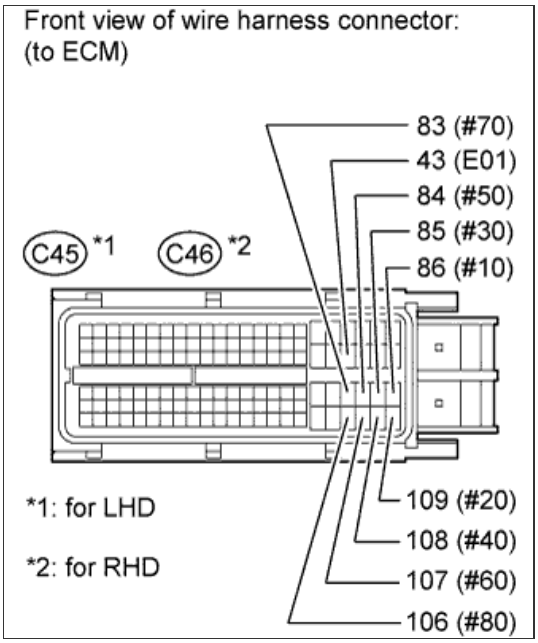
OK

26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

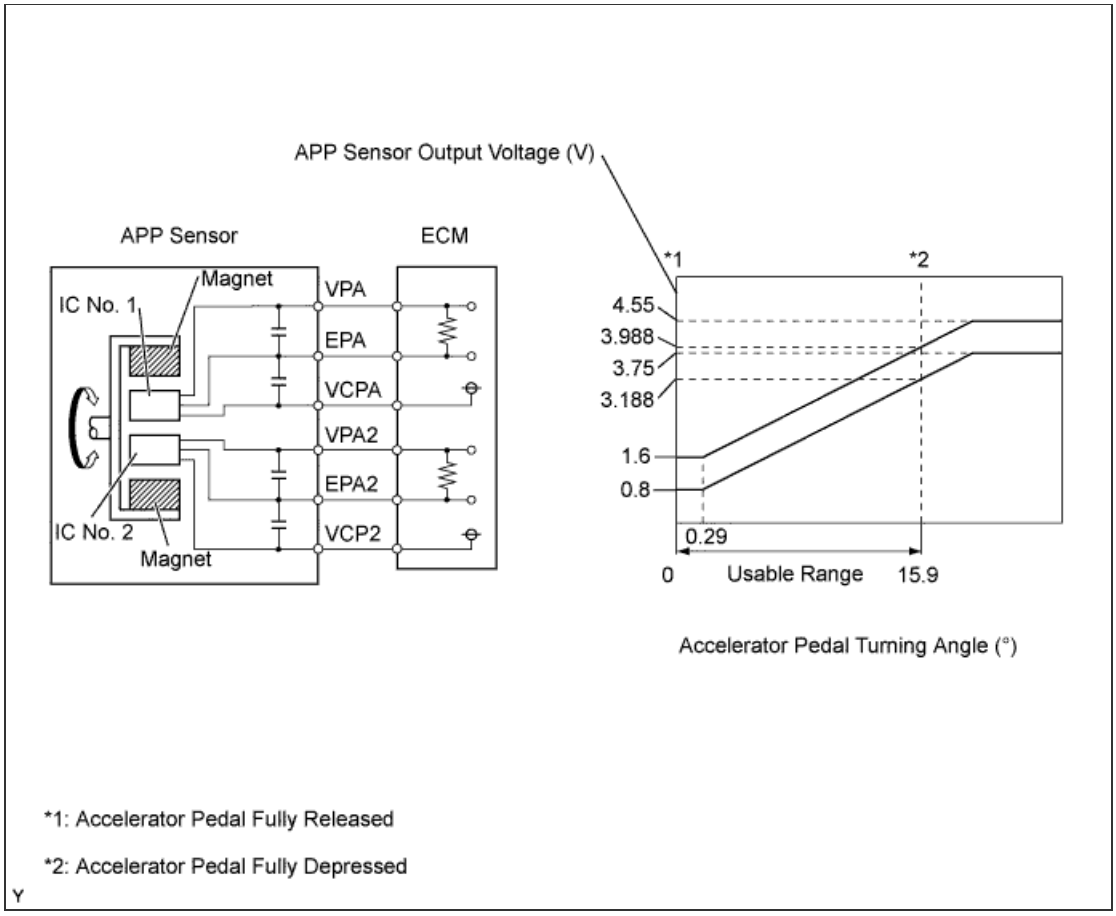
for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
		• APP sensor

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

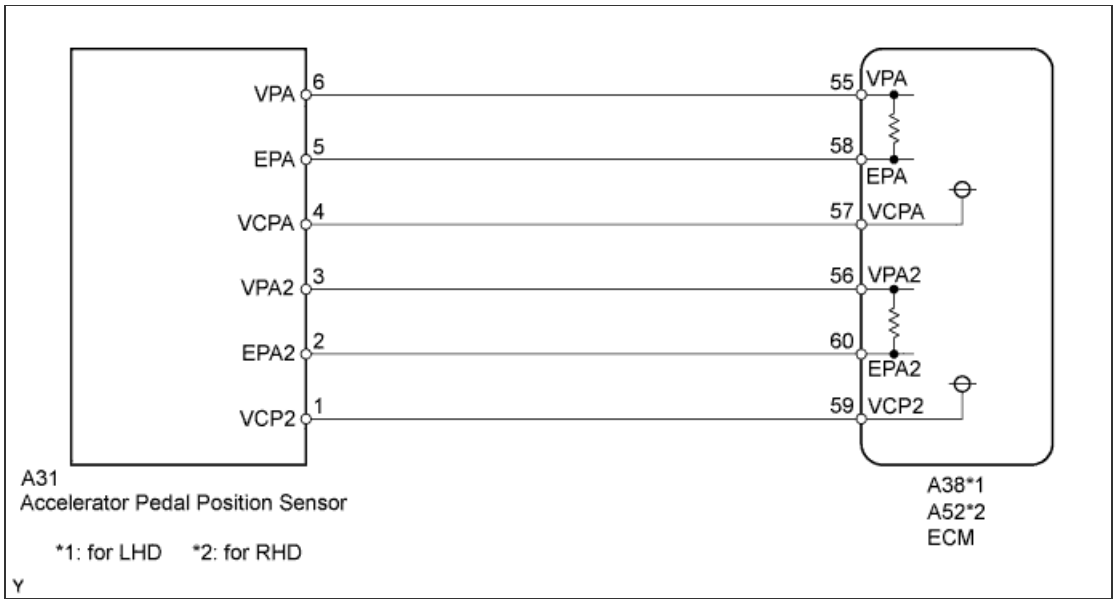
HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

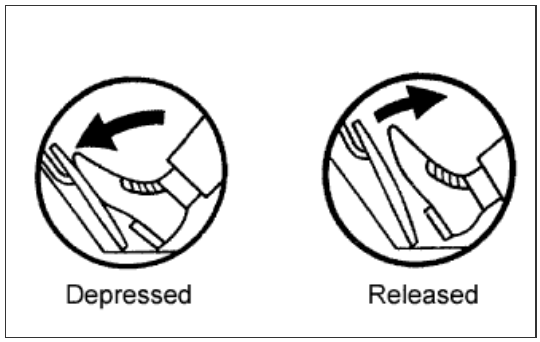
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

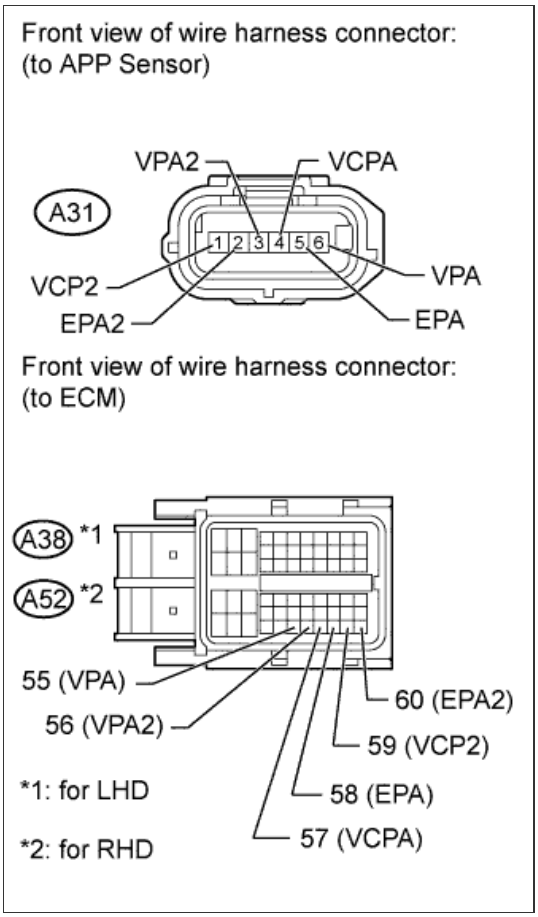
A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the APP sensor connector.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

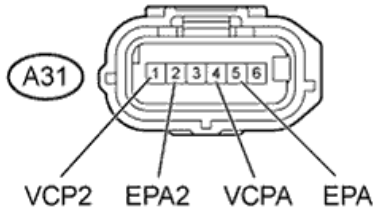
Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A52-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A52-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK ECM (VCPA AND VCP2 VOLTAGE)



a. Disconnect the APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (IG)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (IG)	4.5 to 5.5 V

Front view of wire harness connector:
(to APP Sensor)

NG → REPLACE ECM (Click here)

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

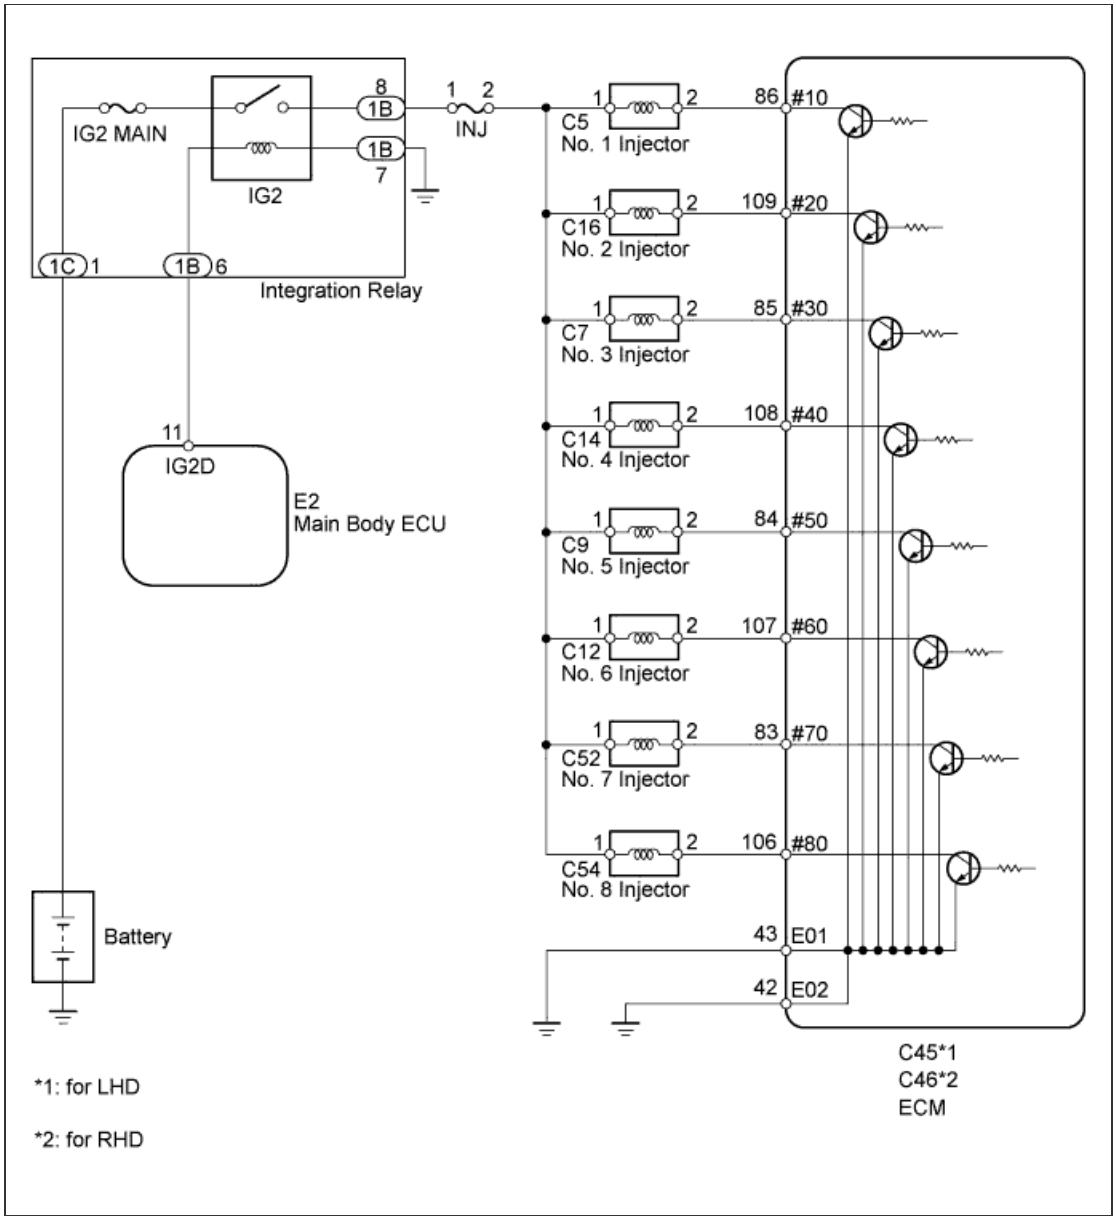
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

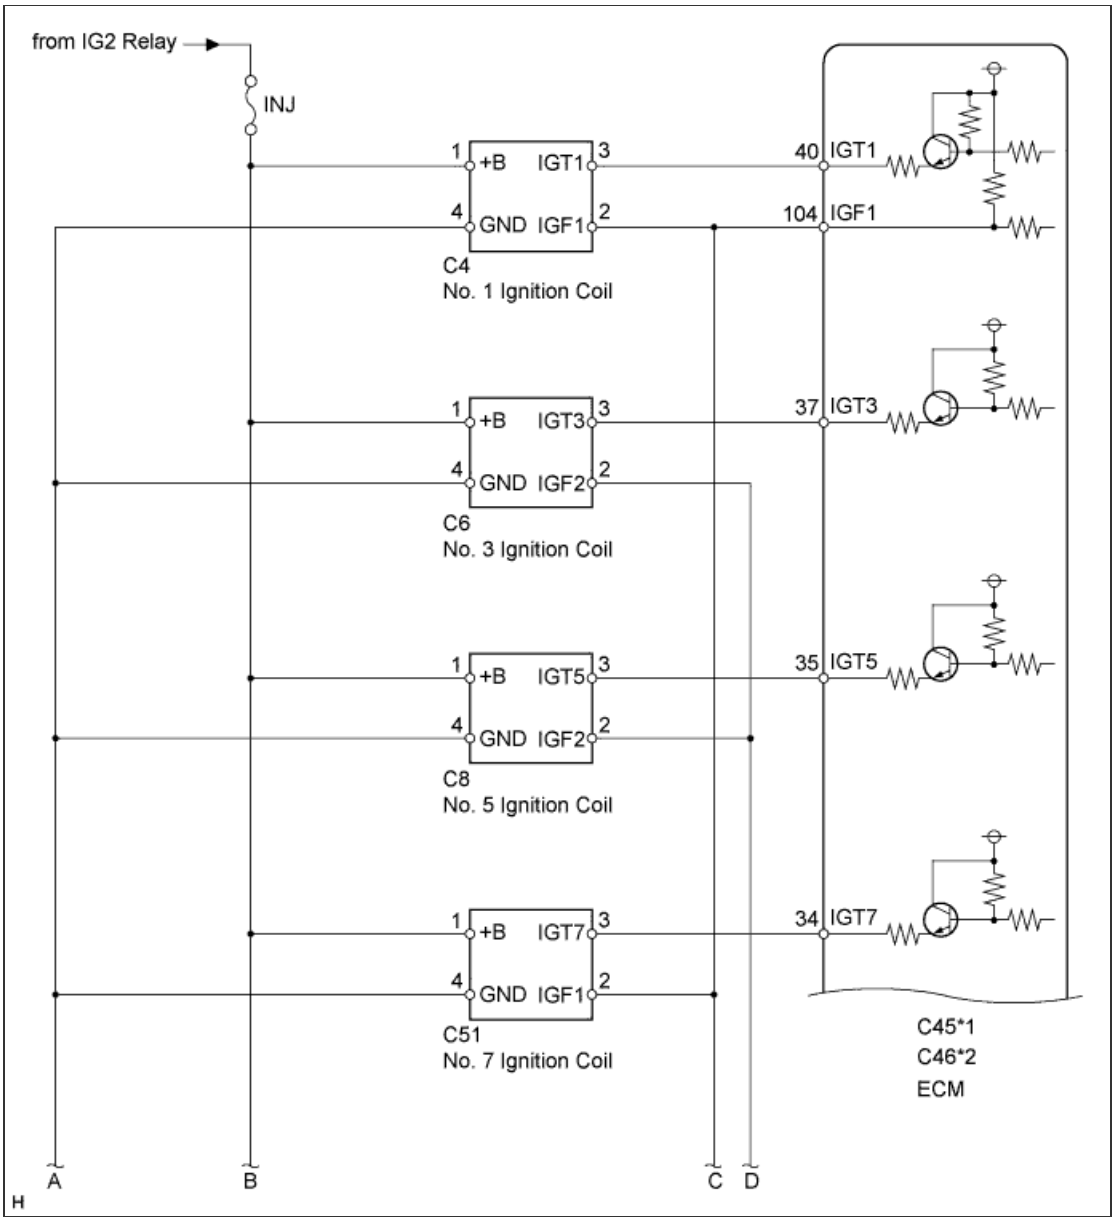
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

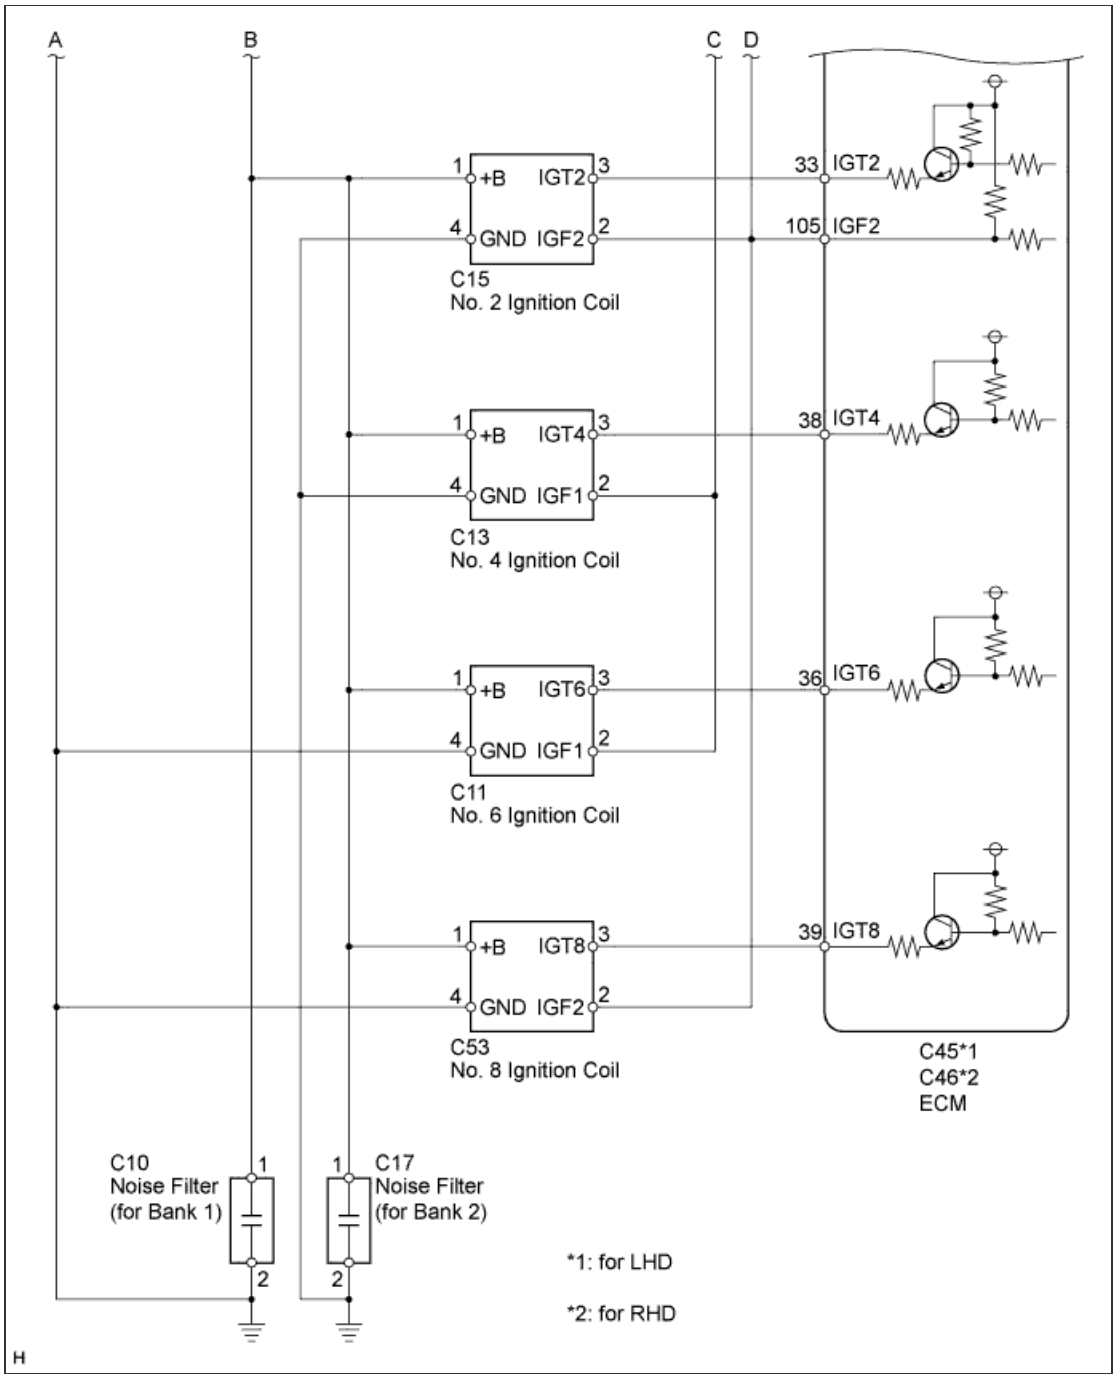
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.



HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

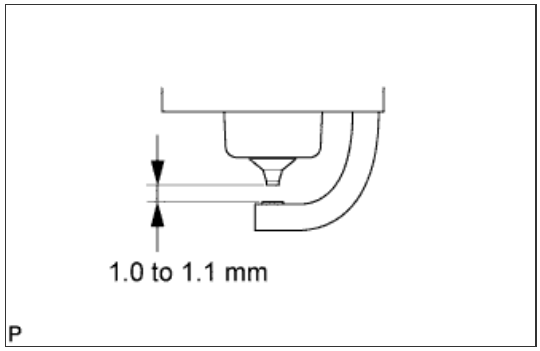
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

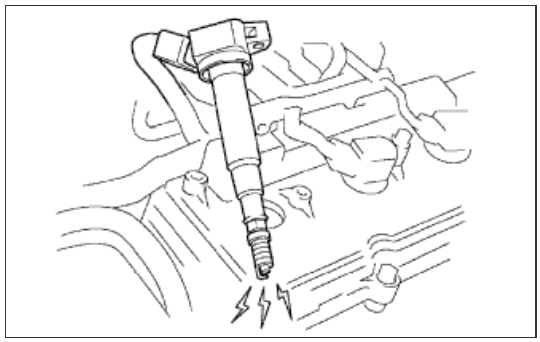
NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

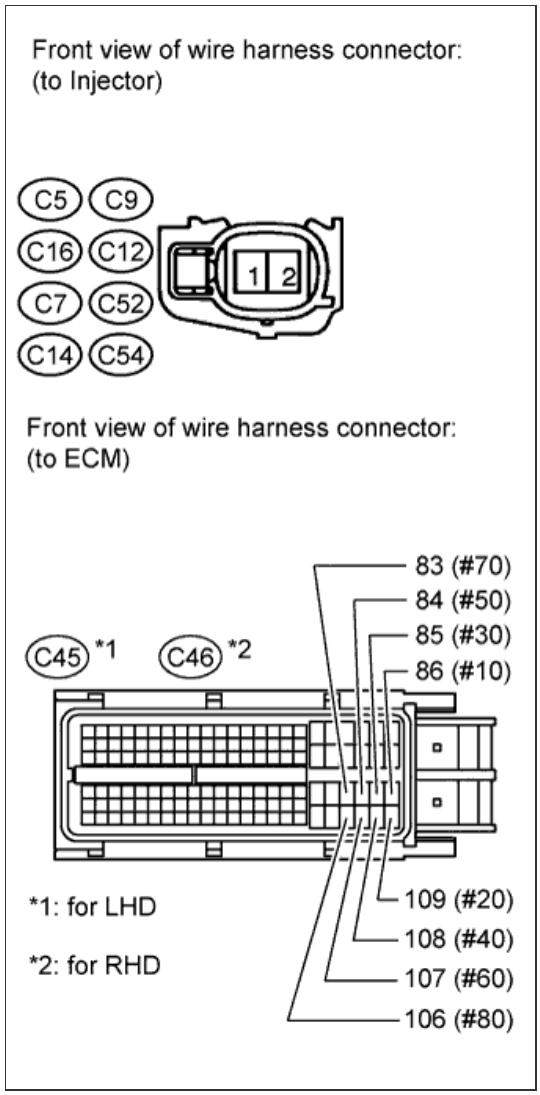
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

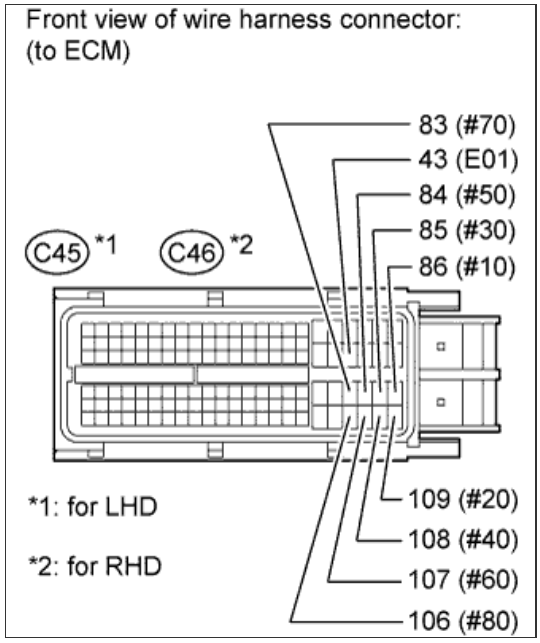
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

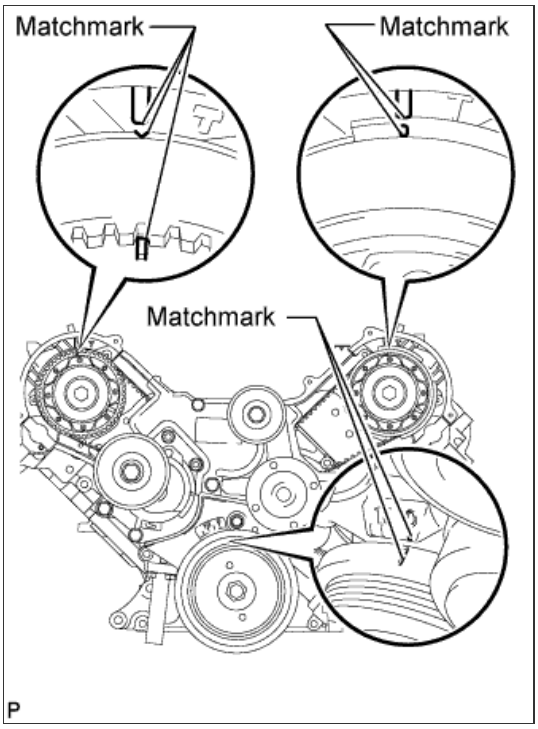
OK

13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

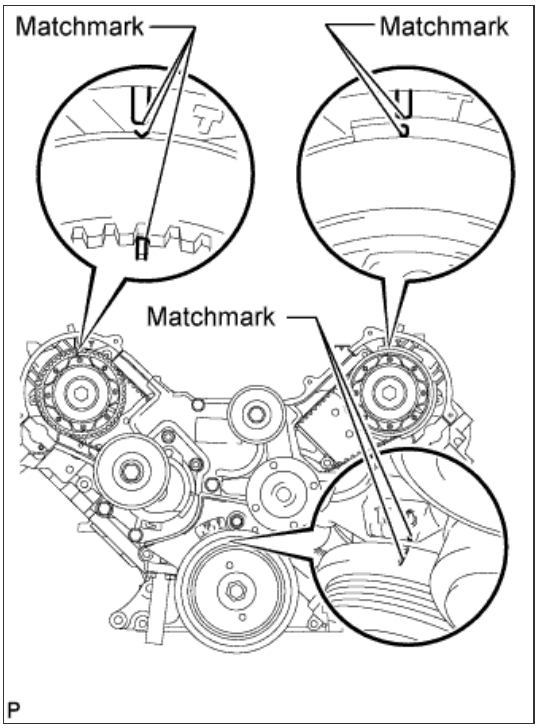
NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

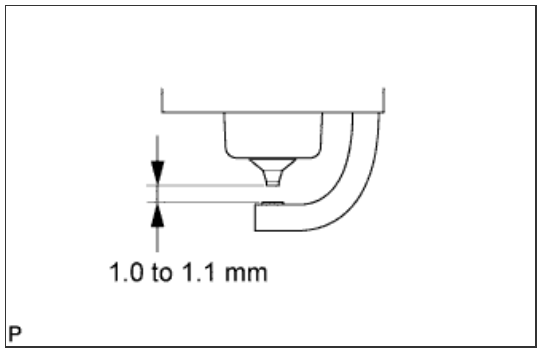
NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)



OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

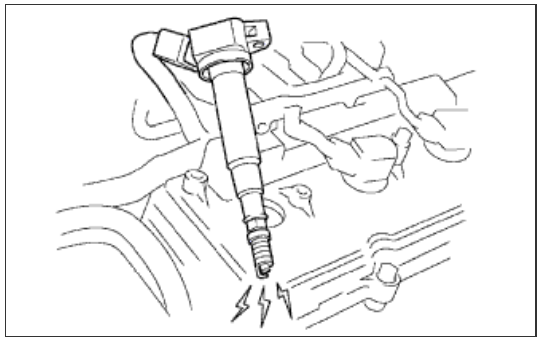
NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

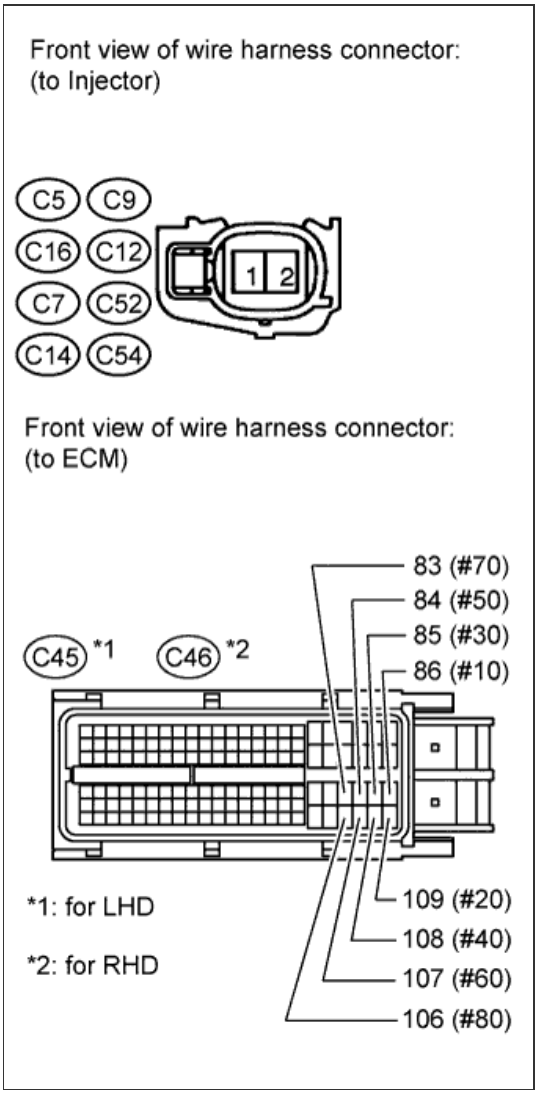
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

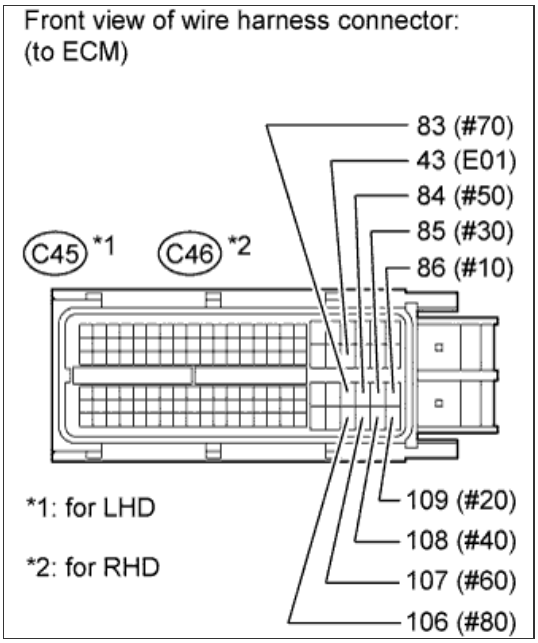
26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

REPLACE ECM (**Click here**)

29.CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the ignition coil with an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK

REPLACE IGNITION COIL (Click here)

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
		• APP sensor

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

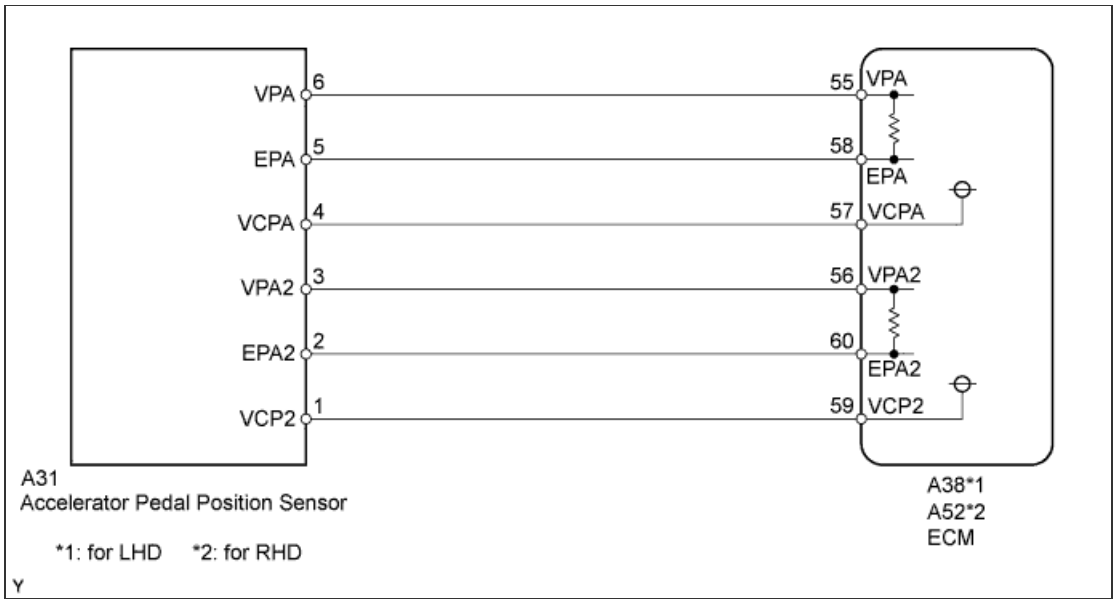
HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

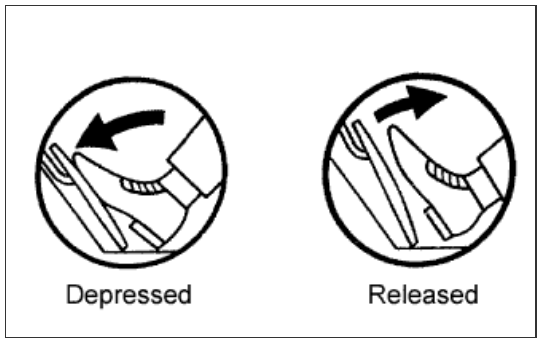
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

Result

Result	Proceed to
NG	A
OK	B

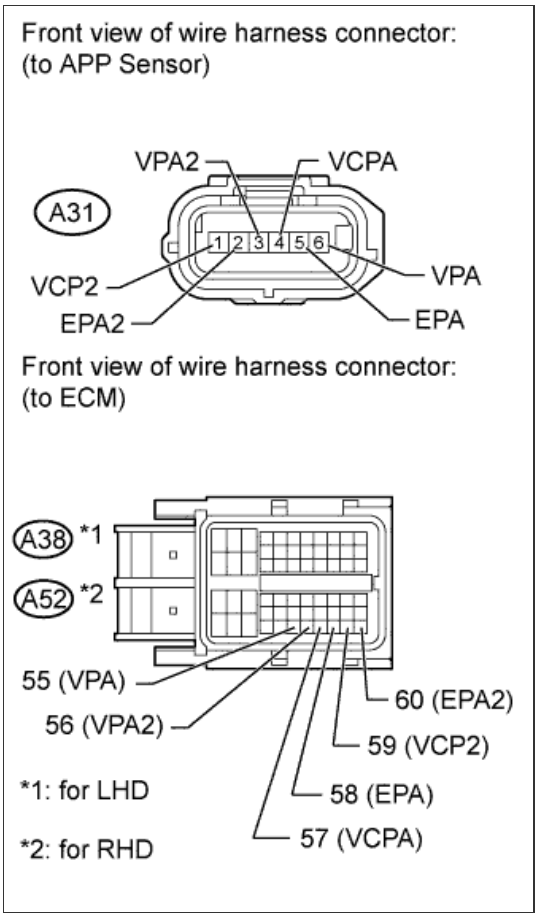
B → Go to step 5

A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the APP sensor connector.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A52-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A52-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

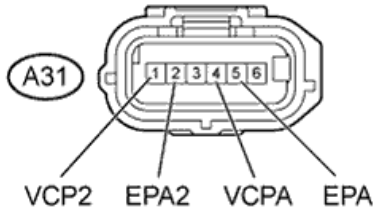
3.CHECK ECM (VCPA AND VCP2 VOLTAGE)



a. Disconnect the APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (IG)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (IG)	4.5 to 5.5 V

Front view of wire harness connector:
(to APP Sensor)

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL SENSOR ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

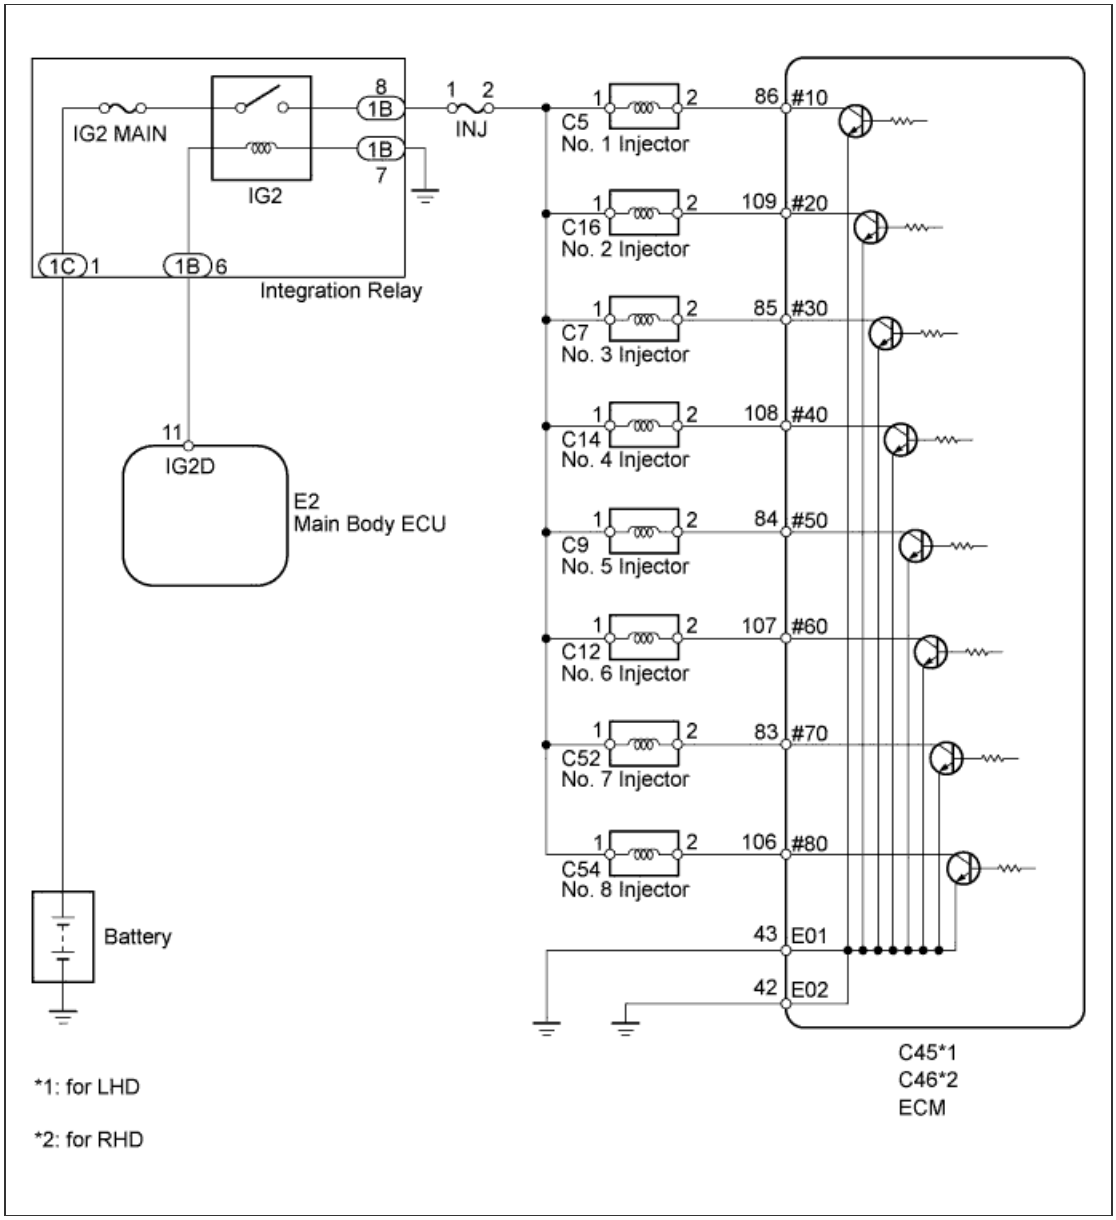
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

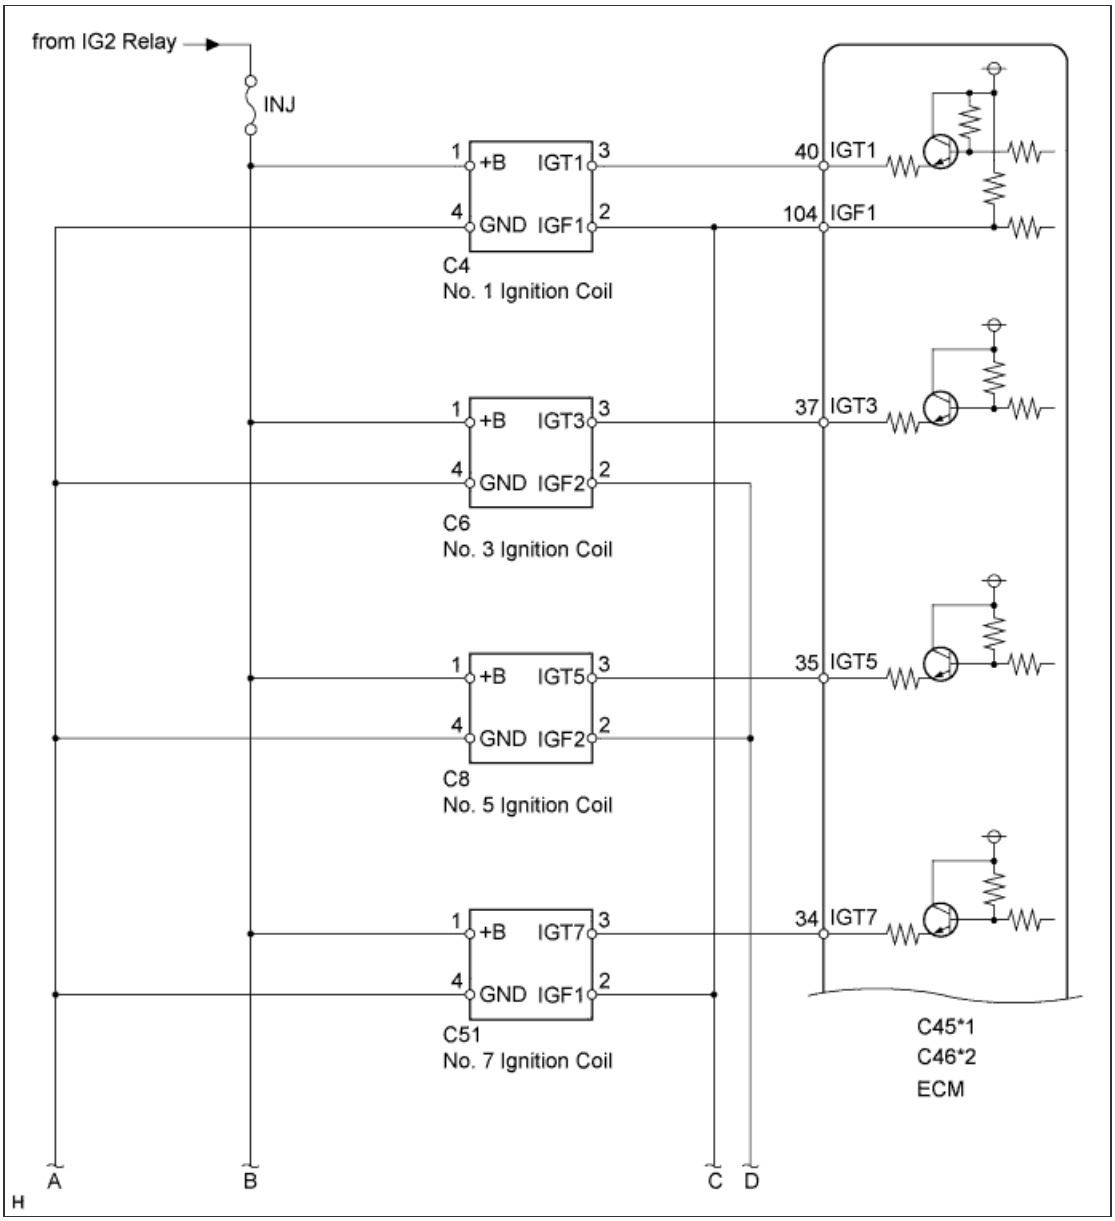
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

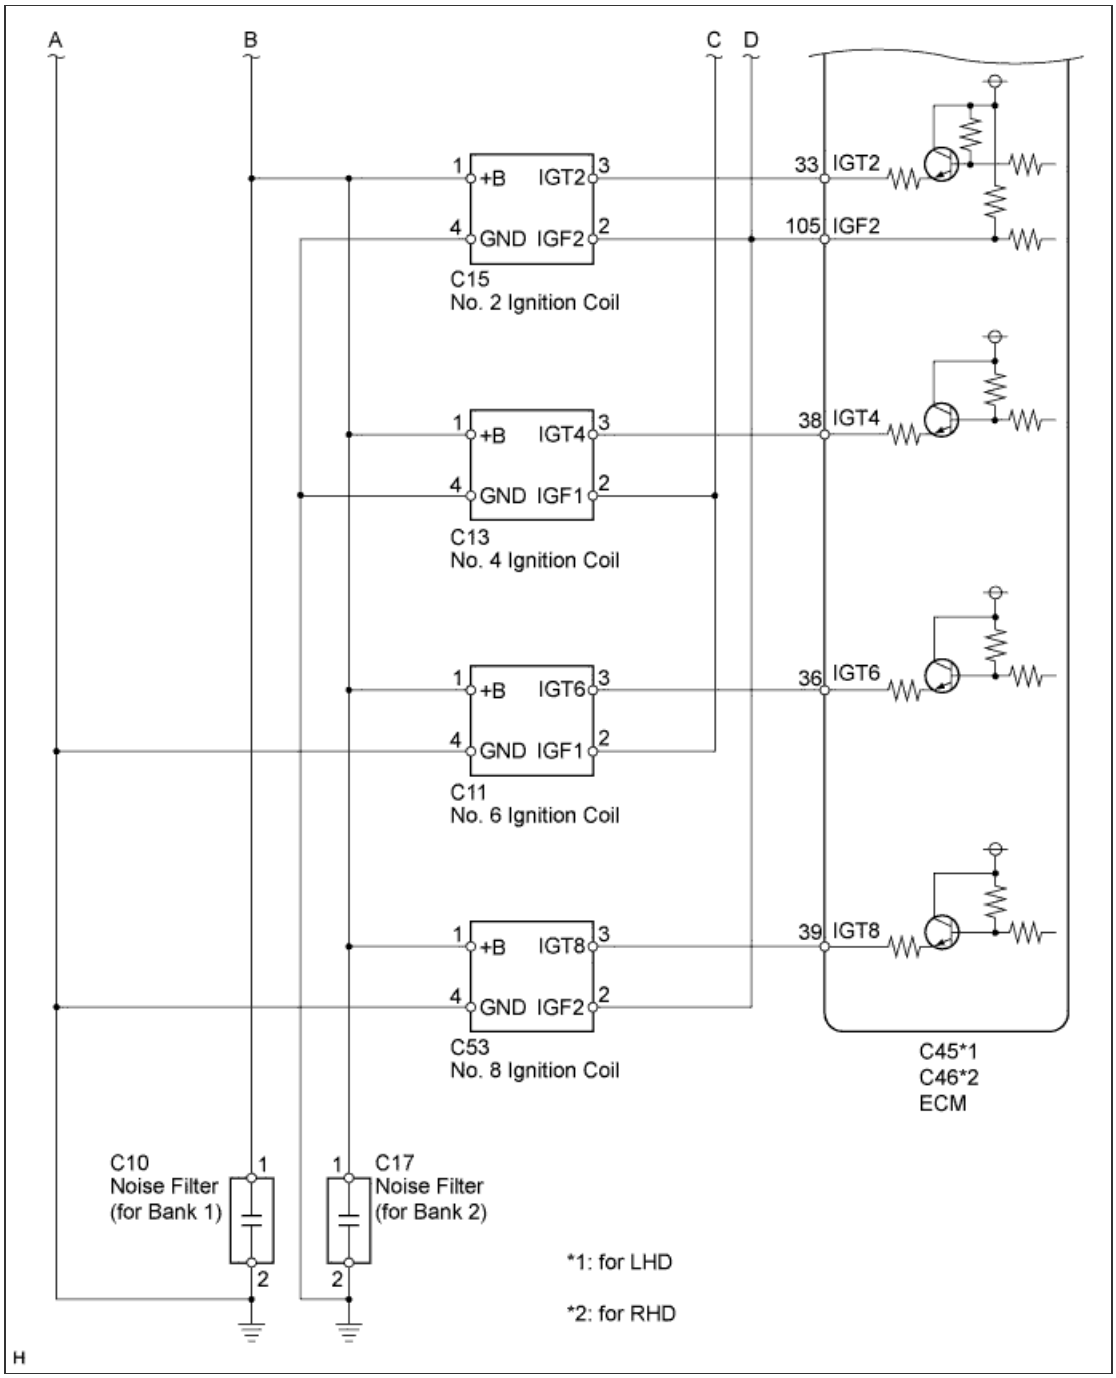
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.



HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

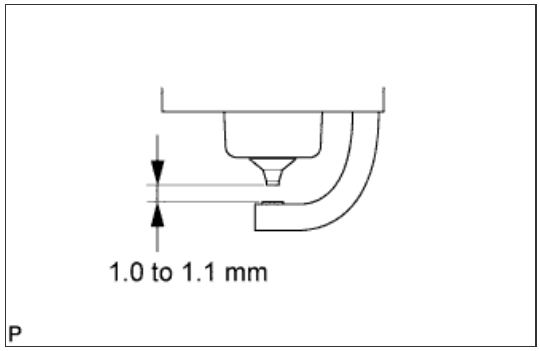
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

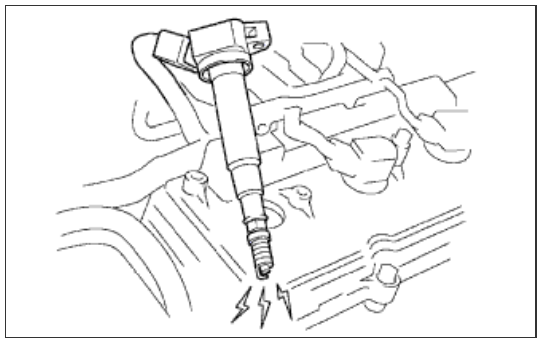
6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

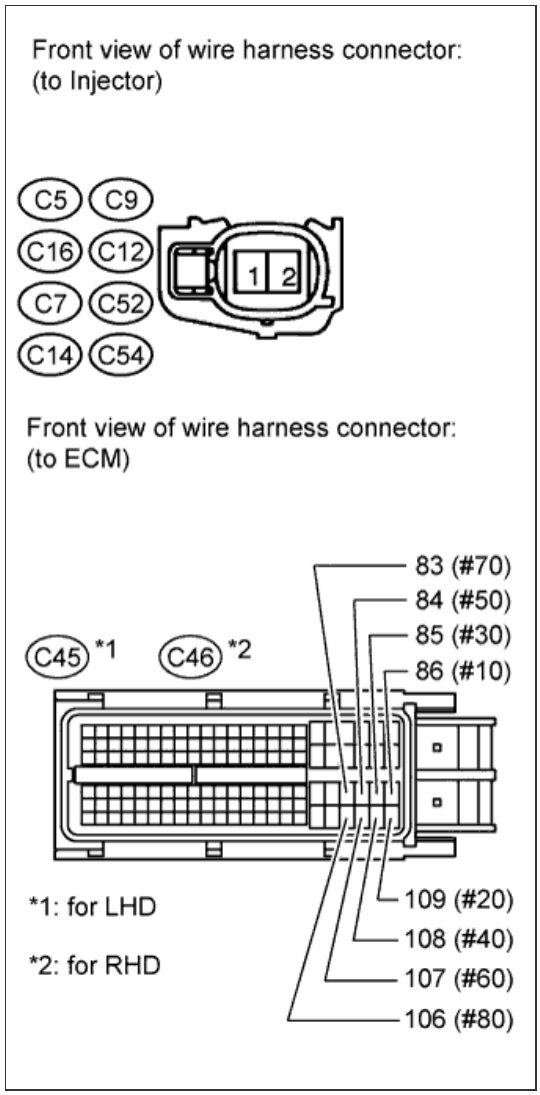
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

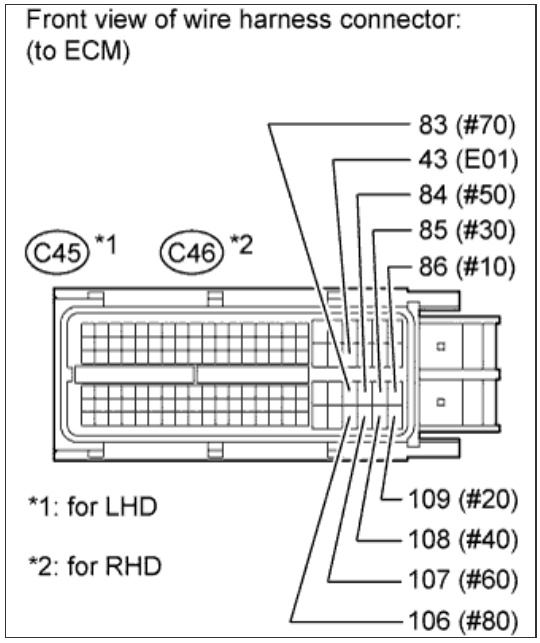
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

OK

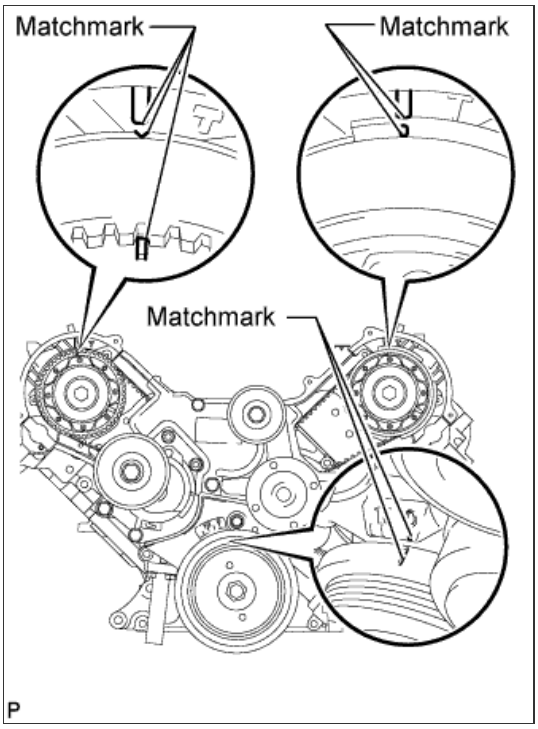
13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

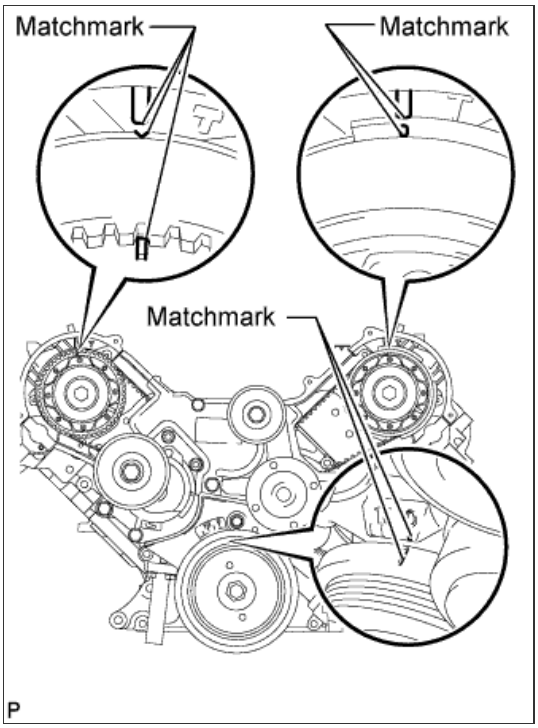
18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

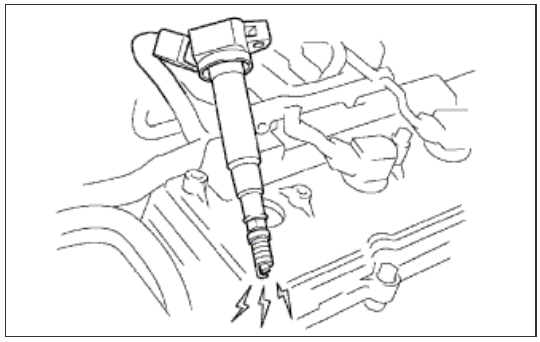
23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

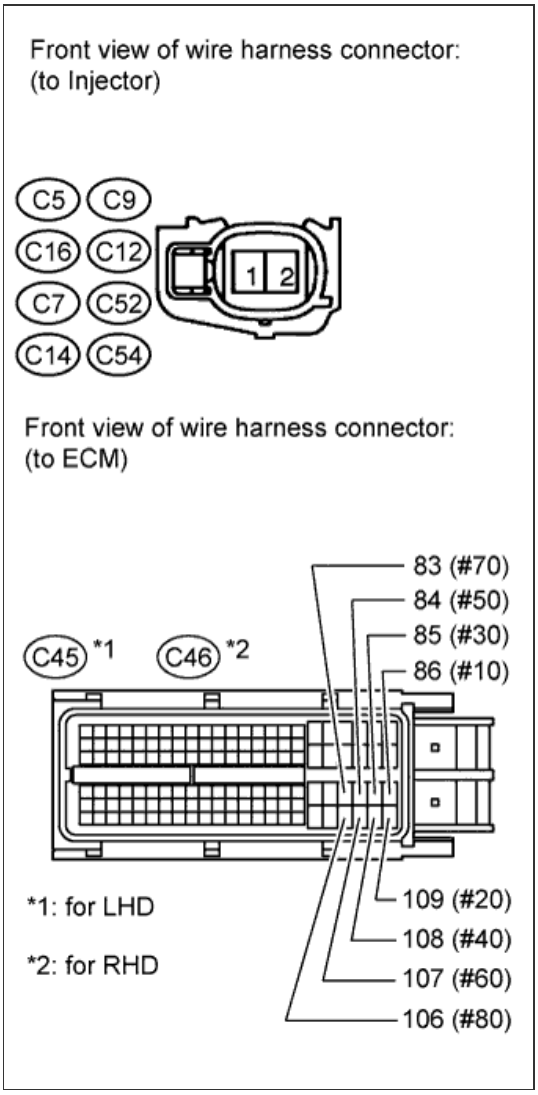
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The APP sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
		• APP sensor

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• Open in VCP1 circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

Trouble Area	Accelerator Position No. 1 When AP Released	Accelerator Position No. 2 When AP Released	Accelerator Position No. 1 When AP Depressed	Accelerator Position No. 2 When AP Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 4.7 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 4.7 V

HINT:

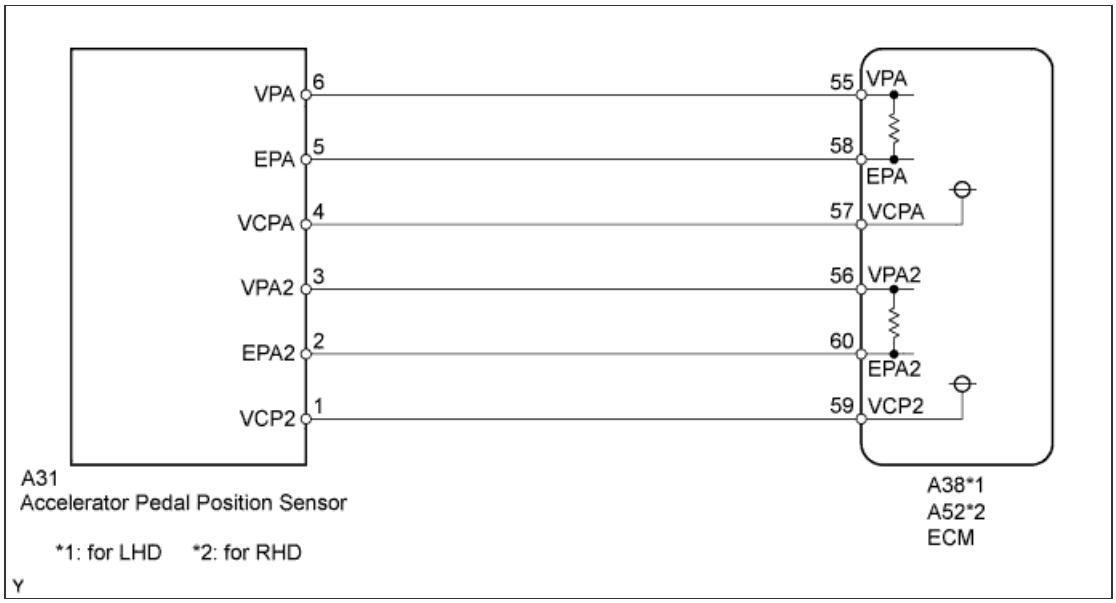
- **Accelerator pedal positions are expressed as voltages.**
- **AP stands for Accelerator Pedal.**



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is less than the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue driving. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the engine switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

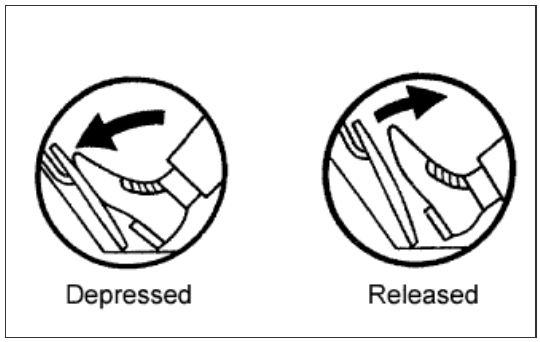
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released → Depressed → Released	0.5 to 4.5 V	1.2 to 4.7 V
	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V	Difference between Accelerator Position No. 1 and Accelerator Position No. 2 is higher than 0.02 V

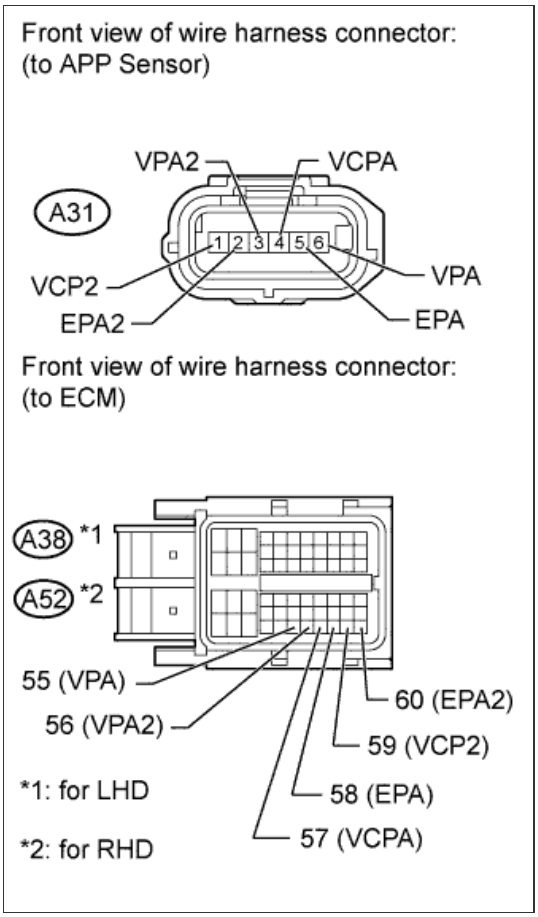
2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the APP sensor connector.

b. Disconnect the ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A38-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-59 (VCP2) - body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-58 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-59 (VCP2)	Always	Below 1 Ω
A31-6 (VPA) or A52-55 (VPA) - body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-58 (EPA) - body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-57 (VCPA) - body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-56 (VPA2) - body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-60 (EPA2) - body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A52-59 (VCP2) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

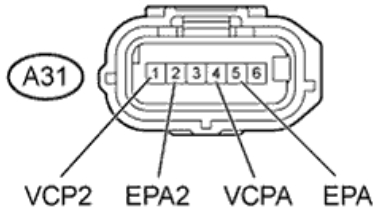
3.CHECK ECM (VCPA AND VCP2 VOLTAGE)



a. Disconnect the APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Engine switch on (IG)	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Engine switch on (IG)	4.5 to 5.5 V

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

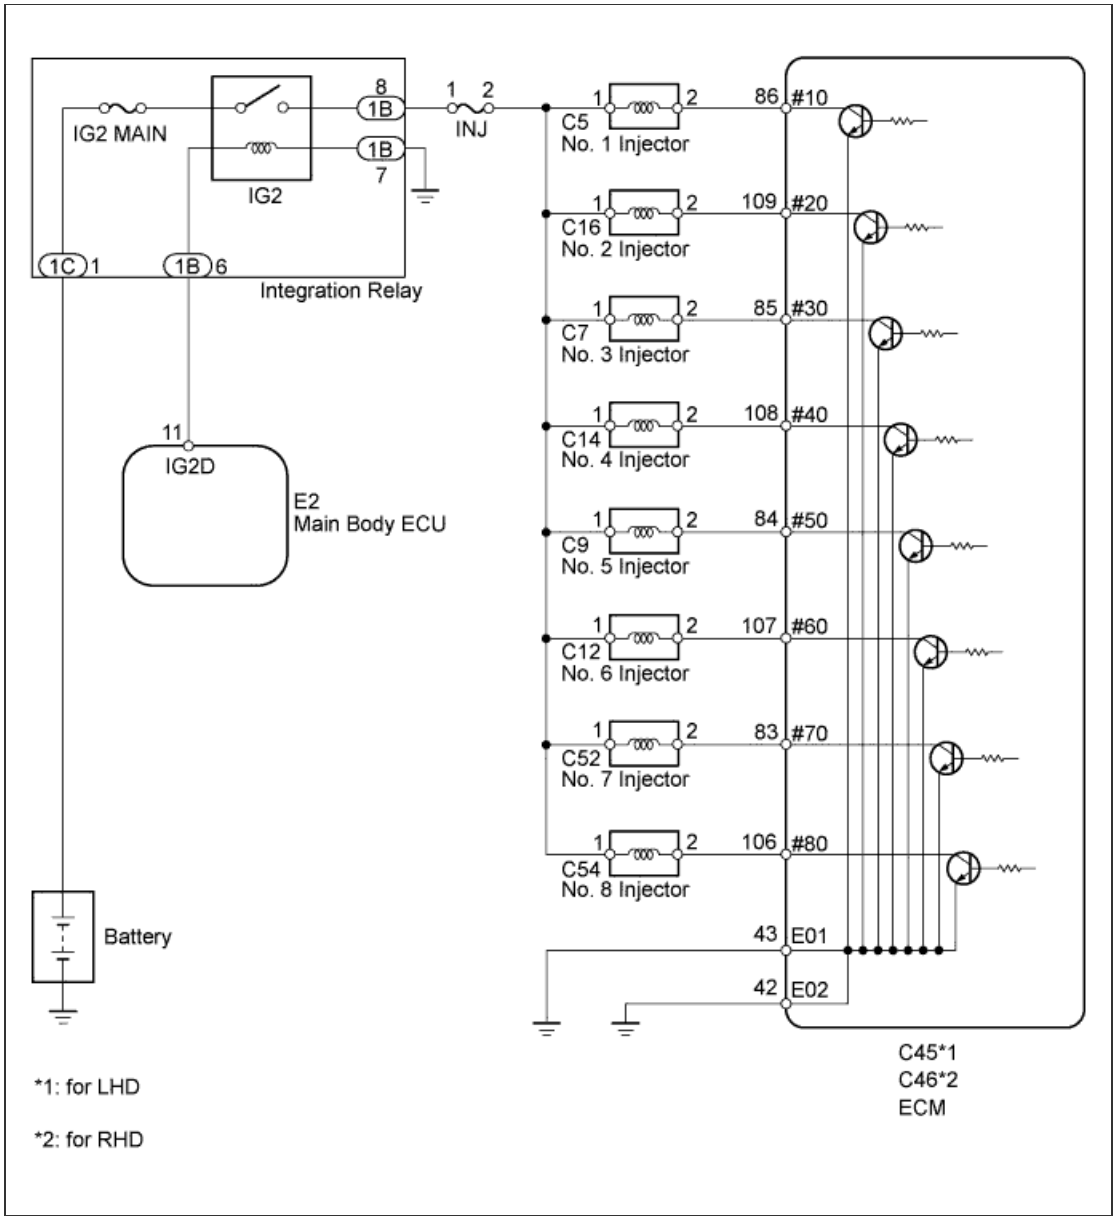
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

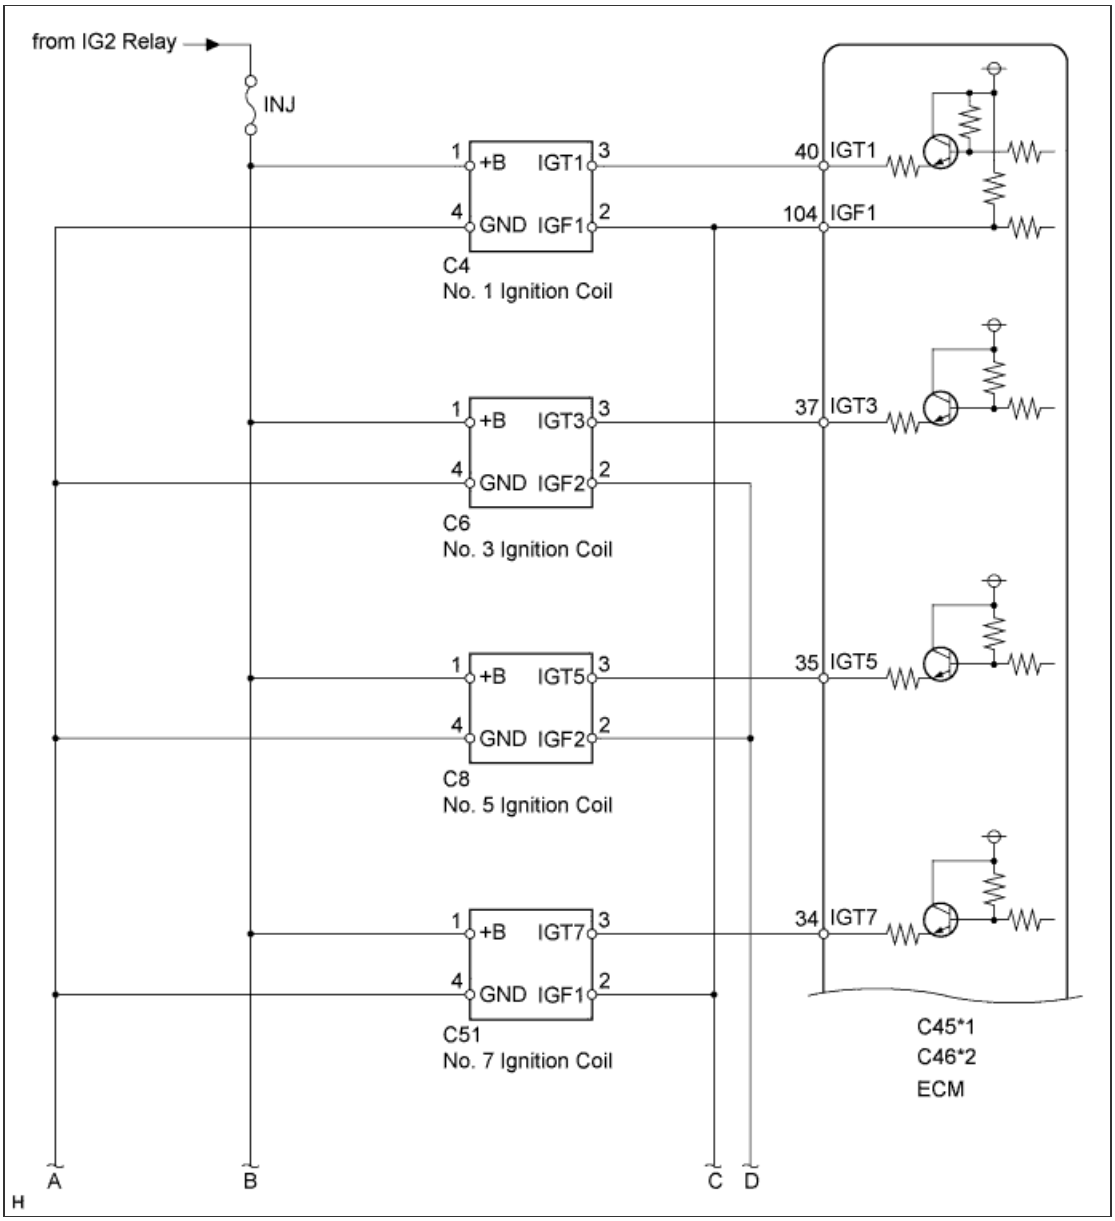
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.

HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

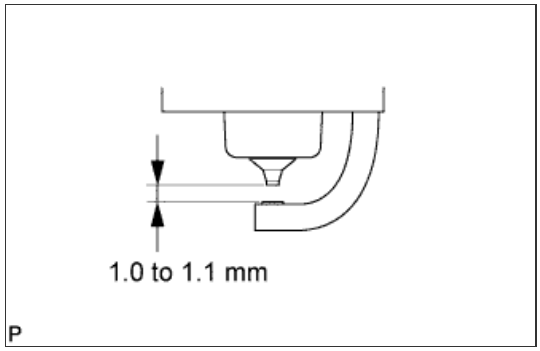
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

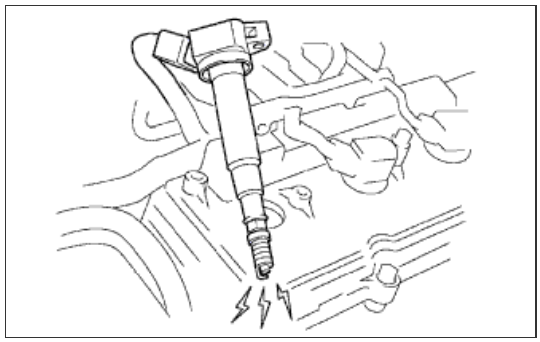
6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

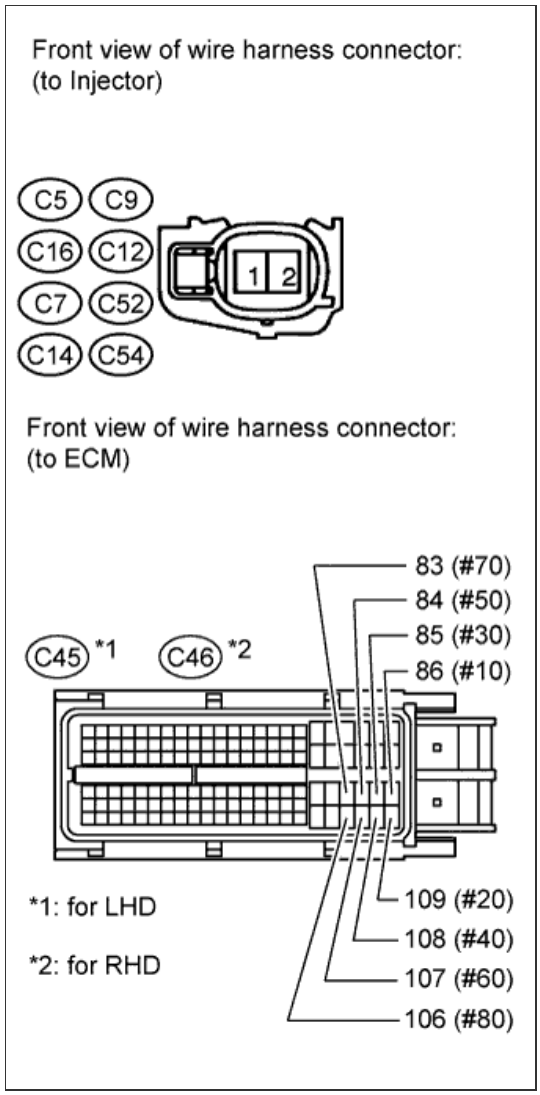
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

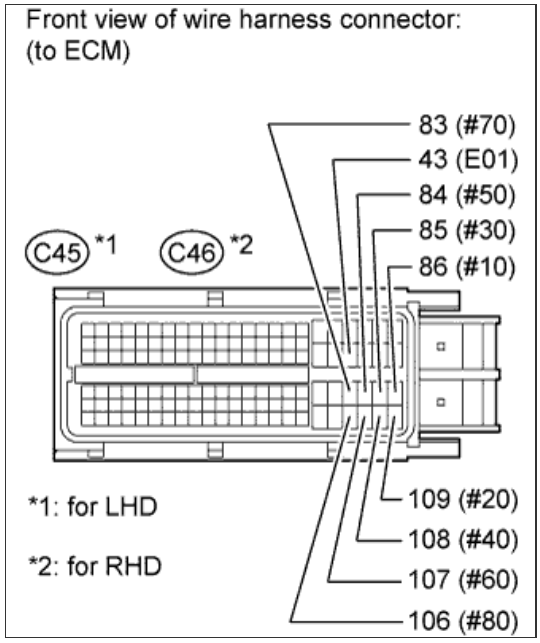
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

OK

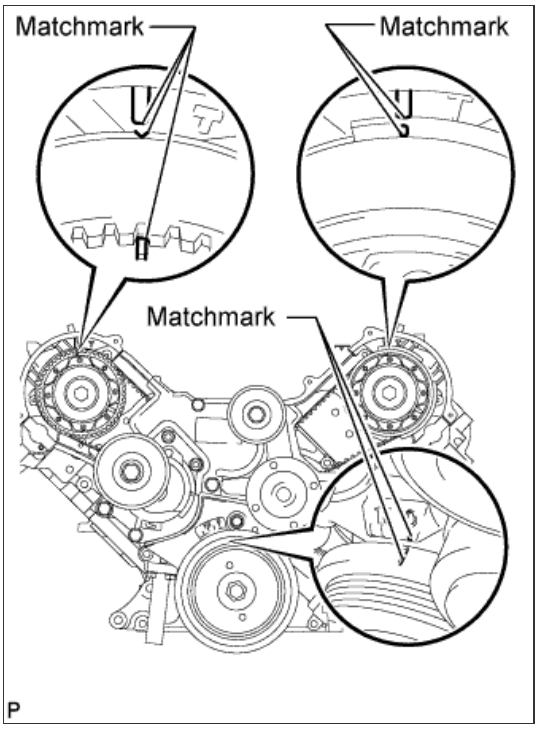
13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

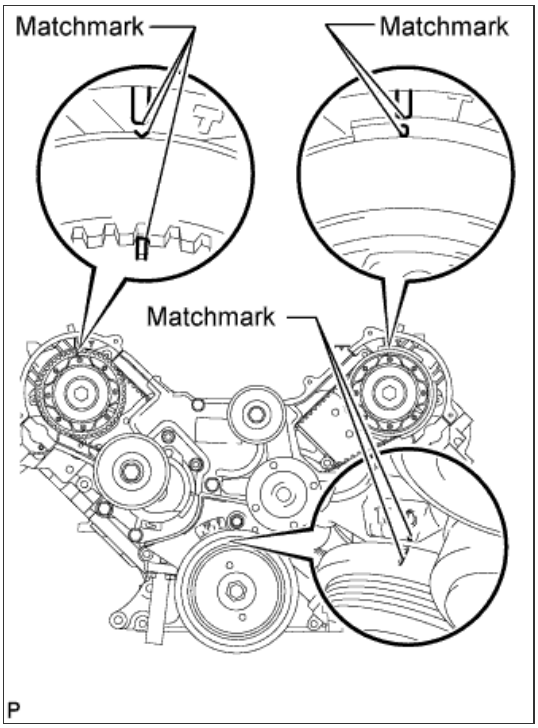
18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

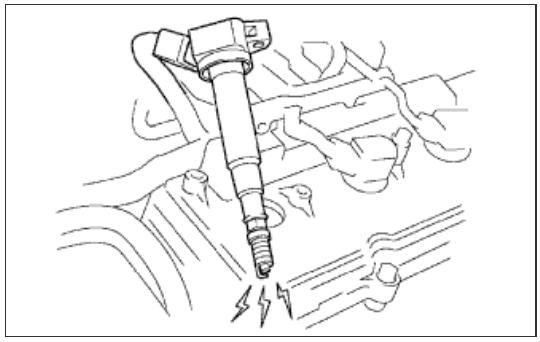
23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

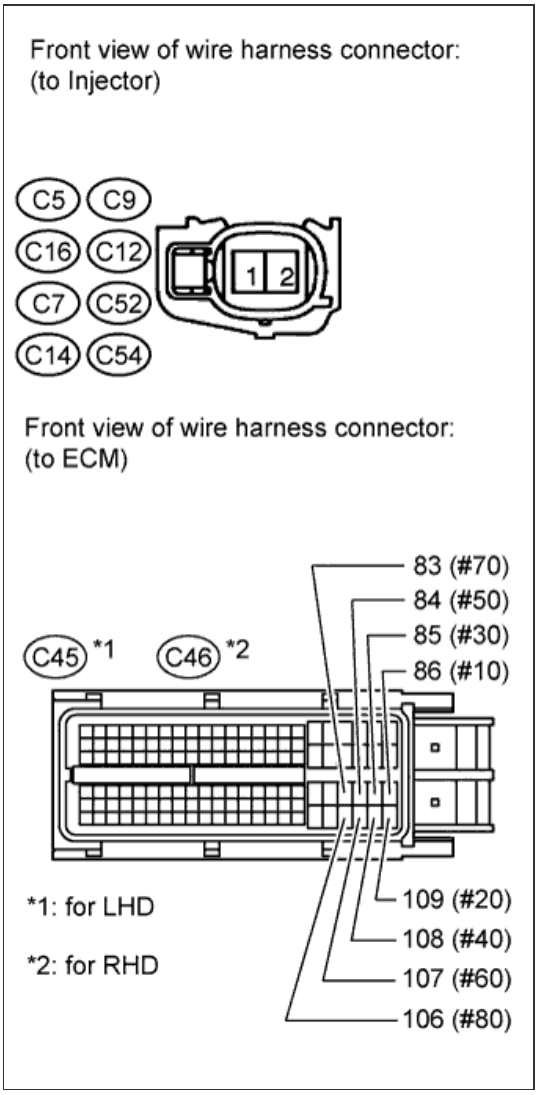
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

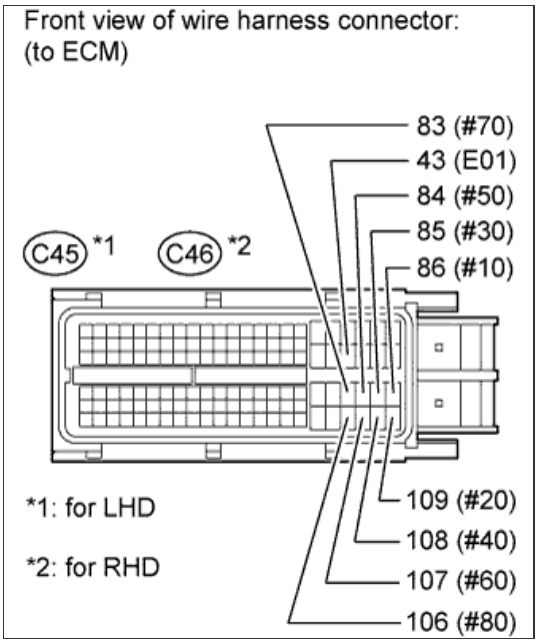
26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

REPLACE ECM (**Click here**)

29.CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the ignition coil with an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK

REPLACE IGNITION COIL (Click here)

DTC P2121 Throttle / Pedal Position Sensor / Switch "D" Circuit Range / Performance

for Preparation Click here

DESCRIPTION

HINT:

Refer to DTC P2120 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2121	The difference between VPA and VPA2 is below 0.4 V, or higher than 1.2 V for 0.5 seconds (1 trip detection logic).	• **Accelerator Pedal Position (APP) sensor** • **ECM**

MONITOR DESCRIPTION

When the difference between the output voltages of VPA and VPA2 deviates from the standard, the ECM determines that the Accelerator Pedal Position (APP) sensor is malfunctioning. The ECM turns on the MIL and the DTC is stored.

FAIL-SAFE

The APP sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the functioning circuit is used to calculate the accelerator pedal opening angle to allow the vehicle to continue driving. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal as being fully closed. In this case, the throttle valve remains closed as if the engine is idling.
If a pass condition is detected and then the engine switch is turned off, the fail-safe operation stops and the system returns to a normal condition.

WIRING DIAGRAM

Refer to DTC P2120 (Click here).

INSPECTION PROCEDURE

HINT:

- **This DTC relates to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2121)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2121 is output	A
P2121 and other DTCs are output	B

HINT:

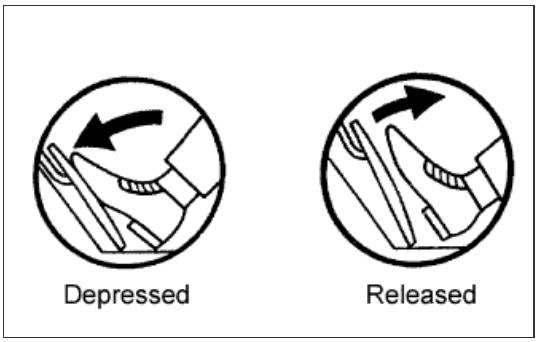
If any DTCs other than P2121 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.



b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

d. Read the values displayed on the tester.

Standard Voltage:

Accelerator Pedal Operations	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 4.7 V

NG → Go to step

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

REPLACE ACCELERATOR PEDAL SENSOR ASSEMBLY

a. Replace the accelerator pedal assembly (Click here).

NEXT

4.CHECK WHETHER DTC OUTPUT RECURS (DTC P2121)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
P2121 is output	A
No DTC is output	B

DTC P0306 Cylinder 6 Misfire Detected

DTC P0307 Cylinder 7 Misfire Detected

DTC P0308 Cylinder 8 Misfire Detected

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

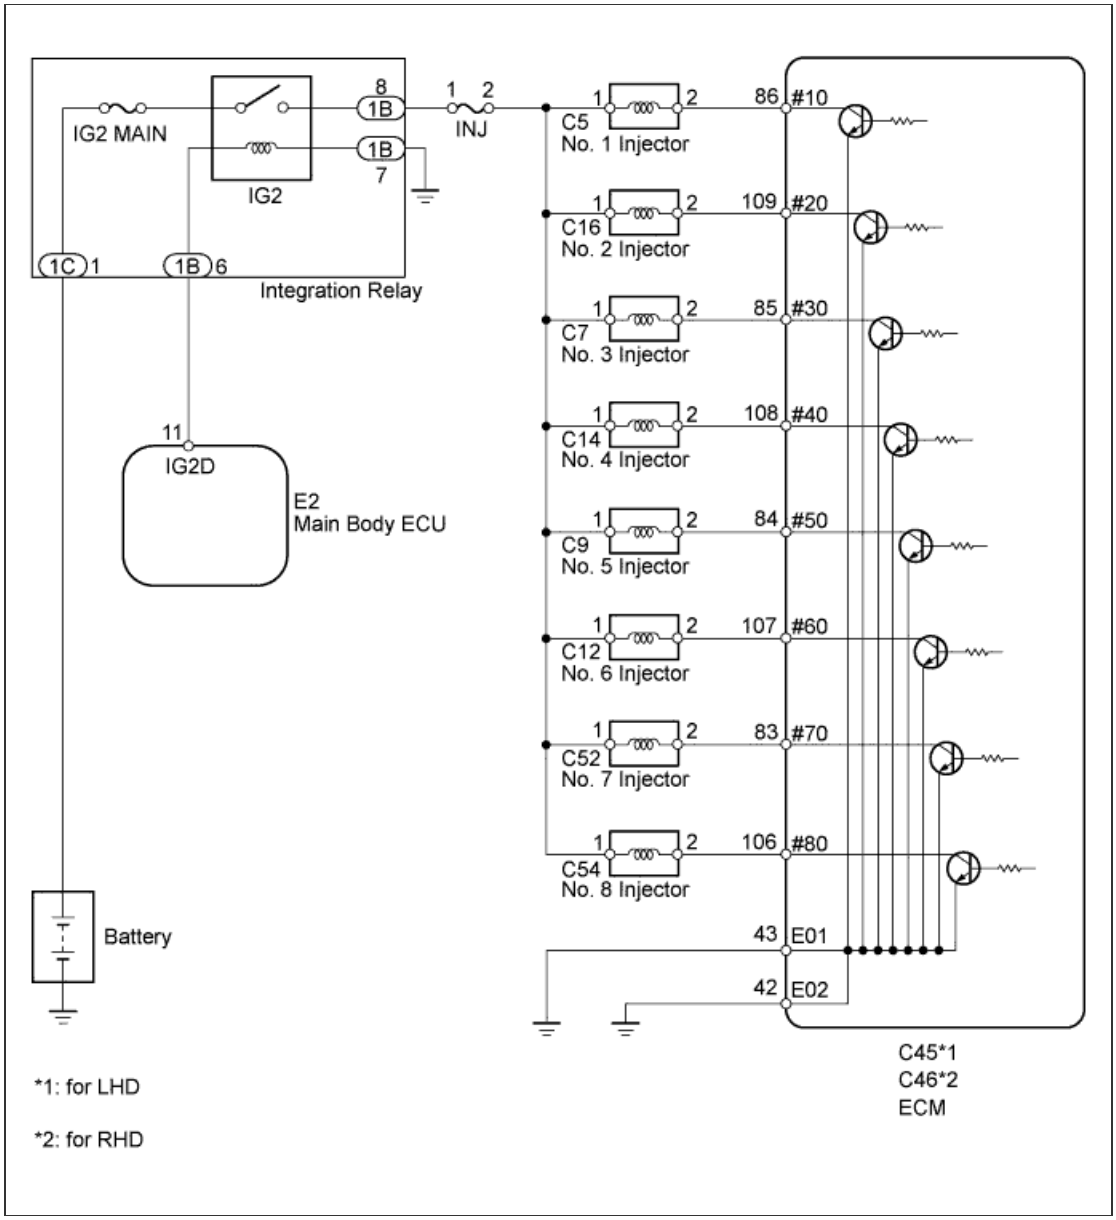
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

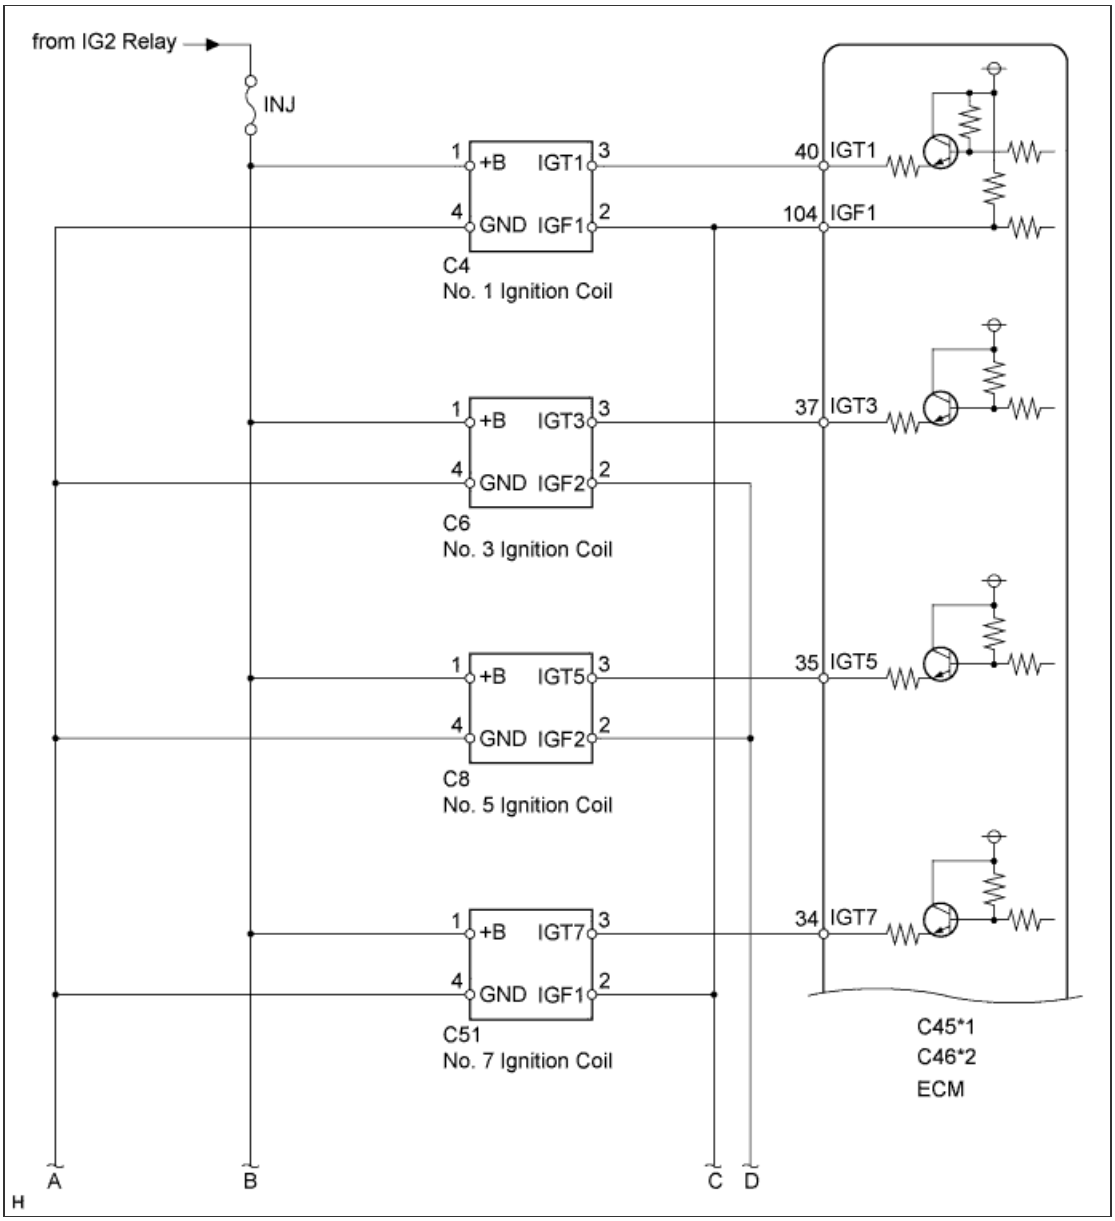
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

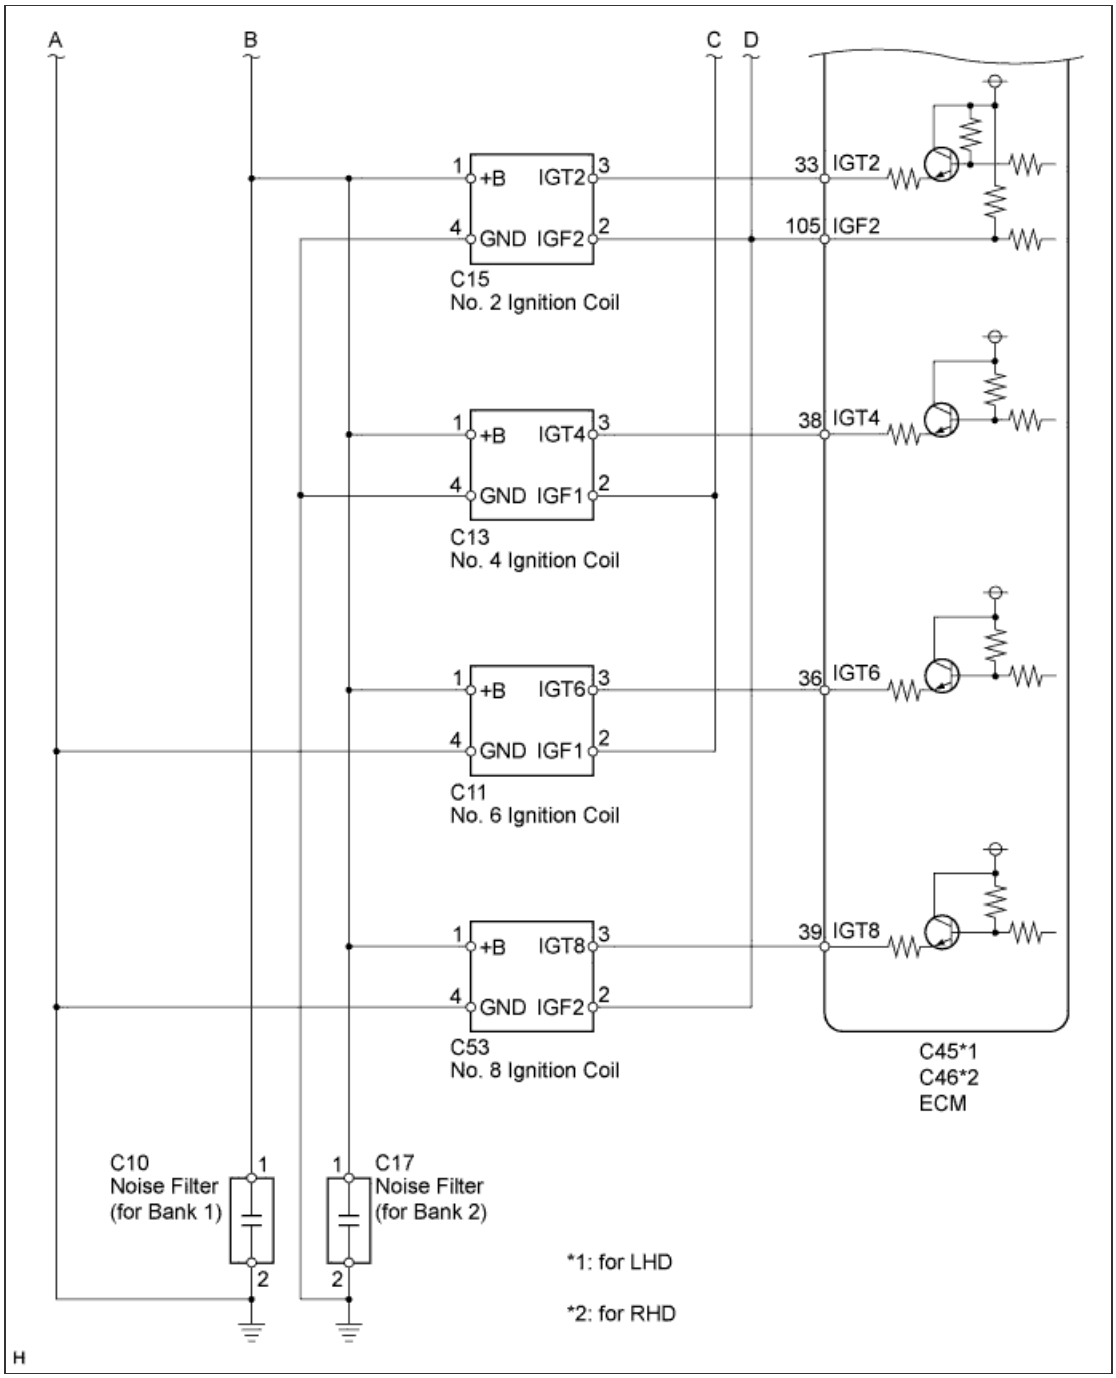
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.



HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

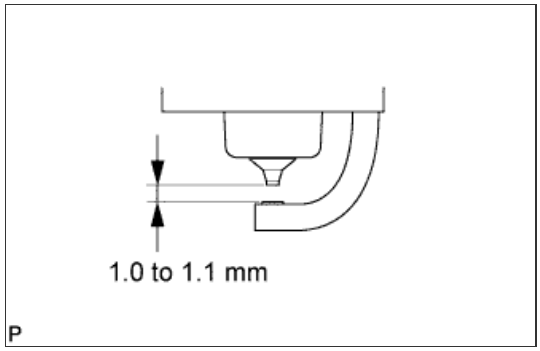
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

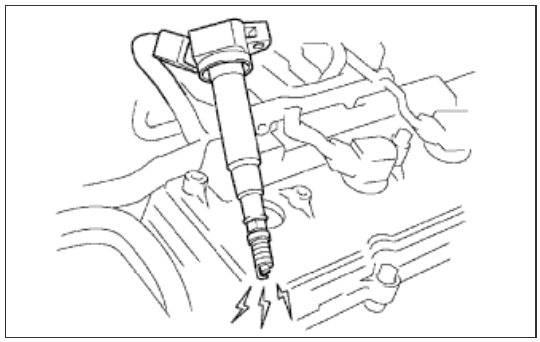
NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

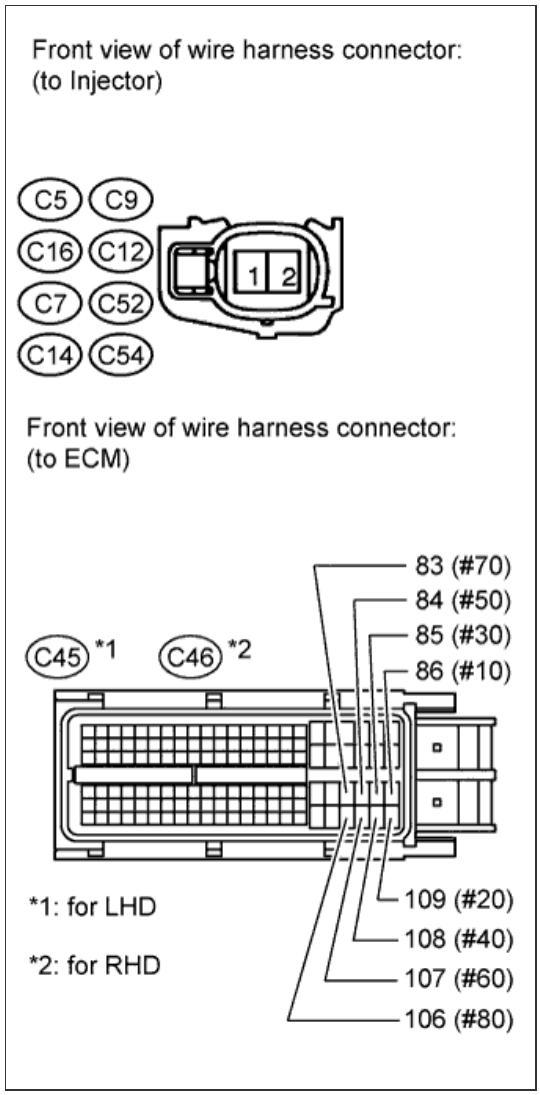
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

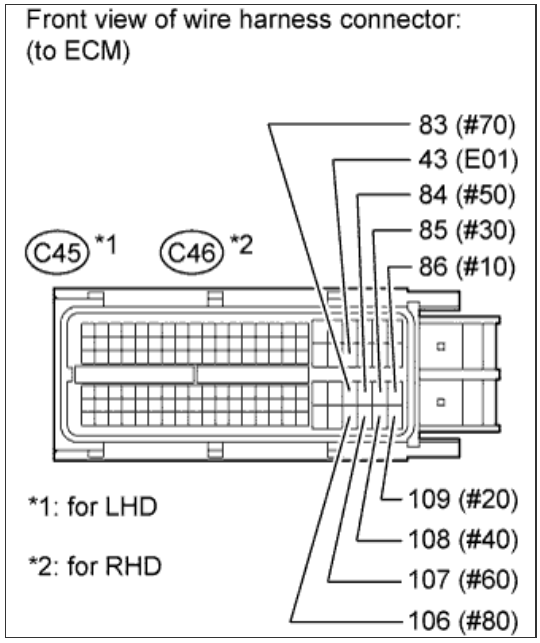
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

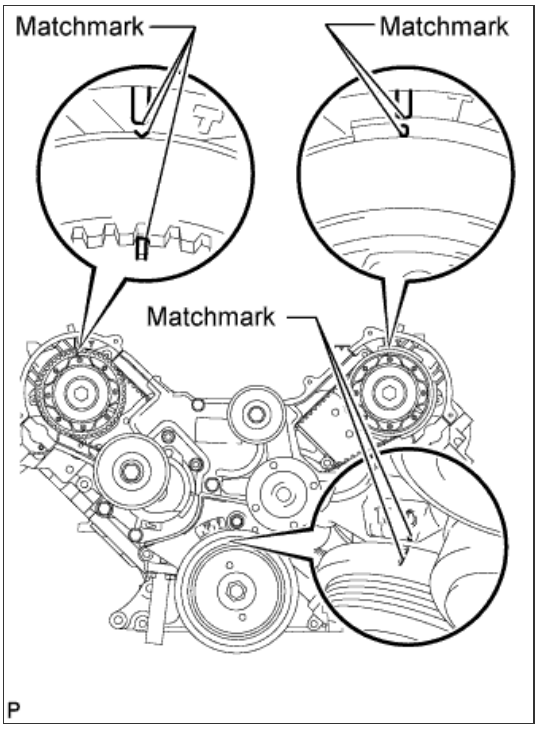
OK

13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

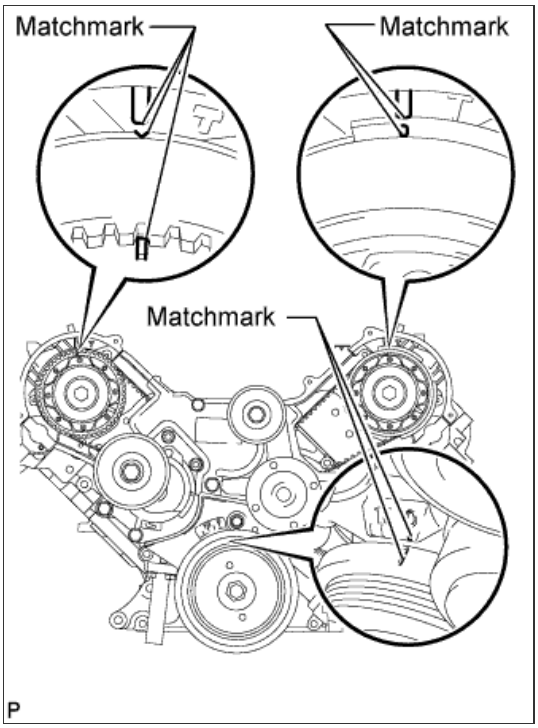
NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

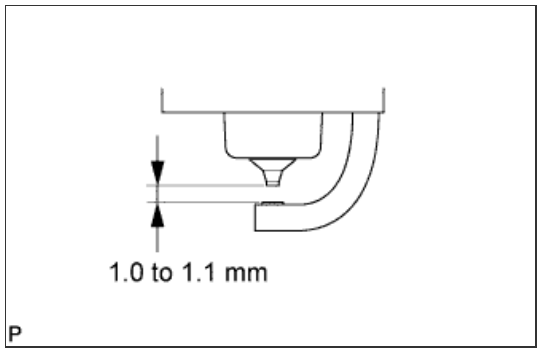
NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)



OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

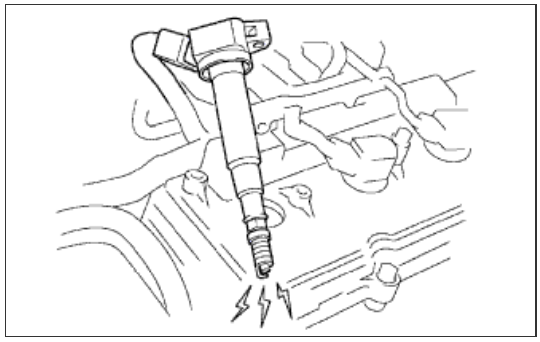
NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

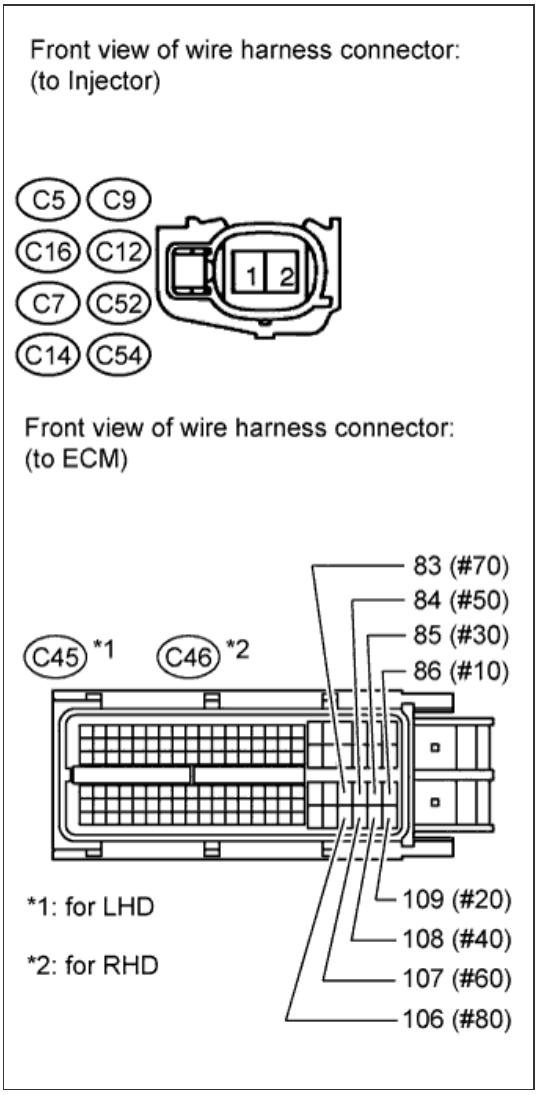
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

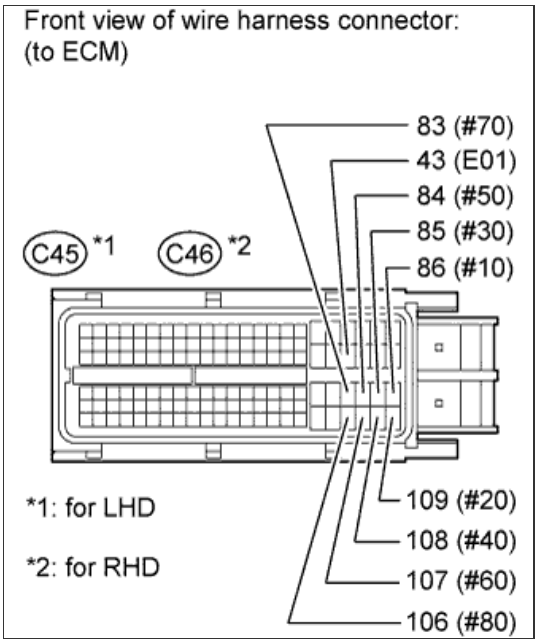
Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

REPLACE ECM (**Click here**)

29.CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the ignition coil with an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

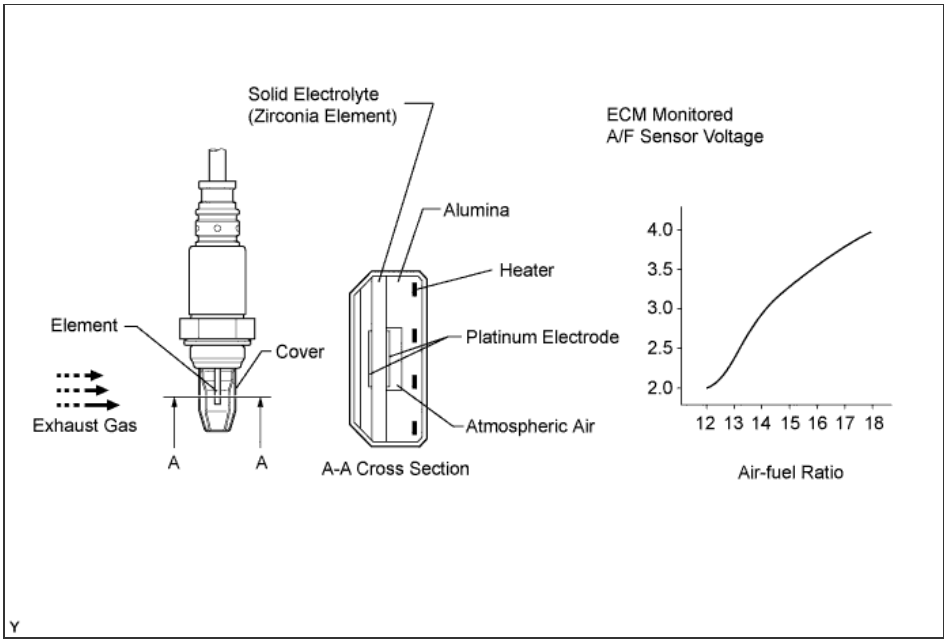
DTC P2197 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)

DTC P2198 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: The value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is higher than 3.8 V for 5 seconds. (b) The Heated Oxygen (HO2) sensor voltage is 0.21 V or higher.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is 3.6 mA or higher for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is below 2.8 V for 5 seconds. (b) The HO2 sensor voltage is below 0.59 V.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is below 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

HINT:

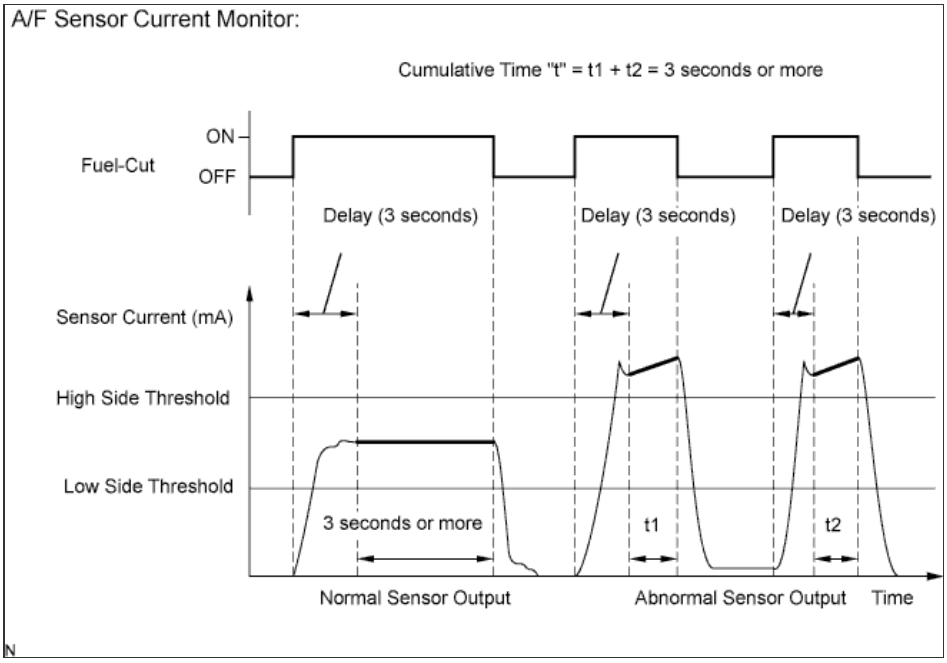
- **DTCs P2195 and P2196 indicate malfunctions related to bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

- **When either of these DTCs is output, check the A/F sensor output voltage by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.**
- **Short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+ and A1A- or A2A+ and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor output voltage cannot be confirmed without using the intelligent tester.**
- **If the A/F sensor is malfunctioning, the ECM stores DTC P2195, P2196, P2197 or P2198.**

MONITOR DESCRIPTION

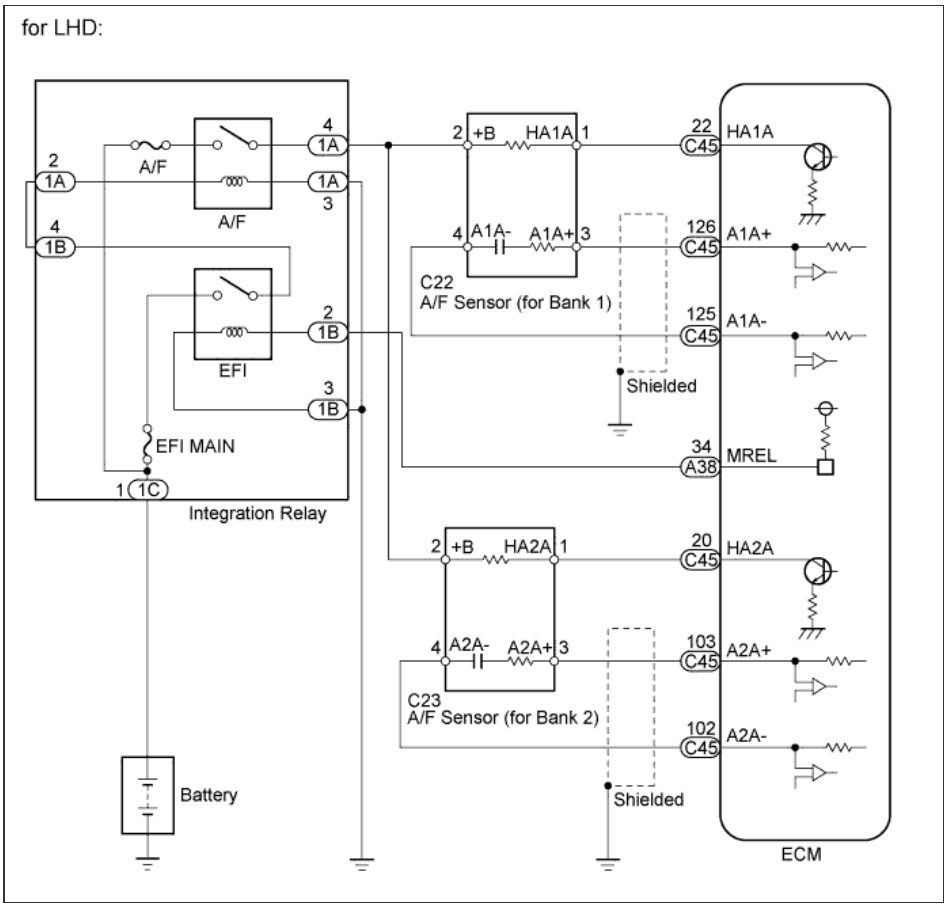
Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor output voltage indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and stores a DTC.

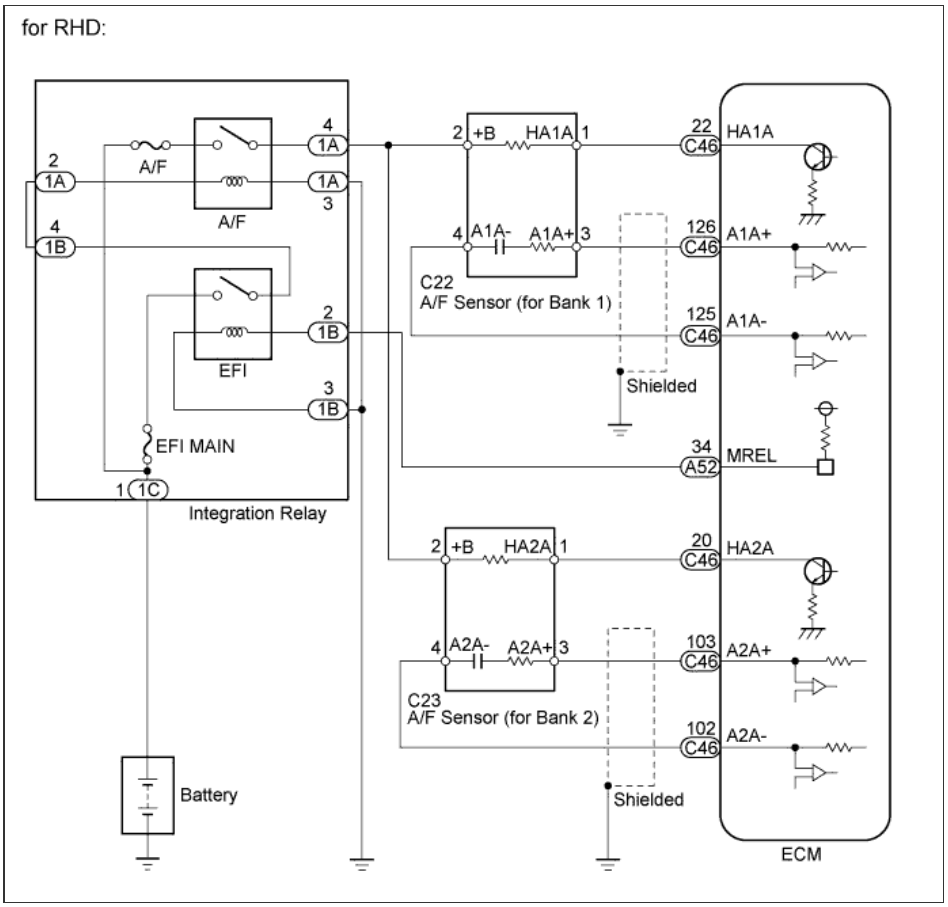


Example:

If the A/F sensor output voltage is below 2.8 V (very rich condition) for 5 seconds, despite the rear HO2 sensor output voltage being below 0.59 V, the ECM stores DTC P2196 or P2198. Alternatively, if the A/F sensor output voltage is higher than 3.8 V (very lean condition) for 5 seconds despite the rear HO2 sensor output voltage being 0.21 V or higher, DTC P2195 or P2197 is stored.



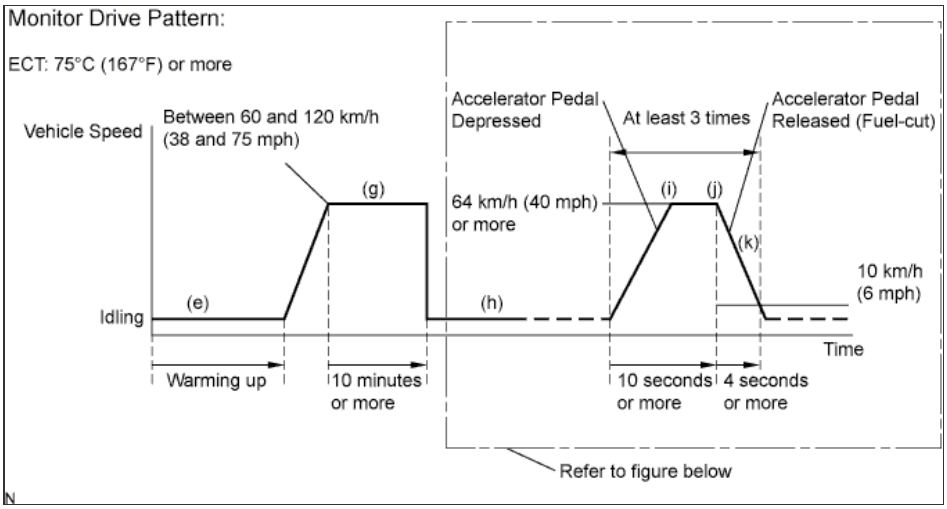
Sensor current detection monitor

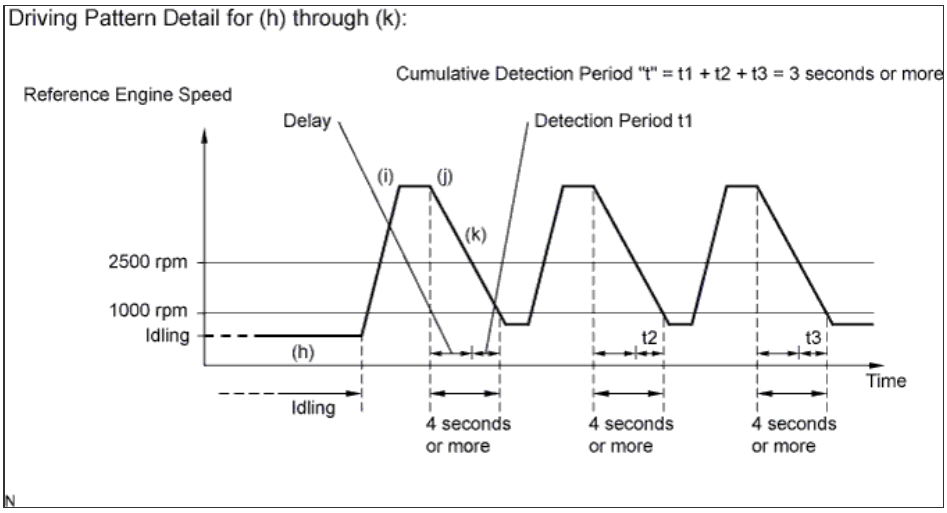


A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or higher for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and stores DTC P2195 or P2197 (high-side stuck). If the A/F sensor output is below 1.4 mA for more than 3 seconds of cumulative time, the ECM stores DTC P2196 or P2198 (low-side stuck).

WIRING DIAGRAM





CONFIRMATION DRIVING PATTERN

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Change the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation.

HINT:

Fuel-cut is performed when the following conditions are met:

- **Accelerator pedal fully released.**
- **Engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in the Data List.

INSPECTION PROCEDURE

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **DTC P2A00 may be stored when the air-fuel ratio is stuck rich or lean.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

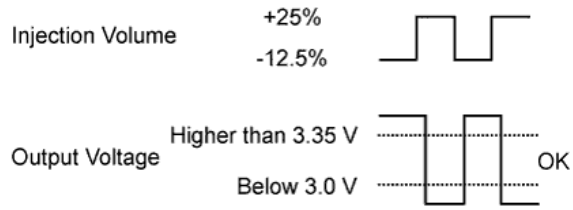
HINT:

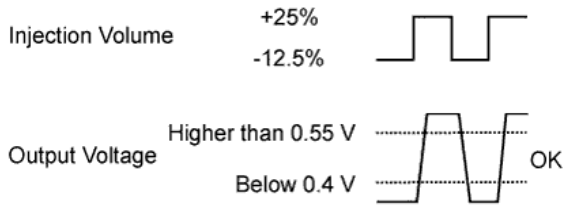
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor function provided in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the Air-fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

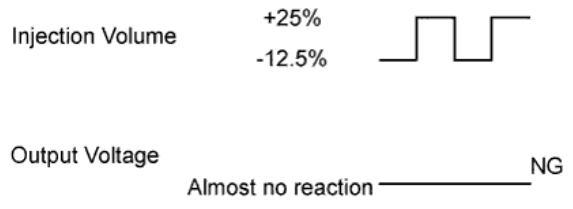
The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the tester.

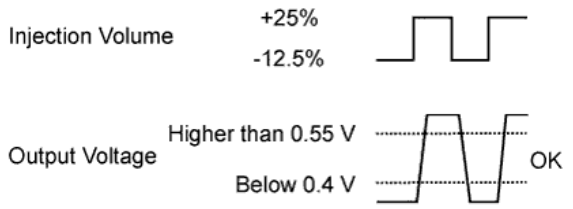
(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
(e) Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

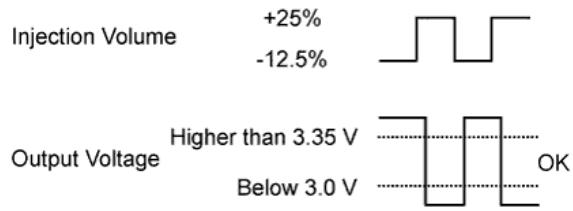
HINT:

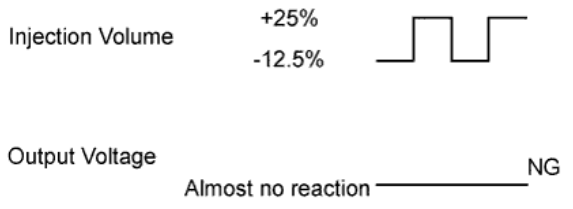












- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **The sensors react in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor (for sensor 2) output has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus on the tester: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2195, P2196, P2197 or P2198 is output	A
P2195, P2196, P2197 or P2198 and other DTCs are output	B

HINT:

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the vehicle to drive in accordance with the drive pattern described in the Confirmation Driving Pattern.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / Monitor Status.

g. Check that the status of O2S (A/FS) Monitor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

HINT:

- **Complete indicates that the component is functioning normally.**
- **Incomplete indicates that the component is malfunctioning.**

h. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

i. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or higher, and below 3.6 mA)	A
Outside normal range (Below 1.4 mA, or 3.6 mA or higher)	B

B → Go to step 12

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the A/F sensor at an engine speed of 2500 rpm for 90 seconds.

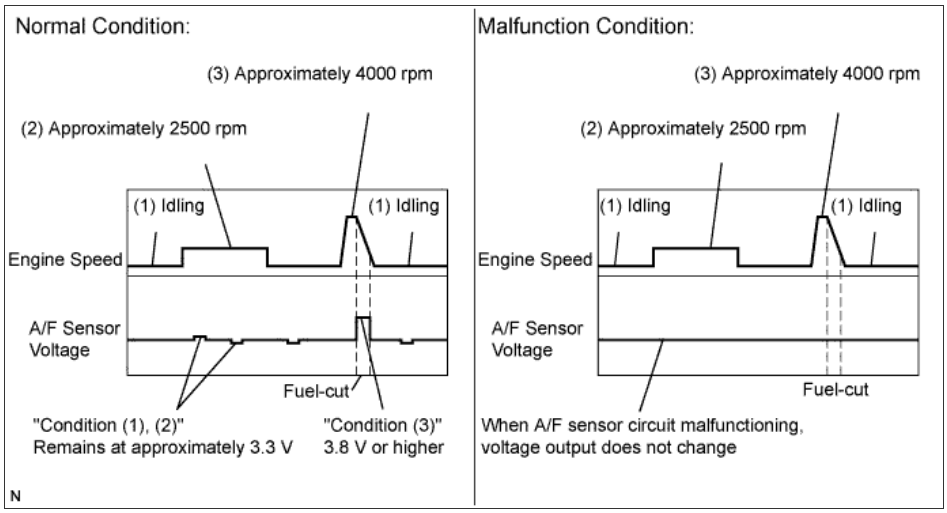
e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS B1 S1 or AFS B2 S1 and Engine Speed.

f. Check the A/F sensor voltage 3 times, when the engine is in each of the following conditions:

i. While idling (check for at least 30 seconds).

ii. At an engine speed of approximately 2500 rpm (without any sudden changes in engine speed).

iii. Raise the engine speed to 4000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.



Standard Voltage:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Remains at approximately 3.3 V	3.1 V to 3.5 V
		This occurs during

(3)	Increases to 3.8 V or higher	engine deceleration (when fuel-cut performed)

HINT:

- **For more information, see the diagrams below.**

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit (this will also happen if the A/F sensor heater has an open circuit).**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or higher, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.**

NG → **Go to step 9**

OK

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

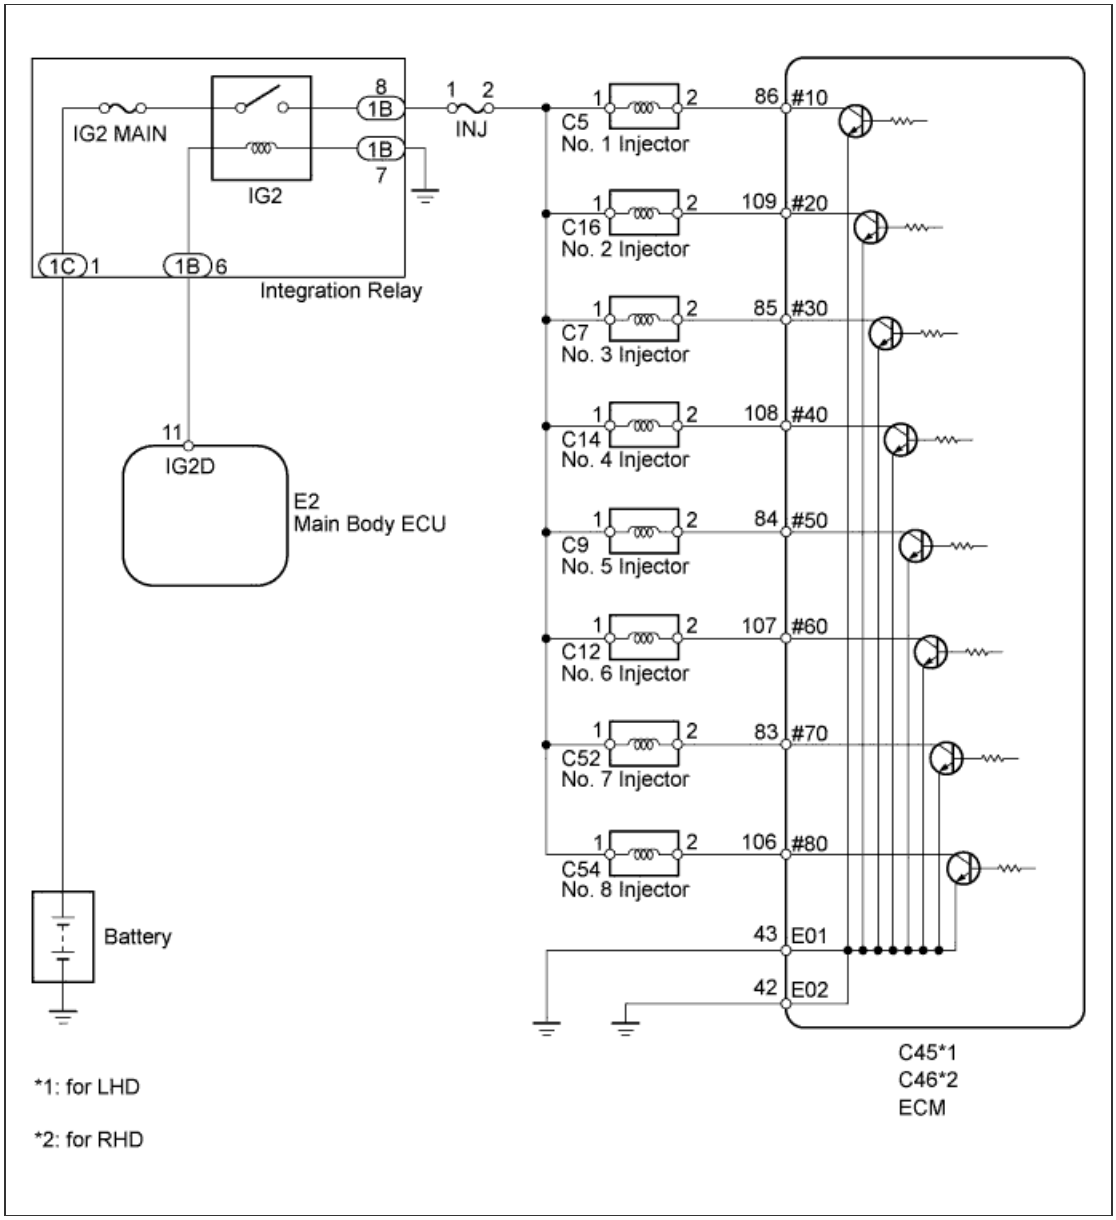
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

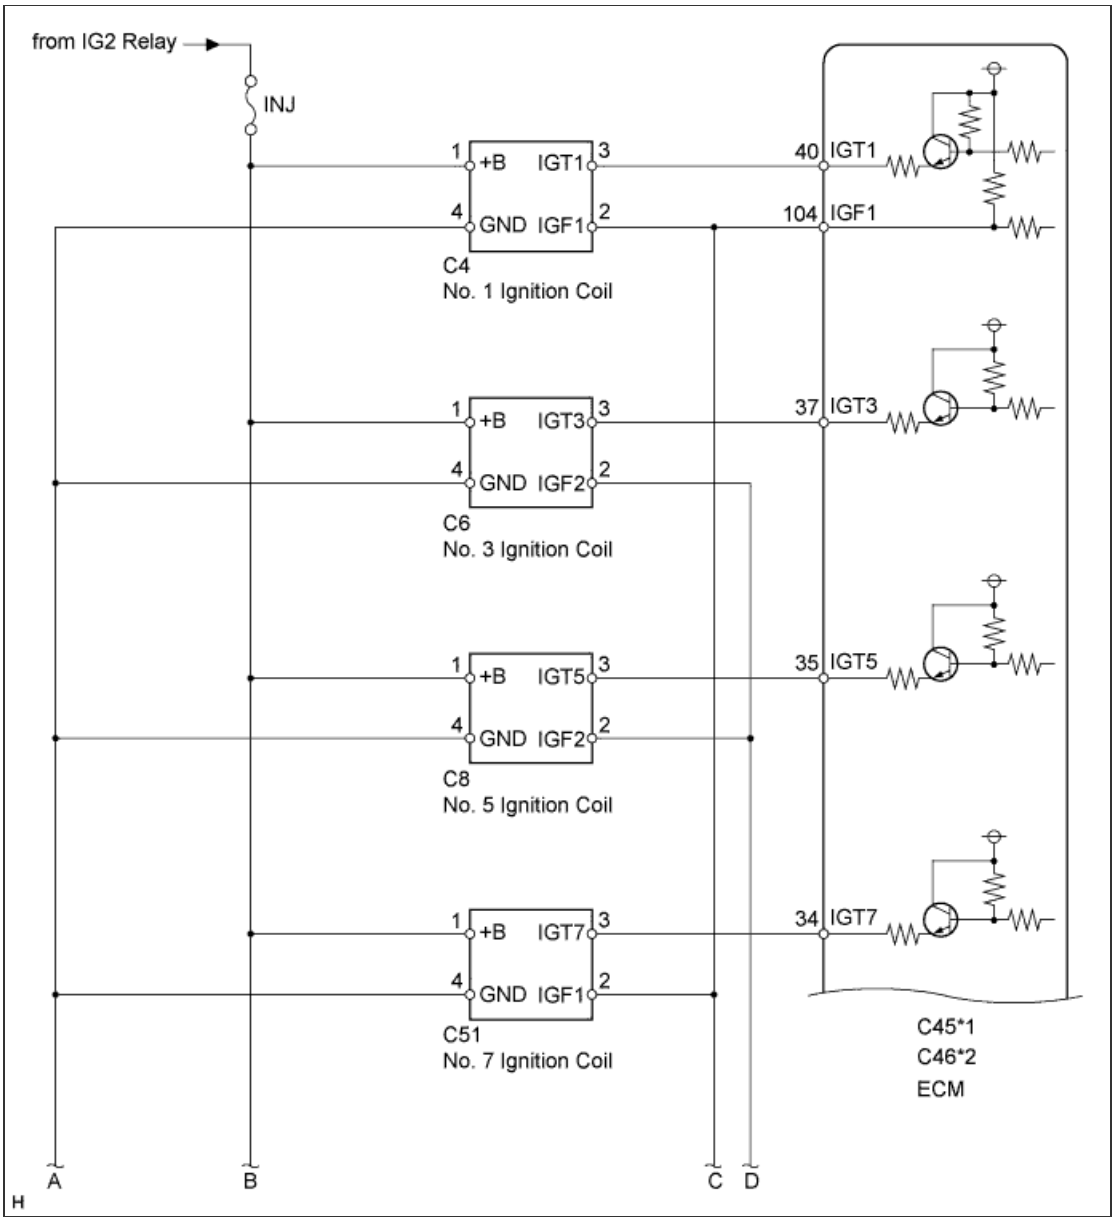
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

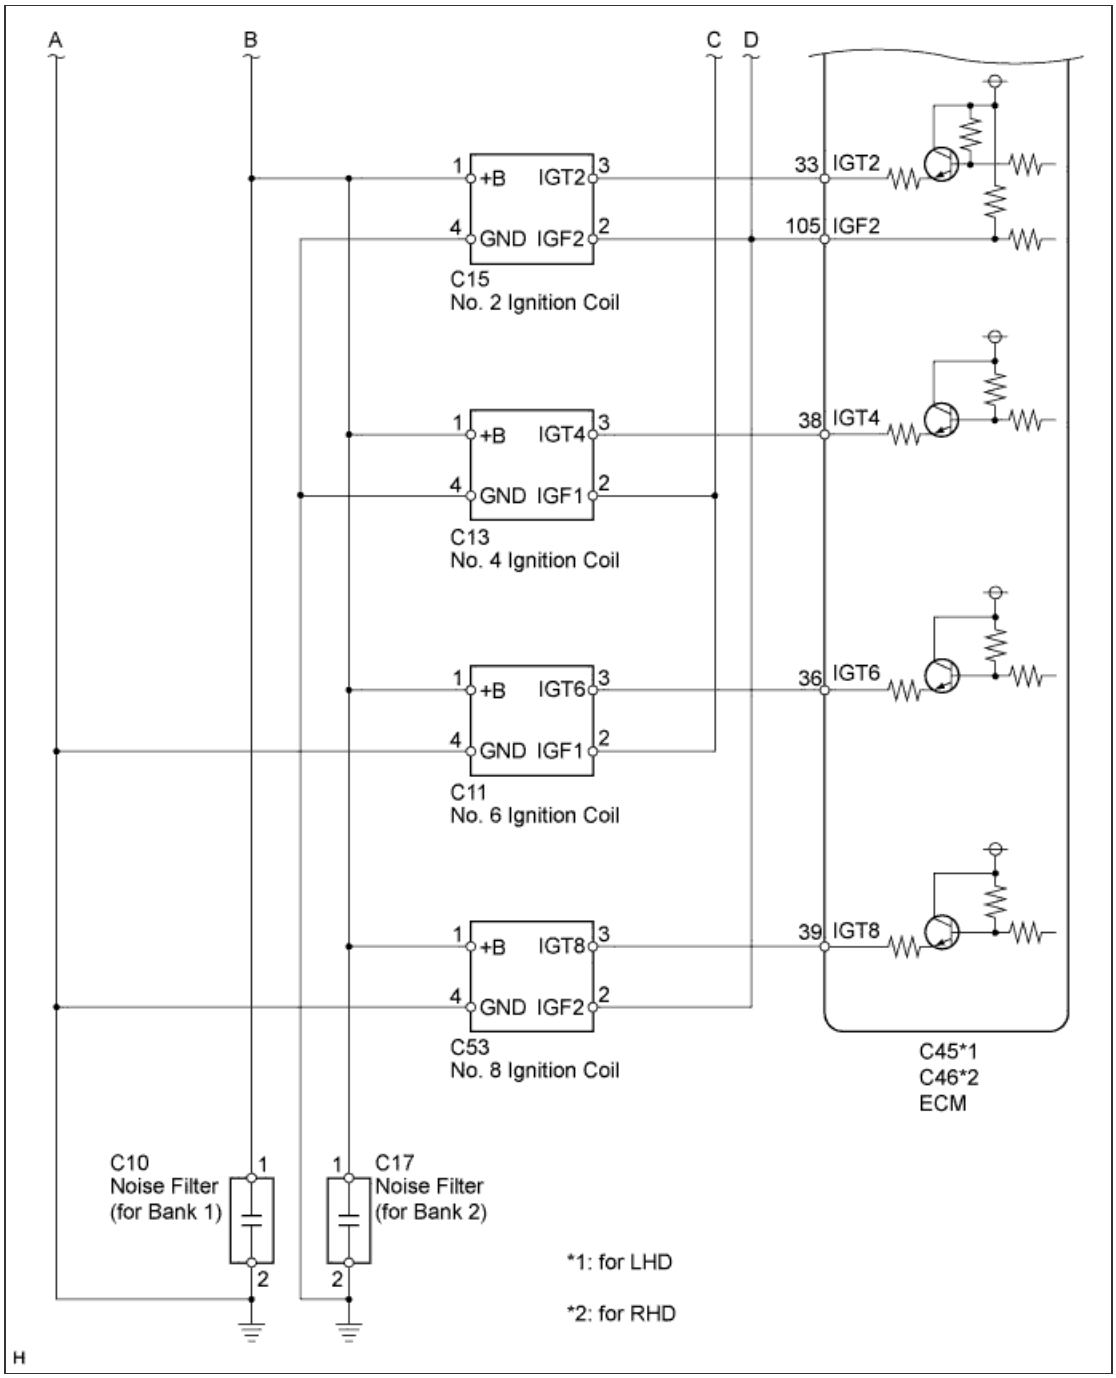
- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.



HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

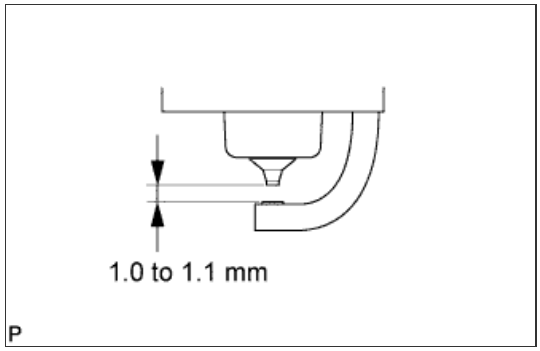
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

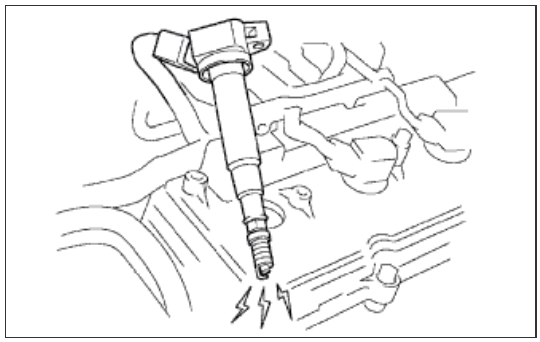
6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

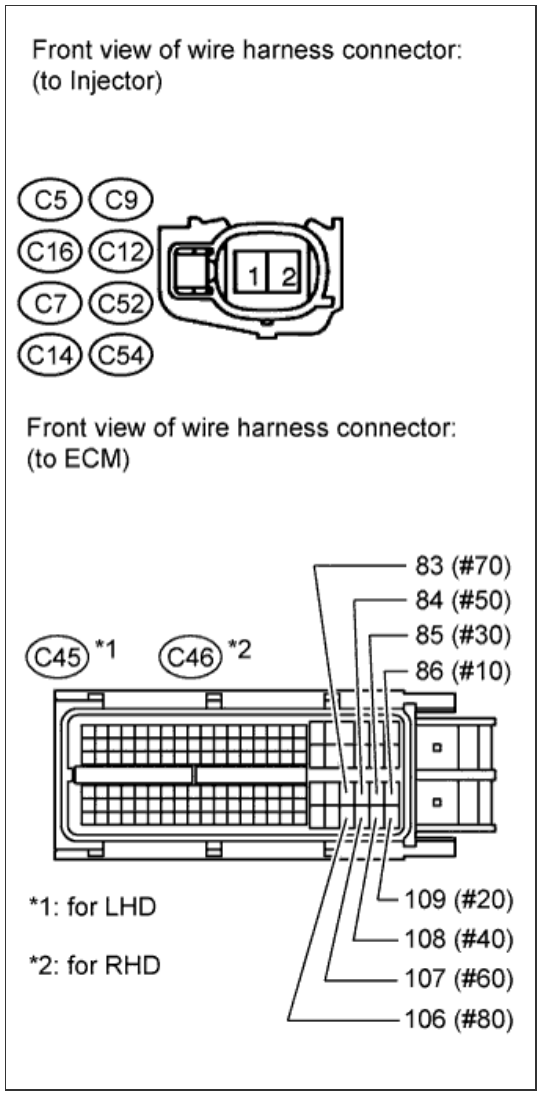
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

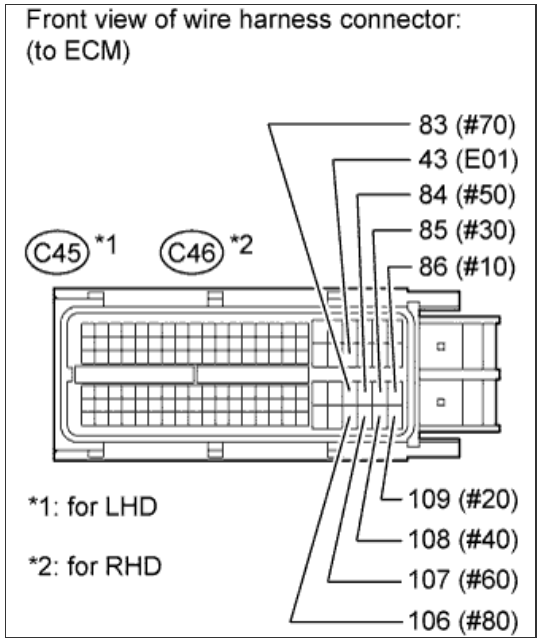
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

OK

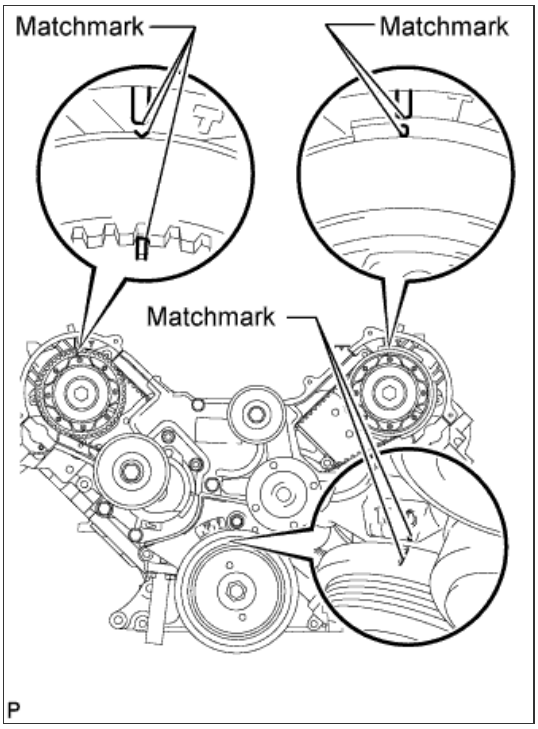
13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

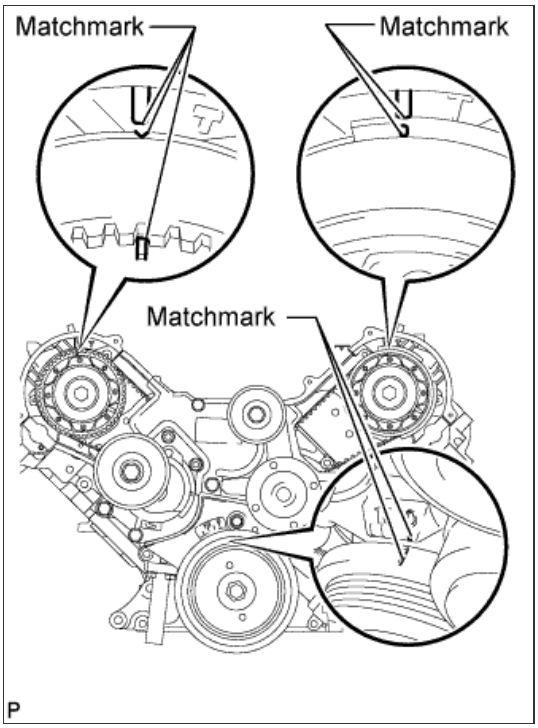
18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

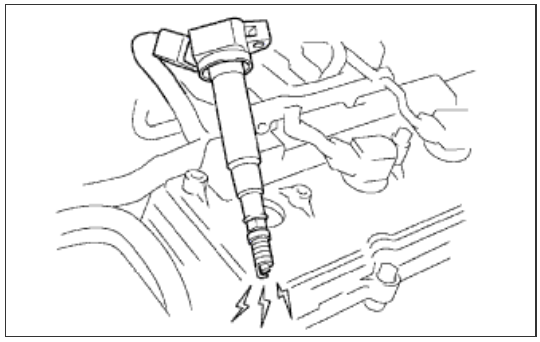
23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

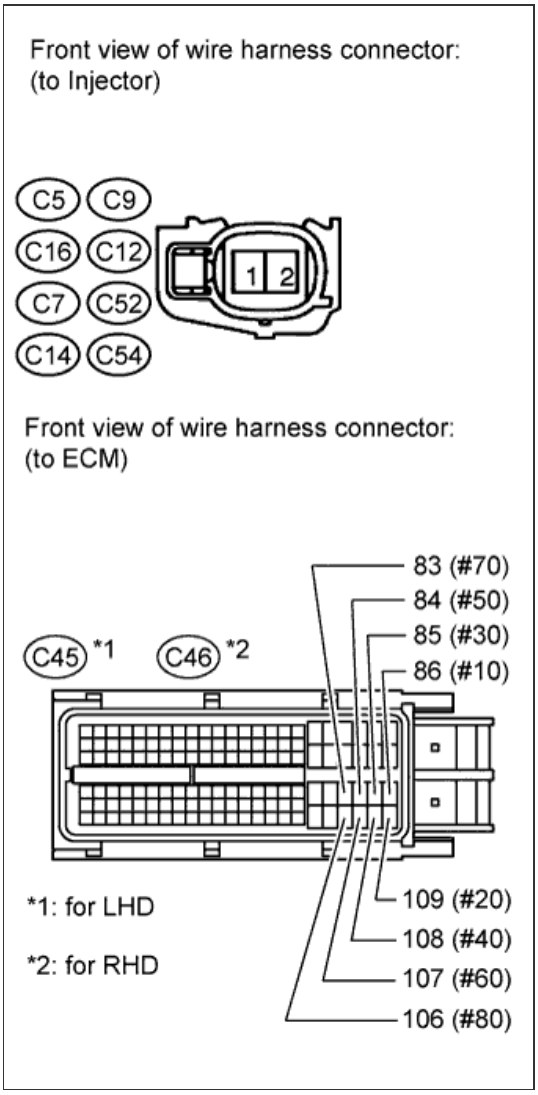
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

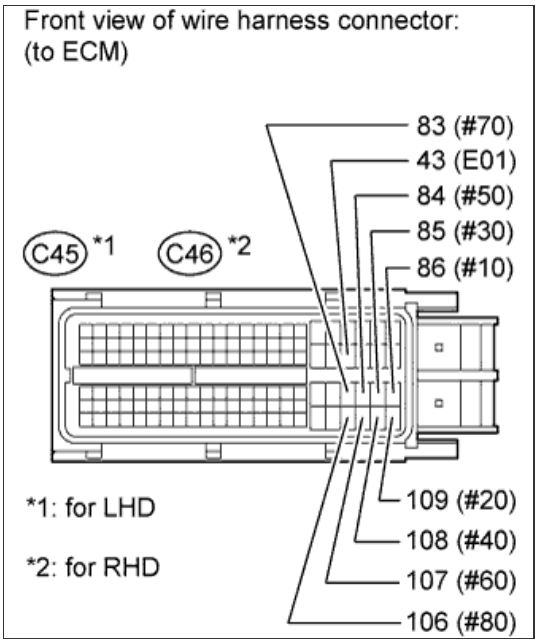
26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

REPLACE ECM (**Click here**)

29.CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the ignition coil with an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK

REPLACE IGNITION COIL (Click here)

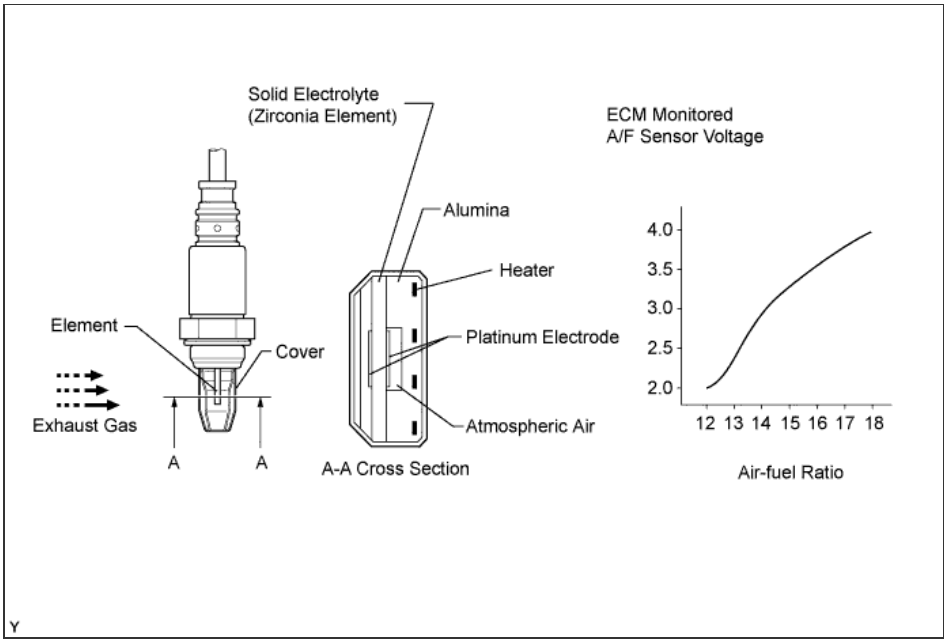
DTC P2195 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)

DTC P2196 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

DTC P2197 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)

DTC P2198 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: The value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is higher than 3.8 V for 5 seconds. (b) The Heated Oxygen (HO2) sensor voltage is 0.21 V or higher.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is 3.6 mA or higher for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is below 2.8 V for 5 seconds. (b) The HO2 sensor voltage is below 0.59 V.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is below 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

HINT:

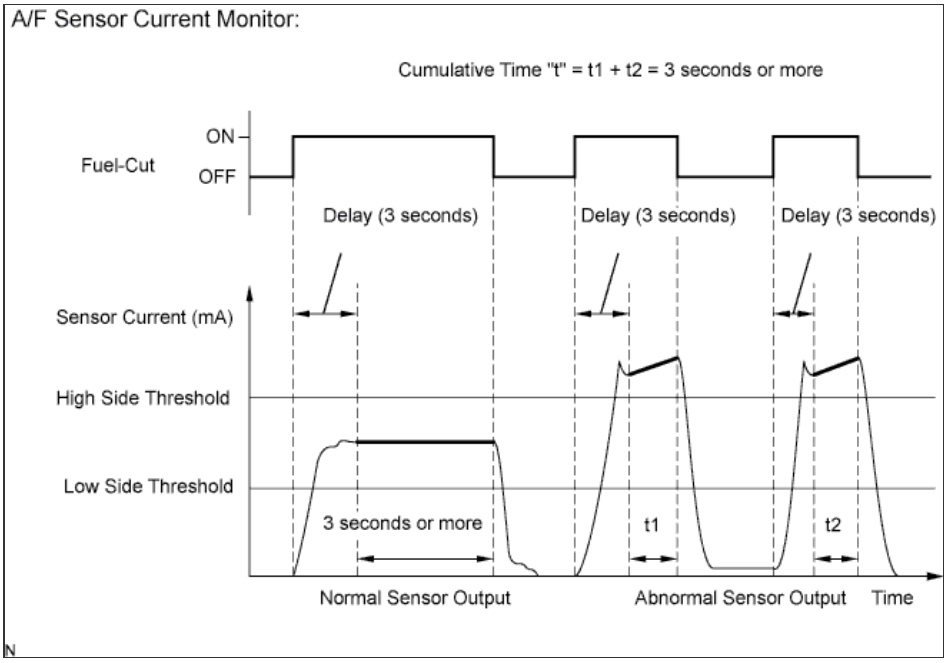
- **DTCs P2195 and P2196 indicate malfunctions related to bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

- **When either of these DTCs is output, check the A/F sensor output voltage by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.**
- **Short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+ and A1A- or A2A+ and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor output voltage cannot be confirmed without using the intelligent tester.**
- **If the A/F sensor is malfunctioning, the ECM stores DTC P2195, P2196, P2197 or P2198.**

MONITOR DESCRIPTION

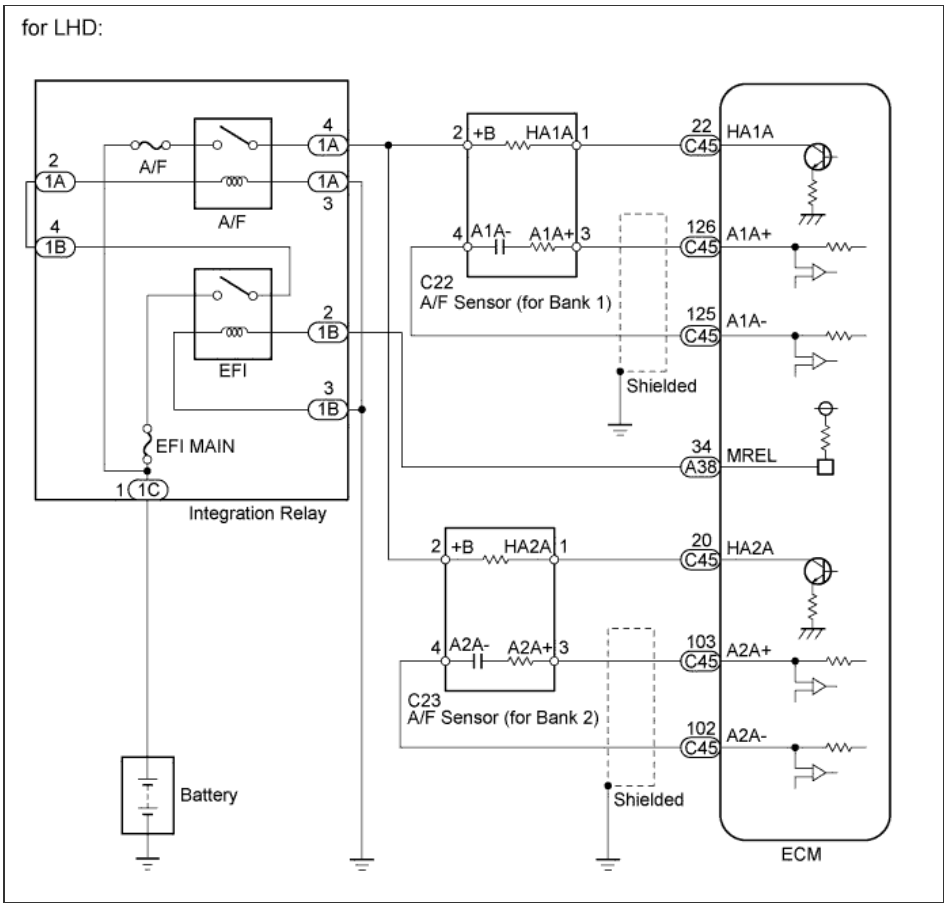
Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor output voltage indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and stores a DTC.

