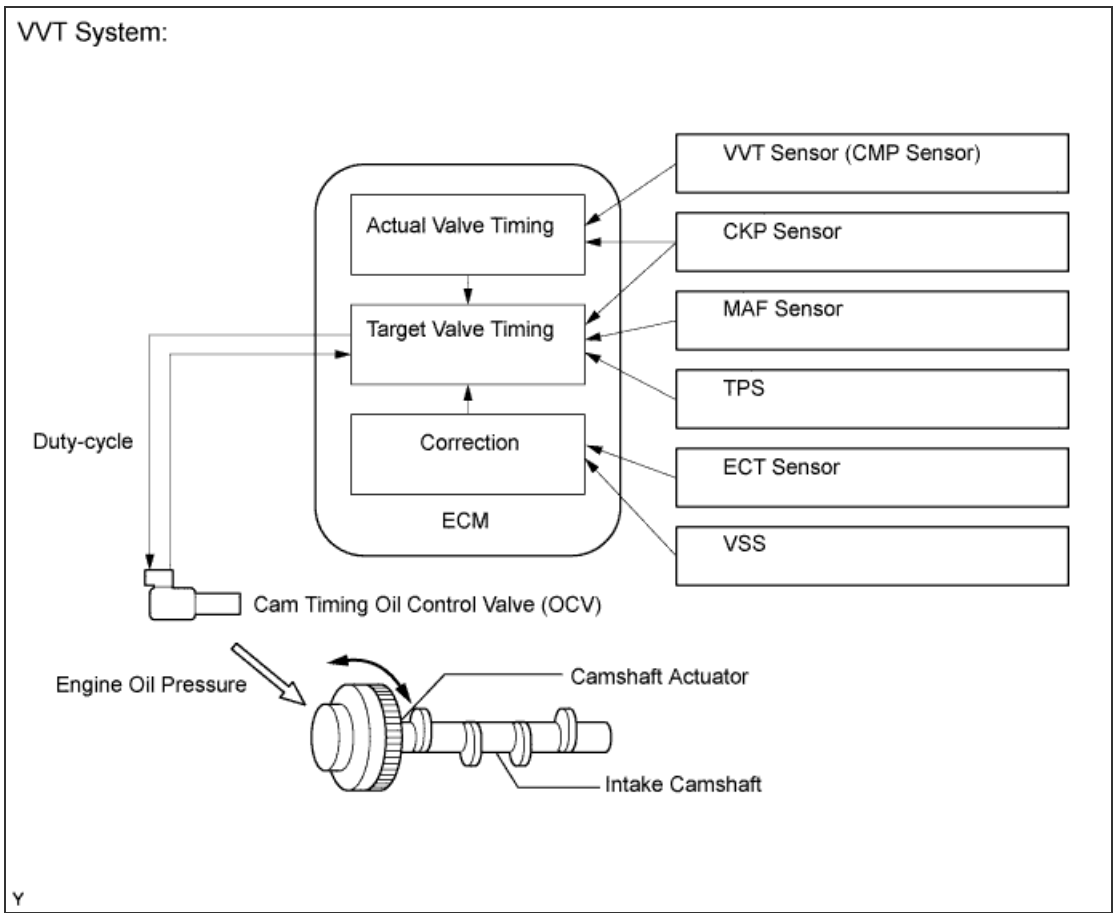
Front view of wire harness connector:
(to Air Injection Control Driver)

Front view of wire harness connector:
(to Air Pump)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)



DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

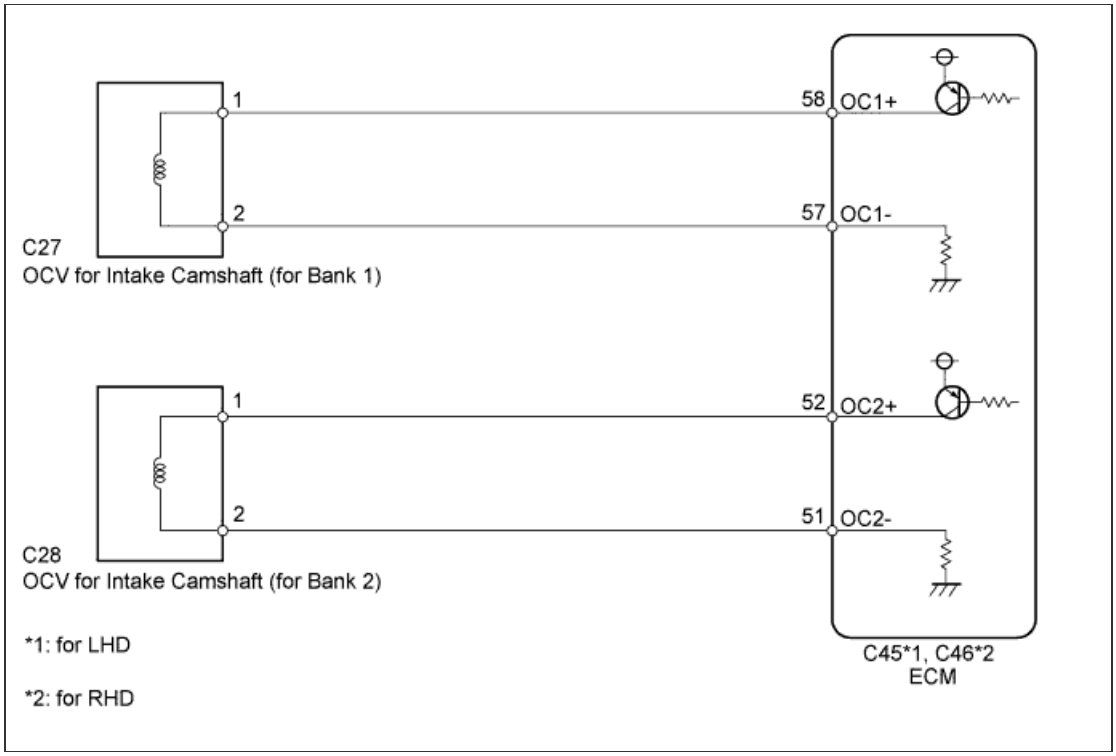
DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the cam timing oil control valve (OCV) circuit. If the duty-cycle of the OCV is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the Cam Timing Oil Control Valve (OCV) (for intake side of bank 1) circuit (1 trip detection logic).	• Open or short in Cam Timing Oil Control Valve (OCV) (for intake side of bank 1) circuit • OCV (for intake side of bank 1) • ECM
P0020	An open or short in the Cam Timing Oil Control Valve (OCV) (for intake side of bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for intake side of bank 2) circuit • OCV (for intake side of bank 2) • ECM



HINT:

This DTC relates to the Oil Control Valve (OCV).

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the cam Timing oil control valve (OCV) circuit. If the duty-cycle of the OCV is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

OK

REPLACE ECM (Click here)

DTC P0420 Catalyst System Efficiency Below Threshold (Bank 1)

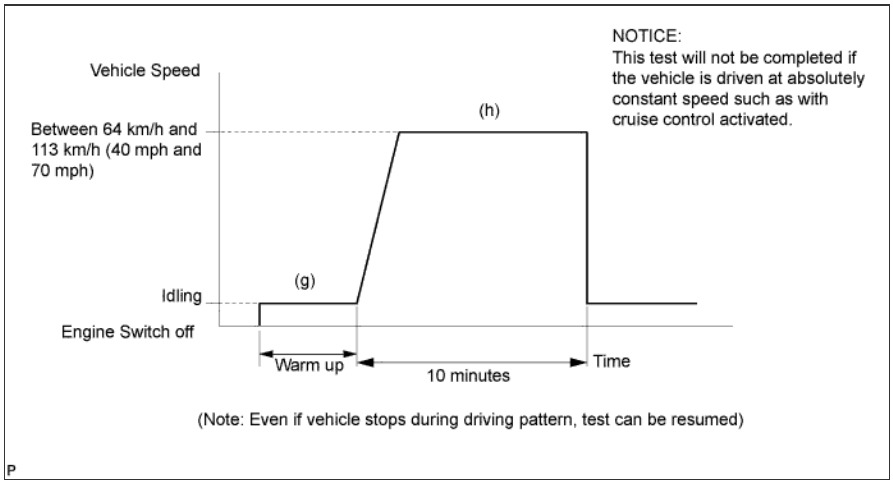
DTC P0430 Catalyst System Efficiency Below Threshold (Bank 2)

for Preparation Click here

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air-Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM. In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and stores the DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Front exhaust pipe (with TWC) • Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (for bank 1 sensor 1) • Heated Oxygen (HO2) sensor (for bank 1 sensor 2)
P0430	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Front No. 2 exhaust pipe (with TWC) • Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (for bank 2 sensor 1) • Heated Oxygen (HO2) sensor (for bank 2 sensor 2)



HINT:

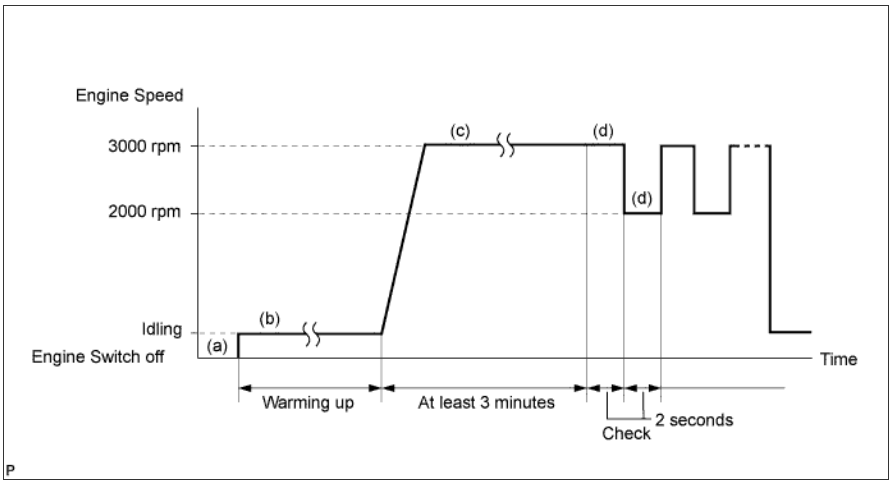
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (if output) (Click here).
(e) Enter the following menus: Powertrain / Engine and ECT / Utility / Monitor Status.
(f) Check that Catalyst is Incomplete.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to Complete as the Catalyst Monitor CMPL monitor operates.
(j) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are output.

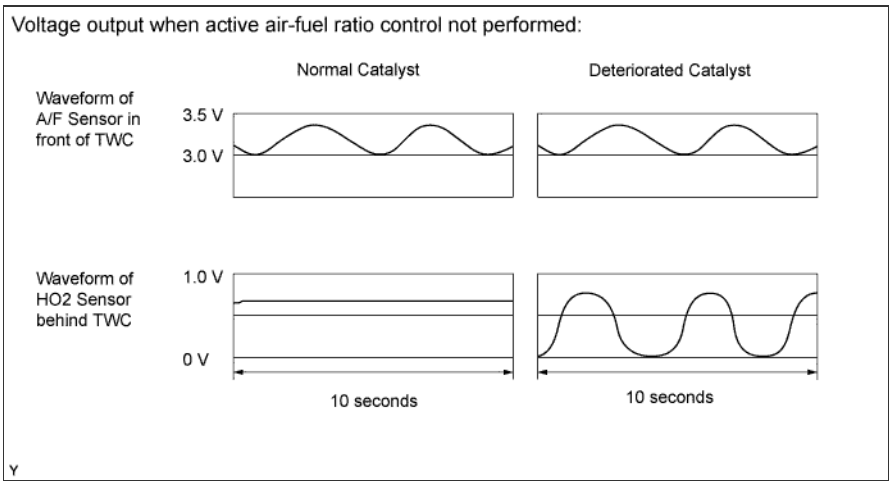


HINT:

If Catalyst Monitor CMPL does not change to Complete, and any pending DTCs fail to store, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:



Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched off until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While running the engine at 3000 rpm and 2000 rpm at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.

HINT:

- **If either voltage output of the A/F or Heated Oxygen (HO2) sensor does not fluctuate, or there is noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following Control the Injection Volume for A/F Sensor using the intelligent tester.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0420 or P0430 is output	A
P0420 or P0430 and other DTCs are output	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

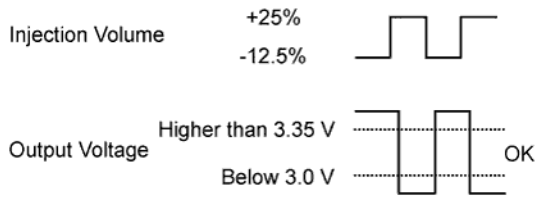
2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

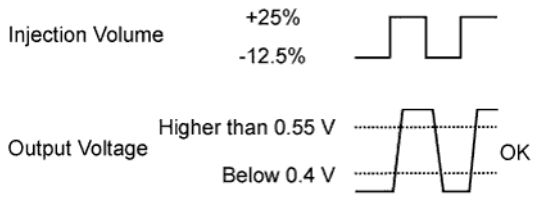
a. Connect the intelligent tester to the DLC3.

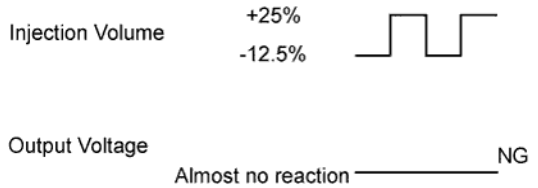
b. Start the engine and turn the tester on.

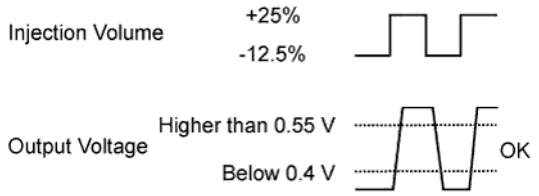
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

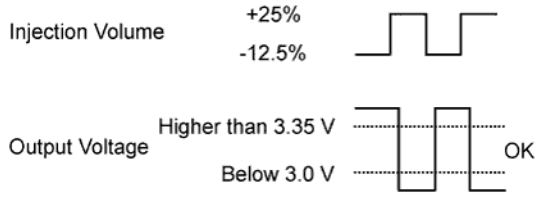
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

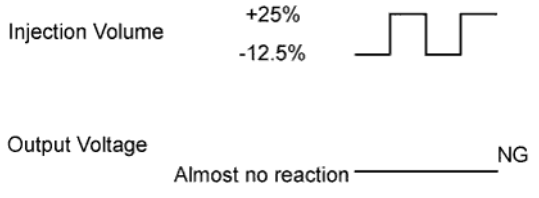


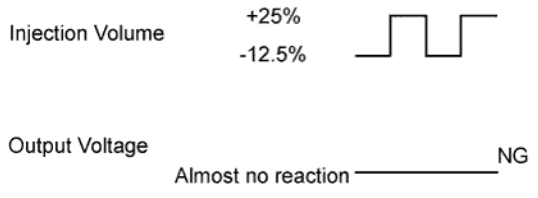


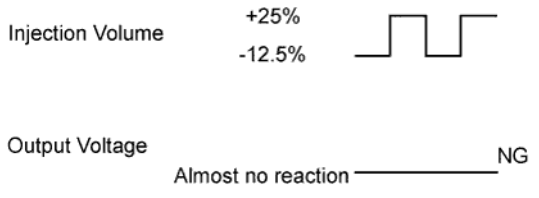












e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

Result

Result	Proceed to
Case 1	A
Case 2	B
Case 3	C
Case 4	D

B → REPLACE AIR FUEL RATIO SENSOR (Click here)

C → Go to step 5

D → CHECK CAUSE OF EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO, REPLACE FAULTY AREA AND GO TO NEXT STEP

A

3.INSPECT FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK

4.CHECK DTC OUTPUT (DTC P0420 AND/OR P0430)

a. According to the DTCs output in the first step (Check Any Other DTCs Output), proceed to the next step by referring to the table below.

Result

Result	Proceed to
P0420 is output	A
P0430 is output	B
P0420 and P0430 is output	A and B

B → REPLACE FRONT NO. 2 EXHAUST PIPE ASSEMBLY (Click here)

A

REPLACE FRONT EXHAUST PIPE ASSEMBLY (Click here)

5.INSPECT FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

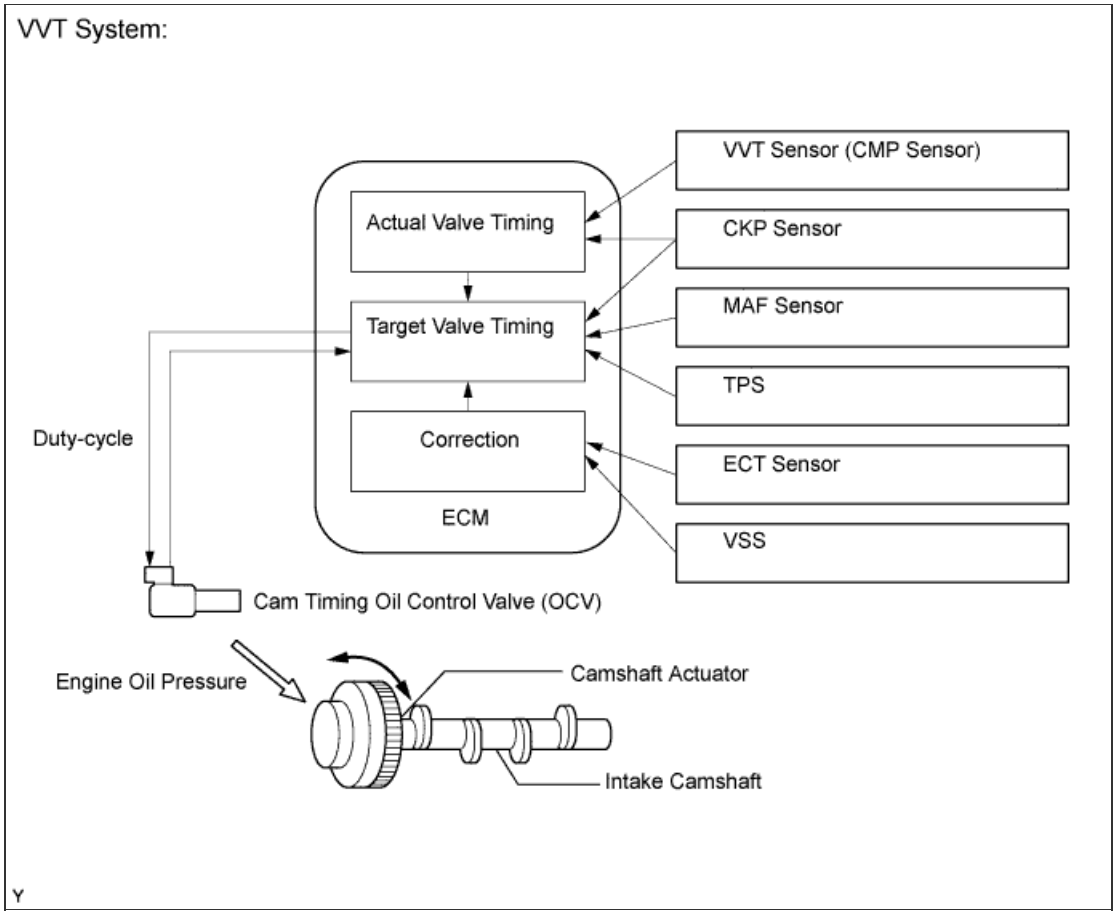
NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK

REPLACE HEATED OXYGEN SENSOR (Click here)

DTC P0011 Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)

DTC P0012 Camshaft Position "A" - Timing Over-Retarded (Bank 1)



DTC P0021 Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)

DTC P0022 Camshaft Position "A" - Timing Over-Retarded (Bank 2)

for Preparation Click here

DESCRIPTION

The VVT system includes the ECM, Cam Timing Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Cam Timing Oil Control Valve (OCV) for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM
P0012 P0022	The valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system

includes the ECM, the Cam Timing Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores a DTC.

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5°CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated 63 times or more.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHEC ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → **GO TO DTC CHART (Click here)**

A

2.PERFORM ACTIVE TEST USING INTE IGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

O

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → Go to step 4

O

CHEC WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.

O :
No DTC output.

NG → Go to step 4

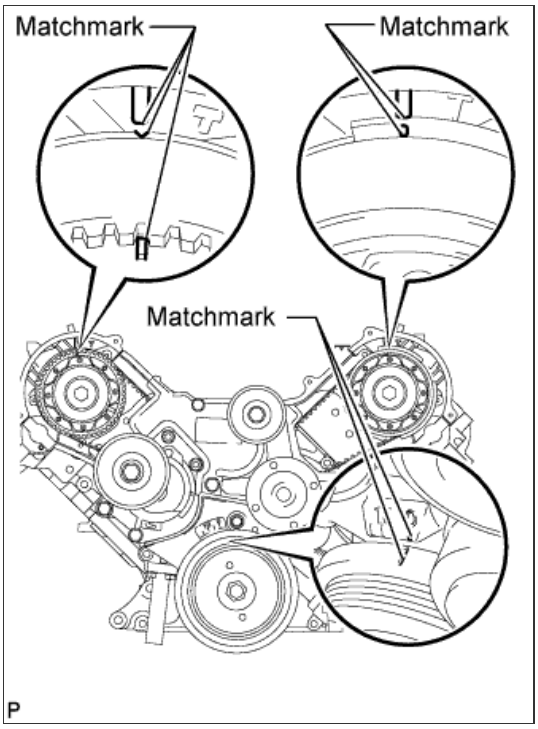
O

CHEC OR INTERMITTENT PROB EMS (**Click here**)

4.CHEC A E TIMING (CHEC OR OOSE AND UMPED TOOTH OF TIMING BE T)

a. Remove the drive belt (Click here).

b. Remove the timing belt cover L and R (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the "0" position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360°. Confirm again if the matchmarks are facing each other.

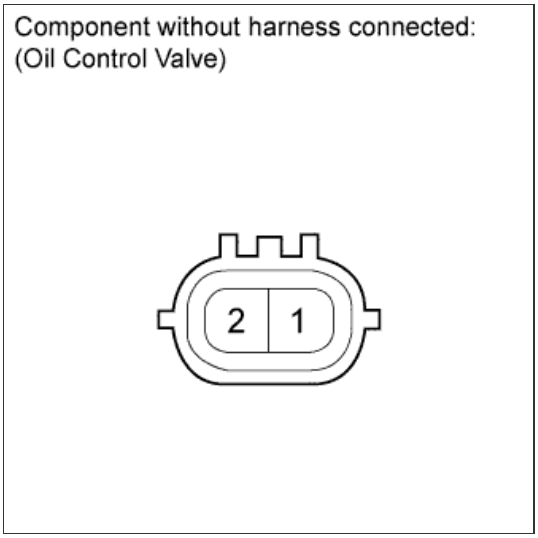
O :
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → AD UST VA E TIMING (Click here)

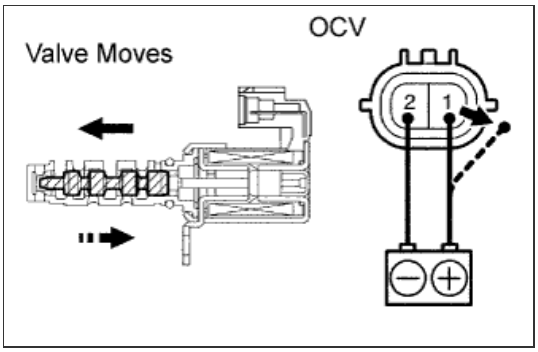
O

INSPECT CAM TIMING OI CONTRO A E ASSEMB (OCV)

a. Remove the OCV.



b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

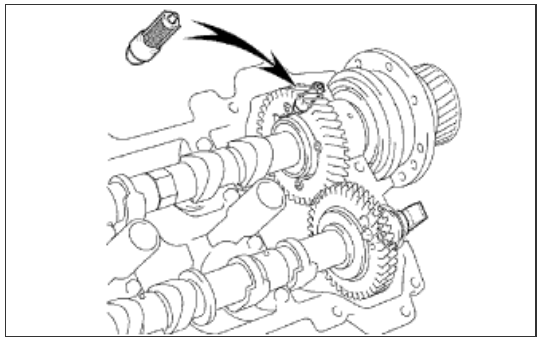
Tester Connection	Condition	Specified Condition
1 - 2	20°C (6 °F)	6. to 7. Ω

c. Apply positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.

O :
Valve moves quickly.

NG → REP ACE CAM TIMING OI CONTRO A E ASSEMB (Click here)

O



INSPECT OI CONTRO A E FI TER

a. Remove the cylinder head cover (Click here).

b. Remove the camshaft bearing cap and OCV filter.

c. Check that the filter is not clogged.

O :
Filter is not clogged.

NG → **CLEAN OIL CONTROL VALVE FILTER**

O

REPLACE CAMSHAFT TIMING TUBE ASSEMB

a. Replace the camshaft timing tube assembly.

HINT:

- **If P0011 or P0012 is output, replace the camshaft timing tube assembly for bank 1 (Click here).**
- **If P0021 or P0022 is output, replace the camshaft timing tube assembly for bank 2 (Click here).**

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read output DTCs using the tester.

O :
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → **REPLACE ECM (Click here)**

SYSTEM O

DTC P0420 Catalyst System Efficiency Below Threshold (Bank 1)

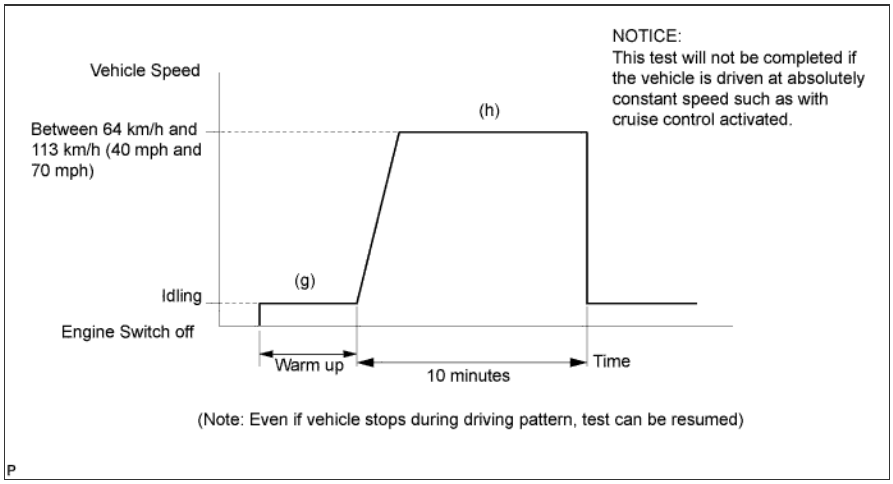
DTC P0430 Catalyst System Efficiency Below Threshold (Bank 2)

for Preparation Click here

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air-Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM. In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air-fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air-fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air-fuel ratio to lean or rich levels. If the rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and stores the DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Front exhaust pipe (with TWC) • Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (for bank 1 sensor 1) • Heated Oxygen (HO2) sensor (for bank 1 sensor 2)
P0430	The OSC value is less than the standard value under active air-fuel ratio control (2 trip detection logic).	• Front No. 2 exhaust pipe (with TWC) • Gas leakage from exhaust system • Air-Fuel Ratio (A/F) sensor (for bank 2 sensor 1) • Heated Oxygen (HO2) sensor (for bank 2 sensor 2)



HINT:

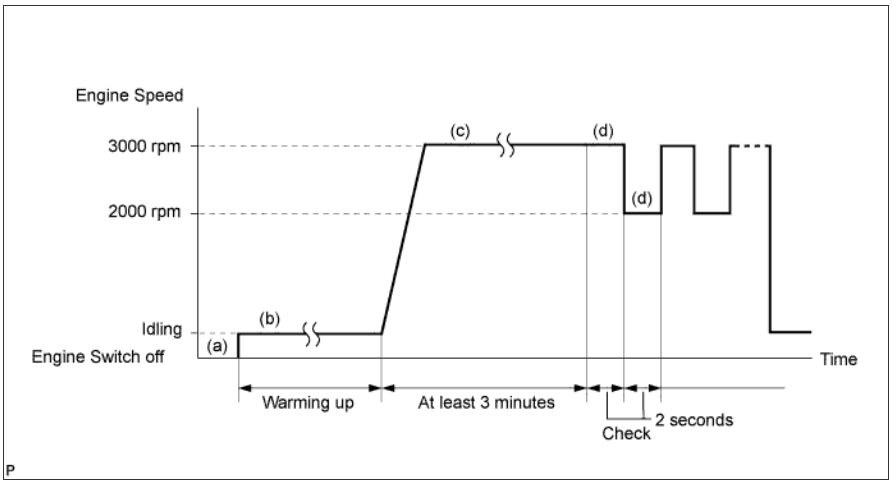
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the catalyst monitor. This is very useful for verifying the completion of a repair.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (if output) (Click here).
(e) Enter the following menus: Powertrain / Engine and ECT / Utility / Monitor Status.
(f) Check that Catalyst is Incomplete.
(g) Start the engine and warm it up.
(h) Drive the vehicle at between 64 km/h and 113 km/h (40 mph and mph) for at least 10 minutes.
(i) Note the state of the Readiness Tests items. Those items will change to Complete as the Catalyst Monitor CMPL monitor operates.
(j) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are output.

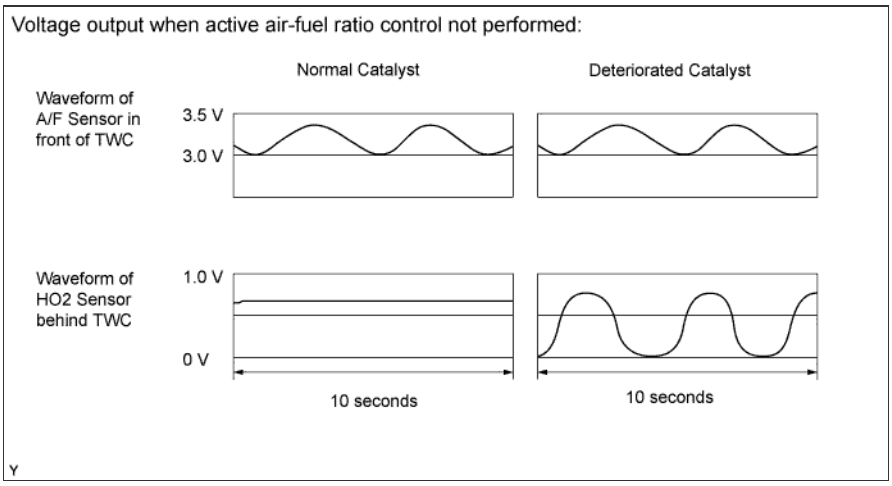


HINT:

If Catalyst Monitor CMPL does not change to Complete, and any pending DTCs fail to store, extend the driving time.

CONDITIONING FOR SENSOR TESTING

HINT:



Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched off until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While running the engine at 3000 rpm and 2000 rpm at 2 second intervals, check the waveforms of the A/F and HO2 sensors using the tester.

HINT:

- **If either voltage output of the A/F or Heated Oxygen (HO2) sensor does not fluctuate, or there is noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air-fuel ratio may be extremely lean or rich. In such cases, perform the following Control the Injection Volume for A/F Sensor using the intelligent tester.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air-fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0420 or P0430 is output	A
P0420 or P0430 and other DTCs are output	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

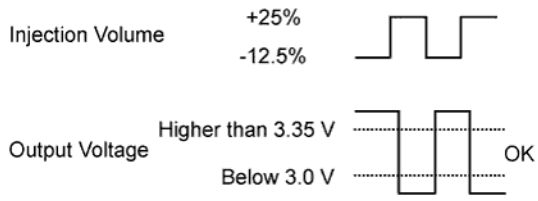
2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

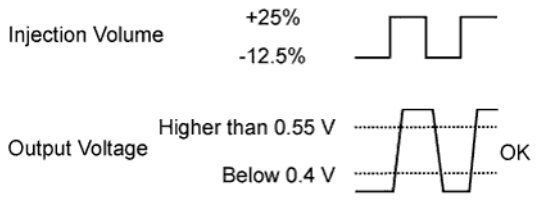
a. Connect the intelligent tester to the DLC3.

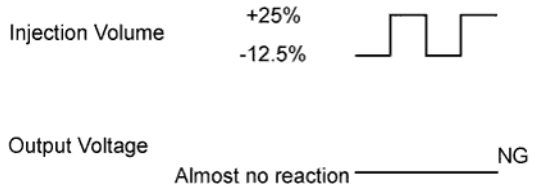
b. Start the engine and turn the tester on.

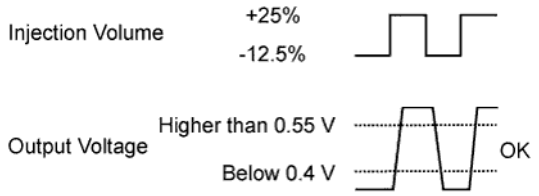
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

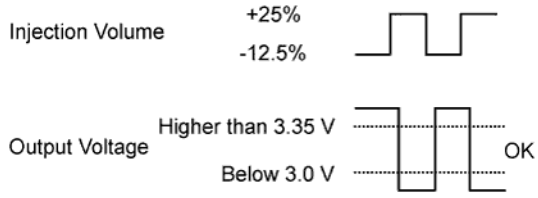
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

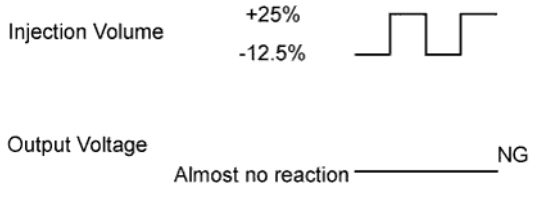


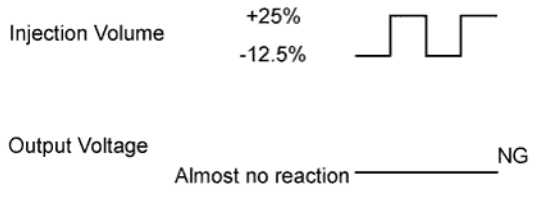


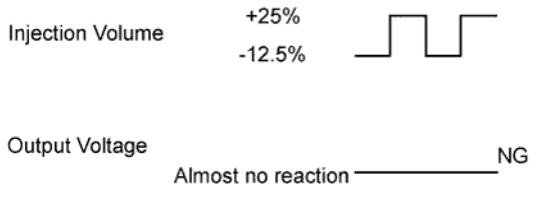












e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
A/F sensor reacts in accordance with increases and decreases in fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

for Preparation Click here

DESCRIPTION

The VVT system includes the ECM, Cam Timing Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Cam Timing Oil Control Valve (OCV) for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM
P0012 P0022	The valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system

includes the ECM, the Cam Timing Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores a DTC.

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5°CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated 63 times or more.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

DESCRIPTION

The VVT system includes the ECM, Cam Timing Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Cam Timing Oil Control Valve (OCV) for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM
P0012 P0022	The valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system

includes the ECM, the Cam Timing Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores a DTC.

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5°CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated 63 times or more.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

O

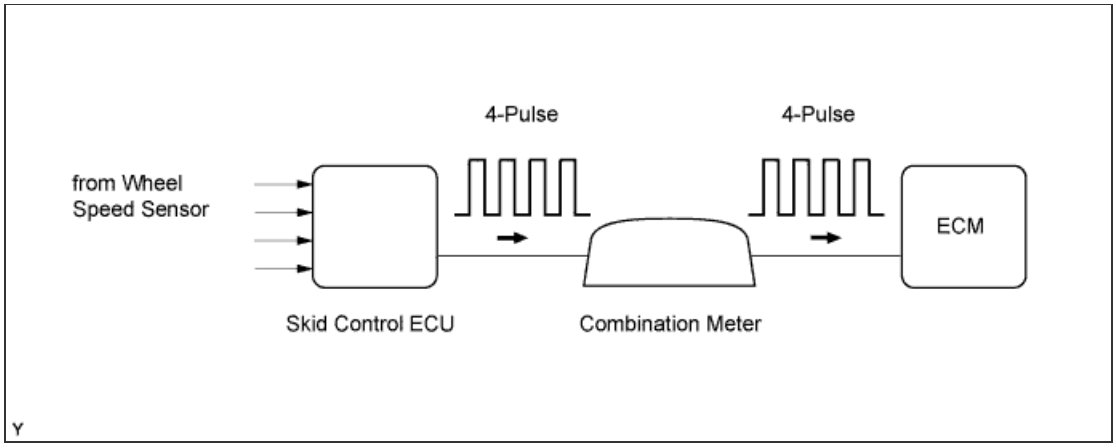
SYSTEM O

DTC P0500 Vehicle Speed Sensor "A"



for Preparation Click here

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.

HINT:

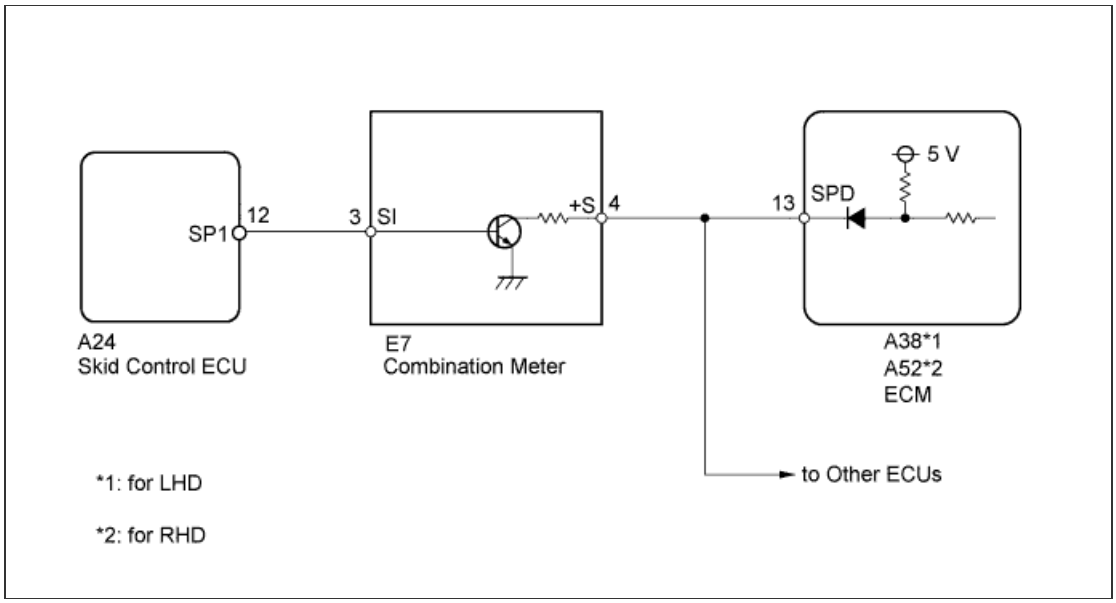
- **A voltage of 12 V or 5 V is output from each ECU and then input to the combination meter. The signal is changed to a pulse signal at the transistor in the combination meter. Each ECU controls the respective system based on the pulse signal.**
- **If a short occurs in any of the ECUs or in the wire harness connected to an ECU, all systems in the diagram below will not operate normally.**



DTC Code	DTC Detection Condition	Trouble Area
P0500	While the vehicle is being driven, no vehicle speed sensor signal is transmitted to the ECM (2 trip detection logic).	• Open or short in speed signal circuit • Combination meter • ECM • Skid control ECU

MONITOR DESCRIPTION

The ECM assumes that the vehicle is being driven when the indicated vehicle speed is more than km/h (5.6 mph). If there is no speed signal from the combination meter despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and stores the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK OPERATION OF SPEEDOMETER

a. Drive the vehicle and check whether the operation of the speedometer in the combination meter is normal.

OK:
Speedometer operation is normal.

HINT:

- **The vehicle speed sensor is operating normally if the speedometer reading is normal.**
- **If the speedometer does not operate, check it by following the procedure described in Speedometer Malfunction (Click here).**

NG → GO TO MALFUNCTION IN SPEEDOMETER (Click here)

OK

2.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPD)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / Vehicle Speed.

e. Drive the vehicle.

f. Read the value displayed on the tester.

OK:
Vehicle speeds displayed on tester and speedometer display are equal.

NG → Go to step 3

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

3.CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - ECM)

a. Disconnect the combination meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

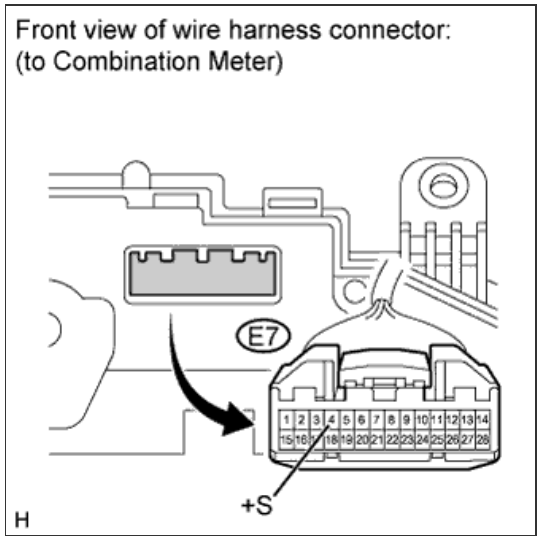
Tester Connection	Condition	Specified Condition
E -4 (+S) - A38- 3 (SPD)	Always	Below Ω
E -4 (+S) or A38- 3 (SPD) - Body ground	Always	0 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
E -4 (+S) - A52- 3 (SPD)	Always	Below Ω
E -4 (+S) or A52- 3 (SPD) - Body ground	Always	0 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK



4.CHECK COMBINATION METER ASSEMBLY (+S VOLTAGE)

a. Disconnect the combination meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
E -4 (+S) - Body ground	Engine switch on (IG)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

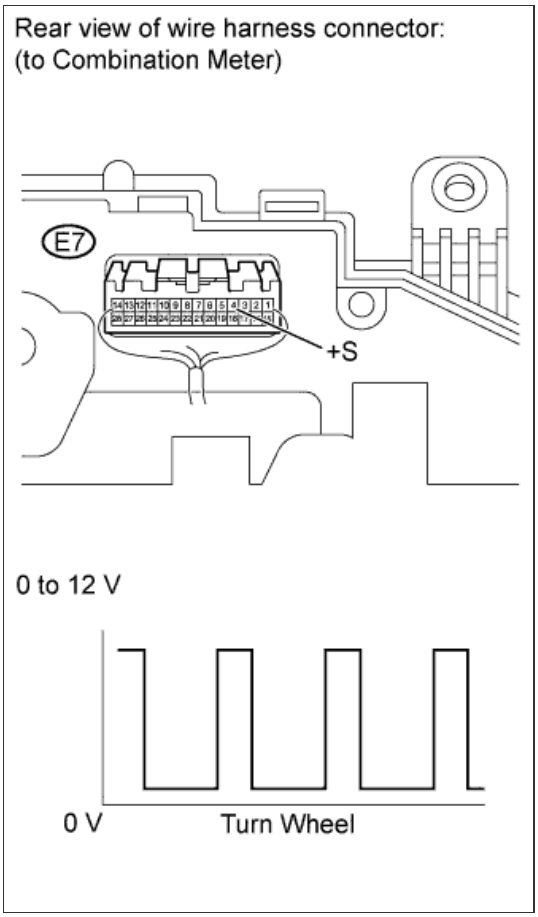
OK

5.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL WAVEFORM)

a. Move the shift lever to N.

b. ack up the vehicle.

c. Measure the voltage according to the value(s) in the table below.



Standard Voltage:

Tester Connection	Condition	Specified Condition
E -4 (+S) - Body ground	• Engine switch on (IG) • Wheel is	Voltage generated intermittently

	turned slowly	

HINT:

The output voltage should fluctuate up and down, similarly to the diagram, when the wheel is turned slowly.

NG → Go to step 6

OK

REPLACE ECM (Click here)

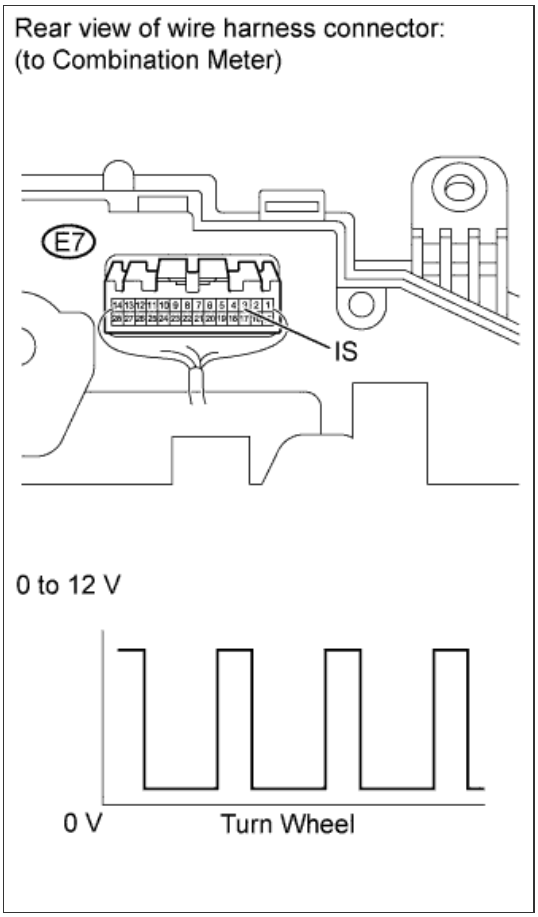
6.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL WAVEFORM)

a. Move the shift lever to N.

b. ack up the vehicle.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Tester Connection	Condition	Specified Condition
E -3 (IS) - Body ground	• Engine switch on (IG) • Wheel is turned slowly	Voltage generated intermittently

DTC P0021 Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)

DTC P0022 Camshaft Position "A" - Timing Over-Retarded (Bank 2)

for Preparation Click here

DESCRIPTION

The VVT system includes the ECM, Cam Timing Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV, based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Cam Timing Oil Control Valve (OCV) for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM
P0012 P0022	The valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV for intake side • OCV filter • Intake camshaft timing tube (for Bank 1, 2) • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system

includes the ECM, the Cam Timing Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores a DTC.

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5°CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5°CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated 63 times or more.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHEC ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to

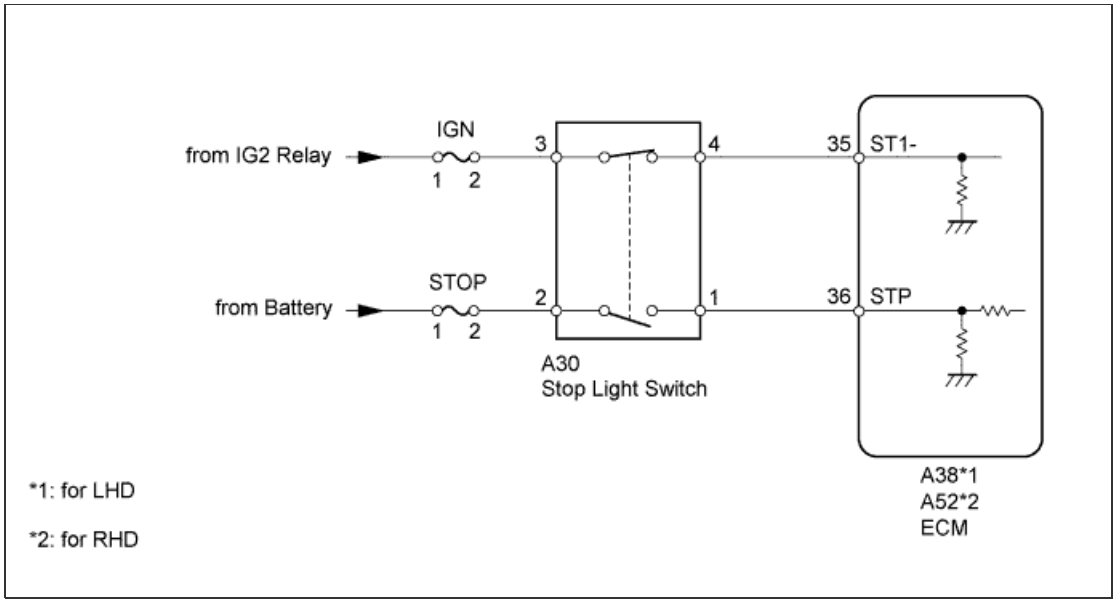
SYSTEM O

DTC P0504 Brake Switch "A" / "B" Correlation

for Preparation Click here

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and stores the DTC.



HINT:

The normal conditions are as shown in the table below. The signals can be read using the intelligent tester.

Signal	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

DTC Code	DTC Detection Condition	Trouble Area
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic): (a) The engine switch is on (IG). (b) The brake pedal is released. (c) The STP signal is OFF when the ST1- signal is OFF.	• Short in stop light switch signal circuit • STOP fuse • IGN fuse • Stop light switch • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

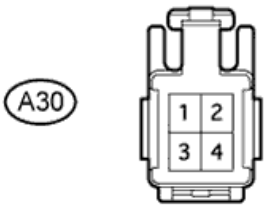
HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **STP signal conditions can be checked using the intelligent tester.**
  - **. Connect the intelligent tester to the DLC3.**
  - **. Turn the engine switch on (IG .**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / All Data / Stop Light Switch.**
  5. **Check the STP signal when the brake pedal is depressed and released.**

Brake Pedal Operation	Specified Condition

Depressed	STP signal ON
Released	STP signal OFF

.CHECK STOP LIGHT SWITCH ASSEMBLY (B+ VOLTAGE



a. Disconnect the stop light switch connector.

b. Measure the oltage according to the alue(s) in the table below.

Standard Voltage:

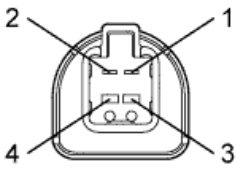
Tester Connection	Condition	Specified Condition
A30-2 - Body ground	Always	11 to 14 V
A30-3 - Body ground	Engine switch on (IG)	11 to 14 V

Front view of wire Harness connector:
(to Stop Light Switch)

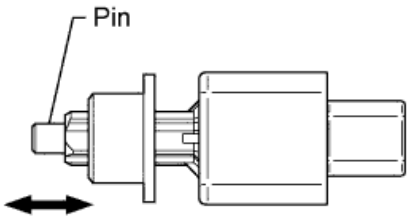
NG → Go to step 4

OK

.INSPECT STOP LIGHT SWITCH ASSEMBLY



a. Remo e the stop light switch.



b. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Switch pin not pushed	Below 1 Ω
	Switch pin pushed	10 kΩ or higher
3 - 4	Switch pin not pushed	10 kΩ or higher
	Switch pin pushed	Below 1 Ω

Component without harness connected:
(Stop Light Switch)

NG → REPLACE STOP LIGHT SWITCH ASSEMBLY (Click here

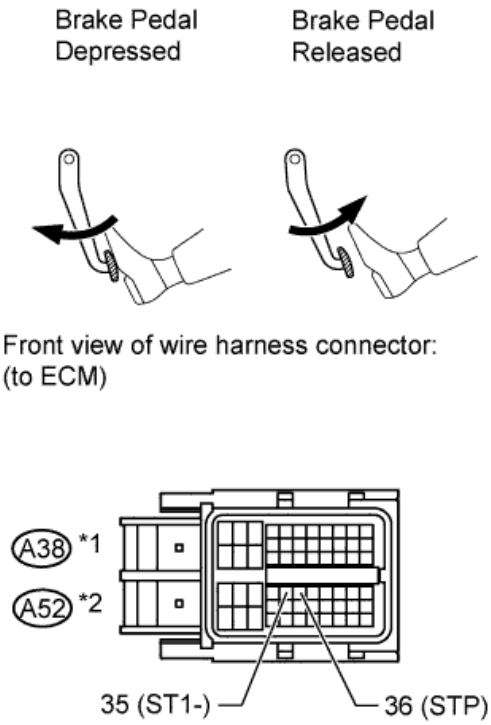
OK

3.CHECK ECM (STP AND ST - VOLTAGE

a. Disconnect the ECM connector.

b. Turn the engine switch on (IG).

c. Measure the oltage according to the alue(s) in the table below.



Standard Voltage (for LHD :

Tester Connection	Condition	Specified Condition

A38-35 (ST1-) - Body ground	Brake pedal released	11 to 14 V
	Brake pedal depressed	0 to 3 V
A38-36 (STP) - Body ground	Brake pedal released	0 to 3 V
	Brake pedal depressed	11 to 14 V

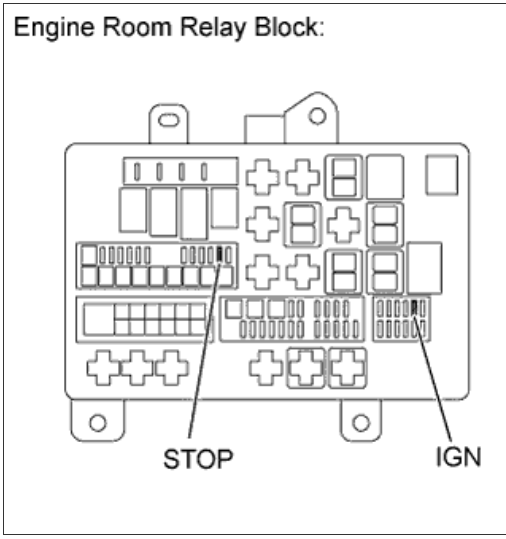
Standard Voltage (for RHD :

Tester Connection	Condition	Specified Condition
A52-35 (ST1-) - Body ground	Brake pedal released	11 to 14 V
	Brake pedal depressed	0 to 3 V
A52-36 (STP) - Body ground	Brake pedal released	0 to 3 V
	Brake pedal depressed	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK →

REPLACE ECM (Click here



4.INSPECT FUSE (STOP AND IGN

a. Remo e the STOP and IGN fuses from the engine room relay block.

b. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
STOP fuse	Always	Below 1 Ω
IGN fuse	Always	Below 1 Ω

NG → CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK →

REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - STOP LIGHT SWITCH

DTC P0016 Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DTC P0018 Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)

for Preparation Click here

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake valve open and close timing is controlled by the ECM. The ECM performs intake valve control by performing the following: 1) controlling the camshaft and camshaft oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the gaps between the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor 1 (for intake side of bank 1) signal (2 trip detection logic).	• Mechanical system (Timing belt has jumped tooth or belt stretched) • Oil control valve • Camshaft timing tube • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor 2 (for intake side of bank 2) signal (2 trip detection logic).	• Mechanical system (Timing belt has jumped tooth or belt stretched) • Oil control valve • Camshaft timing tube • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (for bank 1) or P0018 (for bank 2).

WIRING DIAGRAM

Refer to DTC P0335 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0016 OR P0018)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

2.PERFORM ACTIVE TEST USING INTE IGENT TESTER (OPERATE OCV)

HINT:

If the VVT system can be operated through the Active Test, it can be assumed that the VVT system is operating normally.

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2) / All Data / VVT Change Angle (Bank 1) or VVT Change Angle (Bank 2).

e. Perform the Active Test. Check that the displacement angle varies.

OK:
Varies.

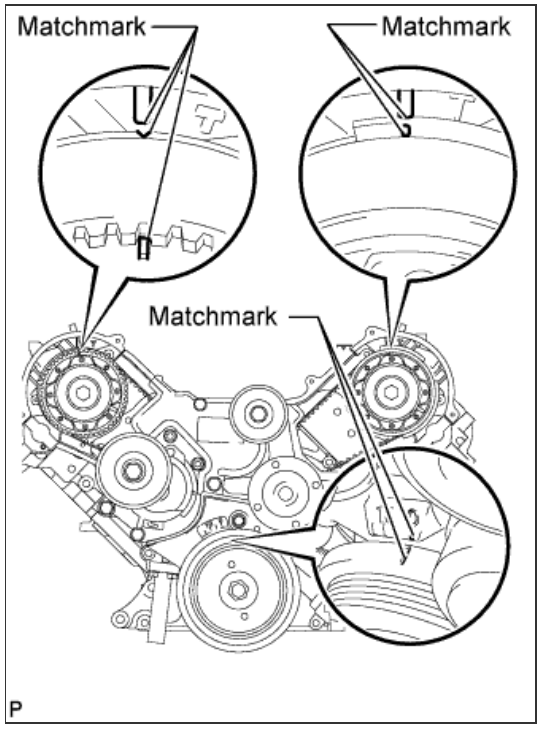
NG → Go to step 4

OK

3.CHECK VA E TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the "0" position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

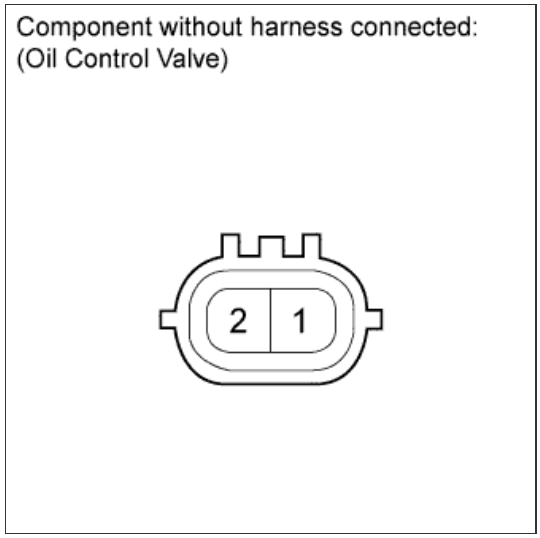
f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360°. Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

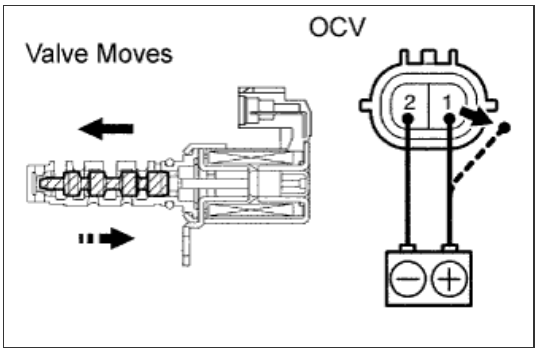
NE T → Go to step 6

4.INSPECT CAMSHAFT OI CONTRO A E

a. Remove the OCV.



b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

c. Apply positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.

OK:
Valve moves uickly.

NG → REP ACE CAMSHAFT OI CONTRO A E (Click here)

OK

5.REP ACE CAMSHAFT TIMING TUBE ASSEMB Y

a. Replace the camshaft timing tube assembly.

HINT:

- **P0016 is output, replace the camshaft timing tube assembly for bank 1 (Click here).**
- **P0018 is output, replace the camshaft timing tube assembly for bank 2 (Click here).**

NE T

6.CONFIRM WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTC (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle in an urban area for approximately 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC is output.

NG → GO TO DTC CHART (Click here)

OK

END

DTC P0505 Idle Control System Malfunction

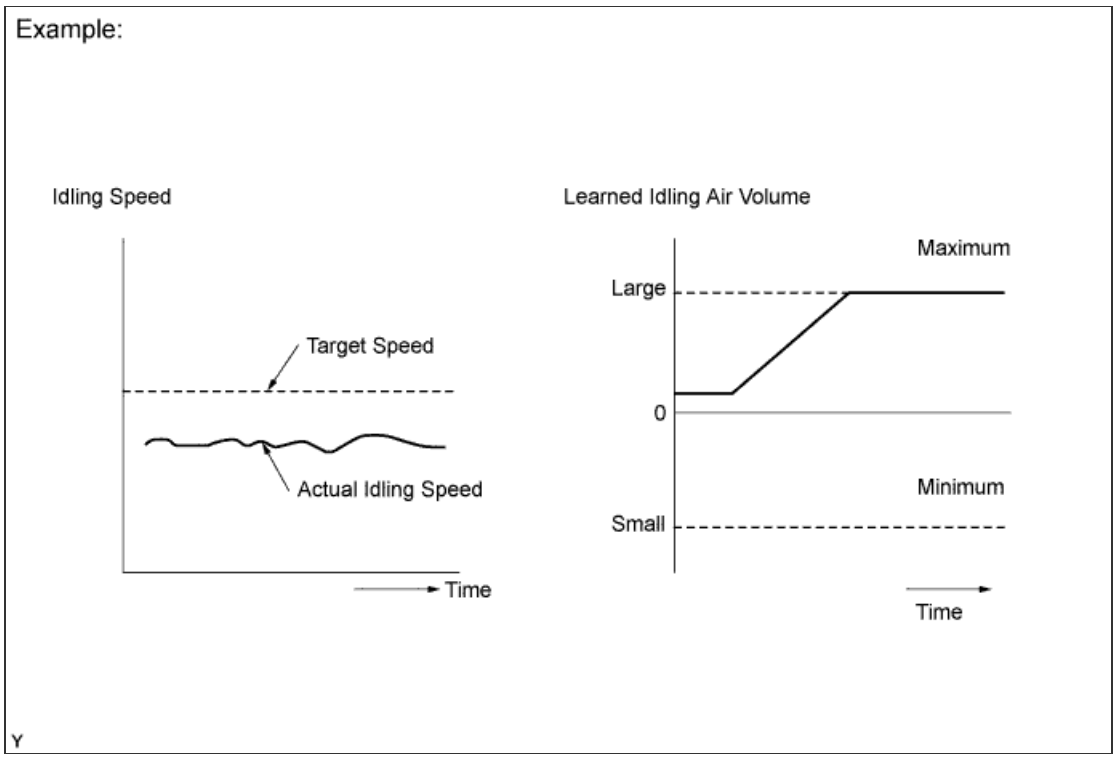
for Preparation Click here

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) the one valve type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

DTC Code	DTC Detection Condition	Trouble Area
P0505	The idling speed continues to vary greatly from the target idling speed (2 trip detection logic).	• ETCS • Air induction system • PCV hose connections • ECM

MONITOR DESCRIPTION



The ECM monitors the idling speed and idling air flow volume to conduct Idle Speed Control (ISC). The ECM determines that the ISC system is malfunctioning if the following conditions apply:

- The learned idling air flow volume remains at the maximum or minimum volume for 5 seconds during a drive cycle.
- After driving at 10 km/h (6.25 mph) or more, the actual engine idling speed varies from the target idling speed by between 100 rpm and 150 rpm, 5 times or more during a drive cycle.

Example:
If the actual idling speed varies from the target idling speed by more than 150 rpm* 5 times during a drive cycle, the ECM illuminates the MIL and stores the DTC.

HINT:

*: Threshold idling speed varies with engine load.

INSPECTION PROCEDURE

HINT:

- **The following conditions may also cause DTC P0505 to be stored:**
  1. **The floor carpet overlapping slightly onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.**
  2. **The accelerator pedal being not fully released.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are**

detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK AN OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

REP ACE ECM (Click here)

DTC P0016 Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DTC P0018 Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)

for Preparation Click here

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake valve open and close timing is controlled by the ECM. The ECM performs intake valve control by performing the following: 1) controlling the camshaft and camshaft oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the gaps between the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor 1 (for intake side of bank 1) signal (2 trip detection logic).	• Mechanical system (Timing belt has jumped tooth or belt stretched) • Oil control valve • Camshaft timing tube • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor 2 (for intake side of bank 2) signal (2 trip detection logic).	• Mechanical system (Timing belt has jumped tooth or belt stretched) • Oil control valve • Camshaft timing tube • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (for bank 1) or P0018 (for bank 2).

WIRING DIAGRAM

Refer to DTC P0335 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0016 OR P0018)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0016 or P0018 is output	A
P0016 or P0018 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTE IGENT TESTER (OPERATE OCV)

HINT:

If the VVT system can be operated through the Active Test, it can be assumed that the VVT system is operating normally.

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2) / All Data / VVT Change Angle (Bank 1) or VVT Change Angle (Bank 2).

e. Perform the Active Test. Check that the displacement angle varies.

OK:
Varies.

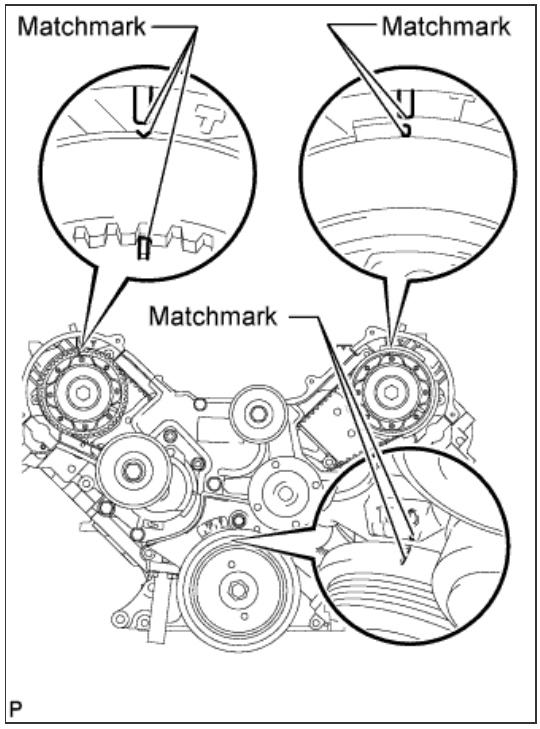
NG → Go to step 4

OK

3.CHECK VA E TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the "0" position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

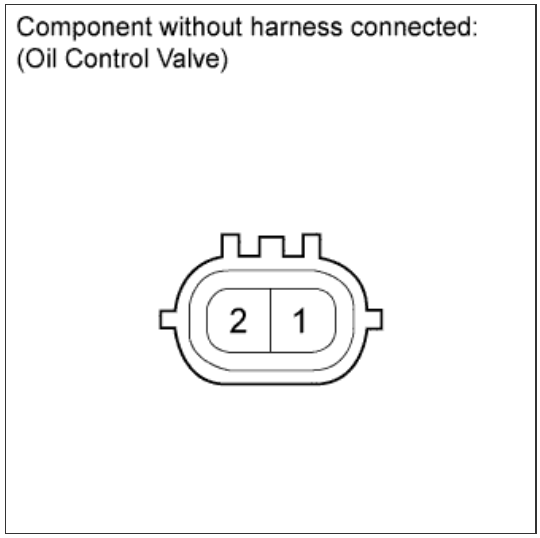
f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360°. Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

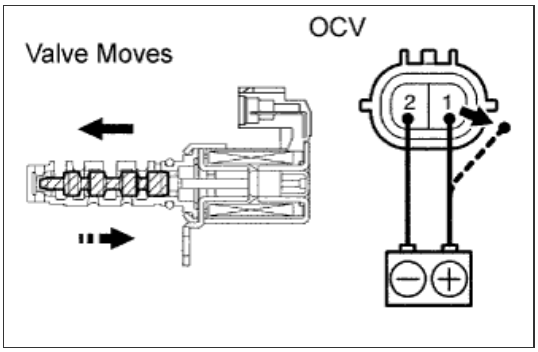
NE T → Go to step 6

4.INSPECT CAMSHAFT OI CONTRO A E

a. Remove the OCV.



b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

c. Apply positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.

OK:
Valve moves uickly.

NG → REP ACE CAMSHAFT OI CONTRO A E (Click here)

OK

5.REP ACE CAMSHAFT TIMING TUBE ASSEMB Y

a. Replace the camshaft timing tube assembly.

HINT:

- **P0016 is output, replace the camshaft timing tube assembly for bank 1 (Click here).**
- **P0018 is output, replace the camshaft timing tube assembly for bank 2 (Click here).**

NE T

6.CONFIRM WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTC (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle in an urban area for approximately 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC is output.

NG → GO TO DTC CHART (Click here)

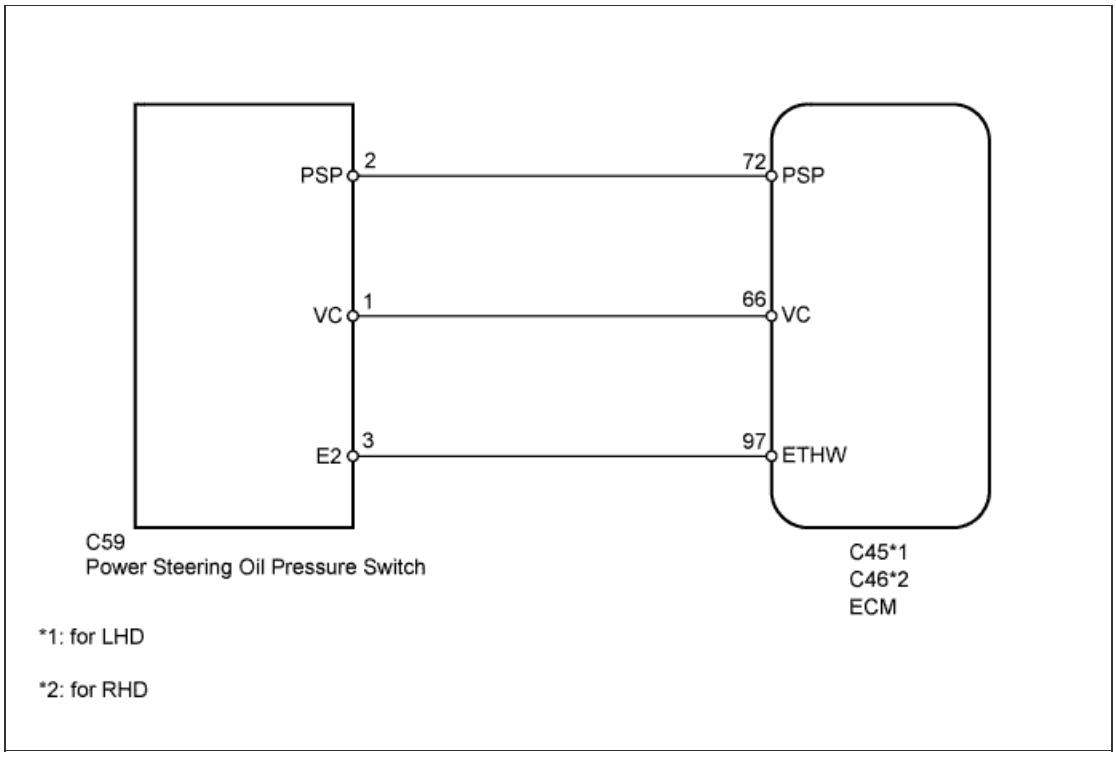
OK

END

DTC P0550 Power Steering Pressure Sensor Circuit Malfunction

DTC P0552 Power Steering Pressure Sensor Circuit Low Input

DTC P0553 Power Steering Pressure Sensor Circuit High Input



for Preparation Click here

DESCRIPTION

The power steering oil pressure sensor is turned on when a power steering wheel load occurs by turning the steering wheel. The ECM regulates the engine idling speed according to the voltage output of the sensor.

DTC Code	DTC Detection Condition	Trouble Area
P0550	Power steering oil pressure sensor voltage less than 0.28 V, or more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0552	Power steering oil pressure sensor voltage less than 0.28 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0553	Power steering oil pressure sensor voltage more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM

WIRING DIAGRAM

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to regulate the engine idling speed. When the sensor output voltage deviates from the normal operating range, the ECM determines that there is a malfunction in the power steering oil pressure sensor and stores a DTC.

INSPECTION PROCEDURE

HINT:

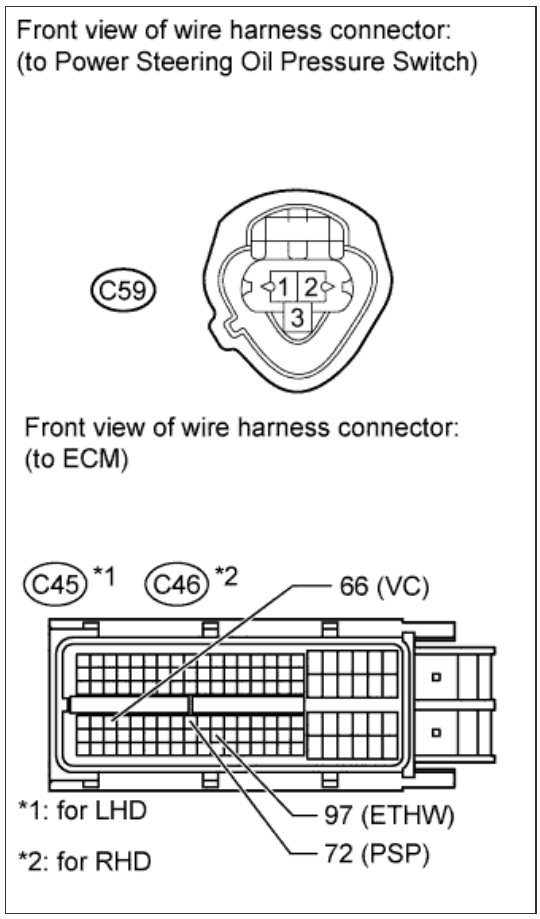
- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK HARNESS AND CONNECTOR (ECM - POWER STEERING OIL PRESSURE SWITCH)

a. Disconnect the ECM connector.

b. Disconnect the power steering oil pressure switch connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C59-2 (PSP) - C45-72 (PSP)	Always	Below 1 Ω
C59-1 (VC) - C45-66 (VC)	Always	Below 1 Ω
C59-3 (E2) - C45-97 (ETHW)	Always	Below 1 Ω
C59-2 (PSP) or C45-72 (PSP) - Body ground	Always	10 kΩ or higher
C59-1 (VC) or C45-66 (VC) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C59-2 (PSP) - C46-72 (PSP)	Always	Below 1 Ω
C59-1 (VC) - C46-66 (VC)	Always	Below 1 Ω
C59-3 (E2) - C46-97 (ETHW)	Always	Below 1 Ω
C59-2 (PSP) or C46-72 (PSP) - Body ground	Always	10 kΩ or higher
C59-1 (VC) or C46-66 (VC) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.REPLACE POWER STEERING OIL PRESSURE SWITCH

a. Replace the power steering oil pressure switch (Click here).

NEXT

3.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read the DTCs.

Result

REPLACE ECM (Click here)

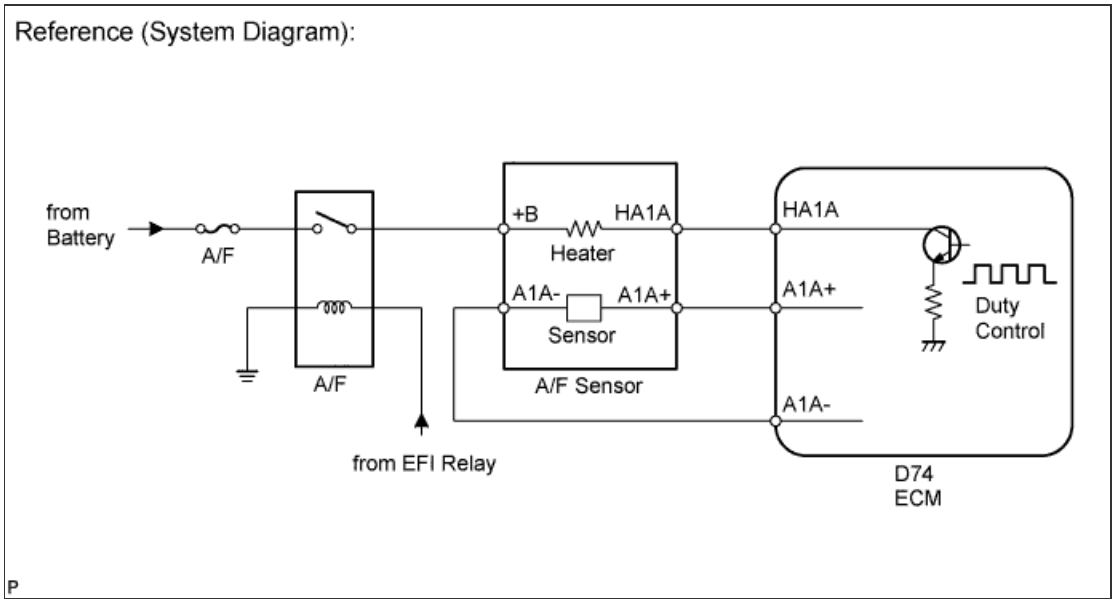
DTC P0031 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC P0032 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air-Fuel Ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air-Fuel Ratio (A/F) sensor heater circuit • A/F sensor heater (for sensor 1) • Integration relay • ECM
P0032 P0052	An Air-Fuel Ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air-Fuel Ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores a DTC.
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is higher than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

WIRING DIAGRAM

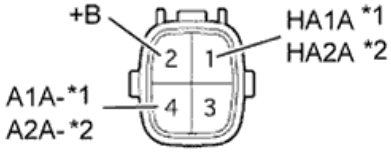
Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω

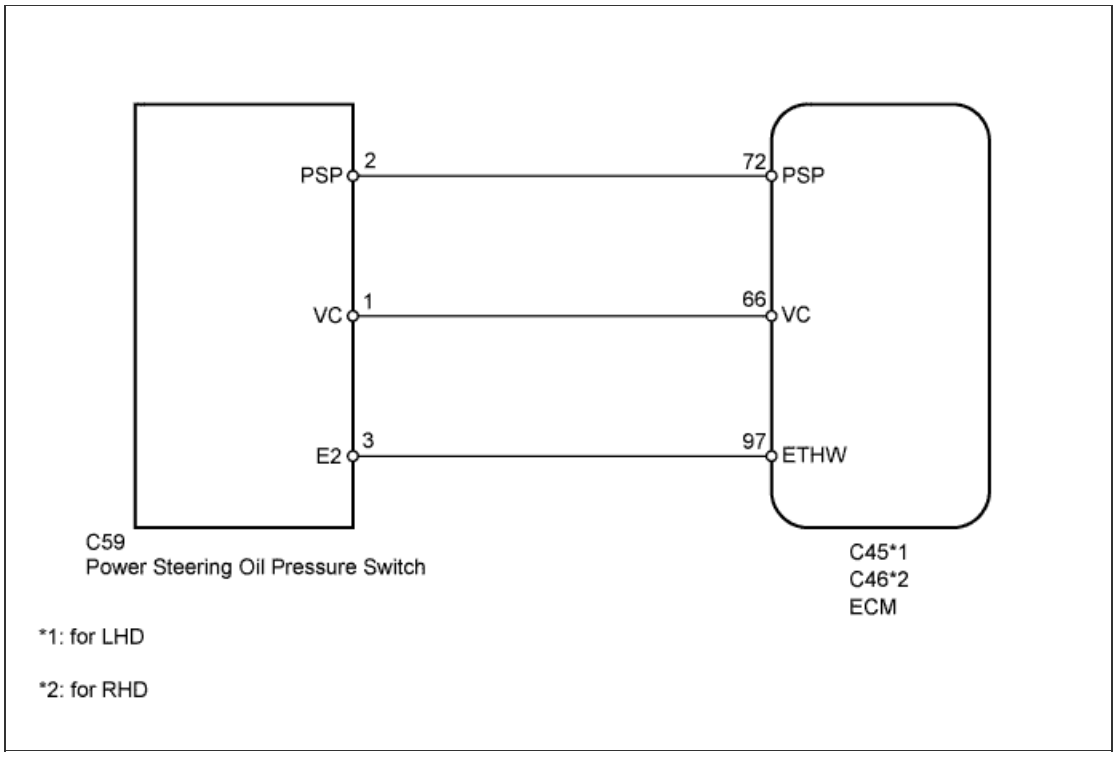
CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0550 Power Steering Pressure Sensor Circuit Malfunction

DTC P0552 Power Steering Pressure Sensor Circuit Low Input

DTC P0553 Power Steering Pressure Sensor Circuit High Input



for Preparation Click here

DESCRIPTION

The power steering oil pressure sensor is turned on when a power steering wheel load occurs by turning the steering wheel. The ECM regulates the engine idling speed according to the voltage output of the sensor.

DTC Code	DTC Detection Condition	Trouble Area
P0550	Power steering oil pressure sensor voltage less than 0.28 V, or more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0552	Power steering oil pressure sensor voltage less than 0.28 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM
P0553	Power steering oil pressure sensor voltage more than 4.9 V for 0.5 seconds while engine running. (1 trip detection logic)	• Open or short in power steering oil pressure sensor circuit • Power steering oil pressure sensor • ECM

WIRING DIAGRAM

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to regulate the engine idling speed. When the sensor output voltage deviates from the normal operating range, the ECM determines that there is a malfunction in the power steering oil pressure sensor and stores a DTC.

INSPECTION PROCEDURE

HINT:

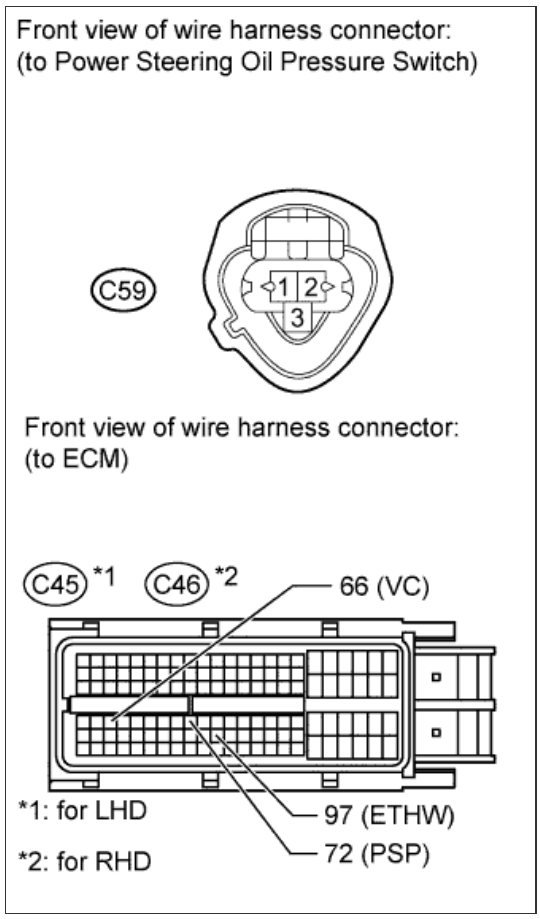
- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK HARNESS AND CONNECTOR (ECM - POWER STEERING OIL PRESSURE SWITCH)

a. Disconnect the ECM connector.

b. Disconnect the power steering oil pressure switch connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C59-2 (PSP) - C45-72 (PSP)	Always	Below 1 Ω
C59-1 (VC) - C45-66 (VC)	Always	Below 1 Ω
C59-3 (E2) - C45-97 (ETHW)	Always	Below 1 Ω
C59-2 (PSP) or C45-72 (PSP) - Body ground	Always	10 kΩ or higher
C59-1 (VC) or C45-66 (VC) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C59-2 (PSP) - C46-72 (PSP)	Always	Below 1 Ω
C59-1 (VC) - C46-66 (VC)	Always	Below 1 Ω
C59-3 (E2) - C46-97 (ETHW)	Always	Below 1 Ω
C59-2 (PSP) or C46-72 (PSP) - Body ground	Always	10 kΩ or higher
C59-1 (VC) or C46-66 (VC) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.REPLACE POWER STEERING OIL PRESSURE SWITCH

a. Replace the power steering oil pressure switch (Click here).

NEXT

3.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

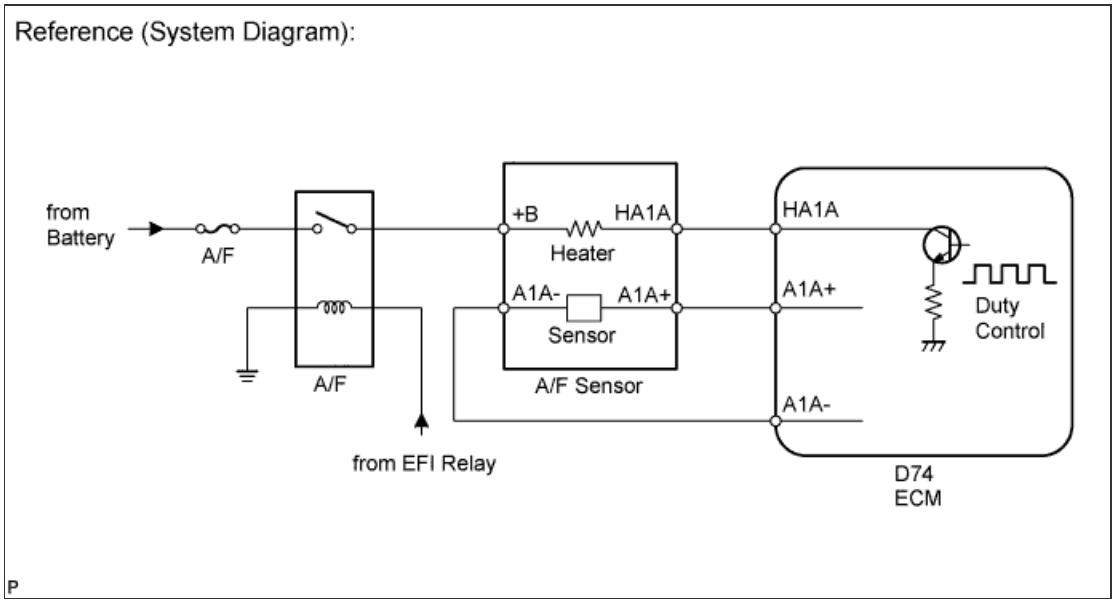
DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **When one of these DTCs is stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air-Fuel Ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air-Fuel Ratio (A/F) sensor heater circuit • A/F sensor heater (for sensor 1) • Integration relay • ECM
P0032 P0052	An Air-Fuel Ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for sensor 1) • Integration relay • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air-Fuel Ratio (A/F) sensor to regulate the air-fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate. As a result, the ECM is unable to regulate air-fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores a DTC.
Example:
The ECM stores DTC P0032 or P0052 when the current in the A/F sensor heater is higher than 10 A. Conversely, when the heater current is below 0.8 A, DTC P0031 or P0051 is stored.

WIRING DIAGRAM

CHECK FOR INTERMITTENT PROBLEMS (Click here)

for Preparation Click here

DESCRIPTION

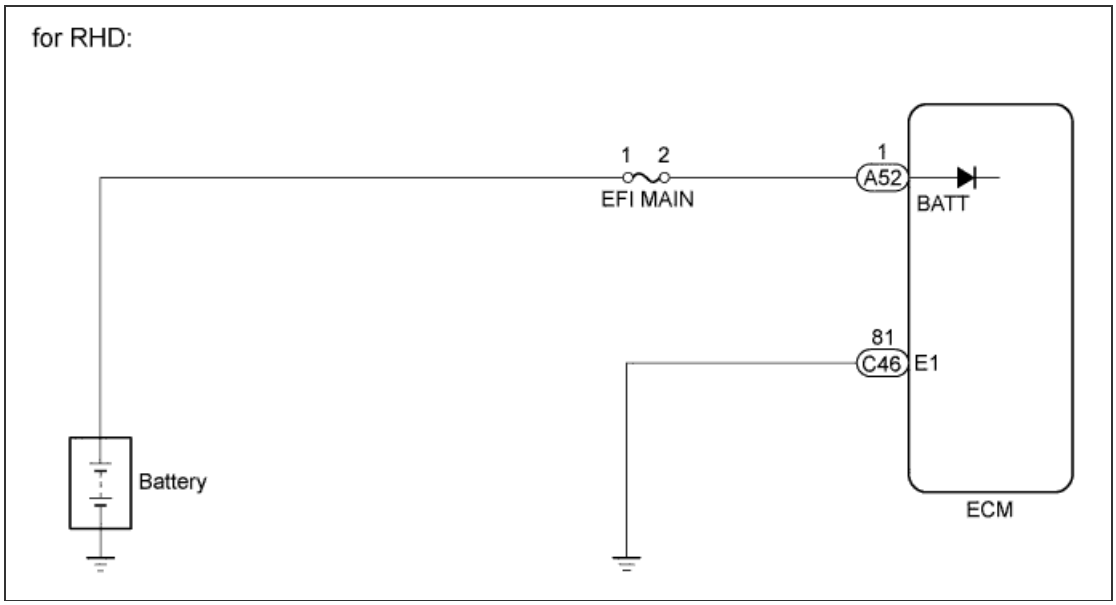
The battery supplies electricity to the ECM even when the engine switch is off. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and stores the DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0560	An open in the ECM back up power source circuit (1 trip detection logic).	• Open in back up power source circuit • Battery • Battery terminals • EFI MAIN fuse • ECM

HINT:

If DTC P0560 is stored, the ECM does not store other DTCs or the data stored in the ECM is partly cleared.

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0604 Random Access Memory (RAM)

for Preparation Click here

DESCRIPTION

The ECM continuously monitors its internal memory status. This self-check ensures that the ECM is functioning properly. This is diagnosed by internal "mirroring" of the main CPU and sub CPU to detect Random Access Memory (RAM) errors. If outputs from these CPUs are different and deviate from the standard, the ECM will illuminate the MIL and store a DTC immediately.

DTC Code	DTC Detection Condition	Trouble Area
P0604	ECM RAM errors.	ECM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in HO2 sensor heater circuit • HO2 sensor heater (for sensor 2) • Integration relay (EFI) • ECM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for sensor 2) • Integration relay (EFI) • ECM

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia ele ent which is used to detect the oxygen concentration in the exhaust gas. If the zirconia ele ent is at the appropriate te perature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia ele ent generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia ele ent, the ECM supple ents the heat fro the exhaust with heat fro a heating ele ent inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):

The ECM onitors the current applied to the HO2 sensor heater to check the heater for alfunctions. If the current is below the threshold value, the ECM deter ines that there is an open circuit in the heater. If the current is above the threshold value, the ECM deter ines that there is a short circuit in the heater.

The ECM constantly onitors the current applied to the heater. If the ECM detects an open or short circuit, the ECM turns the MIL on and stores a DTC.

If a alfunction is detected, the ECM cuts off the current applied to the heater.
Exa ple:
The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

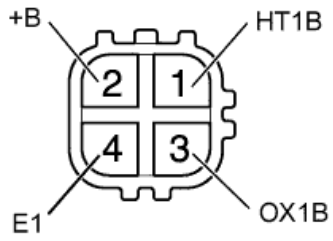
These DTCs are stored when the engine idles for 110 seconds or ore.

INSPECTION PROCEDURE

HINT:

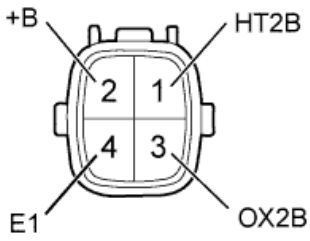
- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1) - 2 (+)	20°C (68°F)	11 to 16 Ω
1 (HT1) - 4 (E1)	Always	10 kΩ or higher
1 (HT2) - 2 (+)	20°C (68°F)	11 to 16 Ω
1 (HT2) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

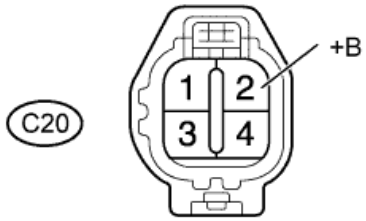
OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Disconnect the HO2 sensor connector.

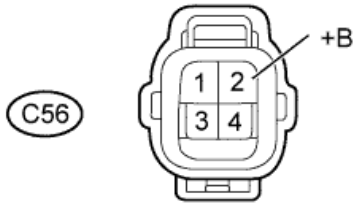
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Tester Connection	Switch Condition	Specified Condition
C20-2 (+) - ody ground	Engine switch on (I)	11 to 14 V

C56-2 (+) - ody ground	Engine switch on (I)	11 to 14 V



Result

Result	Proceed to
	A

3.INSPECT INTEGRATION RELAY (EFI MAIN)

Component without harness connected:
(Integration Relay)

a. Re ove the integration relay fro the engine roo relay block.

b. Inspect the EFI MAI fuse.

i. Re ove the EFI MAI fuse fro the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAI fuse	Always	elow 1 Ω

iii. Reinstall the EFI MAI fuse.

c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1	hen no battery voltage applied to ter inals 1 2 and 1 3	10 kΩ or higher
	When battery voltage applied to ter inals 1 2 and 1 3	elow 1 Ω

NG → REPLACE INTEGRATION RELAY (EFI MAIN)

OK

.CHECK HARNESS AND CONNECTOR (HO2 SENSOR - INTEGRATION RELAY)

a. Check the EFI O. 2 fuse.

i. Re ove the EFI O. 2 fuse fro the engine roo relay block.

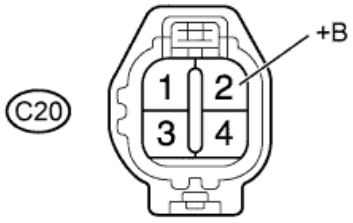
ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI O. 2 fuse	Always	elow 1 Ω

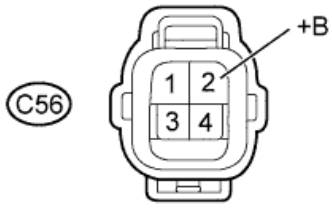
iii. Reinstall the EFI O. 2 fuse.

b. Disconnect the HO2 sensor connector.



c. Re ove the integration relay fro the engine roo relay block.

d. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C20-2 (+) - 1	Always	elow 1 Ω
C56-2 (+) - 1	Always	elow 1 Ω
C20-2 (+) or 1 ody ground	Always	10 kΩ or higher
C56-2 (+) or 1 ody ground	Always	10 kΩ or higher

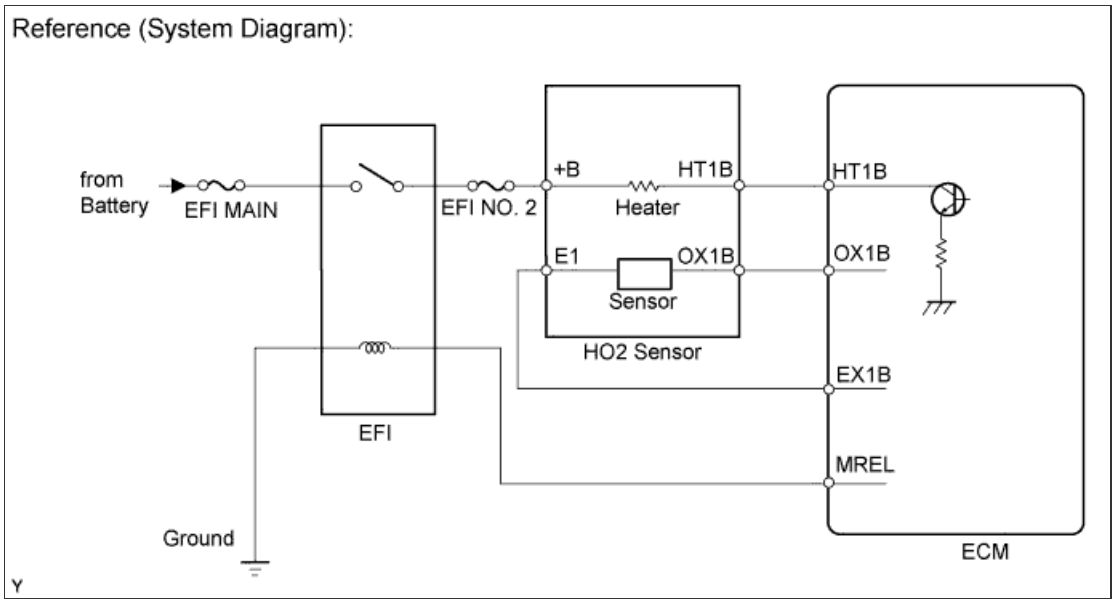
DTC P0038 Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **When any of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the engine switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater current is below 0.3 A (1 trip detection logic).	• Open in HO2 sensor heater circuit • HO2 sensor heater (for sensor 2) • Integration relay (EFI) • ECM
P0038 P0058	The Heated Oxygen (HO2) sensor heater current is higher than 2 A (1 trip detection logic).	• Short in HO2 sensor heater circuit • HO2 sensor heater (for sensor 2) • Integration relay (EFI) • ECM

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a irconia ele ent which is used to detect the oxygen concentration in the exhaust gas. If the irconia ele ent is at the appropriate te perature and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large the irconia ele ent generates voltage signals. In order to increase the oxygen concentration detecting capacity of the irconia ele ent the ECM supple ents the heat fro the exhaust with heat fro a heating ele ent inside the sensor.

Heated oxygen sensor heater range check (P0037 P0038 P0057 and P0058)

The ECM onitors the current applied to the HO2 sensor heater to check the heater for alunctions. If the current is below the threshold value the ECM deter ines that there is an open circuit in the heater. If the current is above the threshold value the ECM deter ines that there is a short circuit in the heater.

The ECM constantly onitors the current applied to the heater. If the ECM detects an open or short circuit the ECM turns the MIL on and stores a DTC.

If a lfunction is detected the ECM cuts off the current applied to the heater.
Exa ple
The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely when the heater current is below 0.3 A DTC P0037 or P0057 is stored.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

CONFIRMATION DRIVING PATTERN

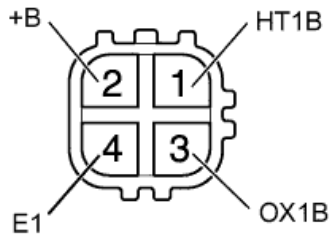
These DTCs are stored when the engine idles for 110 seconds or ore.

INSPECTION PROCEDURE

HINT:

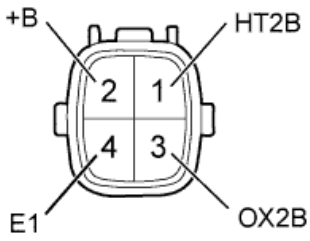
- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1) 2 ( )	20 C (68 F)	11 to 16 Ω
1 (HT1) (E1)	Always	10 kΩ or higher
1 (HT2) 2 ( )	20 C (68 F)	11 to 16 Ω
1 (HT2) (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

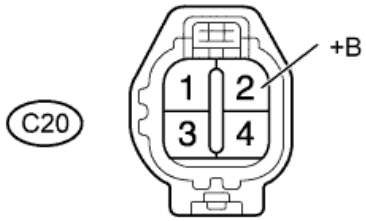
OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Disconnect the HO2 sensor connector.

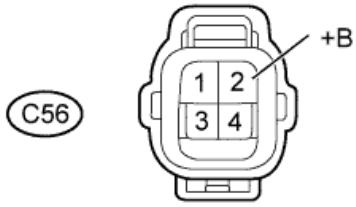
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Tester Connection	Switch Condition	Specified Condition
C20 2 ( ) ody ground	Engine switch on (I)	11 to 14

C56 2 ( ) ody ground	Engine switch on (I)	11 to 14



Result

Result	Proceed to
	A
OK

A

3.INSPECT INTEGRATION RELAY (EFI MAIN)

a. Re ove the integration relay fro the engine roo relay block.

b. Inspect the EFI MAI fuse.

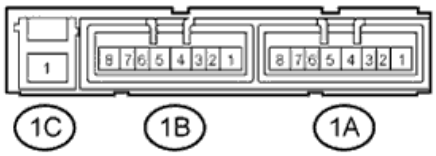
i. Re ove the EFI MAI fuse fro the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAI fuse	Always	elow 1 Ω

iii. Reinstall the EFI MAI fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C 1 1	hen no battery oltage applied to ter inals 1 2 and 1 3	10 kΩ or higher
	When battery oltage applied to ter inals 1 2 and 1 3	elow 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY (EFI MAIN)

OK

.CHECK HARNESS AND CONNECTOR (HO2 SENSOR - INTEGRATION RELAY)

a. Check the EFI O. 2 fuse.

i. Re ove the EFI O. 2 fuse fro the engine roo relay block.

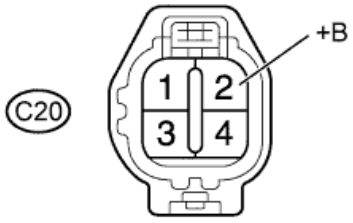
ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI O. 2 fuse	Always	elow 1 Ω

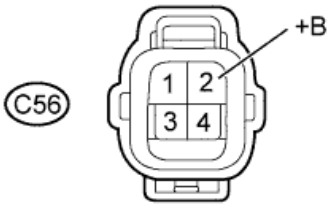
iii. Reinstall the EFI O. 2 fuse.

b. Disconnect the HO2 sensor connector.



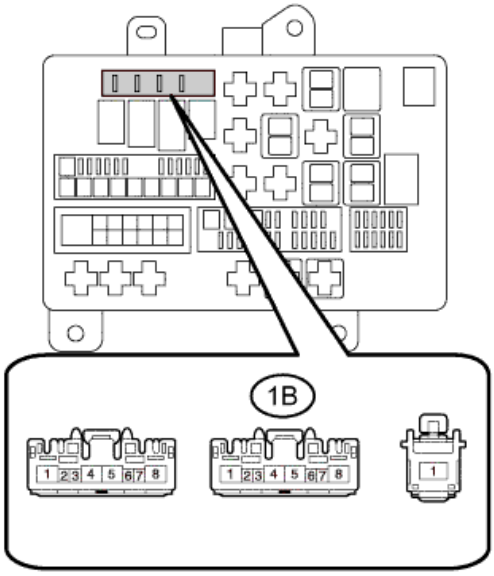
c. Re ove the integration relay fro the engine roo relay block.

d. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C20 2 ( ) 1	lwAys	elow 1 Ω
C56 2 ( ) 1	lwAys	elow 1 Ω
C20 2 ( ) or 1 ody ground	Always	10 kΩ or higher
C56 2 ( ) or 1 ody ground	Always	10 kΩ or higher



Front view of wire harness connector:

DTC P060D Internal Control Module Accelerator Pedal Position Performance

for Preparation Click here

DESCRIPTION

The ECM monitors the input signals of the Accelerator Pedal Position (APP) sensor No. 1. When the input signals and control signals are deviated, a DTC is stored.

DTC Code	DTC Detection Condition	Trouble Area
P060D	When either condition below is met: • An ECM main CPU error. • An ECM sub CPU error.	ECM

INSPECTION PROCEDURE

HINT:

Read free e frame data using the intelligent tester. Free e frame data records the engine condition when malfunctions are detected. When troubleshooting, free e frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear DTC (Click here).

b. Turn the engine switch off.

c. Disconnect the cable from the negative (battery terminal and wait for 1 minute.

d. Connect the cable to the negative (battery terminal.

e. Turn the engine switch on (I).

f. Check for DTC.

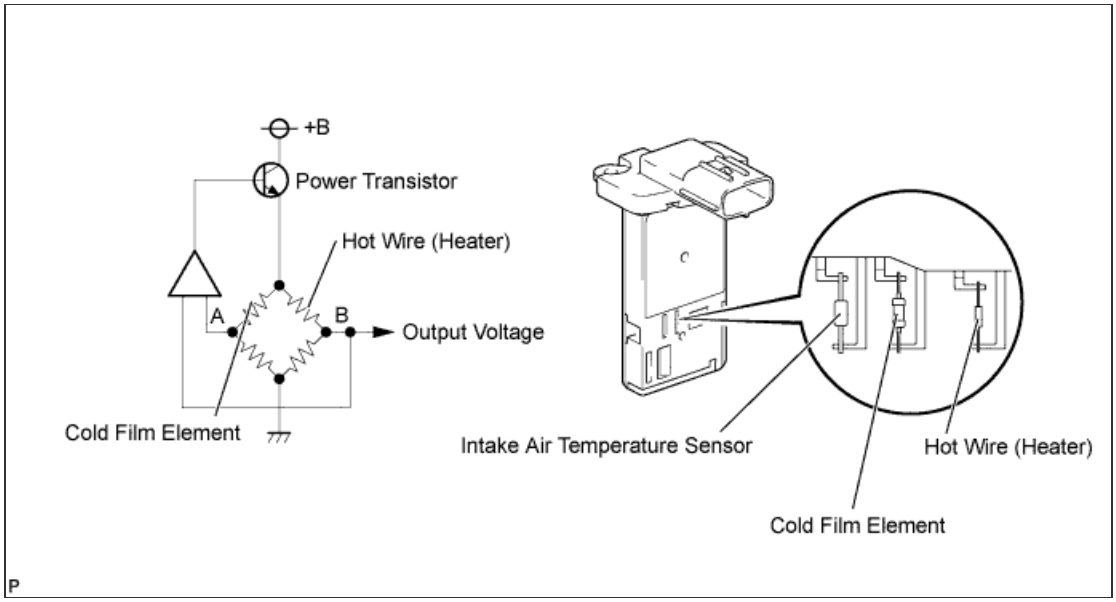
OK:
P060D is not output.

NG → **REPLACE ECM (Click here)**

OK → **CHECK FOR INTERMITTENT PROBLEMS (Click here)**

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.
The ECM uses this information to determine the fuel injection time and to provide the appropriate air-fuel ratio.
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.
By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to these components in the MAF meter.
The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The circuit is constructed so that the platinum hot wire and the temperature sensor create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

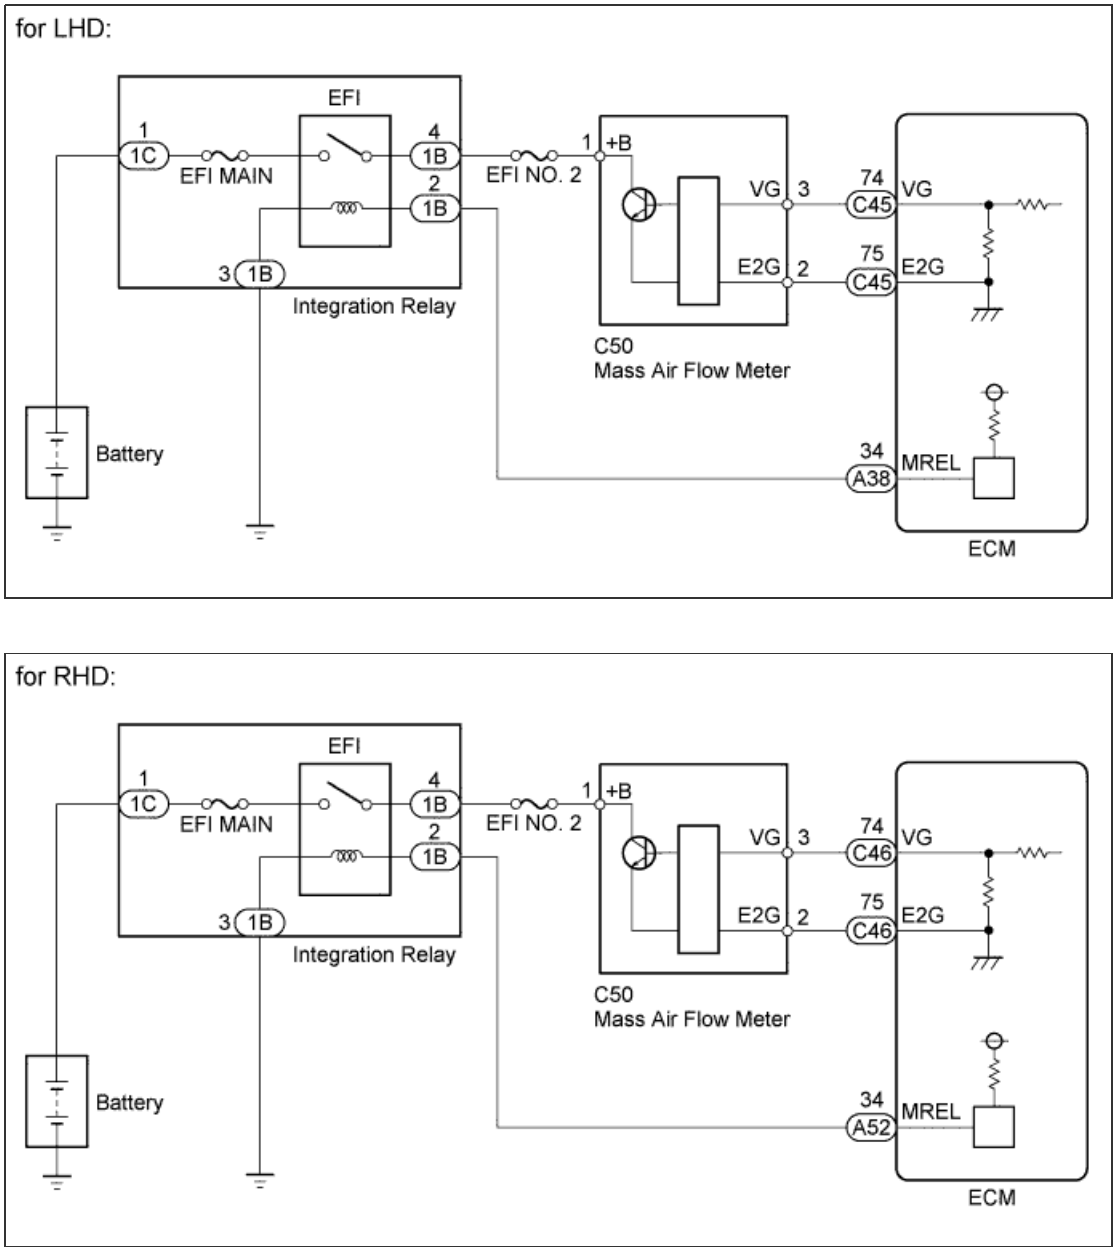
HINT:

When any of these DTCs are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine speed and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0102	The Mass Air Flow (MAF) meter voltage is below 0.2 V for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • MAF meter • ECM
P0103	The MAF meter voltage is higher than 4.9 V for 3 seconds (1 trip detection logic).	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:

When any of these DTCs are output, check the air-flow rate by entering the following menus: Powertrain / Engine and ECT / Data List / MAF.



Mass Air Flow Rate (g/sec.)	Malfunction
Approximately 0.0	• **Open in Mass Air Flow (MAF) meter power source circuit** • **Open or short in VG circuit**
271.0 or more	Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this

deviation as a malfunction in the MAF meter and stores a DTC.
Example:
When the sensor output voltage remains below 0.2 V, or higher than 4.9 V, for more than 3 seconds, the ECM stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 3 seconds after the engine is next started.

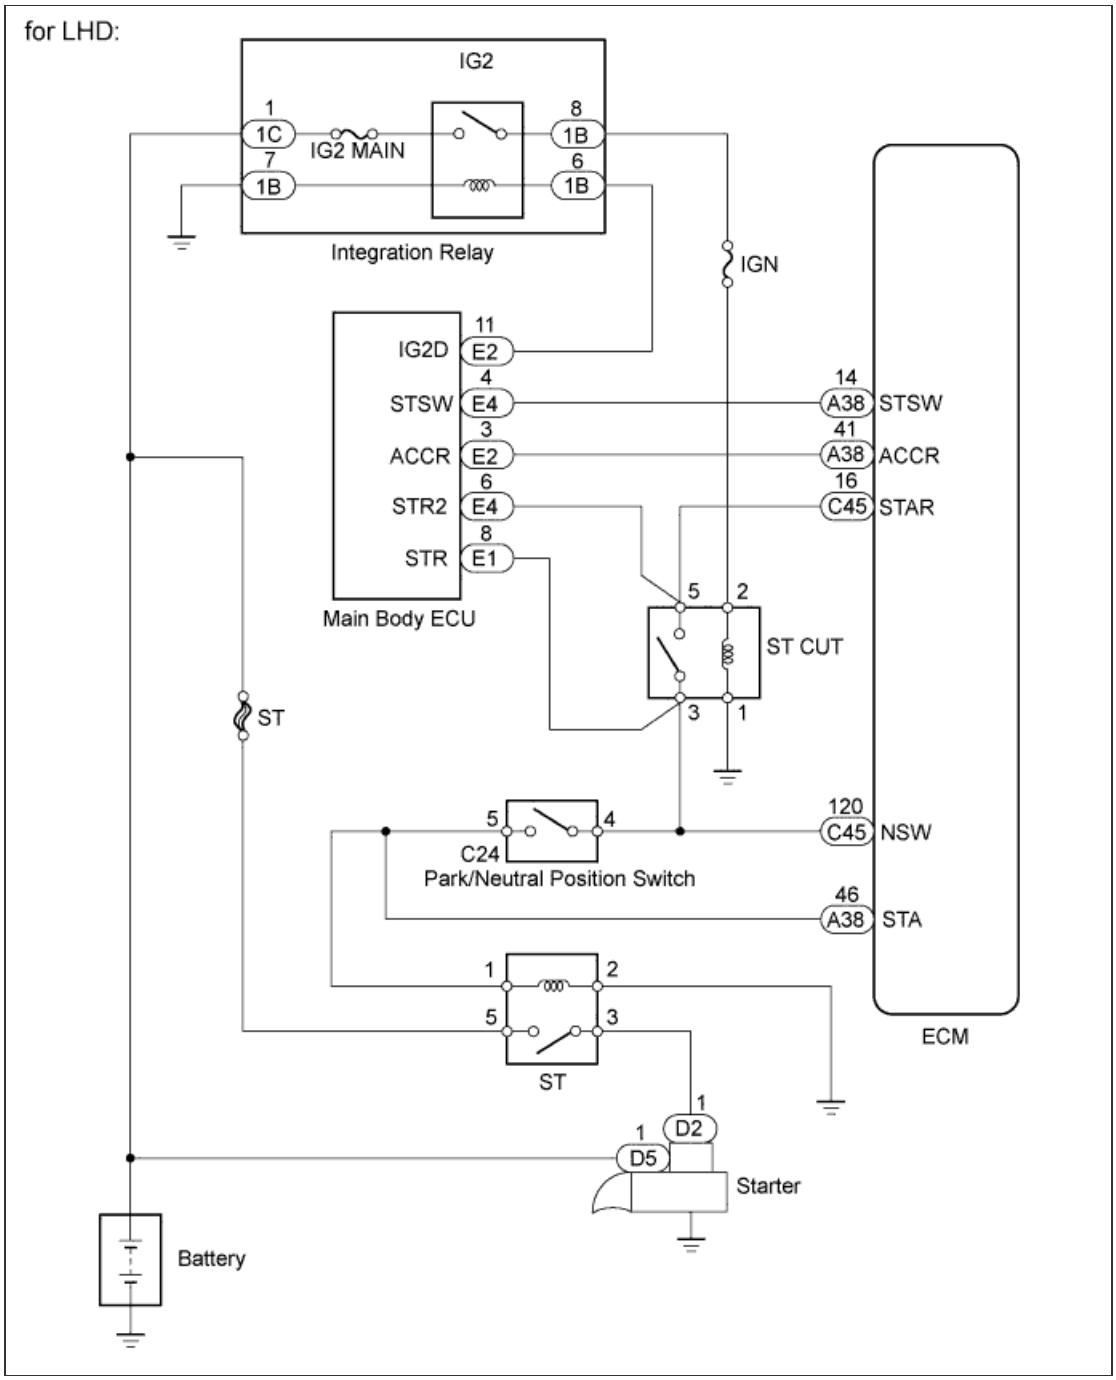
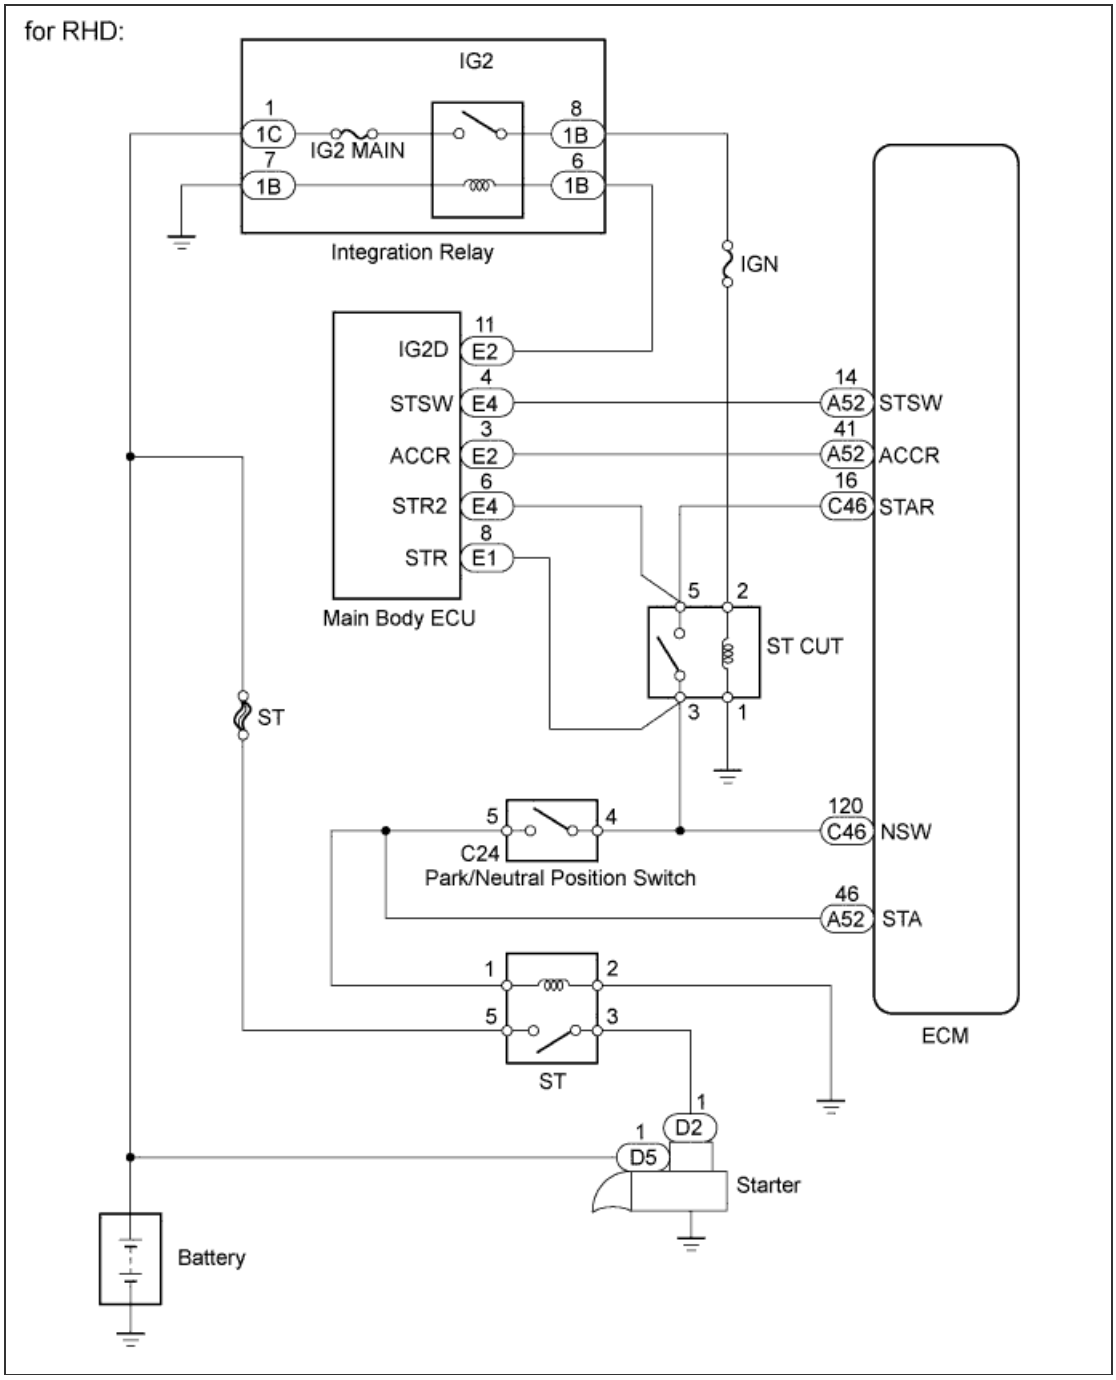
DTC P0617 Starter Relay Circuit High



for Preparation Click here



DESCRIPTION

While the engine is being cranked, positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the starter control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and stores the DTC. This monitor runs when the vehicle is driven at 20 km/h (12.4 mph) for over 20 seconds.

DTC Code	DTC Detection Condition	Trouble Area
P0617	When conditions (a), (b) and (c) are met, a positive (+B) battery voltage of 10.5 V or higher is applied to the ECM for 20 seconds (1 trip detection logic). (a) The vehicle speed is 20 km/h (12.4 mph) or more. (b) The engine speed is 1000 rpm or more. (c) The STA signal is .	• Park/Neutral Position (PNP) switch • Starter relay circuit • Engine switch • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **The following troubleshooting flowchart is based on the premise that the engine is cranked normally.**
  If the engine will not crank, proceed to the Problem Symptoms Table (Click here).
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Activate Test / Activate the Starter Relay.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Starter Signal.

e. Check the Starter Signal on the intelligent tester.

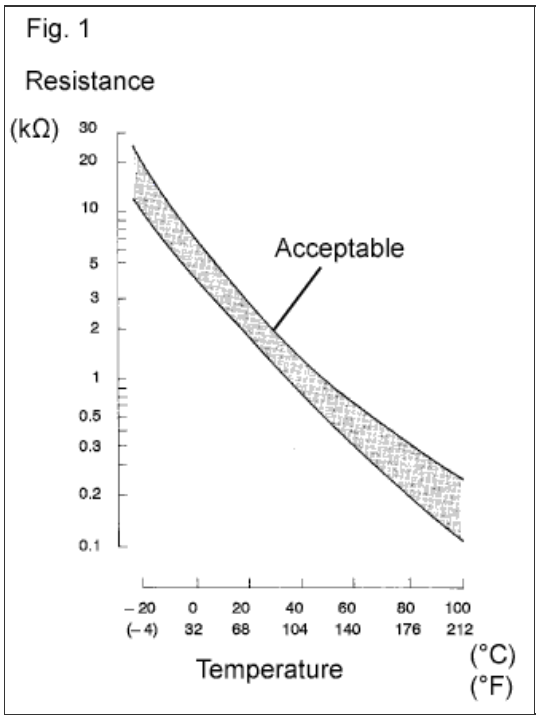
REPLACE ECM (Click here)



DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

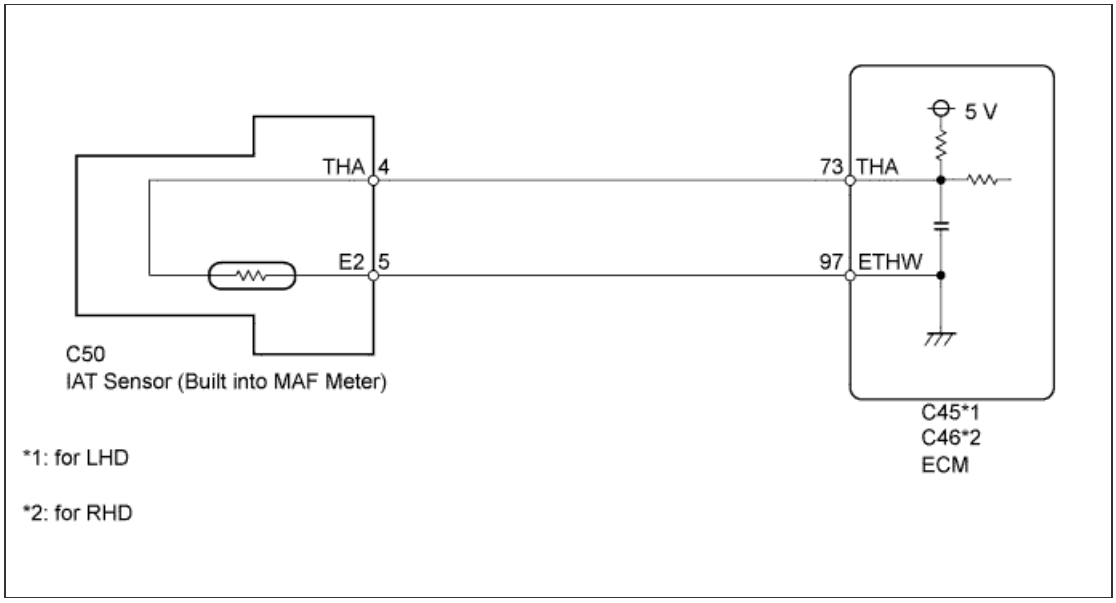
The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (see Fig. 1).
The IAT sensor is powered by a 5 V power supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 are stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into MAF meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:



When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / Intake Air.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0110 is output	A
P0112 is output	B
P0113 is output	C

B → Go to step 5

C → Go to step 3

A

2.READ VALUE USING INTELLIGENT TESTER (INTAKE AIR TEMPERATURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Intake Air.

e. Read the value displayed on the tester.