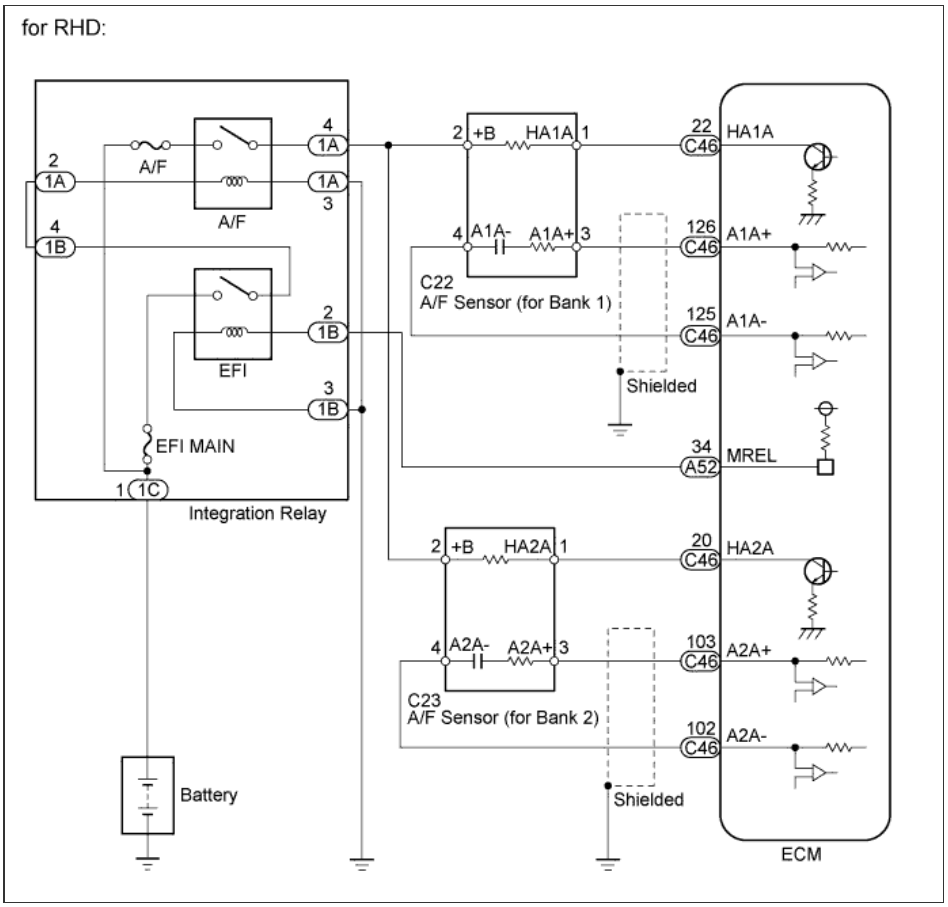


Example:

If the A/F sensor output voltage is below 2.8 V (very rich condition) for 5 seconds, despite the rear HO2 sensor output voltage being below 0.59 V, the ECM stores DTC P2196 or P2198. Alternatively, if the A/F sensor output voltage is higher than 3.8 V (very lean condition) for 5 seconds despite the rear HO2 sensor output voltage being 0.21 V or higher, DTC P2195 or P2197 is stored.



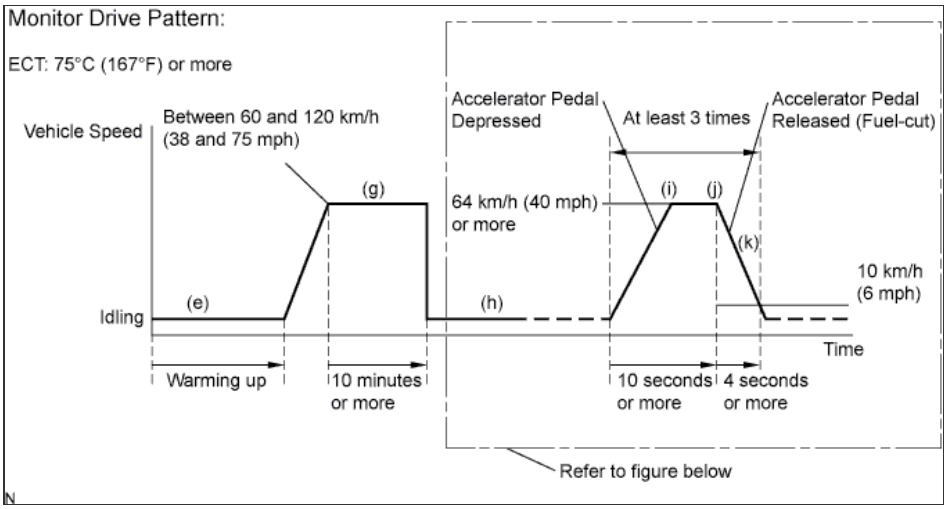
Sensor current detection monitor

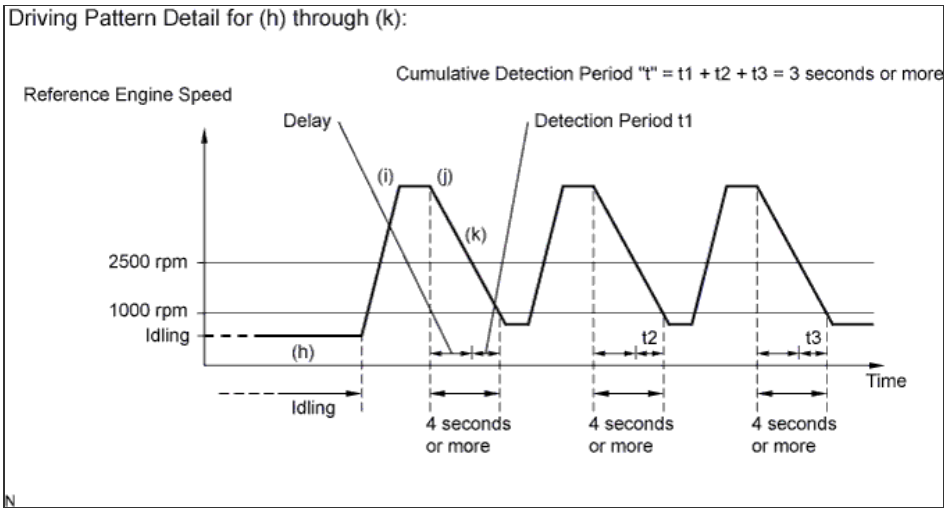


A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or higher for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and stores DTC P2195 or P2197 (high-side stuck). If the A/F sensor output is below 1.4 mA for more than 3 seconds of cumulative time, the ECM stores DTC P2196 or P2198 (low-side stuck).

WIRING DIAGRAM





CONFIRMATION DRIVING PATTERN

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Change the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation.

HINT:

Fuel-cut is performed when the following conditions are met:

- **Accelerator pedal fully released.**
- **Engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in the Data List.

INSPECTION PROCEDURE

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **DTC P2A00 may be stored when the air-fuel ratio is stuck rich or lean.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor function provided in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the Air-fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
(e) Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **The sensors react in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor (for sensor 2) output has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus on the tester: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2195, P2196, P2197 or P2198 is output	A
P2195, P2196, P2197 or P2198 and other DTCs are output	B

HINT:

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the vehicle to drive in accordance with the drive pattern described in the Confirmation Driving Pattern.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / Monitor Status.

g. Check that the status of O2S (A/FS) Monitor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

HINT:

- **Complete indicates that the component is functioning normally.**
- **Incomplete indicates that the component is malfunctioning.**

h. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

i. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or higher, and below 3.6 mA)	A
Outside normal range (Below 1.4 mA, or 3.6 mA or higher)	B

B → Go to step 12

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the A/F sensor at an engine speed of 2500 rpm for 90 seconds.

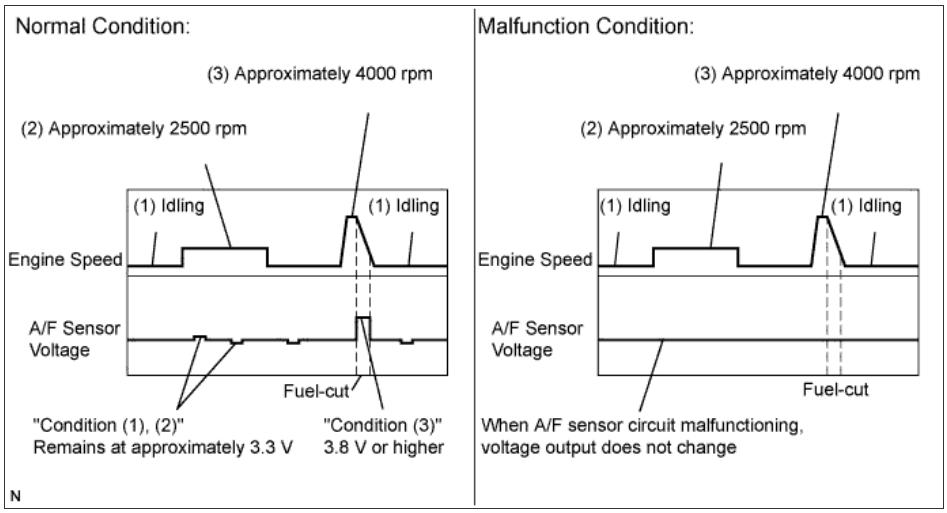
e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS B1 S1 or AFS B2 S1 and Engine Speed.

f. Check the A/F sensor voltage 3 times, when the engine is in each of the following conditions:

i. While idling (check for at least 30 seconds).

ii. At an engine speed of approximately 2500 rpm (without any sudden changes in engine speed).

iii. Raise the engine speed to 4000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.



Standard Voltage:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Remains at approximately 3.3 V	3.1 V to 3.5 V
		This occurs during

(3)	Increases to 3.8 V or higher	engine deceleration (when fuel-cut performed)

HINT:

- **For more information, see the diagrams below.**

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit (this will also happen if the A/F sensor heater has an open circuit).**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or higher, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.**

NG → **Go to step 9**

OK

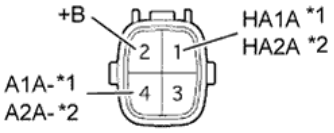
9.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected: (A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

10.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

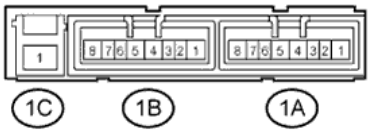
i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected: (Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

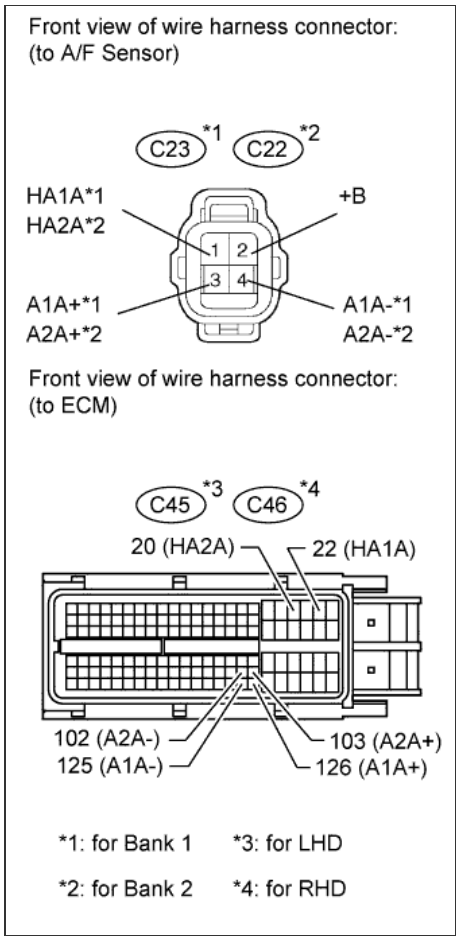
11.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

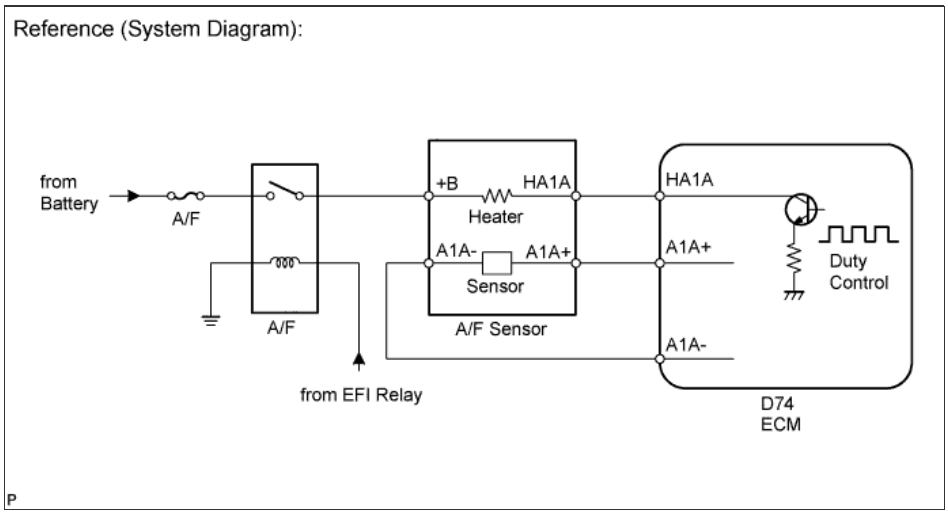
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

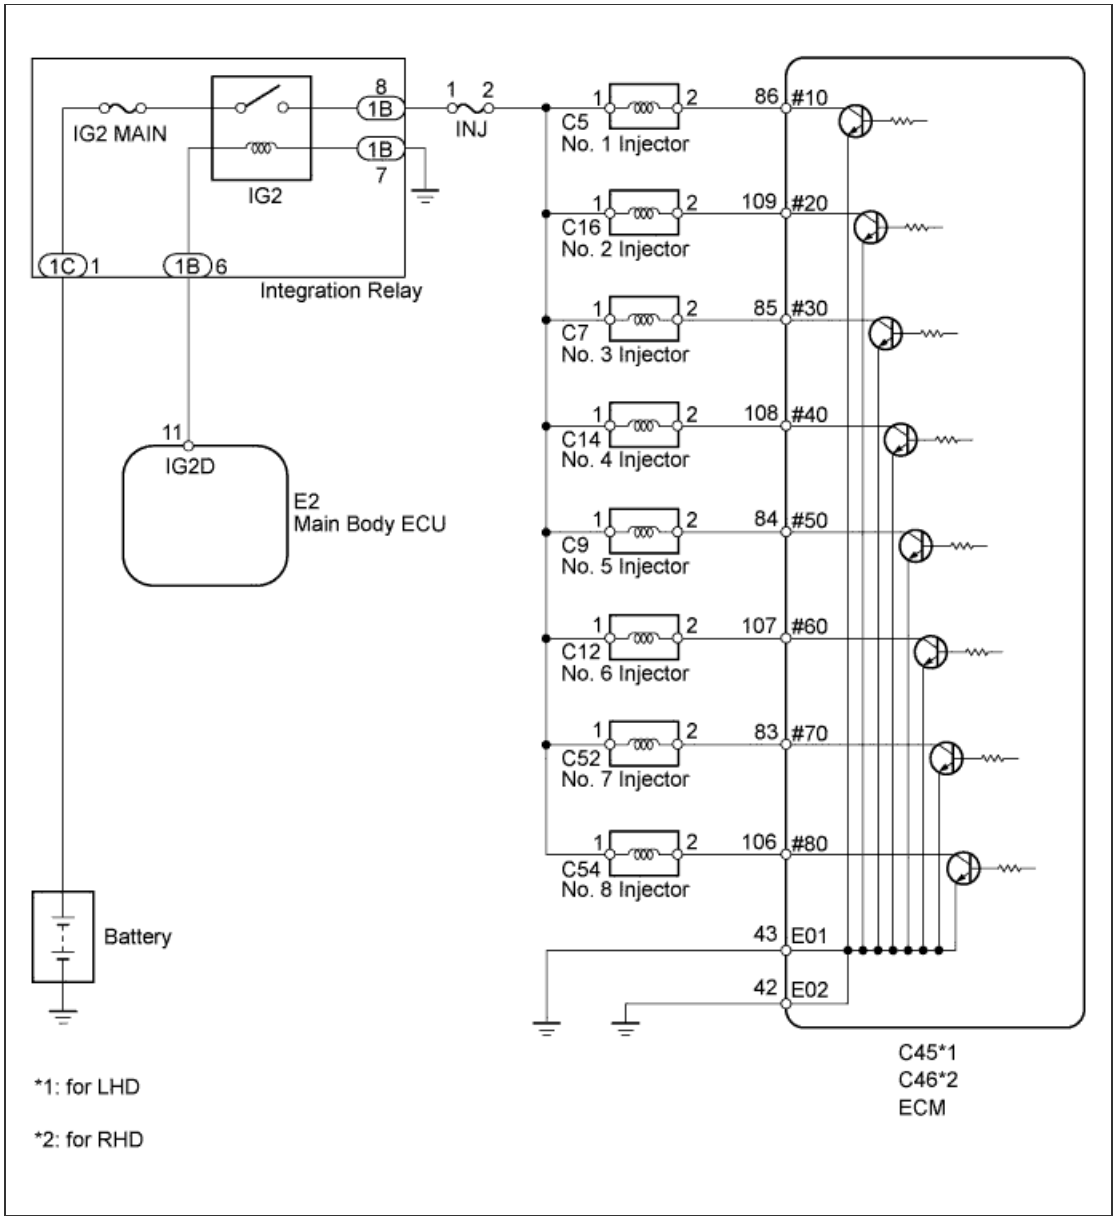
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

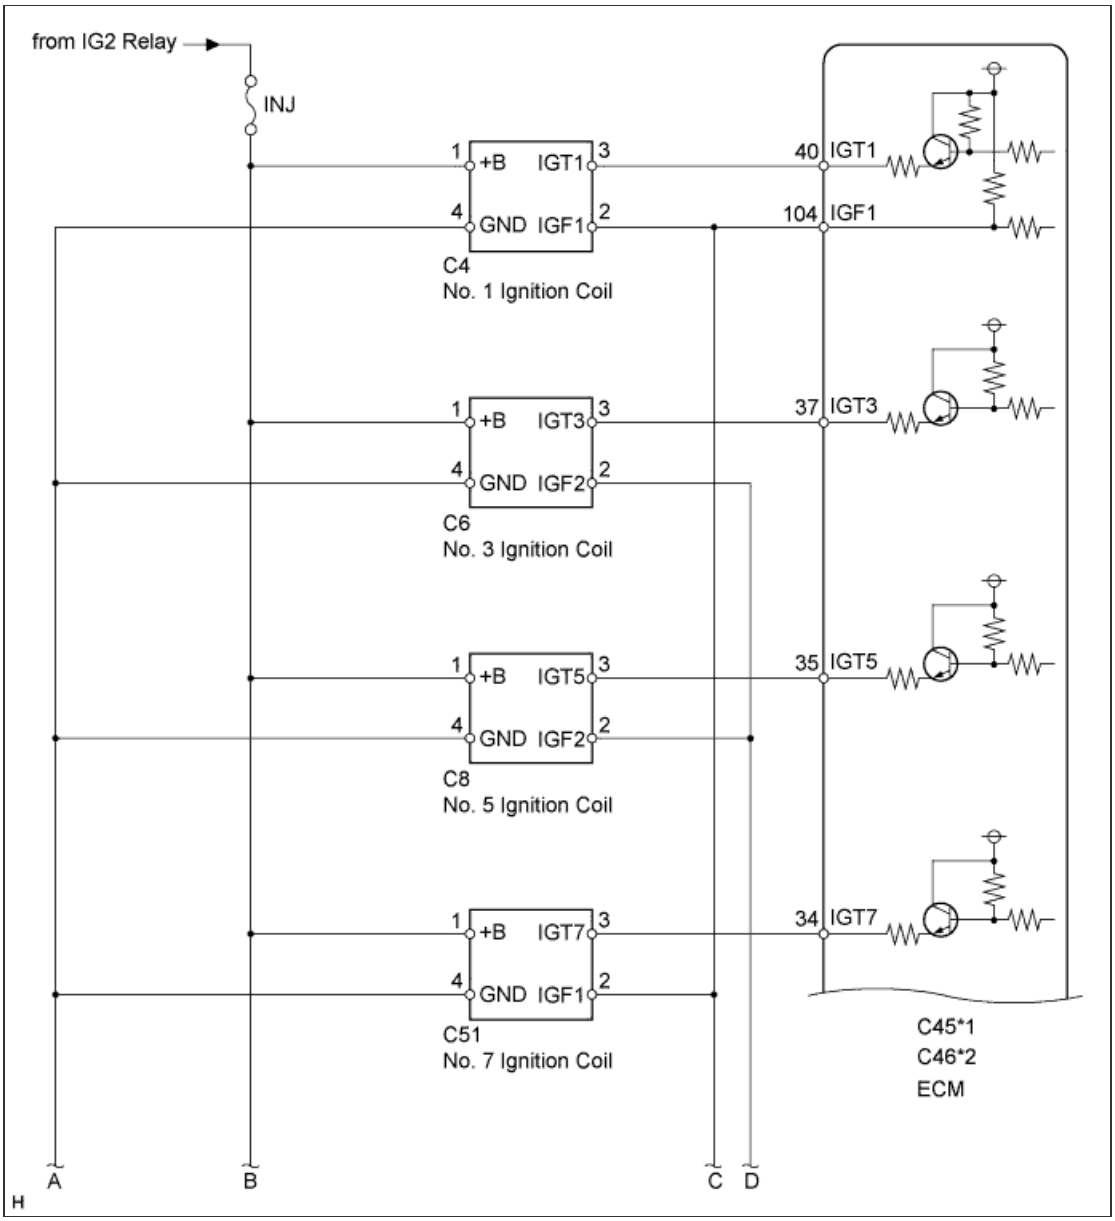
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.

HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

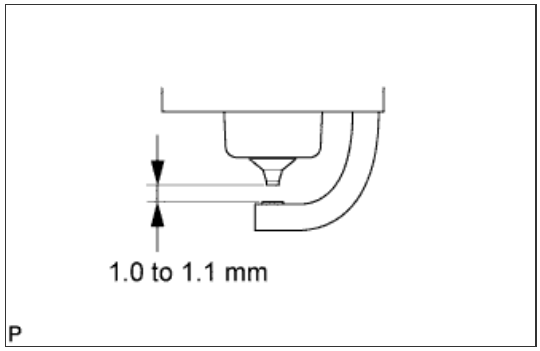
- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

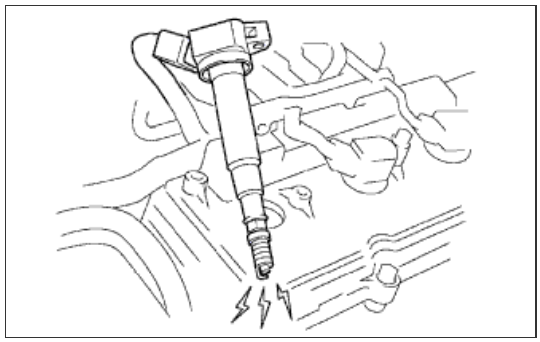
6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

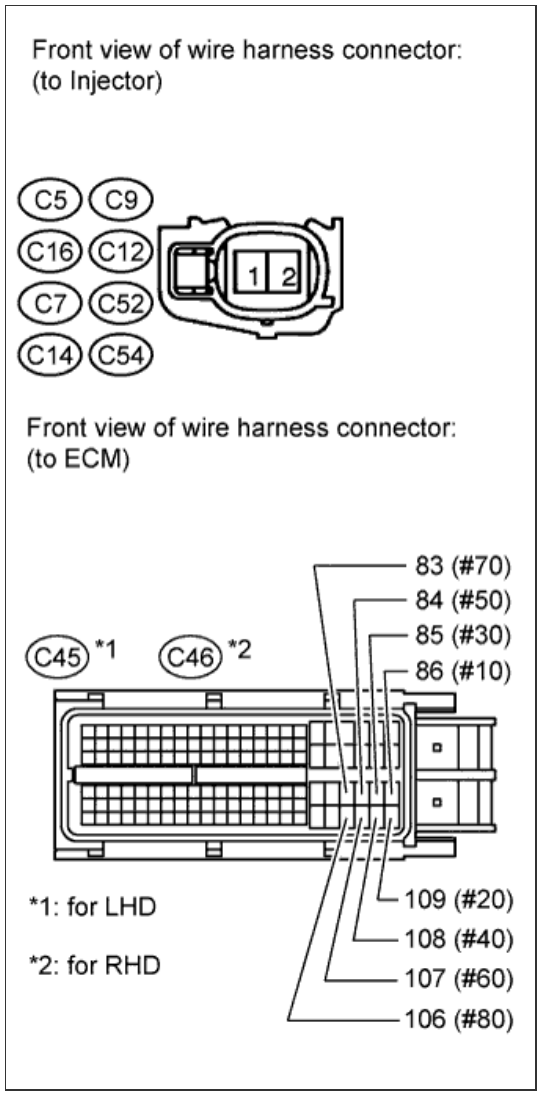
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

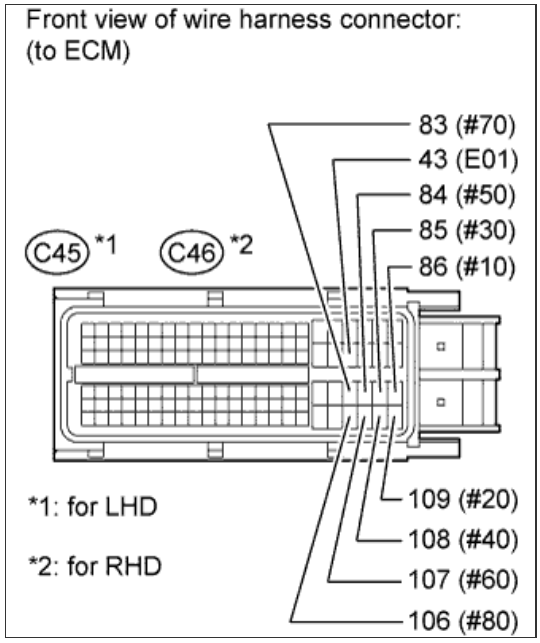
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

OK

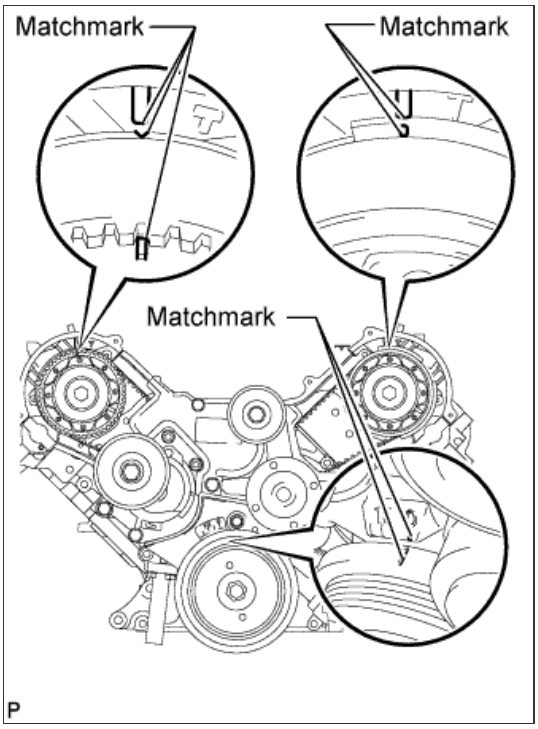
13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

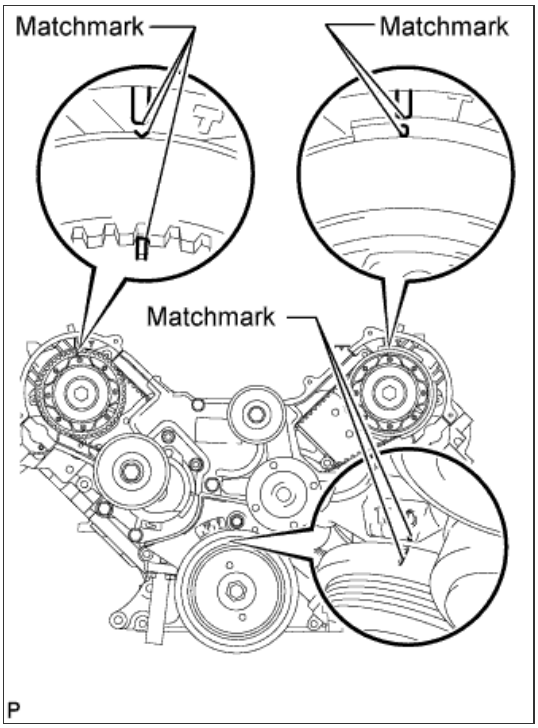
18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

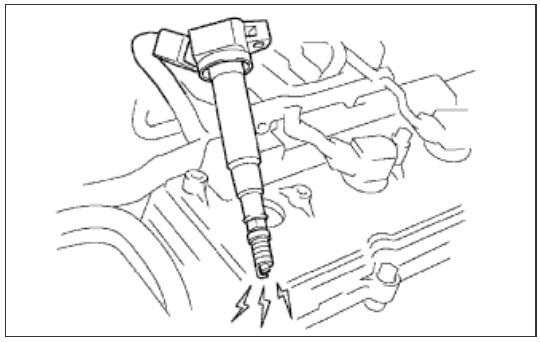
23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

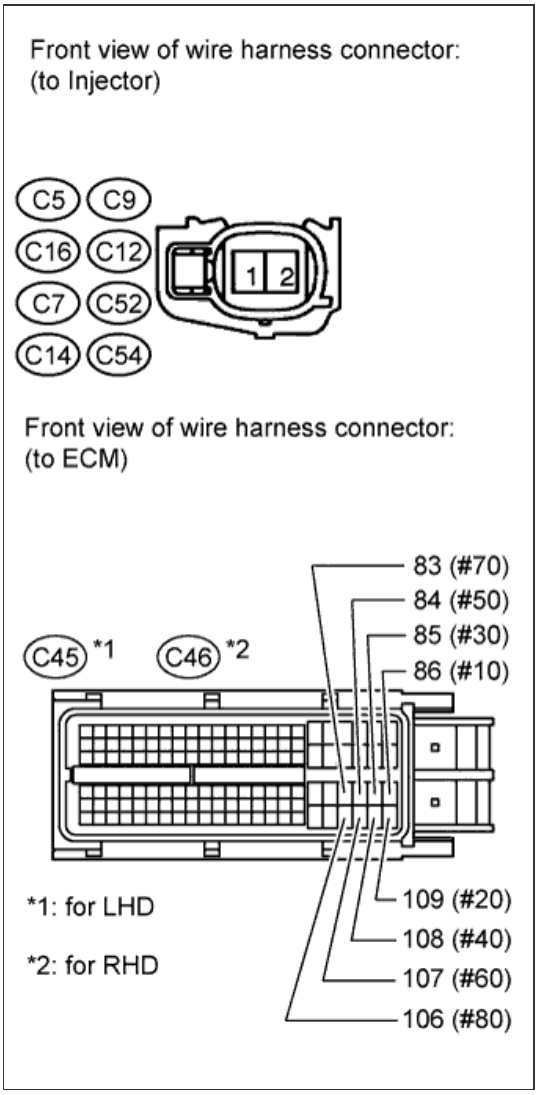
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

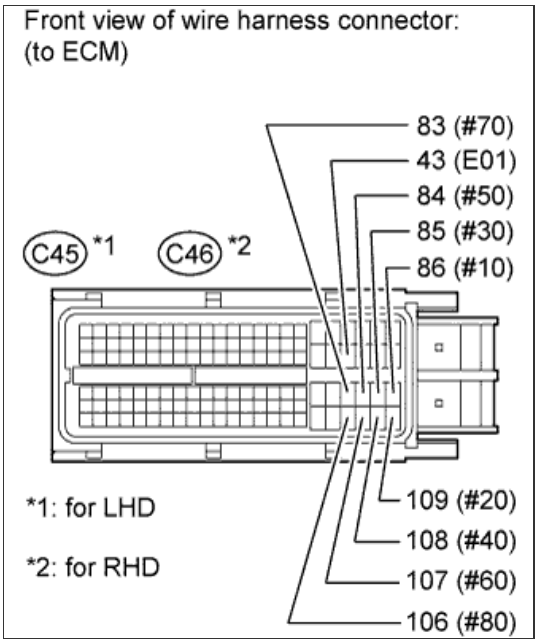
26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

REPLACE ECM (**Click here**)

29.CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the ignition coil with an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK

REPLACE IGNITION COIL (Click here)

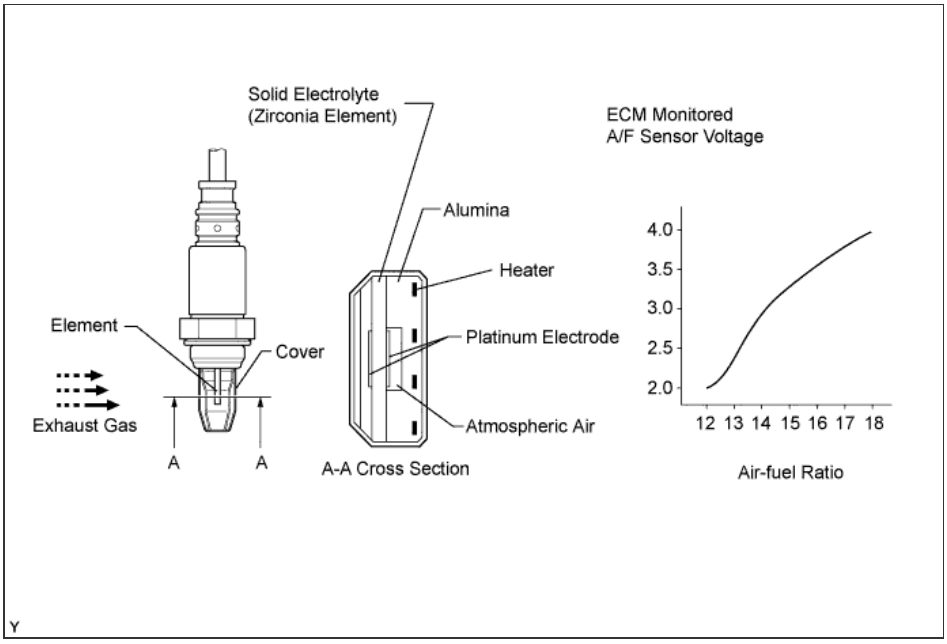
DTC P2195 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)

DTC P2196 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

DTC P2197 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)

DTC P2198 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: The value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is higher than 3.8 V for 5 seconds. (b) The Heated Oxygen (HO2) sensor voltage is 0.21 V or higher.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is 3.6 mA or higher for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is below 2.8 V for 5 seconds. (b) The HO2 sensor voltage is below 0.59 V.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is below 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

HINT:

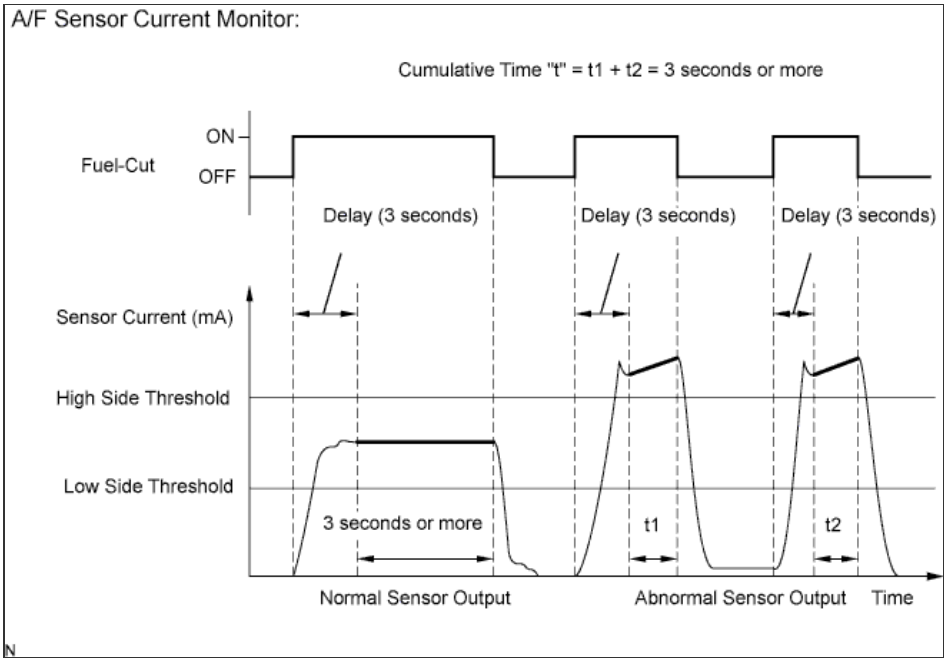
- **DTCs P2195 and P2196 indicate malfunctions related to bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

- **When either of these DTCs is output, check the A/F sensor output voltage by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.**
- **Short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+ and A1A- or A2A+ and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor output voltage cannot be confirmed without using the intelligent tester.**
- **If the A/F sensor is malfunctioning, the ECM stores DTC P2195, P2196, P2197 or P2198.**

MONITOR DESCRIPTION

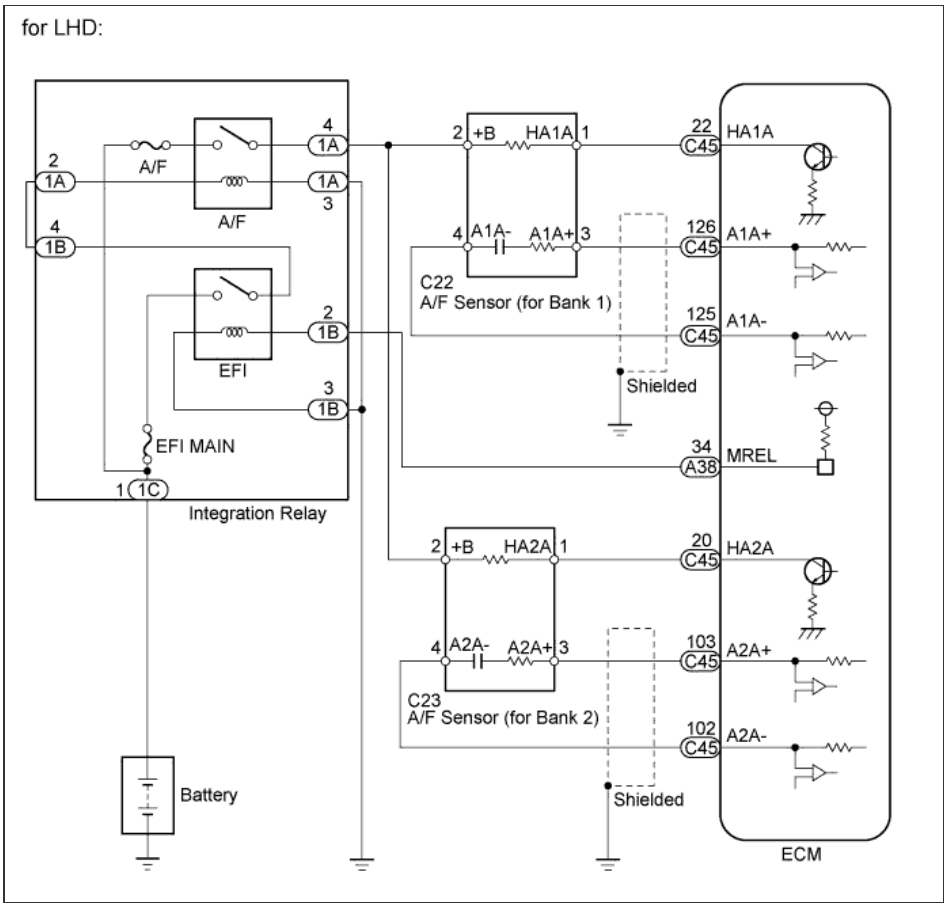
Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor output voltage indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and stores a DTC.

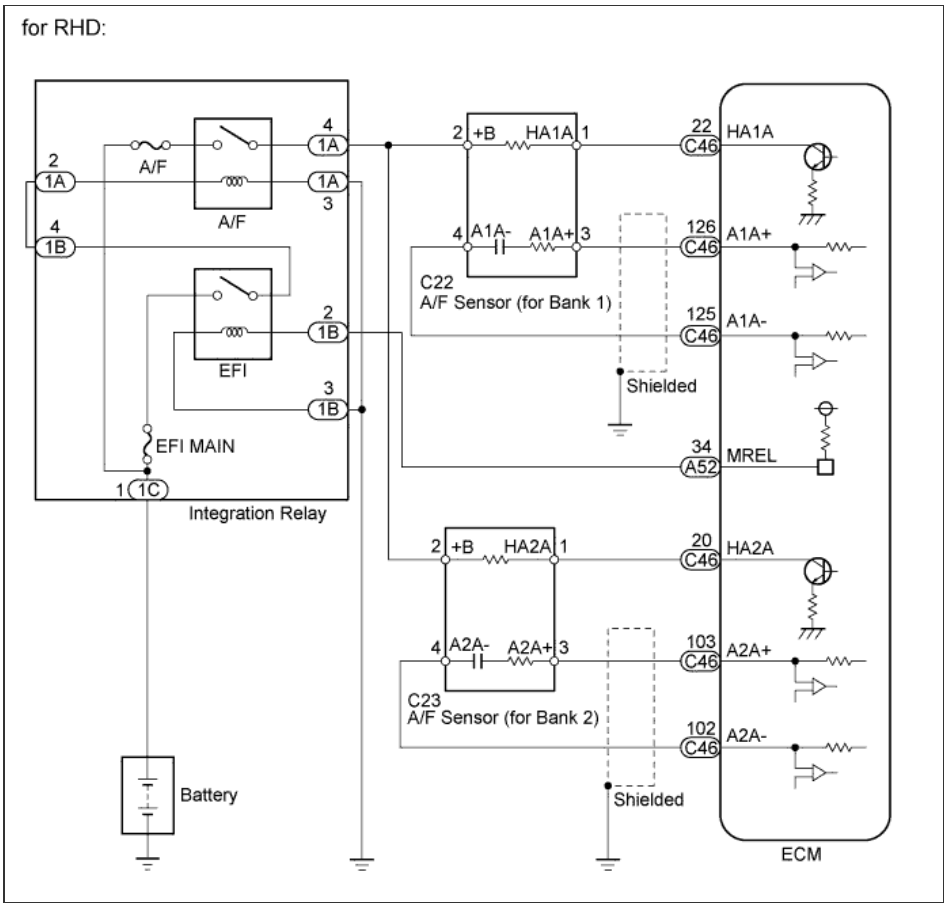


Example:

If the A/F sensor output voltage is below 2.8 V (very rich condition) for 5 seconds, despite the rear HO2 sensor output voltage being below 0.59 V, the ECM stores DTC P2196 or P2198. Alternatively, if the A/F sensor output voltage is higher than 3.8 V (very lean condition) for 5 seconds despite the rear HO2 sensor output voltage being 0.21 V or higher, DTC P2195 or P2197 is stored.



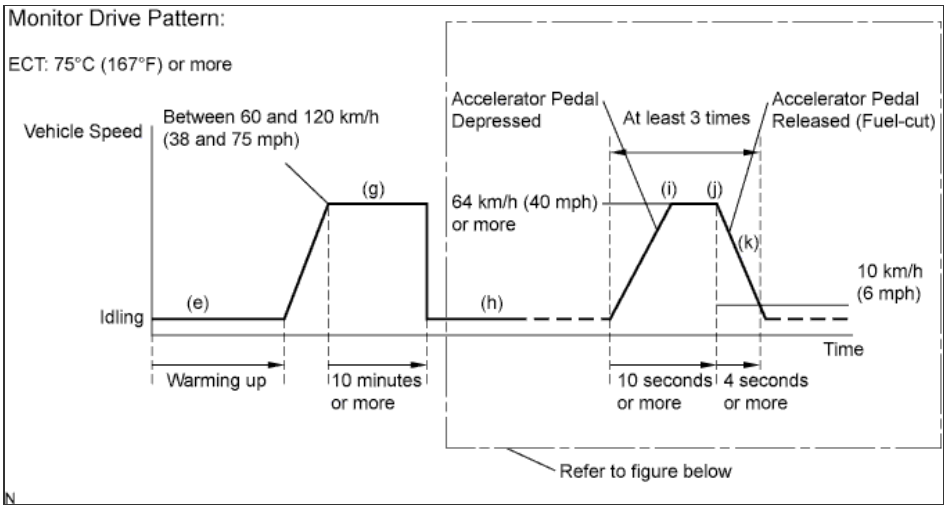
Sensor current detection monitor

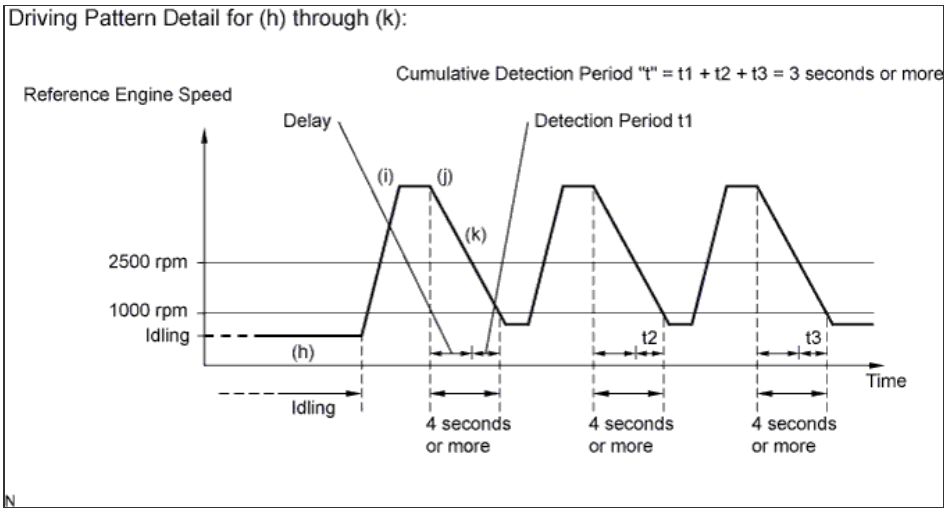


A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or higher for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and stores DTC P2195 or P2197 (high-side stuck). If the A/F sensor output is below 1.4 mA for more than 3 seconds of cumulative time, the ECM stores DTC P2196 or P2198 (low-side stuck).

WIRING DIAGRAM





CONFIRMATION DRIVING PATTERN

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Change the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation.

HINT:

Fuel-cut is performed when the following conditions are met:

- **Accelerator pedal fully released.**
- **Engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in the Data List.

INSPECTION PROCEDURE

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **DTC P2A00 may be stored when the air-fuel ratio is stuck rich or lean.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor function provided in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the Air-fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
(e) Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **The sensors react in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor (for sensor 2) output has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus on the tester: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2195, P2196, P2197 or P2198 is output	A
P2195, P2196, P2197 or P2198 and other DTCs are output	B

HINT:

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the vehicle to drive in accordance with the drive pattern described in the Confirmation Driving Pattern.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / Monitor Status.

g. Check that the status of O2S (A/FS) Monitor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

HINT:

- **Complete indicates that the component is functioning normally.**
- **Incomplete indicates that the component is malfunctioning.**

h. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

i. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or higher, and below 3.6 mA)	A
Outside normal range (Below 1.4 mA, or 3.6 mA or higher)	B

B → Go to step 12

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the A/F sensor at an engine speed of 2500 rpm for 90 seconds.

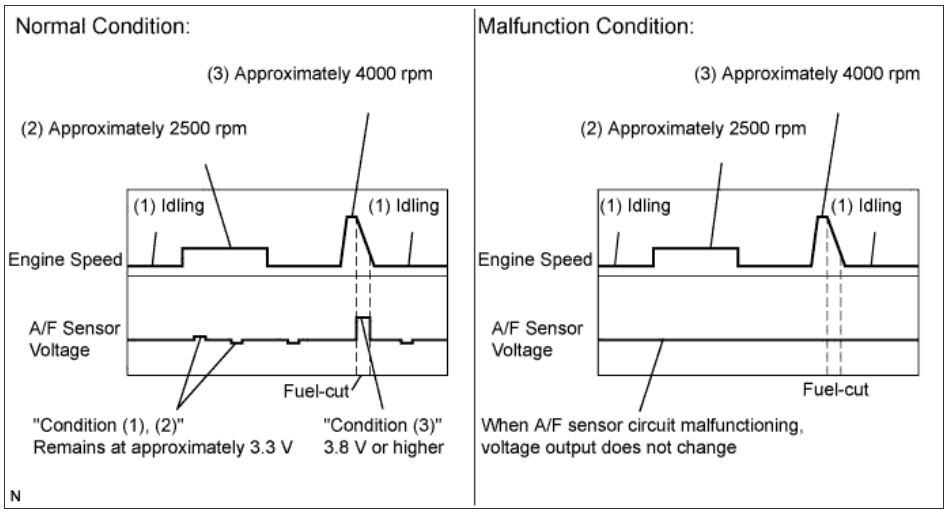
e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS B1 S1 or AFS B2 S1 and Engine Speed.

f. Check the A/F sensor voltage 3 times, when the engine is in each of the following conditions:

i. While idling (check for at least 30 seconds).

ii. At an engine speed of approximately 2500 rpm (without any sudden changes in engine speed).

iii. Raise the engine speed to 4000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.



Standard Voltage:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Remains at approximately 3.3 V	3.1 V to 3.5 V
		This occurs during

(3)	Increases to 3.8 V or higher	engine deceleration (when fuel-cut performed)

HINT:

- **For more information, see the diagrams below.**

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit (this will also happen if the A/F sensor heater has an open circuit).**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or higher, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.**

NG → **Go to step 9**

OK

4.PERFORM CONFIRMATION DRIVING PATTERN

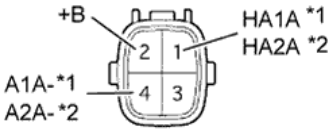
9.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected: (A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

10.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

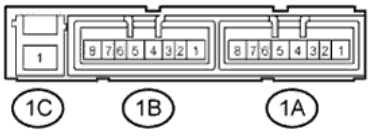
i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected: (Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

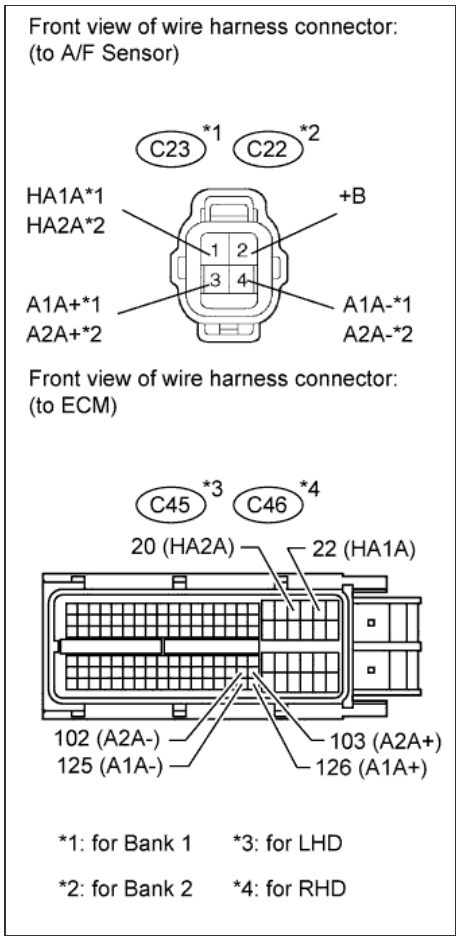
11.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

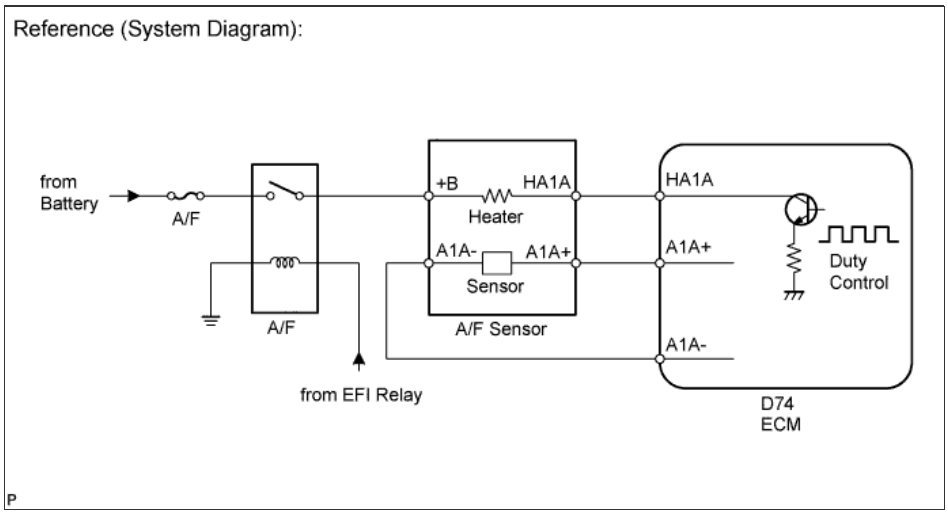
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

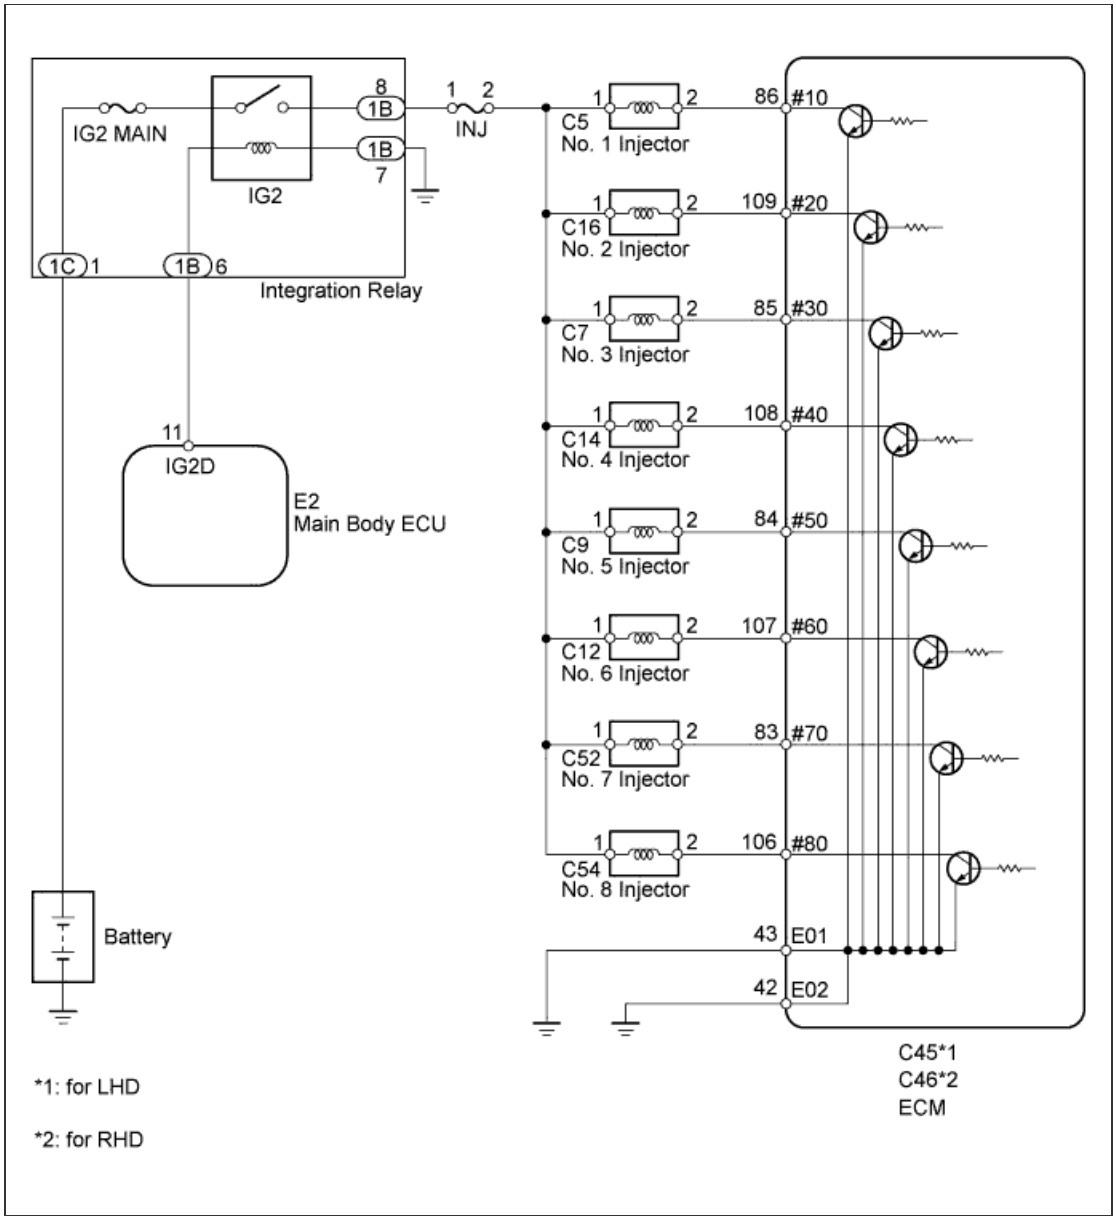
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

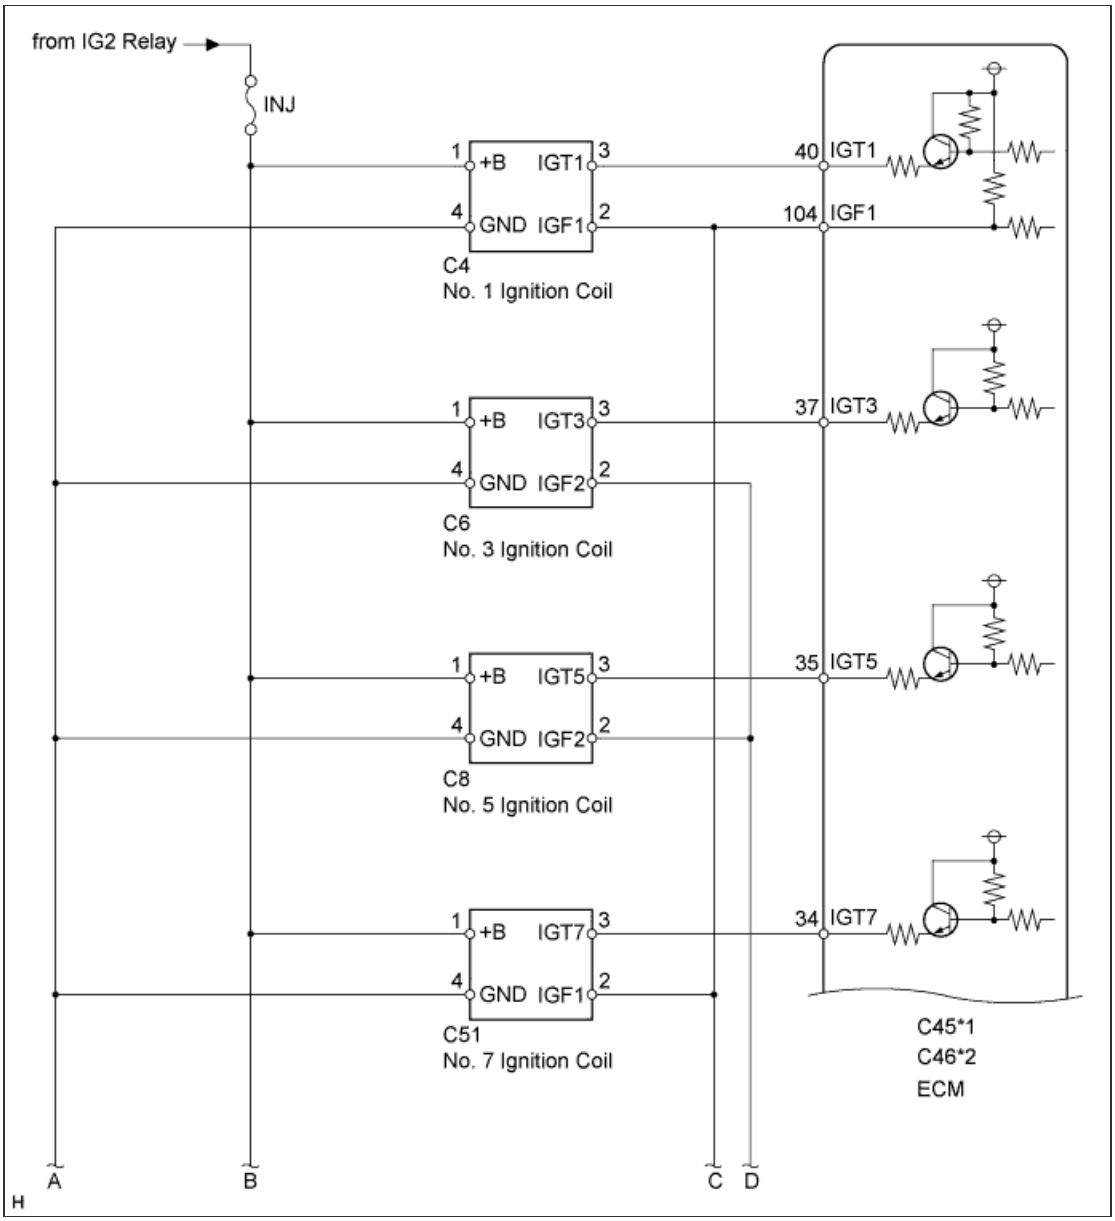
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.

HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

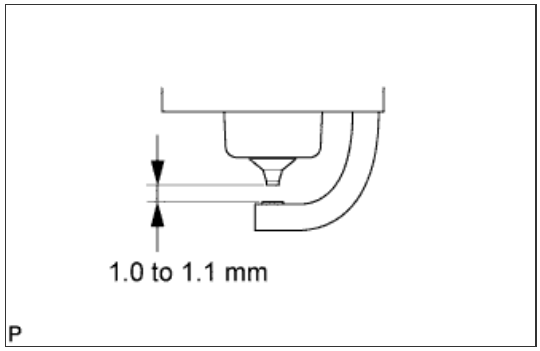
5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

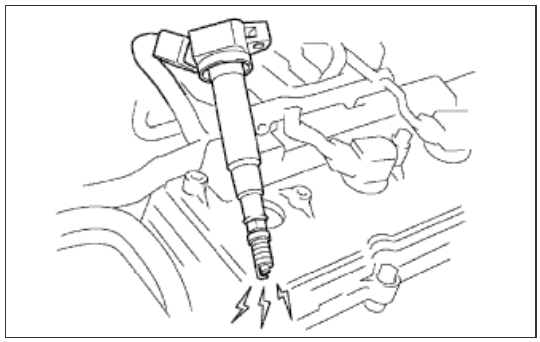
6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

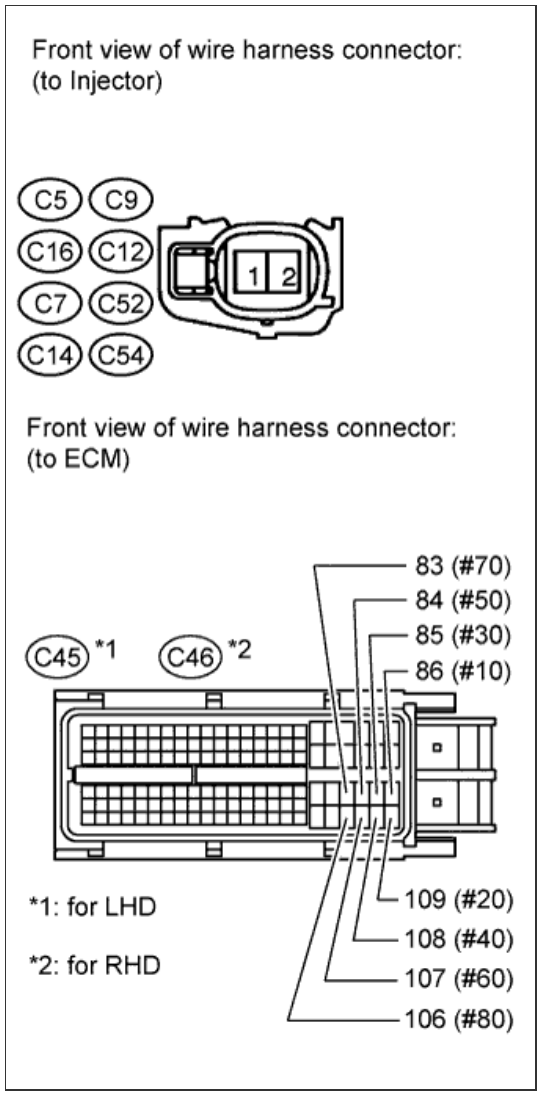
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

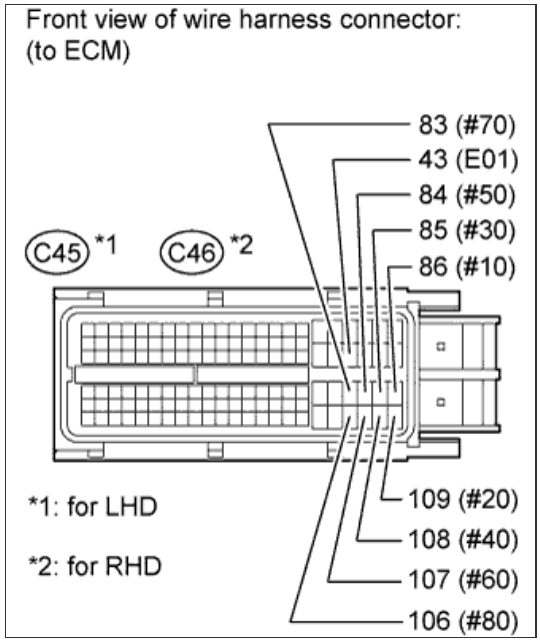
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

OK

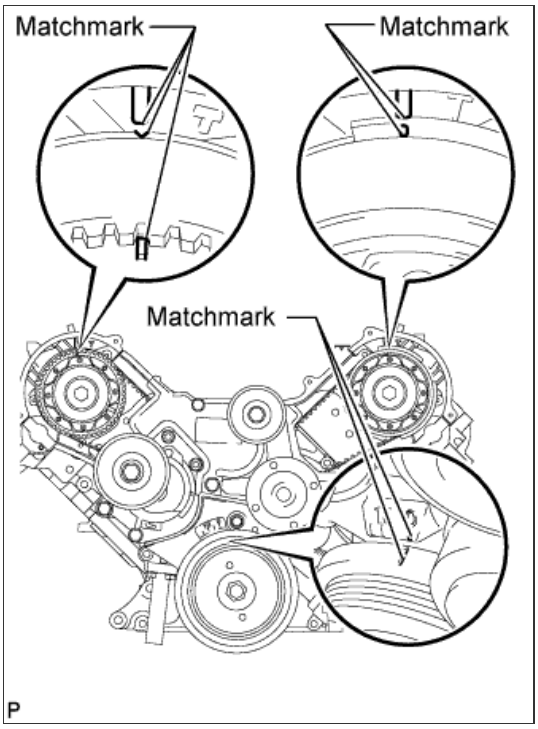
13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

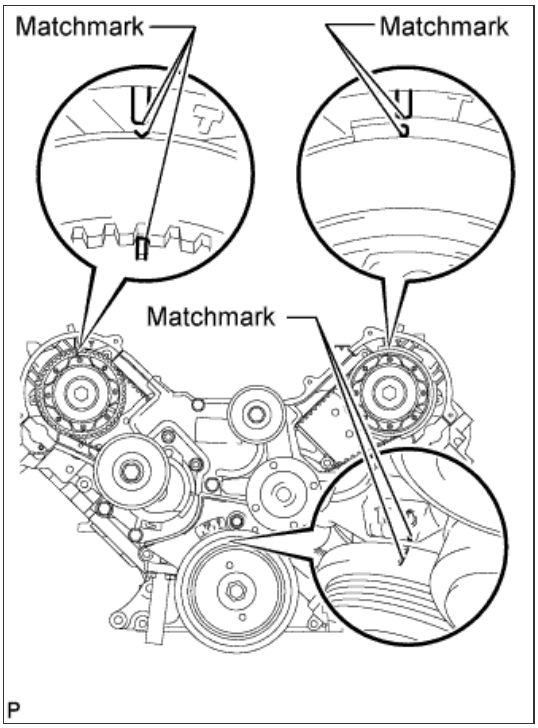
18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

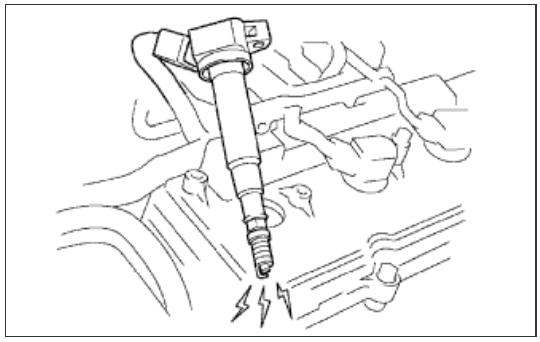
23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

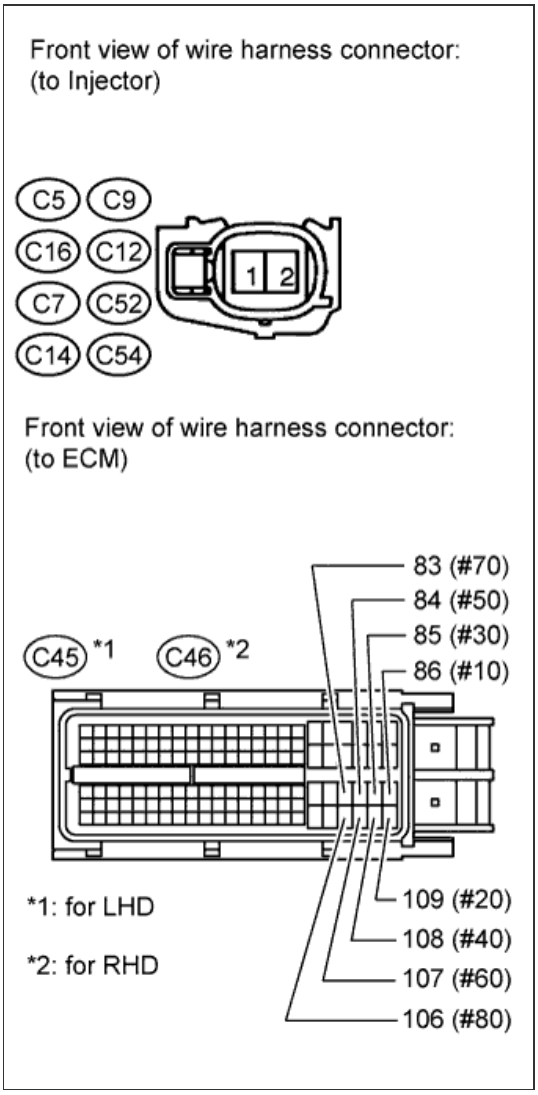
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

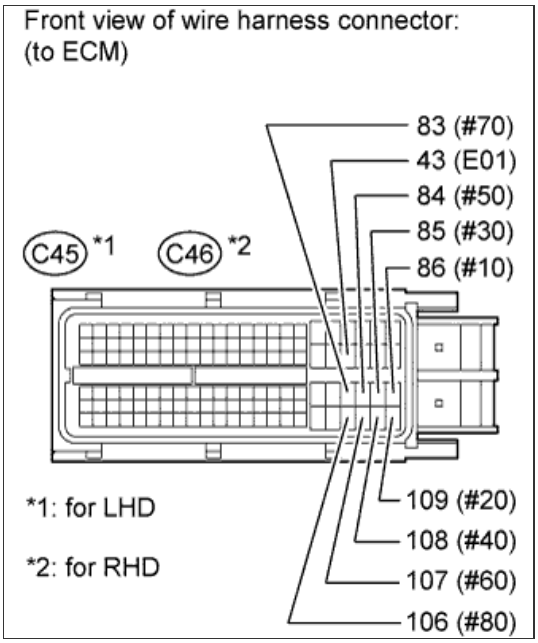
26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

REPLACE ECM (**Click here**)

29.CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the ignition coil with an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK

REPLACE IGNITION COIL (Click here)

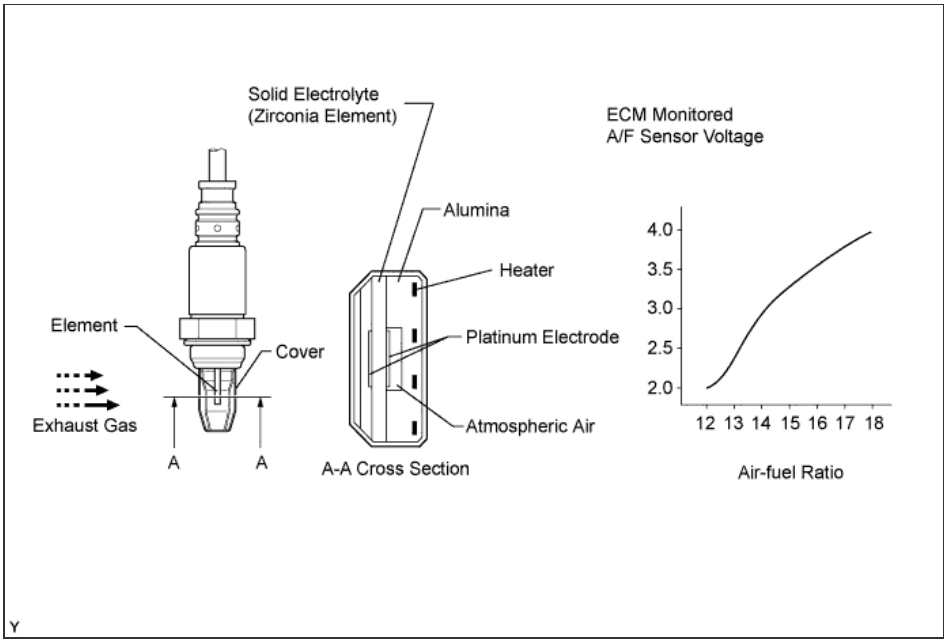
DTC P2195 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)

DTC P2196 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

DTC P2197 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)

DTC P2198 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

The A/F sensor generates a voltage* that corresponds to the actual air-fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air-fuel ratio. The ECM determines the deviation from the stoichiometric air-fuel ratio level, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air-fuel ratio accurately.

The A/F sensor is the planar type and is integrated with the heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate air-fuel ratio detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.

In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air-fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.

*: The value changes inside the ECM. Since the A/F sensor is the current output element, a current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is higher than 3.8 V for 5 seconds. (b) The Heated Oxygen (HO2) sensor voltage is 0.21 V or higher.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is 3.6 mA or higher for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 5 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is below 2.8 V for 5 seconds. (b) The HO2 sensor voltage is below 0.59 V.	• Open or short in A/F sensor (for sensor 1) circuit • A/F sensor (for sensor 1) • A/F sensor heater (for sensor 1) • Integration relay • A/F sensor heater and integration relay circuits • Air induction system • Fuel pressure • Injector • ECM
	While the fuel-cut operation is performed (during vehicle deceleration), the A/F sensor current is below 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

HINT:

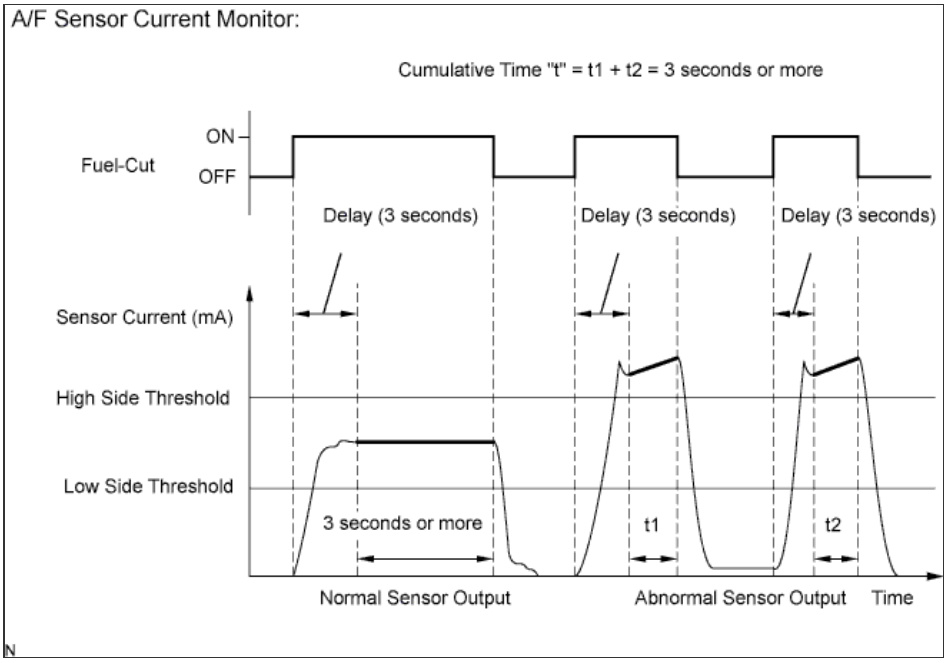
- **DTCs P2195 and P2196 indicate malfunctions related to bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

- **When either of these DTCs is output, check the A/F sensor output voltage by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.**
- **Short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+ and A1A- or A2A+ and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor output voltage cannot be confirmed without using the intelligent tester.**
- **If the A/F sensor is malfunctioning, the ECM stores DTC P2195, P2196, P2197 or P2198.**

MONITOR DESCRIPTION

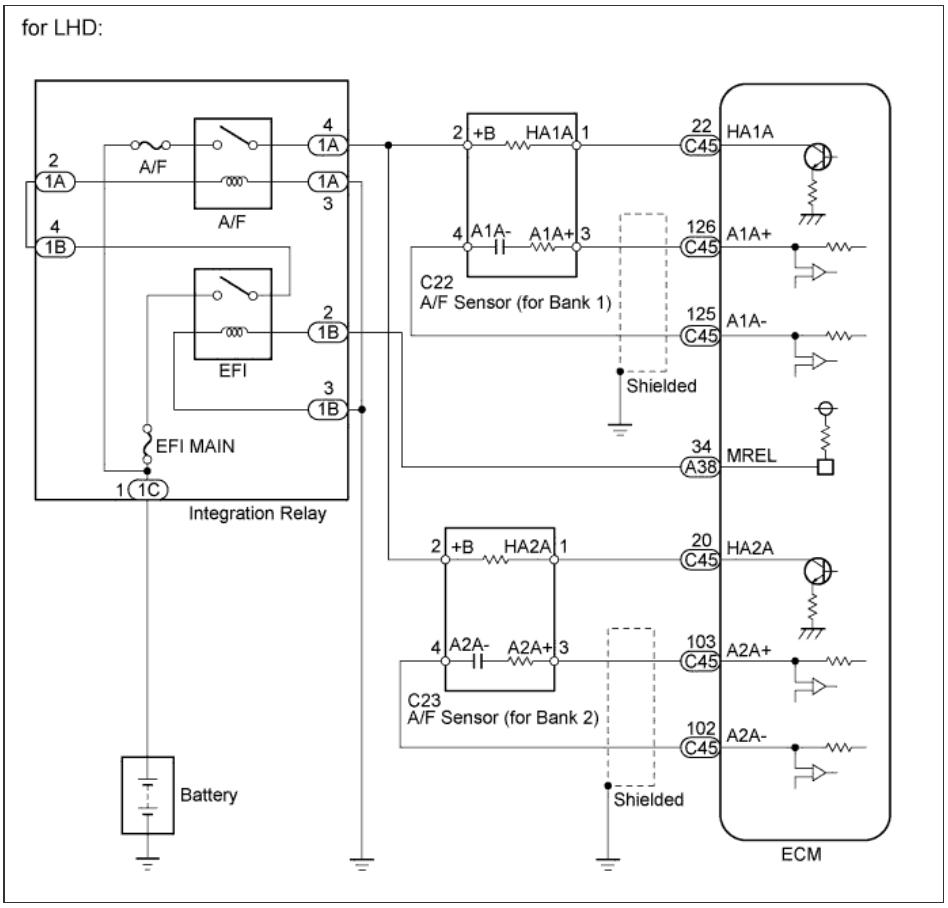
Sensor voltage detection monitor

Under the air-fuel ratio feedback control, if the A/F sensor output voltage indicates rich or lean for a certain period of time, the ECM determines that there is a malfunction in the A/F sensor. The ECM illuminates the MIL and stores a DTC.

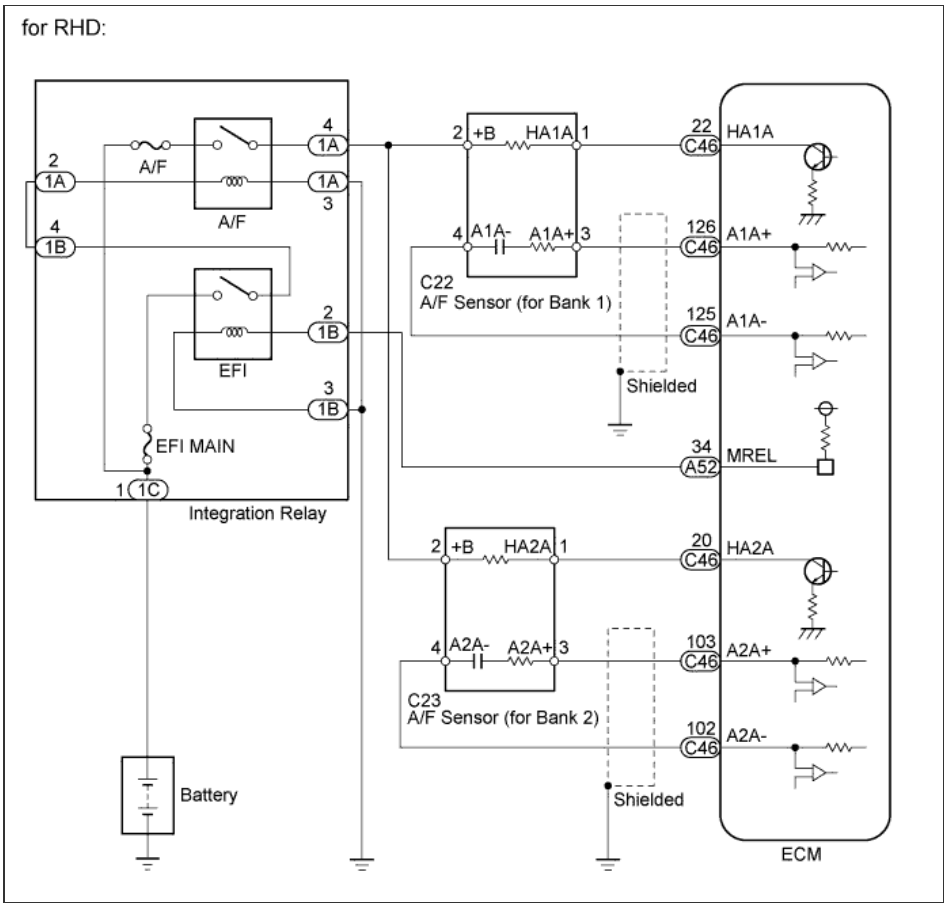


Example:

If the A/F sensor output voltage is below 2.8 V (very rich condition) for 5 seconds, despite the rear HO2 sensor output voltage being below 0.59 V, the ECM stores DTC P2196 or P2198. Alternatively, if the A/F sensor output voltage is higher than 3.8 V (very lean condition) for 5 seconds despite the rear HO2 sensor output voltage being 0.21 V or higher, DTC P2195 or P2197 is stored.



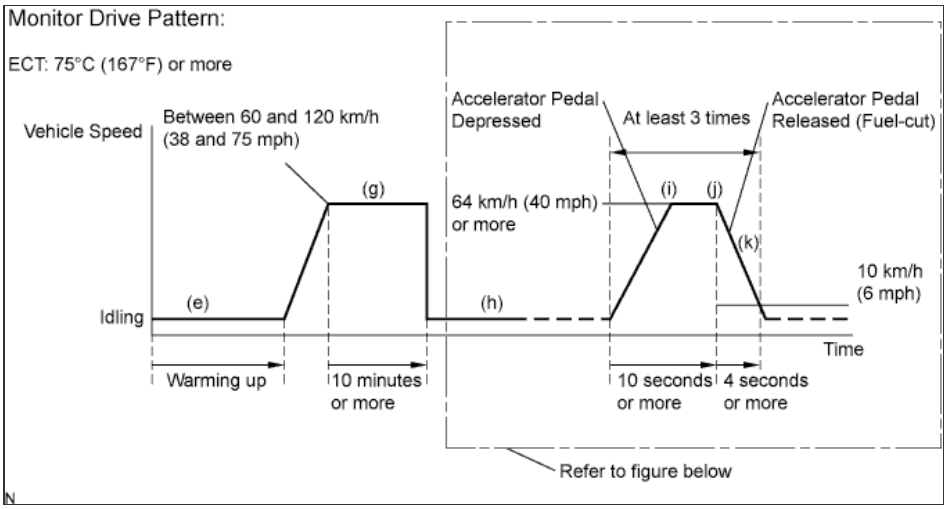
Sensor current detection monitor

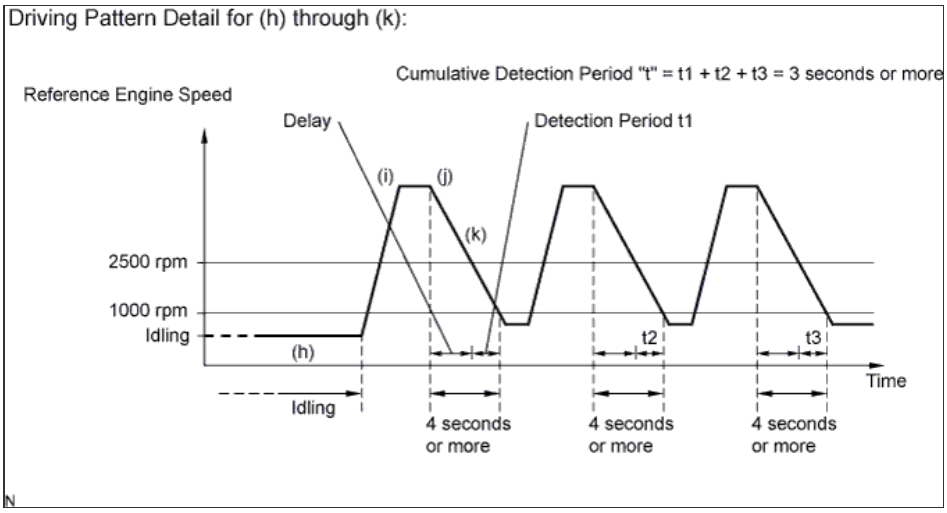


A rich air-fuel mixture causes a low A/F sensor current, and a lean air-fuel mixture causes a high A/F sensor current. Therefore, the sensor output becomes low during acceleration, and it becomes high during deceleration with the throttle valve fully closed. The ECM monitors the A/F sensor current during fuel-cut and detects any abnormal current values.

If the A/F sensor output is 3.6 mA or higher for more than 3 seconds of cumulative time, the ECM interprets this as a malfunction in the A/F sensor and stores DTC P2195 or P2197 (high-side stuck). If the A/F sensor output is below 1.4 mA for more than 3 seconds of cumulative time, the ECM stores DTC P2196 or P2198 (low-side stuck).

WIRING DIAGRAM





CONFIRMATION DRIVING PATTERN

CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

This confirmation driving pattern is used in the "Perform Confirmation Driving Pattern" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Change the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation.

HINT:

Fuel-cut is performed when the following conditions are met:

- **Accelerator pedal fully released.**
- **Engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal, in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in the Data List.

INSPECTION PROCEDURE

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air-Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **DTC P2A00 may be stored when the air-fuel ratio is stuck rich or lean.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F Sensor function provided in the Active Test. The Control the Injection Volume for A/F Sensor function can help to determine whether the Air-fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F Sensor operation using the tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.
(e) Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **The sensors react in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor (for sensor 2) output has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus on the tester: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2195, P2196, P2197 or P2198 is output	A
P2195, P2196, P2197 or P2198 and other DTCs are output	B

HINT:

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Start the engine.

e. Allow the vehicle to drive in accordance with the drive pattern described in the Confirmation Driving Pattern.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / Monitor Status.

g. Check that the status of O2S (A/FS) Monitor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

HINT:

- **Complete indicates that the component is functioning normally.**
- **Incomplete indicates that the component is malfunctioning.**

h. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS B1 S1 or AFS B2 S1.

i. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or higher, and below 3.6 mA)	A
Outside normal range (Below 1.4 mA, or 3.6 mA or higher)	B

B → Go to step 12

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the A/F sensor at an engine speed of 2500 rpm for 90 seconds.

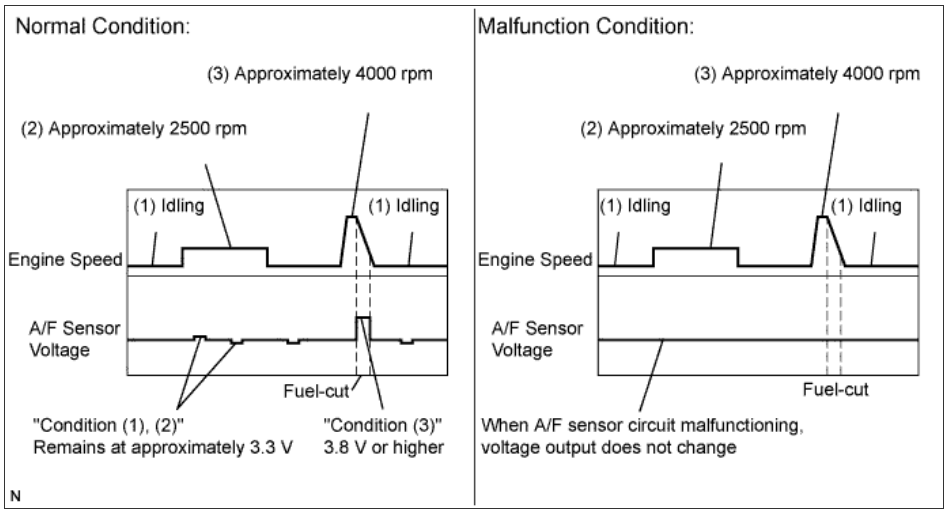
e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS B1 S1 or AFS B2 S1 and Engine Speed.

f. Check the A/F sensor voltage 3 times, when the engine is in each of the following conditions:

i. While idling (check for at least 30 seconds).

ii. At an engine speed of approximately 2500 rpm (without any sudden changes in engine speed).

iii. Raise the engine speed to 4000 rpm and then quickly release the accelerator pedal so that the throttle valve is fully closed.



Standard Voltage:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Remains at approximately 3.3 V	3.1 V to 3.5 V
		This occurs during

(3)	Increases to 3.8 V or higher	engine deceleration (when fuel-cut performed)

HINT:

- **For more information, see the diagrams below.**

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have an open circuit (this will also happen if the A/F sensor heater has an open circuit).**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or higher, or 2.8 V or less (see Malfunction Condition diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learning value to perform fuel cut. If the battery terminal has been reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage result.**

NG → **Go to step 9**

OK

4.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (DTC P2195, P2196, P2197 OR P2198)

a. Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.

b. Read pending DTCs.

Result

Result	Proceed to
P2195, P2196, P2197 or P2198 is output	A
No DTC is output	B

B → **END**

A

6.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

7.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS (DTC P2195, P2196, P2197 OR P2198)

A

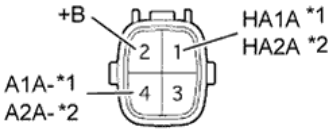
END

9.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected: (A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

10.INSPECT INTEGRATION NO.1 RELAY (A/F)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

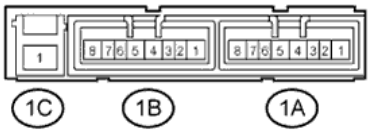
i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.



c. Inspect the integration relay (A/F).

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

Component without harness connected: (Integration Relay)

NG → REPLACE INTEGRATION NO.1 RELAY (A/F)

OK

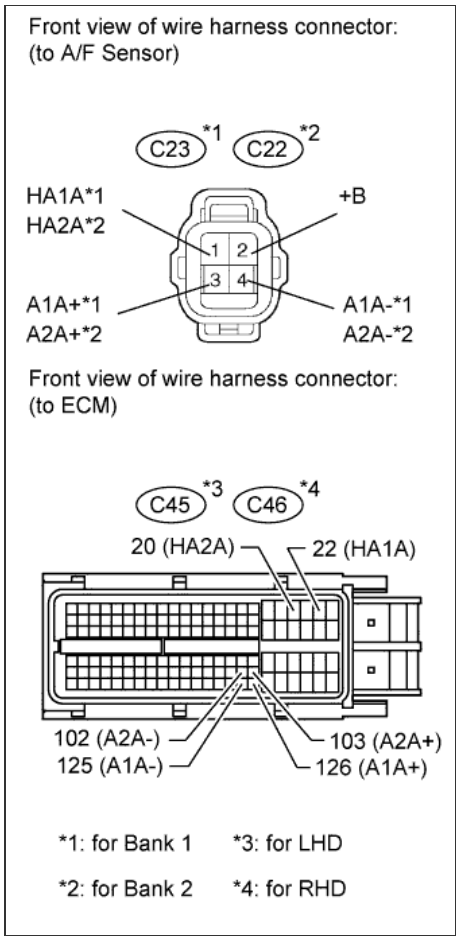
11.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

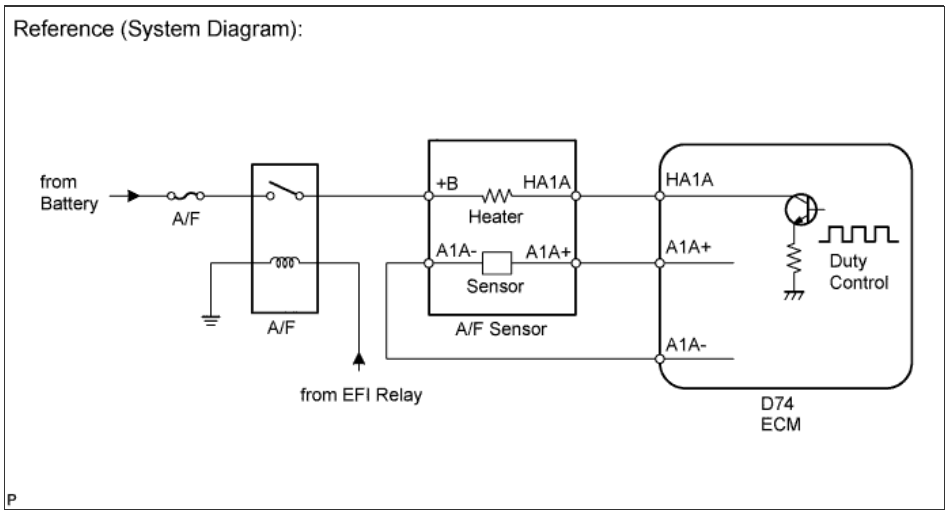
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

for Preparation Click here

DESCRIPTION

When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. Extremely high HC concentration levels can cause increases in exhaust emission levels. High concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent these increases in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire rate. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the Camshaft Position (CMP) sensor and the Crankshaft Position (CKP) sensor. The CMP sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted as when the crankshaft rotation speed variations exceed predetermined thresholds.
If the misfire rate exceeds the threshold level, the ECM illuminates the MIL and stores a DTC.

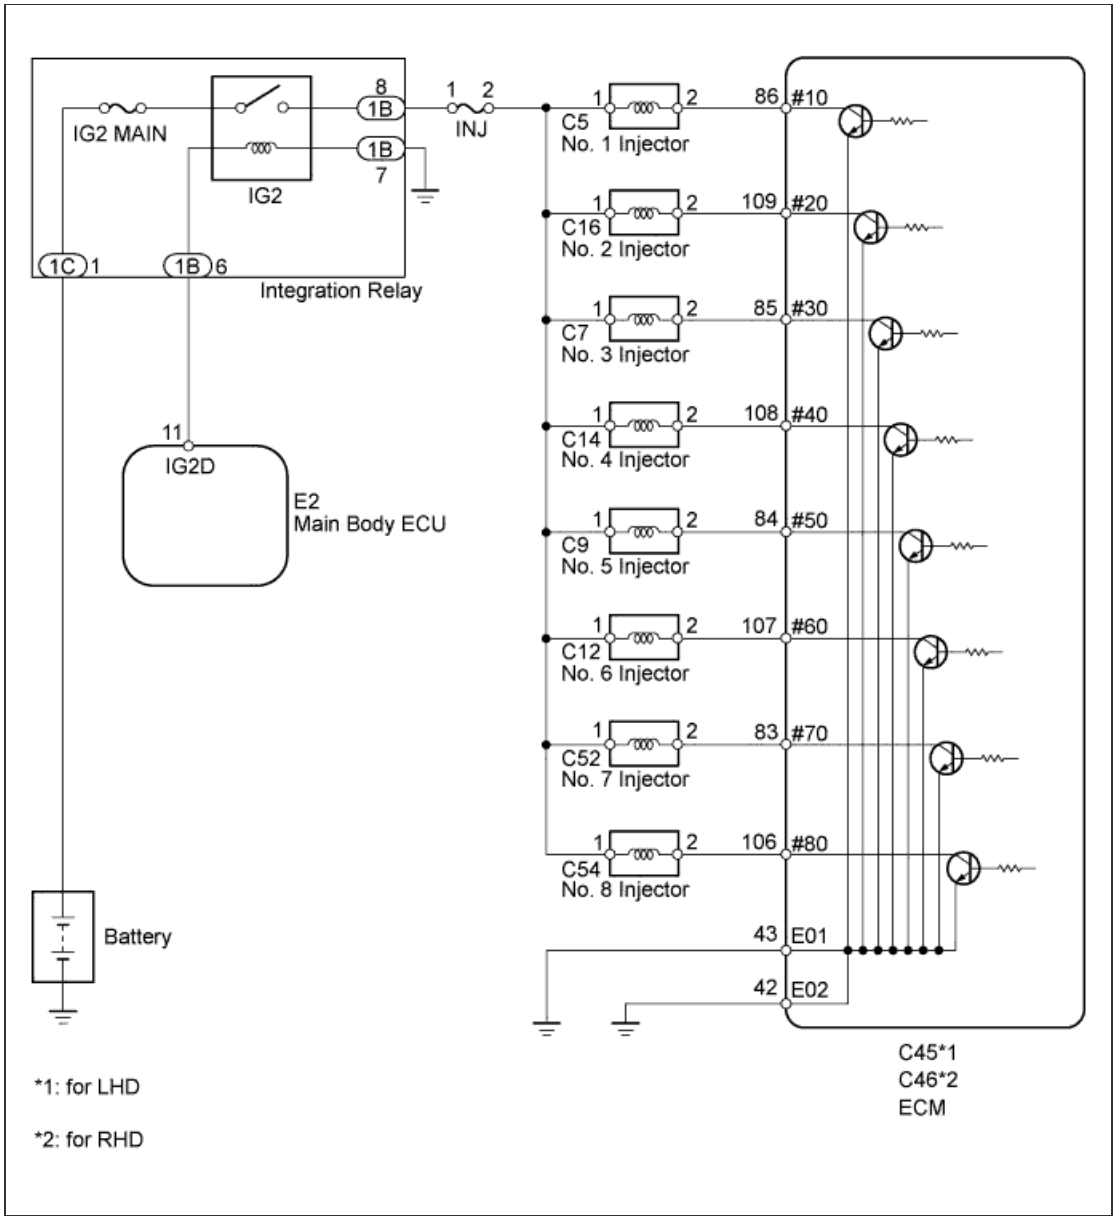
DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connection • Vacuum hose connections • Ignition system • Fuel injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306 P0307 P0308	Misfiring of a specific cylinder occurs and one of the following conditions below is detected (2 trip detection logic): • A high temperature misfire occurs in the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

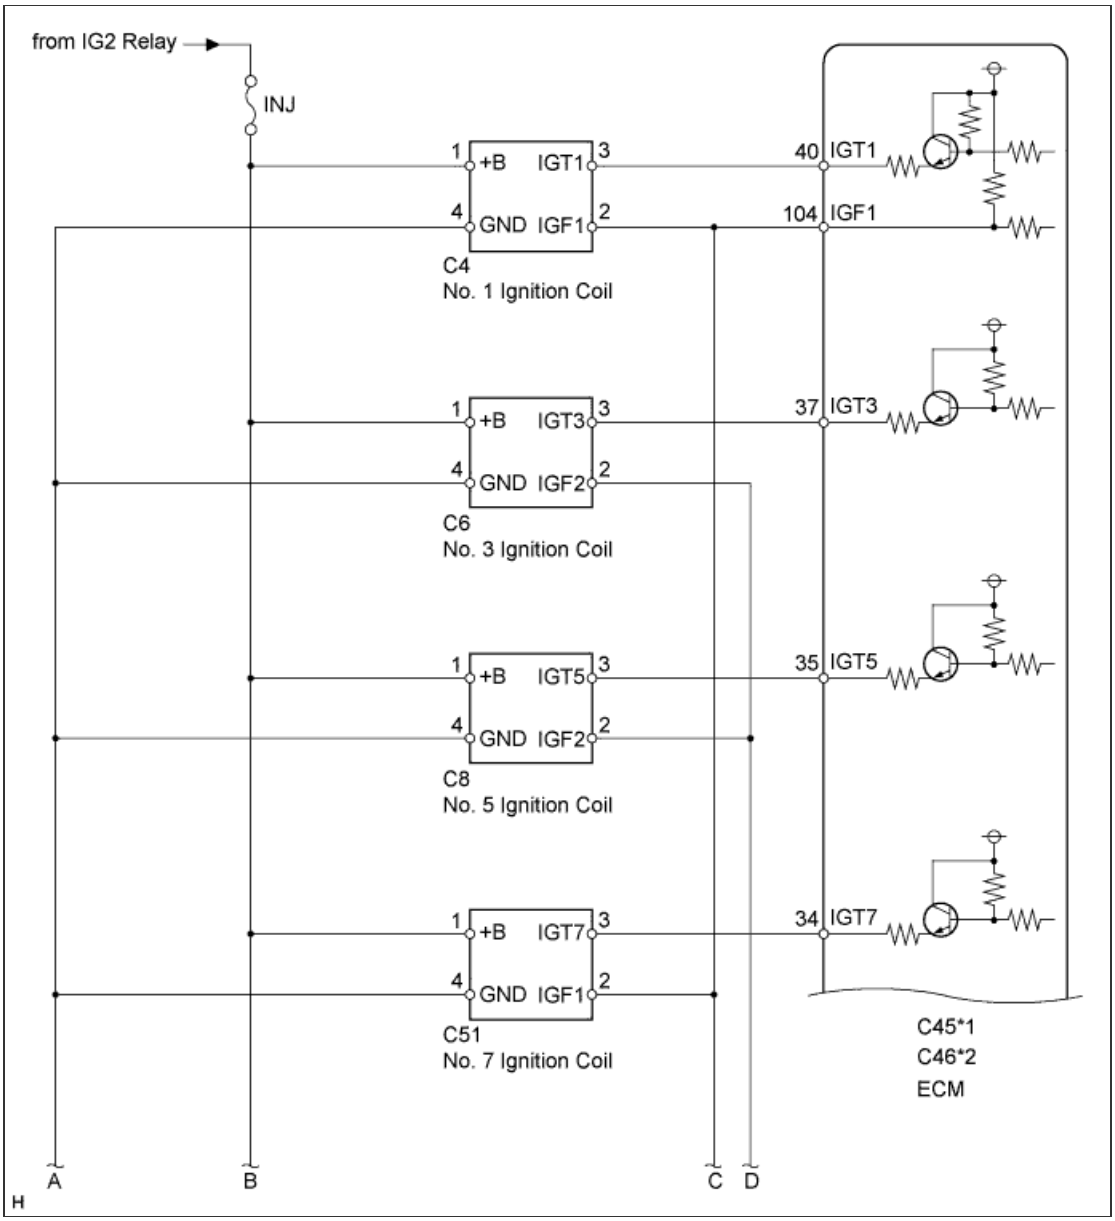
MONITOR DESCRIPTION

The ECM illuminates the MIL and stores a DTC when either one of the following conditions, which could cause emission deterioration, is detected (2 trip detection logic).

- Within the first 1000 crankshaft revolutions of the engine starting, an excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs once.
- An excessive misfiring rate (approximately 130 to 160 misfires per 1000 crankshaft revolutions) occurs a total of 4 times.



The ECM flashes the MIL and stores a DTC when either one of the following conditions, which could cause damage to the Three-Way Catalytic Converter (TWC), is detected (2 trip detection logic).



- At a high engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs once.
- At a normal engine speed, a catalyst damage misfire, which is monitored every 200 crankshaft revolutions, occurs 3 times.

HINT:

If a catalyst damage misfire occurs, the ECM informs the driver by flashing the MIL.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the engine switch on (IG).
3. Turn the tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire counts of each cylinder (cylinder No. 1 to No. 8) with the engine in an idling condition. If any misfire count is displayed, skip the following confirmation driving pattern.
7. Drive the vehicle several times with the conditions, such as engine speed and engine load, shown in Misfire RPM and Misfire Load in the Data List.

HINT:

In order to store misfire DTCs, it is necessary to operate the vehicle for the period of time shown in the table below, with the Misfire RPM and Misfire Load in the Data List.

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

   HINT:

   Do not turn the engine switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data will be cleared.

9. Record the DTC(s), freeze frame data and misfire counts.
10. Turn the engine switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the freeze frame data have been duplicated, one of the following factors is considered to be a possible cause of the problem:**
  1. **The fuel level is low.**
  2. **Improper fuel is used.**
  3. **The spark plugs are dirty.**
- **After finishing repairs, check that no misfires occur in each cylinder (cylinder No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7 and No. 8).**
- **Be sure to confirm that no misfiring cylinder DTCs are output again by conducting the confirmation driving pattern, after the repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speed. If misfires only occur during high engine speed driving, only DTC P0300 is stored.**
  In the event of DTC P0300 being output, perform the following operations:
  1. **Clear the DTC (Click here).**
  2. **Start the engine and conduct the confirmation driving pattern.**
  3. **Read the misfiring rates of each cylinder or DTC(s) using the tester.**
  4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
  5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not output.**
- **When either Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air-fuel ratio may be rich (-20% or less) or lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is below 75°C (167°F), the misfires occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 is output	A
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and/or P0308 and other DTCs are output	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307 and P0308 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (MISFIRE COUNT)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5, #6, #7 and #8.

f. Allow the engine to idle.

g. Read each value for Cylinder #1 Misfire Count to #8 displayed on the tester. If no misfire counts occur in any cylinders, perform the following procedures:

i. Move the shift lever to D.

ii. Check the Cylinder #1 Misfire Count to #8.

iii. If misfire counts are still not displayed, perform procedure A and and then check the misfire counts again.

h. Drive the vehicle with the Misfire RPM and Misfire Load noted in the Read value using intelligent tester (Misfire RPM and Misfire Load) procedures above (procedure A).

i. Read the Cylinder #1 Misfire Count to #8 or DTCs displayed on the tester (procedure).

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have e ual misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data record of the Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

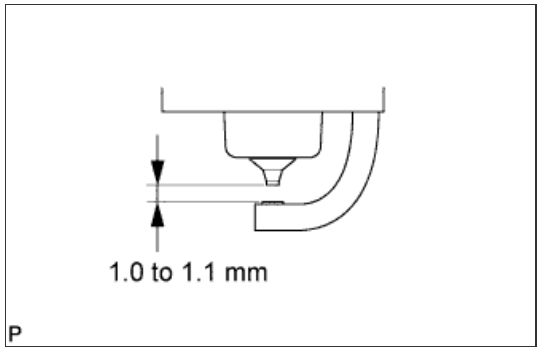
5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).



b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

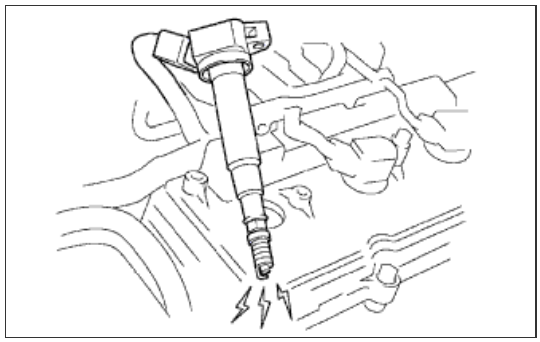
6.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

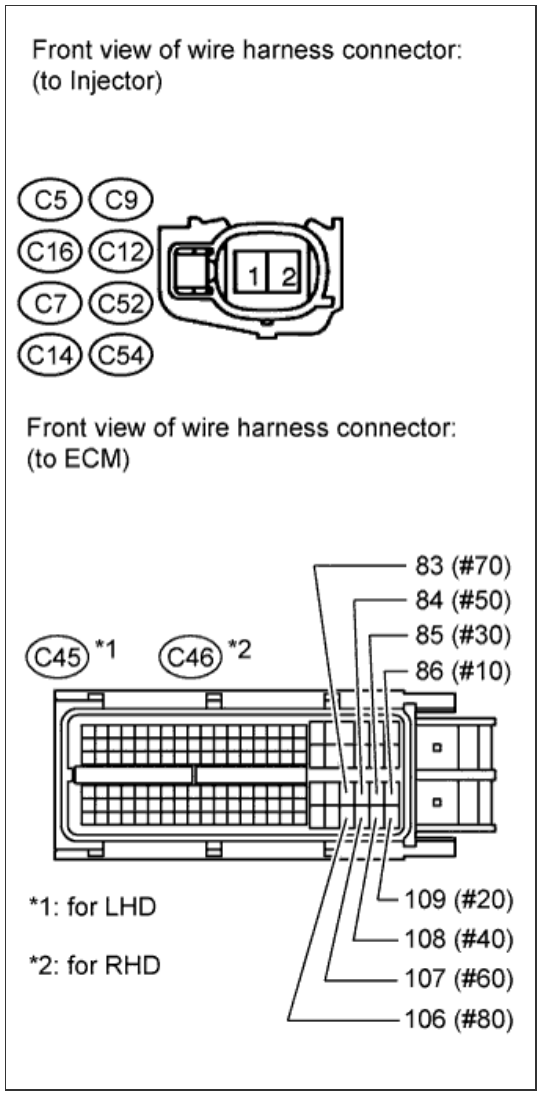
b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.



e. Measure the resistance according to the value(s) in the table below.

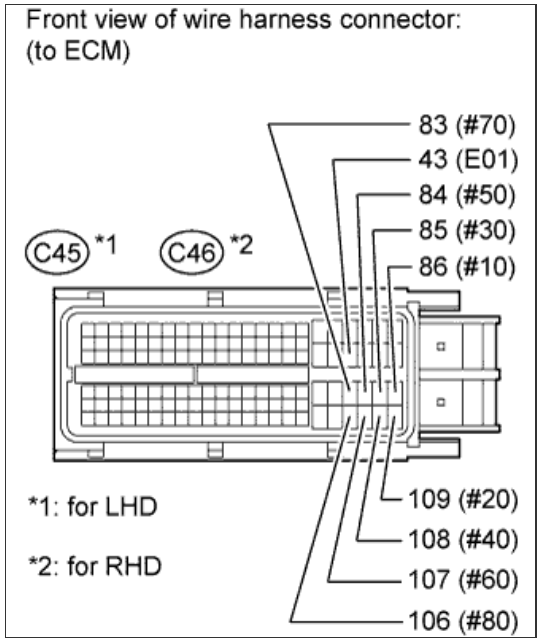
Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher

	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) -	Engine switch on	

C46-43 (E01)	(IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (**Click here**)

OK

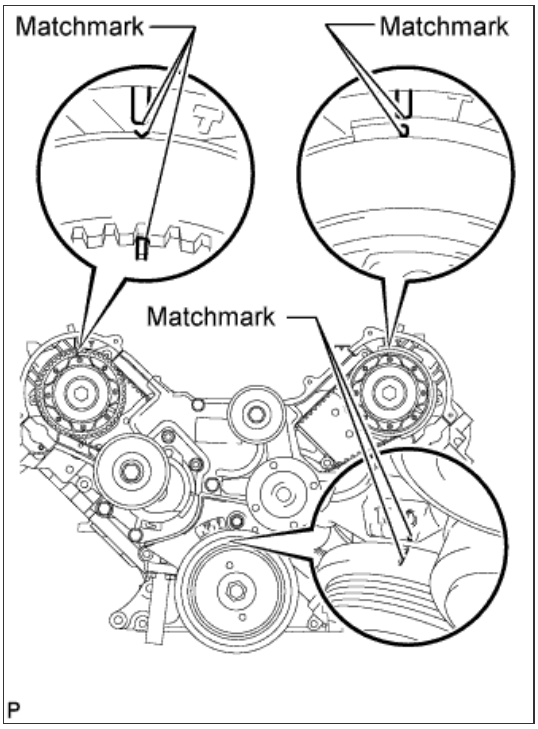
13.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).

c. Turn the crankshaft to align the matchmarks of the crankshaft.



d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:

The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:

With cold engine: Same as ambient air temperature.

With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK ↓

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK ↓

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM (Click here)

OK

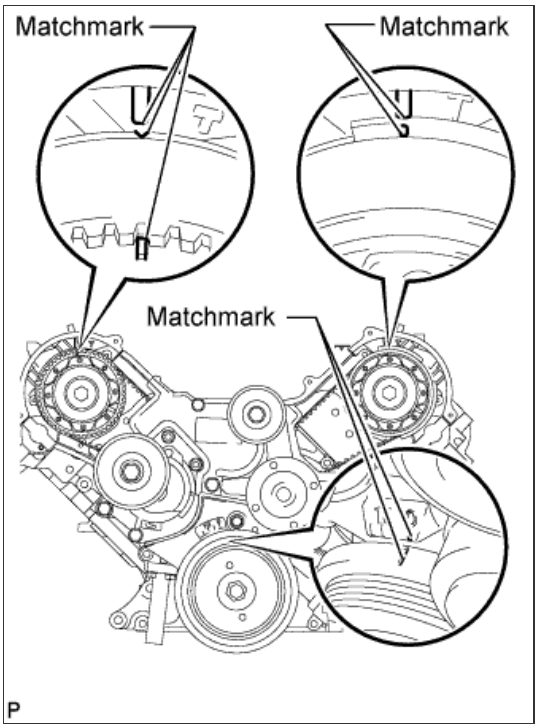
18.CHECK VALVE TIMING

a. Remove the drive belt (Click here).

b. Remove the timing belt cover LH and RH (Click here).



c. Turn the crankshaft to align the matchmarks of the crankshaft.

d. Align the notch of the crankshaft pulley with the 0 position.

e. Confirm whether the matchmarks of the camshaft pulley and cylinder head cover are facing each other.

f. If the matchmarks are not facing each other, turn the crankshaft clockwise by 360 . Confirm again if the matchmarks are facing each other.

OK:
The matchmarks of the camshaft pulley and the cylinder head cover face each other when the notch of the crankshaft pulley is in the "0" position.

NG → ADJUST VALVE TIMING (Click here)

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK AND REPLACE FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

d. Read the Coolant Temp twice, when the engine is both cold and warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: Between 80°C and 100°C (167°F and 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap.

Standard gap:
1.0 to 1.1 mm (0.039 to 0.043 in.)

c. Check the electrode for carbon deposits.

Recommended Spark Plug:

Manufacturer	Product
DENSO	SK20R11
NGK	IFR6A11

NOTICE:

If the electrode gap is larger than standard, replace the spark plug. Do not adjust the electrode gap.

NG → REPLACE SPARK PLUG (Click here)

OK

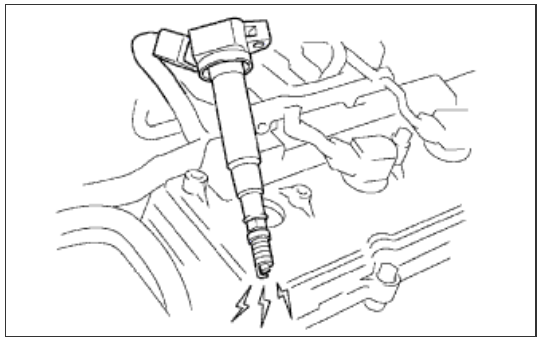
23.CHECK FOR SPARKS AND IGNITION



a. Disconnect the fuel injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head (Click here).

c. Install the spark plug onto the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check the spark.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → REPAIR ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

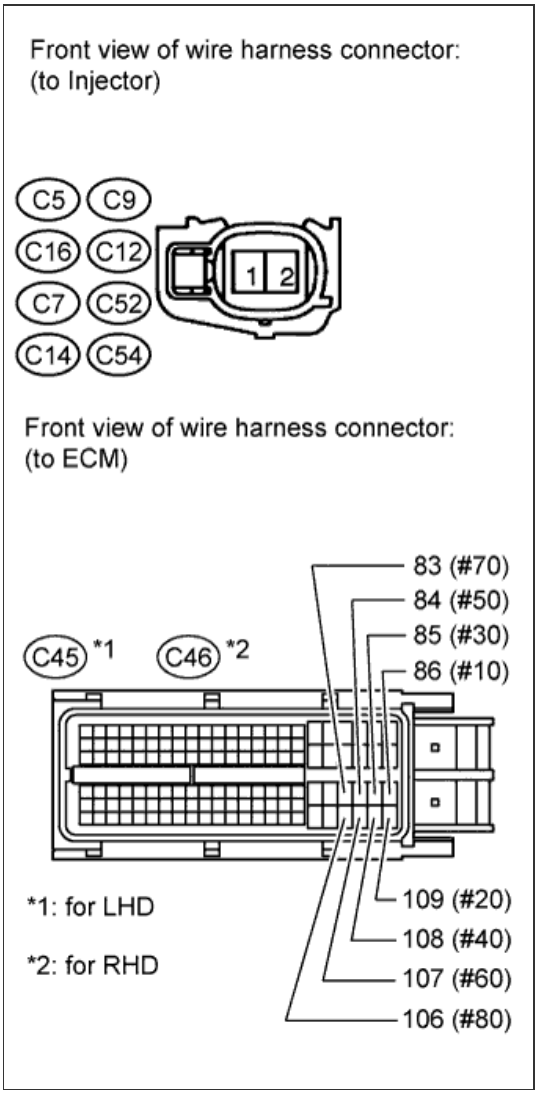
25.CHECK HARNESS AND CONNECTOR (ECM - FUEL INJECTOR)

a. Disconnect the fuel injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

d. Turn the engine switch off.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
	C12-2 - Ground	Always	10 kΩ or higher

No. 6	C12-2 - C45-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Ground	Always	10 kΩ or higher
	C7-2 - C46-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Ground	Always	10 kΩ or higher
	C14-2 - C46-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Ground	Always	10 kΩ or higher
	C9-2 - C46-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Ground	Always	10 kΩ or higher
	C12-2 - C46-107 (#60)	Always	Below 1 Ω
No. 7	C52-2 - Ground	Always	10 kΩ or higher
	C52-2 - C46-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Ground	Always	10 kΩ or higher
	C54-2 - C46-106 (#80)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

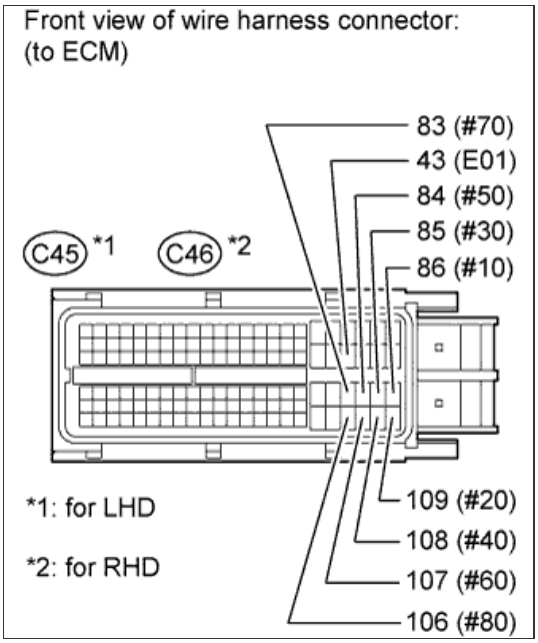
26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50, #60, #70 AND/OR #80 VOLTAGE)



a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
C45-86 (#10) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-109 (#20) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-85 (#30) -	Engine switch on	11 to 14 V

C45-43 (E01)	(IG)	
C45-108 (#40) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-84 (#50) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-107 (#60) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-83 (#70) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V
C45-106 (#80) - C45-43 (E01)	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
C46-86 (#10) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-109 (#20) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-85 (#30) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-108 (#40) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-84 (#50) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-107 (#60) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-83 (#70) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V
C46-106 (#80) - C46-43 (E01)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the fuel injector injection whether fuel volume is high or low, and whether injection pattern is poor (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

REPLACE ECM (**Click here**)

29.CHANGE TO NORMAL SPARK PLUG AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.CHANGE TO NORMAL IGNITION COIL AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the ignition coil with an ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect the injector connector.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK

REPLACE IGNITION COIL (Click here)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

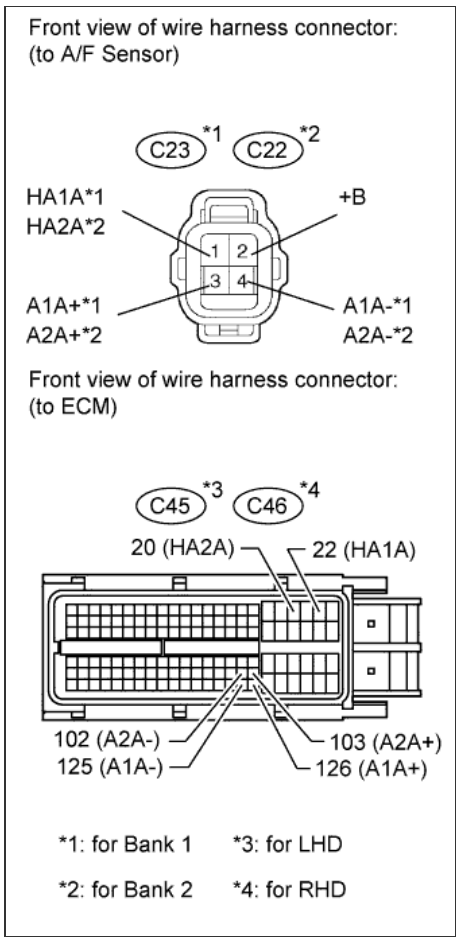
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
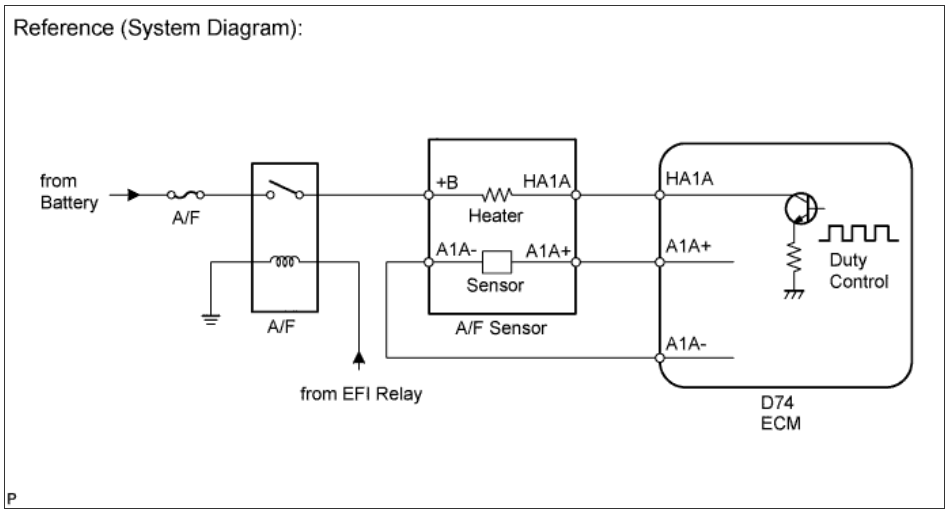
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):



Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher

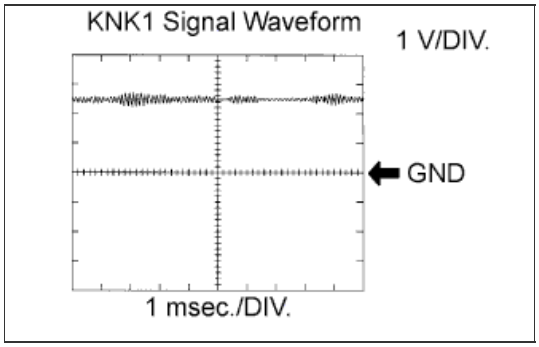
DESCRIPTION



Flat type knock sensors (non-resonant type) have structures that can detect vibrations between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC Code	DTC Detection Condition	Trouble Area
P0327 P0332	The output voltage of the knock sensor is below 0.5 V (1 trip detection logic).	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	The output voltage of the knock sensor is higher than 4.5 V (1 trip detection logic).	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

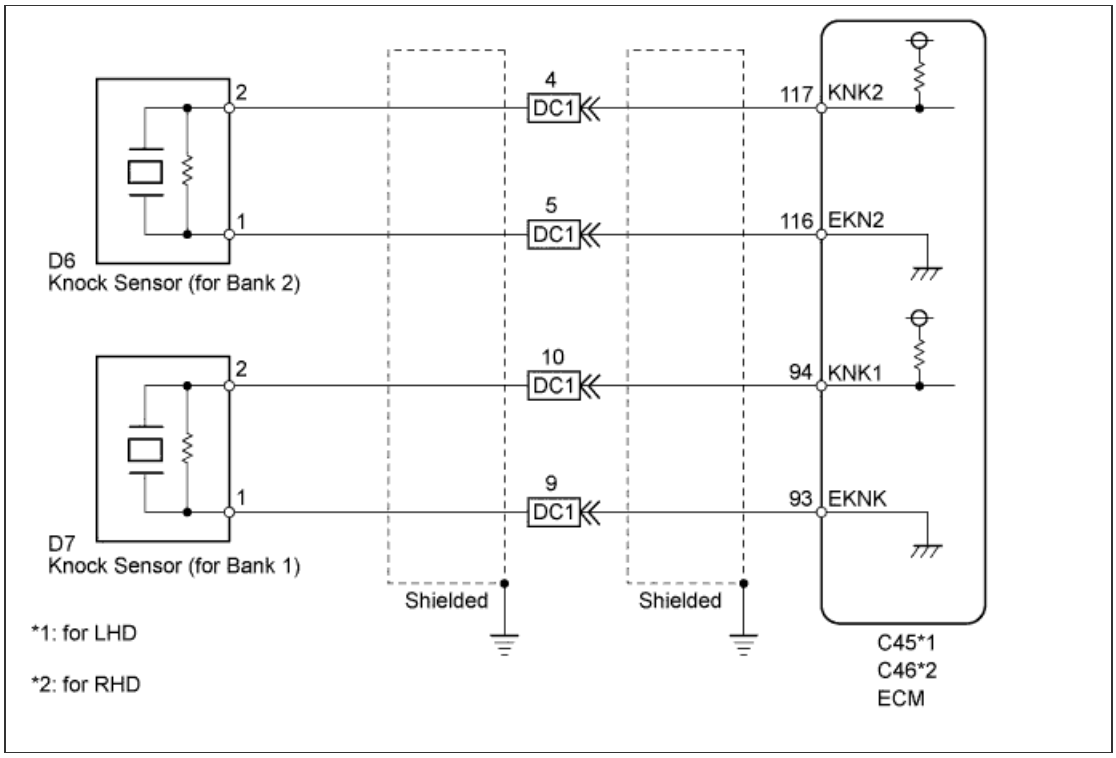
When any of DTCs P0327, P0328, P0332 and P0333 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope



The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Keep engine speed at 4000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and stores a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is stored 5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **DTCs P0327 and P0328 are the bank 1 knock sensor circuit.**
- **DTCs P0332 and P0333 are the bank 2 knock sensor circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ DTC OUTPUT (CHECK KNOCK SENSOR CIRCUIT)

a. Disconnect the DC1 connector.

b. Using lead wires, connect the connectors as follows:

Male Connector - Female Connector
Terminal 10 - Terminal 4
Terminal 9 - Terminal 5
Terminal 4 - Terminal 10
Terminal 5 - Terminal 9

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG) and turn the tester on.

e. Clear DTCs (Click here).

f. Warm up the engine.

g. Run the engine at 3000 rpm for 10 seconds or more.

h. Enter the following menus: Powertrain / Engine and ECT / DTC.

i. Read the DTCs.

Result

Display	Proceed to
DTC is same as when vehicle brought in (for example, P0327 and P0328 are output again, or P0332 and P0333 are output again)	A
DTC is different from when vehicle brought in (for example, P0327 and P0328 are output at first, but then P0332 and P0333 are output, or vice versa)	B

HINT:

- If DTC P0327 or P0328 has changed to P0332 or P0333, check the knock sensor circuit on the left bank side.
- If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the right bank side.

B	Go to step 4

A

2.CHECK HARNESS AND CONNECTOR (CONNECTOR - ECM)

a. Disconnect the DC1 connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
DC1 male connector 10 - C45-94 (KNK1)	Always	Below 1 Ω
DC1 male connector 9 - C45-93 (EKNK)	Always	Below 1 Ω
DC1 male connector 4 - C45-117 (KNK2)	Always	Below 1 Ω
DC1 male connector 5 - C45-116 (EKN2)	Always	Below 1 Ω
DC1 male connector 10 or C45-94 (KNK1) - Body ground	Always	10 kΩ or higher
DC1 male connector 9 or C45-93 (EKNK) - Body ground	Always	10 kΩ or higher
DC1 male connector 4 or C45-117 (KNK2) - Body ground	Always	10 kΩ or higher
DC1 male connector 5 or C45-116 (EKN2) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
DC1 male connector 10 - C46-94 (KNK1)	Always	Below 1 Ω
DC1 male connector 9 - C46-93 (EKNK)	Always	Below 1 Ω
DC1 male connector 4 - C46-117 (KNK2)	Always	Below 1 Ω
DC1 male connector 5 - C46-116 (EKN2)	Always	Below 1 Ω
DC1 male connector 10 or C46-94 (KNK1) - Body ground	Always	10 kΩ or higher
DC1 male connector 9 or	Always	10 kΩ or higher

C46-93 (EKNK) - Body ground		
DC1 male connector 4 or C46-117 (KNK2) - Body ground	Always	10 kΩ or higher
DC1 male connector 5 or C46-116 (EKN2) - Body ground	Always	10 kΩ or higher

DESCRIPTION

Refer to DTC P2195 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

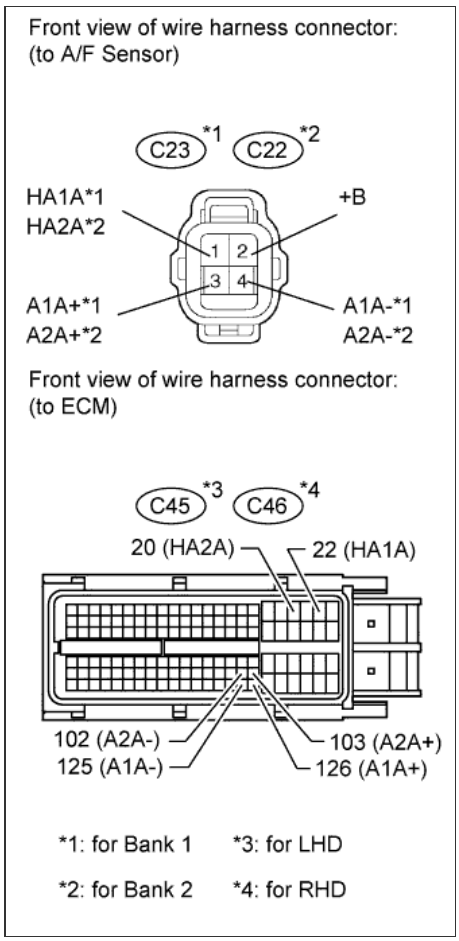
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

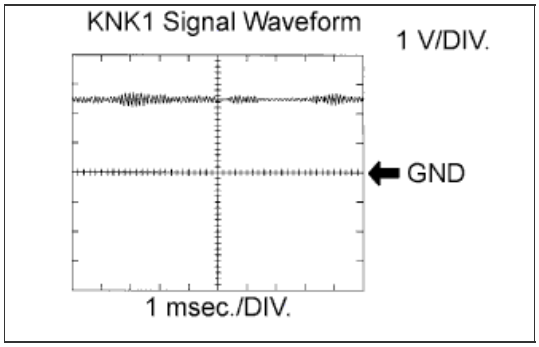
DESCRIPTION



Flat type knock sensors (non-resonant type) have structures that can detect vibrations between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC Code	DTC Detection Condition	Trouble Area
P0327 P0332	The output voltage of the knock sensor is below 0.5 V (1 trip detection logic).	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	The output voltage of the knock sensor is higher than 4.5 V (1 trip detection logic).	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

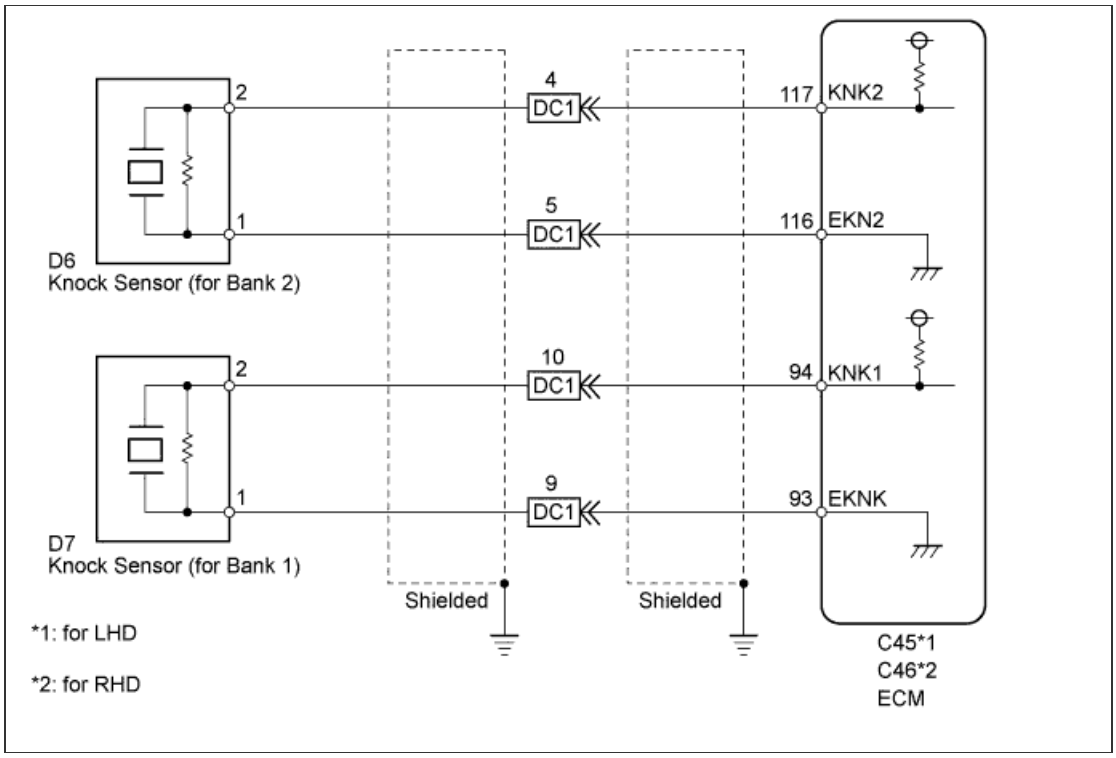
When any of DTCs P0327, P0328, P0332 and P0333 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope



The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Keep engine speed at 4000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and stores a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is stored 5 seconds after the engine is next started.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

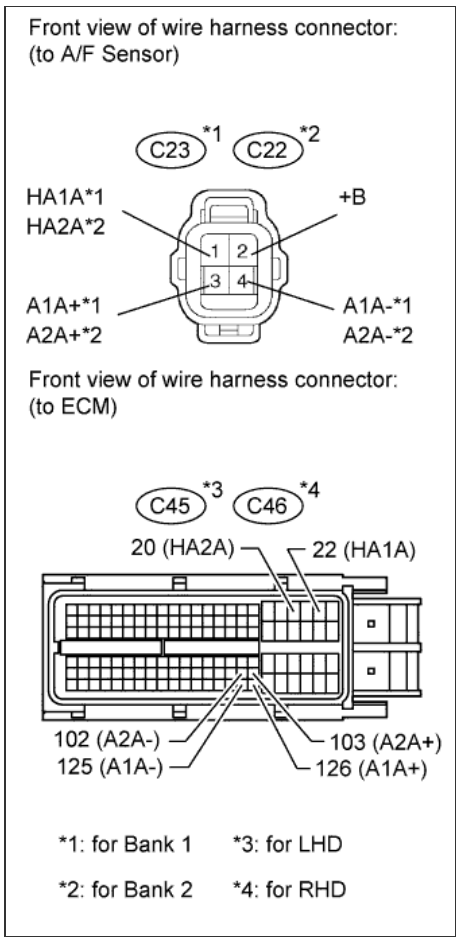
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

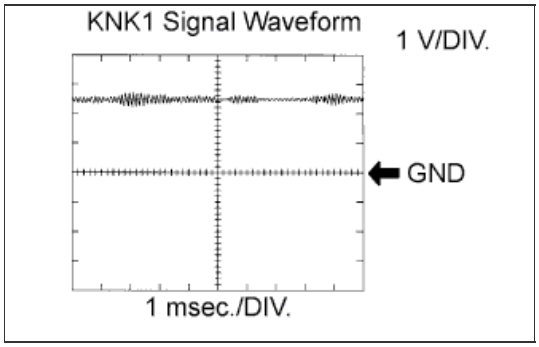
for Preparation Click here

DESCRIPTION



Flat type knock sensors (non-resonant type) have structures that can detect vibrations between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC Code	DTC Detection Condition	Trouble Area
P0327 P0332	The output voltage of the knock sensor is below 0.5 V (1 trip detection logic).	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	The output voltage of the knock sensor is higher than 4.5 V (1 trip detection logic).	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

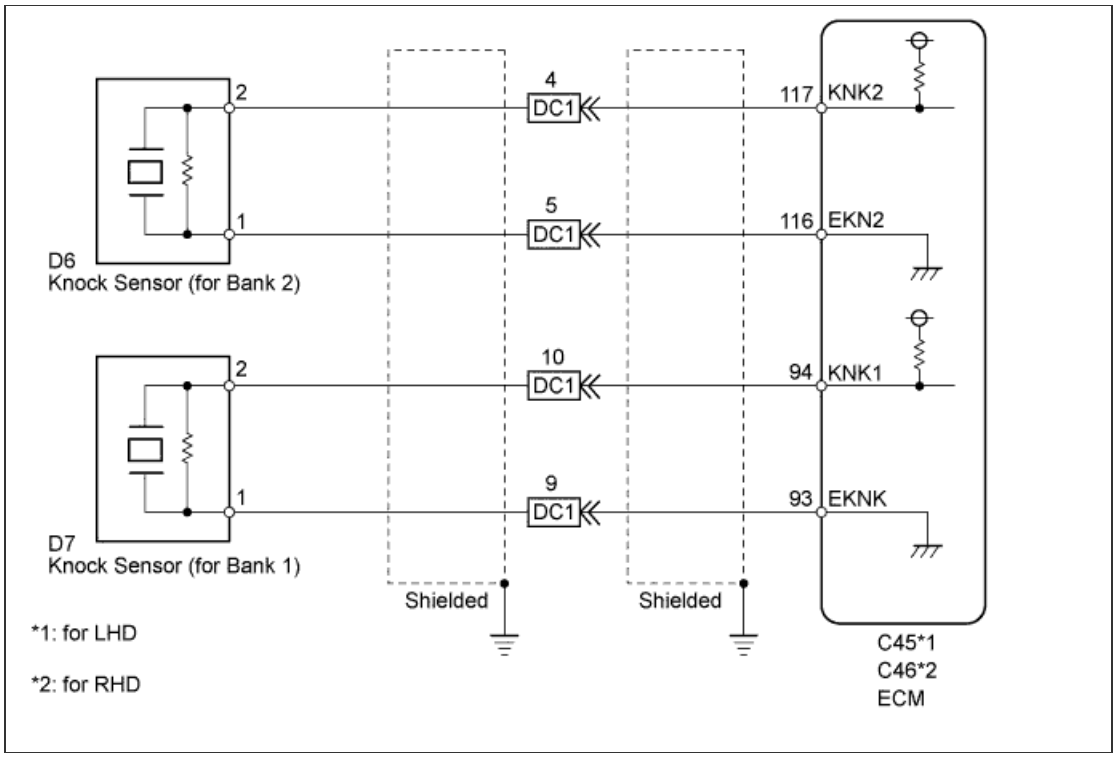
When any of DTCs P0327, P0328, P0332 and P0333 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope



The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Keep engine speed at 4000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and stores a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is stored 5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **DTCs P0327 and P0328 are the bank 1 knock sensor circuit.**
- **DTCs P0332 and P0333 are the bank 2 knock sensor circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

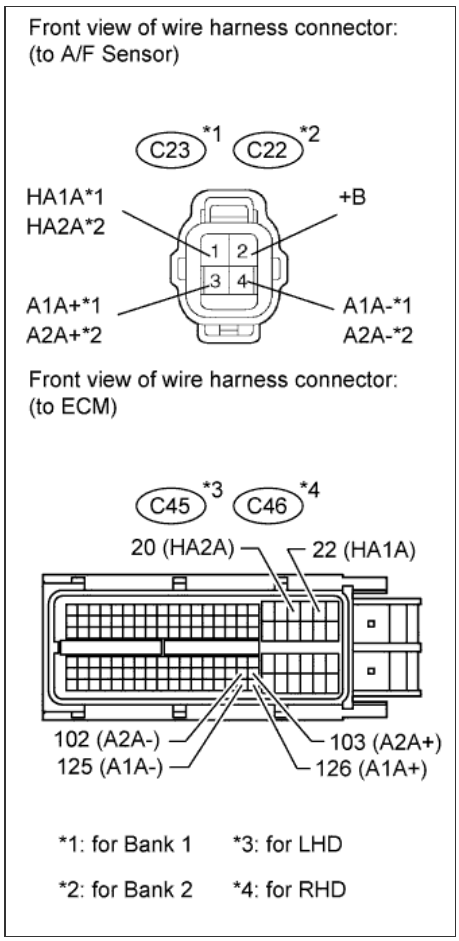
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

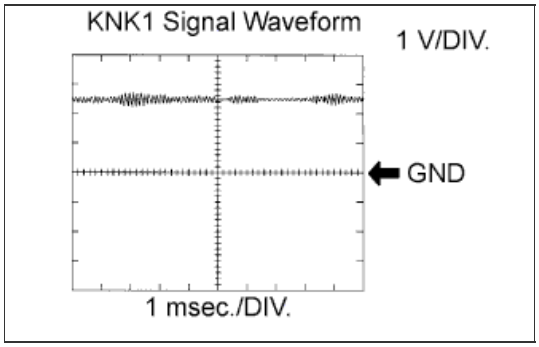
DTC P0333 Knock Sensor 2 Circuit High Input (Bank 2)

for Preparation Click here

DESCRIPTION



Flat type knock sensors (non-resonant type) have structures that can detect vibrations between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC Code	DTC Detection Condition	Trouble Area
P0327 P0332	The output voltage of the knock sensor is below 0.5 V (1 trip detection logic).	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	The output voltage of the knock sensor is higher than 4.5 V (1 trip detection logic).	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

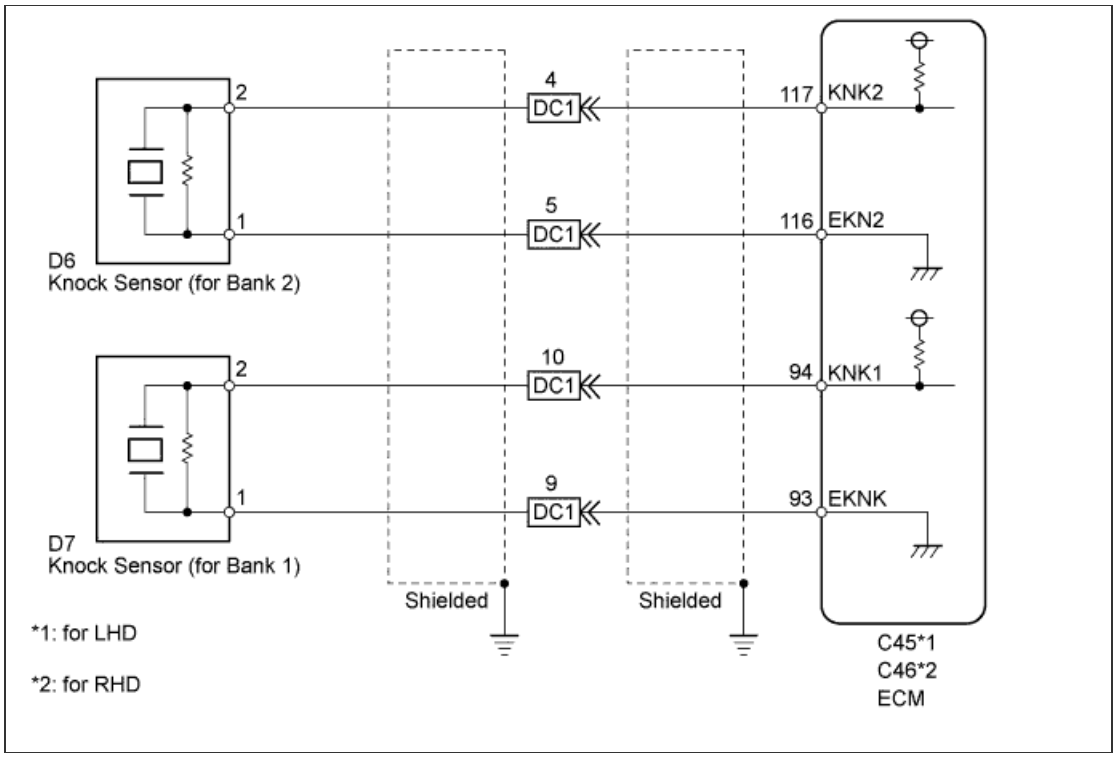
When any of DTCs P0327, P0328, P0332 and P0333 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the engine switch is turned off.

Reference: Inspection using an oscilloscope



The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Keep engine speed at 4000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and stores a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is stored 5 seconds after the engine is next started.

INSPECTION PROCEDURE

HINT:

- **DTCs P0327 and P0328 are the bank 1 knock sensor circuit.**
- **DTCs P0332 and P0333 are the bank 2 knock sensor circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ DTC OUTPUT (CHECK KNOCK SENSOR CIRCUIT)

a. Disconnect the DC1 connector.

b. Using lead wires, connect the connectors as follows:

Male Connector - Female Connector
Terminal 10 - Terminal 4
Terminal 9 - Terminal 5
Terminal 4 - Terminal 10
Terminal 5 - Terminal 9

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG) and turn the tester on.

e. Clear DTCs (Click here).

f. Warm up the engine.

g. Run the engine at 3000 rpm for 10 seconds or more.

h. Enter the following menus: Powertrain / Engine and ECT / DTC.

i. Read the DTCs.

Result

Display	Proceed to
DTC is same as when vehicle brought in (for example, P0327 and P0328 are output again, or P0332 and P0333 are output again)	A
DTC is different from when vehicle brought in (for example, P0327 and P0328 are output at first, but then P0332 and P0333 are output, or vice versa)	B

HINT:

- If DTC P0327 or P0328 has changed to P0332 or P0333, check the knock sensor circuit on the left bank side.
- If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the right bank side.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

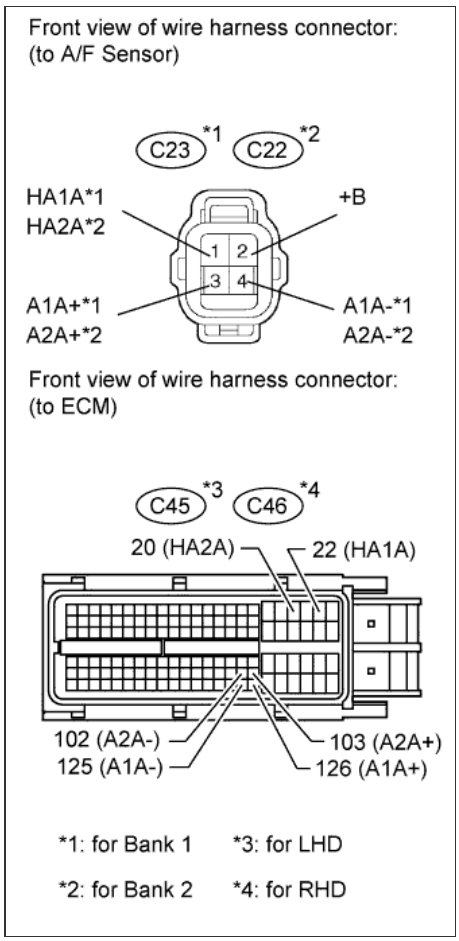
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

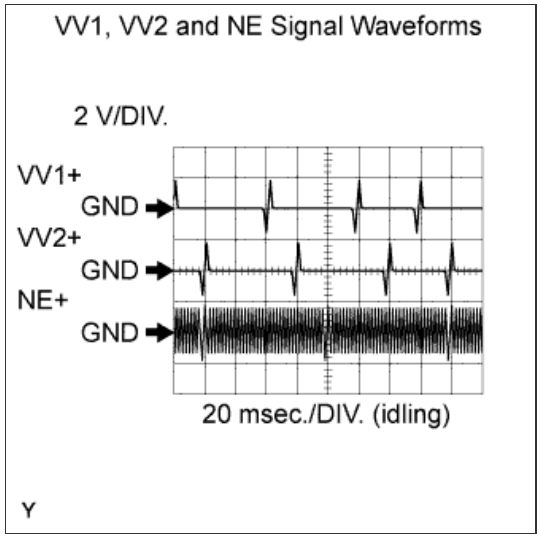
DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent

for Preparation Click here

DESCRIPTION

The Crank Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil.
The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of wound copper wire, an iron core and magnet. The sensor plate rotates and, as each tooth passes by the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per revolution. Based on these signals, the ECM calculates the crankshaft position and engine speed. Using these calculations, the fuel injection time and ignition timing are controlled.



DTC Code	DTC Detection Condition	Trouble Area
P0335	When either condition below is met: • No CKP sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 450 rpm or more (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) An engine speed of 1000 rpm or more. (b) The starter signal is OFF. (c) 3 seconds or more have elapsed since the starter signal switched from ON to OFF.	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

HINT:

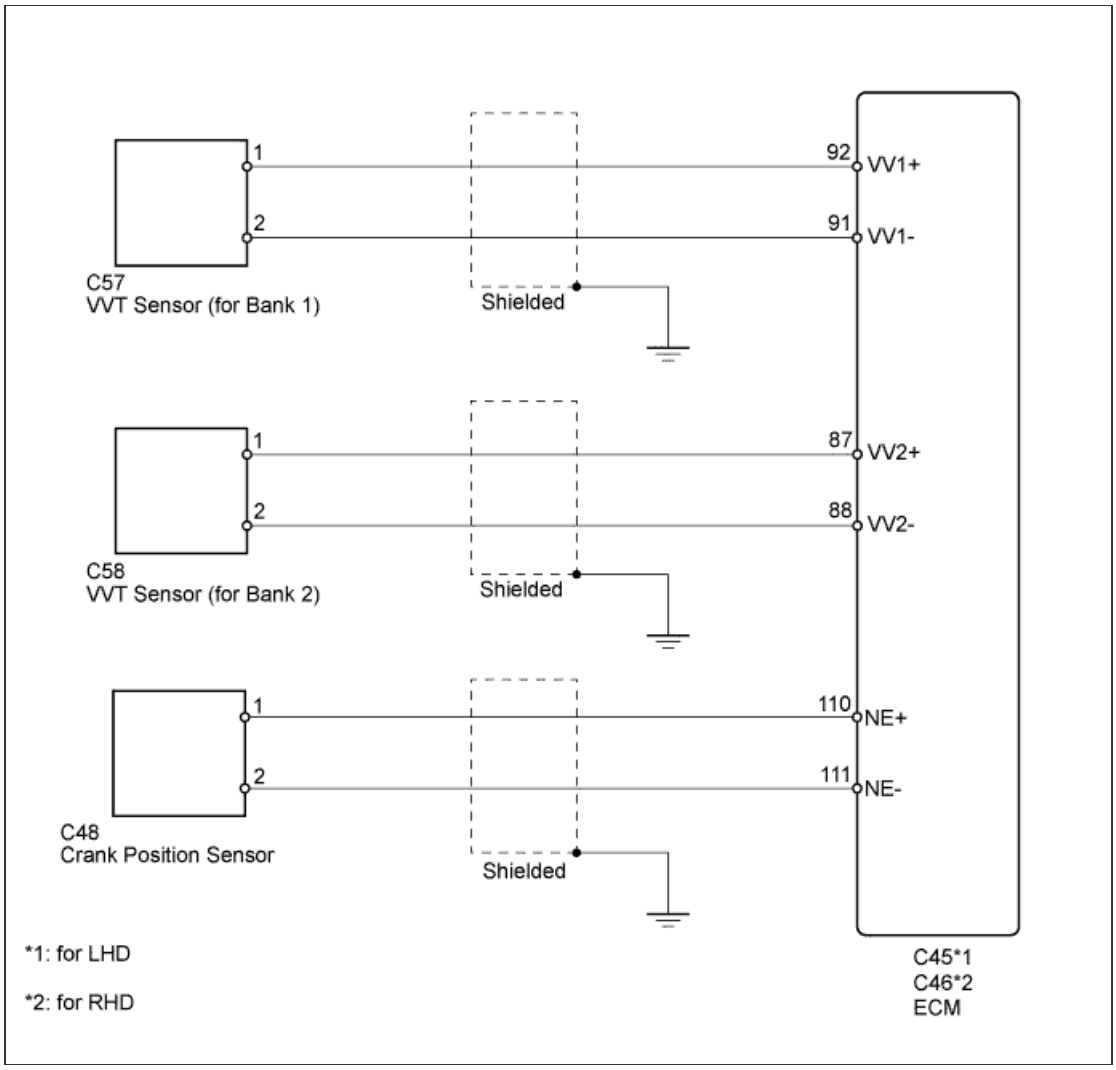
- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**
- **Grounding failure of the shielded wire may cause noise in the waveforms.**



Item	Content
Terminal	VV1+ - VV1- VV2+ - VV2- NE+ - NE-
Equipment Setting	2 V/DIV., 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine running, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If no problem is found through this diagnostic troubleshooting procedure, troubleshoot the engine mechanical systems.**
- **Check the engine speed. The engine speed can be checked by using the intelligent tester. To check, follow the operation below:**
  1. **Connect the intelligent tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / Engine Speed.**
     The engine speed may be indicated as zero despite the engine running normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as less than the actual engine speed if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPD)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / Engine Speed.

e. Start the engine.

f. Read the values displayed on the tester while the engine is running.