Result

Result	Proceed to
-40°C (-40°F)	A
140°C (284°F) or higher	B
Same as actual IAT	C

HINT:

- **If there is an open circuit, the intelligent tester indicates -40°C (-40°F).**
- **If there is a short circuit, the intelligent tester indicates 140°C (284°F) or higher.**

B → Go to step 5

C → CHECK FOR INTERMITTENT PROBLEMS (Click here)

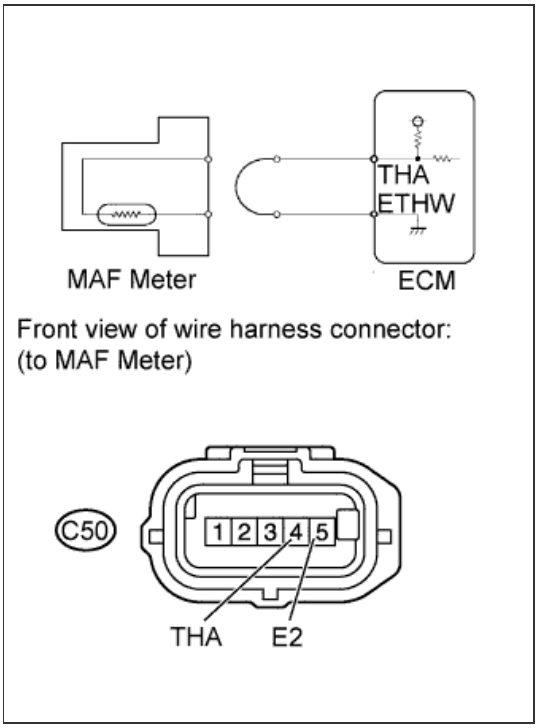
A

3.READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)

a. Disconnect the Mass Air Flow (MAF) meter connector.

b. Connect terminals 4 (THA) and 5 (E2) of the MAF meter wire harness side connector.

c. Connect the intelligent tester to the DLC3.



d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Intake Air.

g. Read the value displayed on the tester.

Standard value:
140°C (284°F) or higher

NG → Go to step 4

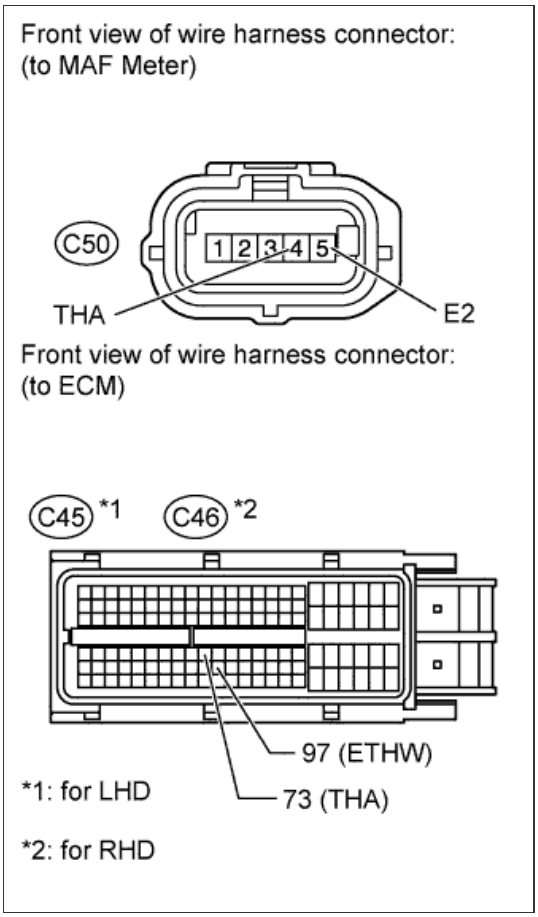
OK

CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE MASS AIR FLOW METER (Click here)

4.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the MAF meter connector.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C50-4 (THA) - C45-73 (THA)	Always	Below 1 Ω
C50-5 (E2) - C45-97 (ETHW)	Always	Below 1 Ω

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C50-4 (THA) - C46-73 (THA)	Always	Below 1 Ω
C50-5 (E2) - C46-97 (ETHW)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

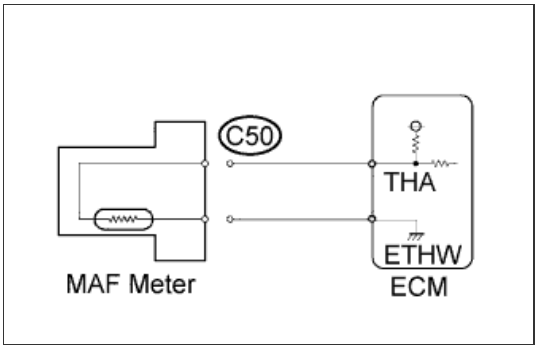
OK →

CONFIRM GOOD CONNECTION TO ECM. IF OK, REPLACE ECM (Click here)

5.READ VALUE USING INTELLIGENT TESTER (CHECK FOR SHORT IN WIRE HARNESS)

a. Disconnect the MAF meter connector.

b. Connect the intelligent tester to the DLC3.



c. Turn the engine switch on (IG).

d. Turn the tester on.

e. Enter the following menus: Powertrain / Engine and ECT / Intake Air.

f. Read the value displayed on the tester.

Standard value:
-40°C (-40°F)

NG → Go to step 6

OK →

REPLACE MASS AIR FLOW METER (Click here)

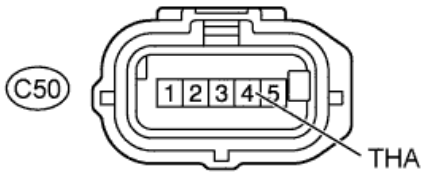
6.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the MAF meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):



Tester Connection	Condition	Specified Condition

C50-4 (THA) or C45-73 (THA) - Body ground	Always	10 kΩ or higher

REPLACE ECM (Click here)

DTC P0657 Actuator Supply Voltage Circuit / Open

for Preparation Click here

DESCRIPTION

The ECM monitors the output voltage to the throttle actuator. This self-check ensures that the ECM is functioning properly. The output voltage usually is 0 V when the engine switch is turned off. If the output voltage is higher than 7 V when the engine switch is turned off, the ECM will illuminate the MIL and store a DTC when the engine switch is turned on (IG).

DTC Code	DTC Detection Condition	Trouble Area
P	throttle actuator power supply error.	ECM

INSPECTION PROCEDURE

1.CHECK DTC

a. Clear DTC (Click here).

b. Turn the engine switch off.

c. Disconnect the cable from the negative (-) battery terminal and wait for 1 minute.

d. Connect the cable to the negative (-) battery terminal.

e. Turn the engine switch on (IG) for 1 seconds.

f. Turn the engine switch off.

g. Turn the engine switch on (IG).

h. Check for DTC.

OK:

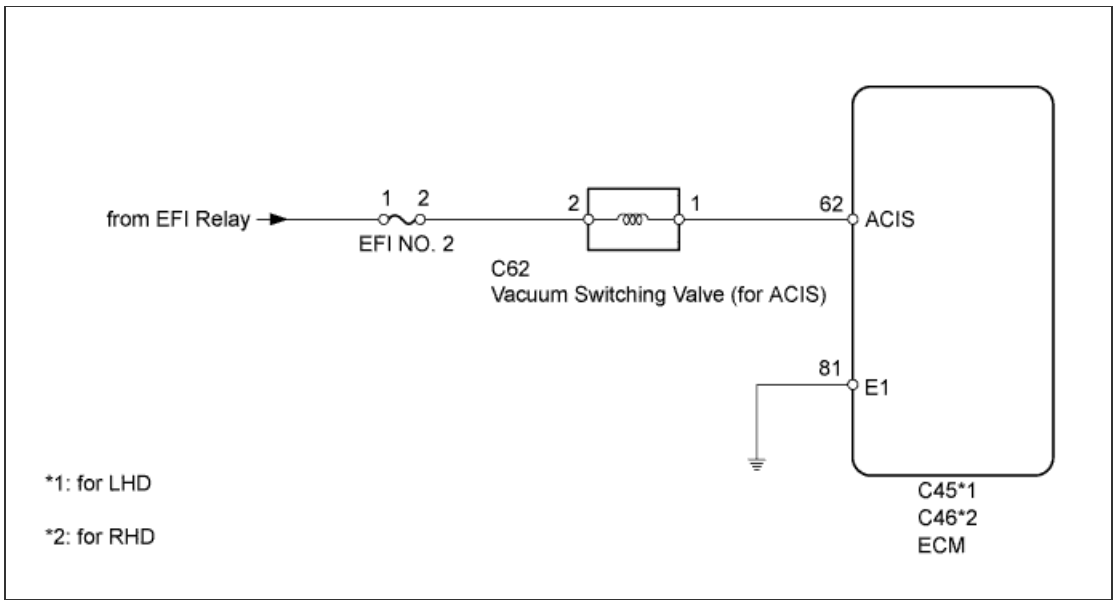
DTC P0660 Intake Manifold Tuning Valve Control Circuit / Open (Bank 1)

for Preparation Click here



DESCRIPTION

This circuit opens and closes the Intake Air Control Valve (IACV) in response to changes in the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).
When the engine speed is between 0 and 4200 rpm and the throttle valve opening angle is 60° or more, the ECM supplies current to the VSV (ON status), to close the IACV. Under other conditions, the VSV is usually OFF and the IACV is open.

DTC Code	DTC Detection Condition	Trouble Area
P0660	The following conditions are met simultaneously for 0.5 seconds or more (2 trip detection logic): 1. The voltage of terminal ACIS of the ECM is low when the VSV is off. 2. The engine has been started.	• Open or short in intake manifold tuning valve control circuit • Surge tank (intake air control valve) • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (VSV (for ACIS))

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Active the VSV for Intake Control.

d. Check if operating noise can be heard when operating the air intake control valve using the intelligent tester.

OK:
Operating noise can be heard.

NG → Go to step 2

OK ↓

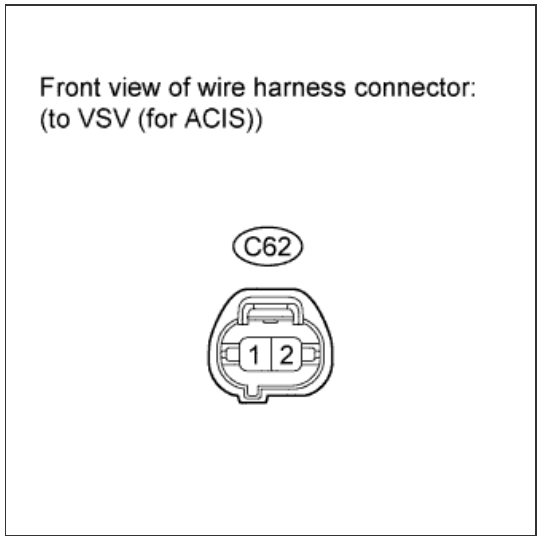
C ECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT VACUUM SWITC ING VALVE ASSEMBLY (for ACIS)

a. Inspect the vacuum switching valve assembly (Click here).

NG → REPLACE VACUUM SWITC ING VALVE ASSEMBLY (Click here)

OK ↓



3.C ECK VACUUM SWITC ING VALVE ASSEMBLY (for ACIS) (POWER SOURCE VOLTAGE)

a. Disconnect the VSV connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C62-2 - Body ground	Engine switch on (IG)	11 to 14 V

NG → Go to step 5

OK ↓

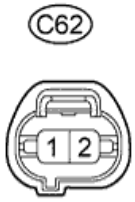
4.C ECK ARNESS AND CONNECTOR (VSV (for ACIS) - ECM)

a. Disconnect the VSV connector.

b. Disconnect the ECM connector.

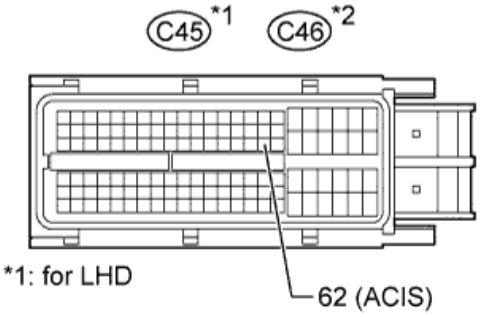
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for L D):



Tester Connection	Condition	Specified Condition
C62-1 - C45-62 (ACIS)	Always	Below 1 Ω
C62-1 or C45-62 (ACIS) - Body ground	Always	10 kΩ or higher

Standard Resistance (for R D):



Tester Connection	Condition	Specified Condition
C62-1 - C46-62	Always	Below 1 Ω

(ACIS)		
C62-1 or C46-62 (ACIS) - Body ground	Always	10 kΩ or higher

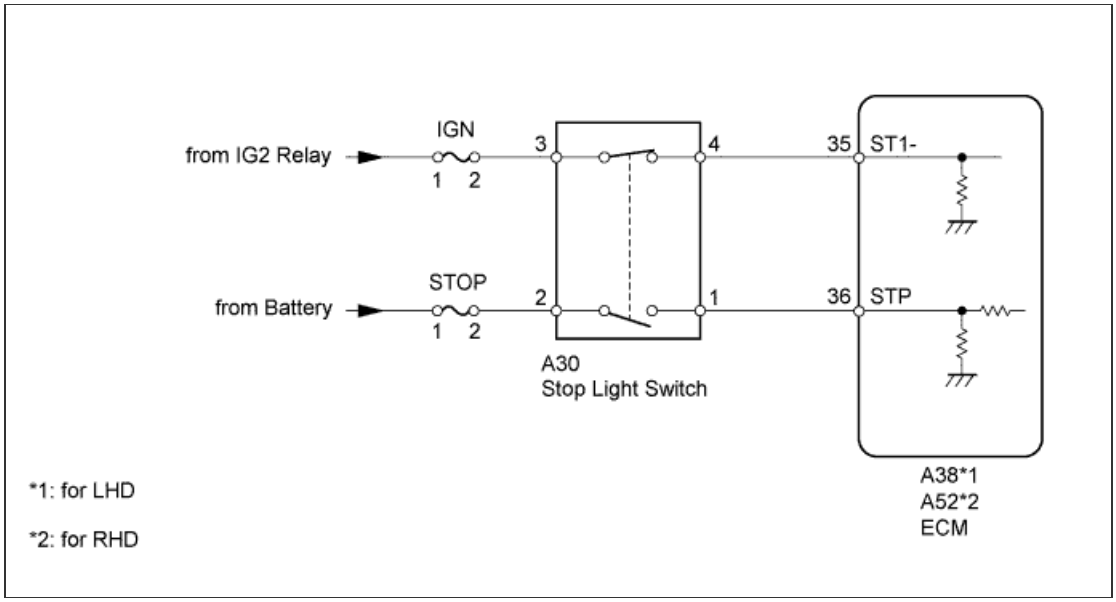
DTC P0724 Brake Switch "B" Circuit High

for Preparation Click here

DESCRIPTION



The purpose of this circuit is to prevent the engine from stalling while driving in the lock-up condition when the brakes are suddenly applied.
When the brake pedal is depressed, this switch sends a signal to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

DTC Code	DTC Detection Condition	Trouble Area
P0724	The stop light switch remains on even when the vehicle is driven in a GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) pattern 5 times (2 trip detection logic).	• Short in stop light switch signal circuit • Stop light switch • ECM

MONITOR DESCRIPTION

This DTC indicates that the stop light switch remains on. When the stop light switch remains on during GO and STOP driving, the ECM interprets this as a fault in the stop light switch. Then the MIL illuminates and the ECM stores the DTC. The vehicle must GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) 5 times for 2 driving cycles in order for the DTC to be stored.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Using the intelligent tester to read the Data List allows switch, sensor, actuator and other item values to be read without removing any parts. Reading the Data List early in troubleshooting is one way to save time.

NOTICE:

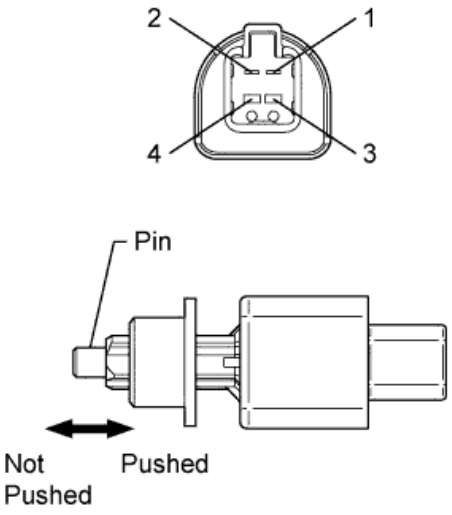
In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

1. Warm up the engine.
2. Turn the engine switch off.
3. Connect the intelligent tester to the DLC3.
4. Turn the engine switch on (IG).
5. Turn the tester on.
6. Enter the following menus: Powertrain / Engine and ECT / Data List /
7. Follow the instructions on the tester and read the Data List.

Item	Measurement Item/ Range (Display)	Normal Condition	Diagnostic Note
	Stop light switch status/	• Brake pedal depressed: ON	

Stop Light Switch	ON or OFF	• Brake pedal released: OFF	-

1.INSPECT STOP LIGHT SWITCH



a. Remove the stop light switch.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Switch pin not pushed	Below 1 Ω
	Switch pin pushed	10 kΩ or higher
3 - 4	Switch pin not pushed	10 kΩ or higher
	Switch pin pushed	Below 1 Ω

Component without harness connected:
(Stop Light Switch)

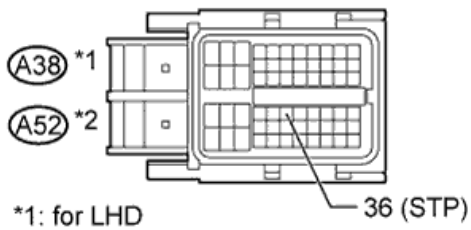
NG → REPLACE STOP LIGHT SWITCH (Click here)

OK ↓

2.CHECK HARNESS AND CONNECTOR (ECM - BATTERY)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.



Standard Voltage (for LHD):

Tester Connection	Condition	Specified Condition
A38-36 (STP) - Body ground	Brake pedal is depressed	11 to 14 V
A38-36 (STP) - Body ground	Brake pedal is released	Below 1 V

Standard Voltage (for RHD):

Tester Connection	Condition	Specified Condition
A52-36 (STP) - Body ground	Brake pedal is depressed	11 to 14 V
A52-36 (STP) - Body ground	Brake pedal is released	Below 1 V

REPLACE ECM (Click here)

DTC P0115 Engine Coolant Temperature Circuit Malfunction

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

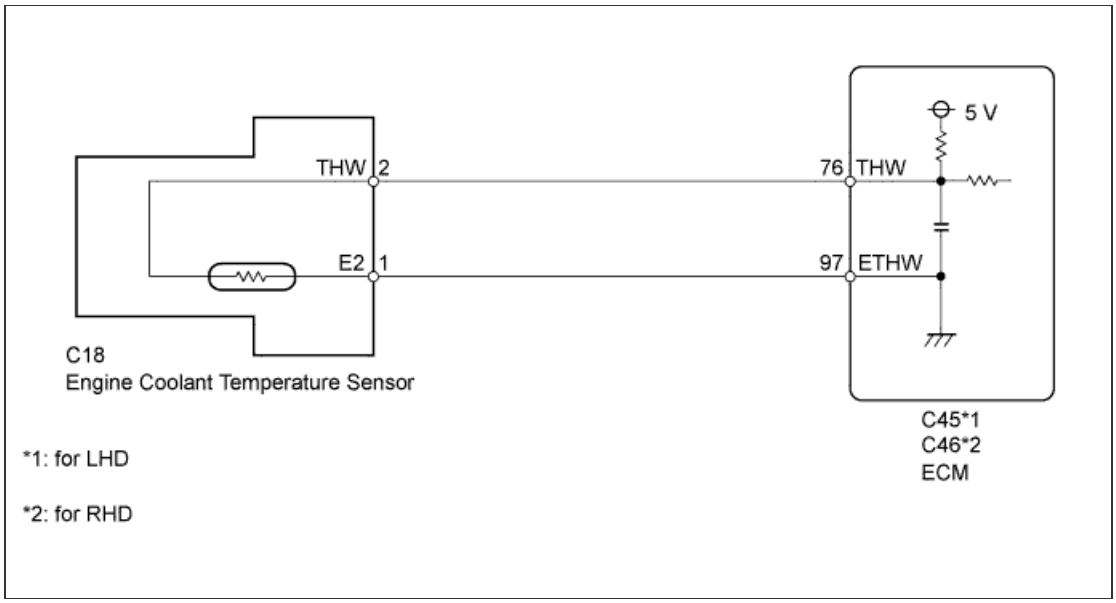
A thermistor, whose resistance value varies according to the ECT, is built into the Engine Coolant Temperature (ECT) sensor.
The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0115	An open or short in the Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Engine Coolant Temperature (ECT) sensor circuit • ECT sensor • ECM
P0117	A short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor • ECT sensor • ECM
P0118	An open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:



When any of these DTCs are output, check the ECT by entering the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and stores DTC P0118. Conversely, if the voltage output is below 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0117.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0115 is output	A

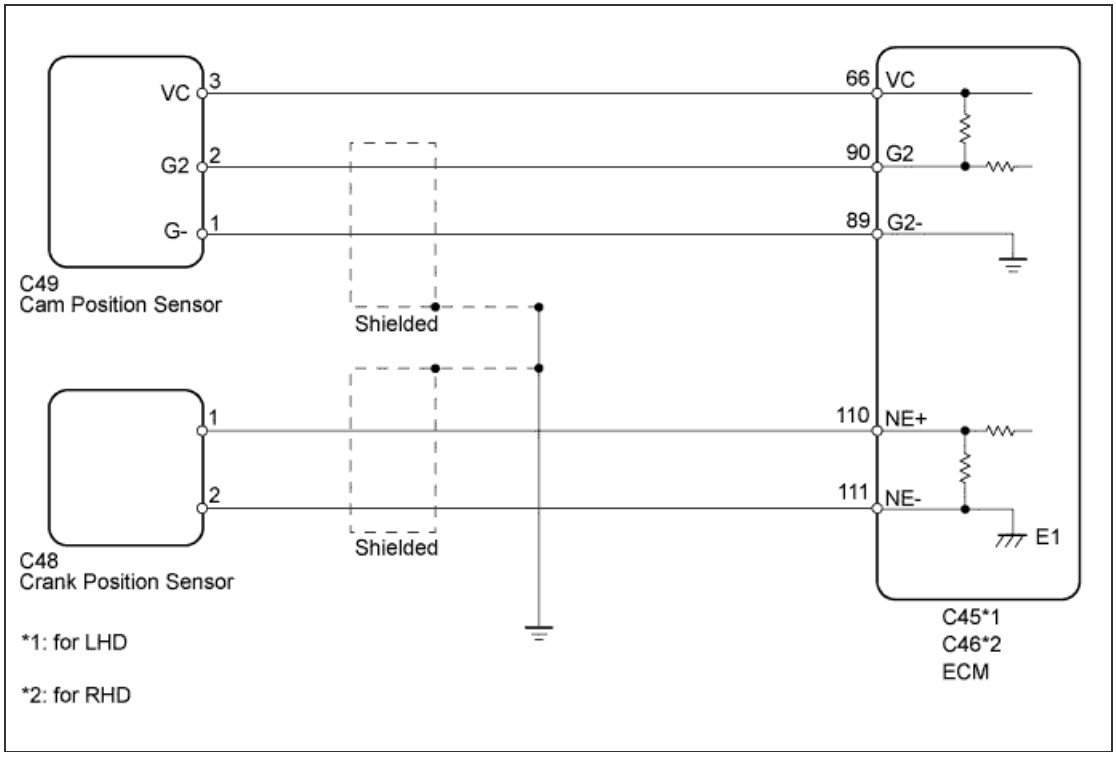
DTC P1340 Camshaft Position Sensor "A" (Bank 1 Sensor 2)

DTC P1342 Camshaft Position Sensor "A" Low Input (MRE)

DTC P1343 Camshaft Position Sensor "A" High Input (MRE)

for Preparation Click here

DESCRIPTION



The cam position sensor (G signal) consists of a magnet, iron core and pickup coil.
The camshaft drive gear (LH) has 3 teeth on its inner circumference. When the camshaft gear rotates, the air gap changes between the protrusion on the gear and the pickup coil. The change affects the magnetic field and results in changes in the resistance of the MRE element.
The crankshaft signal plate has 34 teeth and is mounted on the crankshaft. The crank position sensor generates 34 signals at every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No cam position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in cam position sensor circuit • Camshaft position sensor • Camshaft timing pulley LH • ECM
	No cam position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

The cam position sensor (G signal) consists of a magnet and MRE element.
The camshaft drive gear has 3 teeth on its inner circumference. When the camshaft gear rotates, the air gap changes between the protrusion on the gear and the pickup coil. The change affects the magnetic field and results in changes in the resistance of the MRE element. The crankshaft angle sensor plate has 34 teeth and outputs 34 signals at every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

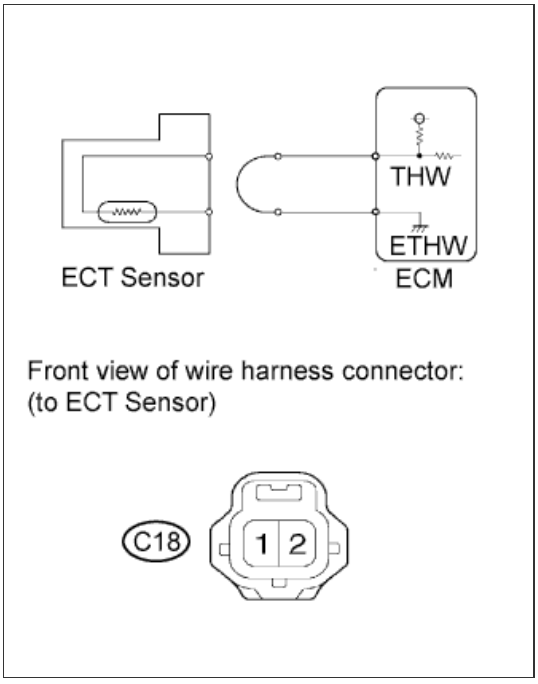
.READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)

a. Disconnect the Engine Coolant Temperature (ECT) sensor connector.

b. Connect terminals 1 and 2 of the ECT sensor connector on the wire harness side.

c. Connect the intelligent tester to the DLC3.



d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

g. Read the value displayed on the tester.

Standard value:
140 C (284 r higher.

NG	Go to step 4

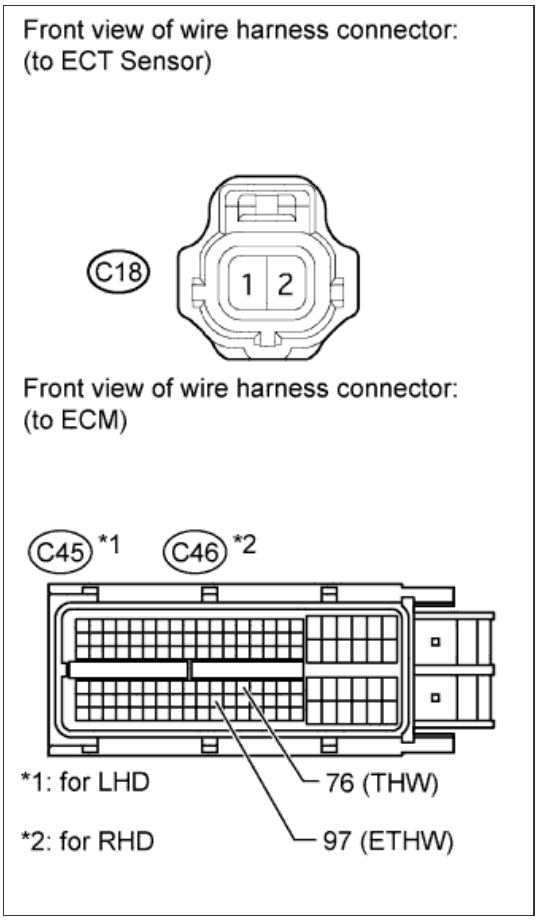
OK

CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

4.CHECK HARNESS AND CONNECTOR (ENGINE COOLANT TEMPERATURE SENSOR - ECM)

a. Disconnect the ECT sensor connector.

b. Disconnect the ECM connector.



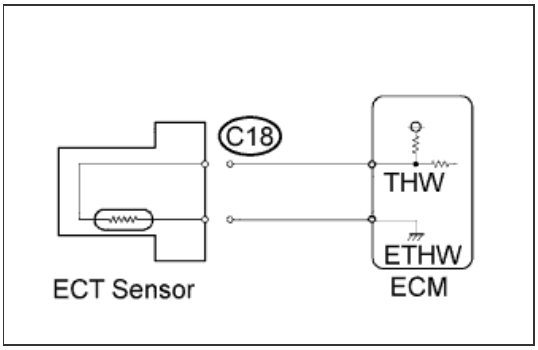
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C18-2 - C45-76 (THW)	Always	Below 1 Ω
C18-1 - C45-97 (ETHW)	Always	Below 1 Ω

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C18-2 - C46-76 (THW)	Always	Below 1 Ω
C18-1 - C46-97 (ETHW)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK →

CONFIRM GOOD CONNECTION TO ECM. IF OK, REPLACE ECM (Click here)

5.READ VALUE USING INTELLIGENT TESTER (CHECK FOR SHORT IN WIRE HARNESS)

a. Disconnect the ECT sensor connector.

b. Connect the intelligent tester to the DLC3.

c. Turn the engine switch on (IG).

d. Turn the tester on.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

f. Read the value displayed on the tester.

Standard value:
-40 C (-40

NG → Go to step 6

OK →

REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

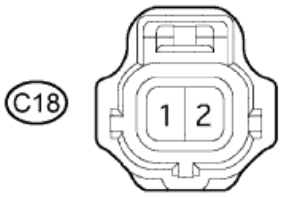
6.CHECK HARNESS AND CONNECTOR (ENGINE COOLANT TEMPERATURE SENSOR - ECM)

a. Disconnect the ECT sensor connector.

b. Disconnect the ECM connector.

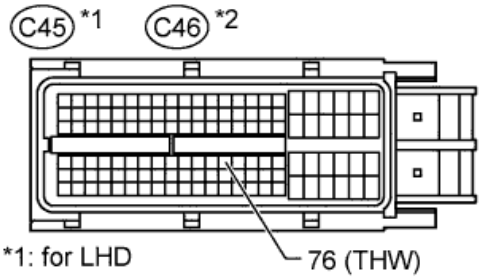
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):



Tester Connection	Condition	Specified

		Condition
C18-2 or C45-76 (THW) - Body ground	Always	10 kΩ or higher



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C18-2 or C46-76 (THW) - Body ground	Always	10 kΩ or higher

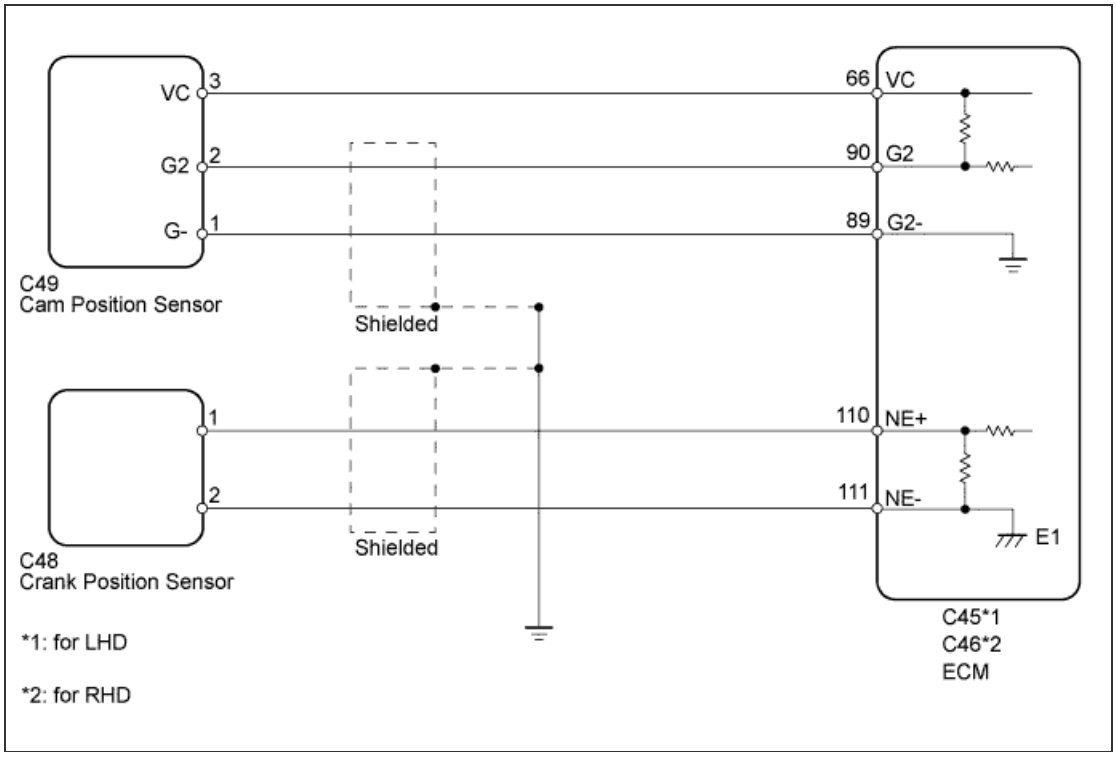
DTC P1340 Camshaft Position Sensor "A" (Bank 1 Sensor 2)

DTC P1342 Camshaft Position Sensor "A" Low Input (MRE)

DTC P1343 Camshaft Position Sensor "A" High Input (MRE)

for Preparation Click here

DESCRIPTION



The cam position sensor (G signal) consists of a magnet, iron core and pickup coil.
The camshaft drive gear (LH) has 3 teeth on its inner circumference. When the camshaft gear rotates, the air gap changes between the protrusion on the gear and the pickup coil. The change affects the magnetic field and results in changes in the resistance of the MRE element.
The crankshaft signal plate has 34 teeth and is mounted on the crankshaft. The crank position sensor generates 34 signals at every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

DTC Code	DTC Detection Condition	Trouble Area
P1340	No cam position sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in cam position sensor circuit • Camshaft position sensor • Camshaft timing pulley LH • ECM
	No cam position sensor signal is sent to the ECM with an engine speed of 600 rpm or more.	
P1342	The output voltage of the camshaft position sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P1343	The output voltage of the camshaft position sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

MONITOR DESCRIPTION

The cam position sensor (G signal) consists of a magnet and MRE element.
The camshaft drive gear has 3 teeth on its inner circumference. When the camshaft gear rotates, the air gap changes between the protrusion on the gear and the pickup coil. The change affects the magnetic field and results in changes in the resistance of the MRE element. The crankshaft angle sensor plate has 34 teeth and outputs 34 signals at every revolution. The ECM detects the standard crankshaft angle based on the G signal, and the actual crankshaft angle and engine speed by the NE signal.

WIRING DIAGRAM

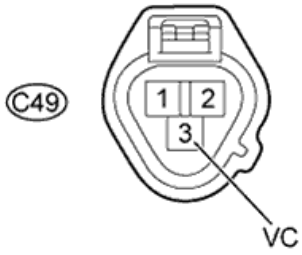
INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio

was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT CAM POSITION SENSOR ASSEMBLY (SENSOR POWER SOURCE)



a. Disconnect the cam position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C49-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

Front view of wire harness connector:
(to Cam Position Sensor)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

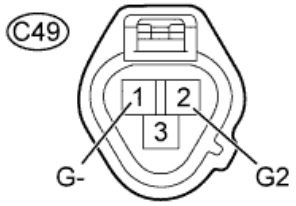
OK

2.CHECK HARNESS AND CONNECTOR (ECM - CAM POSITION SENSOR)

a. Disconnect the cam position sensor connector.

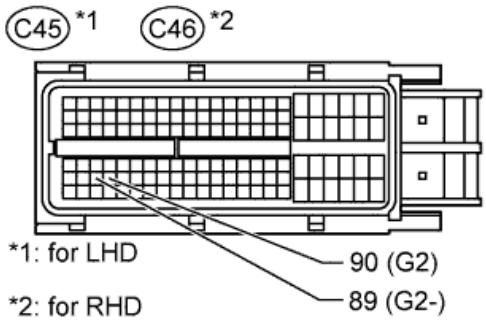
b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C49-2 (G2) - C45-90 (G2)	Always	Below 1 Ω
C49-1 (G-) - C45-89 (G2-)	Always	Below 1 Ω
C49-2 (G2) or C45-90 (G2) - Body ground	Always	10 kΩ or higher
C49-1 (G-) or C45-89 (G2-) - Body ground	Always	10 kΩ or higher



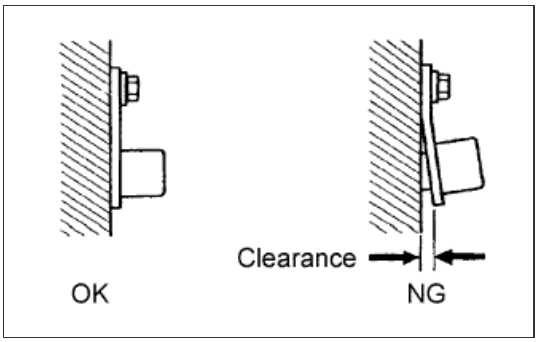
Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C49-2 (G2) - C46-90 (G2)	Always	Below 1 Ω
C49-1 (G-) - C46-89 (G2-)	Always	Below 1 Ω
C49-2 (G2) or C46-90 (G2) - Body ground	Always	10 kΩ or higher
C49-1 (G-) or C46-89 (G2-) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to Cam Position Sensor)

Front view of wire harness connector:
(to ECM)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

3.INSPECT SENSOR INSTALLATION

a. Check the cam position sensor installation.

OK:

The cam position sensor is installed properly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.INSPECT CAMSHAFT TIMING PULLEY LH (SIGNAL PLATE TOOTH)

a. Check the teeth of the signal plate.

OK:

Sensor plate teeth do not have any cracks or deformation.

NG → REPLACE CAMSHAFT TIMING PULLEY LH (Click here)

OK

5.REPLACE CAM POSITION SENSOR ASSEMBLY

a. Replace the cam position sensor (Click here).

NEXT

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No DTC is output	A
P1340, P1342 and/or P1343 is output	B

HINT:

END

DTC P0116 Engine Coolant Temperature Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0115 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0116	The Engine Coolant Temperature (ECT) is between -40°C (-40°F) and 60°C (140°F) when the engine is started, and conditions (a) and (b) are met (2 trip detection logic): (a) The vehicle is driven at varying speeds (accelerated and decelerated). (b) The ECT remains within 3°C (5.4°F) of the initial ECT.	• Thermostat • ECT sensor

MONITOR DESCRIPTION

The ECT sensor is used to monitor the ECT. The ECT sensor has a built-in thermistor with a resistance that varies according to the temperature of the engine coolant. When the ECT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in the resistance are reflected in the output voltage from the ECT sensor.
The ECM monitors the sensor voltage and uses this value to calculate the ECT. If the sensor output voltage deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the ECT sensor and stores the DTC.
Examples:
Upon starting the engine, the ECT is between -40°C (-40°F) and 60°C (140°F). If, after driving for 250 seconds, the ECT remains within 3°C (5.4°F) of the starting temperature, the DTC is stored (2 trip detection logic).

INSPECTION PROCEDURE

HINT:

- **If any of DTCs P0115, P0117, P0118 or P0125 are output simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTC.

Result

Result	Proceed to
P0116 is output	A
P0116 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.INSPECT THERMOSTAT

a. Remove the thermostat (Click here).

b. Measure the valve opening temperature of the thermostat.

Standard opening temperature:
80 to 8 (176 to 183 F)

HINT:

In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

c. Reinstall the thermostat (Click here).

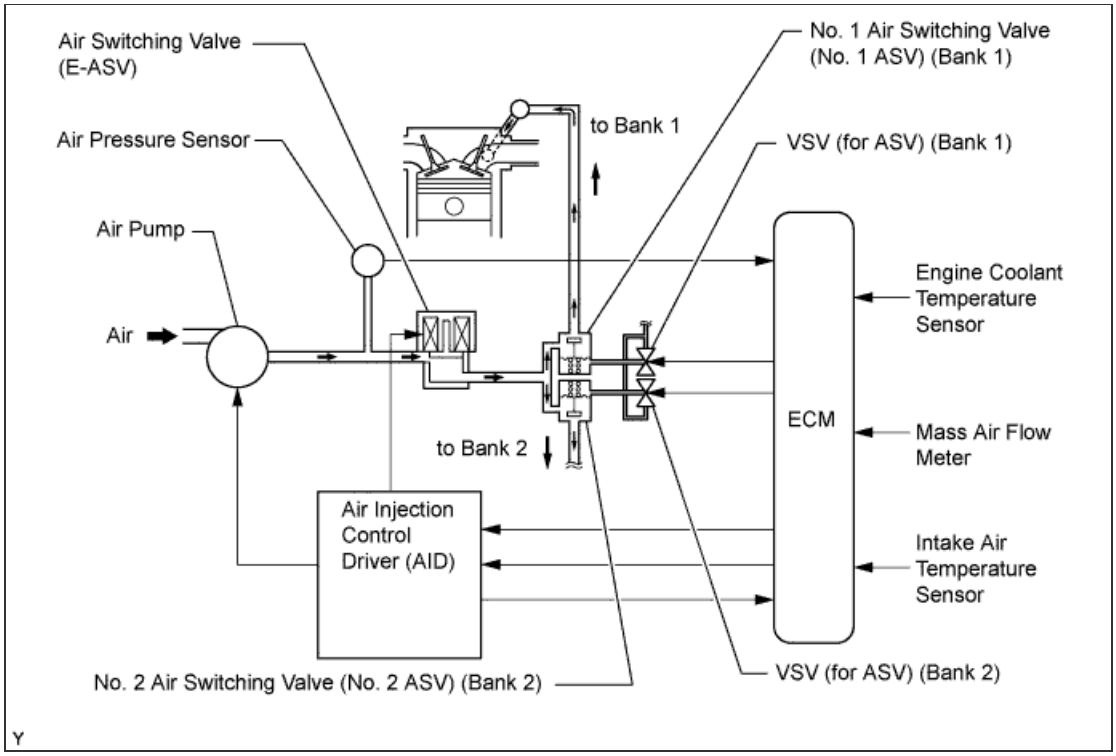
OK → REP ACE ENGINE COO ANT TEMPERATURE SENSOR (Click here)

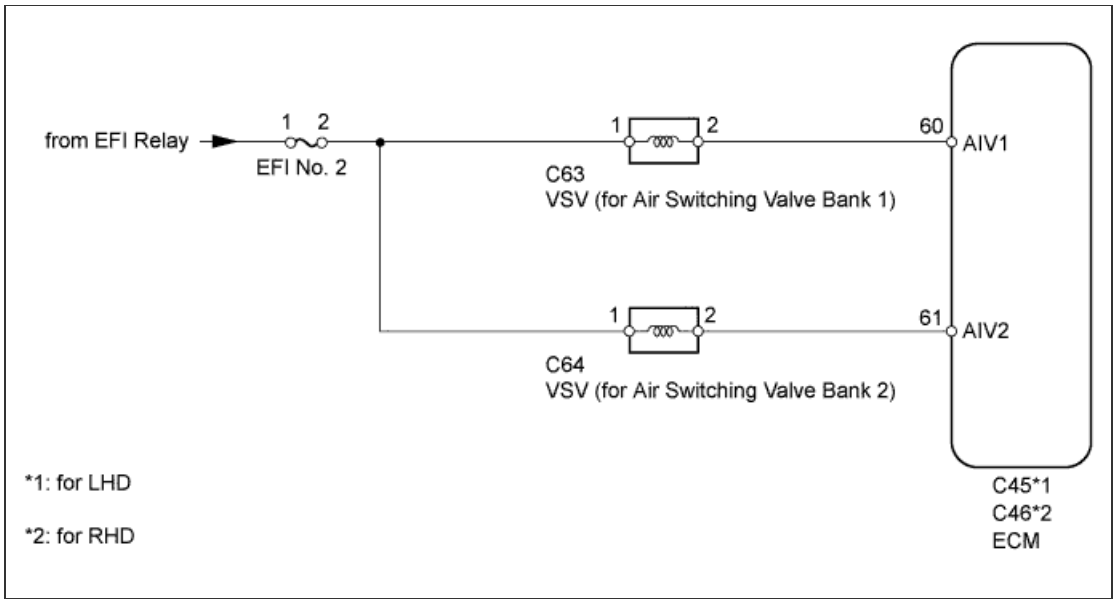
DTC P1440 Secondary Air Injection Vacuum Switching Valve Circuit Malfunction Bank 1



DTC P1443 Secondary Air Injection Vacuum Switching Valve Circuit Malfunction Bank 2

for Preparation Click here

DESCRIPTION



The diagnostic trouble code (DTC) indicates an open in the vacuum switching valve (VSV) circuit of the secondary air injection (AIR) system. The engine control module (ECM) monitors the VSV voltage to detect the malfunction. If the VSV voltage is below half of the battery voltage, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after the engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

DTC Code	DTC Detection Condition	Trouble Area
P1440	The VSV bank 1 voltage is below half of the battery voltage (1 trip detection logic).	• VSV circuit (bank 1) • VSV (bank 1) • ECM
P1443	The VSV bank 2 voltage is below half of the battery voltage (1 trip detection logic).	• VSV circuit (bank 2) • VSV (bank 2) • ECM

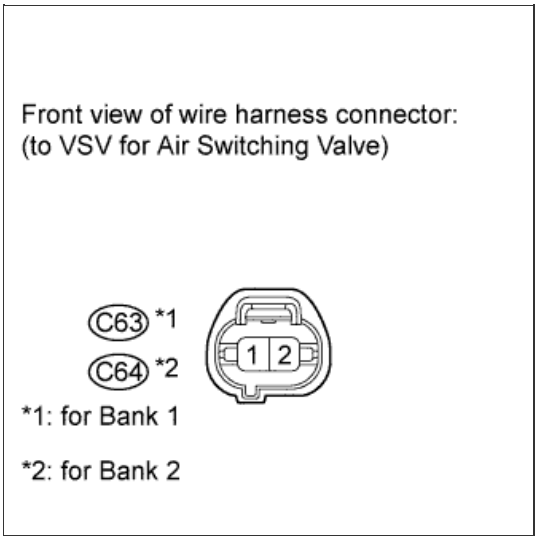
INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (AIR INJECTION SYSTEM POWER SOURCE)



a. Disconnect the VSV for air switching valve connector.

b. Turn the engine switch on (IG).

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C63-1 - Body ground	Engine switch on (IG)	11 to 14 V
C64-1 - Body ground	Engine switch on (IG)	11 to 14 V

NG → Go to step 4

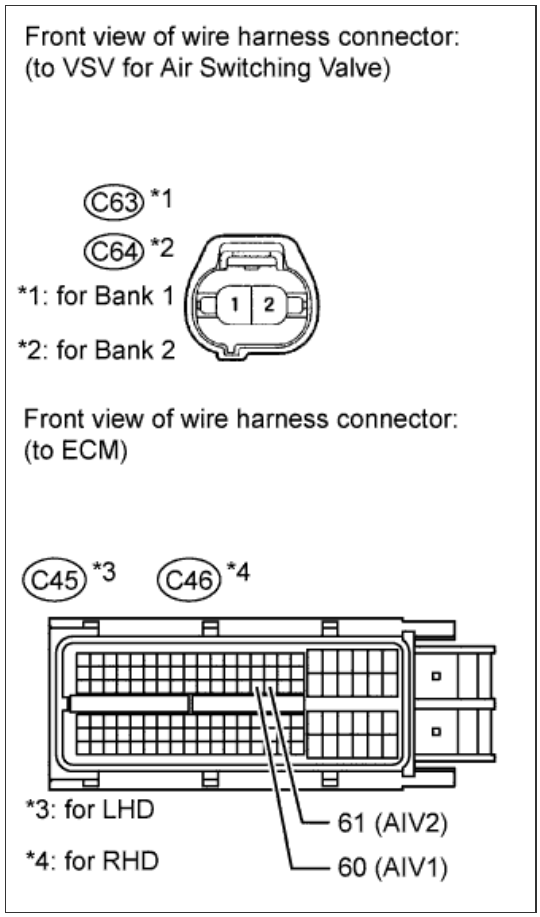
OK

2.CHECK HARNESS AND CONNECTOR (ECM - VSV)

a. Disconnect the ECM connector.

b. Disconnect the VSV for air switching valve connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C63-2 - C45-60 (AIV1)	Always	Below 1 Ω
C64-2 - C45-61 (AIV2)	Always	Below 1 Ω
C63-2 or C45-60		

(AIV1) - Body ground	Always	10 kΩ or higher
C64-2 or C45-61 (AIV2) - Body ground	Always	10 kΩ or higher

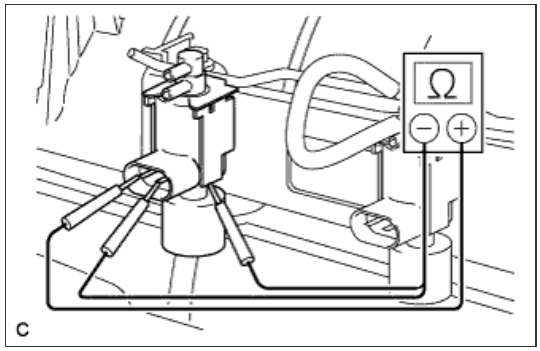
Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C63-2 - C46-60 (AIV1)	Always	Below 1 Ω
C64-2 - C46-61 (AIV2)	Always	Below 1 Ω
C63-2 or C46-60 (AIV1) - Body ground	Always	10 kΩ or higher
C64-2 or C46-61 (AIV2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK VSV (RESISTANCE)



a. Disconnect the VSV for air switching valve connector.

b. Disconnect the 2 vacuum hoses from the VSV.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Always	33 to 39 Ω at 20°C (68°F)
1 - Body ground	Always	10 kΩ or higher
2 - Body ground	Always	10 kΩ or higher

NG → REPLACE VSV (Click here)

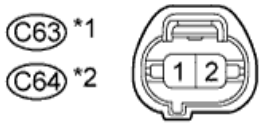
OK

REPLACE ECM (Click here)

4.CHECK HARNESS AND CONNECTOR (VSV - EFI NO. 2 FUSE)

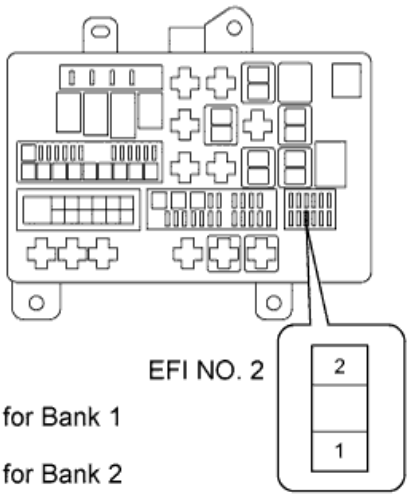
a. Disconnect the VSV connector.

b. Remove the EFI No. 2 fuse from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition

C63-1 - EFI No. 2 fuse terminal 2	Always	Below 1 Ω
C64-1 - EFI No. 2 fuse terminal 2	Always	Below 1 Ω
C63-1 or EFI No. 2 fuse terminal 2 - Body ground	Always	10 kΩ or higher
C64-1 or EFI No. 2 fuse terminal 2 - Body ground	Always	10 kΩ or higher

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

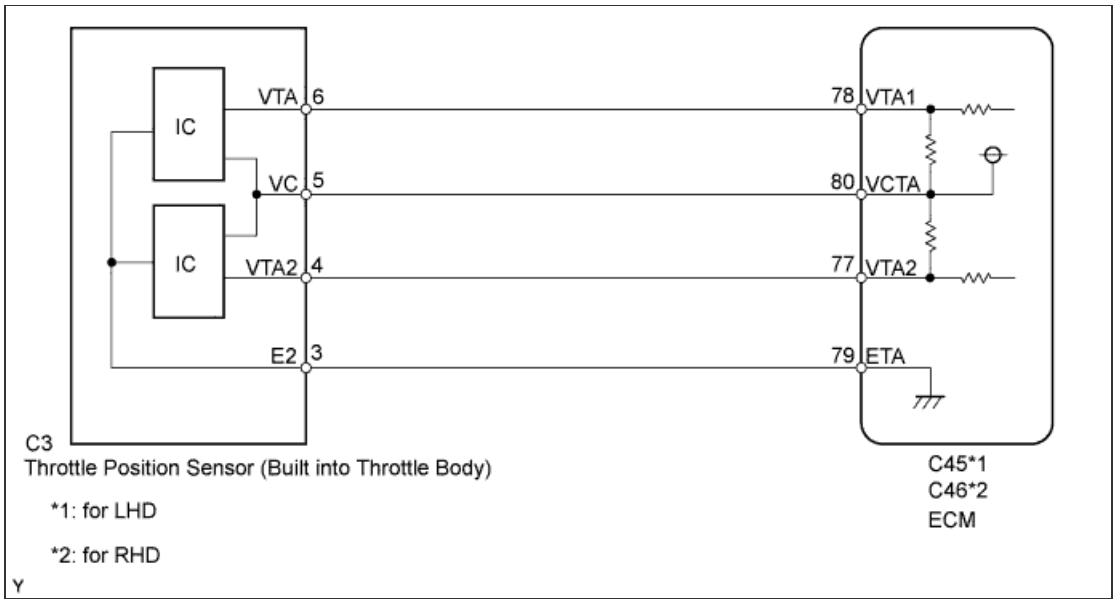
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No. 1 and Throttle Position No. 2.**
- **Throttle Position No. 1 is the VTA1 signal, and Throttle Position No. 2 is the VTA2 signal.**

Reference (Normal Condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No. 1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No. 2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then ad usts the engine output by controlling the fuel in ection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the D C3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain Engine and ECT Data ist ETCS Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

TP 1 (VTA1) When Accelerator Pedal Released	TP 2 (VTA2) When Accelerator Pedal Released	TP 1 (VTA1) When Accelerator Pedal Depressed	TP 2 (VTA2) When Accelerator Pedal Depressed	Trouble Area	Proceed to
0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	VC circuit open	A

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

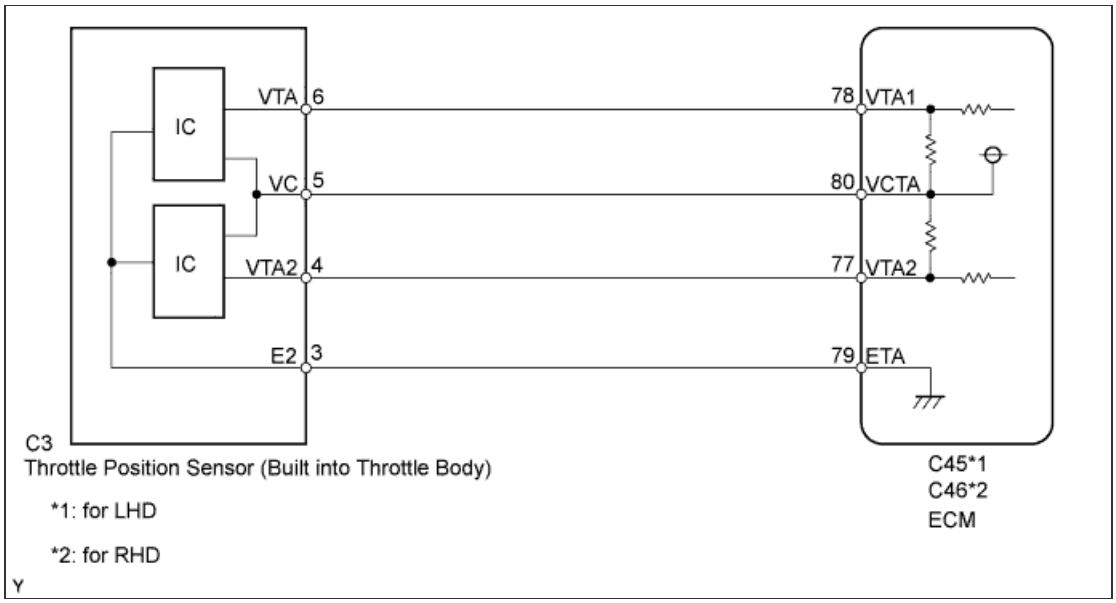
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No. 1 and Throttle Position No. 2.**
- **Throttle Position No. 1 is the VTA1 signal, and Throttle Position No. 2 is the VTA2 signal.**

Reference (Normal Condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No. 1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No. 2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then ad usts the engine output by controlling the fuel in ection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the D C3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain Engine and ECT Data ist ETCS Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

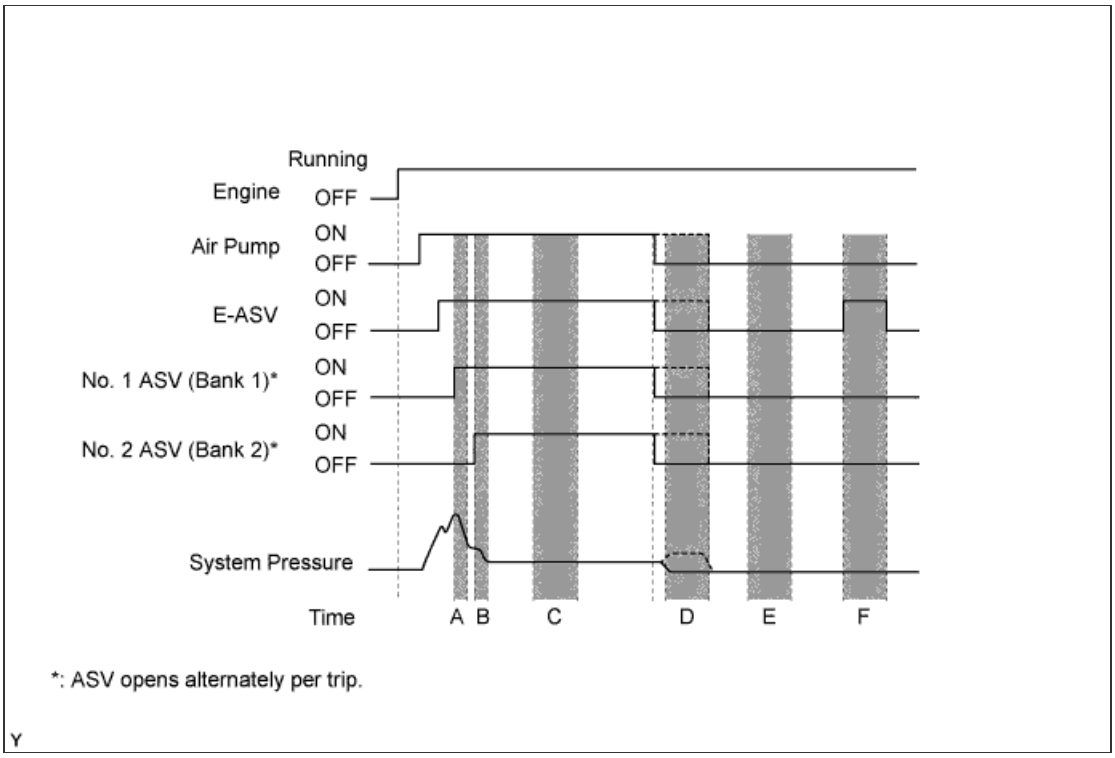
for Preparation Click here



DESCRIPTION

The diagnostic trouble code (DTC) indicates that the electric air switching valve (E-ASV) and air switching valves (ASVs) of the secondary air injection (AIR) system are stuck open. The engine control module (ECM) operates entire components of this system in a sequence, and monitors the system pressure and exhaust pulse (AIR monitor). This monitor will run just after a cold engine start. If abnormal pressure and exhaust pulse are detected, the ECM interprets this as a malfunction. When the malfunction is detected in consecutive driving cycles, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

HINT:

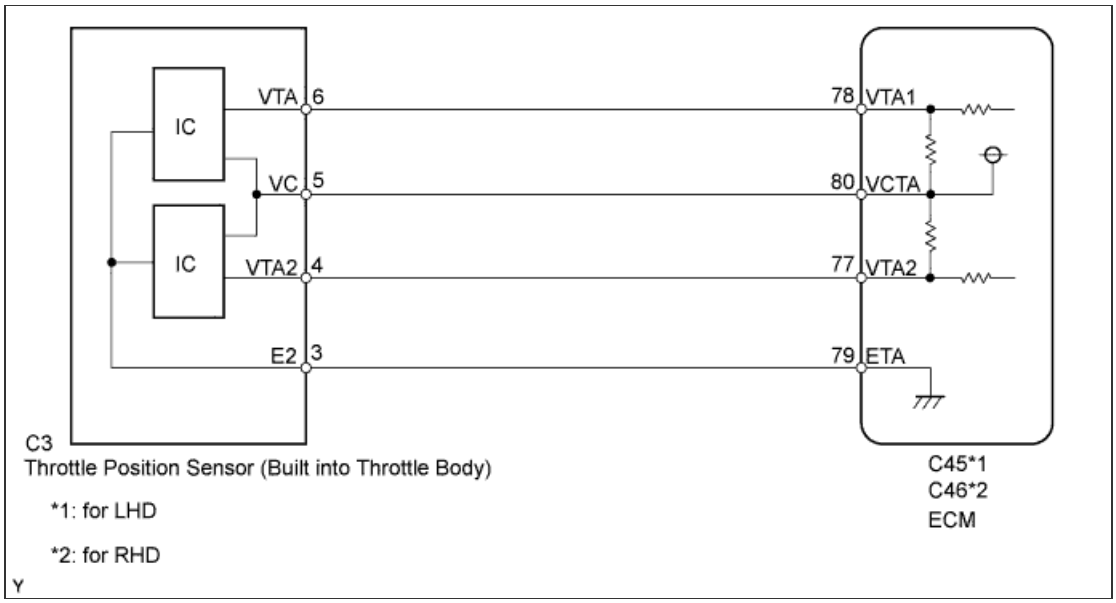
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No. 1 and Throttle Position No. 2.**
- **Throttle Position No. 1 is the VTA1 signal, and Throttle Position No. 2 is the VTA2 signal.**

Reference (Normal Condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No. 1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No. 2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then ad usts the engine output by controlling the fuel in ection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

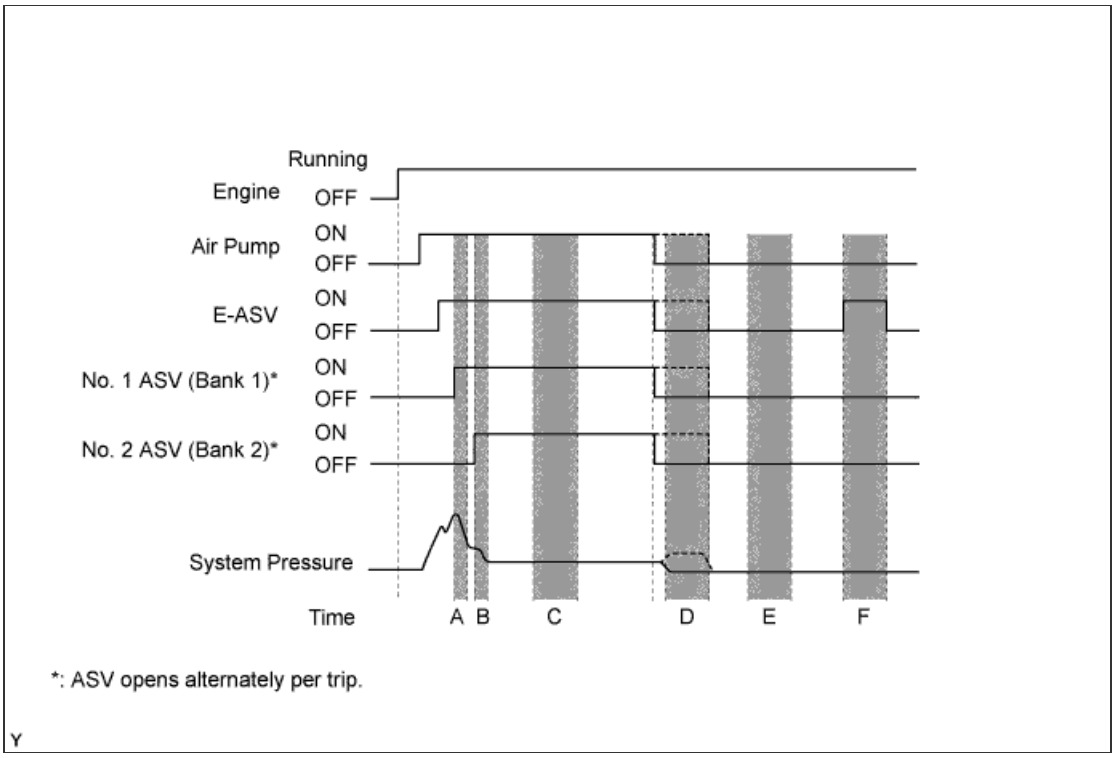
for Preparation Click here



DESCRIPTION

The diagnostic trouble code (DTC) indicates that the electric air switching valve (E-ASV) and air switching valves (ASVs) of the secondary air injection (AIR) system are stuck open. The engine control module (ECM) operates entire components of this system in a sequence, and monitors the system pressure and exhaust pulse (AIR monitor). This monitor will run just after a cold engine start. If abnormal pressure and exhaust pulse are detected, the ECM interprets this as a malfunction. When the malfunction is detected in consecutive driving cycles, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.PERFORM SECONDARY AIR INJECTION SYSTEM CHECK (AUTOMATIC MODE)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Record the DTCs and freeze frame data.

d. Clear the DTCs (Click here).

e. Warm-up the engine.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / Secondary Air Injection Check (Automatic Mode).

g. Perform the Active Test and check the pending DTC.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

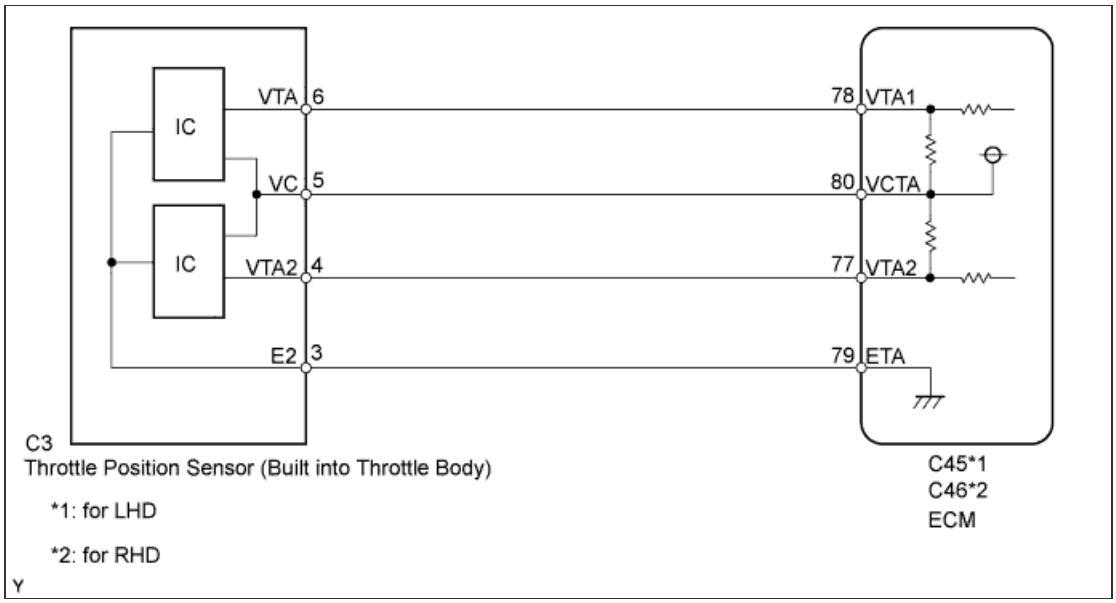
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No. 1 and Throttle Position No. 2.**
- **Throttle Position No. 1 is the VTA1 signal, and Throttle Position No. 2 is the VTA2 signal.**

Reference (Normal Condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No. 1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No. 2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then ad usts the engine output by controlling the fuel in ection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the D C3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data ist / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

HINT:

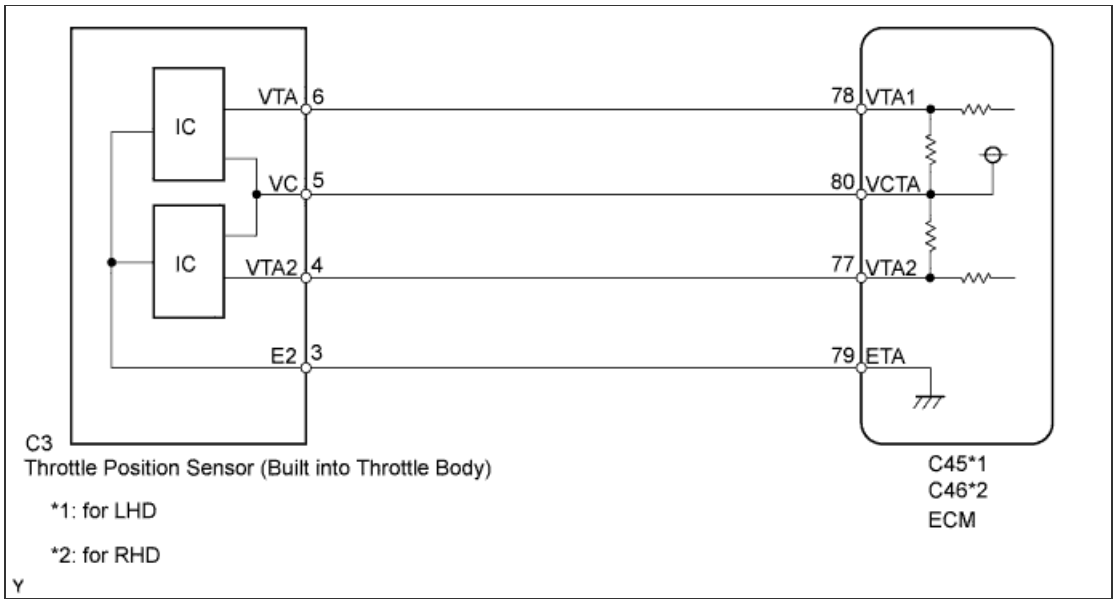
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No. 1 and Throttle Position No. 2.**
- **Throttle Position No. 1 is the VTA1 signal, and Throttle Position No. 2 is the VTA2 signal.**

Reference (Normal Condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No. 1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No. 2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then ad usts the engine output by controlling the fuel in ection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the D C3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data ist / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

TP 1 (VTA1) When Accelerator Pedal Released	TP 2 (VTA2) When Accelerator Pedal Released	TP 1 (VTA1) When Accelerator Pedal Depressed	TP 2 (VTA2) When Accelerator Pedal Depressed	Trouble Area	Proceed to

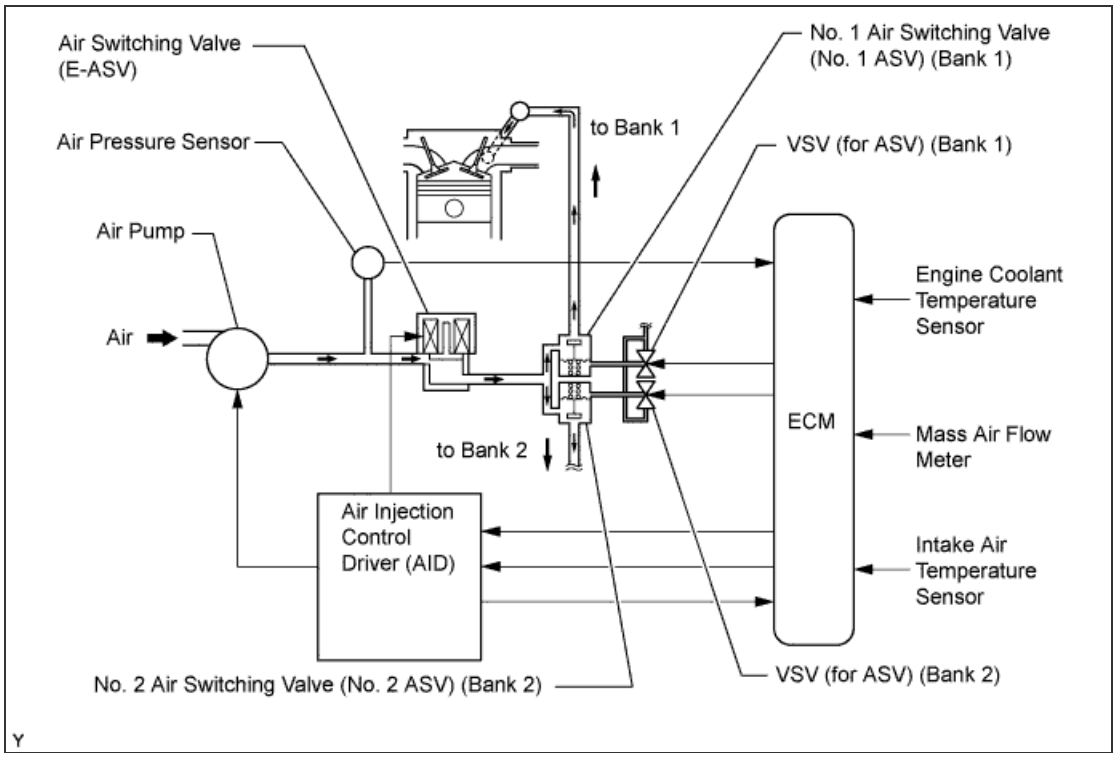
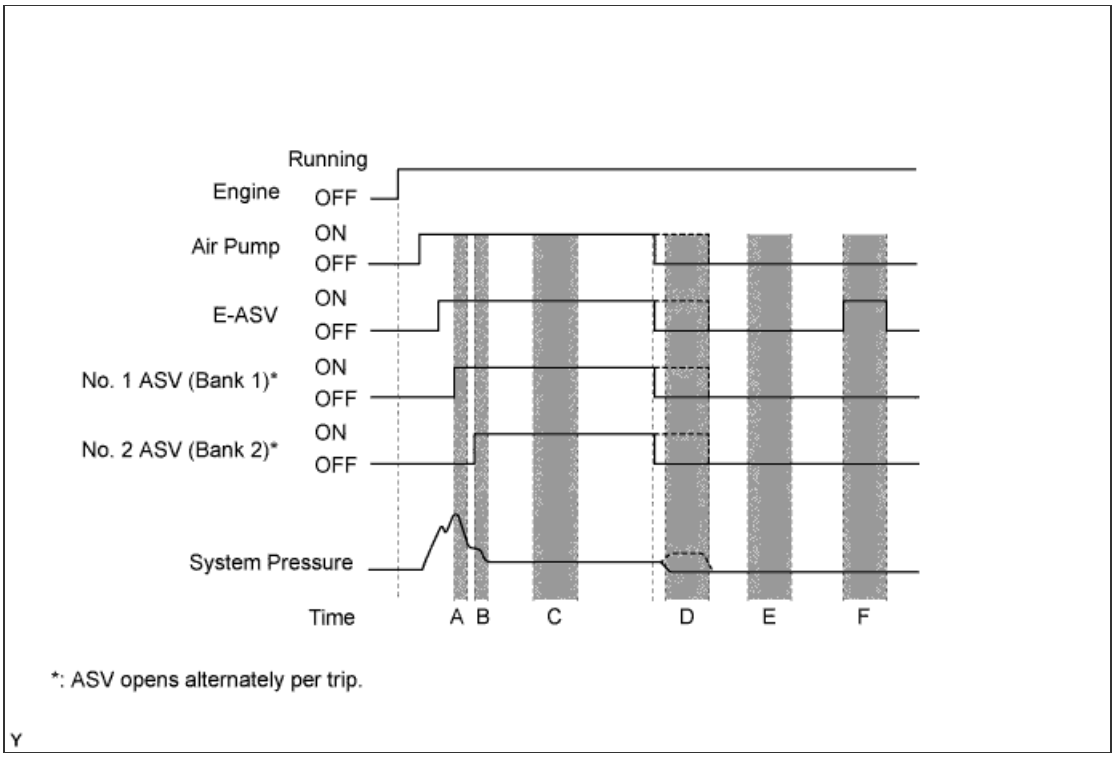
DTC P1442 Stuck Close in Secondary Air Injection Vacuum Switching Valve Bank 1

DTC P1445 Stuck Close in Secondary Air Injection Vacuum Switching Valve Bank 2



DTC P2441 Secondary Air Injection System Switching Valve Stuck Close Bank1

for Preparation Click here



DESCRIPTION

The diagnostic trouble code (DTC) indicates that the electric air switching valve (E-ASV) and air switching valves (ASVs) of the secondary air injection (AIR) system are stuck closed. The engine control module (ECM) operates entire components of this system in a sequence, and monitors the system pressure and exhaust pulse (AIR monitor). This monitor will run just after a cold engine start. If abnormal pressure and exhaust pulse are detected, the ECM interprets this as a malfunction. When the malfunction is detected in consecutive driving cycles, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

2.CHECK VACUUM HOSES (VSV)

a. Check that the vacuum hoses between the throttle body and VSV for the secondary air injection system are securely connected.

OK:
The vacuum hoses are securely connected.

b. Inspect the vacuum hoses for blockages or damage.

OK:
The vacuum hoses have no blockages or damage.

NG → REPAIR OR REPLACE VACUUM HOSES

OK

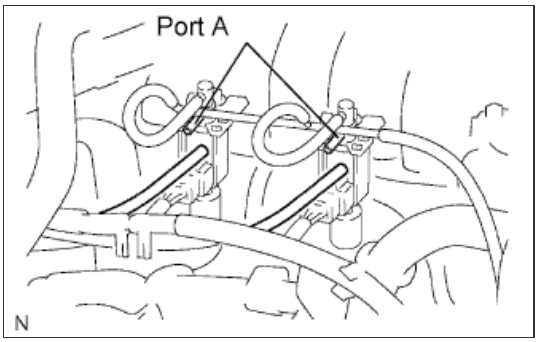
3.CHECK VACUUM SWITCHING VALVE (VSV)



a. Turn the engine switch off.

b. Disconnect the vacuum hoses from the VSV for the secondary air injection system.

c. Connect the intelligent tester to the DLC3.

d. Start the engine and turn the tester on.

e. Perform the Active Test to operate the secondary air injection system, and check that there is negative pressure from ports A. Enter the following menus: Powertrain Engine and ECT Utility Secondary Air Injection Check (Manual Mode) Operation 5 or 6.

OK:

Negative pressure from ports A.

NOTICE:

- **This test only allows technicians to operate the AIR system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.**
  While the AIR system operation using the intelligent tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If ERROR (AI Status NG) is displayed on the tester, stop the engine for 10 minutes and then try again.
- **When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.**
- **Turn the engine switch off when the Secondary Air Injection Check operation finishes.**

NG → REPLACE VACUUM SWITCHING VALVE (Click here)

OK

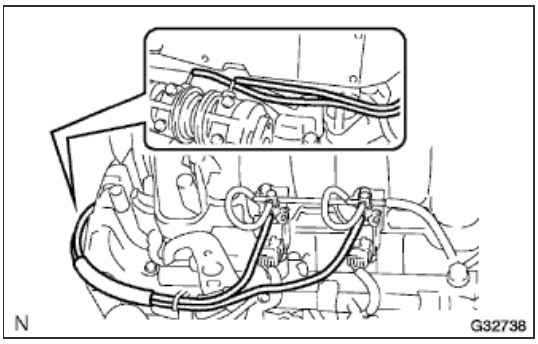
4.CHECK VACUUM HOSES (AIR SWITCHING VALVE)

a. Check that the vacuum hoses between the air switching valve(s) and VSV for the secondary air injection system are securely connected.



OK:

The vacuum hose(s) are securely connected.

b. Check the vacuum hoses for blockages and damage.

OK:

The vacuum hoses have no blockages or damage.

NG → REPAIR OR REPLACE VACUUM HOSES

OK

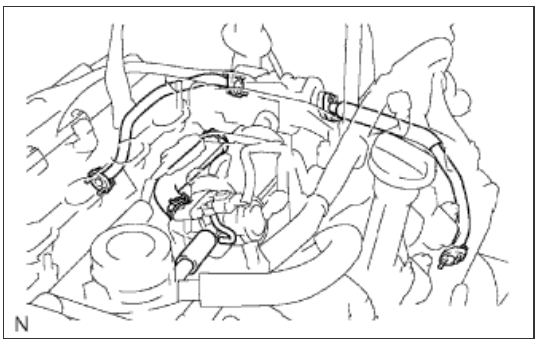
5.CHECK PIPES AND HOSES

a. Remove the intake manifold (Click here).

b. Check all pipes and hoses of the secondary air injection system.



OK:

All air injection pipes and hoses are securely connected.

c. Check all pipes and hoses for blockage or damage.

OK:

All air injection pipes and hoses have no blockages or damage.

NG → REPAIR OR REPLACE PIPE AND HOSES

OK

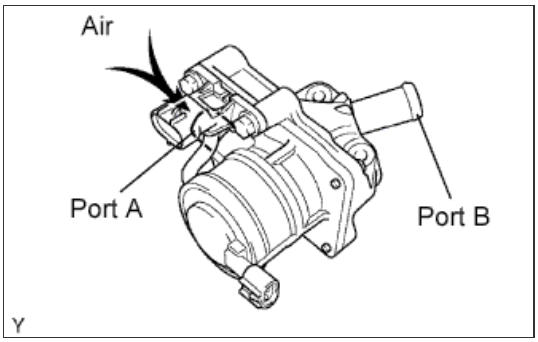
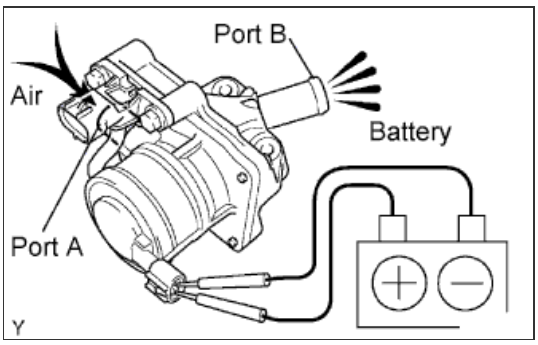
6.CHECK AIR SWITCHING VALVE (OPERATION)



a. Remove the intake manifold (Click here).



b. Remove the Air Switching Valve (ASV).

c. Blow air into port A and check that air is not discharged from port B.

d. Apply battery positive voltage across the terminals.

e. Blow air into port A and check that air is discharged from port B.

OK:

Tester Connection	Condition	Specified Condition
port A - port B	Always	Not discharged
port A - port B	Battery positive voltage applied	Discharged

NG → REPLACE AIR SWITCHING VALVE (Click here)

for Preparation Click here

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

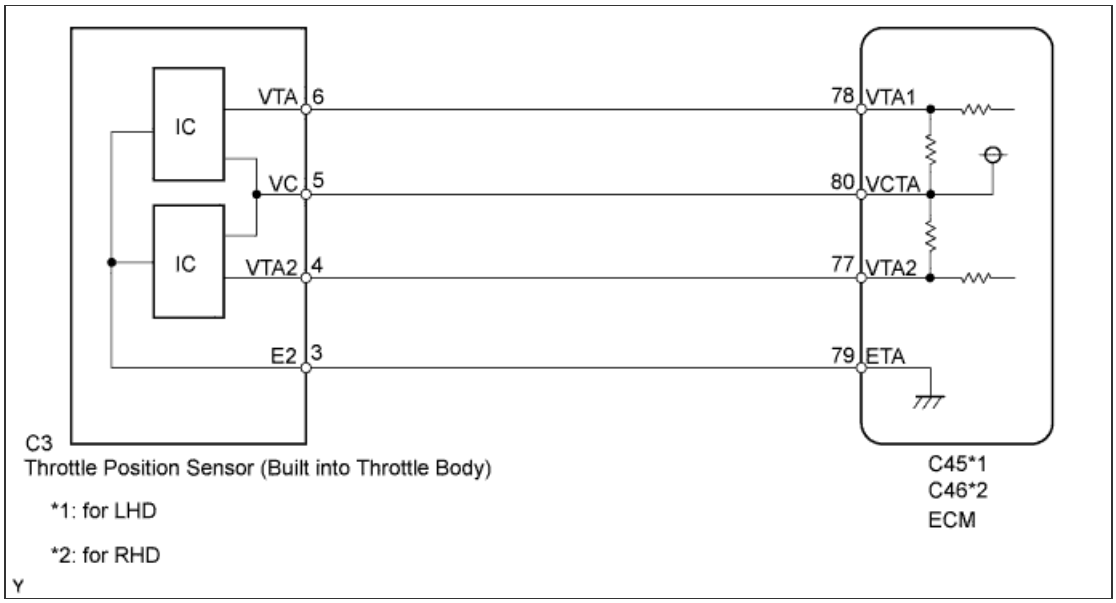
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No. 1 and Throttle Position No. 2.**
- **Throttle Position No. 1 is the VTA1 signal, and Throttle Position No. 2 is the VTA2 signal.**

Reference (Normal Condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No. 1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No. 2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then ad usts the engine output by controlling the fuel in ection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

2.CHECK VACUUM HOSES (VSV)

a. Check that the vacuum hoses between the throttle body and VSV for the secondary air injection system are securely connected.

OK:
The vacuum hoses are securely connected.

b. Inspect the vacuum hoses for blockages or damage.

OK:
The vacuum hoses have no blockages or damage.

NG → REPAIR OR REPLACE VACUUM HOSES

OK

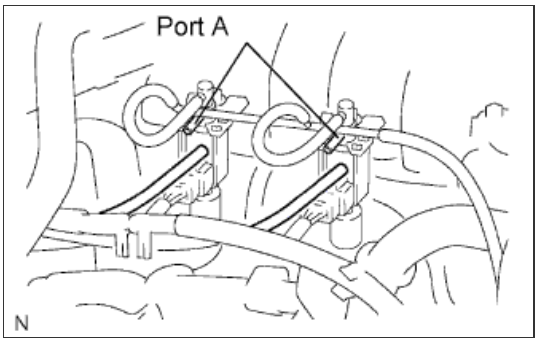
3.CHECK VACUUM SWITCHING VALVE (VSV)



a. Turn the engine switch off.

b. Disconnect the vacuum hoses from the VSV for the secondary air injection system.

c. Connect the intelligent tester to the DLC3.

d. Start the engine and turn the tester on.

e. Perform the Active Test to operate the secondary air injection system, and check that there is negative pressure from ports A. Enter the following menus: Powertrain Engine and ECT Utility Secondary Air Injection Check (Manual Mode) Operation 5 or 6.

OK:

Negative pressure from ports A.

NOTICE:

- **This test only allows technicians to operate the AIR system for 5 seconds. Furthermore, the test can be performed 4 times a trip. If the test is repeated, intervals of at least 30 seconds are required between tests.**
  While the AIR system operation using the intelligent tester is prohibited, the tester displays the prohibition (WAIT or ERROR). If ERROR (AI Status NG) is displayed on the tester, stop the engine for 10 minutes and then try again.
- **When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.**
- **Turn the engine switch off when the Secondary Air Injection Check operation finishes.**

NG → REPLACE VACUUM SWITCHING VALVE (Click here)

OK

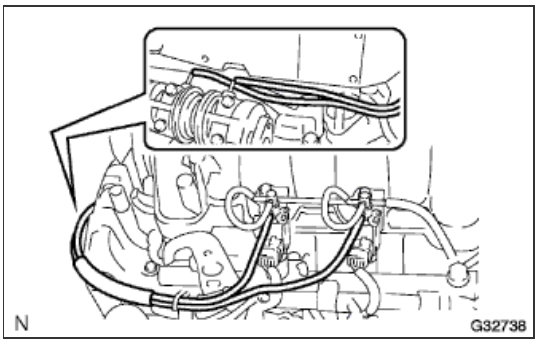
4.CHECK VACUUM HOSES (AIR SWITCHING VALVE)

a. Check that the vacuum hoses between the air switching valve(s) and VSV for the secondary air injection system are securely connected.



OK:

The vacuum hose(s) are securely connected.

b. Check the vacuum hoses for blockages and damage.

OK:

The vacuum hoses have no blockages or damage.

NG → REPAIR OR REPLACE VACUUM HOSES

OK

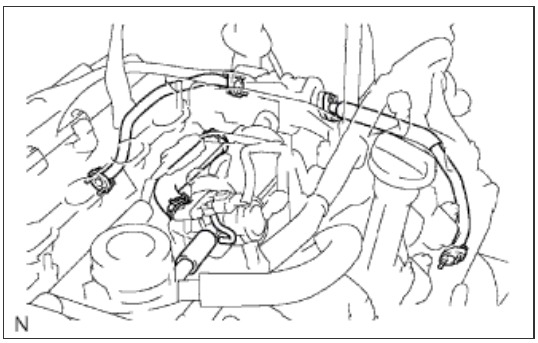
5.CHECK PIPES AND HOSES

a. Remove the intake manifold (Click here).

b. Check all pipes and hoses of the secondary air injection system.



OK:

All air injection pipes and hoses are securely connected.

c. Check all pipes and hoses for blockage or damage.

OK:

All air injection pipes and hoses have no blockages or damage.

NG → REPAIR OR REPLACE PIPE AND HOSES

OK

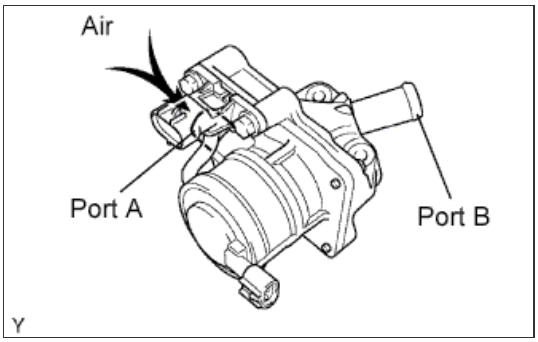
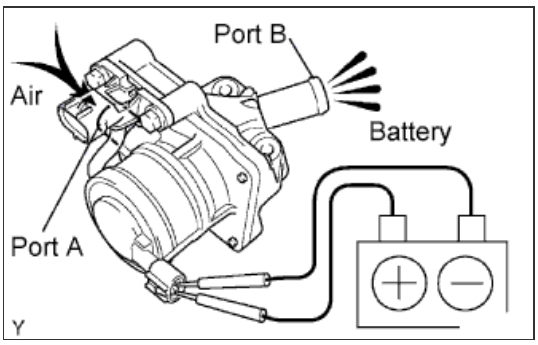
6.CHECK AIR SWITCHING VALVE (OPERATION)



a. Remove the intake manifold (Click here).



b. Remove the Air Switching Valve (ASV).

c. Blow air into port A and check that air is not discharged from port B.

d. Apply battery positive voltage across the terminals.

e. Blow air into port A and check that air is discharged from port B.

OK:

Tester Connection	Condition	Specified Condition
port A - port B	Always	Not discharged
port A - port B	Battery positive voltage applied	Discharged

NG → REPLACE AIR SWITCHING VALVE (Click here)

OK

REPLACE AIR SWITCHING VALVE ASSEMBLY (NO. 1 or NO. 2) (Click here)

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air-fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• Throttle Position (TP) sensor (built into throttle body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

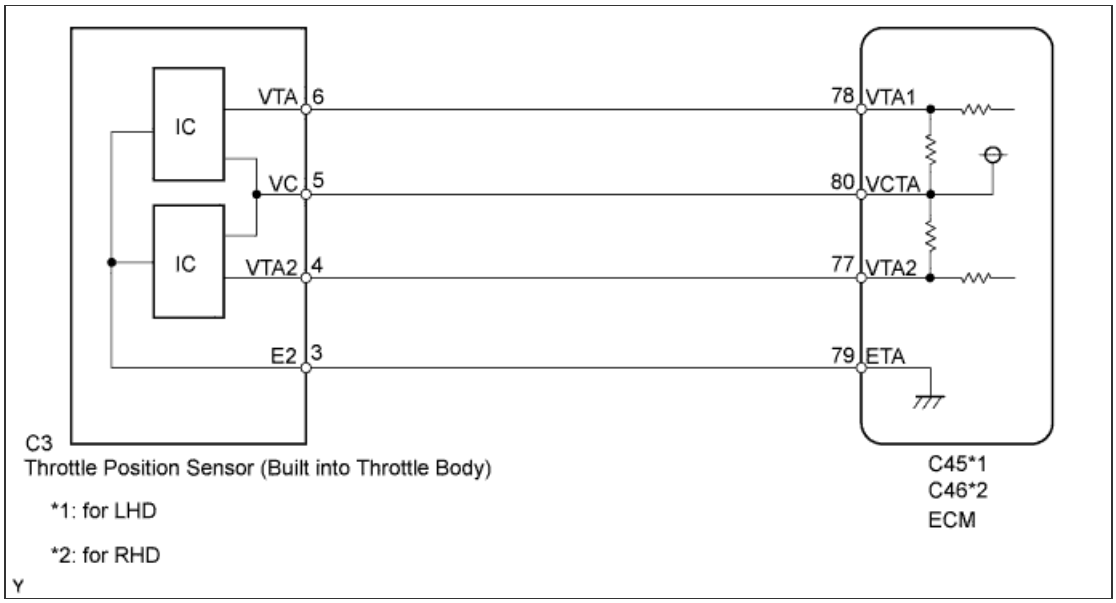
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No. 1 and Throttle Position No. 2.**
- **Throttle Position No. 1 is the VTA1 signal, and Throttle Position No. 2 is the VTA2 signal.**

Reference (Normal Condition):

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No. 1	0.5 to 1.1 V	3.3 to 4.9 V
Throttle Position No. 2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then ad usts the engine output by controlling the fuel in ection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION)

a. Connect the intelligent tester to the D C3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data ist / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

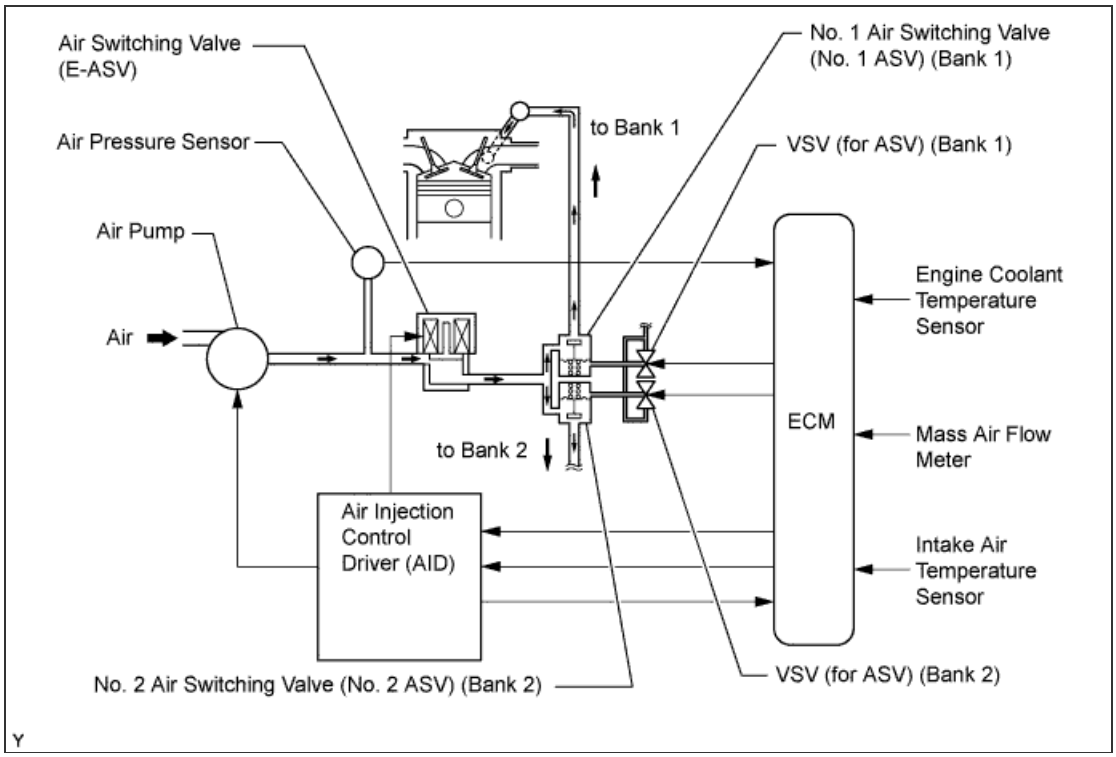
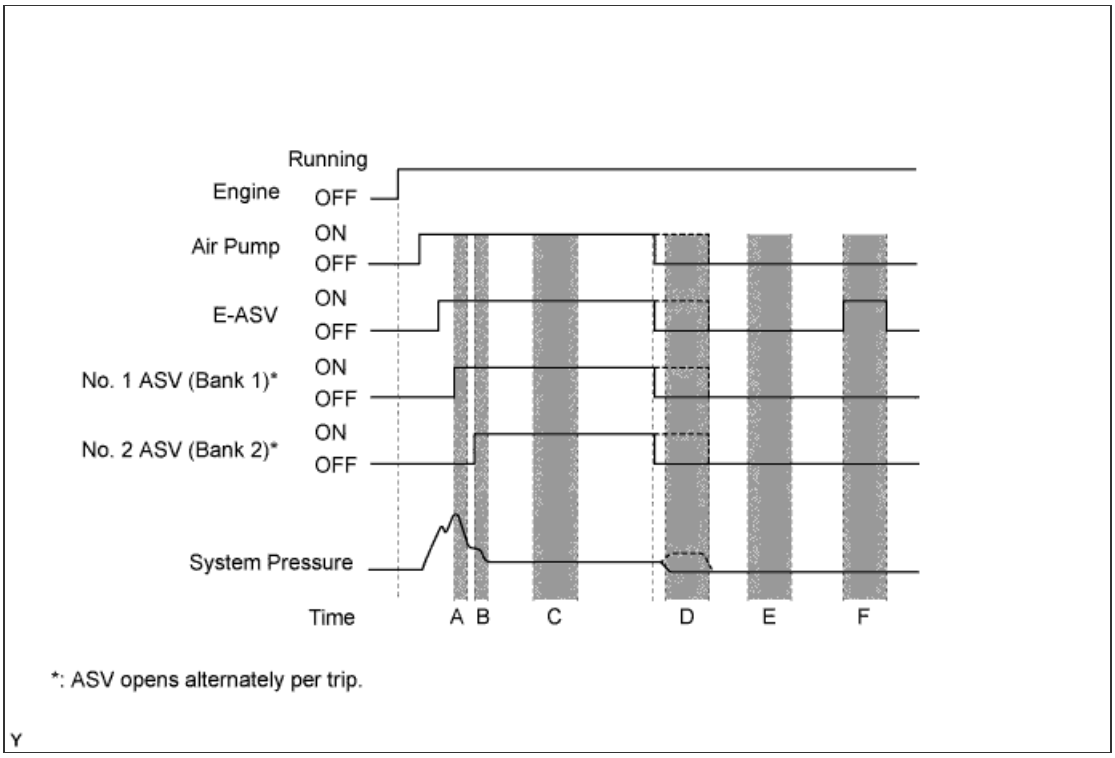
DTC P1442 Stuck Close in Secondary Air Injection Vacuum Switching Valve Bank 1

DTC P1445 Stuck Close in Secondary Air Injection Vacuum Switching Valve Bank 2



DTC P2441 Secondary Air Injection System Switching Valve Stuck Close Bank1

for Preparation Click here



DESCRIPTION

The diagnostic trouble code (DTC) indicates that the electric air switching valve (E-ASV) and air switching valves (ASVs) of the secondary air injection (AIR) system are stuck closed. The engine control module (ECM) operates entire components of this system in a sequence, and monitors the system pressure and exhaust pulse (AIR monitor). This monitor will run just after a cold engine start. If abnormal pressure and exhaust pulse are detected, the ECM interprets this as a malfunction. When the malfunction is detected in consecutive driving cycles, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

DTC P0121 Throttle / Pedal Position Sensor / Switch "A" Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0120 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0121	The difference between the VTA1 and VTA2 voltages is below 0.8 V, or higher than 1.6 V for 2 seconds (1 trip detection logic).	TP sensor (built into throttle body)

MONITOR DESCRIPTION

The ECM uses the TP sensor to monitor the throttle valve opening angle.
This sensor transmits two signals: VTA1 and VTA2. VTA1 is used to detect the throttle opening angle and VTA2 is used to detect malfunctions in VTA1.
The ECM performs several checks to confirm the proper operation of the TP sensor and VTA1.
For each throttle opening angle, a specific voltage difference is expected between the outputs of VTA1 and VTA2. If the output voltage difference between the two signals deviates from the normal operating range, the ECM interprets this as a malfunction of the TP sensor. The ECM illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

INSPECTION PROCEDURE

HINT:

- **This DTC relates to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

DESCRIPTION

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with a heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.21 V. P0138 P0158	• High voltage (short): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is higher than 0.59 V. (b) The target air-fuel ratio is lean.	• Short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • ECM internal circuit malfunction • Air-Fuel Ratio (A/F) sensor (for bank 1, 2)

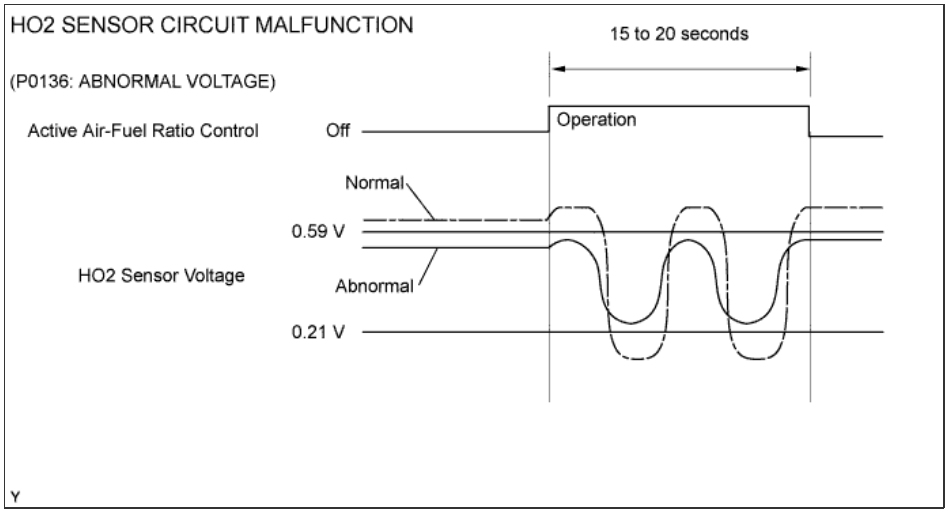
MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

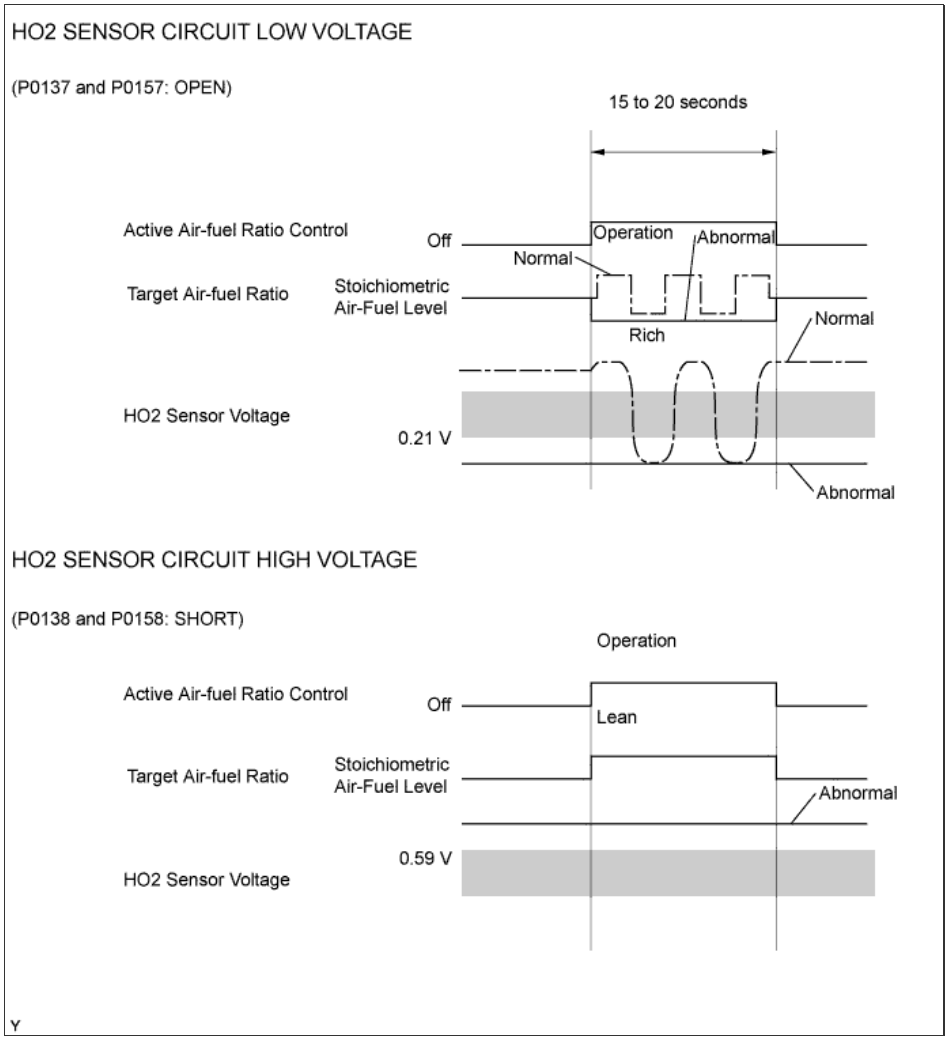
The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

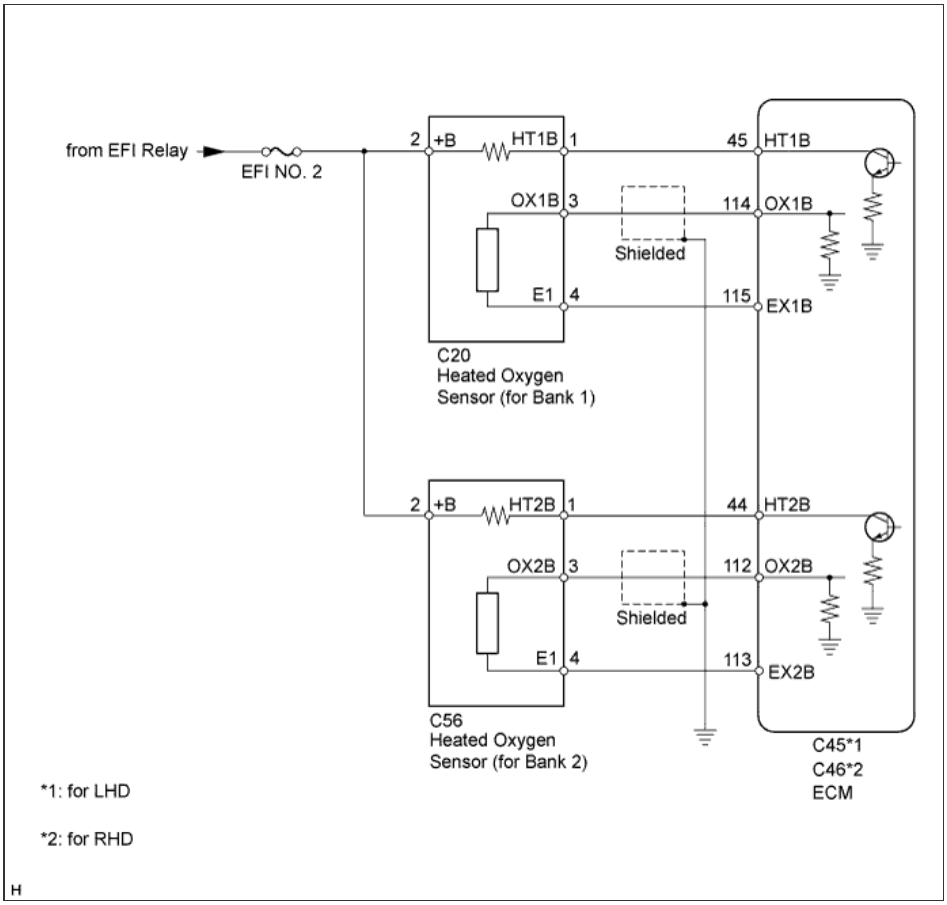
While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



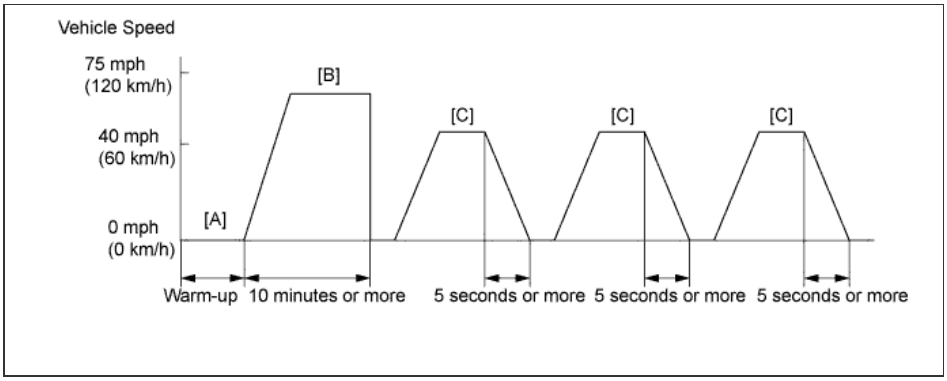
During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.



HINT:

DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.



*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [A].
4. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes or more [B].
5. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times [C].
6. Turn the tester on.
7. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
8. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
9. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern by accelerating and decelerating the vehicle.

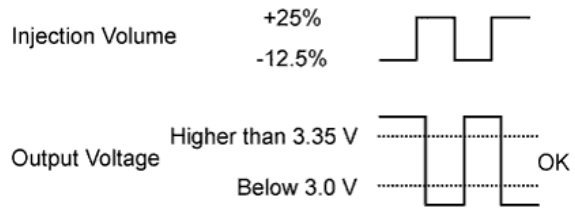
INSPECTION PROCEDURE

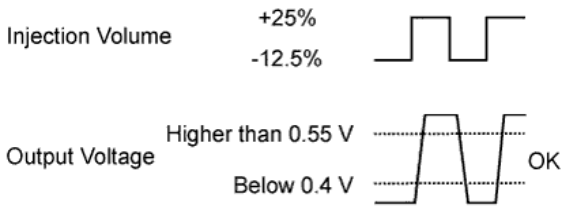
HINT:

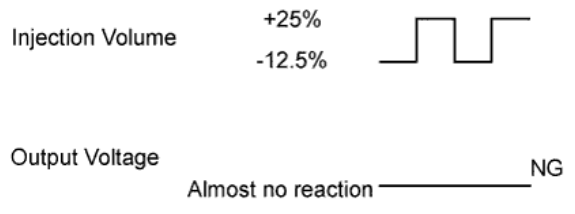
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

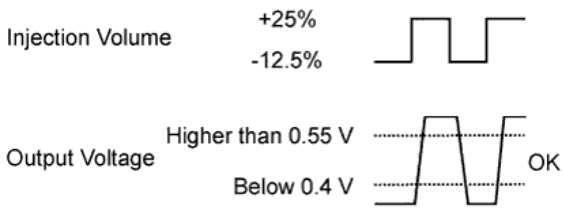
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

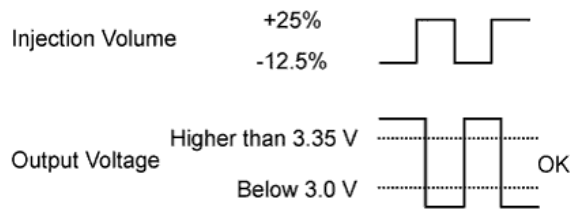
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

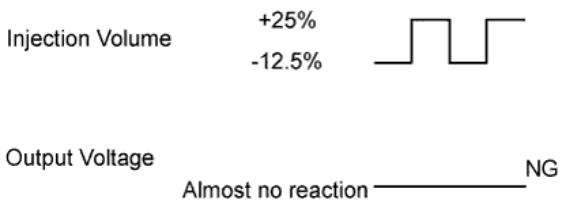


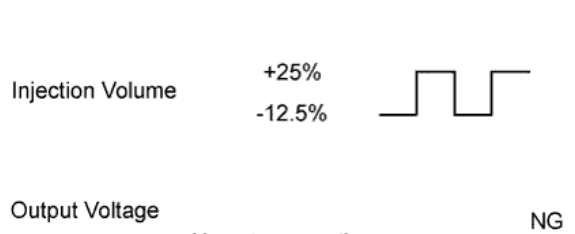


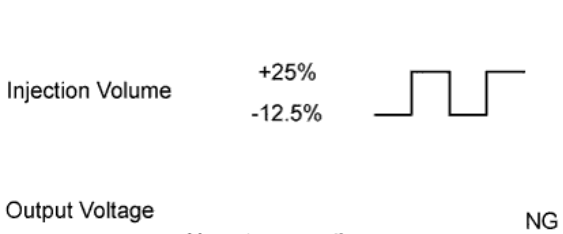












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously terminal E2 may have an open circuit.**
- **Read free e frame data using the intelligent tester. Free e frame data records the engine condition when malfunctions are detected. When troubleshooting free e frame data can help determine if the vehicle was moving or stationary if the engine was warmed up or not if the air fuel ratio was lean or rich and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short circuited to the B wire DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short circuited to the B wire DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B → Go to step 8

C → Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

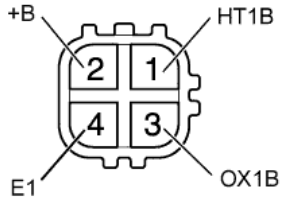
Result

Result	Proceed to
Higher than 1.2 V	A
Below 1.0 V	B

O → o to step 5

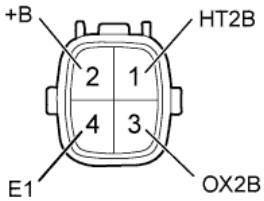
NG → Go to step 3

3.INSPECT HEATED OXYGEN SENSOR (CHEC OR SHORT)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

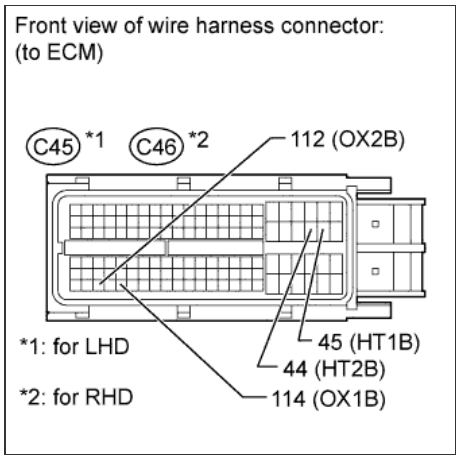
NG → REPLACE HEATED OXYGEN SENSOR (Click here)

O

CHEC HARNESS AND CONNECTOR (CHEC OR SHORT)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-45 (HT1B) - C45-114 (OX1B)	Always	10 kΩ or higher
C45-44 (HT2B) - C45-112 (OX2B)	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-45 (HT1B) - C46-114 (OX1B)	Always	10 kΩ or higher
C46-44 (HT2B) - C46-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

O

REPLACE ECM (Click here)

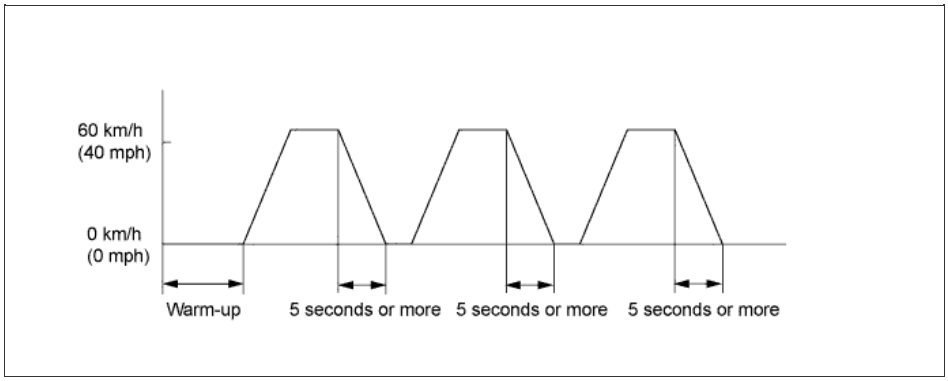
5.CHEC IR FUEL RATIO SENSOR CURRENT

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

d. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more.
Perform this 3 times.

HINT:

If the tester shows Utility / Monitor Status / O2 Sensor / Incomplete again, increase the vehicle speed and use second gear to decelerate the vehicle.

f. Read the value.

Standard current:
Below 3.0 mA

O → o to step 12

NG → Go to step 14

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

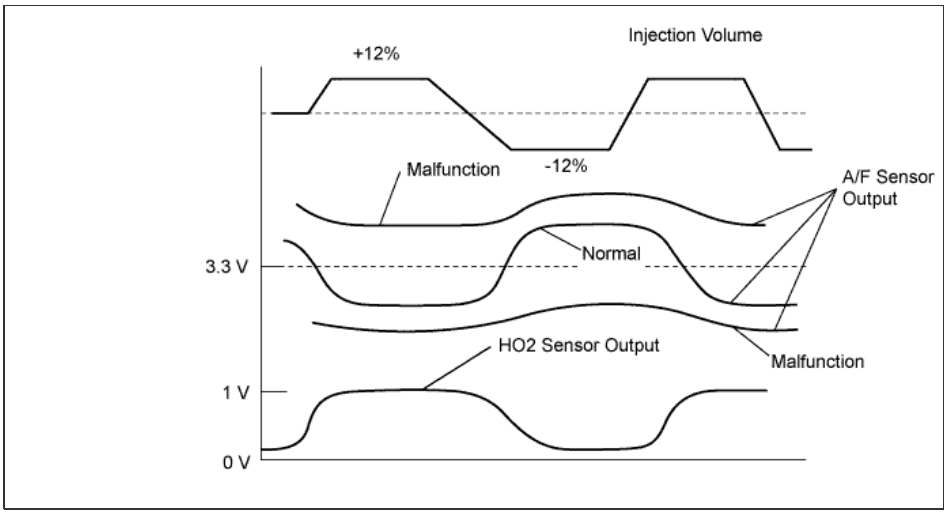
c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:



Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 8

O

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (IN ECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of 12% and 12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1 and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either below or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Go to step 14

O

CHEC EXTREMELY RICH OR LEAN ACTUAL AIR EL RATIO AND REPAIR CAUSE (IN ECTOR EL PRESSURE LEAKAGE FROM EXHAUST SYSTEM, ETC.)

8.CHECK FOR EXHAUST GAS LEAK

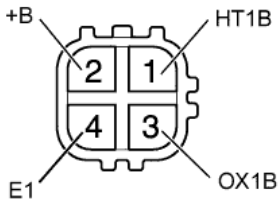
a. Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:
No exhaust gas leakage.