Standard:
Correct values are displayed.

HINT:

- **To check the engine speed change, display the graph on the tester.**

- **If the engine does not start, check the engine speed while cranking.**
- **If the engine speed indicated on the tester remains at zero (0), there may be an open or short in the Crank Position (CKP) sensor circuit.**

NG → Go to step 2

OK

CHECK FOR INTERMITTENT PRO LEMS (Click here)

2.INSPECT CRANK POSITION SENSOR (RESISTANCE)

a. Disconnect the crank position (CKP) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Cold	1630 to 2740 Ω
1 - 2	Hot	2065 to 3225 Ω

NOTICE:

In the above chart, the terms "cold" and "hot" refer to the temperature of the sensor.

"Cold" means approximately -10 to 50°C (14 to 122°F).

"Hot" means approximately 50 to 100°C (122 to 212°F).

Component without harness connected:
(Crank Position Sensor)

NG → REPLACE CRANK POSITION SENSOR (Click here)

OK

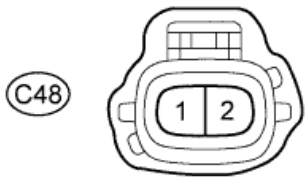
3.CHECK HARNESS AND CONNECTOR (CRANK POSITION SENSOR - ECM)

a. Disconnect the CKP sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
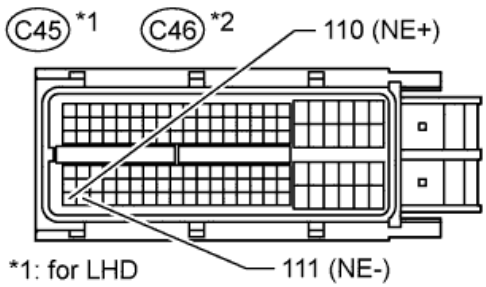
C48-1 (NE+) - C45-110 (NE+)	Always	Below 1 Ω
C48-2 (NE-) - C45-111 (NE-)	Always	Below 1 Ω
C48-1 (NE+) or C45-110 (NE+) - Body ground	Always	10 kΩ or higher
C48-2 (NE-) or C45-111 (NE-) - Body ground	Always	10 kΩ or higher



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C48-1 (NE+) - C46-110 (NE+)	Always	Below 1 Ω
C48-2 (NE-) - C46-111 (NE-)	Always	Below 1 Ω
C48-1 (NE+) or C46-110 (NE+) - Body ground	Always	10 kΩ or higher
C48-2 (NE-) or		

Front view of wire harness connector:
(to Crank Position Sensor)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

C46-111 (NE-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK SENSOR INSTALLATION (CRANK POSITION SENSOR)

a. Check the CKP sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

5.CHECK CRANKSHAFT POSITION SENSOR PLATE NO. 1 (TEETH OF SENSOR PLATE)

a. Check the teeth of the sensor plate.

OK:
Sensor plate does not have any cracks or deformation.

NG → REPLACE CRANKSHAFT POSITION SENSOR PLATE NO. 1

OK

6.REPLACE CRANKSHAFT POSITION SENSOR

a. Replace the crank position sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No DTC is output	A
P0335 or P0339 is output	B

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

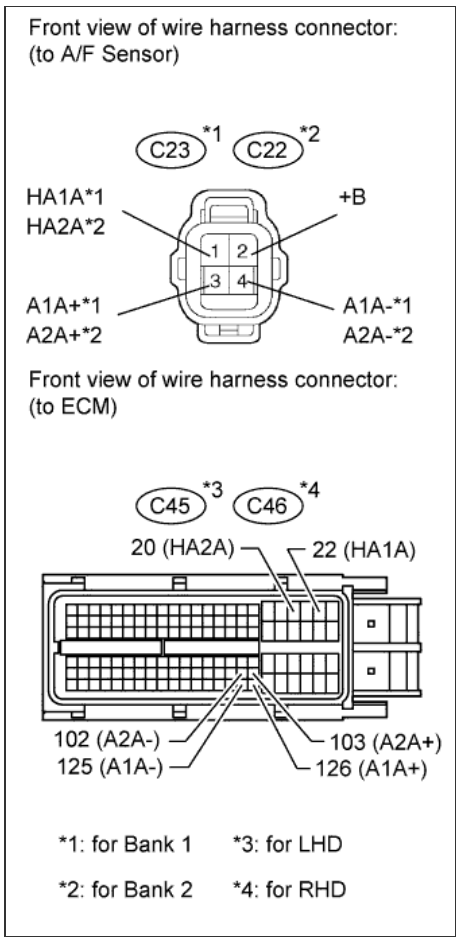
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

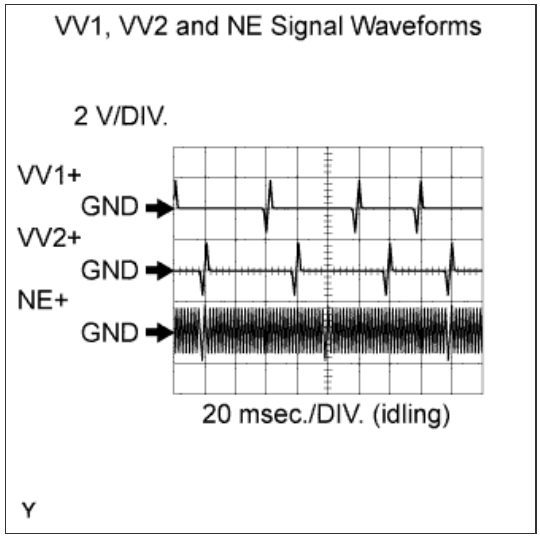
DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent

for Preparation Click here

DESCRIPTION

The Crank Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil.
The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of wound copper wire, an iron core and magnet. The sensor plate rotates and, as each tooth passes by the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per revolution. Based on these signals, the ECM calculates the crankshaft position and engine speed. Using these calculations, the fuel injection time and ignition timing are controlled.



DTC Code	DTC Detection Condition	Trouble Area
P0335	When either condition below is met: • No CKP sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 450 rpm or more (1 trip detection logic).	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) An engine speed of 1000 rpm or more. (b) The starter signal is OFF. (c) 3 seconds or more have elapsed since the starter signal switched from ON to OFF.	• Open or short in CKP sensor circuit • CKP sensor • CKP sensor plate • ECM

Reference: Inspection using an oscilloscope.

HINT:

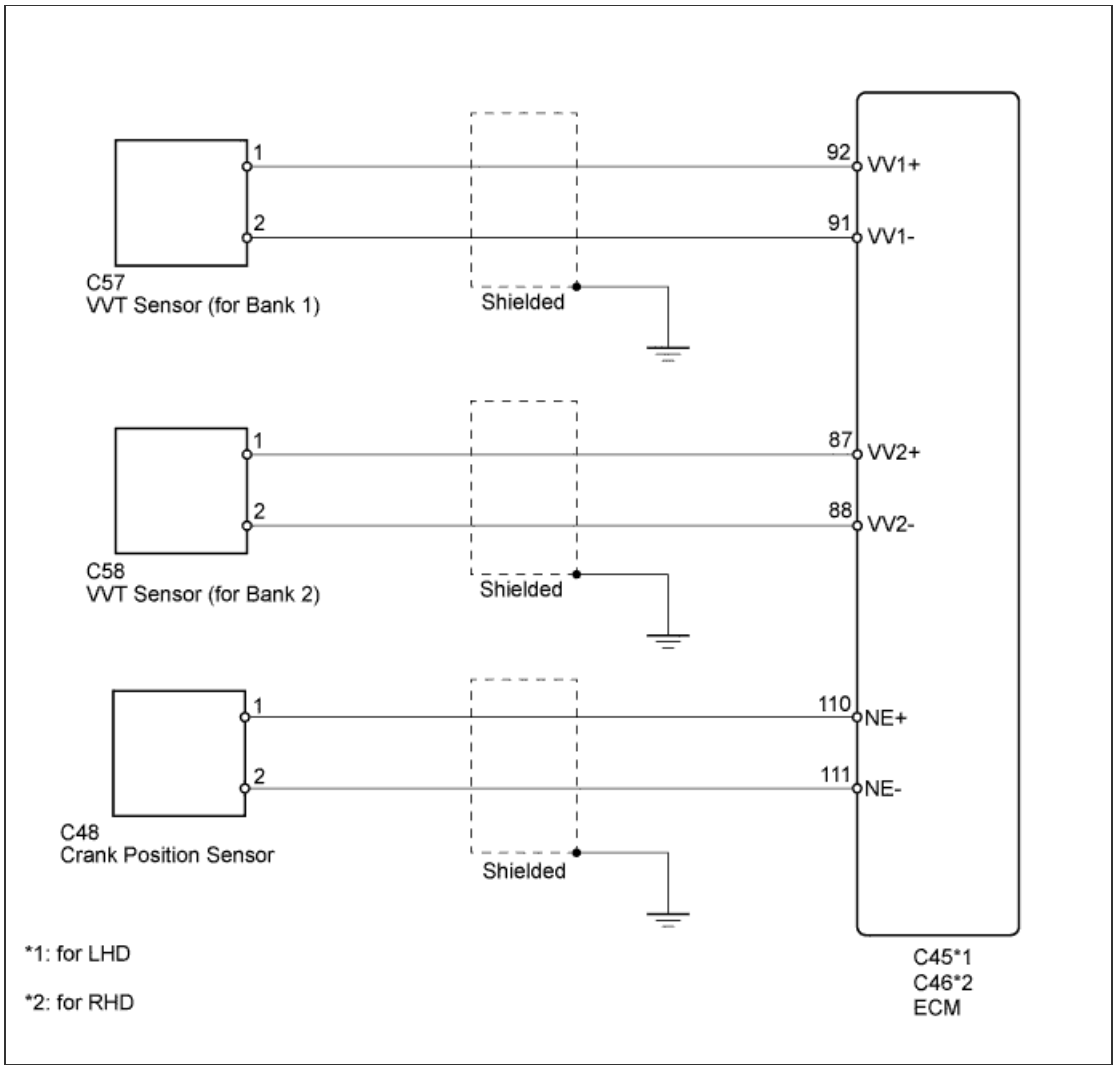
- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**
- **Grounding failure of the shielded wire may cause noise in the waveforms.**



Item	Content
Terminal	VV1+ - VV1- VV2+ - VV2- NE+ - NE-
Equipment Setting	2 V/DIV., 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine running, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If no problem is found through this diagnostic troubleshooting procedure, troubleshoot the engine mechanical systems.**
- **Check the engine speed. The engine speed can be checked by using the intelligent tester. To check, follow the operation below:**
  1. **Connect the intelligent tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / Engine Speed.**
     The engine speed may be indicated as zero despite the engine running normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as less than the actual engine speed if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPD)

a. Connect the intelligent tester to the DLC3.

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

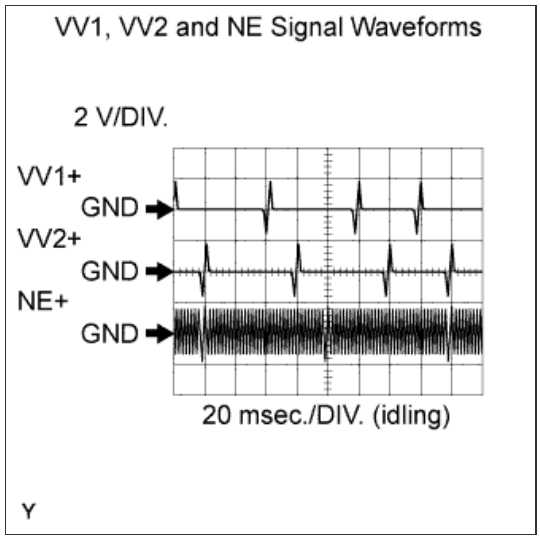
DTC P0340 Camshaft Position Sensor Circuit Malfunction

DTC P0345 Camshaft Position Sensor "A" Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

The Variable Valve Timing (VVT) sensor consists of a magnet, iron core and pickup coil. The VVT signal plate has 3 teeth on its outer circumference and is installed on the camshaft timing pulley. When the camshaft rotates, changes occur on the camshaft protrusions and the pickup coil air gaps. These changes cause fluctuations in the magnetic field and generate voltage in the pickup coil.
Each sensor monitors its timing rotor, which is located on the camshaft. The ECM uses the sensor to detect the camshaft angle. The camshaft rotation synchronizes with the crankshaft rotation, and this sensor communicates the rotation of the camshaft timing rotor as a pulse signal to the ECM. Based on the signal, the ECM controls the camshaft position.
The crankshaft angle sensor plate has 34 teeth. The pickup coil generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.



DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • No VVT sensor signal is sent to the ECM during cranking (2 trip detection logic). • No VVT sensor signal is sent to the ECM with an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in VVT sensor circuit • VVT sensor • Intake camshaft • Timing belt has a jumped tooth • ECM

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω

DTC P0340 Camshaft Position Sensor Circuit Malfunction

DTC P0345 Camshaft Position Sensor "A" Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

The Variable Valve Timing (VVT) sensor consists of a magnet, iron core and pickup coil. The VVT signal plate has 3 teeth on its outer circumference and is installed on the camshaft timing pulley. When the camshaft rotates, changes occur on the camshaft protrusions and the pickup coil air gaps. These changes cause fluctuations in the magnetic field and generate voltage in the pickup coil.
Each sensor monitors its timing rotor, which is located on the camshaft. The ECM uses the sensor to detect the camshaft angle. The camshaft rotation synchronizes with the crankshaft rotation, and this sensor communicates the rotation of the camshaft timing rotor as a pulse signal to the ECM. Based on the signal, the ECM controls the camshaft position.
The crankshaft angle sensor plate has 34 teeth. The pickup coil generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • No VVT sensor signal is sent to the ECM during cranking (2 trip detection logic). • No VVT sensor signal is sent to the ECM with an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in VVT sensor circuit • VVT sensor • Intake camshaft • Timing belt has a jumped tooth • ECM

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
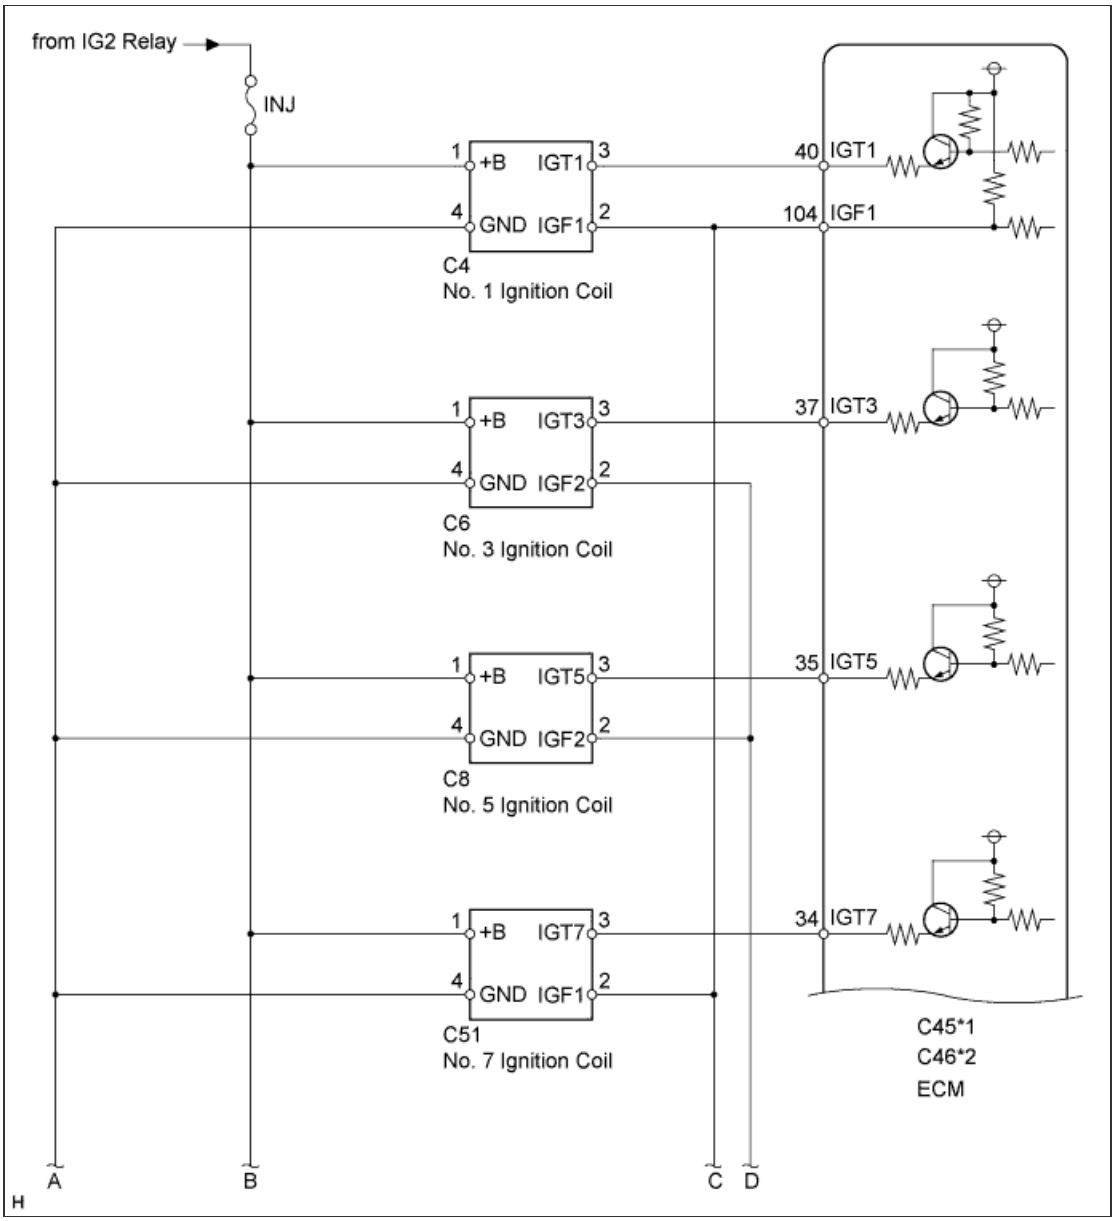
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals AF+ and AF- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) circuit • Air Fuel Ratio (A/F) sensor (for bank 1, 2 sensor 1) • ECM
P2238 P2241	• Case 1: Condition (a) or (b) continues for 5.0 seconds or more (1 trip detection logic): (a) The AF+ voltage is 0.5 V or less. (b) (AF+) - (AF-) = 0.1 V or less. • Case 2: The A/F sensor admittance is less than 0.022 1/Ω (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2239 P2242	The AF+ voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2252 P2255	The AF- voltage is 0.5 V or less for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM
P2253 P2256	The AF- voltage is higher than 4.5 V for 5.0 seconds or more (2 trip detection logic).	• Open or short in A/F sensor (for bank 1, 2 sensor 1) circuit • A/F sensor (for bank 1, 2 sensor 1) • ECM

HINT:

- **DTCs P2238, P2239, P2252 and P2253 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2241, P2242, P2255 and P2256 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that includes the No. 2 cylinder.**

MONITOR DESCRIPTION

These DTCs are output when there is an open or short in the A/F sensor circuit, or if the A/F sensor output drops.
To detect these problems, the voltage of the A/F sensor is monitored when turning the engine switch on (IG), and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is outside of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in the next driving cycle, the MIL is illuminated and a DTC is stored.
The Air-Fuel Ratio (A/F) sensor varies its output voltage in proportion to the air-fuel ratio. If the A/F sensor impedance (alternating current resistance) or output voltage deviates greatly from the standard range, the ECM determines that there is an open or short in the A/F sensor circuit.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Fuel injector • Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the output voltages of both the A/F and HO2 sensors.

To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition

C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
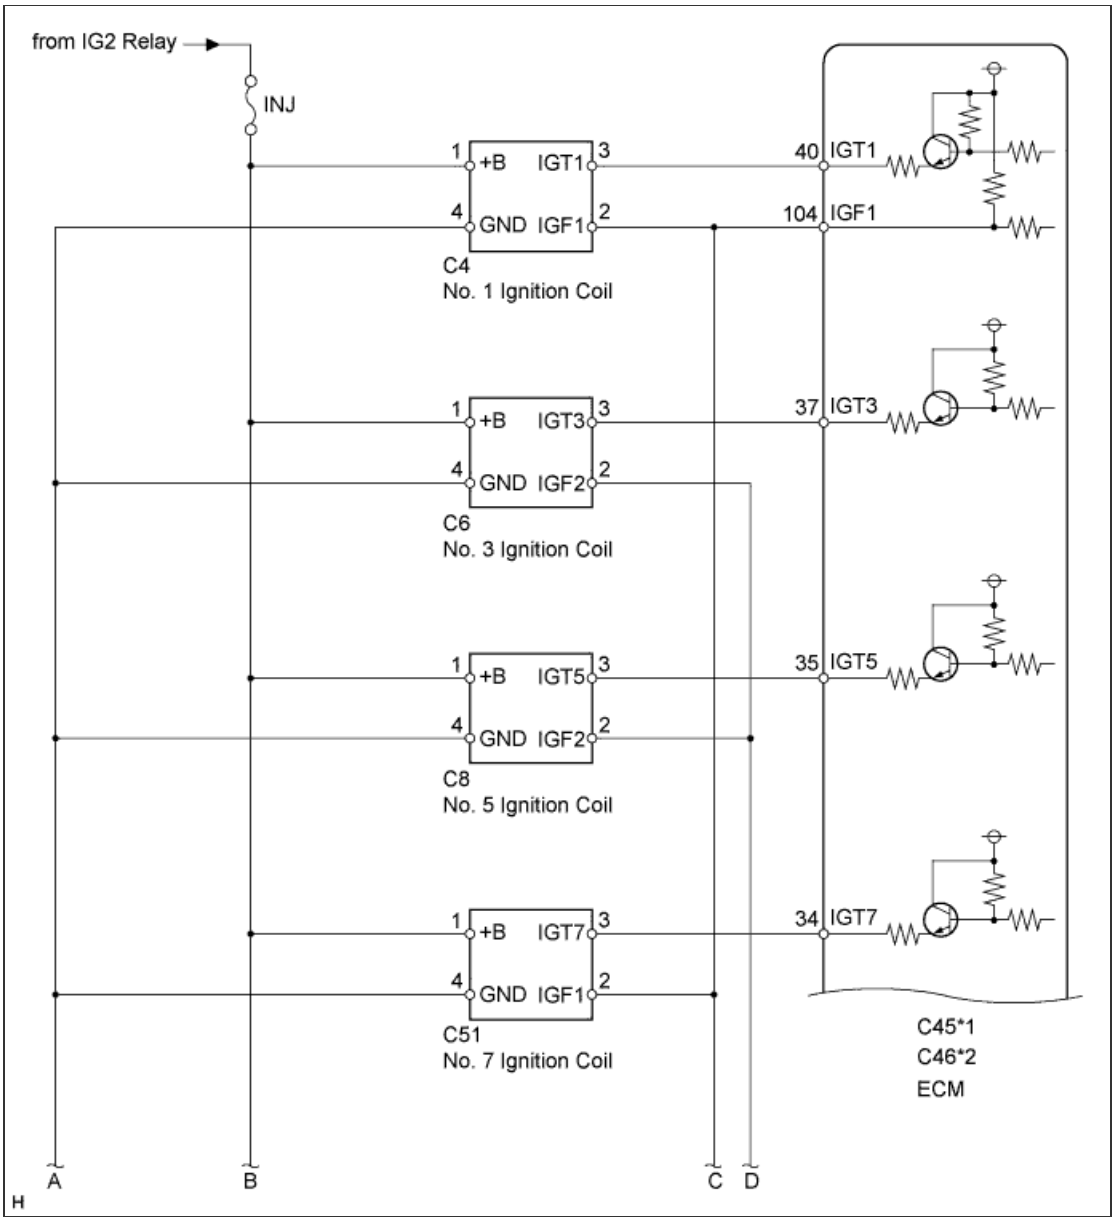
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

DTC P2432 Secondary Air Injection System Air Flow / Pressure Sensor Circuit Low Bank1

DTC P2433 Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank1

for Preparation Click here

DESCRIPTION

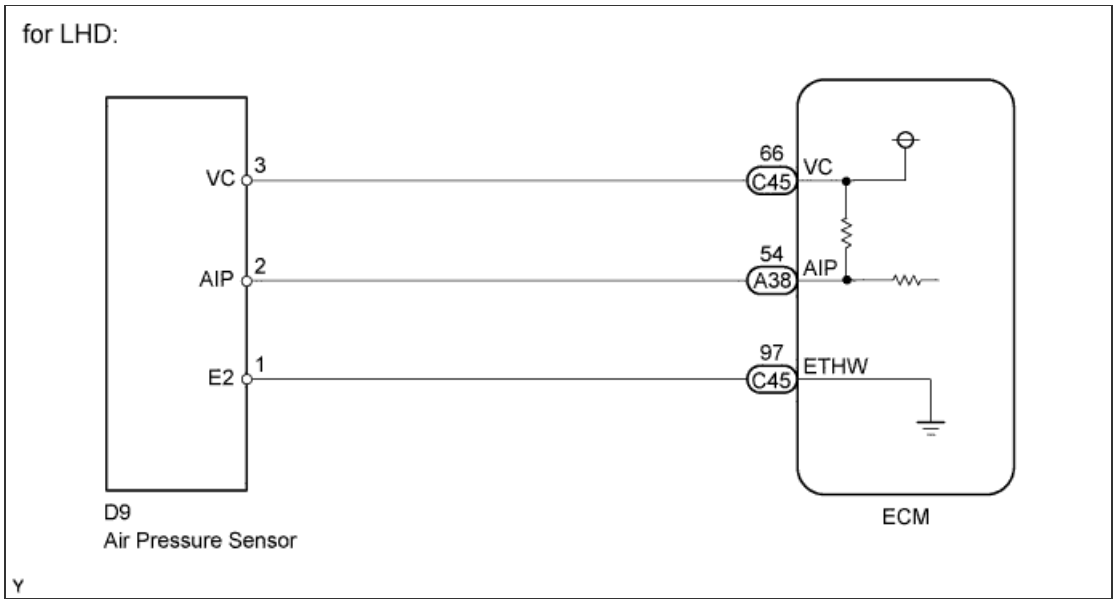
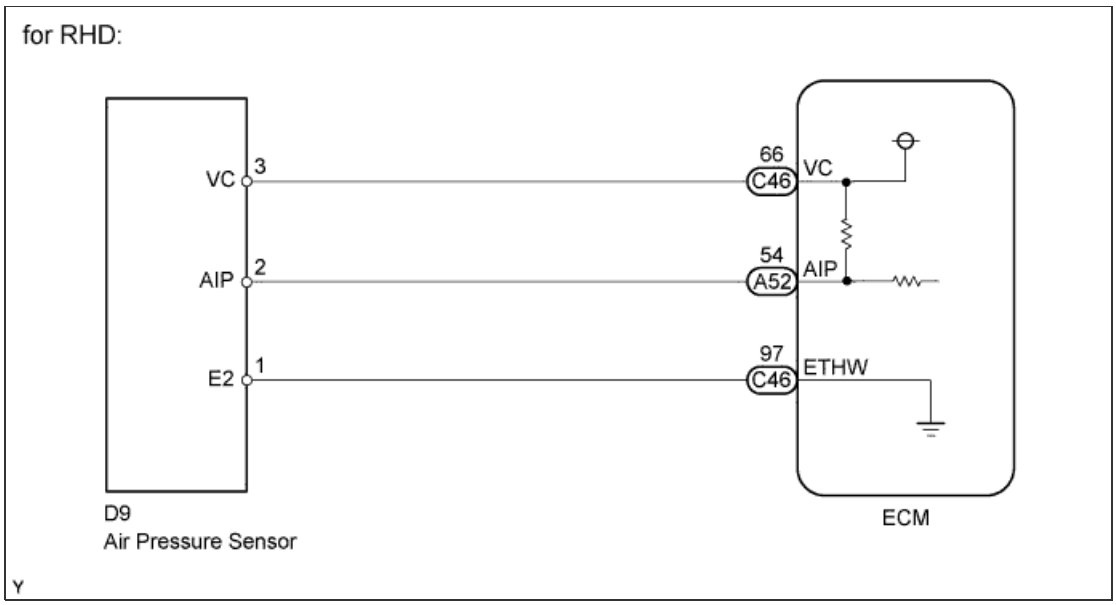
The diagnostic trouble code (DTC) P2431 indicates that the pressure sensor of the secondary air injection (AIR) system malfunctions. The engine control module (ECM) monitors the sensor value to detect the malfunction. If the sensor value reaches the criteria (below 45 kPa or higher than 135 kPa), the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The DTC P2432 and P2433 indicate an open or short circuit in the pressure sensor circuit. The ECM monitors the pressure sensor voltage to detect the open or short circuit. If the voltage reaches the criteria (below 0.1 V or higher than 4.8 V), the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.



The pressure sensor detects the air pressure via a piezo element. The ECM applies 5 volts to the sensor, and it is varied with the air pressure. When the pressure is high, the voltage is high. When the pressure is low, the voltage is low.



The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

DTC Code	DTC Detection Condition	Trouble Area
P2431	The pressure sensor indicates below 45 kPa (338 mmHg) or higher than 135 kPa (1013 mmHg) (2 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM
P2432	The pressure sensor voltage is below 0.1 V (1 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM
P2433	The pressure sensor voltage is higher than 4.8 V (1 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**

1.CHECK HARNESS AND CONNECTOR (AIR PRESSURE SENSOR - ECM)

a. Disconnect the air pressure sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-66 (VC) - D9-3 (VC)	Always	Below 1 Ω
A38-54 (AIP) - D9-2 (AIP)	Always	Below 1 Ω

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
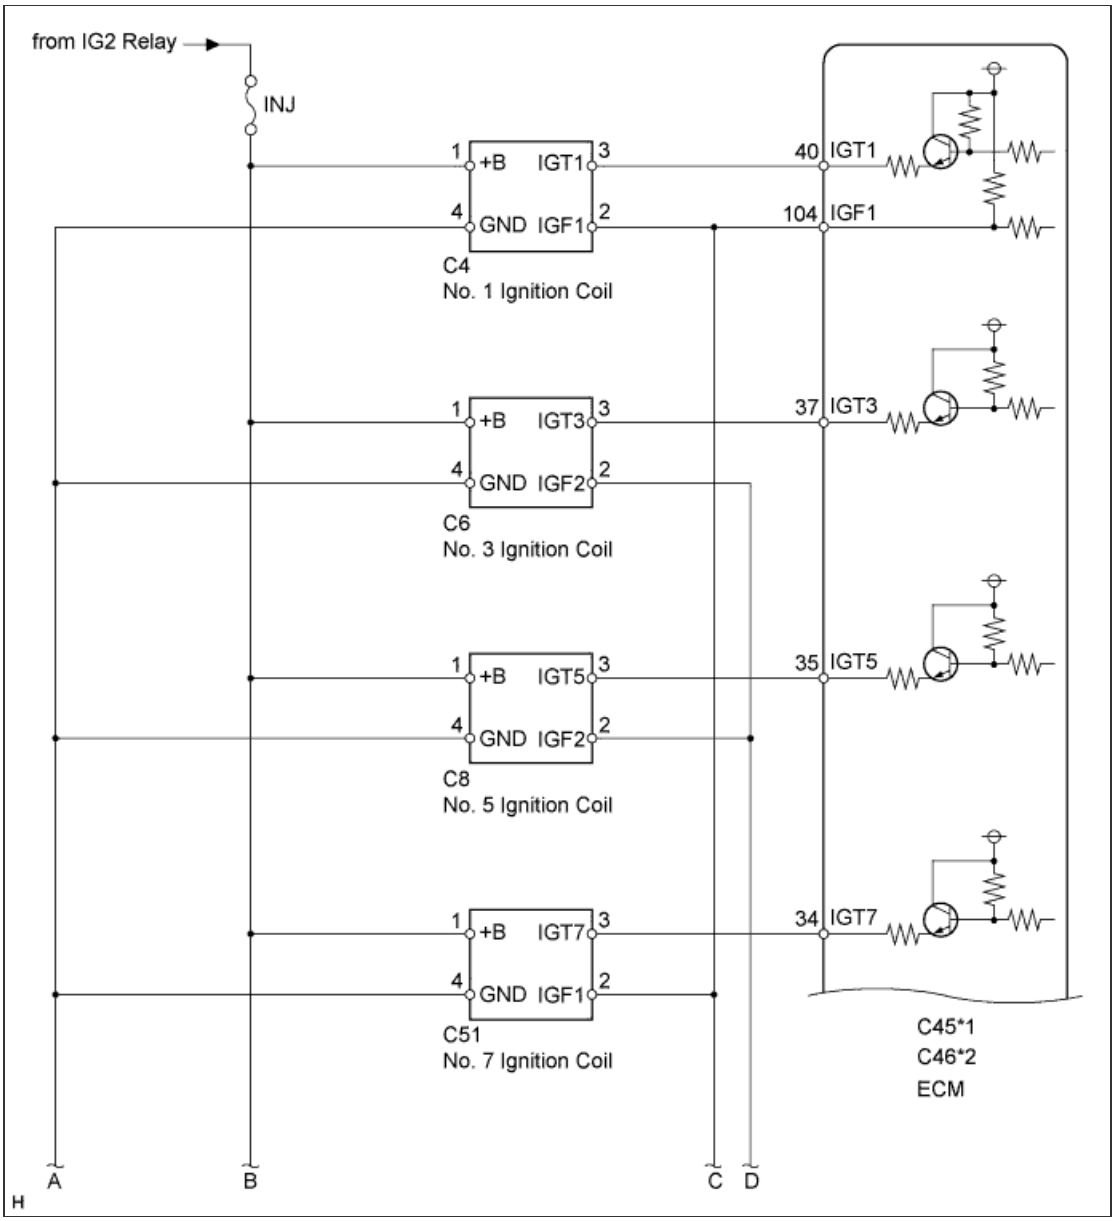
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

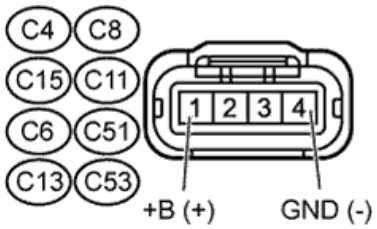
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

Front view of wire harness connector:
(to Ignition Coil with Igniter)

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 ( ) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 ( ) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 ( ) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 ( ) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 ( ) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 ( ) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 ( ) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 ( ) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω

DTC P2431 Secondary Air Injection System Air Flow / Pressure Sensor Circuit Range / Performance Bank1

DTC P2432 Secondary Air Injection System Air Flow / Pressure Sensor Circuit Low Bank1

DTC P2433 Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank1

for Preparation Click here

DESCRIPTION

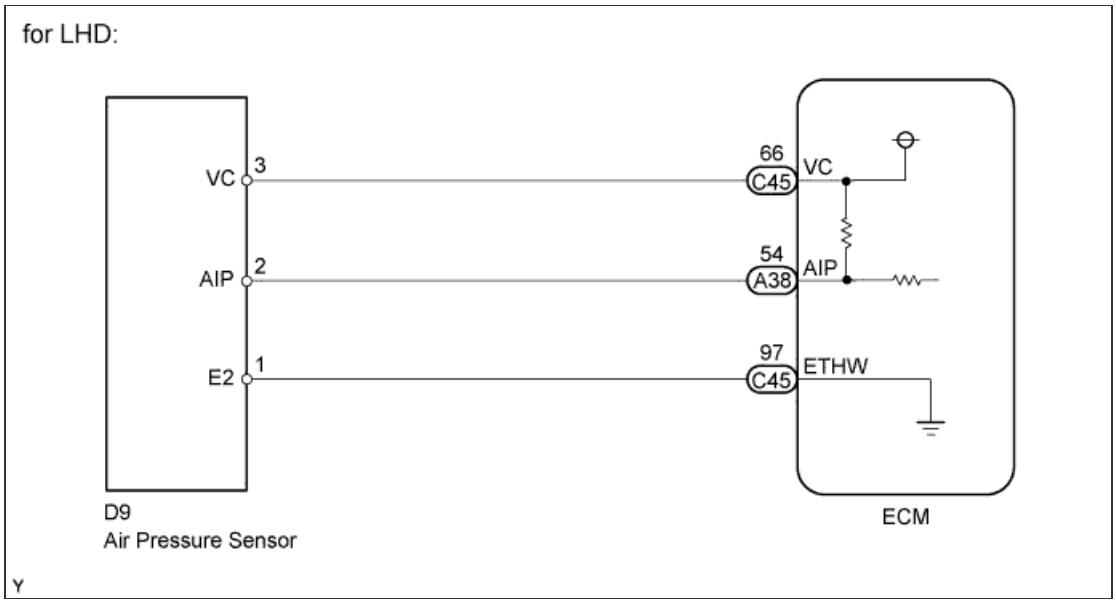
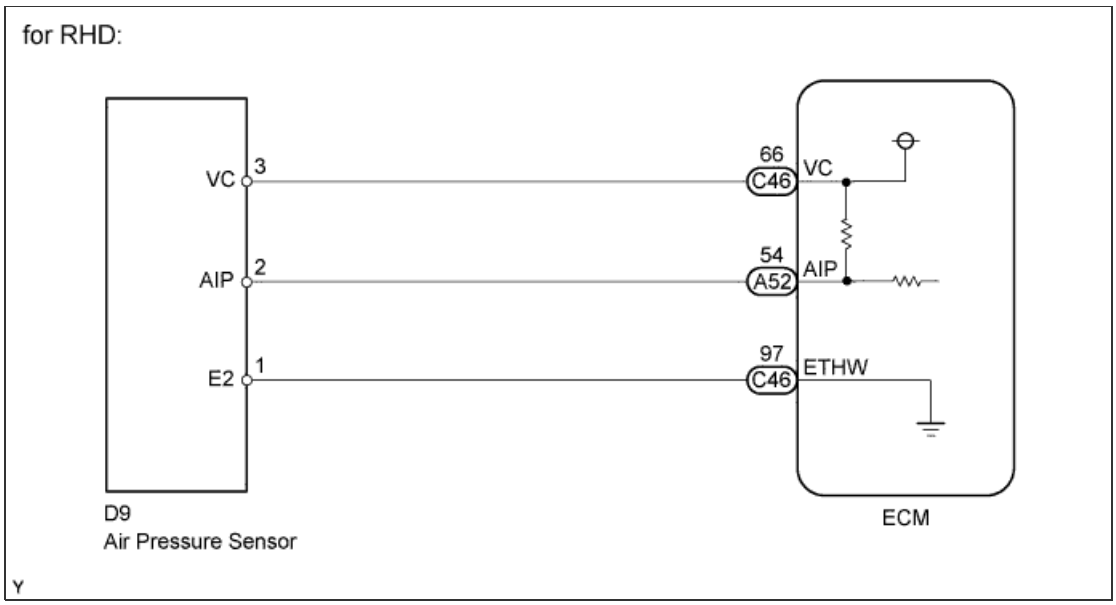
The diagnostic trouble code (DTC) P2431 indicates that the pressure sensor of the secondary air injection (AIR) system malfunctions. The engine control module (ECM) monitors the sensor value to detect the malfunction. If the sensor value reaches the criteria (below 45 kPa or higher than 135 kPa), the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The DTC P2432 and P2433 indicate an open or short circuit in the pressure sensor circuit. The ECM monitors the pressure sensor voltage to detect the open or short circuit. If the voltage reaches the criteria (below 0.1 V or higher than 4.8 V), the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.



The pressure sensor detects the air pressure via a piezo element. The ECM applies 5 volts to the sensor, and it is varied with the air pressure. When the pressure is high, the voltage is high. When the pressure is low, the voltage is low.



The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

DTC Code	DTC Detection Condition	Trouble Area
P2431	The pressure sensor indicates below 45 kPa (338 mmHg) or higher than 135 kPa (1013 mmHg) (2 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM
P2432	The pressure sensor voltage is below 0.1 V (1 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM
P2433	The pressure sensor voltage is higher than 4.8 V (1 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
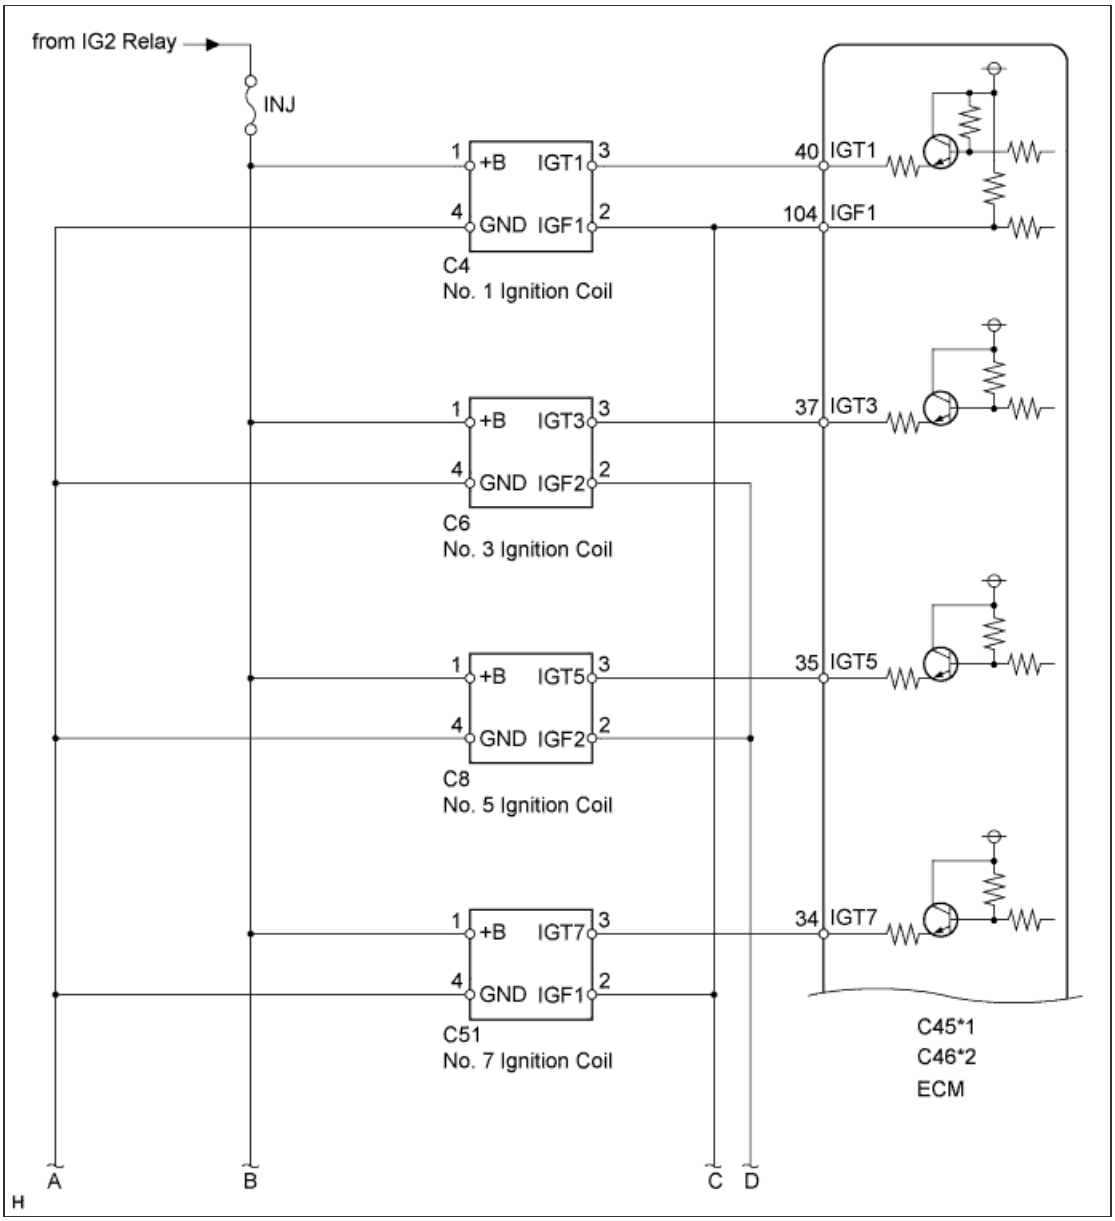
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C51-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C53-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C4-3 (IGT1) - C45-40 (IGT1)	Always	Below 1 Ω

C15-3 (IGT2) - C45-33 (IGT2)	Always	Below 1 Ω
C6-3 (IGT3) - C45-37 (IGT3)	Always	Below 1 Ω
C13-3 (IGT4) - C45-38 (IGT4)	Always	Below 1 Ω
C8-3 (IGT5) - C45-35 (IGT5)	Always	Below 1 Ω
C11-3 (IGT6) - C45-36 (IGT6)	Always	Below 1 Ω
C51-3 (IGT7) - C45-34 (IGT7)	Always	Below 1 Ω
C53-3 (IGT8) - C45-39 (IGT8)	Always	Below 1 Ω
C4-2 (IGF1) or C45-104 (IGF1) - Body ground	Always	10 kΩ or higher
C15-2 (IGF2) or C45-105 (IGF2) - Body ground	Always	10 kΩ or higher
C6-2 (IGF2) or C45-105 (IGF2) - Body ground	Always	10 kΩ or higher
C13-2 (IGF1) or C45-104 (IGF1) - Body ground	Always	10 kΩ or higher
C8-2 (IGF2) or C45-105 (IGF2) - Body ground	Always	10 kΩ or higher
C11-2 (IGF1) or C45-104 (IGF1) - Body ground	Always	10 kΩ or higher

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353, P0354, P0355, P0356, P0357 OR P0358)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Shuffle arrangement of the ignition coils with igniters (among No. 1 to No. 8 cylinders).

NOTICE:

Do not shuffle the connectors.

e. Perform a simulation test.

f. Check the DTCs displayed on the tester.

Result

Result	Proceed to
Same DTC is output	A

REPLACE ECM (Click here)

DTC P2431 Secondary Air Injection System Air Flow / Pressure Sensor Circuit Range / Performance Bank1

DTC P2432 Secondary Air Injection System Air Flow / Pressure Sensor Circuit Low Bank1

DTC P2433 Secondary Air Injection System Air Flow / Pressure Sensor Circuit High Bank1

for Preparation Click here

DESCRIPTION

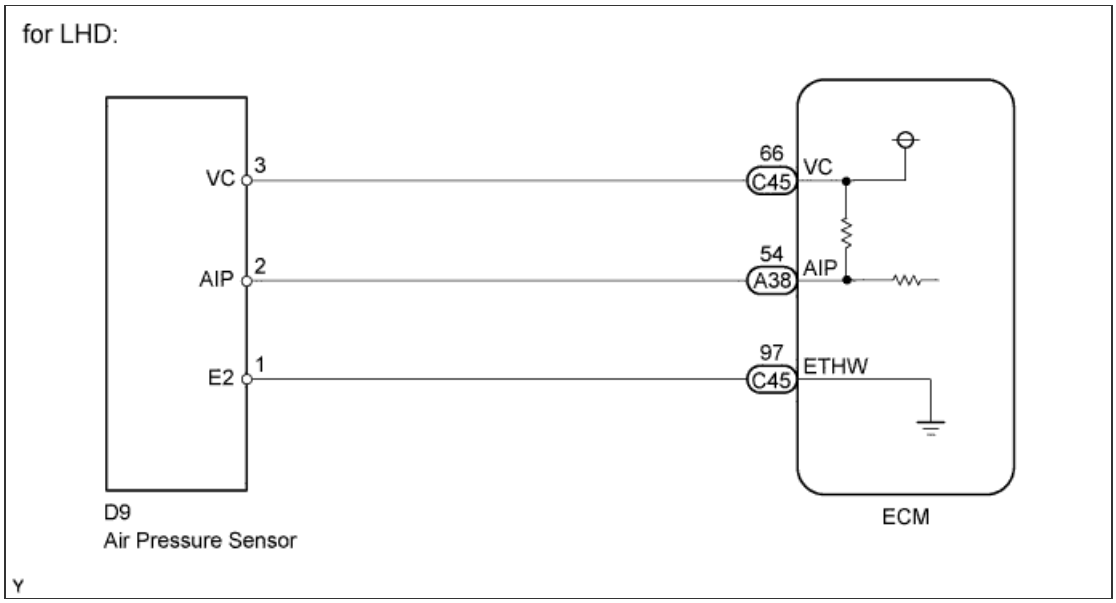
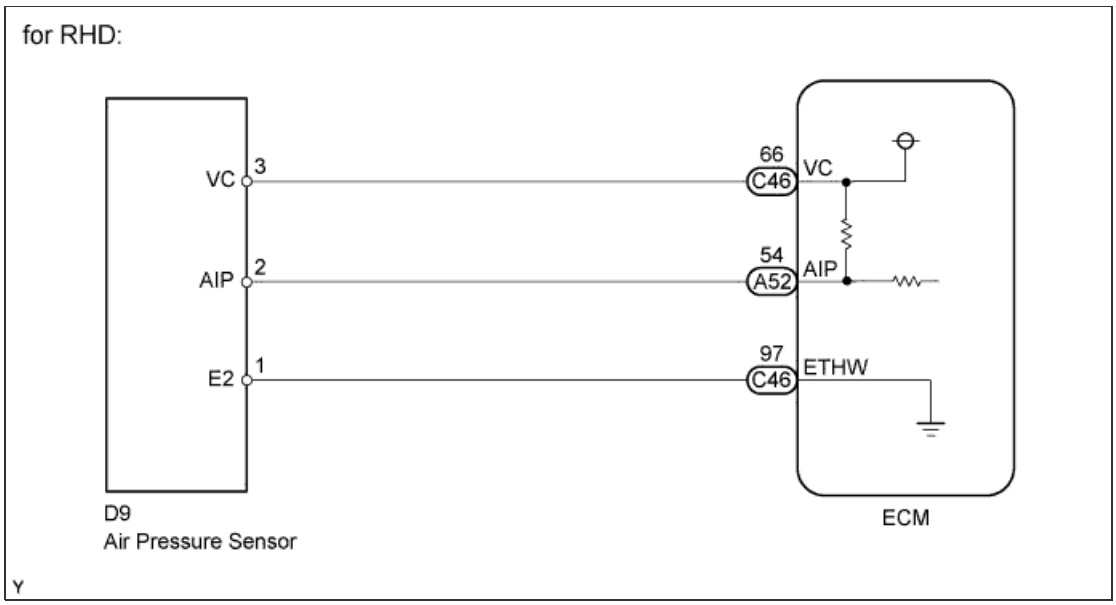
The diagnostic trouble code (DTC) P2431 indicates that the pressure sensor of the secondary air injection (AIR) system malfunctions. The engine control module (ECM) monitors the sensor value to detect the malfunction. If the sensor value reaches the criteria (below 45 kPa or higher than 135 kPa), the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The DTC P2432 and P2433 indicate an open or short circuit in the pressure sensor circuit. The ECM monitors the pressure sensor voltage to detect the open or short circuit. If the voltage reaches the criteria (below 0.1 V or higher than 4.8 V), the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.



The pressure sensor detects the air pressure via a piezo element. The ECM applies 5 volts to the sensor, and it is varied with the air pressure. When the pressure is high, the voltage is high. When the pressure is low, the voltage is low.



The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

DTC Code	DTC Detection Condition	Trouble Area
P2431	The pressure sensor indicates below 45 kPa (338 mmHg) or higher than 135 kPa (1013 mmHg) (2 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM
P2432	The pressure sensor voltage is below 0.1 V (1 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM
P2433	The pressure sensor voltage is higher than 4.8 V (1 trip detection logic).	• Pressure sensor circuit • Pressure sensor • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If other DTCs relating to different systems that have terminal E2 as the ground terminal are output simultaneously, terminal E2 may have an open circuit.**

1.CHECK HARNESS AND CONNECTOR (AIR PRESSURE SENSOR - ECM)

a. Disconnect the air pressure sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-66 (VC) - D9-3 (VC)	Always	Below 1 Ω
A38-54 (AIP) - D9-2 (AIP)	Always	Below 1 Ω
C45-97 (ETHW) - D9-3 (ETHW)	Always	Below 1 Ω
C45-66 (VC) or		

D9-3 (VC) - body ground	Always	10 kΩ or higher
A38-54 (AIP) or D9-2 (AIP) (EPA) - body ground	Always	10 kΩ or higher
C45-97 (ETHW) or D9-3 (ETHW) - body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-66 (VC) - D9-3 (VC)	Always	Below 1 Ω
A52-54 (AIP) - D9-2 (AIP)	Always	Below 1 Ω
C46-97 (ETHW) - D9-3 (ETHW)	Always	Below 1 Ω
C46-66 (VC) or D9-3 (VC) - body ground	Always	10 kΩ or higher
A52-54 (AIP) or D9-2 (AIP) (EPA) - body ground	Always	10 kΩ or higher
C46-97 (ETHW) or D9-3 (ETHW) - body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

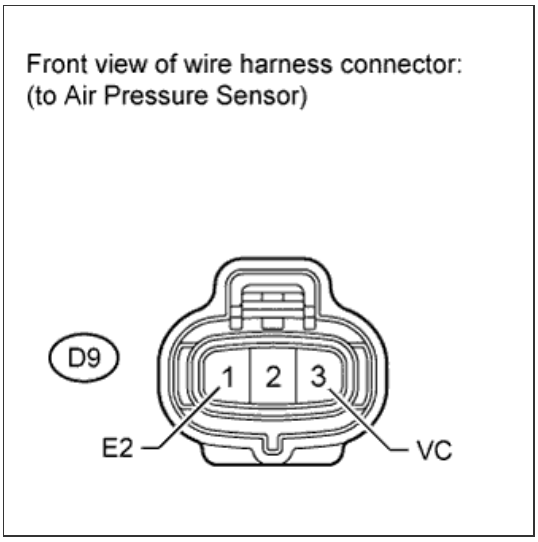
2.CHECK HARNESS AND CONNECTOR (VC VOLTAGE)



a. Remove the intake manifold (Click here).

b. Disconnect the air pressure sensor connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
D9-3 (VC) - D9-1 (VC)	Engine switch on (IG)	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

3.REPLACE AIR PRESSURE SENSOR

a. Replace the air pressure sensor (Click here).

NEXT

4.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Warm-up the engine.

e. Enter the following menus: Powertrain / Engine and ECT / Utility / Secondary Air Injection Check (Automatic Mode).

f. Perform the Active Test and check the pending DTC.

Result

Result	Proceed to
P2430, P2431, P2432, and/or P2433 is output	A
No DTC is output	B

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
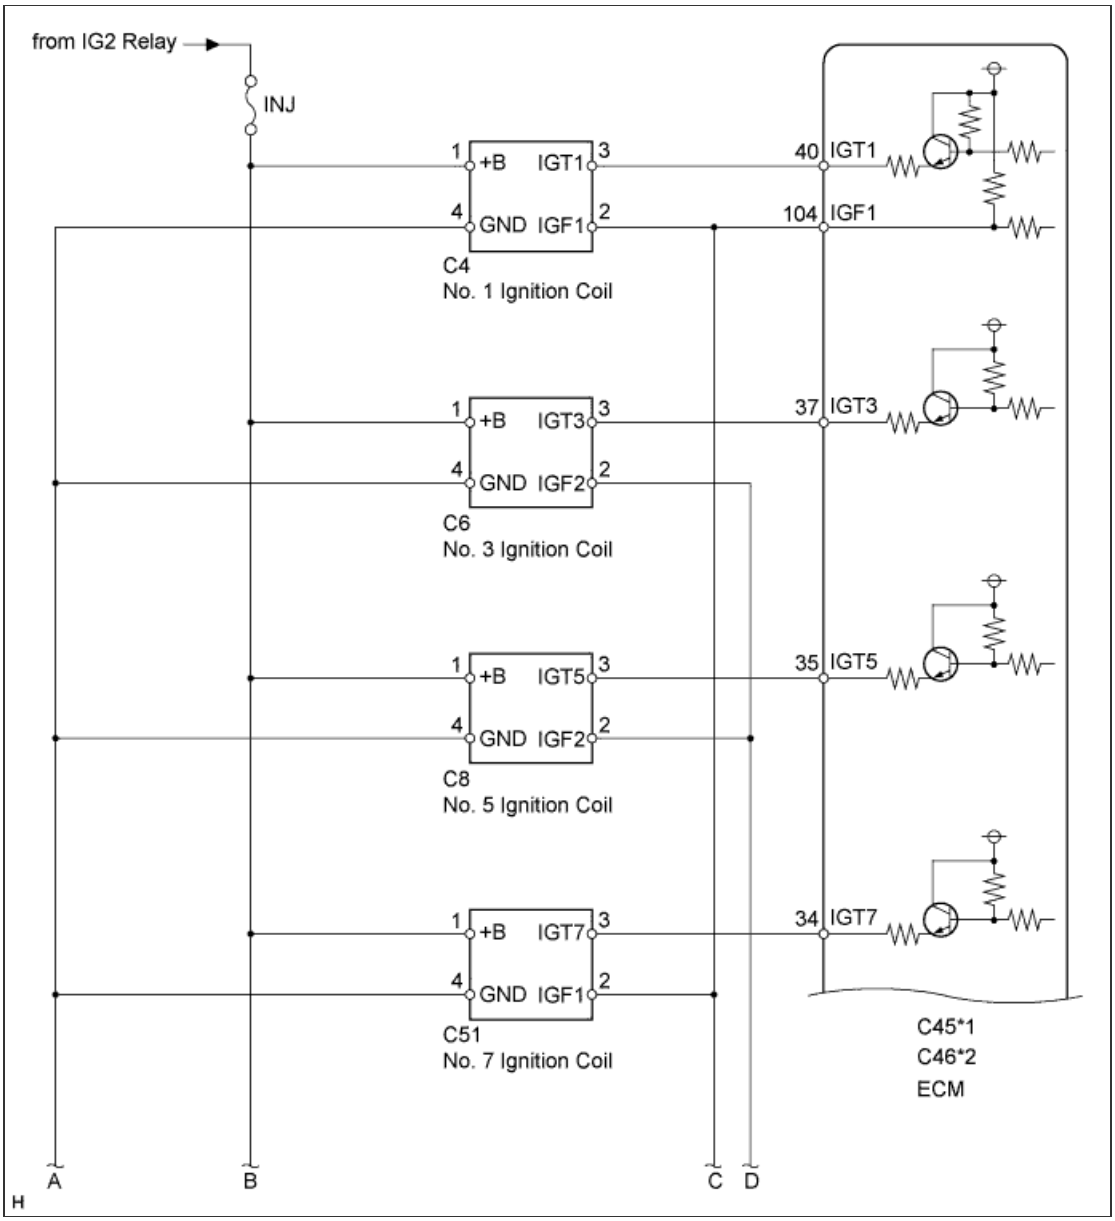
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

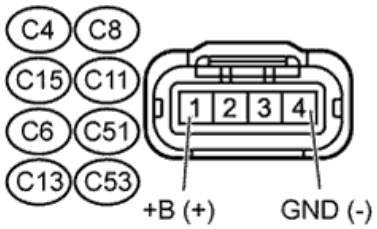
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

C53-3 (IGT8) or C46-39 (IGT8) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0351, P0352, P0353, P0354, P0355, P0356, P0357 OR P0358)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear DTCs (Click here).

d. Shuffle arrangement of the ignition coils with igniters (among No. 1 to No. 8 cylinders).

NOTICE:

Do not shuffle the connectors.

e. Perform a simulation test.

f. Check the DTCs displayed on the tester.

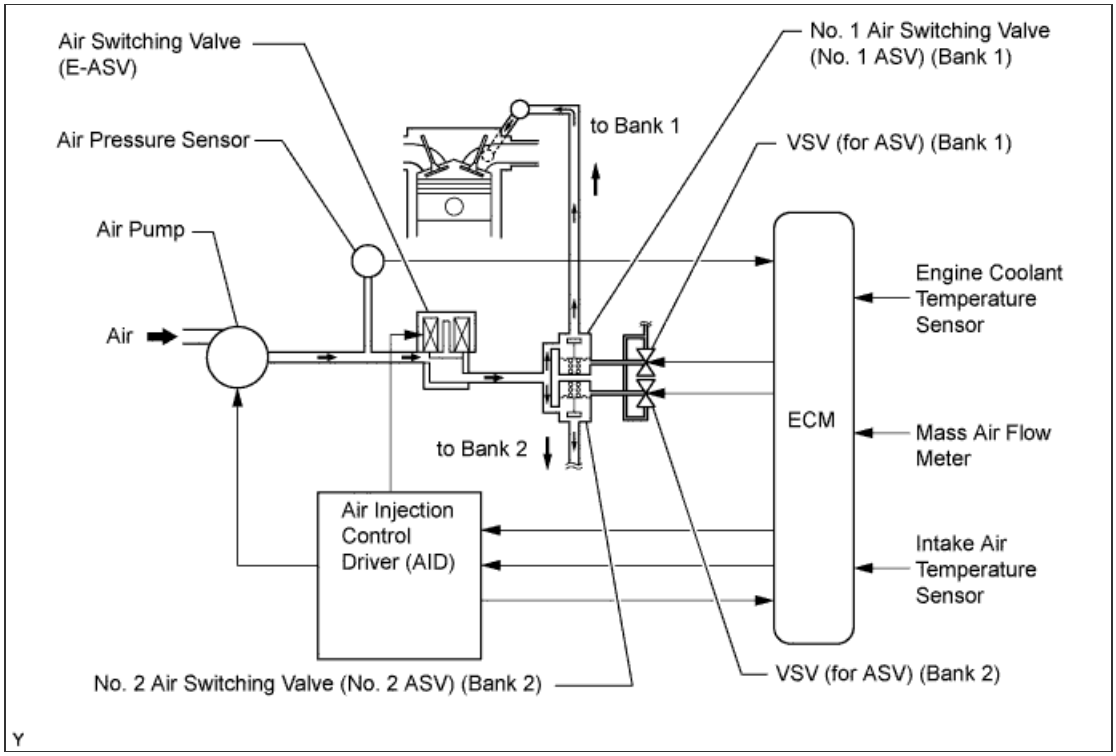
REPLACE ECM (Click here)

DTC P2444 Secondary Air Injection System Pump Stuck On Bank1



DTC P2445 Secondary Air Injection System Pump Stuck Off Bank1

for Preparation Click here

DESCRIPTION

The diagnostic trouble code (DTC) indicates that the air pump of the secondary air injection (AIR) system malfunctions. The engine control module (ECM) operates entire components of this system in a sequence, and monitors the system pressure and exhaust pulse (AIR monitor). This monitor will run just after a cold engine start. If abnormal pressure and exhaust pulse are detected, the ECM interprets this as a malfunction. When the malfunction is detected in consecutive driving cycle, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.

The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.

INSPECTION PROCEDURE

HINT:

Read free e frame data using the intelligent tester. Free e frame data records the engine conditions when malfunctions are detected. When troubleshooting, free e frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.PERFORM SECONDARY AIR INJECTION SYSTEM CHECK (AUTOMATIC MODE)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Record the DTCs and free e frame data.

d. Clear the DTCs (Click here).

e. Warm-up the engine.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / Secondary Air Injection Check (Automatic Mode).

g. Perform the Active Test and check the pending DTC.

Result

Result	Proceed to
P2444 and P2445 is output	A

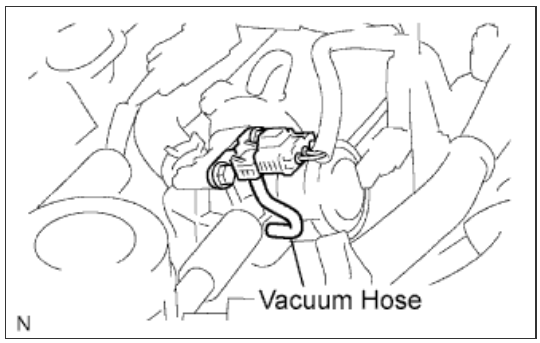
2.CHECK VACUUM HOSE



a. Remove the intake manifold (Click here).

b. Check the vacuum hose connection between the pressure sensor and air switching valve.

OK:
The vacuum hose is securely connected.

c. Inspect the vacuum hose for blockage and damage.

OK:
The vacuum hose has no blockage or damage.

NG → REPAIR OR REPLACE VACUUM HOSE

OK

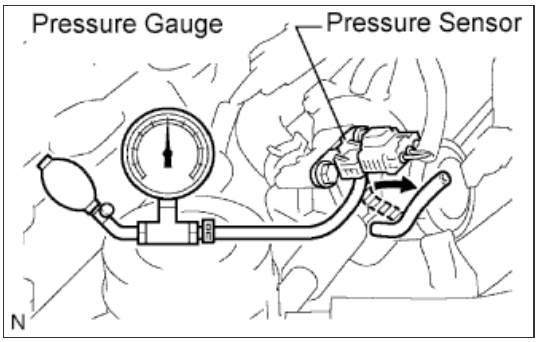
3.READ VALUE USING INTELLIGENT TESTER (AIR VOLTAGE)

a. Remove the intake manifold (Click here).

b. Connect the pressure gauge to the pressure sensor as shown in the illustration.



c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG) and turn the tester on (do not start the engine).

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Air pump pressure.

f. When applying pressure by the hand pump, check that the air pump pressure is almost same as the pressure gauge indication.

OK:
Pressure fluctuates in response to the pressure applied with pressure gauge.

NG → REPLACE AIR PRESSURE SENSOR (Click here)

OK

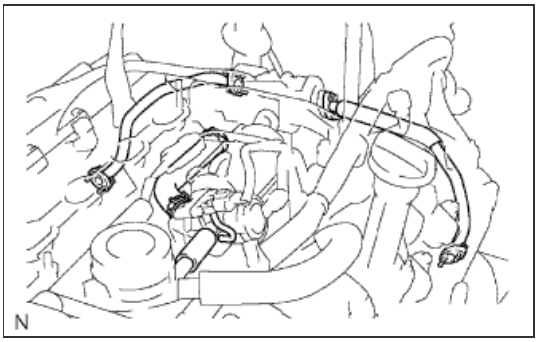
4.CHECK HOSE AND PIPE



a. Remove the intake manifold (Click here).

b. Check that all the pipes and hoses between the air pump and air switching valve are securely connected.

OK:
All air injection pipes and hoses are securely connected.

c. Check all pipes and hoses for blockages and damage.

OK:
All air injection pipes and hoses have no blockages or damage.

NG → REPAIR OR REPLACE HOSES AND TUBES (Click here)

OK

REPLACE AIR PUMP ASSEMBLY (Click here)

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
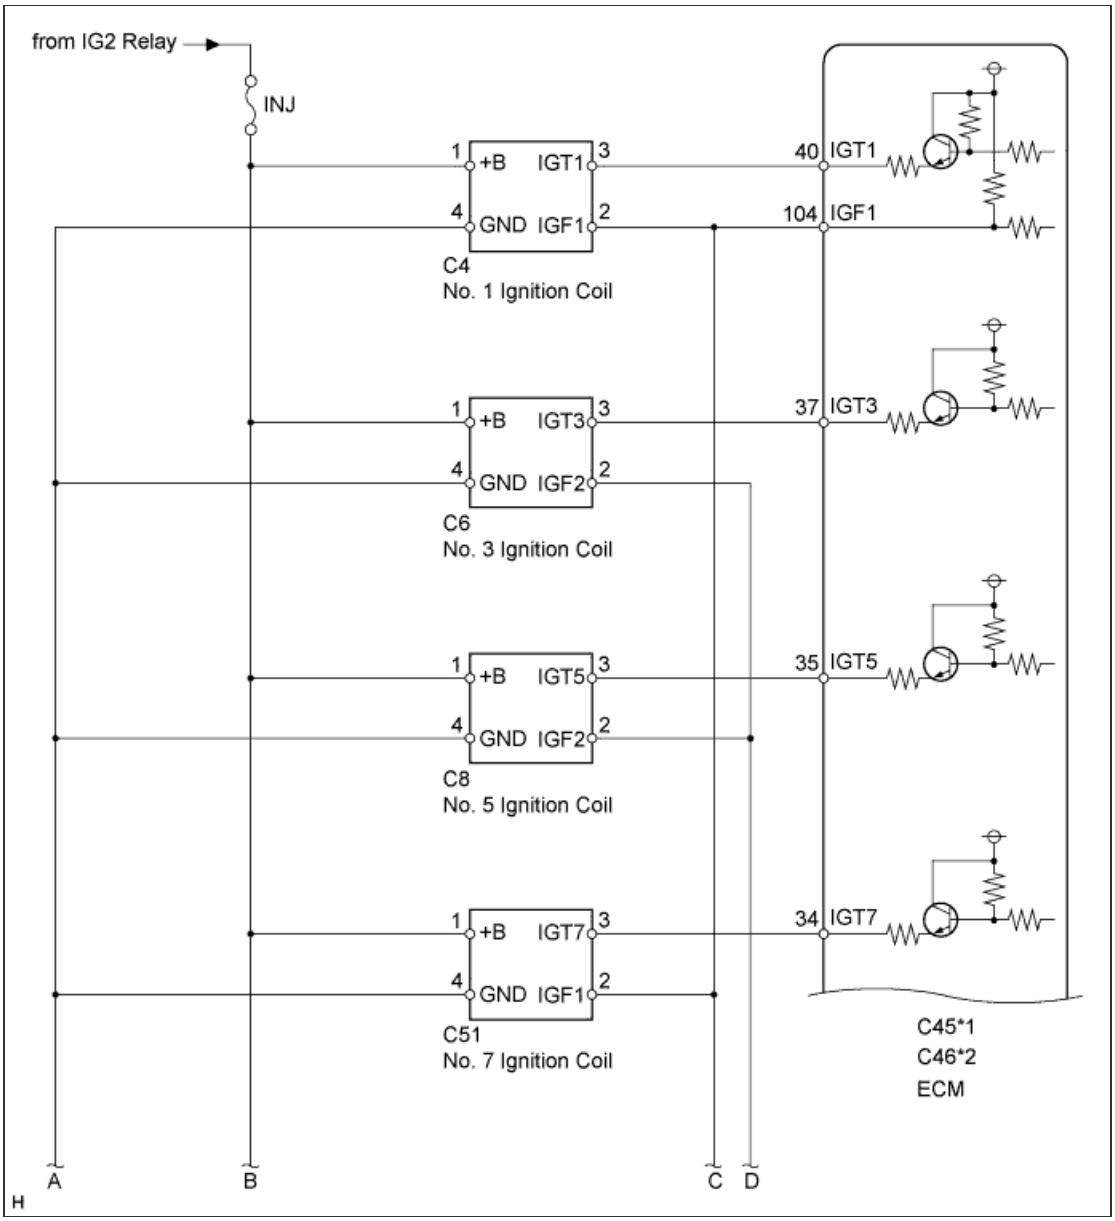
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

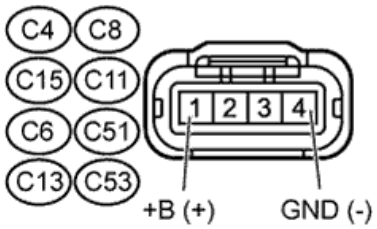
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

Front view of wire harness connector:
(to Ignition Coil with Igniter)

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 ( ) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 ( ) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 ( ) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 ( ) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 ( ) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 ( ) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 ( ) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 ( ) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C51-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C53-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C4-3 (IGT1) - C45-40 (IGT1)	Always	Below 1 Ω

C15-3 (IGT2) - C45-33 (IGT2)	Always	Below 1 Ω
C6-3 (IGT3) - C45-37 (IGT3)	Always	Below 1 Ω

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
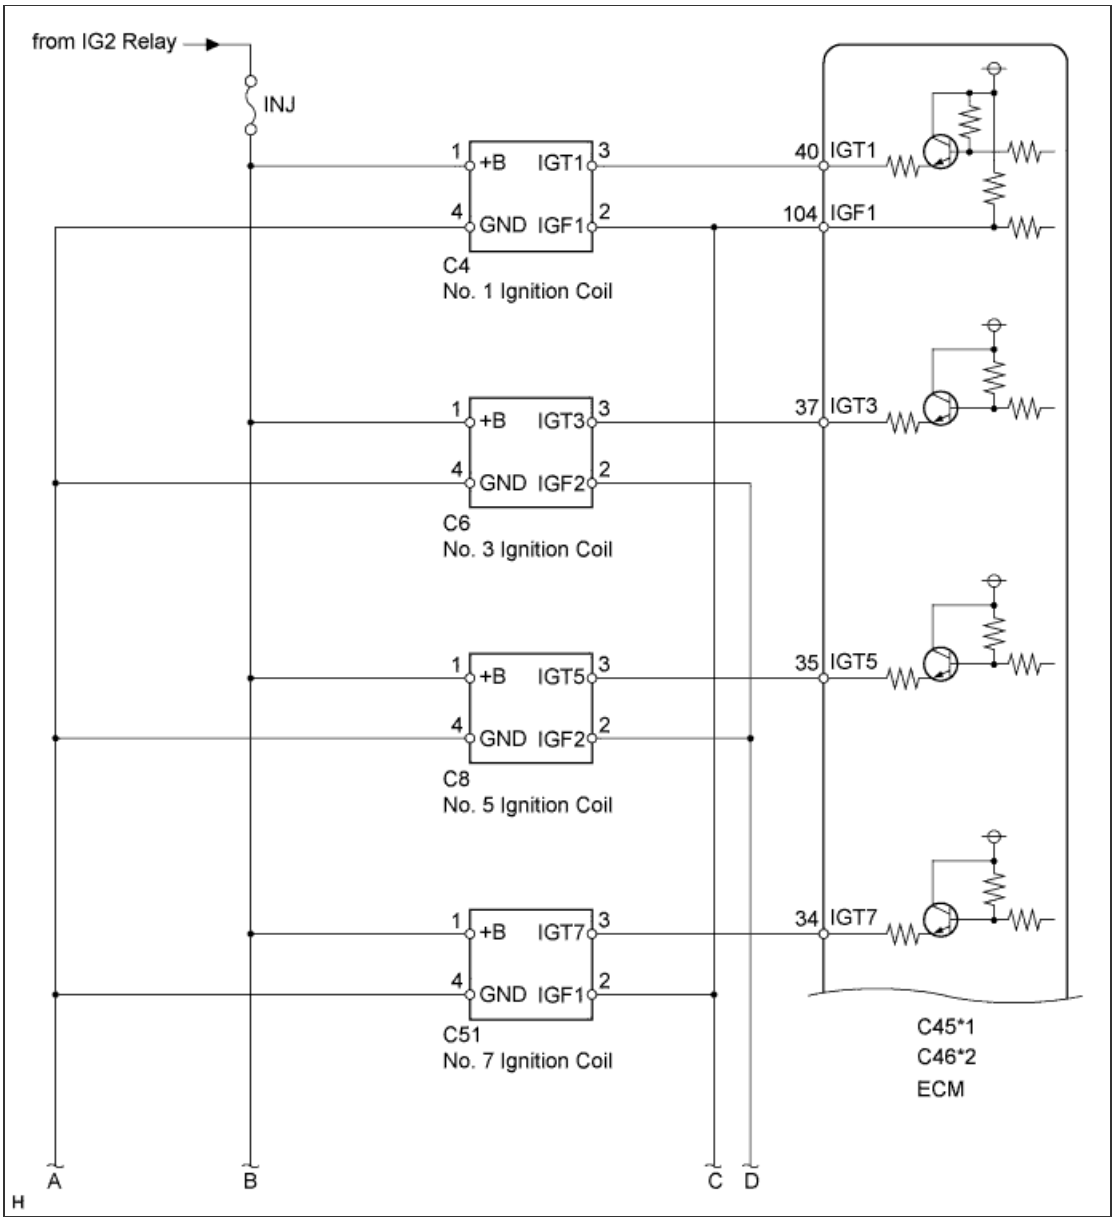
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

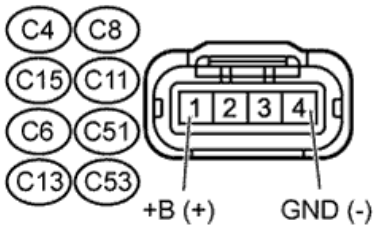
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

Front view of wire harness connector:
(to Ignition Coil with Igniter)

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 ( ) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 ( ) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 ( ) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 ( ) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 ( ) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 ( ) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 ( ) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 ( ) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω

A

REPLACE ECM (Click here)

DTC P2A00 A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

DTC P2A03 A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2A00	The calculated value of the air-fuel ratio (A/F) sensor response rate deterioration level is less than the threshold (2 trip detection logic).	• Open or short in A/F sensor circuit (for bank 1) • A/F sensor (for bank 1) • ECM
P2A03	The calculated value of the air-fuel ratio (A/F) sensor response rate deterioration level is less than the threshold (2 trip detection logic).	• Open or short in A/F sensor circuit (for bank 2) • A/F sensor (for bank 2) • ECM

MONITOR DESCRIPTION

After the engine is warmed up, the ECM performs air-fuel ratio feedback control to maintain the air-fuel ratio at the stoichiometric level. In addition, active A/F control is performed for approximately 10 seconds after the preconditions are met in order to measure the A/F sensor response rate. During active A/F control, the ECM forcibly increases and decreases the injection volume a certain amount, based on the stoichiometric air-fuel ratio learned during normal air-fuel ratio control, and measures the A/F sensor response rate. The ECM receives a signal from the A/F sensor while performing active A/F control and uses it to calculate the A/F sensor response rate deterioration level.
If the A/F sensor response rate deterioration level is less than the threshold, the ECM interprets this as a malfunction and stores the DTC.

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the A/F sensor response monitor.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear the DTCs.
(e) Start the engine.

(f) Enter the following menus: Powertrain / Engine and ECT / Data List / Monitor Status.
(g) Check that O2S (A/FS) Monitor is Incmpl.
(h) Warm up the engine.
(i) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) for 5 minutes. However, the vehicle should be driven at a constant speed.
(j) Check that O2S (A/FS) Monitor is Incmpl.
(k) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(l) Check if any DTCs (any pending DTCs) are output.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/ F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
			• Injector

4	Injection Volume +25% -12.5%  Output Voltage Almost no reaction NG	Injection Volume +25% -12.5%  Output Voltage Almost no reaction NG	• Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **DTC P2A00 indicates malfunctions related to the bank 1 A/F sensor.**
- **DTC P2A03 indicates malfunctions related to the bank 2 A/F sensor.**
- **For Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **For Bank 2 refers to the bank that includes the No. 2 cylinder.**
- **DTC P2A00 or P2A03 may be stored when the air-fuel ratio is stuck rich or lean.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00 AND/OR P2A03)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2A00 and/or P2A03 is output	A
P2A00 and/or P2A03 and other DTCs are output	B

HINT:

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

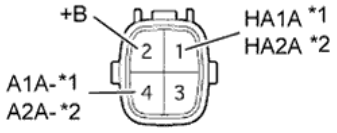
2.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

3.CHECK HARNESS AND CONNECTOR (ECM - AIR-FUEL RATIO SENSOR)

a. Disconnect the A/F sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher

- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
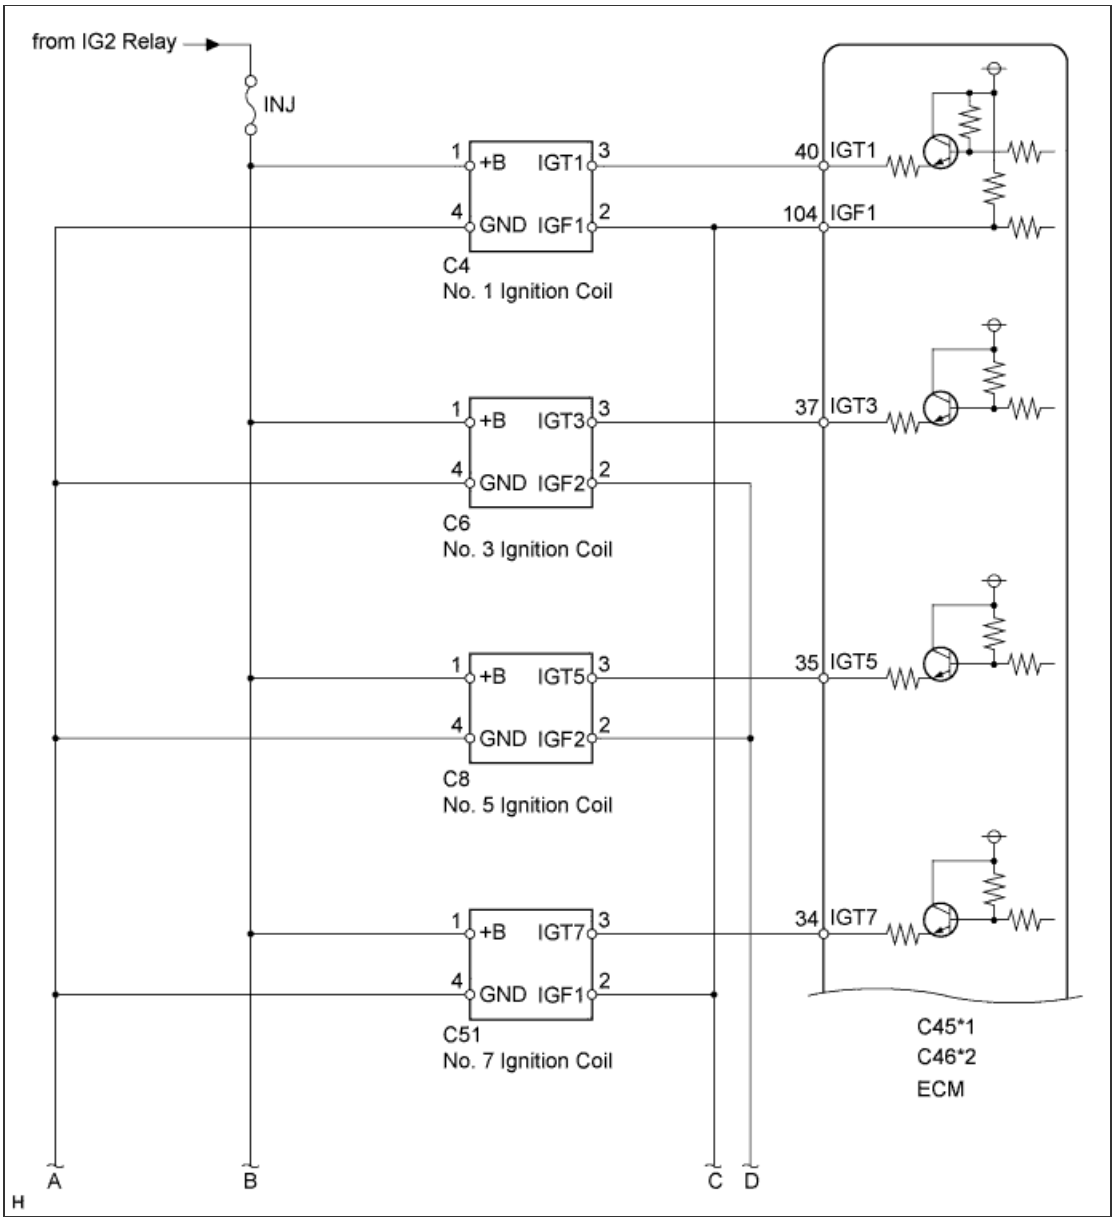
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6, IGT7, IGT8 - E1 CH2: IGF1, IGF2 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

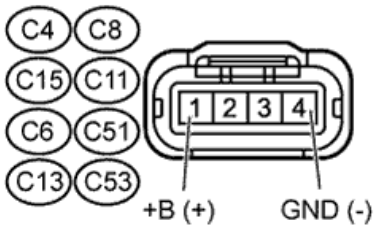
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

Front view of wire harness connector:
(to Ignition Coil with Igniter)

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 ( ) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 ( ) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 ( ) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 ( ) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 ( ) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 ( ) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 ( ) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 ( ) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the No. 1 to No. 8 ignition coil connectors.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C51-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C53-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C4-3 (IGT1) - C45-40 (IGT1)	Always	Below 1 Ω

C15-3 (IGT2) - C45-33 (IGT2)	Always	Below 1 Ω
C6-3 (IGT3) - C45-37 (IGT3)	Always	Below 1 Ω
C13-3 (IGT4) - C45-38 (IGT4)	Always	Below 1 Ω
C8-3 (IGT5) - C45-35 (IGT5)	Always	Below 1 Ω
C11-3 (IGT6) - C45-36 (IGT6)	Always	Below 1 Ω
C51-3 (IGT7) - C45-34 (IGT7)	Always	Below 1 Ω
C53-3 (IGT8) - C45-39 (IGT8)	Always	Below 1 Ω
C4-2 (IGF1) or C45-104 (IGF1) - Body ground	Always	10 kΩ or higher
C15-2 (IGF2) or C45-105 (IGF2) - Body ground	Always	10 kΩ or higher
C6-2 (IGF2) or C45-105 (IGF2) - Body ground	Always	10 kΩ or higher
C13-2 (IGF1) or C45-104 (IGF1) - Body ground	Always	10 kΩ or higher
C8-2 (IGF2) or C45-105 (IGF2) - Body ground	Always	10 kΩ or higher
C11-2 (IGF1) or C45-104 (IGF1) - Body ground	Always	10 kΩ or higher
C51-2 (IGF1) or C45-104 (IGF1) - Body ground	Always	10 kΩ or higher
C53-2 (IGF2) or C45-105 (IGF2) - Body ground	Always	10 kΩ or higher
C4-3 (IGT1) or C45-40 (IGT1) - Body ground	Always	10 kΩ or higher
C15-3 (IGT2) or C45-33 (IGT2) - Body ground	Always	10 kΩ or higher
C6-3 (IGT3) or C45-37 (IGT3) - Body ground	Always	10 kΩ or higher
C13-3 (IGT4) or C45-38 (IGT4) - Body ground	Always	10 kΩ or higher
C8-3 (IGT5) or C45-35 (IGT5) - Body ground	Always	10 kΩ or higher

B → REPLACE IGNITION COIL ASSEMBLY (Click here)

A

REPLACE ECM (Click here)

DTC P2A00 A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

DTC P2A03 A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2A00	The calculated value of the air-fuel ratio (A/F) sensor response rate deterioration level is less than the threshold (2 trip detection logic).	• Open or short in A/F sensor circuit (for bank 1) • A/F sensor (for bank 1) • ECM
P2A03	The calculated value of the air-fuel ratio (A/F) sensor response rate deterioration level is less than the threshold (2 trip detection logic).	• Open or short in A/F sensor circuit (for bank 2) • A/F sensor (for bank 2) • ECM

MONITOR DESCRIPTION

After the engine is warmed up, the ECM performs air-fuel ratio feedback control to maintain the air-fuel ratio at the stoichiometric level. In addition, active A/F control is performed for approximately 10 seconds after the preconditions are met in order to measure the A/F sensor response rate. During active A/F control, the ECM forcibly increases and decreases the injection volume a certain amount, based on the stoichiometric air-fuel ratio learned during normal air-fuel ratio control, and measures the A/F sensor response rate. The ECM receives a signal from the A/F sensor while performing active A/F control and uses it to calculate the A/F sensor response rate deterioration level.
If the A/F sensor response rate deterioration level is less than the threshold, the ECM interprets this as a malfunction and stores the DTC.

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the A/F sensor response monitor.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the engine switch on (IG).
(c) Turn the tester on.
(d) Clear the DTCs.
(e) Start the engine.

(f) Enter the following menus: Powertrain / Engine and ECT / Data List / Monitor Status.
(g) Check that O2S (A/FS) Monitor is Incmpl.
(h) Warm up the engine.
(i) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) for 5 minutes. However, the vehicle should be driven at a constant speed.
(j) Check that O2S (A/FS) Monitor is Incmpl.
(k) Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.
(l) Check if any DTCs (any pending DTCs) are output.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air-Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/ F sensor operation using the intelligent tester.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and turn the tester on.
(c) Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.
(d) Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F sensor.
(e) Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).
(f) Monitor the output voltages of the A/F and HO2 sensors (AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2) displayed on the tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS B1 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B1 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4
AFS B2 S1 (A/F)	+25%	Rich	Below 3.0
	-12.5%	Lean	Higher than 3.35
O2S B2 S2 (HO2)	+25%	Rich	Higher than 0.55
	-12.5%	Lean	Below 0.4

NOTICE:

The A/F sensor has an output delay of a few seconds and the HO2 sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
			• Injector

4	Injection Volume +25% -12.5%  Output Voltage Almost no reaction NG	Injection Volume +25% -12.5%  Output Voltage Almost no reaction NG	• Fuel pressure • Gas leakage from exhaust system (Air-fuel ratio extremely rich or lean)

Following the Control the Injection Volume for A/F Sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors. To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/ F Sensor / A/F Control System / AFS B1 S1 and O2S B1 S2 or AFS B2 S1 and O2S B2 S2.

HINT:

- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**
- **DTC P2A00 indicates malfunctions related to the bank 1 A/F sensor.**
- **DTC P2A03 indicates malfunctions related to the bank 2 A/F sensor.**
- **For Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **For Bank 2 refers to the bank that includes the No. 2 cylinder.**
- **DTC P2A00 or P2A03 may be stored when the air-fuel ratio is stuck rich or lean.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00 AND/OR P2A03)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P2A00 and/or P2A03 is output	A
P2A00 and/or P2A03 and other DTCs are output	B

HINT:

If any DTCs relating to the A/F sensor (DTCs for the A/F sensor heater or A/F sensor admittance) are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

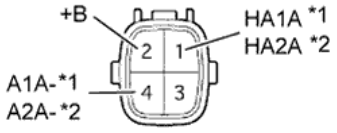
2.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)



a. Disconnect the Air-Fuel Ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

3.CHECK HARNESS AND CONNECTOR (ECM - AIR-FUEL RATIO SENSOR)

a. Disconnect the A/F sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V
C23-2 (+B) - Body ground	Engine switch on (IG)	11 to 14 V

c. Turn the engine switch off.

d. Disconnect the ECM connector.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C45-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-		

103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-102 (A2A-) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-22 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C46-126 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-125 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-20 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-103 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-102 (A2A-)	Always	Below 1 Ω
C22-1 (HA1A) or C46-22 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-126 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-125 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-20 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-103 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-102 (A2A-) - Body ground	Always	10 kΩ or higher

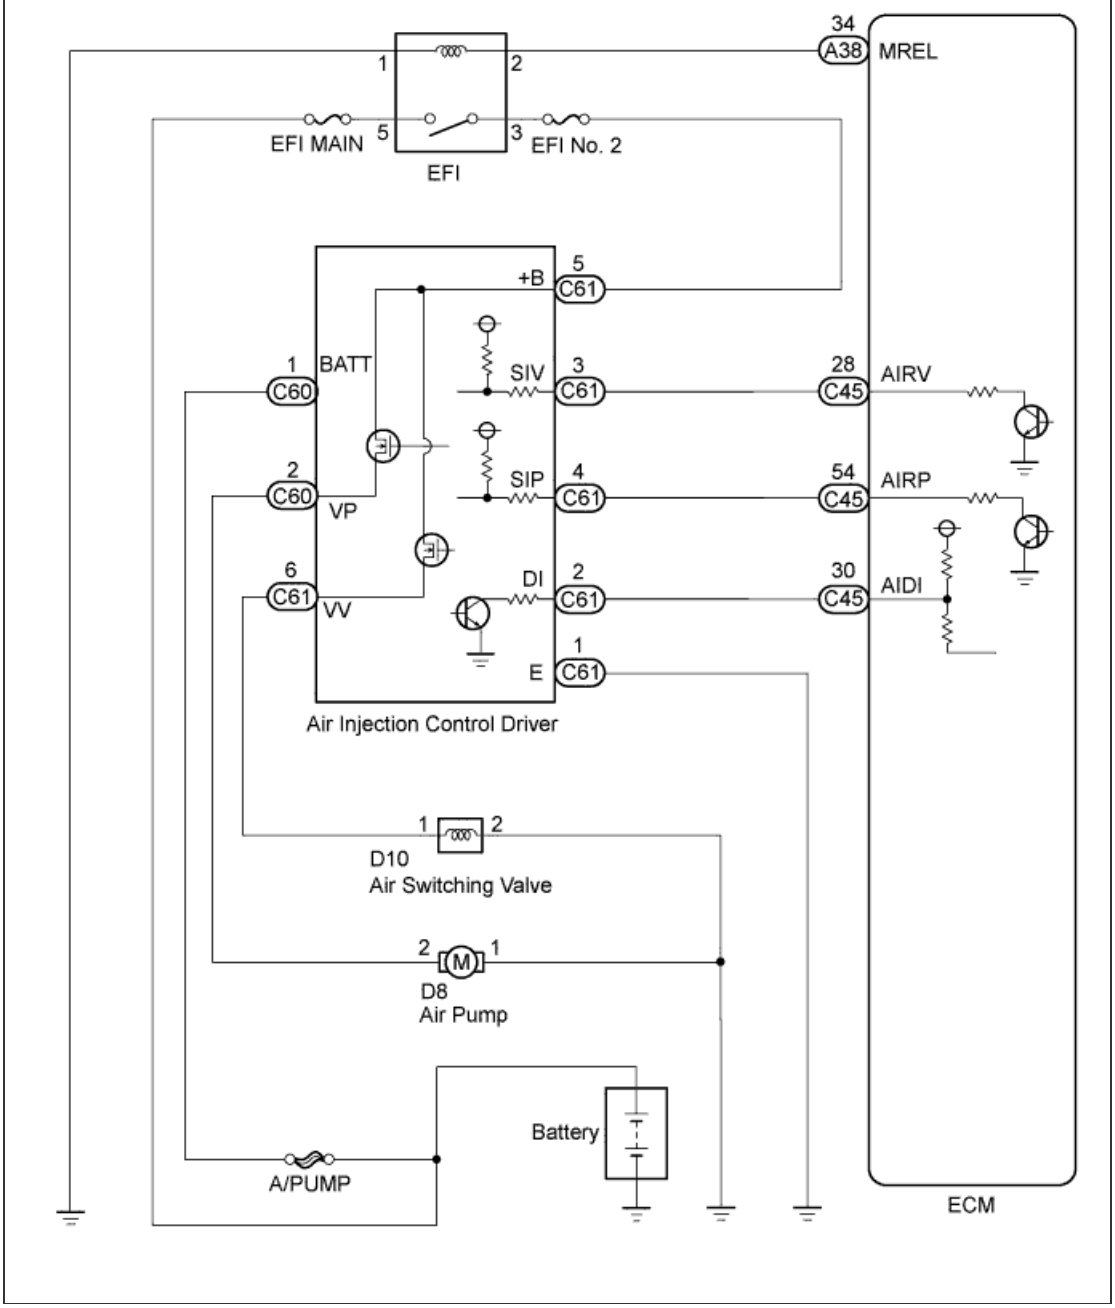
DTC P0412 Secondary Air Injection System Switching Valve "A" Circuit

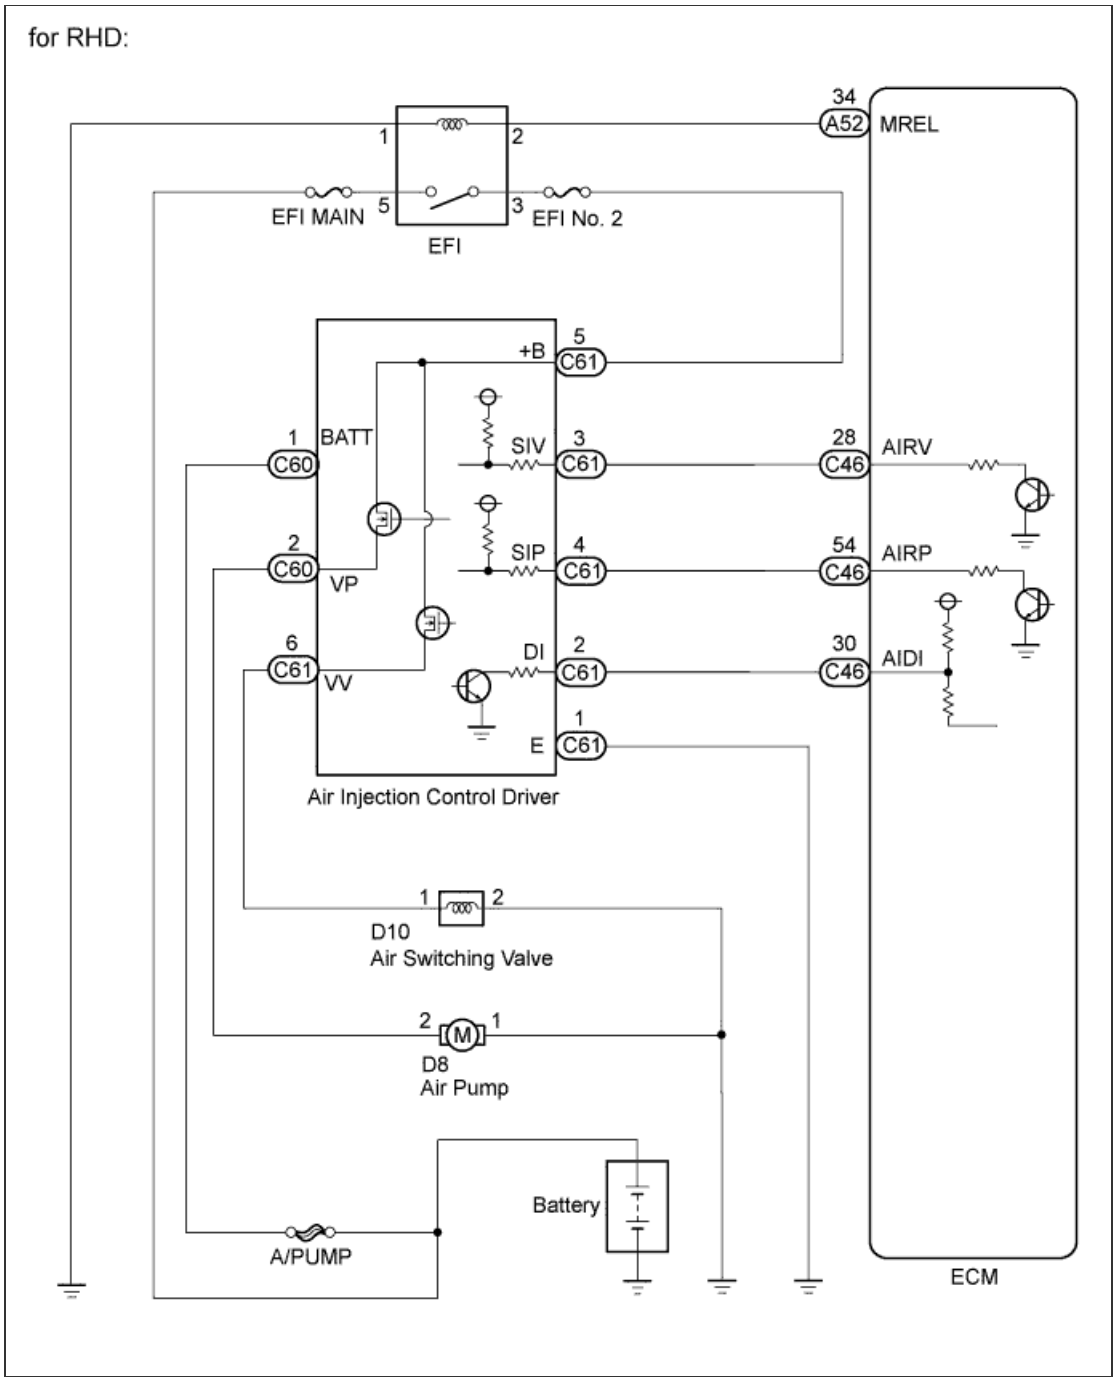
for Preparation Click here

DESCRIPTION

The diagnostic trouble code (DTC) indicates an open or short in the electric air switching valve (E-ASV) circuit of the secondary air injection (AIR) system. The air injection control driver diagnoses the air pump circuit, E-ASV circuit and itself, and sends the diagnosis signal to the engine control module (ECM). If the ECM receives a malfunction signal from the air injection control driver, the ECM illuminates the malfunction indicator lamp (MIL), and stores a DTC.



The secondary air injection (AIR) system introduces fresh air into the exhaust manifold in order to reduce carbon monoxide (CO) and hydrocarbon (HC) in the exhaust emission. This system is activated just after the engine start, and is stopped when the catalyst converter is warmed-up. This system consists of the following components: 1) the air pump which sends fresh air to the exhaust manifold, 2) the electric air switching valve (E-ASV) which switches the fresh air flow, 3) the air switching valve (ASV) which switches the air passage to the exhaust manifold of each bank, 4) the vacuum switching valve (VSV) which switches the vacuum (intake manifold pressure) to operate the ASV, 5) the pressure sensor which detects the fresh air pressure and exhaust pulse, 6) the air injection control driver which controls the power sources of the air pump and E-ASV, 7) the engine control module (ECM) which controls and monitors this system.



DTC Code	DTC Detection Condition	Trouble Area
P0412	The ECM receives a diagnostic signal from the driver (40% duty-cycle) (1 trip detection logic).	• ASV circuit • Air injection control driver • Air switching valve

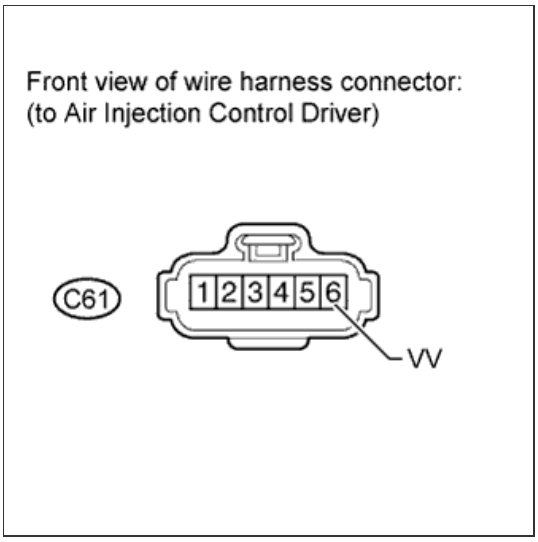
INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was running or stopped, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK HARNESS AND CONNECTOR (AIR INJECTION CONTROL DRIVER - BODY GROUND)

a. Disconnect the air injection control driver connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

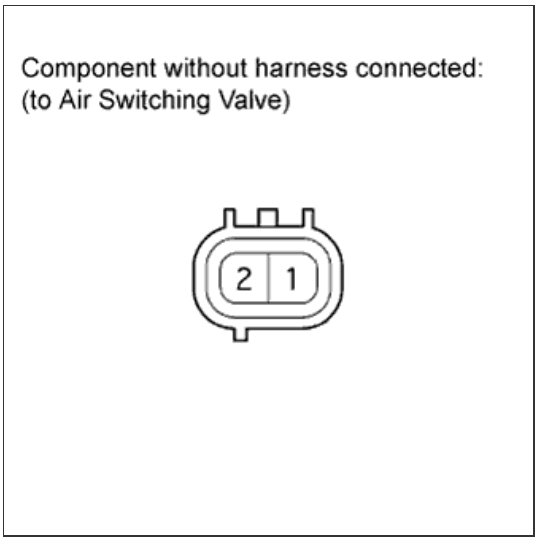
Tester Connection	Condition	Specified Condition
C61-6 (VV) or - Body ground	20°C (68°F)	4.5 to 5.5 Ω

NG → Go to step 2

OK

REPLACE AIR INJECTION CONTROL DRIVER (Click here)

2.INSPECT AIR SWITCHING VALVE



a. Remove the intake manifold (Click here).

b. Disconnect the Air Switching Valve (ASV) connector.

c. Measure the resistance according to the value(s) in the table below.

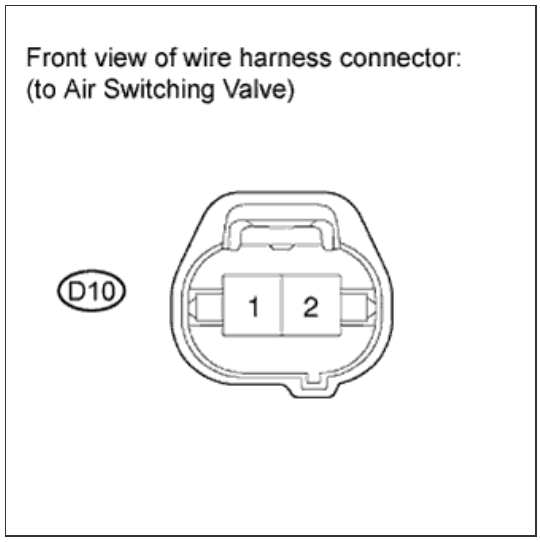
Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	4.5 to 5.5 Ω

NG → REPLACE AIR SWITCHING VALVE (Click here)

OK

3.CHECK HARNESS AND CONNECTOR (AIR SWITCHING VALVE - BODY GROUND)



a. Remove the intake manifold (Click here).

b. Disconnect the Air Switching Valve (ASV) connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

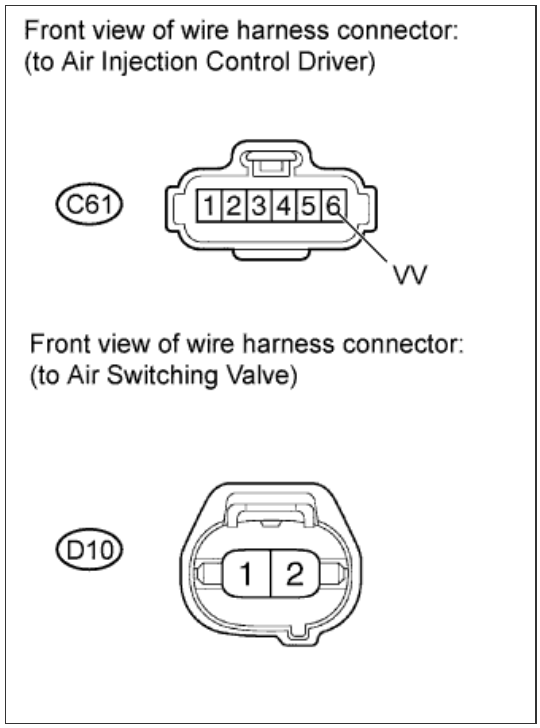
Tester Connection	Condition	Specified Condition
D10-2 - Body ground	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK HARNESS AND CONNECTOR (AIR SWITCHING VALVE - AIR INJECTION CONTROL DRIVER)

a. Remove the intake manifold (Click here).



b. Disconnect the air injection control driver connector.

c. Disconnect the air switching valve connector.

d. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C61-6 (VV) - D10-1	Always	Below 1 Ω
C61-6 (VV) or D10-1 - Body ground	Always	10 kΩ higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC U0101 Lost Communication with TCM

for Preparation Click here

DESCRIPTION

The Transmission Control Module (TCM) and ECM perform 2-way communications with each other via the Controller Area Network (CAN). The TCM sends signals to the ECM concerning required engine speed, required engine torque, warning indicator speed, opening angles of the throttle valve, temperature of intake air, temperature of engine coolant, engine torque and other data. If the TCM cannot communicate with the ECM, the TCM will conclude that there is a malfunction in the CAN system, illuminate the MIL and store a DTC.

DTC Code	DTC Detection Condition	Trouble Area
U0101	No communication from the TCM continues.	• Open or short in TCM and ECM circuit • TCM • ECM

INSPECTION PROCEDURE

1.CHECK OTHER DTC OUTPUT (IN ADDITION TO DTC U0101)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTCs.

Result

Result	Proceed to
U0101 is output	A
U0101 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

3.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Clear the DTC (Click here).

c. Start the engine.

d. Turn the tester on.

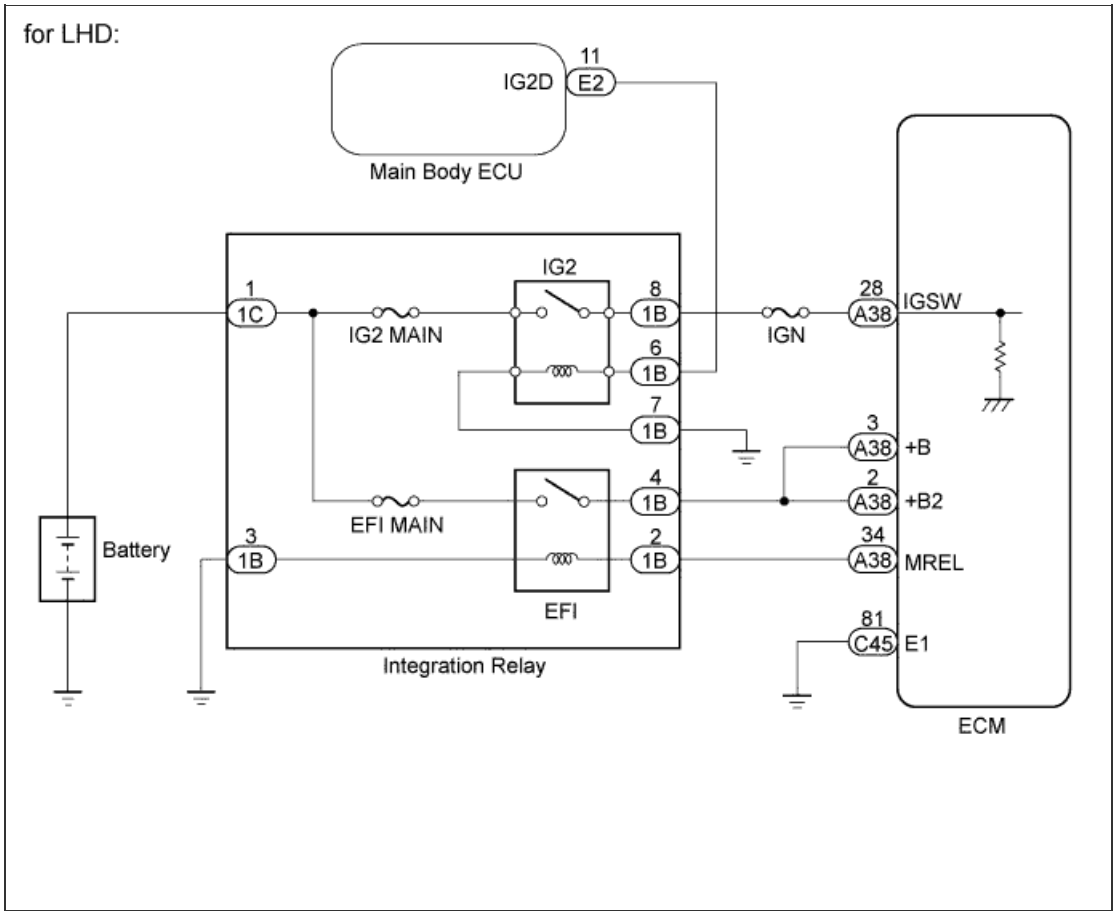
e. Enter the following menus: Powertrain / Engine and ECT / DTC.

f. Read the DTCs.

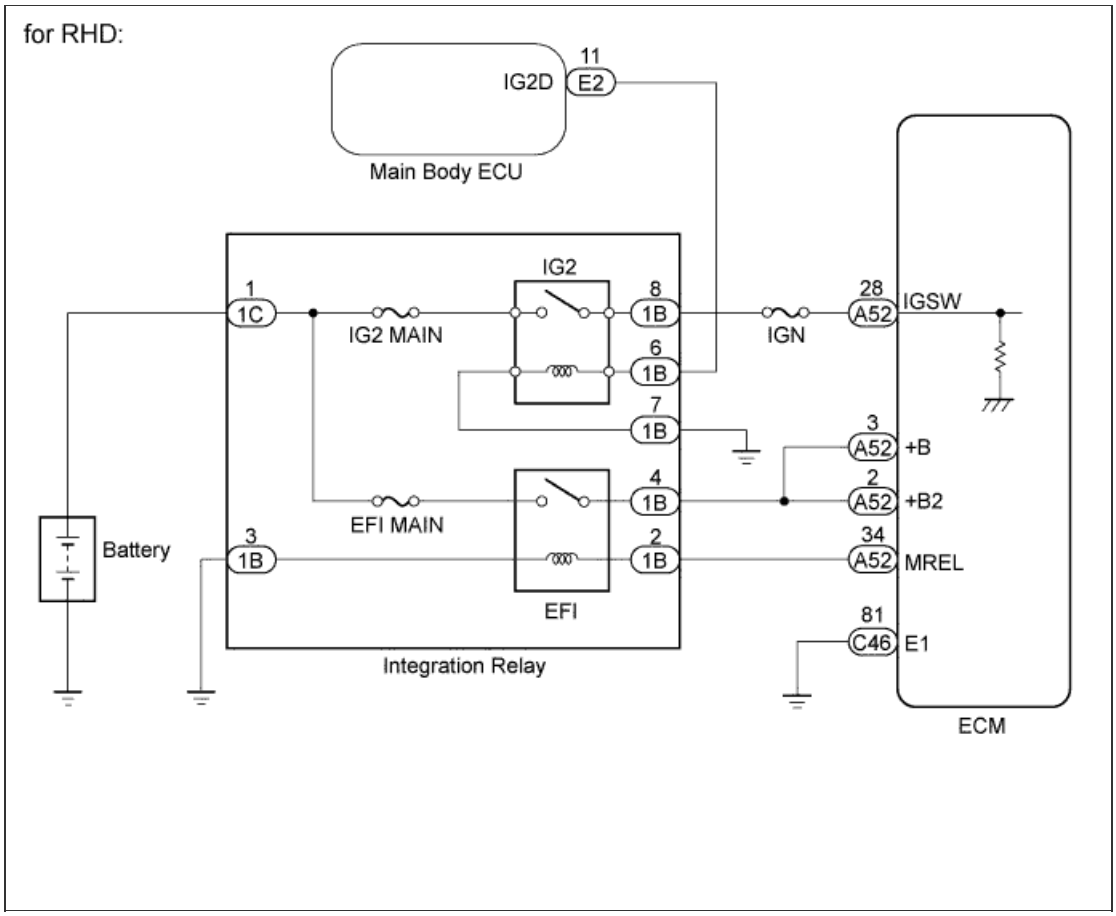
Result

Result	Proceed to
No DTC is output	A
Other DTCs are output	B

B → GO TO DTC CHART (Click here)



A
END



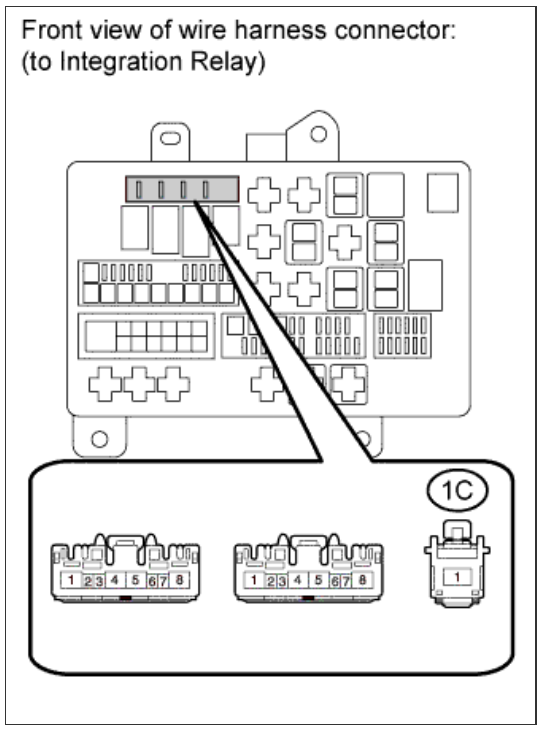
for Preparation Click here

DESCRIPTION

When the engine switch is turned on (IG), battery voltage is applied to terminal IGSW of the ECM. The output signal from the MREL terminal of the ECM causes a current to flow to the coil, closing the contacts of the integration relay (EFI relay) and supplying power to either terminal +B or +B2 of the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE



1.CHECK HARNESS AND CONNECTOR (BATTERY VOLTAGE)

a. Remove the integration relay from the engine room relay block.

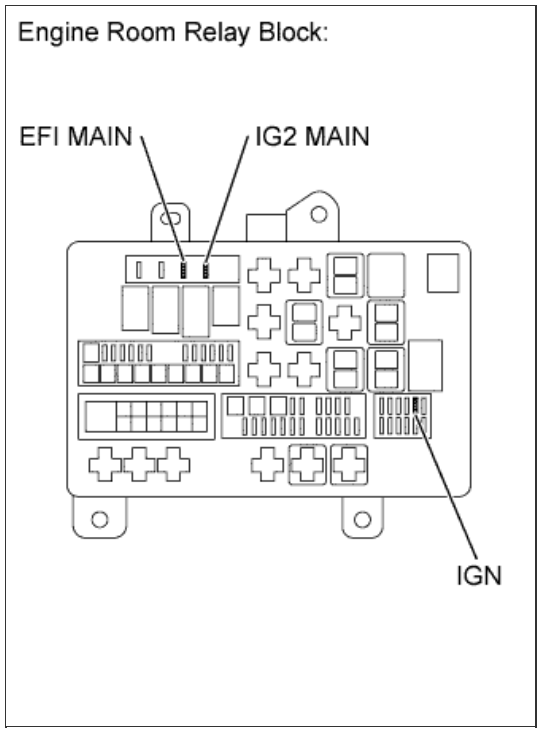
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
1C-1 - Body ground	Always	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - INTEGRATION RELAY)

OK



2.INSPECT FUSES (IG2 MAIN, EFI MAIN AND IGN)

a. Remove the IG2 MAIN fuse, EFI MAIN fuse and IGN fuse from the engine room relay block.

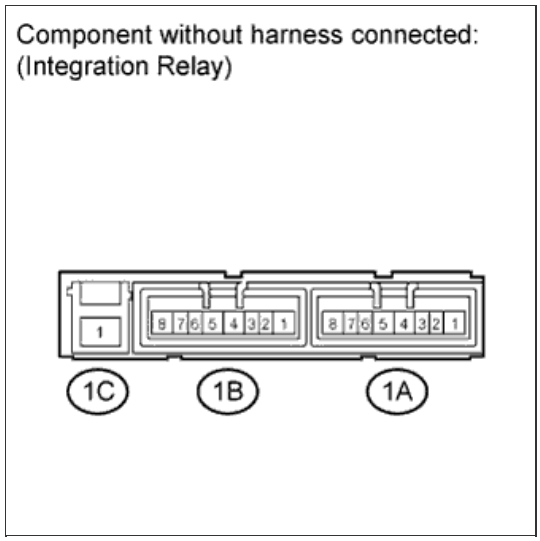
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
IG2 MAIN fuse	Always	Below 1 Ω
EFI MAIN fuse	Always	Below 1 Ω
IGN fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK



3.INSPECT INTEGRATION NO.1 RELAY (IG2, EFI)

a. Remove the integration relay from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-8	Battery voltage is not applied to terminals 1B-6 and 1B-7	10 kΩ or higher
1C-1 - 1B-8	Battery voltage is applied to terminals 1B-6 and 1B-7	Below 1 Ω
1C-1 - 1B-4	Battery voltage is not applied to terminals 1B-2 and 1B-3	10 kΩ or higher
1C-1 - 1B-4	Battery voltage is applied to terminals 1B-2 and 1B-3	Below 1 Ω

NG → REPLACE INTEGRATION NO.1 RELAY

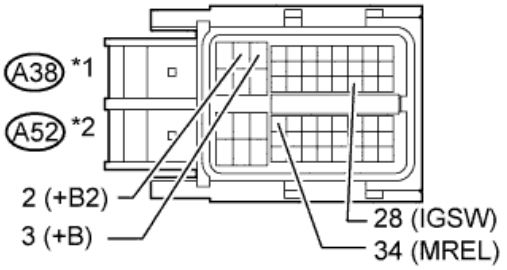
OK

4.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - ECM, BATTERY AND BODY GROUND)

a. Disconnect the ECM connector.

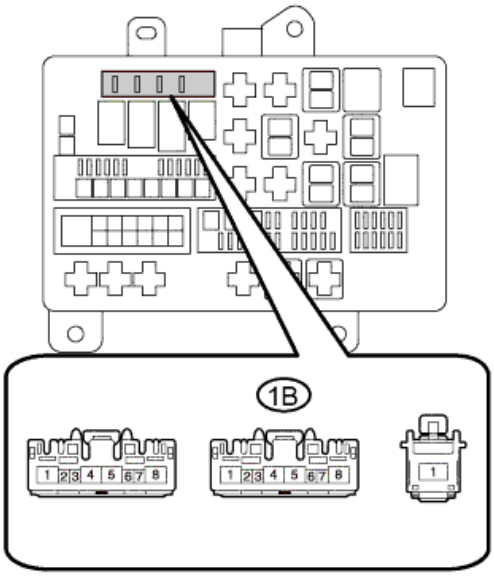
b. Remove the integration relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A38-28 (IGSW) - 1B-8	Always	Below 1 Ω
A38-3 (+B) - 1B-4	Always	Below 1 Ω
A38-2 (+B2) - 1B-4	Always	Below 1 Ω
A38-34 (MREL) - 1B-2	Always	Below 1 Ω
1B-3 - Body ground	Always	Below 1 Ω
1B-7 - Body ground	Always	Below 1 Ω
A38-28 (IGSW) or 1B-8 - Body ground	Always	10 kΩ or higher
A38-3 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher
A38-2 (+B2) or 1B-4 - Body ground	Always	10 kΩ or higher
A38-34 (MREL) or 1B-2 - Body ground	Always	10 kΩ or higher



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A52-28 (IGSW) - 1B-8	Always	Below 1 Ω
A52-3 (+B) - 1B-4	Always	Below 1 Ω
A52-2 (+B2) - 1B-4	Always	Below 1 Ω
A52-34 (MREL) - 1B-2	Always	Below 1 Ω
1B-3 - Body ground	Always	Below 1 Ω
1B-7 - Body ground	Always	Below 1 Ω
A52-28 (IGSW) or 1B-8 - Body ground	Always	10 kΩ or higher
A52-3 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher
A52-2 (+B2) or 1B-4 - Body ground	Always	10 kΩ or higher
A52-34 (MREL) or 1B-2 - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to ECM)

Front view of wire harness connector:
(to Integration Relay)

*1: for LHD

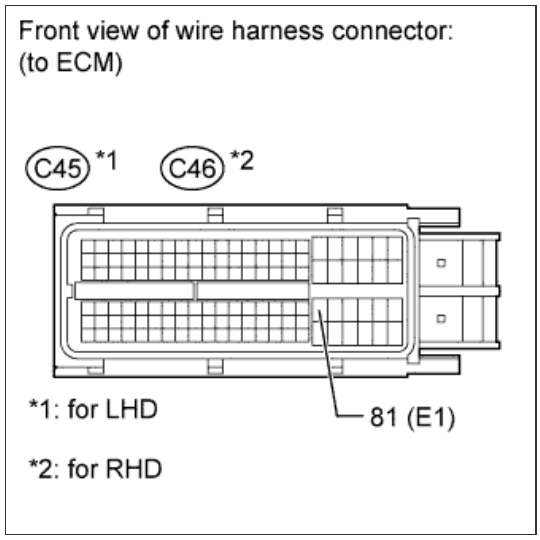
*2: for RHD

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

5.CHECK HARNESS AND CONNECTOR (ECM - BODY GROUND)

a. Disconnect the ECM connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-81 (E1) - Body ground	Always	Below 1 Ω

Standard Resistance (for RHD):

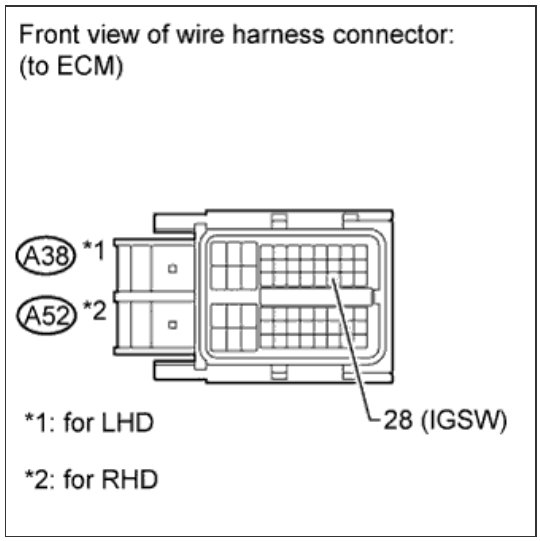
Tester Connection	Condition	Specified Condition
C46-81 (E1) - Body ground	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6.INSPECT ECM (IGSW VOLTAGE)

a. Disconnect the ECM connectors.



b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
A38-28 (IGSW) - Body ground	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
A52-28 (IGSW) - Body ground	Engine switch on (IG)	11 to 14 V

NG → Go to step 9

OK

7.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

8.CHECK PROBLEM SYMPTOM DISAPPEARS

a. Check if the problem symptom disappears.

Result

Result	Proceed to
Problem symptom disappears	A
Problem symptom does not disappear	B

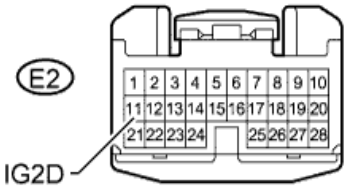
B → GO TO PROBLEM SYMPTOMS TABLE (Click here)

A

END

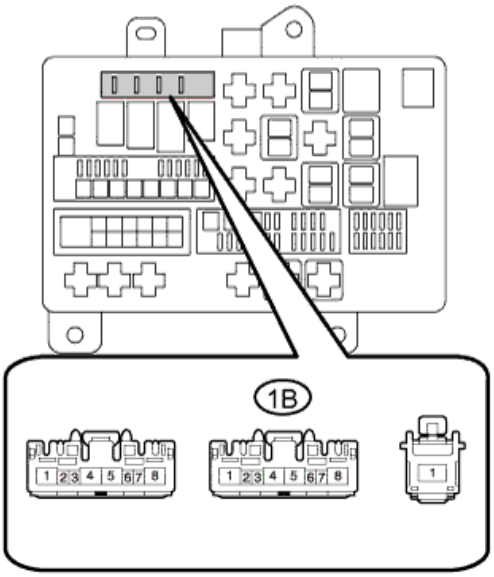
9.CHECK HARNESS AND CONNECTOR (MAIN BODY ECU - INTEGRATION RELAY)

a. Disconnect the main body ECU connector.



b. Remove the integration relay.

c. Measure the resistance according to the value(s) in the table below.



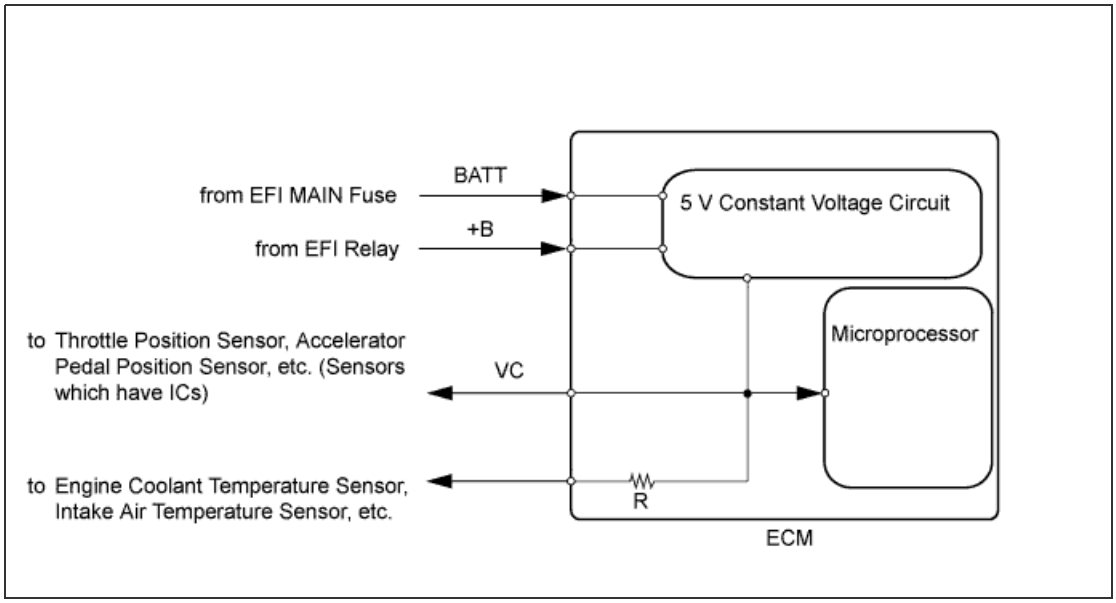
Standard Resistance:

Tester Connection	Condition	Specified Condition
E2-11 (IG2D) - 1B-6	Always	Below 1 Ω
E2-11 (IG2D) or 1B-6 - Body ground	Always	10 kΩ or higher

Front view of wire harness connector:
(to Main Body ECU)

Front view of wire harness connector:
(to Integration Relay)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

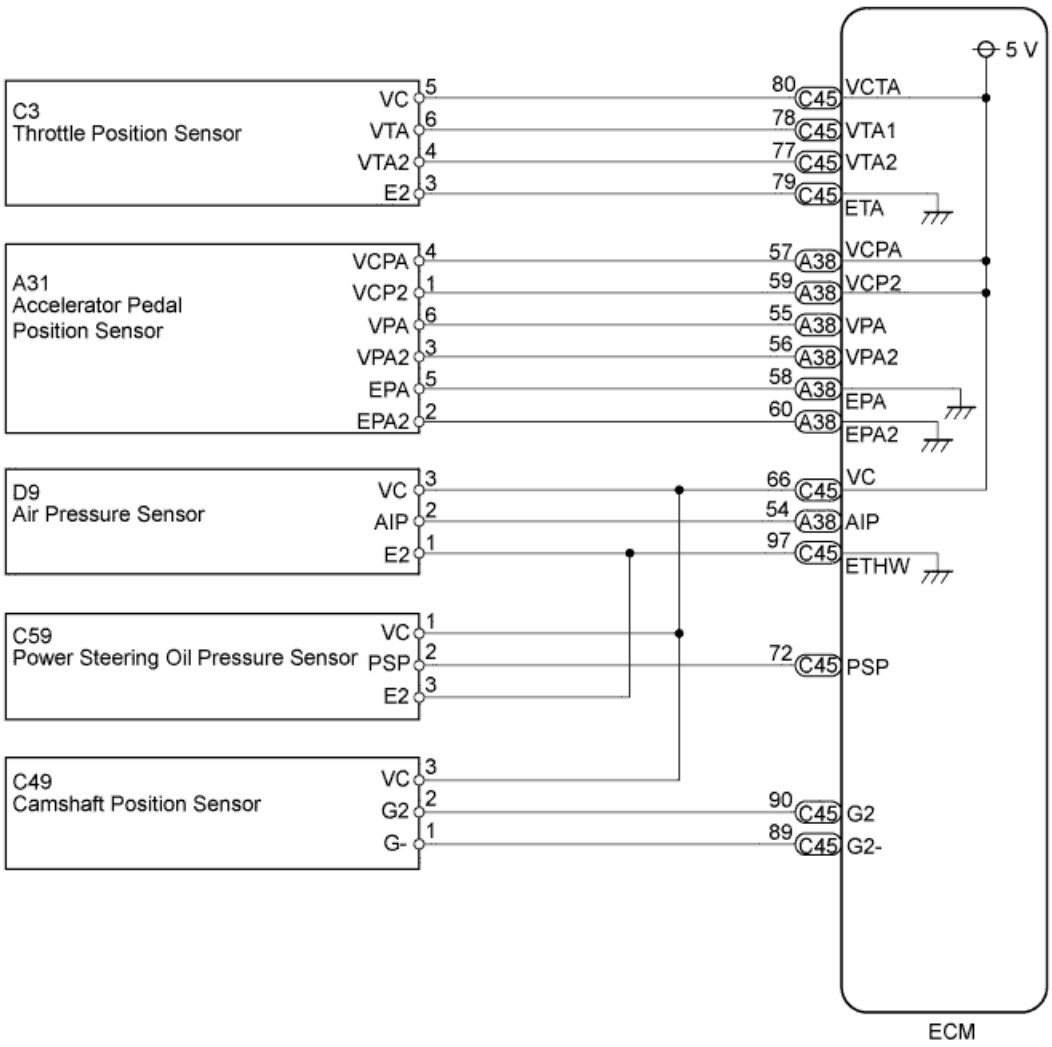
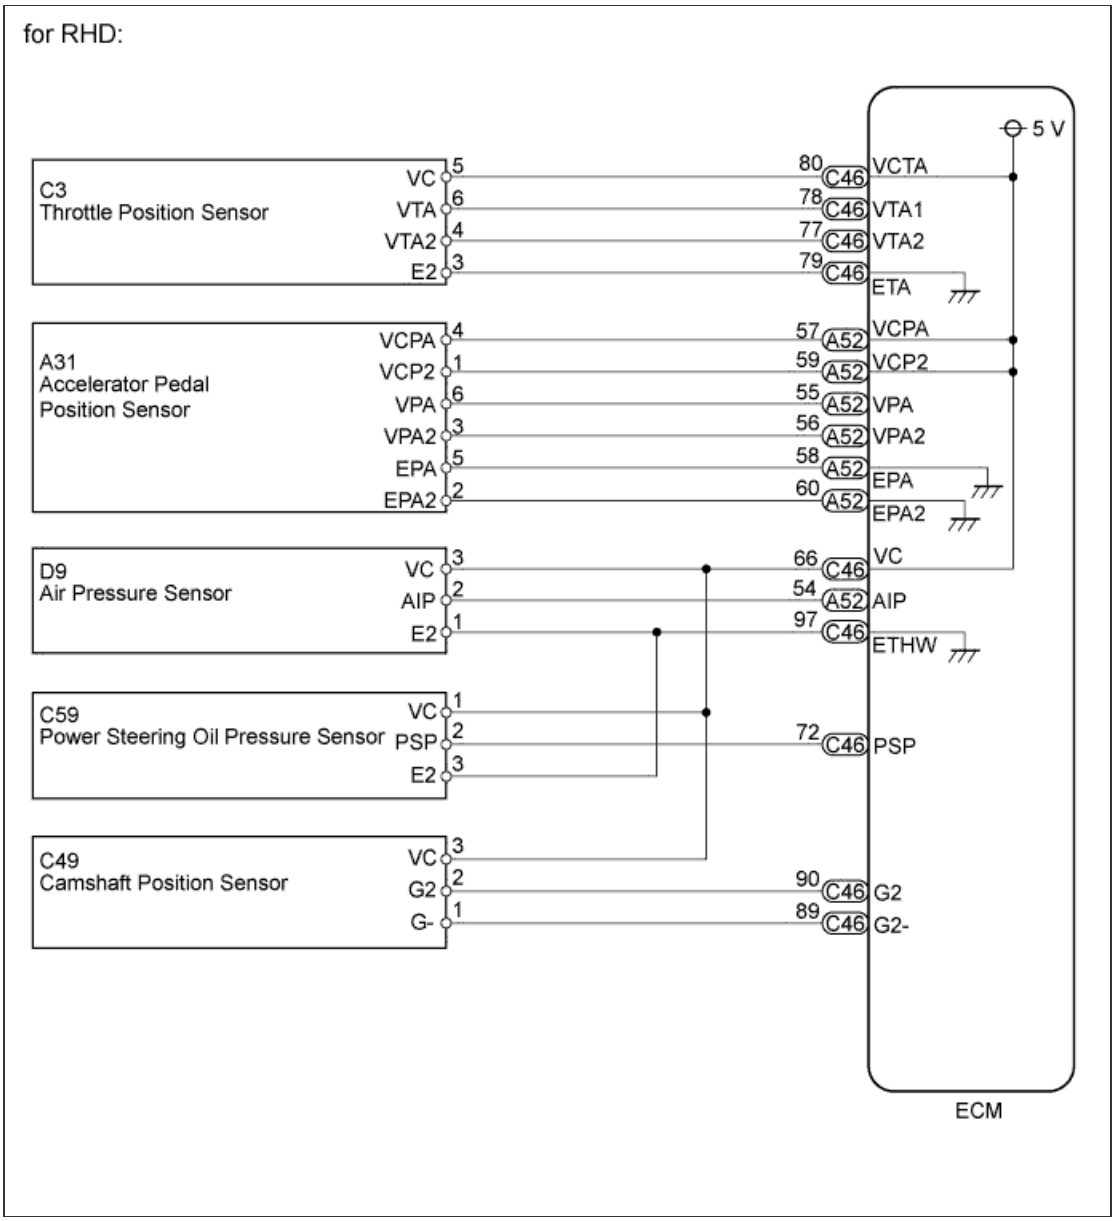
for Preparation Click here

DESCRIPTION

The ECM constantly generates 5 V of power from the battery voltage supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.



When the VC circuit is short-circuited, the microprocessor in the ECM and sensors that are supplied with power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.



HINT:

Under normal conditions, the MIL is illuminated for several seconds when the engine switch is first turned on (IG). The MIL turns off when the engine is started.

INSPECTION PROCEDURE

1.CHECK MIL

a. Check that the Malfunction Indicator Lamp (MIL) illuminates up when turning the engine switch on (IG).

Result

Result	Proceed to
MIL does not illuminate	A
MIL illuminates	B

B → SYSTEM OK

A

2.CHECK COMMUNICATION BETWEEN INTELLIGENT TESTER AND ECM

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and tester on.

c. Check the communication between the tester and ECM.

Result

Result	Proceed to
Communication is not possible	A
Communication is possible	B

B → GO TO MIL CIRCUIT (Click here)

A

3.CHECK MIL (THROTTLE POSITION SENSOR)

a. Disconnect the throttle body connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL does not illuminate	A
MIL illuminates	B

B → REPLACE THROTTLE BODY ASSEMBLY (Click here)

A

4.CHECK MIL (ACCELERATOR PEDAL POSITION SENSOR)

a. Disconnect the accelerator pedal position sensor connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL does not illuminate	A
MIL illuminates	B

B → REPLACE ACCELERATOR PEDAL SENSOR ASSEMBLY (Click here)

A

5.CHECK MIL (POWER STEERING OIL PRESSURE SWITCH)

a. Disconnect the power steering oil pressure sensor connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result:

Result	Proceed to
MIL does not illuminate	A
MIL illuminates	B

B → REPLACE POWER STEERING OIL PRESSURE SWITCH (Click here)

A

6.CHECK MIL (CAMSHAFT POSITION SENSOR)

a. Disconnect the camshaft position sensor connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL does not illuminate	A
MIL illuminates	B

B → REPLACE CAM POSITION SENSOR ASSEMBLY (Click here)

A

7.CHECK MIL (AIR PRESSURE SENSOR)

a. Disconnect the air pressure sensor connector.

b. Turn the engine switch on (IG).

c. Check the MIL.

Result

Result	Proceed to
MIL does not illuminate	A
MIL illuminates	B

B → REPLACE AIR PRESSURE SENSOR (Click here)

A

8.CHECK HARNESS AND CONNECTOR

a. Disconnect the throttle body connector.

b. Disconnect the accelerator pedal position sensor connector.

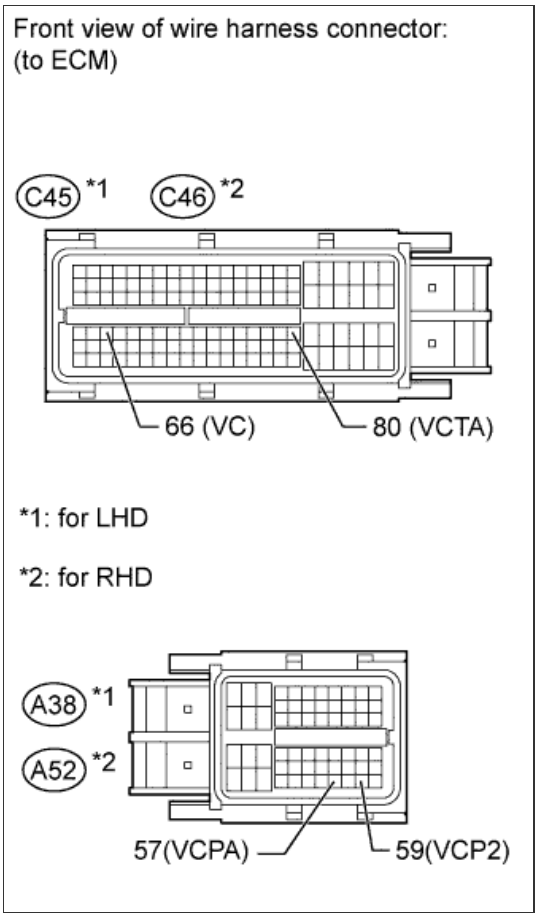
c. Disconnect the air pressure sensor connector.

d. Disconnect the power steering oil pressure switch connector.

e. Disconnect the camshaft position sensor connector.

f. Disconnect the ECM connectors.

g. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-80 (VCTA) - Body ground	Always	10 kΩ or higher
A38-57 (VCPA) - Body ground	Always	10 kΩ or higher
A38-59 (VCP2) - Body ground	Always	10 kΩ or higher
C45-66 (VC) - Body ground	Always	10 kΩ or higher

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C45-80 (VCTA) - Body ground	Always	10 kΩ or higher
A52-57 (VCPA) - Body ground	Always	10 kΩ or higher
A52-59 (VCP2) - Body ground	Always	10 kΩ or higher

C45-66 (VC) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

10.CHECK PROBLEM SYMPTOM DISAPPEARS

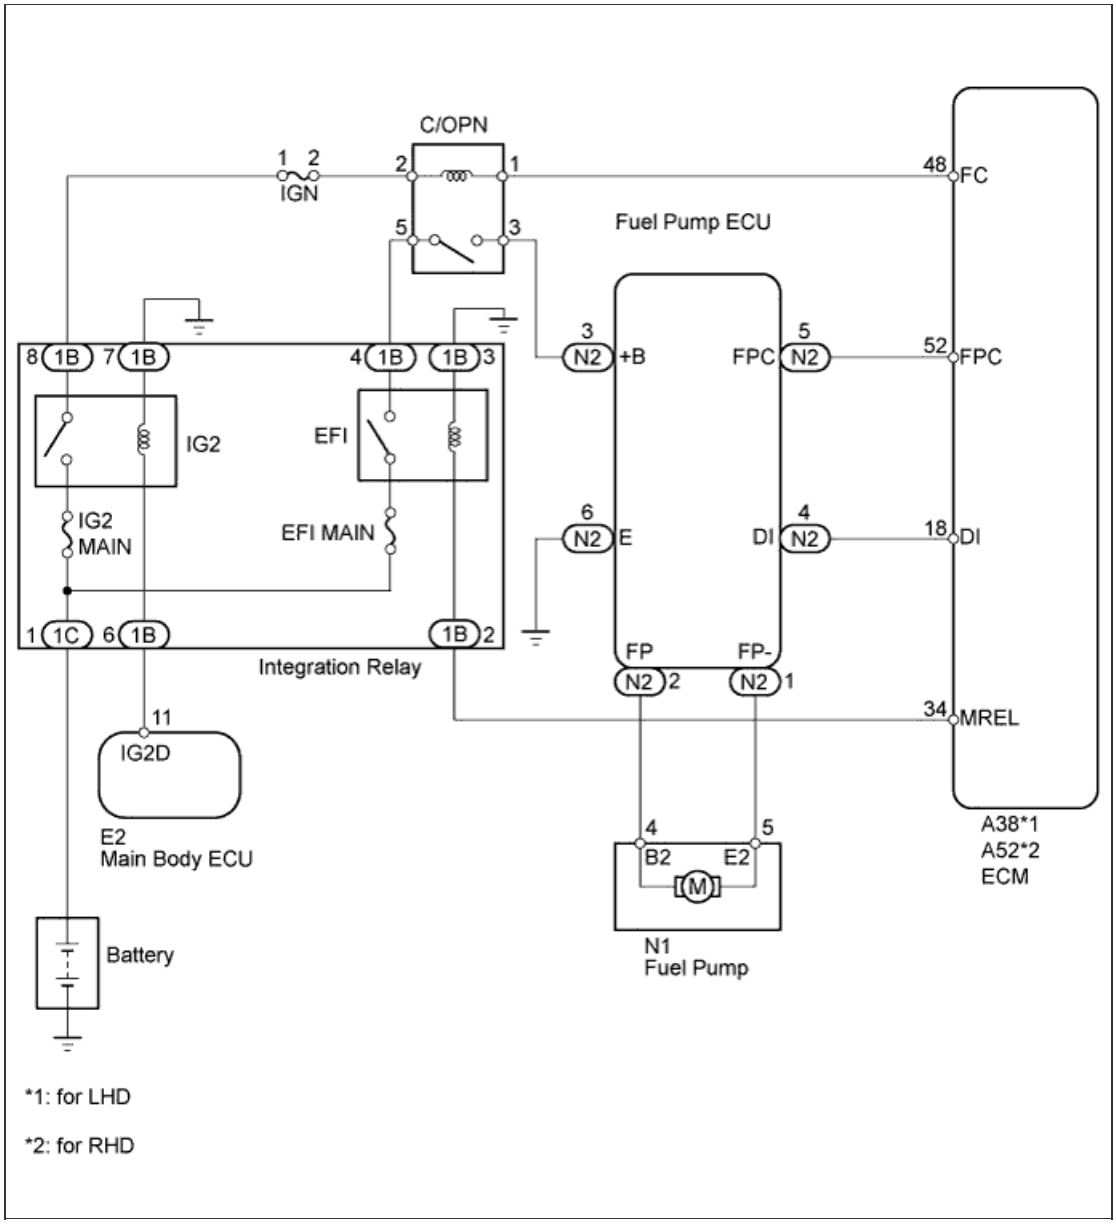
a. Check if the problem symptom disappears.

Result

Result	Proceed to
Problem symptom disappears	A
Problem symptom does not disappear	B

B → GO TO PROBLEM SYMPTOMS TABLE (Click here)

A



END

for Preparation Click here

DESCRIPTION

The fuel pump circuit consists of the ECM, fuel pump and fuel pump ECU (which operates the fuel pump). Based on the engine output, the ECM determines the fuel pump speed. The speed is then converted to a duty signal and sent to the fuel pump ECU. Based on the signal sent from the ECM, the fuel pump ECU adjusts the fuel pump operation speed between 3 settings.

WIRING DIAGRAM

INSPECTION PROCEDURE

This troubleshooting procedure is based on the premise that the engine is started. If the engine is not started, proceed to the Problem Symptoms Table (Click here).

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PUMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump / Speed.

d. Check whether operating sounds can be heard while operating the relay using the tester.

OK:

Operating sounds can be heard from relay.

NG → Go to step 5

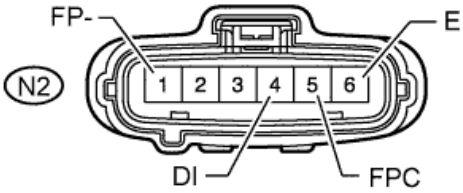
OK

2.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM - FUEL PUMP)

a. Disconnect the fuel pump ECU connector.

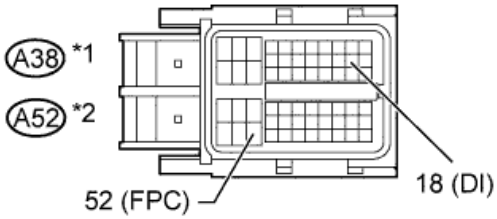
b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - A38-52 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A38-18 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω
N2-5 (FPC) or A38-52 (FPC) - Body ground	Always	10 kΩ or more
N2-4 (DI) or A38-18 (DI) - Body ground	Always	10 kΩ or more
N2-1 (FP-) or N1-5 (E2) - Body ground	Always	10 kΩ or more



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - A52-52 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A52-18 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω
N2-5 (FPC) or A52-52 (FPC) - Body ground	Always	10 kΩ or more
N2-4 (DI) or A52-18 (DI) - Body ground	Always	10 kΩ or more
N2-1 (FP-) or N1-5 (E2) - Body ground	Always	10 kΩ or more

3.REPLACE FUEL PUMP CONTROL ECU

a. Replace the fuel pump control ECU (Click here).

NEXT

4.CHECK PROBLEM SYMPTOM DISAPPEARS

a. Check if the problem symptom disappears.

Result

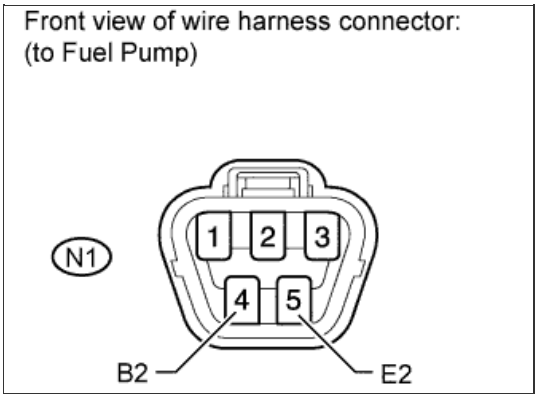
Result	Proceed to
Problem symptom disappears	A
Problem symptom does not disappear	B

B → Go to step 15

A

END

5.CHECK FUEL PUMP (POWER SOURCE VOLTAGE)



a. Disconnect the fuel pump connector.

b. Connect the intelligent tester to the DLC3.

c. Turn the engine switch on (IG) and turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump / Speed.

e. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
N1-4 - N1-5	Engine switch on (IG) Active Test on	11 to 14 V

Result

Result	Proceed to
OK	A
NG (for Single Tank Type)	B
NG (for Double Tank Type)	C

B → REPLACE FUEL PUMP (Click here)

C → REPLACE FUEL PUMP (Click here)

A

6.CHECK HARNESS AND CONNECTOR (ECM - FUEL PUMP CONTROL ECU - FUEL PUMP)

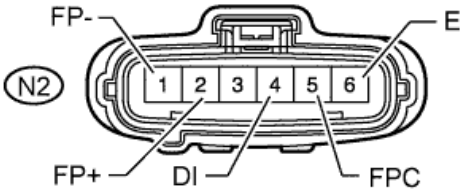
a. Disconnect the ECM connector.

b. Disconnect the fuel pump ECU connector.

c. Disconnect the fuel pump connector.

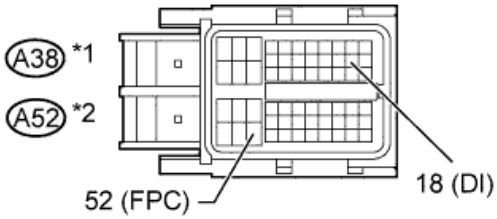
d. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):



Tester Connection	Condition	Specified Condition
N2-5 (FPC) - A38-52 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A38-18 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω
N2-2 (FP+) - N1-4 (B2)	Always	Below 1 Ω
N2-1 (FP-) - N1-5		

(E2)	Always	Below 1 Ω
N2-5 (FPC) or A38-52 (FPC) - Body ground	Always	10 kΩ or more
N2-4 (DI) or A38-18 (DI) - Body ground	Always	10 kΩ or more
N2-2 (FP+) or N1-4 (B2) - Body ground	Always	10 kΩ or more
N2-1 (FP-) or N1-5 (E2) - Body ground	Always	10 kΩ or more



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - A52-52 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A52-18 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω
N2-2 (FP+) - N1-4 (B2)	Always	Below 1 Ω
N2-1 (FP-) - N1-5 (E2)	Always	Below 1 Ω
N2-5 (FPC) or A52-52 (FPC) - Body ground	Always	10 kΩ or more
N2-4 (DI) or A52-18 (DI) - Body ground	Always	10 kΩ or more

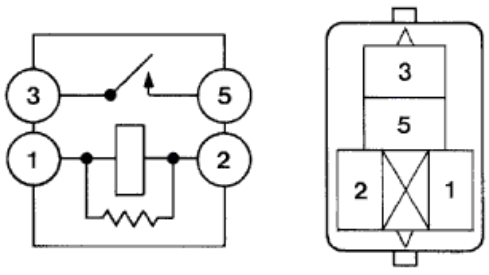
9.CHECK PROBLEM SYMPTOM DISAPPEARS

a. Check if the problem symptom disappears.

Result

Result	Proceed to
Problem symptom disappears	A
Problem symptom does not disappear	B

B → Go to step 15



A

END

10.INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
3 - 5	Battery voltage applied to terminals 1 and 2	Below 1 Ω

NG → REPLACE CIRCUIT OPENING RELAY (C/OPN)

OK

11.CHECK CIRCUIT OPENING RELAY

a. Check the operating sound of the relay when the engine switch is turned on (IG).

OK:

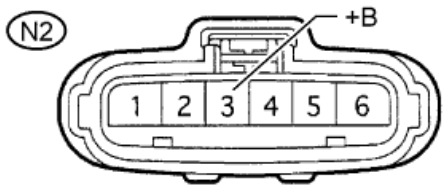
Tester Connection	Switch Condition	Specified Condition
C/OPN relay	Engine switch on (IG)	Operating sound heard

NG → Go to step 13

OK

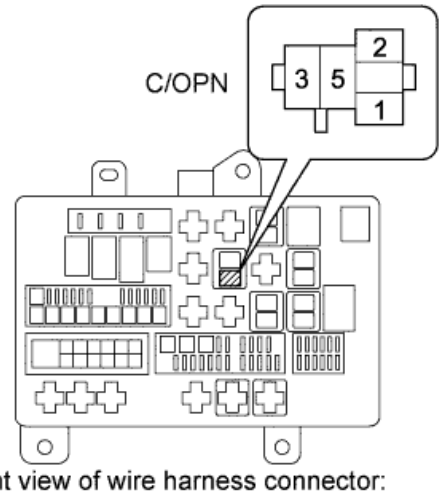
12.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - CIRCUIT OPENING RELAY - INTEGRATION RELAY)

a. Remove the circuit opening relay (C/OPN) and integration relay from the engine room relay block.



b. Disconnect the fuel pump ECU connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
N2-3 (+B) - C/OPN relay terminal 3	Always	Below 1 Ω
1B-4 - C/OPN relay terminal 5	Always	Below 1 Ω
N2 or 3 (+B) - C/OPN relay terminal 3 - Body ground	Always	10 kΩ or more
1B or 4 - C/OPN relay terminal 5 - Body ground	Always	10 kΩ or more

(to Fuel Pump ECU)

Engine Room Relay Block:

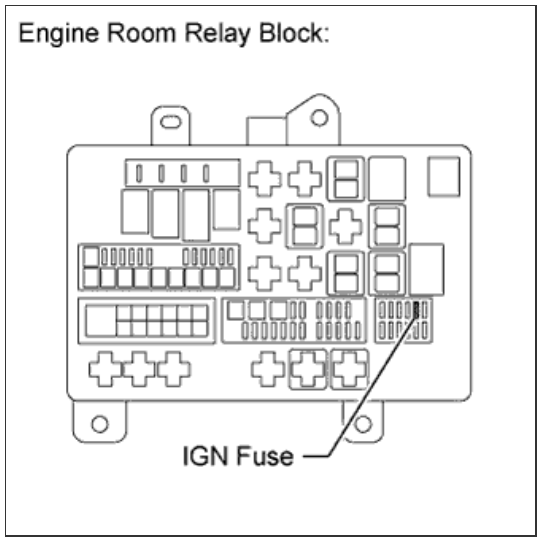
Front view of wire harness connector:
(to Integration Relay)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

GO TO ECU POWER SOURCE CIRCUIT (Click here)

13.INSPECT FUSE (IGN)



a. Remove the IGN fuse from the integration relay.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
IGN fuse	Always	Below 1 Ω

c. Reinstall the IGN fuse.

NG → CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

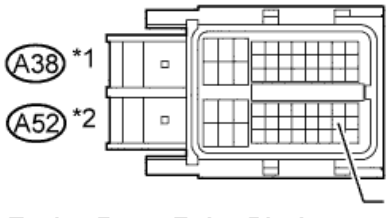
OK

14.CHECK HARNESS AND CONNECTOR (ECM - CIRCUIT OPENING RELAY - INTEGRATION)

a. Remove the circuit opening relay (C/OPN) and integration relay from the engine room relay block.

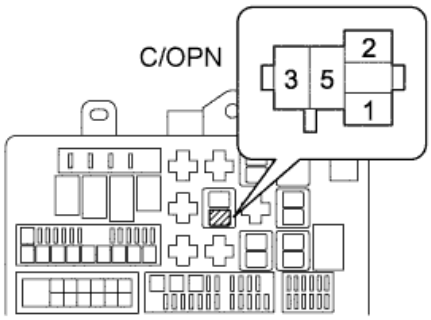
b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A38-48(FC) - 1	Always	Below 1 Ω
1B-8 - 2	Always	Below 1 Ω
A38-48(FC) - 1 or Body ground	Always	10 kΩ or more
1B-8 or 2 - Body ground	Always	10 kΩ or more



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A52-48(FC) - 1	Always	Below 1 Ω
1B-8 - 2	Always	Below 1 Ω
A52-48(FC) - 1 or Body ground	Always	10 kΩ or more

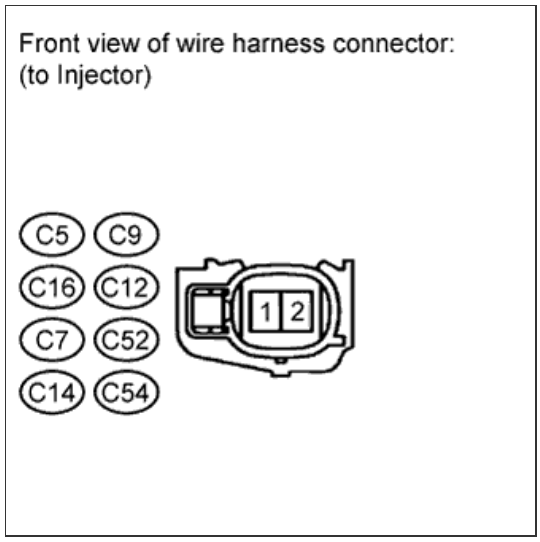
DESCRIPTION

The fuel injectors are located on the intake manifold. They inject fuel into the cylinders based on the signals from the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE

1.CHECK INJECTOR ASSEMBLY (POWER SOURCE)



a. Disconnect the fuel injector connector.

b. Measure the voltage according to the value(s) in the table below.