NG	REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

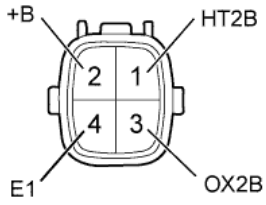
OK

9.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

10.INSPECT INTEGRATION RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

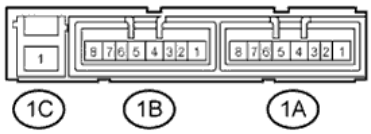
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

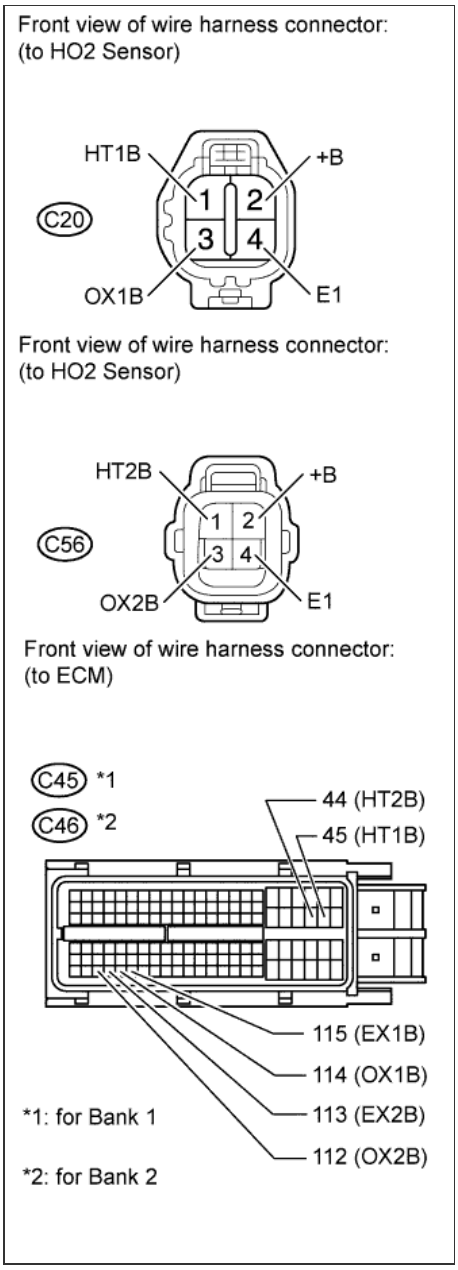
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

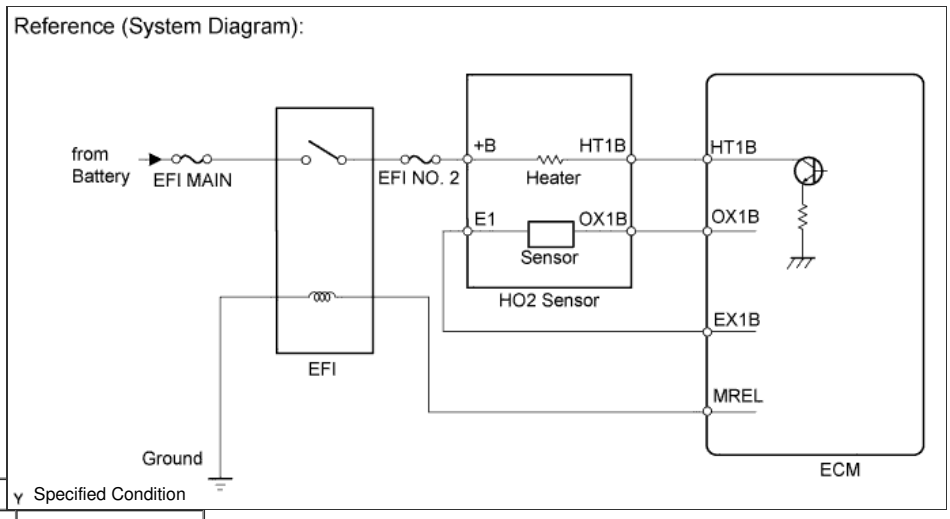
Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	When no battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	When battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY



OK



11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V
C56-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C46-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C46-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C46-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C46-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C46-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C46-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C46-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR (Click here)

12.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

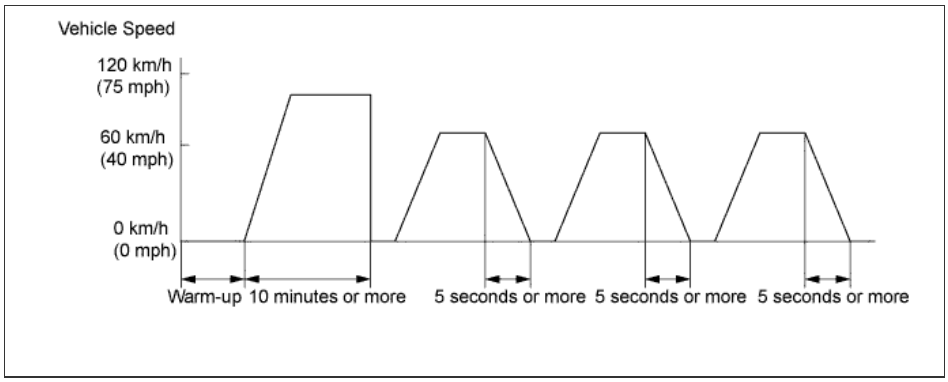
13.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → END

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

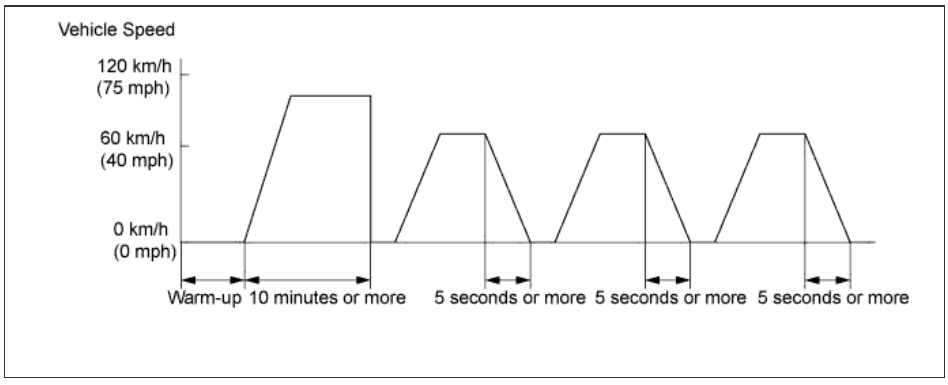
b. Turn the engine switch on (IG).

c. Clear the DTCs.

d. Switch the ECM from normal mode to check mode using the tester.

e. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

f. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



g. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

h. Turn the tester on.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

k. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

END

DTC P1613 Secondary Air Injection Driver Malfunction

for Preparation Click here

DESCRIPTION

The diagnostic trouble code (DTC) indicates an open or short in the air injection control driver circuit of the secondary air injection (AIR) system. The air injection control driver diagnoses the air pump circuit, E-ASV circuit and itself, and sends the diagnosis signal to the engine control module (ECM). If the ECM receives a malfunction signal from the air injection control driver, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.
The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

DTC Code	DTC Detection Condition	Trouble Area
P1613	The ECM receives a diagnostic signal from the driver (duty-cycle: 0%, 100% or other than 0, 20, 40, 60, 80, or 100%).	• Air injection control driver • ECM • Diagnostic signal circuit (Driver - ECM)

WIRING DIAGRAM

Refer to DTC P0412 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK AIR INJECTION CONTROL DRIVER

a. Inspection 1.

i. Disconnect the air injection control driver connector.

ii. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C61-5 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

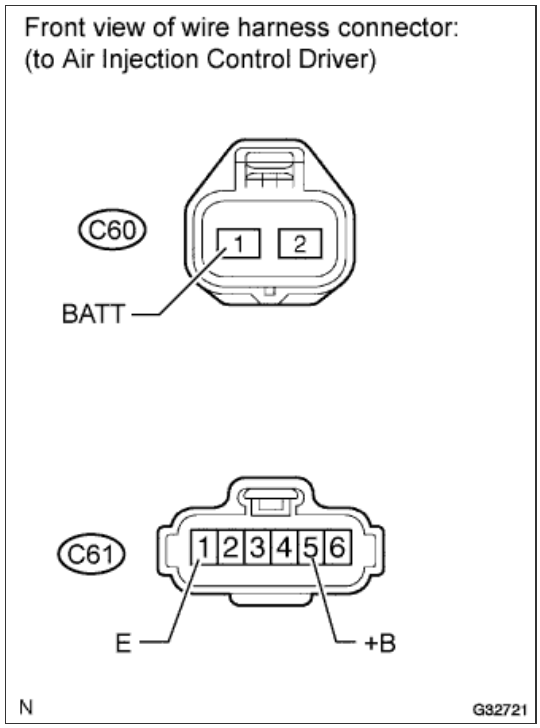
b. Inspection 2.

i. Disconnect the air injection control driver connector.

ii. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C60-1 (BATT) - Body ground	Engine switch on (IG)	11 to 14 V



c. Inspection 3.

i. Disconnect the air injection control driver connector.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C61-1 (E) - Body ground	Always	Below 1 Ω

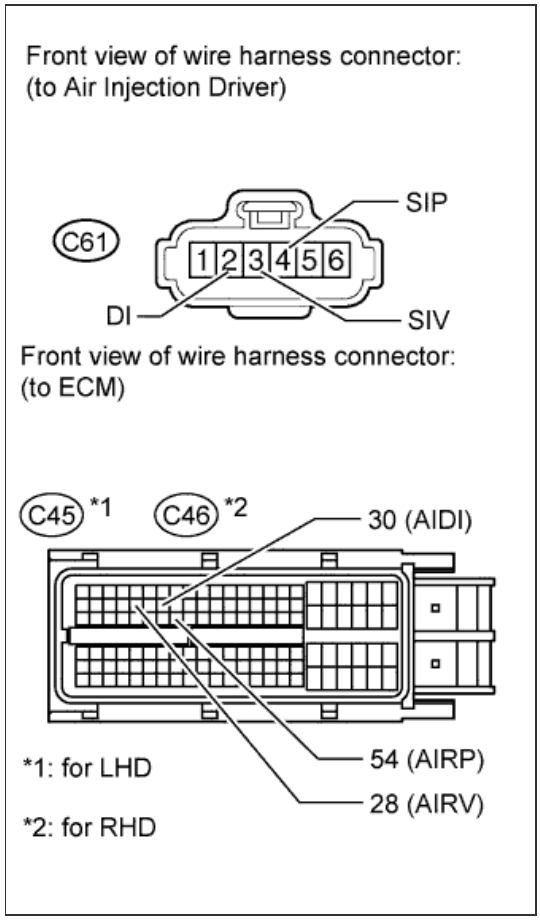
Result

Result	Proceed to
OK	A
Inspection 1 NG	B
Inspection 2 NG	C
Inspection 3 NG	D

B → Go to step 4

C → Go to step 5

D → REPAIR OR REPLACE HARNESS OR CONNECTOR



A

2.CHECK HARNESS AND CONNECTOR (AIR INJECTION CONTROL DRIVER - ECM)

a. Disconnect the ECM connector.

b. Disconnect the air injection control driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C61-3 (SIV) - C45-28 (AIRV)	Always	Below 1 Ω
C61-4 (SIP) - C45-54 (AIRP)	Always	Below 1 Ω
C61-2 (DI) - C45-30 (AIDI)	Always	Below 1 Ω
C61-3 (SIV) or C45-28 (AIRV) - Body ground	Always	10 kΩ or higher
C61-4 (SIP) or C45-54 (AIRP) - Body ground	Always	10 kΩ or higher
C61-2 (DI) or C45-30 (AIDI) - Body ground	Always	10 kΩ or higher

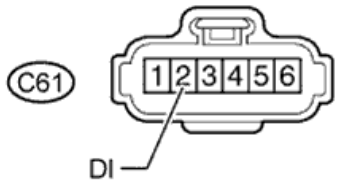
Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C61-3 (SIV) - C46-28 (AIRV)	Always	Below 1 Ω
C61-4 (SIP) - C46-54 (AIRP)	Always	Below 1 Ω
C61-2 (DI) - C46-30 (AIDI)	Always	Below 1 Ω
C61-3 (SIV) or C46-28 (AIRV) - Body ground	Always	10 kΩ or higher
C61-4 (SIP) or C46-54 (AIRP) - Body ground	Always	10 kΩ or higher
C61-2 (DI) or C46-30 (AIDI) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (AIDI VOLTAGE)



a. Disconnect the air injection control driver connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C61-2 (DI) - Body ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector:
(to Air Injection Control Driver)

OK → Go to step 6

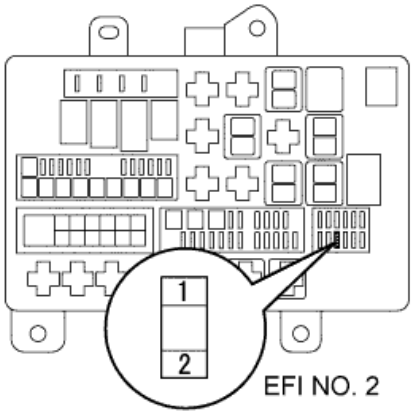
NG → REPLACE ECM (Click here)

4.CHECK HARNESS AND CONNECTOR (AIR INJECTION CONTROL DRIVER - EFI NO. 2 FUSE)

a. Disconnect the air injection control driver connector.

b. Remove the EFI NO. 2 fuse from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C61-5 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω
C61-5 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to Air Injection Control Driver)

Engine Room Relay Block:

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

CHECK ECU POWER SOURCE CIRCUIT (Click here)

5.CHECK HARNESS OR CONNECTOR (BATTERY - A/PUMP FUSE)

a. Remove the A/PUMP fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/PUMP Fuse	Always	Below 1 Ω

NG → CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - A/PUMP FUSE)

6.REPLACE AIR INJECTION CONTROL DRIVER

a. Replace the air injection control driver (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS (DTC P1613)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine.

e. Perform the Active Test to operate the air injection system.
Enter the following menus: Powertrain / Engine and ECT / Utility / Secondary Air Injection Check (Automatic Mode).

f. After operating the secondary air injection system, confirm the pending codes of the secondary air injection system by entering the following menus: Powertrain / Engine and ECT / DTC / Pending codes.

Result

Result	Proceed to
No DTC is output	A
P1613 is output	B

NOTICE:

- **When performing the Secondary Air Injection Check operation after the battery cable has been reconnected, wait for 7 minutes with the engine switch turned on (IG) or the engine running.**
- **Turn the engine switch off when the Secondary Air Injection Check operation finishes.**

B → REPLACE ECM (Click here)

A

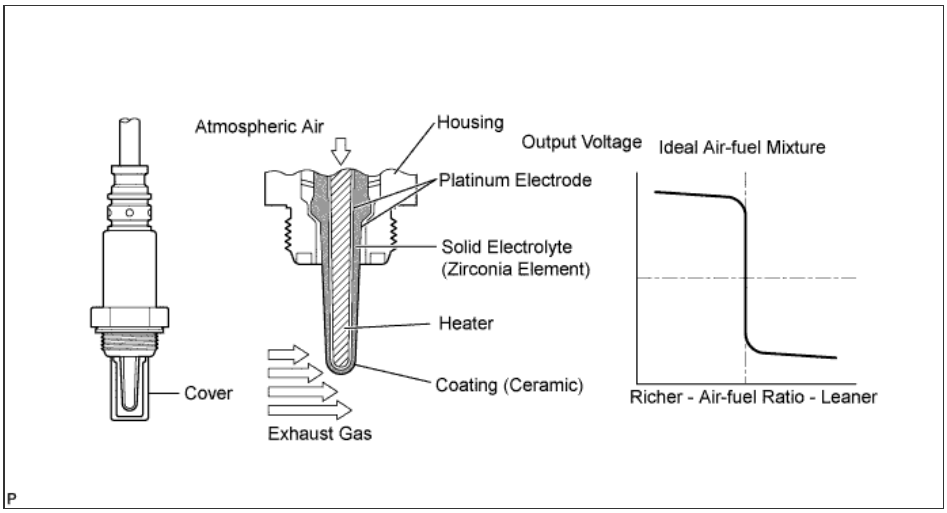
DTC P0158 Oxygen Sensor Circuit High Voltage (Bank 2 Sensor 2)

for Preparation Click here

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with a heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

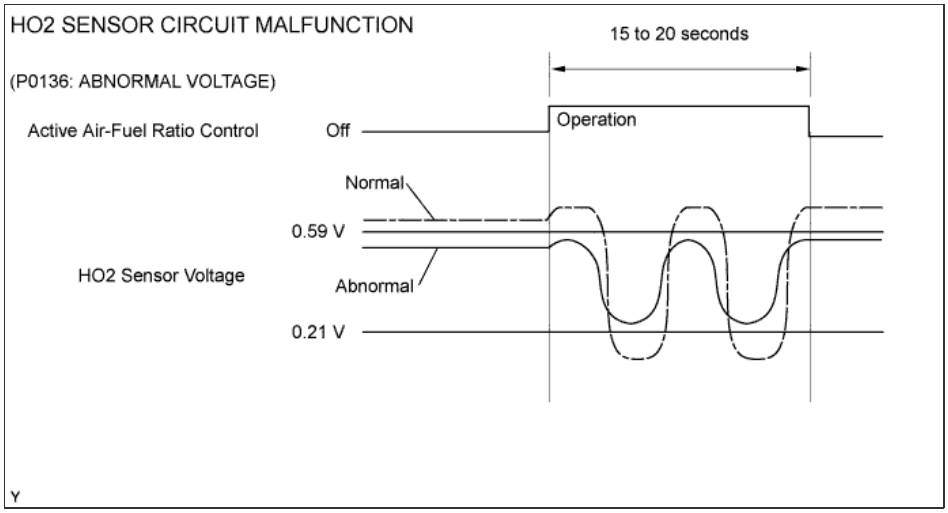
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.21 V. (b) The HO2 sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Air-Fuel Ratio (A/F) sensor (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	• Low voltage (open): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is below 0.21 V. (b) The target air-fuel ratio is rich.	• Open in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138 P0158	• High voltage (short): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is higher than 0.59 V. (b) The target air-fuel ratio is lean.	• Short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • ECM internal circuit malfunction • Air-Fuel Ratio (A/F) sensor (for bank 1, 2)

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

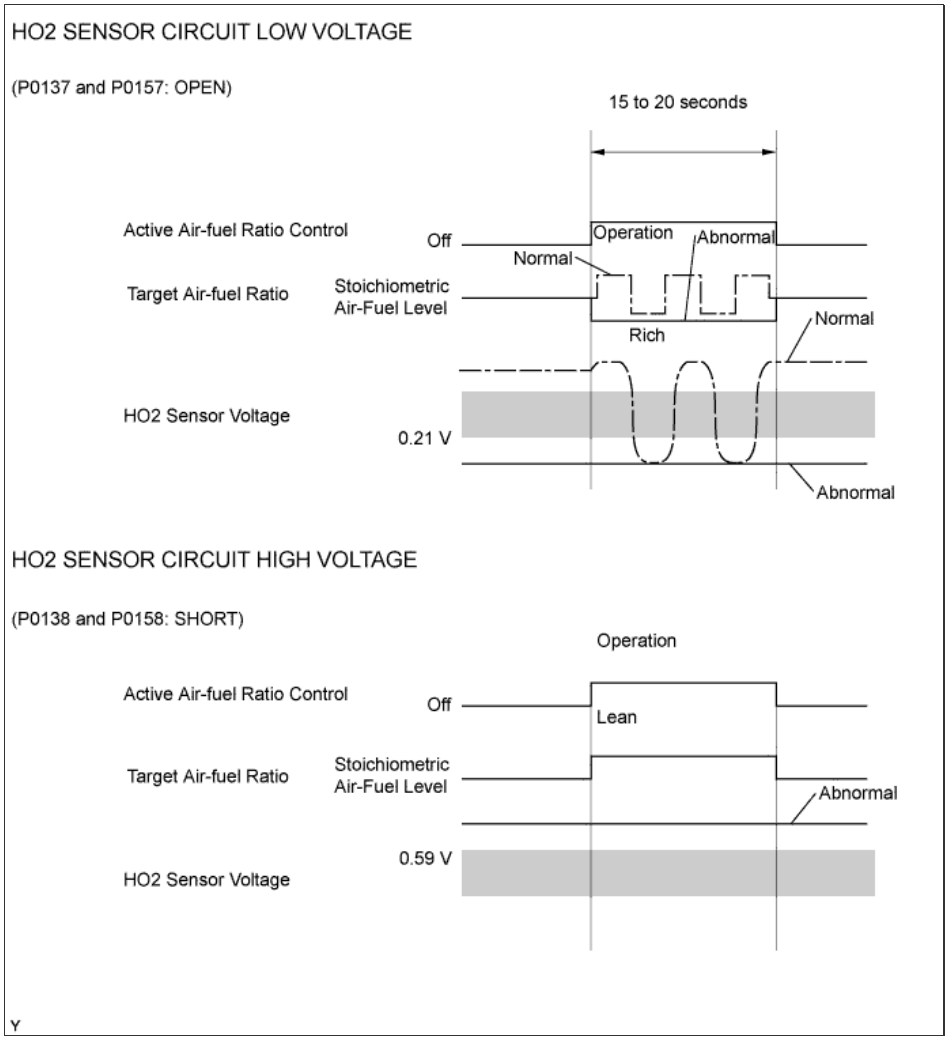
The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

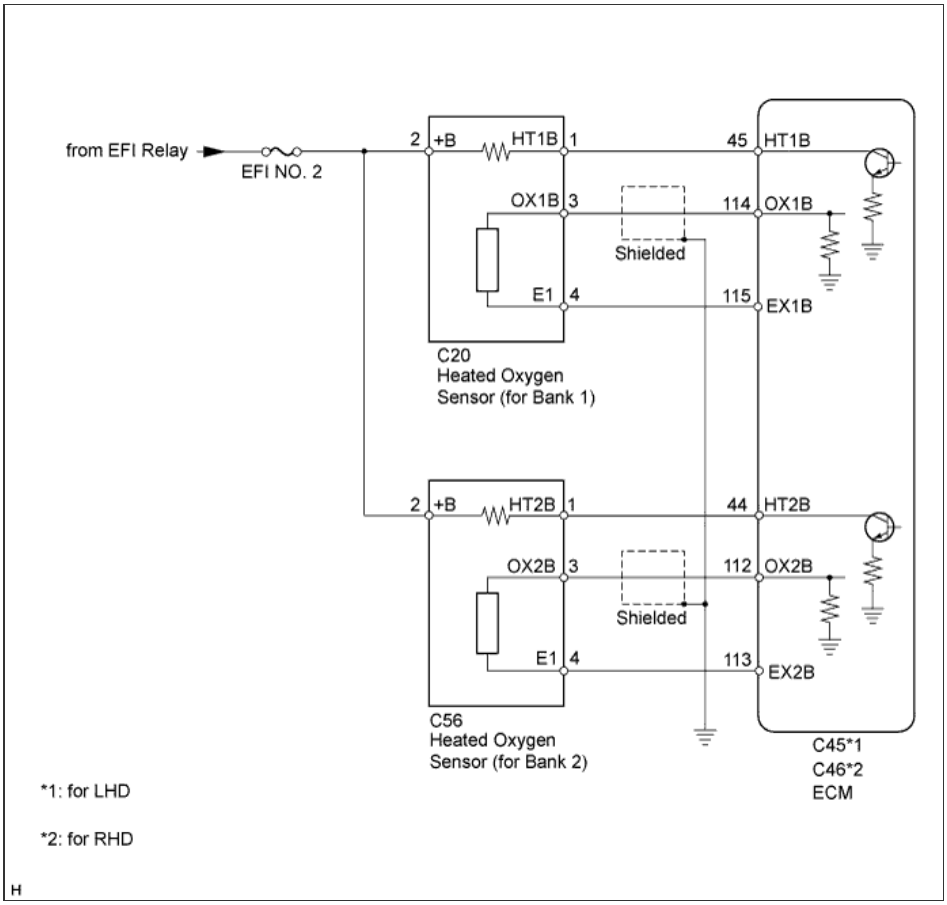
While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



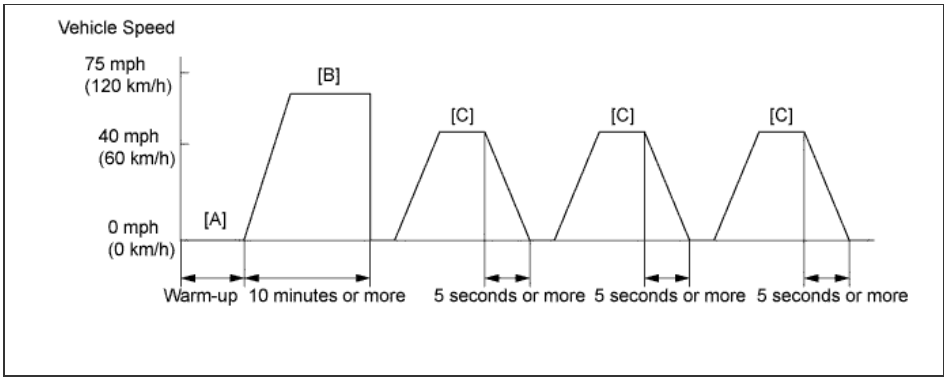
During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.



HINT:

DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.



*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [A].
4. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes or more [B].
5. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times [C].
6. Turn the tester on.
7. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
8. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
9. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern by accelerating and decelerating the vehicle.

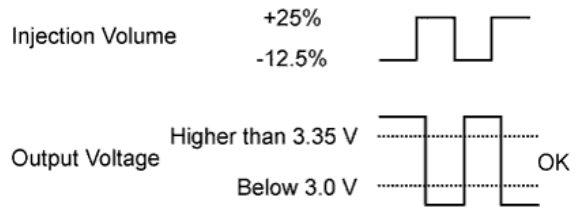
INSPECTION PROCEDURE

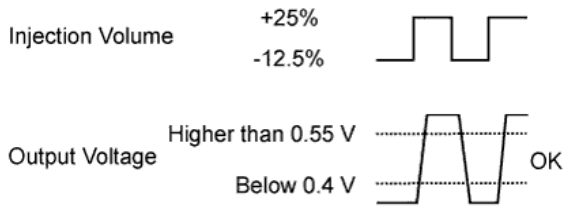
HINT:

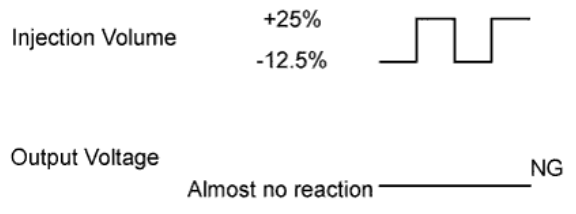
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

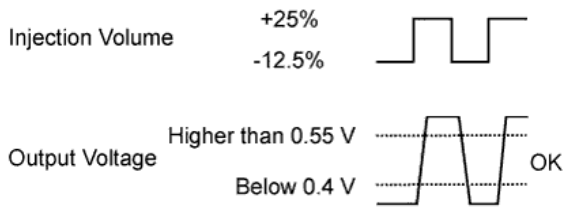
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

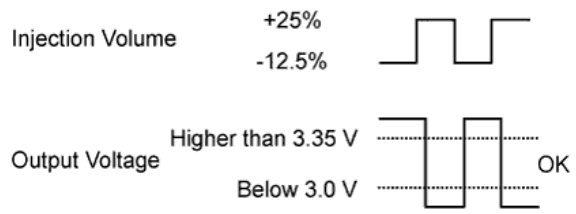
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

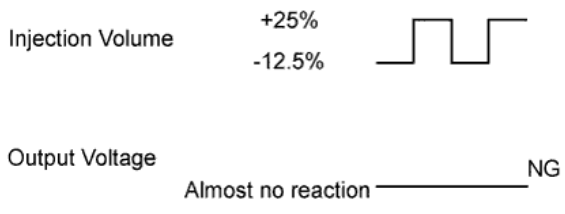


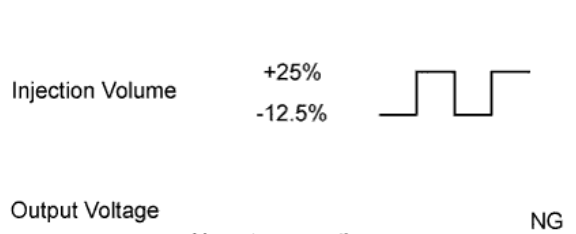


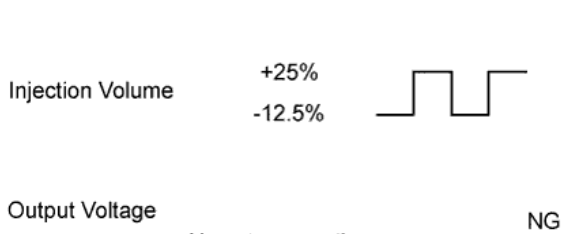












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B → Go to step 8

C → Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

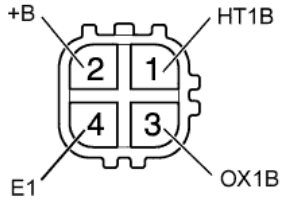
Result

Result	Proceed to
Higher than 1.2 V	A
Below 1.0 V	B

OK → Go to step 5

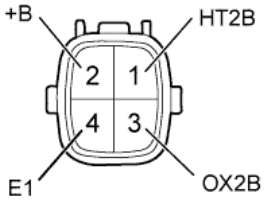
NG → Go to step 3

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

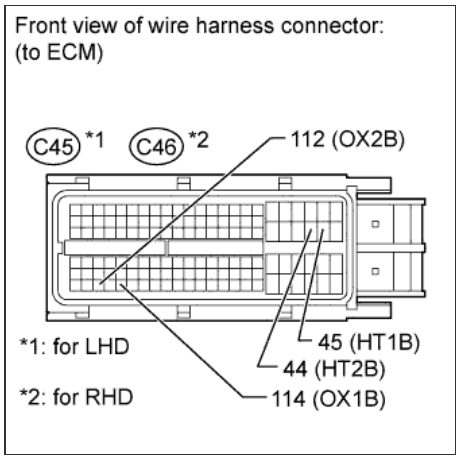
NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-45 (HT1B) - C45-114 (OX1B)	Always	10 kΩ or higher
C45-44 (HT2B) - C45-112 (OX2B)	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-45 (HT1B) - C46-114 (OX1B)	Always	10 kΩ or higher
C46-44 (HT2B) - C46-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

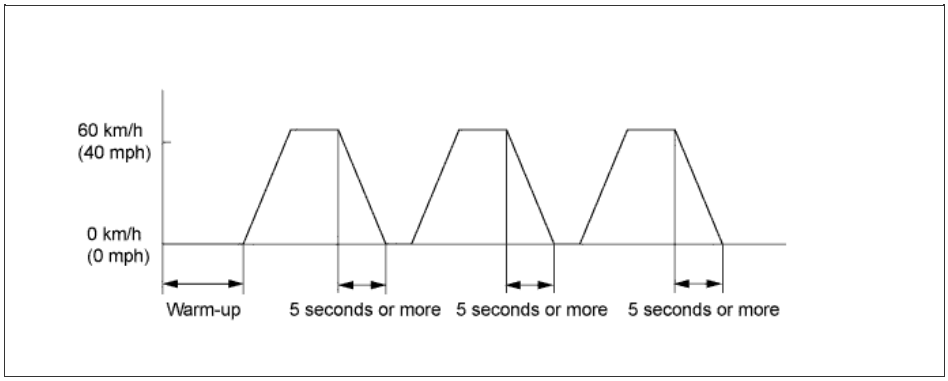
5.CHECK AIR FUEL RATIO SENSOR CURRENT

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

d. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more.
Perform this 3 times.

HINT:

If the tester shows Utility / Monitor Status / O2 Sensor / Incomplete again, increase the vehicle speed and use second gear to decelerate the vehicle.

f. Read the value.

Standard current:
Below 3.0 mA

OK → Go to step 12

NG → Go to step 14

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

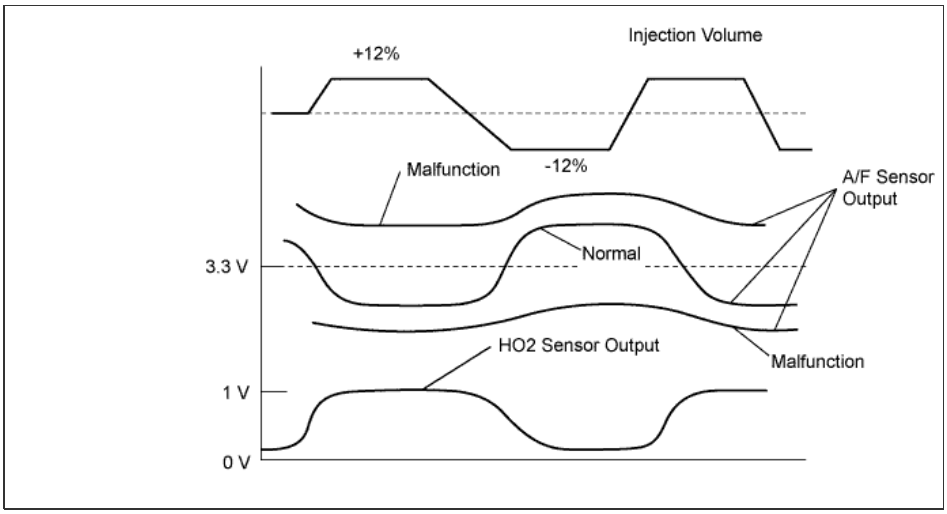
c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:



Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 8

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2, on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either below or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Go to step 14

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO AND REPAIR CAUSE (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

8.CHECK FOR EXHAUST GAS LEAK

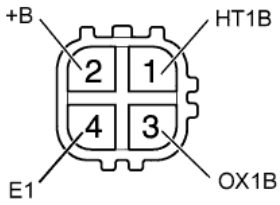
a. Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:
No exhaust gas leakage.

NG	REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

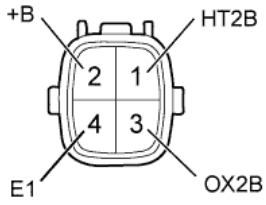
OK

9.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

10.INSPECT INTEGRATION RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

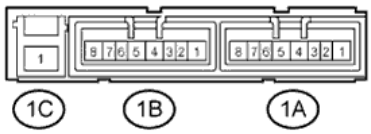
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

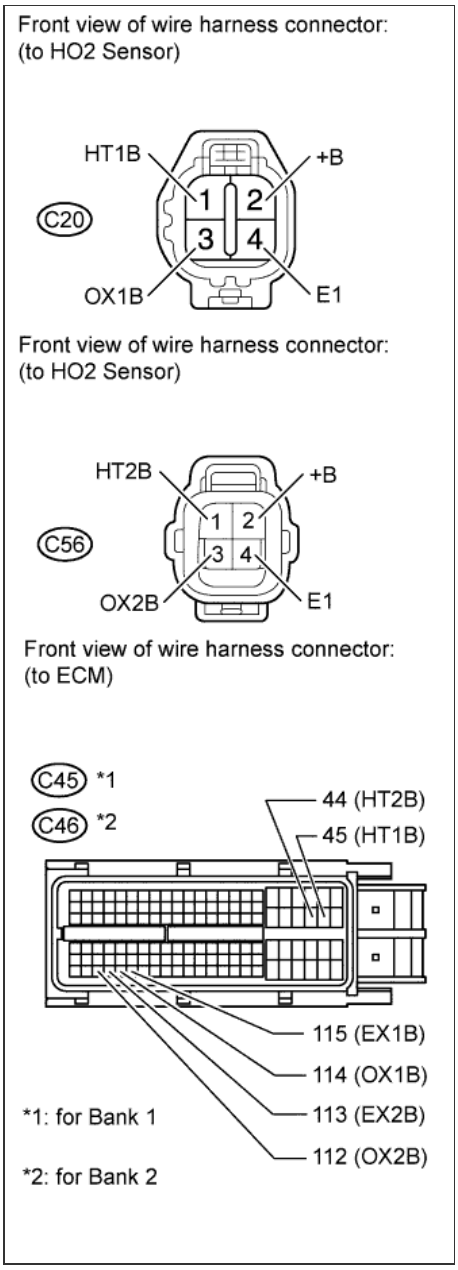
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

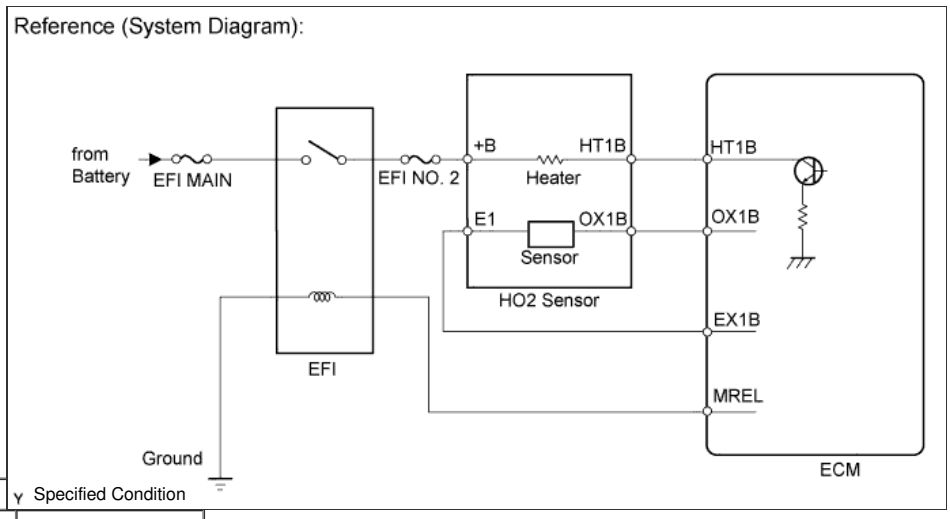
Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	When no battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	When battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY



OK



11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V
C56-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C46-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C46-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C46-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C46-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C46-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C46-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C46-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR (Click here)

12.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

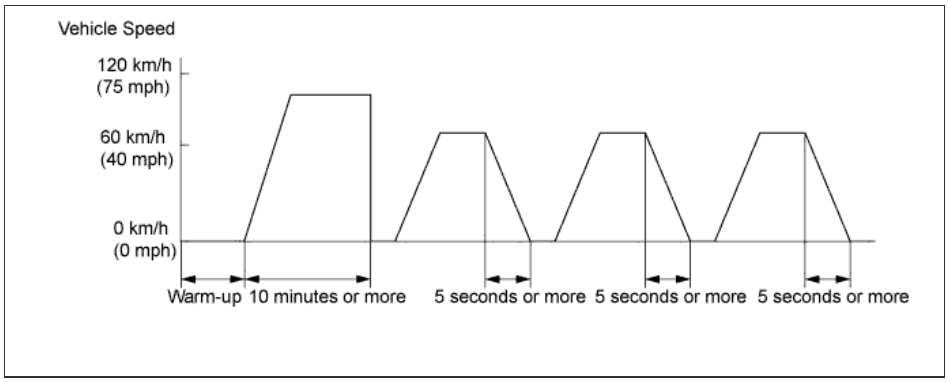
13.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → END

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

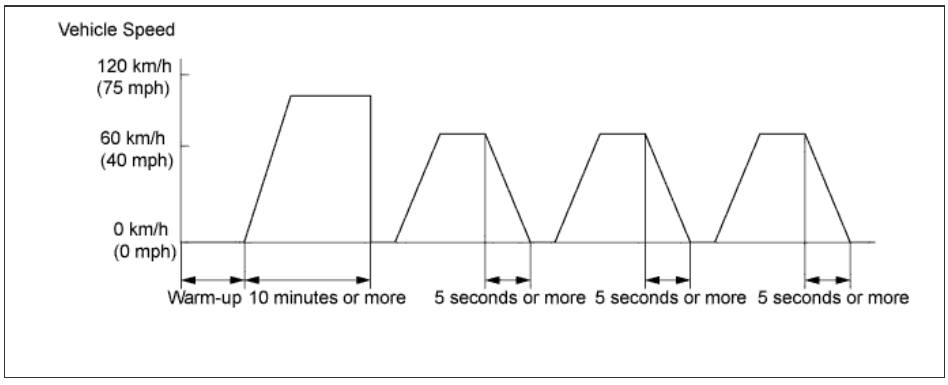
b. Turn the engine switch on (IG).

c. Clear the DTCs.

d. Switch the ECM from normal mode to check mode using the tester.

e. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

f. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



g. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

h. Turn the tester on.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

k. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

END

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

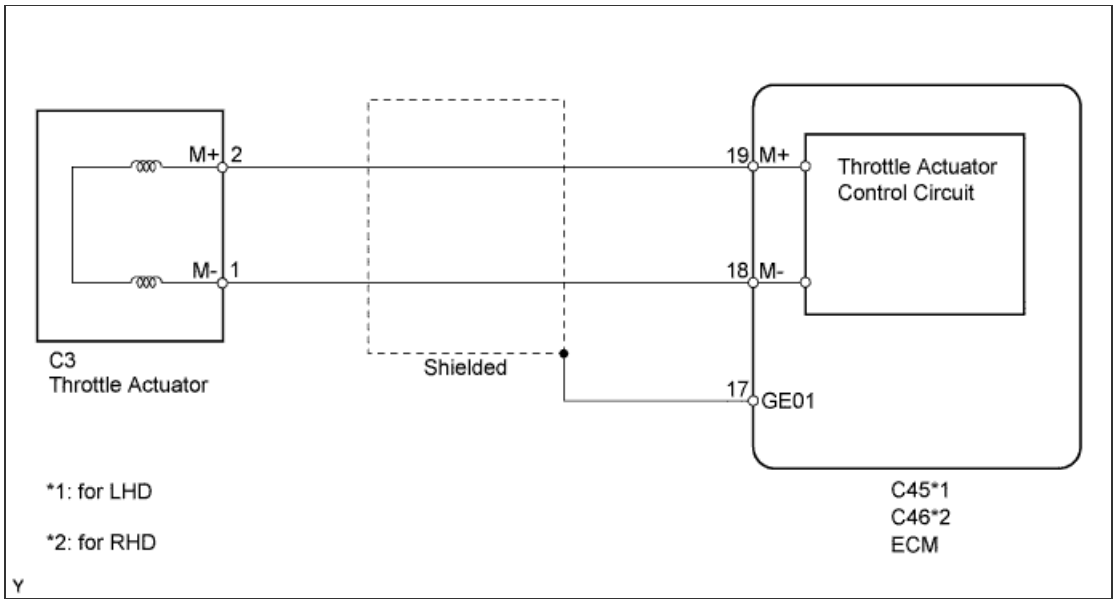
DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is below 0.5 A.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions are met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**



MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores a DTC.
Example:
When the electrical current is below 0.5 A and the throttle actuator duty ratio is 80% or more, the ECM interprets this as the current being outside the standard range, and illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine is started and has idled for 5 seconds.

FAIL-SAFE

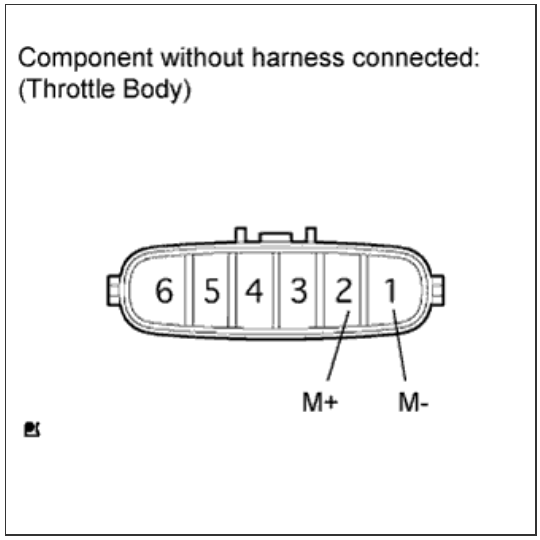
When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **The throttle actuator current (Throttle Motor Current) and the throttle actuator duty ratio (Throttle Motor Open Duty / Throttle Motor Close Duty) can be read using the tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.**



1.INSPECT THROTTLE BODY ASSEMBLY (RESISTANCE OF THROTTLE ACTUATOR)

a. Disconnect the throttle body connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (M+) - 1 (M-)	20°C (68°F)	0.3 to 100 Ω

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

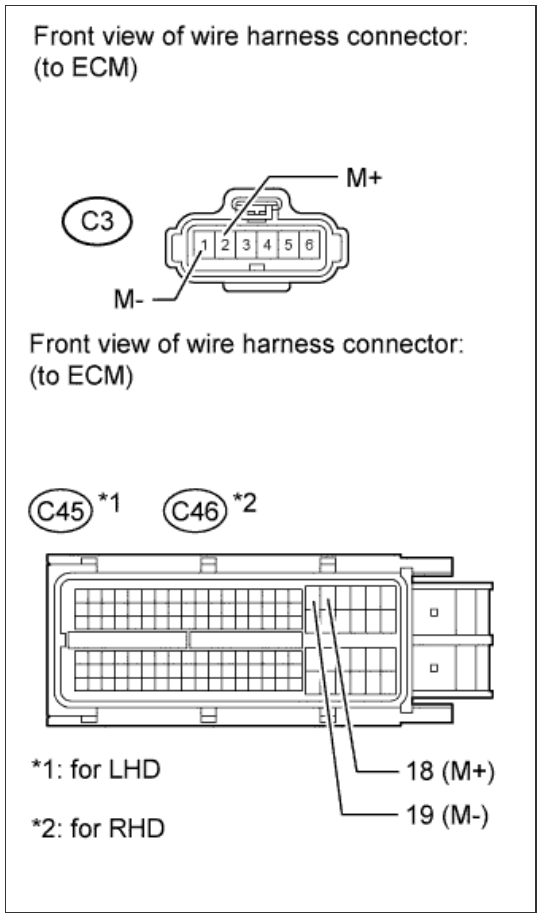
OK

2.CHECK HARNESS AND CONNECTOR (THROTTLE ACTUATOR - ECM)

a. Disconnect the throttle body connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C3-2 (M+) - C45-19 (M+)	Always	Below 1 Ω
C3-1 (M-) - C45-18	Always	Below 1 Ω

(M-)		
C3-2 (M+) or C45-19 (M+) - Body ground	Always	10 kΩ or higher
C3-1 (M-) or C45-18 (M-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C3-2 (M+) - C46-19 (M+)	Always	Below 1 Ω
C3-1 (M-) - C46-18 (M-)	Always	Below 1 Ω
C3-2 (M+) or C46-19 (M+) - Body ground	Always	10 kΩ or higher
C3-1 (M-) or C46-18 (M-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.INSPECT THROTTLE BODY ASSEMBLY

a. Check for foreign objects between the throttle valve and the housing.

OK:
No foreign objects between throttle valve and housing.

NG → REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY

OK

4.INSPECT THROTTLE VALVE

a. Check if the throttle valve opens and closes smoothly.

OK:
Throttle valve opens and closes smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

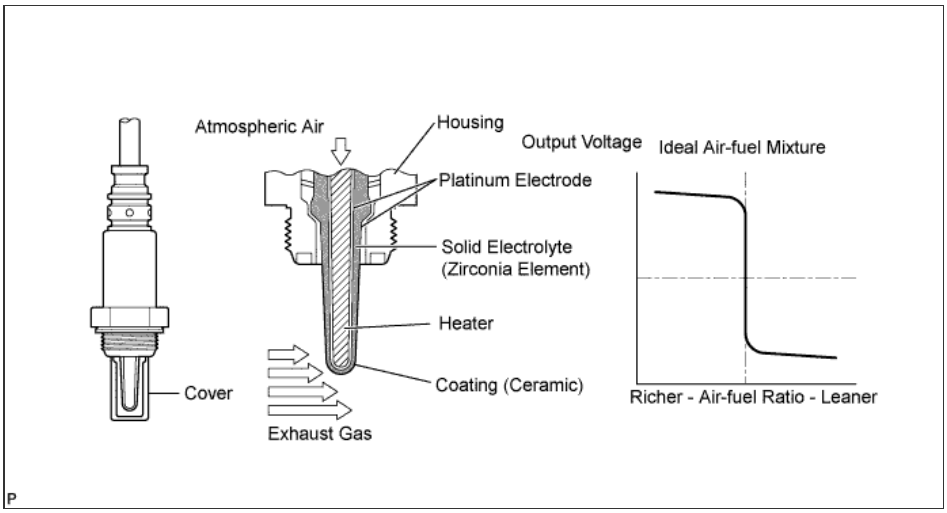
for Preparation Click here

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with a heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

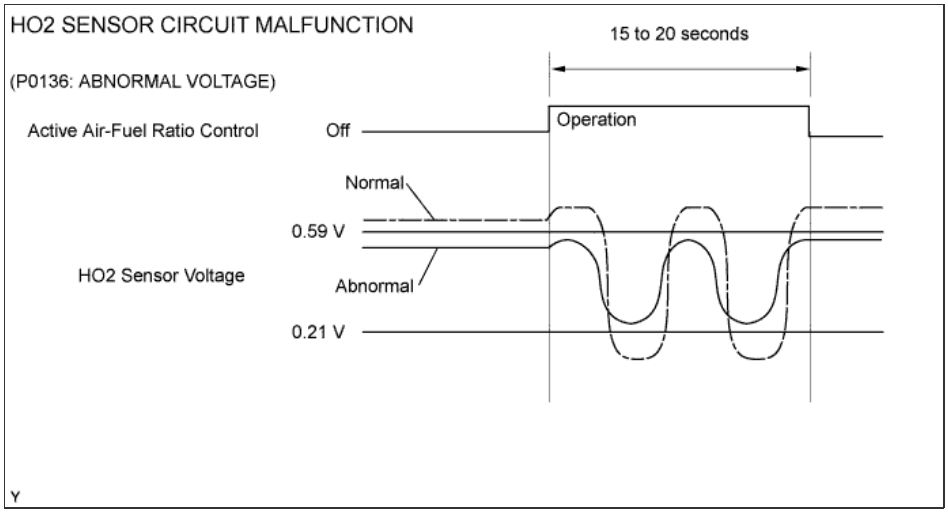
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.21 V. (b) The HO2 sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Air-Fuel Ratio (A/F) sensor (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	• Low voltage (open): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is below 0.21 V. (b) The target air-fuel ratio is rich.	• Open in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138 P0158	• High voltage (short): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is higher than 0.59 V. (b) The target air-fuel ratio is lean.	• Short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • ECM internal circuit malfunction • Air-Fuel Ratio (A/F) sensor (for bank 1, 2)

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

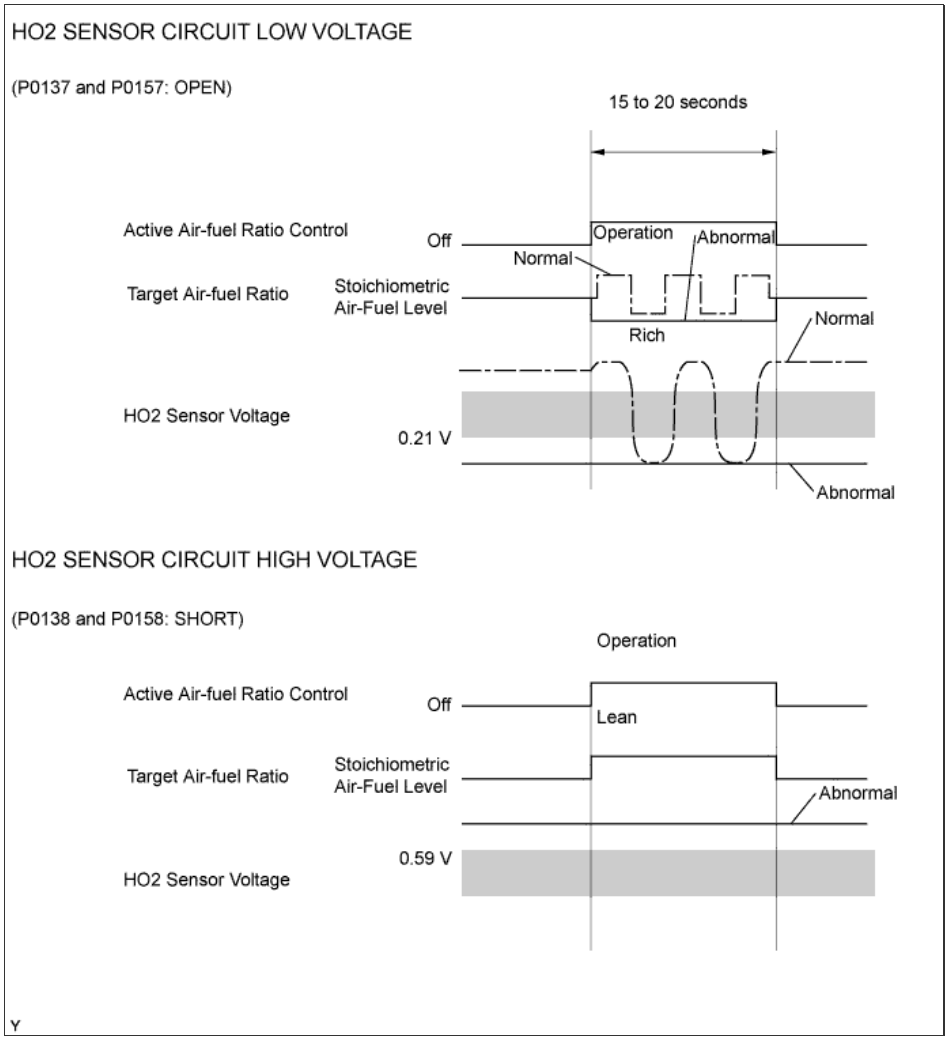
The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

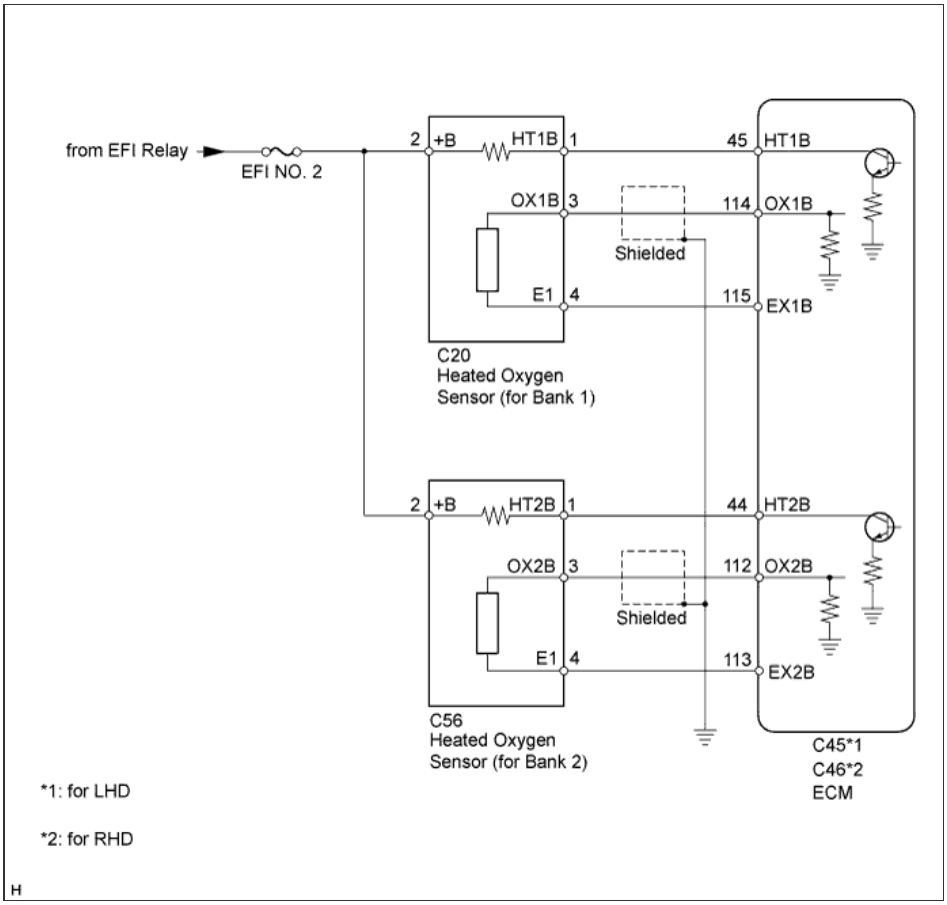
While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



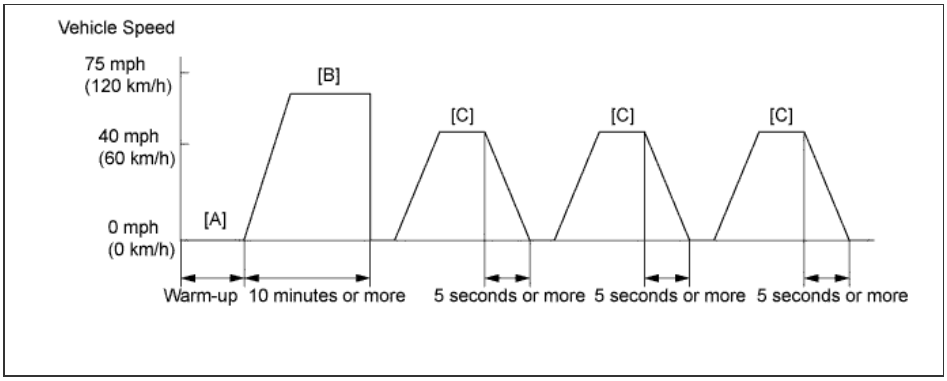
During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.



HINT:

DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.



*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [A].
4. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes or more [B].
5. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times [C].
6. Turn the tester on.
7. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
8. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
9. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern by accelerating and decelerating the vehicle.

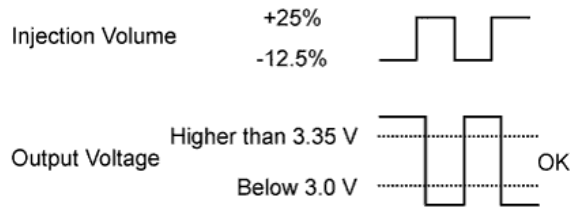
INSPECTION PROCEDURE

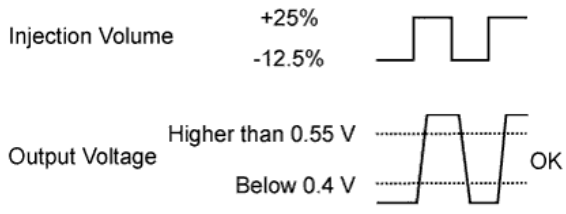
HINT:

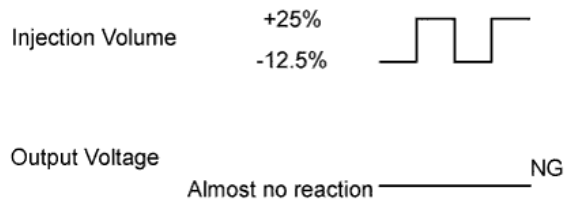
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

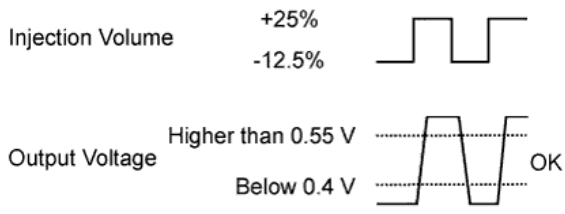
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

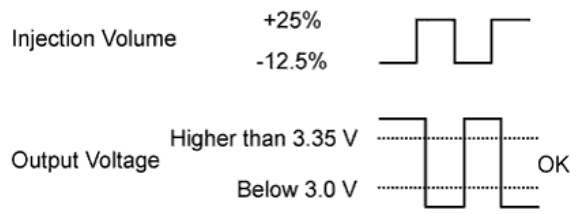
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

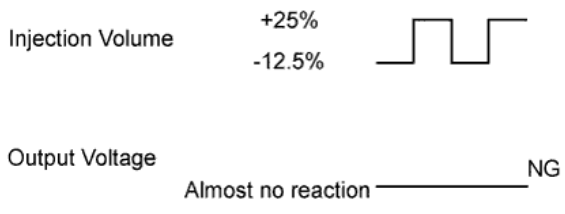


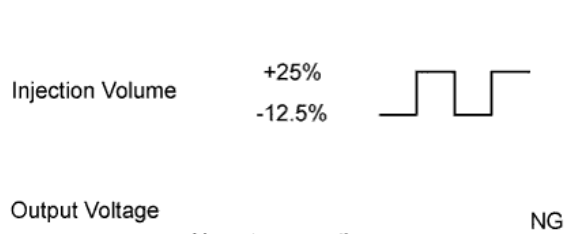


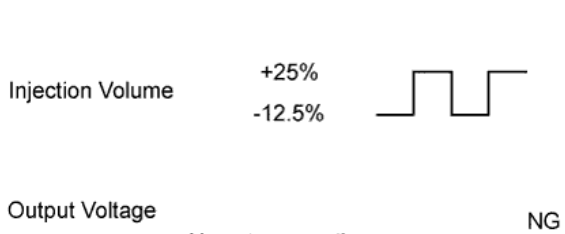












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B → Go to step 8

C → Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

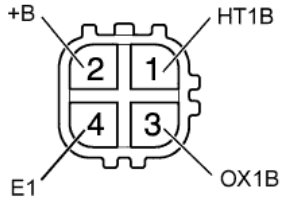
Result

Result	Proceed to
Higher than 1.2 V	A
Below 1.0 V	B

OK → Go to step 5

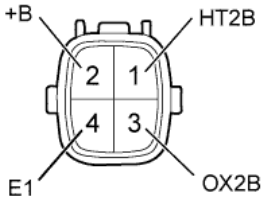
NG → Go to step 3

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

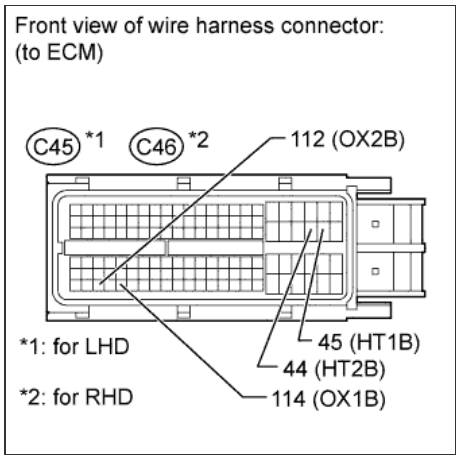
NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-45 (HT1B) - C45-114 (OX1B)	Always	10 kΩ or higher
C45-44 (HT2B) - C45-112 (OX2B)	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-45 (HT1B) - C46-114 (OX1B)	Always	10 kΩ or higher
C46-44 (HT2B) - C46-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

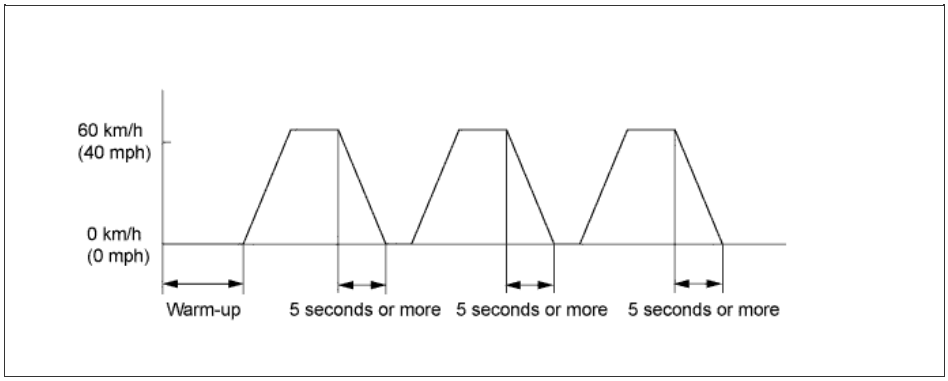
5.CHECK AIR FUEL RATIO SENSOR CURRENT

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

d. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more.
Perform this 3 times.

HINT:

If the tester shows Utility / Monitor Status / O2 Sensor / Incomplete again, increase the vehicle speed and use second gear to decelerate the vehicle.

f. Read the value.

Standard current:
Below 3.0 mA

OK → Go to step 12

NG → Go to step 14

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

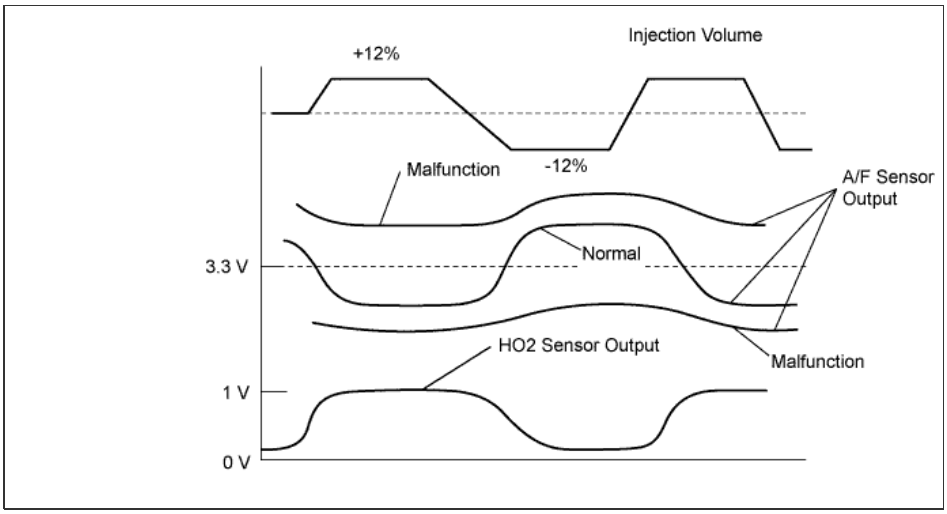
c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:



Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 8

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2, on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either below or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Go to step 14

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO AND REPAIR CAUSE (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

8.CHECK FOR EXHAUST GAS LEAK

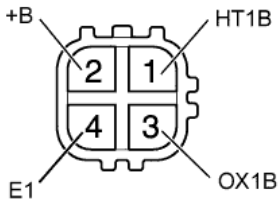
a. Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:
No exhaust gas leakage.

NG	REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

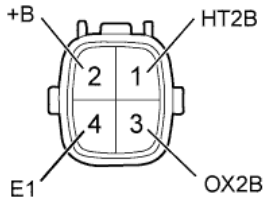
OK

9.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

10.INSPECT INTEGRATION RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

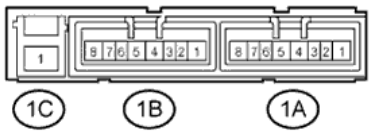
i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

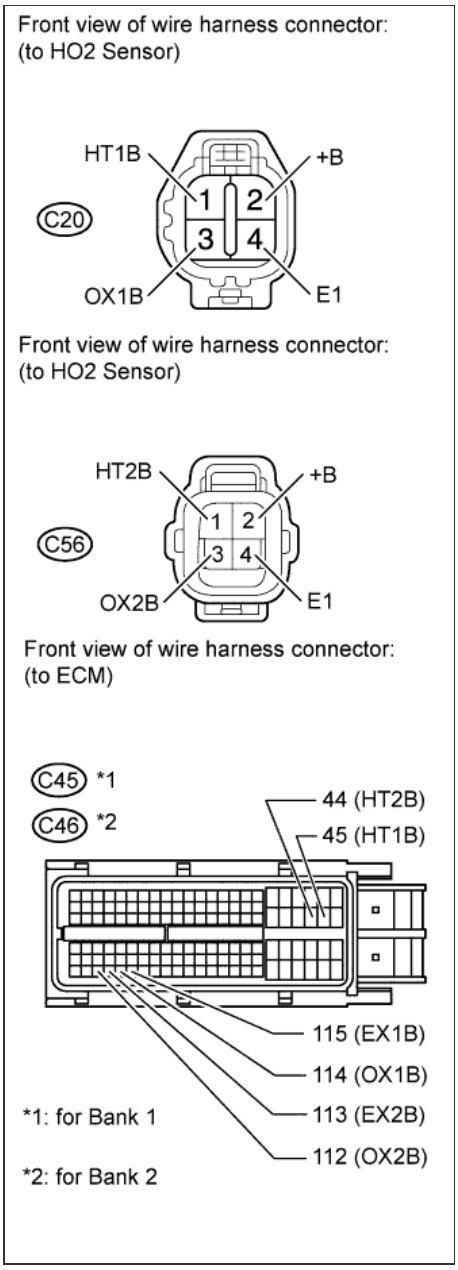
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

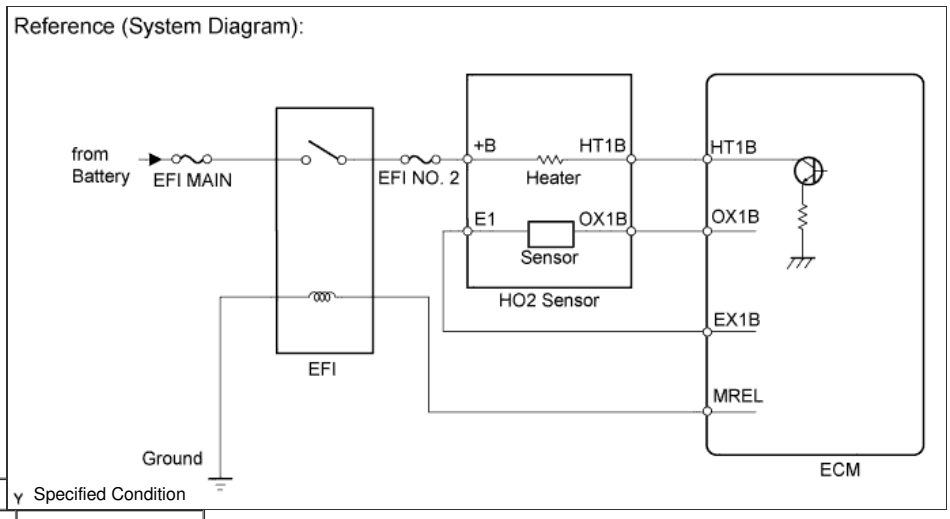
Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	When no battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	When battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY



OK



11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V
C56-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C46-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C46-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C46-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C46-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C46-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C46-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C46-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR (Click here)

12.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

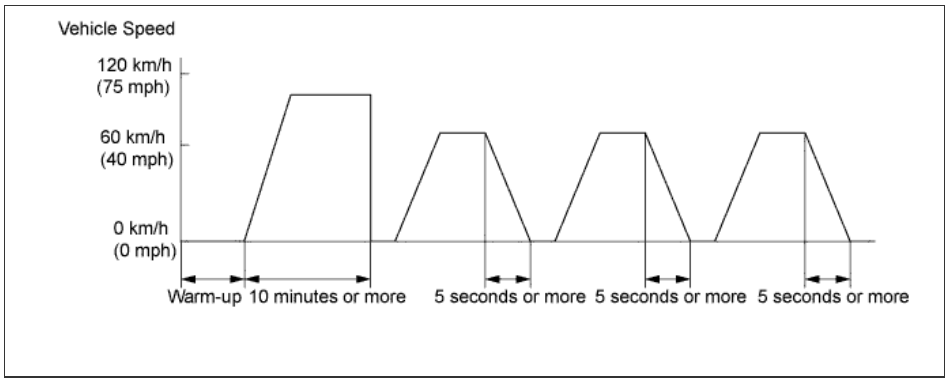
13.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → END

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

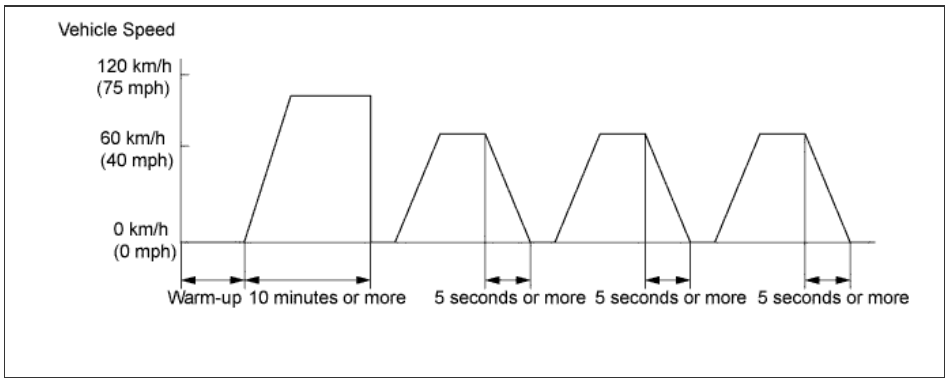
b. Turn the engine switch on (IG).

c. Clear the DTCs.

d. Switch the ECM from normal mode to check mode using the tester.

e. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

f. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



g. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

h. Turn the tester on.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

k. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

END

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

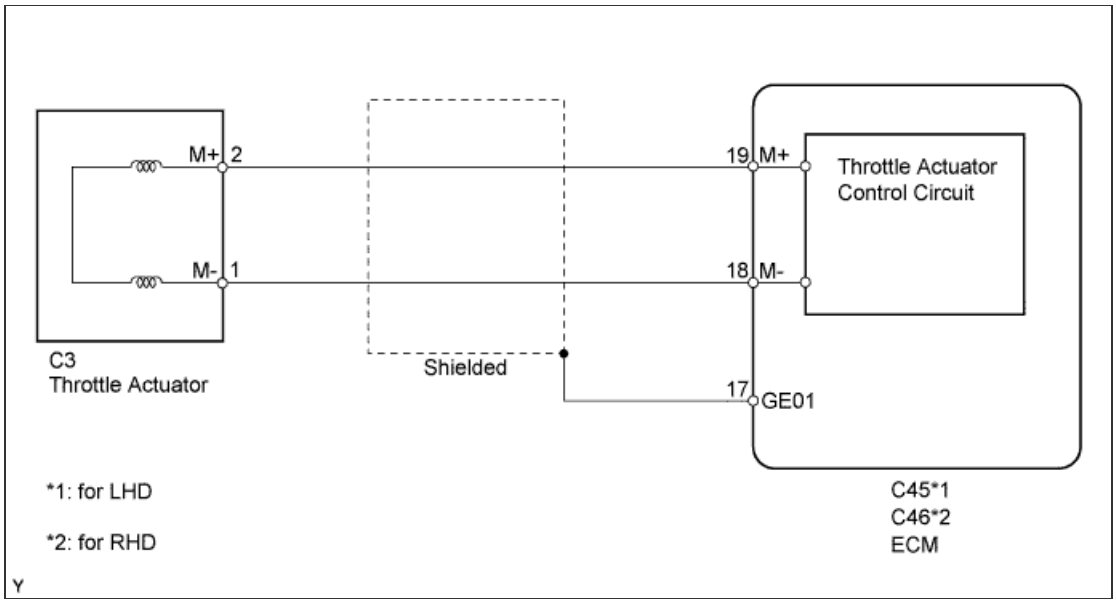
DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is below 0.5 A.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions are met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**



MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores a DTC.
Example:
When the electrical current is below 0.5 A and the throttle actuator duty ratio is 80% or more, the ECM interprets this as the current being outside the standard range, and illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine is started and has idled for 5 seconds.

FAIL-SAFE

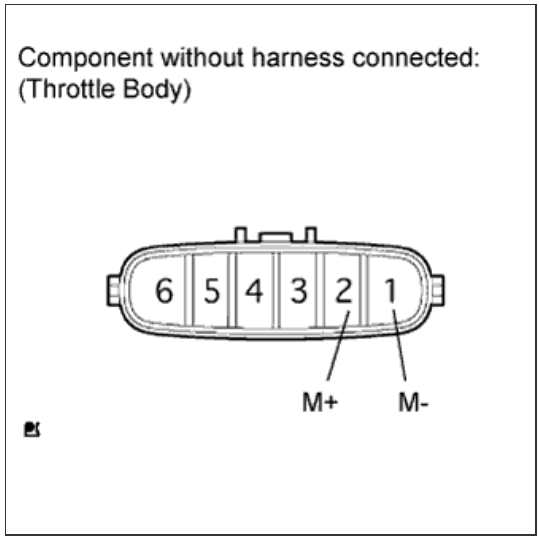
When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **The throttle actuator current (Throttle Motor Current) and the throttle actuator duty ratio (Throttle Motor Open Duty / Throttle Motor Close Duty) can be read using the tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.**



1.INSPECT THROTTLE BODY ASSEMBLY (RESISTANCE OF THROTTLE ACTUATOR)

a. Disconnect the throttle body connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (M+) - 1 (M-)	20°C (68°F)	0.3 to 100 Ω

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

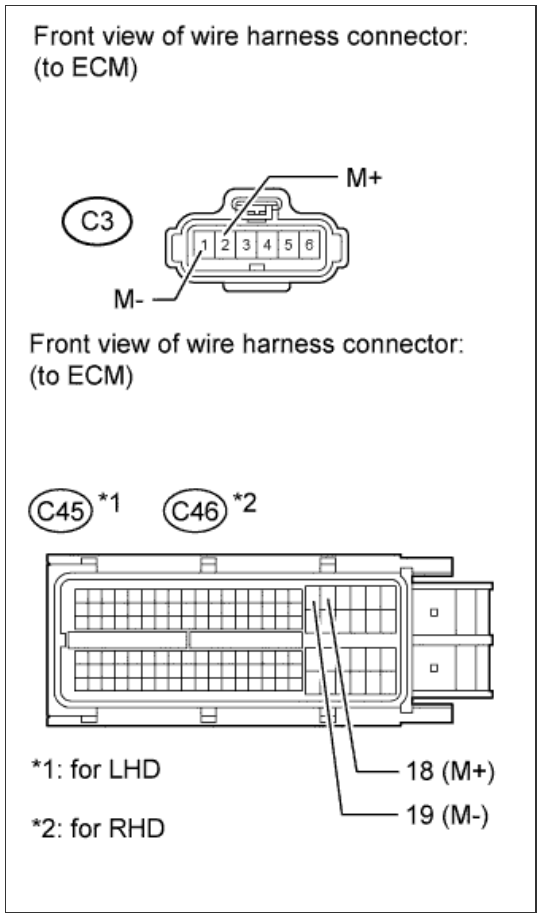
OK

2.CHECK HARNESS AND CONNECTOR (THROTTLE ACTUATOR - ECM)

a. Disconnect the throttle body connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C3-2 (M+) - C45-19 (M+)	Always	Below 1 Ω
C3-1 (M-) - C45-18	Always	Below 1 Ω

(M-)		
C3-2 (M+) or C45-19 (M+) - Body ground	Always	10 kΩ or higher
C3-1 (M-) or C45-18 (M-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C3-2 (M+) - C46-19 (M+)	Always	Below 1 Ω
C3-1 (M-) - C46-18 (M-)	Always	Below 1 Ω
C3-2 (M+) or C46-19 (M+) - Body ground	Always	10 kΩ or higher
C3-1 (M-) or C46-18 (M-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.INSPECT THROTTLE BODY ASSEMBLY

a. Check for foreign objects between the throttle valve and the housing.

OK:
No foreign objects between throttle valve and housing.

NG → REMOVE FOREIGN OBJECT AND CLEAN THROTTLE BODY

OK

4.INSPECT THROTTLE VALVE

a. Check if the throttle valve opens and closes smoothly.

OK:
Throttle valve opens and closes smoothly.

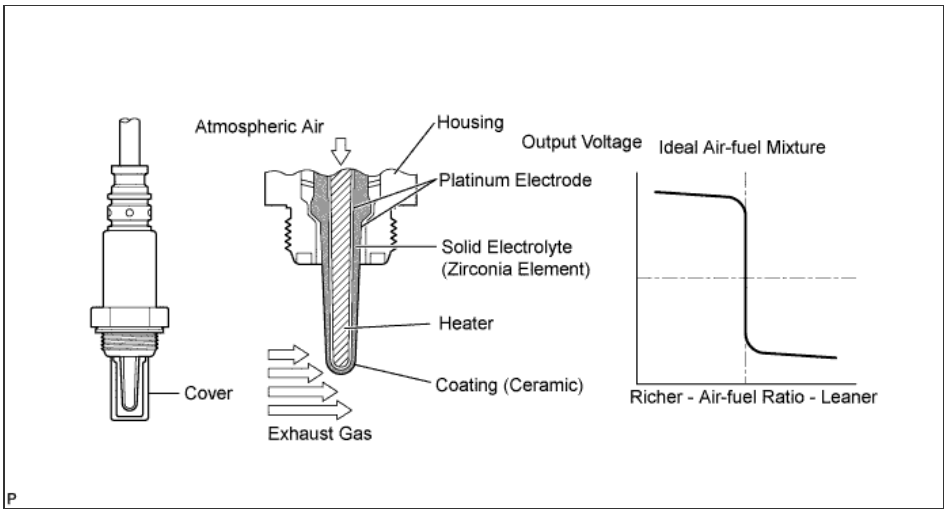
for Preparation Click here

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with a heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

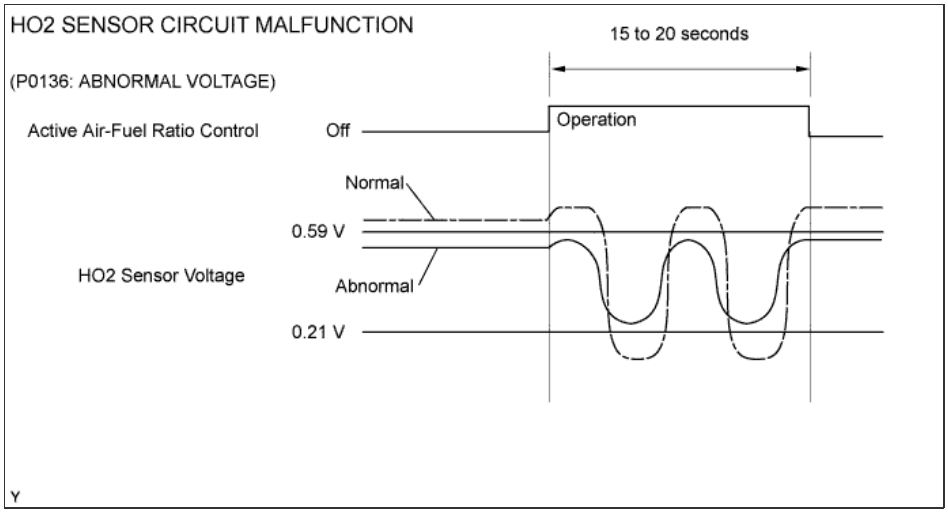
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.21 V. (b) The HO2 sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Air-Fuel Ratio (A/F) sensor (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	• Low voltage (open): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is below 0.21 V. (b) The target air-fuel ratio is rich.	• Open in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138 P0158	• High voltage (short): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is higher than 0.59 V. (b) The target air-fuel ratio is lean.	• Short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • ECM internal circuit malfunction • Air-Fuel Ratio (A/F) sensor (for bank 1, 2)

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

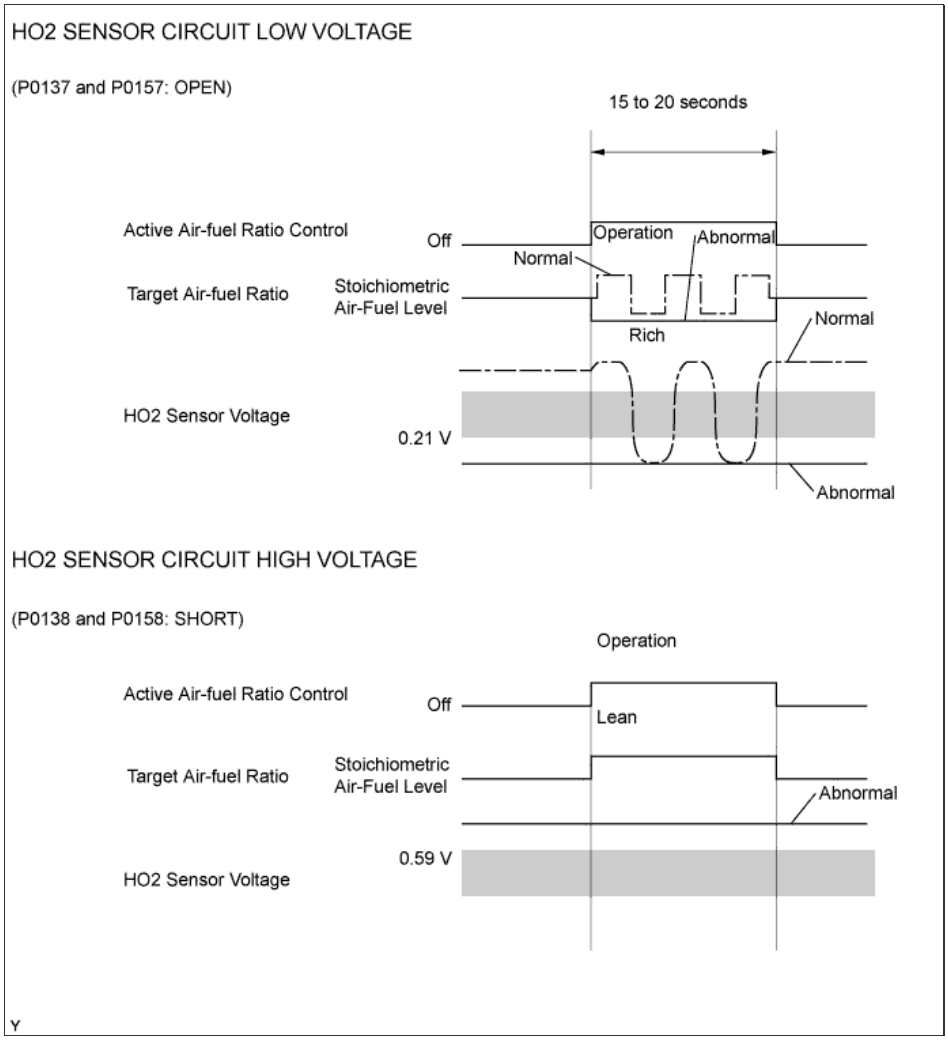
The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

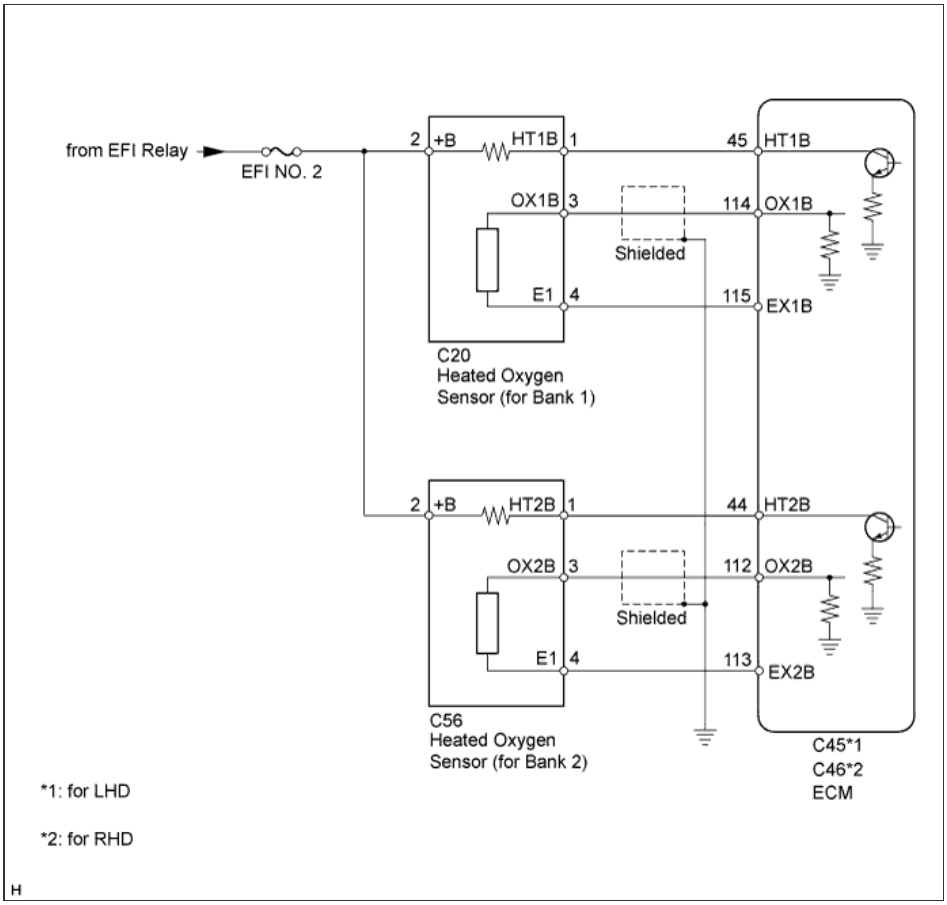
While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



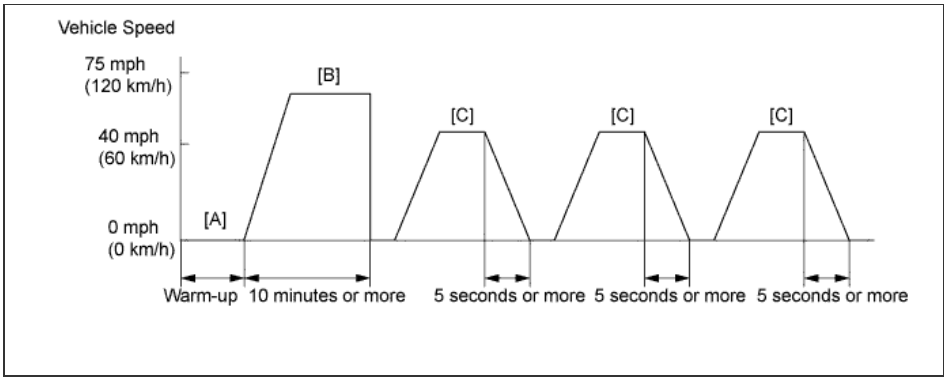
During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.



HINT:

DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.



*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [A].
4. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes or more [B].
5. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times [C].
6. Turn the tester on.
7. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
8. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
9. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern by accelerating and decelerating the vehicle.

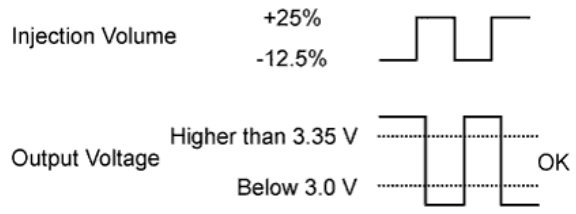
INSPECTION PROCEDURE

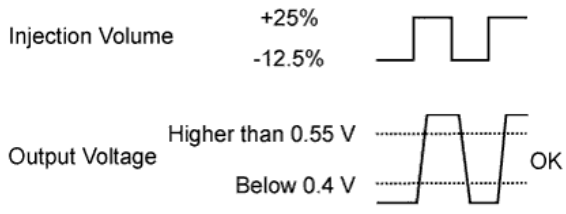
HINT:

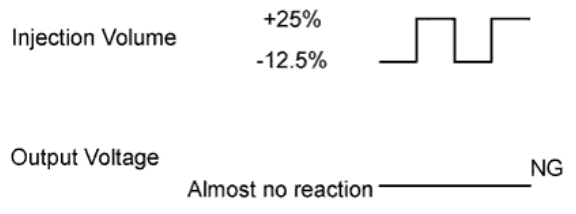
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

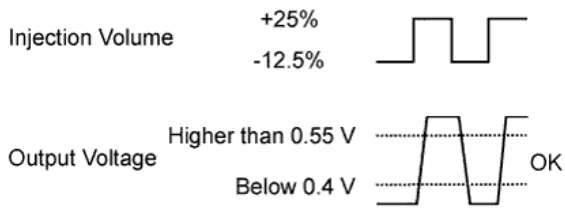
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

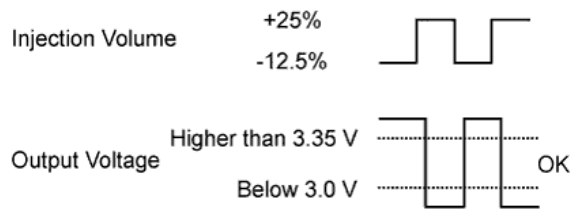
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

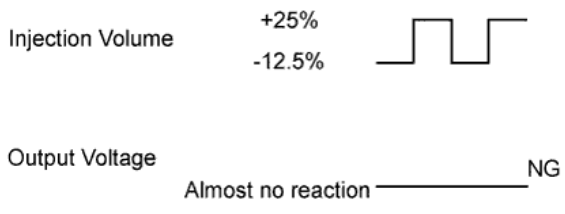


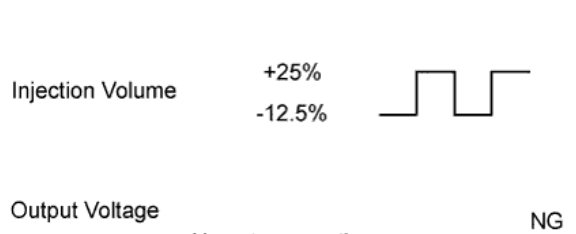


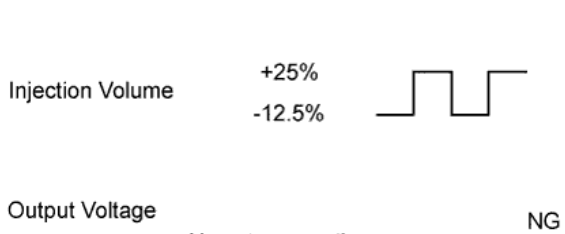












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B → Go to step 8

C → Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

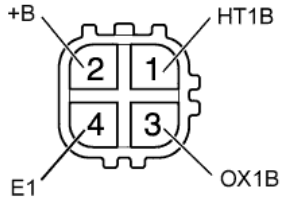
Result

Result	Proceed to
Higher than 1.2 V	A
Below 1.0 V	B

OK → Go to step 5

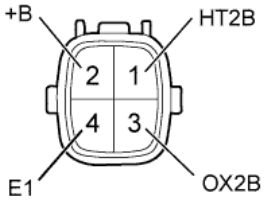
NG → Go to step 3

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

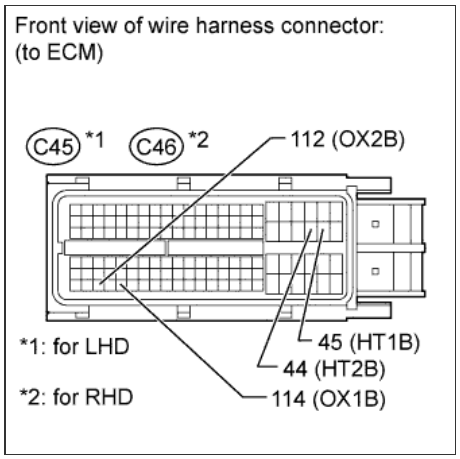
4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-45 (HT1B) - C45-114 (OX1B)	Always	10 kΩ or higher
C45-44 (HT2B) - C45-112 (OX2B)	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-45 (HT1B) - C46-114 (OX1B)	Always	10 kΩ or higher
C46-44 (HT2B) - C46-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

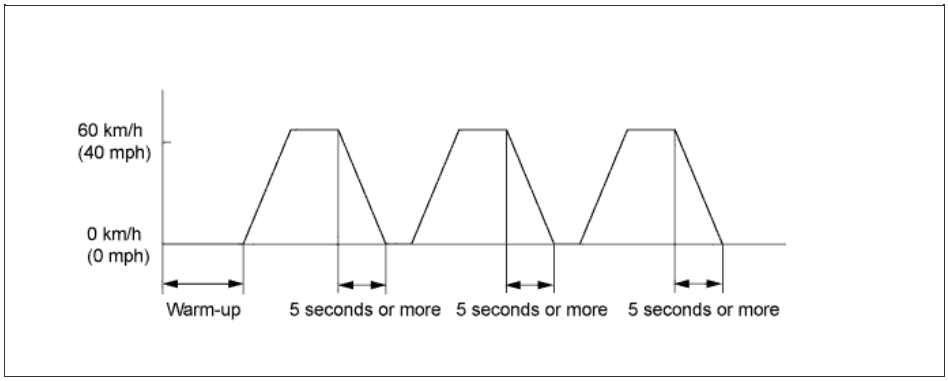
5.CHECK AIR FUEL RATIO SENSOR CURRENT

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

d. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more.
Perform this 3 times.

HINT:

If the tester shows Utility / Monitor Status / O2 Sensor / Incomplete again, increase the vehicle speed and use second gear to decelerate the vehicle.

f. Read the value.

Standard current:
Below 3.0 mA

OK → Go to step 12

NG → Go to step 14

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 8

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2, on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either below or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Go to step 14

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO AND REPAIR CAUSE (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:
No exhaust gas leakage.

NG	REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

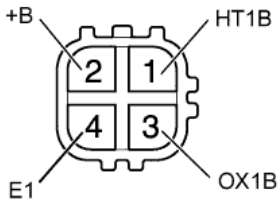
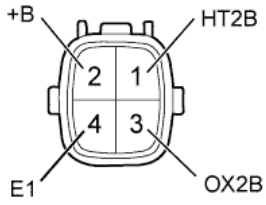
9.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

10.INSPECT INTEGRATION RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
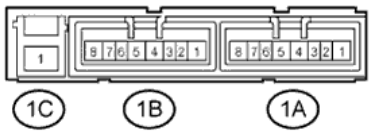
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	When no battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	When battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY

OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V
C56-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C46-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C46-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C46-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C46-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C46-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C46-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C46-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR (Click here)

12.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

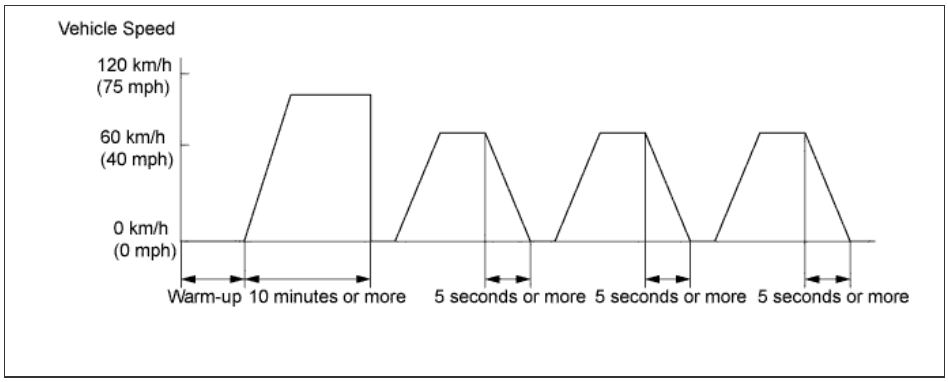
13.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → END

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

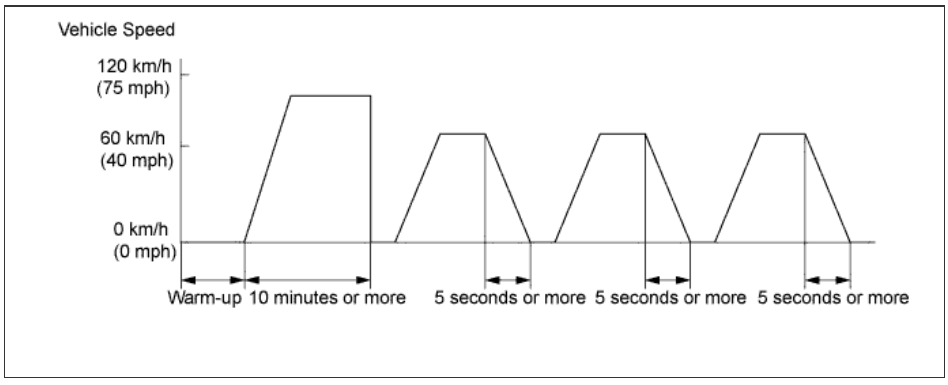
b. Turn the engine switch on (IG).

c. Clear the DTCs.

d. Switch the ECM from normal mode to check mode using the tester.

e. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

f. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



g. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

h. Turn the tester on.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

k. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

END

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The throttle actuator does not close when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**
P2112	The throttle actuator does not open when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2111 or P2112 is output	A
P2111 or P2112 and other DTCs are output	B

HINT:

If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

a. Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No DTC is output	A
P2111 or P2112 is output	B

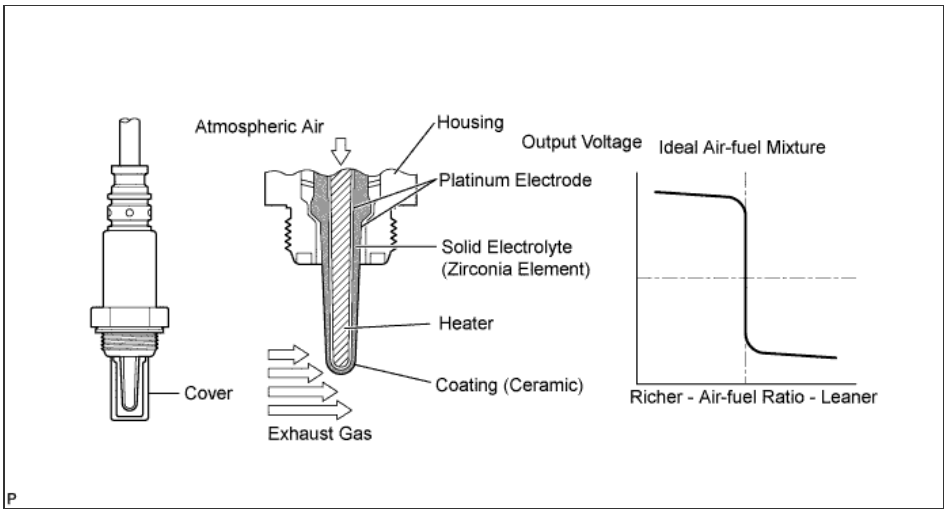
for Preparation Click here

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with a heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

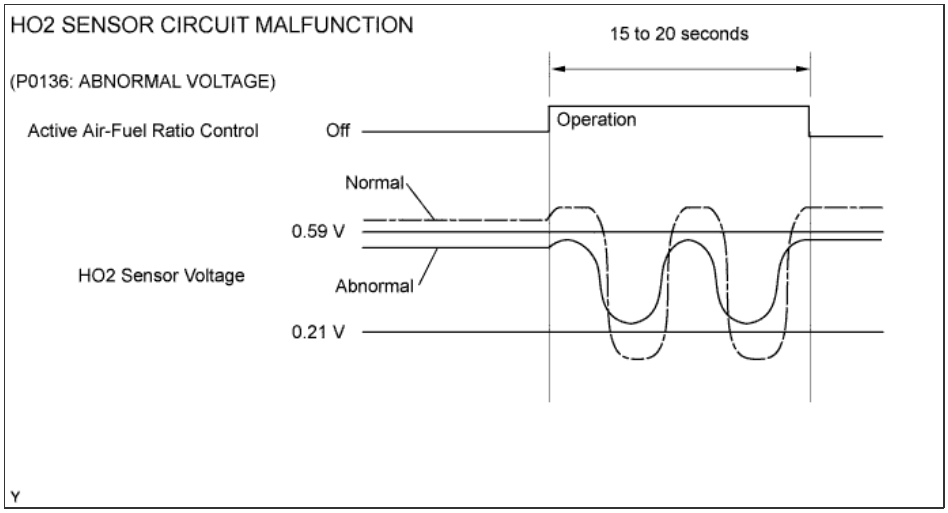
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.21 V. (b) The HO2 sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Air-Fuel Ratio (A/F) sensor (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	• Low voltage (open): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is below 0.21 V. (b) The target air-fuel ratio is rich.	• Open in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138 P0158	• High voltage (short): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is higher than 0.59 V. (b) The target air-fuel ratio is lean.	• Short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • ECM internal circuit malfunction • Air-Fuel Ratio (A/F) sensor (for bank 1, 2)

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

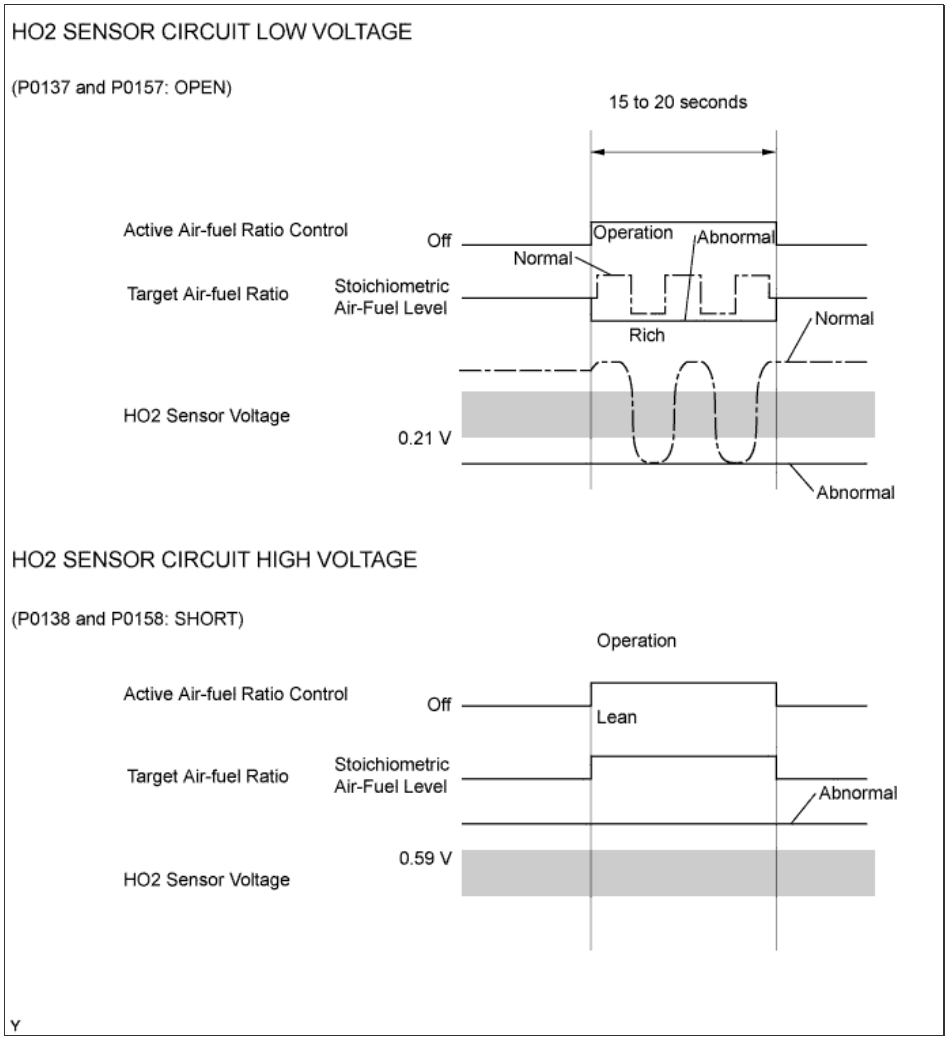
The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

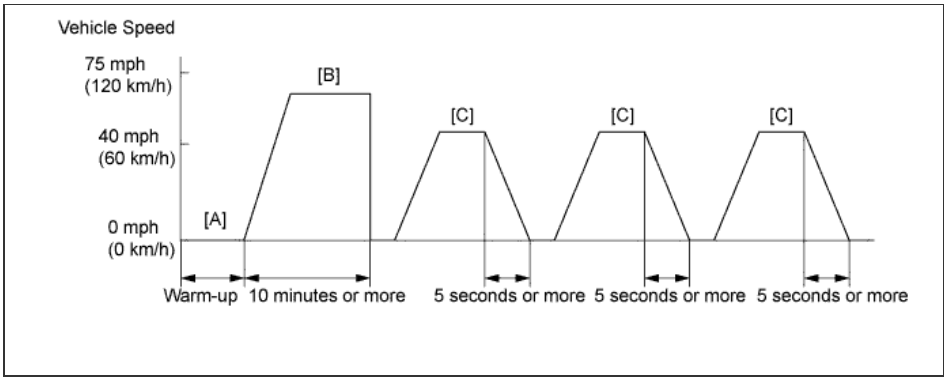
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.



*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [A].
4. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes or more [B].
5. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times [C].
6. Turn the tester on.
7. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
8. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
9. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern by accelerating and decelerating the vehicle.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B → Go to step 8

C → Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

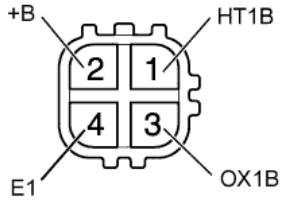
Result

Result	Proceed to
Higher than 1.2 V	A
Below 1.0 V	B

OK → Go to step 5

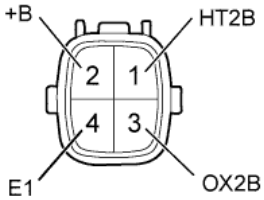
NG → Go to step 3

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

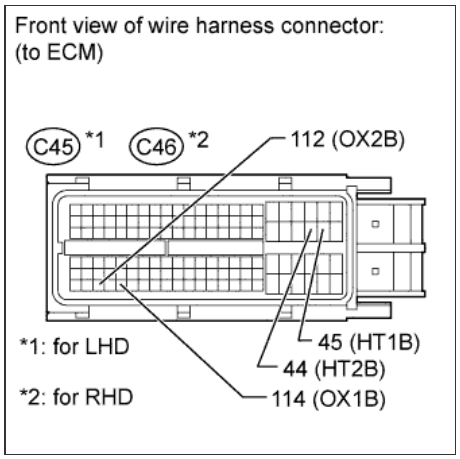
4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-45 (HT1B) - C45-114 (OX1B)	Always	10 kΩ or higher
C45-44 (HT2B) - C45-112 (OX2B)	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-45 (HT1B) - C46-114 (OX1B)	Always	10 kΩ or higher
C46-44 (HT2B) - C46-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR CURRENT

a. Connect the intelligent tester to the DLC3.

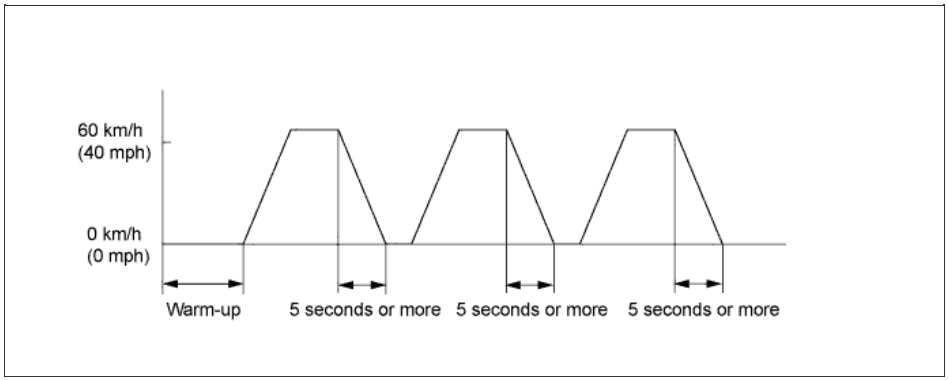
b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

d. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more.
Perform this 3 times.

HINT:

If the tester shows Utility / Monitor Status / O2 Sensor / Incomplete again, increase the vehicle speed and use second gear to decelerate the vehicle.

f. Read the value.

Standard current:
Below 3.0 mA

OK → Go to step 12

NG → Go to step 14

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 8

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2, on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either below or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Go to step 14

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO AND REPAIR CAUSE (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:
No exhaust gas leakage.

NG	REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

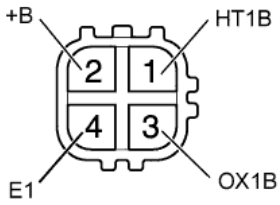
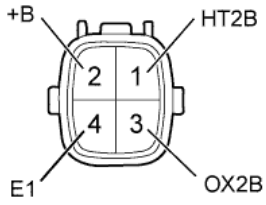
9.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

10.INSPECT INTEGRATION RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
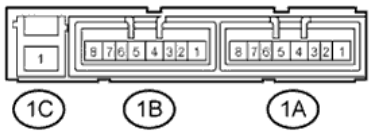
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	When no battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	When battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY

OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V
C56-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C46-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C46-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C46-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C46-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C46-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C46-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C46-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR (Click here)

12.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

13.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

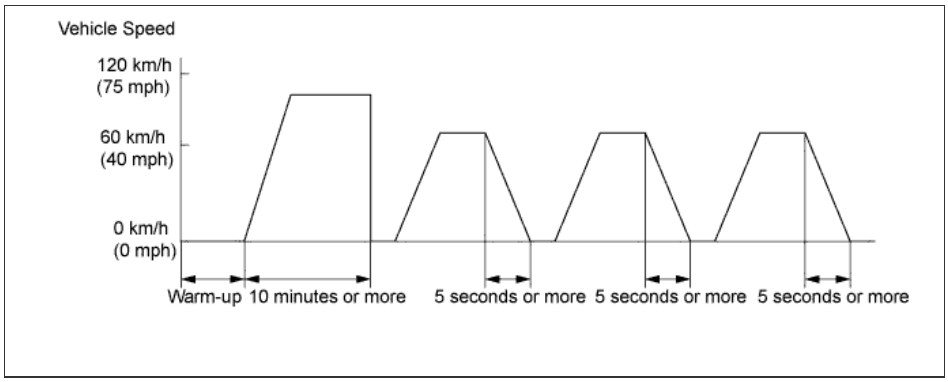
b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → END

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

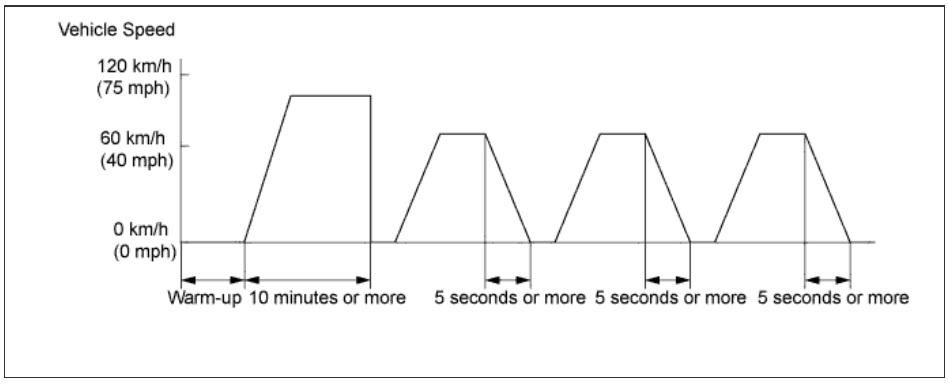
b. Turn the engine switch on (IG).

c. Clear the DTCs.

d. Switch the ECM from normal mode to check mode using the tester.

e. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

f. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



g. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

h. Turn the tester on.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

k. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

END

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM so that it can control the throttle actuator (throttle valve) appropriately in response to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The throttle actuator does not close when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**
P2112	The throttle actuator does not open when signaled by the ECM (1 trip detection logic).	• **Throttle actuator** • **Throttle body assembly** • **Throttle valve**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2111 or P2112 is output	A
P2111 or P2112 and other DTCs are output	B

HINT:

If any DTCs other than P2111 or P2112 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.INSPECT THROTTLE BODY ASSEMBLY (VISUALLY CHECK THROTTLE VALVE)

a. Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No DTC is output	A

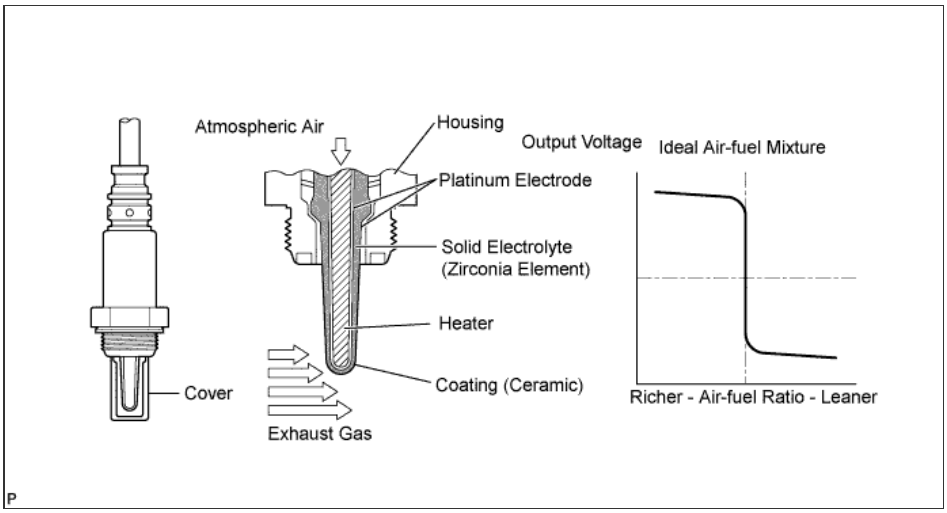
for Preparation Click here

DESCRIPTION



In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric air-fuel level. For the purpose of helping the ECM to deliver accurate air-fuel ratio control, a Heated Oxygen (HO2) sensor is used.

The HO2 sensor is located behind the TWC, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with a heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).

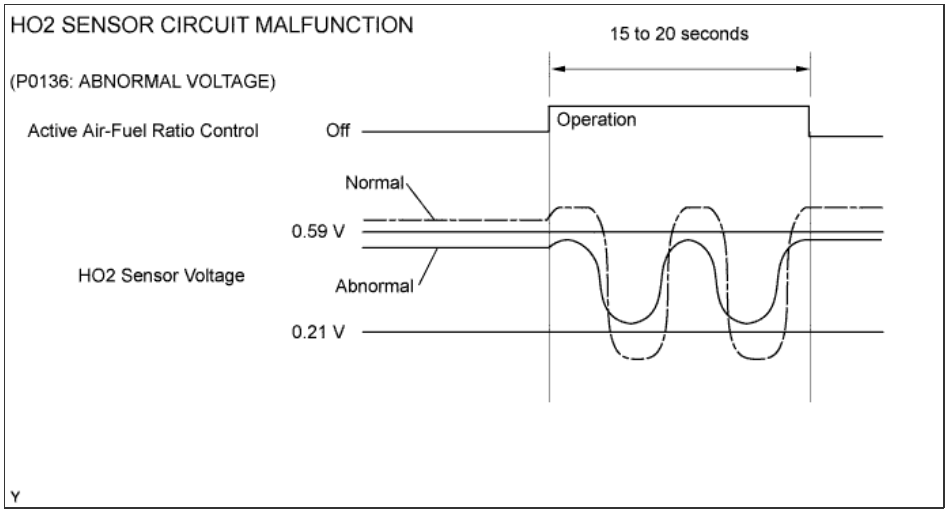
When the air-fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is lean (low voltage, i.e. below 0.45 V).

Conversely, when the air-fuel ratio is richer than the stoichiometric air-fuel level, the oxygen concentration in the exhaust gas becomes lean. The HO2 sensor informs the ECM that the post-TWC air-fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The HO2 sensor has the property of changing its output voltage drastically when the air-fuel ratio is close to the stoichiometric level.

The ECM uses the supplementary information from the HO2 sensor to determine whether the air-fuel ratio after the TWC is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the HO2 sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air-fuel ratio control.

DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The Heated Oxygen (HO2) sensor voltage does not decrease to below 0.21 V. (b) The HO2 sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Air-Fuel Ratio (A/F) sensor (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0137 P0157	• Low voltage (open): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is below 0.21 V. (b) The target air-fuel ratio is rich.	• Open in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • HO2 sensor heater (for bank 1, 2) • Integration relay • Gas leakage from exhaust system
P0138 P0158	• High voltage (short): During active air-fuel ratio control, conditions (a) and (b) are met for a certain period of time (2 trip detection logic): (a) The HO2 sensor voltage output is higher than 0.59 V. (b) The target air-fuel ratio is lean.	• Short in HO2 sensor (for bank 1, 2) circuit • HO2 sensor (for bank 1, 2) • ECM internal circuit malfunction • Air-Fuel Ratio (A/F) sensor (for bank 1, 2)

MONITOR DESCRIPTION



Active Air-Fuel Ratio Control

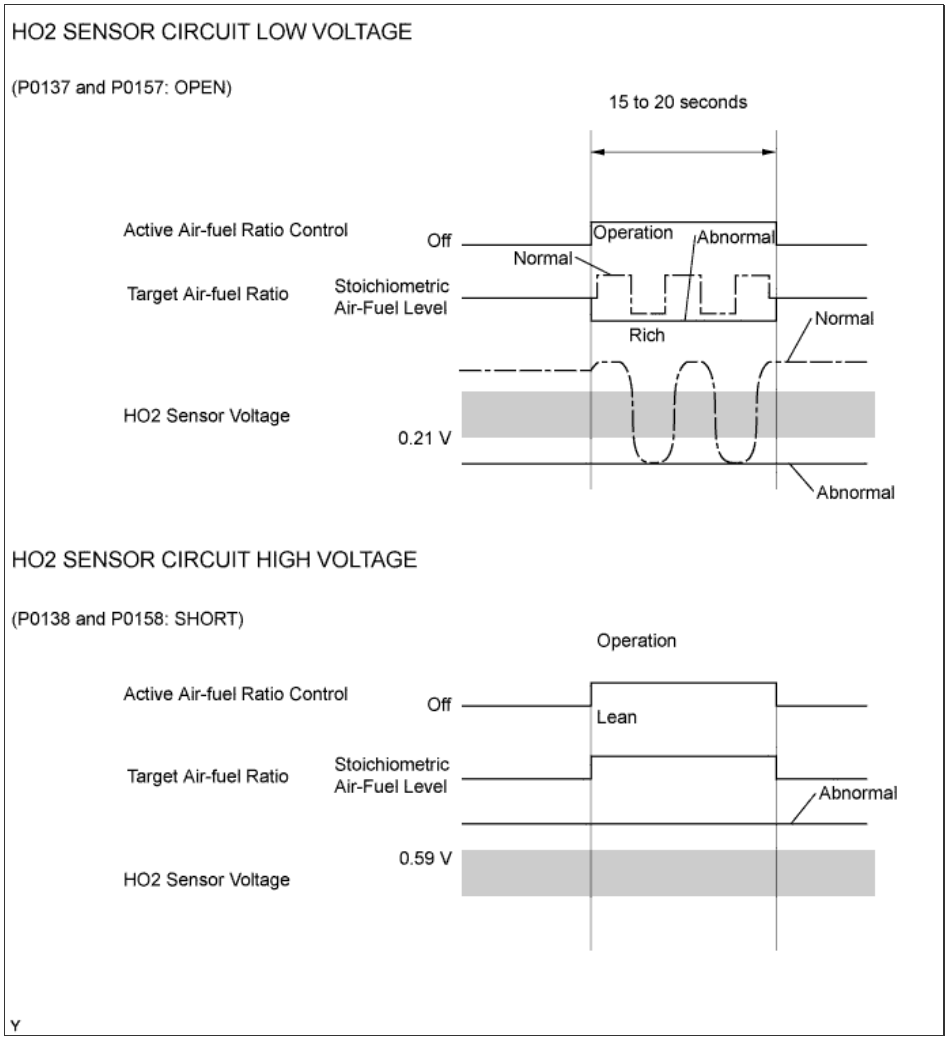
The ECM usually performs air-fuel ratio feedback control so that the Air-Fuel Ratio (A/F) sensor output indicates a near stoichiometric air-fuel level. This vehicle includes active air-fuel ratio control in addition to regular air-fuel ratio control. The ECM performs active air-fuel ratio control to detect any deterioration in the Three-Way Catalytic Converter (TWC) and Heated Oxygen (HO2) sensor malfunctions (refer to the diagram below).

Active air-fuel ratio control is performed for approximately 15 to 20 seconds while driving with a warm engine. During active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become lean or rich by the ECM. If the ECM detects a malfunction, a DTC is stored.

Abnormal Voltage Output of HO2 Sensor (DTC P0136 and P0156)

While the ECM is performing active air-fuel ratio control, the air-fuel ratio is forcibly regulated to become rich or lean. If the sensor is not functioning properly, the voltage output variation is small. For example, when the HO2 sensor voltage does not decrease to below 0.21 V and does not increase to higher than 0.59 V during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormal and stores DTC P0136 or P0156.

Open or Short in Heated Oxygen (HO2) Sensor Circuit (DTC P0137 and P0157 or P0138 and P0158)



During active air-fuel ratio control, the ECM calculates the Oxygen Storage Capacity (OSC)* of the Three-Way Catalytic Converter (TWC) by forcibly regulating the air-fuel ratio to become rich or lean. If the HO2 sensor has an open or short, or the voltage output of the sensor decreases significantly, the OSC indicates an extraordinarily high value. Even if the ECM attempts to continue regulating the air-fuel ratio to become rich or lean, the HO2 sensor output does not change.

While performing active air-fuel ratio control, when the target air-fuel ratio is rich and the HO2 sensor voltage output is 0.21 V or less (lean), the ECM interprets this as an abnormally low sensor output voltage and stores DTC P0137 or P0157. When the target air-fuel ratio is lean and the voltage output is 0.59 V or higher (rich) during active air-fuel ratio control, the ECM determines that the sensor voltage output is abnormally high, and stores DTC P0138 or P0158.

HINT:

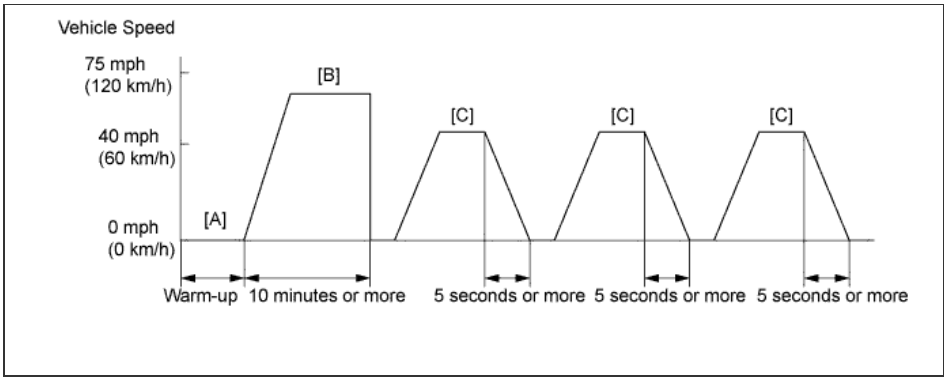
DTC P0138 or P0158 is also stored if the HO2 sensor voltage output is higher than 1.2 V for 10 seconds or more.