Standard voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 2	C16-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 3	C7-1 - Ground	Engine switch on (IG)	11 to 14 V

No. 4	C14-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 5	C9-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 6	C12-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 7	C52-1 - Ground	Engine switch on (IG)	11 to 14 V
No. 8	C54-1 - Ground	Engine switch on (IG)	11 to 14 V

NG → Go to step 6

OK

2.INSPECT FUEL INJECTOR ASSEMBLY

a. Inspect the fuel injector (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

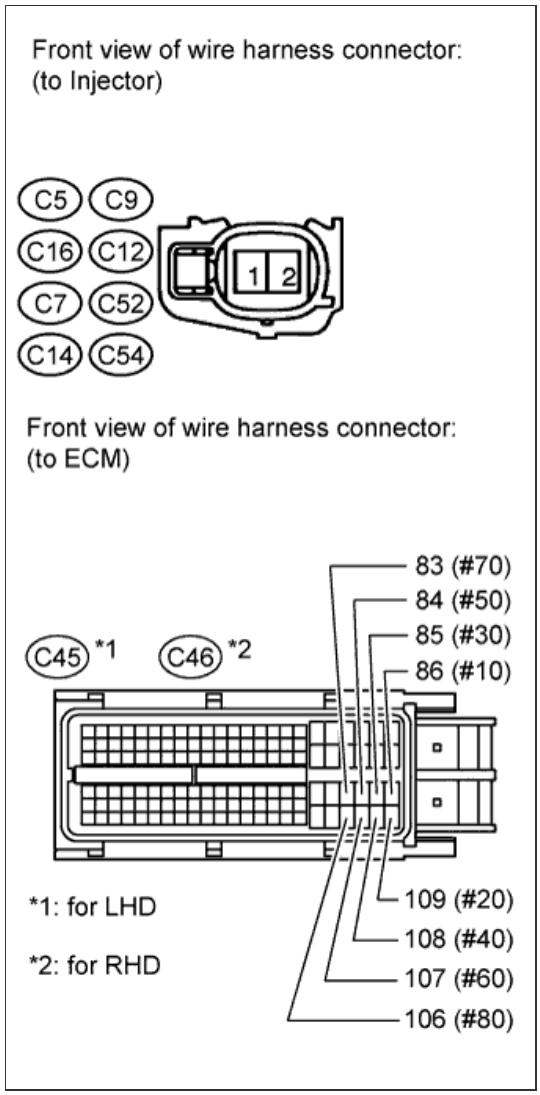
OK

3.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR ASSEMBLY - ECM)

a. Disconnect the fuel injector connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Body ground	Always	10 kΩ or higher
	C16-2 - C45-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Body ground	Always	10 kΩ or higher
	C7-2 - C45-85 (#30)	Always	Below 1 Ω
No. 4	C14-2 - Body ground	Always	10 kΩ or higher
	C14-2 - C45-108 (#40)	Always	Below 1 Ω
No. 5	C9-2 - Body ground	Always	10 kΩ or higher
	C9-2 - C45-84 (#50)	Always	Below 1 Ω
No. 6	C12-2 - Body ground	Always	10 kΩ or higher
	C12-2 - C45-107 (#60)	Always	Below 1 Ω

No. 7	C52-2 - Body ground	Always	10 kΩ or higher
	C52-2 - C45-83 (#70)	Always	Below 1 Ω
No. 8	C54-2 - Body ground	Always	10 kΩ or higher
	C54-2 - C45-106 (#80)	Always	Below 1 Ω

Standard Resistance (for RHD):

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C46-86 (#10)	Always	Below 1 Ω
No. 2	C16-2 - Body ground	Always	10 kΩ or higher
	C16-2 - C46-109 (#20)	Always	Below 1 Ω
No. 3	C7-2 - Body ground	Always	10 kΩ or higher

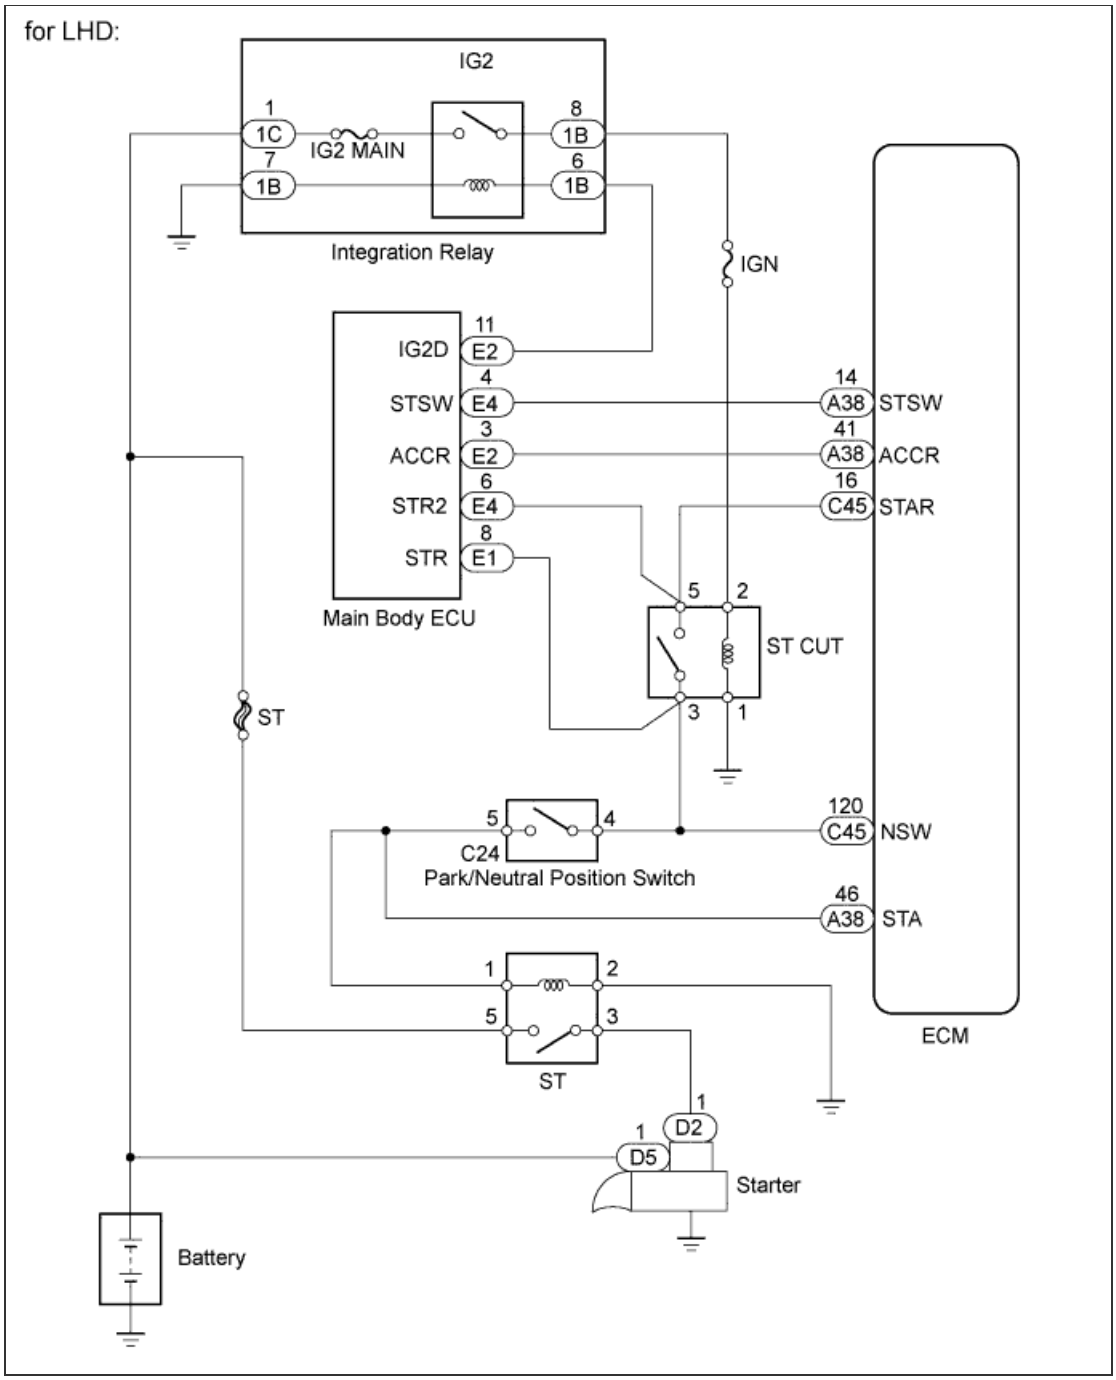
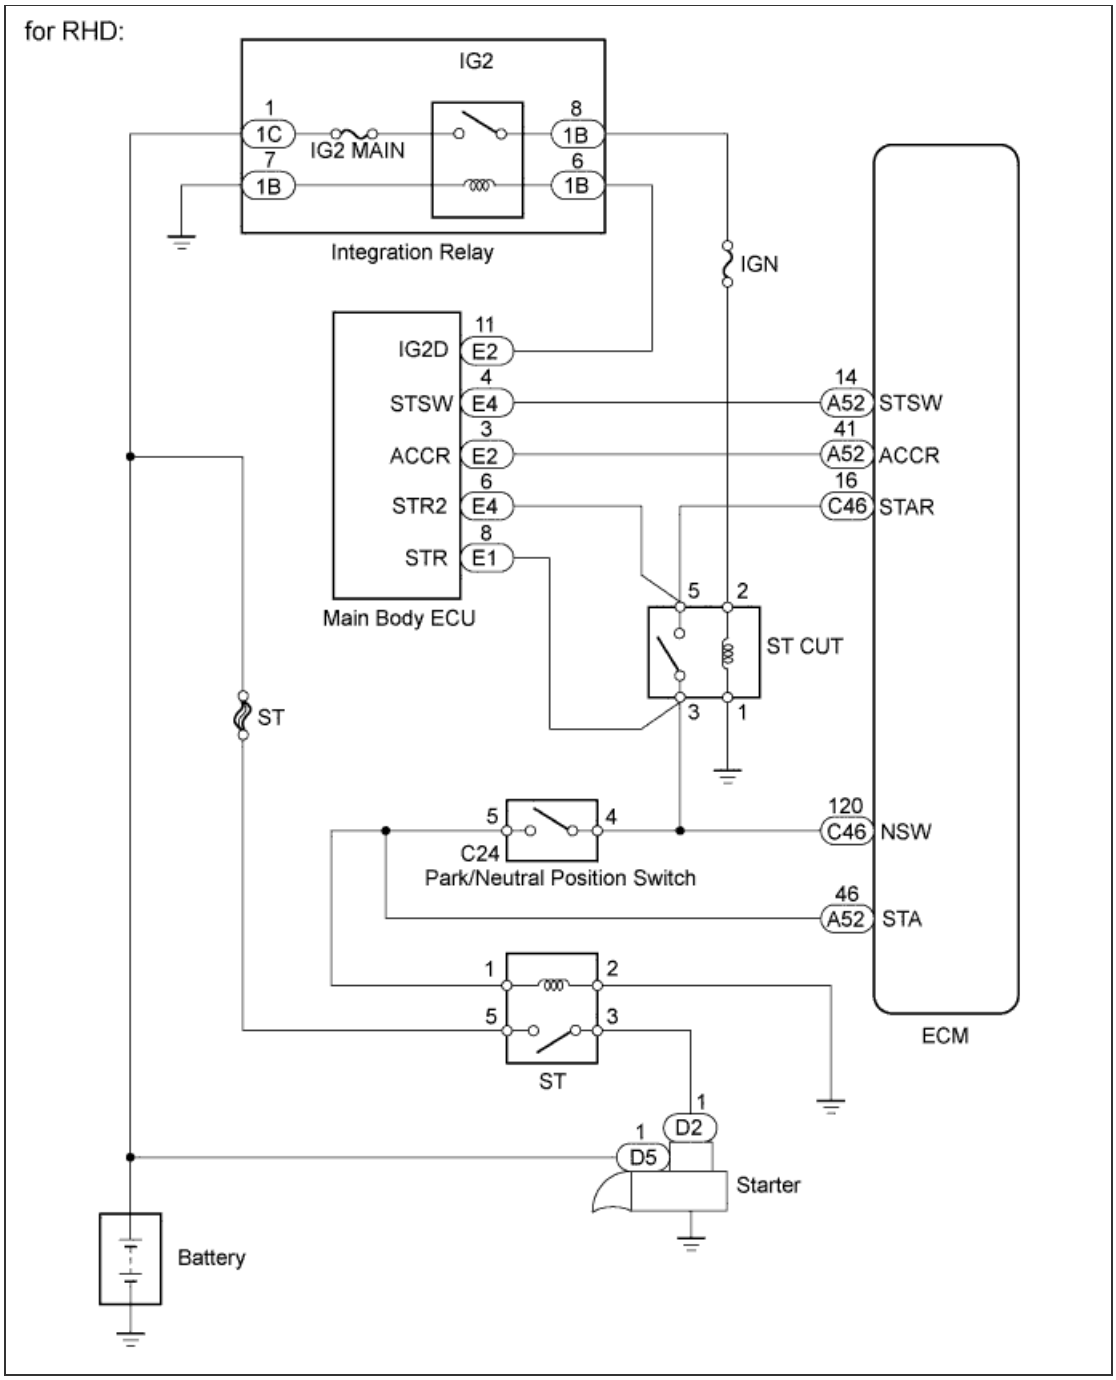
CHECK ECU POWER SOURCE CIRCUIT (Click here)



for Preparation Click here



DESCRIPTION

The cranking holding control system provides current to the starter when the ECM detects the engine switch start signal (STSW). When the ECM performs a firing judgment, the system cuts current to the starter. When an ECM receives the STSW signal, it turns on the ACC Cut relay, which prevents flickering of the combination meter, clock, audio system, etc. Also, the ECM sends a signal to the STAR terminal of the ECM. Then the STAR output signal travels through the Park/Neutral Position (PNP) switch to the STARTER relay, causing the starter to activate.
When the engine is cranking, the starter operation signal is sent to the STA terminal of the ECM.

INSPECTION PROCEDURE

1.CHECK CRANKING

a. Check the cranking of the engine.

OK:
Engine cranks.

NG → [Go to step 2]

OK

GO TO PROBLEM SYMPTOMS TABLE (Click here)

2.READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Activate Test / Activate the Starter Relay.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Starter Signal.

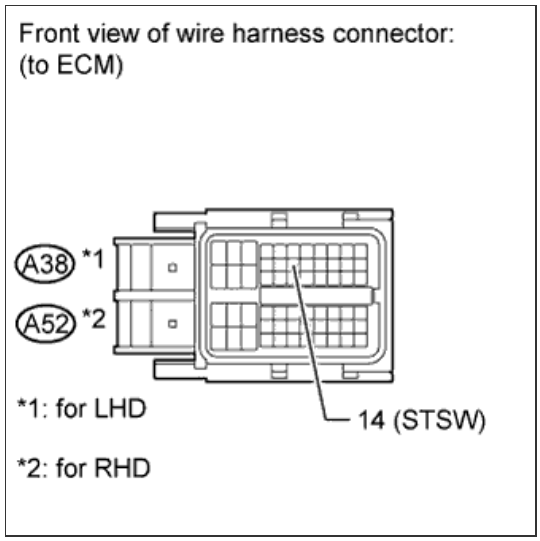
e. Check the Starter Signal on the intelligent tester.

OK:

Activate Test	Starter Signal
ON	ON
OFF	OFF

Result

Result	Proceed to
NG	A
OK	B



B → Go to step 9

A

3.CHECK MAIN BODY ECU RH (COWL SIDE JUNCTION BLOCK RH) (STSW VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Condition	Specified Condition
A38-14 (STSW) - Body ground	Engine switch pressed and held with brake pedal depressed	6.0 V or higher

Standard Voltage (for RHD):

Tester Connection	Condition	Specified Condition
A52-14 (STSW) - Body ground	Engine switch pressed and held with brake pedal depressed	6.0 V or higher

HINT:

Output voltage at terminal STSW is output for 0.3 seconds when the engine starts.

NG → Go to step 13

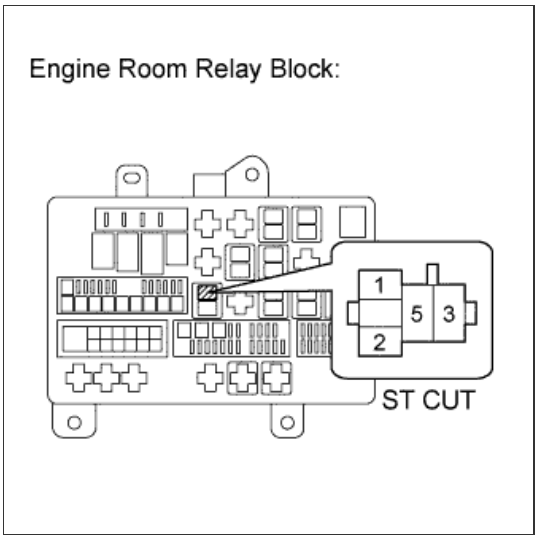
OK

4.CHECK HARNESS AND CONNECTOR (ST CUT RELAY)

a. Remove the starter cut relay (ST CUT) from the engine room relay block.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage (Relay Contact Side):



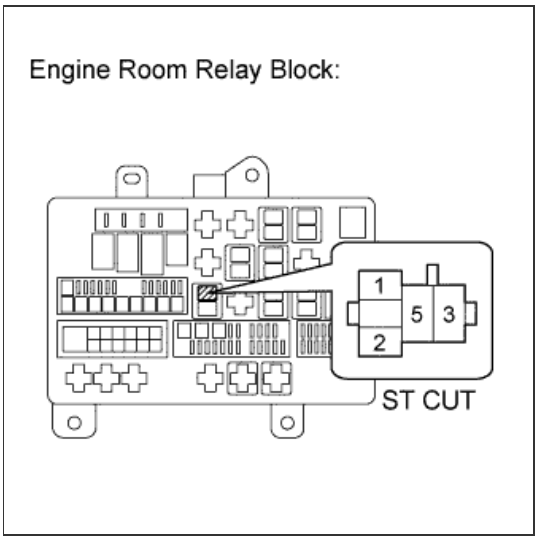
Tester Connection	Condition	Specified Condition
ST CUT relay terminal 3 - Body ground	While engine is cranking	11 to 14 V

Standard Voltage (Relay Coil Side):

Tester Connection	Condition	Specified Condition
ST CUT relay terminal 3 - Body ground	Always	11 to 14 V

Result

Result	Proceed to
OK	A
NG (Relay Contact Side)	B
NG (Relay Coil Side)	C

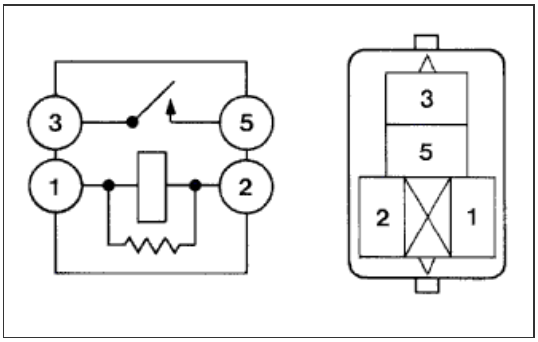


B → Go to step 14

C → Go to step 17

A

5.INSPECT STARTER CUT RELAY (ST CUT)



a. Remove the starter cut relay (ST C) from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

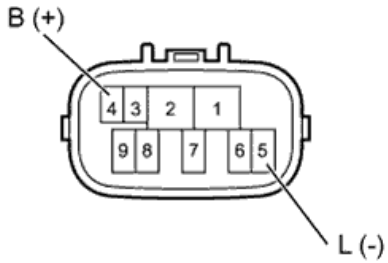
Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
3 - 5	Battery voltage applied to terminals 1 and 2	Below 1 Ω

NG → REPLACE STARTER CUT RELAY (ST CUT)

OK

6.INSPECT PARK/NEUTRAL POSITION SWITCH ASSEMBLY



a. Disconnect the PNP switch connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
4 (B) - 5 (L)	Shift lever in P or N	Below 1 Ω
4 (B) - 5 (L)	Shift lever not in P or N	10 kΩ or higher

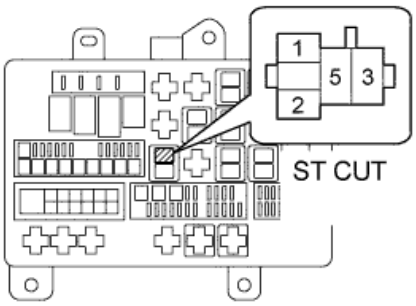
Component without harness connected:
(PNP Switch)

NG → REPLACE PARK/NEUTRAL POSITION SWITCH ASSEMBLY (Click here)

OK

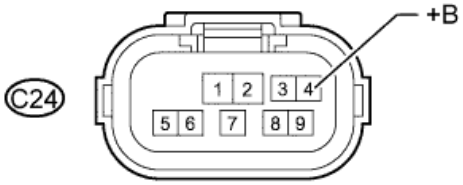
7.CHECK HARNESS AND CONNECTOR (ST CUT RELAY - PNP SWITCH)

a. Disconnect the PNP switch connector.



b. Remove the starter cut relay (ST CUT) from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
ST CUT relay terminal 5 - C24-4 (B)	Always	Below 1 Ω
ST CUT relay terminal 5 or C24-4 (B) - Body ground	Always	10 kΩ or higher

Engine Room Relay Block:

Front view of wire harness connector:
(to PNP Switch)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

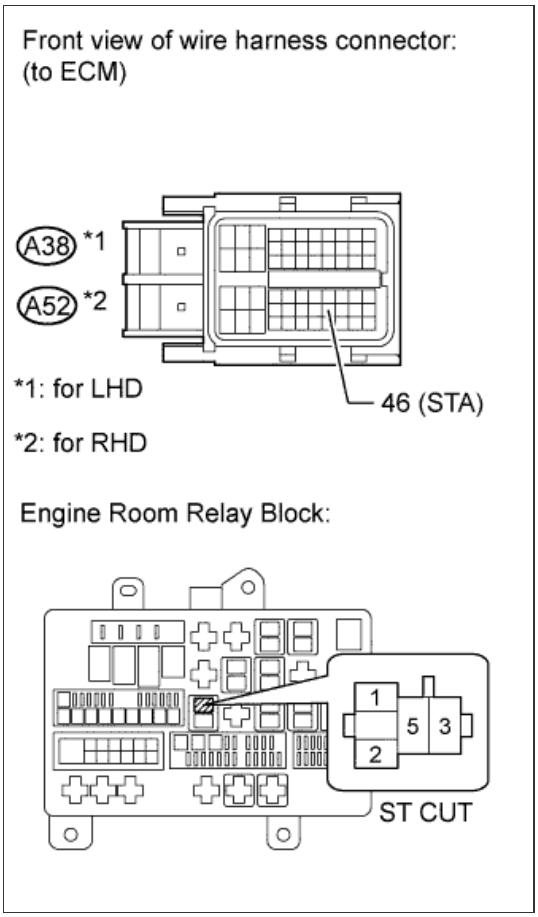
OK

8.CHECK HARNESS AND CONNECTOR (ECM - ST CUT RELAY)

a. Move the shift lever to P or N.

b. Disconnect the ECM connector.

c. Remove the ST CUT relay from the engine room relay block.



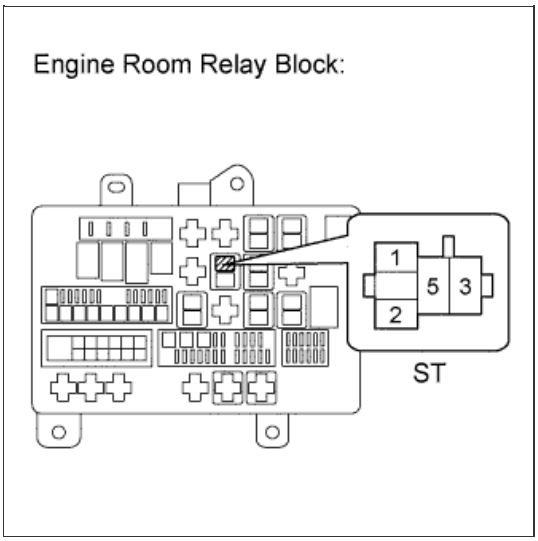
d. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A38-46 (STA) - ST CUT relay terminal 3	Always	Below 1 Ω
A38-46 (STA) or ST CUT relay terminal 3 - Body ground	Always	10 kΩ or more

Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A52-46 (STA) - ST CUT relay terminal 3	Always	Below 1 Ω
A52-46 (STA) or ST CUT relay terminal 3 - Body ground	Always	10 kΩ or more

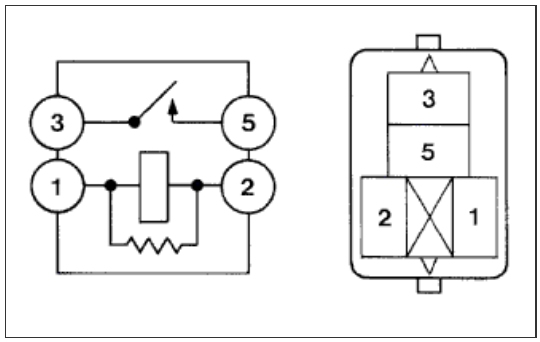


NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT STARTER RELAY (ST)

a. Remove the starter relay (ST) from the engine room relay block.



b. Measure the resistance according to the value(s) in the table below.

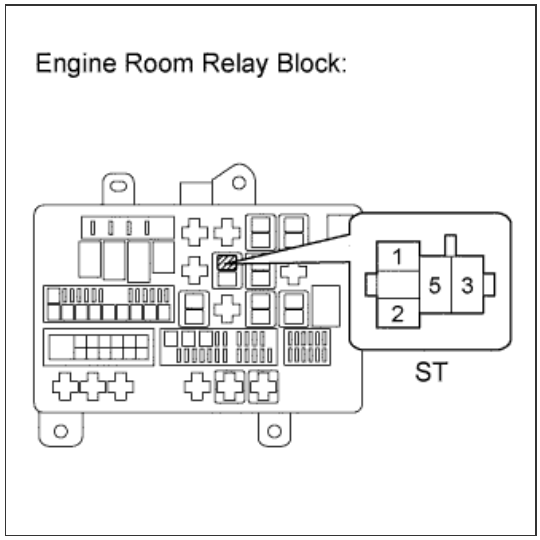
Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage	

3 - 5	applied to terminals 1 and 2	Below 1 Ω

NG → REPLACE STARTER RELAY

OK



10.CHECK HARNESS AND CONNECTOR (ST RELAY)

a. Remove the starter relay (ST) from the engine room relay block.

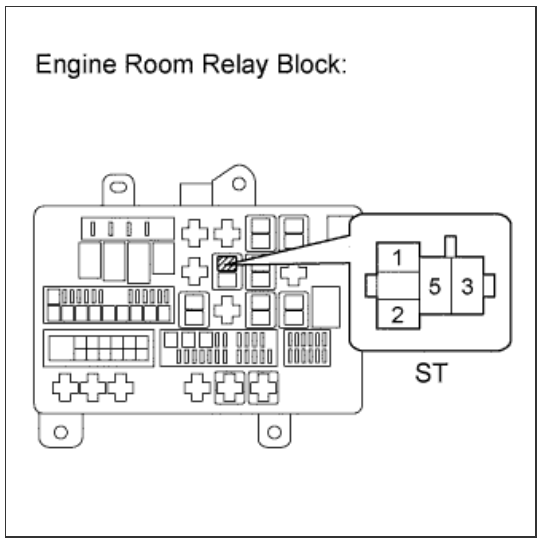
b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
ST relay terminal 1 - 2	While engine is cranking	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (PNP SWITCH - ST RELAY BODY GROUND)

OK



11.CHECK HARNESS AND CONNECTOR (STARTER VOLTAGE)

a. Remove the starter relay (ST) from the engine room relay block.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
ST relay terminal 5 - Body ground	Always	11 to 14 V

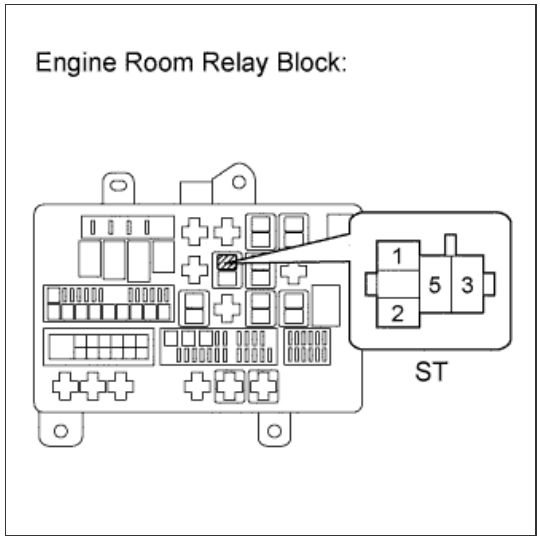
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (STARTER RELAY (ST) - BATTERY)

OK

12.CHECK HARNESS AND CONNECTOR (STARTER - ST RELAY)

a. Disconnect the starter connector.

b. Remove the starter relay (ST) from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
D2 - ST relay terminal 3	Always	Below 1 Ω
D2 or ST relay terminal 3 - Body ground	Always	10 kΩ or higher

Result

Result	Proceed to
NG	A
OK (for 1.4 kW type)	B
OK (for 2.0 kW type)	C

B → REPAIR OR REPLACE STARTER ASSEMBLY (Click here)

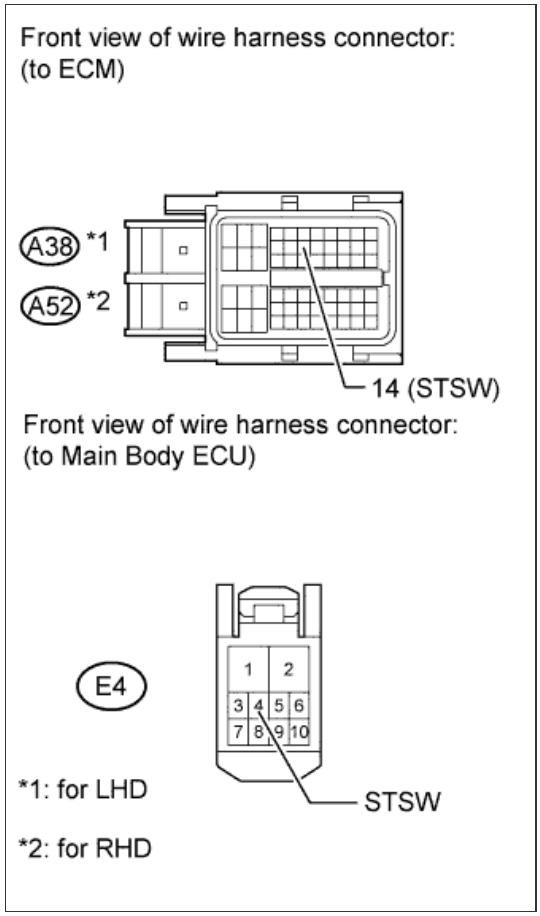
C → REPAIR OR REPLACE STARTER ASSEMBLY (Click here)

A → REPAIR OR REPLACE HARNESS OR CONNECTOR

13.CHECK HARNESS AND CONNECTOR (ECM - MAIN BODY ECU)

a. Disconnect the ECM connector.

b. Disconnect the main body ECU connector.



c. Measure the resistance according to the value(s) in the table below.

Standard resistance (for LHD):

Tester Connection	Condition	Specified Condition
A38-14 (STSW) - E4-4 (STSW)	Always	Below 1 Ω
A38-14 (STSW) or E4-4 (STSW) - Body ground	Always	10 kΩ or higher

Standard resistance (for RHD):

Tester Connection	Condition	Specified Condition
A52-14 (STSW) - E4-4 (STSW)	Always	Below 1 Ω
A52-14 (STSW) or E4-4 (STSW) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

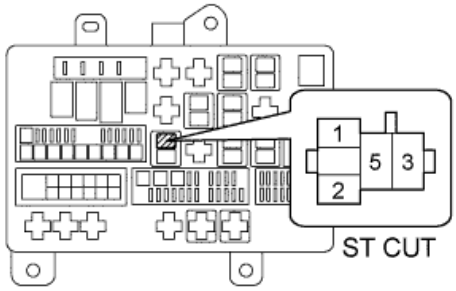
GO TO ENTRY AND START SYSTEM (Click here)

14.CHECK HARNESS AND CONNECTOR (ECM - ST CUT RELAY)

a. Disconnect the ECM connector.

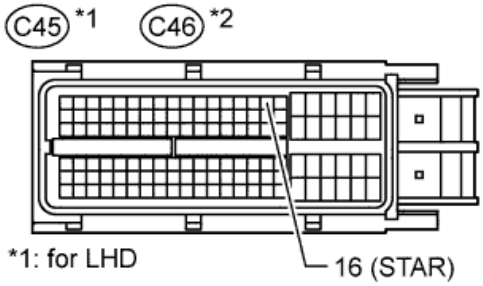
b. Remove the starter cut relay (ST C) from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
C45-16 (STAR) - ST CUT relay terminal 5	Always	Below 1 Ω
C45-16 (STAR) or ST CUT relay terminal 5 - Body ground	Always	10 kΩ or higher



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C46-16 (STAR) - ST CUT relay terminal 5	Always	Below 1 Ω
C46-16 (STAR) or ST CUT relay terminal 5 - Body ground	Always	10 kΩ or higher

Engine Room Relay Block:

16.CHECK PROBLEM SYMPTOM DISAPPEARS

a. Check if the problem symptom disappears.

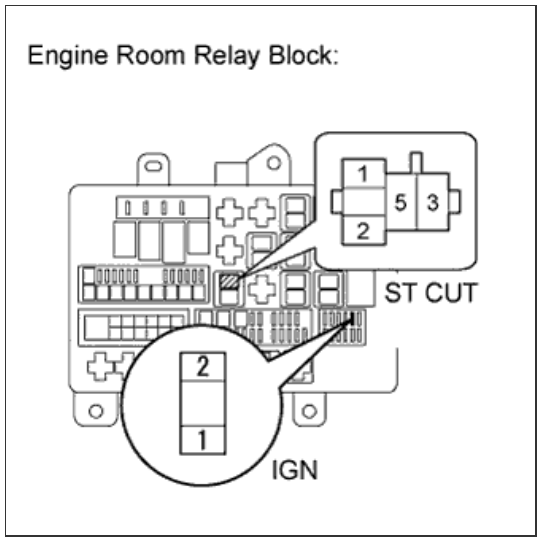
Result

Result	Proceed to
Problem symptom disappears	A
Problem symptom does not disappear	B

B → GO TO PROBLEM SYMPTOMS TABLE (Click here)

A

END



17.CHECK HARNESS AND CONNECTOR (ST CUT RELAY - IGN FUSE)

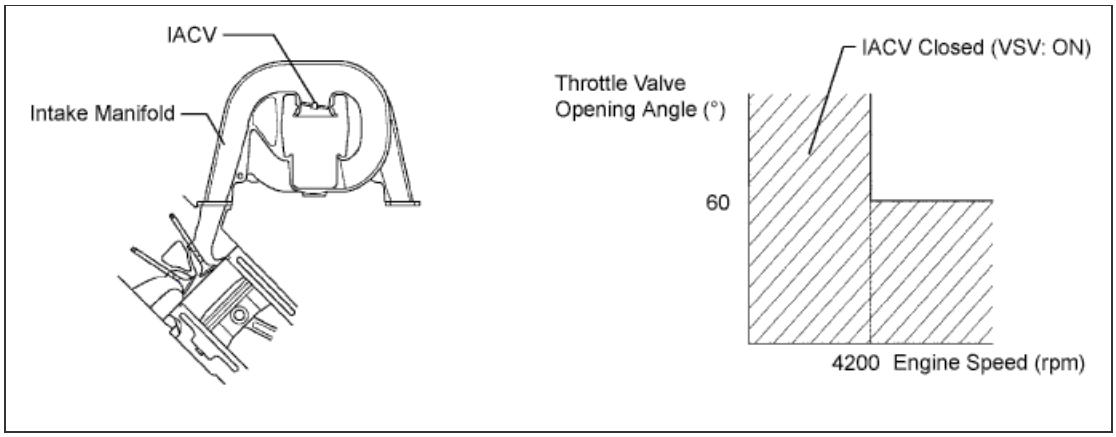
a. Remove the starter cut relay (ST C T) and IGN fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

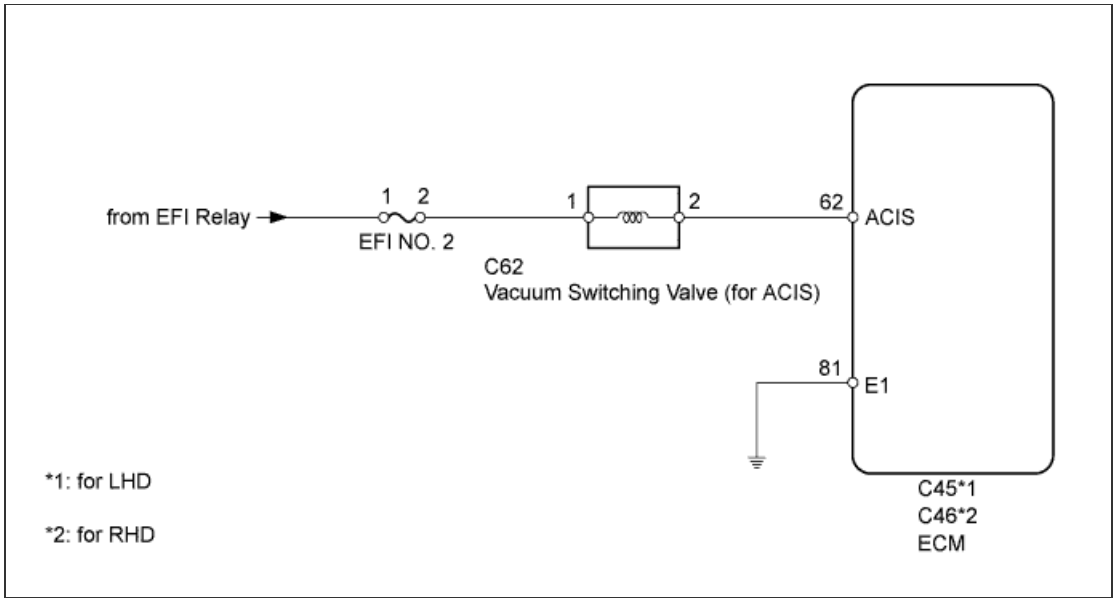
Tester Connection	Condition	Specified Condition
ST C T relay terminal 2 - IGN fuse terminal 2	Always	Below 1 Ω
ST CUT relay terminal 1 - Body ground	Always	Below 1 Ω
ST CUT relay terminal 2 or IGN fuse terminal 2 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

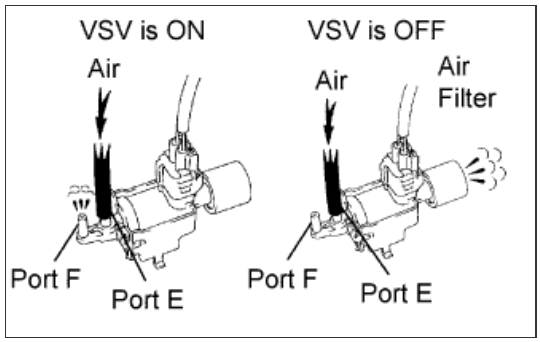
GO TO ECU POWER SOURCE CIRCUIT (Click here)



for Preparation Click here

DESCRIPTION

This circuit opens and closes the Intake Air Control Valve (IACV) in response to the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).
When the engine speed is 4200 rpm or more and the throttle valve opening angle is 60° or more, the IACV is open (VSV: OFF). At all other times, the IACV is closed (VSV: ON).



WIRING DIAGRAM

INSPECTION PROCEDURE

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE VSV (for ACIS))

a. Disconnect the vacuum hose from port F on the vacuum switching valve (for ACIS).

b. Connect the intelligent tester to the DLC3.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Active the VSV for Intake Control.

e. Operate the VSV for ACIS.

f. Check the VSV air flow when switching the VSV.

OK:

Test Condition	Specified Condition

VSV is ON	Air from port E flows out through port F
VSV is OFF	Air from port E flows out through air filter

NG → Go to step 3

OK

2.INSPECT INTAKE MANIFOLD (INTAKE AIR CONTROL VALVE OPERATION)

a. Inspect the intake air control valve operation (Click here).

NG → REPLACE INTAKE MANIFOLD (Click here)

OK

REPLACE VACUUM HOSES

3.INSPECT VACUUM SWITCHING VALVE (for ACIS)

a. Inspect the vacuum switching valve (Click here).

NG → REPLACE VACUUM SWITCHING VALVE (Click here)

OK

4.INSPECT VACUUM SWITCHING VALVE (POWER SOURCE VOLTAGE)

a. Disconnect the VSV connector.

b. Turn the engine switch on (IG).

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C62-1 - Body ground	Engine switch on (IG)	11 to 14 V

Front view of wire harness connector: (to VSV)

NG → Go to step 8

OK

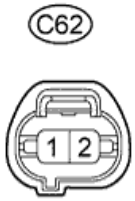
5.CHECK HARNESS AND CONNECTOR (VSV - ECM))

a. Disconnect the VSV connector.

b. Disconnect the ECM connector.

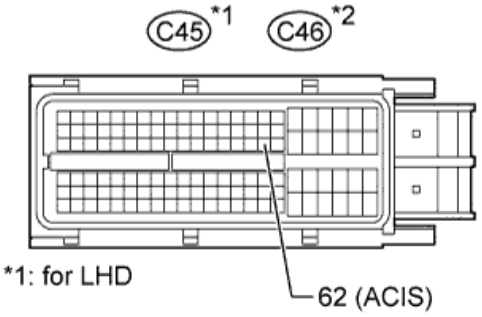
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):



Tester Connection	Condition	Specified Condition

C62-2 - C45-62 (ACIS)	Always	Below 1 Ω
C62-2 or C45-62 (ACIS) - Body ground	Always	10 kΩ or higher



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
C62-2 - C46-62 (ACIS)	Always	Below 1 Ω
C62-2 or C46-62 (ACIS) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector: (to VSV)

Front view of wire harness connector: (to ECM)

*1: for LHD

*2: for RHD

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

7.CHECK PROBLEM SYMPTOM DISAPPEARS

a. Check if the problem symptom disappears.

Result

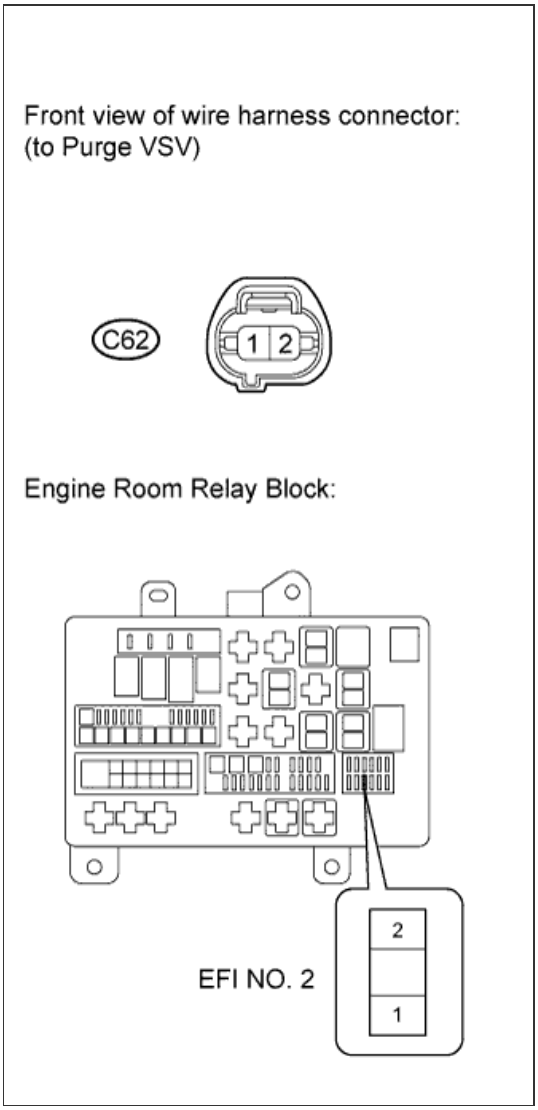
Result	Proceed to
Problem symptom disappears	A
Problem symptom does not disappear	B

B → GO TO PROBLEM SYMPTOMS TABLE (Click here)

A

END

8.CHECK HARNESS AND CONNECTOR (VSV - EFI NO. 2 FUSE)



a. Disconnect the VSV connector.

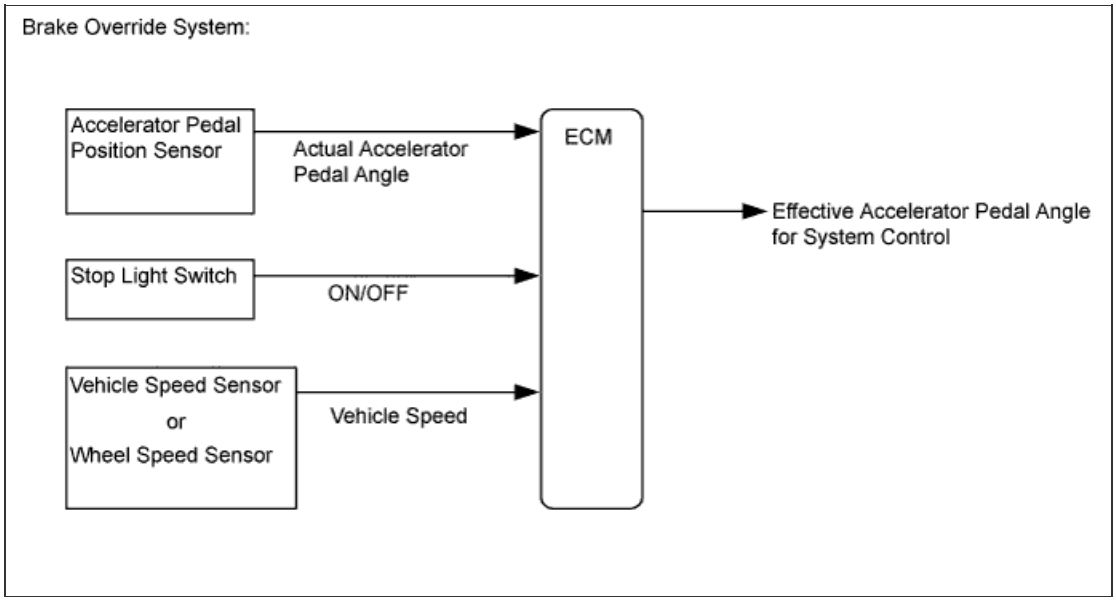
b. Remove the EFI No. 2 fuse from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C62-1 - EFI No. 2 fuse terminal 2	Always	Below 1 Ω
C62-1 or EFI No. 2 fuse terminal 2 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

GO TO ECM POWER SOURCE CIRCUIT (Click here)

for Preparation Click here

DESCRIPTION

When the vehicle is being driven with the accelerator pedal depressed, depressing the brake pedal without releasing the accelerator pedal will activate the brake override system to restrict driving torque. The conditions for activating the brake override system as well as the items that are controlled are explained below.

Activation Conditions:

- Vehicle is running at or above the specified speed.
- The accelerator pedal is depressed beyond a specified level, and then the brake pedal is depressed.

NOTICE:

The vehicle may not enter the brake override system control due to the relation of the accelerator pedal angle and the vehicle's speed.

Items Controlled:

- Driving torque is restricted.

HINT:

During brake override system control, the value for the accelerator pedal angle (which is used for engine control) is forcibly reduced to a specified value. For this reason, the Data List value for Accelerator Position (applied to electronic throttle control) will be replaced with a specified value regardless of the actual accelerator pedal angle (Accel Sens. No. 1 Volt %, Accel Sens. No. 2 Volt %)

Deactivation Conditions:

- When the Stop Light Switch turns OFF or the actual accelerator pedal angle increases or decreases beyond the specified range.

INSPECTION PROCEDURE

Inspection Method

Drive at 10km/h (6.25mph), depress the accelerator pedal by 1/2 to 3/4 and keep it in that position. Under these conditions, if the engine speed decreases to 1000rpm when the brake pedal is depressed, then the brake override system has been activated.

CAUTION:

When carrying out the inspection, use a place where you are able to carry it out safely and also pay close attention to your surroundings.

Also, when driving make absolutely sure that all road traffic laws, such as speed limits, are observed.

HINT:

- **Under normal conditions, the Accelerator Position value changes in response to the Accel Sens. No. 1 Volt % value. For more information on the numerical values, refer to the Data List (Click here).**
- **If the Data List values of Accelerator Position and Accel Sens. No. 1 Volt % do not match, and the value of Accelerator Position changes but the value of Accel Sens. No. 1 Volt % is constant, this confirms that brake override system has activated. (Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.)**

NOTICE:

The brake override system restricts driving torque if the brake pedal is depressed when driving with the accelerator pedal depressed. If a customer reports experiencing loss of torque after the accelerator and brake pedals have both been intentionally depressed, explain to the customer that this is not a malfunction, and that the customer should avoid depressing both the accelerator and brake pedals at the same time.

Example: While operating the accelerator pedal, the customer uses their left foot to operate the brake pedal.

1.CHECK DTC OUTPUT

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the intelligent tester on.

c. Enter the following menus: System Select / Health Check.

d. Check DTCs.

Result

Result	Proceed to
No DTC output	A
DTC output	B

B → **GO TO DTC CHART**

A

2.READ VALUE USING INTELLIGENT TESTER (STOP LIGHT SWITCH AND ST1)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Stop Light Switch and ST1.

d. Check the Data List indication when the brake pedal is depressed and released.

OK:

Tester Display	Condition	Specified Condition
Stop Light Switch	Brake pedal released	OFF
	Brake pedal depressed	ON
ST1	Brake pedal released	OFF
	Brake pedal depressed	ON

NG → **INSPECT STOP LIGHT SWITCH ASSEMBLY (Click here)**

OK

3.INSPECT BRAKE PEDAL

a. Inspect and adjust the brake pedal (for LHD) (Click here).

b. Inspect and adjust the brake pedal (for RHD) (Click here).

HINT:

If the stop light switch turns ON too late, the start of brake override system control may be delayed; if it turns ON too soon, brake override system control may begin too early, so conduct inspection of the brake pedal and stop light switch assembly.

Result

Result	Proceed to
OK	A
NG (for LHD)	B
NG (for RHD)	C

B → **REPAIR OR REPLACE BRAKE PEDAL (Click here)**

C → REPAIR OR REPLACE BRAKE PEDAL (Click here)

A

4.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR PEDAL POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Accel Sens. No. 1 Volt % and Accel Sens. No. 2 Volt %.

d. Read the value displayed on the intelligent tester.

OK:

Tester Display	Condition	Specified Condition
Accel Sens. No. 1 Volt %	Accelerator Pedal Released → Depressed → Released	Values smoothly change following accelerator pedal operation
Accel Sens. No. 2 Volt %		

HINT:

For numerical values of Accel Sens. No. 1 Volt % and Accel Sens. No. 2 Volt %, refer to the Data List (Click here).

NG → REPLACE ACCELERATOR PEDAL SENSOR ASSEMBLY (Click here)

OK

5.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the intelligent tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine / Data List / Vehicle Speed.

e. Read the value displayed on the intelligent tester.

Standard:

Tester Display	Condition	Specified Condition
Vehicle Speed	Vehicle stopped, engine running	0 km/h (0 mph)
	Vehicle running at constant speed between 16.1 to 64.4 km/h (10 to 40 mph)	No large fluctuations when driving at a constant speed

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.

NG → GO TO VEHICLE SPEED SENSOR "A" (Click here)

OK

6.READ VALUE USING INTELLIGENT TESTER (FR, FL, RR, RL WHEEL SPEED)

a. Connect the intelligent tester to the DLC3.

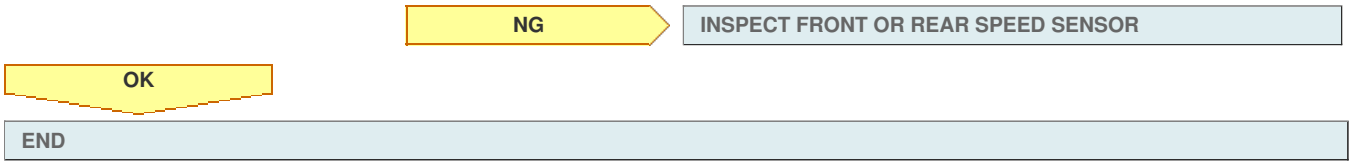
b. Turn the engine switch on (IG) and turn the intelligent tester on.

c. Start the engine.

d. Enter the following menus: Chassis / ABS/VSC/TRC / Data List / FR Wheel Speed, FL Wheel Speed, RR Wheel Speed and RL Wheel Speed.

e. Read the value displayed on the intelligent tester.

Standard:



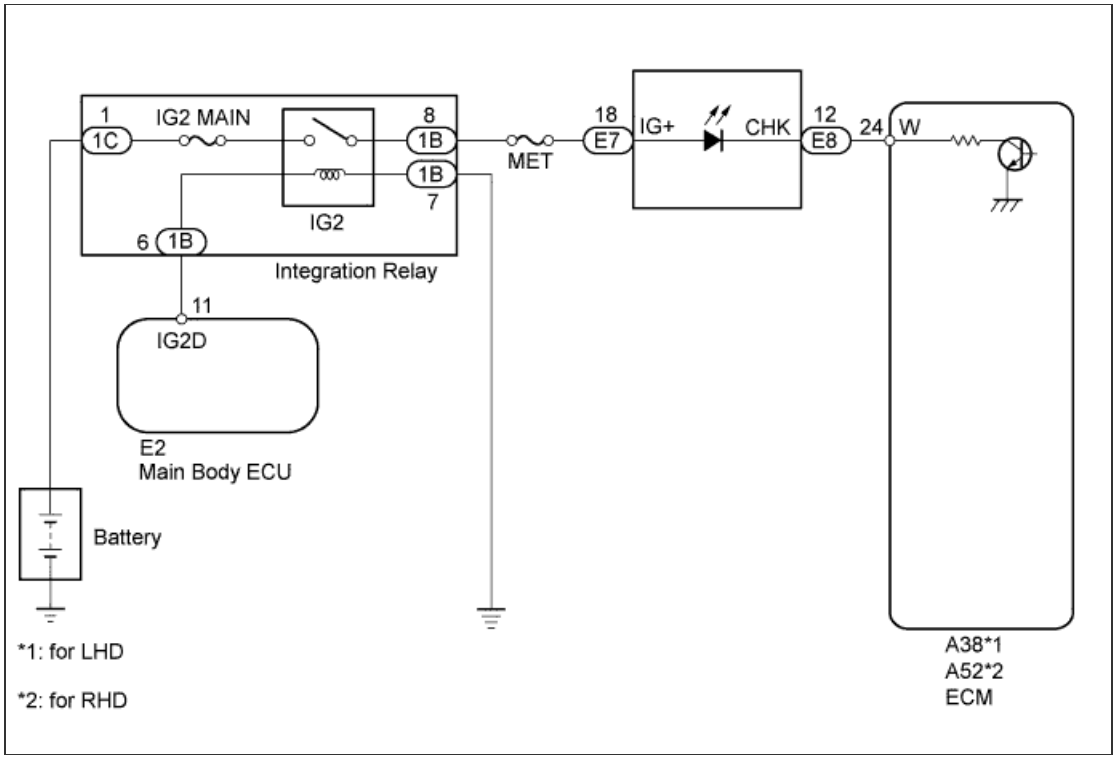
Tester Display	Condition	Specified Condition
FR Wheel Speed FL Wheel Speed RR Wheel Speed RL Wheel Speed	Vehicle stopped, engine running	0 km/h (0 mph)
	Vehicle running at constant speed between 16.1 to 64.4 km/h (10 to 40 mph)	No large fluctuations when driving at a constant speed

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.



for Preparation Click here

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detections by the ECM. When the engine switch is turned on (IG), power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.
The MIL operation can be checked visually: When the engine switch is first turned on (IG), the MIL should be illuminated and should then turn off when the engine is started. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using the intelligent tester.

WIRING DIAGRAM

INSPECTION PROCEDURE

1.CHECK THAT MIL IS ILLUMINATED

a. Check the MIL illumination condition.

Result

Result	Proceed to
MIL remains on	A
MIL does not illuminate	B
MIL remains on → MIL turns off	C

B → Go to step 5

C → SYSTEM OK

A

2.CHECK WHETHER MIL TURNS OFF

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Check if any DTCs have been stored. Note down any DTCs.

e. Clear DTCs (Click here).

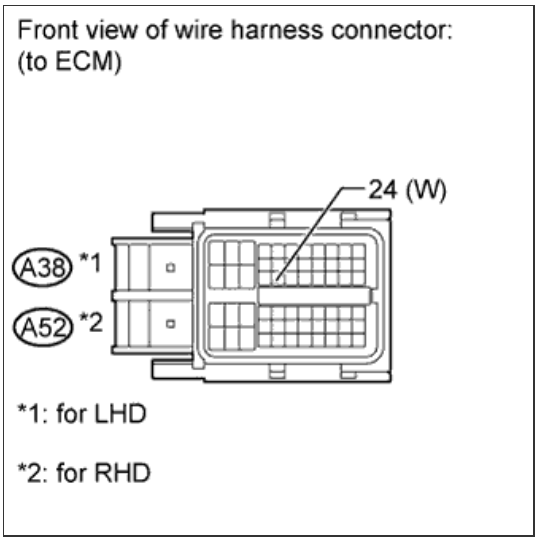
f. Check if the MIL turns off.

OK:
MIL turns off.

NG → Go to step 3

OK

REPAIR CIRCUITS INDICATED BY OUTPUT DTCS (Click here)



3.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT IN WIRE HARNESS)

a. Disconnect the ECM connector.

b. Turn the engine switch on (IG).

c. Check that the MIL is not illuminated.

OK:
MIL is not illuminated.

NG → Go to step 4

OK

REPLACE ECM (Click here)

4.CHECK HARNESS AND CONNECTOR (COMBINATION METER - ECM)

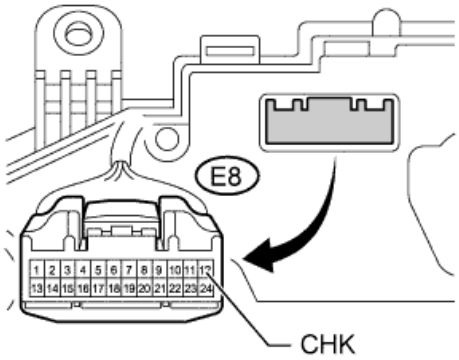
a. Disconnect the ECM connector.

b. Disconnect the combination meter connector.

c. Measure the resistance according to the value(s) in the table below.

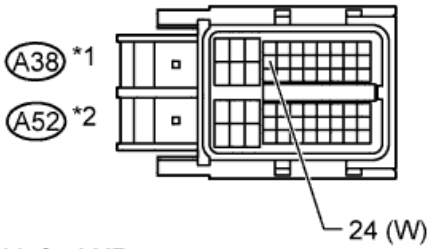
Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A38-24 (W) or E8-12 (CHK) - Body ground	Always	10 kΩ or higher



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A52-24 (W) or E8-12 (CHK) - Body ground	Always	10 kΩ or higher



Result

Result	Proceed to
NG	A
OK (w/ Multi-information Display)	B
OK (w/o Multi-information Display)	C

A

REPAIR OR REPLACE HARNESS OR CONNECTOR

5.CHECK THAT MIL IS ILLUMINATED

a. Check if the MIL is illuminated when the engine switch is turned on (IG).

OK:
MIL is illuminated.

NG	Go to step 6

OK

SYSTEM OK

6.CHECK THAT ENGINE STARTS

a. Turn the engine switch on (IG).

b. Start the engine.

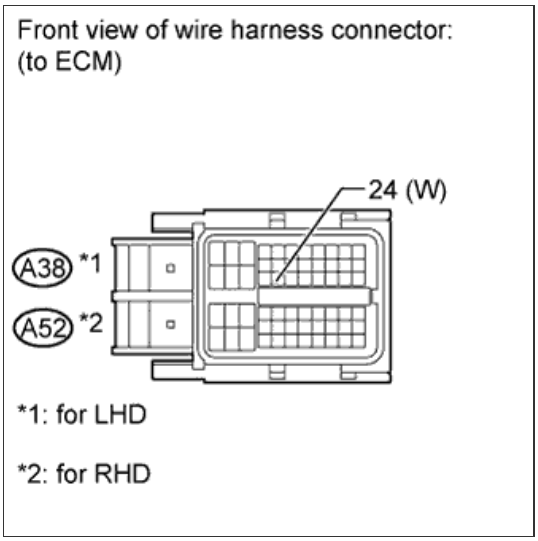
Result

Result	Proceed to
Engine starts	A
Engine does not start*	B

HINT:

*: The intelligent tester cannot communicate with the ECM.

B → GO TO VC OUTPUT CIRCUIT (Click here)



A

7.CHECK HARNESS AND CONNECTOR (W VOLTAGE)

a. Disconnect the ECM connector.

b. Disconnect the combination meter connector.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage (for LHD):

Tester Connection	Switch Condition	Specified Condition
A38-24 (W) - Body ground	Engine switch on (IG)	11 to 14 V

Standard Voltage (for RHD):

Tester Connection	Switch Condition	Specified Condition
A52-24 (W) - Body ground	Engine switch on (IG)	11 to 14 V

NG → Go to step 8

OK

REPLACE ECM (Click here)

8.CHECK HARNESS AND CONNECTOR (COMBINATION METER - ECM)

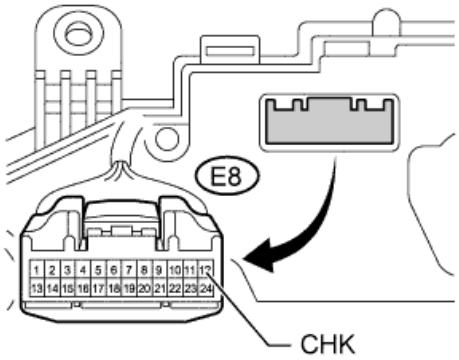
a. Disconnect the ECM connector.

b. Disconnect the combination meter connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for LHD):

Tester Connection	Condition	Specified Condition
A38-24 (W) - E8-12 (CHK)	Always	Below 1 Ω



Standard Resistance (for RHD):

Tester Connection	Condition	Specified Condition
A52-24 (W) - E8-12 (CHK)	Always	Below 1 Ω

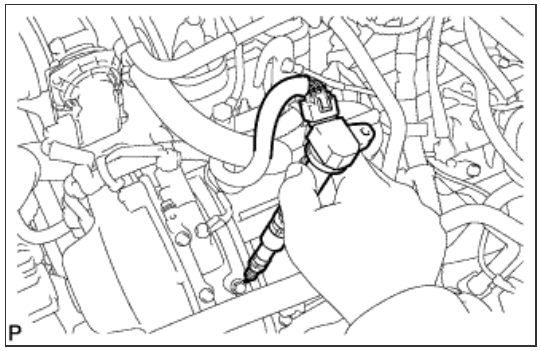
1. PERFORM SPARK TEST

a. Check for DTCs (Click here).

NOTICE:

If any DTC is output, perform troubleshooting procedures for that DTC.

b. Check if sparks occur.



i. Remove the ignition coils and spark plugs (Click here).

ii. Install the spark plug to the ignition coil and connect the ignition coil connector.

iii. Disconnect the 8 injector connectors.

iv. Ground the spark plugs.

v. Visually check that sparks occur while the engine is being cranked.

NOTICE:

- **Be sure to ground the spark plug when checking.**
- **If the ignition coil has been struck or dropped, replace it.**
- **Do not crank the engine for more than 2 seconds.**

c. Check that the wire harness side connector of the ignition coil with igniter is securely connected.

Result

Result	Proceed to
NG	Connect securely
OK	Go to next step

d. Perform a spark test on each ignition coil with igniter.

i. If there is a cylinder where sparks do not occur, replace its ignition coil with the ignition coil of a cylinder where sparks occur normally.

ii. Crank the engine and visually check that sparks occur at the cylinder with the normally operating ignition coil.

Result

Result	Proceed to
OK	Replace ignition coil with igniter
NG	Go to next step

e. Inspect the spark plug.

i. Replace the spark plug with a normal one.

ii. Perform spark teat again.

Result

Result	Proceed to
OK	Replace spark plug
NG	Go to next step

f. Check power supply to the ignition coil with igniter.

i. Turn the engine switch on (IG).

ii. Check that there is battery voltage at the ignition coil positive (+) terminal.

Result

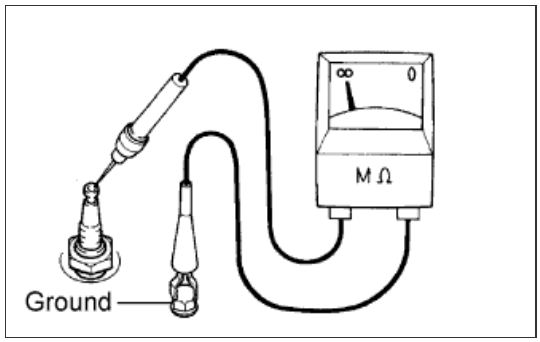
Result	Proceed to
NG	Check wiring between engine switch and ignition coil with igniter
OK	Go to next step

g. Check the VVT sensor (Click here).

h. Check the crankshaft position sensor (Click here).

i. Check the IGT signal circuit (Click here).

j. Connect the 8 injector connectors.



k. Install the 8 ignition coils and 8 spark plugs (Click here).

2. INSPECT SPARK PLUG

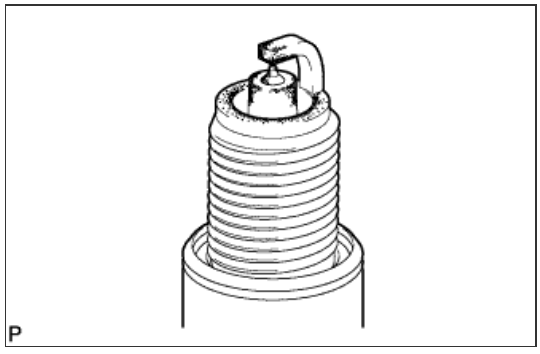
NOTICE:

Do not use a wire brush for cleaning.

a. Check the electrode.

i. Using a megohmmeter, measure the insulation resistance.

Standard Insulation Resistance:



Tester Connection	Condition	Specified Condition
Spark Plug (terminal part) - Body Ground	Always	10 MΩ or higher

If the insulation resistance is below the specified range, replace the spark plug.

HINT:

If a megohmmeter is not available, perform the following simple inspection instead.

b. Alternative inspection method:

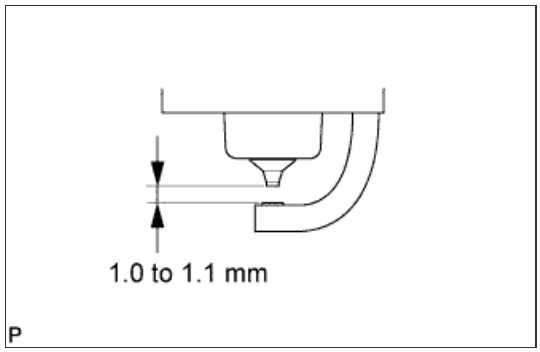
i. Quickly accelerate the engine to 4000 rpm 5 times.

ii. Remove the spark plug.

iii. Visually check the spark plug.
If the electrode is dry, the spark plug is functioning properly. If the electrode is damp, proceed to the next step.

c. Check the spark plug for any damage on its threads and insulator.
If there is any damage, replace the spark plug.

Recommended Spark Plug

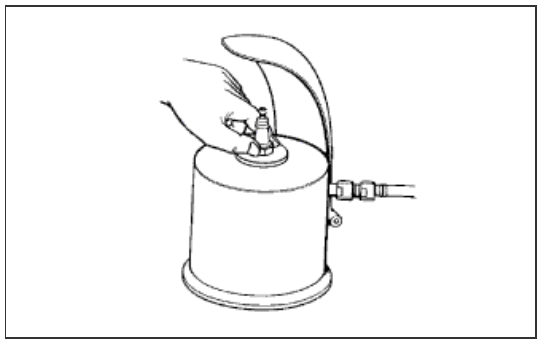


Manufacturer	Type
DENSO made	SK20R11
NGK made	IFR6A11

HINT:

Maximum electrode gap for a used spark plug: 1. mm (0.0512 in.)

If the gap is more than the maximum, replace the spark plug.

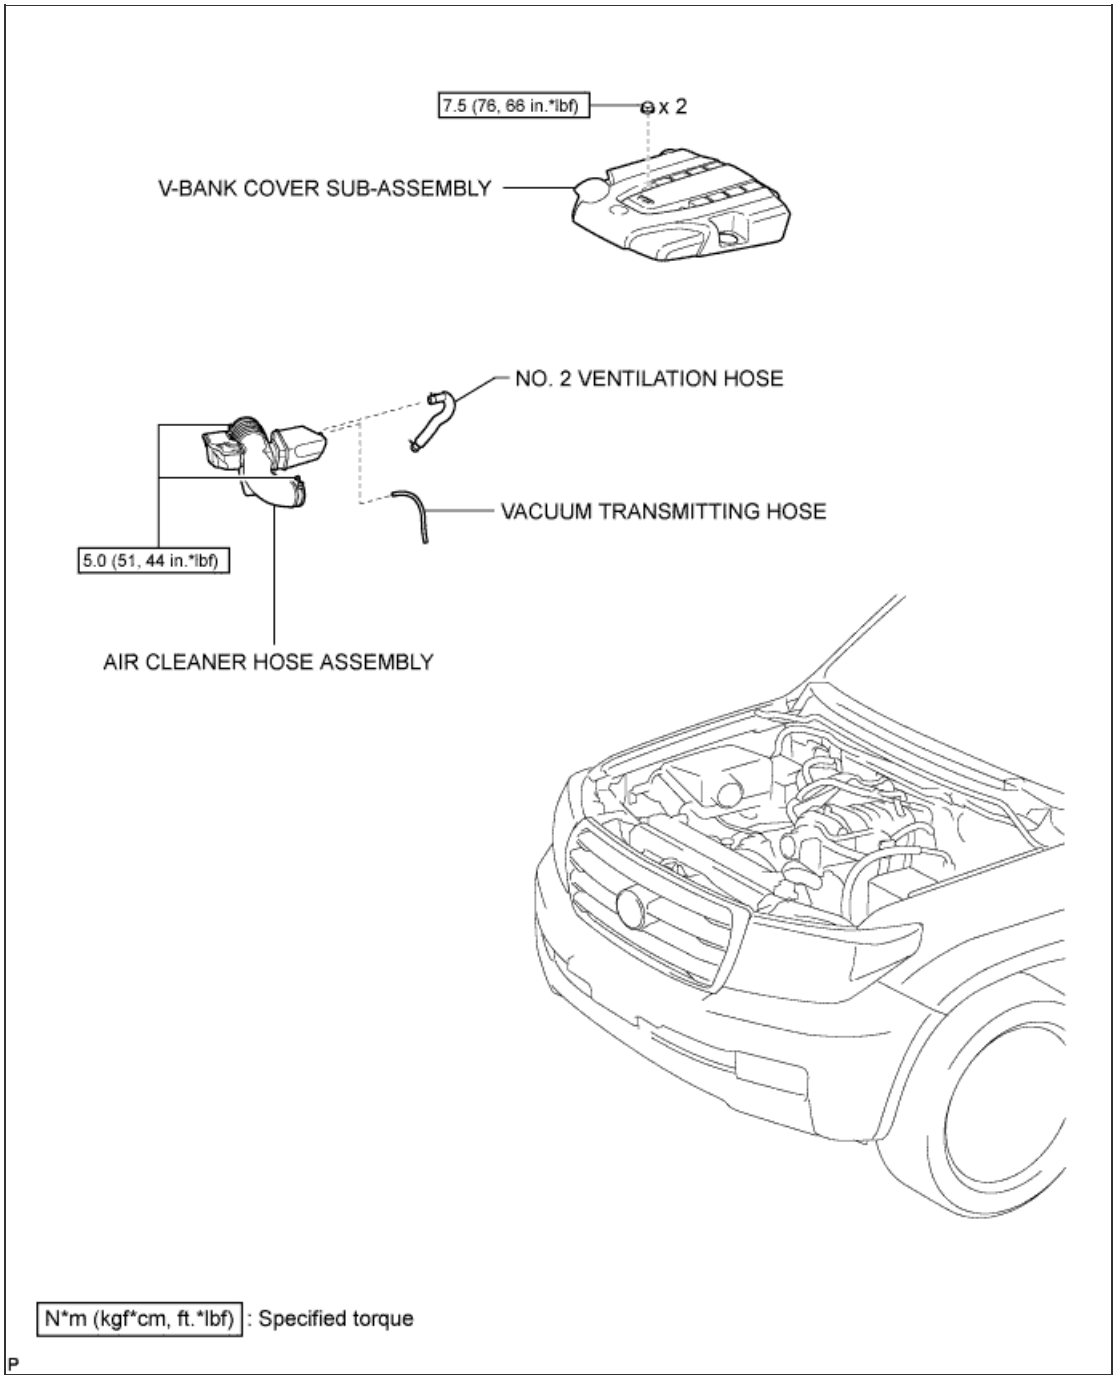


Electrode gap for a new spark plug: 1.0 to 1.1 mm (0.0394 to 0.04 in.)

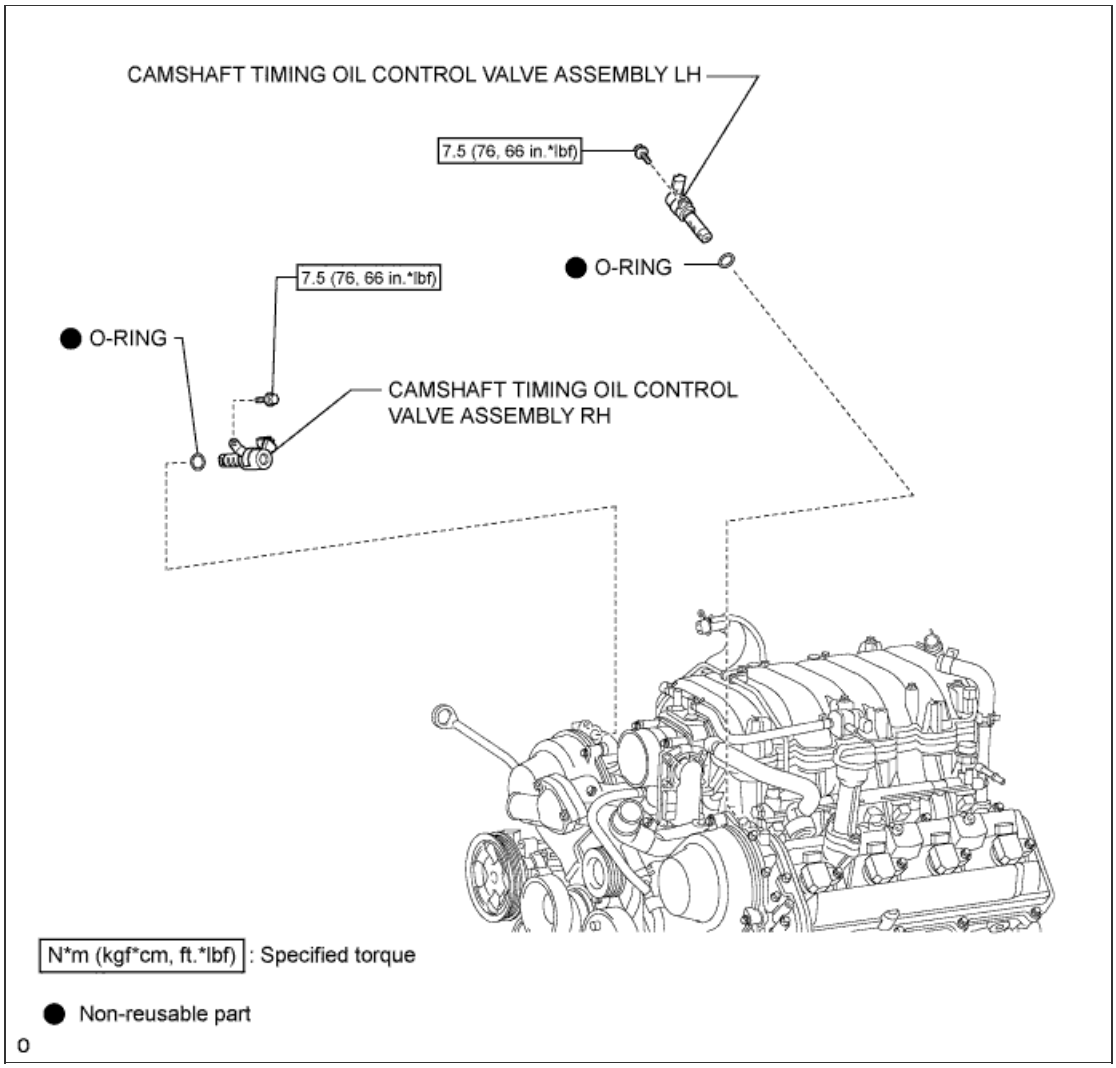
NOTICE:

Do not adjust the electrode gap of any spark plug, as the ground electrode tip will be damaged.

d. If the electrode has traces of wet carbon, allow it to dry and then clean it with a spark plug cleaner.



Standard air pressure:
588 kPa (6.0 kgf/cm^2, 85 psi)



Standard duration:
20 seconds or less

HINT:

Only use the spark plug cleaner when the electrode is free of oil. If the electrode has traces of oil, use gasoline to clean off the oil before using the spark plug cleaner.

CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY LH
7.5 (76, 66 in.*lbf)
O-RING
7.5 (76, 66 in.*lbf)
O-RING
CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY RH
N*m (kgf*cm, ft.*lbf) : Specified torque
Non-reusable part

0

for Preparation Click here

1. INSPECT CAMSHAFT OIL CONTROL VALVE

a. Connect the intelligent tester to the DLC3.

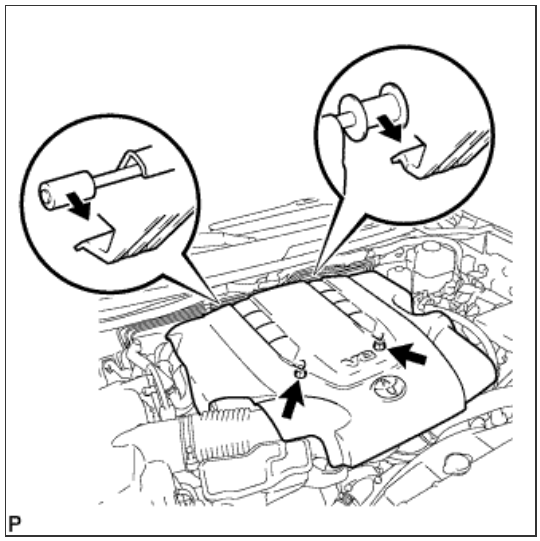
b. Start the engine and turn the intelligent tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the intelligent tester.

OK:



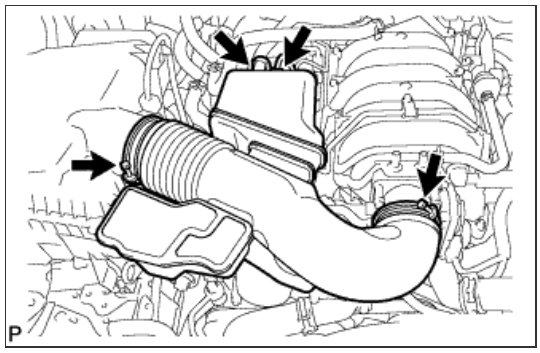
Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

If the result is not as specified, check the oil control valve, wirings and camshaft timing gear.

for Preparation Click here

1. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Remove the 2 nuts and V-bank cover.

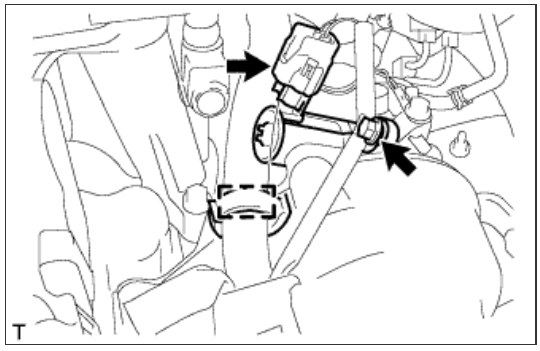


2. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum transmitting hose and No. 2 ventilation hose.

b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

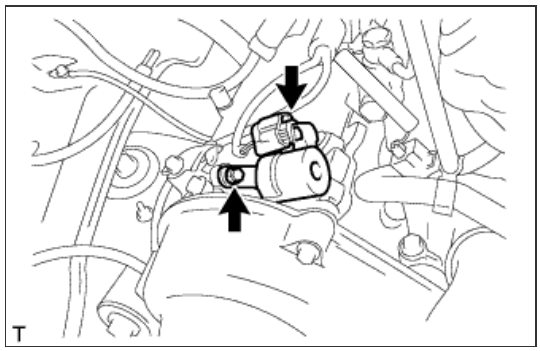


3. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY LH

a. Disconnect the oil control valve connector and wire harness clamp.

b. Remove the bolt and camshaft timing oil control valve.

c. Remove the O-ring from the camshaft timing oil control valve.



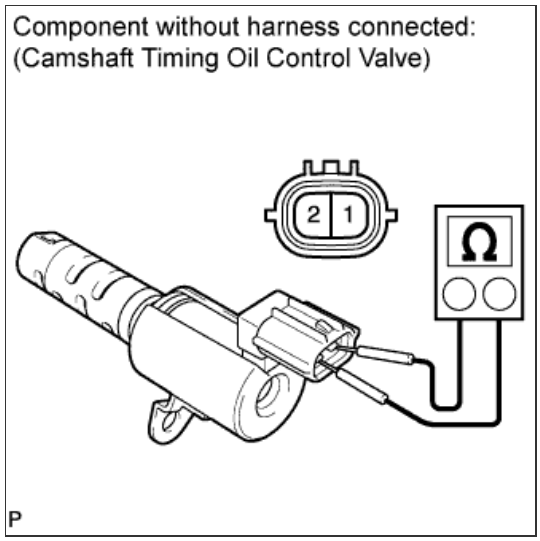
4. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY RH

a. Disconnect the oi contro va ve connector.

b. Remove the bo t and camshaft timing oi contro va ve.

c. Remove the -ring from the camshaft timing oi contro va ve.

for Preparation Click here



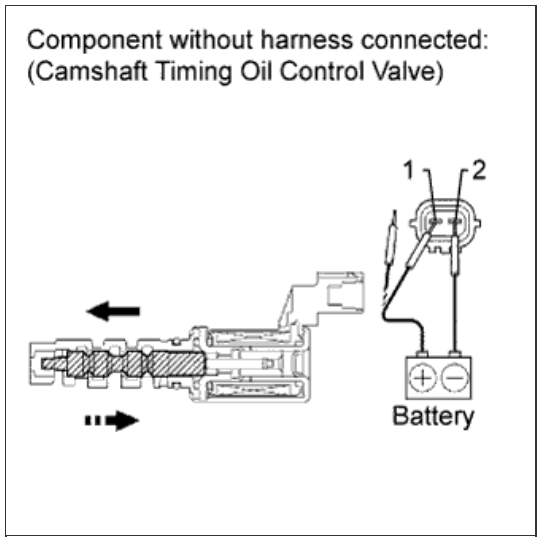
1. INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

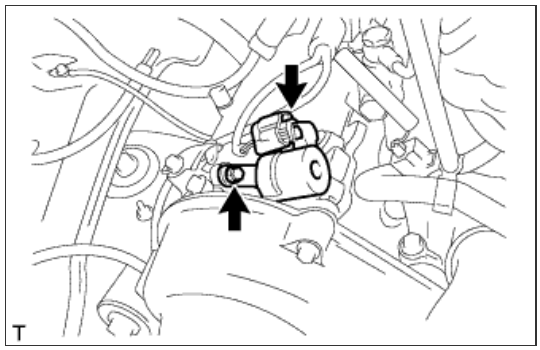
Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

If the result is not as specified, replace the oil control valve assembly.



b. Connect the battery positive (+) lead to terminal 1 and the negative (-) lead to terminal 2, and check the movement of the valve.

OK:



Condition	Specified Condition
Battery positive (+) voltage is applied	Valve moves in the direction of the left arrow shown in the illustration
Battery positive (+) voltage is cut off	Valve moves in the direction of the right arrow shown in the illustration

If the result is not as specified, replace the camshaft timing oil control valve. If the valve cannot return properly because of foreign matter, a small pressure leak in the advanced direction may occur and a DTC may be stored.

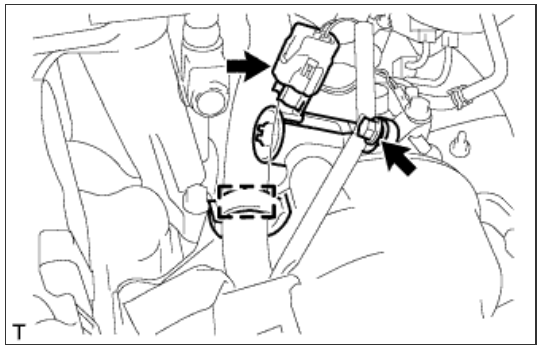
for Preparation Click here

1. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY RH

a. Install a new O-ring to the camshaft timing oil control valve.

b. ly a light coat of engine oil to the O-ring.

c. Install the oil control valve with the bolt.



Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head cover).**
- **Be careful that the O-ring is not cracked when installing the oil control valve.**

d. Connect the camshaft timing oil control valve connector.

2. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY LH

a. Install a new O-ring to the camshaft timing oil control valve.

b. ly a light coat of engine oil to the O-ring.

c. Install the camshaft timing oil control valve with the bolt.

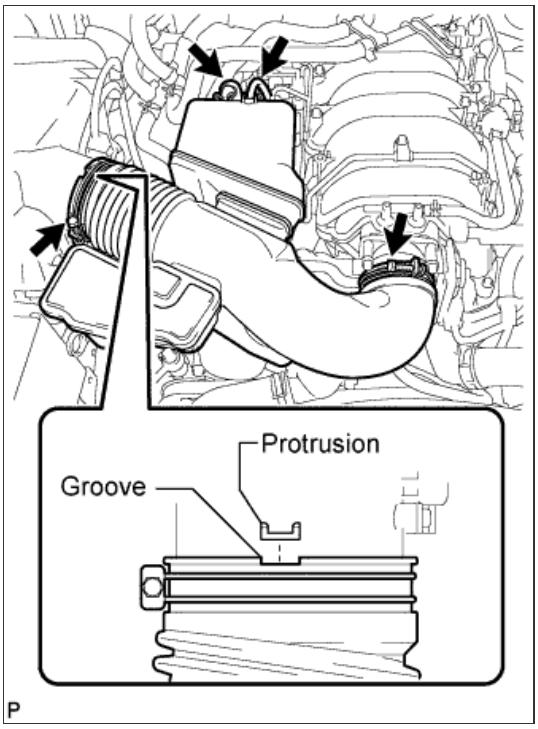
Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head cover).**
- **Be careful that the O-ring is not cracked when installing the oil control valve.**

d. Connect the camshaft timing oil control valve connector and wire harness clamp.

3. INSTALL AIR CLEANER HOSE ASSEMBLY



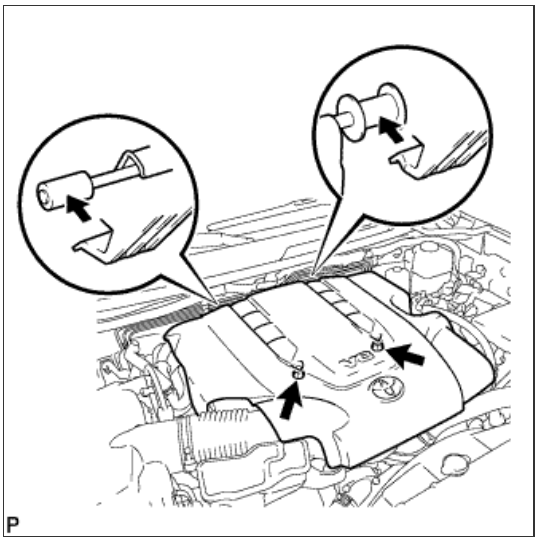
a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

b. Tighten the 2 clamps.

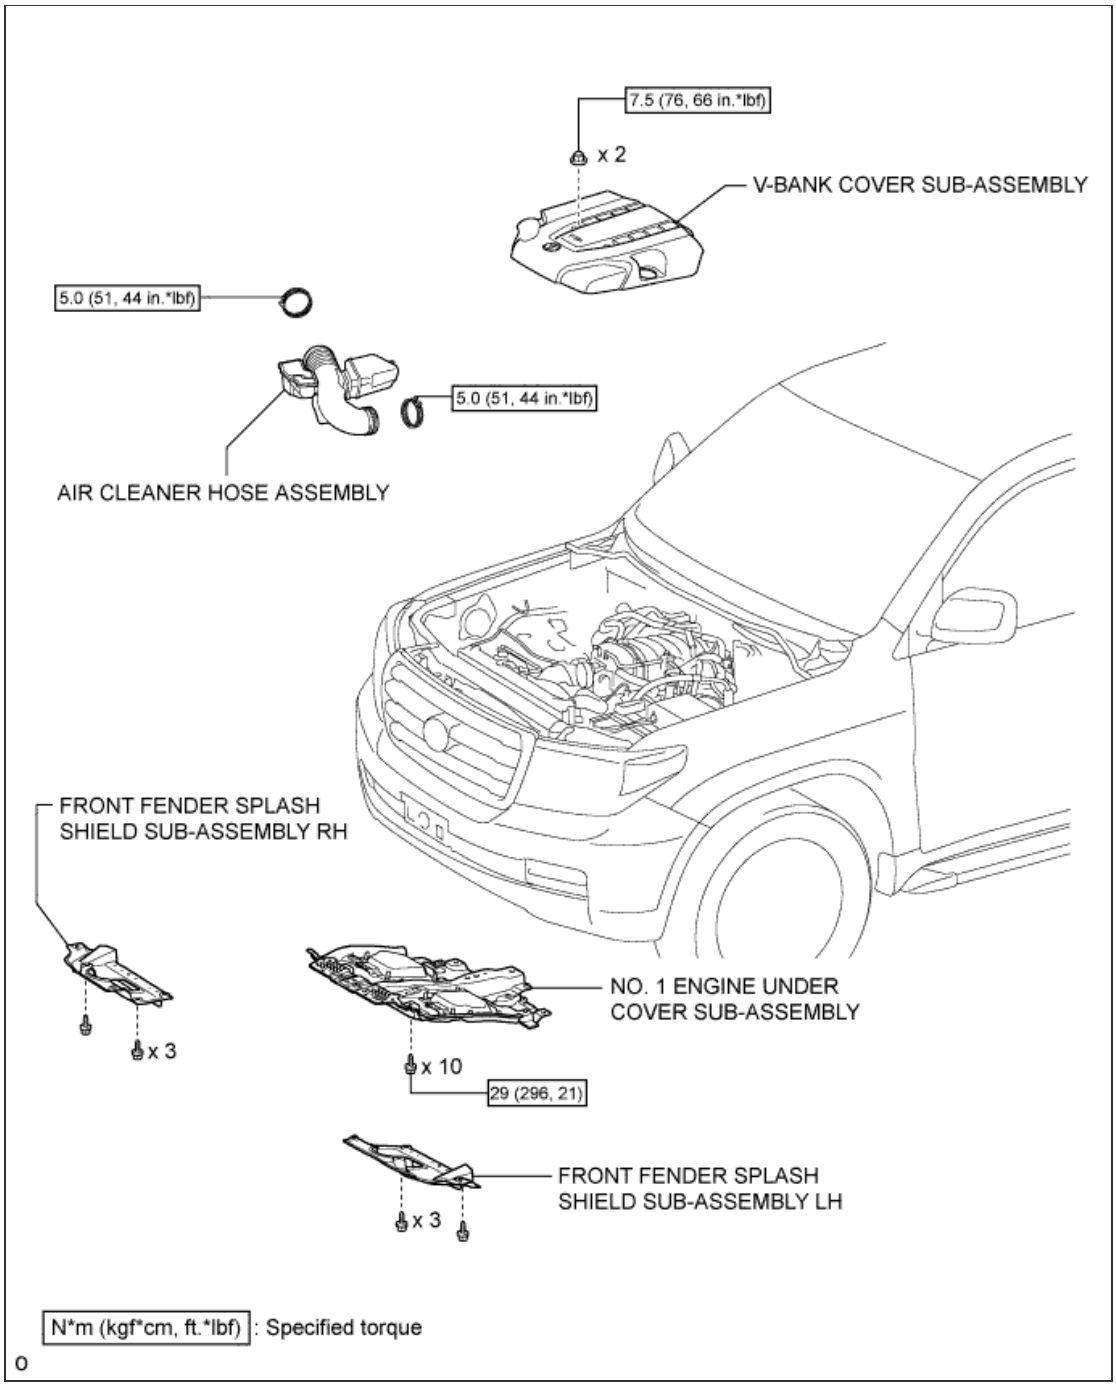
Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum transmitting hose.

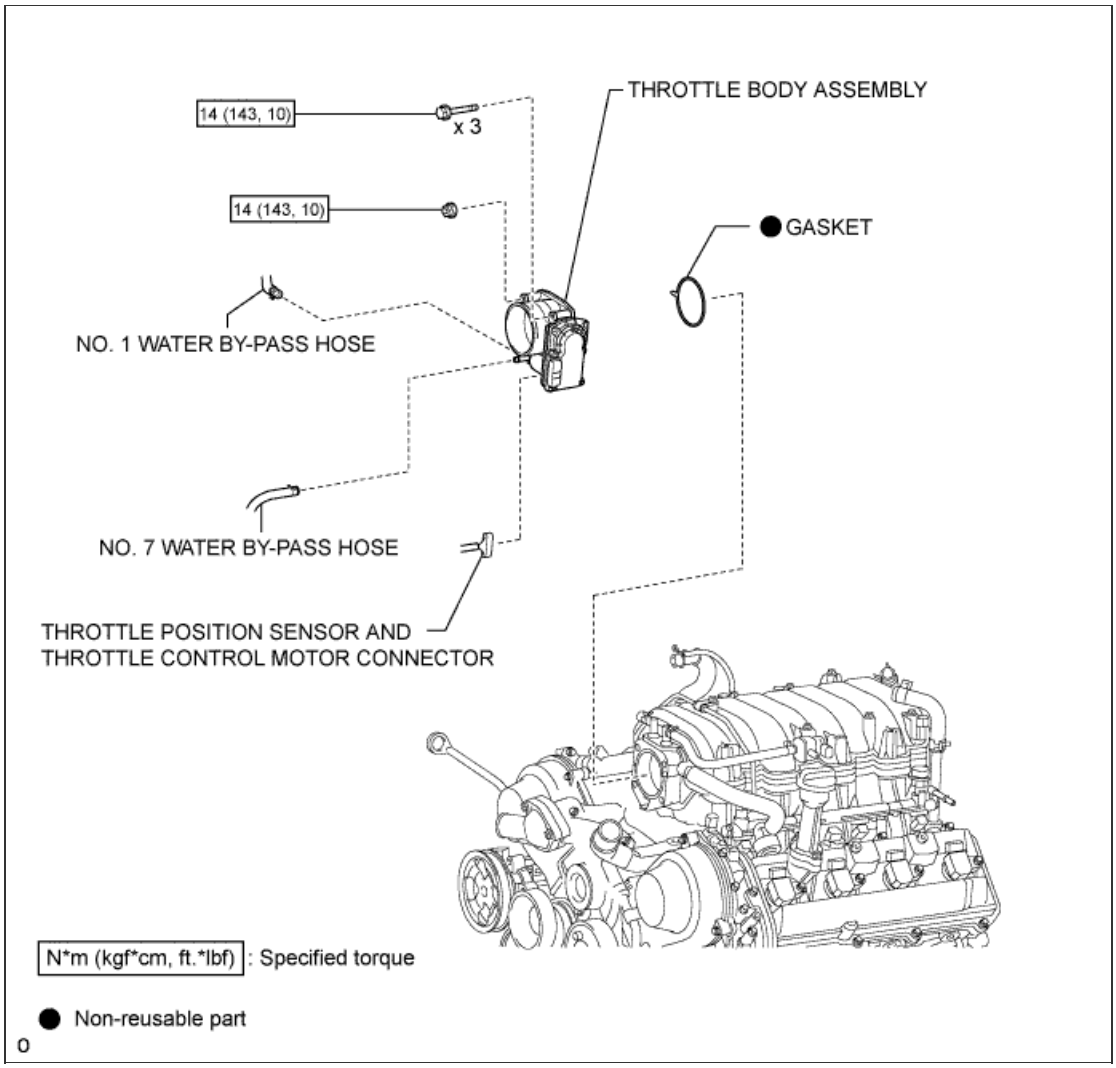
d. Connect the No. 2 ventilation hose.



. INSTALL V BAN COVER S B ASSEMBLY



a. ttach the 2 V-bank cover hooks to the bracket.



b. Install the V-bank cover with the 2 nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

for Preparation Click here

x 3
14 (143, 10)
THROTTLE BODY ASSEMBLY
GASKET
NO. 1 WATER BY-PASS HOSE
NO. 7 WATER BY-PASS HOSE
THROTTLE POSITION SENSOR AND
THROTTLE CONTROL MOTOR CONNECTOR
N*m (kgf*cm, ft.*lbf) : Specified torque
Non-reusable part

o

for Preparation Click here

1. CHECK THROTTLE BODY ASSEMBLY

a. Check the throttle control motor operating sounds.

i. Turn the engine switch on (IG).

ii. When depressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises are emitted from the motor. If friction noise exists, replace the throttle body.

b. Check the throttle position sensor.

i. Connect the intelligent tester to the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester on.

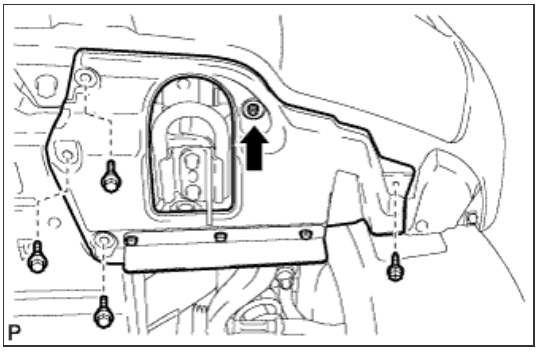
iv. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Throttle Sensor Position.

v. Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of the "Throttle Sensor Position" is within the specification.

Standard throttle valve opening percentage:
60% or more

HINT:

When checking the standard throttle valve opening percentage, the shift lever should be in N.



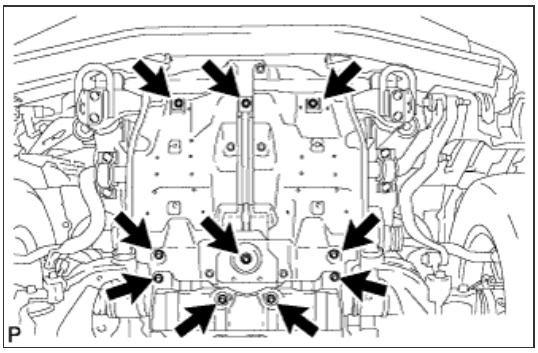
If the percentage is less than 60%, replace the throttle body.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

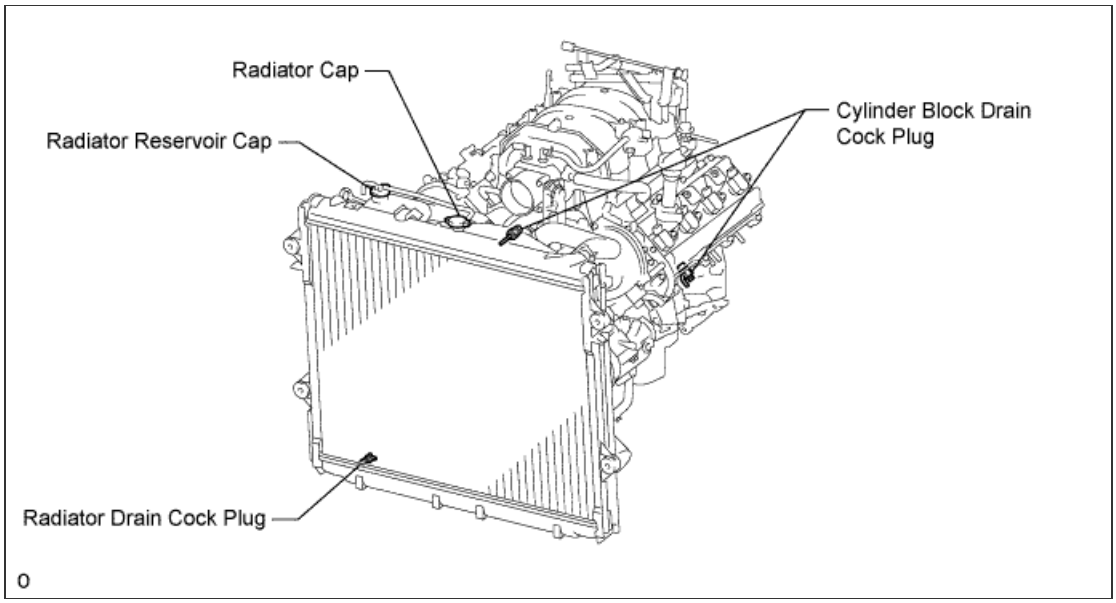


2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

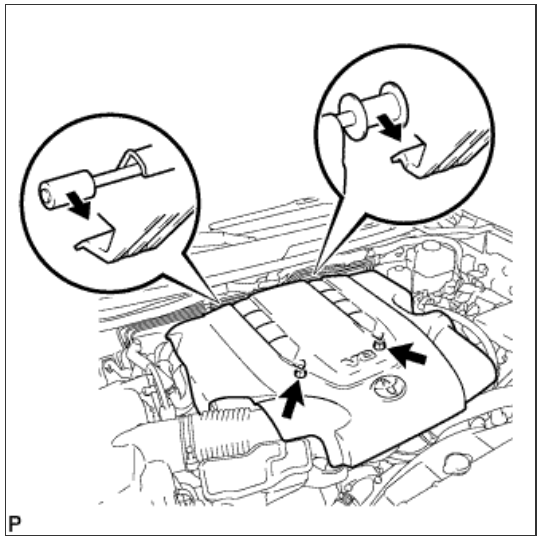
a. Loosen the radiator drain cock plug.

b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.



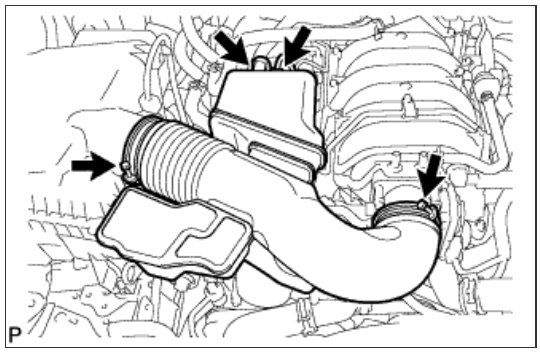
d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 130 kgf*cm , 9 ft.*lbf }

e. Tighten the radiator drain cock plug by hand.

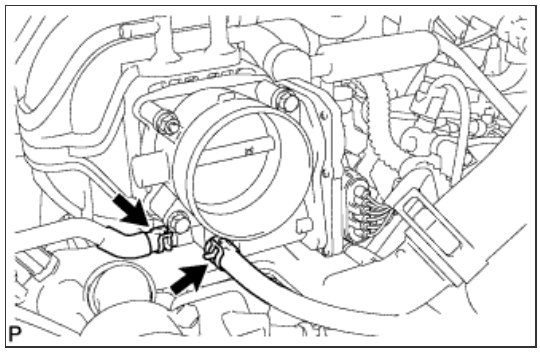
5. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Remove the 2 nuts and V-bank cover.



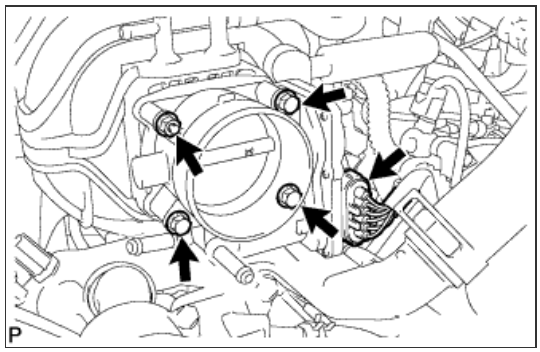
. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum transmitting hose and No. 2 ventilation hose.



b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.



7. REMOVE THROTTLE BODY ASSEMBLY

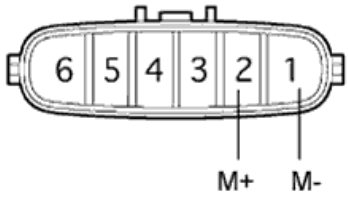
a. Disconnect the No. 1 water by-pass hose and No. 7 water by-pass hose from the throttle body.

b. Disconnect the throttle position sensor and throttle control motor connector.

c. Remove the 3 bolts, nut, throttle body and gasket.

for Preparation Click here

1. INSPECT THROTTLE BODY ASSEMBLY

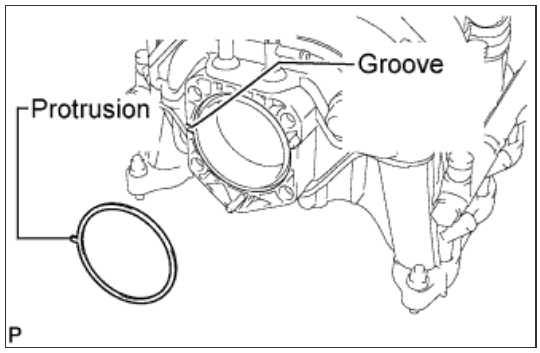


a. Measure the resistance according to the value(s) in the table below.

Stan ar Resistance:

Tester Connection	Condition	Specified Condition
1 (M-) - 2 (M+)	20°C (68°F)	0.3 to 100 Ω

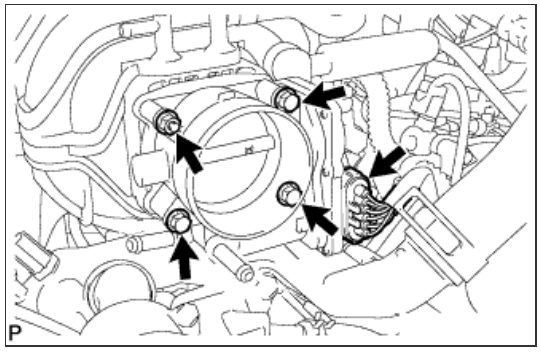
If the result is not as specified, replace the throttle body assembly.



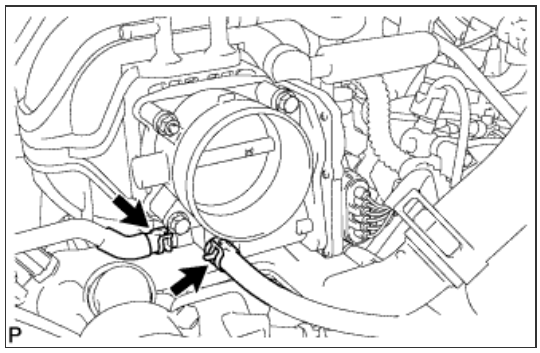
Component without harness connected:
(Throttle Body)

for Preparation Click here

1. INSTALL THROTTLE BODY ASSEMBLY



a. Align the protrusion of a new gasket with the groove of the intake manifold, and install the gasket.



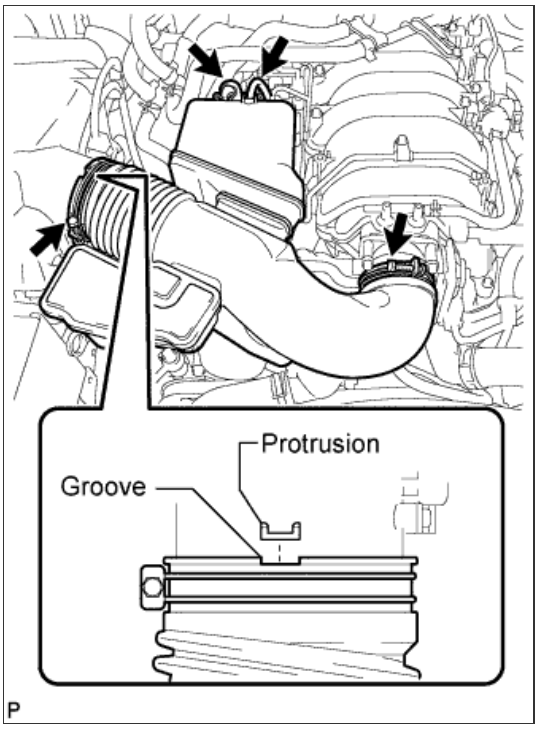
b. Install the throttle body with the 3 bolts and nut.

Torque:
14 N*m{ 143 kgf*cm , 10 ft.*lbf }

c. Connect the throttle position sensor and throttle control motor connector.

d. Connect the No. 1 water by-pass hose and No. 7 water by-pass hose to the throttle body.

2. INSTALL AIR CLEANER HOSE ASSEMBLY



a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

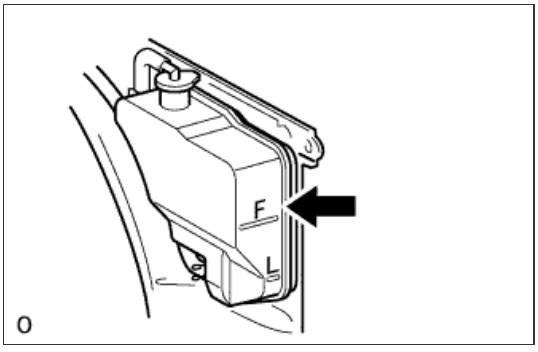
b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum transmitting hose.

d. Connect the No. 2 ventilation hose.

3. ADD ENGINE COOLANT



a. Add engine coolant.

Standard Capacity:

Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	16.3 liters (17.2 US qts, 14.3 Imp. qts)
w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	16.9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the radiator reservoir cap.

d. Press the inlet and outlet radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

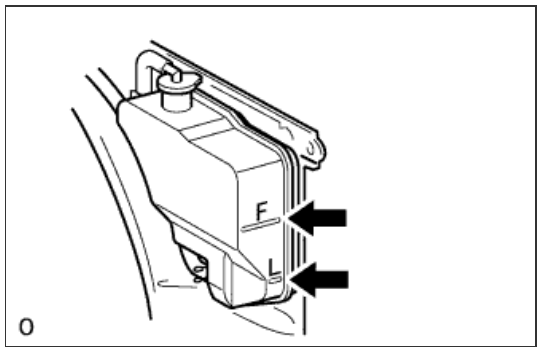
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the inlet and outlet radiator hoses several times by hand to bleed air.

CAUTION:



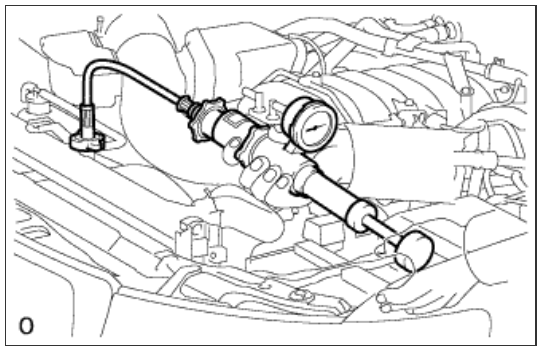
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

i. Stop the engine, and wait until the engine coolant cools down to the ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines. If the coolant level is below the L line, repeat all of the procedures above. If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.



4. INSPECT FOR COOLANT LEAK

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

5. CHECK THROTTLE BODY ASSEMBLY

a. Check the throttle control motor operating sounds.

i. Turn the engine switch on (IG).

ii. When depressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises are emitted from the motor. If friction noise exists, replace the throttle body.

b. Check the throttle position sensor.

i. Connect the intelligent tester to the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester on.

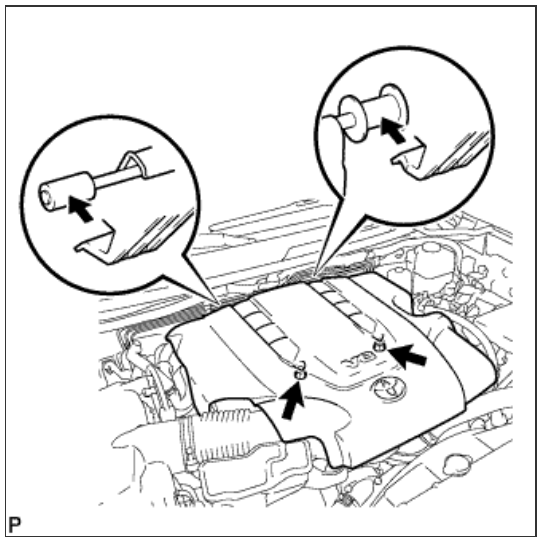
iv. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Throttle Sensor Position.

v. Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of the "Throttle Sensor Position" is within the specification.

Standard throttle valve opening percentage:
60% or more

HINT:

When checking the standard throttle valve opening percentage, the shift lever should be in N.

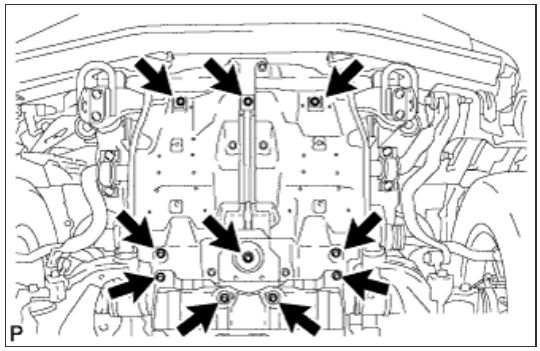


If the percentage is less than 60%, replace the throttle body.

6. INSTALL V-BANK COVER SUB-ASSEMBLY

a. Attach the 2 V-bank cover hooks to the bracket.

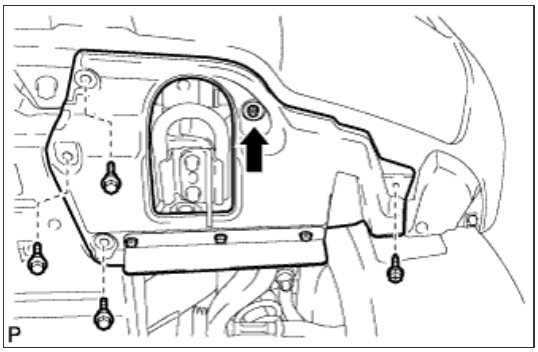
b. Install the V-bank cover with the 2 nuts.



Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

7. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.

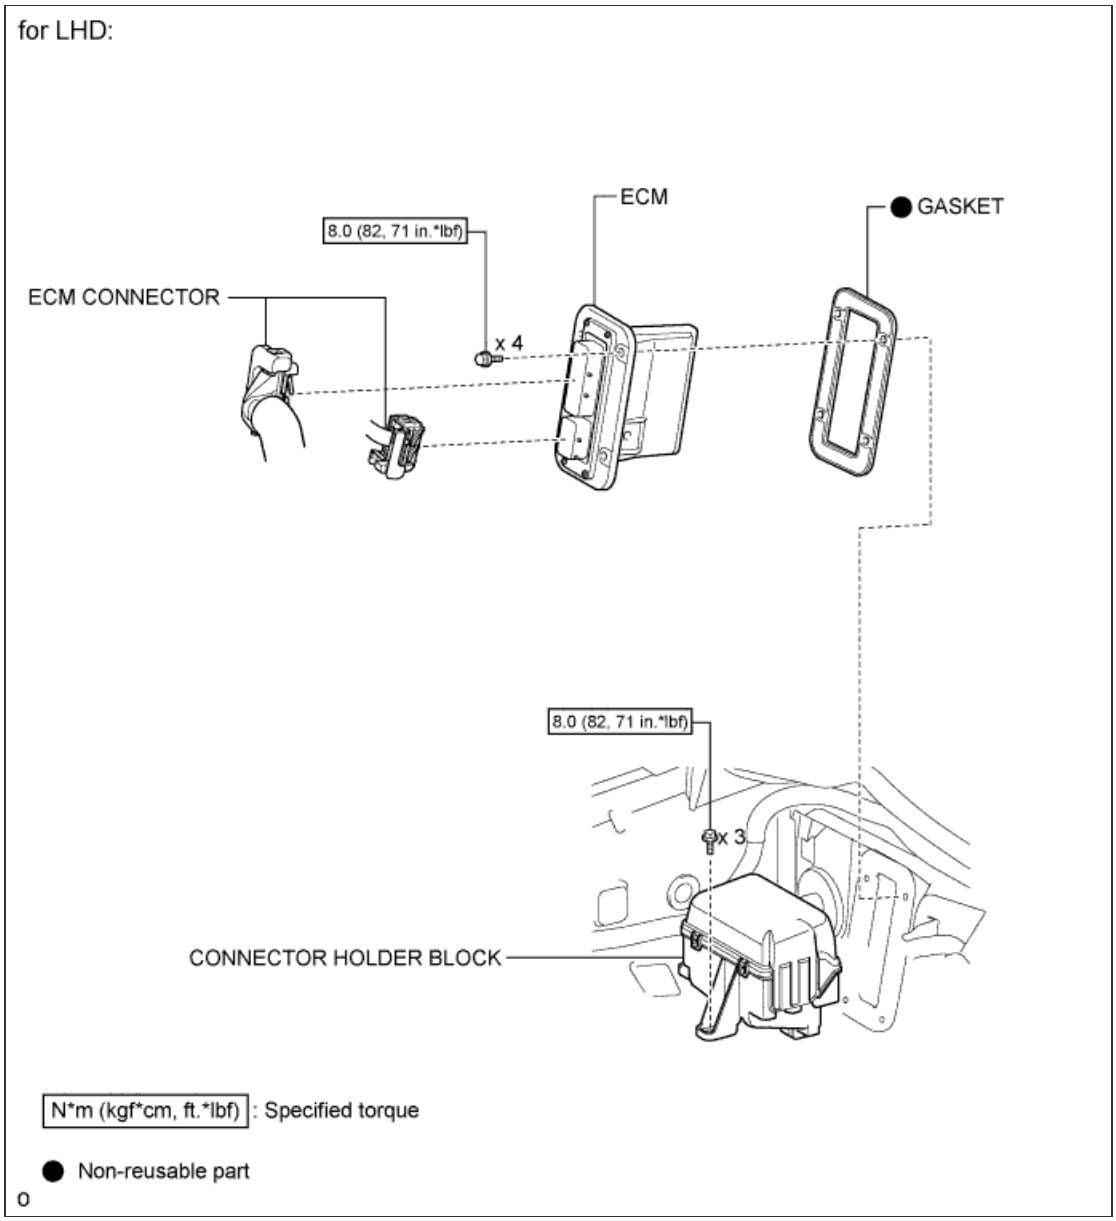


Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

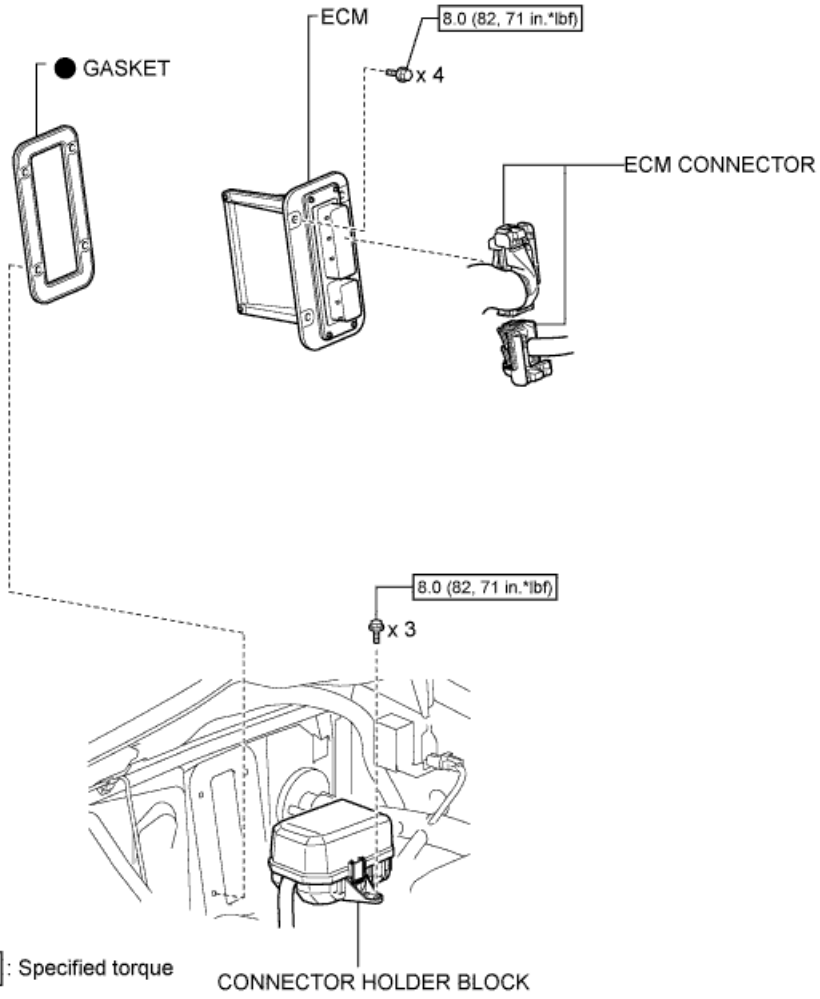
8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.



9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

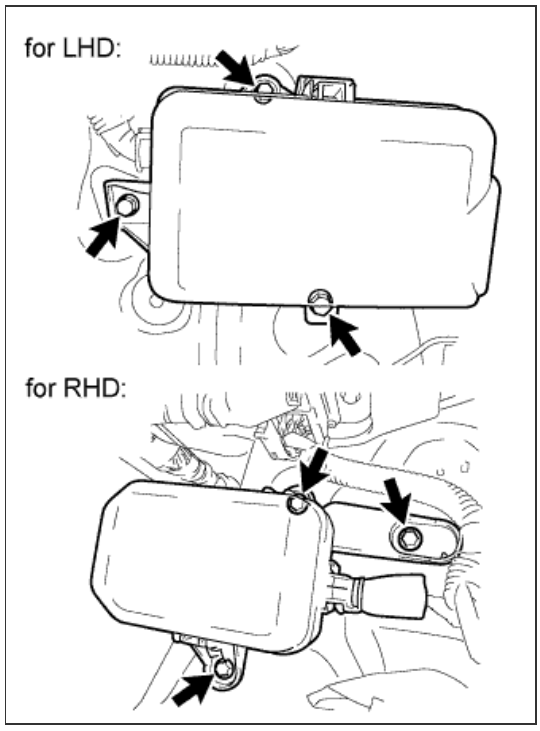
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:



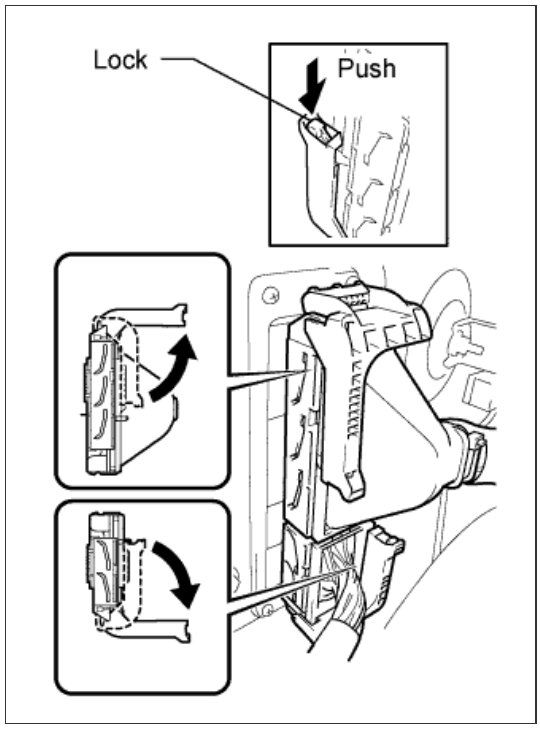
Wait at least 90 seconds after disconnecting the cable from the negative (-) battery terminal to disable SRS system.

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

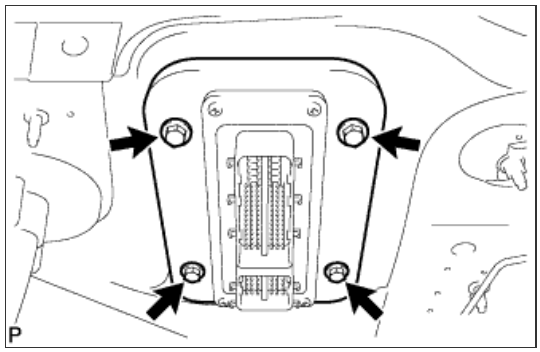
2. DISCONNECT CONNECTOR HOLDER BLOCK

a. Remove the 3 bolts and move the connector holder block so that the ECM can be removed in the next step.



3. REMOVE ECM

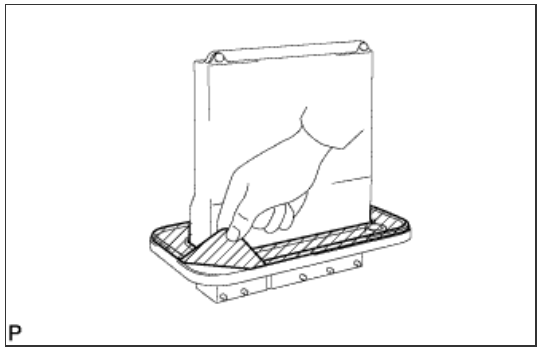
a. Raise the 2 levers while pushing the locks on the 2 levers.



NOTICE:

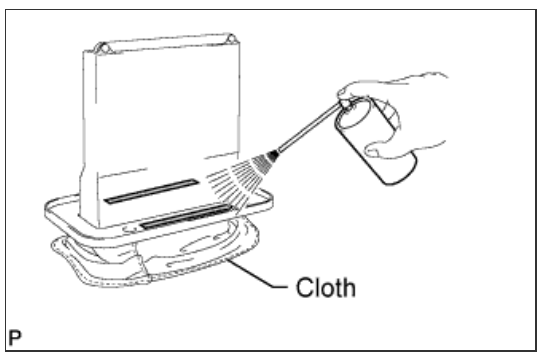
Make sure that the lock levers are raised 90° as shown in the illustration before disconnecting the ECM connectors. Failure to do this may cause the ECM connectors to break.

b. Disconnect the 2 connectors.

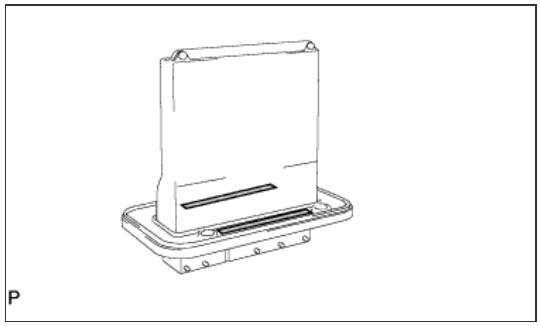


c. Remove the 4 bolts and ECM.

4. REMOVE GASKET



a. Peel off the gasket.



b. Spray gasket remover or equivalent on the remaining tape of the gasket.

NOTICE:

When using gasket remover or equivalent, cover the ECM connectors with a cloth.

c. Remove the tape of the gasket without using bladed objects.

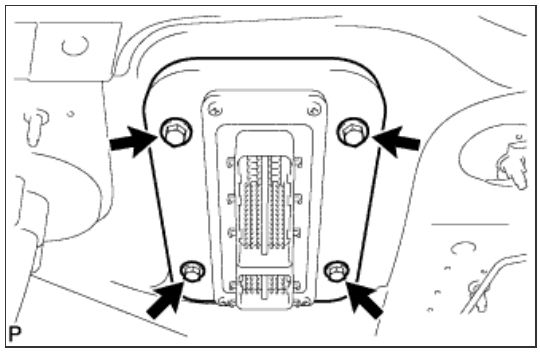
P

for Preparation Click here

1. INSTALL GASKET

a. Clean the ECM seal surface with non-residue solvent.

b. Attach a new gasket to the ECM.

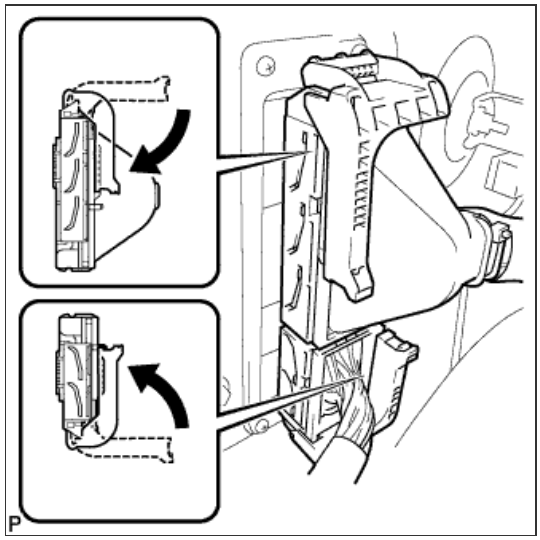


2. INSTALL ECM

a. Install the ECM with the 4 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

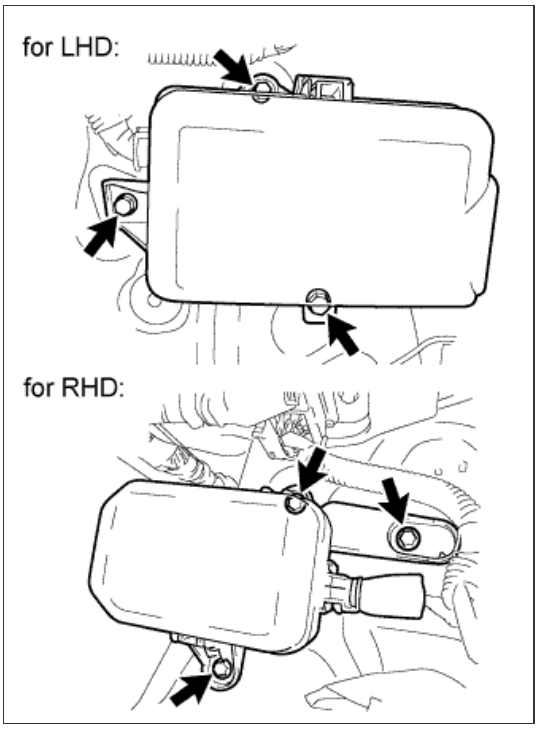
NOTICE:



- **Make sure the gasket is not folded or caught on any area of the surrounding part.**
- **Make sure there is no foreign matter caught between the gasket and surrounding part.**
- **Do not damage the gasket.**

b. Connect the 2 ECM connectors and push each lock lever down to lock the ECM connectors.

NOTICE:

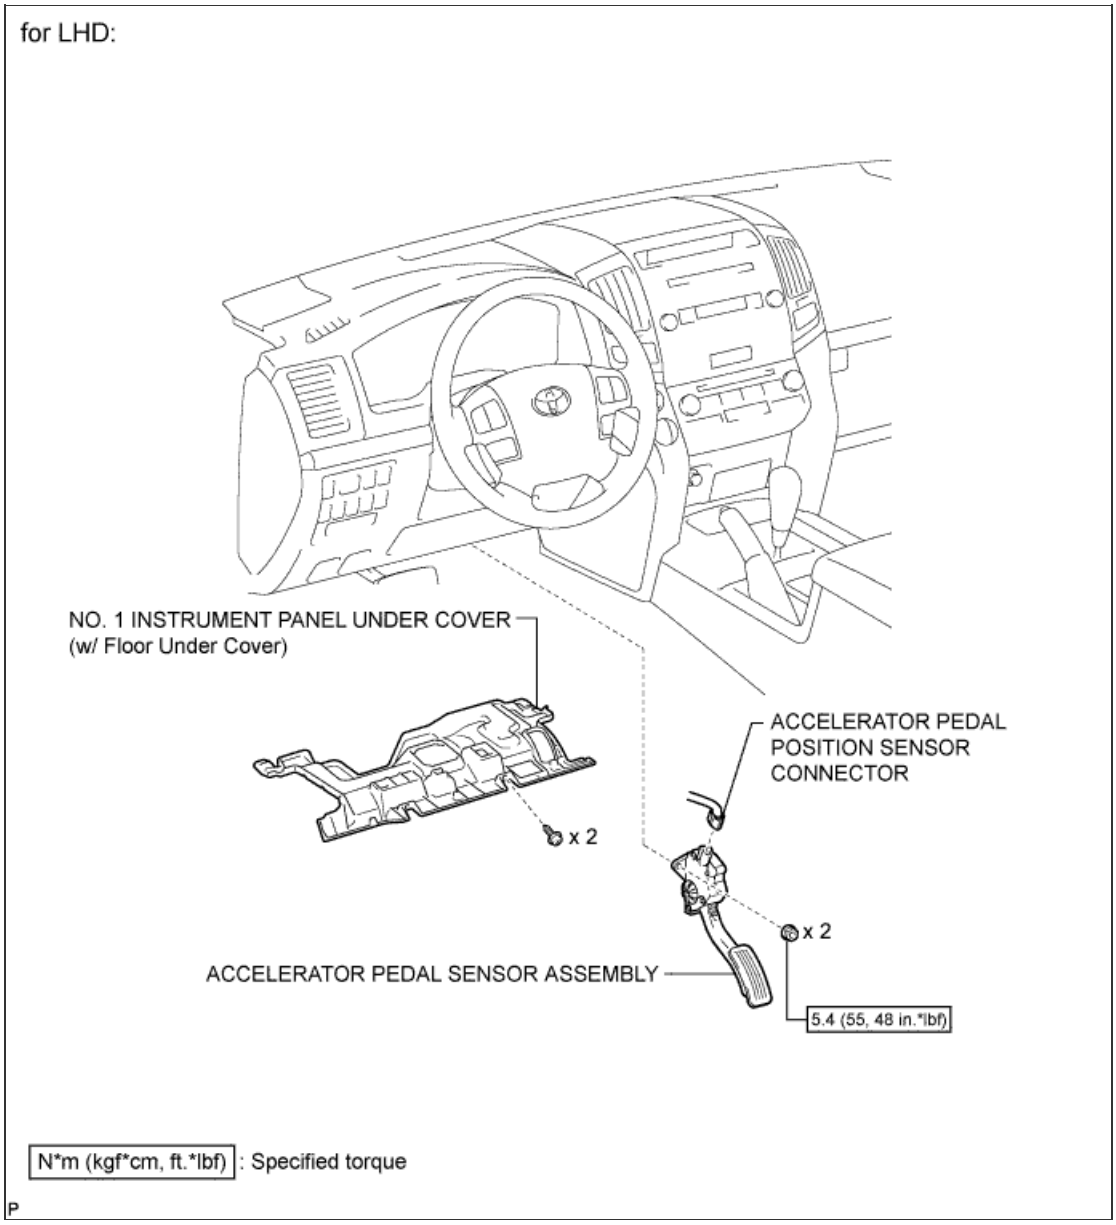


- **Be careful not to allow dirt, water, or other foreign matter to adhere to the connecting parts when connecting the connectors.**
- **Do not twist the wire harness when connecting the ECM connectors.**
- **Make sure that the lock lever is raised 90° before connecting the ECM connectors. Failure to do this may cause the lock lever and terminals to break.**
- **Make sure that the levers are securely locked.**

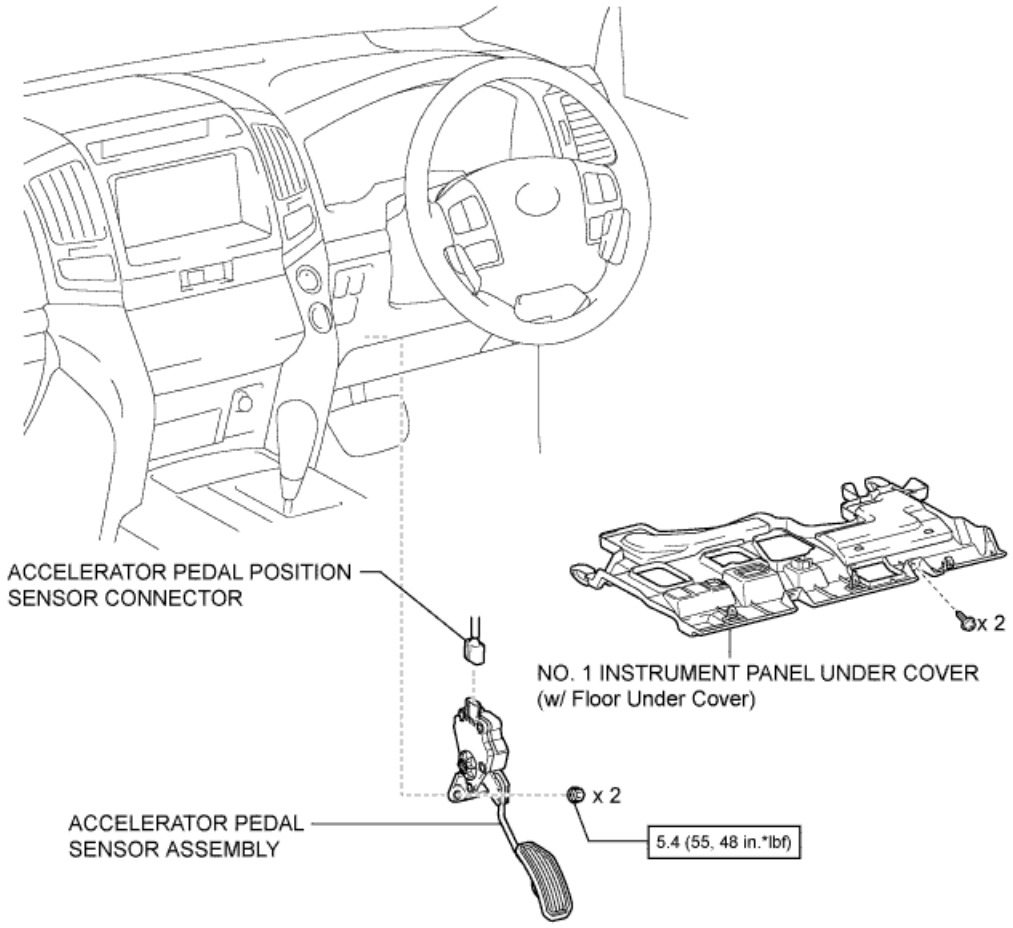
3. CONNECT CONNECTOR HOLDER BLOCK

a. Connect the connector holder block with the 3 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL



NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

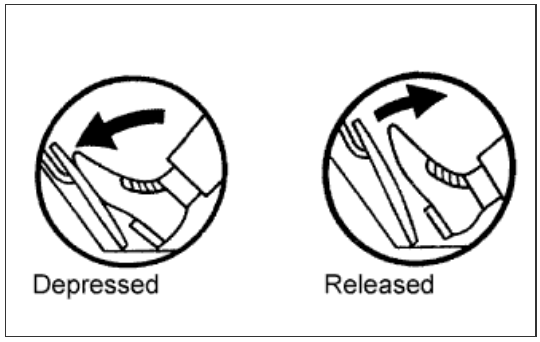
1. INSPECT ACCELERATOR PEDAL SENSOR ASSEMBLY

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the intelligent tester on.



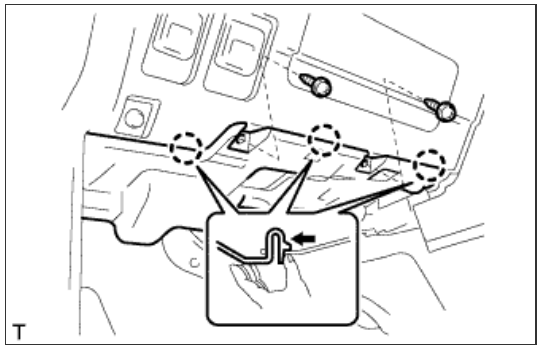
d. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

e. Read the value displayed on the intelligent tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

If the result is not as specified, check the accelerator pedal, wire harness and ECM.



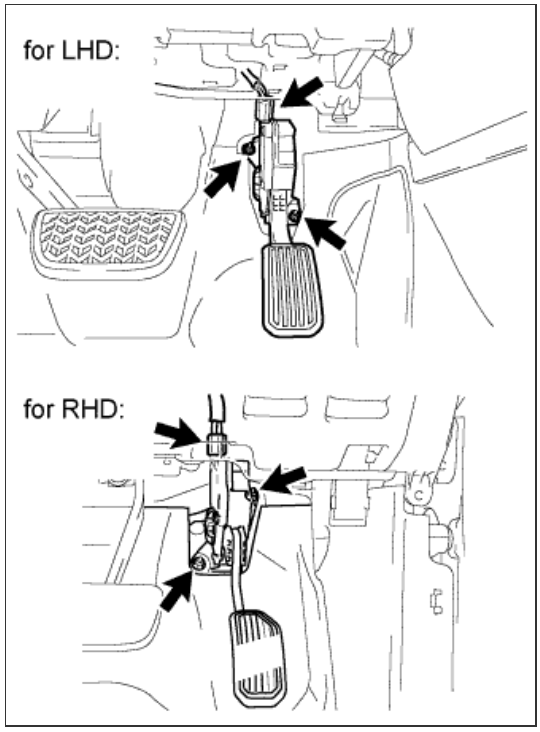
for Preparation Click here

1. REMOVE NO. 1 INSTRUMENT PANEL UNDER COVER (Under Cover)

a. Remove the 2 screws.

b. Detach the 3 claws.

c. Disconnect the connectors and remove the No. 1 instrument panel under cover.



2. REMOVE ACCELERATOR PEDAL SENSOR ASSEMBL

NOTICE:

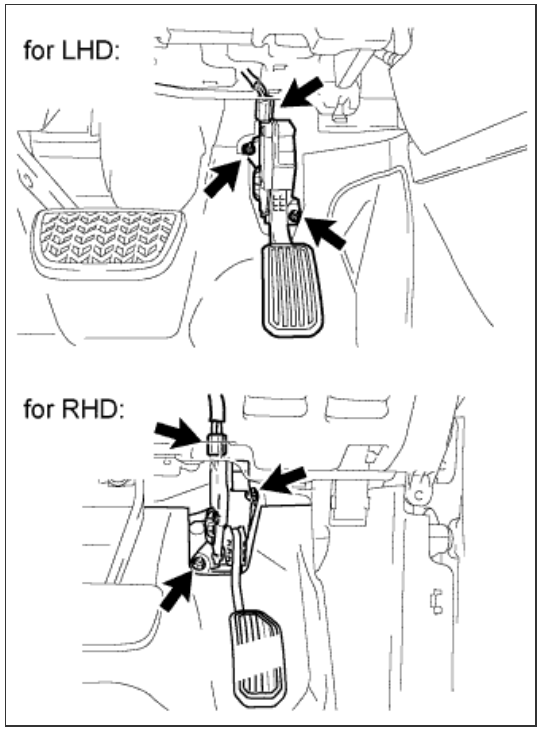
- **Avoid physical shocks to the accelerator pedal sensor assembly.**
- **Do not disassemble the accelerator pedal sensor assembly.**

a. Disconnect the accelerator pedal position sensor connector.

b. Remove the 2 nuts and accelerator pedal sensor.

for Preparation Click here

1. INSTALL ACCELERATOR PEDAL SENSOR ASSEMBLY



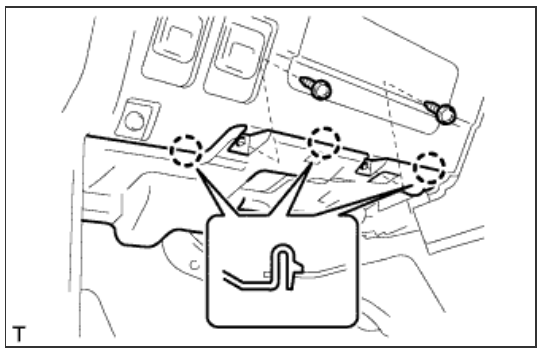
NOTICE:

- **Avoid physical shocks to the accelerator pedal sensor assembly.**
- **Do not disassemble the accelerator pedal sensor assembly.**

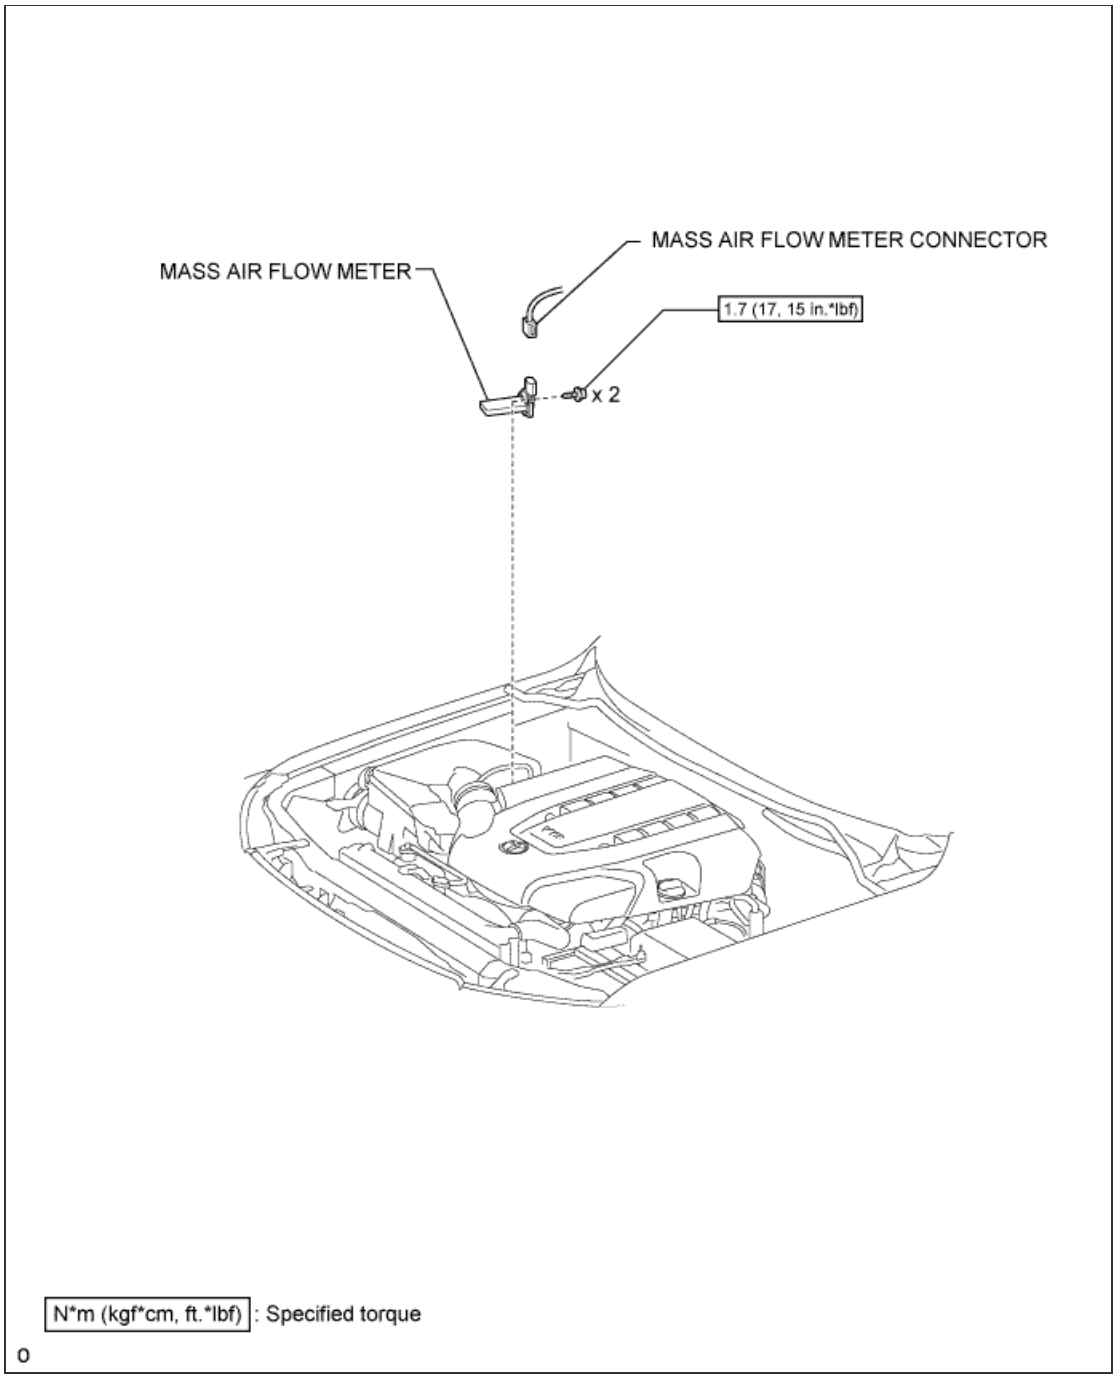
a. Install the accelerator pedal sensor with the 2 nuts.

Torque:
5.4 N*m{ 55 kgf*cm , 48 in.*lbf }

b. Connect the accelerator pedal position sensor connector.



2. INSTALL NO. 1 INSTRUMENT PANEL UNDER COVER (w/ Floor Under Cover



a. Connect the connectors.

b. Attach the 3 claws to install the No. 1 instrument panel under cover.

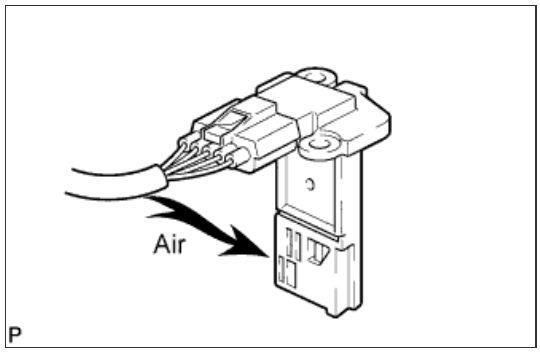
c. Install the 2 screws.

for Preparation [Click here]

for Preparation Click here

1. CHECK MASS AIR FLOW METER

a. Check the mass air flow value.



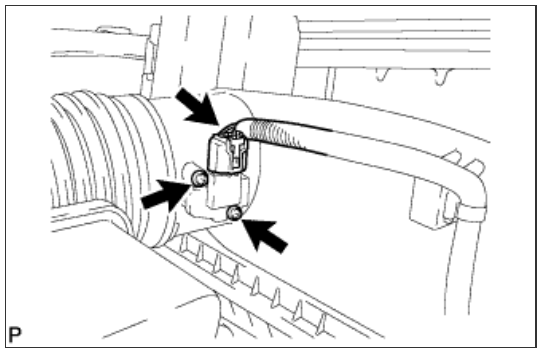
i. Connect the intelligent tester the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester on.

iv. Enter the following menus: Powertrain / Engine / Data List / All Data / MAF.

v. Blow air into the MAF meter, and check that the MAF value fluctuates. If the result is not as specified, check the MAF meter (Click here), or wiring and ECM (Click here).



for Preparation Click here

1. REMOVE MASS AIR FLOW METER

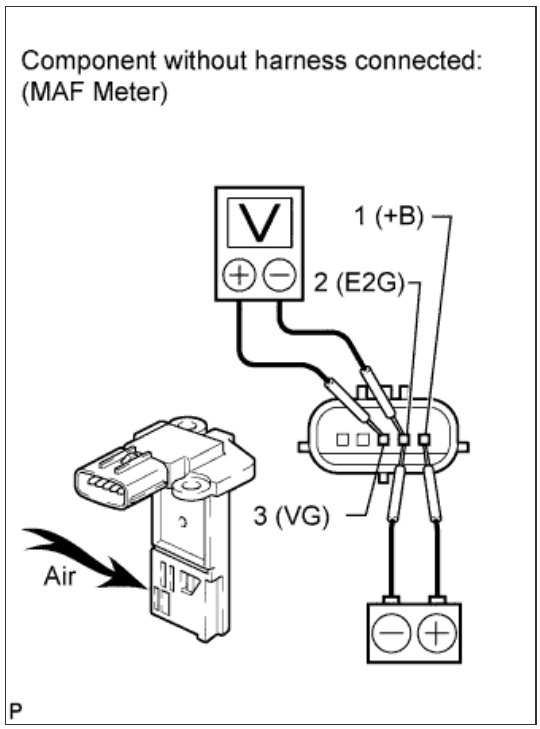
a. Disconnect the MAF meter connector.

b. Remove the 2 screws and MAF meter.

for Preparation Click here

1. INSPECT MASS AIR FLOW METER

a. Check the output voltage.

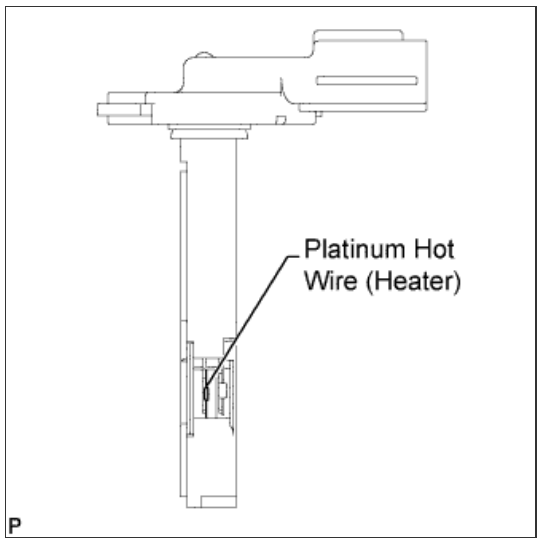


i. Apply battery voltage across terminals 1 (+B) and 2 (E2G).

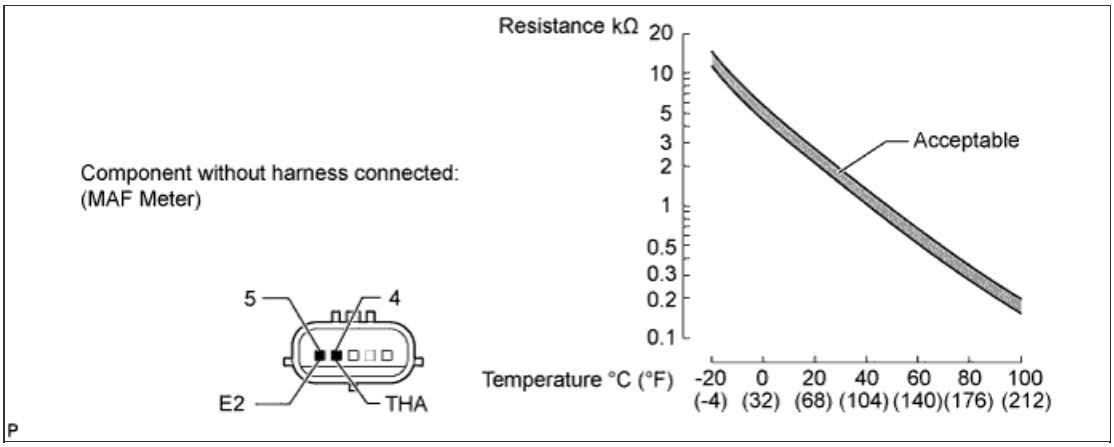
NOTICE:

While using the battery during inspection, do not bring the positive and negative tester probes too close to each other as a short circuit may occur.

ii. Using a voltmeter, connect the positive (+) tester probe to terminal 3 (VG), and negative (-) tester probe to terminal 2 (E2G).



iii. Blow air into the MAF meter, and check that the voltage fluctuates.
If the result is not as specified, replace the MAF meter.



b. Perform a visual check for any foreign matter on the platinum hot wire (heater) of the mass air flow meter shown in the illustration.

OK:
There is no foreign material.

If the result is not as specified, replace the mass air flow meter.

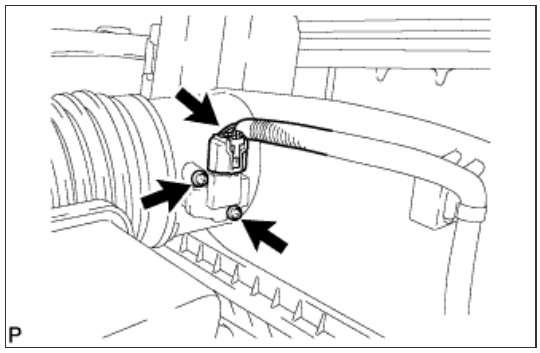
c. Check the IAT sensor.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

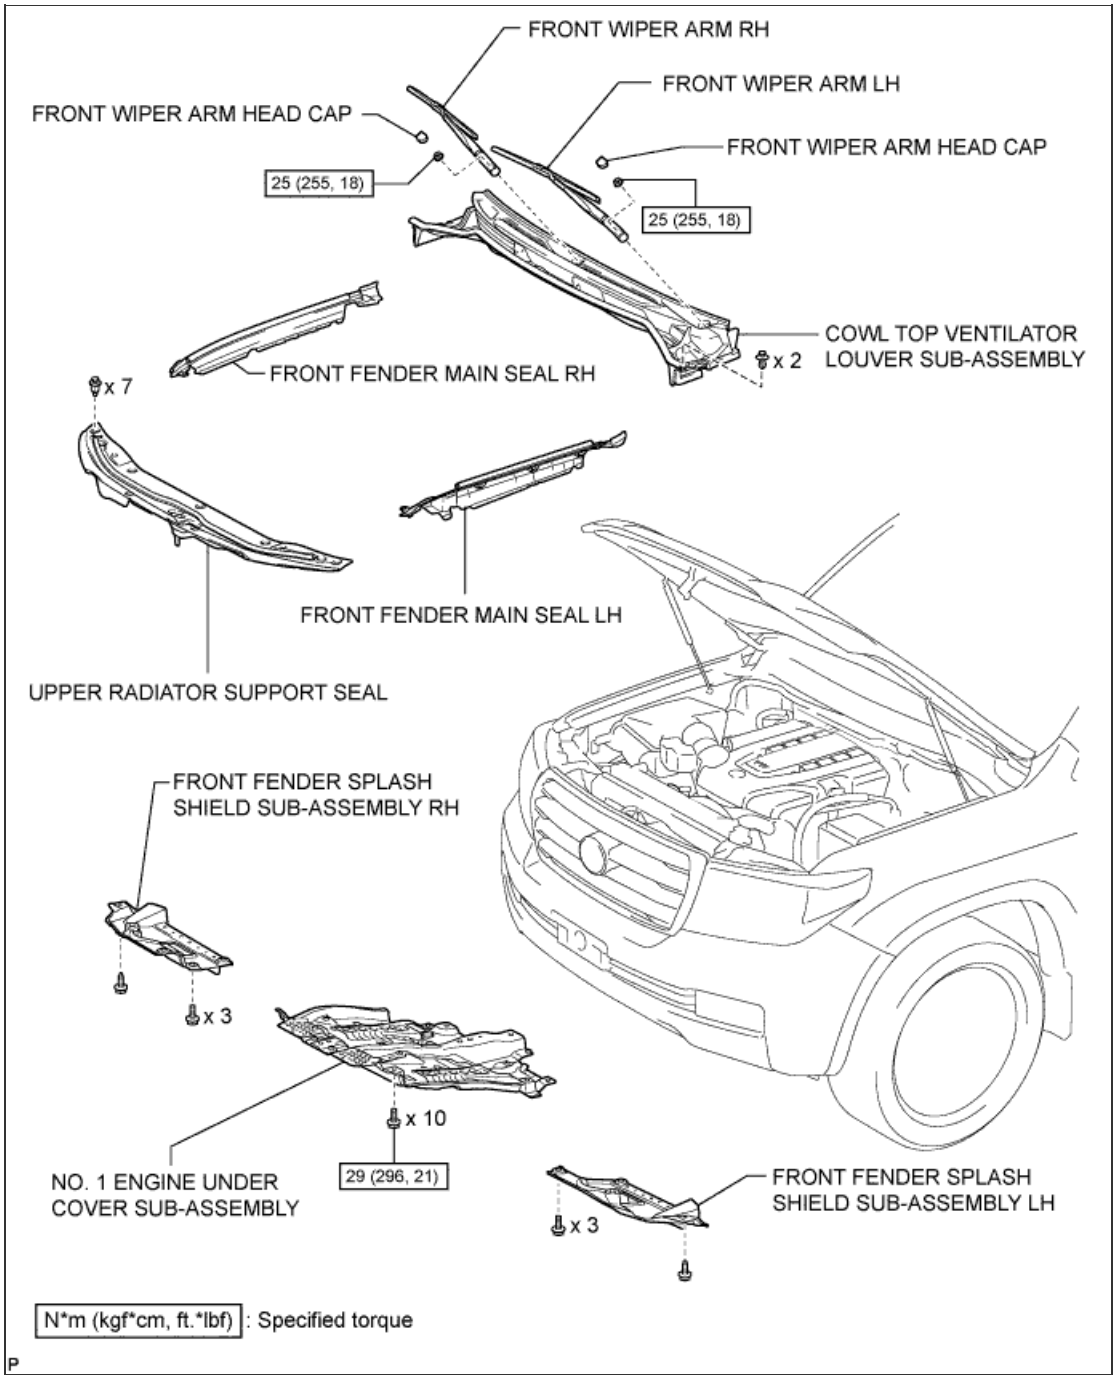
Tester Connection	Condition	Specified Condition
4 (THA) - 5 (E2)	-20°C (-4°F)	12.5 to 16.9 kΩ
	20°C (68°F)	2.19 to 2.67 kΩ
	60°C (140°F)	0.50 to 0.68 kΩ

If the result is not as specified, replace the MAF meter.

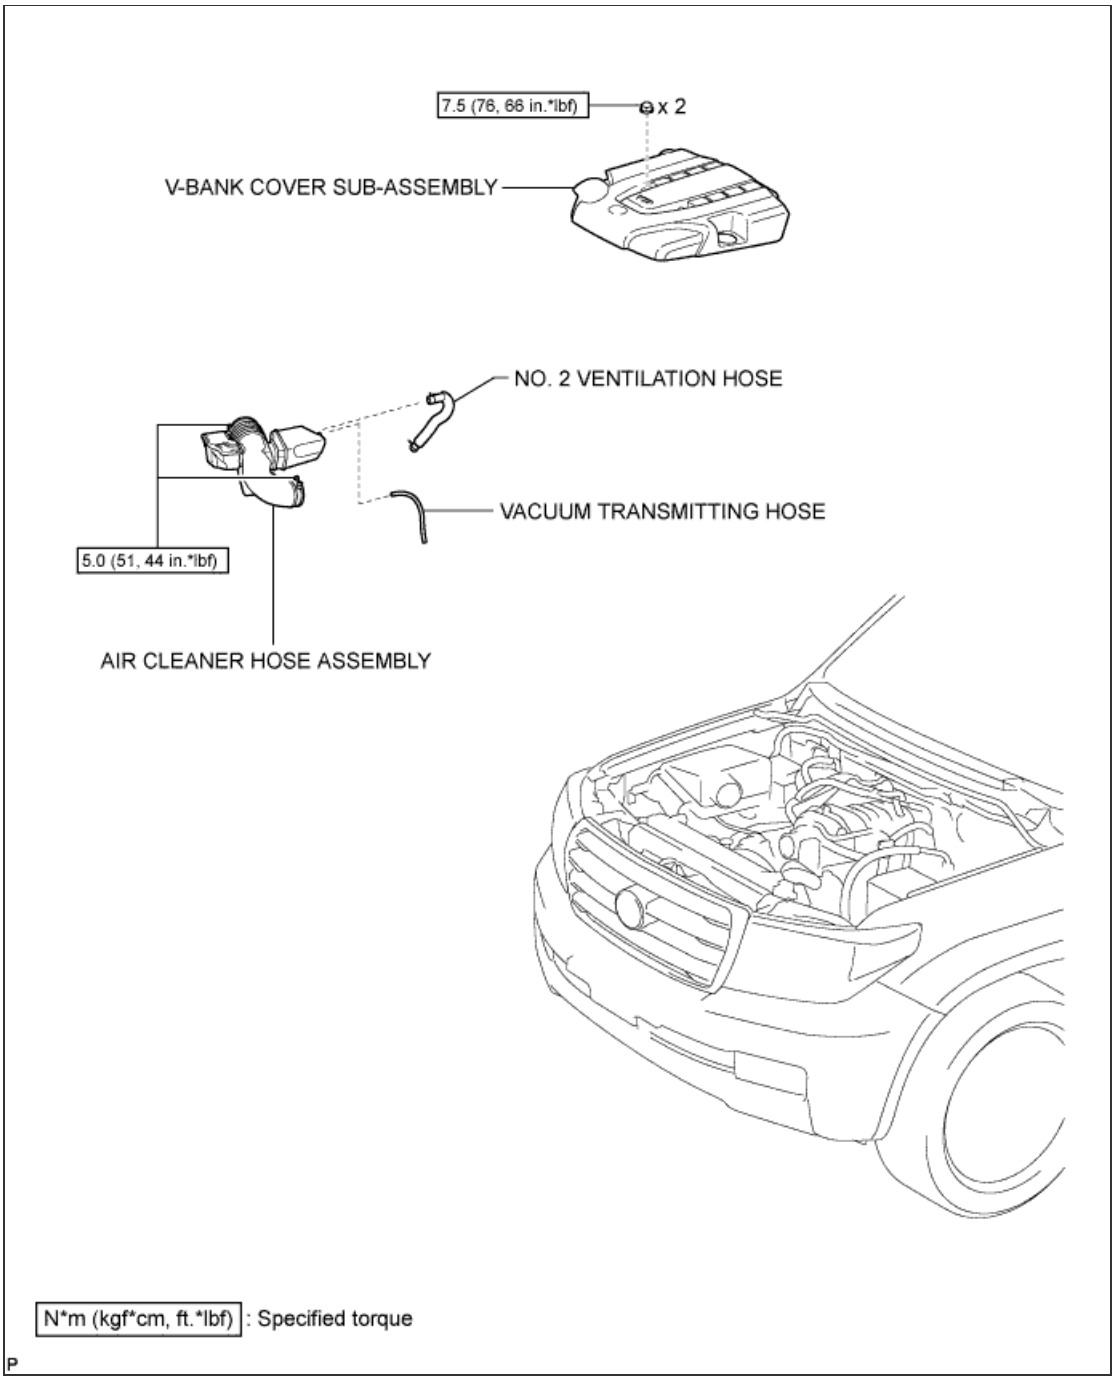


for Preparation Click here

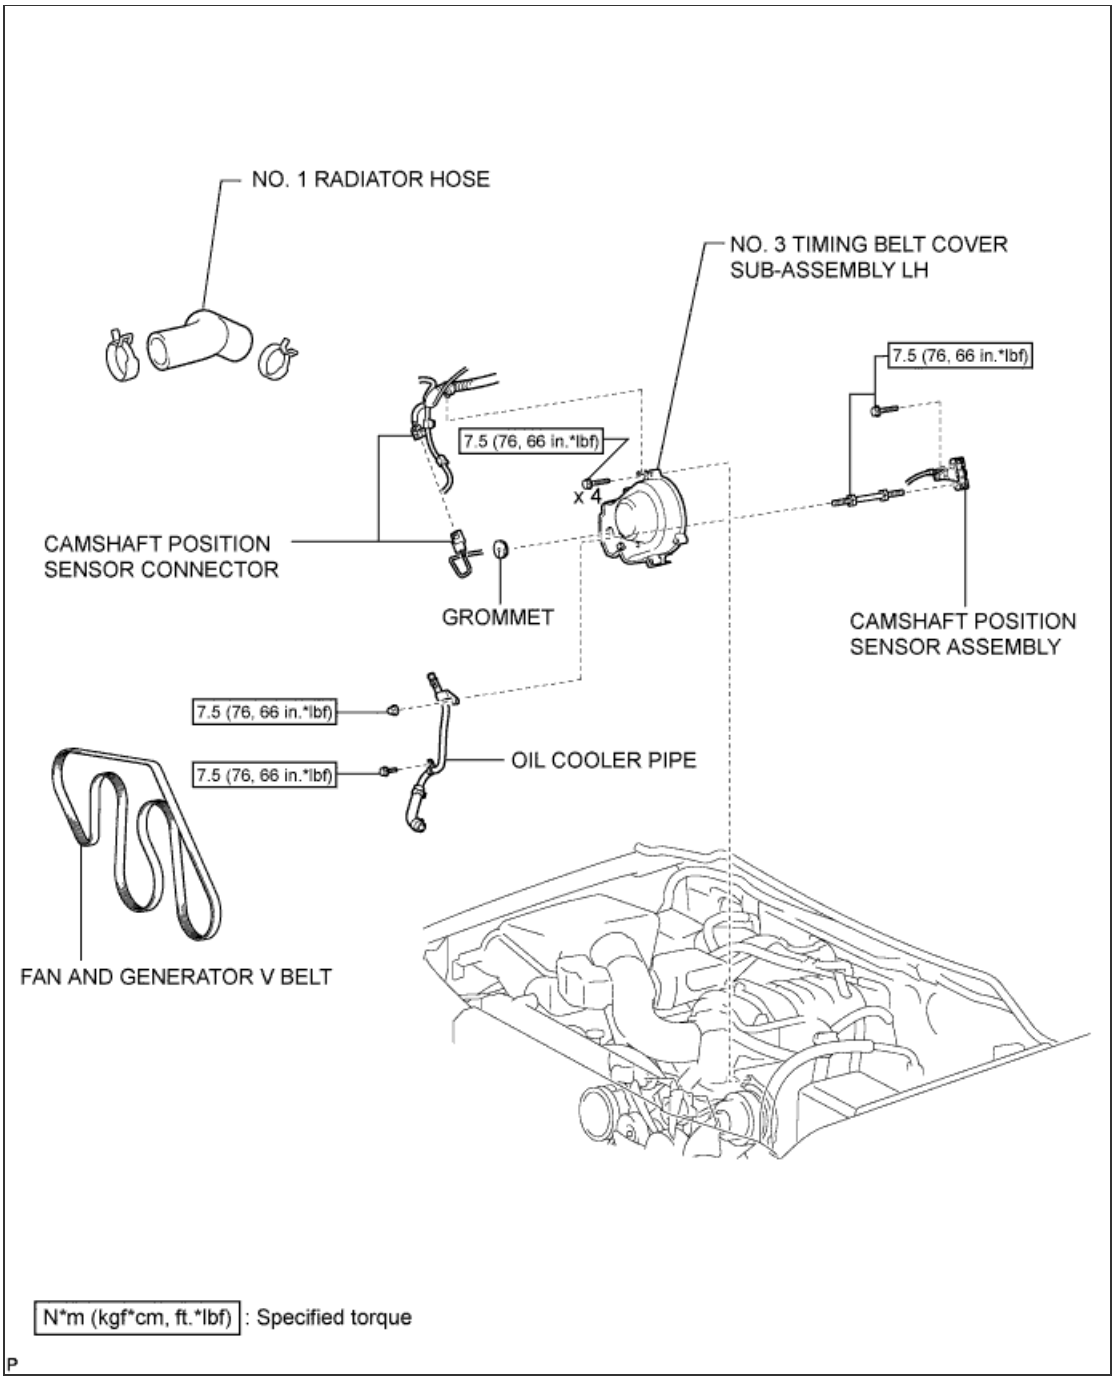
1. INSTALL MASS AIR FLOW METER



a. Install the MAF meter with the 2 screws.



Torque:
1.7 N*m{ 17 kgf*cm , 15 in.*lbf }



b. Connect the MAF meter connector.

HINT:

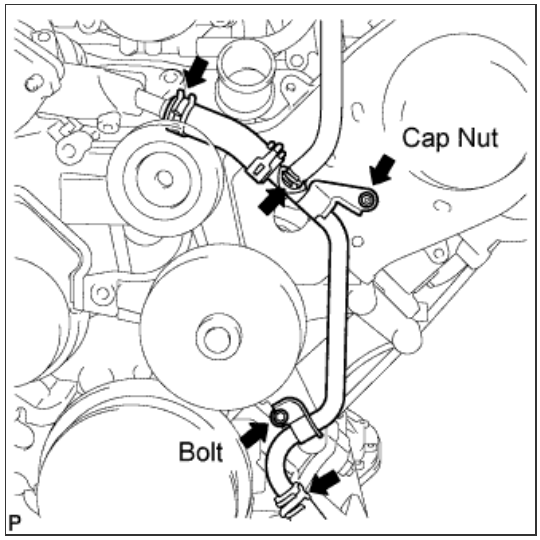
he pulley b lt for the belt te si er has left-ha thread.

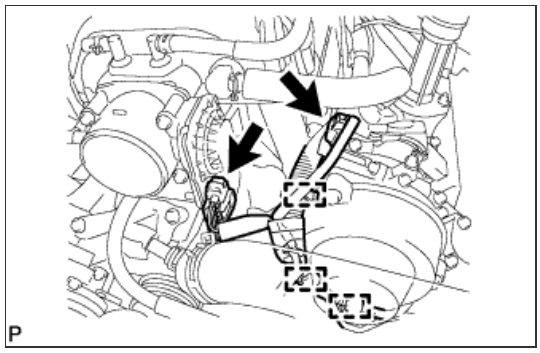
8. REMOVE NO. 1 RADIATOR HOSE

a. Usi g eedle- espliers, grip the claws of the clamps a slide the clamps to



rem e the radiat r hose.

9. REMOVE OIL COOLER PIPE

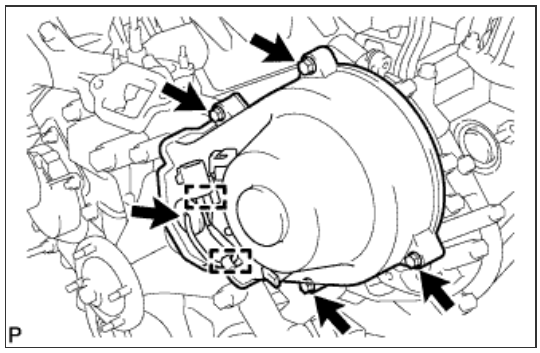


a. Remove the cap ut a b lt.

b. Usi g eedle- espliers, grip the claws of the clamps a slide the clamps to disc ect the 3 water by-pass hoses a remove the oil cooler pipe.

10. REMOVE NO. 3 TIMING BELT COVER SUB-ASSEMBLY LH

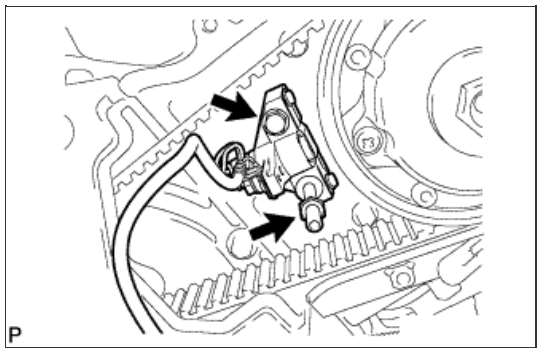
a. Detach the 3 wire clamps a disc ect the camshaft timi g oil co tr l valve c ect r a co tr l motor co ect r.



b. Disc ect the camshaft positio se sr co ect r.

c. Disc ect the camshaft positio se sr wire from the 2 wire clamps o the timi g belt cover.

d. Rem e the wire grommet from the timi g belt cover.

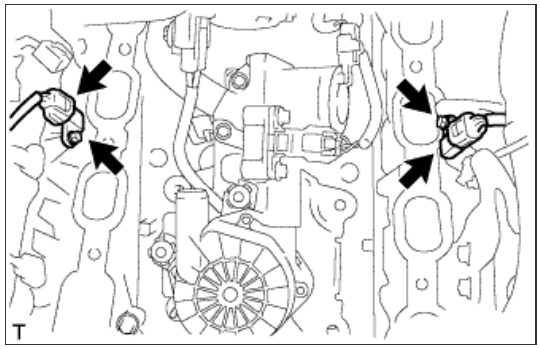


e. Rem e the 4 b lts.

f. Pull the cover outward, pull the camshaft positio se sr wire out of the cover, a remove the cover.

11. REMOVE CAMSHAFT POSITION SENSOR ASSEMBLY

a. Rem e the b lt, stud b lt a camshaft positio se sr.



12. REMOVE INTAKE MANIFOLD

a. Rem e the i take ma fi ld (Click here).

13. REMOVE VVT SENSOR

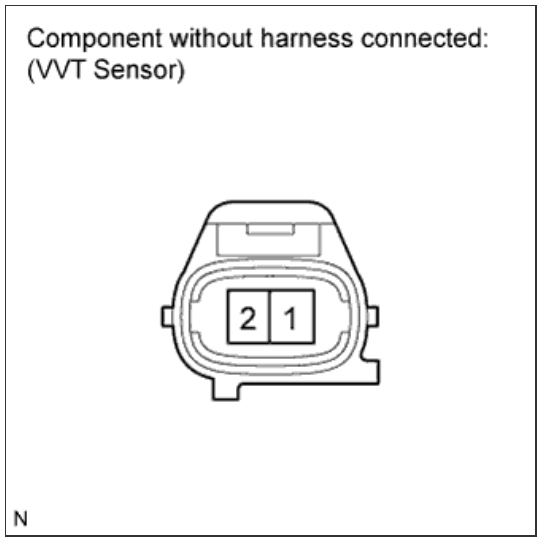
a. Disco ect the 2 se sr co ect rs.

b. Rem e the 2 b lts a 2 se srs.

for Preparation Click here

1. INSPECT VVT SENSOR

a. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

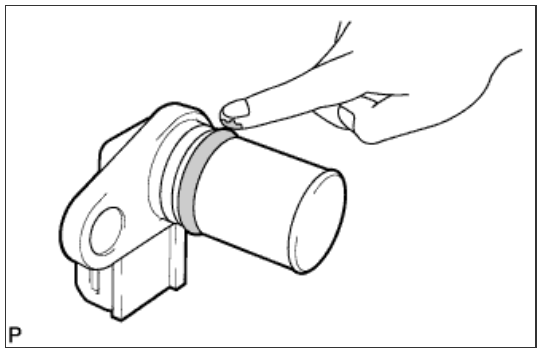
Tester Connection	Condition	Specified Condition
1 - 2	Cold	835 to 1400 Ω
1 - 2	Hot	1060 to 1645 Ω

NOTICE:

In the table above, the terms "cold" and "hot" refer to the temperature of the sensor. "Cold" means approximately -10 to 50°C (14 to 122°F). "Hot" means approximately 50 to 100°C (122 to 212°F).

If the result is not as specified, replace the sensor.

for Preparation Click here

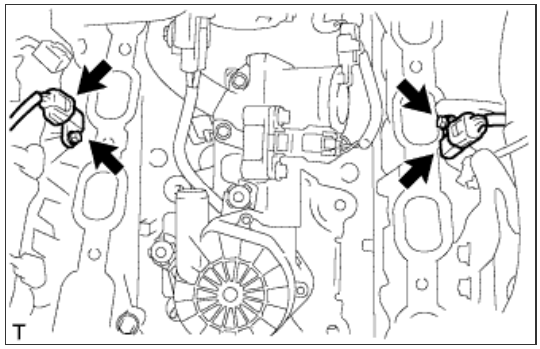


1. INSTALL VVT SENSOR

a. Apply a light coat of engine oil to the O-ring.

NOTICE:

When reusing the sensor, inspect the O-ring.

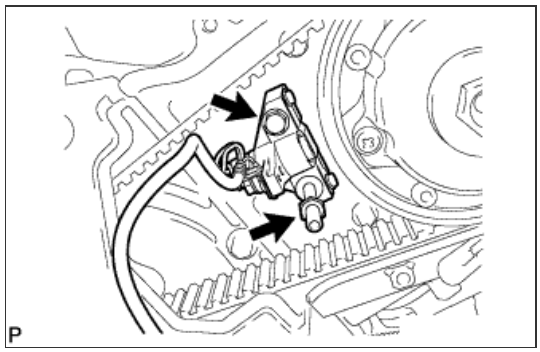


If the O-ring has scratches or cuts, replace the sensor.

b. Install the 2 sensors with the 2 bolts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

c. Connect the 2 sensor connectors.



2. INSTALL INTAKE MANIFOLD

a. Install the intake manifold (Click here).

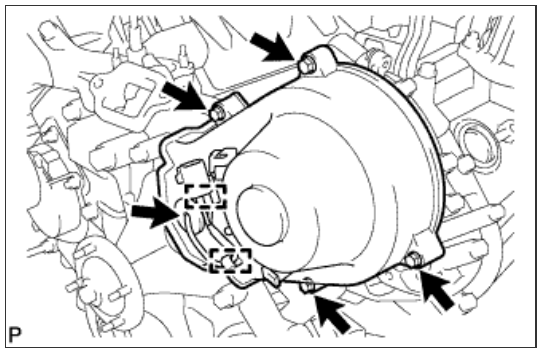
3. INSTALL CAMSHAFT POSITION SENSOR ASSEMBLY

a. Install the camshaft position sensor with the bolt and stud bolt.

Torque:
7.5 N*m{ 80 kgf*cm , 66 in.*lbf }

4. INSTALL NO. 3 TIMING BELT COVER SUB-ASSEMBLY LH

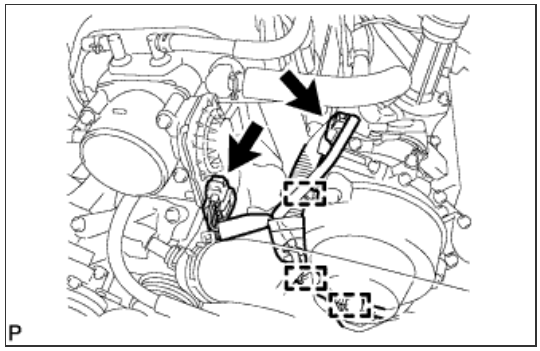
a. Pass the camshaft position sensor wire through the cover hole.



b. Install the timing belt cover with the 4 bolts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

c. Install the wire grommet to the timing belt cover.

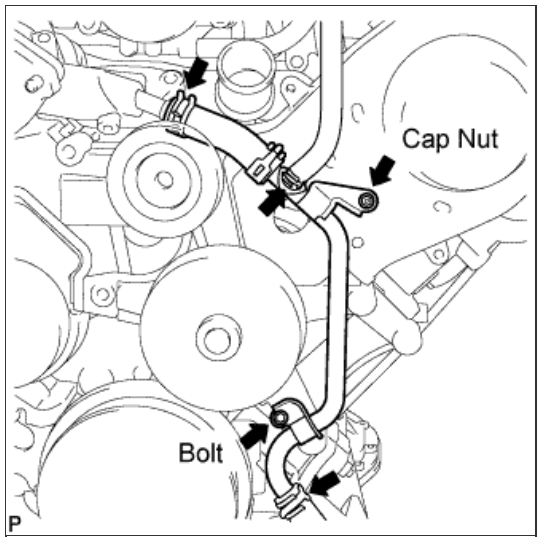


d. Connect the sensor connector.

e. Install the sensor wire to the 2 wire clamps on the cover.

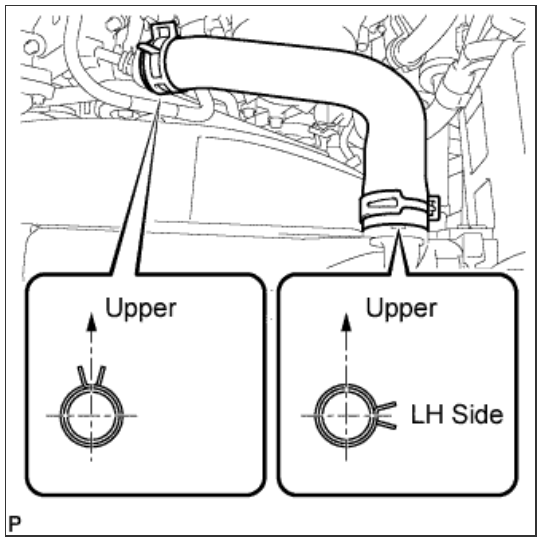
f. Connect the engine wire to the 3 wire clamps.

g. Connect the camshaft timing oil control valve connector and control motor connector.



5. INSTALL OIL COOLER PIPE

a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to connect the 3 water by-pass hoses.

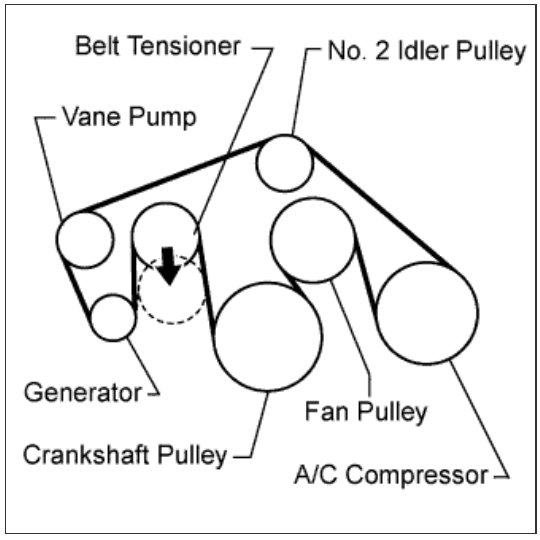


b. Install the oil cooler pipe with the cap nut and bolt.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

6. INSTALL NO. 1 RADIATOR HOSE

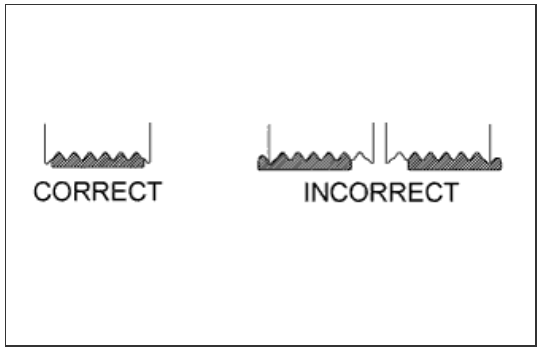
a. Using needle-nose pliers, grip the claws of the clamps and slide the clamps to install the radiator hose.



7. INSTALL FAN & GENERATOR V BELT

a. Set the V belt onto every part except the belt tensioner, as shown in the illustration.

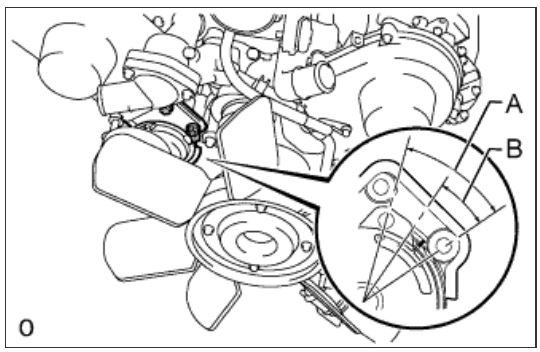
b. Loosen the V belt by turning the belt tensioner counterclockwise.



c. Set the V belt to the belt tensioner.

d. Check that the belt fits properly in the ribbed grooves.

HINT:



Make sure to check by hand that the belt has not slipped out of the grooves on the bottom of the pulley.

e. Check that the arrow on the belt tensioner is within area "A".
If the arrow is outside area "A", replace the fan and generator V belt.

HINT:

When a new belt is installed, the arrow should be within area "B". If not, the fan and generator V belt is not installed correctly.

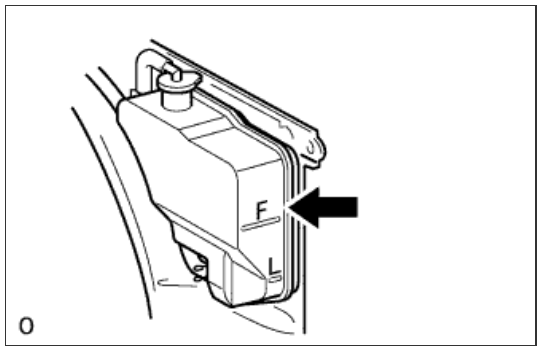
8. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

9. ADD ENGINE COOLANT

a. Add engine coolant.



Standard Capacity:

Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	16.3 liters (17.2 US qts, 14.3 Imp. qts)
w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	16.9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the radiator reservoir cap.

d. Press the inlet and outlet radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

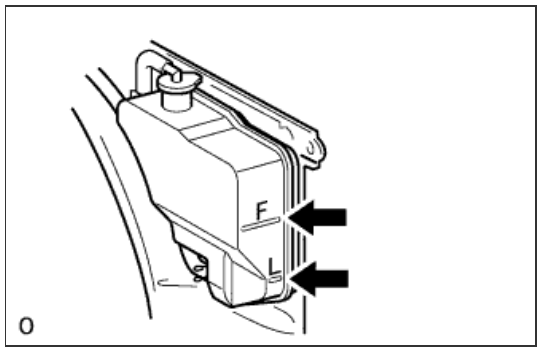
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. Press the inlet and outlet radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

i. Stop the engine, and wait until the engine coolant cools down to the ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

j. Check that the coolant level is between the F and L lines. If the coolant level is below the L line, repeat all of the procedures above. If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

10. INSPECT FOR FUEL LEAK

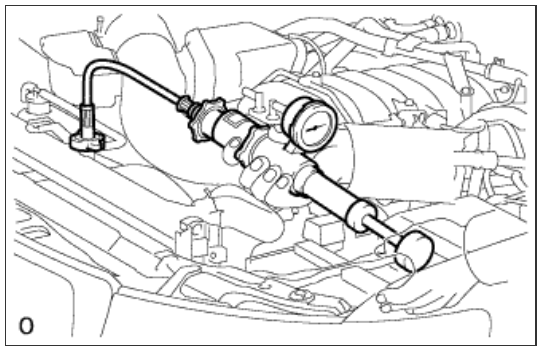
a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and intelligent tester ON.

NOTICE:

Do not start the engine.

c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Activate the Fuel Pump Speed Control.

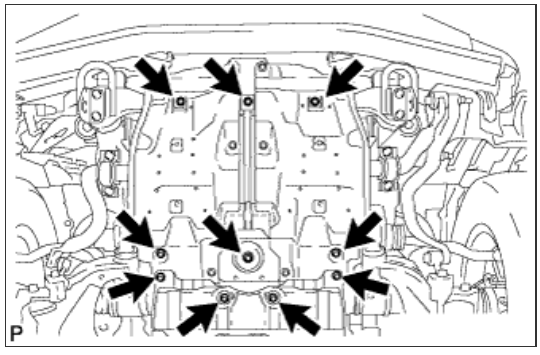


d. Check that there are no fuel leaks after doing maintenance anywhere on the fuel system.

11. INSPECT FOR COOLANT LEAK

a. Fill the radiator with coolant and attach a radiator cap tester.

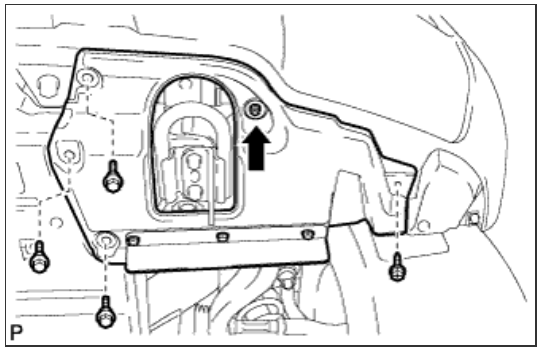
b. Warm up the engine.



c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

12. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.

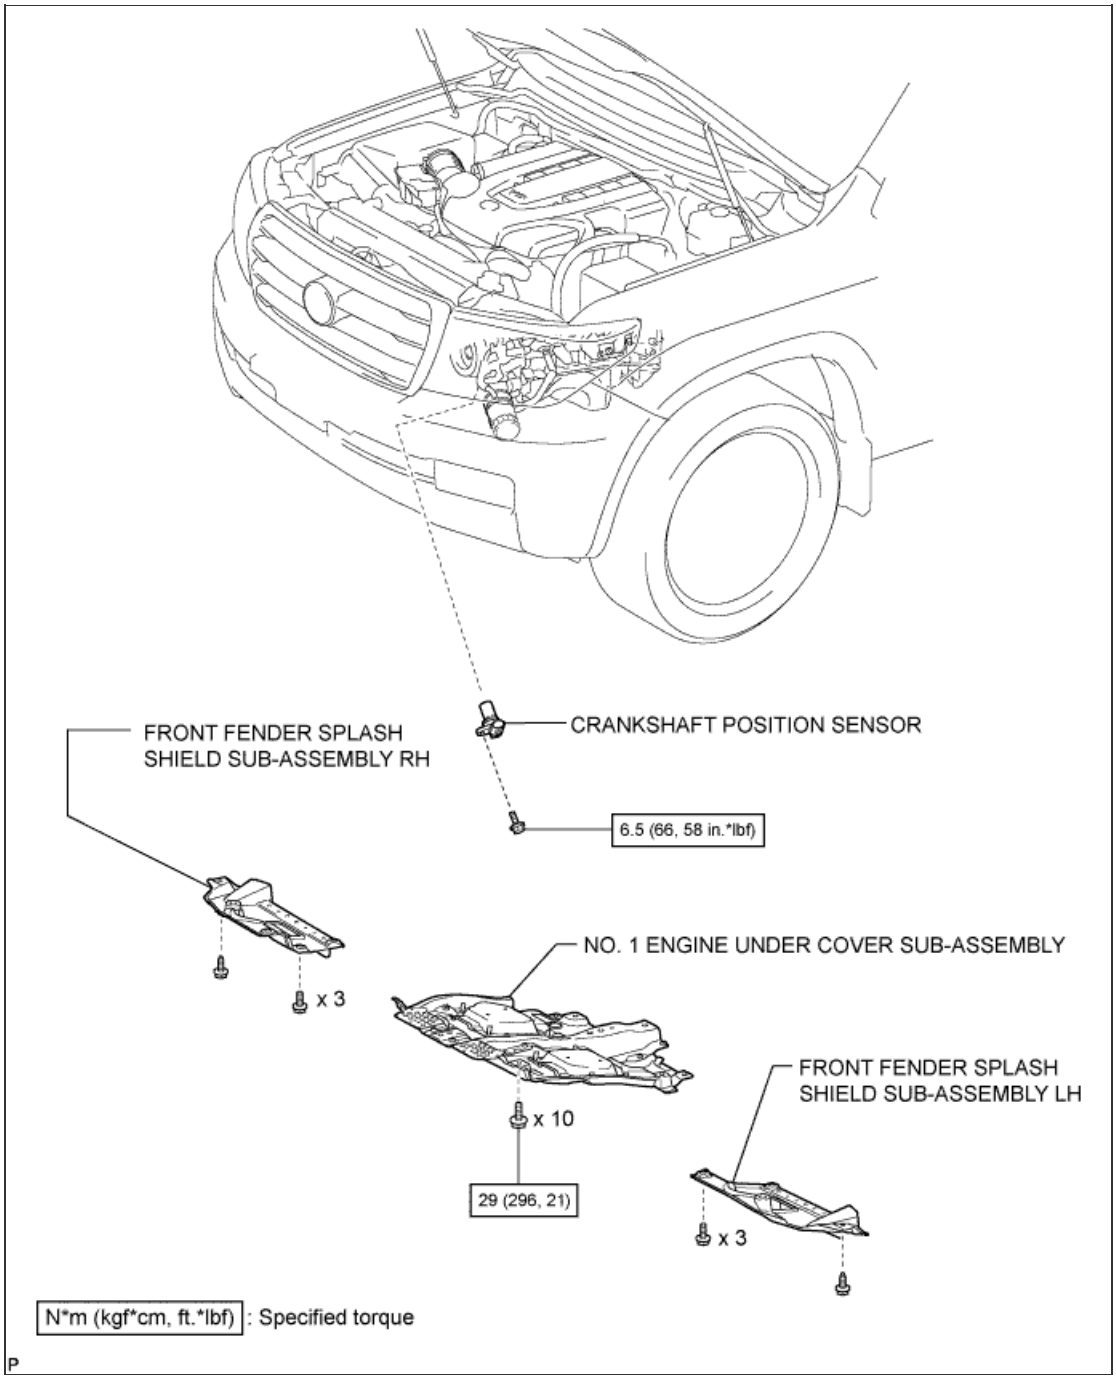


Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

13. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

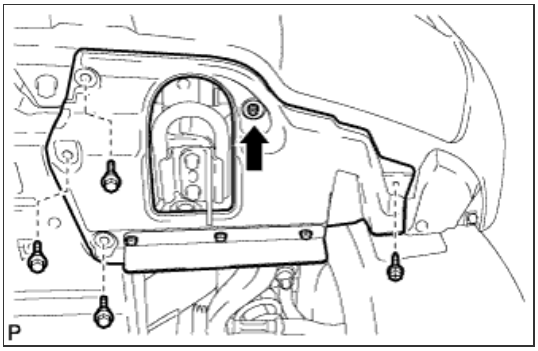


14. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

for Preparation Click here

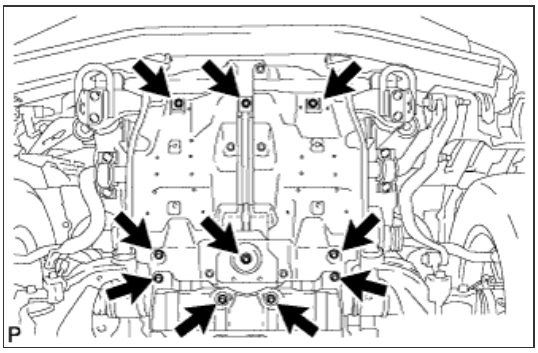


for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

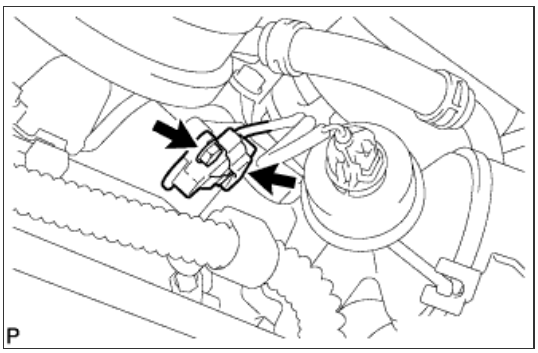


2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

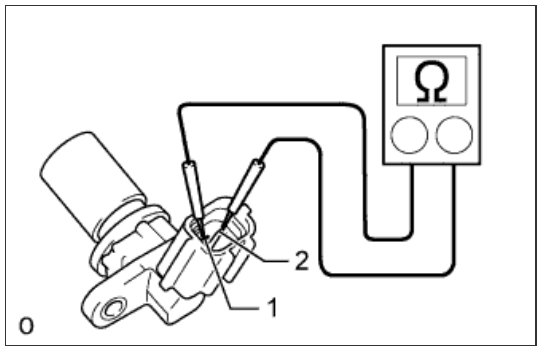
3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Remove the 10 bolts and No. 1 engine under cover.

4. REMOVE CRANKSHAFT POSITION SENSOR

a. Disconnect the sensor connector.



b. Remove the bolt and sensor.

for Preparation Click here

1. INSPECT CRANKSHAFT POSITION SENSOR

a. Measure the resistance according to the value(s) in the table below.

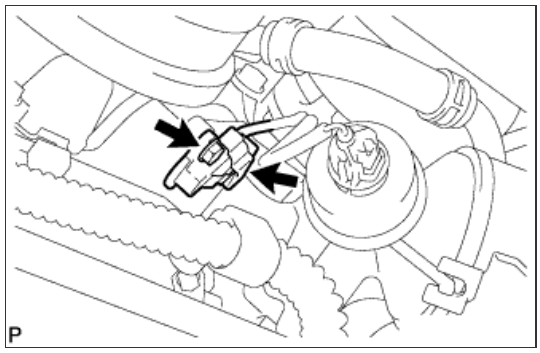
Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Cold	1 to 2 Ω
1 - 2	Hot	20 to 3225 Ω

NOTICE:

In the table above, the terms "cold" and "hot" refer to the temperature of the sensor. "Cold" means approximately -10 to 50°C (1 to 122°F). "Hot" means approximately 50 to 100°C (122 to 212°F).

If the result is not as specified, replace the cran shaft position sensor.

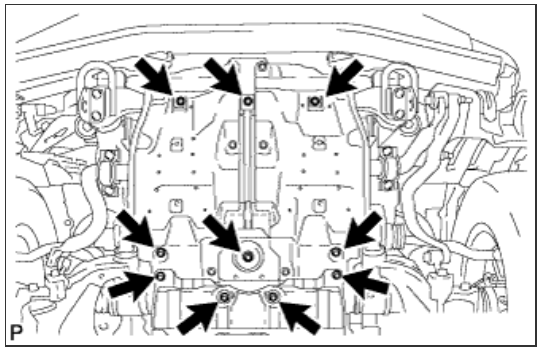


for Preparation Click here

1. INSTALL CRANKSHAFT POSITION SENSOR

a. Install the sensor with the bolt.

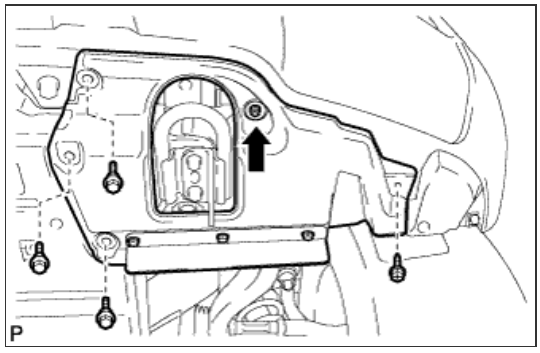
Torque:
6.5 N*m{ 66 kgf*cm , 58 in.*lbf }



b. Connect the sensor connector.

2. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.

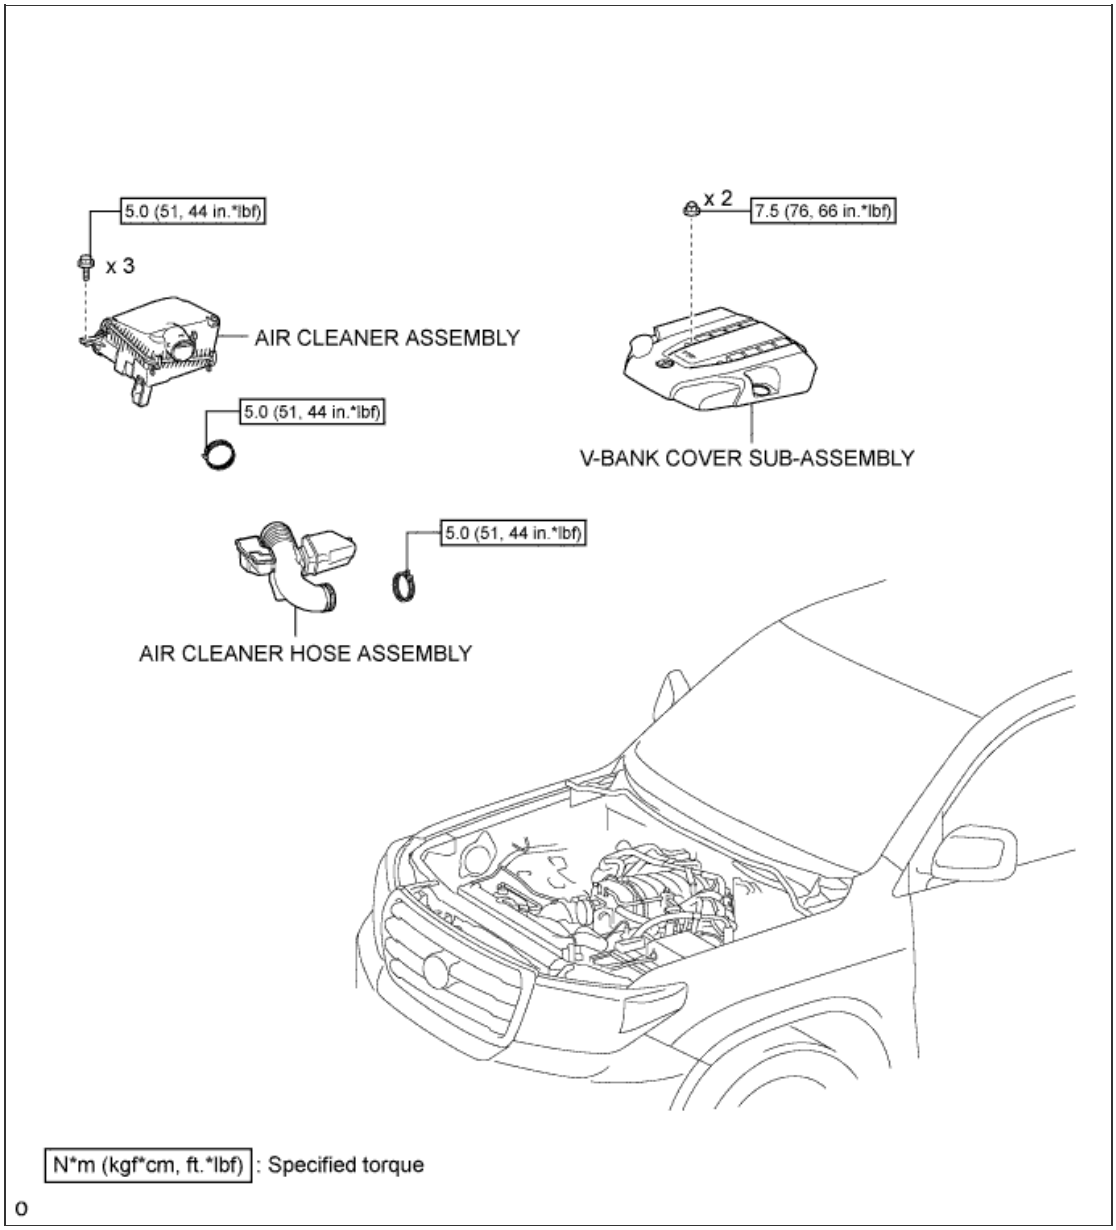


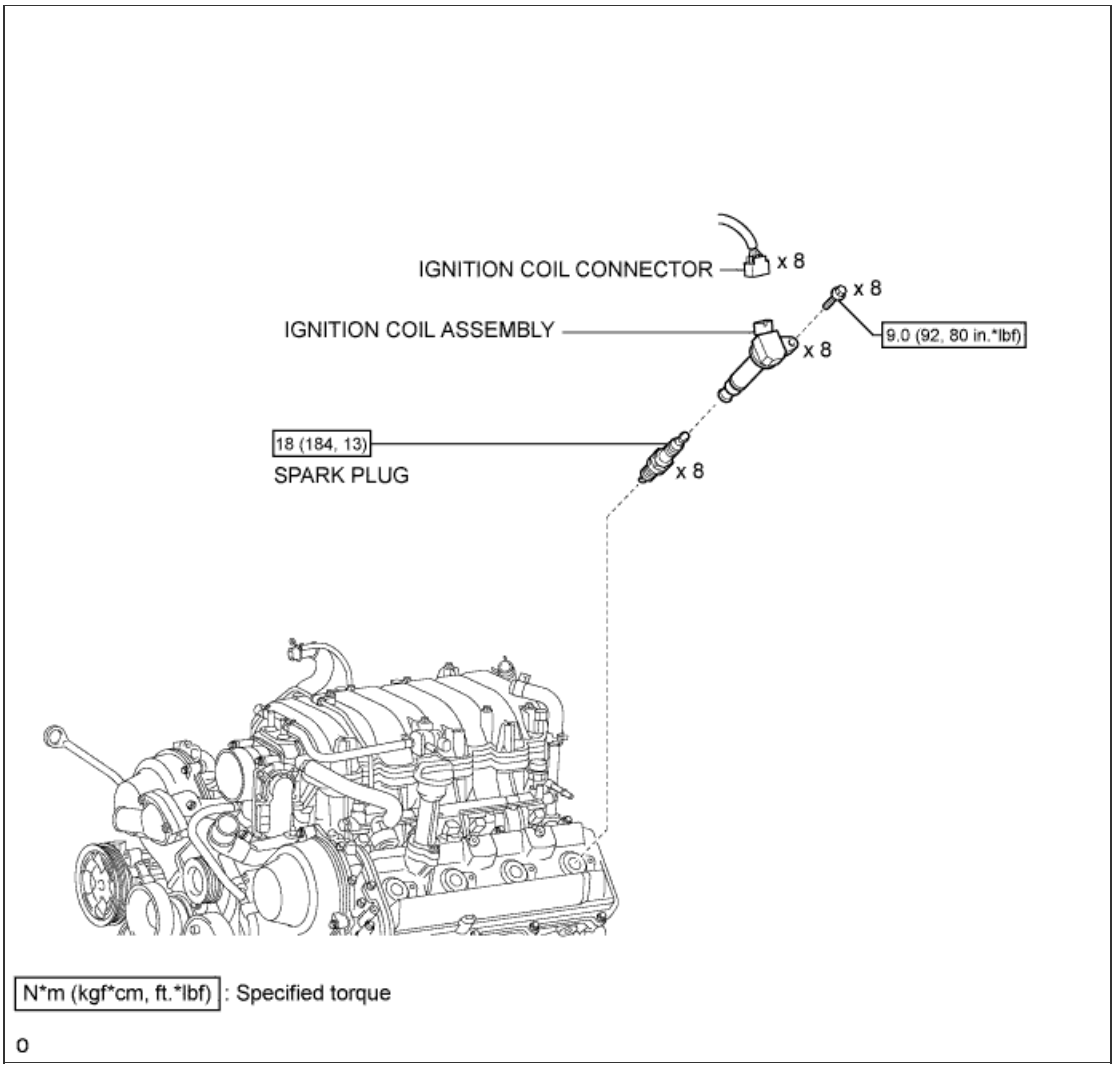
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

3. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.



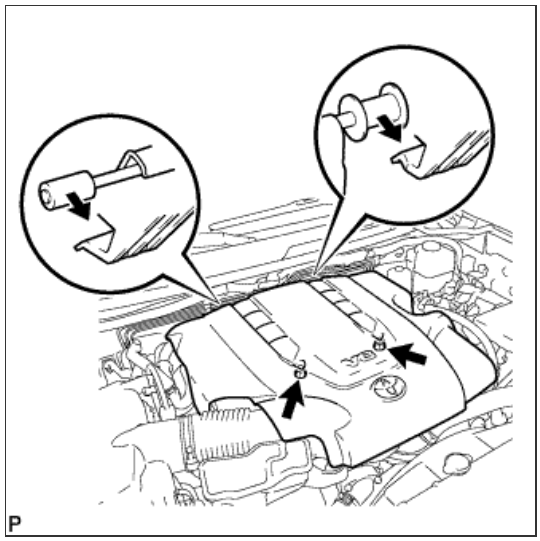


4. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

for Preparation [Click here]



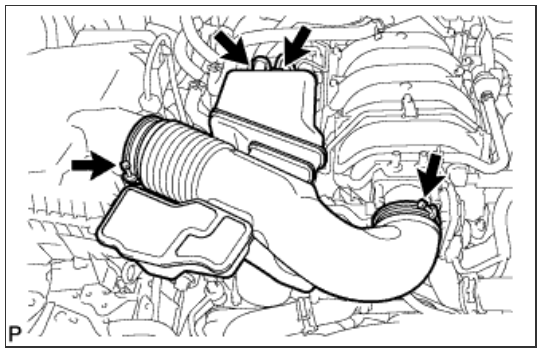
N*m (kgf*cm, ft.*lbf) : Specified torque

o

for Preparation Click here

1. REMOVE V-BANK COVER SUB-ASSEMBLY

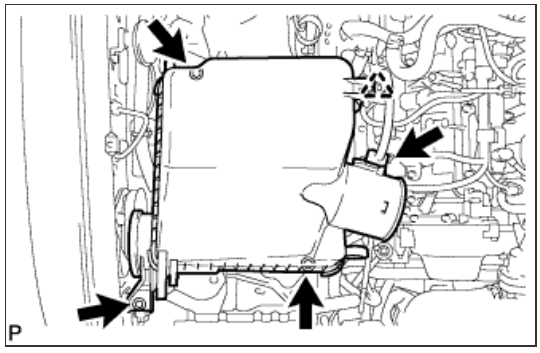
a. Remove the 2 nuts and V-bank cover.



2. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum transmitting hose and No. 2 ventilation hose.

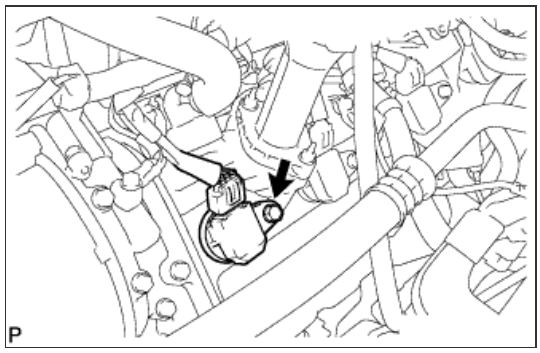
b. Loosen the 2 hose clamps.



c. Remove the air cleaner hose.

3. REMOVE AIR CLEANER ASSEMBLY

a. Disconnect the clamp and MAF connector.



b. Remove the 3 bolts and air cleaner.

4. REMOVE IGNITION COIL ASSEMBLY

a. Disconnect the 8 ignition coil connectors.

b. Remove the 8 bolts and pull out the 8 ignition coils.

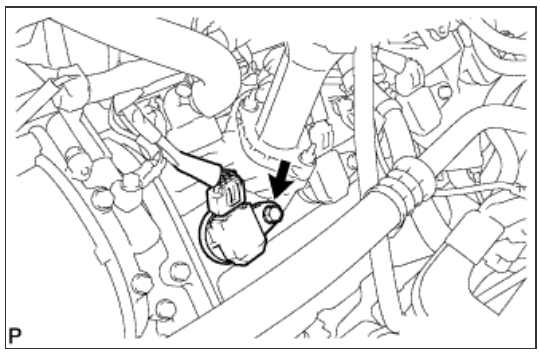
5. REMOVE SPARK PLUG

a. Remove the 8 spark plugs.

for Preparation Click here

1. INSTALL SPARK PLUG

a. Install the 8 spark plugs.



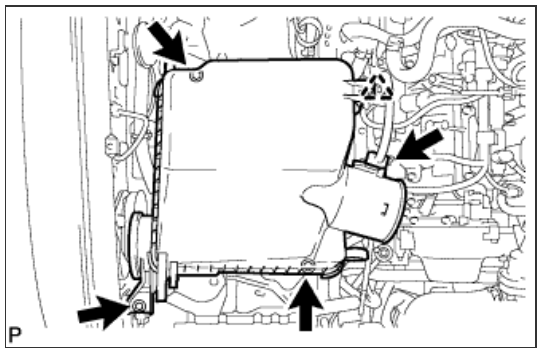
Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

2. INSTALL IGNITION COIL ASSEMBLY

a. Install the 8 ignition coils with the 8 bolts.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

b. Connect the 8 ignition coil connectors.



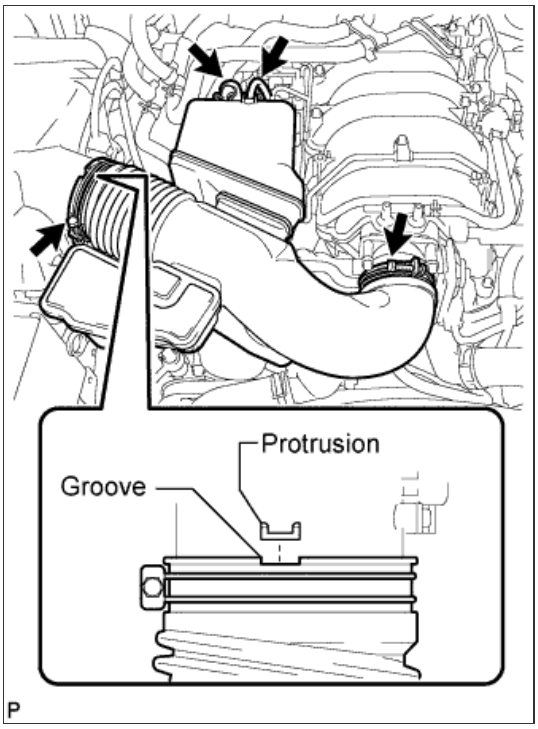
3. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner with the 3 bolts.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

b. Connect the clamp and MAF connector.

4. INSTALL AIR CLEANER HOSE ASSEMBLY



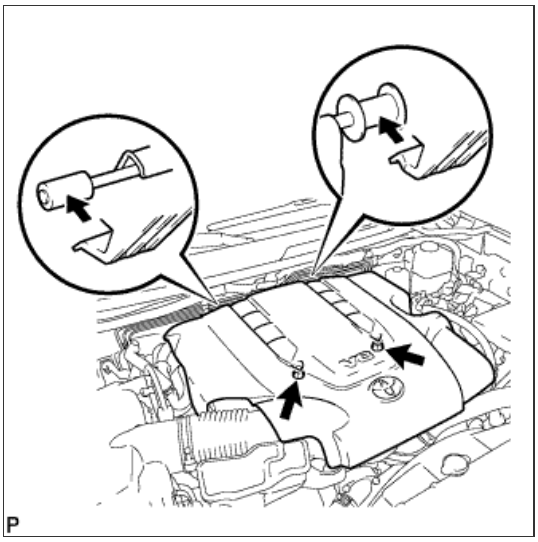
a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

b. Tighten the 2 clamps.

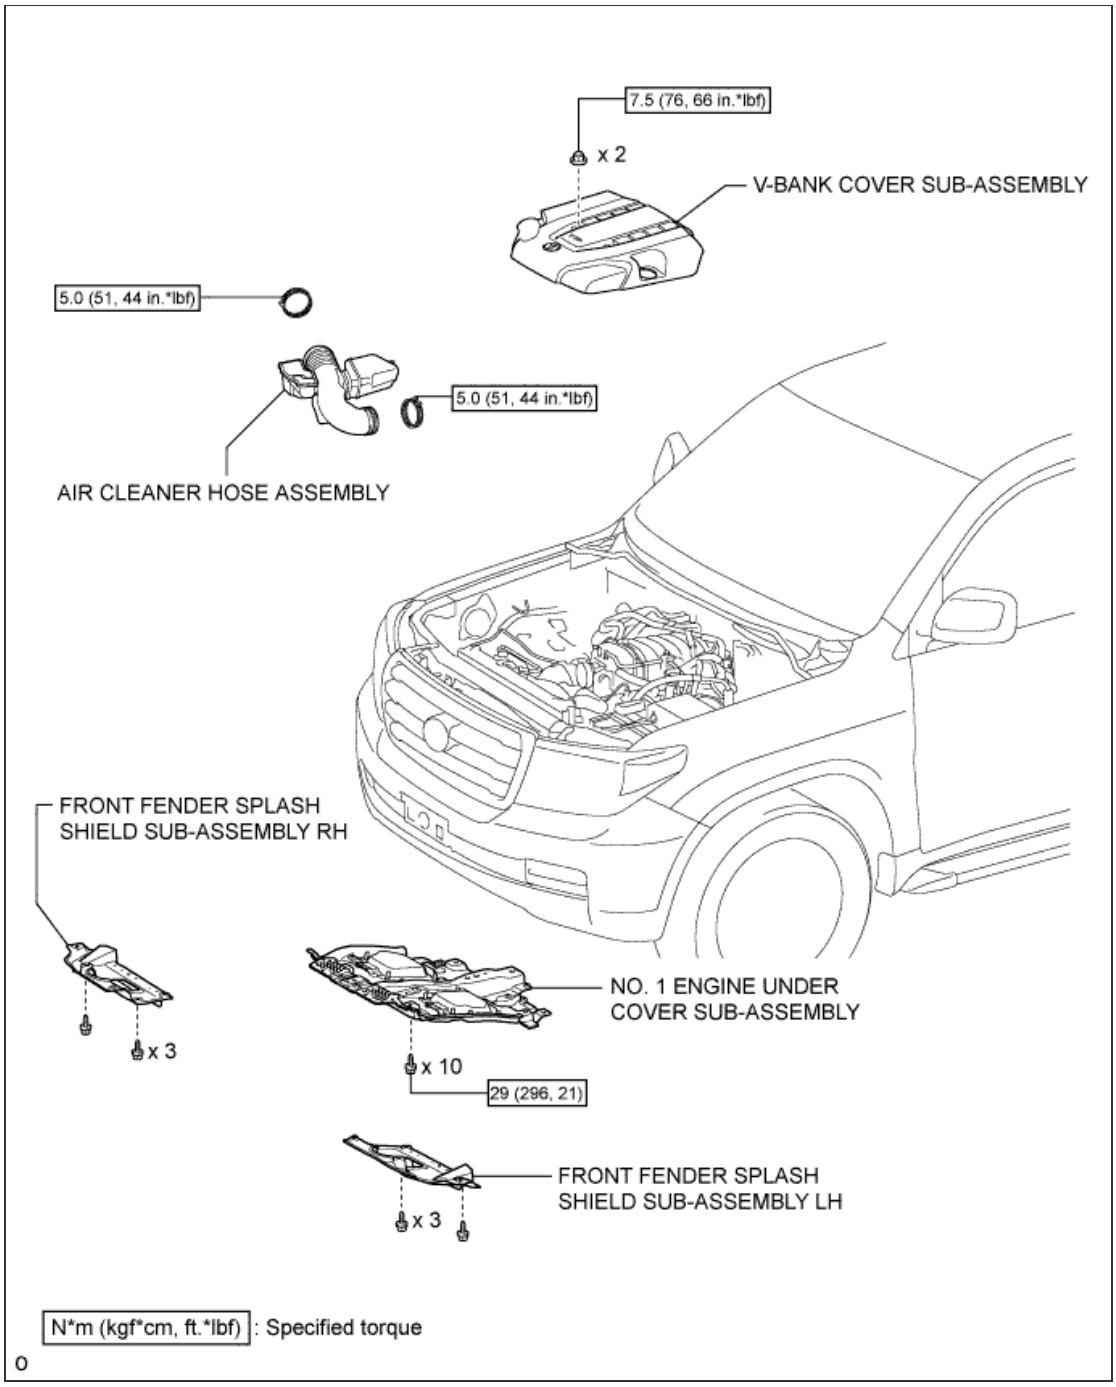
Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum transmitting hose.

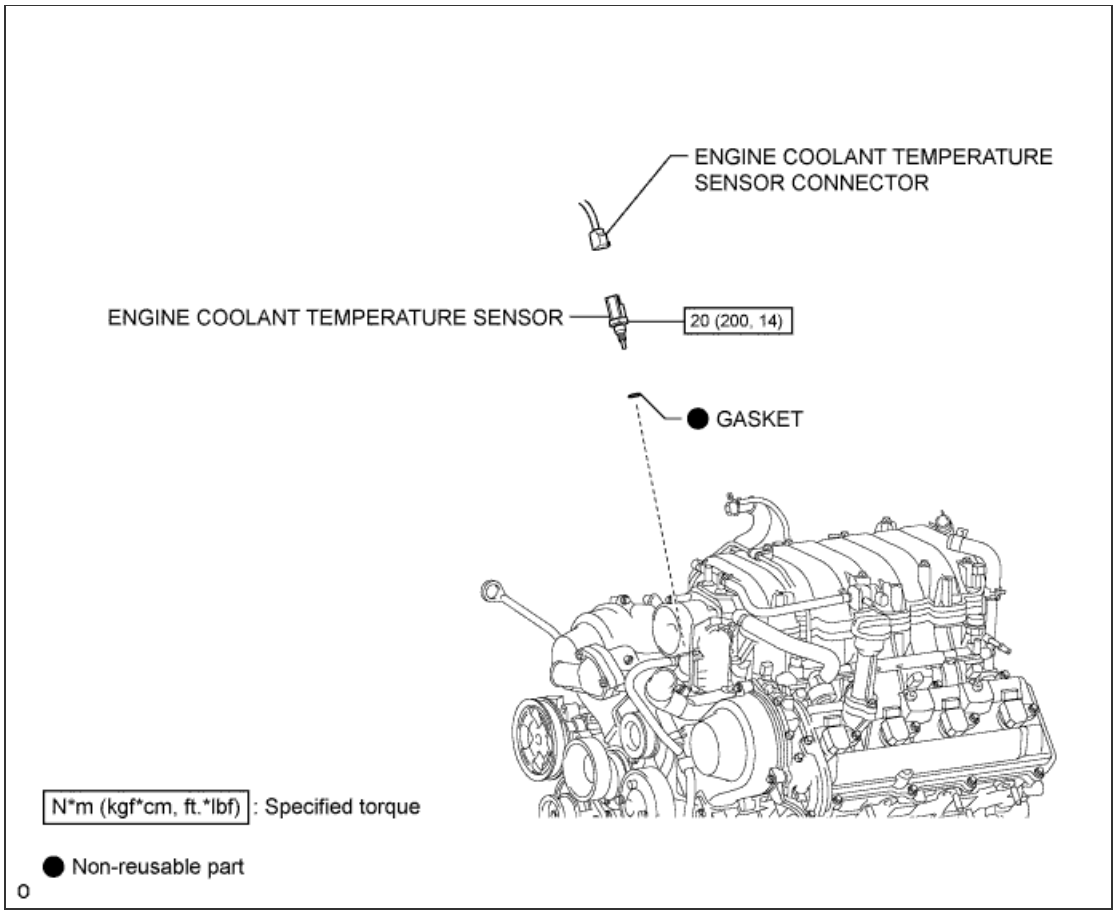
d. Connect the No. 2 ventilation hose.



5. INSTALL V-BANK COVER SUB-ASSEMBLY



a. Attach the 2 V-bank cover hooks to the bracket.



b. Install the V-bank cover with the 2 nuts.

Torque:
7.5 N*m{ kgf*cm , in.*lbf }

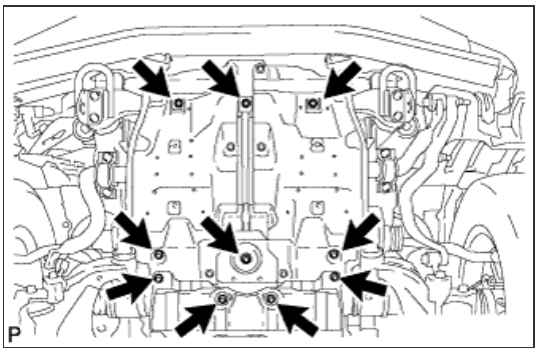
1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

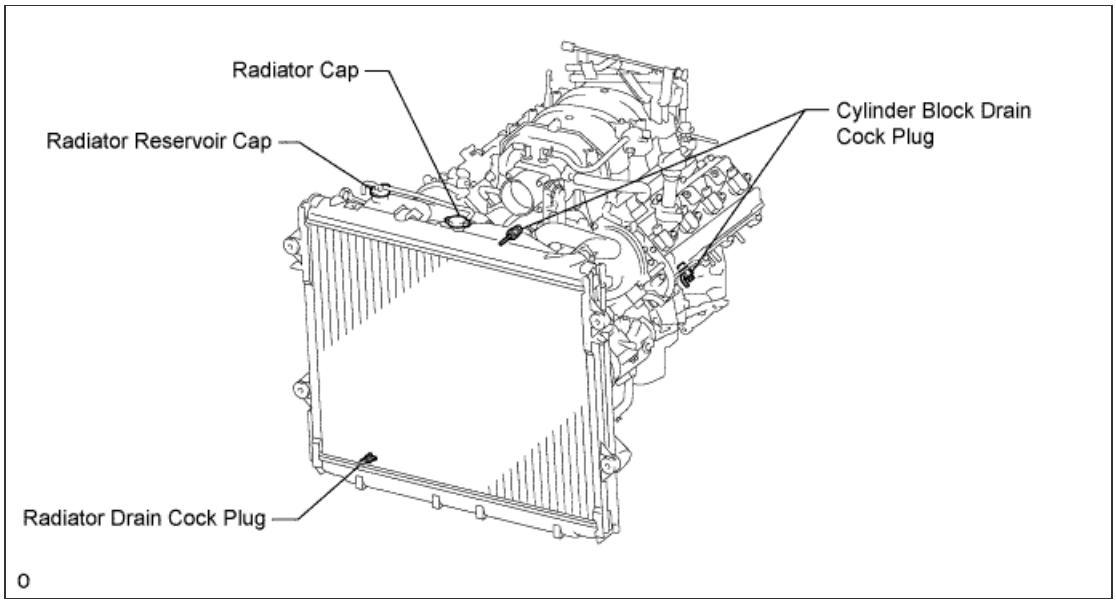


2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Remove the 10 bolts and No. 1 engine under cover.

4. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

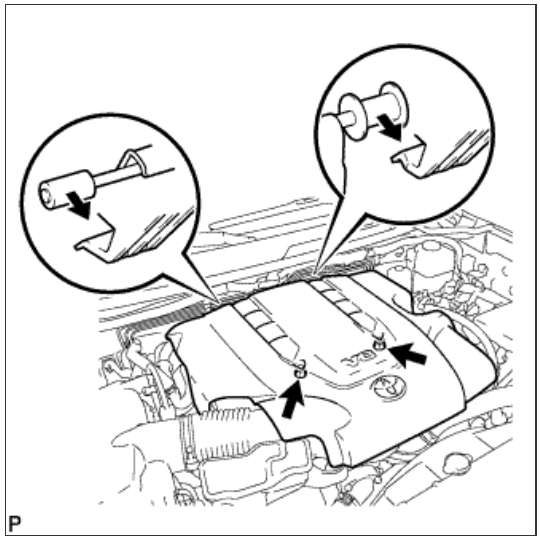
a. Loosen the radiator drain cock plug.

b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Loosen the 2 cylinder block drain cock plugs. Then drain the coolant from the engine.



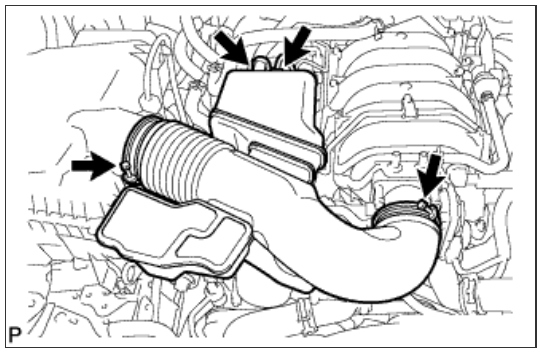
d. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 130 kgf*cm , 9 ft.*lbf }

e. Tighten the radiator drain cock plug by hand.

5. REMOVE V-BANK COVER SUB-ASSEMBLY

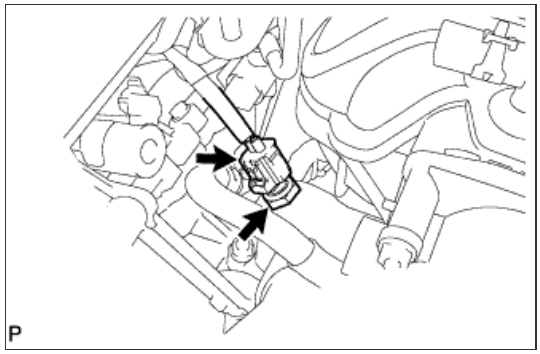
a. Remove the 2 nuts and V-bank cover.



. REMOVE AIR CLEANER HOSE ASSEMBLY

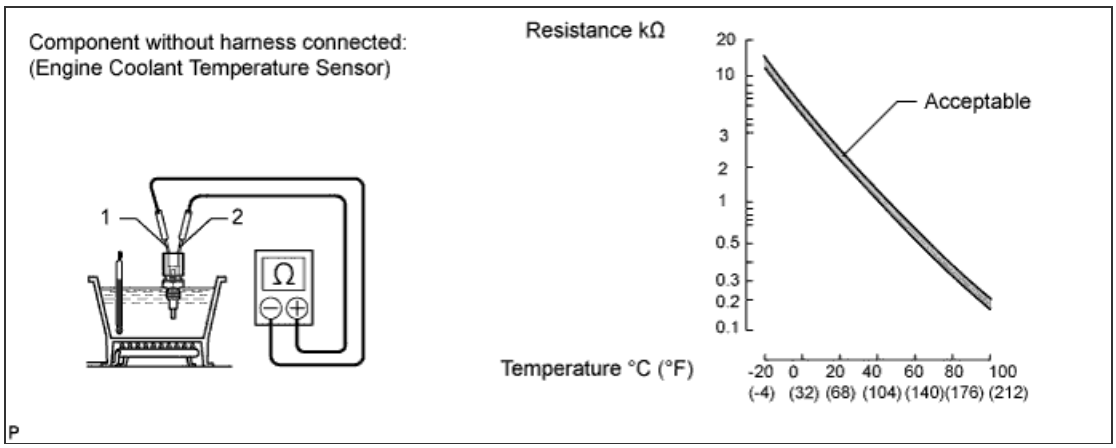
a. Disconnect the vacuum transmitting hose and No. 2 ventilation hose.

b. Loosen the 2 hose clamps.



c. Remove the air cleaner hose.

7. REMOVE ENGINE COOLANT TEMPERATURE SENSOR



a. Disconnect the sensor connector.

b. Using a 1 mm deep socket wrench, remove the sensor and gasket.

for Preparation Click here

1. INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Partially immerse the sensor in water and warm up the water.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

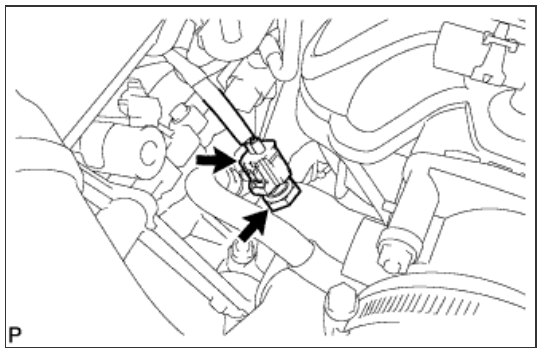
Tester Connection	Condition	Specified Condition
1 - 2	Approximately. 20°C (68°F)	2.32 to 2.59 kΩ
1 - 2	Approximately. 80°C (176°F)	0.310 to 0.326 kΩ

If the result is not as specified, replace the sensor.

NOTICE:

When checking the sensor in water, keep the terminals dry. After the check, wipe the sensor dry.

for Preparation Click here



1. INSTALL ENGINE COOLANT TEMPERATURE SENSOR

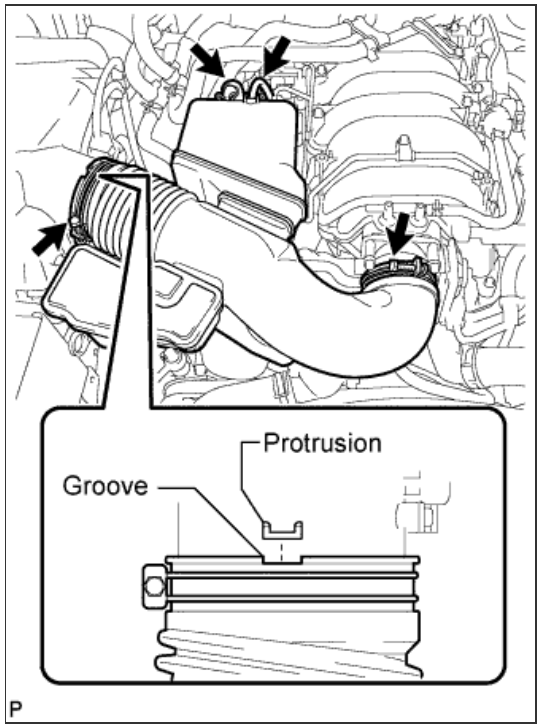
a. Install a new gasket to the sensor.

b. Using a 19 mm deep socket wrench, install the sensor.

Torque:
20 N*m{ 200 kgf*cm , 14 ft.*lbf }

c. Connect the sensor connector.

2. INSTALL AIR CLEANER HOSE ASSEMBLY



a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

b. Tighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

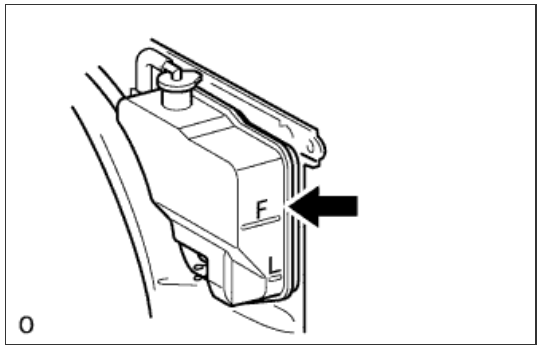
c. Connect the vacuum transmitting hose.

d. Connect the No. 2 ventilation hose.

3. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:



Item		Specified Condition
w/o Transmission oil cooler	w/o Rear Heater	13.4 liters (14.2 US qts, 11.8 Imp. qts)
	w/ Rear Heater	1 .3 liters (17.2 US qts, 14.3 Imp. qts)

w/ Transmission oil cooler	w/o Rear Heater	14.1 liters (14.9 US qts, 12.4 Imp. qts)
	w/ Rear Heater	1 .9 liters (17.9 US qts, 14.9 Imp. qts)

HINT:

TO OTA vehicles are filled with TO OTA SLLC at the factor . In order to avoid damage to the engine cooling s stem and other technical pro lems, onl use TO OTA SLLC or similar high qualit eth lene gl col ased non-silicate, non-amine, non-nitrite, non- orate coolant with long-life h rid organic acid technolog (coolant with long-life h rid organic acid technolog consists of a com ination of low phosphates and organic acids).

b. Slowl pour coolant into the radiator reservoir until it reaches the F line.

c. Install the radiator reservoir cap.

d. ress the inlet and outlet radiator hoses several times hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Start the engine and warm it up until the thermostat opens.

NOTICE:

Switch off the A/C.

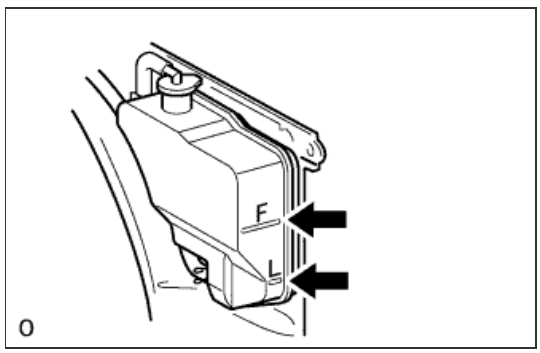
g. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

h. ress the inlet and outlet radiator hoses several times hand to leed air.

CAUTION:



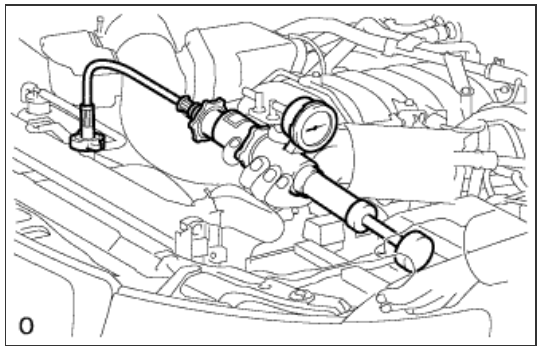
- **Wear protective gloves.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the cooling fan.**

i. Stop the engine, and wait until the engine coolant cools down to the am ient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. ressurized, hot engine coolant and steam ma e released and cause serious urns.

j. Check that the coolant level is etween the F and L lines. If the coolant level is elow the L line, repeat all of the procedures a ove. If the coolant level is a ove the F line, drain coolant so that the coolant level is etween the F and L lines.

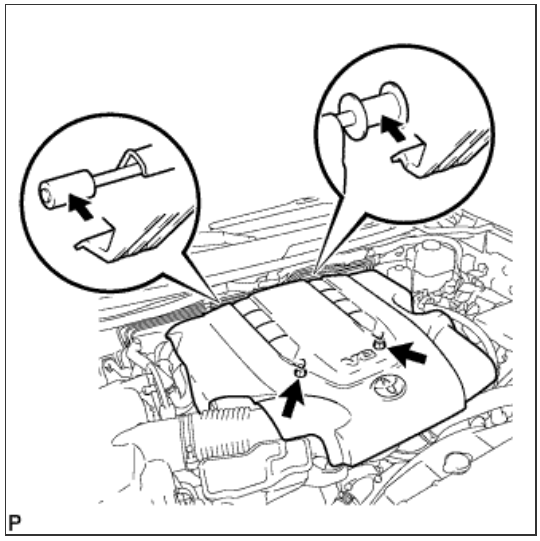


4. INSPECT FOR ENGINE COOLANT LEAK

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

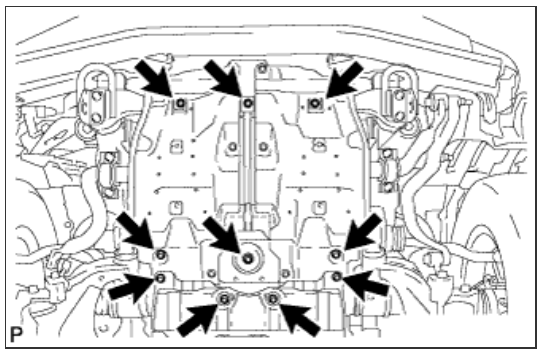
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 k a (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, c linder lock and head.



5. INSTALL BAN CO ER SUB ASSEMBLY

a. Attach the 2 V- ank cover hooks to the racket.

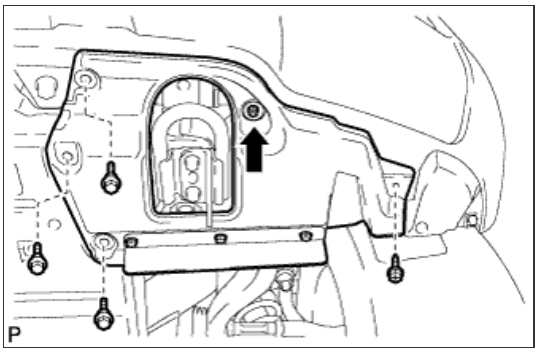
b. Install the V- ank cover with the 2 nuts.



Torque:
5 N*m{ kgf*cm , in.*lbf }

INSTALL NO. 1 ENGINE UNDER CO ER SUB ASSEMBLY

a. Install the No. 1 engine under cover with the 10 olts.

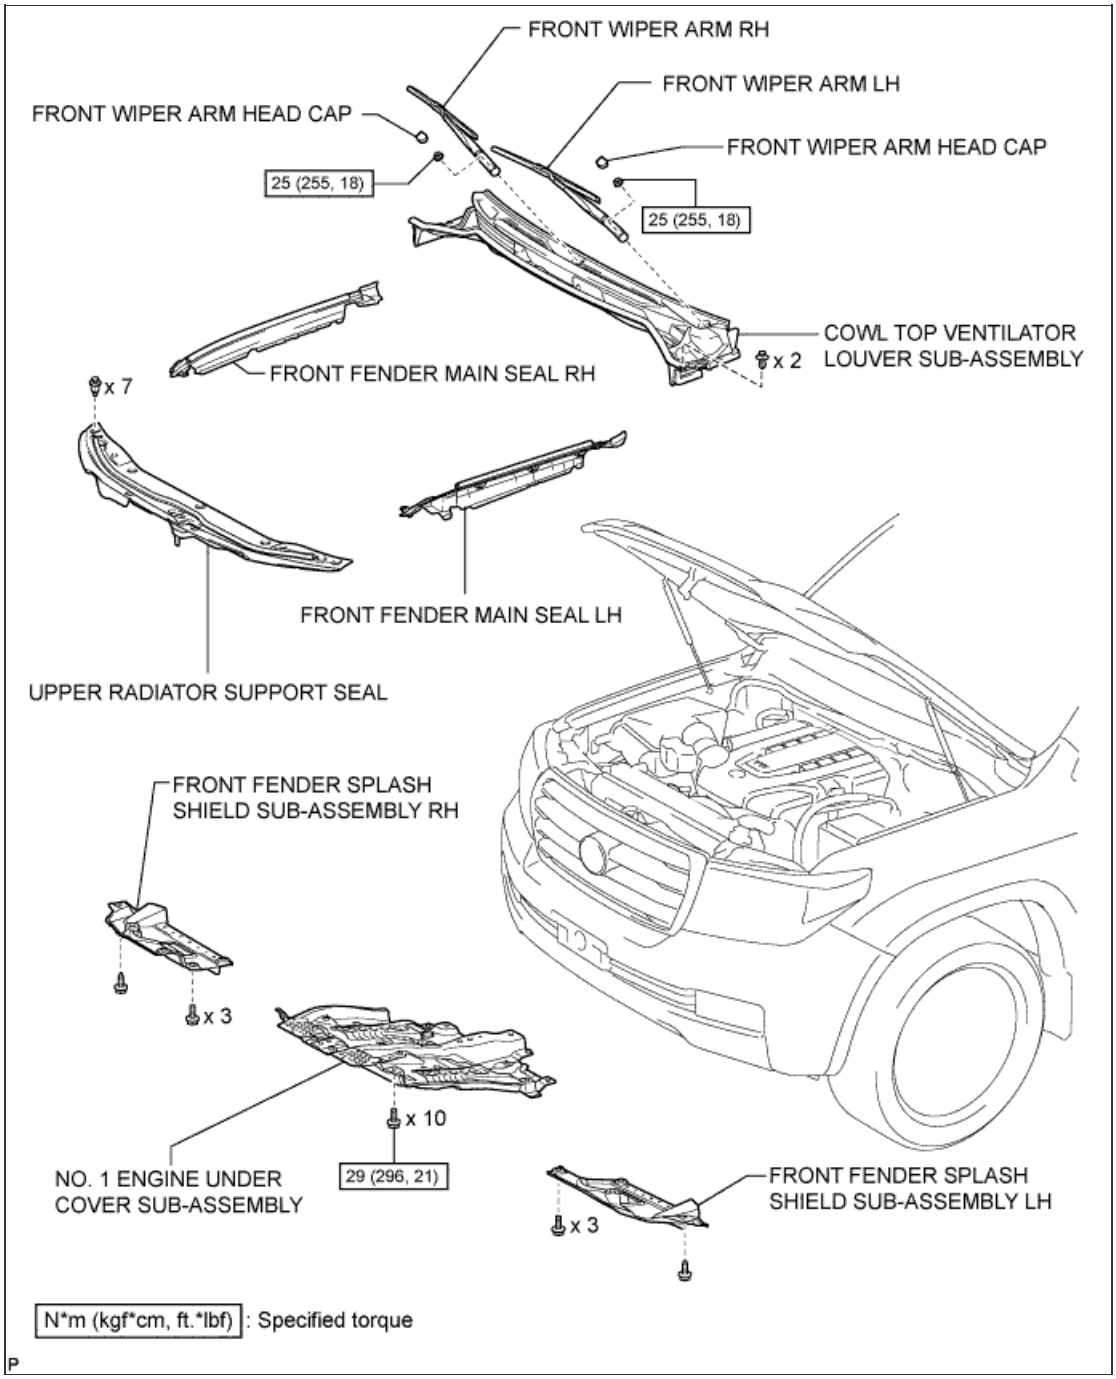


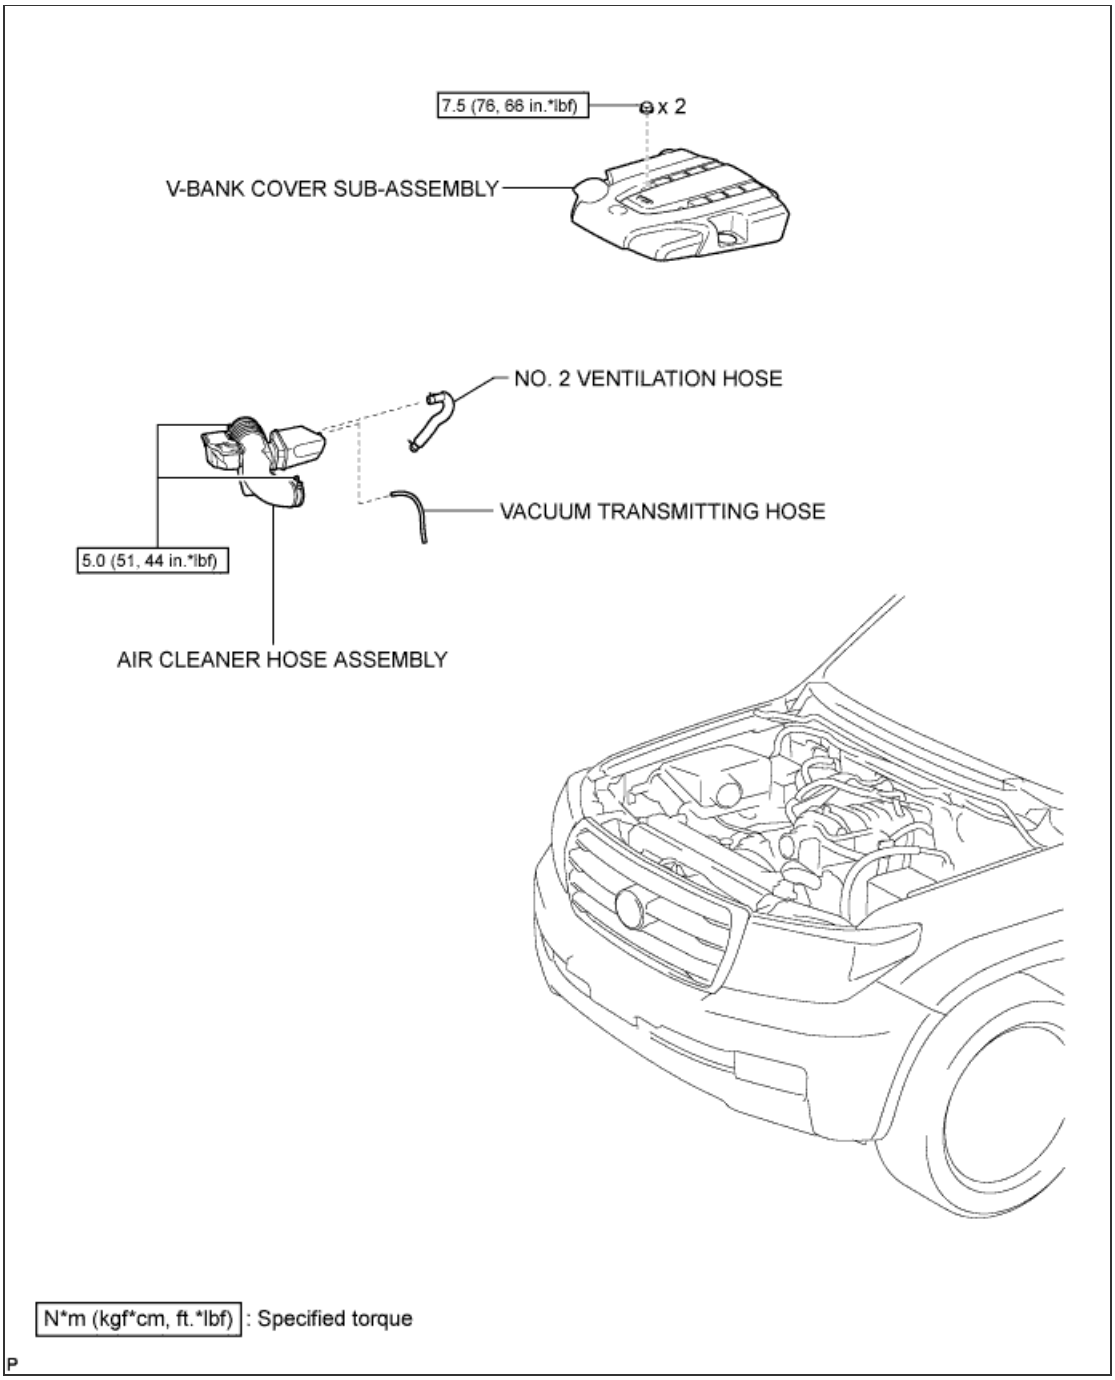
Torque:
2 N*m{ 2 kgf*cm , 21 ft.*lbf }

INSTALL RONT ENDER SPLASH SHIELD SUB ASSEMBLY LH

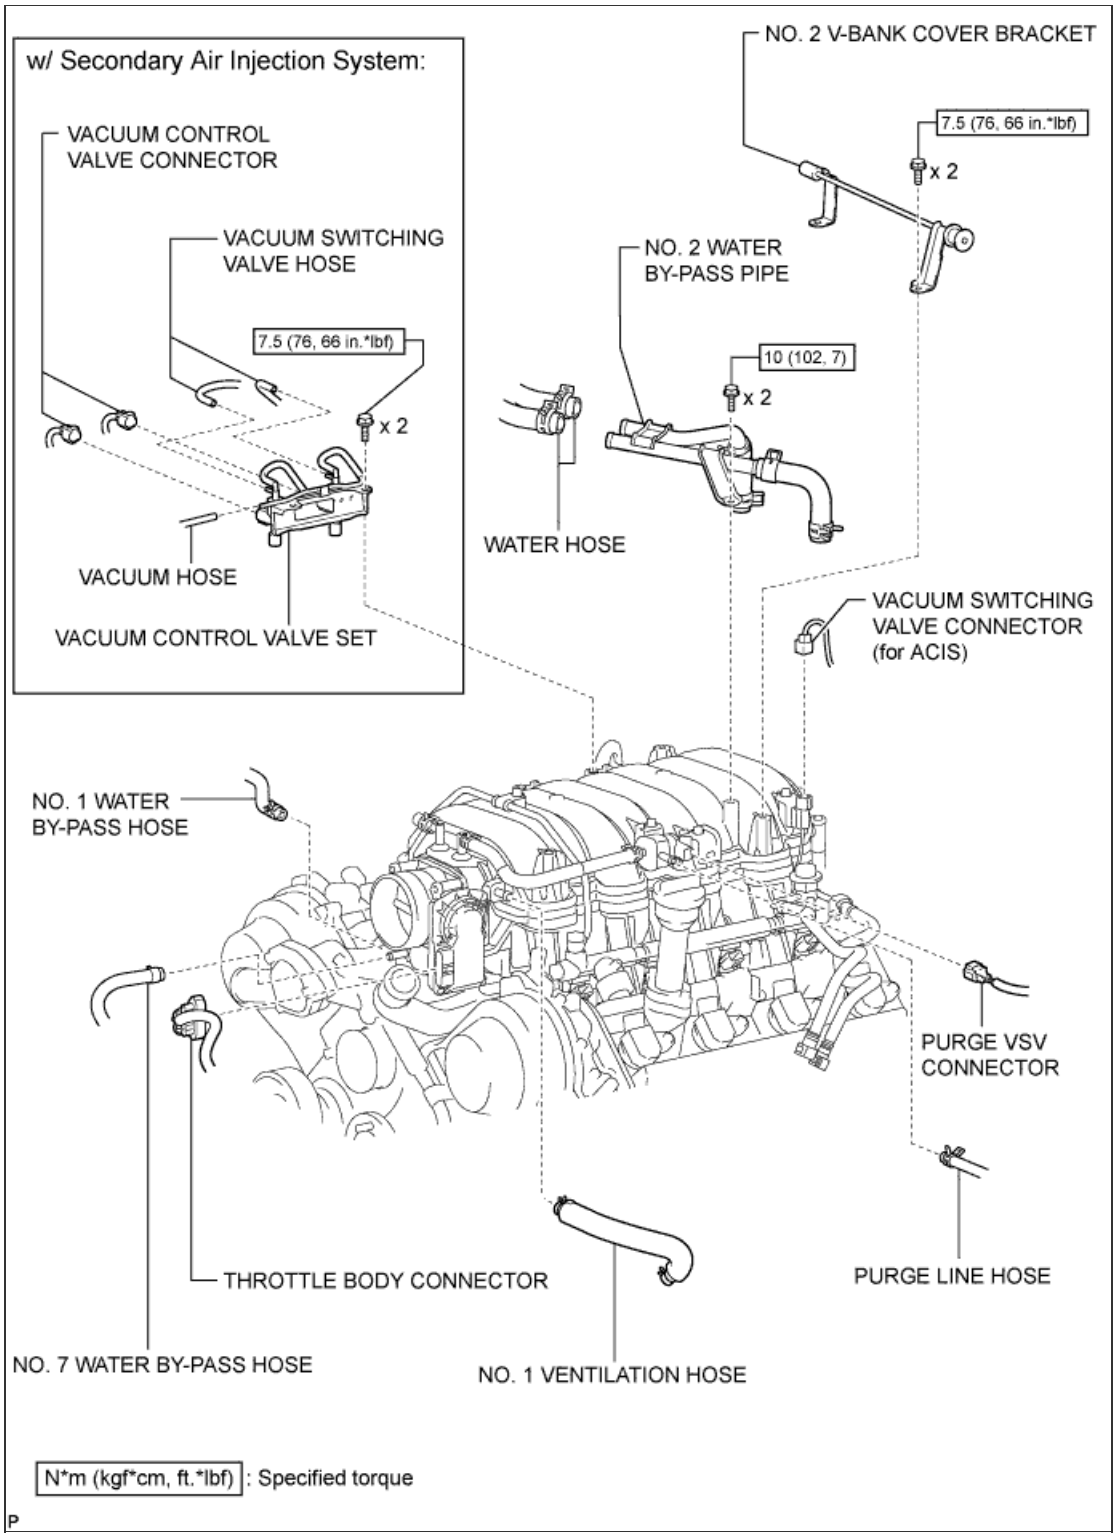
a. ush in the clip indicated the arrow in the illustration to install the fender splash shield.

b. Install the 3 olts and screw.

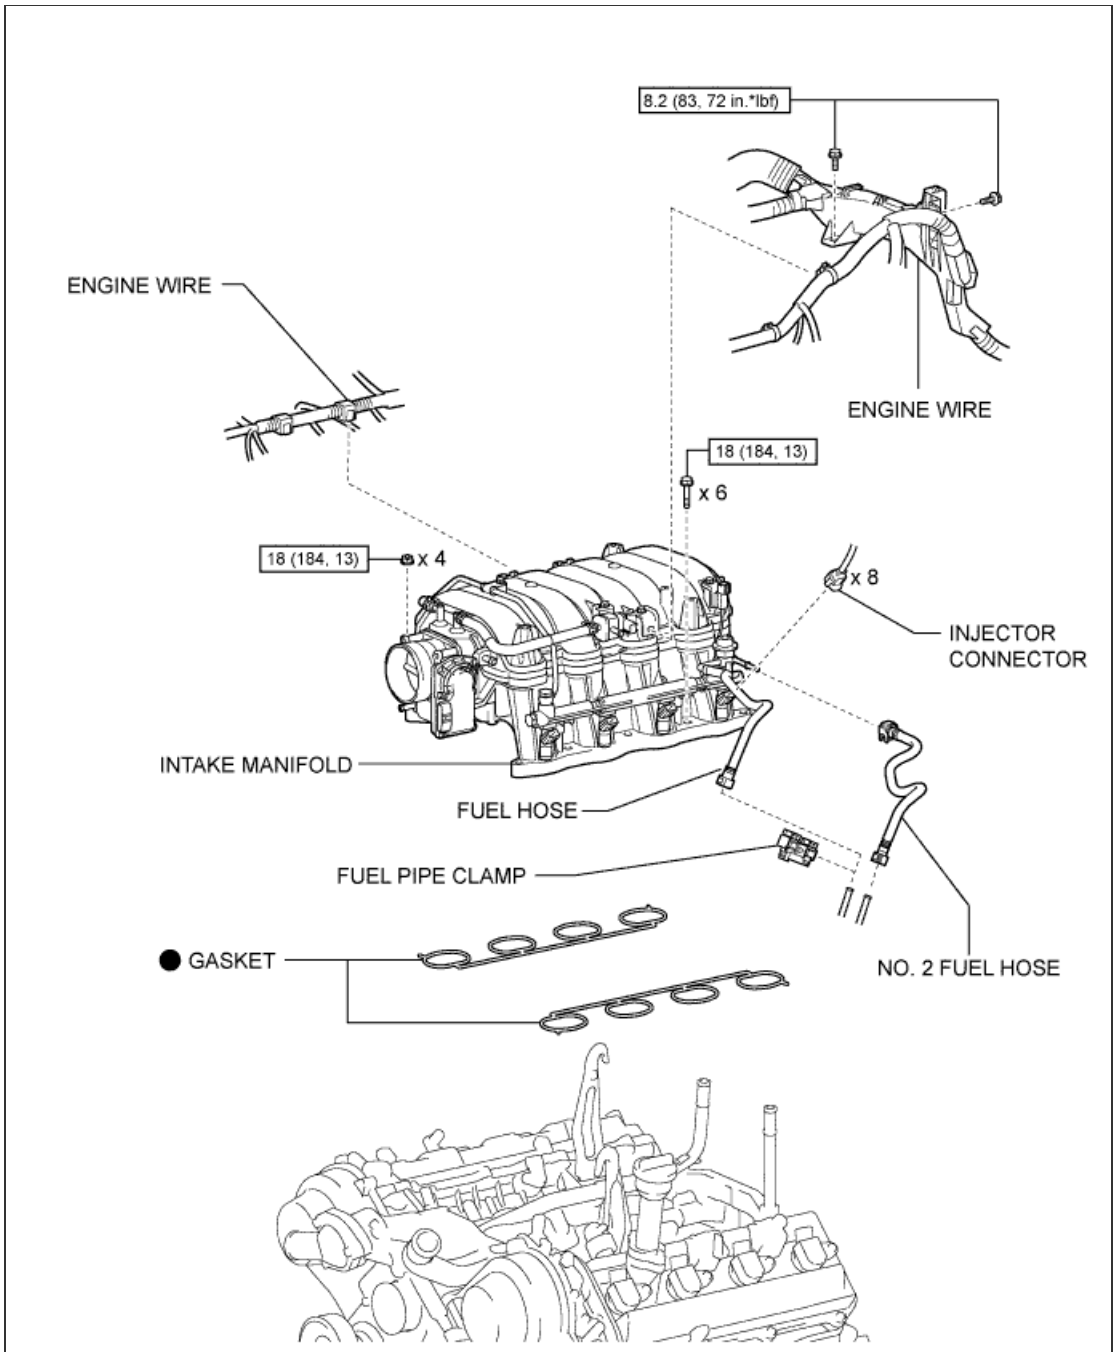




INSTALL RONT ENDER SPLASH SHIELD SUB ASSEMBLY RH



HINT:



Use the same procedures descri ed for the LH side.

1. DISCHARGE FUEL SYSTEM PRESSURE

a. Discharge the fuel system pressure (Click here).

2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

CAUTION:

Wait at least seconds after disconnecting the cable from the negative (-) battery terminal to disable SRS system.

NOTICE:

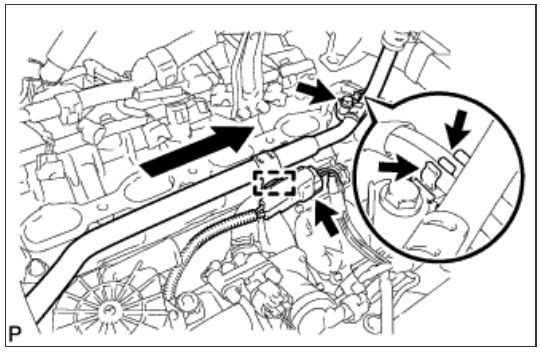
When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

3. REMOVE INTAKE MANIFOLD

a. Remove the intake manifold (Click here).

4. REMOVE WATER BY-PASS PIPE SUB-ASSEMBLY

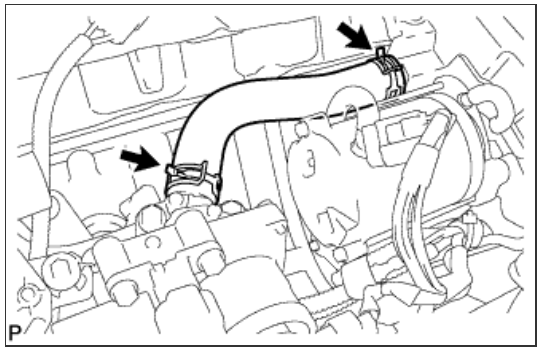
a. Disconnect the connector.



b. Disconnect the ire harness clamp from the ater by-pass pipe.

c. Disconnect the acuum s itching valve hoses from the ater by-pass pipe clamp.

d. Remove the bolt.

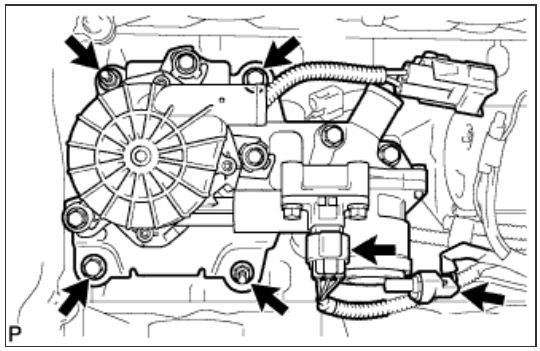


e. Pull out the ater by-pass pipe.

f. Remove the -ring from the ater by-pass pipe.

5. REMOVE NO. 2 AIR INJECTION SYSTEM HOSE

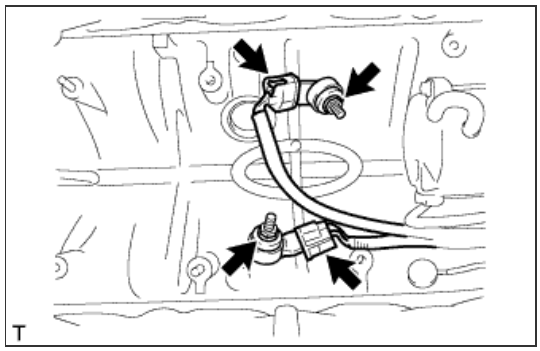
a. Remove the o air in etion system hose from the rear ater by-pass int and air s itching valve.



6. REMOVE AIR PUMP WITH BRACKET AND AIR SWITCHING VALVE

a. Disconnect the air s itching valve connector.

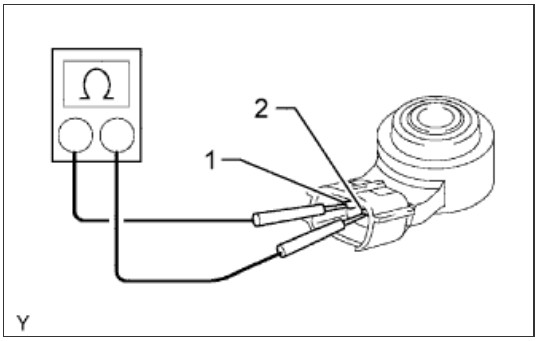
b. Disconnect the air pressure sensor connector.



c. Remove the bolts, uts and air pump ith bracket.

7. REMOVE KNOCK SENSOR

a. Disconnect the senso connectors.



b. Remove the uts and senso s.

for Preparation Click here

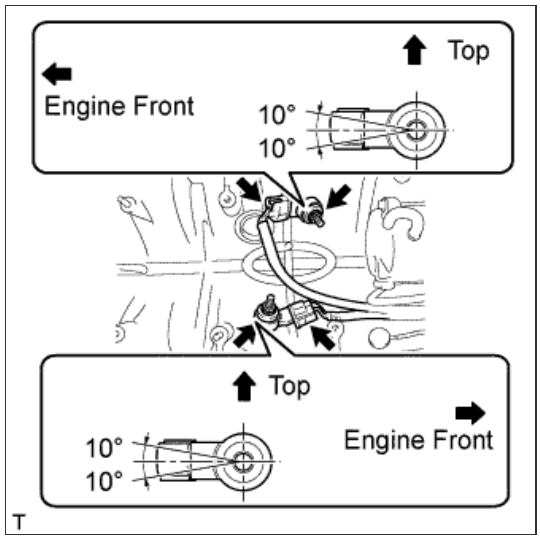
1. INSPECT KNOCK SENSOR

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	120 to 280 kΩ

f the result is not as specified, replace the sensor.



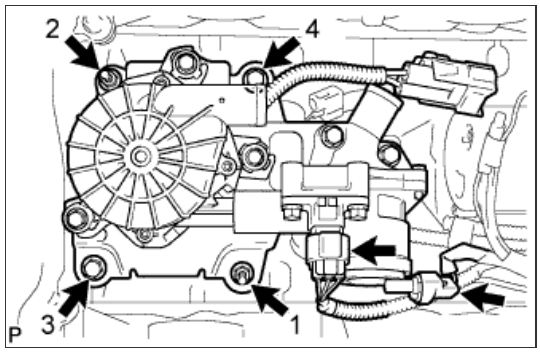
for Preparation Click here

1. INSTALL KNOCK SENSOR

a. Install the 2 sensors with the 2 nuts as shown in the illustration.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

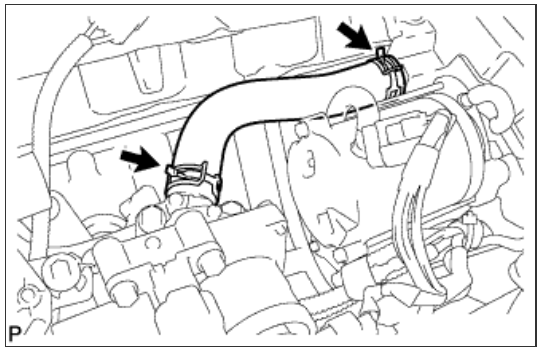
b. Connect the 2 sensor connectors.



2. INSTALL AIR PUMP WITH BRACKET AND AIR SWITCHING VALVE

a. Install the air pump with bracket with the 2 bolts and 2 nuts in the order shown in the illustration.

Torque:
16 N*m{ 163 kgf*cm , 12 ft.*lbf }



b. Connect the pressure sensor connector.

c. Connect the air switching valve connector.

3. INSTALL NO. 2 AIR INJECTION SYSTEM HOSE

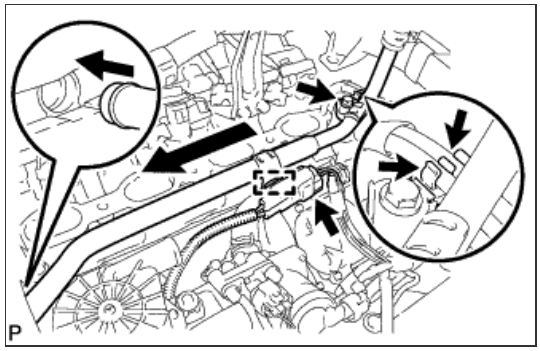
a. Install the hose.

4. INSTALL WATER BY-PASS PIPE SUB-ASSEMBLY

a. Apply soapy water to the ring.

b. Install a new ring to the water by-pass pipe.

c. Push in the water by-pass pipe.



d. Install the water by-pass pipe with the bolt.

Torque:
18 N*m{ 184 kgf*cm , 13 ft.*lbf }

e. Connect the 2 vacuum switching valve hoses to the water by-pass pipe clamp.

f. Connect the wire harness clamp.

g. Connect the connector.

5. INSTALL INTAKE MANIFOLD

a. Install the intake manifold (Click here).

6. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

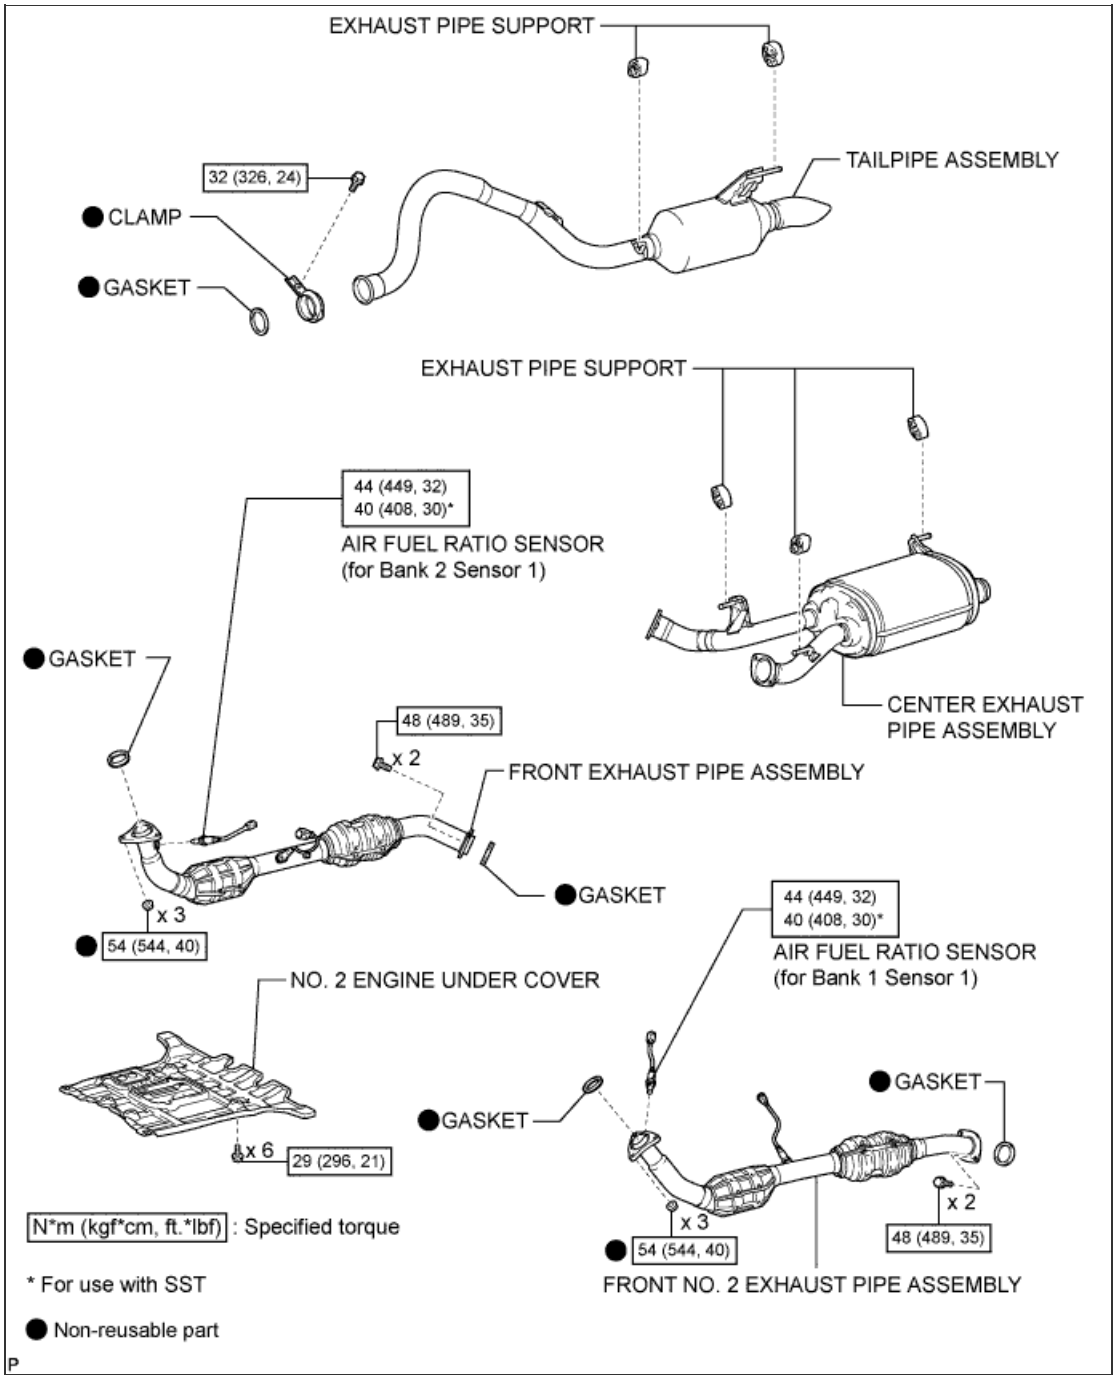
NOTICE:

hen disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

7. INSPECT FOR FUEL LEAK

a. Connect the intelligent tester to the D C3.

b. Turn the engine switch on (IG) and intelligent tester .



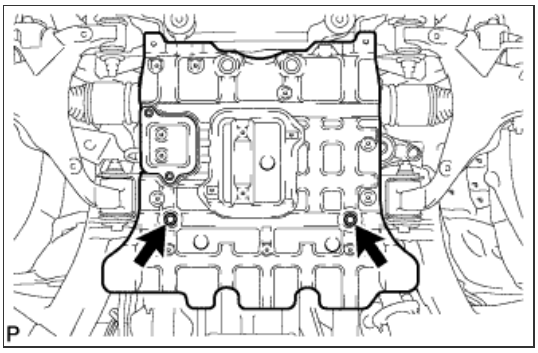
NOTICE:

o not start the engine.

c. nter the following menus: Powertrain / gine and CT / Active Test / Activate the Fuel Pump Speed Control.

d. Check that there are no fuel leaks after doing maintenance anywhere on the fuel system.

for Preparation Click here



for Preparation Click here

CAUTION:

- **The procedures should be performed by at least 2 people.**
- **Wear protective gloves when removing the exhaust pipe.**
- **The exhaust pipe is extremely hot immediately after the engine has stopped.**
- **Confirm that the exhaust pipe has cooled down before removing it.**

1. REMOVE NO. 2 ENGINE UNDER COVER

a. Remove the 2 bolts and No. 2 engine under cover.

2. REMOVE TAILPIPE ASSEMBLY

a. Remove the bolt, clamp and gasket.

b. Remove the tailpipe from the 2 exhaust pipe supports.

3. REMOVE CENTER EXHAUST PIPE ASSEMBLY

a. Remove the 4 bolts.

b. Remove the center exhaust pipe from the 3 exhaust pipe supports.

c. Remove the 2 gaskets from the front exhaust pipe and front No. 2 exhaust pipe.

4. REMOVE FRONT NO. 2 EXHAUST PIPE ASSEMBLY

a. Disconnect the air fuel ratio sensor connector.

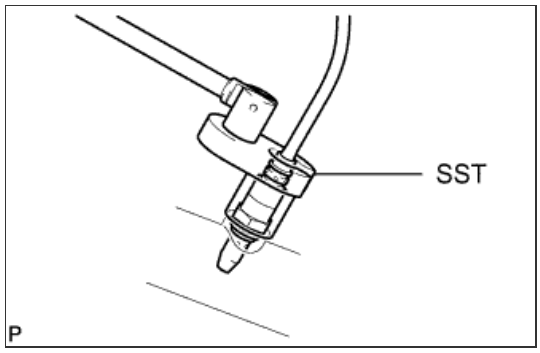
b. Disconnect the heated oxygen sensor connector.

c. Remove the 3 nuts, front No. 2 exhaust pipe and gasket.

5. REMOVE FRONT EXHAUST PIPE ASSEMBLY

a. Disconnect the air fuel ratio sensor connector.

b. Disconnect the heated oxygen sensor connector.

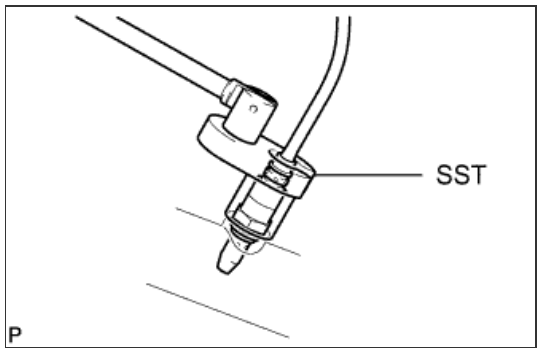


c. Detach the heated oxygen sensor wire clamp.

d. Remove the 3 nuts, front exhaust pipe and gasket.

6. REMOVE AIR FUEL RATIO SENSOR for Bank 1 Sensor 1)

a. Using remove the sensor.



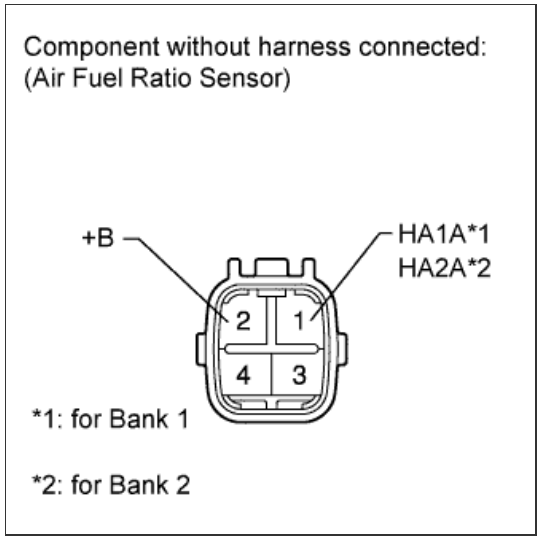
SST
09224-00010

7. REMOVE AIR FUEL RATIO SENSOR (for Bank 2 Sensor 1)

a. Using remove the sensor.

SST
09224-00010

for Preparation Click here

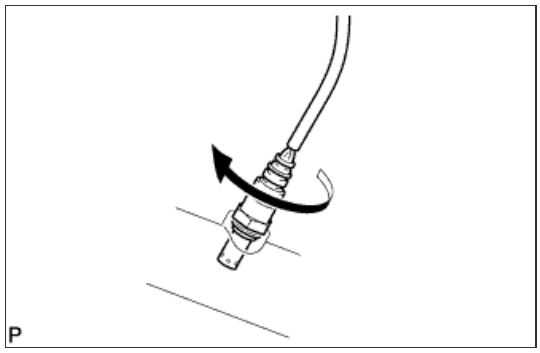


1. INSPECT AIR FUEL RATIO SENSOR

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B) for Bank 1	20°C (68°F)	1.8 to 3. Ω
1 (HA2A) - 2 (+B) for Bank 2		

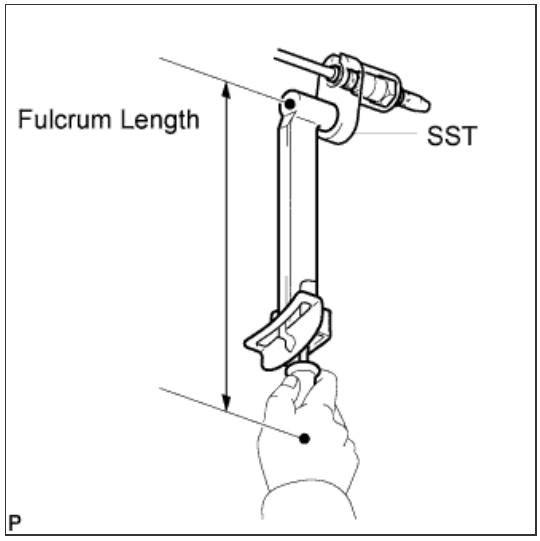


If the result is not as specified, replace the sensor.

for Preparation Click here

1. INSTALL AIR FUEL RATIO SENSOR (for Bank 2 Sensor 1)

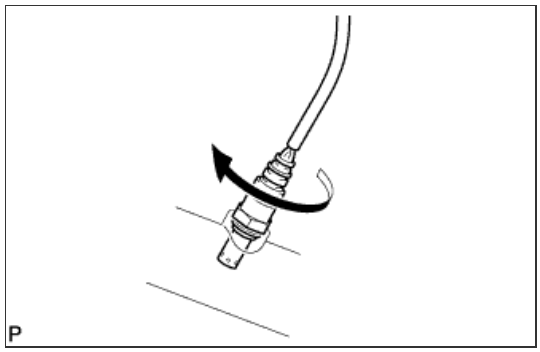
a. Temporarily install the sensor to the exhaust pipe by hand.



b. Using SST, tighten the sensor.

SST
09224-00010

Torque:
without SST:
44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }



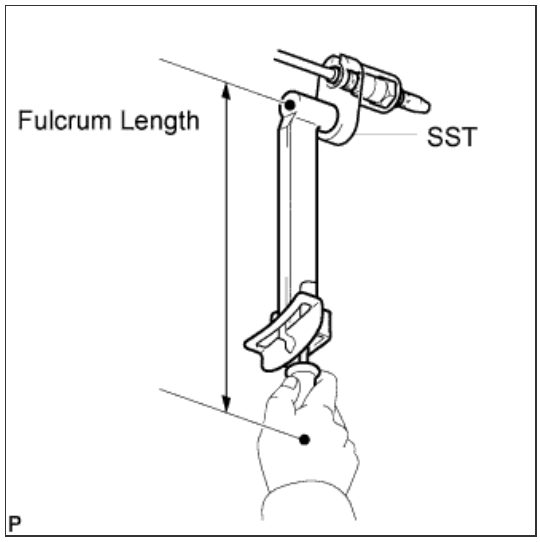
HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).**
- **Make sure SST and the wrench are connected in a straight line.**

2. INSTALL AIR FUEL RATIO SENSOR (for Bank 1 Sensor 1)

a. Temporarily install the sensor to the exhaust pipe by hand.

b. Using SST, tighten the sensor.



SST
09224-00010

Torque:
without SST:

44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

HINT:

- Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).
- Make sure SST and the wrench are connected in a straight line.

3. INSTALL FRONT EXHAUST PIPE ASSEMBL

a. Install a new gasket and the front exhaust pipe to the exhaust manifold with 3 new nuts.

Torque:
4 N*m{ 4 kgf*cm , 40 ft.*lbf }

b. Conne t the air fuel ratio sensor one tor.

c. Conne t the heated oxygen sensor one tor.

d. Atta h the heated oxygen sensor wire lamp.

4. INSTALL FRONT NO. 2 EXHAUST PIPE ASSEMBL

a. Install a new gasket and the front No. 2 exhaust pipe to the exhaust manifold with 3 new nuts.

Torque:
4 N*m{ 4 kgf*cm , 40 ft.*lbf }

b. Conne t the air fuel ratio sensor one tor.

c. Conne t the heated oxygen sensor one tor.

. INSTALL CENTER EXHAUST PIPE ASSEMBL

a. Install the enter exhaust pipe to the 3 exhaust pipe supports.

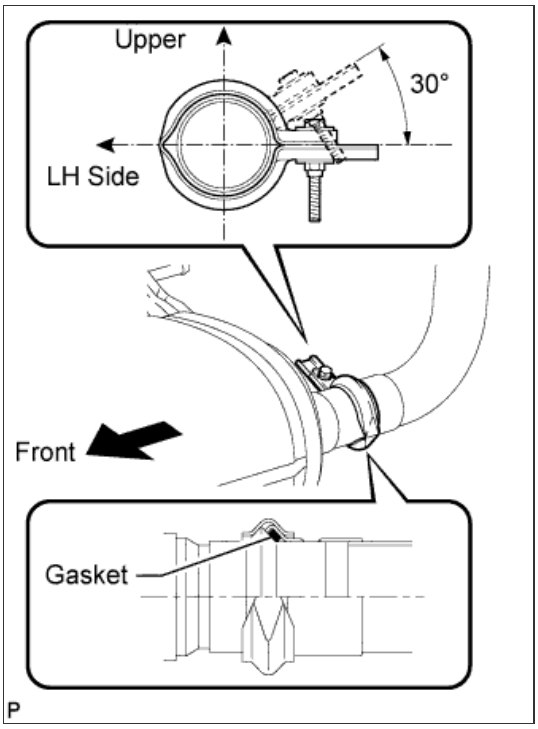
b. Install 2 new gaskets to the front exhaust pipe and front No. 2 exhaust pipe.

c. Install the 4 bolts.

Torque:
48 N*m{ 489 kgf*cm , 3 ft.*lbf }

6. INSTALL TAILPIPE ASSEMBL

a. Install the tailpipe to the 2 exhaust pipe supports.



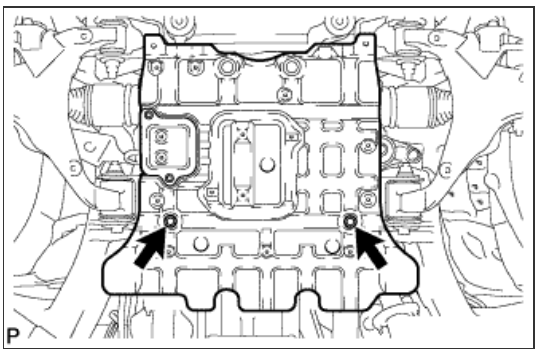
b. Install a new gasket to the enter exhaust pipe.

c. Conne t the tailpipe and enter exhaust pipe with a new lamp.

Torque:
32 N*m{ 326 kgf*cm , 24 ft.*lbf }

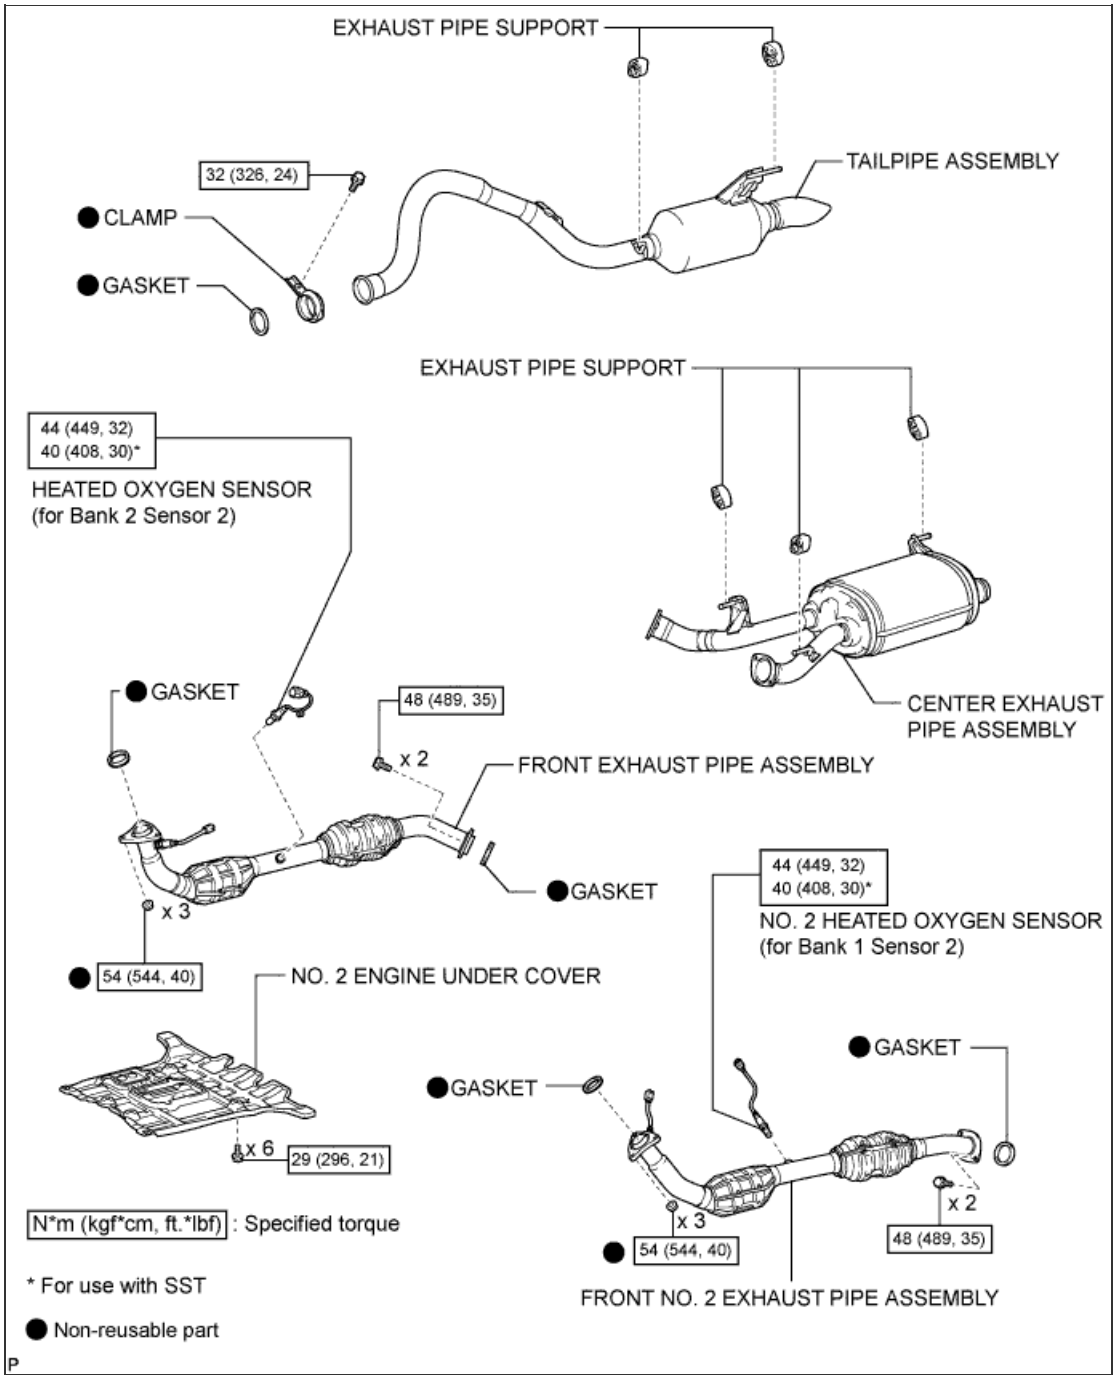
HINT:

Install the lamp within the angle range shown in the illustration.



. INSPECT FOR EXHAUST AS LEA

If gas is leaking, tighten the areas ne essary to stop the leak. Repla e damaged parts as ne essary.

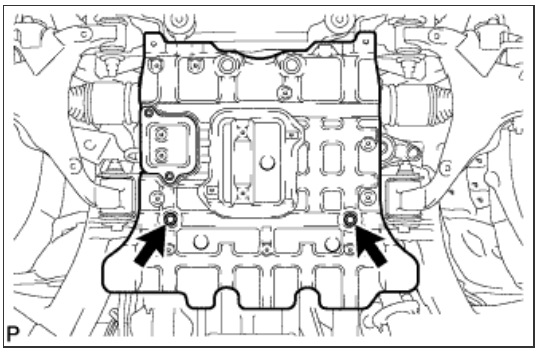


8. INSTALL NO. 2 EN INE UN B COVER

a. Install the No. 2 engine under oer with the 2 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

for Preparation Click here



for Preparation Click here

CAUTION:

- **The procedures should be performed by at least 2 people.**
- **Wear protective gloves when removing the exhaust pipe.**
- **The exhaust pipe is extremely hot immediately after the engine has stopped.**
- **Confirm that the exhaust pipe has cooled down before removing it.**

1. REMOVE NO. 2 ENGINE UNDER COVER

a. Remove the 2 bolts and No. 2 engine under cover.

2. REMOVE TAILPIPE ASSEMBLY

a. Remove the bolt, clamp and gasket.

b. Remove the tailpipe from the 2 exhaust pipe supports.

3. REMOVE CENTER EXHAUST PIPE ASSEMBLY

a. Remove the 4 bolts.

b. Remove the center exhaust pipe from the 3 exhaust pipe supports.

c. Remove the 2 gaskets from the front exhaust pipe and front No. 2 exhaust pipe.

4. REMOVE FRONT NO. 2 EXHAUST PIPE ASSEMBLY

a. Disconnect the air fuel ratio sensor connector.

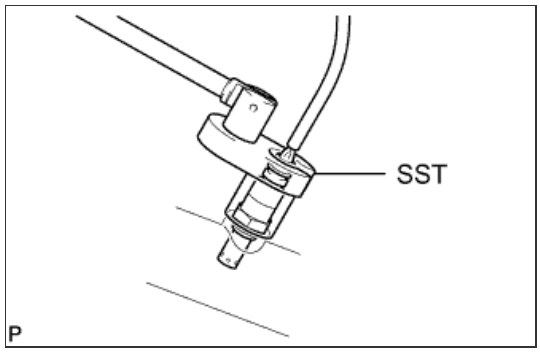
b. Disconnect the heated oxygen sensor connector.

c. Remove the 3 nuts, front No. 2 exhaust pipe and gasket.

5. REMOVE FRONT EXHAUST PIPE ASSEMBLY

a. Disconnect the air fuel ratio sensor connector.

b. Disconnect the heated oxygen sensor connector.

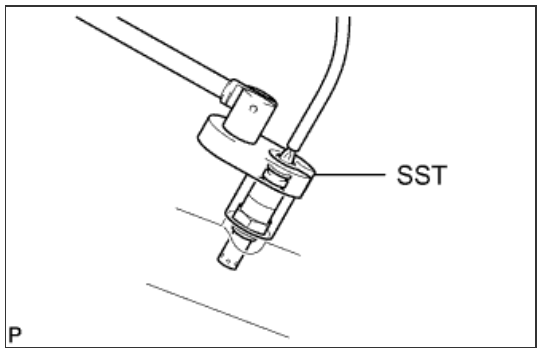


c. Detach the heated oxygen sensor wire clamp.

d. Remove the 3 nuts, front exhaust pipe and gasket.

6. REMOVE NO. 2 HEATED OXYGEN SENSOR for Bank 1 Sensor 2)

a. Using remove the sensor.



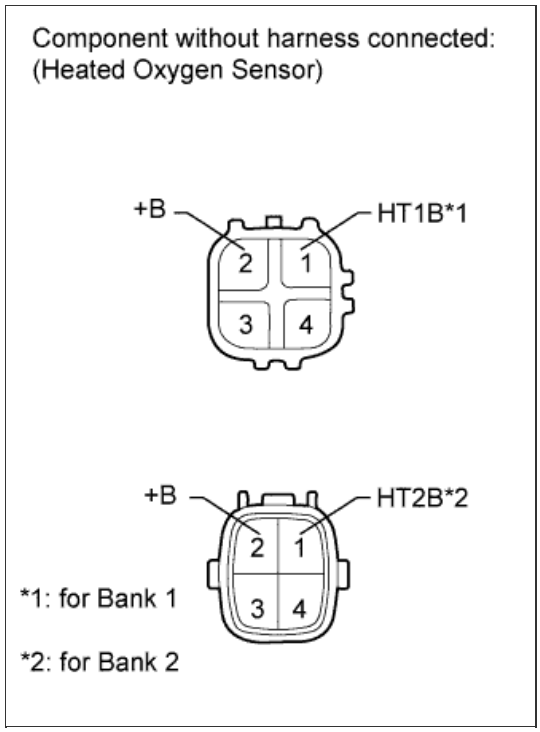
SST
09224-00010

7. REMOVE HEATED OXYGEN SENSOR (for Bank 2 Sensor 2)

a. Using remove the sensor.

SST
09224-00010

for Preparation Click here

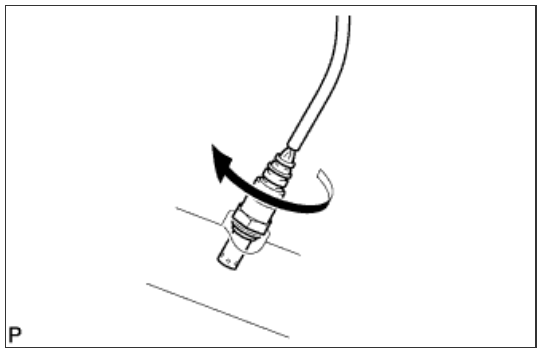


1. INSPECT HEATED OXYGEN SENSOR

a. Measure the heater resistance according to the value(s) in the table below.

Standard Resistance

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B) for Bank 1	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 2 (+B) for Bnak 2		

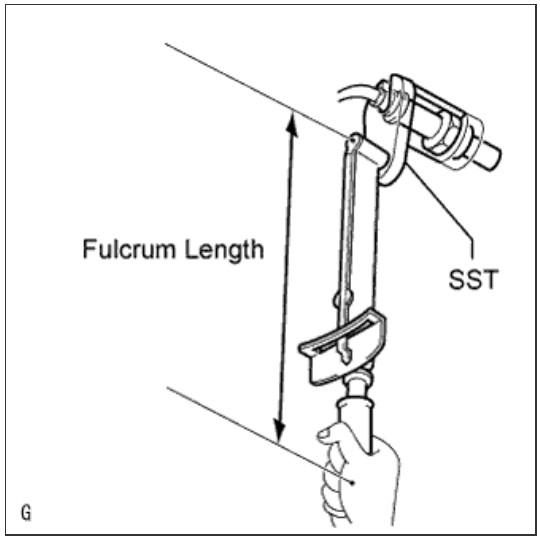


If the result is not as specified, replace the sensor.

for Preparation Click here

1. INSTALL HEATED OXYGEN SENSOR (for Bank 2 Sensor 2)

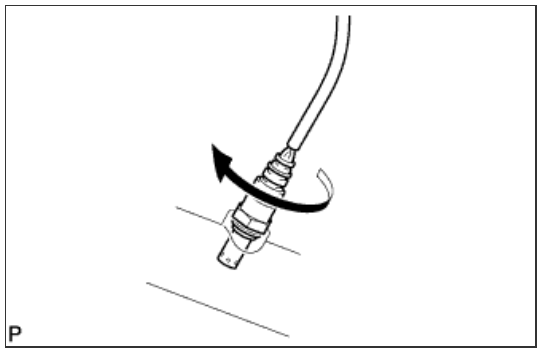
a. Temporarily install the sensor to the exhaust pipe by hand.



b. Using SST, tighten the sensor.

SST
09224-00010

Torque:
without SST:
44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }



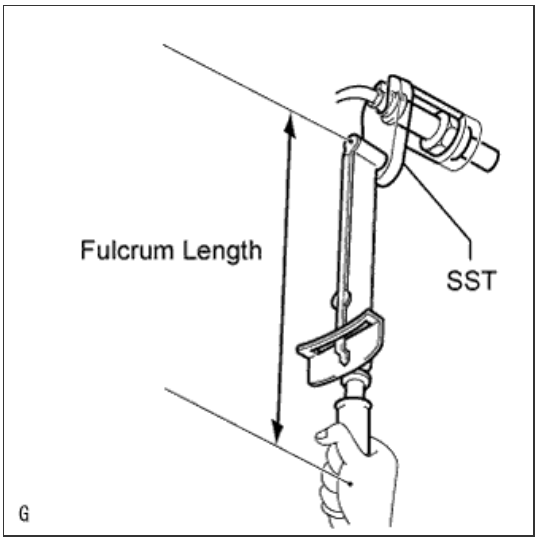
HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).**
- **Make sure SST and the wrench are connected in a straight line.**

2. INSTALL NO. 2 HEATED OXYGEN SENSOR (for Bank 1 Sensor 2)

a. Temporarily install the sensor to the exhaust pipe by hand.

b. Using SST, tighten the sensor.



SST
09224-00010

Torque:
without SST:

44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).**
- **Make sure SST and the wrench are connected in a straight line.**

3. INSTALL FRONT EXHAUST PIPE ASSEMBLY

a. Install a new gasket and the front exhaust pipe to the exhaust manifold with 3 new nuts.

Torque:
54 N*m{ 554 kgf*cm , 40 ft.*lbf }

b. Conne t the air fuel ratio sensor one tor.

c. Conne t the heated oxygen sensor one tor.

d. Atta h the heated oxygen sensor wire lamp.

4. INSTALL FRONT NO. 2 EXHAUST PIPE ASSEMBLY

a. Install a new gasket and the front No. 2 exhaust pipe to the exhaust manifold with 3 new nuts.

Torque:
54 N*m{ 554 kgf*cm , 40 ft.*lbf }

b. Conne t the air fuel ratio sensor one tor.

c. Conne t the heated oxygen sensor one tor.

5. INSTALL CENTER EXHAUST PIPE ASSEMBLY

a. Install the enter exhaust pipe to the 3 exhaust pipe supports.

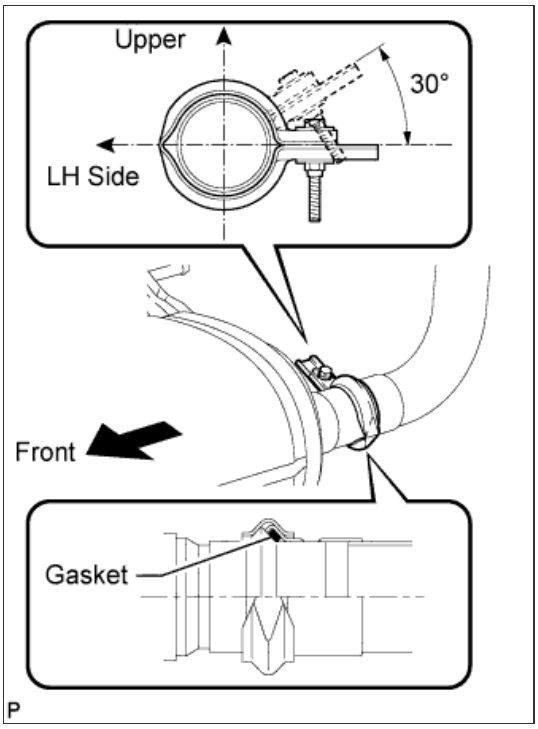
b. Install 2 new gaskets to the front exhaust pipe and front No. 2 exhaust pipe.

c. Install the 4 bolts.

Torque:
48 N*m{ 489 kgf*cm , 35 ft.*lbf }

. INSTALL TAILPIPE ASSEMBLY

a. Install the tailpipe to the 2 exhaust pipe supports.



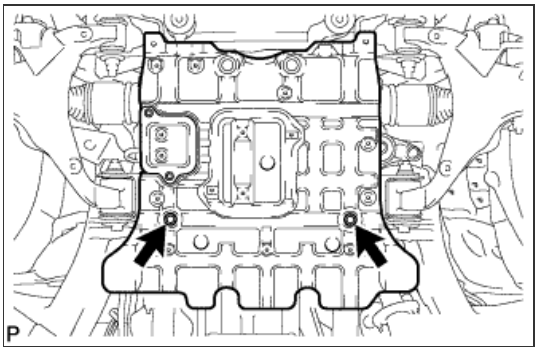
b. Install a new gasket to the enter exhaust pipe.

c. Conne t the tailpipe and enter exhaust pipe with a new lamp.

Torque:
32 N*m{ 32 kgf*cm , 24 ft.*lbf }

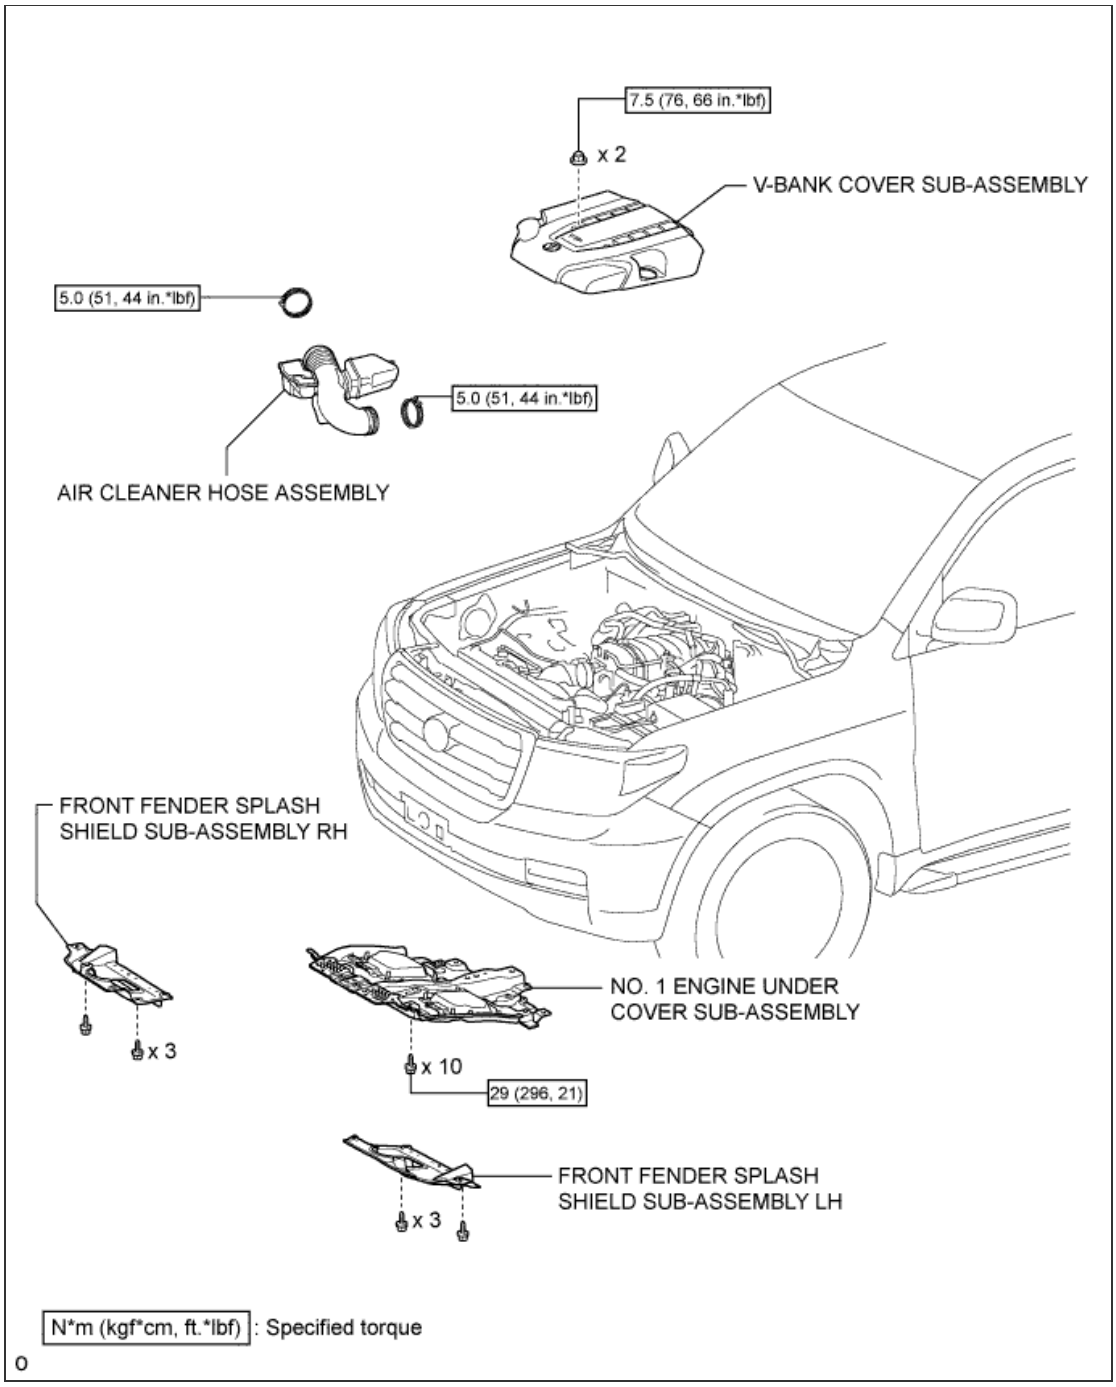
HINT:

Install the lamp within the angle range shown in the illustration.

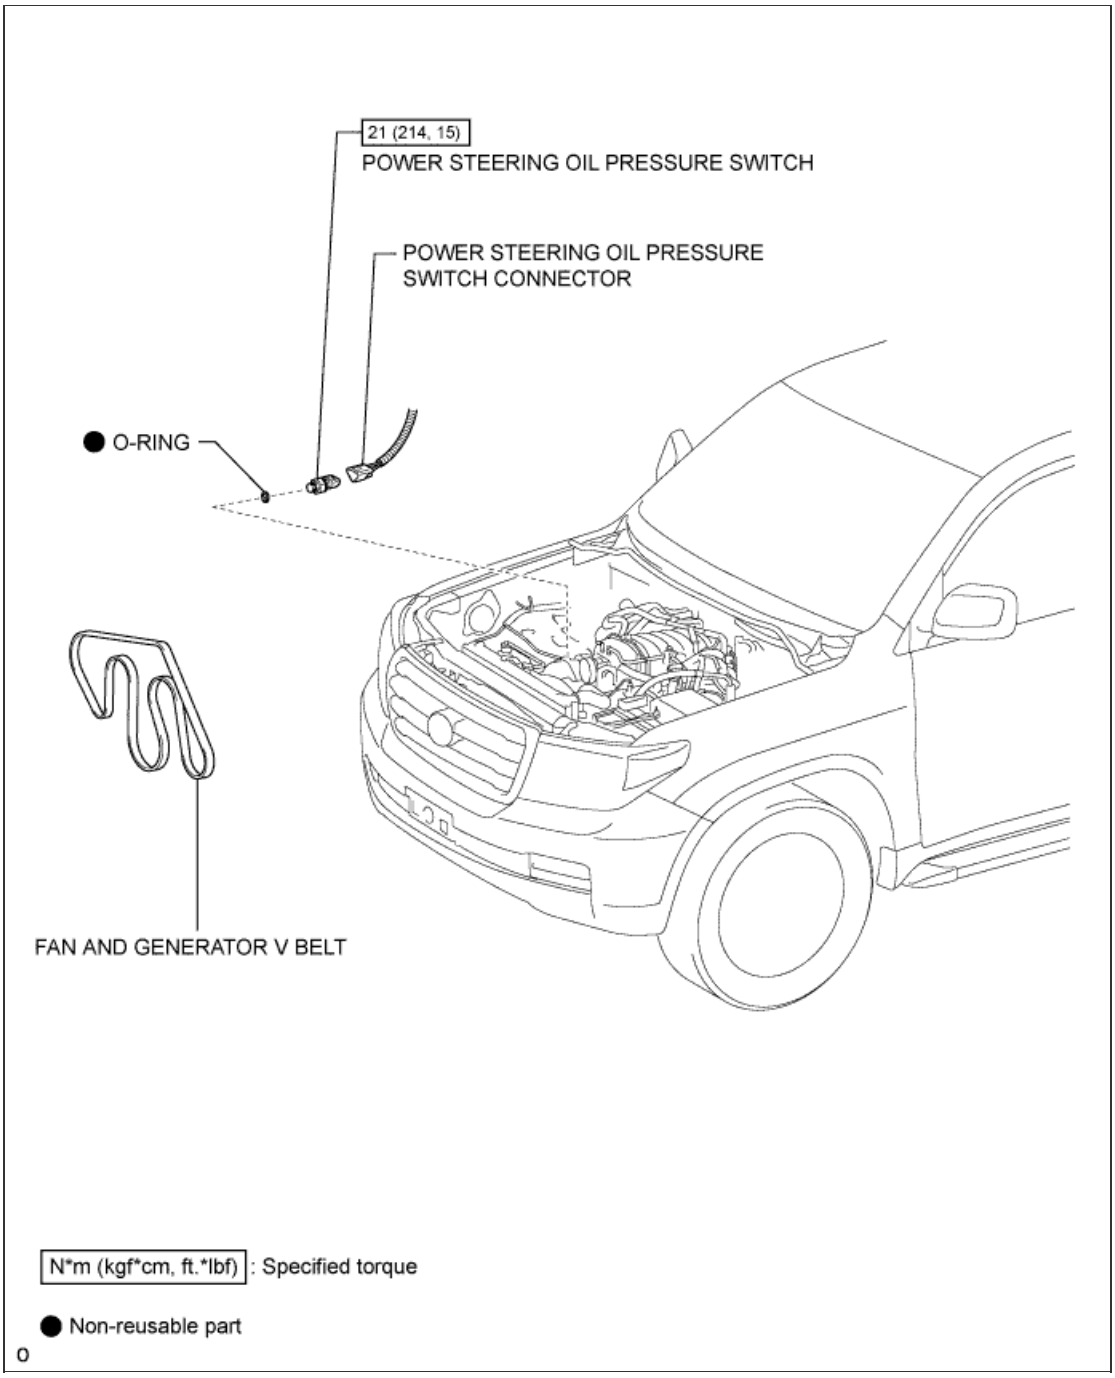


. INSPECT FOR EXHAUST GAS LEAK

If gas is leaking, tighten the areas ne essary to stop the leak. Repla e damaged parts as ne essary.



8. INSTALL NO. 2 ENGINE UNDER COVER



a. Install the No. 2 engine under oer with the 2 bolts.

Torque:
29 N*m{ 29 kgf*cm , 21 ft.*lbf }

for Preparation Click here

21 (214, 15)
POWER STEERING OIL PRESSURE SWITCH
POWER STEERING OIL PRESSURE SWITCH CONNECTOR
● O-RING
FAN AND GENERATOR V BELT
N*m (kgf*cm, ft.*lbf) : Specified torque
● Non-reusable part

o

for Preparation Click here

1. INSPECT POWER STEERING OIL PRESSURE SWITCH

a. Check the oil pressure switch.

i. Connect the intelligent tester to the DLC3.

ii. Turn the engine switch on (IG).

iii. Turn the intelligent tester on.

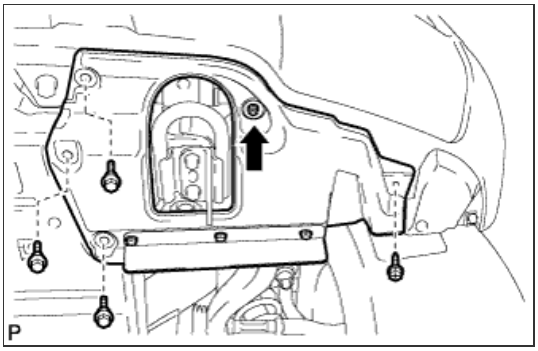
iv. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Power Steering Pressure.

v. Start the engine.

vi. Operate the steering wheel while idling, and read the alue on the intelligent tester.

Standard:

Condition	Specified Condition
Power steering not operating	0 to 2 MPa
Power steering operating	Values change from a o e alue



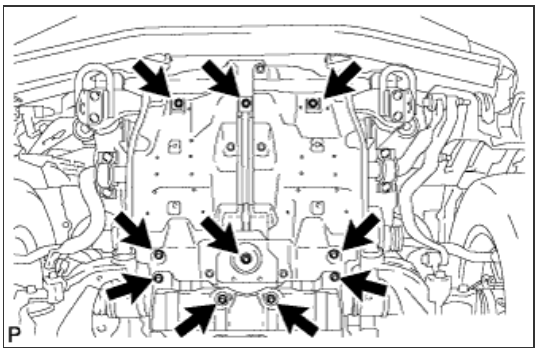
If not as specified, check for DTCs (Click here). If the power steering system inspection results are normal and a DTC is not output, replace the power steering oil pressure switch.
Inspect the power steering system (Click here). If the power steering system inspection results are normal and a DTC is not output, replace the power steering oil pressure switch.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

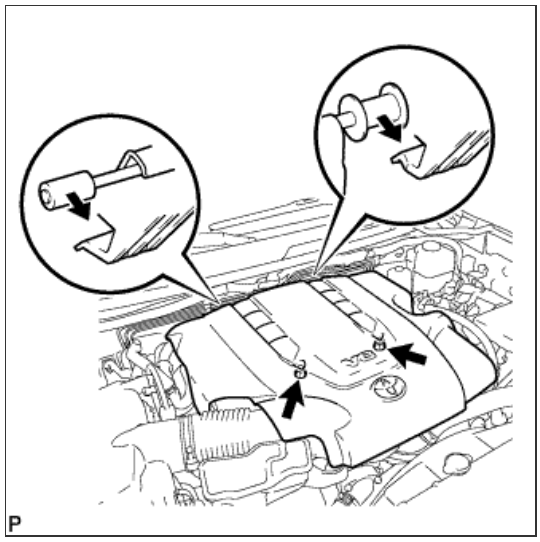
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the LH side.