*: The TWC has the capability to store oxygen. The OSC and the emission purification capacity of the TWC are mutually related. The ECM determines whether the catalyst has deteriorated based on the calculated OSC value (Click here).

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [A].
4. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes or more [B].
5. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times [C].
6. Turn the tester on.
7. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.
8. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
9. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern by accelerating and decelerating the vehicle.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 or AFS B2 S1 (A/F)	+25%	Rich	Below 3.0 V
AFS B1 S1 or AFS B2 S1 (A/F)	-12.5%	Lean	Higher than 3.35 V
O2S B1 S2 or O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55 V
O2S B1 S2 or O2S B2 S2 (HO2)	-12.5%	Lean	Below 0.4 V

NOTICE:

The Air-Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the OX1B wire from the ECM connector is short-circuited to the +B wire, DTC P0136 will be stored.**
- **If the OX2B wire from the ECM connector is short-circuited to the +B wire, DTC P0156 will be stored.**

1.READ OUTPUT DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0138 or P0158 is output	A
P0137 or P0157 is output	B
P0136 or P0156 is output	C

B → Go to step 8

C → Go to step 6

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

d. Allow the engine to idle.

e. Read the Heated Oxygen (HO2) sensor output voltage while idling.

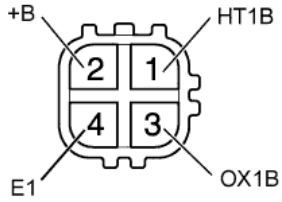
Result

Result	Proceed to
Higher than 1.2 V	A
Below 1.0 V	B

OK → Go to step 5

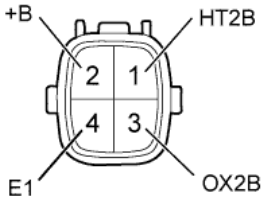
NG → Go to step 3

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher
2 (+B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

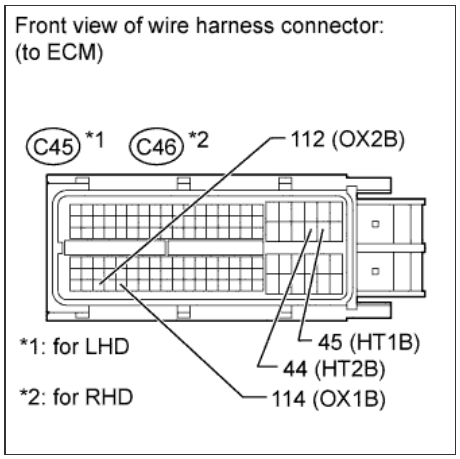
4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Turn the engine switch off and wait for 5 minutes.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-45 (HT1B) - C45-114 (OX1B)	Always	10 kΩ or higher
C45-44 (HT2B) - C45-112 (OX2B)	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-45 (HT1B) - C46-114 (OX1B)	Always	10 kΩ or higher
C46-44 (HT2B) - C46-112 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.CHECK AIR FUEL RATIO SENSOR CURRENT

a. Connect the intelligent tester to the DLC3.

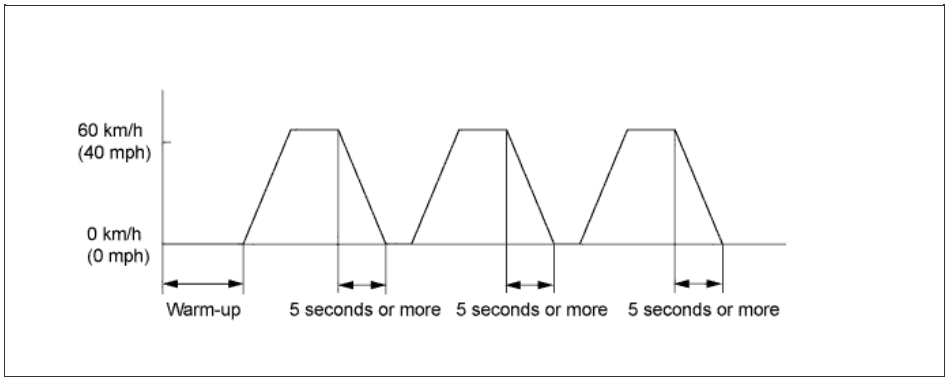
b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

d. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more.
Perform this 3 times.

HINT:

If the tester shows Utility / Monitor Status / O2 Sensor / Incomplete again, increase the vehicle speed and use second gear to decelerate the vehicle.

f. Read the value.

Standard current:
Below 3.0 mA

OK → Go to step 12

NG → Go to step 14

6.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1 S2 or O2S B2 S2.

e. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

f. Read the output voltage of the HO2 sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.5 V or higher.

NG	Go to step 8

OK

7.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume.

e. Change the fuel injection volume using the tester, and monitor the voltage output of Air-Fuel Ratio (A/F) and HO2 sensors displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within the range.**
- **The A/F sensor is displayed as AFS B1 S1 or AFS B2 S1, and the HO2 sensor is displayed as O2S B1 S2 or O2S B2 S2, on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS B1 S1 (A/F) AFS B2 S1 (A/F)	Alternates between higher than and below 3.3 V	OK
	Remains at higher than 3.3 V	NG
	Remains at below 3.3 V	NG

HINT:

A normal HO2 sensor voltage (O2S B1 S2 or O2S B2 S2) reacts in accordance with increases and decreases in fuel injection volumes. When the A/F sensor voltage remains at either below or higher than 3.3 V despite the HO2 sensor indicating a normal reaction, the A/F sensor is malfunctioning.

NG	Go to step 14

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR-FUEL RATIO AND REPAIR CAUSE (INJECTOR, FUEL PRESSURE, GAS LEAKAGE FROM EXHAUST SYSTEM, ETC.)

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage from the exhaust manifold and pipe.

OK:
No exhaust gas leakage.

NG	REPAIR OR REPLACE EXHAUST GAS LEAKAGE POINT

OK

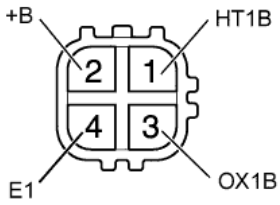
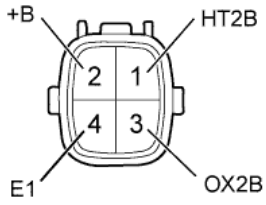
9.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)



a. Disconnect the Heated Oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E1)	Always	10 kΩ or higher
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 4 (E1)	Always	10 kΩ or higher

Component without harness connected:
(HO2 Sensor for Bank 1)

Component without harness connected:
(HO2 Sensor for Bank 2)

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

10.INSPECT INTEGRATION RELAY (EFI RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse.

i. Remove the EFI MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
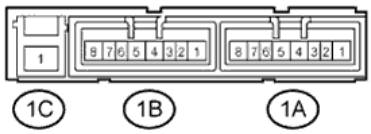
EFI MAIN fuse	Always	Below 1 Ω

iii. Reinstall the EFI MAIN fuse.



c. Inspect the EFI relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	When no battery voltage applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	When battery voltage applied to terminals 1B-2 and 1B-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY

OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the HO2 sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V
C56-2 (+B) - Body ground	Engine switch on (IG)	9 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C45-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C45-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C45-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C45-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C45-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C45-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C45-112 (OX2B) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-45 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-114 (OX1B)	Always	Below 1 Ω
C20-4 (E1) - C46-115 (EX1B)	Always	Below 1 Ω
C56-1 (HT2B) - C46-44 (HT2B)	Always	Below 1 Ω
C56-3 (OX2B) - C46-112 (OX2B)	Always	Below 1 Ω
C56-4 (E1) - C46-113 (EX2B)	Always	Below 1 Ω
C20-1 (HT1B) or C46-45 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-114 (OX1B) - Body ground	Always	10 kΩ or higher
C56-1 (HT2B) or C46-44 (HT2B) - Body ground	Always	10 kΩ or higher
C56-3 (OX2B) or C46-112 (OX2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE HEATED OXYGEN SENSOR (Click here)

12.REPLACE HEATED OXYGEN SENSOR

a. Replace the heated oxygen sensor (Click here).

NEXT

13.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

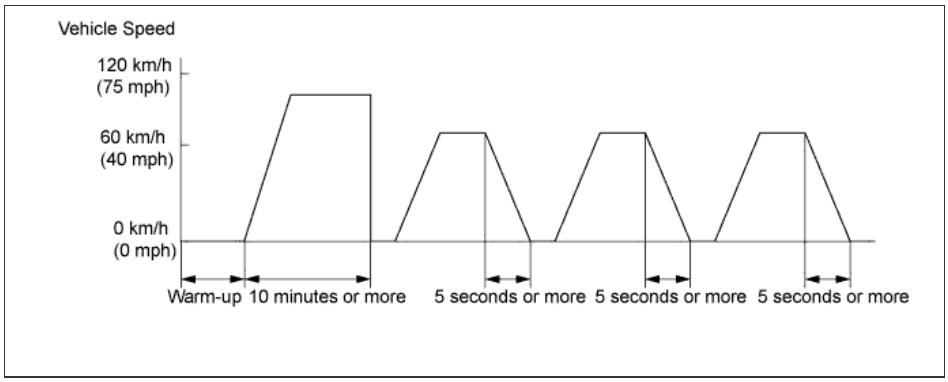
b. Turn the engine switch on (IG).

c. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

d. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



e. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

f. Turn the tester on.

g. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

h. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

i. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK → END

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

a. Connect the intelligent tester to the DLC3.

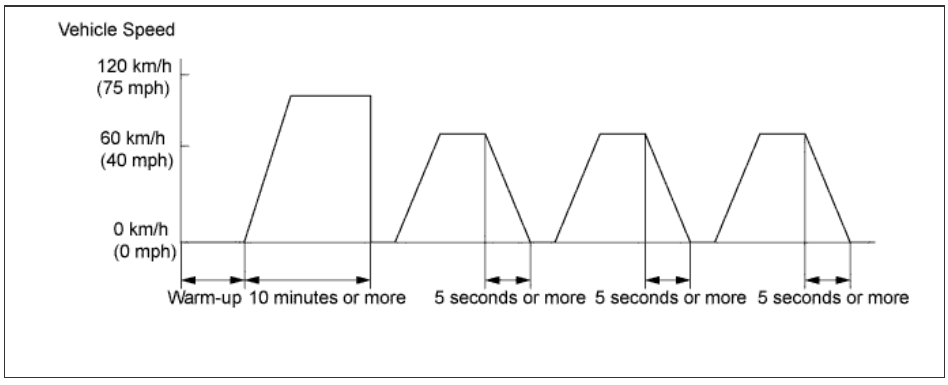
b. Turn the engine switch on (IG).

c. Clear the DTCs.

d. Switch the ECM from normal mode to check mode using the tester.

e. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher.

f. Drive the vehicle at 60 to 120 km/h (40 to 75 mph) for 10 minutes.



g. Drive the vehicle at 60 km/h (40 mph) or more and decelerate the vehicle for 5 seconds or more. Perform this 3 times.

h. Turn the tester on.

i. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

j. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.

k. Check that DTC monitor is NORMAL. If DTC monitor is INCOMPLETE, perform the drive pattern increasing the vehicle speed and using second gear to decelerate the vehicle.

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

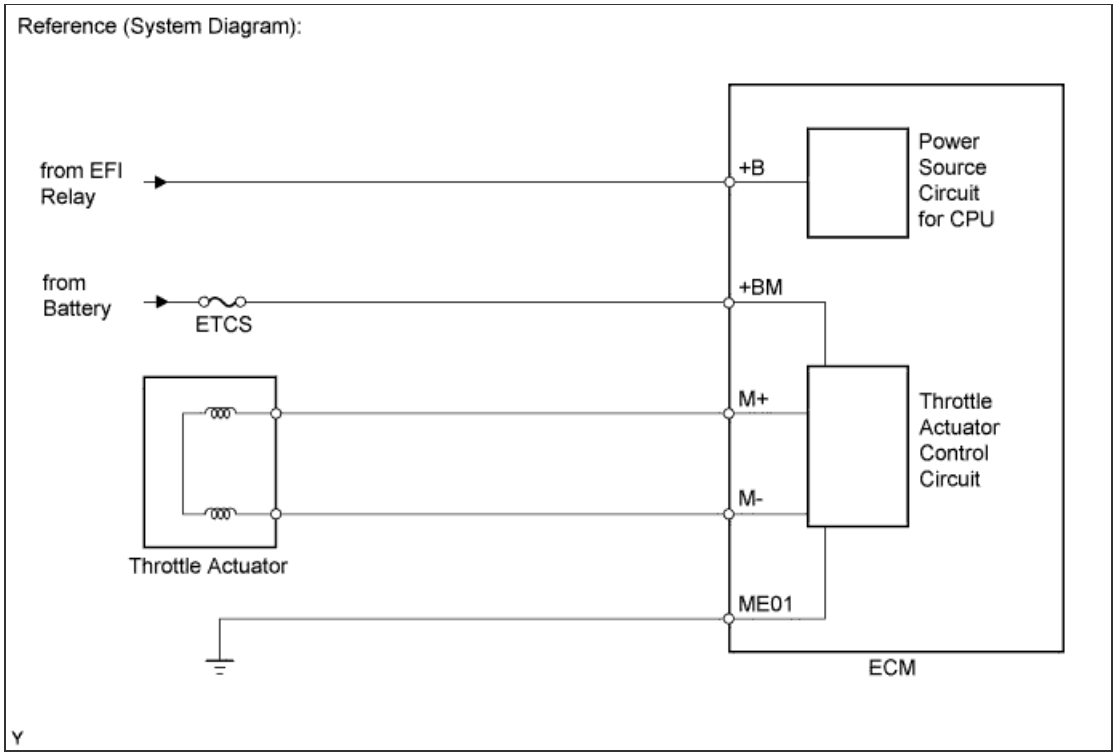
END

DTC P2118 Throttle Actuator Control Motor Current Range / Performance



for Preparation Click here

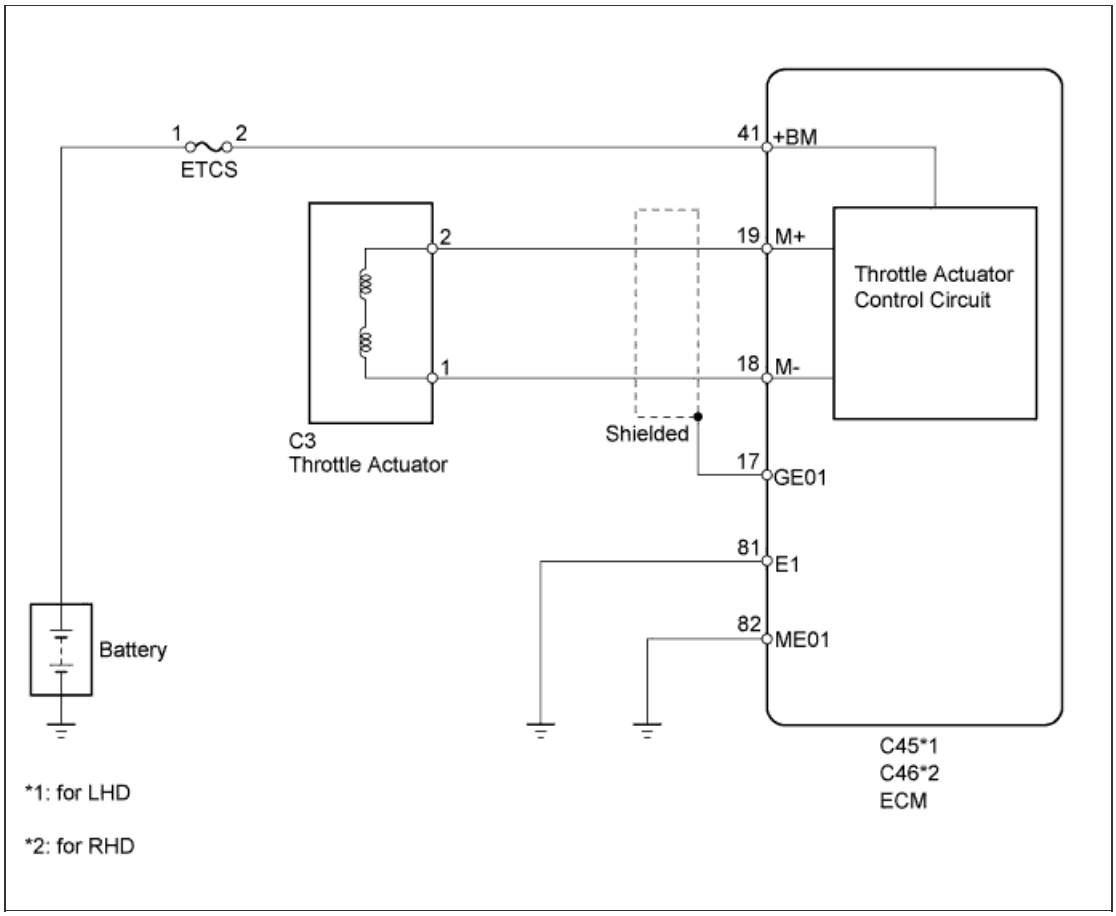
DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (below 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the engine switch off. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.

HINT:

The ETCS does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2118	An open in the ETCS power source (+BM) circuit (1 trip detection logic).	• Open in ETCS power source circuit • Battery • Battery terminals • ETCS fuse • ECM



MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored 5 seconds after the engine is next started.

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (+BM VOLTAGE)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / +BM Voltage.

e. Read the value displayed on the tester.

Result

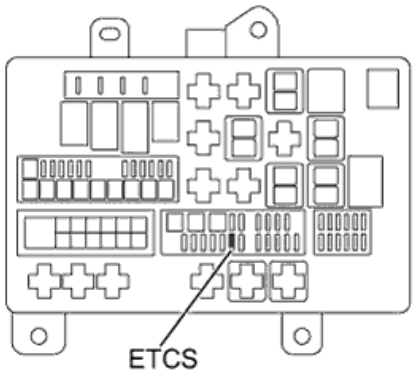
Result	Proceed to
Below 11 V or higher than 14 V	A
11 to 14 V	B

B → Go to step 5

A

2.INSPECT FUSE (ETCS)

a. Remove the ETCS fuse from the engine room relay bloc .



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition

ETCS fuse	Always	Below 1 Ω

Engine Room Relay Block:

NG

CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

3.CHECK HARNESS AND CONNECTOR (ECM - ETCS FUSE, ETCS FUSE - BATTERY)

a. Chec the harness and connector between the ETCS fuse and ECM.

i. Remove the ETCS fuse from the engine room relay bloc .

ii. Disconnect the ECM connector.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

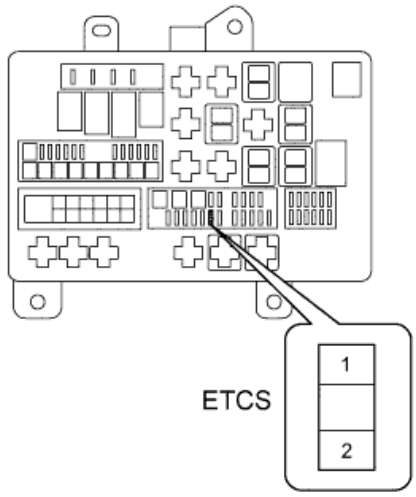
Tester Connection	Condition	Specified Condition
ETCS fuse terminal 2 - C45-41 (+BM)	Always	Below 1 Ω
ETCS fuse terminal 2 or C45-41 (+BM) - Body ground	Always	10 Ω or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
ETCS fuse terminal 2 - C4 -41 (+BM)	Always	Below 1 Ω
ETCS fuse terminal 2 or C4 -41 (+BM) - Body ground	Always	10 Ω or higher

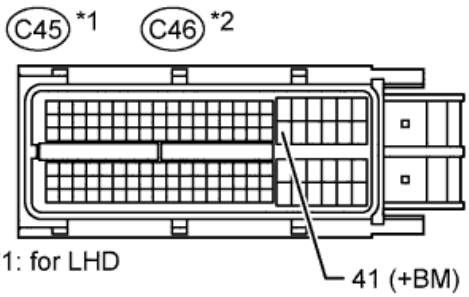
b. Chec the harness and connector between the ETCS fuse and positive battery cable.

i. Remove the ETCS fuse from the engine room relay bloc .



ii. Disconnect the cable from the positive (+) battery terminal.

iii. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
Positive battery cable - ETCS fuse terminal 1	Always	Below 1 Ω
Positive battery		

Engine Room Relay Block:

Front view of wire harness connector: (to ECM)

*1: for LHD

*2: for RHD

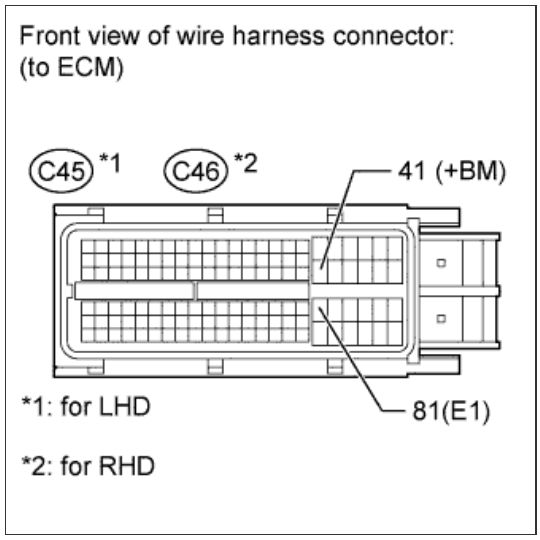
cable or ETCS fuse terminal 1 - Body ground	Always	10 Ω or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.INSPECT ECM (+BM VOLTAGE)

a. Disconnect the ECM connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Condition	Specified Condition
C45-41 (+BM) - C45-81 (E1)	Always	11 to 14 V

Standard voltage (for RHD):

Tester Connection	Condition	Specified Condition
C4 -41 (+BM) - C4 -81 (E1)	Always	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

5.INSPECT BATTERY

a. Chec that the battery is not depleted (Clic here).

OK:

Battery is not depleted.

NG → REPLACE BATTERY

OK

6.CHECK BATTERY TERMINAL

a. Chec that the battery terminals and ECM ground are not loose or corroded.

OK:

Battery terminals and ECM ground are not loose or corroded.

NG → REPAIR OR REPLACE BATTERY TERMINAL

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0171 System Too Lean (Bank 1)

DTC P0172 System Too Rich (Bank 1)

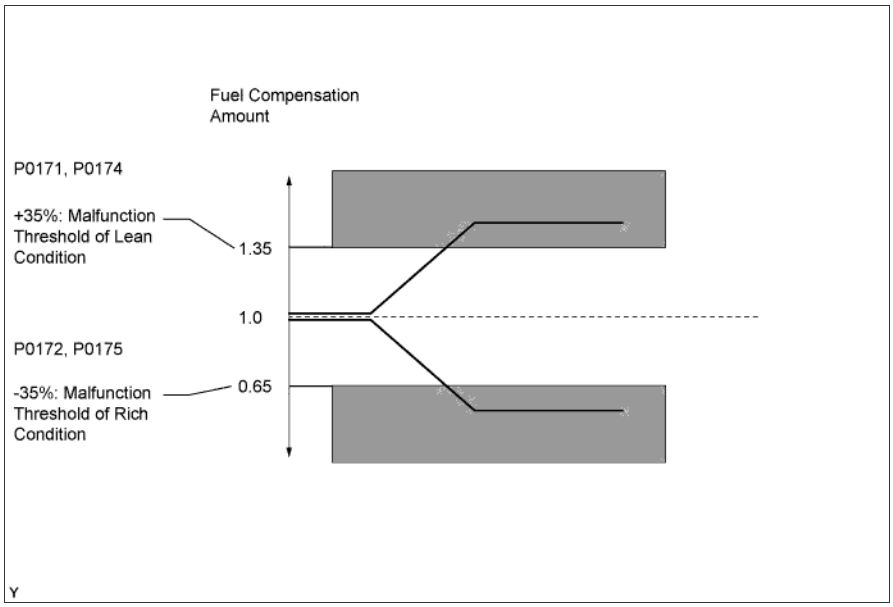
DTC P0174 System Too Lean (Bank 2)

DTC P0175 System Too Rich (Bank 2)

for Preparation Click here

DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and the long-term fuel trims.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in Air-Fuel Ratio (A/F) sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air-fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air-fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is higher than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the fuel injection volumes estimated by the ECM also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction threshold, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
The average fuel trim learning value is +35% or more or -35% or less, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0171, P0172, P0174 or P0175 is output	A
P0171, P0172, P0174 or P0175 and other DTCs are output	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

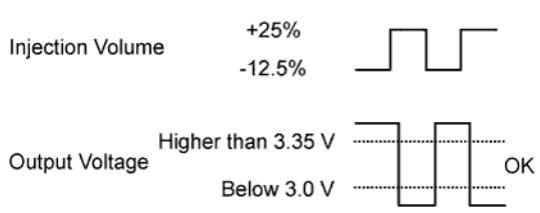
a. Connect the intelligent tester to the DLC3.

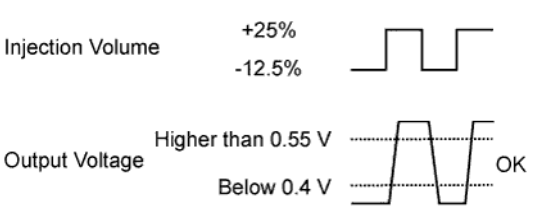
b. Start the engine and turn the tester on.

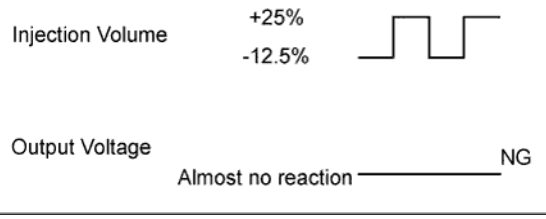
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

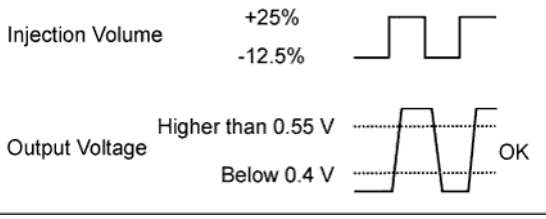
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

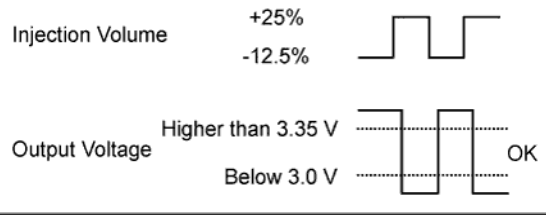
e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

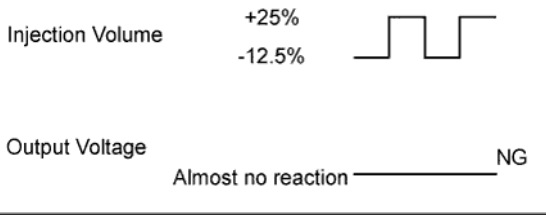


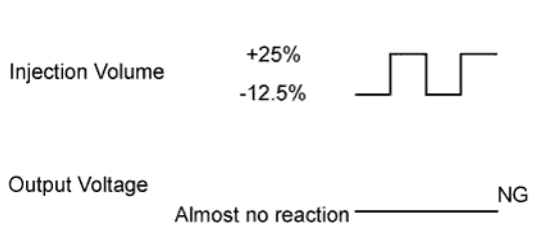


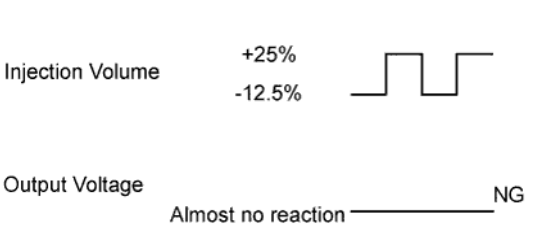












f. Monitor the output voltages of A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
The A/F sensor reacts in accordance with increases and decreases in the fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area

1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

Result

Result	Proceed to
Case 1	C
Case 2	B
Case 3	A

B → Go to step 11

C → Go to step 15

A

3.CHECK MASS AIR FLOW METER

a. Check the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

5.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK ↓

6.CHECK AIR INDUCTION SYSTEM

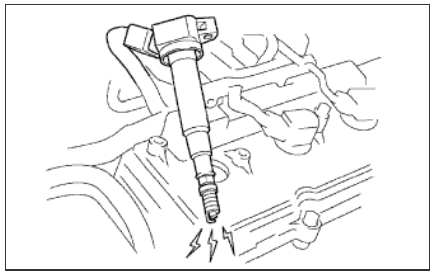
a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK ↓

7.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

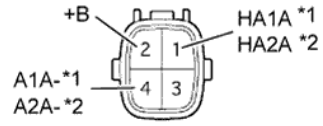
11.INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

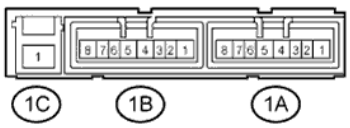
i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

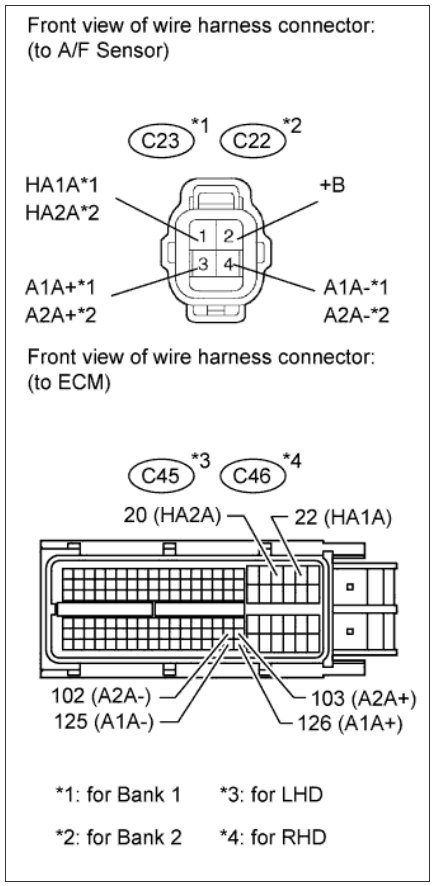
Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY

OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

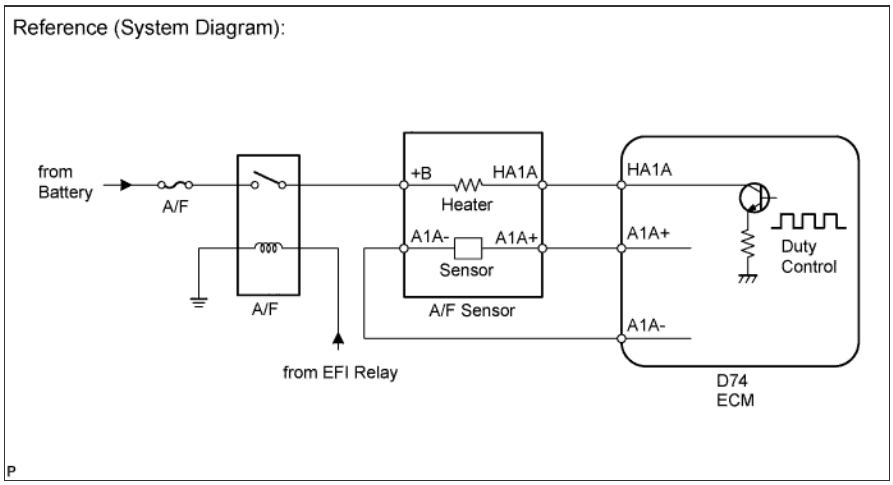
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

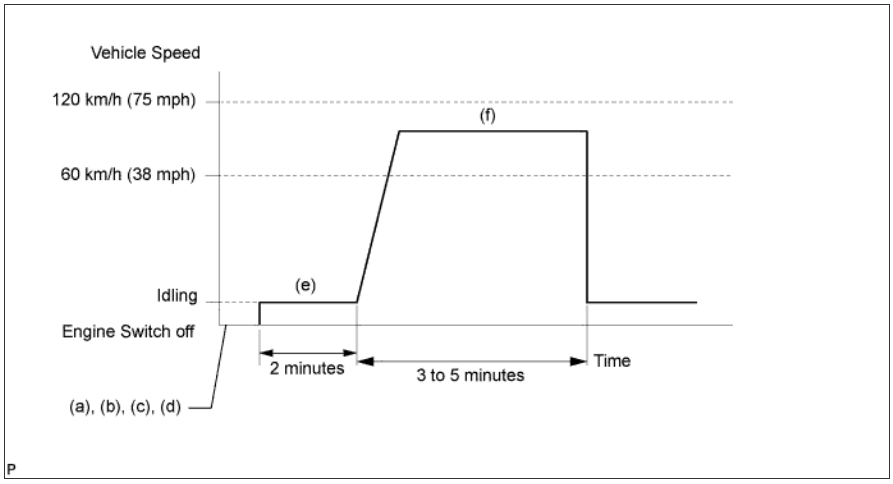
Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher

C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG) and turn the tester on.
(c) Clear DTCs (Click here).
(d) Switch the ECM from normal mode to check mode using the tester (Click here).
(e) Start the engine and warm it up with all the accessories switched off.
(f) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) and at an engine speed of between 1400 rpm and 3200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL will be illuminated during step (f).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

DTC P2119 Throttle Actuator Control Throttle Body Range / Performance

for Preparation Click here

DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P2119	The throttle valve opening angle continues to vary greatly from the target opening angle (1 trip detection logic).	• ETCS • ECM

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5000 rpm by the accelerator pedal being fully depressed (fully open the throttle valve).

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 7° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly. Fail-safe mode continues until a pass condition is detected, and the engine switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK AN OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2119 is output	A
P2119 and other DTCs are output	B

HINT:

If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Fully depress and release the accelerator pedal several times quickly.

g. Enter the following menus: Powertrain / Engine and ECT / DTC.

h. Read the DTCs.

OK:

No DTC is output.

HINT:

The output voltage of the throttle position sensor can be checked using the intelligent tester. Variations in the output voltage indicate that the throttle actuator is in operation. To check the output voltage using the intelligent tester, enter the following menus: Powertrain / Engine and ECT / ETCS / Throttle Position o1.

NG → REPLACE THROTTLE BOD ASSEMBL (Click here)

OK

DTC P0171 System Too Lean (Bank 1)

DTC P0172 System Too Rich (Bank 1)

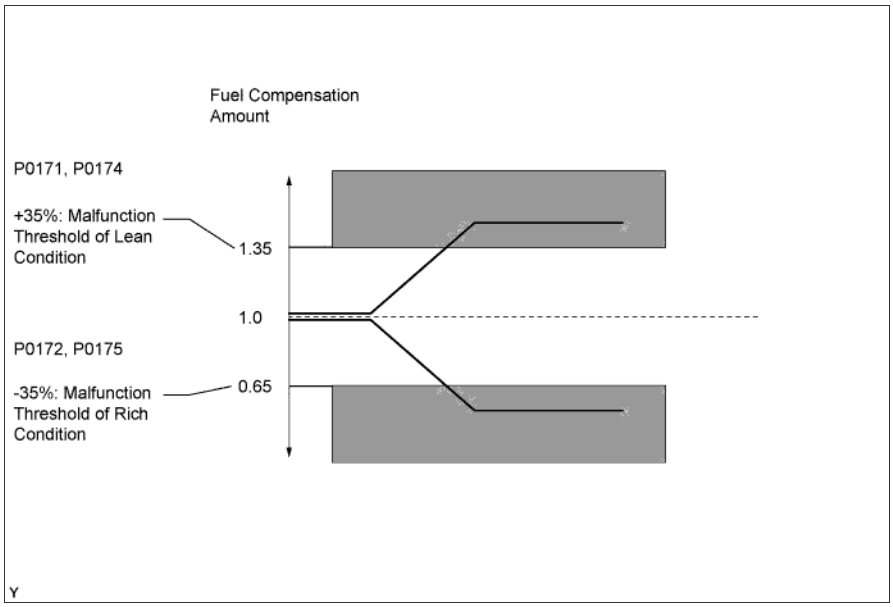
DTC P0174 System Too Lean (Bank 2)

DTC P0175 System Too Rich (Bank 2)

for Preparation Click here

DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and the long-term fuel trims.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in Air-Fuel Ratio (A/F) sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air-fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air-fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is higher than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the fuel injection volumes estimated by the ECM also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction threshold, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
The average fuel trim learning value is +35% or more or -35% or less, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0171, P0172, P0174 or P0175 is output	A
P0171, P0172, P0174 or P0175 and other DTCs are output	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

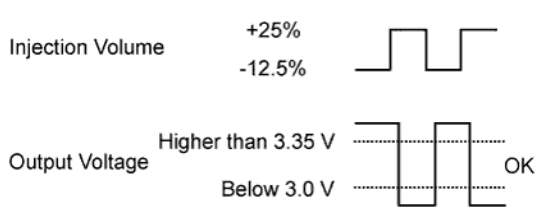
a. Connect the intelligent tester to the DLC3.

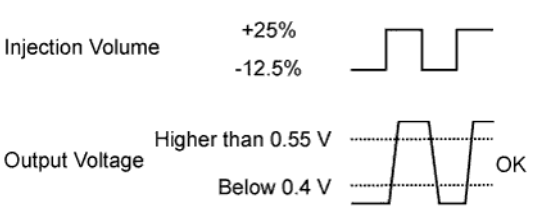
b. Start the engine and turn the tester on.

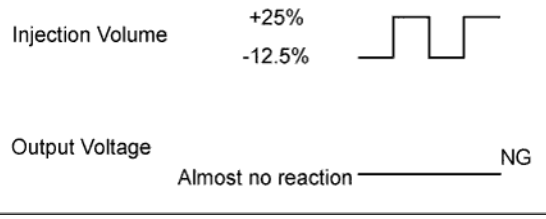
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

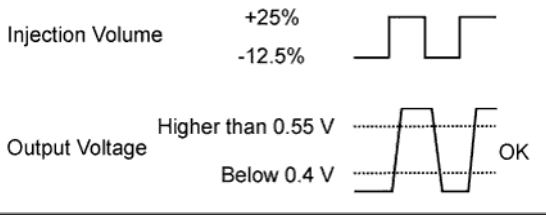
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

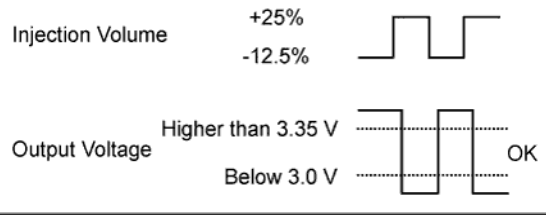
e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

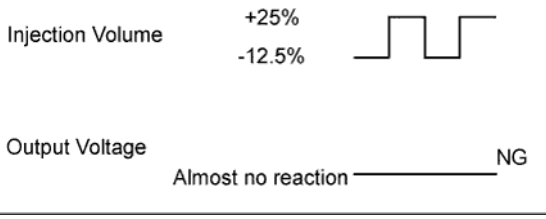


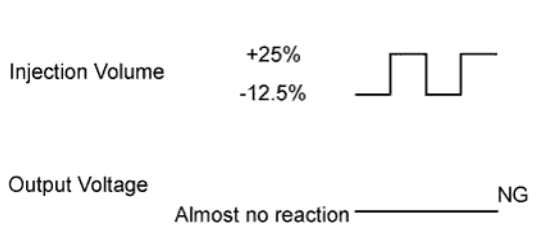


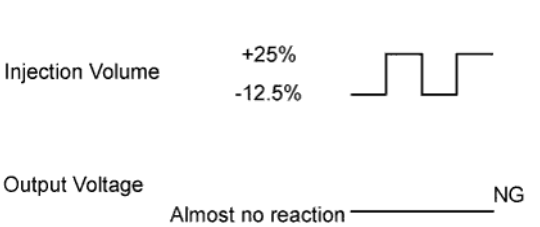












f. Monitor the output voltages of A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
The A/F sensor reacts in accordance with increases and decreases in the fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area

1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

Result

Result	Proceed to
Case 1	C
Case 2	B
Case 3	A

B → Go to step 11

C → Go to step 15

A

3.CHECK MASS AIR FLOW METER

a. Check the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

5.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK ↓

6.CHECK AIR INDUCTION SYSTEM

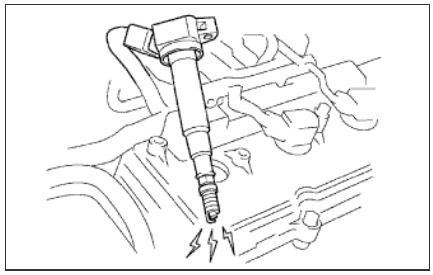
a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK ↓

7.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

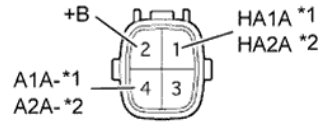
10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

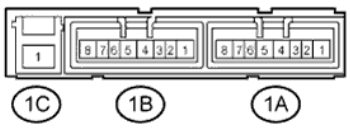
i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

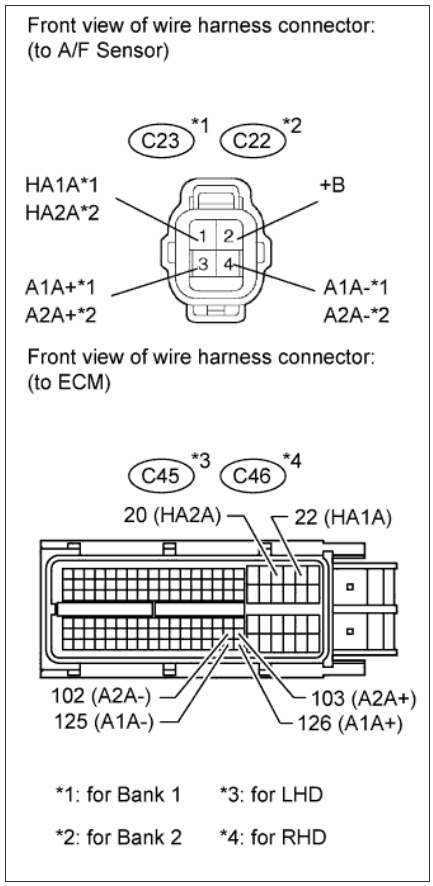
Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY

OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

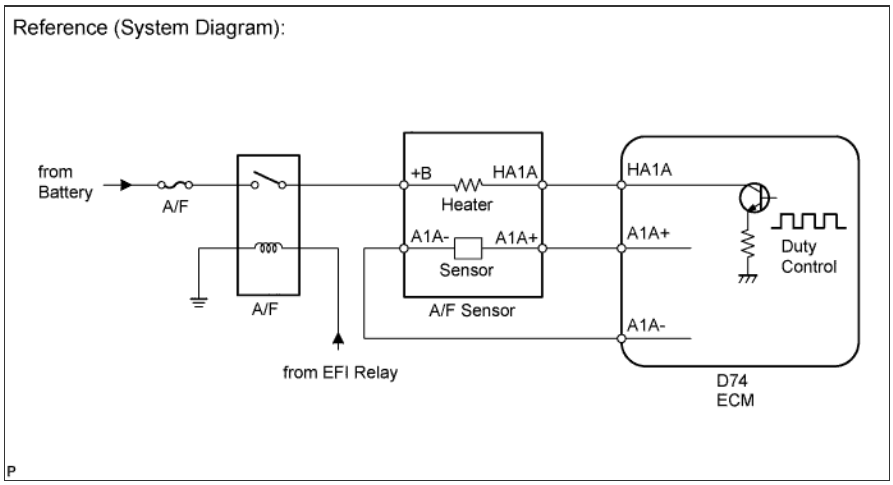
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
		• APP sensor

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

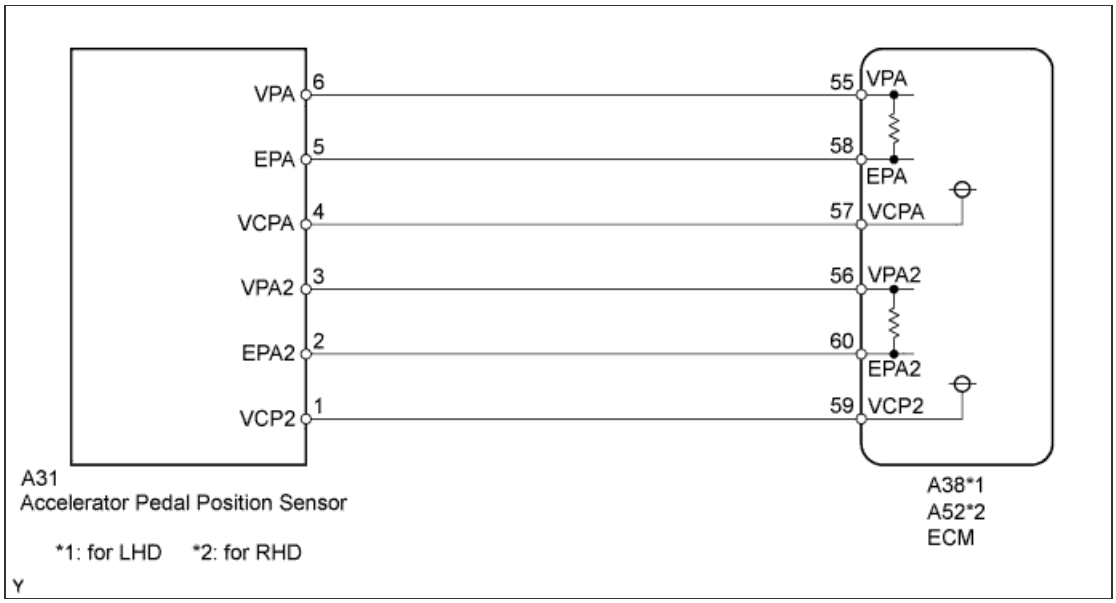
HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

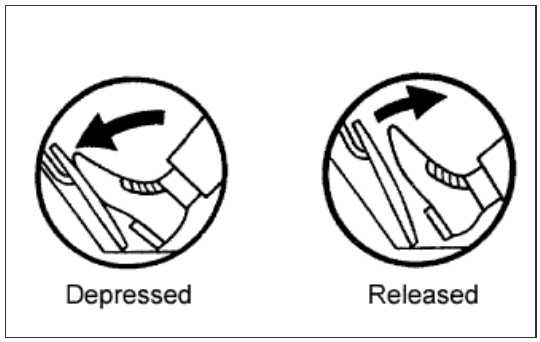
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

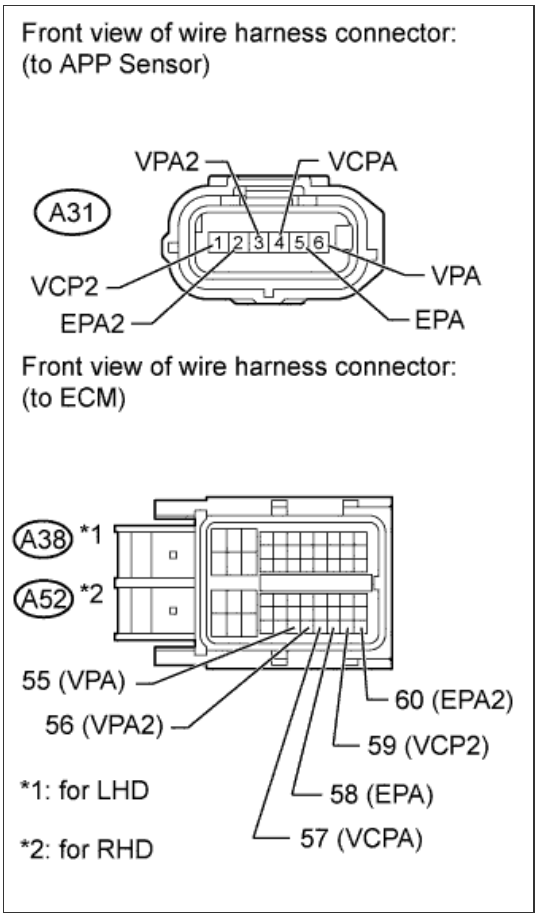
2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the APP sensor connector.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

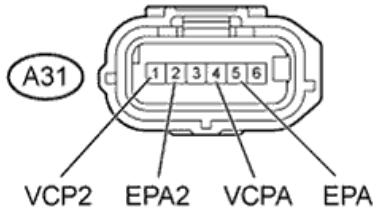
Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A52-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A52-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)



a. Disconnect the APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

Front view of wire harness connector:
(to APP Sensor)

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL SENSOR ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

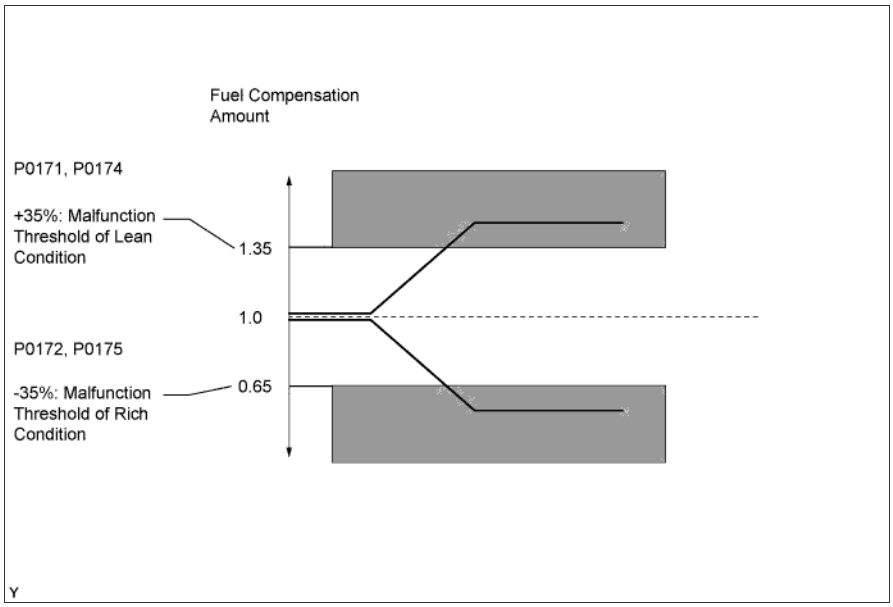
DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and the long-term fuel trims.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in Air-Fuel Ratio (A/F) sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air-fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air-fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is higher than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the fuel injection volumes estimated by the ECM also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction threshold, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
The average fuel trim learning value is +35% or more or -35% or less, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0171, P0172, P0174 or P0175 is output	A
P0171, P0172, P0174 or P0175 and other DTCs are output	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

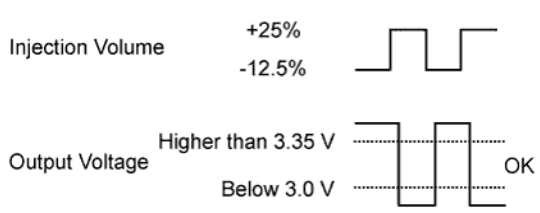
a. Connect the intelligent tester to the DLC3.

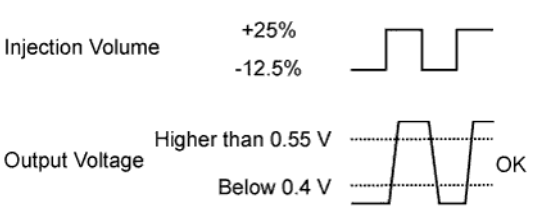
b. Start the engine and turn the tester on.

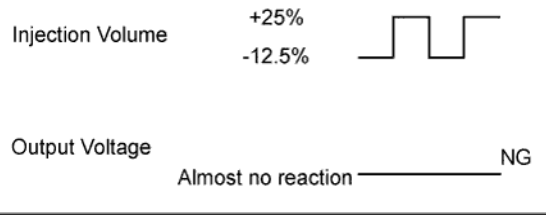
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

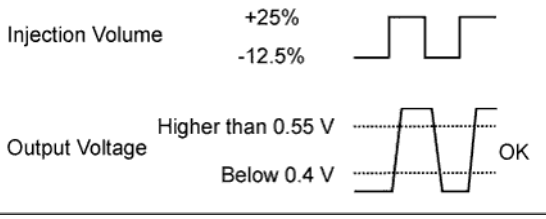
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

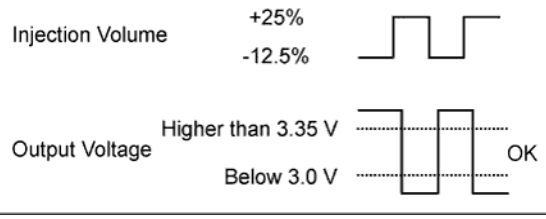
e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

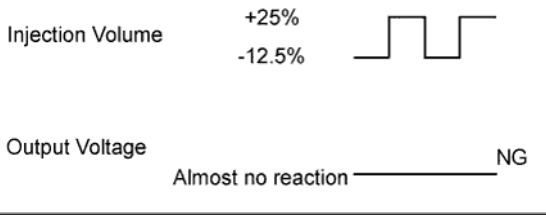


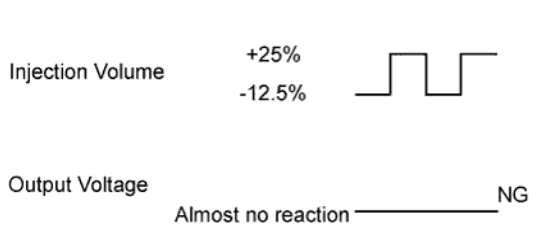


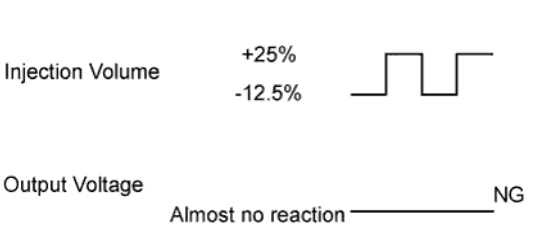












f. Monitor the output voltages of A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
The A/F sensor reacts in accordance with increases and decreases in the fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area

1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

Result

Result	Proceed to
Case 1	C
Case 2	B
Case 3	A

B → Go to step 11

C → Go to step 15

A

3.CHECK MASS AIR FLOW METER

a. Check the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

5.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK ↓

6.CHECK AIR INDUCTION SYSTEM

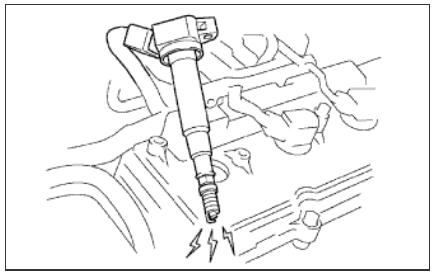
a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK ↓

7.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

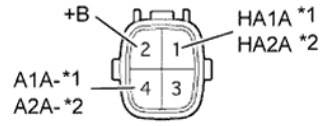
10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

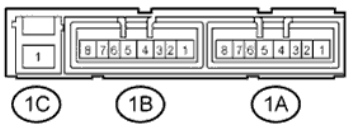
i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

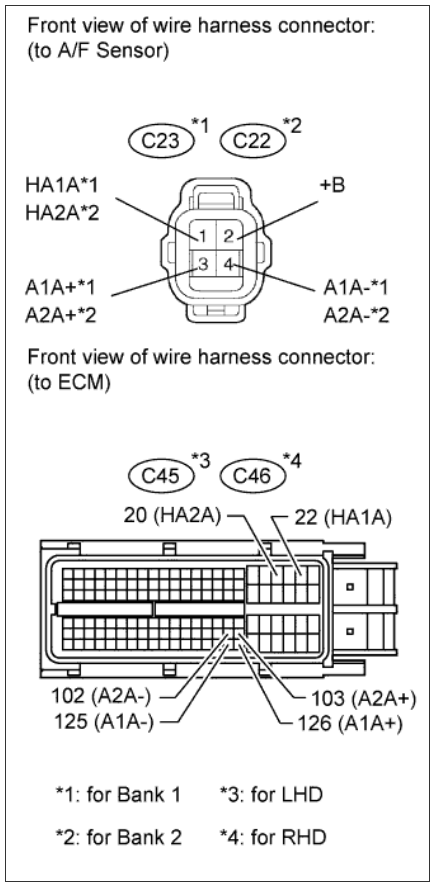
Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY

OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

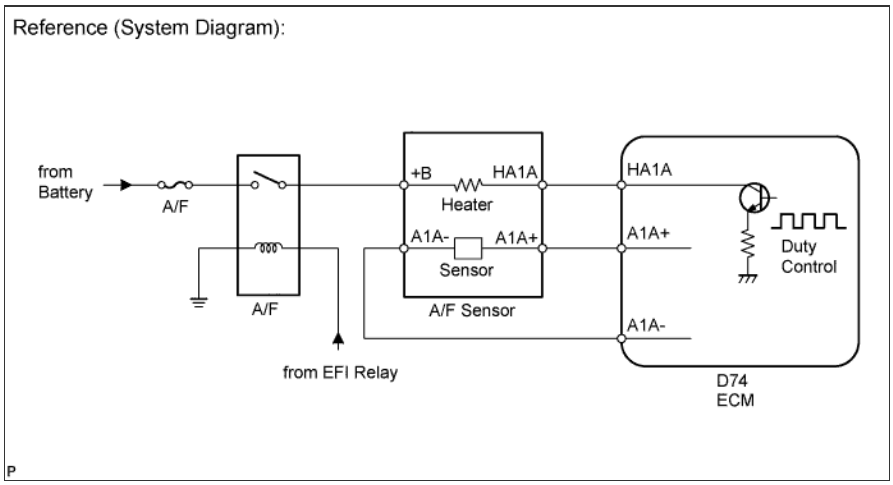
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher

C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher

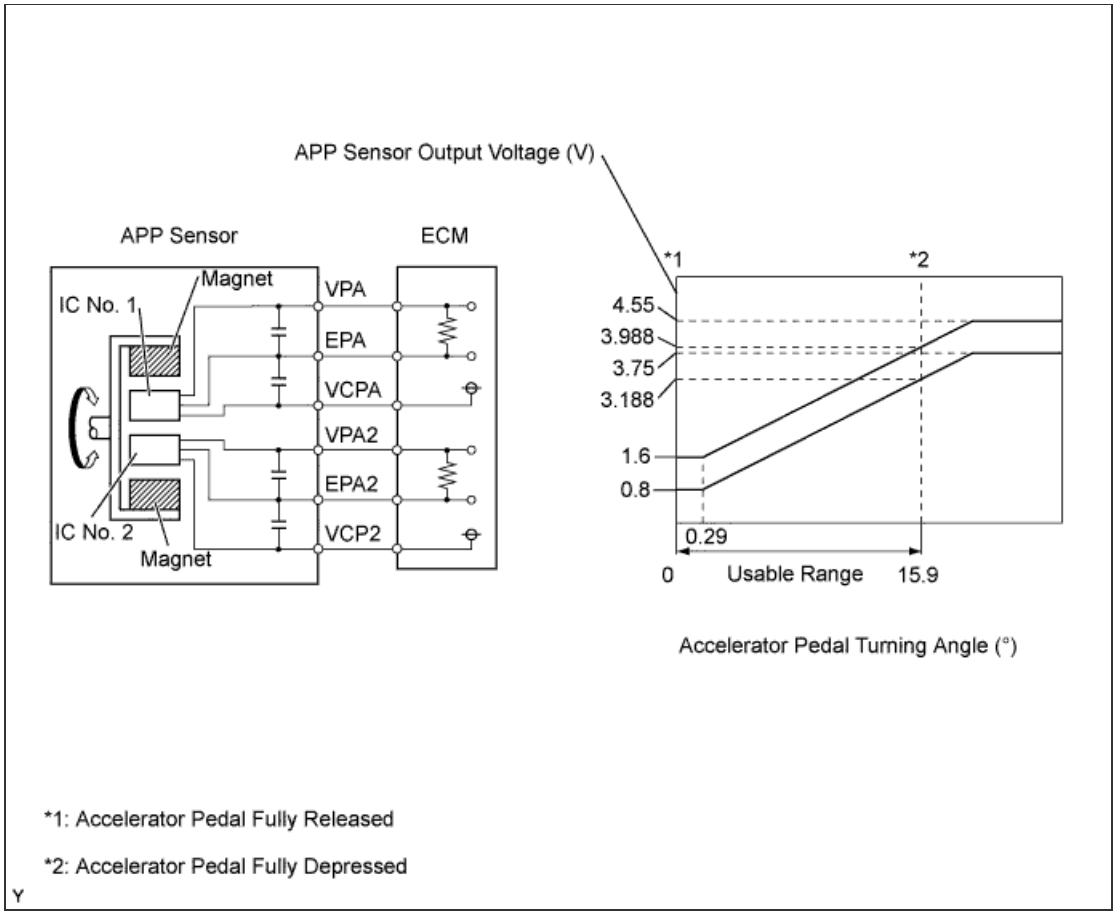
for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
		• APP sensor

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

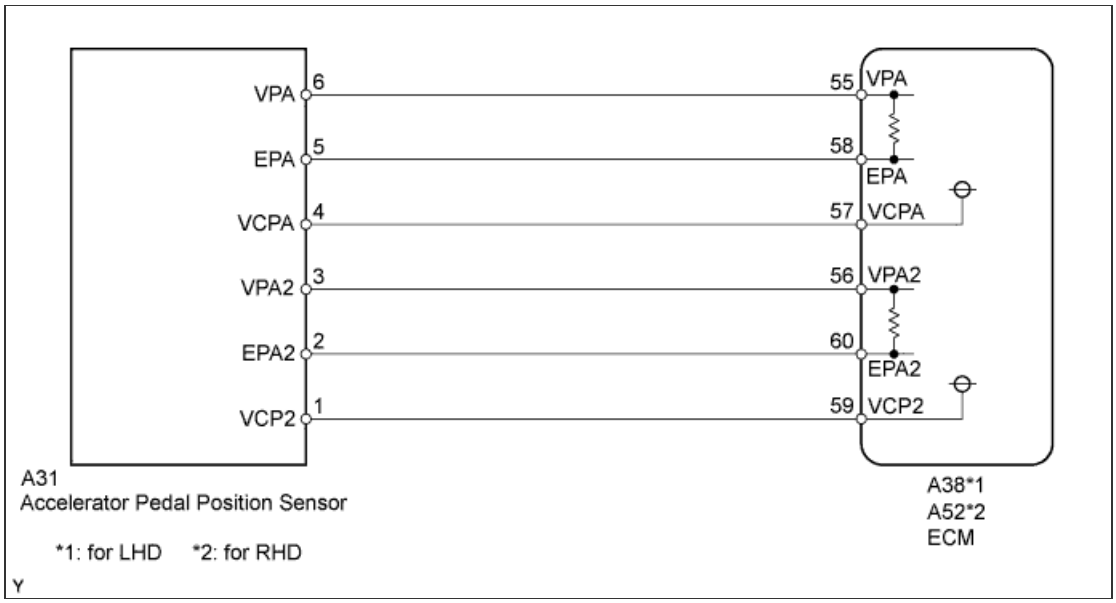
HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

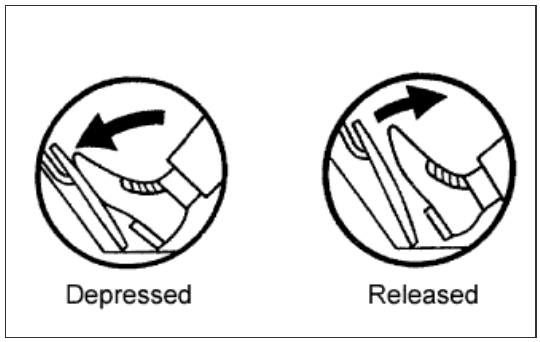
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

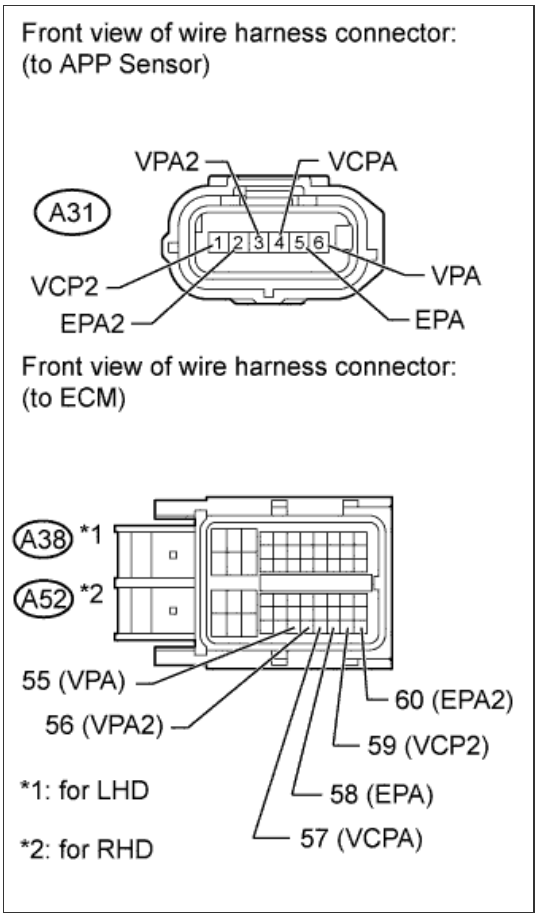
2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the APP sensor connector.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

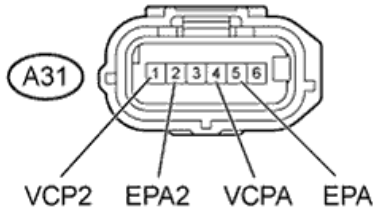
Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A52-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A52-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)



a. Disconnect the APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (I)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (I)	4.5 to 5.5 V

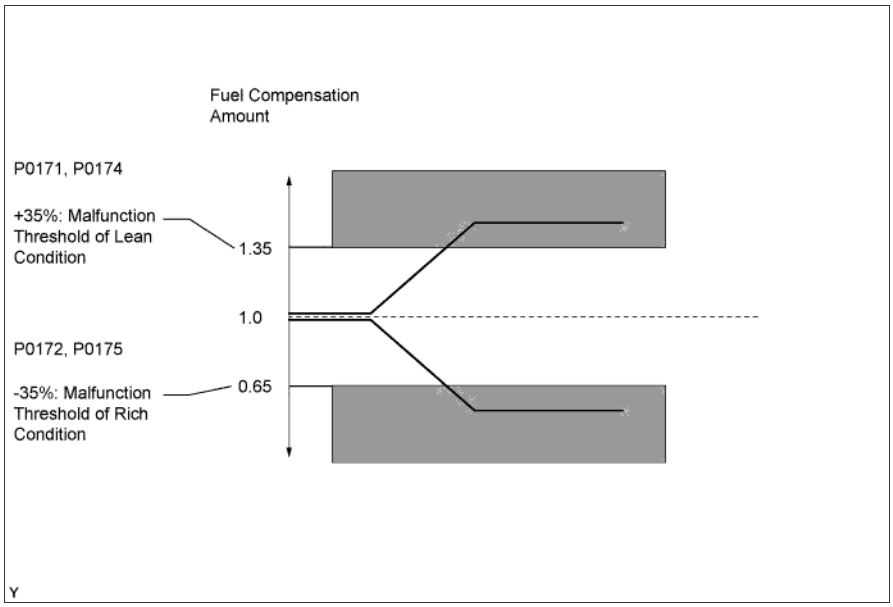
for Preparation Click here

DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and the long-term fuel trims.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air-fuel ratio at stoichiometric levels. The signal from the Air-Fuel Ratio (A/F) sensor indicates whether the air-fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air-fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in Air-Fuel Ratio (A/F) sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air-fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air-fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air-fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air-fuel ratio is lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is higher than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the fuel injection volumes estimated by the ECM also affect the average fuel trim learning value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learning value of the air-fuel ratio). If the average fuel trim learning value exceeds the malfunction threshold, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
The average fuel trim learning value is +35% or more or -35% or less, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0171, P0172, P0174 or P0175 is output	A
P0171, P0172, P0174 or P0175 and other DTCs are output	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

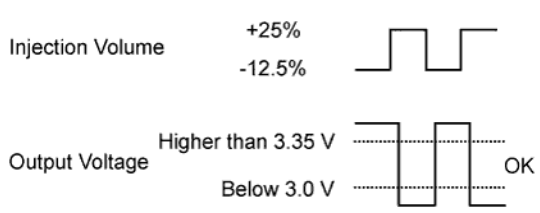
a. Connect the intelligent tester to the DLC3.