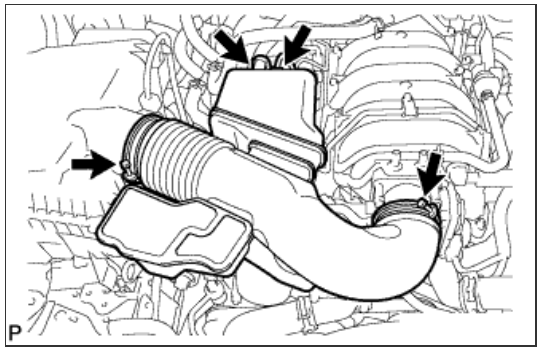


3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and No. 1 engine under cover.

4. REMOVE V-BANK COVER SUB-ASSEMBLY

a. Remove the 2 nuts and V-bank cover.

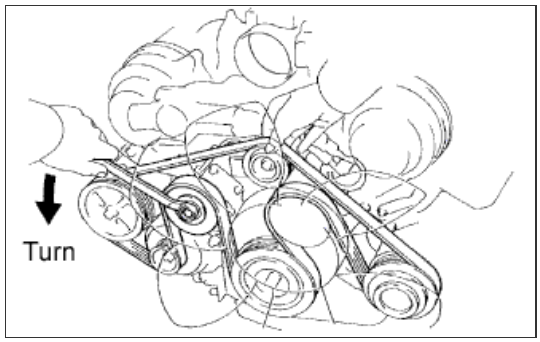


5. REMOVE AIR CLEANER HOSE ASSEMBLY

a. Disconnect the vacuum transmitting hose and No. 2 ventilation hose.

b. Loosen the 2 hose clamps.

c. Remove the air cleaner hose.

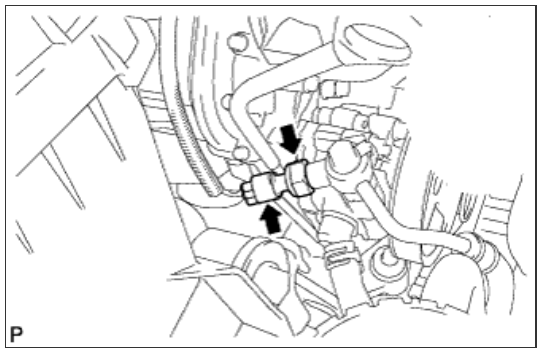


6. REMOVE FAN & GENERATOR V BELT

a. Loosen the belt tension by turning the belt tensioner counterclockwise, and then remove the fan and generator V belt.

HINT:

The pulley bolt for the belt tensioner has left-hand thread.



7. DRAIN POWER STEERING FLUID

8. REMOVE POWER STEERING OIL PRESSURE SWITCH

a. Disconnect the sensor connector.

b. Using a 24 mm deep socket wrench, remove the oil pressure switch.

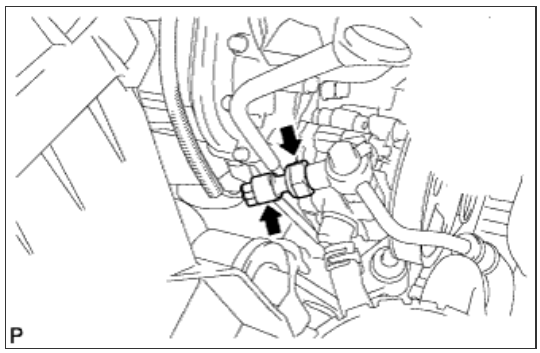
c. Remove the ring.

P

for Preparation Click here

1. INSTALL POWER STEERING OIL PRESSURE SWITCH

a. Install a new O-ring to the oil pressure switch.



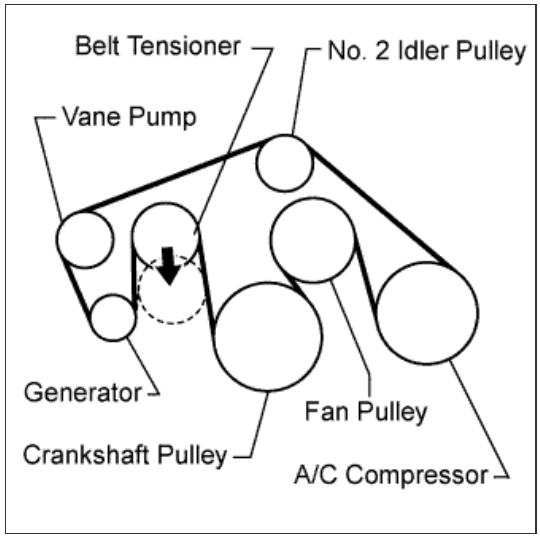
b. Apply a light coat of engine oil to the O-ring of the oil pressure switch.

c. Using a 24 mm deep socket wrench, install the oil pressure switch.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the power steering oil pressure switch (connecting surface with pressure feed tube).**
- **Be careful not to damage the O-ring when installing the power steering oil pressure switch.**

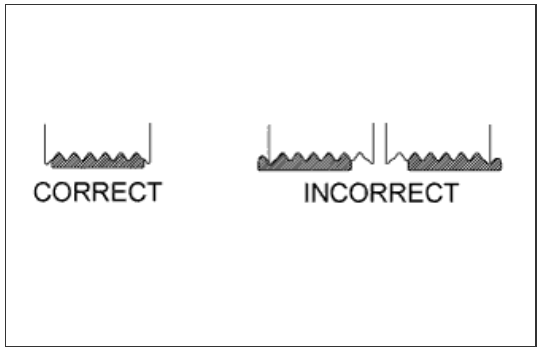


d. Connect the oil pressure switch connector.

2. INSTALL FAN & GENERATOR V BELT

a. Set the V belt onto every part e ept the belt tensioner, as shown in the illustration.

b. oosen the V belt by turning the belt tensioner counterclockwise.

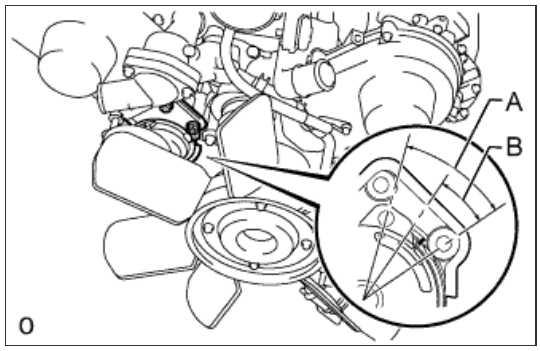


c. Set the V belt to the belt tensioner.

d. Check that the belt fits properly in the ribbed grooves.

HINT:

Make sure to check by hand that the belt has not slipped out of the grooves on the bottom of the pulley.



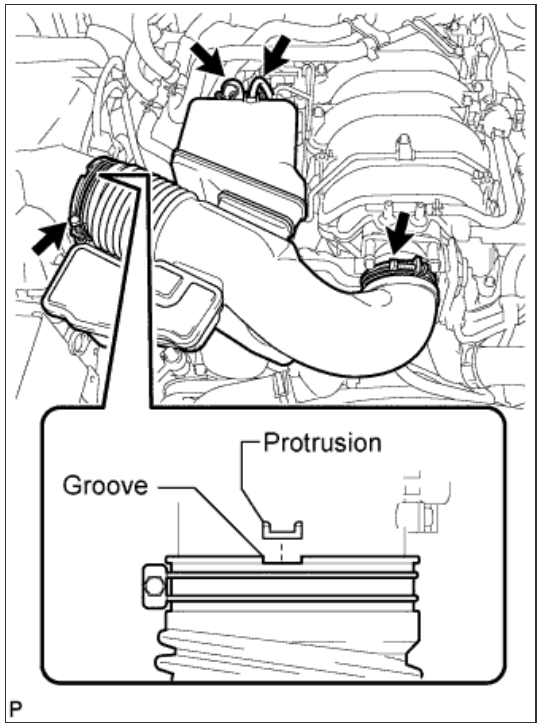
e. Check that the arrow on the belt tensioner is within area A .

If the arrow is outside area A , replace the fan and generator V belt.

HINT:

When a new belt is installed, the arrow should be within area . If not, the fan and generator V belt is not installed correctly.

3. INSTALL AIR CLEANER HOSE ASSEMBLY



a. Install the air cleaner hose so that the protrusion of the air cleaner cap aligns with the groove of the hose as shown in the illustration.

b. ighten the 2 clamps.

Torque:
5.0 N*m{ 51 kgf*cm , 44 in.*lbf }

c. Connect the vacuum transmitting hose.

d. Connect the No. 2 ventilation hose.

4. ADD POWER STEERING FLUID

5. BLEED POWER STEERING FLUID

a. Check the fluid level.

b. ak up the front of the vehicle and support it with stands.

c. urn the steering wheel.

i. With the engine stopped, turn the wheel slowly from lock to lock several times.

d. ower the vehicle.

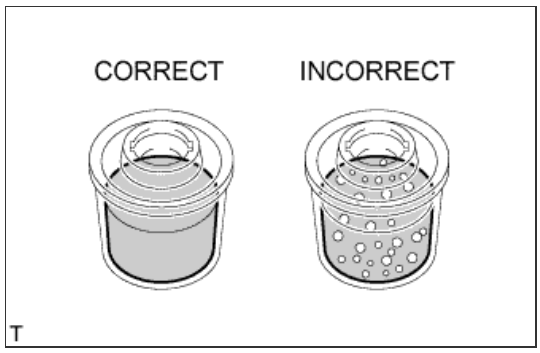
e. Start the engine.

f. Idle the engine for a few minutes.

g. urn the steering wheel.

i. With the engine idling, turn the wheel left or right to the full lock position and keep it there for 2 to econds, then turn the wheel to the opposite full lock position and keep it there for 2 to econds.

ii. epeat several times.



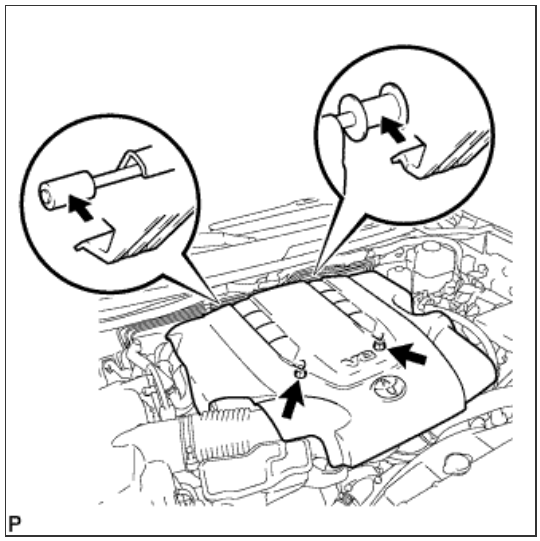
NOTICE:

For vehicles with VG S, if the steering wheel is turned from lock to lock repeatedly, the system may stop operating and the amount of rotation before the steering wheel locks may increase due to operation of the overheating prevention function. When the system temperature drops, the system operation automatically returns to normal.

h. Stop the engine.

i. Check for foaming or emulsification.
If the system has to be bled twice because of foaming or emulsification, check for fluid leaks in the system.

j. Check the fluid level.

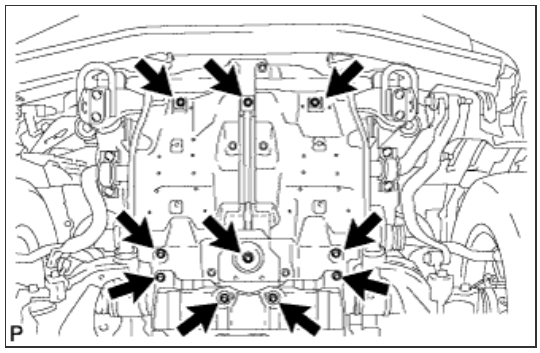


6. INSPECT FOR POWER STEERING FLUID LEAK

7. INSTALL V-BANK COVER SUB-ASSEMBLY

a. Attach the 2 V-bank cover hooks to the bracket.

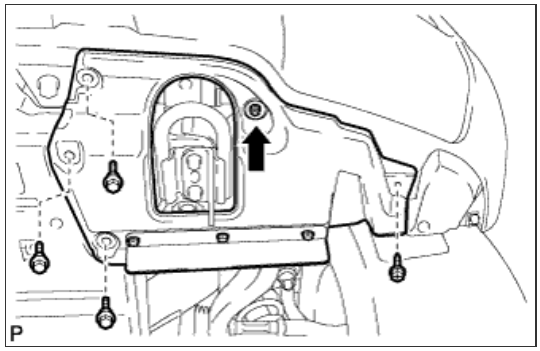
b. Install the V-bank cover with the 2 nuts.



Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

8. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the No. 1 engine under cover with the 10 bolts.



Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

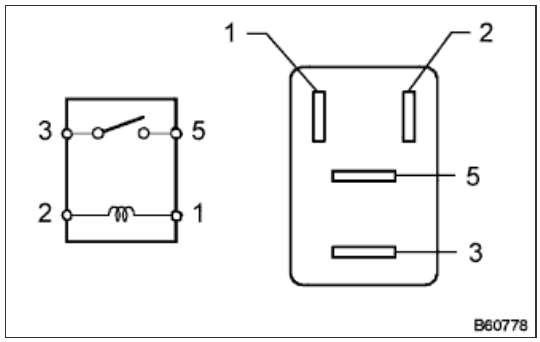
a. ush in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the bolts and screw.

10. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

HINT:

Use the same procedures described for the ide.



for Preparation Click here

1. INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage is not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage is applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

2. INSPECT INTEGRATION RELAY (IG2)

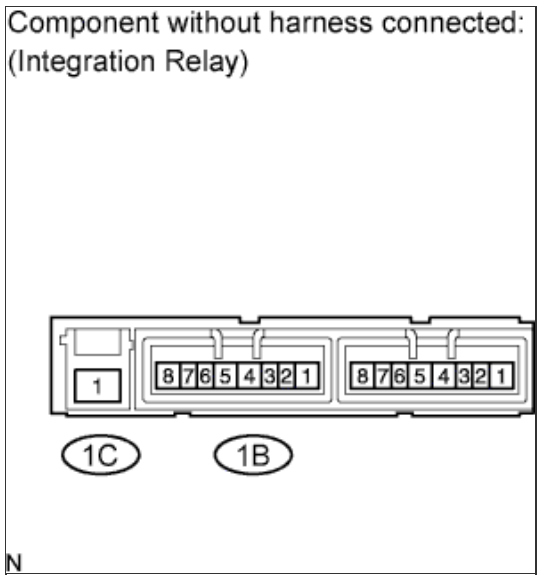
a. Measure the resistance of the IG2 MAIN fuse.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
IG2 MAIN fuse	Always	Below 1 Ω

If the result is not as specified, replace the IG2 MAIN fuse.



b. Measure the resistance of the ignition relay No. 2 (IG2) circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-8	Battery voltage is not applied to terminals 1B-6 and 1B-7	10 kΩ or higher
	Battery voltage is applied to terminals 1B-6 and 1B-7	Below 1 Ω

If the result is not as specified, replace the integration relay.

3. INSPECT INTEGRATION RELAY (EFI)

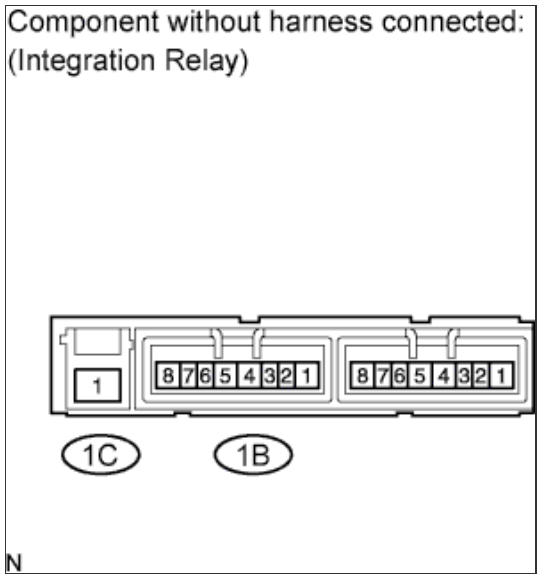
a. Measure the resistance of the EFI MAIN fuse.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
IAM fuse	Always	Below 1 Ω

If the result is not as specified, replace the EFI MAIN fuse.



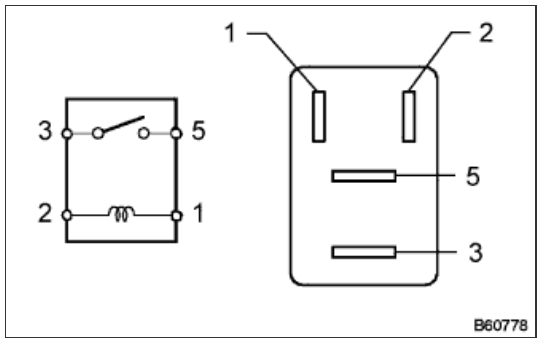
b. Measure the resistance of the EFI relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	Battery voltage is not applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage is applied to terminals 1B-2 and 1B-3	Below 1 Ω

If the result is not as specified, replace the integration relay.



4. INSPECT EFI NO. 2 RELAY (EFI NO. 2)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage is not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage is applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

5. INSPECT INTEGRATION RELAY (A/F)

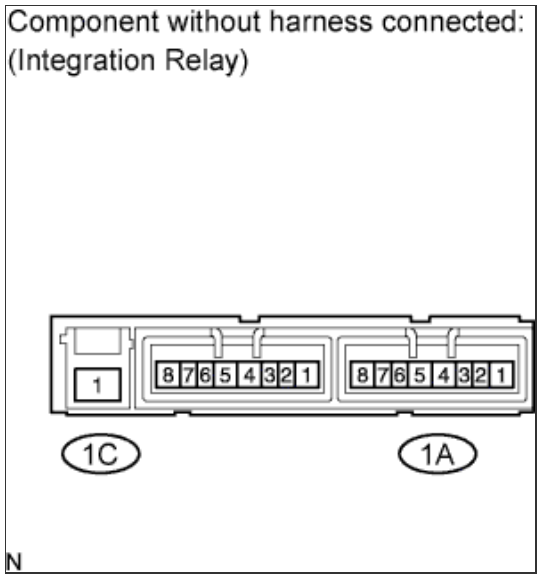
a. Measure the resistance of the A/F fuse.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

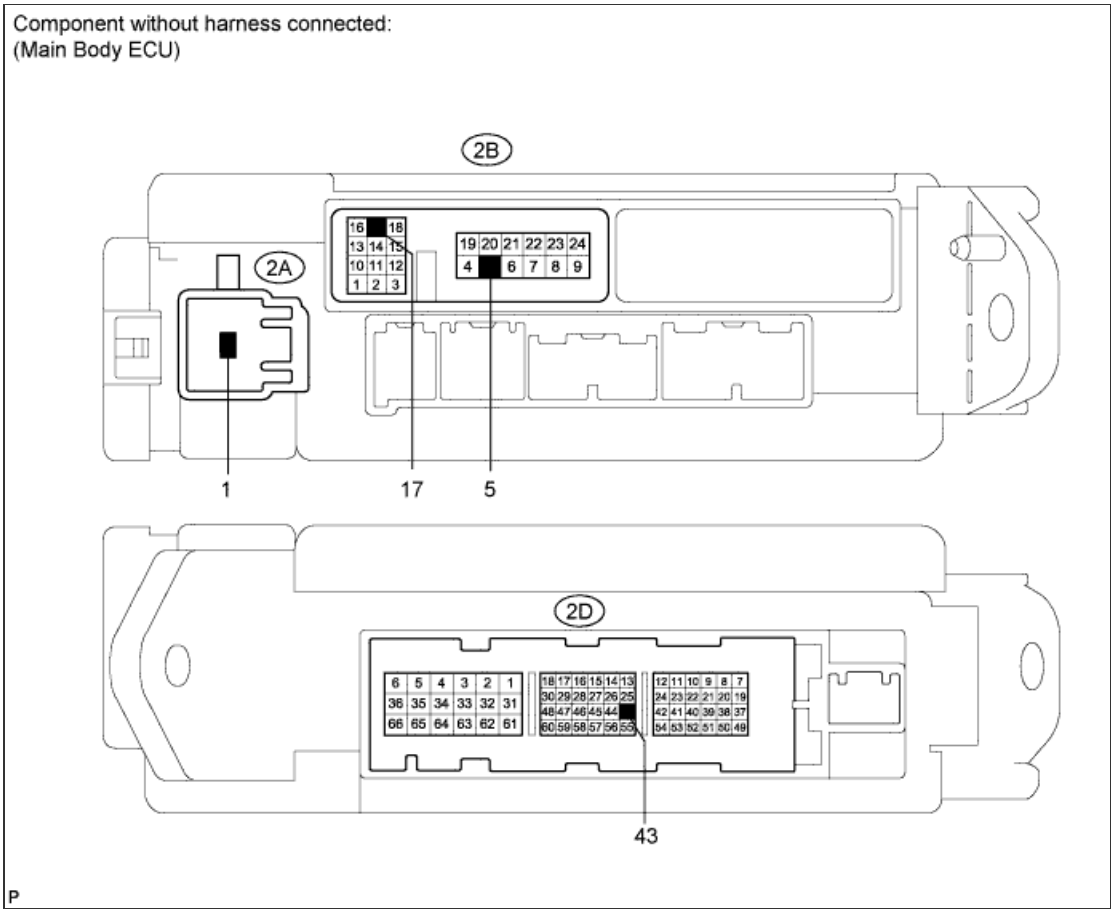
If the result is not as specified, replace the A/F fuse.



b. Measure the resistance of the A/F sensor heater relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1C-1 - 1A-	Battery voltage is not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage is applied to terminals 1A-2 and 1A-3	Below 1 Ω

If the result is not as specified, replace the integration relay.

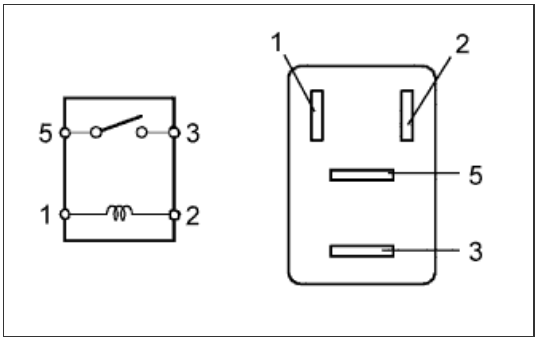
6. INSPECT MAIN BODY ECU (IG1 NO. 1)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Condition	Condition	Specified Condition
2A-1 - 2B-17	Battery voltage is not applied to terminals 2B-5 and 2D-43	10 kΩ or higher
	Battery voltage is applied to	

	terminals 2B-5 and 2D-43	Below 1 Ω



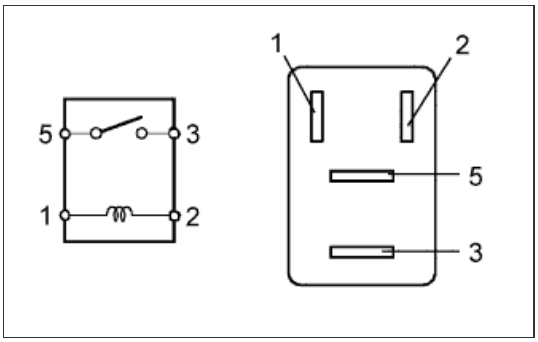
If the result is not as specified, replace the cowl side junction block LH.

7. INSPECT STARTER RELAY (ST)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

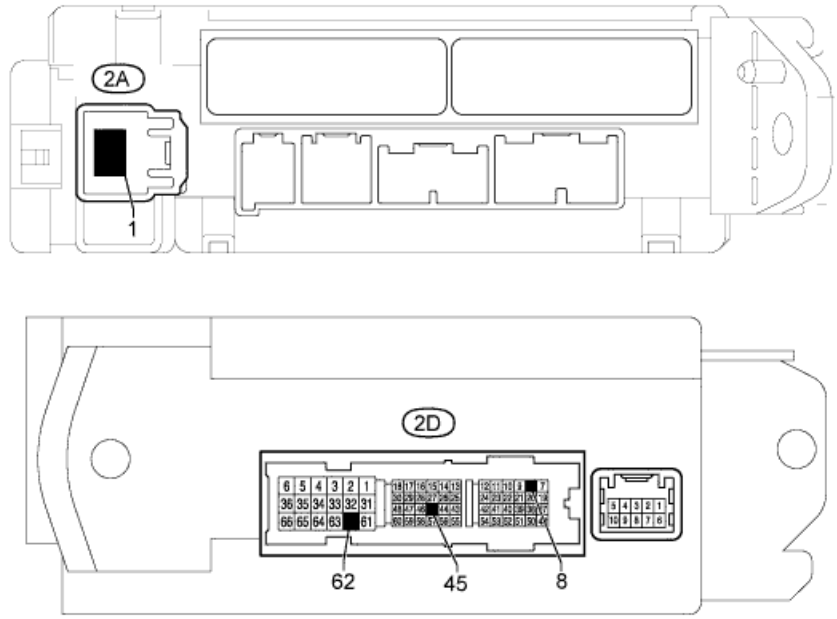


If the result is not as specified, replace the relay.

8. INSPECT STARTER CUT RELAY (ST CUT)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

9. INSPECT MAIN BODY ECU (ACC RELAY)

Component without harness connected: (Main Body ECU)

P

a. Measure the resistance of the ACC relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2A-1 - 2D-8	Battery voltage not applied between 2D-45 and 2D-62	10 kΩ or higher
	Battery voltage applied between 2D-45 and 2D-62	Below 1 Ω

If the result is not as specified, replace the main body ECU.

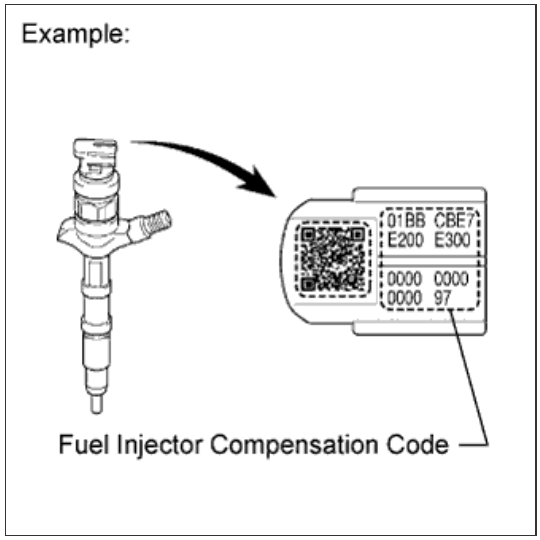
for Preparation Click here

1.IGNITION SWITCH EXPRESSION

HINT:

The type of ignition switch used on this model differs according to the specifications of the vehicle. The e pressions listed in the table below are used in this section.

E pression	Ignition Switch (position)	Engine Switch (condition)
Ignition Switch off	ff	ff
Ignition Switch		n (IG)
Ignition Switch ACC	ACC	n (ACC)
Engine Start	STA T	Start



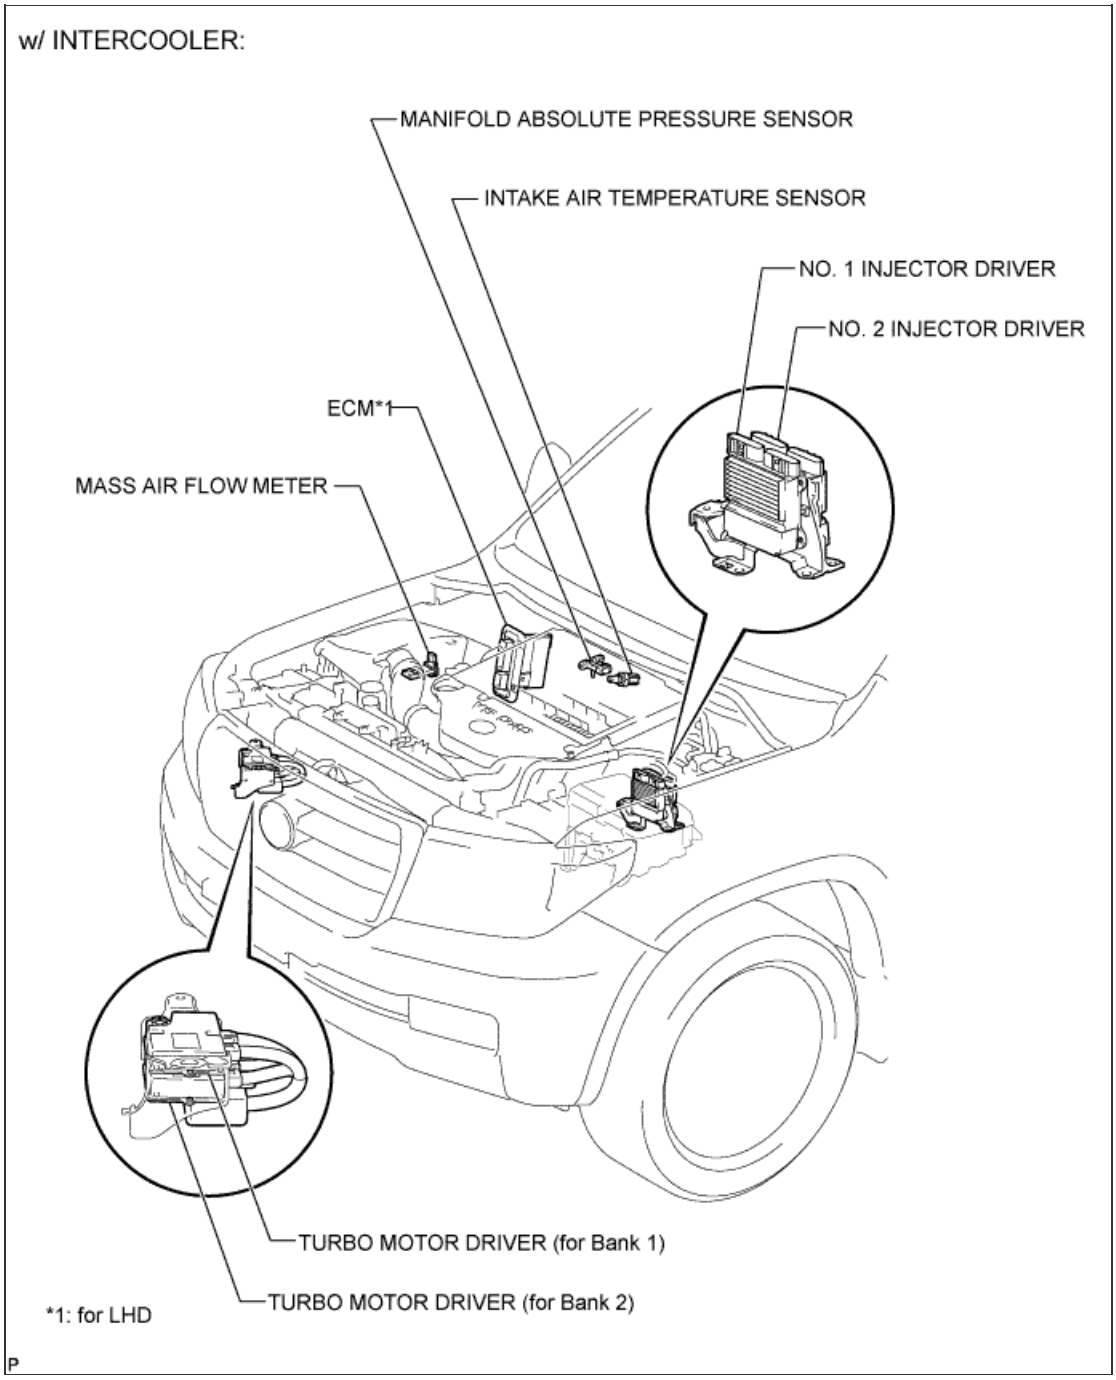
2.FUEL INJECTOR COMPENSATION CODE

a. Each fuel in ector has different fuel in ection characteristics. In order to optimize fuel in ection performance, the ECM compensates for these differences by ad usting the fuel in ection duration of each fuel in ector according to its compensation code. Fuel in ector compensation codes are unique, 30 digit, alphanumeric values printed on the head portion of each fuel in ector.

b. hen a fuel in ector is replaced, the new fuel in ector compensation code must be input into the ECM.

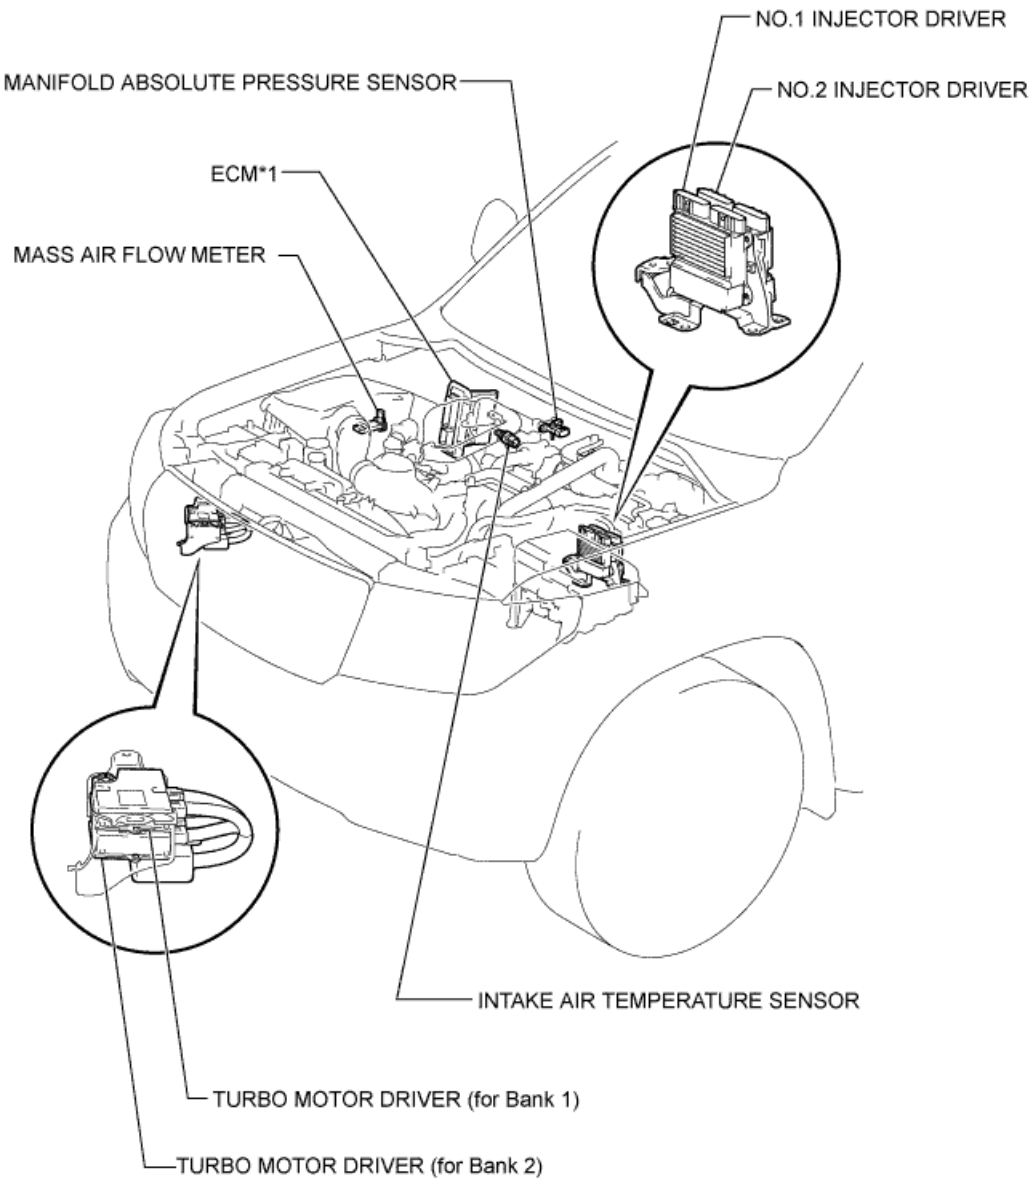
c. hen the ECM is changed, all of the e isting fuel in ector compensation codes must be input into the new ECM.

d. If an incorrect fuel in ector compensation code is input into the ECM, the engine assembly may rattle or engine idling may become rough. In addition, engine failure may occur and the life of the engine may be shortened.



3.FOR USING INTELLIGENT TESTER

CAUTION:



Observe the following items for safety reasons:

- **Before using the tester, read its instruction manual.**
- **Prevent the tester cable from being caught on the pedals, shift lever or steering wheel when driving with the tester connected to the vehicle.**
- **When driving the vehicle for testing purposes using the tester, two persons are required. One person drives the vehicle, and the other operates the tester.**

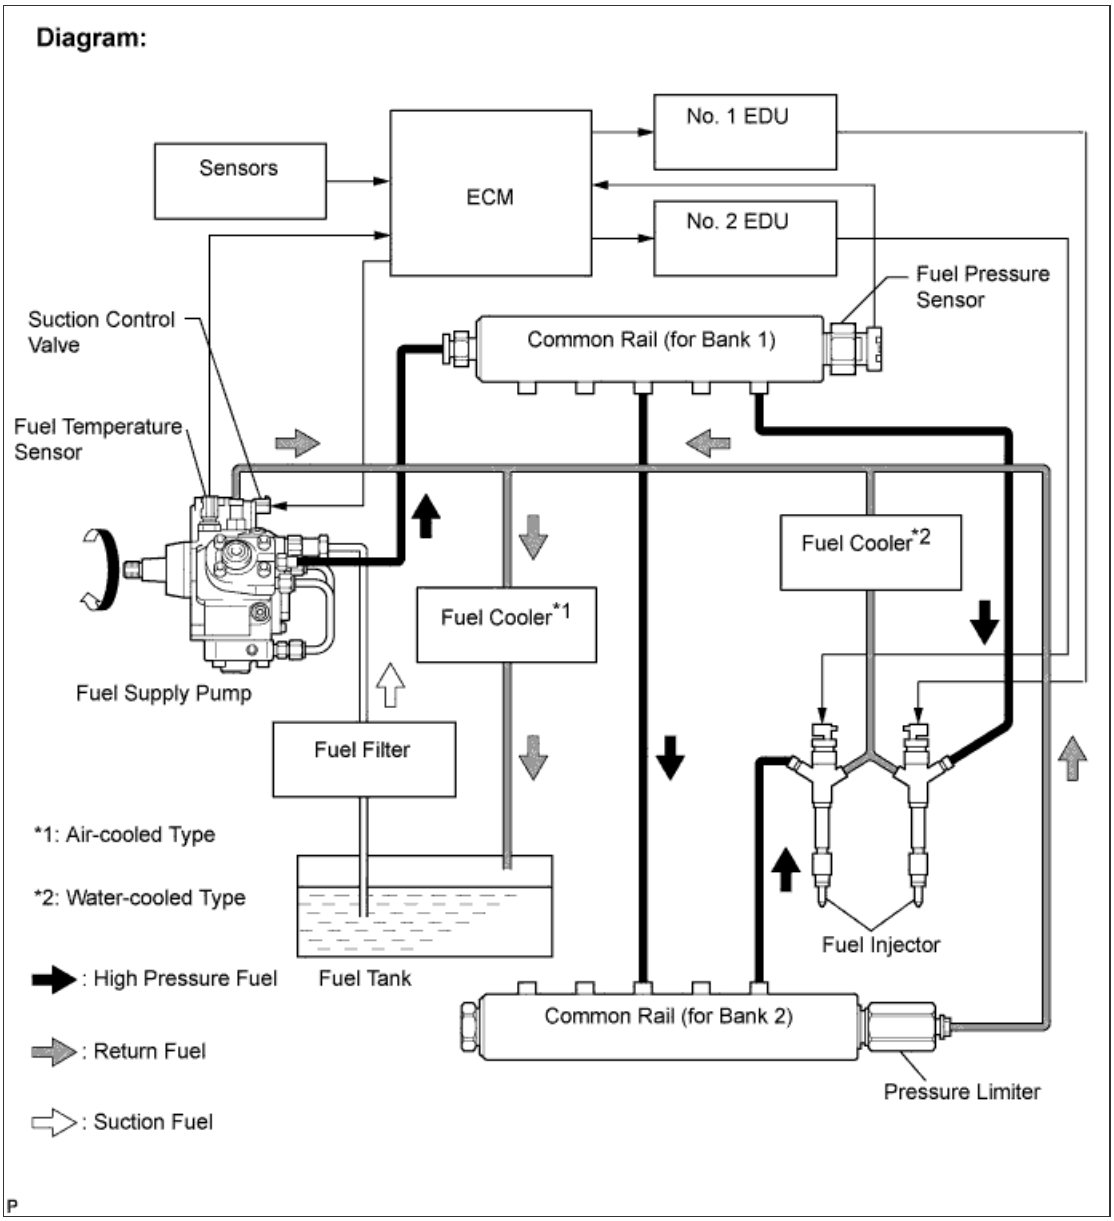
SYSTEM DIAGRAM

COMMON RAIL INJECTION SYSTEM

Common Rail Injection System:

The common rail injection system uses high-pressure fuel to improve fuel economy and to provide robust engine power, while suppressing engine vibration and noise.



This system stores fuel, which has been pressurized and supplied by the fuel supply pump, in the common rail. By storing fuel at high-pressure, the common rail system can provide fuel at stable fuel injection pressures, regardless of engine speed or engine load.

The ECM regulates the fuel injection timing and volume by using the EDU to provide an electric current to the solenoid valve in the fuel injector. The ECM also monitors the internal fuel pressure of the common rail using the fuel pressure sensor. The ECM causes the fuel supply pump to supply the fuel necessary to obtain the target fuel pressure.

In addition, this system has a 2-Way Valve (TWV) inside the fuel injector to open and close the fuel passage. As a result, both fuel injection timing and fuel injection volume can be precisely regulated by the ECM.

The common rail system provides two split fuel injections. In order to soften combustion shock, this system performs "pilot-injection" as the subsidiary fuel injection prior to the main fuel injection. This helps to reduce engine vibration and noise.

Diagram:

Components:

Component	Description
Common rail	Stores high-pressure fuel produced by fuel supply pump
Fuel supply pump	Operated by crankshaft. Supplies high-pressure fuel to common rail.
Fuel injector	Injects fuel to combustion chamber based on signals from ECM
Fuel pressure sensor	Monitors internal fuel pressure of common rail and sends signals to ECM
Pressure limiter	Opens pressure limiter valve to reduce internal pressure in common rail when common rail pressure exceeds specified level
Suction control valve	Based on signals from ECM, adjusts fuel volume supplied to common rail and regulates internal fuel pressure

Diagnostic Trouble Code (DTC) Table for Common Rail System:

HINT:

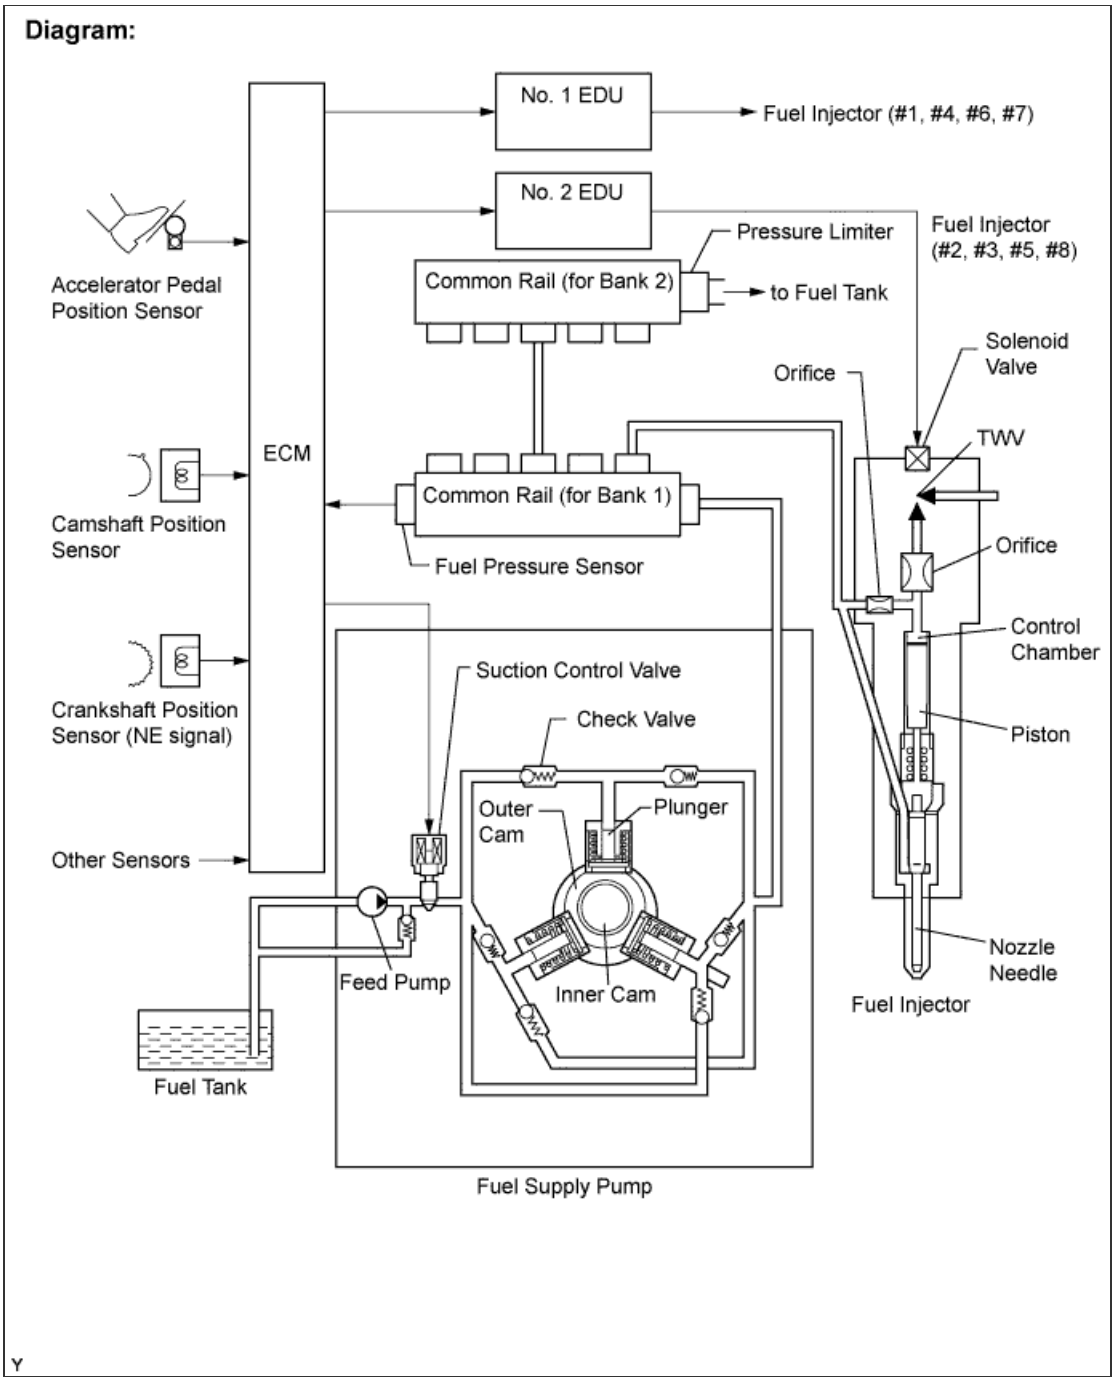
This table indicates typical DTCs for each malfunction.

Component	Trouble Area	DTC No.
Fuel injector	Open or short in fuel injector circuit	P062D, P062E, P1238, P0093*
	Stuck open	P0093, P1238
	Stuck closed	P1238
Fuel pressure sensor	Open or short in fuel pressure sensor circuit or pressure sensor output fixed	P0087, P0190, P0192, P0193
	Stuck open	P0093

Pressure limiter	Stuck closed	P0088*
Suction control valve	Open or short in suction control valve circuit	P0627, P1229, P0088*
	Stuck open	P1229, P0088*
	Stuck closed	-
Injector driver (EDU)	Faulty EDU	P0093*, P062D*, P062E*, P1238*
Common rail system (Fuel system)	Fuel leaks in high-pressure areas	P0093

HINT:

*: There may be no DTC output depending on the condition of the malfunction.



Diagnostic Trouble Code Description for Common Rail System:

DTC No.	Description
P0087	Fuel pressure sensor output does not change
P0088	Internal fuel pressure too high (230 MPa [2345 kgf/cm ^{2}, 33350 psi] or more)
P0093	Fuel leaks in high-pressure areas
P0190	Open or short in fuel pressure sensor circuit (Low or high output)
P0192	Open or short in fuel pressure sensor circuit (Low output)
P0193	Open or short in fuel pressure sensor circuit (High output)
P062D	Open or short in No. 1 injector driver or fuel injector circuit
P062E	Open or short in No. 2 injector driver or fuel injector circuit
P0627	Open or short in suction control valve circuit
P1229	Fuel over-feed
P1238	Injection malfunction; excludes open or short in fuel injector circuit
P1601	Fuel injector compensation code malfunction

INJECTION CONTROL

The ECM controls the fuel injection system by using the fuel injectors and fuel supply pump. The ECM regulates the fuel injection volume and fuel injection timing by controlling the duration and timing of the electric current provided to the solenoid valve in the fuel injector. The ECM regulates injection pressure by controlling the suction control valve located in the fuel supply pump.
The feed pump is used to pump fuel from the fuel tank to the fuel supply pump.

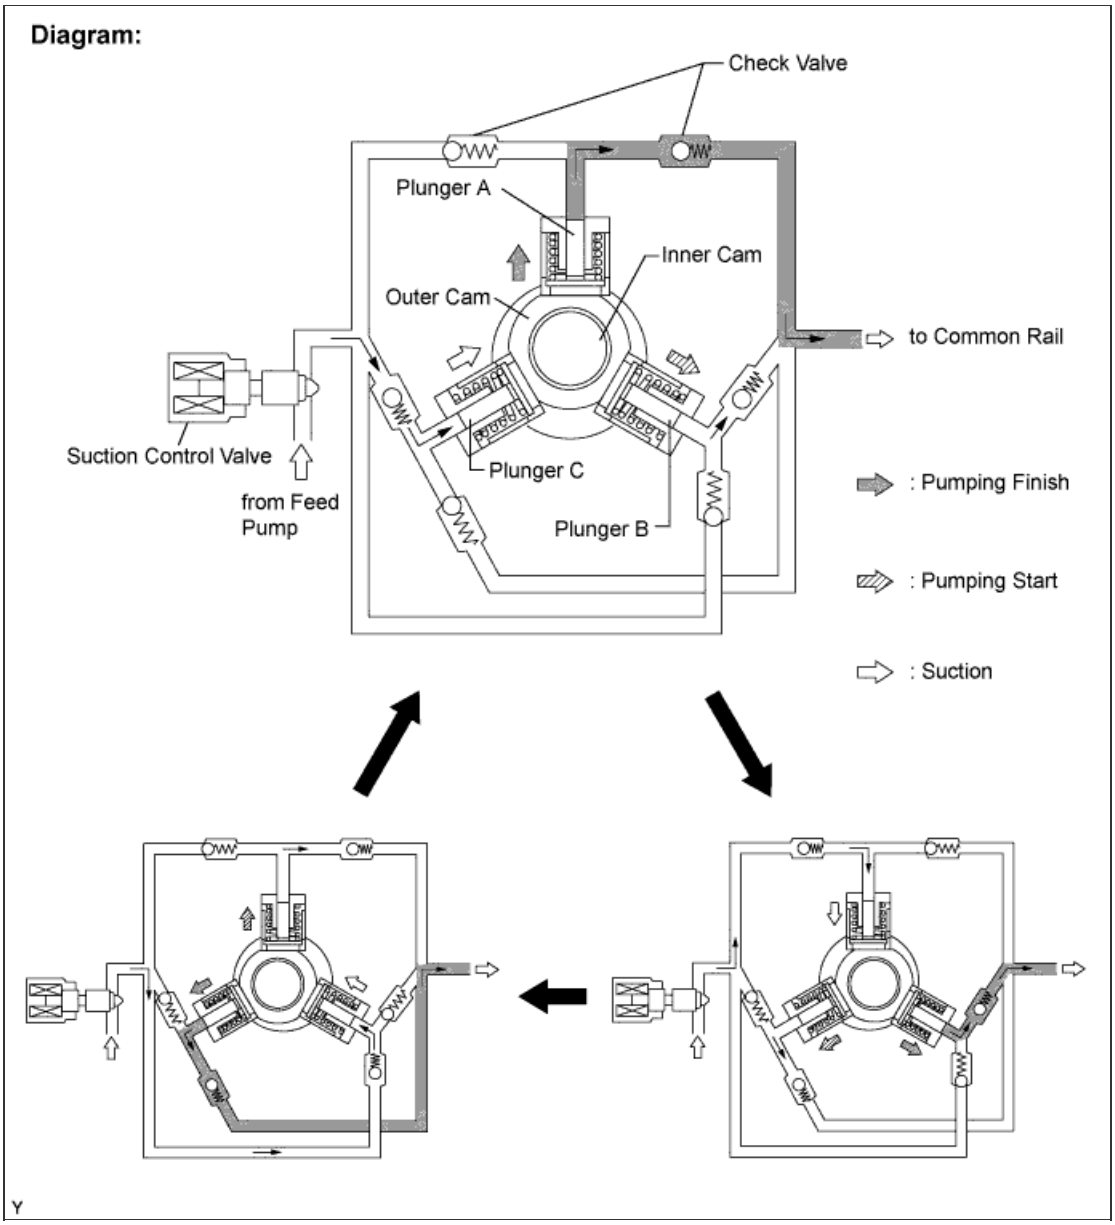


Diagram:

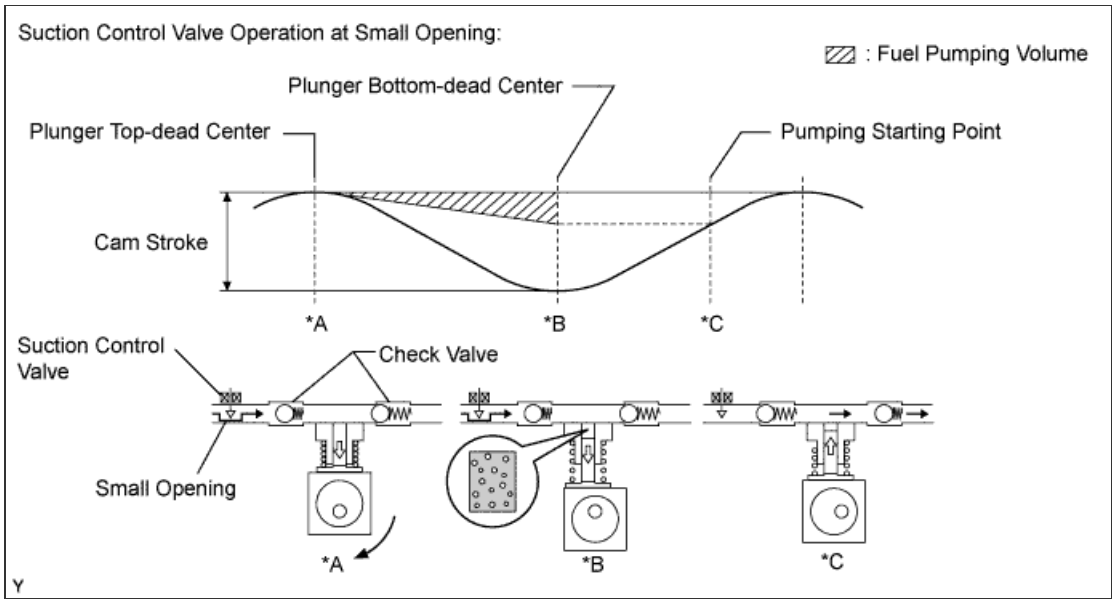
FUEL SUPPLY PUMP

Due to the rotation of the inner cam (eccentric cam), the outer cam pushes plunger A upward as illustrated below. The force of the spring pulls plunger B and C. As a result, plunger B and C draw fuel in, and plunger A pumps fuel at the same time.

Diagram:

SUCTION CONTROL VALVE

HINT:



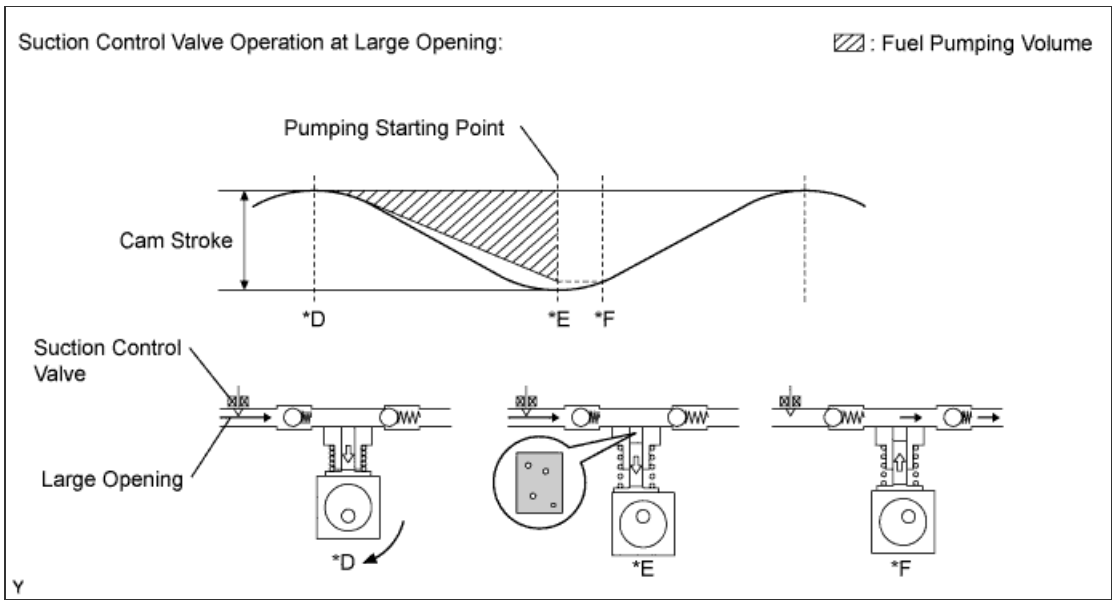
The ECM controls the suction control valve operation to regulate the fuel volume that is pumped by the fuel supply pump to the common rail. This control is performed to adjust the internal fuel pressure of the common rail to the targeted injection pressure.

a. Small opening of the suction control valve:

i. When the opening of the suction control valve is small, the fuel suction path is kept narrow. Therefore the transferable fuel volume is reduced*A.

ii. The suction volume becomes small due to the narrow path despite the plunger stroke being full. The difference between the geometrical volume and suction volume creates a vacuum*B.

iii. Pumping will start when the fuel pressure becomes higher than the common rail pressure*C.



b. Large opening of the suction control valve:

i. When the opening of the suction control valve is large, the fuel suction path is kept wide. Therefore the transferable fuel volume is increased*D.

ii. If the plunger stroke is full, the suction volume becomes large because of the wide path*E.

iii. Pumping will start when the fuel pressure becomes higher than the common rail pressure*F.

for Preparation Click here

HINT:

Intelligent tester only:

Inspect the vehicle ECM using check mode. Intermittent problems are easier to detect with the intelligent tester when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. Clear DTCs (Click here).
2. Switch the ECM from normal mode to check mode using the intelligent tester (Click here).
3. Perform a simulation test.
4. Check and wiggle the harness(es), connector(s) and terminal(s).

for Preparation Click here

HINT:

When a malfunction cannot be confirmed by the DTC check, troubleshooting should be performed on all circuits that are possible causes of the problem. However, in most cases, performing the basic engine check shown below can help you find the problem quickly and efficiently. Always perform this check first when troubleshooting the engine.

1.CHECK BATTERY VOLTAGE

NOTICE:

Perform the battery voltage check with the engine stopped and ignition switch off.

1. REGISTRATION

NOTICE:

- **When a fuel injector is replaced, the new fuel injector compensation code must be input into the ECM. When the ECM is replaced, all of the existing fuel injector compensation codes must be input into the new ECM.**
- **Fuel injector compensation codes are unique, 30 digit, alphanumeric values printed on the head portion of each fuel injector. If an incorrect fuel injector compensation code is input into the ECM, the engine assembly may rattle or engine idling may become rough. In addition, engine failure may occur and the life of the engine may be shortened.**

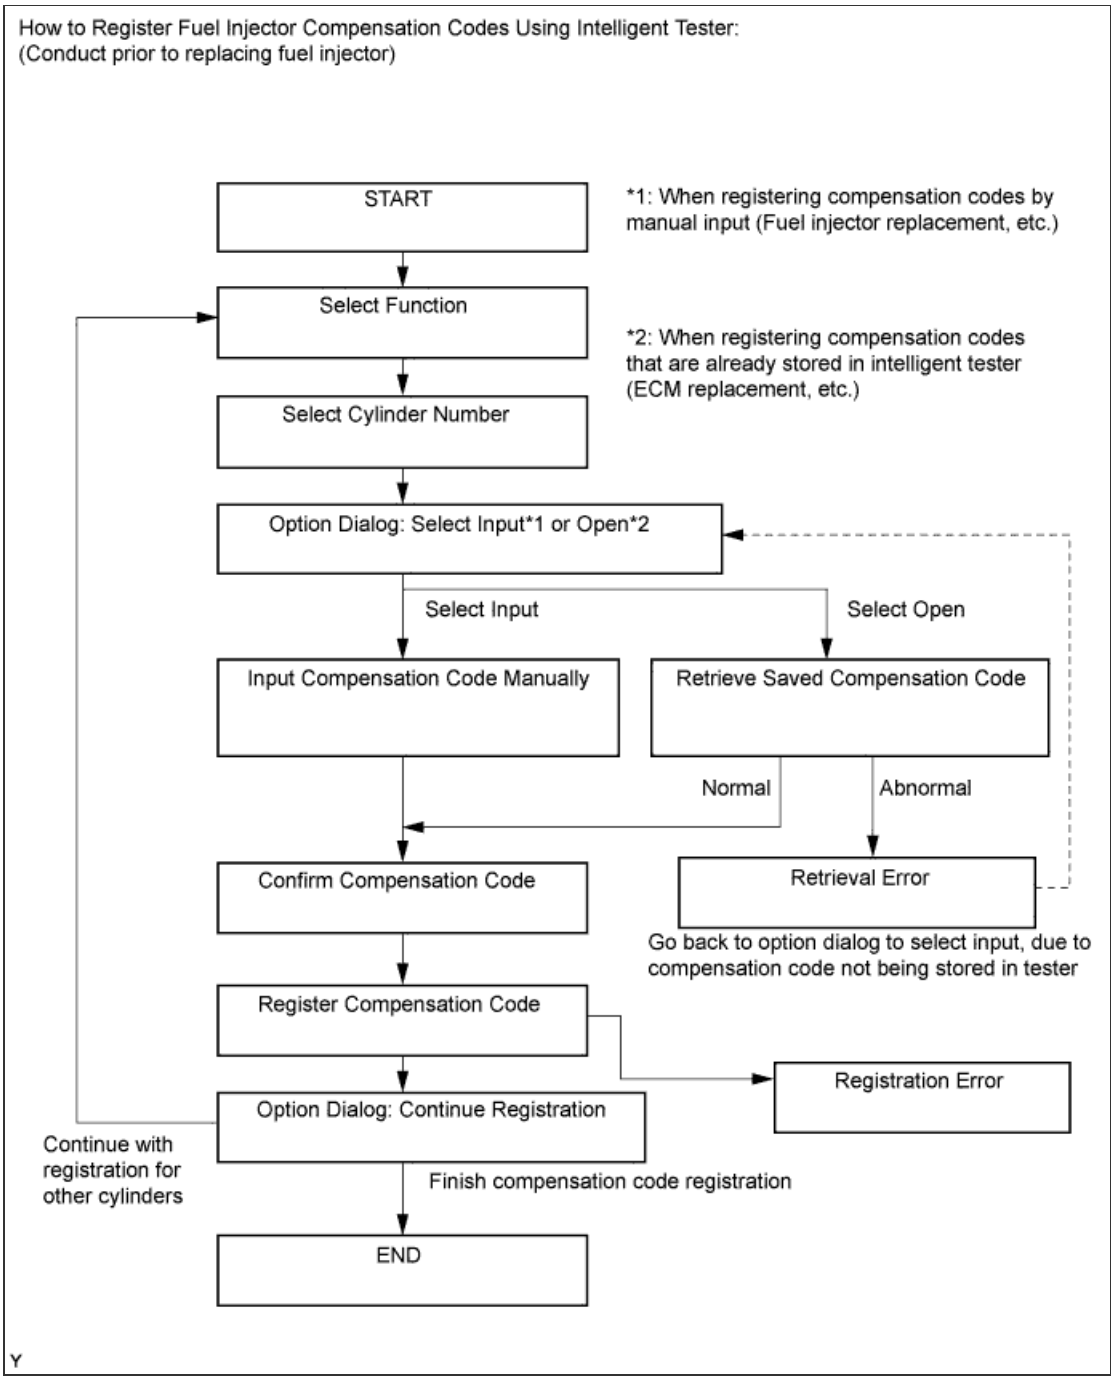
a. After replacing fuel injector(s) with new one(s), input compensation code(s) of fuel injector(s) into ECM as follows

HINT:

- **Each fuel injector has different fuel injection characteristics. In order to optimize the fuel injections, the ECM uses the compensation codes to balance the different fuel injections between each fuel injector.**
- **When you first turn the ignition switch to ON after replacing the ECM or a fuel injector(s), DTC P1601 is set. This is to inform you that registration of a fuel injector compensation code(s) is/are required. Manually clear the DTC upon completion of the compensation code registration.**

i. nput the compensation code(s), which is are imprinted on the head portion(s) of the new fuel injector(s), into the intelligent tester.

ii. nput the new compensation code(s) into the ECM using the tester.



iii. Turn the tester off and turn the ignition switch off.

iv. Wait for at least 30 seconds.

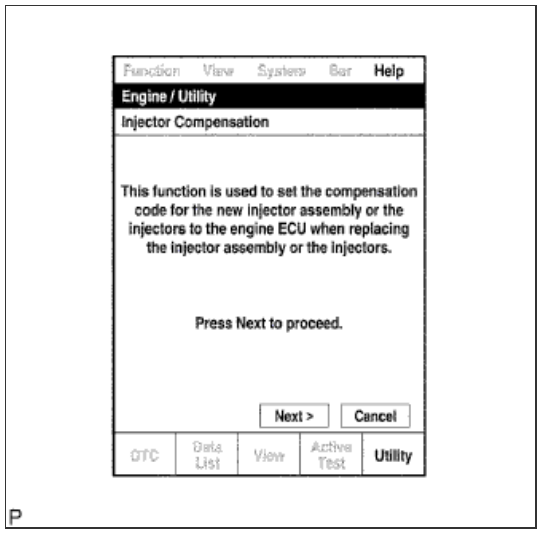
v. Turn the ignition switch to O and turn the tester on.

vi. Clear DTC P1 01 stored in the ECM using the tester (Click here).

b. Register compensation code.

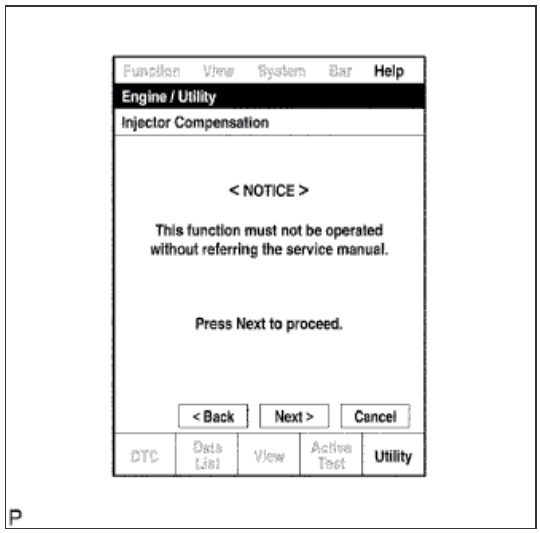
i. Connect the intelligent tester to the DLC3.

ii. Turn the ignition switch to O .



NOTICE:

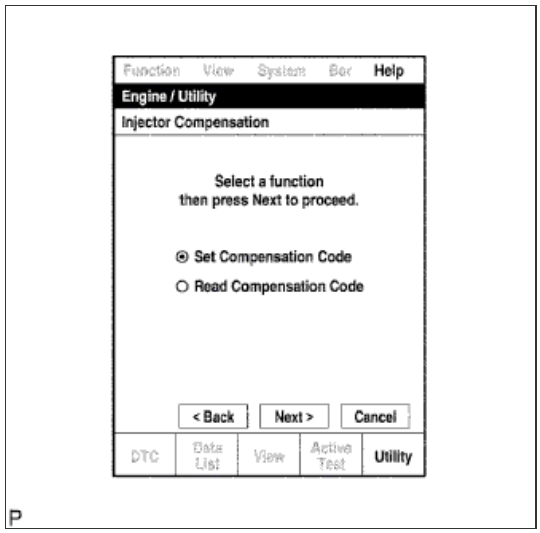
Do not start the engine.



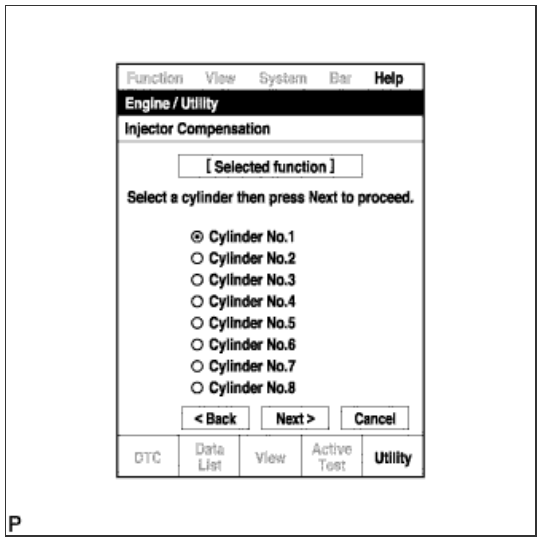
iii. Turn the tester on.

iv. Enter the following menus Powertrain Engine Utilit njector Compensation.

v. Press e t.



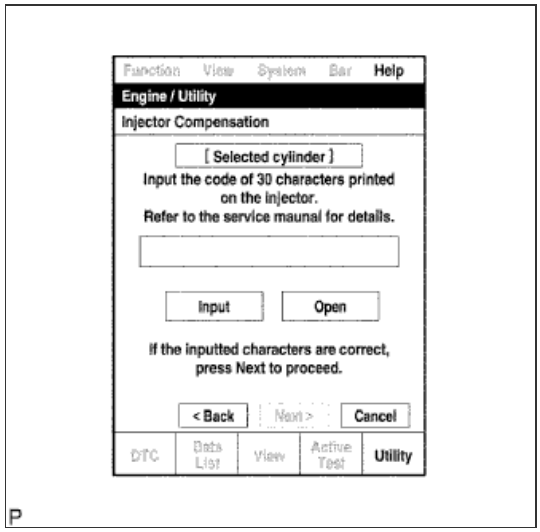
vi. Press e t again to proceed.



vii. Select et Compensation Code .

viii. Press e t.

ix. Select the num er of the c linder corresponding to the fuel injector compensation code that ou want to read.



x. Press e t.

P

xi. Register compensation code.

1. Press nput.

P

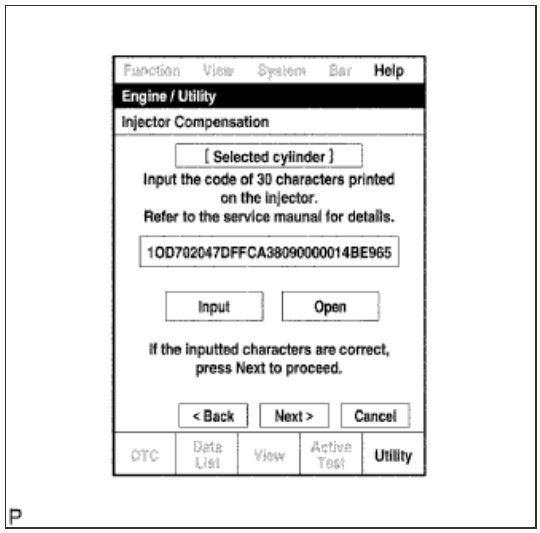
2. Manuall input the c linder compensation code using the ke oard on the tester screen. The code is a 30 digit, alphanumeric value printed on the injector head portion.

HINT:

Each fuel injector compensation code is uni e. The compensation code for each selected c linder must e input into the tester correctl .

3. Confirm that the compensation code for the selected c linder is correct, and then press O .

P



xii. Check that the compensation code displa ed on the screen is correct comparing it with the 30 digit alphanumeric value on the head portion of the fuel injector.

NOTICE:

f an incorrect fuel injector compensation code is input into the ECM, the engine ma rattle or engine idling ma ecome rough. n addition, engine failure ma occur and the life of the engine ma e shortened.

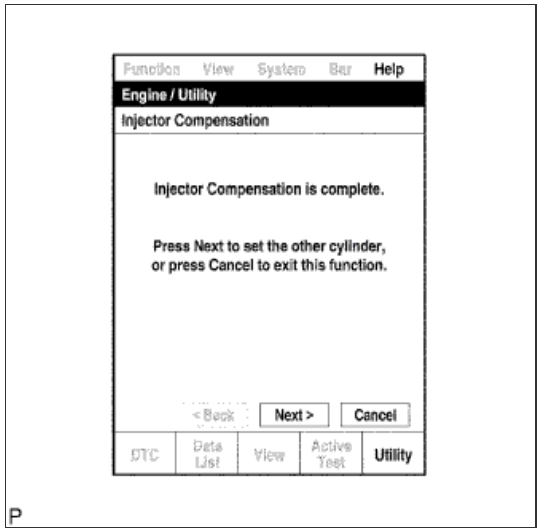
HINT:

- **If a wrong compensation code is input or read, return to the Input Value screen by pressing Input.**
- **The saving process may fail due to a problem with the wire harness or a bad connection with the DLC3. Check the wire harness and DLC3 connection. If no problem is found with either, the ECM may be malfunctioning. Check the ECM and repeat this operation.**

xiii. Press e t to register the compensation code in the ECM.

HINT:

- **If the registration process fails, the compensation code may be incorrect. Check the compensation code again.**
- **If the input compensation code fails to register even though it is input correctly, there may be a problem with the wire harness or a bad connection with the DLC3. Check the wire harness and DLC3 connection. If no problem is found with either, the ECM may be malfunctioning. Check the ECM and restart this operation.**



xiv. f ou want to continue with other compensation code registrations, press e t. To finish the registration, press Cancel.

xv. Turn the ignition switch off and then turn the tester off.

xvi. Wait for at least 30 seconds.

xvii. Turn the ignition switch to O and then turn the tester on.

xviii. Clear DTC P1 01 stored in the ECM using the tester (Click here).

2. READING REGISTERED DATA

NOTICE:

- **When a fuel injector is replaced, the new fuel injector compensation code must be input into the ECM. When the ECM is changed, all of the existing fuel injector compensation codes must be input into the new ECM.**
- **Fuel injector compensation codes are unique, 30 digit, alphanumeric values printed on the head portion of each fuel injector. If an incorrect fuel injector compensation code is input into the ECM, the engine may rattle or engine idling may become rough. In addition, engine failure may occur and the life of the engine may be shortened.**

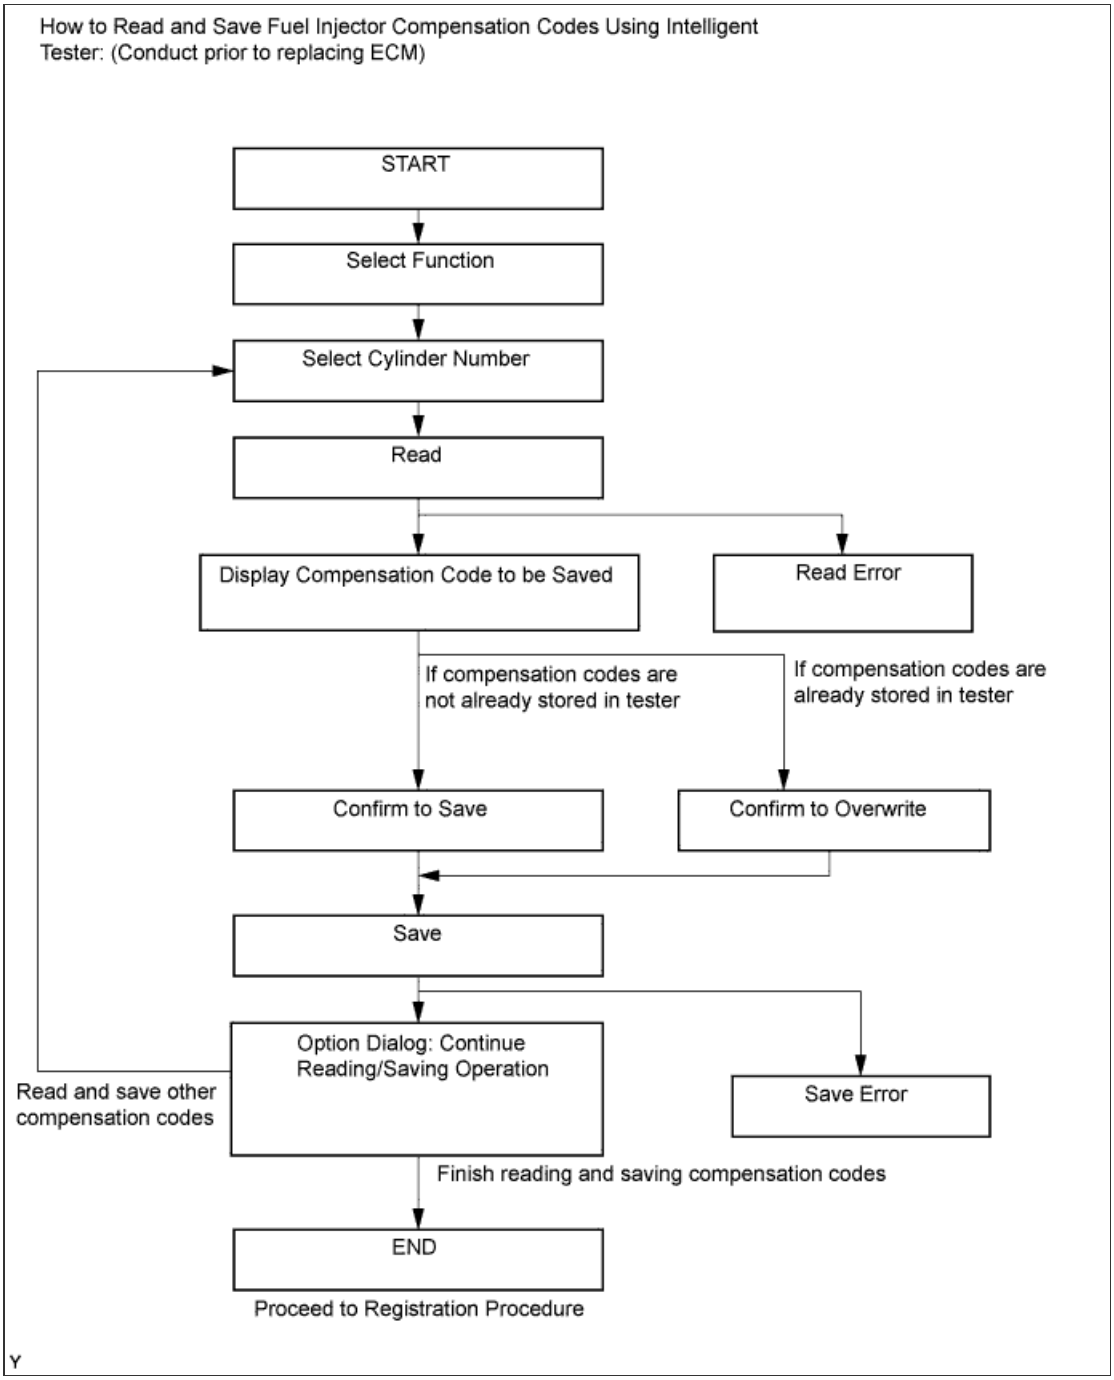
a. When replacing ECM with a new one, input all fuel injector compensation codes into new ECM as follows

HINT:

- **Each fuel injector has different fuel injection characteristics. In order to optimize the fuel injections, the ECM uses the compensation codes to balance the different fuel injections between each injector.**
- **When you first turn the ignition switch to ON after replacing the ECM or a fuel injector(s), DTC P1601 is set. This is to inform you that registration of a fuel injector compensation codes(s) is/are required. Manually clear the DTC upon completion of the compensation code registration.**

i. rior to replacing the ECM, read and save each fuel injector compensation code, stored in the original ECM, using the intelligent tester.

ii. After installing a new ECM, input the saved compensation codes into the new ECM using the tester.



iii. Turn the tester off and turn the ignition switch off.

iv. Wait for at least 30 seconds.

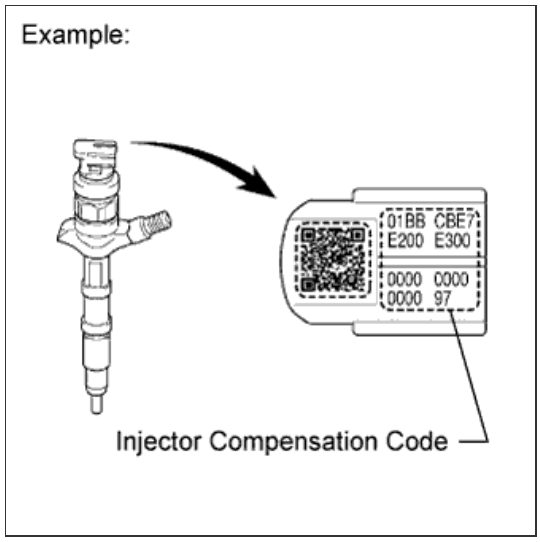
v. Turn the ignition switch to O and turn the tester on.

vi. Clear DTC P1 01 stored in the ECM using the tester (Click here).

b. Read and save fuel injector compensation codes.

HINT:

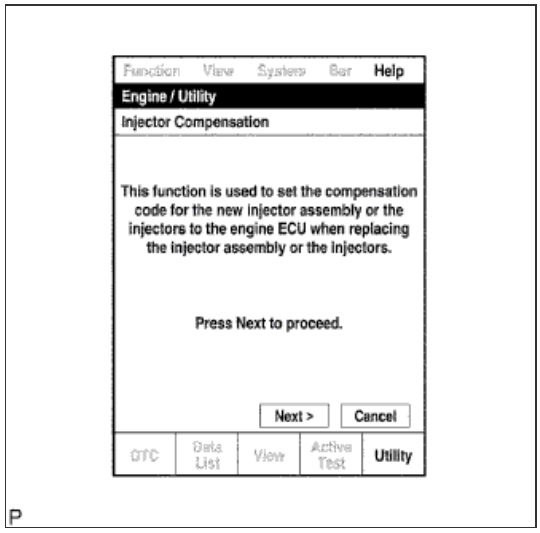
The following operation is availa le with ECMs that can transmit the registered fuel injector compensation codes to the intelligent tester.



i. Connect the intelligent tester to the DLC3.

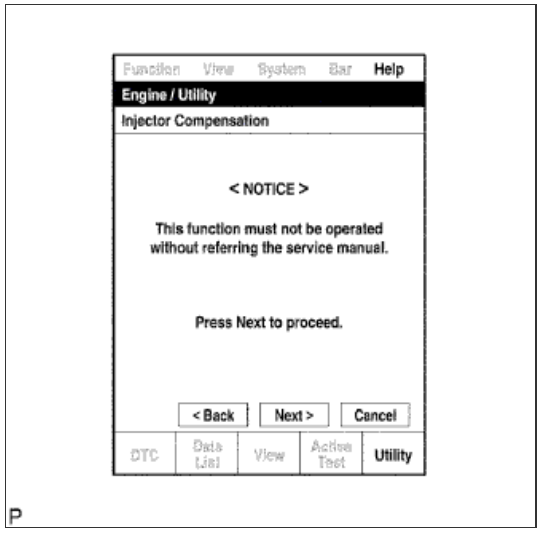
ii. Turn the ignition switch to O .

NOTICE:



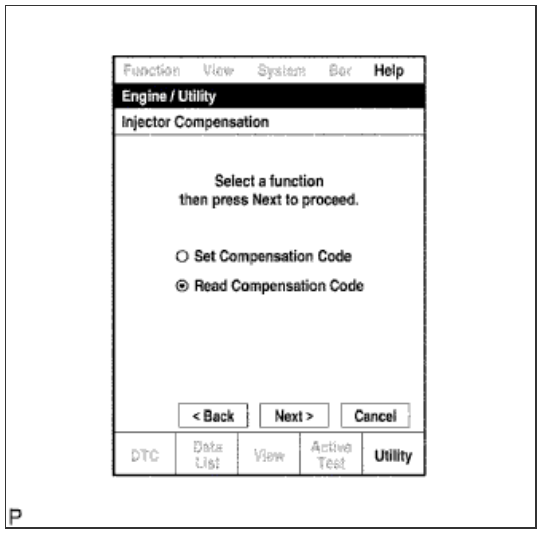
Do not start the engine.

iii. Turn the tester on.



iv. Enter the following menus Powertrain Engine Utilit njector Compensation.

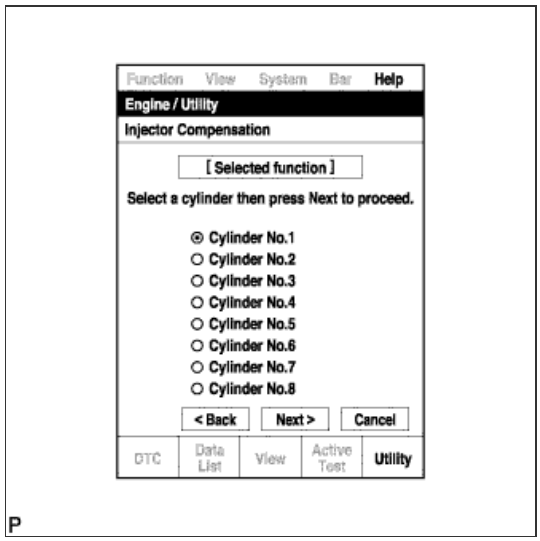
v. Press e t.



vi. Press e t again to proceed.

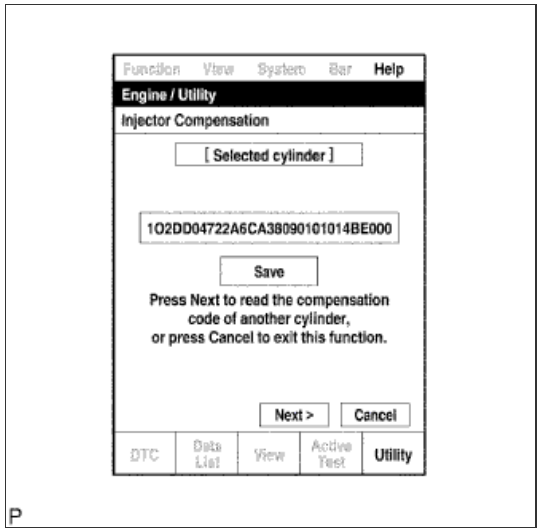
vii. Select Read Compensation Code.

viii. Press e t.



ix. Select the num er of the c linder corresponding to the fuel injector compensation code that ou want to read.

x. Press e t.



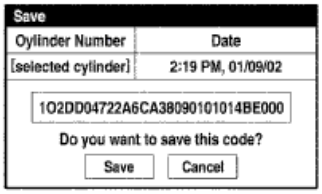
HINT:

The reading process ma fail due to a pro lem with the wire harness or a ad connection with the DLC3. Check the wire harness and DLC3 connection. f no pro lem is found, the ECM ma e malfunctioning. Check the ECM and restart this operation.

xi. Check the fuel injector compensation code (30 digit alphanumeric value) displa ed on the tester screen.

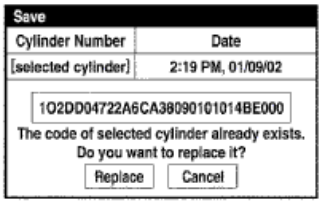
xii. Press Save.

xiii. Check that the compensation code displa ed on the tester screen is correct.



xiv. Press Save or Replace to save the fuel injector compensation code.

HINT:

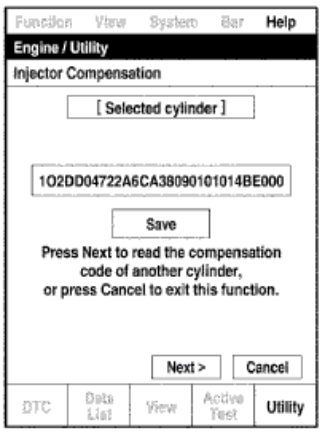


- **The existing compensation code is overwritten with the new compensation code and is deleted from the tester.**
- **The saving process may fail due to a problem with the**

wire harness or a bad connection with the DLC3. Check the wire harness and DLC3 connection. If no problem is found with either, the ECM may be malfunctioning. Check the ECM and restart this operation.

When no fuel injector compensation code for the cylinder exists in the tester:

When another fuel injector compensation code for the cylinder exists in the tester:



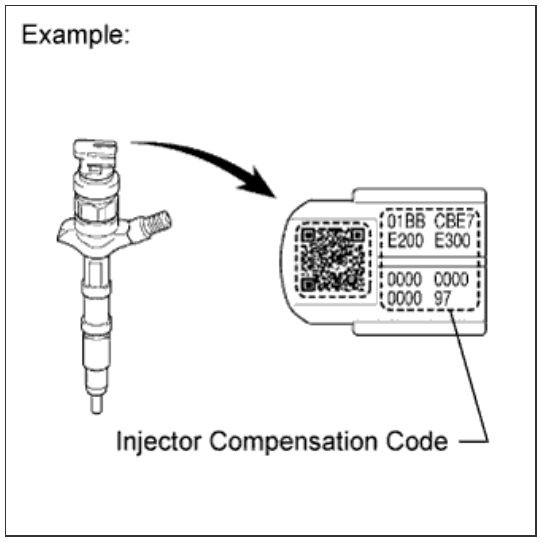
xv. f ou want to read and save other fuel injector compensation codes for other c linders, press e t to continue. To finish this operation, press Cancel.

xvi. Turn the ignition switch off.

xvii. Turn the tester off.

xviii. Replace the ECM.

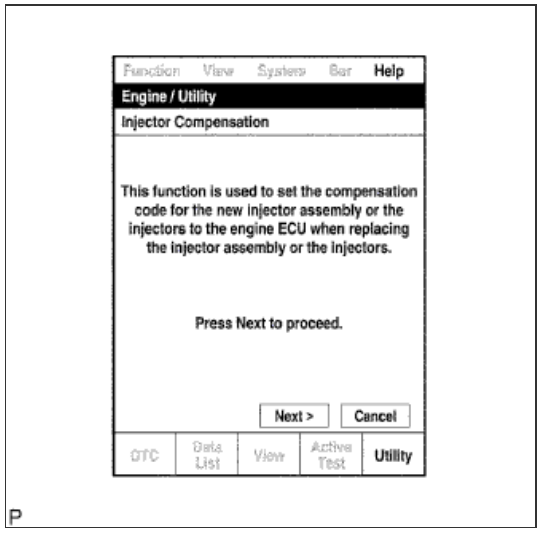
P



xix. Connect the intelligent tester to the DLC3.

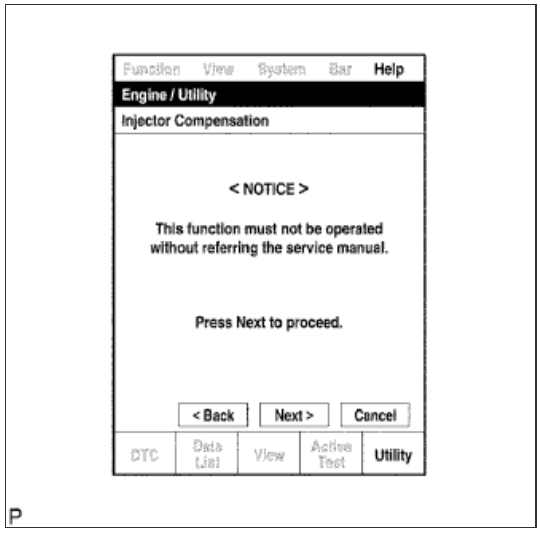
xx. Turn the ignition switch to O .

NOTICE:



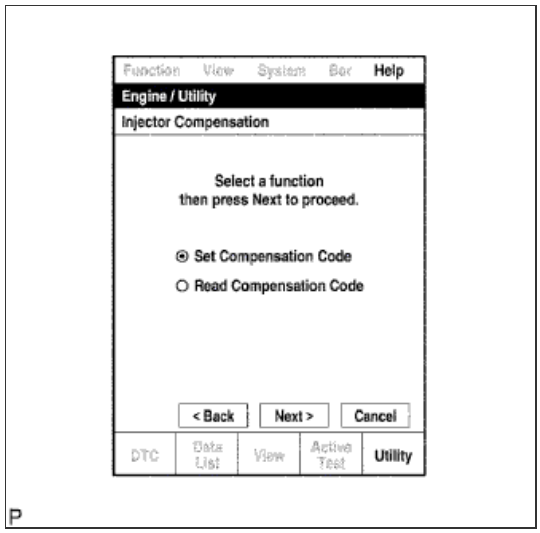
Do not start the engine.

xxi. Turn the tester on.

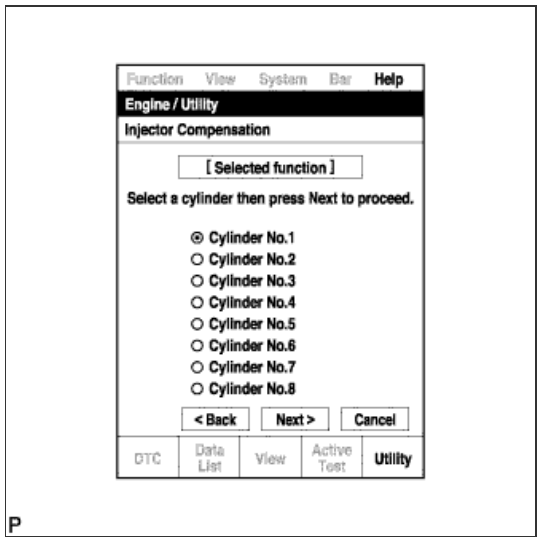


xxii. Enter the following menus Powertrain Engine Utilit njector Compensation.

xxiii. Press e t.



xxiv. Press e t again to proceed.

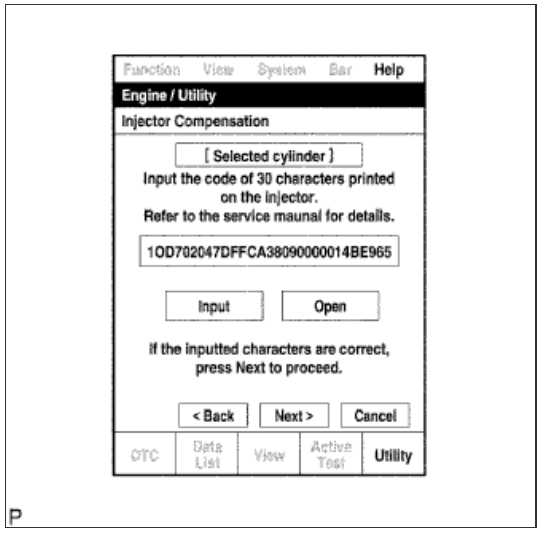


xxv. Select Set Compensation Code.

xxvi. Press e t.

xxvii. Select the num er of the c linder corresponding to the fuel injector compensation code that ou want to read.

xxviii. Press e t.



xxix. Check that the compensation code displa ed on the screen is correct comparing it with the 30 digit alphanumeric value on the head portion of the fuel injector.

NOTICE:

f an incorrect fuel injector compensation code is input into the ECM, the engine ma rattle or engine idling ma ecome rough. n addition, engine failure ma occur and the life of the engine ma e shortened.

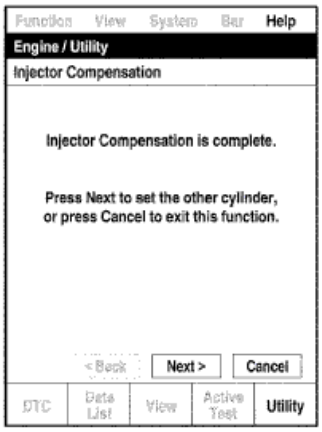
HINT:

- **If a wrong compensation code is input or read, return to the Input Value screen by pressing input.**
- **The saving process may fail due to a problem with the wire harness or a bad connection with the DLC3. Check the wire harness and DLC3 connection. If no problem is found with either, the ECM may be malfunctioning. Check the ECM and repeat this operation.**

xxx. Press e t to register the compensation code in the ECM.

HINT:

- **If the registration process fails, the compensation code may be incorrect. Check the compensation code again.**
- **If the input compensation code fails to register even though it is input correctly, there may be a problem with the wire harness or a bad connection with the DLC3. Check the wire harness and DLC3 connection. If no problem is found with either, the ECM may be malfunctioning. Check the ECM and restart this operation.**



xxxi. f ou want to continue with other compensation code registrations, press e t. To finish the registration, press Cancel.

xxxii. Turn the ignition switch off and then turn the tester off.

xxxiii. Wait for at least 30 seconds.

xxxiv. Turn the ignition switch to O and then turn the tester on.

xxxv. Clear DTC P1 01 stored in the ECM using the tester (Click here).

P

for Preparation Click here

HINT:

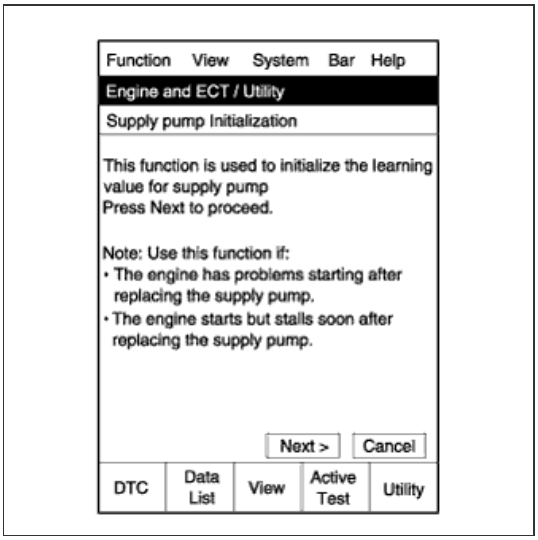
After replacing the supply pump and/or the ECM, the ECM learned values must be initialized.

The engine can be initialized through the intelligent tester or by connecting DLC3 terminals.

FUEL SUPPLY PUMP INITIALIZATION PROCEDURE

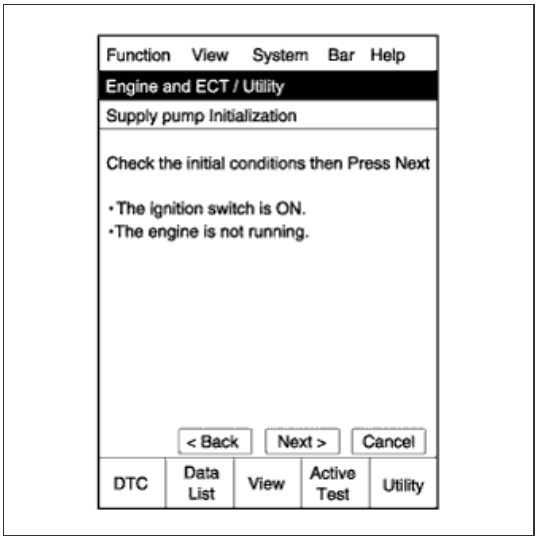
a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.



NOTICE:

Do not start the engine.



c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / Utility / Supply Pump Initialization.

e. Press "Next".

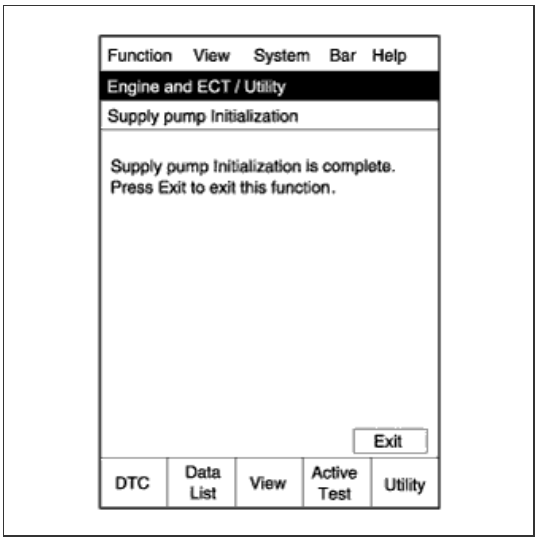
f. Press "Next".

g. Press "Exit".

h. Start the engine to check if the initialization is complete. If the engine cannot be started, repeat the initialization procedures from the beginning.

i. Idle the engine for at least 1 minute under the following conditions:

- The engine coolant temperature is 60°C (140°F) or more.
- The fuel temperature is 20°C (68°F) or more.



NOTICE:

Do not race the engine immediately after starting the engine. After warming up the engine, racing the engine is acceptable.

HINT:

If the engine coolant temperature is difficult to estimate, use the intelligent tester and enter the following menus: Powertrain / Engine / Data List / Coolant Temp and Fuel Temperature.

j. Initialization is complete.

for Preparation Click here

HINT:

Use the table below to help determine the cause of problem symptoms. If multiple suspected areas are listed, the potential causes of the symptoms are listed in order of probability in the "Suspected Area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.

Measure the voltage according to the value(s) in the table below.

HINT:

The standard normal voltage between each pair of ECM terminals is shown in the table below. The appropriate conditions for checking each pair of terminals are also indicated.

The result of the checks should be compared with the standard normal voltage for that pair of terminals, which is displayed in the Specified Condition column.

The illustration above can be used as a reference to identify the ECM terminal locations.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38*1-20 (BATT) - C45*1-81 (E1) A52*2-20 (BATT) - C46*2-81 (E1)	L - BR	Battery (for measuring the battery voltage and for the ECM memory)	Always	11 to 14 V
A38*1-28 (IGSW) - C45 (E1) A52 (IGSW) - C46 (E1)	B - BR	Ignition switch	Ignition switch ON	11 to 14 V
A3 (+B) - C45 (E1) A52 (+B) - C46 (E1)	B - BR	Power source of ECM	Ignition switch ON	11 to 14 V
A3 (MRE) - C45 (E1) A52 (MRE) - C46 (E1)	W-R - BR	E relay	Ignition switch ON	11 to 14 V
			10 seconds elapsed after ignition switch turned off	0 to 1.5 V
C45 (VCPM) - C45 (E2) C46 (VCPM) - C46 (E2)		ower source of manifold absolute pressure sensor (for PIM)	Ignition switch ON	4.5 to 5.5 V
C45 (VCM) - C45 (E2) C46 (VCM) - C46 (E2)		ower source of fuel pressure sensor (for PCR1)	Ignition switch ON	4.5 to 5.5 V

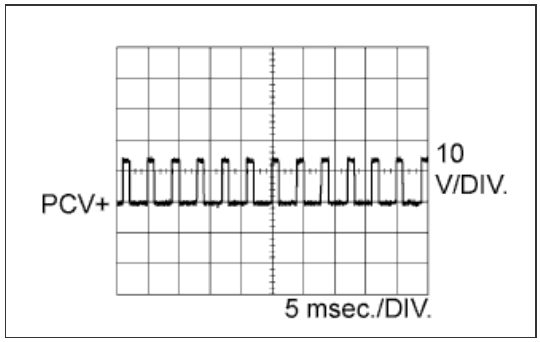
- ***2: for RHD**
- ***3: for M/T**

WAVEFORM 1

Fuel Injector No. 1 (to No. 8) Injection Signal

ECM Terminal Name	From #1 to #8 and E1
Tester Range	5 V DIV., 20 msec. DIV.
Condition	Idling with warm engine



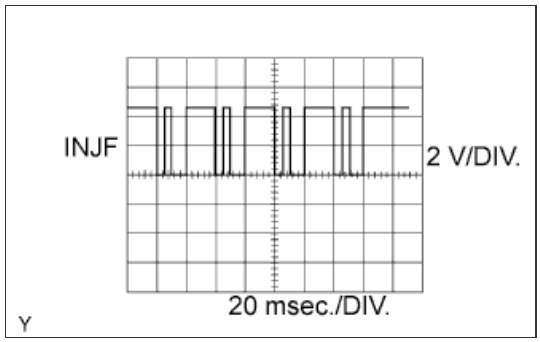
HINT:

The waveform varies depending on the in ector in ection.

WAVEFORM 2

Suction Control Valve Signal

ECM Terminal Name	PCV+ and PCV-
Tester Range	10 V DIV., 5 msec. DIV.
Condition	Idling or cranking with warm engine



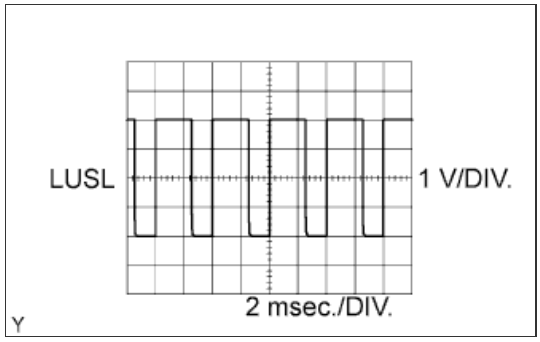
HINT:

The waveform varies depending on the suction control valve operation.

WAVEFORM 3

Injector Injection Confirmation Signal

ECM Terminal Name	IN and E1 INF2 and E1
Tester Range	2 V DIV., 20 msec. DIV.
Condition	Idling with warm engine



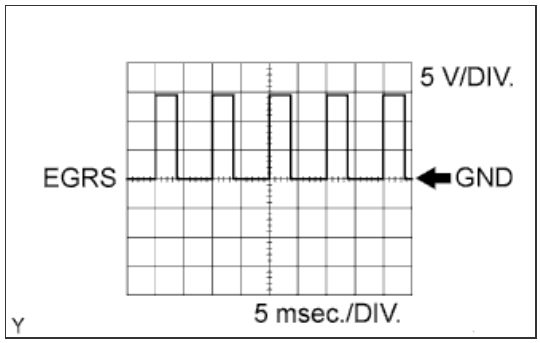
HINT:

The waveform varies depending on the in ector in ection.

WAVEFORM 4

Diesel Throttle Motor Signal

ECM Terminal Name	L SL and E1 L S2 and E1
Tester Range	1 V DIV., 2 msec. DIV.
Condition	Racing with warm engine



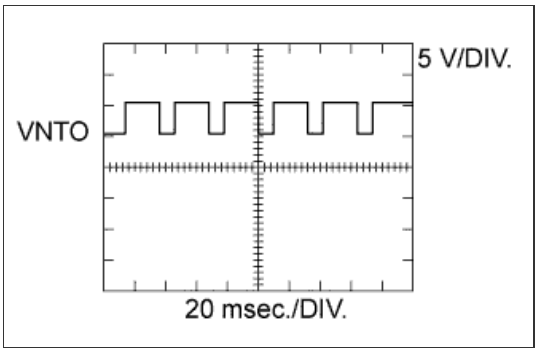
HINT:

The waveform varies depending on the throttle valve operation.

WAVEFORM 5

EGR Position Sensor Signal

ECM Terminal Name	EGRS and E1 ERS2 and E1
Tester Range	5 V DIV., 5 msec. DIV.
Condition	Idling



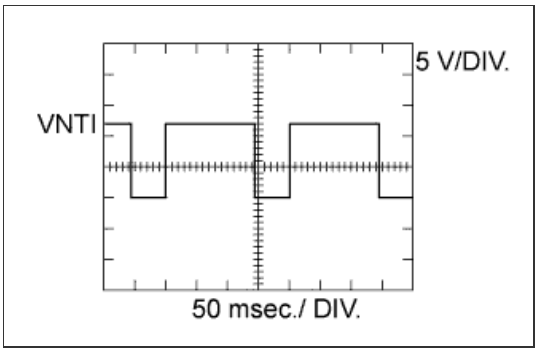
HINT:

The waveform varies depending on the throttle valve operation.

WAVEFORM 6

Turbo Motor Driver Input Signal

ECM Terminal Name	VNTO and E1 VNO2 and E1
Tester Range	5 V DIV., 20 msec. DIV.
Condition	Idling with warm engine



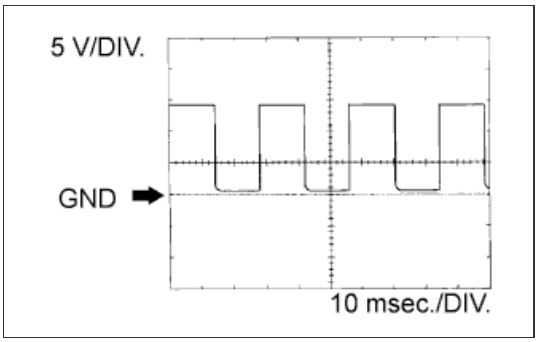
HINT:

The waveform varies depending on the turbocharger operation.

WAVEFORM 7

Turbo Motor Driver Output Signal

ECM Terminal Name	VNTI and E1 VNI2 and E1
Tester Range	5 V DIV., 50 msec. DIV.
Condition	Idling with warm engine



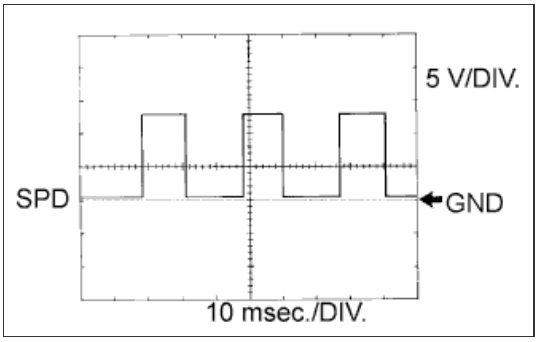
HINT:

The waveform varies depending on the turbocharger status.

WAVEFORM 8

Engine Speed Signal

ECM Terminal Names	TAC and E1
Tester Range	5 V DIV., 10 msec. DIV.
Conditions	Idling



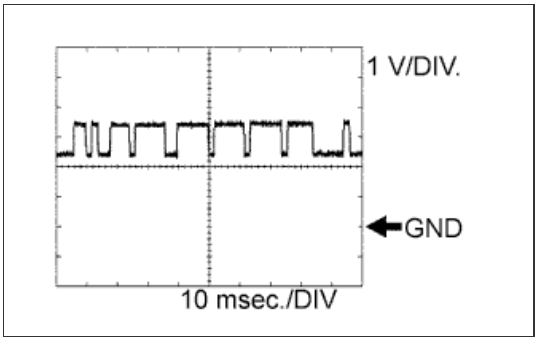
HINT:

The wavelength becomes shorter as the engine speed increases.

WAVEFORM 9

Vehicle Speed Signal

ECM Terminal Name	SPD and E1
Tester Range	5 V DIV., 10 msec. DIV.
Condition	Driving at vehicle speed of 40 km h (25 mph)



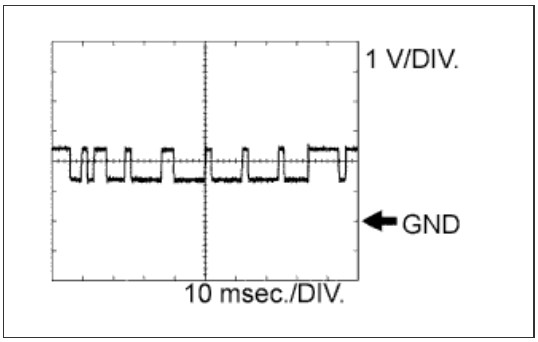
HINT:

The wavelength becomes shorter as the vehicle speed increases.

WAVEFORM 10

CAN Communication Signal

ECM Terminal Name	CAN+ and E1
Tester Range	1 V DIV., 10 msec. DIV.
Condition	Engine stopped, ignition switch ON



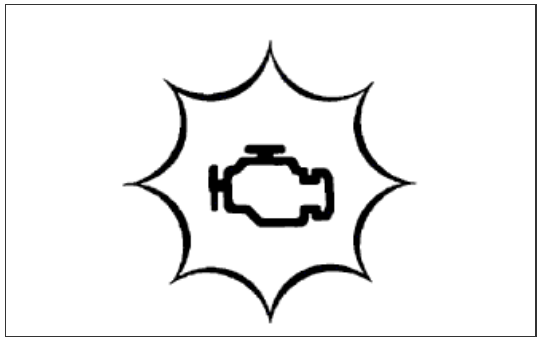
HINT:

The waveform varies depending on the CAN communication signal.

WAVEFORM 11

CAN Communication Signal

ECM Terminal Name	CAN- and E1
Tester Range	1 V DIV., 10 msec. DIV.
Condition	Engine stopped, ignition switch ON



HINT:

The waveform varies depending on the CAN communication signal.

EURO-OBD

When troubleshooting Europe ON-Boarding Diagnostic (Euro-OBD) vehicles, the vehicle must be connected to the intelligent tester. Various data output from the vehicle Engine Control Module (ECM) can then be read.
The Malfunction Indicator Lamp (MIL) is illuminated when the vehicle on-board computer detects a malfunction in the computer itself or in drive system components. In addition, the applicable Diagnostic Trouble Codes (DTCs) are stored in the ECM memory (Click here).
When the malfunction does not reoccur, the MIL stays illuminated until the ignition switch is turned off, and the MIL turns off when the engine is started. Be aware that the DTCs remain stored in the ECM memory.
To check DTCs, connect the intelligent tester to the DLC3 on the vehicle.

M-OBD (EXCEPT EUROPEAN SPEC.)

When troubleshooting Multiplex On-Board Diagnostic (M-OBD) vehicles, the vehicle must be connected to the intelligent tester. Various data output from the vehicle Engine Control Module (ECM) can then be read.
The Malfunction Indicator Lamp (MIL) is illuminated when the vehicle onboard computer detects a malfunction in the computer itself or in drive system components. In addition, the applicable Diagnostic Trouble Codes (DTCs) are stored in the ECM memory (Click here).
When the malfunction does not recur, the MIL stays illuminated until the ignition switch is turned off, and the MIL turns off when the engine is started. Be aware that the DTCs remain stored in the ECM memory.
To check DTCs, connect the intelligent tester to the DLC3 on the vehicle.

NORMAL MODE AND CHECK MODE

The diagnosis system operates in "normal mode" during normal vehicle use. In normal mode, "2 trip detection logic" is used to ensure accurate detection of malfunctions. "Check mode" is also available to technicians as an option. In check mode, "1 trip detection logic" is used for simulating malfunction symptoms and increasing the ability of the system to detect malfunctions, including intermittent malfunctions (Click here).

2 TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the next subsequent drive cycle, the MIL is illuminated (2nd trip).

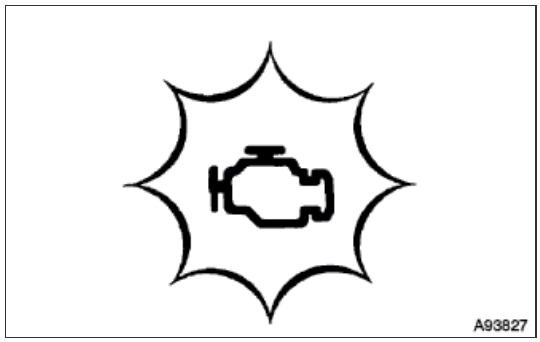
FREEZE FRAME DATA

The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was moving or stationary, whether the engine was warmed up or not, as well as other data recorded at the time of a malfunction.

BATTERY VOLTAGE

If the voltage is below 11 V, recharge or replace the battery before proceeding.

Standard voltage:
11 to 14 V



MIL

a. The MIL illuminates when the ignition switch is turned to ON and the engine is not running.

HINT:

If the MIL is not illuminated, check the MIL circuit (Click here).

b. When the engine is started, the MIL should turn off. If the MIL remains on, the diagnosis system has detected a malfunction or abnormality in the ECD system.

ALL READINESS

HINT:

- **With "All Readiness" you can check whether or not the DTC judgment has been completed by using the intelligent tester.**
- **You should check "All Readiness" after simulating malfunction symptoms or for validation after finishing repairs.**

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Perform the DTC judgment driving pattern to run the DTC judgment.

f. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

g. Input the DTCs to be confirmed.

h. Check the DTC judgment result.

Result

Tester Display	Description
NORMAL	• DTC judgment completed • System normal
ABNORMAL	• DTC judgment completed • System abnormal
INCOMPLETE	• DTC judgment not completed • You should perform driving after confirming DTC enabling conditions
UNKNOWN	• Unable to perform DTC judgment • Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

for Preparation Click here

NOTICE:

When the diagnosis system is changed from the normal mode to check mode or vice versa, all DTCs and freeze frame data stored in normal mode are erased. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

- **DTCs which are stored in the ECM can be output on the intelligent tester. The intelligent tester can output current and pending DTCs.**
- **The same DTCs are not stored if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.**

CHECK DTC (Using Intelligent Tester)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / DTC.

e. Check the DTC(s) and freeze frame data, and then write them down.

f. Check the details of the DTC(s) (Click here).

CLEAR DTC (Using Intelligent Tester)

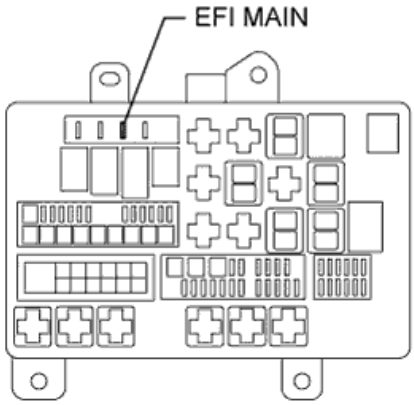
a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / DTC / Clear.

e. Press the button.



CLEAR DTC (Without using Intelligent Tester)

a. Perform either one of the following operations.

i. Disconnect the cable from the negative ( ) battery terminal for more than 1 minute.

ii. emove the EFI M N fuse from the engine room relay block (located inside the vehicle) for more than 1 minute.

Engine Room Relay Block:

Y

for Preparation Click here

HINT:

Intelligent tester only:

Compared to the normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect the malfunctions that cannot be detected by normal mode.

NOTICE:

All the stored DTCs and freeze frame data are erased if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the ignition switch is turned from ON to ACC or off while in check mode. Before changing modes, always check and make a note of any DTCs and freeze frame data.

CHECK MODE PROCEDURE (Using Intelligent Tester)

a. Check and ensure the following conditions:

   i. Battery positive voltage 11 V or higher.

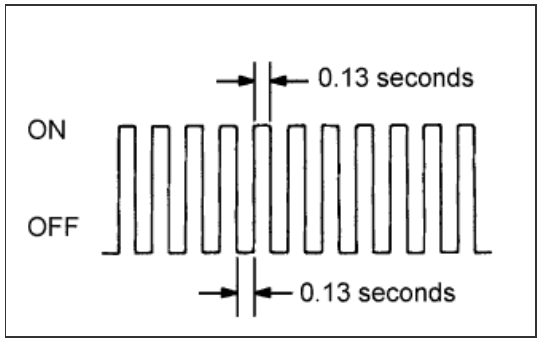
   ii. Throttle valve fully closed.

   iii. Transmission in neutral.

   iv. A/C switched off.

b. Turn the ignition switch off.

c. Connect the intelligent tester to the DLC3.



d. Turn the ignition switch to ON.

e. Turn the tester on.

f. Enter the following menus: Utility / Check Mode.

g. Switch the ECM from normal mode to check mode.

h. Make sure the MIL flashes as shown in the illustration.

i. Start the engine.

j. Make sure the MIL turns off.

k. Simulate the conditions of the malfunction described by the customer.

l. Check for DTCs and freeze frame data using the tester.

m. After checking for DTCs, inspect the applicable circuits.

for Preparation Click here

FAIL-SAFE CHART

If any of the following DTCs are stored, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily.

DTC No.	Detection Item	Fail-safe Operation	Fail-safe Deactivation Condition
P00AF	Turbocharger/ Supercharger Boost Control "A" Module Performance	The engine power is limited.	Ignition switch off
P00B0	Turbocharger/ Supercharger Boost Control "B" Module Performance	The engine power is limited.	Ignition switch off
P0046	Turbocharger / Supercharger Boost Control Solenoid Circuit Range / Performance	The engine power is limited.	Ignition switch off
P0047	Turbocharger / Supercharger Boost Control "A" Circuit Low	The engine power is limited.	Ignition switch off
P0048	Turbocharger / Supercharger Boost Control "A" Circuit High	The engine power is limited.	Ignition switch off
P004B	Turbocharger/ Supercharger Boost Control Solenoid "B" Circuit Range/ Performance	The engine power is limited.	Ignition switch off
P004C	Turbocharger/ Supercharger Boost Control Solenoid "B" Circuit Low	The engine power is limited.	Ignition switch off
P004D	Turbocharger/ Supercharger Boost Control Solenoid "B" Circuit High	The engine power is limited.	Ignition switch off
P0087	Fuel Rail/System Pressure - Too Low	The engine power is reduced by 90%.*	Ignition switch off
P0088	Fuel Rail/System Pressure - Too High	The engine power is reduced by 90%.*	Ignition switch off
P0093	Fuel System Leak Detected - Large Leak	The engine power is reduced by 90%.* (Limits the engine power for 30 second and then stalls the engine).	Ignition switch off
P0100	Mass or Volume Air Flow Circuit	The engine power is limited.	Pass condition detected
P0101	Mass or Volume Air Flow Circuit	The engine power is limited.	Ignition switch off
P0102	Mass or Volume Air Flow Circuit Low Input	The engine power is limited.	Pass condition detected
P0103	Mass or Volume Air Flow Circuit High Input	The engine power is limited.	Pass condition detected
P0105	Manifold Absolute Pressure/Barometric Pressure Circuit	The turbo pressure is fixed at a specified value.	Pass condition detected
P0107	Manifold Absolute Pressure/Barometric Pressure Circuit Low Input	The turbo pressure is fixed at a specified value.	Pass condition detected
P0108	Manifold Absolute Pressure/Barometric Pressure Circuit High Input	The turbo pressure is fixed at a specified value.	Pass condition detected
P0110	Intake Air Temperature Circuit	The intake air temperature value is fixed.	Pass condition detected
P0112	Intake Air Temperature Circuit Low Input	The intake air temperature value is fixed.	Pass condition detected
P0113	Intake Air Temperature Circuit High Input	The intake air temperature value is fixed.	Pass condition detected
P0115	Engine Coolant Temperature Circuit	The engine coolant temperature sensor output is fixed at a specified value (the fixed value varies depending on conditions).	Pass condition detected
P0117	Engine Coolant Temperature Circuit Low Input	The engine coolant temperature sensor output is fixed at a specified value (the fixed value varies depending on conditions).	Pass condition detected
P0118	Engine Coolant Temperature Circuit High Input	The engine coolant temperature sensor output is fixed at a specified value (the fixed value varies depending on conditions).	Pass condition detected
P0122	Throttle/Pedal Position Sensor/Switch "A" Circuit Low Input	The engine power is limited.	Ignition switch off
P0123	Throttle/Pedal Position Sensor/Switch "A" Circuit High Input	The engine power is limited.	Ignition switch off
P0168	Fuel Temperature Too High	The engine power is limited.	Pass condition detected

P0180	Fuel Temperature Sensor "A" Circuit	The fuel temperature is fixed at a specified value.	Pass condition detected
P0182	Fuel Temperature Sensor "A" Circuit Low Input	The fuel temperature is fixed at a specified value.	Pass condition detected
P0183	Fuel Temperature Sensor "A" Circuit High Input [Fuel temperature sensor high input]	The fuel temperature is fixed at a specified value.	Pass condition detected
P0190	Fuel Rail Pressure Sensor Circuit	The engine power is limited.	Ignition switch off
P0192	Fuel Rail Pressure Sensor Circuit Low Input	The engine power is limited.	Ignition switch off
P0193	Fuel Rail Pressure Sensor Circuit High Input	The engine power is limited.	Ignition switch off
P0222	Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input	The engine power is limited.	Ignition switch off
P0223	Throttle / Pedal Position Sensor / Switch "B" Circuit High Input	The engine power is limited.	Ignition switch off
P0299	Turbocharger / Supercharger Underboost	The engine power is limited.	Ignition switch off
P0335	Crankshaft Position Sensor "A" Circuit	The engine power is reduced by 90%.*	Pass condition detected
P0340	Camshaft Position Sensor "A" Circuit (Bank 1 or Single Sensor)	The engine power is reduced by 90%.*	Pass condition detected
P0400	Exhaust Gas Recirculation Flow	The engine power is limited.	Ignition switch off
P0405	Exhaust Gas Recirculation Sensor "A" Circuit Low	The engine power is limited.	Ignition switch off
P0406	Exhaust Gas Recirculation Sensor "A" Circuit High	The engine power is limited.	Ignition switch off
P0407	Exhaust Gas Recirculation Sensor "B" Circuit Low	The engine power is limited.	Ignition switch off
P0408	Exhaust Gas Recirculation Sensor "B" Circuit High	The engine power is limited.	Ignition switch off
P0488	Exhaust Gas Recirculation Throttle Position Control Range/Performance	The engine power is limited.	Ignition switch off
P0500	Vehicle Speed Sensor "A"	The vehicle speed is fixed at 0 km/h (0 mph).	Pass condition detected
P0607	Control Module Performance	The engine is stopped.	Ignition switch off
P0627	Fuel Pump Control Circuit / Open	The engine power is limited.	Pass condition detected
P062D	Fuel Injector Driver Circuit Performance Bank 1	The engine power is limited.	Ignition switch off
P062E	Fuel Injector Driver Circuit Performance Bank 2	The engine power is limited.	Ignition switch off
P1229	Fuel Pump System	The engine power is limited.	Ignition switch off
P1248	Exhaust Gas Recirculation Flow Bank 2	The engine power is limited.	Ignition switch off
P1251	Turbocharger / Supercharger Overboost Condition (Too High)	The engine power is limited.	Ignition switch off
P1258	VNT Position Sensor Range/Performance Bank 2 Sensor 1	The engine power is limited.	Ignition switch off
P1259	VNT Position Sensor Low Bank 2 Sensor 1	The engine power is limited.	Ignition switch off
P1260	VNT Position Sensor High Bank 2 Sensor 1	The engine power is limited.	Ignition switch off
P1262	VNT Position Sensor Low Bank 2 Sensor 2	The engine power is limited.	Ignition switch off
P1263	VNT Position Sensor High Bank 2 Sensor 2	The engine power is limited.	Ignition switch off
P1495	Intake Air Temperature Sensor 1 Circuit	The intake air temperature is fixed at a specified value.	Pass condition detected
P1496	Intake Air Temperature Sensor 1 Circuit Low	The intake air temperature is fixed at a specified value.	Pass condition detected
P1497	Intake Air Temperature Sensor 1 Circuit High	The intake air temperature is fixed at a specified value.	Pass condition detected
P1611	Run Pulse	The engine is stopped.	Ignition switch off
P2120	Throttle/Pedal Position Sensor/Switch "D" Circuit	The engine power is limited.	Ignition switch off
P2121	Throttle/Pedal Position Sensor/Switch "D" Circuit Range/Performance	The engine power is limited.	Ignition switch off

P2122	Throttle/Pedal Position Sensor/Switch "D" Circuit Low Input	The engine power is limited.	Ignition switch off
P2123	Throttle/Pedal Position Sensor/Switch "D" Circuit High Input	The engine power is limited.	Ignition switch off
P2125	Throttle/Pedal Position Sensor/Switch "E" Circuit	The engine power is limited.	Ignition switch off
P2127	Throttle/Pedal Position Sensor/Switch "E" Circuit Low Input	The engine power is limited.	Ignition switch off
P2128	Throttle/Pedal Position Sensor/Switch "E" Circuit High Input	The engine power is limited.	Ignition switch off
P2138	Throttle/Pedal Position Sensor/Switch "D"/"E" Voltage Correlation	The engine power is limited.	Ignition switch off
P213B	Exhaust Gas Recirculation Throttle Position Control (Range / Performance)	The engine power is limited.	Ignition switch off
P2226	Barometric Pressure Circuit	The atmospheric pressure is fixed at a specified value.	Pass condition detected
P2228	Barometric Pressure Circuit Low Input	The atmospheric pressure is fixed at a specified value.	Pass condition detected
P2229	Barometric Pressure Circuit High Input	The atmospheric pressure is fixed at a specified value.	Pass condition detected
P2563	Turbocharger / Supercharger Boost Control Position Sensor "A" Circuit Range / Performance	The engine power is limited.	Ignition switch off
P2564	Turbocharger / Supercharger Boost Control Position Sensor "A" Circuit Low	The engine power is limited.	Ignition switch off
P2565	Turbocharger / Supercharger Boost Control Position Sensor "A" Circuit High	The engine power is limited.	Ignition switch off
P2588	Turbocharger / Supercharger Boost Control Position Sensor "B" Circuit Low	The engine power is limited.	Ignition switch off
P2589	Turbocharger / Supercharger Boost Control Position Sensor "B" Circuit High	The engine power is limited.	Ignition switch off

HINT:

*: Engine power is limited immediately after the DTC is stored.

DATA LIST

HINT:

Using the intelligent tester to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. This non-intrusive inspection can be very useful because intermittent conditions or signals may be discovered before parts or wiring is disturbed. Reading the Data List information early in troubleshooting is one way to save diagnostic time.

NOTICE:

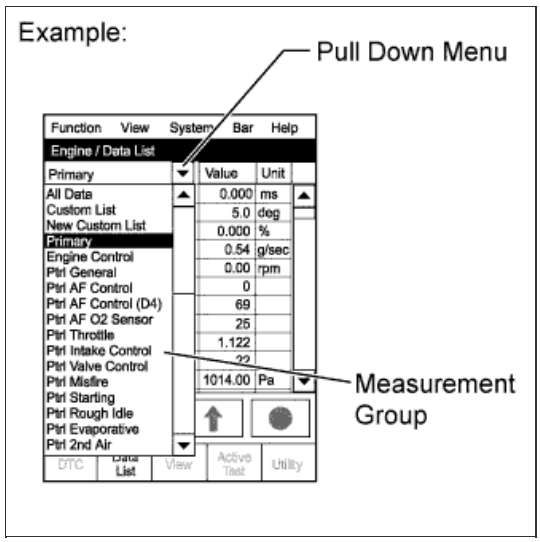
In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

a. Warm up the engine.

b. Turn the ignition switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON.



e. Start the engine.

f. Turn the intelligent tester on.

g. Enter the following menus: Powertrain / Engine / Data List.

HINT:

- **To display the list box, press the pull down menu button next to Primary. Then select a measurement group.**
- **When you select a measurement group, the ECU data belonging to that group is displayed.**
- **Measurement Group List / Description**
  - **All Data / All data**
  - **Primary / -**
  - **Engine Control / Engine control system related data**
  - **Diesel General / General data to analyze engine conditions for diesel engine**
  - **Common Rail / Fuel system (common rail system) related data**
  - **Common Rail (All) / Fuel system (common rail system) related data**
  - **Diesel EGR / EGR system related data**
  - **Diesel Throttle / Diesel throttle system related data**
  - **VN Turbo / VN turbo related data**
  - **Diesel Exhaust / Exhaust system related data including intake system**
  - **Diesel Starting / "Difficult to start" related data**
  - **Diesel Rough Idle / "Rough idle" related data**
  - **Diesel Lack of Power / "Lack of power" related data**
  - **Diesel Knocking / "Engine knocking" related data**
  - **Diesel Black Smoke / "Black smoke" related data**
  - **Check Mode / ECM mode related data**
  - **Monitor Status / Monitor status related data**
  - **Charging Control / Charging control system related data**
  - **Compression / Data used during "Check the Cylinder Compression" in "Active Test"**
  - **Vehicle Information / Vehicle information**

h. Check the values by referring to the table below.

HINT:

"Result of real-vehicle check" is the assessment of one vehicle. Use it only for reference.

Engine Control

Calculate Load

<table>
<tr><th>Tester Display</th><th>Measurement Item/Range</th><th>Normal Condition</th><th>Type</th><th>Cause of Out of Range</th></tr>
<tr><td rowspan="3">Calculate Load</td><td>Calculated load by ECM: Min.: 0%, Max.: 100%</td><td>Idling: 15.4 to 20.4%
Running without load (2500 rpm): 20.1 to 25.9%
Driving with the accelerator fully open at 3000 rpm: 80.3 to 99.6%
Driving with the accelerator fully open at 4000 rpm: 96.4 to 98%</td><td>Calculated by ECM</td><td>Malfunction in which turbo pressure or Mass Air Flow (MAF) decreases</td></tr>
<tr><td colspan="4">Results of real-vehicle check:
Ignition switch ON: 0%
Cranking: 70%
Idling (warm up the engine): 18% (2 minutes after starting the vehicle)
Running without load (2500 rpm): 22%
Driving with the accelerator fully open at 2000 rpm: 99%
Driving with the accelerator fully open at 3000 rpm: 100%</td></tr>
<tr><td colspan="4">Diagnostic Note:
Calculate load = (Final injection volume / max. injection volume at current engine speed) x 100.</td></tr>
</table>

MAF

<table>
<tr><th>Tester Display</th><th>Measurement Item/Range</th><th>Normal Condition</th><th>Type</th><th>Cause of Out of Range</th></tr>
<tr><td rowspan="4">MAF</td><td>Air flow rate from MAF meter: Min.: 0 gm/sec., Max.: 400 gm/sec.</td><td>w/ EGR (depending on EGR rate)
Idling: 5 to 12 g/sec.
Running without load (2000 rpm): 28.2 to 130 g/sec.
w/o EGR
Idling: 20 to 28 g/sec.
Running without load (2000 rpm): 90 to 130 g/sec.</td><td>Sensor output (MAF meter)</td><td>MAF meter
MAF meter circuit
Intake related clog or leak
Exhaust related clog
Turbocharger sub-assembly
Leak or clog in passages for turbocharger
Malfunction in which EGR valve does not close</td></tr>
<tr><td colspan="4">Results of real-vehicle check:
w/ EGR:
Ignition switch ON: 1.54 g/sec.
Cranking: 15 g/sec.
Idling (warm up the engine): 9 g/sec. (2 minutes after starting the vehicle)
Running without load (2500 rpm): 80 g/sec.
Driving with the accelerator fully open at 2000 rpm: 110 g/sec.
Driving with the accelerator fully open at 3000 rpm: 230 g/sec.</td></tr>
<tr><td colspan="4">Symptoms when out of range:
Rough idling</td></tr>
<tr><td colspan="4">Diagnostic Note:
Based on the MAF, the ECM controls the fuel injection volume, injection timing, EGR, etc.
If the value is always approximately 0 g/sec.:
Mass air flow meter power source circuit is open.
VG circuit is open or shorted.
If the value is always 200 g/sec. or more:
EVG circuit is open.</td></tr>
</table>

Engine Speed

<table>
<tr><th>Tester Display</th><th>Measurement Item/Range</th><th>Normal Condition</th><th>Type</th><th>Cause of Out of Range</th></tr>
<tr><td rowspan="3">Engine Speed</td><td>Engine speed: Min.: 0 rpm, Max.: 6000 rpm</td><td>Idling: 550 to 650 rpm (A/T)
Idling: 500 to 600 rpm (M/T)</td><td>Sensor output (crankshaft position sensor)</td><td>Crankshaft position sensor
Crankshaft position sensor circuit</td></tr>
<tr><td colspan="4">Symptoms when out of range:
-</td></tr>
<tr><td colspan="4"></td></tr>
</table>

	Diagnostic Note: When the crankshaft position sensor is malfunctioning, "Engine speed" is approximately 0 or varies greatly from the actual engine speed.

Target Idle Engine Speed

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Target Idle Engine Speed	Target engine speed for idling: Min.: 0 rpm, Max.: 51199 rpm	• Idling: 550 to 650 rpm (A/T) • Idling: 500 to 600 rpm (M/T)	Calculated by ECM	-
	Diagnostic Note: • Target engine speed for idling speed control. • The ECM calculates the target engine idling speed in consideration of the air conditioner load, electric load, shift position changes, idle-up control for cold engine start, etc.			

MAP

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
MAP	Absolute pressure inside intake manifold: Min.: 0 kPa, Max.: 255 kPa	• Idling: 90 to 102 kPa (depending on barometric pressure) • Engine running at 3000 rpm: 100 to 150 kPa	Sensor output (manifold absolute pressure sensor)	• Manifold absolute pressure sensor • Intake related clog or leak • Exhaust related clog • Turbocharger sub-assembly • Leak or clog in passages for turbocharger • EGR valve stuck open • Exhaust leak • Throttle valve stuck closed
	Results of real-vehicle check: • Ignition switch ON: 99 kPa • Cranking: 99 kPa • Idling (warm up the engine): 99 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 113 kPa • Running without load (4000 rpm): 150 kPa • Driving with the accelerator fully open at 2000 rpm: 143 kPa • Driving with the accelerator fully open at 3000 rpm: 209 kPa			
	Symptoms when out of range: Lack of power			
	Diagnostic Note: • When the ignition switch is ON or the vehicle is idling, the intake manifold absolute pressure and atmospheric pressure are approximately the same (standard atmospheric pressure = 101 kPa). Above approximately 1500 rpm, the turbo becomes effective, and the pressure becomes higher than atmospheric pressure. • Inspect while comparing with "Target Booster Pressure". • With the accelerator fully open, if the actual manifold absolute pressure (MAP) is low compared to the target booster pressure by at least 20 kPa for 5 seconds or more, a feeling of insufficient power will occur.			

Vehicle Speed

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Vehicle Speed	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	Sensor output (speed sensor)	• Speed sensor • Speed sensor circuit
	Symptoms when out of range: -			
	Diagnostic Note: -			

Coolant Temp

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Coolant Temp	Engine coolant temperature: Min.: -40°C, Max.: 140°C	After warming up engine: 75 to 90°C (167 to 194°F)	Sensor output (engine coolant temperature sensor)	• Engine coolant temperature sensor • Thermostat
	Symptoms when out of range: Difficult starting when engine is cold, rough idle, black smoke, lack of power			
	Diagnostic Note: • If the value is -40°C (-40°F) or 140°C (284°F), the sensor circuit is open or shorted. • After a long soak, the coolant temperature, intake air temperature, and ambient air temperature are approximately equal.			

Intake Air

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Intake Air	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to temperature at intake manifold	Sensor output (intake air temperature sensor (built into MAF meter))	Intake air temperature sensor
	Symptoms when out of range: -			
	Diagnostic Note: • After a long soak, the engine coolant temperature, intake air temperature, and ambient air temperature are approximately equal. • If the value is -40°C (-40°F) or 140°C (284°F), the sensor circuit is open or shorted.			

Initial Engine Coolant Temp

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Initial Engine Coolant Temp	Initial engine coolant temperature: Min.: -40°C, Max.: 120°C	Engine coolant temperature when engine started	Sensor output when engine started	-
	Diagnostic Note: For Freeze Frame Data, this tells whether the malfunction happened at a cold start or with a warm engine.			

Initial Intake Air Temp

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Initial Intake Air Temp	Initial intake air temperature: Min.: -40°C, Max.: 120°C	Intake air temperature when engine started	Sensor output when engine started	-
	Diagnostic Note: -			

Intake Air Temp (Turbo)

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Intake Air Temp (Turbo)	Intake air temperature after intercooler: Min.: -40°C, Max.: 190°C	70°C (158°F) or less	Sensor output (intake air temperature sensor after intercooler)	Decreased cooling efficiency of intercooler (contamination, clogging)
	Diagnostic Note: • Intake air temperature at the intake manifold (after intercooler). • During fail-safe operation, the value is set to 165°C (329°F). As the value is set to a high temperature, the turbo pressure may be suppressed and there may be a lack of power.			

Alternate Duty Ratio

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
		• No electrical		

<table>
<tr><td rowspan="4">Alternate Duty Ratio</td><td>Alternator generation duty ratio:
Min.: 0%, Max.: 100%</td><td>load at idling: 10 to 60%
• High electrical load at idling: 100%</td><td>Duty value from ALT terminal</td><td>• Battery deterioration
• Alternator malfunction
• Check for accessory lights, malfunctions, etc.</td></tr>
<tr><td colspan="4">Results of real-vehicle check:
• Idling (No electrical load) (warm up the engine): 30% (2 minutes after starting the vehicle)</td></tr>
<tr><td colspan="4">Symptoms when out of range:
-</td></tr>
<tr><td colspan="4">Diagnostic Note:
• Outputs the alternator generation duty in order to see the electrical load.
• Can be used to determine whether a higher-than-normal injection volume at idle, etc. is resulting from electrical loading or from some other source. For example, when the duty is not high but the idling injection volume is high, there is injector volume degradation or high engine friction.
• Can be used for judging whether or not a malfunctioning component in the electrical system is generating continual generation requests (ex. battery deterioration is causing an unending full recharge request, etc.). Regardless of whether or not an auxiliary device like the A/C or heater is active, the alternator duty is always at MAX status. There is an electrical system abnormality, like battery deterioration.</td></tr>
</table>

Starter Signal

<table>
<tr><th>Tester Display</th><th>Measurement Item/Range</th><th>Normal Condition</th><th>Type</th><th>Cause of Out of Range</th></tr>
<tr><td rowspan="3">Starter Signal</td><td>Starter signal:
ON or OFF</td><td>ON:
Cranking</td><td>-</td><td>• OFF malfunction (ignition switch (STA) is ON but the signal is OFF and the starter is operating): Wire harness is open or shorted to ground
• ON malfunction (ignition switch (STA) is OFF but the signal is ON and the starter is not operating): Wire harness is shorted to +B
• Operation malfunction: Ignition switch malfunction, starter relay malfunction, starter malfunction, battery or battery cable is defective, or wire harness is open or shorted</td></tr>
<tr><td colspan="4">Symptoms when out of range:
• Ignition switch is ON but the starter does not operate: Starting is not possible
• Ignition switch is off but the starter continues to operate: STA signal malfunction (P0617) is stored</td></tr>
<tr><td colspan="4">Diagnostic Note:
• Ignition switch (STA) output:
• ON: Starter is operating.
• OFF: Starter is not operating.</td></tr>
</table>

Power Steering Signal Record

<table>
<tr><th>Tester Display</th><th>Measurement Item/Range</th><th>Normal Condition</th><th>Type</th><th>Cause of Out of Range</th></tr>
<tr><td rowspan="3">Power Steering Signal Record</td><td>Power steering switch status:
ON or OFF</td><td>ON: Power steering operation</td><td>Switch output (power steering switch)</td><td>• OFF malfunction: Wire harness (power steering switch to ECM) is open or shorted to ground
• ON malfunction:
Wire harness (power steering switch to ECM) is shorted to +B
• Power steering switch malfunction</td></tr>
<tr><td colspan="4">Symptoms when out of range:
• OFF malfunction (OFF during power steering operation): Engine speed decreases temporarily when power steering is operating</td></tr>
<tr><td colspan="4">Diagnostic Note:
-</td></tr>
</table>

Power Steer. Sig. Record

<table>
<tr><th>Tester Display</th><th>Measurement Item/Range</th><th>Normal Condition</th><th>Type</th><th>Cause of Out of Range</th></tr>
<tr><td></td><td>Power steering switch status history:</td><td>ON: When steering wheel first turned after ignition switch ON</td><td>Power steering switch output history (after disconnecting and reconnecting the battery)</td><td>-</td></tr>
</table>

Power Steer. Sig Record	ON or OFF			

	Diagnostic Note:
	• Power steering switch output history (after disconnecting and reconnecting the battery):
	  • ON: Power steering operated in the past.
	  • OFF: Power steering did not operate in the past.			

A/C Signal

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
A/C Signal	A/C (Air Conditioner) signal: ON or OFF	ON: A/C on	A/C operation signal output from A/C amplifier • ON: Operating • OFF: Not operating	• A/C switch • A/C amplifier • A/C system malfunction, wire harness between A/C amplifier and ECU open or shorted
	Symptoms when out of range: • OFF malfunction (OFF even when A/C switch is turned on): • Engine speed decreases temporarily when the A/C is operating.			
	Diagnostic Note: -			

Stop Light Switch

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Stop Light Switch	Stop light switch: ON or OFF	• ON: Brake pedal depressed • OFF: Brake pedal released	Switch output (stop light switch)	• OFF malfunction: Wire harness (stop light switch to ECM, stop light switch to +B) open or shorted to ground • ON malfunction: Wire harness (stop light switch to ECM) shorted to +B • Stop light switch
	Symptoms when out of range: • Stop light switch malfunction DTC P0504 is stored			

	Diagnostic Note:
	• Stop light switch (STP) operation condition:
	  • ON: Light is on (Brake pedal is depressed).
	  • OFF: Light is off (Brake pedal is released).			

Intank Fuel Pump

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Intank Fuel Pump	Intank fuel pump status: ON or OFF	Operates according to fuel consumption amount (Operates after about 10 minutes of driving)	Operation command	-
	Symptoms when out of range: -			
	Diagnostic Note: • ON: Intank fuel pump is operating. • Only for vehicles equipped with a double tank.			

Immobiliser Communication

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Immobiliser Communication	Immobiliser communication: ON or OFF	ON: Normal	-	• Use of a non-registered key • Key battery is fully depleted
	Symptoms when out of range: -			
	Diagnostic Note: -			

Low Gear Switch

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Low Gear Switch	Shift position switch: ON or OFF	ON: First position	Switch output (low gear switch)	-
	Symptoms when out of range: • When OFF with the shift lever in 1, the torque increases like the other gears • When OFF with the shift lever not in 1, the torque decreases like 1st gears			
	Diagnostic Note: The shift position switch is used to limit torque for manual transmissions			

Neutral Position SW Signal

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Neutral Position SW Signal	Neutral position switch status: ON or OFF	ON: Neutral position	Switch output (neutral position switch)	-
	Symptoms when out of range: -			
	Diagnostic Note: -			

Clutch Switch

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Clutch Switch	Clutch switch: ON or OFF	ON: Clutch pedal depressed	Switch output (clutch switch)	-
	Symptoms when out of range: When OFF with the clutch pedal depressed, the engine does not start.			
	Diagnostic Note: -			

Battery Voltage

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Battery Voltage	Battery voltage: Min.: 0 V, Max.: 15 V	11 to 14 V	-	-
	Results of real-vehicle check: • Ignition switch ON: 12.5 V • Cranking (with engine warmed up): 9.0 V • Idling (warm up the engine): 13.4 V • Running without load (2500 rpm): 13.5 V • Driving with the accelerator fully open at 2000 rpm: 13 V • Driving with the accelerator fully open at 3000 rpm: 13.2 V			
	Symptoms when out of range: If 5 V or less, starting becomes difficult			
	Diagnostic Note: If 11 V or less, characteristics of some electrical components change.			

Atmosphere Pressure

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Atmosphere Pressure	Atmospheric pressure value: Min.: 50 kPa, Max.: 120 kPa	Actual atmospheric pressure	Sensor output (atmospheric pressure sensor (built into ECM))	Atmospheric pressure sensor itself has failed (atmospheric pressure sensor is inside the ECM)
	Symptoms when out of range: -			
	Diagnostic Note: • With the ignition switch ON, when the difference between the atmospheric pressure sensor and intake manifold absolute pressure is 10 kPa or higher, there is a malfunction in one of the sensors. • With the ignition switch ON, when the atmospheric pressure is 0 kPa or 140 kPa, there is a malfunction in the sensor circuit. • Standard atmospheric pressure: 101 kPa. • For every 100 m increase in altitude, pressure drops by 1 kPa.			

	Varies by weather (high atmospheric pressure, low atmospheric pressure).

ACT VSV

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
ACT VSV	A/C cut status for Active Test: ON or OFF	-	-	-
	Diagnostic Note: Active Test "Control the A/C Cut Signal" support data.			

ACM Inhibit

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
ACM Inhibit	VSV for engine mount status: ON or OFF	-	-	-

	Diagnostic Note:
	• VSV for engine mount status:
	  • Ignition switch is ON: OFF.
	  • Idling: ON.
	• Active Test "Control the ACM Inhibit" support data.			

TC and TE1

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
TC and TE1	Connect the TC and TE1 status for Active Test: ON or OFF	-	-	-
	Diagnostic Note: • When the Active Test "Connect the TC and TE1" is performed, the system behaves as if TC and CG were connected.			

Codes(Include History)

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
# Codes(Include History)	Number of codes: Min.: 0, Max.: 255	-	-	-
	Diagnostic Note: Number of DTCs appearing at least once during the last 40 times the vehicle was warmed up.			

Check Mode

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Check Mode	Check mode: ON or OFF	ON: Check mode ON	-	-
	Diagnostic Note: Check Mode: The mode in which certain DTCs can be detected more easily and with higher sensitivity.			

SPD Test

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
SPD Test	Check mode result for vehicle speed sensor: Compl or Incompl	-	-	-
	Diagnostic Note: SPD Test: Check mode result for vehicle speed sensor.			

MIL

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
MIL	MIL status: ON or OFF	ON: MIL on	-	-

MIL ON Run Distance

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	MIL on run distance: Min.: 0 km, Max.: 65535 km	Distance after DTC stored	Result of ECU calculations (using the vehicle speed)	-

MIL ON Run Distance	Diagnostic Note: • Distance traveled after a DTC is stored. • Cleared when the negative (-) battery cable is disconnected or when the DTC is cleared using the intelligent tester.

Running Time from MIL ON

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Running Time from MIL ON	Running time from MIL on: Min.: 0 min., Max.: 65535 min.	Running time after MIL turns on	-	-
	Diagnostic Note: • Engine run time since the MIL illumination. • Cleared when the negative (-) battery cable is disconnected or when the DTC is cleared using the intelligent tester.			

Engine Run Time

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Run Time	Engine run time: Min.: 0 sec., Max.: 65535 sec.	Time after the ignition switch turned to ON	ECU calculations (using the engine speed)	-
	Diagnostic Note: Time passed since the ignition switch was turned to ON.			

Time after DTC Cleared

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Time after DTC Cleared	Time after DTC cleared: Min.: 0 min., Max.: 65535 min.	Time after DTCs cleared	-	-
	Diagnostic Note: Time elapsed since the DTCs were cleared (or shipment from the factory).			

Distance from DTC Cleared

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Distance from DTC Cleared	Distance after DTC cleared: Min.: 0 km, Max.: 65535 km	Driving distance after DTCs were cleared	-	-
	Diagnostic Note: • Distance driven since the DTCs were cleared. • (Data List's "Distance from DTC clear") - (Freeze frame data's "Distance from DTC clear") = Distance driven since the abnormality occurred.			

Warmup Cycle Cleared DTC

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Warmup Cycle Cleared DTC	Warmup cycle after DTC cleared: Min.: 0, Max.: 255	-	-	-
	Diagnostic Note: • Number of engine warm ups since DTCs were cleared. • (Data List "Warmup Cycle Cleared DTC") - (Freeze frame data "Warmup Cycle Cleared DTC") = Warmup cycles since the abnormality occurred.			

OBD Requirements

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
OBD Requirements	Identifying OBD requirement	-	-	-
	Diagnostic Note: Euro-OBD.			

Number of Emission DTC

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Number of Emission DTC	Number of emission DTCs	-	-	
	Diagnostic Note:			

	-

Complete Parts Monitor

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Complete Parts Monitor	Complete parts monitor: Not Avl or Avail	-	-	-
	Diagnostic Note: -			

Engine Start Time

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Start Time	Engine start time: Min.: 0 ms, Max.: 267000 ms	-	-	-
	Diagnostic Note: Time necessary for the engine to start. **CAUTION:** This Data List item cannot be used.			

ACC Relay

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
ACC Relay	ACC (accessory) relay: ON or OFF	ON: Cranking	-	-
	Diagnostic Note: -			

Starter Relay

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Starter Relay	Starter relay: ON or OFF	ON: Cranking	-	-
	Diagnostic Note: -			

Accel Position

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Accel Position	Accelerator position status: Min.: 0%, Max.: 100%	• Accelerator pedal released: 0% • Accelerator pedal fully depressed: 100%	• Accelerator pedal position sensor opening position • ETC request opening position • Cruise request opening position • VSC request opening position	-
	Results of real-vehicle check: • Ignition switch ON: 0% (accelerator pedal released) • Running without load (2500 rpm): 24.6% • Running without load (4700 rpm): 99.6% (accelerator pedal fully depressed)			
	Symptoms when out of range: -			
	Diagnostic Note: • "Accel Position" is the accelerator opening angle (%) for engine control use. • When the MIL is illuminated, even with the accelerator pedal fully depressed and an "Accel Position" of around 10% or 25%, it means the fail-safe is restricting the accelerator. • When the accelerator pedal position sensor output itself (Accel Sens. No.1 Volt % and Accel Sens. No.2 Volt %) is in the normal range, another actuator malfunction has caused the fail-safe to restrict the accelerator. • Without cruise or ETC, VSC requests, and without accelerator restriction by the fail-safe, this is adjusted proportionally to the depressing of the accelerator pedal by the driver. • Accelerator fully closed: 0% • Accelerator fully open: 100%			

HINT:

Accel Sens. No.1 Volt % and Accel Sens. No.2 Volt % express the value obtained by dividing the output voltage from the accelerator pedal position sensor by 5 (expressed in percentage). This is used only for diagnosing malfunctions in the accelerator pedal position sensor. Under normal conditions, it is sufficient to only check the accelerator opening angle final value "Accel Position".

Pre Glow

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Pre Glow	Pre-glow operation status (pre-heating control): ON or OFF	Status is ON when the pre-glow is requested	Glow command signal	• Engine coolant temperature sensor • Engine coolant temperature sensor circuit
	Results of real-vehicle check: Ignition switch turned to ON (engine not started), engine coolant temperature 35°C (95°F): ON for about 10 seconds **HINT:** Under above conditions, the glow indicator light is turns on for about 1.0 second.			
	Symptoms when out of range: Difficult to start, rough idling			
	Diagnostic Note: • The pre-glow ON period varies according to the engine coolant temperature. • Whether the glow plug operation is affected or not can be determined by monitoring the glow plug energization command value when a problem occurs during engine start-up. • When the battery voltage value remains the same even if the glow command is changed (ON to OFF, or OFF to ON), it is likely that there may be a malfunction in the glow plug or circuit. (TIPS: Whether the problem causes are related to the glow system or not can be determined only when all cylinders do not operate such as in a case of relay operation problem.)			

After Glow

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
After Glow	After-glow operation status: ON or OFF	Status is ON when the after-glow is requested	Glow command signal	• Engine coolant temperature sensor • Engine coolant temperature sensor circuit
	Results of real-vehicle check: Engine started, engine coolant temperature 35°C (95°F): ON for about 15 seconds			
	Symptoms when out of range: Difficult to start, rough idling			
	Diagnostic Note: • The after-glow ON period varies according to the engine coolant temperature. • Whether the glow plug operation is affected or not can be determined by monitoring the glow plug energization command value when a problem occurs during engine start-up. • When the battery voltage value remains the same even if the glow command is changed (ON to OFF, or OFF to ON), it is likely that there may be a malfunction in the glow plug or circuit. (TIPS: Whether the problem causes are related to the glow system or not can be determined only when all cylinders do not operate such as in a case of relay operation problem.)			

Compression

Engine Speed of Cyl #1

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #1	Engine speed for No. 1 cylinder: Min.: 0 rpm, Max.: 51199 rpm	"Engine speed" of all cylinders almost same	-	Cyl #1 compression goes down
	Symptoms when out of range: When the engine speed of all cylinders is not equal, idling will be rough.			
	Diagnostic Note: • Output only when the Active Test "Check the Cylinder Compression" is performed. • Indicates the speed of each cylinder when cranking. Example - Normal: Engine speed of all cylinders is approximately equal. When No. 1 cylinder compression is low, "Engine speed of Cyl #1" is approximately 300 rpm, and "Engine speed of Cyl #2 to #8" is approximately 200 rpm.			

Engine Speed of Cyl #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #2	Engine speed for No. 2 cylinder: Min.: 0 rpm, Max.: 51199 rpm	-	-	-

Engine Speed of Cyl #3

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #3	Engine speed for No. 3 cylinder: Min.: 0 rpm, Max.: 51199 rpm	-	-	-

Engine Speed of Cyl #4

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #4	Engine speed for No. 4 cylinder: Min.: 0 rpm, Max.: 51199 rpm	-	-	-

Engine Speed of Cyl #5

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #5	Engine speed for No. 5 cylinder: Min.: 0 rpm, Max.: 51199 rpm	-	-	-

Engine Speed of Cyl #6

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #6	Engine speed for No. 6 cylinder: Min.: 0 rpm, Max.: 51199 rpm	-	-	-

Engine Speed of Cyl #7

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #7	Engine speed for No. 7 cylinder: Min.: 0 rpm, Max.: 51199 rpm	-	-	-

Engine Speed of Cyl #8

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed of Cyl #8	Engine speed for No. 8 cylinder: Min.: 0 rpm, Max.: 51199 rpm	-	-	-

Av Engine Speed of All Cyl

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Av Engine Speed of All Cyl	Engine speed for all cylinders: Min.: 0 rpm, Max.: 51199 rpm	-	-	-
	Diagnostic Note: • Output only when the Active Test "Check the Cylinder Compression" is performed. • Indicates the average engine speed of all cylinders during cranking.			

Vehicle Information

Model Code

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Model Code	Model code	-	-	-
	Diagnostic Note: • Identifying model code:			

Engine Type

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Type	Engine type	-	-	-
	Diagnostic Note: • Identifying engine type: 1VDFTV			

Cylinder Number

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Cylinder Number	Cylinder number: Min.: 0, Max.: 255	-	-	-
	Diagnostic Note: • Identifying cylinder number: 8			

Transmission Type

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Transmission Type	Transmission type: MT or ECT 6th	-	-	-
	Diagnostic Note: Identifying transmission type: • MT: Manual transmission • ECT 6th: Automatic transmission			

Destination

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Destination	Destination	-	-	-
	Diagnostic Note: • Identifying destination:			

Model Year

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Model Year	Model year: Min.: 1900, Max.: 2155	-	-	-
	Diagnostic Note: • Identifying model year: 200#			

System Identification

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
System Identification	System identification	-	-	-
	Diagnostic Note: • Identifying engine type: Diesel			

Diesel Injection

Target Common Rail Pressure

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Target Common Rail Pressure	Target common rail pressure: Min.: 0 kPa, Max.: 250000 kPa	25000 to 180000 kPa when engine running	Target common rail pressure (ECU calculated value)	-
	Results of real-vehicle check: • Ignition switch ON: 32000 kPa • Cranking: 29000 kPa • Idling (warm up the engine): 32000 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 62000 kPa • Running without load (3500 rpm): 80200 kPa • Driving with the accelerator fully open at 2000 rpm: 95000 kPa • Driving with the accelerator fully open at 3000 rpm: 155000 kPa			
	Symptoms when out of range: -			

	Diagnostic Note: • Inspect the (actual) fuel pressure, comparing it against the common rail target value. • Considered normal when the actual fuel pressure is within +/-5 MPa of the target fuel pressure under stable conditions.

Fuel Press

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Fuel Press	Fuel pressure: Min.: 0 kPa, Max.: 250000 kPa	Idling: 27000 to 37000 kPa	Sensor output (fuel pressure sensor)	• Fuel supply pump • High pressure pipes • Fuel pressure sensor • Fuel injector • Feed pump (fuel supply pump) • Fuel filter • Pressure limmiter • Air bleed to the fuel • Lack of fuel
	Results of real-vehicle check: • Ignition switch ON: 0 kPa • Cranking: 29000 kPa • Idling (warm up the engine): 32000 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 62000 kPa • Driving with the accelerator fully open at 2000 rpm: 92000 kPa • Driving with the accelerator fully open at 3000 rpm: 155000 kPa			
	Symptoms when out of range: • Difficult to start, poor driveability, lack of power, abnormal combustion noise			
	Diagnostic Note: • Fuel pressure is the actual common rail fuel pressure. • Inspect by comparing the fuel pressure with the target fuel pressure. • When in a stable condition such as when idling, the fuel pressure is within +/-5 MPa of the target fuel pressure. • The ECM uses fuel pressure for feedback control of the target fuel pressure via the supply pump. The injection amount is determined based on the injection timing and fuel pressure. Also, the spray pattern is selected based on the fuel pressure. • For startup, at least 25 MPa of fuel pressure is needed (take care as there is a response lag when the pressure rises). • When the fuel pressure is below 25 MPa, it may cause rough idling. • When the fuel pressure has decreased by 20 MPa from the target fuel pressure, there may be a lack of power. • If actual fuel pressure is 40 MPa higher than the target fuel pressure, P1229 will be stored. When it is lower than the target fuel pressure, "Lack of Power" will occur, but a DTC will not be stored. • When the fuel pressure is higher than 200 MPa, DTC P0088 will be stored.			

Target Pump SCV Current

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Target Pump SCV Current	Pump current target final value: Min.: 0 mA, Max.: 4000 mA	Idling: 923 to 1123 mA	Control target (pump current)	• Suction control valve malfunction • Clogged fuel filter
	Results of real-vehicle check: • Ignition switch ON: 0 mA • Cranking: 1200 mA • Running without load (2500 rpm): 1300 mA • Driving with the accelerator fully open at 2000 rpm: 1440 mA • Driving with the accelerator fully open at 3000 rpm: 1560 mA			
	Symptoms when out of range: Difficult starting, lack of power, or rough idling			
	Diagnostic Note: • ECU-calculated value for the suction control valve actuation target current. • Value is large when a high fuel pressure is desired. • Value becomes stuck at 3 A or more or operation is poor (poor movement due to deposits, etc.).			

	• When this deviates from the standard value, it indicates that for some reason, even though the pump is running hard, the actual fuel pressure is inconsistent with the target fuel pressure.

Inj. FB Vol. for Idle

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Inj. FB Vol. for Idle	Idle stability status integral control volume: Min.: -80 mm^3/st, Max.: 79 mm^3/st	-10 to 10 mm^3/st	-	-
	Results of real-vehicle check: • Idling (warm up the engine): -0.57 mm^3/st			
	Symptoms when out of range: Engine friction problem, compression problem, or injector breakdown			
	Diagnostic Note: • When the actual engine speed does not match the target idling RPM, this corrects the injection volume. Abnormal if +/-10 mm^3/st or more. • Only calculated and reflected at idle.			

Injection Volume

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Volume	Injection volume: Min.: 0 mm^3/st, Max.: 1279.98 mm^3/st	Idling: 3.0 to 10 mm^3/st	Calculated value	-
	Results of real-vehicle check: • Cranking: 21 mm^3/st • Idling (warm up the engine): 6 mm^3/st • Running without load (2500 rpm): 9 mm^3/st • Running without load (4700 rpm): 16 mm^3/st • Driving with the accelerator fully open at 2000 rpm: 50 mm^3/st • Driving with the accelerator fully open at 3000 rpm: 70 mm^3/st			
	Symptoms when out of range: -			
	Diagnostic Note: • Injection amount for each combustion. • If injectors are clogged, fuel quality is poor, the fuel filter is clogged, or engine friction increases, "Injection Volume" will increase. • If there is a malfunction due to low turbocharger pressure or a low intake air volume, the injection volume is limited and there is a lack of power.			

Injection Pressure Correction

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Pressure Correction	Injection pressure feedback compensation volume: Min.: -500 mm^3/st, Max.: 780 mm^3/st	-20 to 20 mm^3/st at standard temperature	Calculated value	• Suction control valve malfunction • Clogged fuel filter
	Results of real-vehicle check: • Ignition switch ON: 0 mm^3/st • Cranking: 0 mm^3/st • Idling (warm up the engine): 8 mm^3/st (2 minutes after starting the vehicle) • Running without load (2500 rpm): 11 mm^3/st • Driving with the accelerator fully open at 2000 rpm: 44 mm^3/st • Driving with the accelerator fully open at 3000 rpm: 71 mm^3/st			
	Symptoms when out of range: -			
	Diagnostic Note: • When the (actual) fuel pressure is equal to the target fuel pressure, this value becomes 0. • This indicator can be used for diagnosing supply pump related malfunctions. • When this value (absolute value) is large, it indicates that the difference between the actual and target fuel pressure is also large. A positive value indicates that the pressure feed is being increased due to insufficient pressure. A			

	negative value indicates that pressure is being reduced due to excessive rail pressure. When the suction control valve does not close properly, it causes rail overpressure, and this value and the "Pump SCV Learning Value" slip to the negative volume side.

Injection Feedback Val #1

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Feedback Val #1	Injection volume correction for No. 1 cylinder: Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	• Injector clogging • Injector deterioration • Decrease in cylinder compression • Injector compensation code is incorrectly set (forgot to input code after replacement or made mistake during setting of code after replacing ECM with one from another vehicle)
	Results of real-vehicle check: Idling:			
	Symptoms when out of range: Rough idling, black smoke, white smoke, poor driveability, lack of power, abnormal combustion noise, difficult to start			
	Diagnostic Note: • When idling after warm up, the injection amount for each cylinder is corrected to optimize the difference between the engine speed of each cylinder. Example: For cylinders that are slowing the engine speed compared to other cylinders, the injection volume is increased. • "Injection Feedback Val" more than 3.0 mm^3/st: Injector may have a problem which causes injection volume deviation, or insufficient compression which causes poor combustion may exist in the cylinder. If the value is within the correctable range which is controlled by the ECM and symptoms such as engine knocking and rough idling are not present, the system is normal even though the value exceeds 3.0 mm^3/st,			

Injection Feedback Val #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Feedback Val #2	Injection volume correction for No. 2 cylinder: Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	-

Injection Feedback Val #3

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Feedback Val #3	Injection volume correction for No. 3 cylinder: Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	-

Injection Feedback Val #4

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Feedback Val #4	Injection volume correction for No. 4 cylinder: Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	-

Injection Feedback Val #5

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Feedback Val #5	Injection volume correction for No. 5 cylinder: Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	-

Injection Feedback Val #6

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Feedback Val #6	Injection volume correction for No. 6 cylinder: Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	-

Injection Feedback Val #7

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injection Feedback Val #7	Injection volume correction for No. 7 cylinder: Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	-

Injection Feedback Val #8

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	Injection volume correction for No. 8 cylinder:			

Injection Feedback Val #8	Min.: -10 mm^3/st, Max.: 10 mm^3/st	Idling: -3.0 to 3.0 mm^3/st	Learned value	-

Pilot 1 Injection Period

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Pilot 1 Injection Period	Pilot 1 injection period: Min.: 0 µs, Max.: 65535 µs	Idling: 0 µs	Calculated value	-
	Results of real-vehicle check: • Cranking: 0 µs • Idling (warm up the engine): 0 µs • Running without load (2500 rpm): 0 µs • Running without load (3500 rpm): 363 µs • Driving with the accelerator fully open at 2000 rpm: 380 µs • Driving with the accelerator fully open at 3000 rpm: 0 µs			
	Symptoms when out of range: Combustion noise, poor driveability, white smoke.			
	Diagnostic Note: Check to see if "Pilot 1 Injection Period" is not zero when the symptoms occur.			

Pilot 2 Injection Period

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Pilot 2 Injection Period	Pilot 2 injection period: Min.: 0 µs, Max.: 65535 µs	Idling: 390 to 490 µs	Calculated value	-
	Results of real-vehicle check: • Ignition switch ON: 0 µs • Cranking: 660 µs • Idling (warm up the engine): 440 µs (2 minutes after starting the vehicle) • Running without load (2500 rpm): 380 µs • Driving with the accelerator fully open at 2000 rpm: 0 µs • Driving with the accelerator fully open at 3000 rpm: 0 µs			
	Symptoms when out of range: Combustion noise, poor driveability, white smoke.			
	Diagnostic Note: Check to see if "Pilot 2 Injection Period" is not zero when the symptoms occur.			

Main Injection Period

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Main Injection Period	Main injection period: Min.: 0 µs, Max.: 65535 µs	Idling: 490 to 690 µs	Calculated value	-
	Results of real-vehicle check: • Cranking: 1250 µs • Idling (warm up the engine): 630 µs (2 minutes after starting the vehicle) • Running without load (2500 rpm): 515 µs • Driving with the accelerator fully open at 2000 rpm: 980 µs • Driving with the accelerator fully open at 3000 rpm: 1010 µs			
	Symptoms when out of range: -			
	Diagnostic Note: • When the fuel pressure becomes 15 MPa or less, "Main Injection Period" is set to 0. • When the engine will not start, confirm that injection is performed. • When P0093, P0607, P0627, P062D or P062E is stored, there is an engine stall request. At that time, "Main Injection Period" equals 0. **HINT:** As the engine stalls 1 minute after the MIL illuminates, freeze frame data cannot be checked.			

After Injection Period

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	After injection period: Min.: 0 µs, Max.: 65535 µs	-	Calculated value	-
	Symptoms when out of range:			

After Injection Period	-
	Diagnostic Note: Check to see if "After Injection Period" is not zero when the following symptoms occur: Black smoke, poor driveability.

Pilot 1 Injection Timing

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Pilot 1 Injection Timing	Pilot 1 injection timing: Min.: -70°CA, Max.: 20°CA	Idling after engine warmed up and vehicle under normal atmospheric pressure: 0°CA	Calculated value	-
	Symptoms when out of range: -			
	Diagnostic Note: -			

Pilot 2 Injection Timing

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Pilot 2 Injection Timing	Pilot 2 injection timing: Min.: -50°CA, Max.: 20°CA	Idling after engine warmed up and vehicle under normal atmospheric pressure: -6 to -2°CA	Calculated value	-
	Results of real-vehicle check: • Ignition switch ON: 0°CA • Cranking: -6.0°CA • Idling (warm up the engine): -3.7°CA • Running without load (2500 rpm): -18°CA • Driving with the accelerator fully open at 2000 rpm: -35.8°CA • Driving with the accelerator fully open at 3000 rpm: -35.8°CA			
	Symptoms when out of range: -			
	Diagnostic Note: -			

Main Injection Timing

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Main Injection Timing	Main injection timing: Min.: -90°CA, Max.: 90°CA	Idling after engine warmed up and vehicle under normal atmospheric pressure: -0.5 to 4°CA	Calculated value	-
	Results of real-vehicle check: • Ignition switch ON: -3.4°CA • Cranking: -3.0°CA • Idling (warm up the engine): 1.0°CA • Running without load (2500 rpm): 0°CA • Driving with the accelerator fully open at 2000 rpm: -7.6°CA • Driving with the accelerator fully open at 3000 rpm: -4.5°CA			
	Symptoms when out of range: -			
	Diagnostic Note: Use "Main Injection Timing" to check poor drivability when the following symptoms are present: Bad injection timing, black smoke, and white smoke.			

After Injection Timing

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	After injection timing: Min.: -10°CA, Max.: 50°CA	-	Calculated Value	-
	Results of real-vehicle check: • Ignition switch ON: 0°CA • Cranking: 0°CA			

After Injection Timing	• Idling (warm up the engine): 0°CA • Running without load (2500 rpm): 21.9°CA • Driving with the accelerator fully open at 2000 rpm: 17°CA • Driving with the accelerator fully open at 3000 rpm: 22°CA
	Symptoms when out of range:
	Diagnostic Note: Use "Main Injection Timing" to check poor drivability when the following symptoms are present: Bad injection timing, black smoke, and white smoke.

Fuel Temperature

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Fuel Temperature	Fuel temperature: Min.: -40°C, Max.: 140°C	Actual fuel temperature	Sensor output (fuel temperature sensor)	-
	Symptoms when out of range: -			
	Diagnostic Note: After fully cold soaking, the fuel temperature is the same as the outside air temperature.			

Fuel Return Temp

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Fuel Return Temp	Estimated fuel temperature in injector: Min.: -40°C, Max.: 215°C	-	Calculated by ECM	-
	Results of real-vehicle check: • Ignition switch ON, engine coolant temperature 35°C (95°F): 70°C (158°F) • Idling, engine warmed up, fuel temperature 52°C (125°F): 88°C (190°F)			
	Symptoms when out of range: -			
	Diagnostic Note: • The ECM calculates this value based on the fuel temperature sensor output and engine running conditions.			

Fuel System Monitor

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Fuel System Monitor	Fuel system monitor: Not Avl or Avail	-	-	-
	Symptoms when out of range: -			
	Diagnostic Note: This item does not apply to diesel engines.			

Injector Memory Error

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Injector Memory Error	Compensation (QR) code writing error status: No Error or Error	No Error	Calculated by ECM	• Injector compensation (QR) code writing error
	Symptoms when out of range: Poor driveability, rough idling, black smoke, white smoke, abnormal combustion noise			
	Diagnostic Note: This flag displays an error when the injector compensation code is not input for a new ECM or an injector for a different type or a value beyond the compensation setting range is input. This error may not be detected when a wrong compensation (QR) code is input.			

EGR system

Target EGR Valve Pos.

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	No. 1 EGR valve target opening	Idling after engine	ECU-calculated value based on sensors (MAF meter, manifold	

Target EGR Valve Pos.	angle: Min.: 0%, Max.: 100%	warmed up: 0 to 80%	absolute pressure sensor, intake air temperature (built into MAF meter), etc.)	-
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 43% • Running without load (2500 rpm): 22% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%			
	Symptoms when out of range: • When value is out of range and approaching 0%: MAF meter degradation, intake or exhaust system blockage • When value is out of range and approaching 100%: EGR pipe blockage			
	Diagnostic Note: • Fully open: 100%. • Fully closed: 0%. • Used for comparison to "Actual EGR Valve Pos.".			

Target EGR Valve Pos. #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Target EGR Valve Pos. #2	No. 2 EGR valve target opening angle: Min.: 0%, Max.: 100%	Idling after engine warmed up: 0 to 80%	ECU-calculated value based on sensors (MAF meter, manifold absolute pressure sensor, intake air temperature (built into MAF meter), etc)	-
	Diagnostic Note: Used for comparison to "Actual EGR Valve Pos #2".			

Actual EGR Valve Pos.

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Actual EGR Valve Pos.	No. 1 EGR valve position: Min.: 0%, Max.: 100%	Idling after engine warmed up: 0 to 80%	Calculated from EGR valve opening position sensor	
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 84% • Running without load (2500 rpm): 34% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%			
	Symptoms when out of range: • EGR valve stuck open: Poor starts (engine does not stop), black smoke, white smoke, lack of power • EGR valve stuck closed: Increased turbo booster noise			
	Diagnostic Note: • Fully open: 100%. • Fully closed: 0%. • Inspect while comparing to "Target EGR Valve Pos.". • Check the valve movement via the Active Test. • Sometimes the malfunction only occurs around a certain temperature, so refer to the engine coolant temperature and outside temperature at the time the malfunction occurred.			

Actual EGR Valve Pos. #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	No. 2 EGR valve position:	Idling after engine warmed up: 0	Calculated from EGR valve opening	

Actual EGR Valve Pos. #2	Min.: 0%, Max.: 100%	to 80%	position sensor	-
	Results of real-vehicle check: Same as Actual EGR Valve Pos.			
	Symptoms when out of range: Same as Actual EGR Valve Pos.			
	Diagnostic Note: Inspect while comparing to "Target EGR Valve Pos. #2".			

EGR Lift Sensor Volt %

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Lift Sensor Volt %	No. 1 EGR valve lift position: Min.: 0%, Max.: 100%	Idling: 25 to 90%	Calculated from EGR valve opening position sensor	-
	Results of real-vehicle check: • Ignition switch ON: 77% • Cranking: 77% • Idling (warm up the engine): 53% • Running without load (2500 rpm): 65% • Driving with the accelerator fully open at 2000 rpm: 77% • Driving with the accelerator fully open at 3000 rpm: 77%			
	Symptoms when out of range: -			
	Diagnostic Note: • EGR Lift Sensor Volt % is calculated from the EGR position sensor output voltage. Value is 0 to 5 V converted to 0 to 100%. • Fully open: 33.5 to 35.5%. • Fully closed: 76.9 to 77.3%.			

EGR Lift Sensor Volt % #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Lift Sensor Volt % #2	No. 2 EGR valve lift position: Min.: 0%, Max.: 100%	Idling: 25 to 90%	Calculated from EGR valve opening position sensor	-

EGR Motor Duty #1

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Motor Duty #1	No. 1 EGR valve actuate duty: Min.: 0%, Max.: 127.5%	Idling after engine warmed-up: 0 to 100%	-	-
	Results of real-vehicle check: -			
	Symptoms when out of range: -			
	Diagnostic Note: • This EGR Motor Duty #1 is calculated based on Target EGR Valve Pos. to actuate the EGR valve. • To 0%: Close side EGR valve actuation. • To 100%: Open side EGR valve actuation. • When this value is large but the actual valve position does not reach the target valve position, there is an unable to open malfunction.			

EGR Motor Duty #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Motor Duty #2	No. 2 EGR valve actuate duty: Min.: 0%, Max.: 127.5%	Idling after engine warmed-up: 0 to 100%	-	-

EGR Operation Prohibit

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	EGR operation prohibit:	OK: Active Test item "Control the EGR Step Position" and "Activate the EGR	-	-

EGR Operation Prohibit	OK or NG	Valve Close" can be performed
	Symptoms when out of range: -	
	Diagnostic Note: • OK: "EGR Valve Control Active Test Possible" Condition. • NG: "Not Possible" Condition.	

EGR Close Learn Val.

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Close Learn Val.	No. 1 EGR valve lift volume learned value: Min.: 0 V, Max.: 5 V	Idling: 3.5 to 4.5 V	No. 1 EGR valve position sensor value when EGR valve fully closed	-
	Results of real-vehicle check: 3.85 V			
	Symptoms when out of range: -			
	Diagnostic Note: At the upper and lower limits of the normal range, it is possible that a foreign object is lodged in the EGR valve seat area.			

EGR Close Lrn. Val. #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Close Lrn. Val. #2	No. 2 EGR valve lift volume learned value: Min.: 0 V, Max.: 5 V	Idling: 3.5 to 4.5 V	No. 2 EGR valve position sensor value when EGR valve fully closed	-
	Results of real-vehicle check: 3.85 V			
	Symptoms when out of range: -			
	Diagnostic Note: • This value is the EGR position sensor output voltage. • At the upper and lower limits of the normal range, it is possible that a foreign object is lodged in the EGR valve seat area.			

EGR Close Lrn. Val.

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Close Lrn. Val.	No. 1 EGR valve fully closed position learned value: Min.: 0 V, Max.: 5 V	3.5 to 4.5 V	No. 1 EGR valve position sensor value when EGR valve fully closed	-
	Results of real-vehicle check: 3.85 V			
	Symptoms when out of range: -			
	Diagnostic Note: • This value is the EGR position sensor output voltage. • At the upper and lower limits of the normal range, it is possible that a foreign object is lodged in the EGR valve seat area. • As the lower and upper limits are 3.5 V and 4.5 V respectively, if the value becomes stuck at either of these values, there is a malfunction in the lift sensor or the valve position may be misaligned (foreign matter is present, etc.).			

EGR Close Lrn. Val. #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	No. 2 EGR valve fully closed position learned value: Min.: 0 V, Max.: 5 V	3.5 to 4.5 V	No. 2 EGR valve position sensor value when EGR valve fully closed	-
	Results of real-vehicle check: 3.85 V			

EGR Close Lrn. Val. #2	Symptoms when out of range: -
	Diagnostic Note: • This value is the EGR position sensor output voltage. • At the upper and lower limits of the normal range, it is possible that a foreign object is lodged in the EGR valve seat area. • As the lower and upper limits are 3.5 V and 4.5 V respectively, if the value becomes stuck at either of these values, there is a malfunction in the lift sensor or the valve position may be misaligned (foreign matter is present, etc.).

EGR Close Lrn. Status

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Close Lrn. Status	No. 1 EGR valve fully closed position learning status: OK or NG	OK	-	-
	Symptoms when out of range: -			
	Diagnostic Note: • "OK" means the fully closed position learning has completed normally. • When NG, the learned fully closed position may be outside of the normal range. When NG, there may be foreign matter stuck in the valve. **HINT:** After disconnecting and reconnecting the battery cable, if the ignition switch has not been turned off once, learning may not be completed.			

EGR Close Lrn. Status #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR Close Lrn. Status #2	No. 2 EGR valve fully closed position learning status: OK or NG	OK	-	-
	Symptoms when out of range: -			
	Diagnostic Note: • "OK" means the fully closed position learning has completed normally. • When NG, the learned fully closed position may be outside of the normal range. When NG, there may be foreign matter stuck in the valve. **HINT:** After disconnecting and reconnecting the battery cable, if the ignition switch has not been turned off once, learning may not be completed.			

EGR/VVT Monitor

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
EGR/VVT Monitor	EGR Monitor: Not Avl or Avail	-	Result of ECU calculations	-
	Symptoms when out of range: -			
	Diagnostic Note: EGR monitor indicates that the storage of related DTCs is complete.			

Diesel throttle system

Throttle Sensor Volt %

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	Absolute throttle position sensor (bank 1): Min.: 0%, Max.: 100%	• Ignition switch ON: 60 to 80% • Warmed-up and idling: 10 to 80%	Sensor output (throttle position sensor (bank 1))	-
	Results of real-vehicle check: • Ignition switch ON: 70%			

Throttle Sensor Volt %	• Cranking: 70% • Idling (warm up the engine): 21.9% • Running without load (2500 rpm): 51% • Driving with the accelerator fully open at 2000 rpm: 69.8% • Driving with the accelerator fully open at 3000 rpm: 69.8%
	Symptoms when out of range: • Stuck closed: Engine stall, difficult to start, rough idling, lack of power, black smoke, white smoke • Stuck open: Loud turbocharging sound, bad vibration when engine stopped • When the ECM detects a malfunction with the diesel throttle (MIL on), engine power is restricted but city driving is possible.
	Diagnostic Note: • Throttle position sensor output voltage is converted using 5 V = 100%. • When fully closed: 14%. • When fully open: 70%. • When the ignition switch is turned from off to ON, the throttle valve fully opens once. • When the ignition switch is turned from ON to off, the throttle valve fully closes once.

Throttle Sensor #2 Volt %

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Throttle Sensor #2 Volt %	Absolute throttle position sensor (bank 2): Min.: 0%, Max.: 100%	• Ignition switch ON: 60 to 80% • Warmed-up and idling: 10 to 80%	Sensor output (throttle position sensor (bank 2))	Same as Throttle Sensor Volt %

Actual Throttle Position

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Actual Throttle Position	Actual diesel throttle (bank 1) angle: Min.: -20%, Max.: 120%	Idling after engine warmed-up: 0 to 90%	-	-
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 84% • Running without load (2500 rpm): 32% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%			
	Symptoms when out of range: • Stuck closed: Engine stall, difficult to start, lack of power, black smoke, rough idle • Stuck open: Loud turbocharging sound, bad vibration when engine stopped • When ECM detects a malfunction of diesel throttle (MIL on), engine power is restricted so that the vehicle can drive with a maximum speed of 80 to 120 km/h.			
	Diagnostic Note: Closing percentage of the throttle valve. • Fully closed: 100%. • Fully open: 0%. **HINT:** There is no connection with the accelerator. However, under full load, the throttle is usually fully open (0%).			

Actual Throttle Position #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Actual Throttle Position #2	Actual diesel throttle (bank 2) angle: Min.: -20%, Max.: 120%	Idling after engine warmed-up: 0 to 90%	-	-

Target Throttle Position

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	Target diesel throttle valve (bank 1) opening angle:	Idling after engine warmed-up: 0	Calculated by	-

Target Throttle Position	Min.: -20%, Max.: 120%	to 90%	ECM	
	Results of real-vehicle check: Actual Throttle Position follows this value			
	Symptoms when out of range: -			
	Diagnostic Note: • If the actual throttle position follows this value, it is normal. • Fully closed: 100% • Fully open: 0% • The value should not largely differ from the actual throttle position.			

Target Throttle Position #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Target Throttle Position #2	Target diesel throttle valve (bank 2) opening angle: Min.: -20%, Max.: 120%	Idling after engine warmed-up: 0 to 90%	Calculated by ECM	-

Throttle Motor Duty #1

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Throttle Motor Duty #1	Diesel throttle motor actuate duty (bank 1): Min.: 0%, Max.: 100%	Idling after engine warmed-up: 10 to 90%	-	-
	Results of real-vehicle check: • Ignition switch ON: 61.5% • Cranking: 63% • Idling (warm up the engine): 37% • Running without load (2500 rpm): 53% • Driving with the accelerator fully open at 2000 rpm: 62.5% • Driving with the accelerator fully open at 3000 rpm: 64%			
	Symptoms when out of range: -			
	Diagnostic Note: • To 0%: Closed side diesel throttle actuation. • To 100%: Open side diesel throttle actuation. • When this value is large but the actual opening angle does not reach the target opening angle, there is an unable to close malfunction. • If it is small, but the actual opening angle does not reach the target opening angle, there is an unable to open malfunction. • Usually this value is at approximately 50 +/-20%, but momentary jumps outside this range do occur. • If a duty outside 50 +/-40% continues for several seconds, it will be judged that the diesel throttle does not move properly and the MIL will be illuminated.			

Throttle Motor Duty #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Throttle Motor Duty #2	Diesel throttle motor actuate duty (bank 2): Min.: 0%, Max.: 100%	Idling after engine warmed-up: 10 to 90%	-	-

Throttle Close Learning Val.

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Throttle Close Learning Val.	Throttle fully closed position learned value (bank 1): Min.: 0 deg, Max.: 84 deg	14 to 22 deg	-	-
	Results of real-vehicle check: 17 deg			
	Symptoms when out of range: Ignition switch ON: 17 deg			
	Diagnostic Note: • When the ignition is turned from switch ON to off and 5 seconds elapse, learning of "Throttle Close Learning Val." will be complete. • When "Throttle Close Learning Val." is outside of the normal range, a foreign object may lodged in the throttle valve. • Fully closed: 17.25 deg. • Fully open: 87.25 deg.			

	• If the value is stuck at the upper limit of 21.25 deg, there is a chance that a malfunction is present. However, as the initial value for the learned value is 21.25 deg, it is necessary to check the value after learning is completed.

Throttle Close Learning Val. #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Throttle Close Learning Val. #2	Throttle fully closed position learned value (bank 2): Min.: 0 deg, Max.: 84 deg	14 to 22 deg	-	-

Diesel Throttle Learn Status

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Diesel Throttle Learn Status	Diesel throttle learning history (bank 1): OK or NG	OK	-	-
	Symptoms when out of range: -			
	Diagnostic Note: • If the system is functioning properly, learning will be performed when the ignition switch is turned from ON to off. • NG indicates that a foreign object may be lodged in the throttle valve or actuator components, or a disconnect/short exists in the signal wires.			

Diesel Throttle Learn Status #2

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Diesel Throttle Learn Status #2	Diesel throttle learning history (bank 2): OK or NG	OK	-	-

VN Turbo system

Target Booster Pressure

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Target Booster Pressure	Target boost pressure: Min.: 0 kPa, Max.: 320 kPa	Idling and vehicle under normal atmospheric pressure: 87 to 103 kPa	Calculated Value by ECM	-
	Results of real-vehicle check: • Ignition switch ON: 96 kPa • Cranking: 100 kPa • Idling (warm up the engine): 99.5 kPa • Running without load (2500 rpm): 119 kPa • Running without load (4700 rpm): 151 kPa (accelerator pedal depressed) • Driving with the accelerator fully open at 2000 rpm: 185 kPa • Driving with the accelerator fully open at 3000 rpm: 222 kPa			
	Symptoms when out of range: -			
	Diagnostic Note: • Inspect while comparing with "MAP". • With the accelerator fully open, if the actual manifold absolute pressure (MAP) is low compared to the target booster pressure by at least 20 kPa for 5 sec. or more, a feeling of a lack of power will occur.			

Boost Pressure Deviation

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Boost Pressure Deviation	Boost pressure deviation: Min.: -320 kPa, Max.: 320 kPa	Idling after engine warmed up and vehicle under normal atmospheric pressure: -3 to 10 kPa	-	-
	Diagnostic Note: Difference between target and actual supercharging pressure.			

VN Turbo Command

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
VN Turbo Command	VN turbo command value: Min.: 20%, Max.: 100%	20 to 100%	Controls the VN turbo vane opening position.	-
	Results of real-vehicle check: • Ignition switch ON: 100% • Cranking: 100% • Idling (warm up the engine): 88% • Running without load (2500 rpm): 76% • Running without load (4700 rpm): 50% (accelerator pedal depressed) • Driving with the accelerator fully open at 2000 rpm: 85% • Driving with the accelerator fully open at 3000 rpm: 46%			
	Symptoms when out of range: -			
	Diagnostic Note: • "VN Turbo command" is a command value. • 0%: Full open vanes (contraction of actuation-use rods) • 90% or more: Full closed vanes (extension of actuation-use rods) • When this value is large, the turbo works well. • There is no actual opening angle data to handle the VN Turbo command value.			

VN Turbo Error Level

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
VN Turbo Error Level	VN turbo driver opening angle level when abnormality detected: 1, 2 or 3	0: Normal	-	-
	Symptoms when out of range: -			
	Diagnostic Note: • 3: Nearly fully closed (supercharging pressure and pre-turbine pressure are incredibly high and there is a risk of engine damage). • 2: Roughly intermediate opening angle (not as bad as "3", but long-term usage is problematic). • 1: Nearly fully open (will not cause engine damage, but at a low RPM, turbocharging pressure will not rise and insufficient power will be felt).			

VN Turbo Max Angle

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
VN Turbo Max Angle	VN turbo maximum opening angle: Min.: 0%, Max.: 100%	100% **HINT:** As this value displays the ideal constant upper limit, no matter what happens, this value should not change.	-	-
	Results of real-vehicle check: • Ignition switch ON: 99.6%			
	Symptoms when out of range: -			
	Diagnostic Note: • Vane maximum angle expressed in % (Fully open: to 100%). • VD engine is usually 100%.			

VN Turbo Min Angle

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
	VN turbo minimum opening angle: Min.: 0%, Max.: 100%	0% **HINT:** As this value displays the ideal constant lower limit, no matter what happens, this value should not change.	-	-

VN Turbo Min Angle	Results of real-vehicle check: • Ignition switch ON: 51.9%
	Symptoms when out of range: -
	Diagnostic Note: • Vane maximum angle expressed in % (Fully open: to 100%). • VD engine is usually 52%.

VN Turbo Operation prohibit

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
VN Turbo Operation prohibit	VN turbo operation prohibit: OK or NG	OK: Active Test item "Test the Turbo Charger Step Motor" can be performed	-	-
	Symptoms when out of range: -			
	Diagnostic Note: When NG, indicates a condition where the engine software does not allow the VN turbo Active Test.			

VN Turbo Type

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
VN Turbo Type	VN turbo type: Not, Commo or Vacuum	Commo	-	-
	Symptoms when out of range: -			
	Diagnostic Note: Indicates the VN turbo vane actuation method. • DC motor system. • Negative-pressure diaphragm system. • Step motor system.			

Diesel Starting

Engine Speed (Starter Off)

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Engine Speed (Starter Off)	Engine speed when starter off: Min.: 0 rpm, Max.: 1594 rpm	-	-	-
	Diagnostic Note: Engine speed immediately after starting the engine.			

Starter Count

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Starter Count	Starter on count: Min.: 0, Max.: 255	-	-	-
	Diagnostic Note: Number of times the starter turned on from the time the ignition switch was turned to ON.			

Run Dist of Previous Trip

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
Run Dist of Previous Trip	Distance driven during previous trip: Min.: 0 km, Max.: 261 km	-	-	-
	Diagnostic Note: Used to confirm the driving conditions of the previous trip (before the malfunction occurred).			

Diesel Rough

Electric Duty Feedback Value

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range

Electric Duty Feedback Value	Electric load feedback value: Min.: 0 mm^3/st, Max.: 39.8 mm^3/st	0 to 2.5 mm^3/st	-	-
	Symptoms when out of range: -			
	Diagnostic Note: Expected injection volume increase after the electrical load turns from off to on.			

A/C Duty Feedback Value

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
A/C Duty Feedback Value	A/C load feedback value: Min.: 0 mm^3/st, Max.: 39.8 mm^3/st	• 0 to 4.1 mm^3/st (A/T) • 0 to 2.6 mm^3/st (M/T)	-	-
	Symptoms when out of range: -			
	Diagnostic Note: Expected injection volume increase after the A/C turns from off to on.			

PS Duty Feedback Value

Tester Display	Measurement Item/Range	Normal Condition	Type	Cause of Out of Range
PS Duty Feedback Value	Power steering load feedback value: Min.: 0 mm^3/st, Max.: 39.8 mm^3/st	0 mm^3/st	-	-
	Symptoms when out of range: -			
	Diagnostic Note: Expected injection volume increase after the power steering turns from off to on.			

ACTIVE TEST

HINT:

Using the intelligent tester to perform Active Tests allows relays, VSVs, actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing Active Tests early in troubleshooting is one way to save diagnostic time. Data List information can be displayed while performing Active Tests.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine / Active Test.

e. Perform the Active Test.

Tester Display	Test Part	Control Range	Diagnostic Note
Control the A/C Cut Signal	Control the A/C signal	ON/OFF	-
Control the ACM Inhibit	Control the VSV for engine mount	ON/OFF	-
Connect the TC and TE1	Turn on TC and TE1 connection	ON/OFF	-
Activate the ACC Cut Relay	Activate ACC (accessory) relay	ON/OFF	-
Activate the Starter Relay	Activate Starter relay	ON/OFF	-
Control the EGR Step Position	Control the No. 1 EGR valve	0 to 100%	Test is possible when the following conditions are met: • Ignition switch is ON. • Engine is stopped.
Control the EGR Step Position #2	Control the No. 2 EGR valve	0 to 100%	Test is possible when the following conditions are met: • Ignition switch is ON. • Engine is stopped.
Test the Turbo Charger Step Motor	Activate the turbocharger (for Bank 1)	52 to 100%	Test is possible when the following conditions are met: • Ignition switch is ON. • Engine is stopped.
			Test is possible when the

Test the Turbo Charger Step Motor #2	Activate the turbocharger (for Bank 2)	52 to 100%	following conditions are met: • Ignition switch is ON. • Engine is stopped.
Test the Fuel Leak	Pressurizes common rail internal fuel pressure, and checks for fuel leaks	Stop/Start	Performs inspection of the high pressure fuel system. • Engine Speed: 2050 rpm • Fuel Pressure: 172000 kPa • Target Common Rail Pressure: 176000 kPa • Target Pump SCV Current: 1.4 A • MAP: 176 kPa • MAF: 39 g/sec.
Diesel Throttle Target Angle	Control the diesel throttle valve (bank 1)	0 to 90%	Test is possible when the following conditions are met: • Ignition switch is ON. • Engine is stopped.
Diesel Throttle Target Angle #2	Control the diesel throttle valve (bank 2)	0 to 90%	Test is possible when the following conditions are met: • Ignition switch is ON. • Engine is stopped.
Activate the VN Turbo Open	Activate the turbocharger	ON/OFF	Confirm that the engine is running.
Activate the EGR Valve Close	Activate the electric EGR control valve assembly	ON/OFF	Confirm that the vehicle is stopped and the engine is idling
Activate the Intank Fuel Pump Relay	Activate SUB PUMP relay	ON/OFF	• Engine is stopped. • This test activates the relay for only 60 seconds. • After finishing this test, the vehicle does not permit activating the relay again within 60 seconds.
Control the Cylinder#1 Fuel Cut	Cut off fuel injection from No. 1 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.
Control the Cylinder#2 Fuel Cut	Cut off fuel injection from No. 2 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.

Control the Cylinder#3 Fuel Cut	Cut off fuel injection from No. 3 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.
Control the Cylinder#4 Fuel Cut	Cut off fuel injection from No. 4 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.
Control the Cylinder#5 Fuel Cut	Cut off fuel injection from No. 5 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.
Control the Cylinder#6 Fuel Cut	Cut off fuel injection from No. 6 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.
Control the Cylinder#7 Fuel Cut	Cut off fuel injection from No. 7 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of

			the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.
Control the Cylinder#8 Fuel Cut	Cut off fuel injection from No. 8 injector	ON/OFF	Fuel injection is stopped while the test is ON. • Confirm that the vehicle is stopped and the engine is idling. • If the running condition of the engine does not worsen even though injection of the designated cylinder is stopped, the cylinder can be confirmed to be malfunctioning.
Control the All Cylinders Fuel Cut	All cylinder injector fuel cut	ON/OFF	Used when the cylinder compression is measured. Test possible during vehicle stopping
Check the Cylinder Compression*	Check the cylinder compression pressure	ON/OFF	Fuel injection stop in all cylinders.

HINT:

*: When cranking the engine, the Active Test measures the speed of each cylinder.

In this Active Test, the fuel of all cylinders is cut, and cranking occurs for approximately 10 seconds. At this time, the speed of each cylinder is measured. If the speed of one cylinder is higher than the other cylinders, the compression pressure of that cylinder is determined to be lower than the other cylinders.

1. Warm up the engine.
2. Turn the ignition switch off.
3. Connect the intelligent tester to the DLC3.
4. Turn the ignition switch to ON and turn the tester on.
5. Enter the following menus: Powertrain / Engine / Active Test / Check the Cylinder Compression.

   HINT:

   If the results are not displayed normally, select the display items from the Data List before performing the Active Test. Enter the following menus: Powertrain / Engine / Data List / Compression / Engine Speed of Cyl #1, Engine Speed of Cyl #2, Engine Speed of Cyl #3, Engine Speed of Cyl #4, Engine Speed of Cyl #5, Engine Speed of Cyl #6, Engine Speed of Cyl #7, Engine Speed of Cyl #8 and Av Engine Speed of All Cyl.

6. While the engine is not running, press the RIGHT or LEFT button to change Check the Cylinder Compression to ON.

   HINT:

   After performing the above procedure, the Active Test Check the Cylinder Compression will start. Fuel injection for all cylinders is prohibited, and the engine speed measurement of each cylinder will enter standby mode.

7. Crank the engine for about 10 seconds.
8. Monitor the engine speed (Engine Speed of Cyl #1 to #8, Av Engine Speed of All Cyl) displayed on the tester.

   HINT:

   At first, the tester's display will show the engine speed measurement of each cylinder to be extremely high. After approximately 10 seconds of engine cranking, the engine speed measurement of each cylinder will change to the actual engine speed.

   NOTICE:

   - **After the Active Test Check the Cylinder Compression is turned on, it will automatically turn off after 255 seconds.**
   - **When the Check the Cylinder Compression test is off and the engine is cranked, the engine will start.**
   - **If the Check the Cylinder Compression test needs to be performed after it is turned on and performed once, press EXIT to return to the Active Test menu screen. Then perform the Check the Cylinder Compression test again.**
   - **Use a fully-charged battery.**

for Preparation Click here

HINT:

Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.

If any DTCs are output during a check mode DTC check, check the circuit for the DTCs listed in the table below. For details of each DTC, refer to the page indicated.

for Preparation Click here

DESCRIPTION

These DTCs indicates that the DC motor of the turbocharger is malfunctioning. The ECM monitors the DC motor current to detect an open or short in the DC motor circuit. If the current meets the criteria, the ECM sets a DTC and illuminates the MIL immediately.
The DC motor is used to operate the nozzle vane of the turbocharger. The nozzle vane opens and closes to change the velocity of exhaust emissions in order to control the turbo pressure. The ECM varies the duty-cycle of the DC motor in accordance with the driving condition.
If the nozzle vane is stuck closed (DC motor stuck off), the drivability may deteriorate at wide open throttle. If the nozzle vane is stuck open (DC motor stuck on), the drivability may deteriorate at intermediate throttle or the engine power may be in sufficient.

P0046, P004B

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 5 seconds	Either of the following conditions are met when the motor is driving (1 trip detection logic): • DC motor duty ratio is +/-100% for 1.3 seconds or more. • DC motor current is 2.2 A or more for 5 seconds or more.	• Open or short in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

P0047, P004C

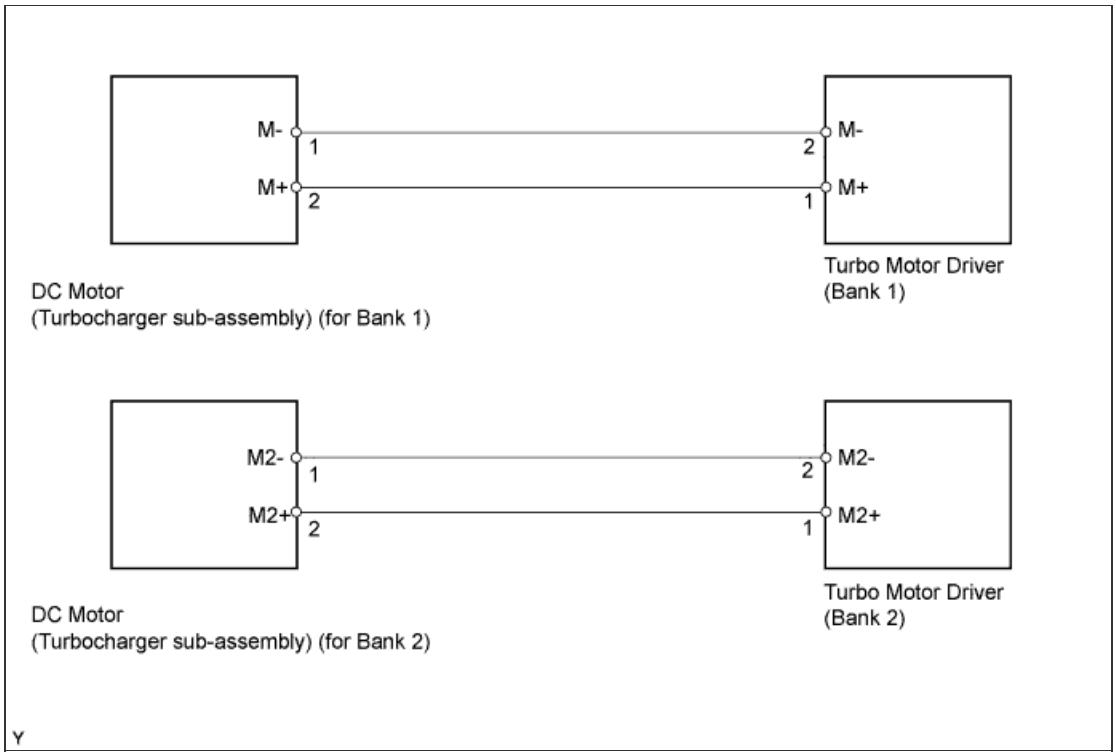
DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	Both of following conditions are met for 1 second or more when the motor is driving (1 trip detection logic): • DC motor duty ratio is 100%. • DC motor current is 0.5 A or less.	• Open in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC Motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

P0048, P004D

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	DC motor current is 6.5 A or more for 0.5 seconds or more when the motor is operating (1 trip detection logic).	• Short in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC Motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

HINT:

If DTC P0046, P0047, P0048, P004B, P004C and/or P004D is stored, the following symptoms may appear.



Stuck closed malfunction:

- **Vehicle surge when driving with full load**

Stuck open malfunction:

- **Lack of power**
- **Vehicle surge or hesitation under light or medium load**
- **White smoke**

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

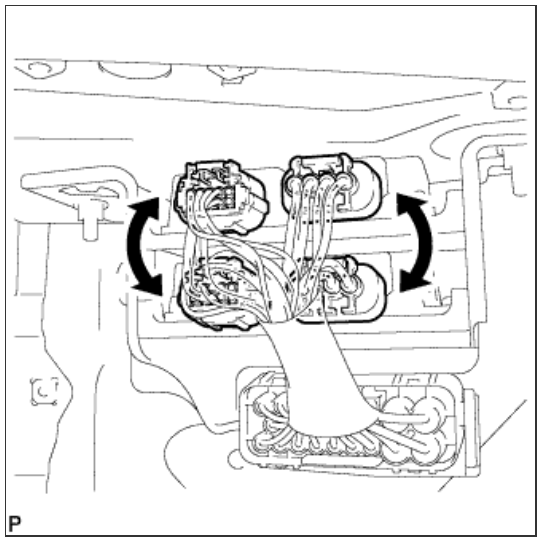
HINT:

Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 5 seconds or more.

k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs do not change	A
DTCs change	B
No DTC output	C

B → Go to step

C → Go to step 8

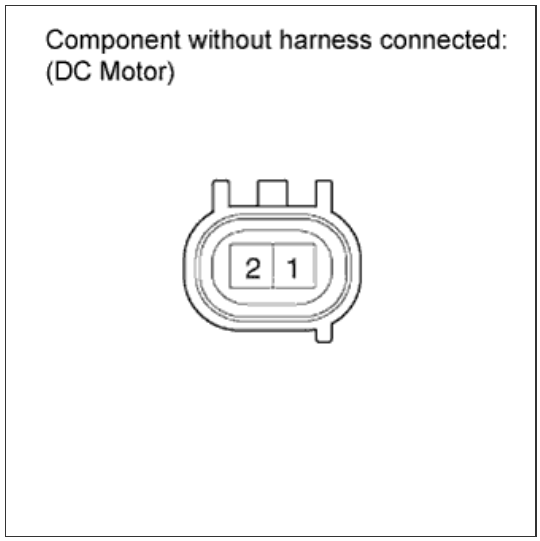
A

2.INSPECT TURBOCHARGER SUB-ASSEMBLY (DC MOTOR) (for Bank 1 or Bank 2)

a. Disconnect the DC motor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



for Bank 1

Tester Connection	Condition	Specified Condition
1 (M-) - 2 (M+)	Always	1 to 100 Ω

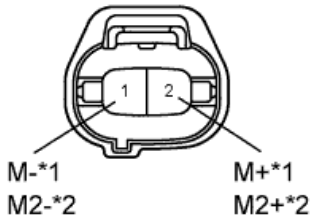
Standard Resistance:

for Bank 2

Tester Connection	Condition	Specified Condition
1 (M2-) - 2 (M2+)	Always	1 to 100 Ω

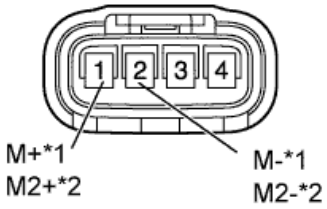
NG → Go to step 4

OK



3.CHECK HARNESS AND CONNECTOR (DC MOTOR - TURBO MOTOR DRIVER)

a. Disconnect the DC motor connector.



b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to DC Motor)

Front view of wire harness connector:
(to Turbo Motor Driver)

*1: for Bank 1

*2: for Bank 2

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M-) - Turbo motor driver connector-2 (M-)	Always	Below 1 Ω
DC motor connector-2 (M+) - Turbo motor driver connector-1 (M+)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M2-) - Turbo motor driver connector-2 (M2-)	Always	Below 1 Ω
DC motor connector-2 (M2+) - Turbo motor driver connector-1 (M2+)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M-) or Turbo motor driver connector-2 (M-) - Body ground	Always	10 kΩ or higher
DC motor connector-2 (M+) or Turbo motor driver connector-1 (M+) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M2-) or Turbo motor driver connector-2 (M2-) - Body ground	Always	10 kΩ or higher
DC motor connector-2 (M2+) or Turbo motor driver connector-1 (M2+)	Always	10 kΩ or

- Body ground		higher

OK → Go to step 8

NG → Go to step 6

4.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2)

a. Replace turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 7

5.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 7

6.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 5 seconds or more.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END

8.INSPECT TURBOCHARGER SUB - ASSEMBLY

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

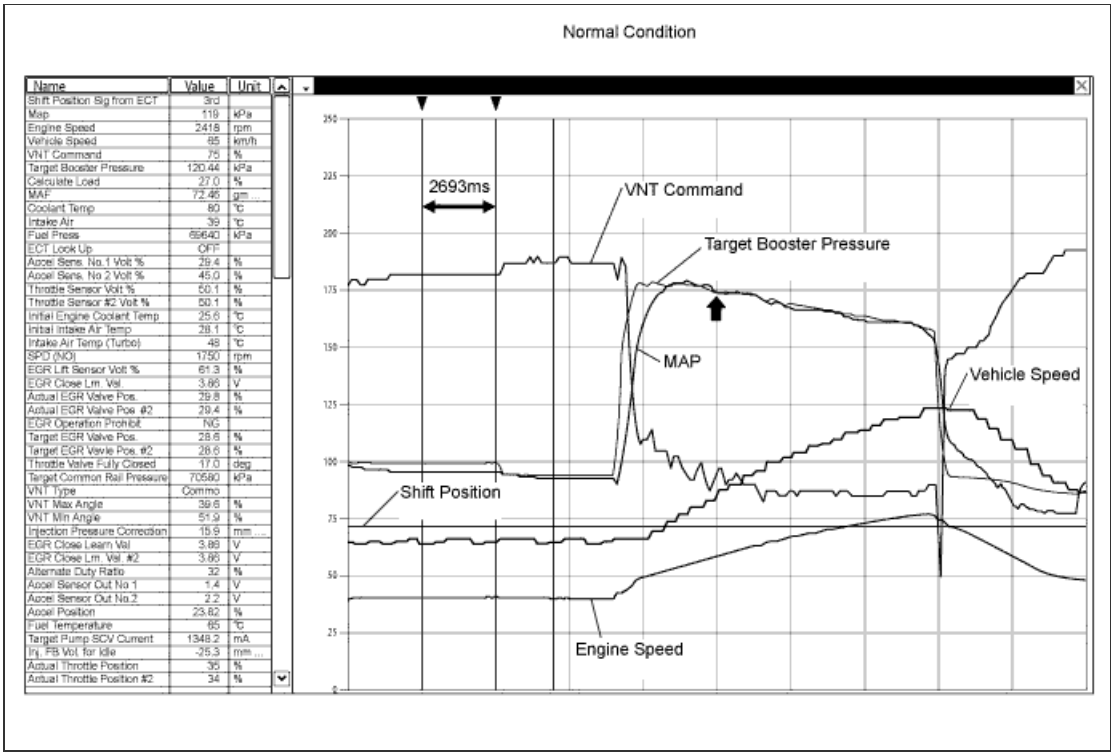
c. Start the engine and warm up.

d. Move the shift lever to 3rd and accelerate the vehicle with the accelerator fully open.

e. Stop the vehicle

f. Enter the following menus: Powertrain / Engine / DTC.

g. Read the DTCs.



Result:

Display (DTC Output)	Proceed to
DTC P0046, P0047, P0048, P004B, P004C and/or P004D are output	A

No DTC output	B

HINT:

- **A snapshot can be used to compare vehicle data from the time of the malfunction to normal data and is very useful for troubleshooting.**
- **"Target Booster Pressure" and "MAP" in the snapshot can be used to heck the operation of the turbocharger. If "MAP" does not follow "Target Booster Pressure", the turbocharger nozzle vane may be stuck or the movement may be irregular.**
- **When the engine speed is 2500 to 3000 rpm with the accelerator pedal fully depressed, "MAP" is within +/- 10 kPa * of "Target Booster Pressure" (not immediately after beginning of acceleration).**
- *** If the turbocharger pressure does not reach a specified value, it cannot be determined whether the system is normal by checking whether "MAP" is within +/-10 kPa of "Target Booster Pressure"**

HINT:

Compare "MAP" with "Target Booster Pressure" at the point indicated by the arrow (↑) in the illustration.

DESCRIPTION

The EGR valve position sensor is mounted on the EGR valve and used for detecting the lift amount of the valve. The lift amount detected by the sensor is provided to the ECM as feedback. The ECM then regulates the lift amount of the valve in accordance with engine running conditions.

P0405

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 1 EGR valve position sensor output voltage is less than 0.1 V for 5 seconds (1 trip detection logic).	• Open in No. 1 EGR valve position sensor circuit • No. 1 EGR valve (EGR valve position sensor) • ECM

P0406

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 1 EGR valve position sensor output voltage is more than 4.9 V for 5 seconds (1 trip detection logic).	• Short in No. 1 EGR valve position sensor circuit • No. 1 EGR valve (EGR valve position sensor) • ECM

P0407

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 2 EGR valve position sensor output voltage is less than 0.1 V for 5 seconds (1 trip detection logic).	• Open in No. 2 EGR valve position sensor circuit • No. 2 EGR valve (EGR valve position sensor) • ECM

P0408

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 2 EGR valve position sensor output voltage is more than 4.9 V for 5 seconds (1 trip detection logic).	• Short in No. 2 EGR valve position sensor circuit • No. 2 EGR valve (EGR valve position sensor) • ECM

MONITOR DESCRIPTION

When the output voltage of the EGR valve position sensor deviates from the normal operating range of 0.1 to 4.9 V for more than 5 seconds, the ECM interprets this as a malfunction of the sensor circuit, and illuminates the MIL.

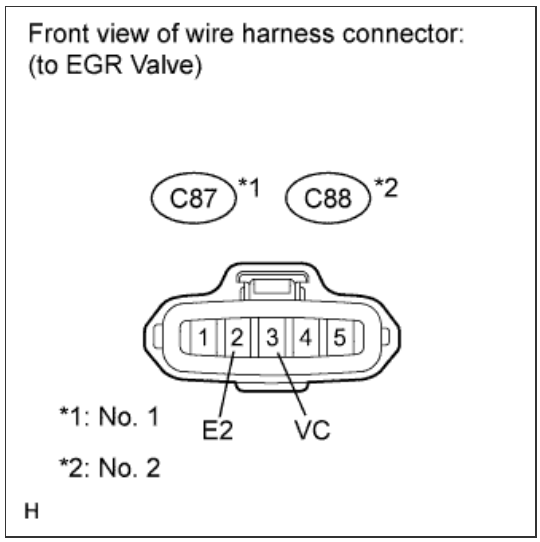
WIRING DIAGRAM

Refer to DTC P0400 (Click here).

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).



HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**
- **Data List items "EGR Lift Sensor Volt %" and "EGR Lift Sensor Volt % #2" are values calculated by converting the EGR position sensor output voltage of 0 to 5 V to a percentage from 0 to 100%.**

1.CHECK HARNESS AND CONNECTOR (POWER SOURCE)

a. Disconnect the EGR valve connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

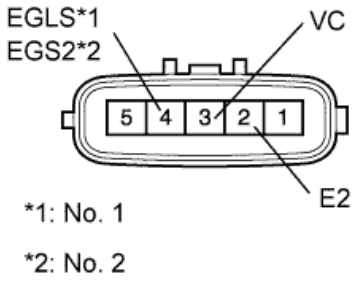
No. 1

Tester Connection	Switch Condition	Specified Condition
C87-3 (VC) - C87-2 (E2)	Ignition switch ON	4.5 to 5.5 V

No. 2

Tester Connection	Switch Condition	Specified Condition
C88-3 (VC) - C88-2 (E2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 3



OK

2.INSPECT EGR VALVE ASSEMBLY (No. 1 or No. 2) (POSITION SENSOR)

a. Disconnect the EGR valve connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(EGR Valve)

*1: No. 1

*2: No. 2

Standard Resistance:

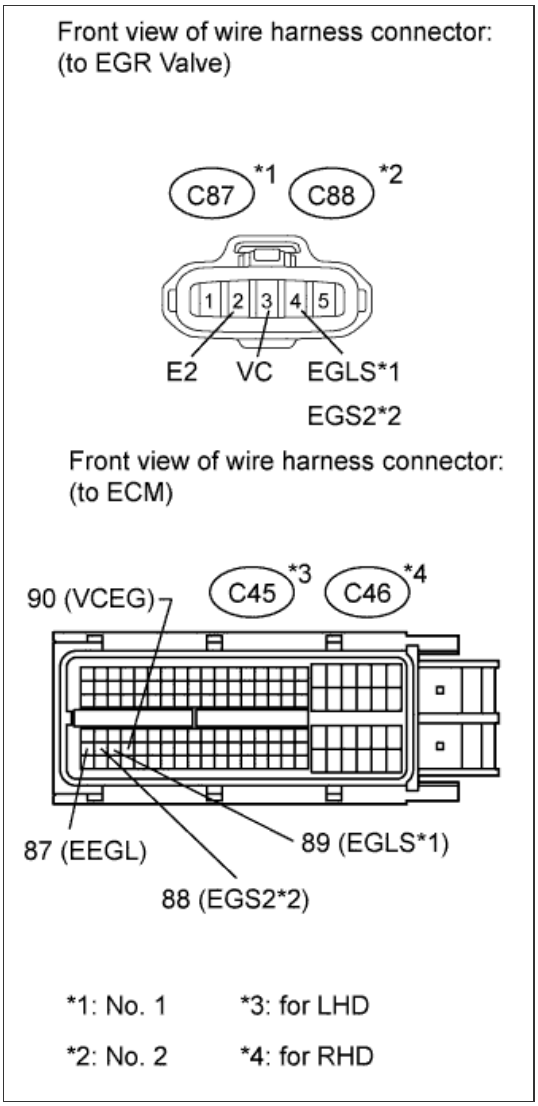
No. 1

Tester Connection	Condition	Specified Condition
3 (VC) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ
4 (EGLS) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ

No. 2

Tester Connection	Condition	Specified Condition
3 (VC) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ
4 (EGS2) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ

NG → Go to step 5



OK

3.CHECK HARNESS AND CONNECTOR (EGR VALVE POSITION SENSOR - ECM)

a. Disconnect the EGR valve connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) - C45-90 (VCEG)	Always	Below 1 Ω
C87-4 (EGLS) - C45-89 (EGLS)	Always	Below 1 Ω
C87-2 (E2) - C45-87 (EEGL)	Always	Below 1 Ω

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) - C45-90 (VCEG)	Always	Below 1 Ω
C88-4 (EGS2) - C45-88 (EGS2)	Always	Below 1 Ω
C88-2 (E2) - C45-87 (EEGL)	Always	Below 1 Ω

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) - C46-90 (VCEG)	Always	Below 1 Ω
C87-4 (EGLS) - C46-89 (EGLS)	Always	Below 1 Ω
C87-2 (E2) - C46-87 (EEGL)	Always	Below 1 Ω

No. 2 (RHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) - C46-90 (VCEG)	Always	Below 1 Ω
C88-4 (EGS2) - C46-88 (EGS2)	Always	Below 1 Ω

C88-2 (E2) - C46-87 (EEGL)	Always	Below 1 Ω

Standard Resistance (Check for Short):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) or C45-90 (VCEG) - Body ground	Always	10 kΩ or higher
C87-4 (EGLS) or C45-89 (RGLS) - Body ground	Always	10 kΩ or higher

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) or C45-90 (VCEG) - Body ground	Always	10 kΩ or higher
C88-4 (EGS2) or C45-88 (EGS2) - Body ground	Always	10 kΩ or higher

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) or C46-90 (VCEG) - Body ground	Always	10 kΩ or higher

P0407

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 2 EGR valve position sensor output voltage is less than 0.1 V for 5 seconds (1 trip detection logic).	• Open in No. 2 EGR valve position sensor circuit • No. 2 EGR valve (EGR valve position sensor) • ECM

P0408

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 2 EGR valve position sensor output voltage is more than 4.9 V for 5 seconds (1 trip detection logic).	• Short in No. 2 EGR valve position sensor circuit • No. 2 EGR valve (EGR valve position sensor) • ECM

MONITOR DESCRIPTION

When the output voltage of the EGR valve position sensor deviates from the normal operating range of 0.1 to 4.9 V for more than 5 seconds, the ECM interprets this as a malfunction of the sensor circuit, and illuminates the MIL.

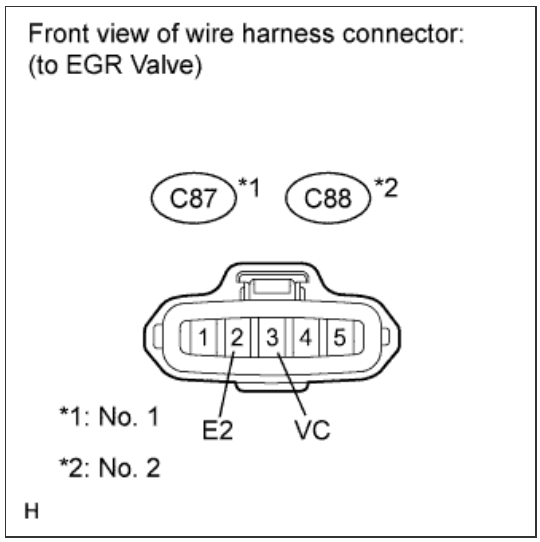
WIRING DIAGRAM

Refer to DTC P0400 (Click here).

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).



HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**
- **Data List items "EGR Lift Sensor Volt %" and "EGR Lift Sensor Volt % #2" are values calculated by converting the EGR position sensor output voltage of 0 to 5 V to a percentage from 0 to 100%.**

1.CHECK HARNESS AND CONNECTOR (POWER SOURCE)

a. Disconnect the EGR valve connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

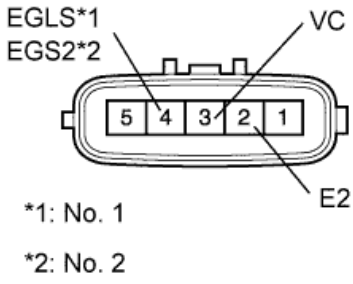
No. 1

Tester Connection	Switch Condition	Specified Condition
C87-3 (VC) - C87-2 (E2)	Ignition switch ON	4.5 to 5.5 V

No. 2

Tester Connection	Switch Condition	Specified Condition
C88-3 (VC) - C88-2 (E2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 3



OK

2.INSPECT EGR VALVE ASSEMBLY (No. 1 or No. 2) (POSITION SENSOR)

a. Disconnect the EGR valve connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(EGR Valve)

*1: No. 1

*2: No. 2

Standard Resistance:

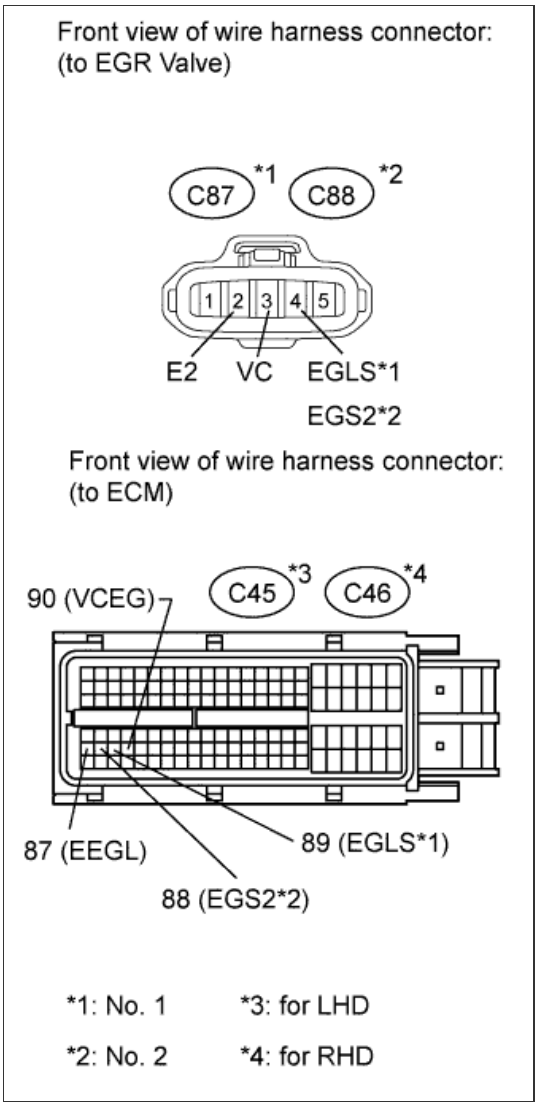
No. 1

Tester Connection	Condition	Specified Condition
3 (VC) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ
4 (EGLS) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ

No. 2

Tester Connection	Condition	Specified Condition
3 (VC) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ
4 (EGS2) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ

NG → Go to step 5



OK

3.CHECK HARNESS AND CONNECTOR (EGR VALVE POSITION SENSOR - ECM)

a. Disconnect the EGR valve connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) - C45-90 (VCEG)	Always	Below 1 Ω
C87-4 (EGLS) - C45-89 (EGLS)	Always	Below 1 Ω
C87-2 (E2) - C45-87 (EEGL)	Always	Below 1 Ω

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) - C45-90 (VCEG)	Always	Below 1 Ω
C88-4 (EGS2) - C45-88 (EGS2)	Always	Below 1 Ω
C88-2 (E2) - C45-87 (EEGL)	Always	Below 1 Ω

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) - C46-90 (VCEG)	Always	Below 1 Ω
C87-4 (EGLS) - C46-89 (EGLS)	Always	Below 1 Ω
C87-2 (E2) - C46-87 (EEGL)	Always	Below 1 Ω

No. 2 (RHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) - C46-90 (VCEG)	Always	Below 1 Ω
C88-4 (EGS2) - C46-88 (EGS2)	Always	Below 1 Ω

C88-2 (E2) - C46-87 (EEGL)	Always	Below 1 Ω

Standard Resistance (Check for Short):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) or C45-90 (VCEG) - Body ground	Always	10 kΩ or higher
C87-4 (EGLS) or C45-89 (RGLS) - Body ground	Always	10 kΩ or higher

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) or C45-90 (VCEG) - Body ground	Always	10 kΩ or higher
C88-4 (EGS2) or C45-88 (EGS2) - Body ground	Always	10 kΩ or higher

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) or C46-90 (VCEG) - Body ground	Always	10 kΩ or higher
C87-4 (EGLS) or C46-89 (EGLS) - Body ground	Always	10 kΩ or higher

No. 2 (RHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) or C46-90 (VCEG) - Body ground	Always	10 kΩ or higher
C88-4 (EGS2) or C46-88 (EGS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 6

OK

4.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 7

5.REPLACE EGR VALVE ASSEMBLY (No. 1 or No. 2)

a. Replace the EGR valve assembly (No. 1 or No. 2) (Click here).

NEXT → Go to step 7

6.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 5 seconds.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

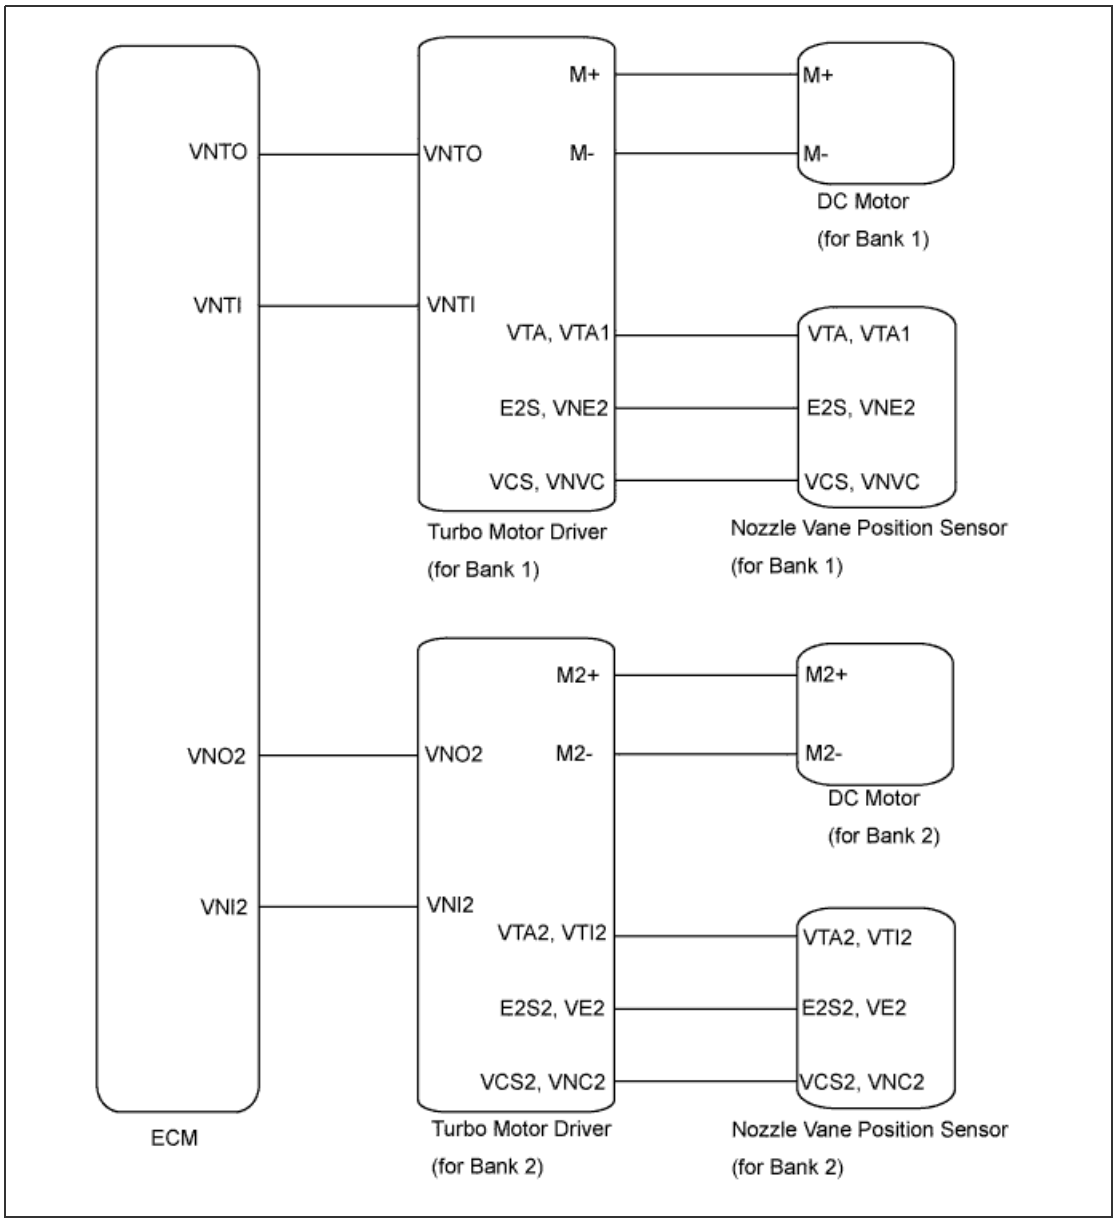
DTC P004B Turbocharger/Supercharger Boost Control Solenoid "B" Circuit Range/Performance



DTC P004C Turbocharger/Supercharger Boost Control Solenoid "B" Circuit Low

DTC P004D Turbocharger/Supercharger Boost Control Solenoid "B" Circuit High

for Preparation Click here

DESCRIPTION

These DTCs indicates that the DC motor of the turbocharger is malfunctioning. The ECM monitors the DC motor current to detect an open or short in the DC motor circuit. If the current meets the criteria, the ECM sets a DTC and illuminates the MIL immediately.
The DC motor is used to operate the nozzle vane of the turbocharger. The nozzle vane opens and closes to change the velocity of exhaust emissions in order to control the turbo pressure. The ECM varies the duty-cycle of the DC motor in accordance with the driving condition.
If the nozzle vane is stuck closed (DC motor stuck off), the drivability may deteriorate at wide open throttle. If the nozzle vane is stuck open (DC motor stuck on), the drivability may deteriorate at intermediate throttle or the engine power may be in sufficient.

P0046, P004B

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 5 seconds	Either of the following conditions are met when the motor is driving (1 trip detection logic): • DC motor duty ratio is +/-100% for 1.3 seconds or more. • DC motor current is 2.2 A or more for 5 seconds or more.	• Open or short in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

P0047, P004C

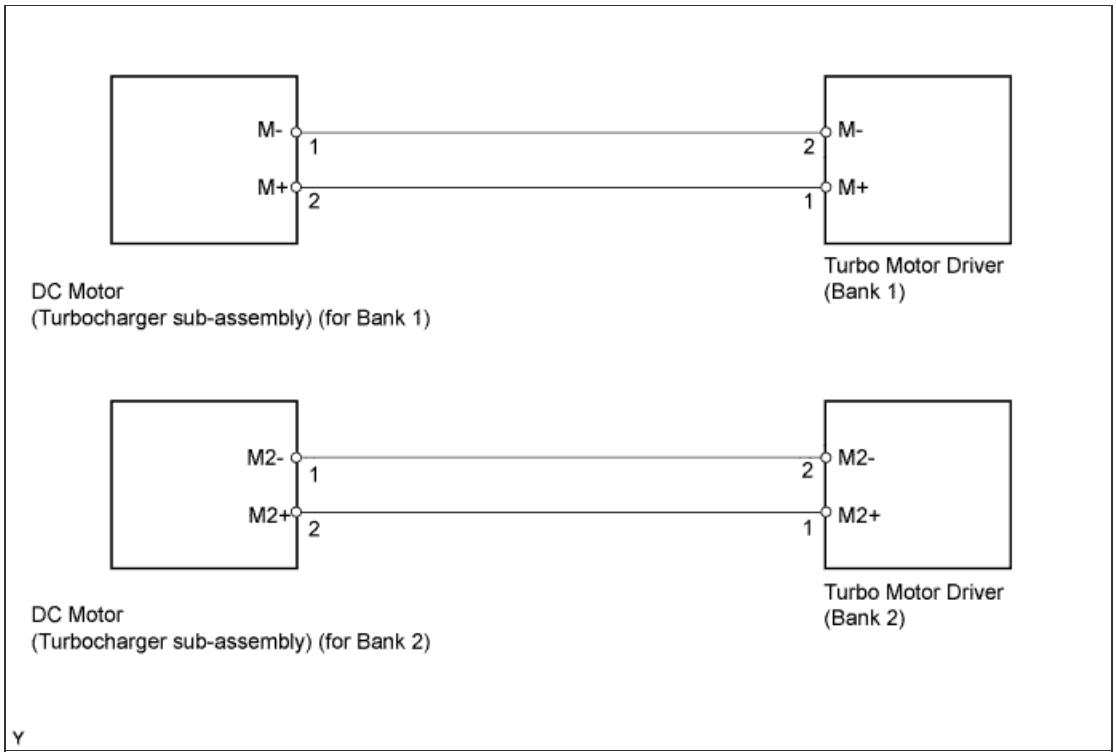
DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	Both of following conditions are met for 1 second or more when the motor is driving (1 trip detection logic): • DC motor duty ratio is 100%. • DC motor current is 0.5 A or less.	• Open in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC Motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

P0048, P004D

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	DC motor current is 6.5 A or more for 0.5 seconds or more when the motor is operating (1 trip detection logic).	• Short in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC Motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

HINT:

If DTC P0046, P0047, P0048, P004B, P004C and/or P004D is stored, the following symptoms may appear.



Stuck closed malfunction:

- **Vehicle surge when driving with full load**

Stuck open malfunction:

- **Lack of power**
- **Vehicle surge or hesitation under light or medium load**
- **White smoke**

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

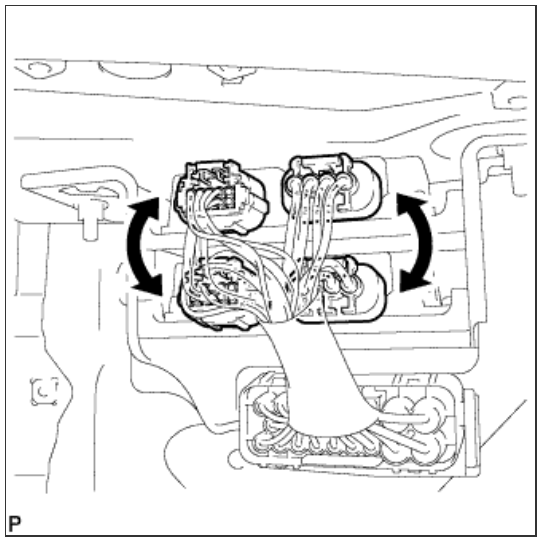
HINT:

Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 5 seconds or more.

k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs do not change	A
DTCs change	B
No DTC output	C

B → Go to step

C → Go to step 8

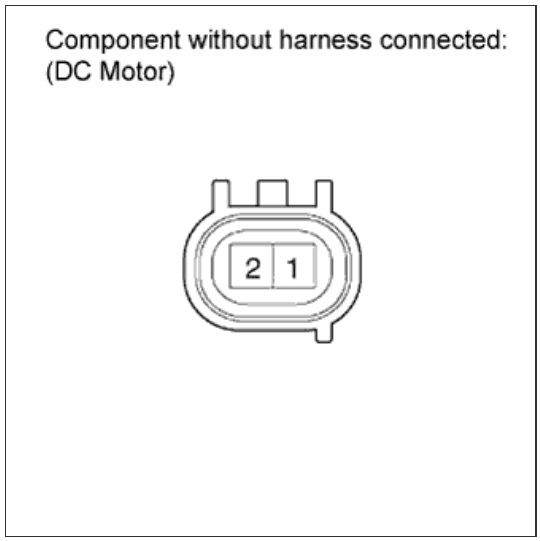
A

2.INSPECT TURBOCHARGER SUB-ASSEMBLY (DC MOTOR) (for Bank 1 or Bank 2)

a. Disconnect the DC motor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



for Bank 1

Tester Connection	Condition	Specified Condition
1 (M-) - 2 (M+)	Always	1 to 100 Ω

Standard Resistance:

for Bank 2

Tester Connection	Condition	Specified Condition
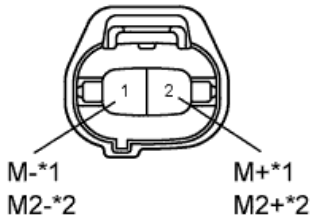
1 (M2-) - 2 (M2+)	Always	1 to 100 Ω

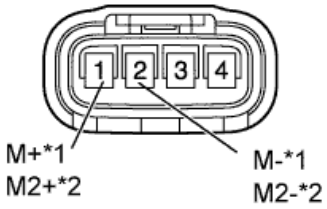
NG → Go to step 4

OK



3.CHECK HARNESS AND CONNECTOR (DC MOTOR - TURBO MOTOR DRIVER)

a. Disconnect the DC motor connector.



b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to DC Motor)

Front view of wire harness connector:
(to Turbo Motor Driver)

*1: for Bank 1

*2: for Bank 2

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M-) - Turbo motor driver connector-2 (M-)	Always	Below 1 Ω
DC motor connector-2 (M+) - Turbo motor driver connector-1 (M+)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M2-) - Turbo motor driver connector-2 (M2-)	Always	Below 1 Ω
DC motor connector-2 (M2+) - Turbo motor driver connector-1 (M2+)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M-) or Turbo motor driver connector-2 (M-) - Body ground	Always	10 kΩ or higher
DC motor connector-2 (M+) or Turbo motor driver connector-1 (M+) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
DC motor connector-1 (M2-) or Turbo motor driver connector-2 (M2-) - Body ground	Always	10 kΩ or higher
DC motor connector-2 (M2+) or Turbo motor driver connector-1 (M2+)	Always	10 kΩ or

- Body ground		higher

OK → Go to step 8

NG → Go to step 6

4.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2)

a. Replace turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 7

5.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 7

6.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 5 seconds or more.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END

8.INSPECT TURBOCHARGER SUB - ASSEMBLY

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

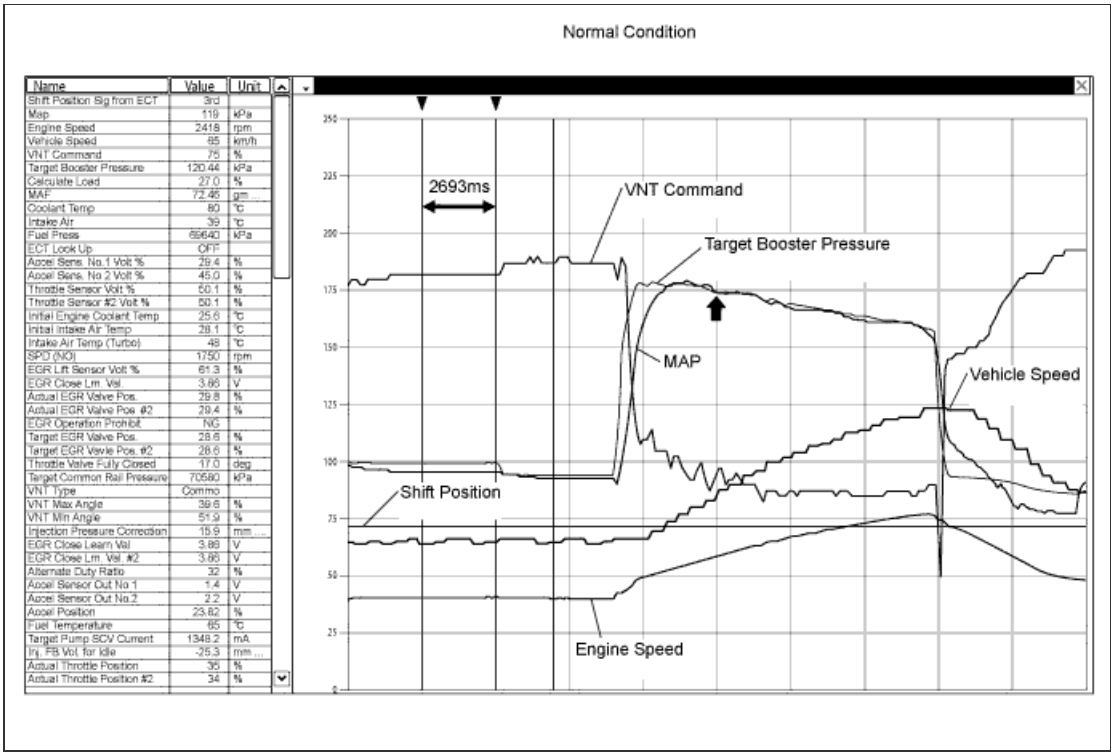
c. Start the engine and warm up.

d. Move the shift lever to 3rd and accelerate the vehicle with the accelerator fully open.

e. Stop the vehicle

f. Enter the following menus: Powertrain / Engine / DTC.

g. Read the DTCs.



Result:

Display (DTC Output)	Proceed to
DTC P0046, P0047, P0048, P004B, P004C and/or P004D are output	A

No DTC output	B

HINT:

- **A snapshot can be used to compare vehicle data from the time of the malfunction to normal data and is very useful for troubleshooting.**
- **"Target Booster Pressure" and "MAP" in the snapshot can be used to heck the operation of the turbocharger. If "MAP" does not follow "Target Booster Pressure", the turbocharger nozzle vane may be stuck or the movement may be irregular.**
- **When the engine speed is 2500 to 3000 rpm with the accelerator pedal fully depressed, "MAP" is within +/- 10 kPa * of "Target Booster Pressure" (not immediately after beginning of acceleration).**
- *** If the turbocharger pressure does not reach a specified value, it cannot be determined whether the system is normal by checking whether "MAP" is within +/-10 kPa of "Target Booster Pressure"**

HINT:

Compare "MAP" with "Target Booster Pressure" at the point indicated by the arrow (↑) in the illustration.

CHECK FOR INTERMITTENT PROBLEMS

DTC P0488 Exhaust Gas Recirculation Throttle Position Control Range / Performance

DTC P213B Exhaust Gas Recirculation Throttle Position Control (Range / Performance)

for Preparation Click here

DESCRIPTION

The ECM opens and closes the throttle valve using a rotary solenoid type actuator. Due to the opening and closing of the valve, the exhaust gas recirculation volume can be properly controlled. Also, engine vibration and noise will be reduced by closing the valve when the engine is stopped.

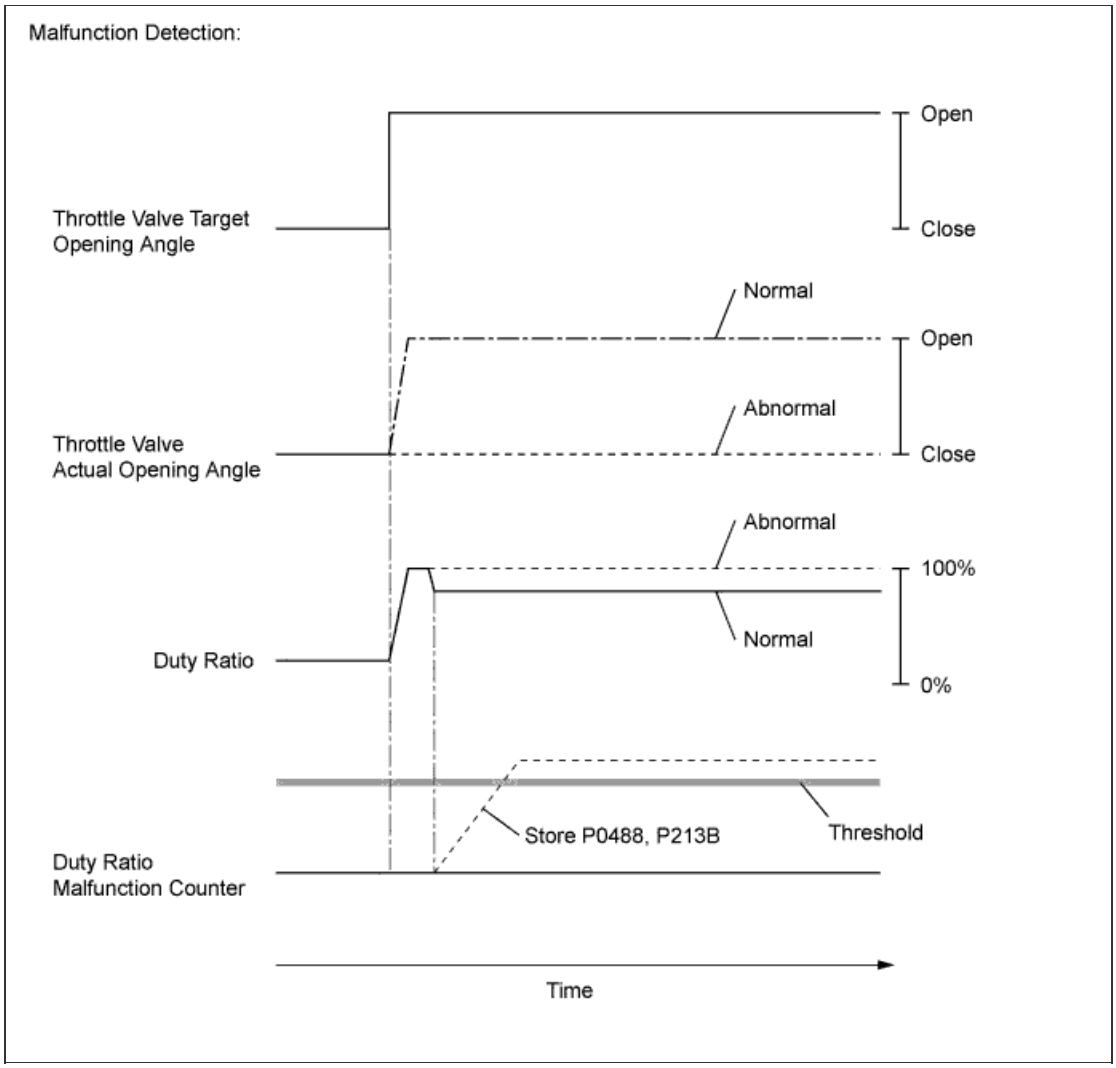
P0488

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Over a period of 10 seconds or more, slowly raise engine speed to 3000 rpm and lower it	The throttle motor activation duty is less than 10% or 90% or more for 30 seconds (1 trip detection logic). **HINT:** The throttle valve commanded duty can be read using the tester as the Data List item Throttle Motor Duty.	• Throttle valve (for Bank 1) stuck • Throttle valve (for Bank 1) does not move smoothly • Open or short in throttle control motor (for Bank 1) circuit • ECM

P213B

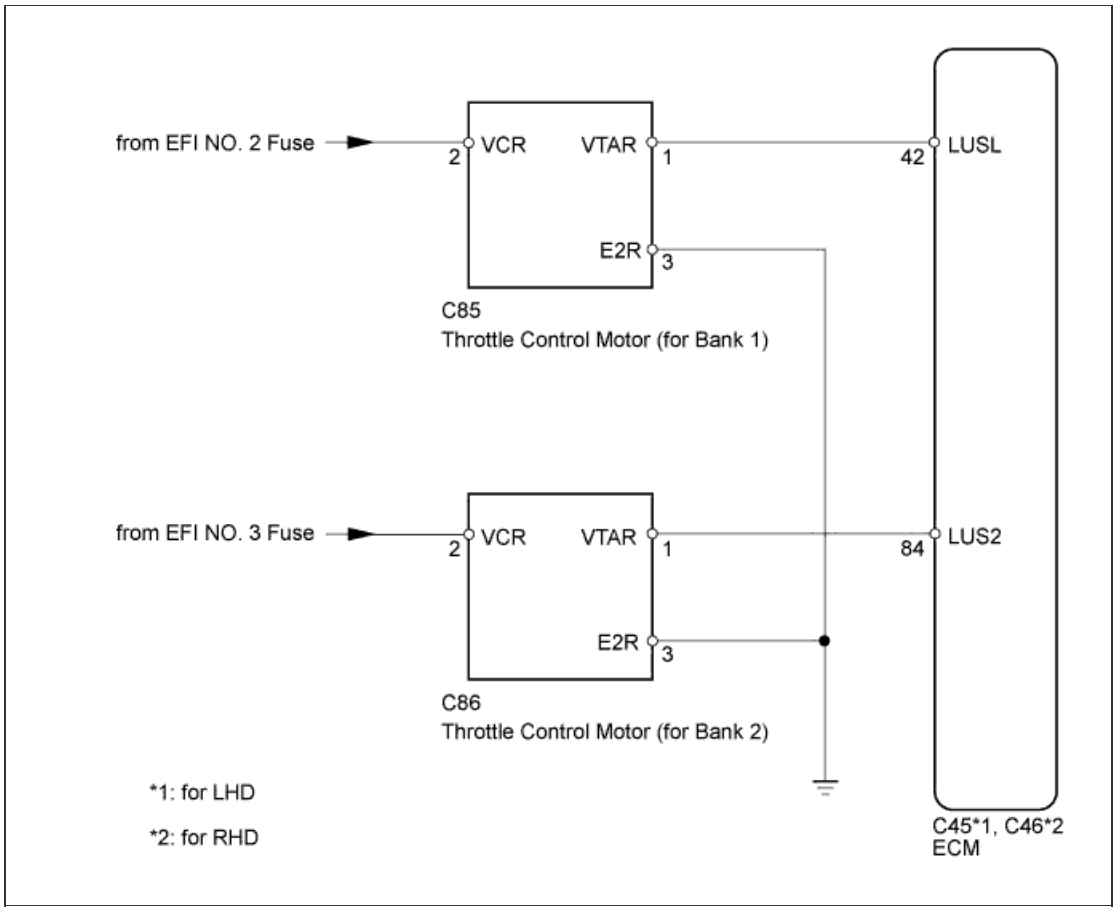
DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Over a period of 10 seconds or more, slowly raise engine speed to 3000 rpm and lower it	The throttle motor activation duty is less than 10% or 90% or more for 30 seconds (1 trip detection logic). **HINT:** The throttle valve commanded duty can be read using the tester as the Data List item Throttle Motor Duty.	• Throttle valve (for Bank 2) stuck • Throttle valve (for Bank 2) does not move smoothly • Open or short in throttle control motor (for Bank 2) circuit • ECM

Related Data List



DTC No.	Data List
P0488	• Throttle Motor Duty #1 • Throttle Motor Duty #2 • Actual Throttle Position • Actual Throttle Position #2
P213B	

Reference



Condition	Throttle Valve Position
Moment when accelerator pedal is depressed further or released at 3000 rpm	Throttle valve opening angle varies smoothly

MONITOR DESCRIPTION

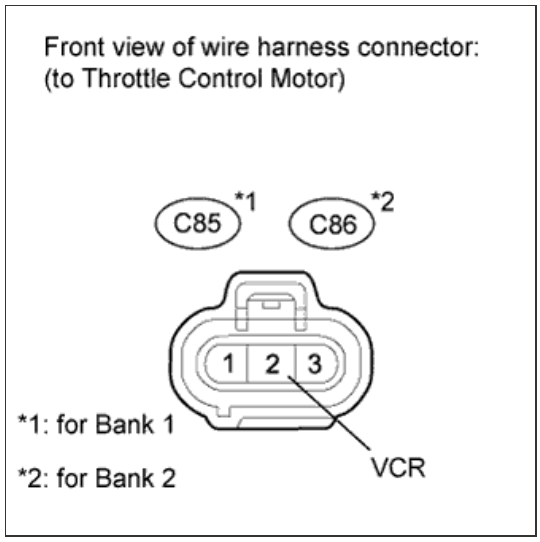
The ECM opens and closes the throttle valve by adjusting the current flowing to the rotary solenoid with a duty ratio. If the throttle valve does not move smoothly or is stuck, the duty ratio used during valve movement control increases or decreases greatly. The ECM will determine that the throttle valve is malfunctioning and illuminate the MIL.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).



HINT:

- **Although the DTC titles say Exhaust Gas Recirculation Throttle Position Control Range / Performance, these DTCs relate to the throttle valve**
- **After warming up the engine, DTC P0488 and P213B can be stored when 1 second or more passes after quickly accelerating the engine from idling.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.CHECK HARNESS AND CONNECTOR (THROTTLE CONTROL MOTOR POWER SOURCE)

a. Disconnect the throttle control motor connector.

b. Measure the voltage according to the value(s) in the table below.

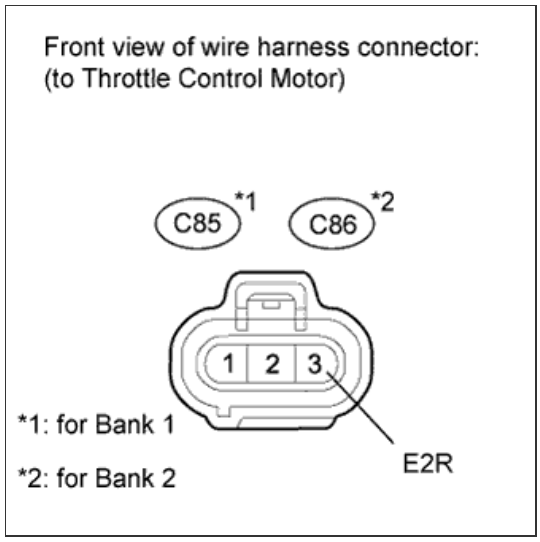
Standard Voltage:

for Bank 1

Tester Connection	Switch Condition	Specified Condition
C85-2 (VCR) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2

Tester Connection	Switch Condition	Specified Condition
C86-2 (VCR) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 7

OK

2.CHECK HARNESS AND CONNECTOR (GROUND CIRCUIT)

a. Disconnect the throttle control motor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
C85-3 (E2R) - Body ground	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
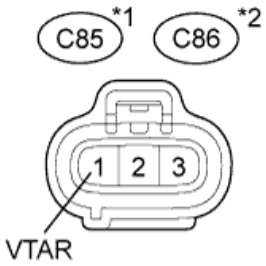
C86-3 (E2R) - Body ground	Always	Below 1 Ω

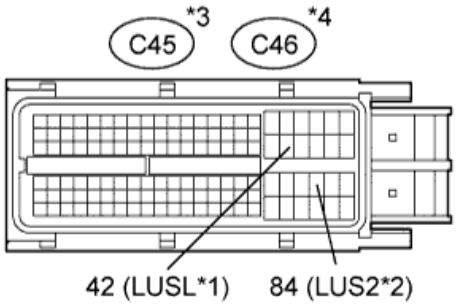
NG → Go to step 8

OK



3.CHECK HARNESS AND CONNECTOR (THROTTLE CONTROL MOTOR - ECM)

a. Disconnect the throttle control motor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Throttle Control Motor)

for Bank 2 (RHD)

Tester Connection	Condition	Specified Condition
C86-1 (VTAR) - C46-84 (LUS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1 (LHD)

Tester Connection	Condition	Specified Condition
C85-1 (VTAR) or C45-42 (LUSL) - Body ground	Always	10 kΩ or higher

for Bank 2 (LHD)

Tester Connection	Condition	Specified Condition
C86-1 (VTAR) or C45-84 (LUS2) - Body ground	Always	10 kΩ or higher

for Bank 1 (RHD)

Tester Connection	Condition	Specified Condition
C85-1 (VTAR) or C46-42 (LUSL) - Body ground	Always	10 kΩ or higher

for Bank 2 (RHD)

Tester Connection	Condition	Specified Condition
C86-1 (VTAR) or C46-84 (LUS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 8

OK

4.REPLACE DIESEL THROTTLE BODY ASSEMBLY (for Bank 1 or Bank 2)

a. Replace the diesel throttle body assembly (for Bank 1 or Bank 2) (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS

a. Clear DTCs (Click here).

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Start the engine.

e. Over a period of 10 seconds or more, slowly raise the engine speed to 3000 rpm and lower it.

f. Enter the following menus: Powertrain / Engine / DTC.

g. Read the DTCs.

Result

Result	Proceed to
P0488 and/or P213B is output	A
No DTC is output	B

B → Go to step 9

A

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 9

7.REPAIR OR REPLACE HARNESS OR CONNECTOR (THROTTLE CONTROL MOTOR - BATTERY)

NEXT

Go to step 9

8.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

9.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine.

e. Over a period of 10 seconds or more, slowly raise the engine speed to 3000 rpm and lower it.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0488 and/or P213B.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, over a period of 10 seconds or more, slowly raise the engine speed to 3000 rpm again and then idle the engine for 5 minutes.

CHECK FOR INTERMITTENT PROBLEMS

DTC P0488 Exhaust Gas Recirculation Throttle Position Control Range / Performance

DTC P213B Exhaust Gas Recirculation Throttle Position Control (Range / Performance)

for Preparation Click here

DESCRIPTION

The ECM opens and closes the throttle valve using a rotary solenoid type actuator. Due to the opening and closing of the valve, the exhaust gas recirculation volume can be properly controlled. Also, engine vibration and noise will be reduced by closing the valve when the engine is stopped.

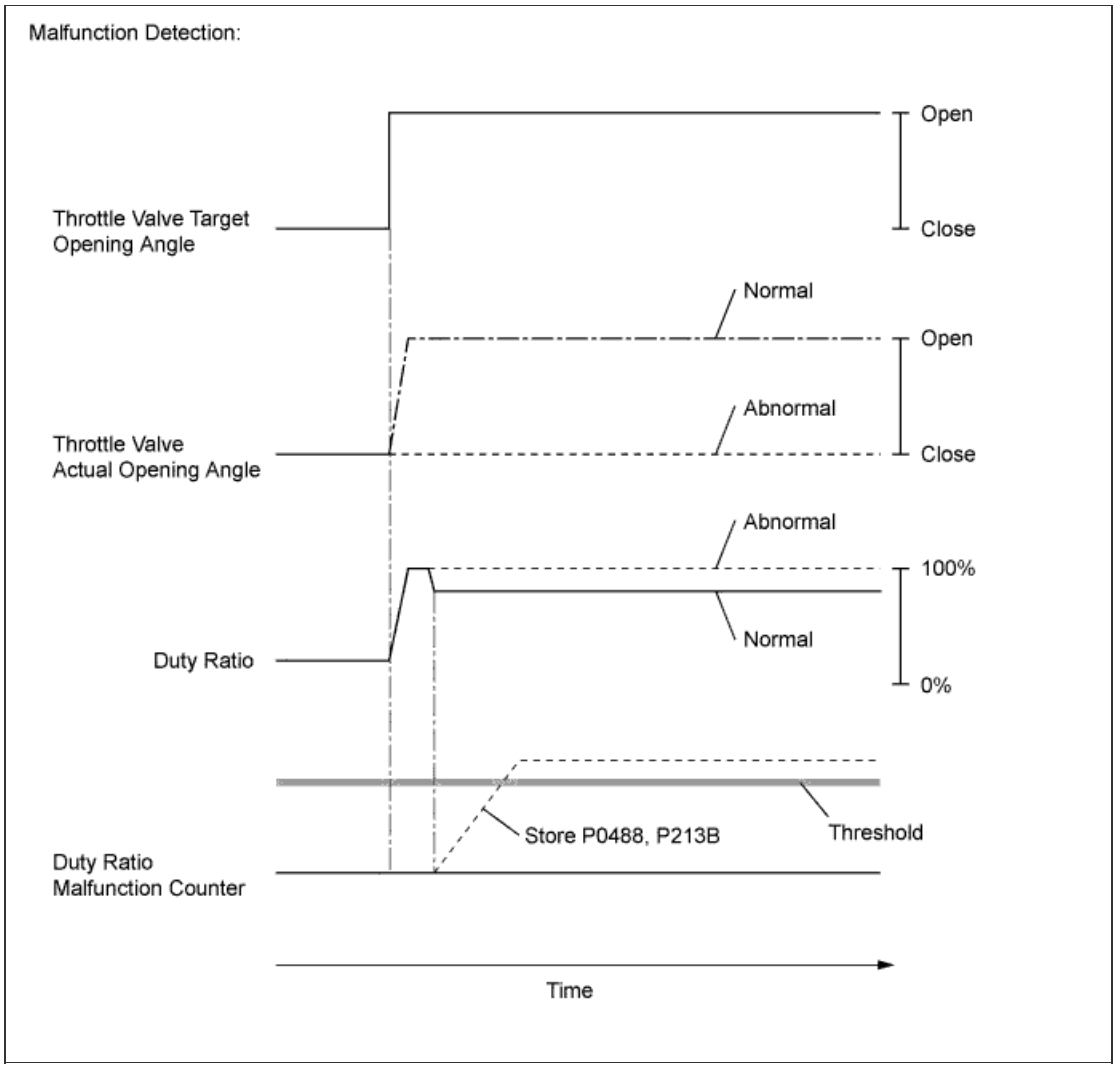
P0488

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Over a period of 10 seconds or more, slowly raise engine speed to 3000 rpm and lower it	The throttle motor activation duty is less than 10% or 90% or more for 30 seconds (1 trip detection logic). **HINT:** The throttle valve commanded duty can be read using the tester as the Data List item Throttle Motor Duty.	• Throttle valve (for Bank 1) stuck • Throttle valve (for Bank 1) does not move smoothly • Open or short in throttle control motor (for Bank 1) circuit • ECM

P213B

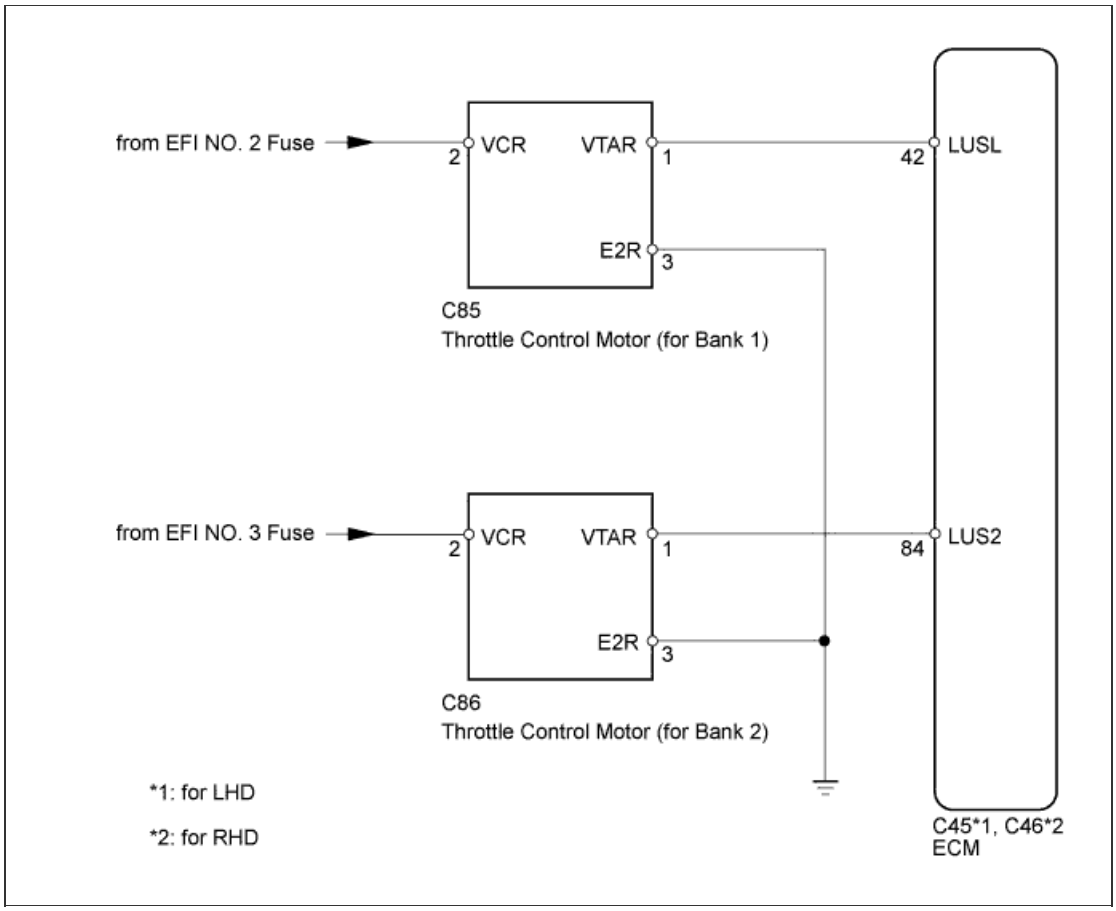
DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Over a period of 10 seconds or more, slowly raise engine speed to 3000 rpm and lower it	The throttle motor activation duty is less than 10% or 90% or more for 30 seconds (1 trip detection logic). **HINT:** The throttle valve commanded duty can be read using the tester as the Data List item Throttle Motor Duty.	• Throttle valve (for Bank 2) stuck • Throttle valve (for Bank 2) does not move smoothly • Open or short in throttle control motor (for Bank 2) circuit • ECM

Related Data List



DTC No.	Data List
P0488	• Throttle Motor Duty #1 • Throttle Motor Duty #2 • Actual Throttle Position • Actual Throttle Position #2
P213B	

Reference



Condition	Throttle Valve Position
Moment when accelerator pedal is depressed further or released at 3000 rpm	Throttle valve opening angle varies smoothly

MONITOR DESCRIPTION

The ECM opens and closes the throttle valve by adjusting the current flowing to the rotary solenoid with a duty ratio. If the throttle valve does not move smoothly or is stuck, the duty ratio used during valve movement control increases or decreases greatly. The ECM will determine that the throttle valve is malfunctioning and illuminate the MIL.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **Although the DTC titles say Exhaust Gas Recirculation Throttle Position Control Range / Performance, these DTCs relate to the throttle valve**
- **After warming up the engine, DTC P0488 and P213B can be stored when 1 second or more passes after quickly accelerating the engine from idling.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.CHECK HARNESS AND CONNECTOR (THROTTLE CONTROL MOTOR POWER SOURCE)

a. Disconnect the throttle control motor connector.

b. Measure the voltage according to the value(s) in the table below.

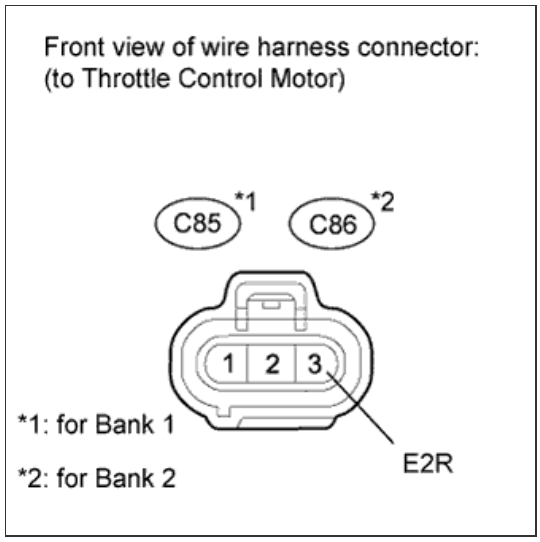
Standard Voltage:

for Bank 1

Tester Connection	Switch Condition	Specified Condition
C85-2 (VCR) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2

Tester Connection	Switch Condition	Specified Condition
C86-2 (VCR) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 7

OK

2.CHECK HARNESS AND CONNECTOR (GROUND CIRCUIT)

a. Disconnect the throttle control motor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
C85-3 (E2R) - Body ground	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
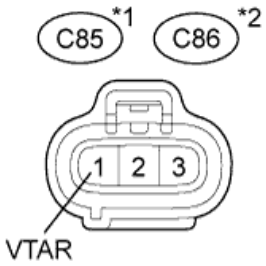
C86-3 (E2R) - Body ground	Always	Below 1 Ω

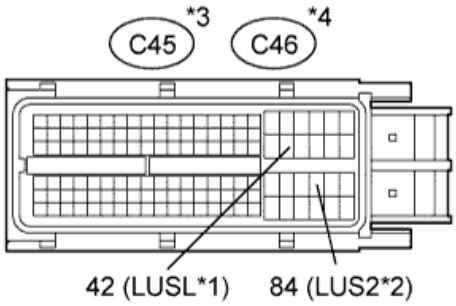
NG → Go to step 8

OK



3.CHECK HARNESS AND CONNECTOR (THROTTLE CONTROL MOTOR - ECM)

a. Disconnect the throttle control motor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Throttle Control Motor)

Front view of wire harness connector:
(to ECM)

*1: for Bank 1
*2: for Bank 2
*3: for LHD
*4: for RHD

Standard Resistance (Check for Open):

for Bank 1 (LHD)

Tester Connection	Condition	Specified Condition
C85-1 (VTAR) - C45-42 (LUSL)	Always	Below 1 Ω

for Bank 2 (LHD)

Tester Connection	Condition	Specified Condition
C86-1 (VTAR) - C45-84 (LUS2)	Always	Below 1 Ω

for Bank 1 (RHD)

Tester Connection	Condition	Specified Condition
C85-1 (VTAR) - C46-42 (LUSL)	Always	Below 1 Ω

for Bank 2 (RHD)

Tester Connection	Condition	Specified Condition
C86-1 (VTAR) - C46-84 (LUS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1 (LHD)

Tester Connection	Condition	Specified Condition
C85-1 (VTAR) or C45-42 (LUSL) - Body ground	Always	10 kΩ or higher

for Bank 2 (LHD)

Tester Connection	Condition	Specified Condition
C86-1 (VTAR) or C45-84 (LUS2) - Body ground	Always	10 kΩ or higher

for Bank 1 (RHD)

Tester Connection	Condition	Specified Condition
C85-1 (VTAR) or C46-42 (LUSL) - Body ground	Always	10 kΩ or higher

for Bank 2 (RHD)

Tester Connection	Condition	Specified Condition
C86-1 (VTAR) or C46-84 (LUS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 8

OK

4.REPLACE DIESEL THROTTLE BODY ASSEMBLY (for Bank 1 or Bank 2)

a. Replace the diesel throttle body assembly (for Bank 1 or Bank 2) (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS

a. Clear DTCs (Click here).

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Start the engine.

e. Over a period of 10 seconds or more, slowly raise the engine speed to 3000 rpm and lower it.

f. Enter the following menus: Powertrain / Engine / DTC.

g. Read the DTCs.

Result

Result	Proceed to
P0488 and/or P213B is output	A
No DTC is output	B

B → Go to step 9

A

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 9

7.REPAIR OR REPLACE HARNESS OR CONNECTOR (THROTTLE CONTROL MOTOR - BATTERY)

NEXT

Go to step 9

8.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

9.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine.

e. Over a period of 10 seconds or more, slowly raise the engine speed to 3000 rpm and lower it.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0488 and/or P213B.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, over a period of 10 seconds or more, slowly raise the engine speed to 3000 rpm again and then idle the engine for 5 minutes.

DTC P004C Turbocharger/Supercharger Boost Control Solenoid "B" Circuit Low

DTC P004D Turbocharger/Supercharger Boost Control Solenoid "B" Circuit High

for Preparation Click here

DESCRIPTION

These DTCs indicates that the DC motor of the turbocharger is malfunctioning. The ECM monitors the DC motor current to detect an open or short in the DC motor circuit. If the current meets the criteria, the ECM sets a DTC and illuminates the MIL immediately.
The DC motor is used to operate the nozzle vane of the turbocharger. The nozzle vane opens and closes to change the velocity of exhaust emissions in order to control the turbo pressure. The ECM varies the duty-cycle of the DC motor in accordance with the driving condition.
If the nozzle vane is stuck closed (DC motor stuck off), the drivability may deteriorate at wide open throttle. If the nozzle vane is stuck open (DC motor stuck on), the drivability may deteriorate at intermediate throttle or the engine power may be in sufficient.

P0046, P004B

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 5 seconds	Either of the following conditions are met when the motor is driving (1 trip detection logic): • DC motor duty ratio is +/-100% for 1.3 seconds or more. • DC motor current is 2.2 A or more for 5 seconds or more.	• Open or short in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

P0047, P004C

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	Both of following conditions are met for 1 second or more when the motor is driving (1 trip detection logic): • DC motor duty ratio is 100%. • DC motor current is 0.5 A or less.	• Open in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC Motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

P0048, P004D

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	DC motor current is 6.5 A or more for 0.5 seconds or more when the motor is operating (1 trip detection logic).	• Short in DC motor (turbocharger sub-assembly) circuit • Turbo motor driver • DC Motor (turbocharger sub-assembly) • Turbocharger nozzle vane is stuck or movement is irregular

HINT:

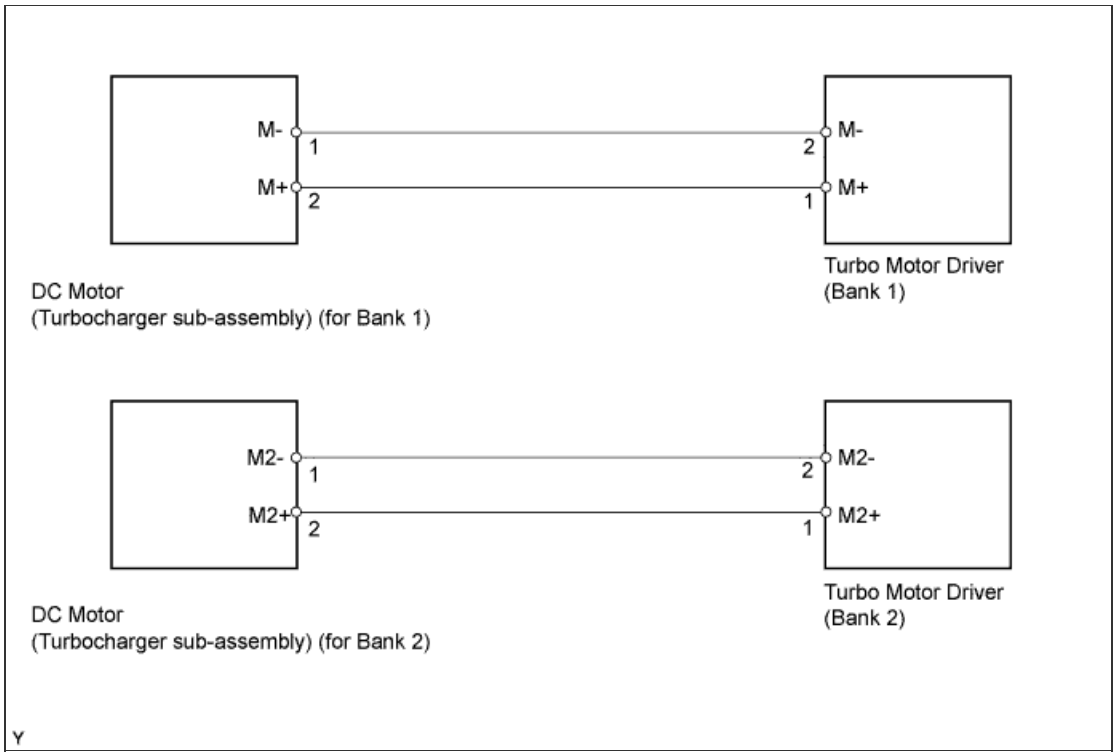
If DTC P0046, P0047, P0048, P004B, P004C and/or P004D is stored, the following symptoms may appear.



Stuck closed malfunction:

- **Vehicle surge when driving with full load**

Stuck open malfunction:

- **Lack of power**
- **Vehicle surge or hesitation under light or medium load**
- **White smoke**

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

HINT:

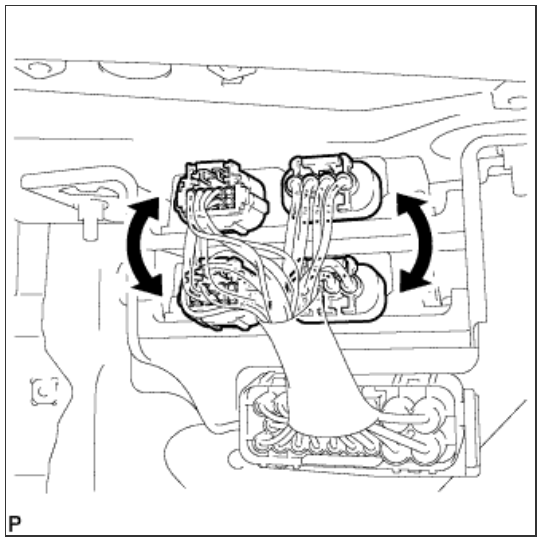
Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 5 seconds or more.

k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs do not change	A
DTCs change	B
No DTC output	C

B → Go to step

C → Go to step 8

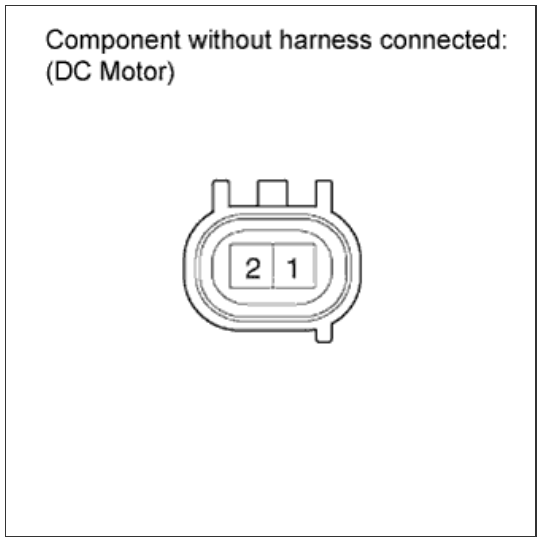
A

2.INSPECT TURBOCHARGER SUB-ASSEMBLY (DC MOTOR) (for Bank 1 or Bank 2)

a. Disconnect the DC motor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



for Bank 1

Tester Connection	Condition	Specified Condition
1 (M-) - 2 (M+)	Always	1 to 100 Ω

Standard Resistance:

for Bank 2

Tester Connection	Condition	Specified Condition
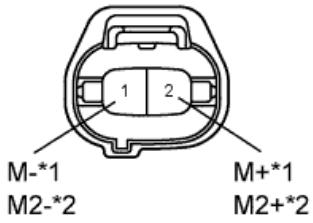
1 (M2-) - 2 (M2+)	Always	1 to 100 Ω

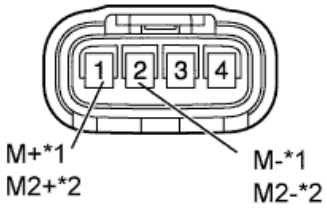
NG → Go to step 4

OK



3.CHECK HARNESS AND CONNECTOR (DC MOTOR - TURBO MOTOR DRIVER)

a. Disconnect the DC motor connector.



b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to DC Motor)

Front view of wire harness connector:
(to Turbo Motor Driver)

*1: for Bank 1

*2: for Bank 2

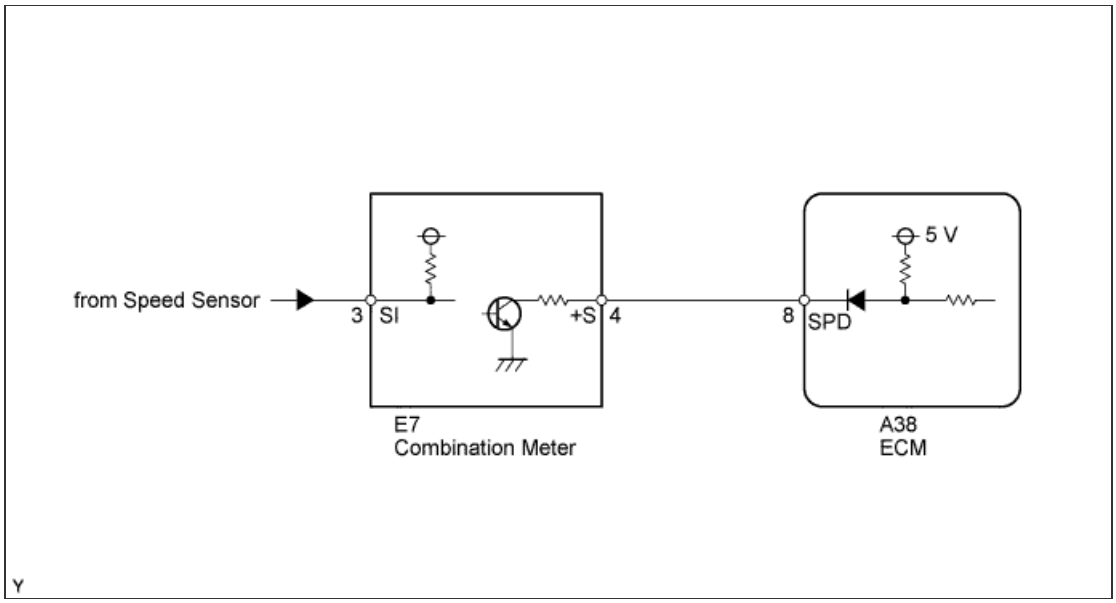
CHECK FOR INTERMITTENT PROBLEMS

DTC P0500 Vehicle Speed Sensor "A"

for Preparation Click here

DESCRIPTION

Vehicles which are equipped with a manual transmission detect the vehicle speed using the speed sensor. The speed sensor transmits a 4-pulse signal for every revolution of the rotor shaft, which is rotated by the transmission output shaft via the driven gear. The 4-pulse signal is converted into a more precise rectangular waveform by the waveform shaping circuit inside the combination meter. The signal is then transmitted to the ECM. The ECM determines the vehicle speed based on the frequency of the pulse signal.



P0500

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Vehicle being driven	Conditions (a), (b), (c) and (d) are met for 8 seconds or more (2 trip detection logic): (a) Engine coolant temperature is more than 70°C (158°F). (b) Engine speed is between 1500 and 4000 rpm. (c) Vehicle is running. (d) No speed signal is input to the ECM.	• Open or short in speedometer circuit • Speedometer assembly • ECM
Drive vehicle during fuel-cut operation	Conditions (a), (b) and (c) are met for 5 seconds or more (2 trip detection logic): (a) Vehicle is running. (b) During the fuel-cut operation. (c) No speed signal is input to the ECM.

DTC No.	Data List
P0500	Vehicle Speed

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK OPERATION OF SPEEDOMETER

a. Drive the vehicle and check whether the operation of the speedometer in the combination meter is normal.

HINT:

The vehicle speed sensor is operating normally if the speedometer reading is normal.

If the speedometer does not operate, check it by following the procedure described in Speedometer Malfunction.

NG → GO TO SPEEDOMETER MALFUNCTION (Click here)

OK

2.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and start the engine.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / Data List / All Data / Vehicle Speed.

e. Drive the vehicle.

f. Read the value displayed on the tester.

OK:

Vehicle speeds displayed on tester and speedometer display are equal.

OK → CHECK FOR INTERMITTENT PROBLEMS (Click here)

NG → Go to step 3

3.CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - ECM)

a. Disconnect the combination meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) - A38-8 (SPD)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) - A52-8 (SPD)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) or A38-8 (SPD) - Body ground	Always	10 kΩ or higher

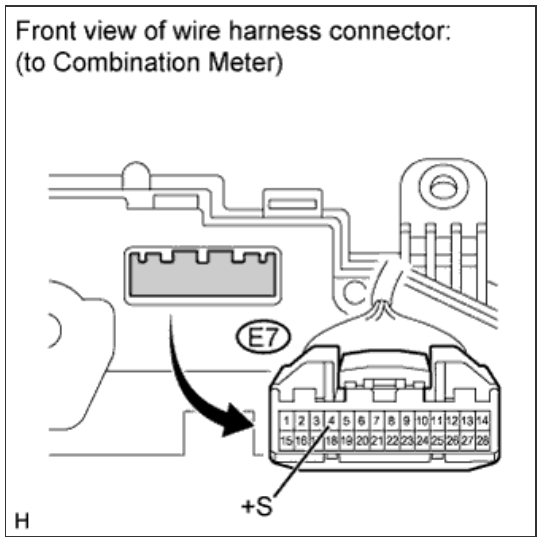
for RHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) or A52-8 (SPD) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (OTHER SYSTEMS RELATED TO SPEED SIGNAL)

OK

4.CHECK COMBINATION METER ASSEMBLY (S VOLTAGE)



a. Disconnect the combination meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Volta e

Tester Connection	Switch Condition	Specified Condition
E7-4 (+S) - Body ground	Ignition switch ON	4.5 to 5.5 V

c. Reconnect the combination meter connector.

NG → REPLACE ECM (Click here)

OK

5.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL OUTPUT WAVEFORM)

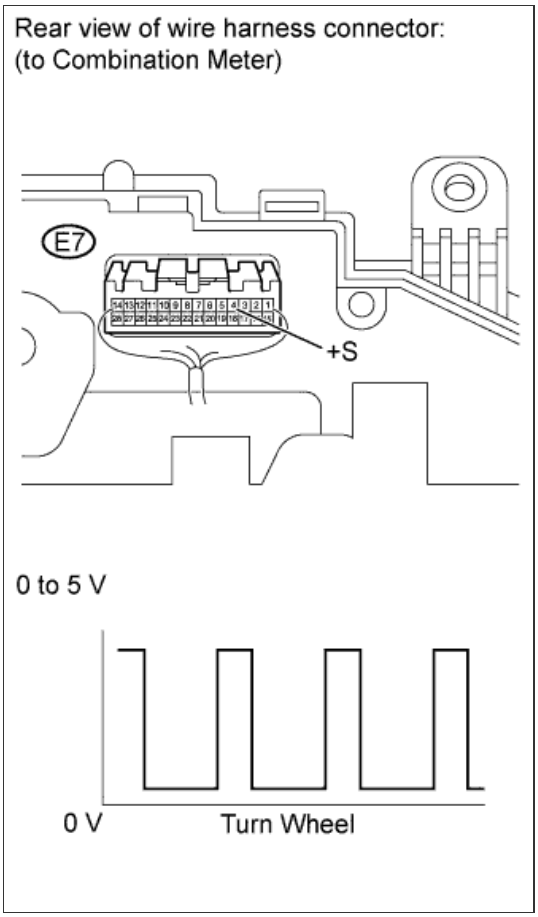
a. Remove the combination meter.

b. Connect the combination meter connector.

c. Move the shift lever to N.

d. Jack up the vehicle.

e. Check the voltage between the terminal of the combination meter and the body ground while a wheel is turned slowly.



Standard Volta e

Tester Connection	Switch Condition	Specified Condition
E7-4 (+S) - Body ground	Ignition switch ON	Voltage generated intermittently

HINT:

The output voltage should fluctuate up and down, similarly to the diagram, when the wheel is turned slowly.

f. Reinstall the combination meter.

OK	REPLACE ECM (Click here)
NG	Go to step 6

6.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL INPUT WAVEFORM)

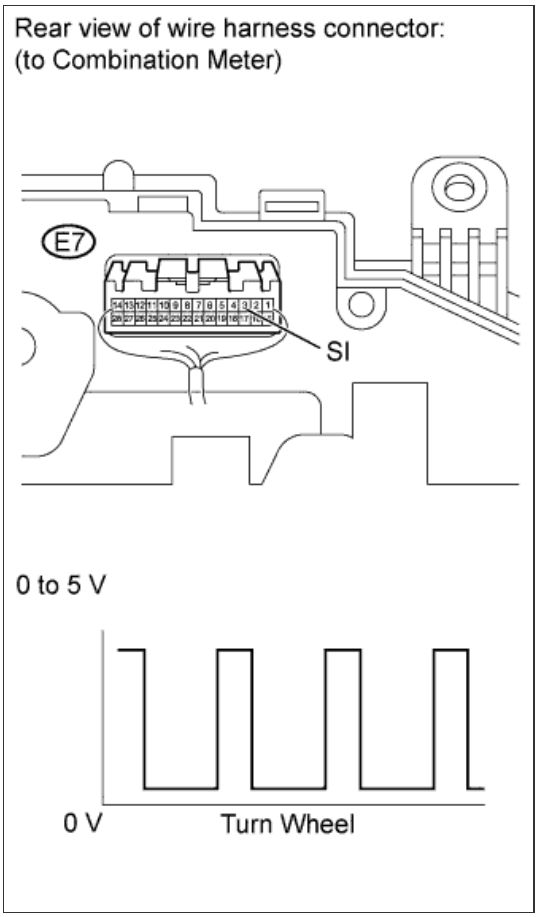
a. Remove the combination meter.

b. Connect the combination meter connector.

c. Move the shift lever to N.

d. Jack up the vehicle.

e. Check the voltage between the terminal of the combination meter and the body ground while a wheel is turned slowly.



Standard Volta e:

Tester Connection	Switch Condition	Specified Condition
E7-4 (SI) - Body ground	Ignition switch ON	Voltage generated intermittently

HINT:

The output voltage should fluctuate up and down, similarly to the diagram, when the wheel is turned slowly.

f. Reinstall the combination meter.

CHECK FOR INTERMITTENT PROBLEMS

DTC P0504 Brake Switch "A" / "B" Correlation

for Preparation Click here

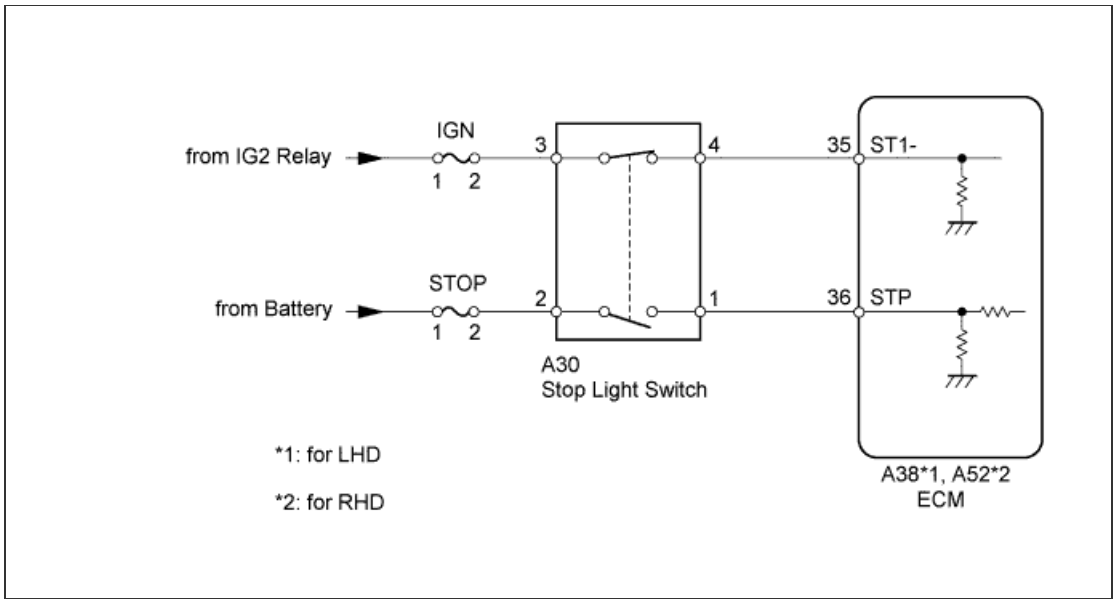
DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate that the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and sets the DTC.

HINT:

The normal conditions are as shown in the table below.

Signals	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF



P0504

DTC Detection Dri e Pattern	DTC Detection Condition	Trouble Area
Release and depress brake pedal with ignition switch ON	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic): (a) Ignition switch is ON. (b) Brake pedal is released. (c) The STP signal is off when the ST1- signal is off, or the STP signal is on when the ST1- signal is on.	• Open or short in stop light switch signal circuit • STOP fuse • IGN fuse • Stop light switch • ECM

INSPECTION PROCEDURE

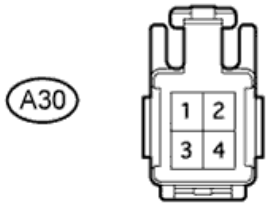
HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**
- **Stop light switch conditions can be checked using the intelligent tester.**
  1. **Connect the intelligent tester to the DLC3.**

2. Turn the ignition switch to ON.
3. Turn the tester on.
4. Enter the following menus: Powertrain / Engine / Data List / Stop Light Switch.
5. Check Stop Light Switch when the brake pedal is depressed and released.

Brake Pedal Operation	Specified Condition
Depressed	ON
Released	OFF

1.CHECK STOP LIGHT SWITCH ASSEMBLY (TERMINAL B VOLTAGE)



a. Disconnect the stop light switch connector.

b. Measure the oltage according to the alue(s) in the table below.

Standard Voltage:

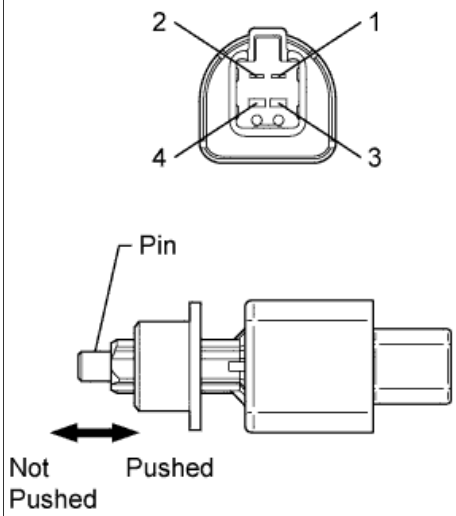
Tester Connection	Condition	Specified Condition
A30-2 - Body ground	Always	11 to 14
A30-3 - Body ground	Ignition switch ON	11 to 14

Front view of wire harness connector:
(to Stop Light Switch)

NG → Go to step 4

OK

2.INSPECT STOP LIGHT SWITCH ASSEMBLY



a. Remo e the stop light switch.

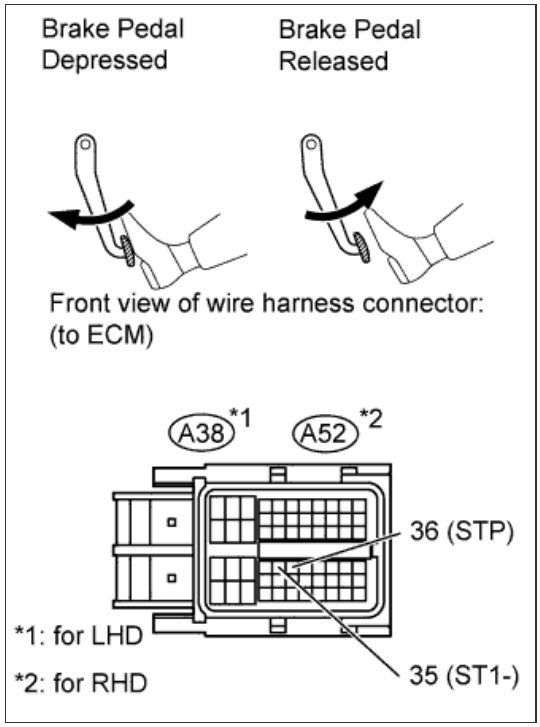
b. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Switch pin not pushed	Below 1 Ω
	Switch pin pushed	10 kΩ or higher
3 - 4	Switch pin not pushed	10 kΩ or higher
	Switch pin pushed	Below 1 Ω

Component without harness connected:
(Stop Light Switch)

NG → Go to step 5



OK

3.CHECK ECM (STP AND ST1- VOLTAGE)

a. Disconnect the ECM connector.

b. Turn the ignition switch to ON.

c. Measure the oltage according to the alue(s) in the table below.

Standard Voltage:

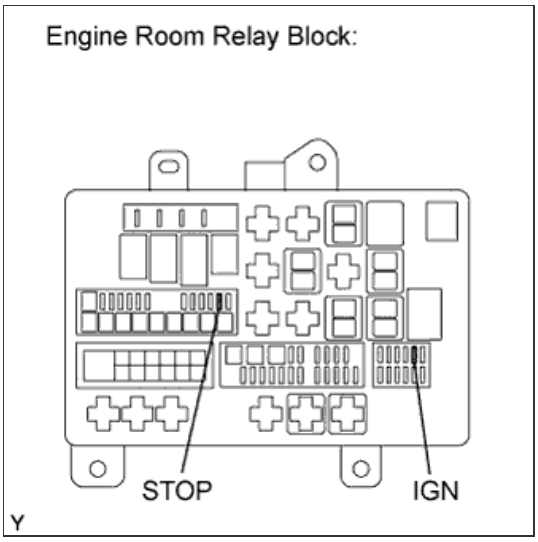
for LHD

Tester Connection	Brake Pedal Condition	Specified Condition
A38-35 (ST1-) - Body ground	Released	11 to 14
	Depressed	0 to 3
A38-36 (STP) - Body ground	Released	0 to 3
	Depressed	11 to 14

for RHD

Tester Connection	Brake Pedal Condition	Specified Condition
A52-35 (ST1-) - Body ground	Released	11 to 14
	Depressed	0 to 3
A52-36 (STP) - Body ground	Released	0 to 3
	Depressed	11 to 14

OK	Go to step 6
NG	Go to step 7



4.INSPECT FUSE (STOP, IGN)

a. Remo e the STOP and IGN fuses from the engine room relay block.

b. Measure the resistance according to the alue(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
STOP fuse	Always	Below 1 Ω
IGN fuse		

OK	Go to step 7
NG	Go to step

5.REPLACE STOP LIGHT SWITCH ASSEMBLY

a. Replace the stop light switch assembly (Click here).

NEXT	Go to step 9

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT	Go to step 9

e. Brake pedal released and depressed.

f. Enter the following menus: Powertrain / Engine / DTC.

g. Confirm that the DTC is not output again.

NEXT

END

DTC P0069 MAP Sensor Too High or Too Low

for Preparation Click here

DESCRIPTION

To detect atmospheric pressure, the atmospheric pressure sensor built into the ECM is used in the common rail system. Following the changes in the atmospheric pressure, the ECM corrects the fuel injection volume, timing and duration, and adjusts the common rail internal fuel pressure to optimize combustion.

P0069

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
1 second elapses after ignition switch turned from off to ON (starter remains off)	After the ignition switch is turned to ON, the difference between the atmospheric pressure sensor output and manifold absolute pressure sensor output exceeds the range of Pa for 0.5 seconds.	ECM

Related Data List

DTC No.	Data List
P0069	• Atmosphere Pressure • MAP

HINT:

- **Turn the ignition switch to ON and check the Atmosphere Pressure and MAP items in the Data List. If the atmospheric pressure displayed on the tester differs greatly from the actual atmospheric pressure (standard: 101 kPa), the sensor (atmospheric pressure sensor or manifold absolute pressure sensor) is malfunctioning.**
- **If DTC P0069 is stored, the following symptoms may appear:**
  - **Misfire**
  - **Combustion noise**
  - **Black smoke**
  - **White smoke**
  - **Lack of power**

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Clic here) and initialization (Clic here).

HINT:

- **Although the DTC titles say MAP Sensor Too High or Too Low, these DTCs relate to the atmospheric pressure sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.CHECK OTHER DTC OUTPUT (IN ADDITION TO DTC P0069)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result

Result	Proceed to
P0069 and other DTCs are output	A
P0069 is output	B

HINT:

If codes other than P0069 are output, perform troubleshooting for those DTCs first.

d. Turn the ignition switch to ON for 1 second.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END

for Preparation Click here

DESCRIPTION

The battery supplies electricity to the ECM even when the ignition switch is off. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the ECM memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and stores the DTC.

P0560

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	The voltage at terminal BATT drops excessively for 3 seconds and part of the stored values in the ECU are initialized (1 trip detection logic).	• Open in bac up power source circuit (to BATT terminal) • Battery • Battery terminals • EFI MAIN fuse • ECM

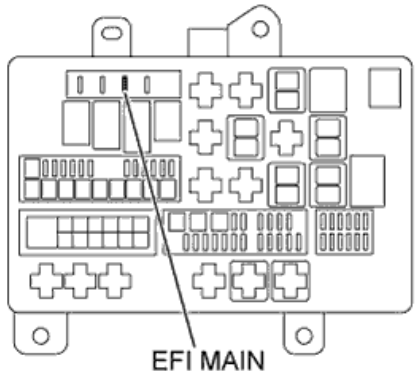
After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**
- **When the ignition switch is ON, even though +B voltage is present, when the voltage at terminal BATT (power supply for maintaining memorized values in the ECM) drops excessively, a DTC is stored.**

1.INSPECT FUSE (EFI MAIN)



a. Remove the EFI MAIN fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

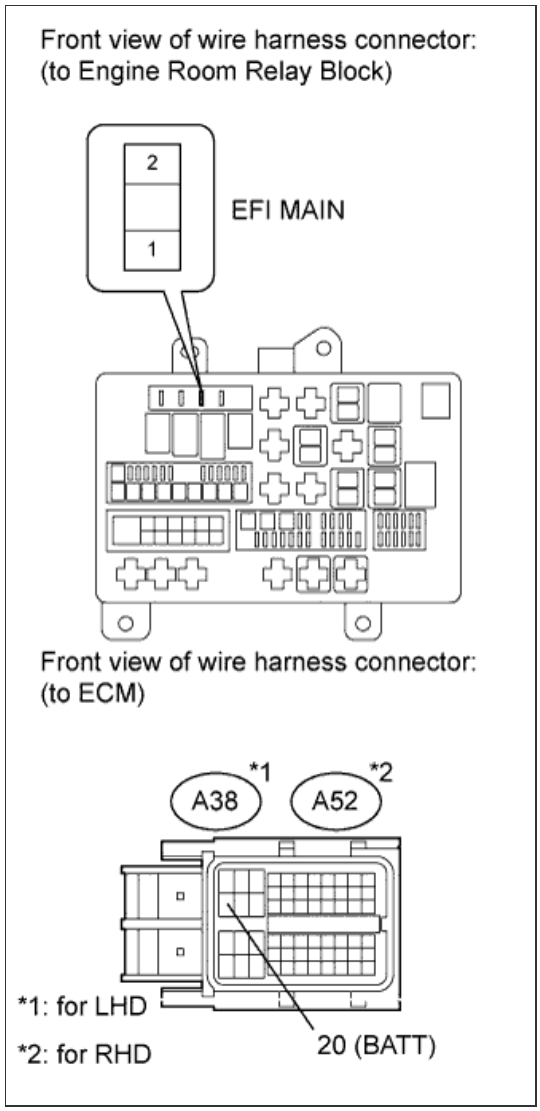
Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN Fuse	Always	Below 1 Ω

Engine Room Relay Block:

NG → Go to step 7

OK



2.CHECK HARNESS AND CONNECTOR (ENGINE ROOM RELAY BLOCK - ECM, BATTERY)

a. Check the harness and the connector between the EFI MAIN fuse and ECM.

i. Remove the EFI MAIN fuse from the engine room relay block.

ii. Disconnect the ECM connector.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
EFI MAIN fuse (2) - A38-20 (BATT)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
EFI MAIN fuse (2) - A52-20 (BATT)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
EFI MAIN fuse (2) or A38-20 (BATT) - Body ground	Always	10 Ω or higher

for RHD

Tester Connection	Condition	Specified Condition
EFI MAIN fuse (2) or A52-20 (BATT) - Body ground	Always	10 Ω or higher

b. Check the harness and the connector between the EFI MAIN fuse and battery.

i. Remove the EFI MAIN fuse from the engine room relay block.

ii. Disconnect the cable from the positive (+) battery terminal.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
Battery positive terminal - EFI MAIN fuse (1)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
Battery positive terminal or EFI MAIN fuse (1) - Body ground	Always	10 Ω or higher

NG → Go to step 8

OK

3.INSPECT BATTERY

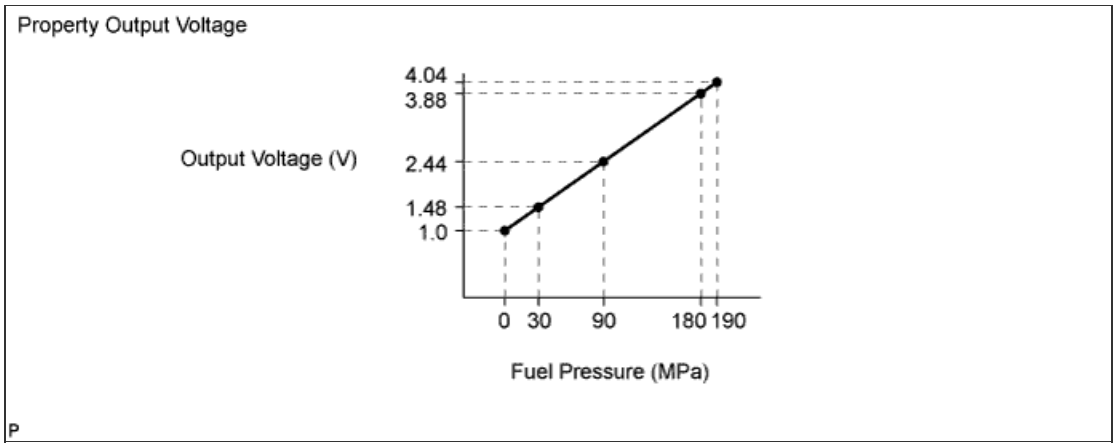
DTC P0087 Fuel Rail / System Pressure - Too Low

DTC P0190 Fuel Rail Pressure Sensor Circuit



DTC P0192 Fuel Rail Pressure Sensor Circuit Low Input

DTC P0193 Fuel Rail Pressure Sensor Circuit High Input

for Preparation Click here

DESCRIPTION

The ECM monitors the internal fuel pressure of the common rail using the fuel pressure sensor, and controls the suction control valve to regulate the internal pressure to the target pressure. The pressure sensor is a semiconductor that varies electrical resistance when pressure is applied to its silicon chip. This sensor outputs the voltage in proportion to the internal fuel pressure.

P0087

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

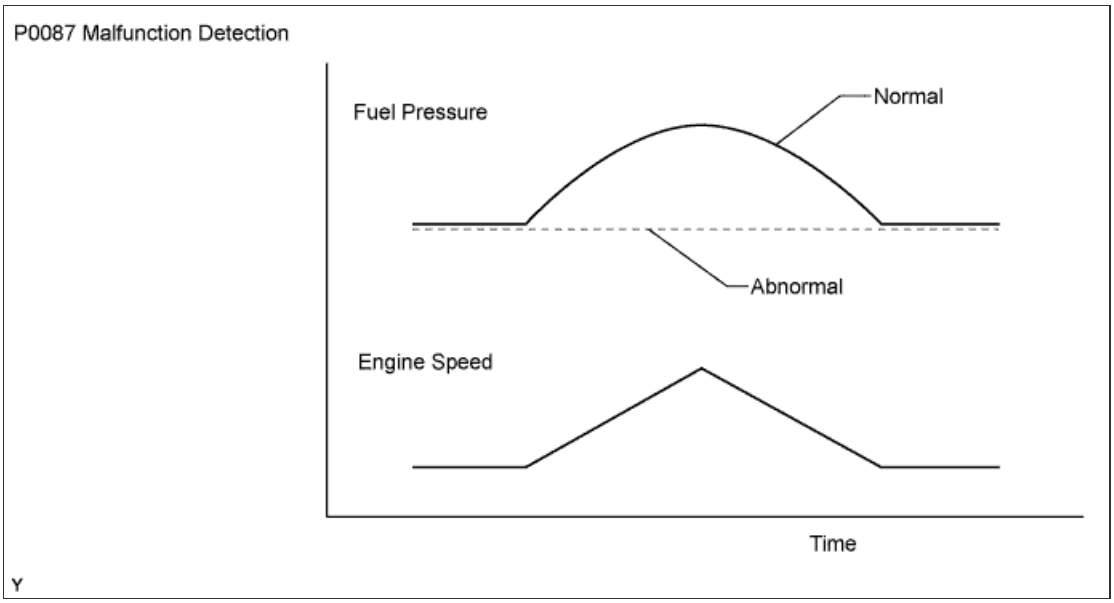
Related Data List

DTC No.	Data List
P0087	• Fuel Press • Target Common Rail Pressure
P0190	
P0192	
P0193	

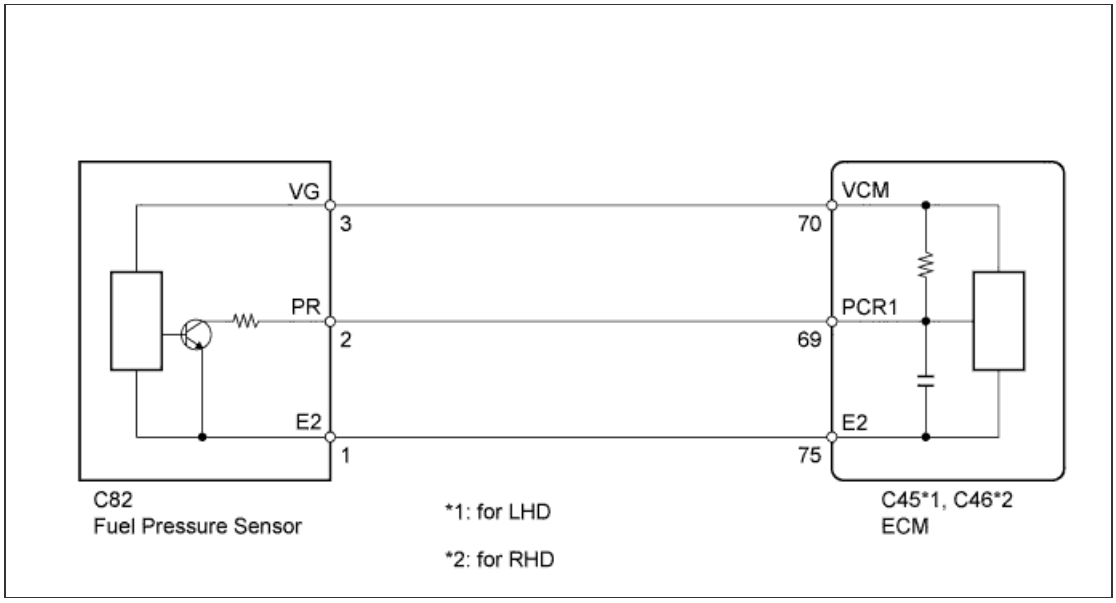
HINT:



- **Check Fuel Press compared to Target Common Rail Pressure in the Data List by enter the following menus: Powertrain / Engine / Data List / Fuel Press, Target Common Rail Pressure. Under stable conditions, the difference between Fuel Press and Target Common Rail Pressure is within +/-5 MPa.**
- **For more information on the fuel pressure sensor and common rail system, refer to the System Description (Click here).**
- **If DTC P0087 is stored, the following symptoms may appear:**
  - **Black smoke**
  - **Poor drivability**
  - **Lack of power**
- **If DTC P0190, P0192 and/or P0193 is stored, the following symptoms may appear.**
  - **Lack of power due to accelerator restriction of fail-safe function**

MONITOR DESCRIPTION

P0087 (Fuel pressure sensor output stays at fixed value):



- Under normal conditions, the internal fuel pressure of the common rail usually fluctuates 1 to 2 MPa (10 to 20 kgf/cm ^{2}, 145 to 290 psi) even when the driving conditions are constant. This DTC is stored if there is no fluctuation of the fuel pressure. The internal fuel pressure is approximately 27 to 37 MPa (275 to 377 kgf/cm^2, 3915 to 5365 psi) when idling, and it increases to approximately 50 to 70 MPa (510 to 714 kgf/cm^2, 7250 to 10150 psi) when running the engine at 2500 rpm.
  If this DTC is stored, the ECM enters fail-safe mode and limits engine power. The fail-safe mode continues until the ignition switch is turned off.

- The diagram below indicates that fuel pressure rises as engine speed increases, but for the malfunction indicated by this DTC, that does not happen.

P0190, P0192 and P0193 (Open or short in fuel pressure sensor circuit):
These DTCs are stored if the fuel pressure sensor output voltage is out of the standard range due to an open or short malfunction of the sensor circuit.
If these DTCs are stored, the ECM enters fail-safe mode and limits the engine power. The fail-safe mode continues until the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **If DTCs relating to different systems are stored, and they share terminal E2 as their ground, check this ground circuit first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

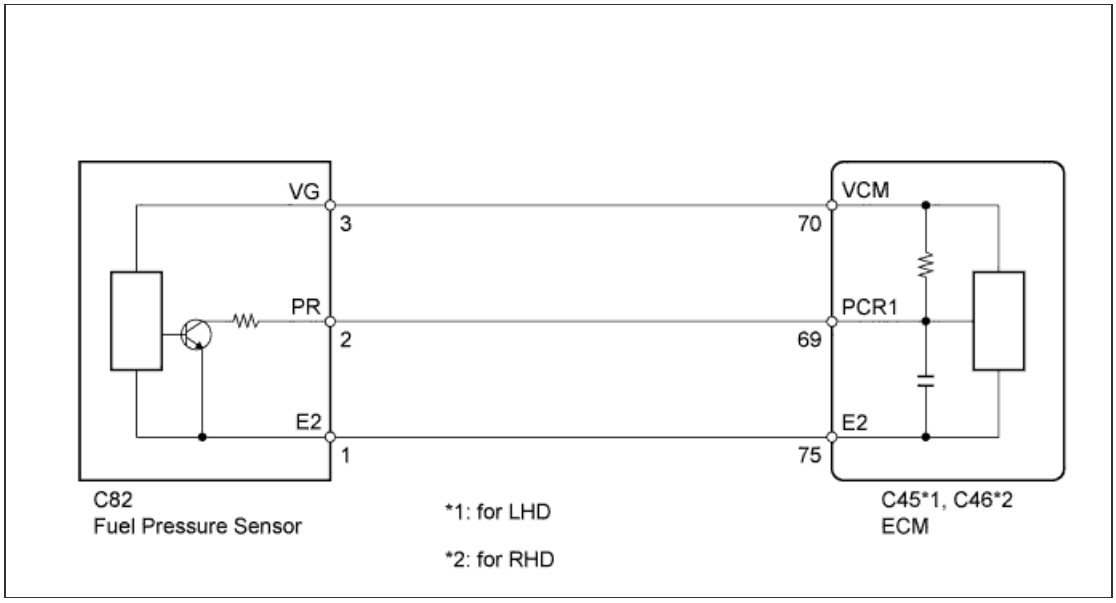
  - **Lack of power**
- **If DTC P0190, P0192 and/or P0193 is stored, the following symptoms may appear.**
  - **Lack of power due to accelerator restriction of fail-safe function**

MONITOR DESCRIPTION

P0087 (Fuel pressure sensor output stays at fixed value):



- Under normal conditions, the internal fuel pressure of the common rail usually fluctuates 1 to 2 MPa (10 to 20 kgf/cm ^{2}, 145 to 290 psi) even when the driving conditions are constant. This DTC is stored if there is no fluctuation of the fuel pressure. The internal fuel pressure is approximately 27 to 37 MPa (275 to 377 kgf/cm^2, 3915 to 5365 psi) when idling, and it increases to approximately 50 to 70 MPa (510 to 714 kgf/cm^2, 7250 to 10150 psi) when running the engine at 2500 rpm.
  If this DTC is stored, the ECM enters fail-safe mode and limits engine power. The fail-safe mode continues until the ignition switch is turned off.

- The diagram below indicates that fuel pressure rises as engine speed increases, but for the malfunction indicated by this DTC, that does not happen.

P0190, P0192 and P0193 (Open or short in fuel pressure sensor circuit):
These DTCs are stored if the fuel pressure sensor output voltage is out of the standard range due to an open or short malfunction of the sensor circuit.
If these DTCs are stored, the ECM enters fail-safe mode and limits the engine power. The fail-safe mode continues until the ignition switch is turned off.

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **If DTCs relating to different systems are stored, and they share terminal E2 as their ground, check this ground circuit first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.CHECK DTC OUTPUT

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

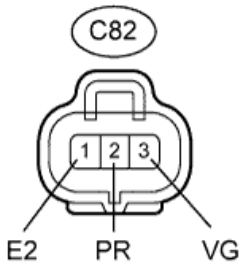
d. Read the DTCs.

Result

Display (DTC output)	Proceed to
P0190, P0192, P0193	A
P0087	B

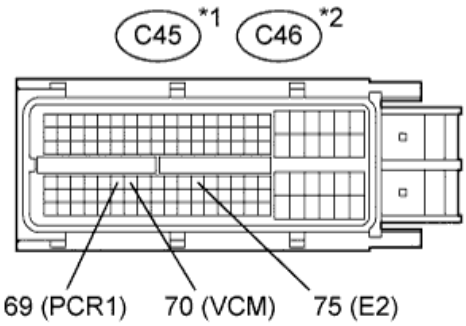
B → Go to step 4

A



2.CHECK HARNESS AND CONNECTOR (FUEL PRESSURE SENSOR - ECM)

a. Disconnect the fuel pressure sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Fuel Pressure Sensor)

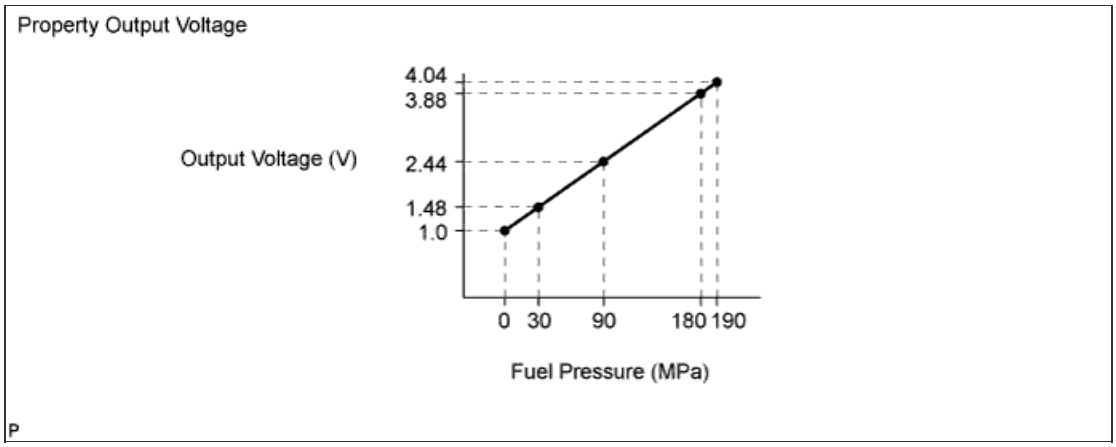
DTC P0087 Fuel Rail / System Pressure - Too Low

DTC P0190 Fuel Rail Pressure Sensor Circuit



DTC P0192 Fuel Rail Pressure Sensor Circuit Low Input

DTC P0193 Fuel Rail Pressure Sensor Circuit High Input

for Preparation Click here

DESCRIPTION

The ECM monitors the internal fuel pressure of the common rail using the fuel pressure sensor, and controls the suction control valve to regulate the internal pressure to the target pressure. The pressure sensor is a semiconductor that varies electrical resistance when pressure is applied to its silicon chip. This sensor outputs the voltage in proportion to the internal fuel pressure.