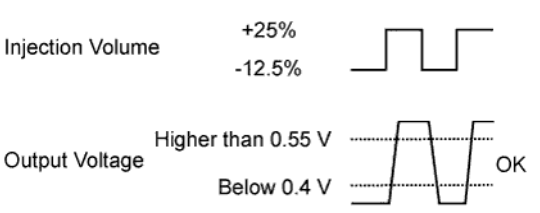
b. Start the engine and turn the tester on.

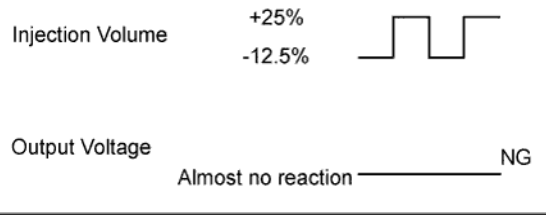
c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

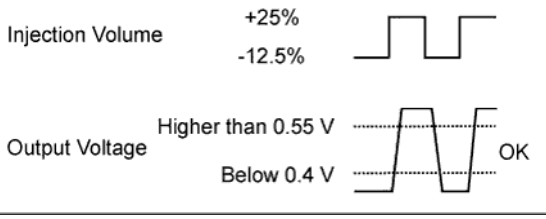
d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

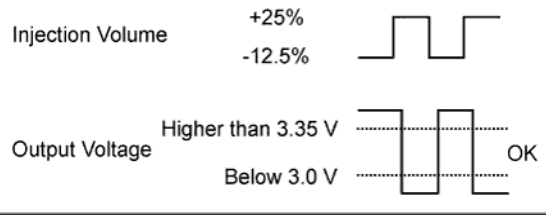
e. Perform the Control the Injection Volume for A/F Sensor operation with the engine in an idling condition (press the RIGHT or LEFT button to change the fuel injection volume).

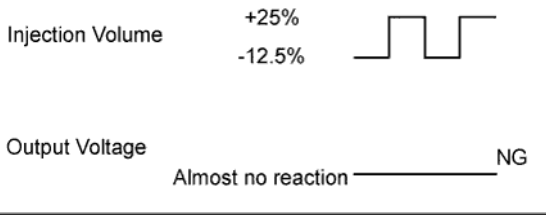


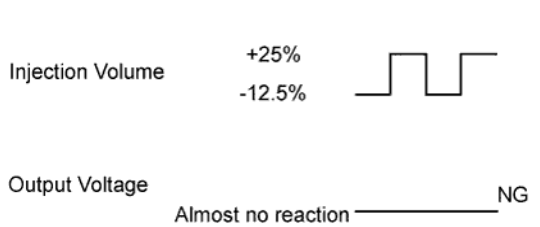


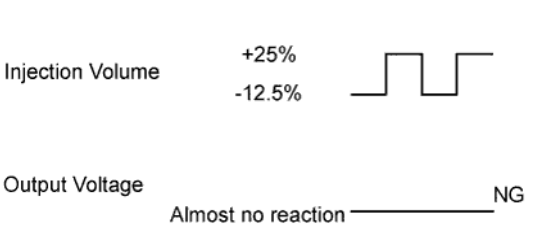












f. Monitor the output voltages of A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

Result:
The A/F sensor reacts in accordance with increases and decreases in the fuel injection volume:
+25% = Rich output:
Below 3.0 V
-12.5% = Lean output:
Higher than 3.35 V

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area

1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

Case 2	B
Case 3	A

B → Go to step 11

C → Go to step 15

A

3.CHECK MASS AIR FLOW METER

a. Check the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

5.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK ↓

6.CHECK AIR INDUCTION SYSTEM

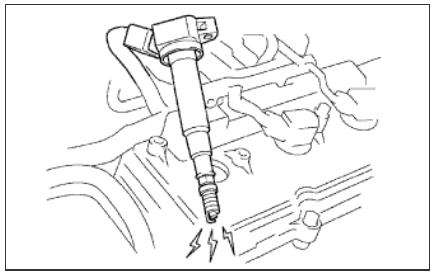
a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK ↓

7.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK ↓

8.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK ↓

9.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

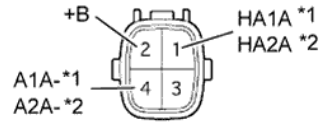
10.INSPECT FUEL INJECTOR (INJECTION AND VOLUME)

a. Check the injection volume (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

11.INSPECT AIR-FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

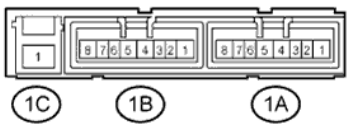
i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

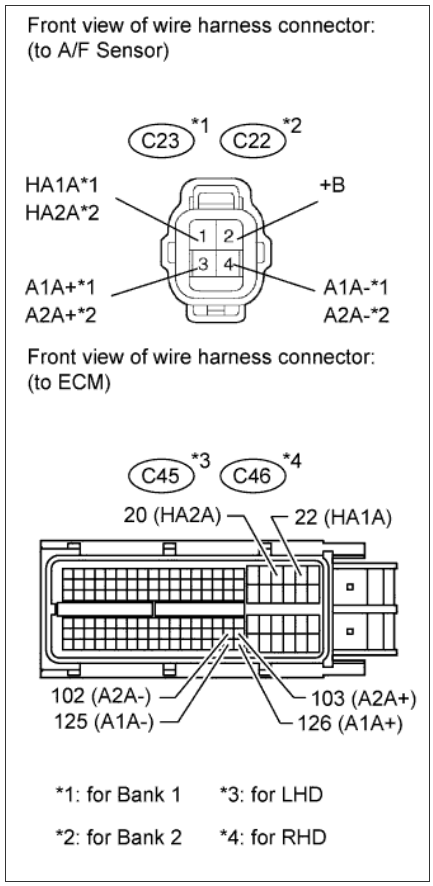
Component without harness connected:
(Integration Relay)

NG → REPLACE INTEGRATION RELAY

OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

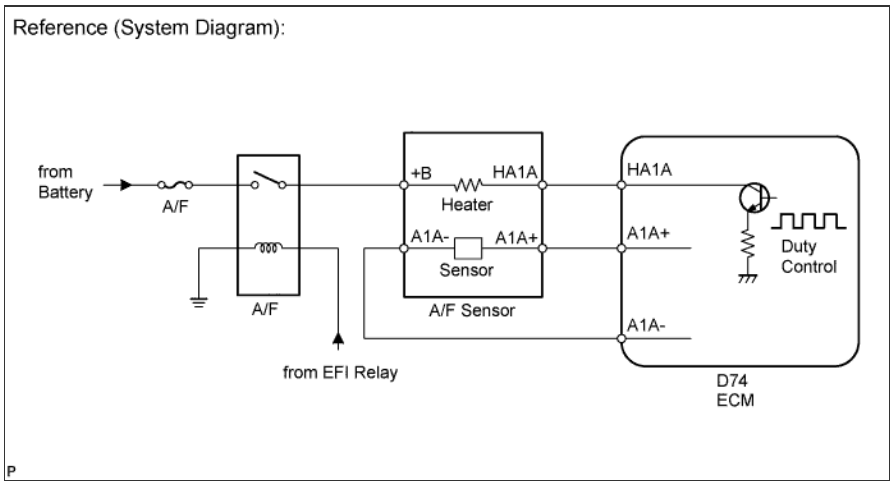
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

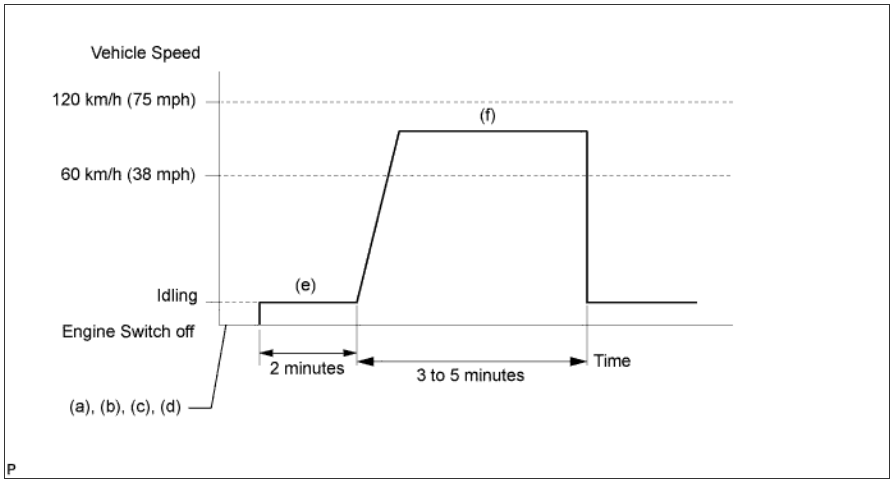
Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher

C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG) and turn the tester on.
(c) Clear DTCs (Click here).
(d) Switch the ECM from normal mode to check mode using the tester (Click here).
(e) Start the engine and warm it up with all the accessories switched off.
(f) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) and at an engine speed of between 1400 rpm and 3200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL will be illuminated during step (f).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16.CHECK WHETHER DTC OUTPUT RECURS (DTC P0171, P0172, P0174 OR P0175)

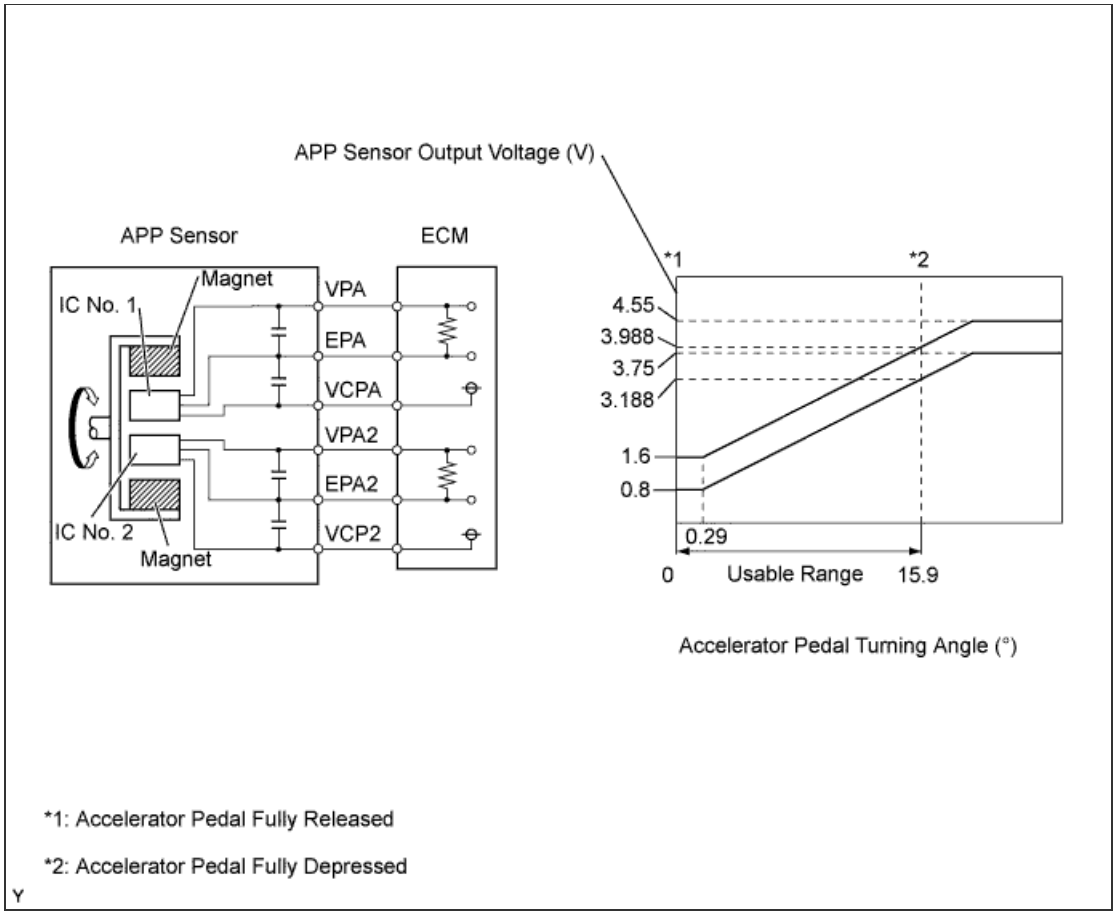
for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
		• APP sensor

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

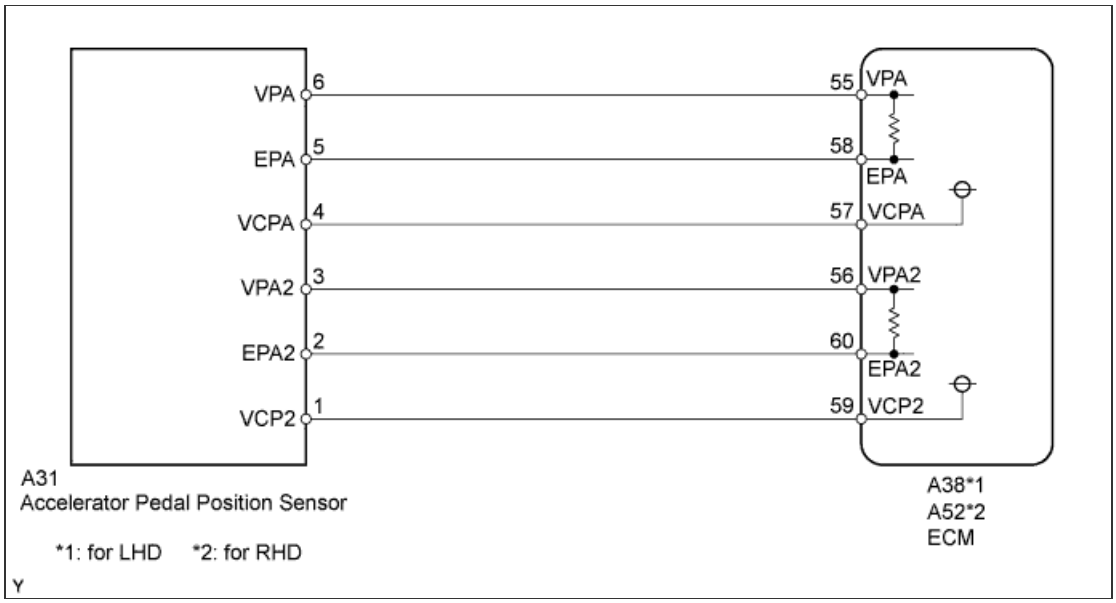
HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

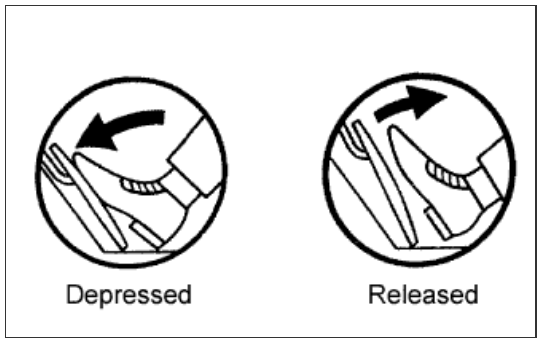
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (I) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

Result

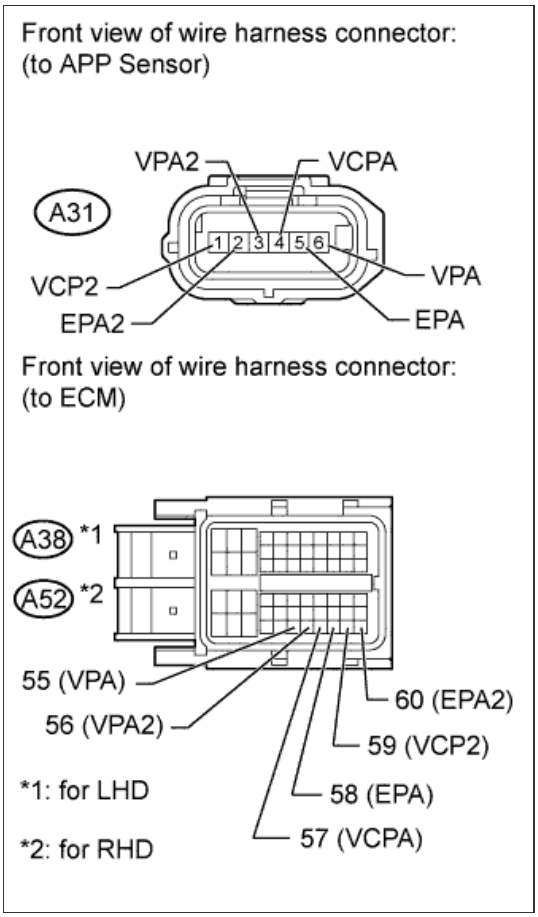
A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the APP sensor connector.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-59 (VCP2)	Always	Below 1 Ω

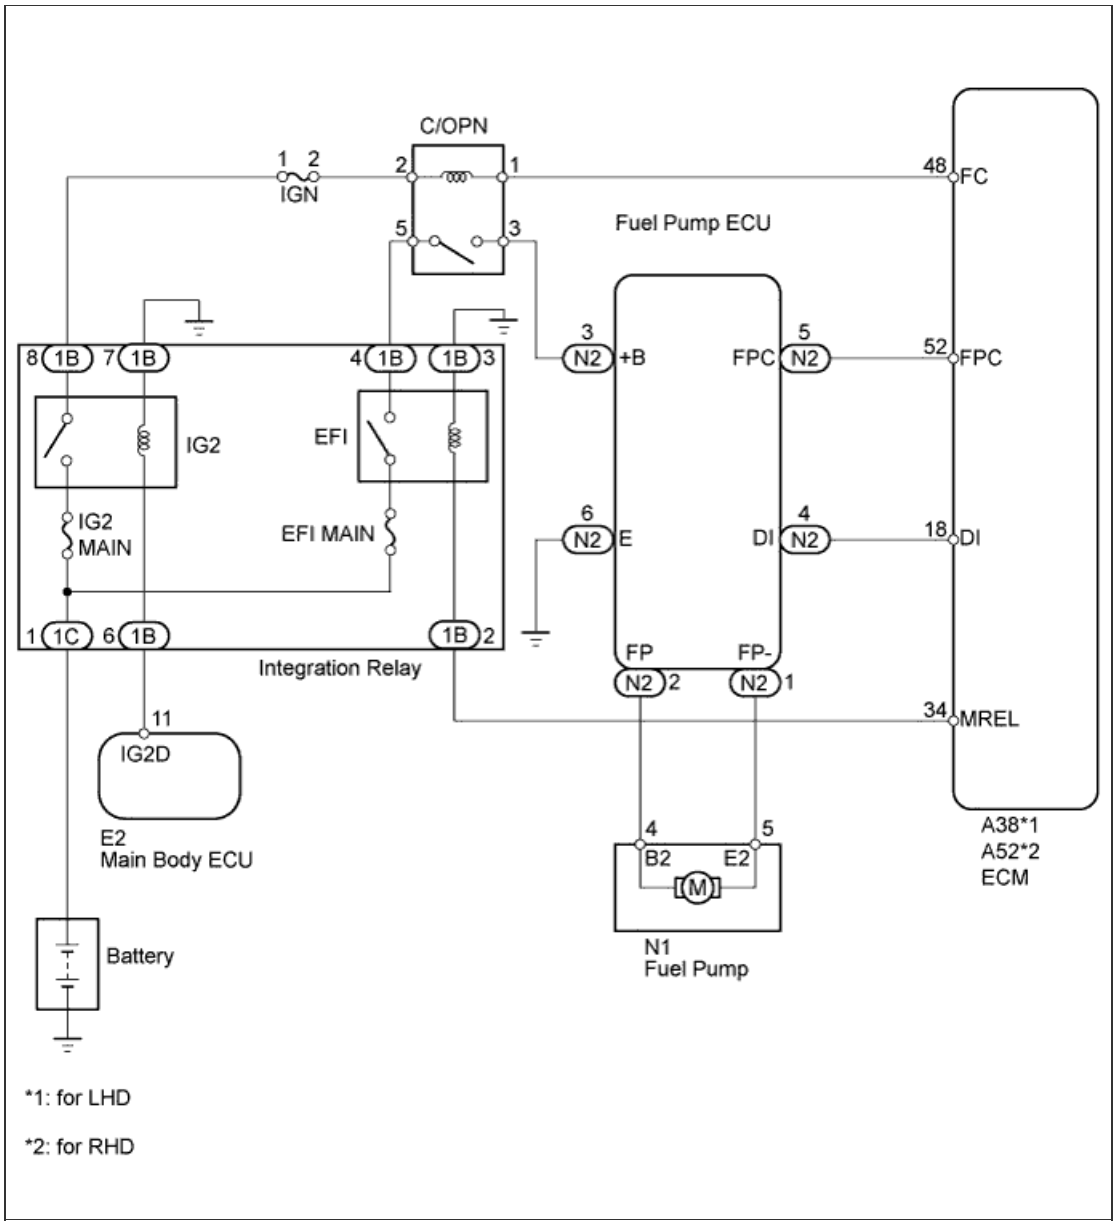
REPLACE ECM (Click here)

DTC P0230 Fuel Pump Primary Circuit

for Preparation Click here

DESCRIPTION

When a malfunction in the fuel pump circuit is detected, DTC P0230 is stored.
The fuel pump circuit consists of the ECM, fuel pump and fuel pump ECU (which operates the fuel pump). Based on the engine output, the ECM determines the fuel pump speed. The speed is then converted to a duty signal and sent to the fuel pump ECU. Based on the signal sent from the ECM, the fuel pump ECU adjusts the fuel pump operation speed between 3 settings. The fuel pump ECU also has a self-diagnosis function. Based on the fuel pump circuit condition, the fuel pump ECU outputs a diagnostic signal (DI) to the ECM, and the ECM determines if there is a malfunction in the fuel pump circuit.



DTC Code	DTC Detection Condition	Trouble Area

P0230	When either condition below is met (1 trip detection logic):
	• When the fuel pump is operating:
	  • The remaining amount of fuel is 17 L or more.
	  • The DI terminal output is low.
	• When the fuel pump is not operating:
	  • The DI terminal output is high.
		• Open or short in fuel pump circuit
		• Fuel pump
		• Fuel pump ECU
		• ECM

MONITOR DESCRIPTION

To monitor the fuel pump circuit, the ECM checks the fuel pump control signal (FPC) and diagnostic signal (DI). The FPC voltage varies between approximately 0 V to approximately 12 V (duty signal). Based on the condition of the fuel pump ECU malfunction, the DI voltage varies between approximately 0 V and approximately 12 V. The ECM then compares the variance of the FPC voltage and DI voltage, and determines if the fuel pump circuit is malfunctioning. When the ECM determines that the fuel pump circuit is malfunctioning, a DTC is stored immediately.

WIRING DIAGRAM

INSPECTION PROCEDURE

This troubleshooting procedure is based on the premise that the engine is started. If the engine is not started, proceed to the Problem Symptoms Table (Click here).

1.CHECK FOR DTC (B1500)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Body / (desired system) / DTC.

e. Read the DTC.

Result

Result	Proceed to
DTC B1500 is not output	A
DTC B1500 is output	B

B → GO TO DTC B1500 (Click here)

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PUMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump / Speed.

d. Check whether operating sounds can be heard while operating the relay using the tester.

OK:

Operating sounds can be heard from fuel pump.

NG → Go to step 6

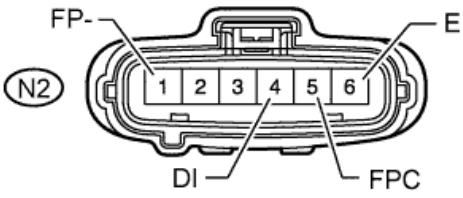
OK ↓

3.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM - FUEL PUMP)

a. Disconnect the fuel pump ECU connector.

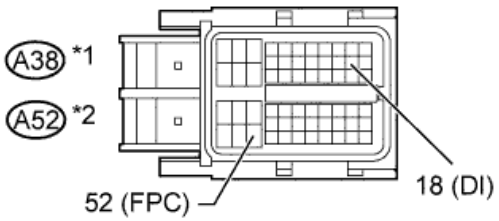
b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - A38-52 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A38-18 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω
N2-5 (FPC) or A38-52 (FPC) - Body ground	Always	10 kΩ or more
N2-4 (DI) or A38-18 (DI) - Body ground	Always	10 kΩ or more
N2-1 (FP-) or N1-5 (E2) - Body ground	Always	10 kΩ or more



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - A52-52 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A52-18 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω
N2-5 (FPC) or A52-52 (FPC) - Body ground	Always	10 kΩ or more
N2-4 (DI) or A52-18 (DI) - Body ground	Always	10 kΩ or more
N2-1 (FP-) or N1-5 (E2) - Body ground	Always	10 kΩ or more

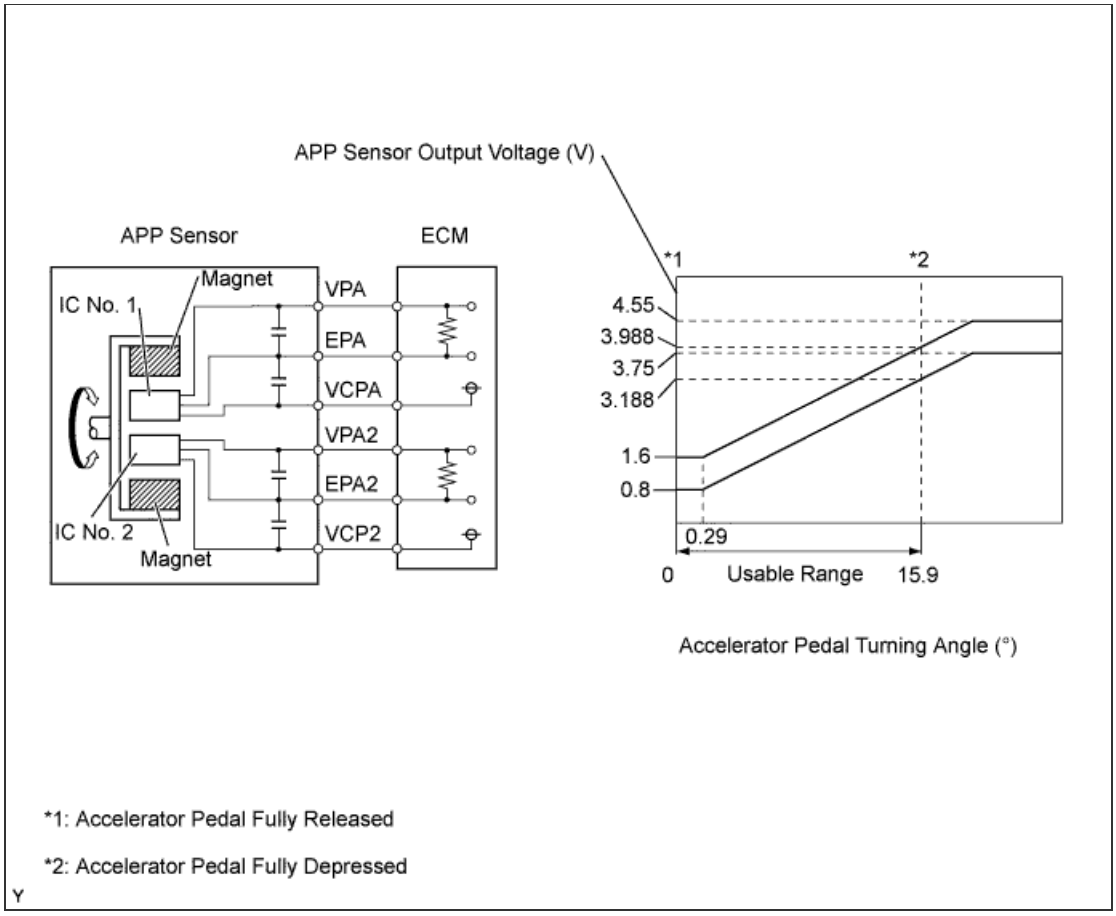
for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
		• APP sensor

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

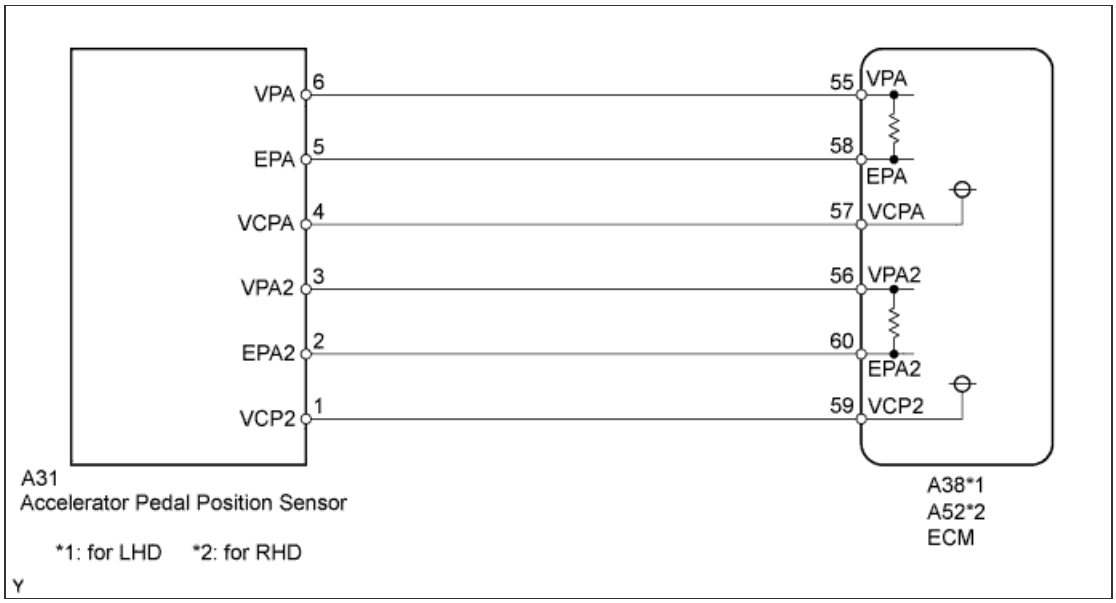
HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

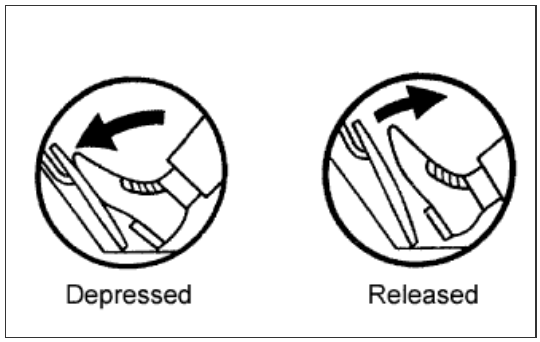
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

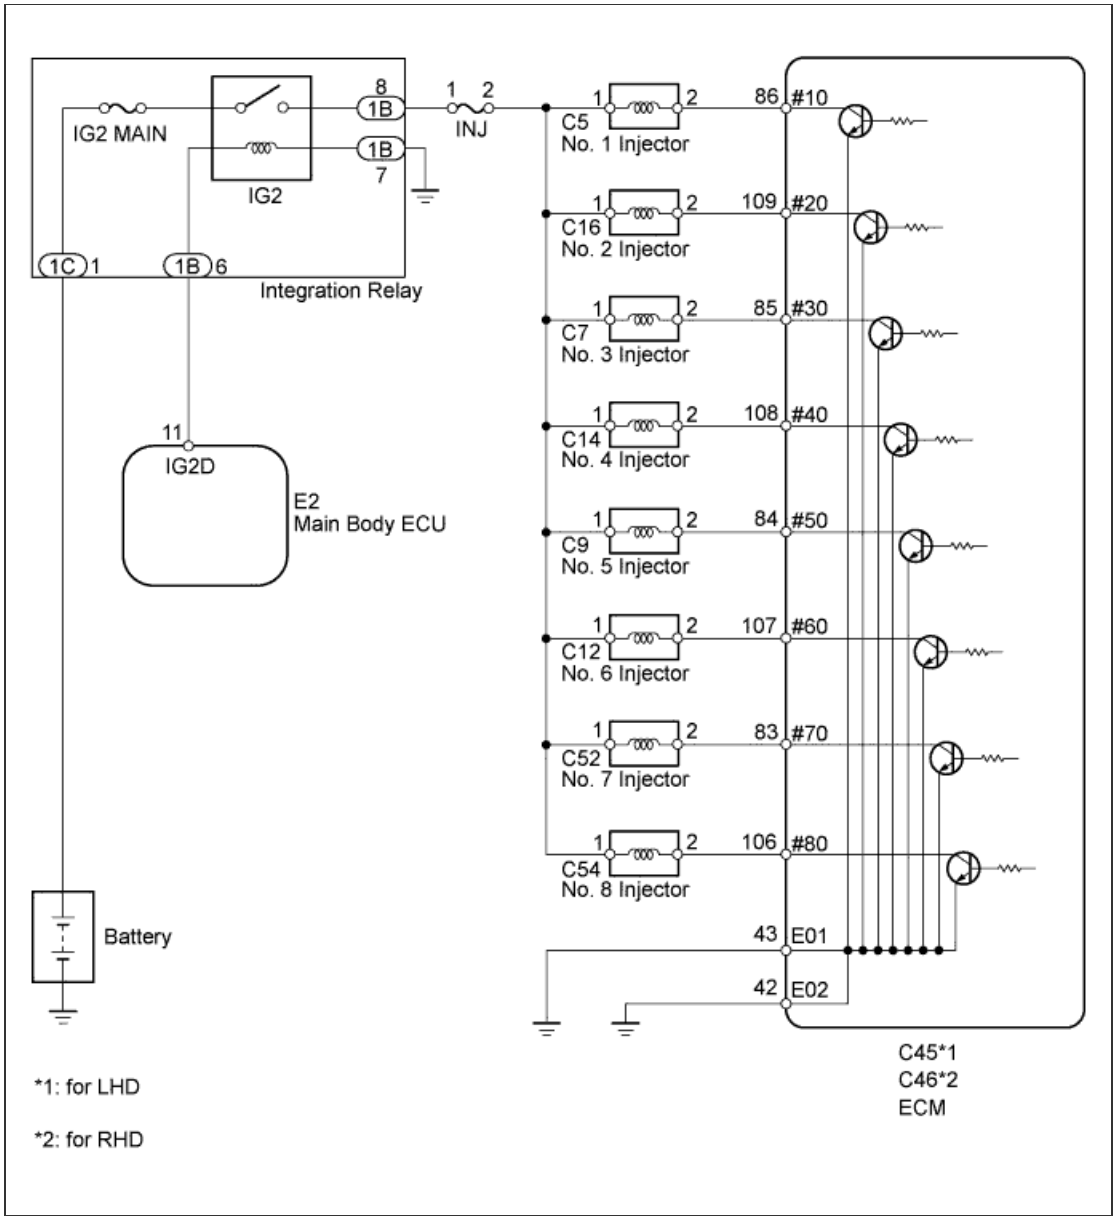
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

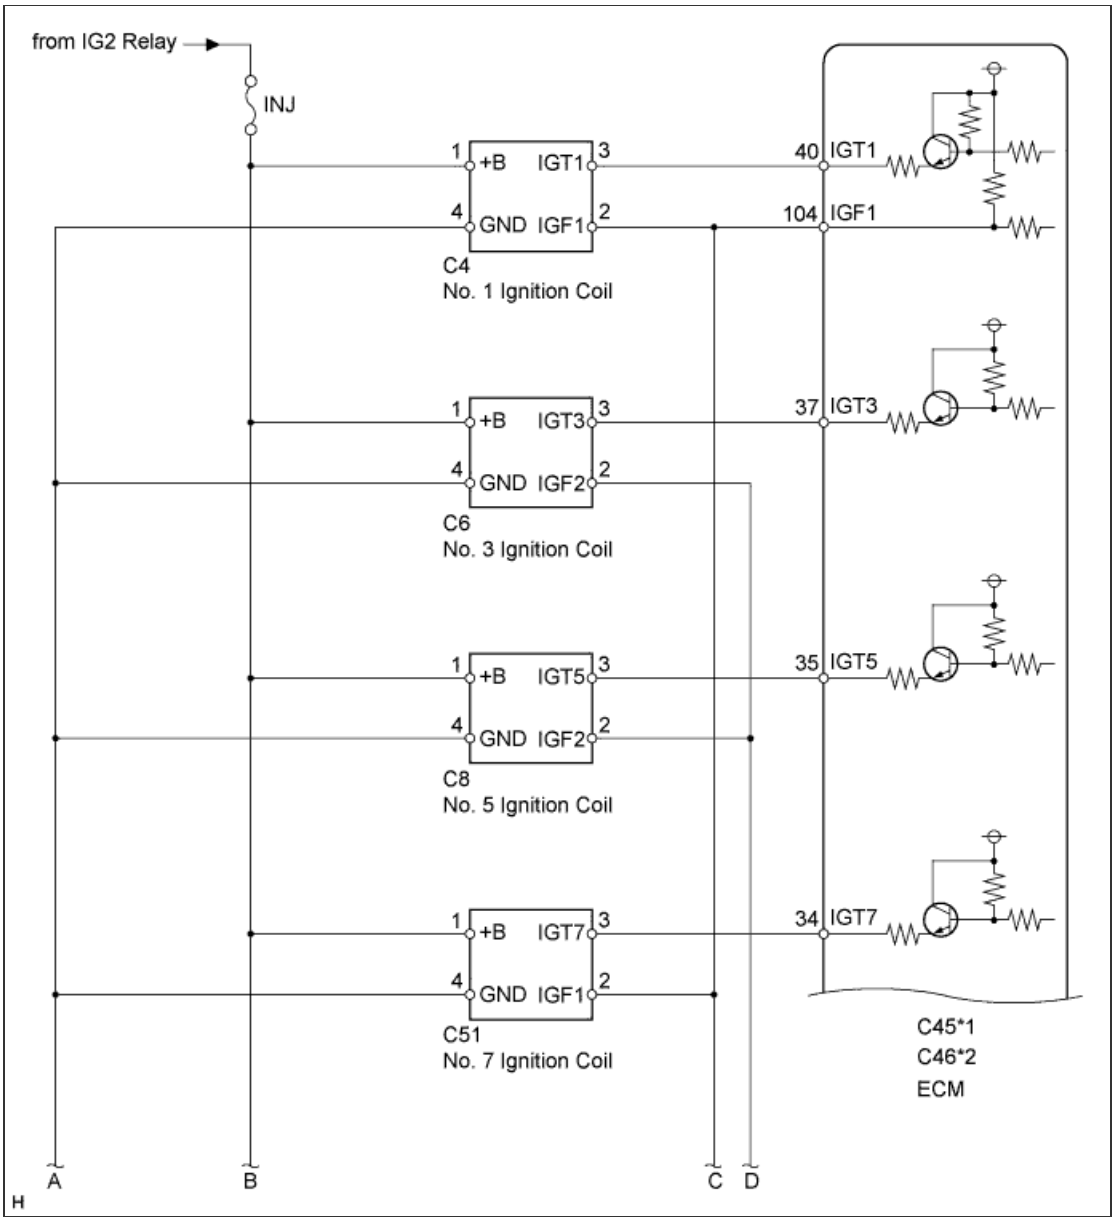
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

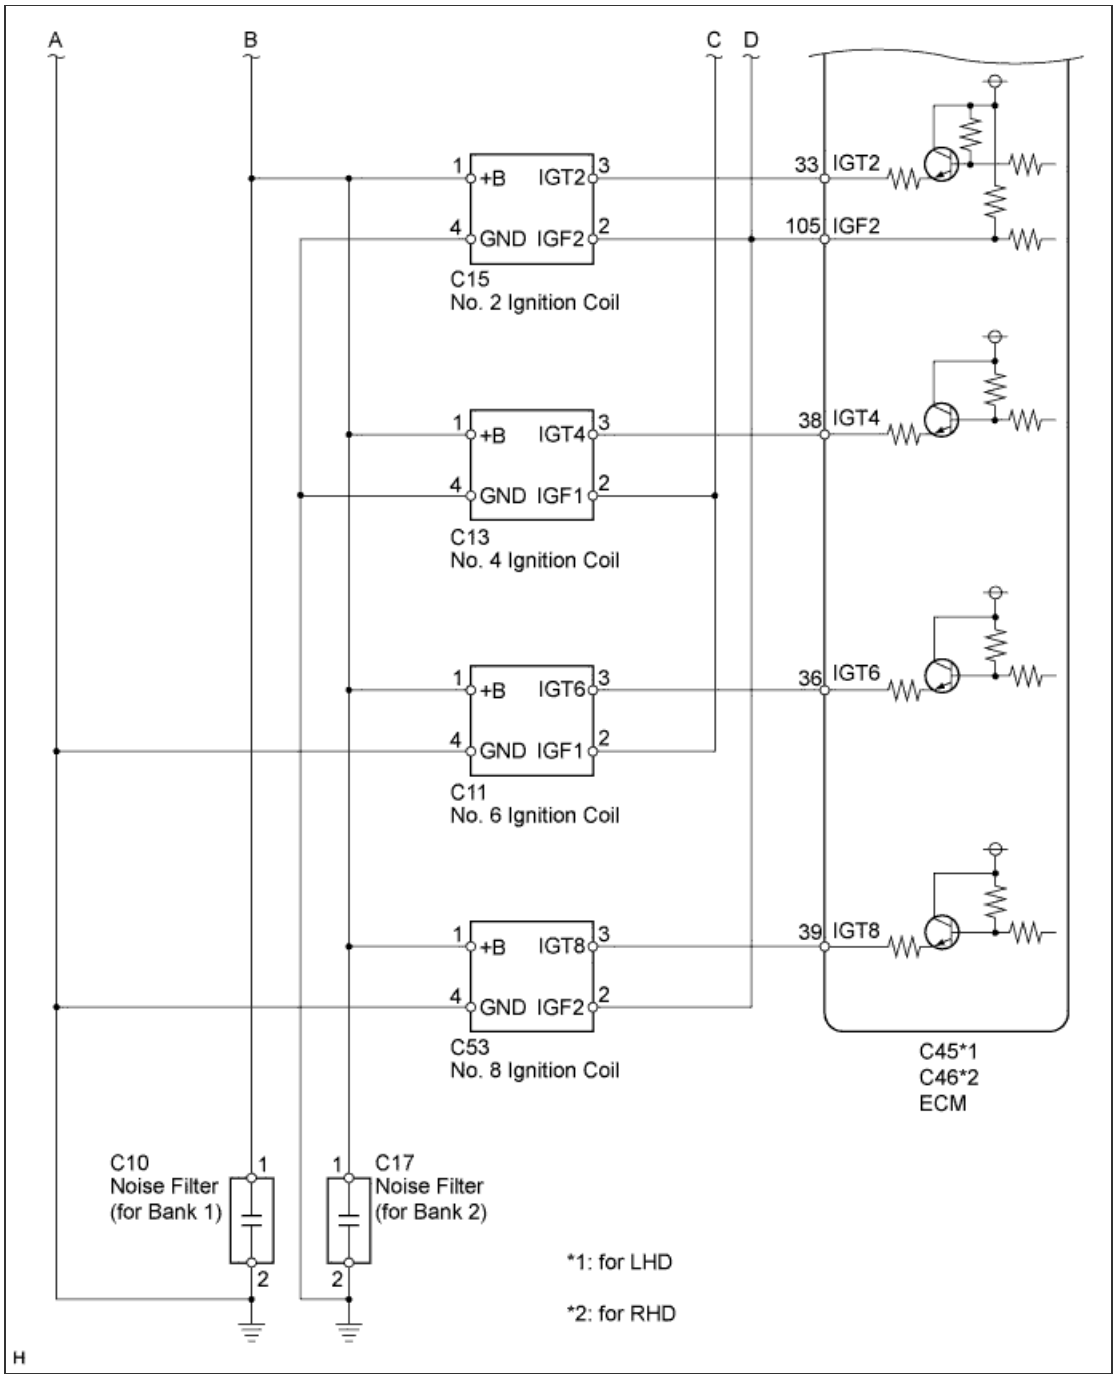
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.



HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

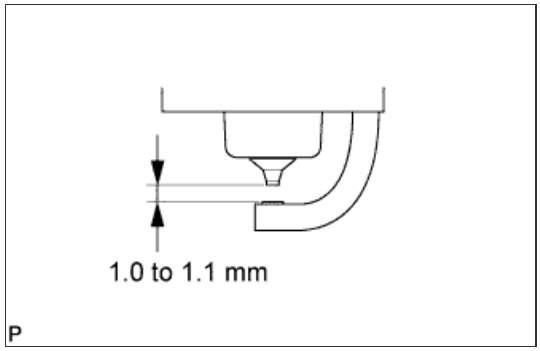
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

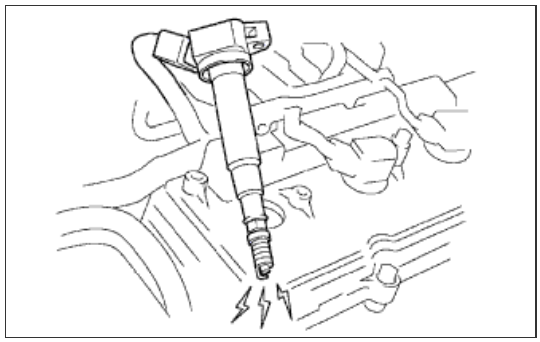
NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

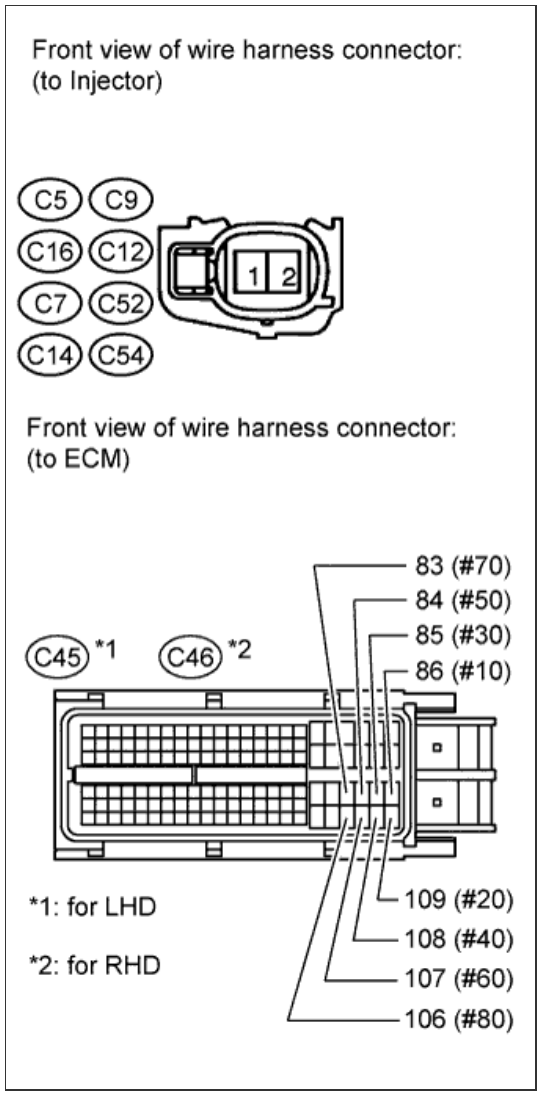
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

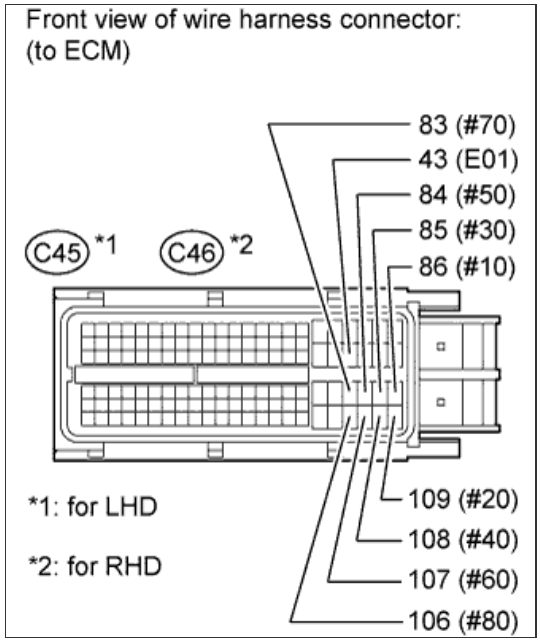
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

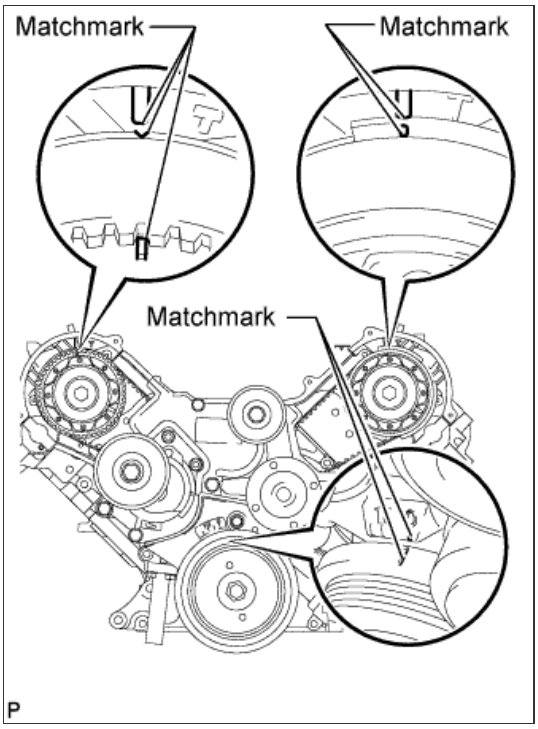
OK

13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

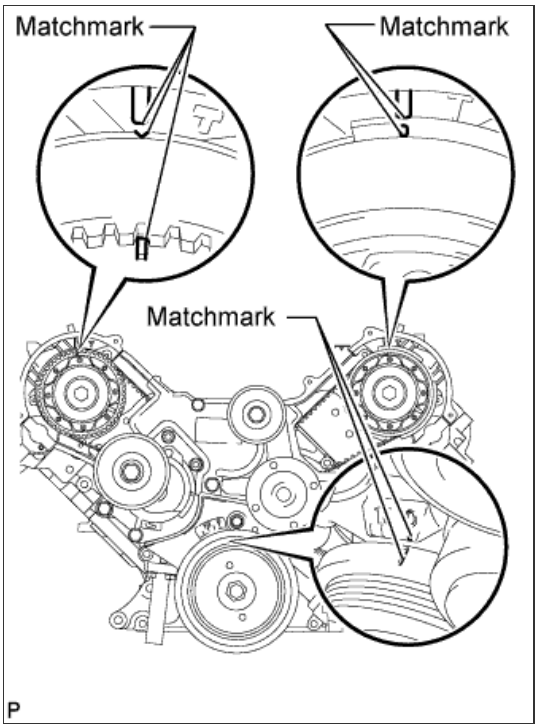
NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

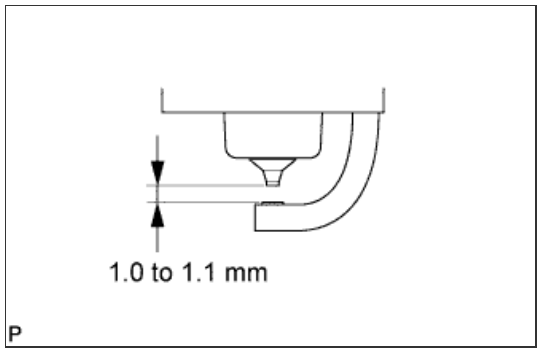
NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)



OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

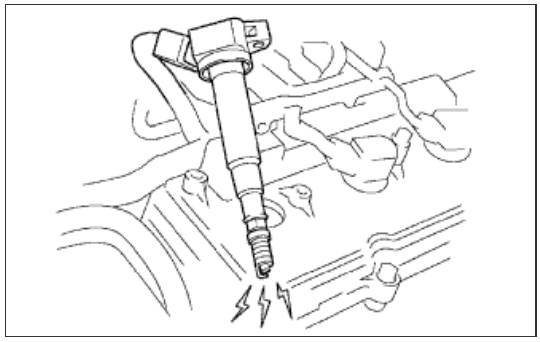
NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

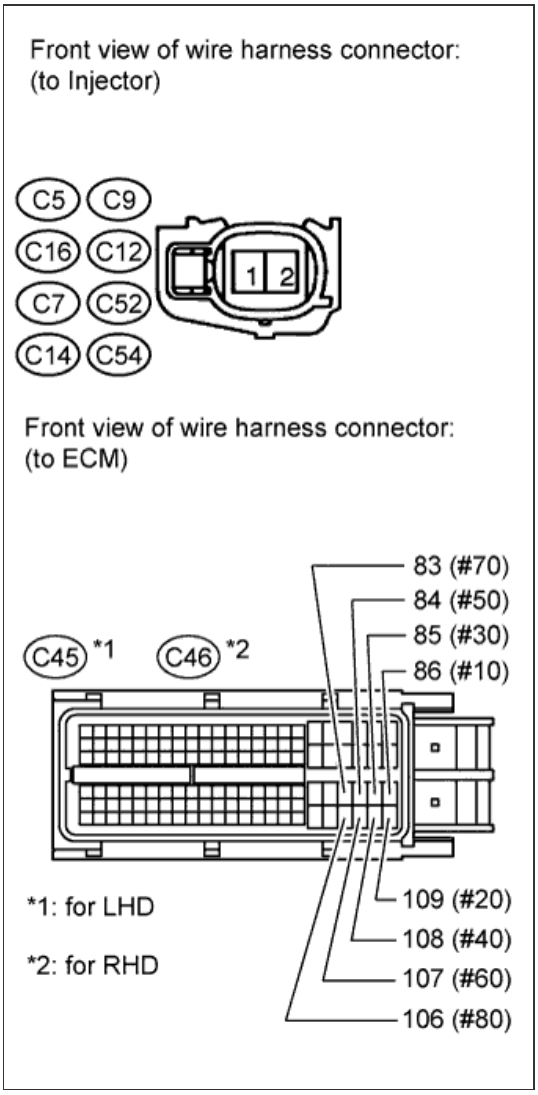
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):