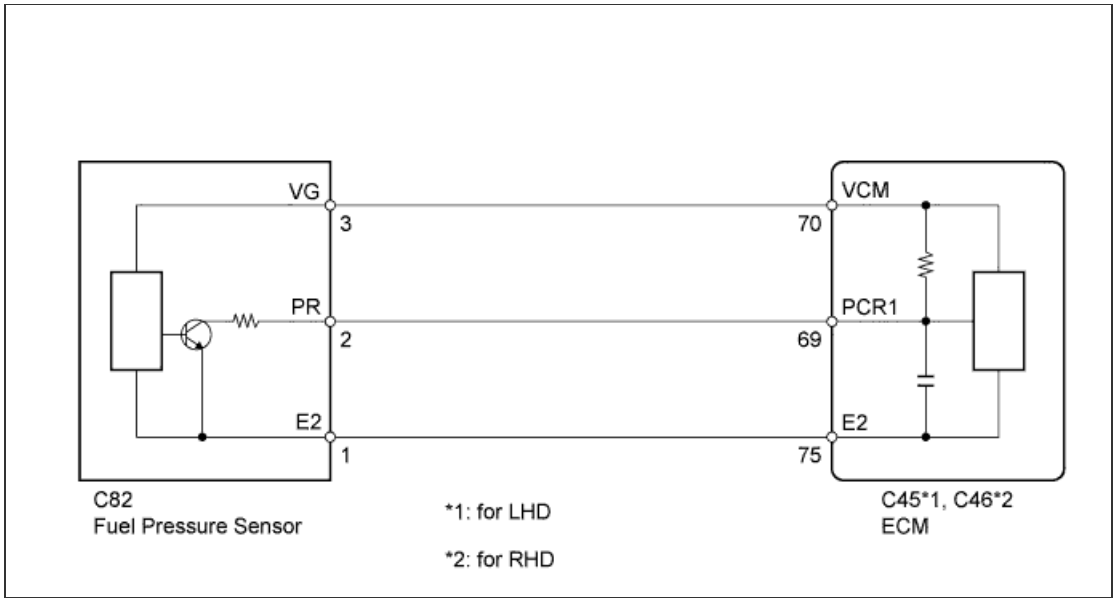
  - **Black smoke**
  - **Poor drivability**
  - **Lack of power**
- **If DTC P0190, P0192 and/or P0193 is stored, the following symptoms may appear.**
  - **Lack of power due to accelerator restriction of fail-safe function**

MONITOR DESCRIPTION

P0087 (Fuel pressure sensor output stays at fixed value):



- Under normal conditions, the internal fuel pressure of the common rail usually fluctuates 1 to 2 MPa (10 to 20 kgf/cm ^{2}, 145 to 290 psi) even when the driving conditions are constant. This DTC is stored if there is no fluctuation of the fuel pressure. The internal fuel pressure is approximately 27 to 37 MPa (275 to 377 kgf/cm^2, 3915 to 5365 psi) when idling, and it increases to approximately 50 to 70 MPa (510 to 714 kgf/cm^2, 7250 to 10150 psi) when running the engine at 2500 rpm.
  If this DTC is stored, the ECM enters fail-safe mode and limits engine power. The fail-safe mode continues until the ignition switch is turned off.

- The diagram below indicates that fuel pressure rises as engine speed increases, but for the malfunction indicated by this DTC, that does not happen.

P0190, P0192 and P0193 (Open or short in fuel pressure sensor circuit):
These DTCs are stored if the fuel pressure sensor output voltage is out of the standard range due to an open or short malfunction of the sensor circuit.
If these DTCs are stored, the ECM enters fail-safe mode and limits the engine power. The fail-safe mode continues until the ignition switch is turned off.

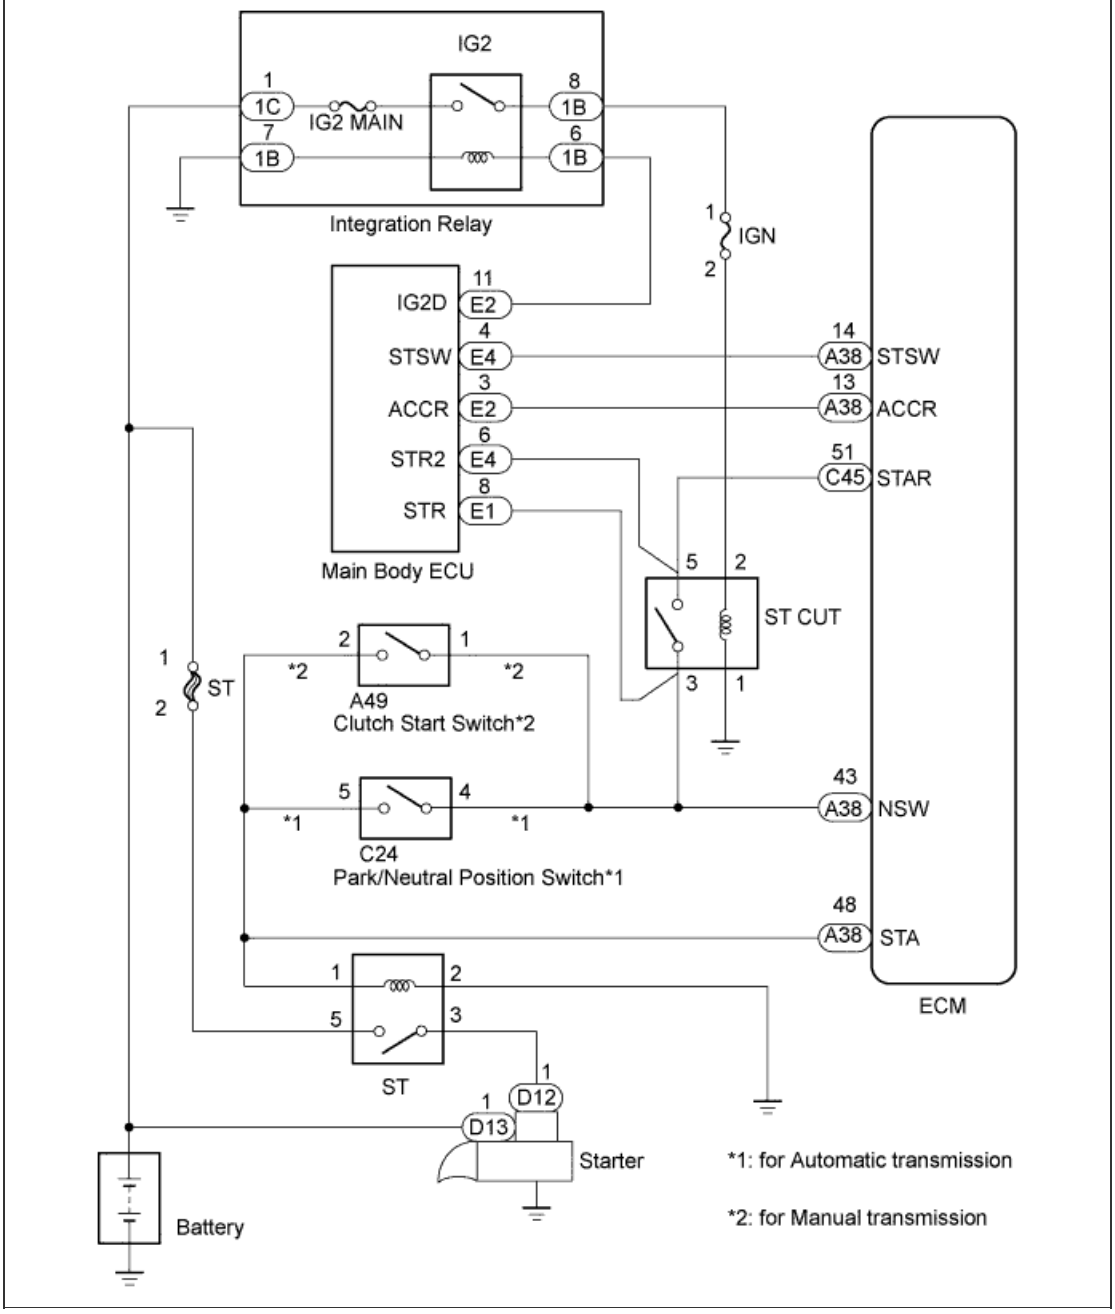
DTC P0617 Starter Relay Circuit High

for Preparation Click here

DESCRIPTION

While the engine is being cranked, positive battery voltage is applied to terminal STA of the ECM.
If the ECM detects the starter control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and stores the DTC.
This monitor runs when the vehicle has been driven at 20 km/h (12.4 mph) or more for more than 20 seconds.

P0617



DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Drive vehicle for 25 seconds or more at a speed of 20 km/h (12.4 mph) or more and an engine speed of 1000 rpm or more	Conditions (a), (b) and (c) are met for 20 seconds (a) Vehicle speed is more than 20 km/h (12.4 mph). (b) Engine speed is more than 1000 rpm. (c) STA signal is on.	• Park/neutral position switch (A/T) • Starter relay circuit • Clutch start switch (M/T)

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **The following troubleshooting process is based on the premise that the engine can crank normally. If the engine does not crank, proceed to the Problem Symptoms Table (Click here).**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.CHECK IF VEHICLE IS EQUIPPED WITH ENTRY AND START SYSTEM

a. Check if the vehicle is e uipped with the entry and start system.

Result

Result	Proceed to
w/ Entry and Start System	A
w/o Entry and Start System	

B → Go to step 10

A

.READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / All Data / Starter Signal.

d. Check the value displayed on the tester when the ignition switch is turned to and the engine is started.

OK:

Ignition Switch Condition	Starter Signal
Engine started	

Result

esult	Proceed to

REPLACE ECM (**Click here**)

DTC P0088 Fuel Rail / System Pressure - Too High

for Preparation Click here

DESCRIPTION

Refer to System Description (Click here).

P0088

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After idling for 60 seconds, repeat quick engine speed accelerations (to 2500 rpm) for 30 seconds	The fuel pressure of common rail is too high The fuel pressure exceeds 230 MPa (2345 kgf/cm^2, 33358 psi) (1 trip detection logic).	• Fuel supply pump (suction control valve) • Pressure limiter (common rail (for Bank 2)) • Open or short in fuel supply pump (suction control valve) circuit • ECM

Related Data List

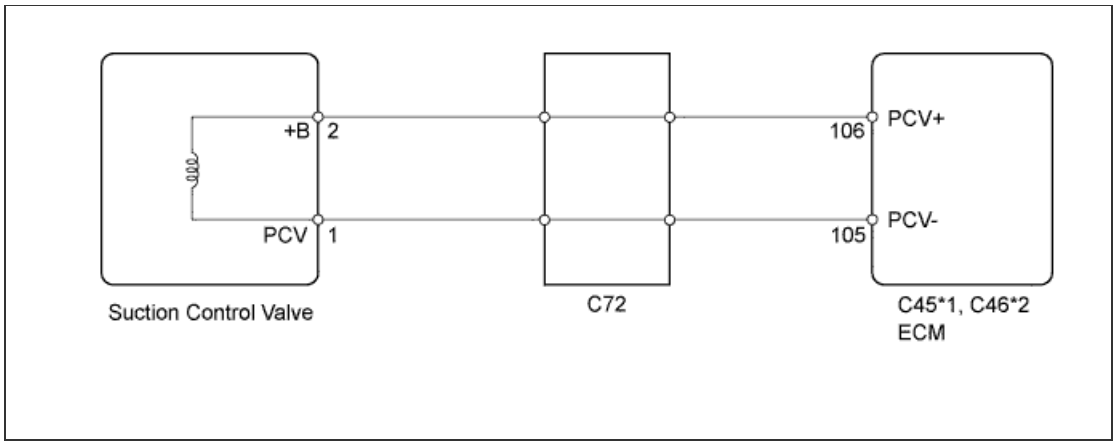
DTC No.	Data List
P0088	• Fuel Press • Target Common Rail Pressure • Injection Pressure Correction • Target Pump SCV Current

HINT:

- **For more information on the fuel supply pump (suction control valve) and common rail system, refer to System Description (Click here).**
- **When DTC P0088 is stored, check the internal fuel pressure of the common rail by entering the following menus: Powertrain / Engine / Data List / Fuel Press.**

  Reference

Engine Speed	Fuel Press
Idling	Approximately 27 to 37 MPa
2500 rpm (No engine load)	Approximately 50 to 70 MPa



- **When there is an operating problem with the fuel supply pump (when Fuel Press is more than Target Common Rail Pressure due to a problem with the closing of the suction valve), the values of Injection Pressure Correction and Target Pump SCV Current decrease.**

MONITOR DESCRIPTION

P0088 (Internal fuel pressure too high):

The ECM stores this DTC if the fuel pressure inside the common rail is more than 230 MPa (2345 kgf/cm ^{2}, 33350 psi). This DTC indicates that: 1) the suction control valve may be stuck open, or 2) there may be a short in the suction control valve circuit.
If this DTC is stored, the ECM enters fail-safe mode and limits the engine power. The fail-safe mode continues until the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT FUEL SUPPLY PUMP (SUCTION CONTROL VALVE)

a. Disconnect the suction control valve connector and then start the engine.

OK:
Engine does not start.

NG → Go to step 6

OK

2.READ VALUE USING INTELLIGENT TESTER

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / Data List / Target Pump SCV Current.

e. Read the value.

Standard

Engine Speed	Target Pump SCV Current
Idling	923 to 1123 mA
2500 rpm (No engine load)	1013 to 1212 mA

NG → Go to step 6

OK

3.READ VALUE USING INTELLIGENT TESTER (FUEL PRESS)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / Data List / Fuel Press, Target Common Rail Pressure.

e. Check the difference in pressure between Fuel Press and Target Common Rail Pressure.

OK:

Difference in pressure between Fuel Press and Target Common Rail Pressure is within +/-5 MPa.

NG	Go to step 5

OK

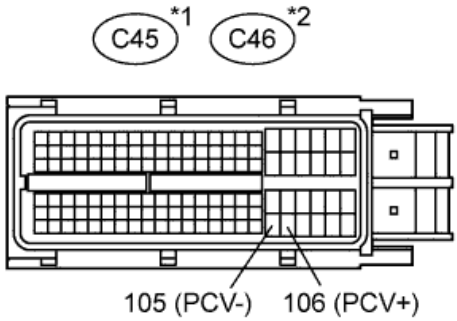
4.REPLACE PRESSURE LIMITER (COMMON RAIL (for Bank 2))

a. Replace the common rail (for Bank 2) (Click here).

NEXT	Go to step 10

5.CHECK HARNESS AND CONNECTOR (SUCTION CONTROL VALVE CONNECTOR - ECM)

a. Disconnect the suction control valve connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Suction Control Valve)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for open):

for LHD

Tester Connection	Condition	Specified Condition
Suction control valve-1 (PCV) - C45-105 (PCV-)	Always	Below 1 Ω

Suction control valve-2 (+B) - C45-106 (PCV+)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
Suction control valve-1 (PCV) - C46-105 (PCV-)	Always	Below 1 Ω
Suction control valve-2 (+B) - C46-106 (PCV+)	Always	Below 1 Ω

Standard Resistance (Check for short):

for LHD

Tester Connection	Condition	Specified Condition
Suction control valve-1 (PCV) or C45-105 (PCV-) - Body ground	Always	10 kΩ or higher
Suction control valve-2 (+B) or C45-106 (PCV+) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
Suction control valve-1 (PCV) or C46-105 (PCV-) - Body ground	Always	10 kΩ or higher
Suction control valve-2 (+B) or C46-106 (PCV+) - Body ground	Always	10 kΩ or higher

NG → Go to step 9

OK

6.REPLACE FUEL SUPPLY PUMP

a. Replace the fuel supply pump (Click here).

NEXT

7.CHECK DTC OUTPUT

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine.

e. After idling for 60 seconds, repeat engine speed accelerations (from idling to 2500 rpm) for 30 seconds.

f. Enter the following menus: Powertrain / Engine / DTC.

g. Read the DTCs.

Result

Display (DTC output)	Proceed to
P0088 is output	A
No DTC is output	B

B → END

A

8.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 10

9.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

10.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON and start the engine.

e. After idling for 60 seconds, repeat engine speed accelerations (from idling to 2500 rpm) for 30 seconds.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0088.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, race the engine to 2500 rpm repeatedly for 30 seconds and increase idling time.

NEXT

END

DTC P0627 Fuel Pump Control Circuit / Open

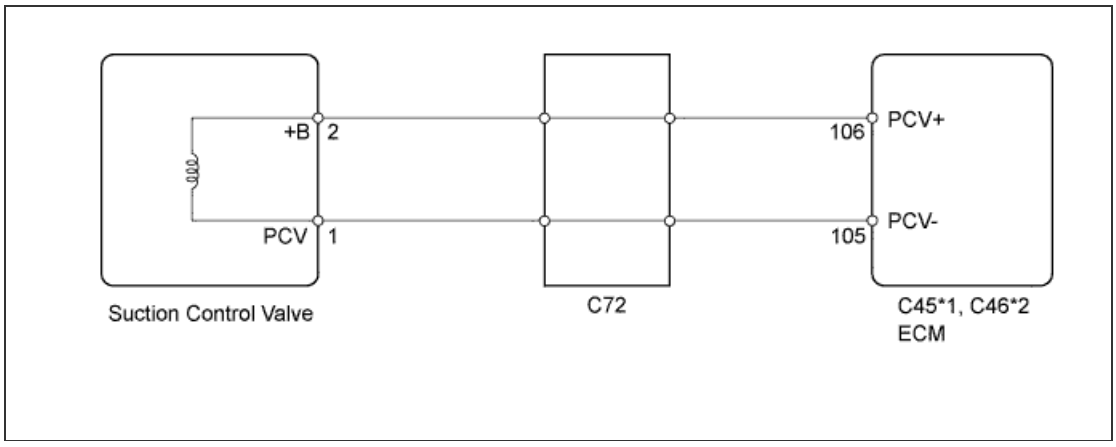
for Preparation Click here

DESCRIPTION

Refer to the System Description (Click here).

P0627

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Idling for 1 second	Even though the CPU (command area inside ECU) is outputting the suction control valve operation duty, the output monitor signal is absent for 0.5 seconds (1 trip detection logic).	• Open or short in suction control valve circuit • Suction control valve • ECM



Related Data List

DTC No.	Data List
P0627	Fuel Press

HINT:

- **For more information on the fuel supply pump (suction control valve) and the common rail system, refer to the System Description (Click here).**
- **When DTC P0627 is stored, check the internal fuel pressure of the common rail by entering the following menus on the intelligent tester: Powertrain / Engine / Data List / Fuel Press.**
  Under a stable operating condition such as idling, Fuel Press is within +/-5 MPa of Target Common Rail Pressure.

WIRING DIAGRAM

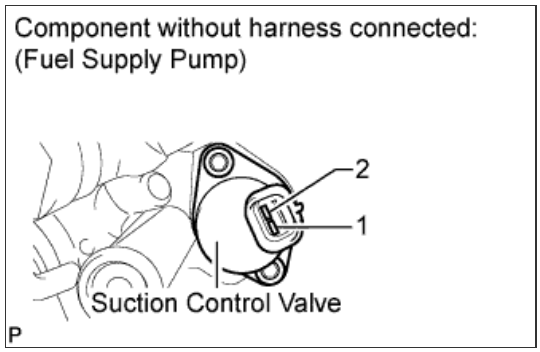
INSPECTION PROCEDURE

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.



1.INSPECT FUEL SUPPLY PUMP (SUCTION CONTROL VALVE)

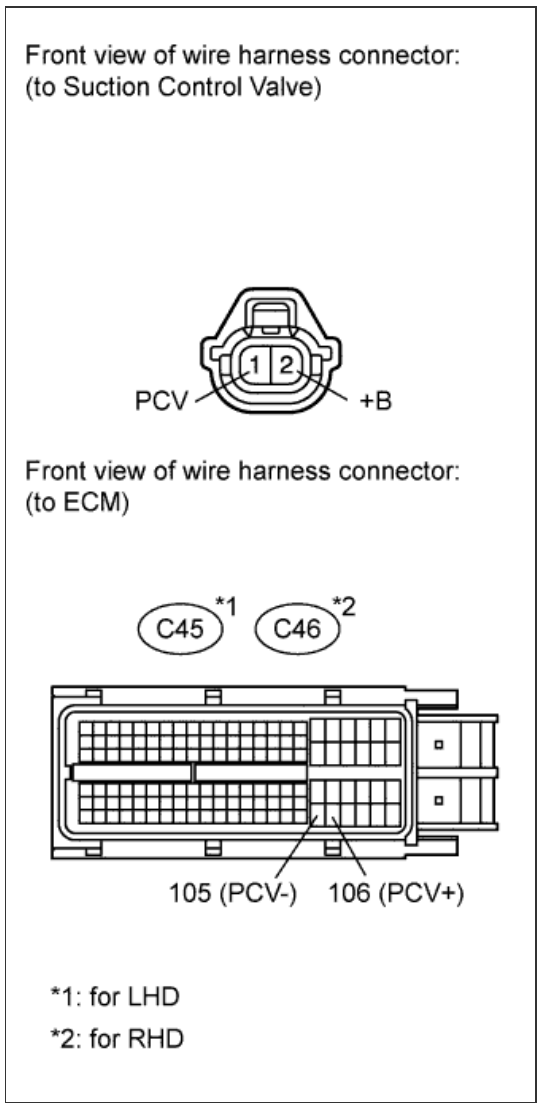
a. Disconnect the suction control valve connector.

b. Measure the resistance according to the value(s) in the table belo .

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	1.9 to 2.3 Ω

NG → Go to step 4



OK

2.CHECK HARNESS AND CONNECTOR (SUCTION CONTROL VALVE - ECM)

a. Disconnect the suction control valve connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
Suction control valve connector-1 (PCV) - C45-105 (PCV-)	Always	Below 1 Ω

DTC P0093 Fuel System Leak Detected - Large Leak

for Preparation Click here

DESCRIPTION

Refer to System Description (Click here).

P0093

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After idling for 60 seconds, run engine at 2500 rpm for 30 seconds	The fuel pressure decreases greatly when the engine is running (1 trip detection logic).	• Fuel line between fuel supply pump and common rail • Fuel line between common rail and fuel in etor • Fuel supply pump • Common rail (for Bank 2) (pressure limiter) • Fuel in etor (P1238 set simultaneously) • Open or short in EDU circuit (P062D and/or P062E set simultaneously) • Open or short in fuel in etor circuit (P062D, P062E and/or P1238 set simultaneously) • EDU (P062D and/or P062E set simultaneously) • Fuel line (air bleeding) • ECM

Related Data List

DTC No.	Data List
P0093	• Fuel Press • Target Common Rail Pressure • In etion Pressure Correction • Target Pump SCV Current

HINT:

- **For more information on the common rail system, refer to System Description (Click here).**
- **If DTC P0093 is present, refer to the "Diagnostic Trouble Code (DTC) Table for Common Rail System" (Click here).**
- **When DTC P0093 is stored, check the internal fuel pressure of the common rail by entering the following menus: Powertrain / Engine / Data List / Fuel Press.**

  Reference

Engine Speed	Fuel Press
Idling	Approximately 27 to 37 MPa
2500 rpm (No engine load)	Approximately 50 to 70 MPa

- **When there is an operating problem with the fuel supply pump (Fuel Press is less than Target Common Rail Pressure), the values of Injection Pressure Correction and Target Pump SCV Current will increase.**

MONITOR DESCRIPTION

P0093 (Fuel leaks in high-pressure areas):
This DTC indicates that fuel leaks exist in highly-pressurized areas in the common rail system. The ECM constantly monitors the internal fuel pressure of the common rail after the engine is started. The ECM stores this DTC if the drop in the internal fuel pressure is large when the fuel is in eted.
In the common rail system, high-pressure fuel is always supplied to the high-pressure areas including the fuel supply pump, common rail, fuel in etors, and piping. The ECM ad usts the suction control valve opening angle to obtain the desired fuel pressure.
If this DTC is stored, the ECM enters fail-safe mode. The fail-safe mode suspends both fuel in etion and fuel supply pump operation, and then stops the engine. Before stopping the engine, the ECM permits the vehicle to be driven for 60 seconds. The fail-safe mode continues until the ignition switch is turned to off.

INSPECTION PROCEDURE

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**
- **After replacing the fuel injector, the ECM needs registration (Click here).**

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0093)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P0093 is output	A
P0093 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL LEAK TEST)

HINT:

By performing this Active Test, the engine speed is maintained at 2000 rpm and the common rail internal fuel pressure is raised to the maximum operating pressure. As a result, a fuel leak check can be conducted while retaining the high common rail pressure.

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Test the Fuel Leak.

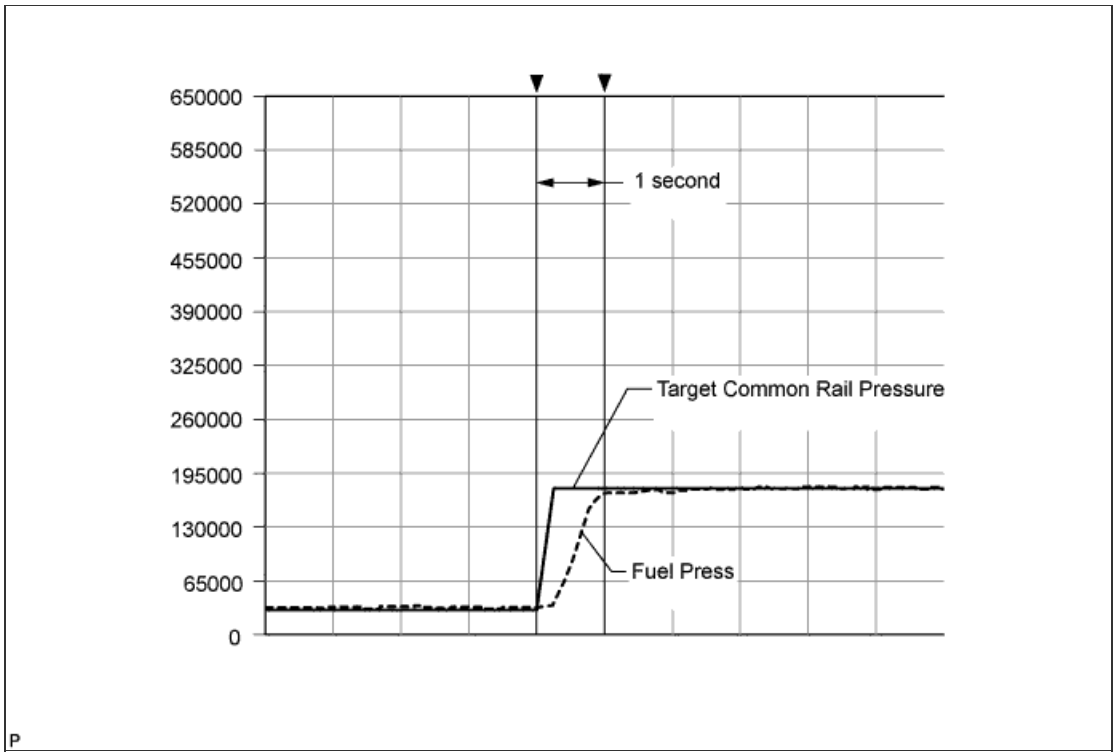
d. Visually check the fuel supply pump, fuel in etor and fuel line located between the fuel supply pump and common rail for fuel leaks and fuel pressure leaks. Also, perform the same check on the fuel line between the common rail and the fuel in etor.

OK:
No leakage.

NG → Go to step 9

OK

3.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL LEAK TEST)



a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Test the Fuel Leak / Data List / Fuel Press and Target Common Rail Pressure.

d. When the Active Test is started, check that Fuel Press follows Target Common Rail Pressure and that the fuel pressure increases.

OK:
Fuel pressure reaches target pressure within 1 second.

OK	o to step 8
NG	Go to step 4

4.CHECK WHETHER DTC OUTPUT RECURS (DTC P0093)

a. Check the fuel receiver gauge. If the indicator is illuminated, add fuel.

b. Operate the hand pump of the fuel filter, and bleed air from the fuel line.

c. Connect the intelligent tester to the DLC3.

d. Clear the DTCs (Click here).

e. Start the engine, and accelerate the engine at full throttle several times.

f. Enter the following menus: Powertrain / Engine / DTC.

g. Read the DTCs.

Result

Result	Proceed to
P0093 is output	A
No DTC is output	B

B	Go to step 10

A

5.CHECK WHETHER DTC OUTPUT RECURS (DTC P0093)

a. Start the engine, and allow the engine to idle for 20 seconds or more.

b. Stop the engine, and wait for 15 seconds or more.

c. Perform the procedures above 3 times or more in succession.

d. Enter the following menus: Powertrain / Engine / DTC.

e. Read the DTCs.

Result

Result	Proceed to
P0093 is output	A
No DTC is output	B

HINT:

If the MIL turns off, accelerate the engine at full throttle several times.

B → Go to step 10

A

6.READ VALUE USING INTELLIGENT TESTER (COMPENSATORY INJECTION VOLUME FOR EACH CYLINDER)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine.

d. After warming up the engine (engine coolant temperature is 75°C (167°F) or more), idle the engine (A/C off and electrical load off) for 1 minute or more.

e. Enter the following menus: Powertrain / Engine / Data List / In etion Feedback Val #1 to #8.

f. Read the values.

OK:

Compensatory injection volume is between -3.0 mm^3/st to 3.0 mm^3/st.

HINT:

- **If the fuel injector is malfunctioning, the compensatory injection volume remains at -5.0 mm^3/st or 5.0 mm^3/st.**
- **The compensatory injection volume is usually between -3.0 mm^3/st to 3.0 mm^3/st.**
- **Any cylinders that have a higher compensatory injection volume than shown above are considered to be faulty.**

NG → Go to step 11

OK

7.REPLACE FUEL SUPPLY PUMP

a. Replace the fuel supply pump (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS (DTC P0093 OUTPUT AREA)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Allow the engine to idle for 1 minute and then run it at 2500 rpm for 30 seconds.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

Result

Result	Proceed to
No DTC is output	A
P0093 is output	B

B → Go to step 12

A

END

9.REPAIR OR REPLACE FUEL LEAKAGE POINT

NEXT → Go to step 13

10.DTC CAUSED BY RUNNING OUT OF FUEL

NEXT → Go to step 13

11.REPLACE FUEL INJECTOR

a. Replace the fuel in etor (Click here).

NEXT → Go to step 13

12.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

13.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON and start the engine.

e. Allow the engine to idle for 1 minute and then run it at 2500 rpm for 30 seconds.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC udgment has been carried out.

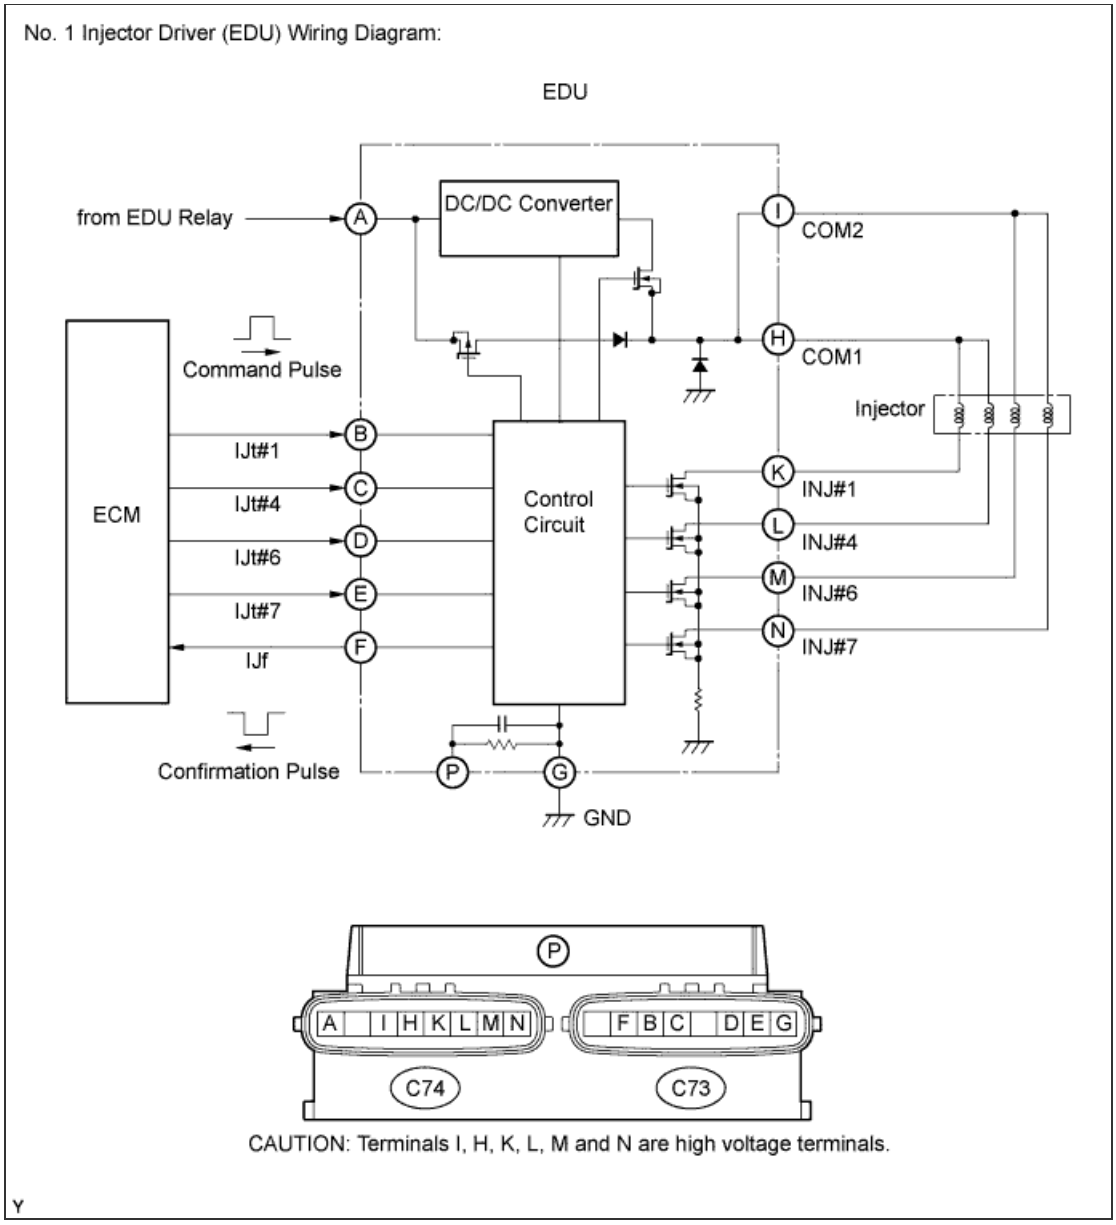
i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0093.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, maintain the engine at 2500 rpm for 30 seconds and then increase idling time.

NEXT

END



DTC P062D Fuel Injector Driver Circuit Performance Bank1

DTC P062E Fuel Injector Driver Circuit Performance Bank2

for Preparation Click here

DESCRIPTION

The EDU delivers drive signals to fuel injectors using the DC/DC converter, which provides a high-voltage and quick-charging system.
Soon after the EDU receives a fuel injection command (IJT) signal from the ECM, the EDU responds to the command with an injector injection confirmation (IJF) signal when the current is applied to the fuel injector.

P062D

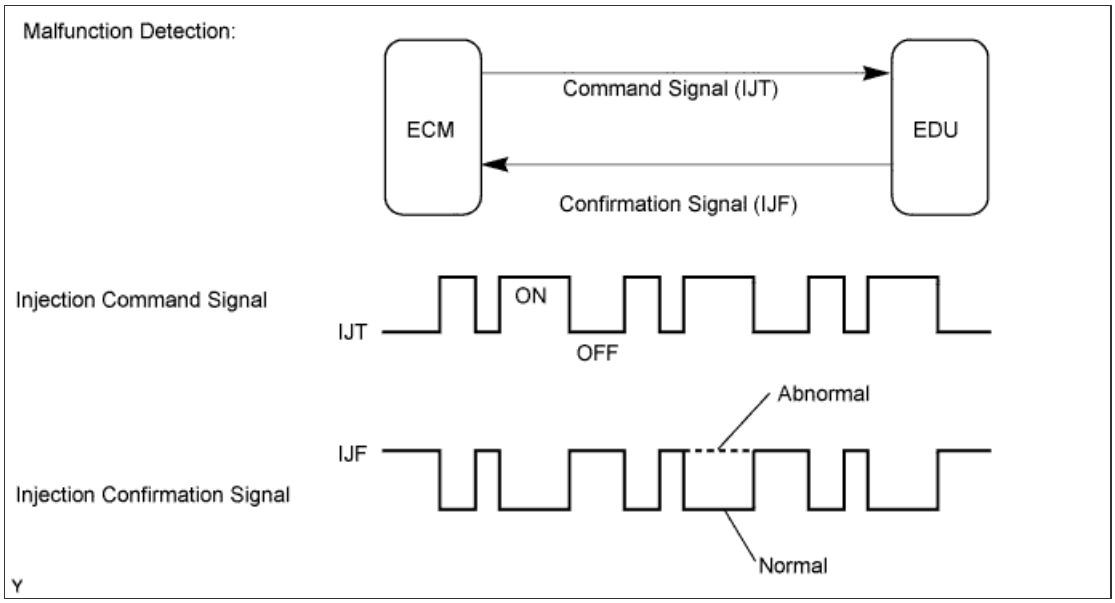
DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Idling for 10 seconds	Open or short in the No. 1 injector driver (EDU) or fuel injector circuit (1 trip detection logic).	• Open or short in No. 1 injector driver (EDU) circuit • Fuel injector • No. 1 EDU • ECM

P062E

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
		• Open or short in No. 2 injector driver

Idling for 10 seconds	Open or short in the No. 2 injector driver (EDU) or fuel injector circuit (1 trip detection logic).	• Open or short in No. 2 injector driver (EDU) circuit • Fuel injector • No. 2 EDU • ECM

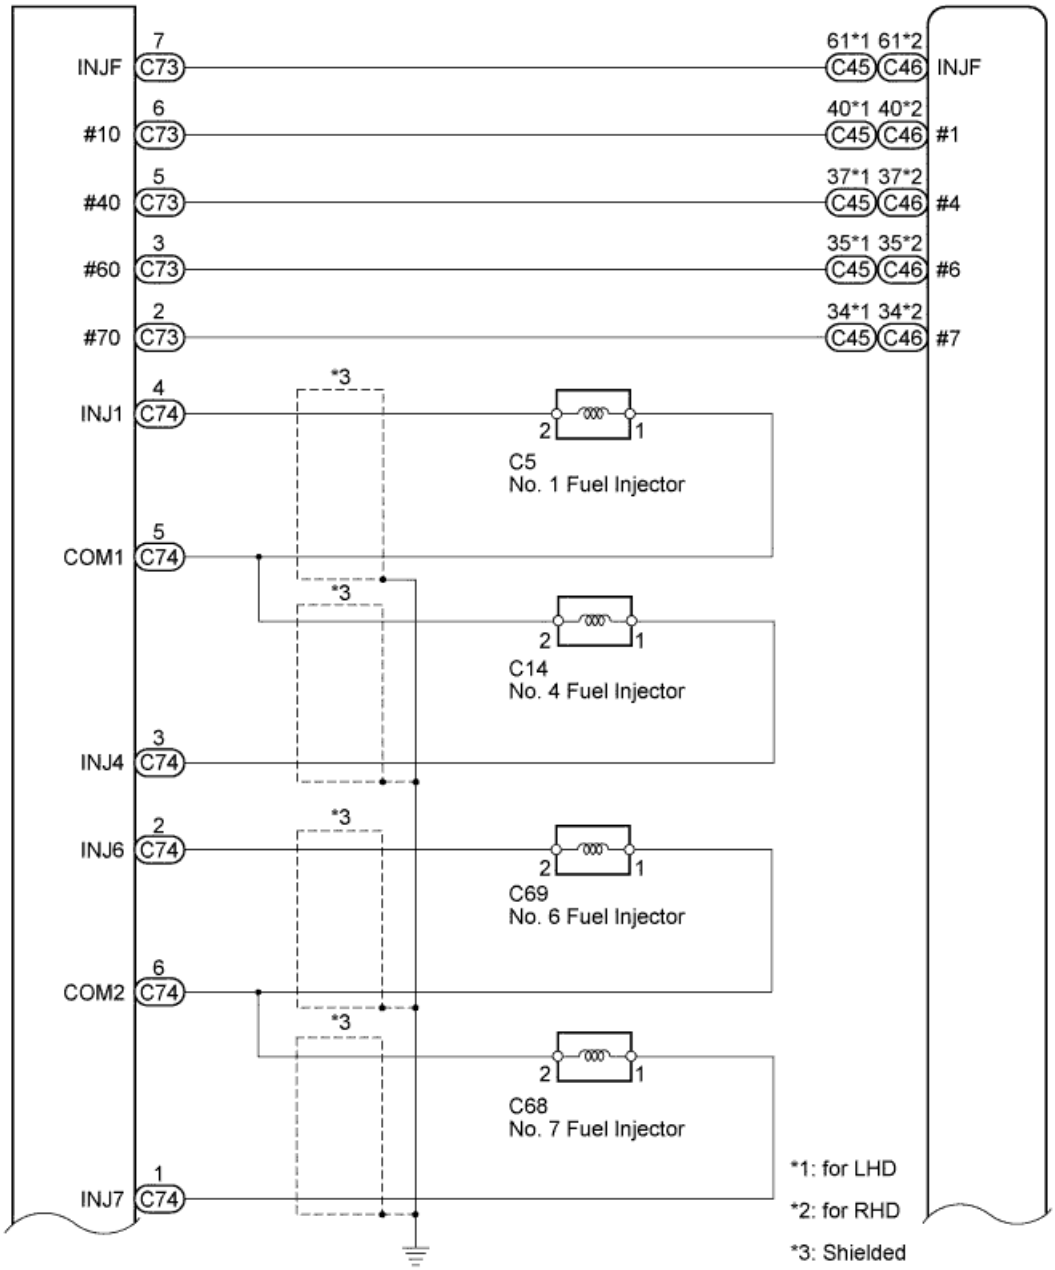
MONITOR DESCRIPTION



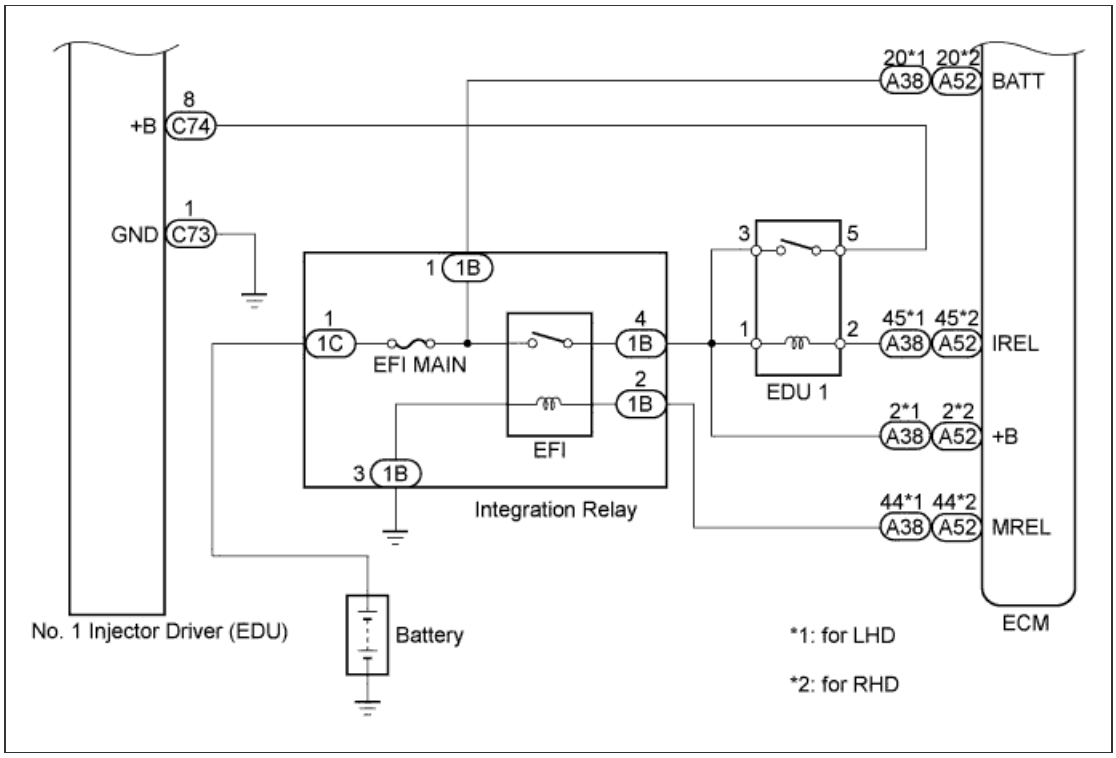
P062D, P062E (Open or short in EDU or fuel injector circuit):

The ECM continuously monitors both injection command (IJT) signals and injection confirmation (IJF) signals. This DTC will be stored if the ECM determines that the number of IJT signals and IJF signals are inconsistent.

The fuel injectors are grounded over a Field Effect Transistor (FET) and a serial resistor. This resistor creates a voltage drop, which is monitored by the EDU (injector drive circuit) in relation to the current drawn by the fuel injector. When the fuel injector current becomes too high, the voltage drop over the resistor exceeds a specified level and no IJF signal for that cylinder is sent to the ECM.



After the engine is started, when there is no injection confirmation (IJF) signal from the No. 1 or No. 2 EDU to the ECM even though the ECM sends injection command (IJT) signals to the No. 1 or No. 2 EDU, DTC P062D or DTC P062E is stored.



If this DTC is stored, the ECM enters fail-safe mode and limits engine power or stops the engine. The fail-safe mode continues until the ignition switch is turned off.

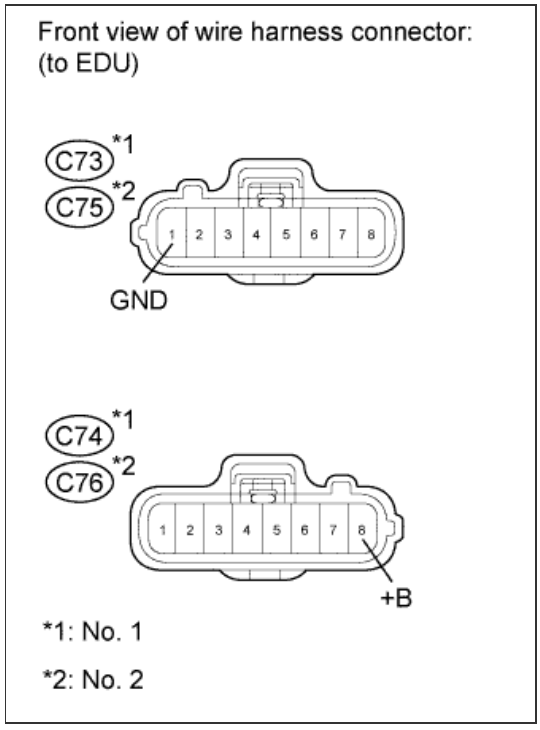
INSPECTION PROCEDURE

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing a fuel injector, the ECM needs registration (Click here).**

HINT:



Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK TERMINAL VOLTAGE EDU POWER SOURCE

a. Disconnect the No. 1 injector driver (EDU) connectors.

b. Disconnect the No. 2 injector driver (EDU) connectors.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

No. 1

Tester Connection	Switch Condition	Specified Condition
C74-8 (+B) - C73-1 (GND)	Ignition switch ON	11 to 14 V

No. 2

Tester Connection	Switch Condition	Specified Condition
C76-8 (+B) - C75-1 (GND)	Ignition switch ON	11 to 14 V

NG → Go to step 7

OK

2.INSPECT INJECTOR DRIVER (No. 1 and No. 2)

a. Interchange the No. 1 and No. 2 EDU connectors.

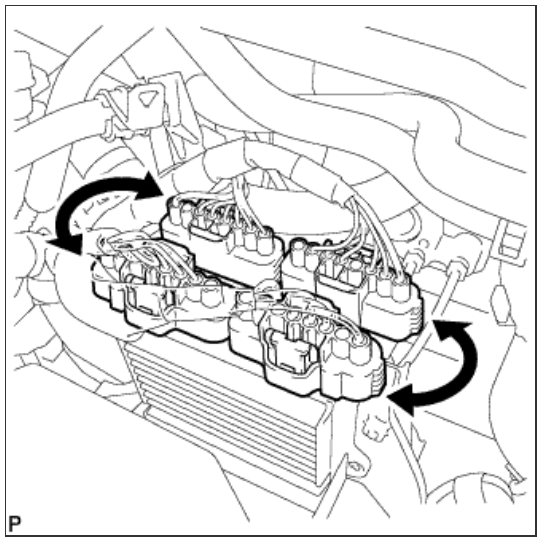
b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Clear the DTCs (Click here).

NOTICE:

Before clearing the DTCs, write them down.



e. Start the engine.

f. Enter the following menus: Powertrain / Engine / DTC.

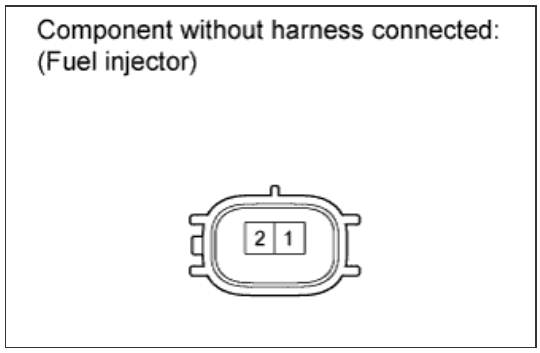
g. Read the DTCs.

Result

Result	Proceed to
DTCs do not change	A
DTCs change (change in malfunctioning cylinder or EDU code)	B

B → Go to step 8

A



3.INSPECT FUEL INJECTOR (RESISTANCE)

a. Disconnect the fuel injector connectors.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	0.85 to 1.05 Ω

NG → Go to step 9

OK

4.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - EDU)

a. Disconnect the fuel injector connectors.

b. Disconnect the No. 1 EDU connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

No. 1

Tester Connection	Condition	Specified Condition
C5-2 - C74-4 (INJ1)	Always	Below 1 Ω
C14-2 - C74-3 (INJ4)	Always	Below 1 Ω
C69-2 - C74-2 (INJ6)	Always	Below 1 Ω
C68-2 - C74-1 (INJ7)	Always	Below 1 Ω
C5-1 - C74-5 (COM1)	Always	Below 1 Ω
C14-1 - C74-5 (COM1)	Always	Below 1 Ω
C69-1 - C74-6 (COM2)	Always	Below 1 Ω
C68-1 - C74-6 (COM2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

No. 1

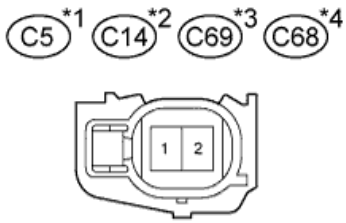
Tester Connection	Condition	Specified Condition
C5-2 or C74-4 (INJ1) - Body ground	Always	10 kΩ or higher
C14-2 or C74-3 (INJ4) - Body ground	Always	10 kΩ or higher
C69-2 or C74-2 (INJ6) - Body ground	Always	10 kΩ or higher
C68-2 or C74-1 (INJ7) - Body ground	Always	10 kΩ or higher
C5-1 or C74-5 (COM1) - Body ground	Always	10 kΩ or higher
C14-1 or C74-5 (COM1) - Body ground	Always	10 kΩ or higher
C69-1 or C74-6 (COM2) - Body ground	Always	10 kΩ or higher
C68-1 or C74-6 (COM2) - Body ground	Always	10 kΩ or higher

d. Disconnect the fuel injector connectors.

e. Disconnect the No. 2 EDU connector.

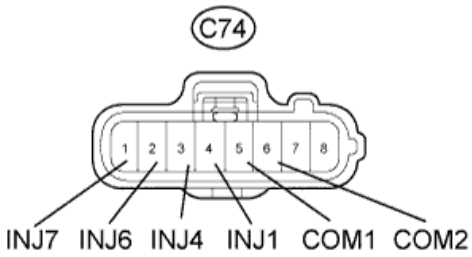
f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):



No. 2

Tester Connection	Condition	Specified Condition
C70-2 - C76-4 (INJ2)	Always	Below 1 Ω
C9-2 - C76-3 (INJ5)	Always	Below 1 Ω
C67-2 - C76-1 (INJ3)	Always	Below 1 Ω
C54-2 - C76-2 (INJ8)	Always	Below 1 Ω
C70-1 - C76-5 (COM4)	Always	Below 1 Ω
C9-1 - C76-5 (COM4)	Always	Below 1 Ω
C67-1 - C76-6 (COM5)	Always	Below 1 Ω
C54-1 - C76-6 (COM5)	Always	Below 1 Ω



Standard Resistance (Check for Short):

NG → Go to step 10

OK

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 11

7.GO TO INJECTOR CIRCUIT

a. Go to the injector circuit (Click here).

NEXT → Go to step 11

8.REPLACE INJECTOR DRIVER (No. 1 or No. 2)

a. Replace the injector driver (No. 1 or No. 2) (Click here).

NEXT → Go to step 11

9.REPLACE FUEL INJECTOR

a. Replace the fuel injector (Click here).

NEXT → Go to step 11

10.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

11.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

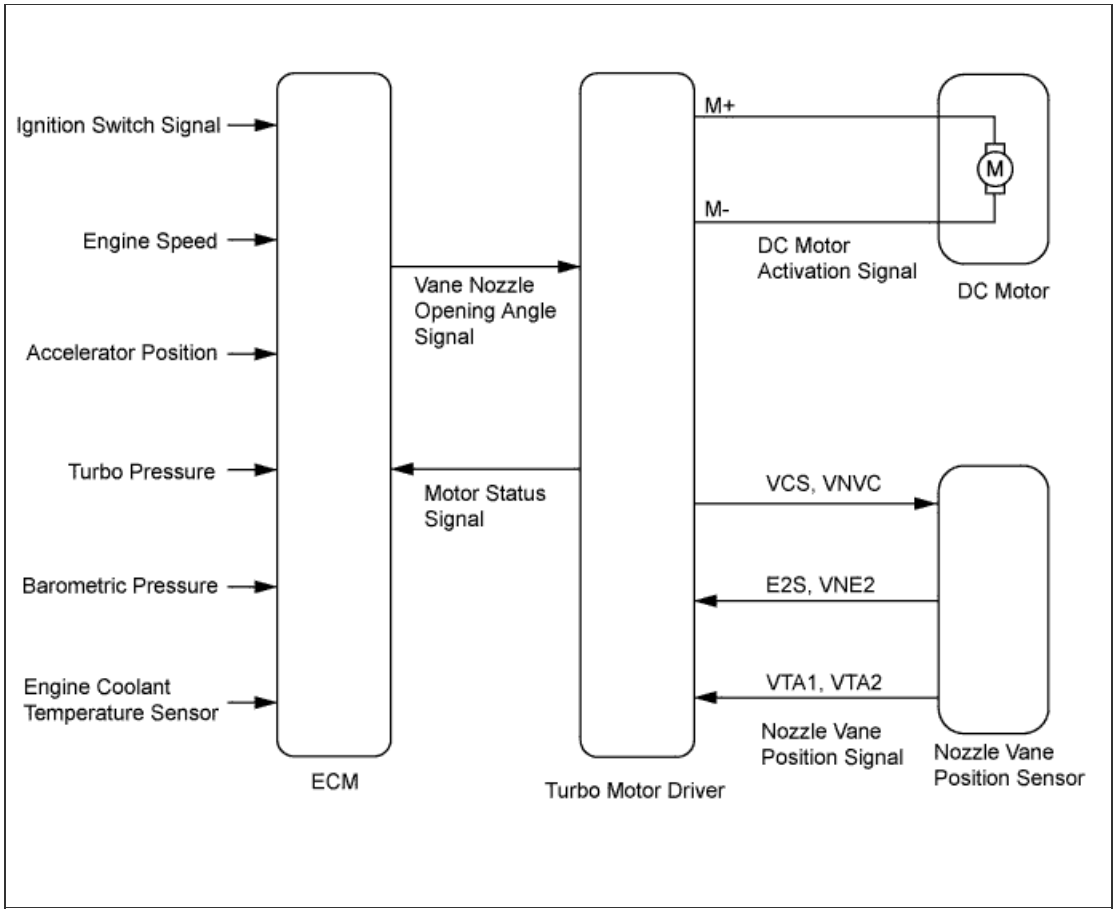
d. Start the engine and idle it for 10 seconds.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END



DTC P00AF Turbocharger/Supercharger Boost Control "A" Module Performance

DTC P00B0 Turbocharger/Supercharger Boost Control "B" Module Performance

for Preparation Click here

DESCRIPTION

The turbocharger system is comprised of the Variable Nozzle (VN) type turbocharger, turbo motor driver and ECM.
The turbocharger has a nozzle vane which opens and closes to control the volume of the exhaust gas flowing into the turbine. This, in turn, controls the boost pressure. When the nozzle vane moves towards the closing direction, the pressure increases. When the vane moves towards the opening direction, the pressure decreases.
The turbocharger actuator, which consists of the DC motor and the nozzle vane position sensor, is built on the turbocharger sub-assembly, and activates the nozzle vane. The nozzle vane position sensor detects the opening angle of the nozzle vane. The turbo motor driver receives an opening angle request from the ECM and a nozzle vane position signal from the nozzle vane position sensor. Based on these signals, the turbo motor driver operates the DC motor and adjusts the nozzle vane opening angle. The turbo motor driver sends the status as a turbo driver status signal to the ECM
The ECM sends a target nozzle vane position signal to the turbo motor driver to obtain the nozzle vane position for the optimal boost pressure in accordance with the driving conditions.

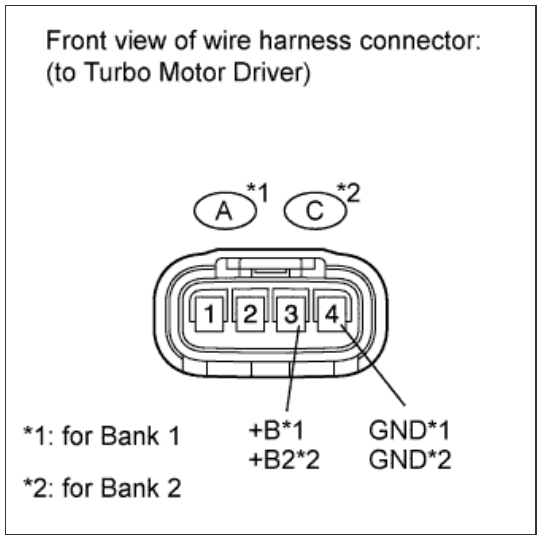
		ground problem • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Excessive electrical noise, such as from wireless radios or electrical modifications, may cause a DTC to be stored.**



NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

1.INSPECT TURBO MOTOR DRIVER (POWER SOURCE CIRCUIT)

a. Disconnect the turbo motor driver connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-3 (+B) - Turbo motor driver connector-4 (GND)	Ignition switch ON	11 to 14 V

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-3 (+B2) - Turbo motor driver connector-4 (GND2)	Ignition switch ON	11 to 14 V

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-4 (GND) - Body ground	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-4 (GND2) - Body ground	Always	Below 1 Ω

NG → Go to step 5

OK

2.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

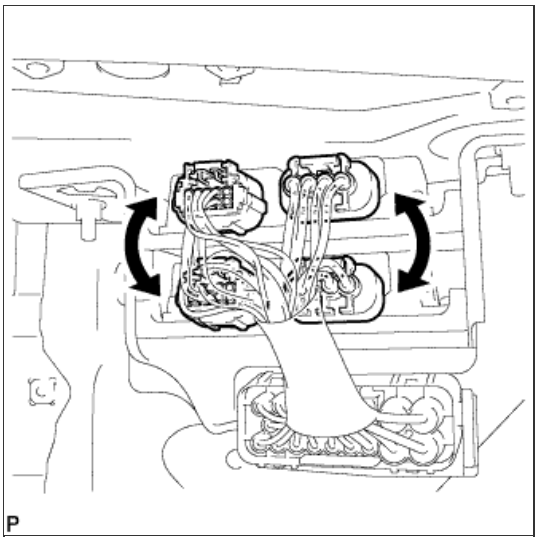
b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.



HINT:

Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.

j. Start the engine.

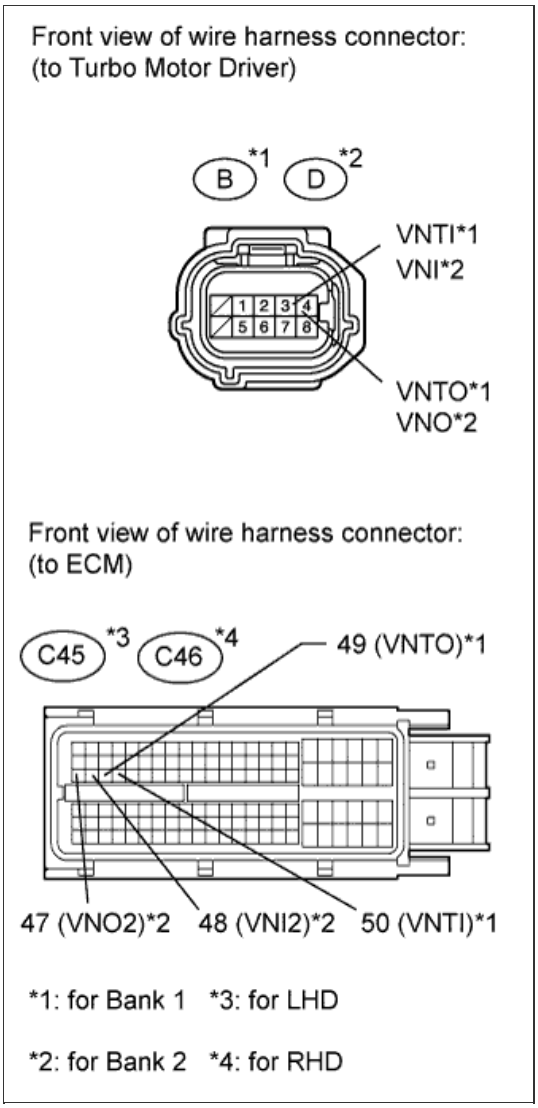
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 6



A

3.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - ECM)

a. Disconnect the turbo motor driver connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C45-49 (VNTO) - B-4 (VNTO)	Always	Below 1 Ω
C45-50 (VNTI) - B-3 (VNTI)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C46-49 (VNTO) or B-4 (VNTO) - Body ground	Always	10 kΩ or higher
C46-50 (VNTI) or B-3 (VNTI) - Body ground	Always	10 kΩ or higher
C46-47 (VNO2) or D-4 (VNO2) - Body ground	Always	10 kΩ or higher
C46-48 (VNI2) or D-3 (VNI2) - Body ground	Always	10 kΩ or higher

NG → Go to step 5

OK

4.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 7

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 7

6.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

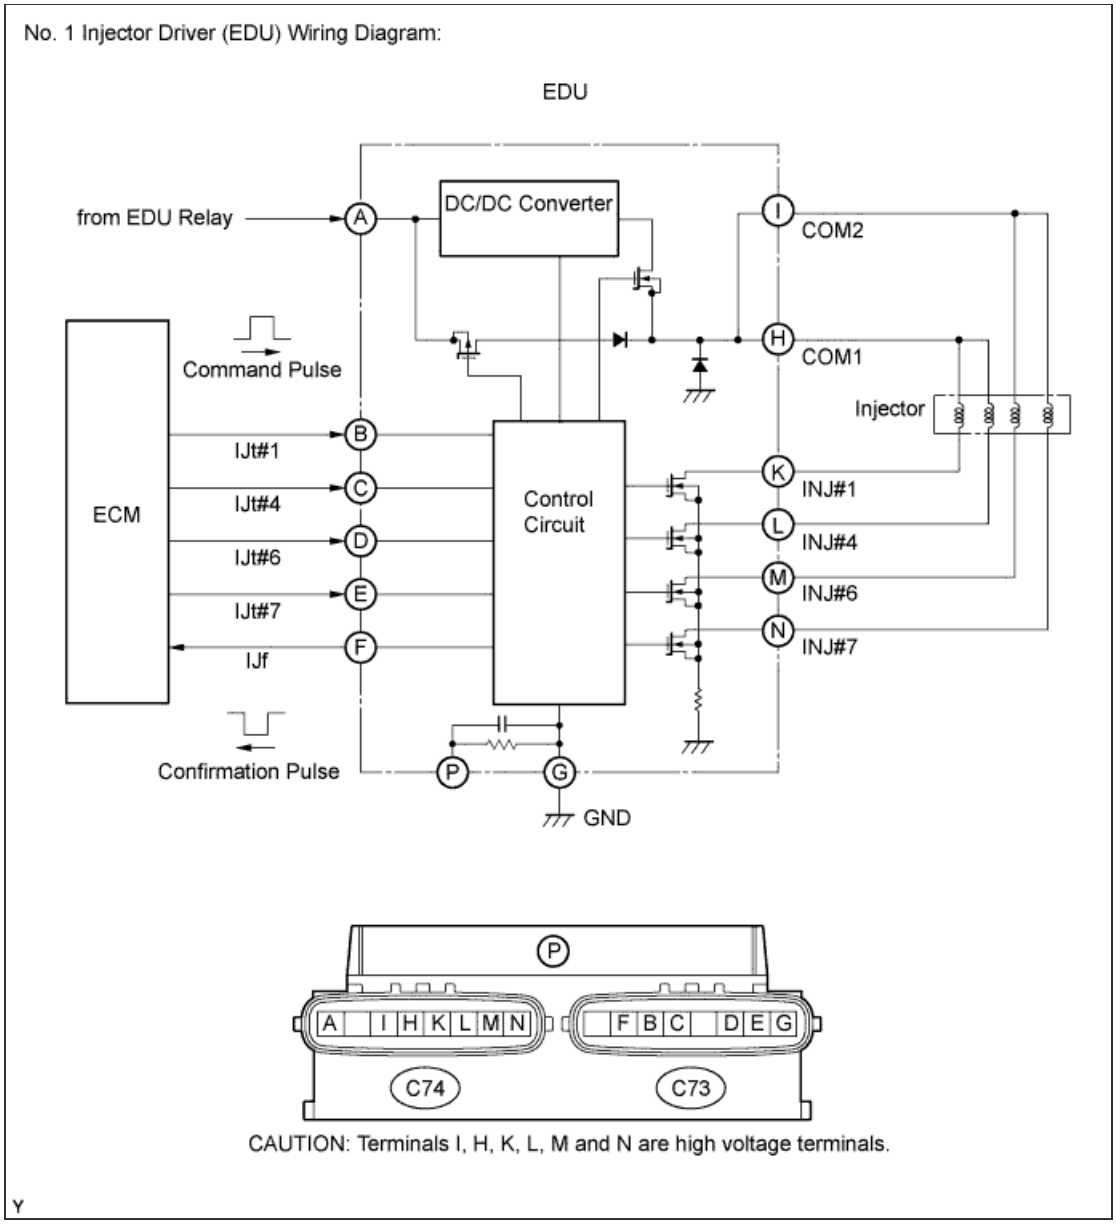
d. After starting the engine, idle it for 5 seconds.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END



DTC P062D Fuel Injector Driver Circuit Performance Bank1

DTC P062E Fuel Injector Driver Circuit Performance Bank2

for Preparation Click here

DESCRIPTION

The EDU delivers drive signals to fuel injectors using the DC/DC converter, which provides a high-voltage and quick-charging system.
Soon after the EDU receives a fuel injection command (IJT) signal from the ECM, the EDU responds to the command with an injector injection confirmation (IJF) signal when the current is applied to the fuel injector.

P062D

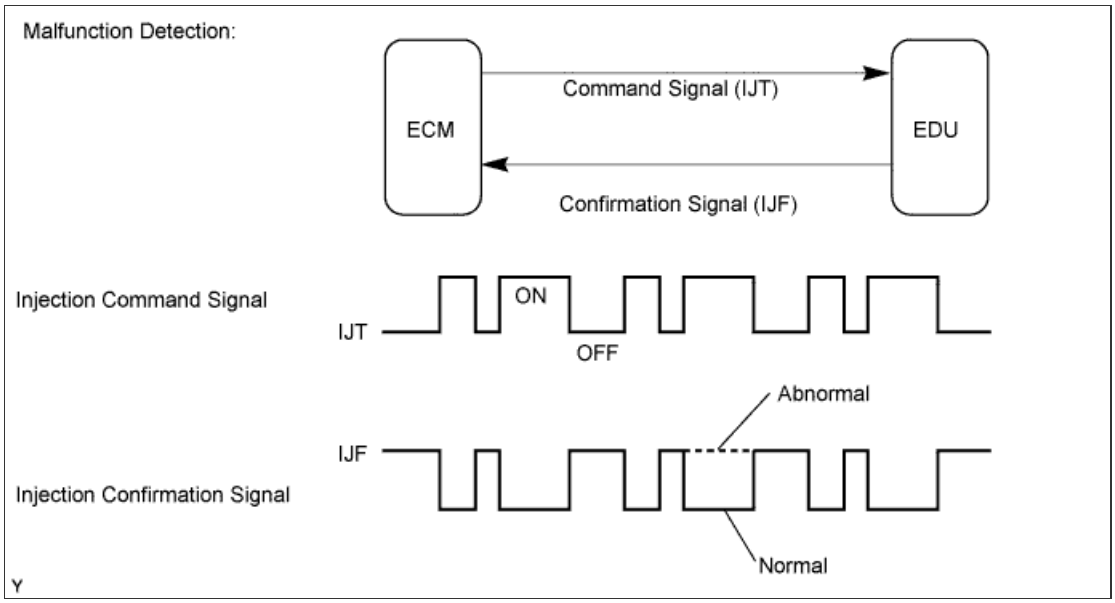
DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Idling for 10 seconds	Open or short in the No. 1 injector driver (EDU) or fuel injector circuit (1 trip detection logic).	• Open or short in No. 1 injector driver (EDU) circuit • Fuel injector • No. 1 EDU • ECM

P062E

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
		• Open or short in No. 2 injector driver

Idling for 10 seconds	Open or short in the No. 2 injector driver (EDU) or fuel injector circuit (1 trip detection logic).	• Open or short in No. 2 injector driver (EDU) circuit • Fuel injector • No. 2 EDU • ECM

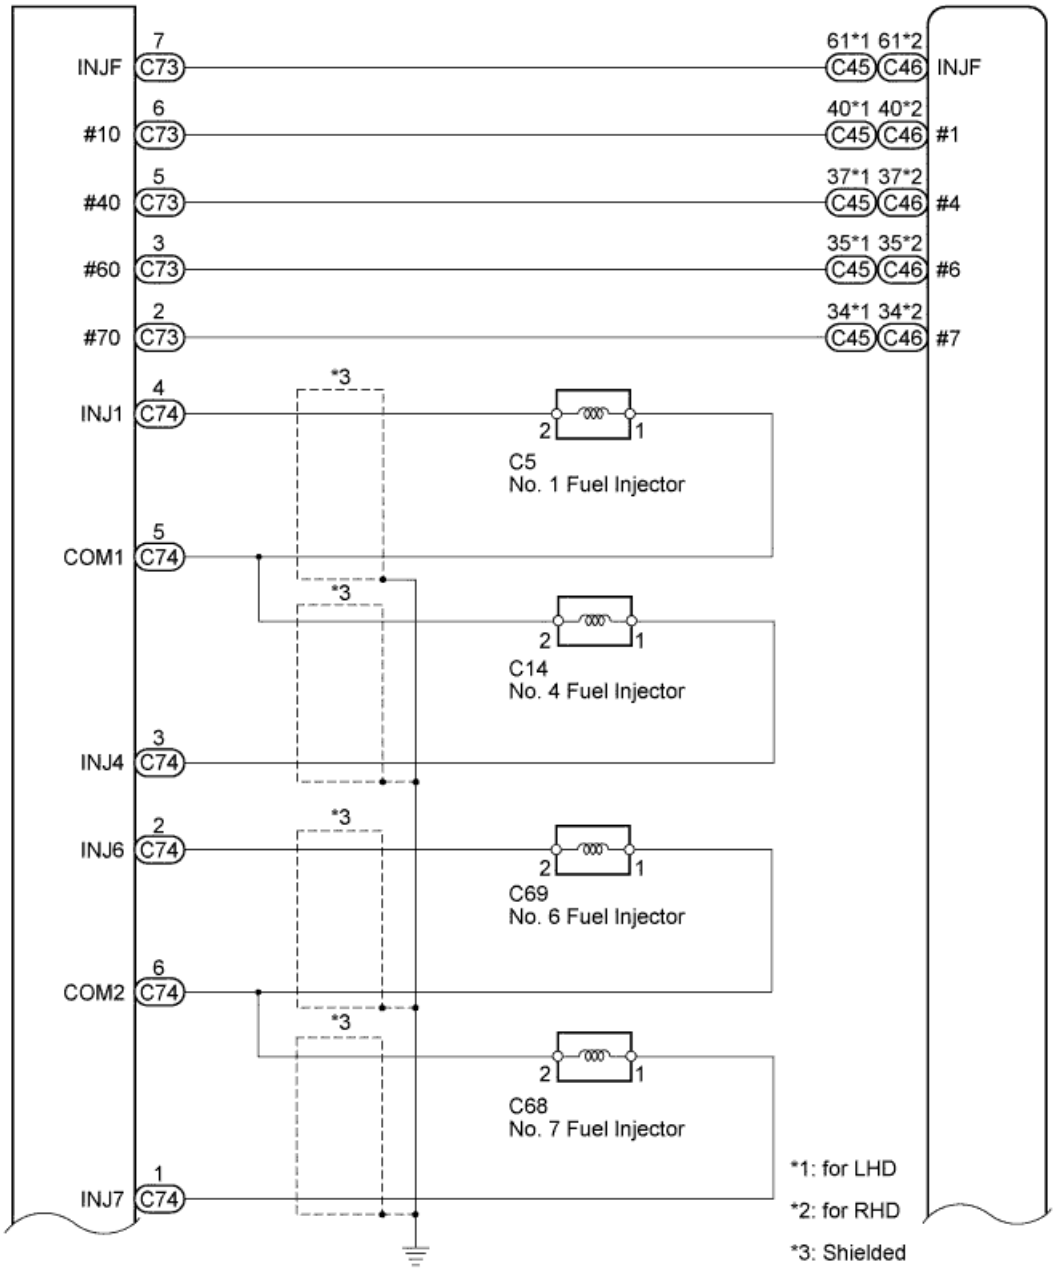
MONITOR DESCRIPTION



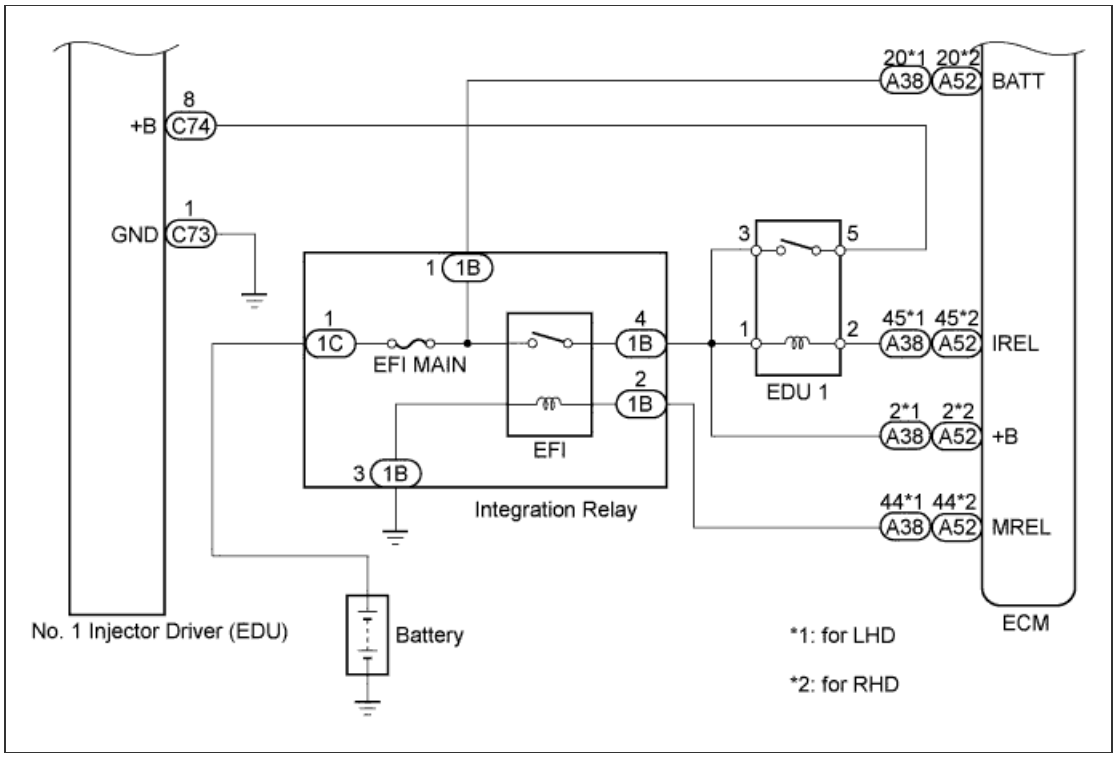
P062D, P062E (Open or short in EDU or fuel injector circuit):

The ECM continuously monitors both injection command (IJT) signals and injection confirmation (IJF) signals. This DTC will be stored if the ECM determines that the number of IJT signals and IJF signals are inconsistent.

The fuel injectors are grounded over a Field Effect Transistor (FET) and a serial resistor. This resistor creates a voltage drop, which is monitored by the EDU (injector drive circuit) in relation to the current drawn by the fuel injector. When the fuel injector current becomes too high, the voltage drop over the resistor exceeds a specified level and no IJF signal for that cylinder is sent to the ECM.



After the engine is started, when there is no injection confirmation (IJF) signal from the No. 1 or No. 2 EDU to the ECM even though the ECM sends injection command (IJT) signals to the No. 1 or No. 2 EDU, DTC P062D or DTC P062E is stored.



If this DTC is stored, the ECM enters fail-safe mode and limits engine power or stops the engine. The fail-safe mode continues until the ignition switch is turned off.

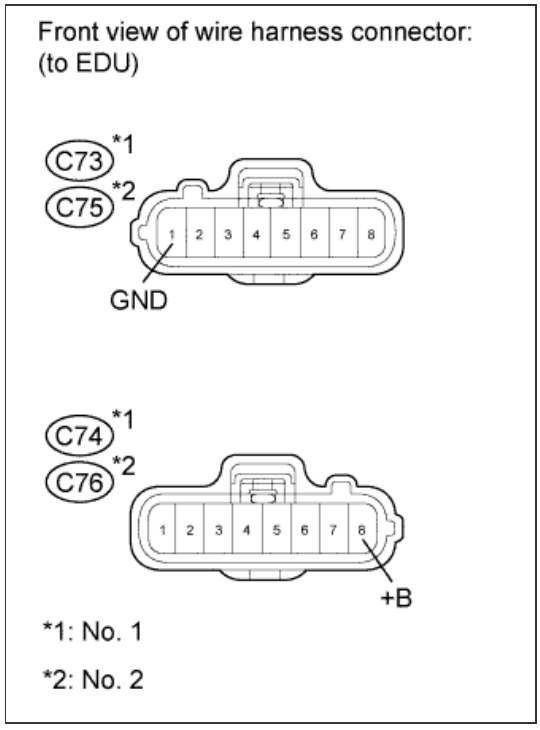
INSPECTION PROCEDURE

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing a fuel injector, the ECM needs registration (Click here).**

HINT:



Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK TERMINAL VOLTAGE EDU POWER SOURCE

a. Disconnect the No. 1 injector driver (EDU) connectors.

b. Disconnect the No. 2 injector driver (EDU) connectors.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

No. 1

Tester Connection	Switch Condition	Specified Condition

DTC P00AF Turbocharger/Supercharger Boost Control "A" Module Performance

DTC P00B0 Turbocharger/Supercharger Boost Control "B" Module Performance

for Preparation Click here

DESCRIPTION

The turbocharger system is comprised of the Variable Nozzle (VN) type turbocharger, turbo motor driver and ECM.
The turbocharger has a nozzle vane which opens and closes to control the volume of the exhaust gas flowing into the turbine. This, in turn, controls the boost pressure. When the nozzle vane moves towards the closing direction, the pressure increases. When the vane moves towards the opening direction, the pressure decreases.
The turbocharger actuator, which consists of the DC motor and the nozzle vane position sensor, is built on the turbocharger sub-assembly, and activates the nozzle vane. The nozzle vane position sensor detects the opening angle of the nozzle vane. The turbo motor driver receives an opening angle request from the ECM and a nozzle vane position signal from the nozzle vane position sensor. Based on these signals, the turbo motor driver operates the DC motor and adjusts the nozzle vane opening angle. The turbo motor driver sends the status as a turbo driver status signal to the ECM
The ECM sends a target nozzle vane position signal to the turbo motor driver to obtain the nozzle vane position for the optimal boost pressure in accordance with the driving conditions.

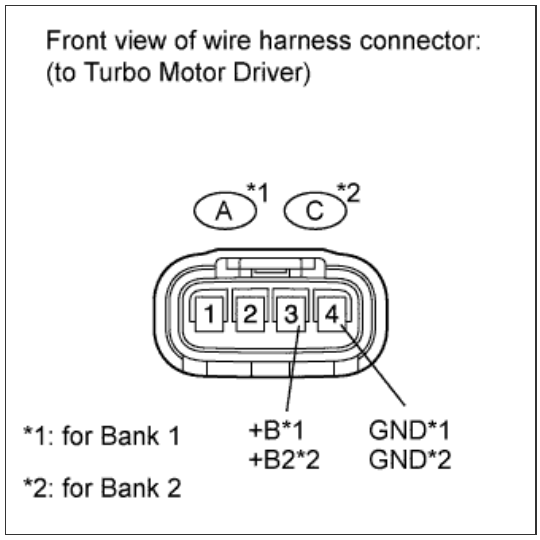
INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Excessive electrical noise, such as from wireless radios or electrical modifications, may cause a DTC to be stored.**



NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

1.INSPECT TURBO MOTOR DRIVER (POWER SOURCE CIRCUIT)

a. Disconnect the turbo motor driver connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-3 (+B) - Turbo motor driver connector-4 (GND)	Ignition switch ON	11 to 14 V

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-3 (+B2) - Turbo motor driver connector-4 (GND2)	Ignition switch ON	11 to 14 V

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-4 (GND) - Body ground	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-4 (GND2) - Body ground	Always	Below 1 Ω

NG → Go to step 5

OK

2.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

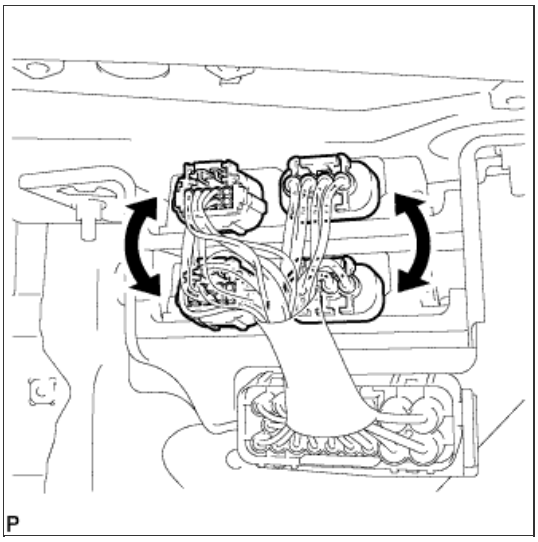
b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.



HINT:

Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.

j. Start the engine.

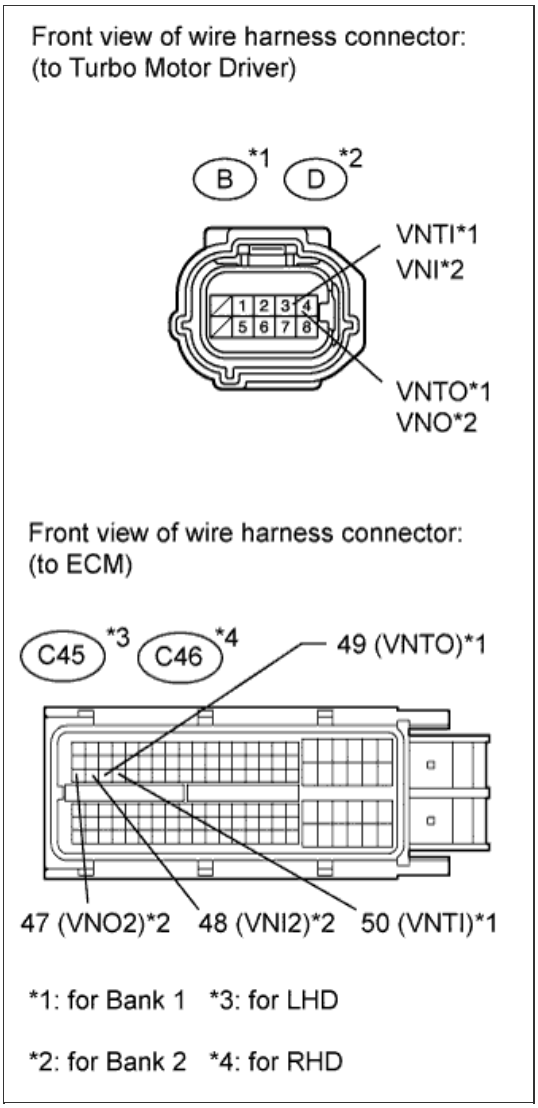
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 6



A

3.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - ECM)

a. Disconnect the turbo motor driver connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C45-49 (VNTO) - B-4 (VNTO)	Always	Below 1 Ω

DTC P1229 Fuel Pump System

for Preparation Click here

DESCRIPTION

Refer to the System Description (Click here).

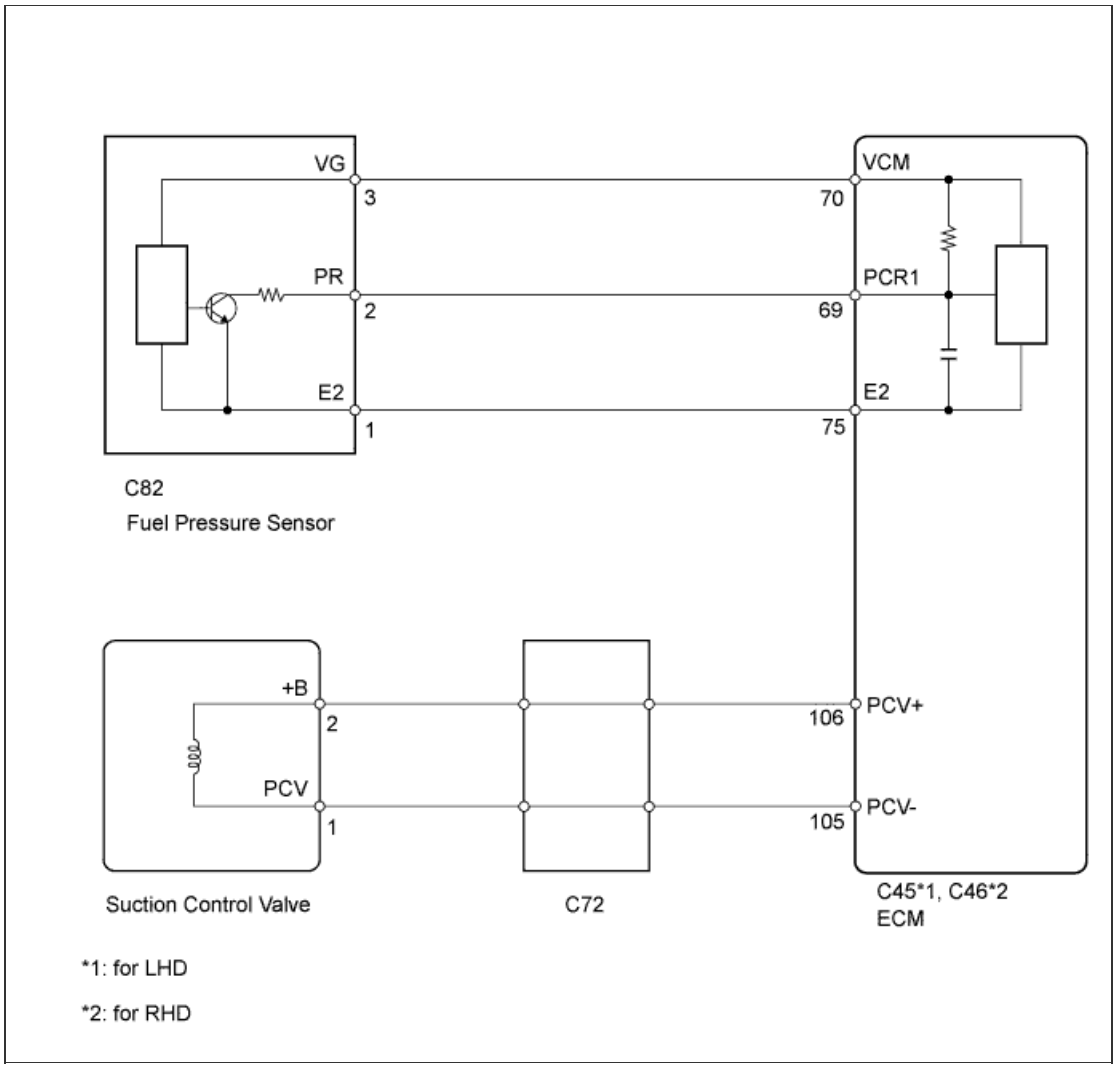
P1229

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Idling for 60 seconds	The actual fuel pressure e ceeds the target fuel pressure by 40 MPa or more for 10 seconds (1 trip detection logic).	• Short in fuel supply pump (suction control valve) circuit • Fuel supply pump (suction control valve) • Fuel pressure sensor (common rail (for Bank 1)) • ECM

Related Data List

DTC No.	Data List
P122	• Fuel Press • Target Common Rail Pressure • Injection Pressure Correction • Target Pump SCV Current

HINT:



- **For more information on the fuel supply pump (suction control valve) and common rail system, refer to the System Description (Click here).**
- **When DTC P1229 is stored, check the internal fuel pressure of the common rail by entering the following menus: Powertrain / Engine / Data List / Fuel Press, Target Common Rail Pressure.**
  Under a stable condition such as idling or running the engine at 2500 rpm without load, Fuel Press is within +/-5 MPa of Target Common Rail Pressure.
- **When there is an operating problem with the fuel supply pump (when Fuel Press is more than Target Common Rail Pressure due to a problem with the closing of the suction valve), the values of Injection Pressure Correction and Target Pump SCV Current decrease.**

MONITOR DESCRIPTION

P122 (Fuel over-feed):

The ECM stores this DTC if the actual fuel pressure inside the common rail remains higher than the target fuel pressure, despite the ECM closing the suction control valve. This DTC indicates that the suction control valve may be stuck open, or there may be a short in its circuit. If this DTC is stored, the ECM enters fail-safe mode and limits the engine po er. The fail-safe mode continues until the ignition s itch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**

HINT:

Read free e frame data using the intelligent tester. Free e frame data records the engine condition n malfunctions are detected. When troubleshooting, free e frame data can help determine if the vehicle as moving or stationary, if the engine as armed up or not, and other data from the time the malfunction occurred.

1.INSPECT FUEL SUPPLY PUMP (SUCTION CONTROL VALVE)

a. Disconnect the suction control valve connector and then check if the engine starts.

OK:
Engine does not start.

NG → Go to step 6

OK

2.READ VALUE USING INTELLIGENT TESTER (TARGET PUMP SCV CURRENT)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Enter the follo ing menus: Po ertrain / Engine / Data List / Target Pump SCV Current.

e. Read the value.

OK:

Engine Speed	Target Pump SCV Current
Idling	to 1123 mA
2500 rpm (No engine load)	1013 to 1212 mA

NG → Go to step 4

OK

3.READ VALUE USING INTELLIGENT TESTER (FUEL PRESS)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the follo ing menus: Po ertrain / Engine / Data List / Fuel Press.

d. Check that the internal fuel pressure of the common rail is ithin the specification belo .

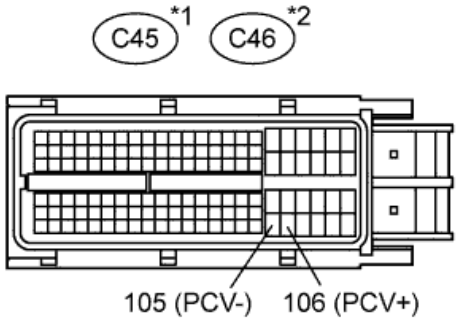
OK:
Fuel Press is within +/-5 MPa of Target Common Rail Pressure when engine is idling and running at 2500 rpm without load.

OK → Go to step 5

NG → Go to step 4

4.CHECK HARNESS AND CONNECTOR (SUCTION CONTROL VALVE CONNECTOR - ECM)

a. Disconnect the suction control valve connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table belo .

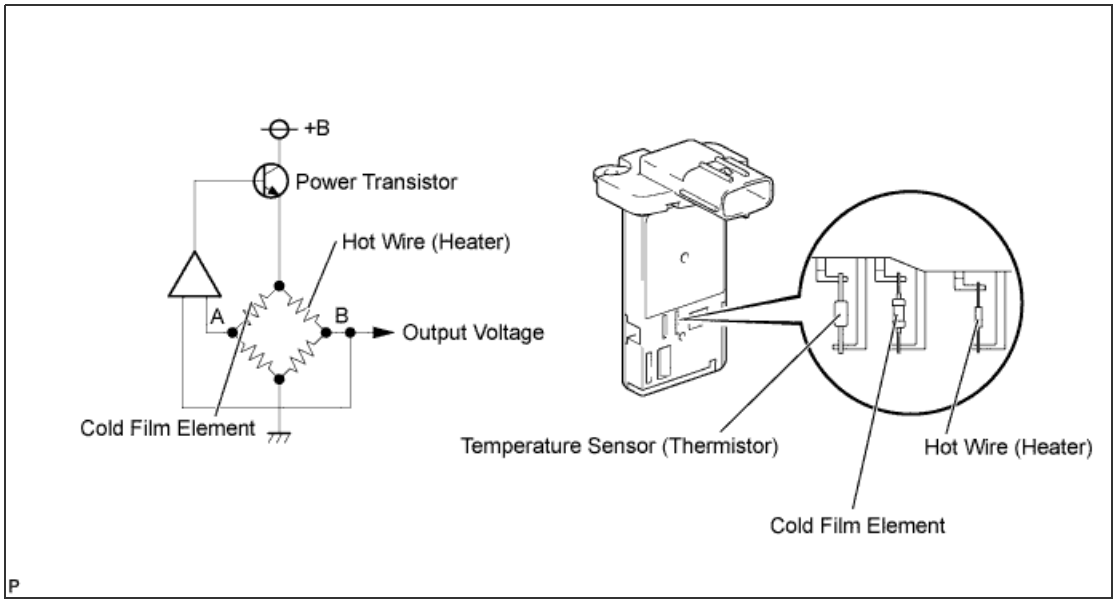
DTC P0100 Mass or Volume Air Flow Circuit

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter uses a platinum hot wire. The mass air flow meter consists of a platinum hot wire, a temperature sensor and a control circuit installed in a plastic housing. The mass air flow meter hot wire and temperature sensor (located in the intake air by-pass of the housing) detect changes in the intake air temperature.

The hot wire is maintained at the predetermined temperature by controlling the current flow through the hot wire. This current flow is then used as the output voltage of the mass air flow meter.

The circuit is constructed so that the platinum hot wire and temperature sensor provide a bridge circuit, with the power transistor controlled so that the potential of A and B remains equal to maintain the predetermined temperature.

P0100

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	Mass air flow (MAF) meter voltage is 0.2 V or less, or 4. V or more with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

P0102

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	MAF meter voltage is 0.2 V or less with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Open in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

P0103

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	MAF meter voltage is 4. V or more with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Shot in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

  - **Combustion noise worsens**
- **If DTC P0100, and/or P0103 is stored, the following symptoms may appear (as the ECU mistakenly determines that there is more air than the actual intake air amount, EGR is increased to match the target EGR):**
  - **Misfire**
  - **White smoke**
  - **Black smoke**
- **After confirming DTC P0100, P0102 or P0103, check the mass air flow ratio by entering the following menus: Powertrain / Engine / Data List / MAF.**

Reference:

Air Flow Value (g/sec.)	Malfunction
Approximately 0.0	• **Open in mass air flow meter power source circuit** • **Open or short in VG circuit**
174.0 or more	Open in EVG circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MASS AIR FLOW RATE)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / MAF.

d. Read the value.

Result

Result	Proceed to
0.0	A
174.0 or more	B
Between 1 and 173.0*	C

HINT:

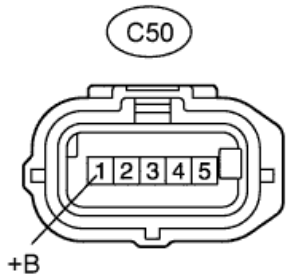
*: The value should change when the throttle valve is opened or closed.

B → Go to step 8

C → Go to step 15

A

2.INSPECT MASS AIR FLOW METER (POWER SOURCE CIRCUIT)



a. Disconnect the mass air flow meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C50-1 (+B) - Body ground	Ignition switch ON	11 to 14 V

Front view of wire harness connector:
(to Mass Air Flow Meter)

NG → Go to step 5

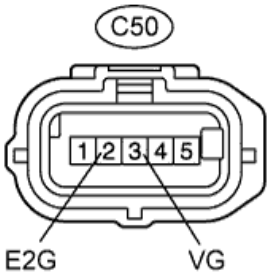
OK

3.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

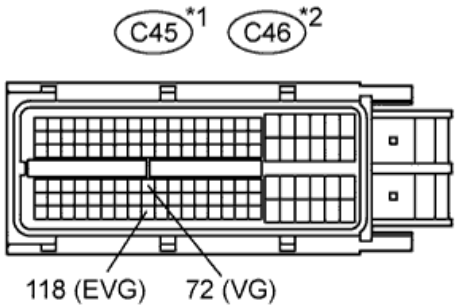
NG → Go to step 11

OK



4.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Mass Air Flow Meter)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C50-3 (VG) - C45-72 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C45-118 (EVG)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C50-3 (VG) - C46-72 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C46-118 (EVG)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

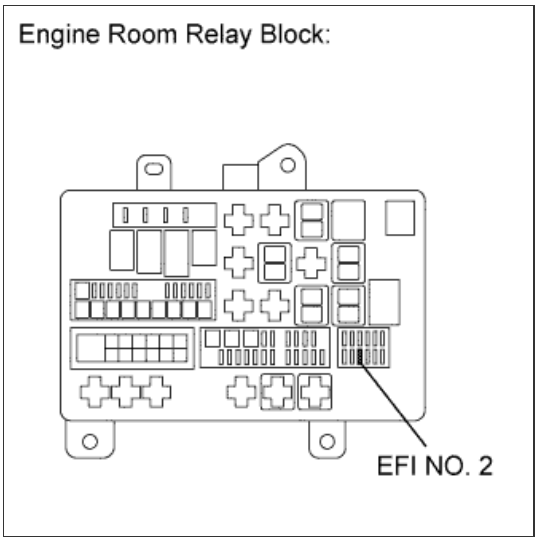
Tester Connection	Condition	Specified Condition
C50-3 (VG) or C45-72 (VG) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C50-3 (VG) or C46-72 (VG) - Body ground	Always	10 kΩ or higher

OK → Go to step 10

NG → Go to step 12



5.INSPECT FUSE (EFI NO. 2)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

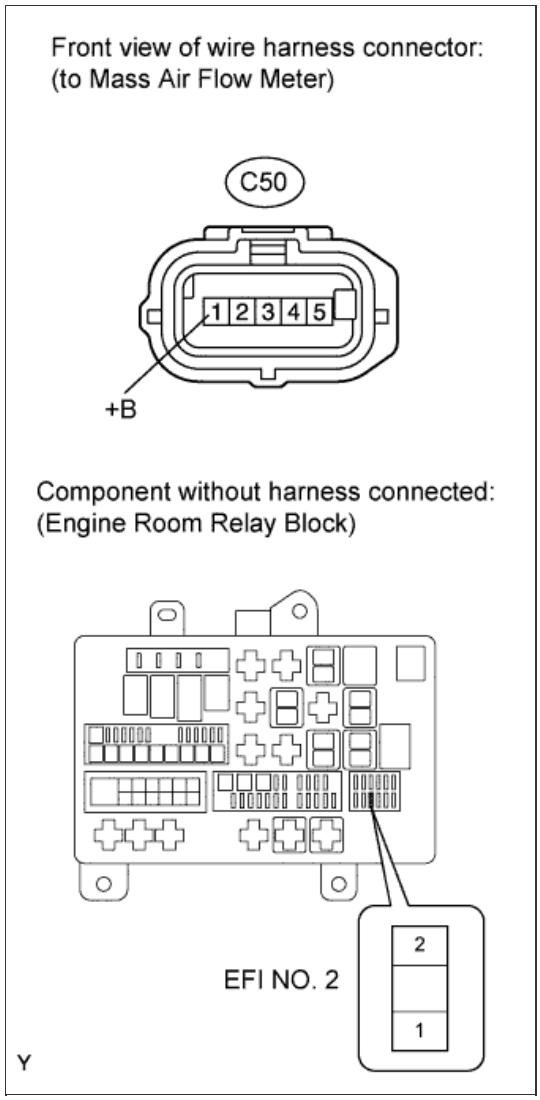
NG → Go to step 13

OK

6.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ENGINE ROOM RELAY BLOCK)

a. Disconnect the mass air flow meter connector.

b. Remove the EFI NO. 2 fuse from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C50-1 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C50-1 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

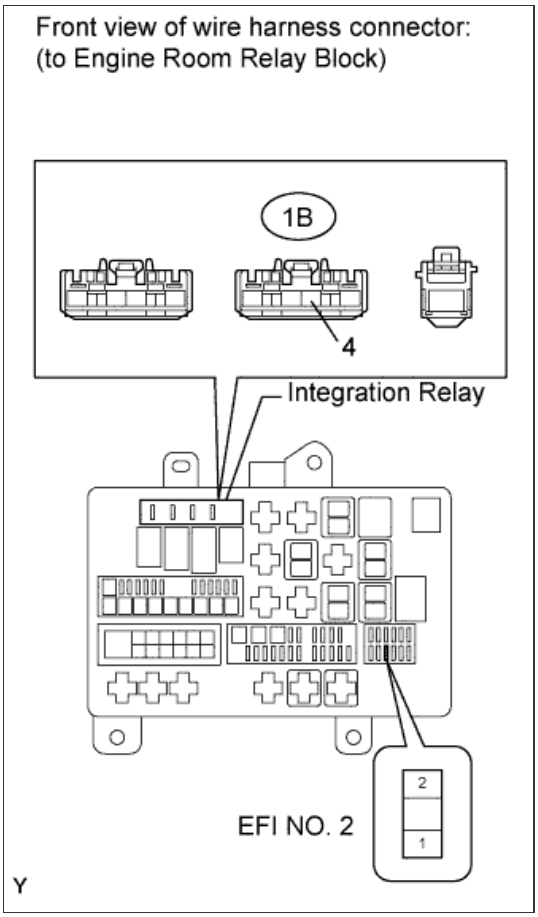
NG → Go to step 12

OK

7.CHECK HARNESS AND CONNECTOR (ENGINE ROOM RELAY BLOCK)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Remove the integration relay from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

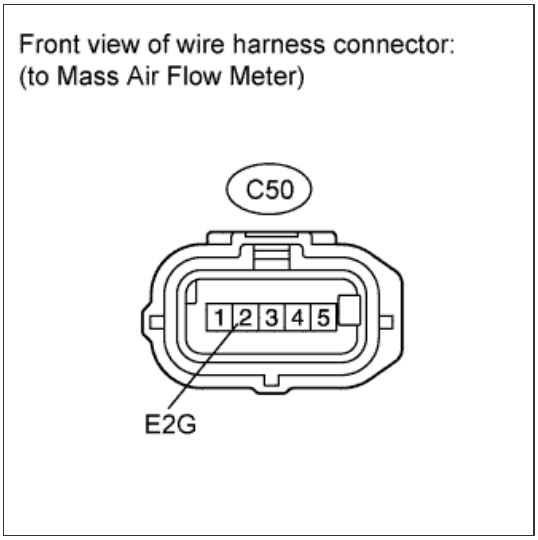
Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) or 1B-4 - Body ground	Always	10 kΩ or higher

OK	Go to step 14
NG	Go to step 12



8.CHECK HARNESS AND CONNECTOR (SENSOR GROUND)

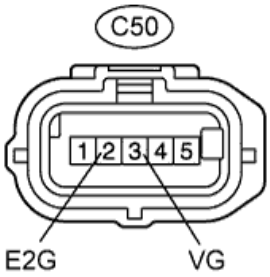
a. Disconnect the mass air flow meter connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

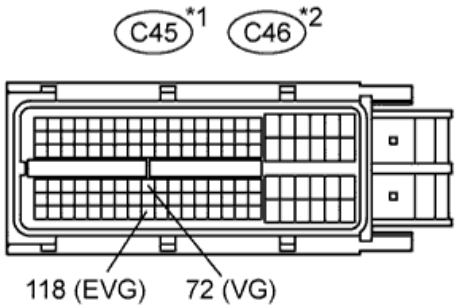
Tester Connection	Condition	Specified Condition
C50-2 (E2G) - Body ground	Always	Below 1 Ω

OK	Go to step 11
NG	Go to step 9



9.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Mass Air Flow Meter)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C50-3 (VG) - C45-72 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C45-118 (EVG)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C50-3 (VG) - C46-72 (VG)	Always	Below 1 Ω
C50-2 (E2G) - C46-118 (EVG)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C50-3 (VG) or C45-72 (VG) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C50-3 (VG) or C46-72 (VG) - Body ground	Always	10 kΩ or higher

NG → Go to step 12

OK

10.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 15

11.REPLACE MASS AIR FLOW METER

a. Replace the mass air flow meter (Click here).

NEXT → Go to step 15

12.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 15

13.CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

NEXT → Go to step 15

14.CHECK ECM POWER SOURCE CIRCUIT

a. Check the ECM power source circuit (Click here).

NEXT

15.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 3 seconds

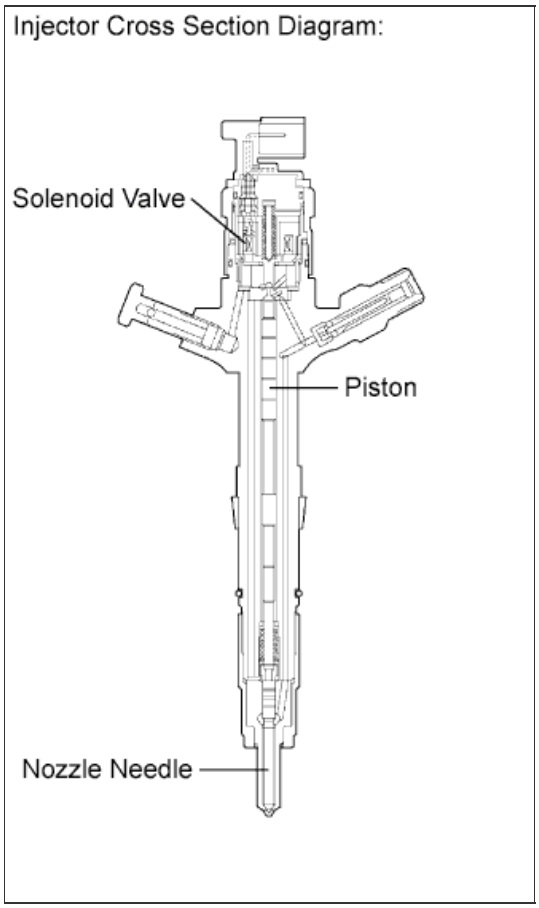
e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END

DTC P1238 Injector Malfunction



for Preparation Click here

DESCRIPTION

HINT:

- **For more information on the fuel injector and the common rail system refer to the System Description (Click here).**
- **If DTC P1238 has been stored, refer to the Diagnostic Trouble Code (DTC) Table for Common Rail System (Click here).**

The ECM detects combustion deterioration for a specific cylinder.

HINT:

- **The cylinder which has the compensation value for Injection Feedback Val #1, #2, #3, #4, #5, #6, #7 and #8 that varies from the other cylinders may be malfunctioning.**
- **If DTC P0093 (fuel leaks from high-pressure area) is stored simultaneously, a leakage malfunction of the cylinder has probably occurred.**
- **If DTC P062D (open or short in the No. 1 injector driver (EDU) or fuel injector circuit) is stored simultaneously, there is probably a faulty circuit located between the ECM and the fuel injector including the No. 1 EDU.**
- **If DTC P062E (open or short in the No. 2 injector driver (EDU) or fuel injector circuit) is stored simultaneously, there is probably a faulty circuit located between the ECM and the fuel injector including the No. 2 EDU.**
- **If only DTC P1238 (injector malfunction) has been stored, a fuel injector mechanical malfunction or insufficient compression (valve clearance, etc.) has probably occurred. An open or short malfunction of the ECM, EDU or fuel injector circuit is unlikely.**

P1238

DTC Detection Drive Pattern	DTC Detection Condition	Main Trouble Area	Related Trouble Area
Warm up the engine and idle it for 60 seconds	A large engine speed fluctuation when idling continues for 60 seconds (2 trip detection logic).	• Fuel injector • Injector driver (EDU) (P062D and/or P062E set simultaneously) • Connector connection (P062D and/or P062E set simultaneously) • Compression pressure	• Valve timing • Fuel with low cetane number used • ECM

Related Data List

DTC No.	Data List
P1238	• Injection Volume • Injection Feedback Val #1 to #8

HINT:

- **If DTC P1238 is stored, the following symptoms may appear:**
  - **Rough idle**
  - **Poor driveability**
- **After confirming DTC P1238, check the internal fuel pressure on the intelligent tester by entering the following menus: Powertrain / Engine / Data List / Fuel Press, Target Common Rail Pressure.**
  Under a stable condition such as idling or running the engine at 2500 rpm without load, Fuel Press is within +/-5 MPa of Target Common Rail Pressure.

MONITOR DESCRIPTION

P1238 (Injection malfunction, except open or short in fuel injector circuit):
This DTC will be stored if the engine speed fluctuation between each cylinder is large. The ECM monitors changes in the crankshaft rotation speed using the crankshaft position sensor in order to detect improper combustion. The camshaft position sensor also plays a role in determining which cylinder has the problem. The fluctuation counter increases when irregular crankshaft rotation speed variation exceeds the threshold with the engine idling. Therefore, if any one of the cylinders is operating poorly (rough idle), the ECM stores this DTC.

WIRING DIAGRAM

Refer to DTC P062D (Click here).

INSPECTION PROCEDURE

NOTICE:

After replacing a fuel injector, the ECM needs registration (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1238)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result

Result	Proceed to
P1238 is output	A
P1238 and other DTCs are output	B

HINT:

- **If any DTCs other than P1238 are output, troubleshoot those DTCs first.**
- **If DTCs other than P1238 are not output, check the fuel condition before proceeding to the next step.**

B → GO TO DTC CHART (Click here)

A

2.CHECK HARNESS AND CONNECTOR (ENGINE WIRE HARNESS)

a. Check the wire harness and connector connections.

OK:
The wire harness and connectors have been connected securely and there are good connections.

NG → Go to step 9

OK

3.READ VALUE USING INTELLIGENT TESTER (COMPENSATORY INJECTION VOLUME FOR EACH CYLINDER)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine and warm it up (engine coolant temperature is 75°C (167°F) or more), and then idle the engine for 1 minute or more.

d. Enter the following menus: Powertrain / Engine / Data List / Injection Feedback Val #1 to #8.

e. Read the value.

Standard value:
The compensatory injection volume is from -3.0 to 3.0 mm^3/st.

HINT:

- **If the fuel injector is malfunctioning, the compensatory injection volume remains at -5.0 or 5.0 mm^3/st.**
- **The compensatory injection volume is usually from -3.0 to 3.0 mm^3/st.**
- **The numbers of the Data List item Injection Feedback Val #1 to #8 do not match the cylinder numbers (refer to the Diesel Injection section of the Data List) (Click here).**

f. Any cylinders that have a higher compensatory injection volume than shown above are considered to be faulty. Use the following steps to inspect and repair the cylinders.

NEXT

4.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL CUT FOR IDENTIFYING MALFUNCTION CYLINDER)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1 to #8 Fuel Cut.

d. Check the 8 cylinders in sequence to identify a faulty cylinder by performing the power-balance inspection.

HINT:

- **If the engine idle speed does not change when a fuel injector is disabled, the cylinder being tested is malfunctioning.**
- **If the cylinder being tested is normal, there will be a significant change in idle speed when the fuel injection is stopped for that cylinder.**

NEXT

5.CHECK CYLINDER COMPRESSION PRESSURE OF MALFUNCTIONING CYLINDER

a. Check the cylinder compression pressure (Click here).

NG → Go to step 10

OK

6.REPLACE FUEL INJECTOR

a. Replace the fuel injector (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS (DTC P1238)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Turn the ignition switch off.

e. Start the engine.

f. Switch the ECM from normal mode to check mode (Click here).

g. Warm up the engine (engine coolant temperature is 75°C (167°F) or more) and idle it for 60 seconds.

h. Enter the following menus: Powertrain / Engine / DTC.

i. Read the DTCs.

Result

Result	Proceed to
P1238 is output	A
No DTC is output	B

B → END

A

8.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 11

9.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 11

10.CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

NEXT

11.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine.

e. Warm up the engine and idle it for 60 seconds.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1238.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, increase idling time.

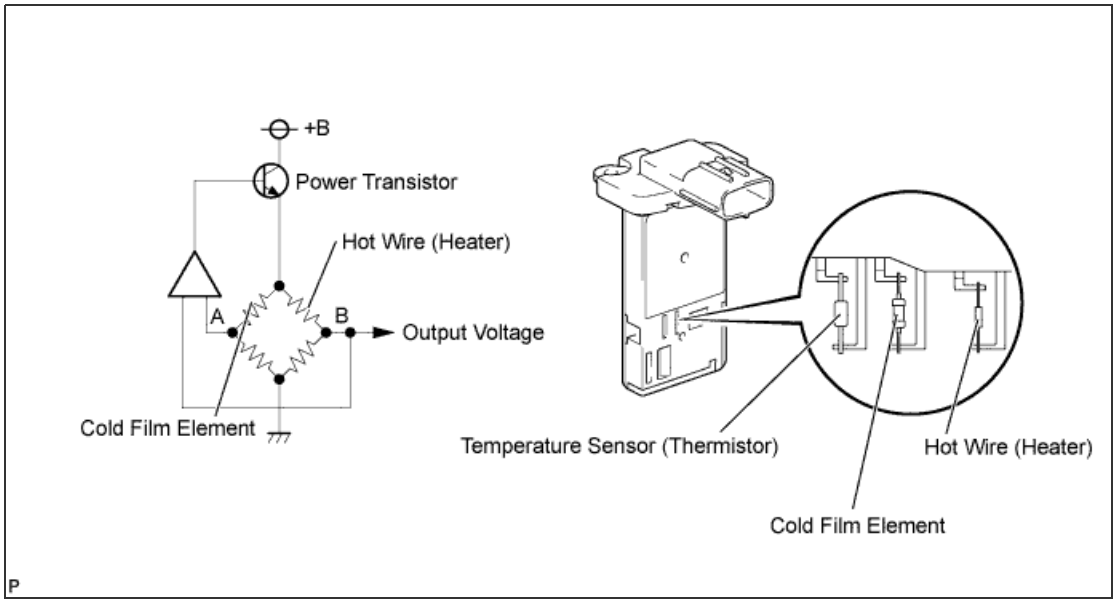
```
END
```

DTC P0100 Mass or Volume Air Flow Circuit

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter uses a platinum hot wire. The mass air flow meter consists of a platinum hot wire, a temperature sensor and a control circuit installed in a plastic housing. The mass air flow meter hot wire and temperature sensor (located in the intake air by-pass of the housing) detect changes in the intake air temperature.

The hot wire is maintained at the predetermined temperature by controlling the current flow through the hot wire. This current flow is then used as the output voltage of the mass air flow meter.

The circuit is constructed so that the platinum hot wire and temperature sensor provide a bridge circuit, with the power transistor controlled so that the potential of A and B remains equal to maintain the predetermined temperature.

P0100

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	Mass air flow (MAF) meter voltage is 0.2 V or less, or 4. V or more with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

P0102

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	MAF meter voltage is 0.2 V or less with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Open in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

P0103

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	MAF meter voltage is 4. V or more with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Shot in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

DTC P1251 Turbocharger / Supercharger Overboost Condition (Too High)

for Preparation Click here

DESCRIPTION

HINT:

Refer to DTC P0046 (Click here).

Refer to DTC P00AF (Click here).

P1251

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Vehicle being driven	The turbo motor driver detects an overcurrent caused by the DC motor being stuck (1 trip detection logic).	• Turbocharger sub-assembly • Turbo motor driver • Turbo motor driver power source • VN turbo link stuck malfunction • Extremely low battery voltage (P0560 stored simultaneously) • ECM

Related Data List

DTC No.	Data List
P1251	• MAP • Target Booster Pressure

If DTC P1251 is stored, the following symptoms may appear:

- VN turbo vane stuck closed malfunction
  - Vehicle surge when driving with full load
  - Sudden lack of power due to power being limited

WIRING DIAGRAM

Refer to DTC P0046 (Click here).
Refer to DTC P00AF (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1251)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

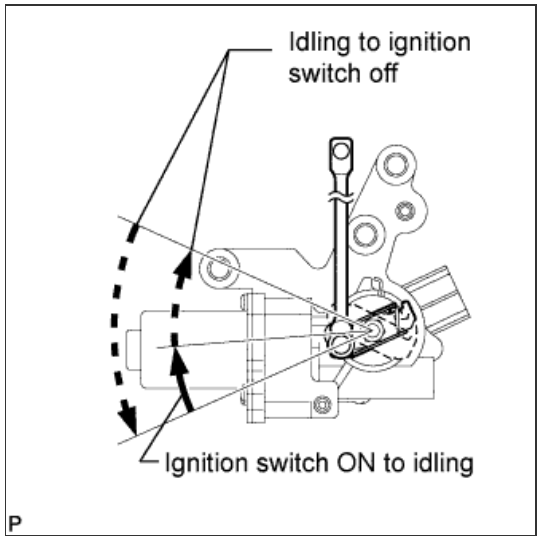
c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
P1251	A
P1251 and other DTCs	B

B → GO TO DTC CHART (Click here)



A

2.INSPECT TURBOCHARGER SUB-ASSEMBLY (for Bank 1 and/or Bank 2)

a. Check the motor movement when turning the ignition switch to ON, when starting the engine and then when turning the ignition switch off.

OK:

Motor moves as shown in the illustration.

NG → Go to step 4

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P1251)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following: Powertrain / Engine / DTC / Clear.

d. Clear DTCs (Click here).

e. Turn the ignition switch off.

f. Start the engine and warm it up.

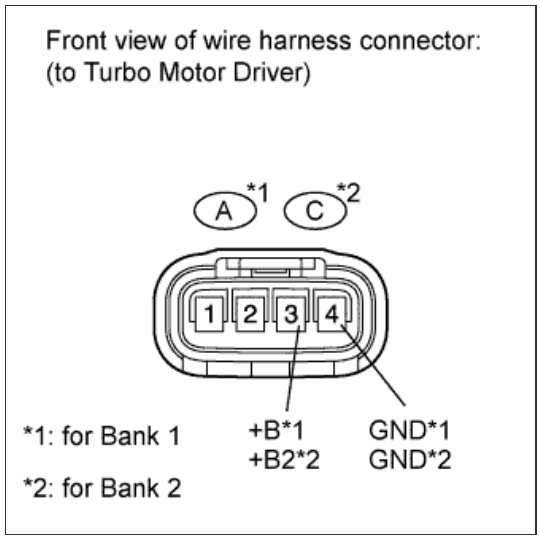
g. Drive the vehicle.

h. Enter the following menus: Powertrain / Engine / DTC.

i. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
P1251	A
No output	B



A → Go to step 11

B → END

4.INSPECT TURBO MOTOR DRIVER (POWER SOURCE CIRCUIT)

a. Disconnect the turbo motor driver connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-3 (+B) - Turbo motor driver connector-4 (GND)	Ignition switch ON	11 to 14 V

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-3 (+B2) - Turbo motor driver connector-4 (GND2)	Ignition switch ON	11 to 14 V

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

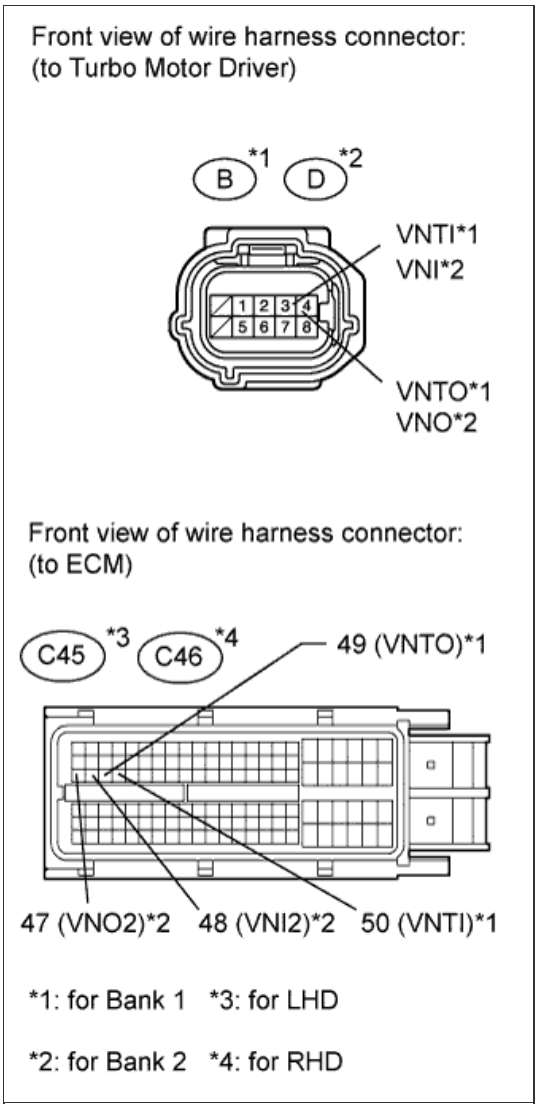
for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-4 (GND) - Body ground	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-4 (GND2) - Body ground	Always	Below 1 Ω

NG → Go to step 10



OK

5.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - ECM)

a. Disconnect the turbo motor driver connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C45-49 (VNTO) - B-4 (VNTO)	Always	Below 1 Ω

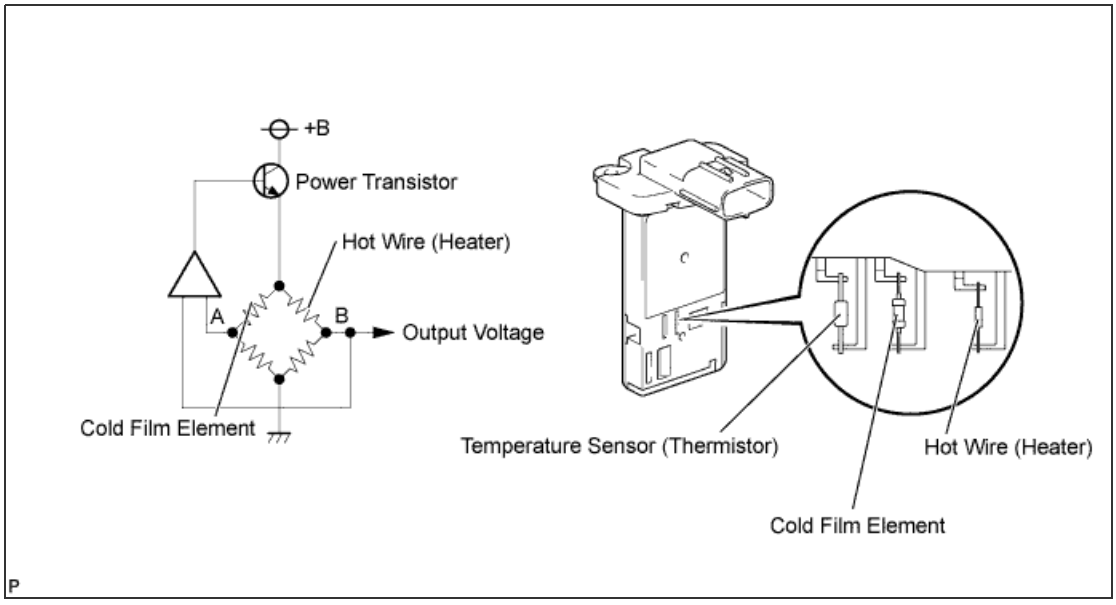
DTC P0100 Mass or Volume Air Flow Circuit

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

The Mass Air Flow (MAF) meter uses a platinum hot wire. The mass air flow meter consists of a platinum hot wire, a temperature sensor and a control circuit installed in a plastic housing. The mass air flow meter hot wire and temperature sensor (located in the intake air by-pass of the housing) detect changes in the intake air temperature.

The hot wire is maintained at the predetermined temperature by controlling the current flow through the hot wire. This current flow is then used as the output voltage of the mass air flow meter.

The circuit is constructed so that the platinum hot wire and temperature sensor provide a bridge circuit, with the power transistor controlled so that the potential of A and B remains equal to maintain the predetermined temperature.

P0100

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	Mass air flow (MAF) meter voltage is 0.2 V or less, or 4. V or more with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

P0102

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	MAF meter voltage is 0.2 V or less with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Open in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

P0103

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	MAF meter voltage is 4. V or more with the engine speed at 4000 rpm or less for 3 seconds (1 trip detection logic).	• Shot in Mass Air Flow (MAF) meter circuit • Mass air flow meter • ECM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MASS AIR FLOW RATE)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / MAF.

d. Read the value.

Result

Result	Proceed to
0.0	A
174.0 or more	B
Between 1 and 173.0*	C

HINT:

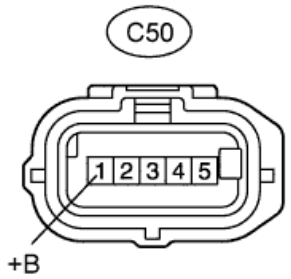
*: The value should change when the throttle valve is opened or closed.

B → Go to step 8

C → Go to step 15

A

2.INSPECT MASS AIR FLOW METER (POWER SOURCE CIRCUIT)



a. Disconnect the mass air flow meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C50-1 (+B) - Body ground	Ignition switch ON	11 to 14 V

DESCRIPTION

The variable nozzle vane type turbocharger consists primarily of a compressor wheel, turbine wheel, nozzle vane, unison ring, DC motor and nozzle vane position sensor.

The nozzle vane position sensor consists of a Hall IC and a magnetic yoke that rotates in unison with the movement of the linkage that actuates the nozzle vane. The nozzle vane position sensor converts the changes in the magnetic flux that are caused by the rotation of the DC motor (hence, the rotation of the magnetic yoke) into electric signals, and outputs them to the turbo motor driver. The turbo motor driver determines the actual nozzle vane position from the electric signals in order to calculate the target nozzle vane position.

P1258

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTI2 and VTA2 voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P1259

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 1 second	VTI2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1260

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTI2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1262

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1263

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2563

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTA1 and VTA voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P2564

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2565

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
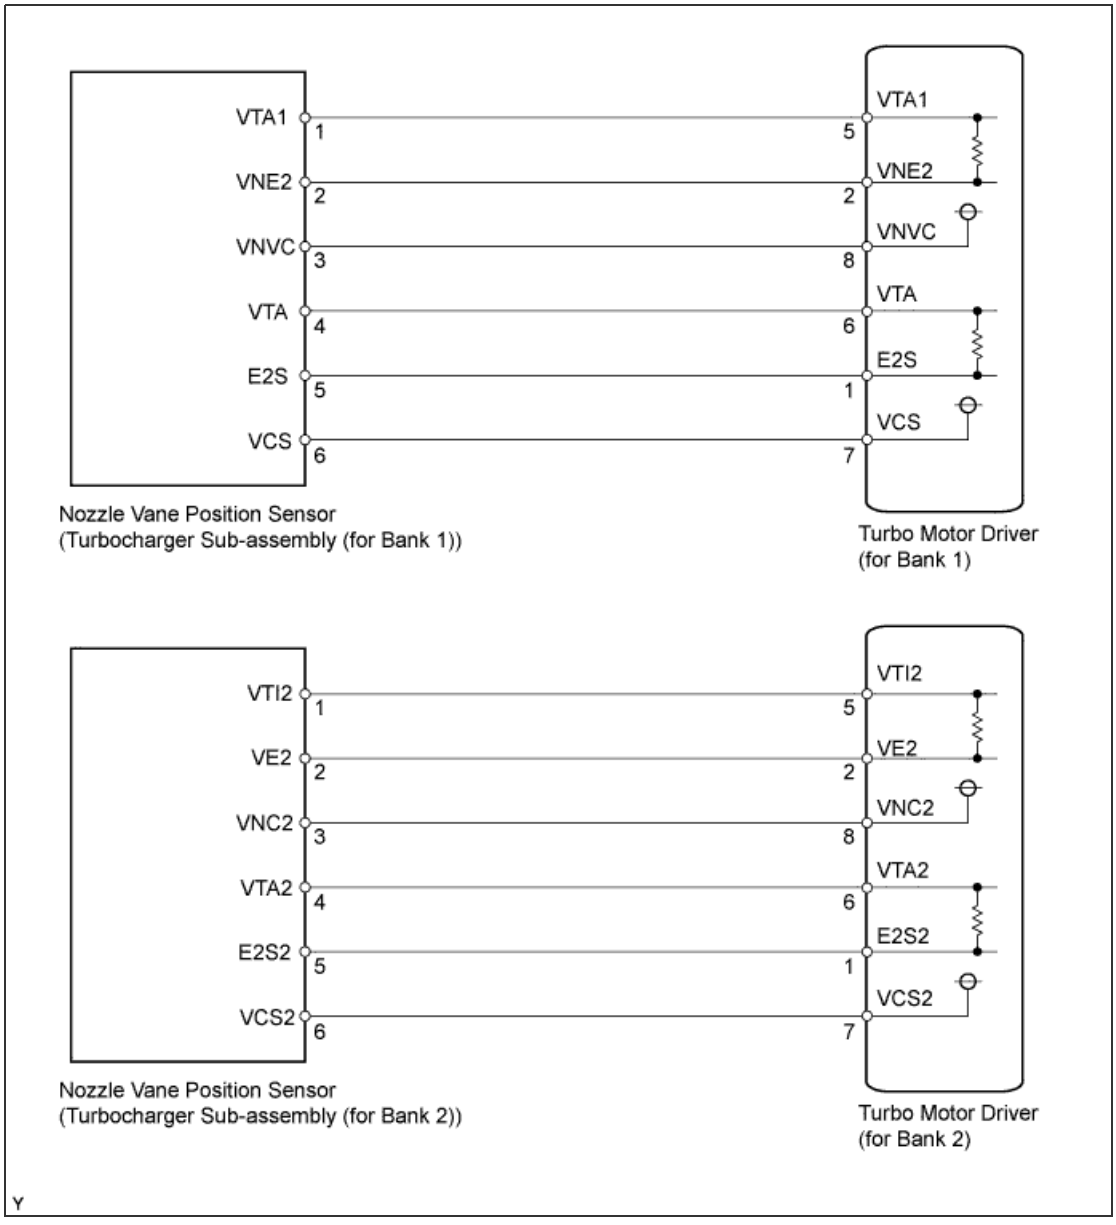
Ignition switch ON for 1 second	VTA voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver



HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

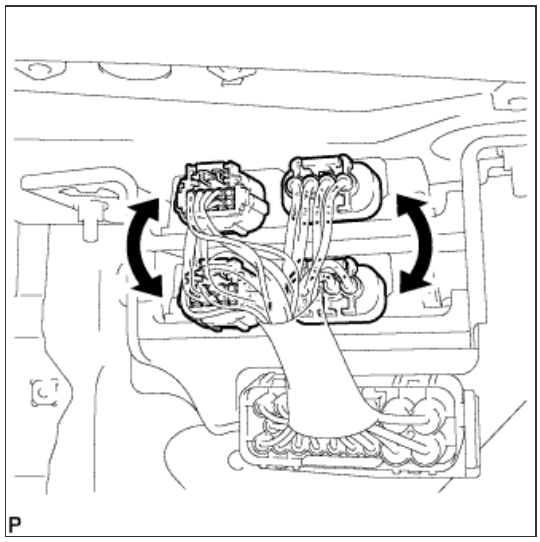
HINT:

Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

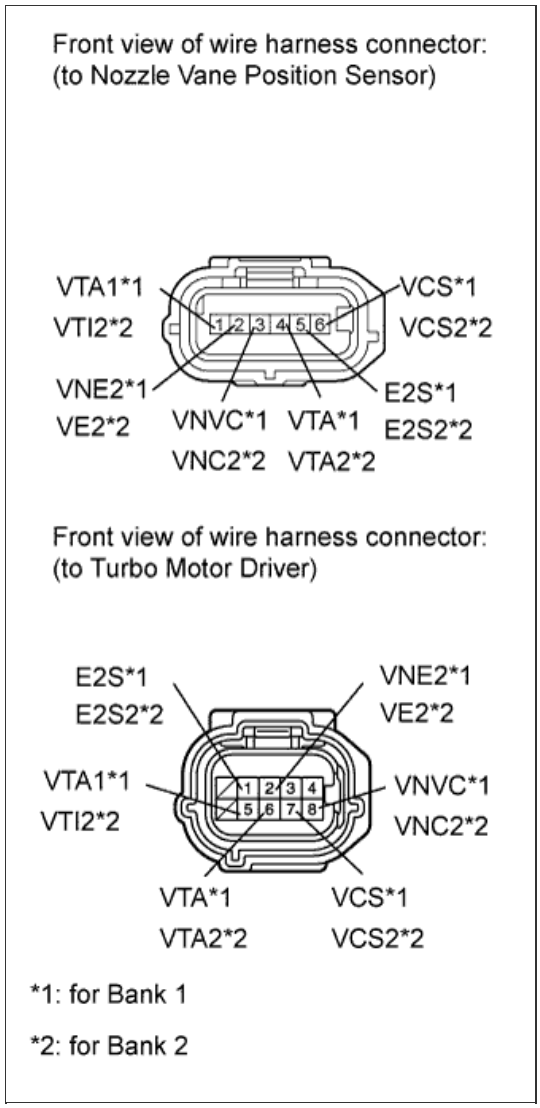
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω
Turbo motor driver connector-8 (VNVC) - Nozzle vane position sensor connector-3 (VNVC)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA) - Nozzle vane position sensor connector-4 (VTA)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S) - Nozzle vane position sensor connector-5 (E2S)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS) - Nozzle vane position sensor connector-6 (VCS)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) - Nozzle vane position sensor connector-1 (VTI2)	Always	Below 1 Ω
Turbo motor driver connector-2 (VE2) - Nozzle vane position sensor	Always	Below 1 Ω

connector-2 (VE2)		
Turbo motor driver connector-8 (VNC2) - Nozzle vane position sensor connector-3 (VNC2)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA2) - Nozzle vane position sensor connector-4 (VTA2)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S2) - Nozzle vane position sensor connector-5 (E2S2)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS2) - Nozzle vane position sensor connector-6 (VCS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) or Nozzle vane position sensor connector-1 (VTA1) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VNE2) or Nozzle vane position sensor connector-2 (VNE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNVC) or Nozzle vane position sensor connector-3 (VNVC) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA) or Nozzle vane position sensor connector-4 (VTA) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S) or Nozzle vane position sensor connector-5 (E2S) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS) or Nozzle vane position sensor connector-6 (VCS) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) or Nozzle vane position sensor connector-1 (VTI2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VE2) or Nozzle vane position sensor connector-2 (VE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNC2) or Nozzle vane position sensor connector-3 (VNC2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA2) or Nozzle vane position sensor connector-4 (VTA2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S2) or Nozzle vane position sensor connector-5 (E2S2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS2) or Nozzle vane position sensor connector-6 (VCS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 5

OK

3.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (NOZZLE VANE POSITION SENSOR)

a. Replace the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

4.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

6.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

END

DTC P0101 Mass or Volume Air Flow Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0100 (Click here).

P0101

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After warming up engine, idle engine for 20 seconds, then maintain engine at 3000 rpm for 20 seconds	After the engine is warmed up, condition (a) continues for more than 10 seconds when idling (2 trip detection logic): (a) Mass air flow meter output is more than 4.4 V.	Mass air flow meter
	Conditions (a) and (b) continue for more than 10 seconds with the engine speed at 1250 rpm or more (2 trip detection logic): (a) VTA is more than 0.1 V. (b) Mass air flow meter output is less than 0.7 V.	

Related Data List

DTC No.	Data List
P0101	• MAF • Actual EGR Valve Pos. • Actual EGR Valve Pos. #2 • Actual Throttle position • Actual Throttle position #2

HINT:

If DTC P0101 is stored, either of the following symptoms may appear:

1. **As the ECU mistakenly determines that there is less air than the actual intake air amount, EGR is decreased to match the target EGR.**
   - **Combustion noise worsens**
2. **As the ECU mistakenly determines that there is more air than the actual intake air amount, EGR is increased to match the target EGR):**
   - **Misfire**
   - **White smoke**
   - **Black smoke**

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK OTHER DTC OUTPUT (IN ADDITION TO DTC P0101)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result

Result	Proceed to
P0101 and other DTCs are output	A
P0101 is output	B

HINT:

If codes other than P0101 are output, perform troubleshooting for those DTCs first.

A → GO TO DTC CHART (Click here)

B

2.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → Go to step 4

OK

3.REPLACE MASS AIR FLOW METER

a. Replace the mass air flow meter (Click here).

NEXT → Go to step

4.REPAIR OR REPLACE AIR INDUCTION SYSTEM

NEXT

5.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine.

e. After warming up the engine, idle the engine for 20 seconds, then maintain the engine at 3000 rpm for 20 seconds.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0101.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, maintain the engine at 3000 rpm for 30 seconds and then idle the engine for 5 minutes.

for Preparation Click here

DESCRIPTION

The variable nozzle vane type turbocharger consists primarily of a compressor wheel, turbine wheel, nozzle vane, unison ring, DC motor and nozzle vane position sensor.

The nozzle vane position sensor consists of a Hall IC and a magnetic yoke that rotates in unison with the movement of the linkage that actuates the nozzle vane. The nozzle vane position sensor converts the changes in the magnetic flux that are caused by the rotation of the DC motor (hence, the rotation of the magnetic yoke) into electric signals, and outputs them to the turbo motor driver. The turbo motor driver determines the actual nozzle vane position from the electric signals in order to calculate the target nozzle vane position.

P1258

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTI2 and VTA2 voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P1259

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 1 second	VTI2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1260

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTI2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1262

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1263

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2563

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTA1 and VTA voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P2564

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2565

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

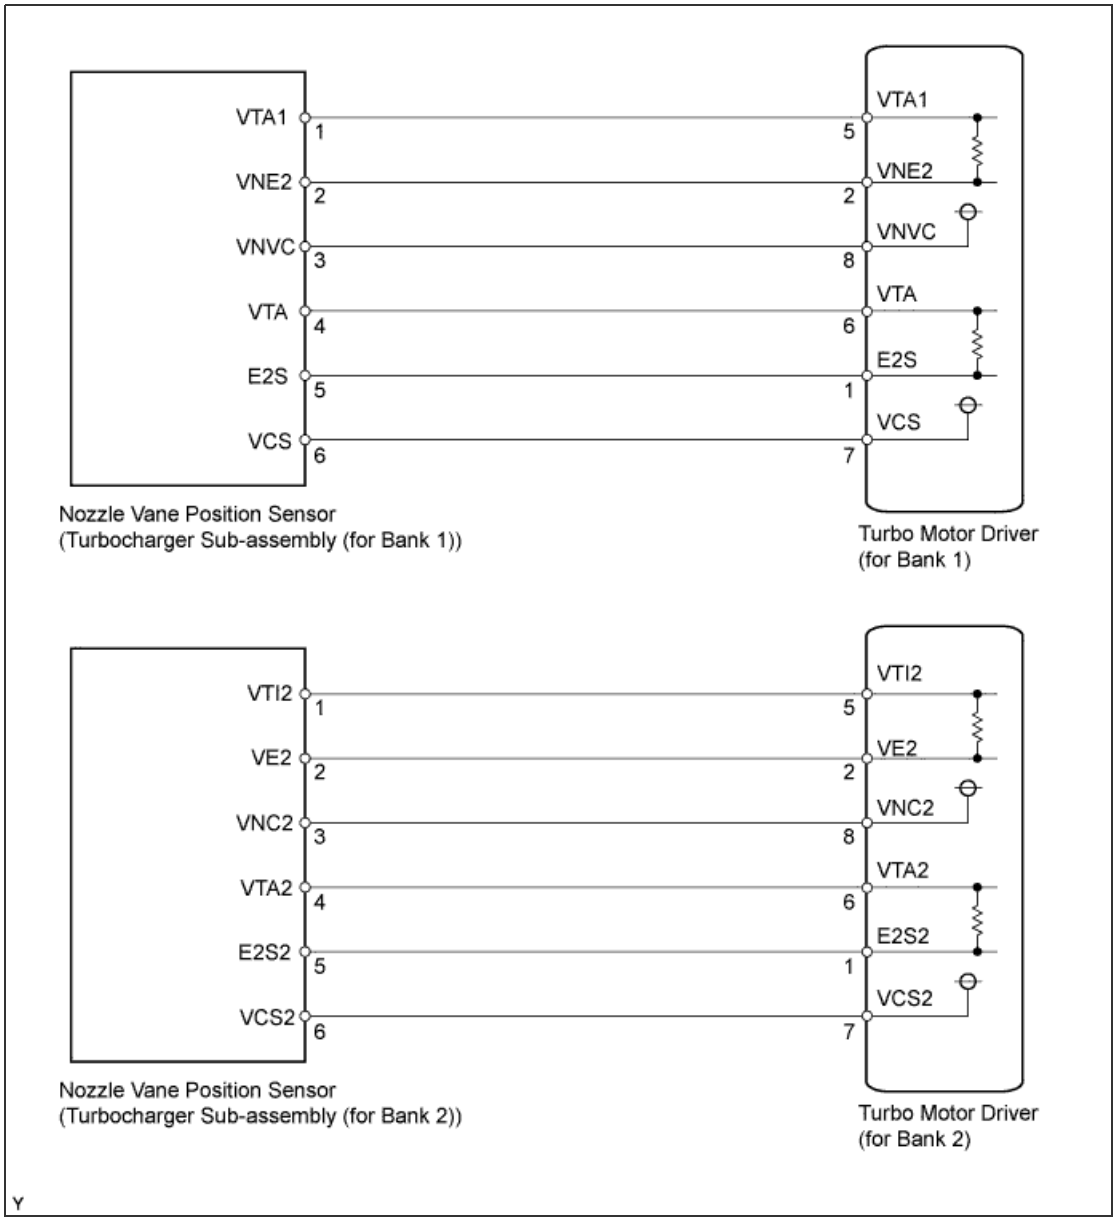
P2588

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
		• Nozzle vane position sensor (turbocharger sub-assembly)

Ignition switch ON for 1 second	VTA voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2589

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver



HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

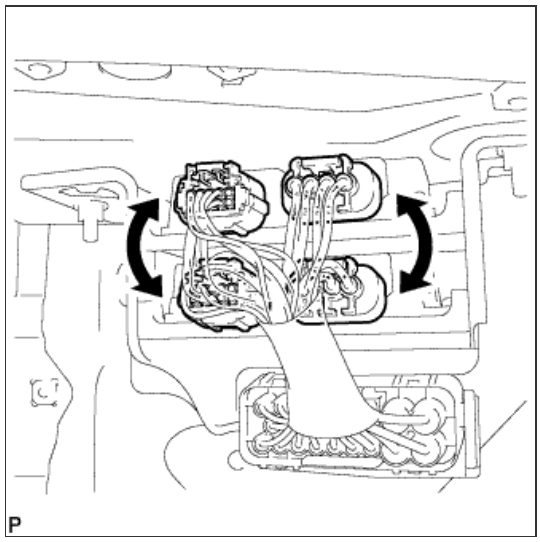
HINT:

Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

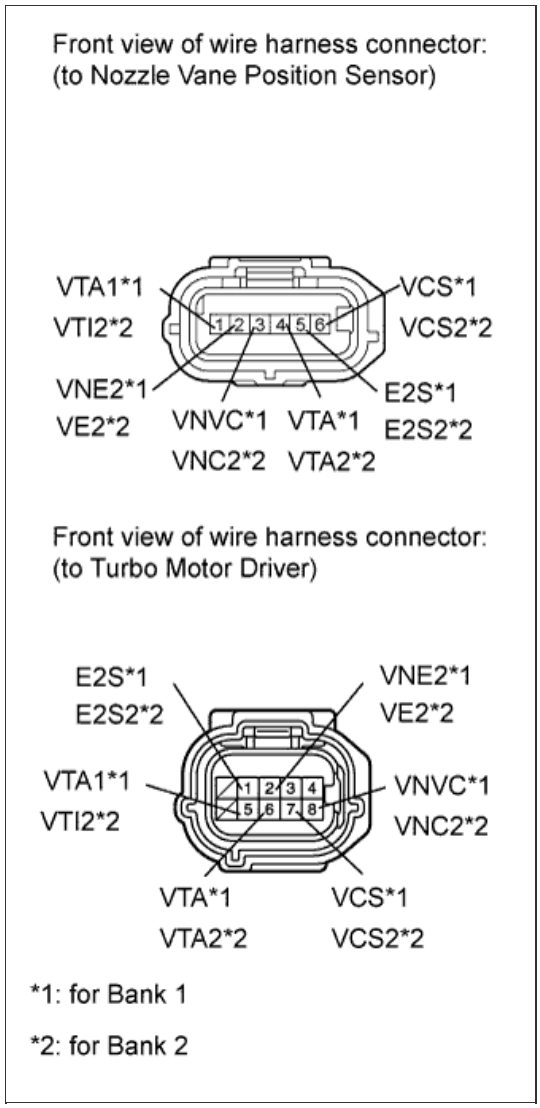
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω
Turbo motor driver connector-8 (VNVC) - Nozzle vane position sensor connector-3 (VNVC)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA) - Nozzle vane position sensor connector-4 (VTA)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S) - Nozzle vane position sensor connector-5 (E2S)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS) - Nozzle vane position sensor connector-6 (VCS)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) - Nozzle vane position sensor connector-1 (VTI2)	Always	Below 1 Ω
Turbo motor driver connector-2 (VE2) - Nozzle vane position sensor	Always	Below 1 Ω

connector-2 (VE2)		
Turbo motor driver connector-8 (VNC2) - Nozzle vane position sensor connector-3 (VNC2)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA2) - Nozzle vane position sensor connector-4 (VTA2)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S2) - Nozzle vane position sensor connector-5 (E2S2)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS2) - Nozzle vane position sensor connector-6 (VCS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) or Nozzle vane position sensor connector-1 (VTA1) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VNE2) or Nozzle vane position sensor connector-2 (VNE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNVC) or Nozzle vane position sensor connector-3 (VNVC) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA) or Nozzle vane position sensor connector-4 (VTA) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S) or Nozzle vane position sensor connector-5 (E2S) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS) or Nozzle vane position sensor connector-6 (VCS) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) or Nozzle vane position sensor connector-1 (VTI2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VE2) or Nozzle vane position sensor connector-2 (VE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNC2) or Nozzle vane position sensor connector-3 (VNC2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA2) or Nozzle vane position sensor connector-4 (VTA2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S2) or Nozzle vane position sensor connector-5 (E2S2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS2) or Nozzle vane position sensor connector-6 (VCS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 5

OK

3.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (NOZZLE VANE POSITION SENSOR)

a. Replace the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

4.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

6.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out

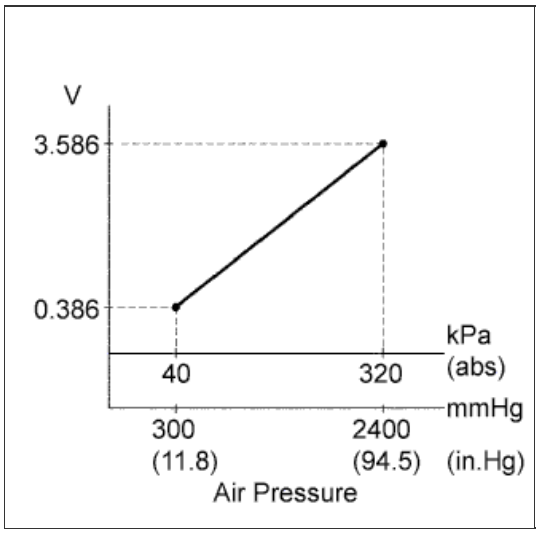
i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

NEXT

END



DTC P0105 Manifold Absolute Pressure / Barometric Pressure Circuit

DTC P0107 Manifold Absolute Pressure / Barometric Pressure Circuit Low Input

DTC P0108 Manifold Absolute Pressure / Barometric Pressure Circuit High Input

for Preparation Click here

DESCRIPTION

The manifold absolute pressure sensor detects the intake manifold pressure by using its built-in sensor unit. The ECM determines the basic injection duration and injection advance timing based on the voltage output by the manifold absolute pressure sensor.
The manifold absolute pressure sensor monitors the absolute pressure inside the intake manifold (default is 0 kPa [0 mmHg, 0 in.Hg]). As a result the ECM controls the air-fuel ratio at the proper level under any driving conditions.

P0105

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After engine is started, race engine for 1 second	After the engine is started, condition (a) continues for more than 2.0 seconds (1 trip detection logic): (a) Manifold absolute pressure sensor voltage is 0.1 V or less, or 4.8 V or more.	• Open or short in manifold absolute pressure sensor circuit • Manifold absolute pressure sensor • ECM

P0107

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After engine is started, race engine for 1 second	After the engine is started, condition (a) continues for more than 2.0 seconds (1 trip detection logic): (a) Manifold absolute pressure sensor voltage is 0.1 V or less.	• Open or short in manifold absolute pressure sensor circuit • Manifold absolute pressure sensor • ECM

P0108

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After engine is started, race engine for 1 second	After engine is started, condition (a) continues for more than 2.0 seconds (1 trip detection logic): (a) Manifold absolute pressure sensor voltage is 4.8 V or more.	• Open or short in manifold absolute pressure sensor circuit • Manifold absolute pressure sensor • ECM

Related Data List

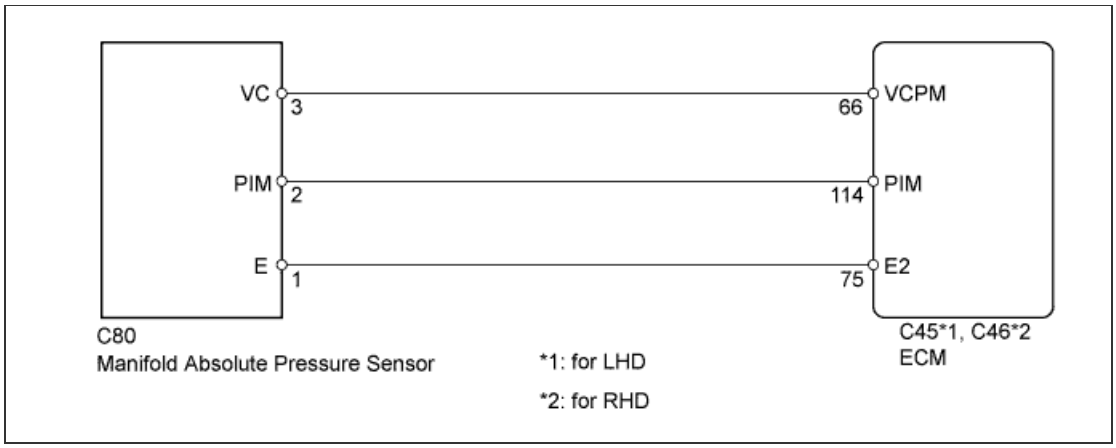
P0107	
P0108	

HINT:

- **If DTC P0105, P0107 and/or P0108 is stored, the following symptoms may appear:**



- Misfire
- Combustion noise
- Black smoke
- White smoke
- Lack of power

- When DTC P0105, P0107 or P0108 is stored, check the intake manifold pressure by entering the following menus: Powertrain / Engine / Data List / MAP.

Reference

Intake Manifold Pressure	Malfunction
Approximately 0 kPa	• Open in VC circuit • Short in PIM circuit
250 kPa (1875 mmHg, 73.8 in.Hg) or higher	• Open in PIM circuit • Open in E2 circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- If DTCs relating to different systems are stored, and they share terminal E2 as their ground, check this ground circuit first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MANIFOLD ABSOLUTE PRESSURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / MAP.

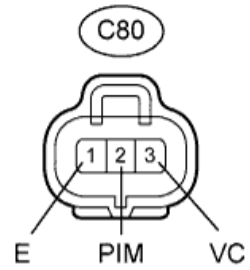
d. Read the value.

OK:
Same value as the actual atmospheric pressure.

HINT:

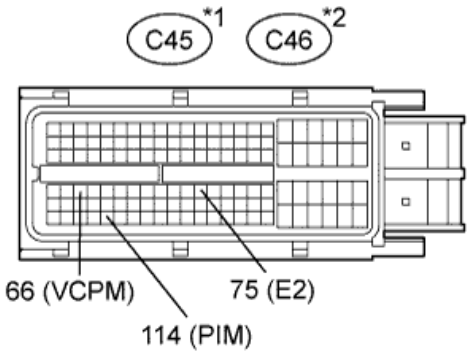
Standard atmospheric pressure is 101 kPa. For every 100 m increase in altitude, pressure drops by 1 kPa. Varies by weather (high atmospheric pressure, low atmospheric pressure).

OK	Go to step 8
NG	Go to step 2



2.CHECK HARNESS AND CONNECTOR (MANIFOLD ABSOLUTE PRESSURE SENSOR - ECM)

a. Disconnect the manifold absolute pressure sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Manifold Absolute Pressure Sensor)

Front view of wire harness connector:

DESCRIPTION

The manifold absolute pressure sensor detects the intake manifold pressure by using its built-in sensor unit. The ECM determines the basic injection duration and injection advance timing based on the voltage output by the manifold absolute pressure sensor.
The manifold absolute pressure sensor monitors the absolute pressure inside the intake manifold (default is 0 kPa [0 mmHg, 0 in.Hg]). As a result the ECM controls the air-fuel ratio at the proper level under any driving conditions.

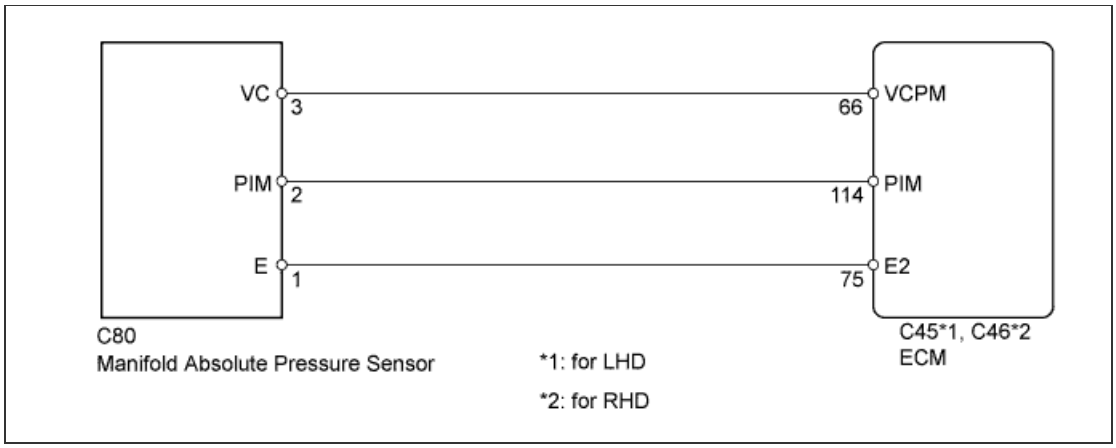
DTC No.	Data List
P0105	MAP
P0107	
P0108	

HINT:

- **If DTC P0105, P0107 and/or P0108 is stored, the following symptoms may appear:**



- Misfire
- Combustion noise
- Black smoke
- White smoke
- Lack of power

- When DTC P0105, P0107 or P0108 is stored, check the intake manifold pressure by entering the following menus: Powertrain / Engine / Data List / MAP.

Reference

Intake Manifold Pressure	Malfunction
Approximately 0 kPa	• Open in VC circuit • Short in PIM circuit
250 kPa (1875 mmHg, 73.8 in.Hg) or higher	• Open in PIM circuit • Open in E2 circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- If DTCs relating to different systems are stored, and they share terminal E2 as their ground, check this ground circuit first.
- Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MANIFOLD ABSOLUTE PRESSURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / MAP.

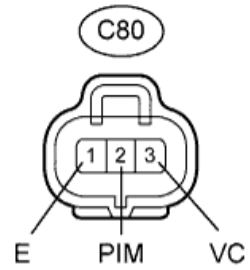
d. Read the value.

OK:
Same value as the actual atmospheric pressure.

HINT:

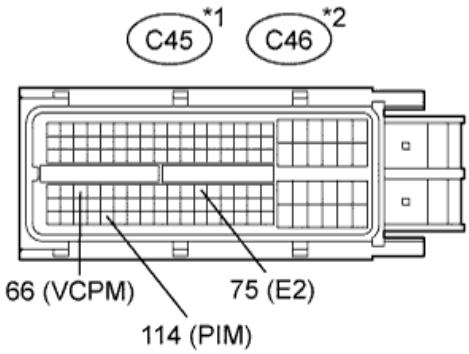
Standard atmospheric pressure is 101 kPa. For every 100 m increase in altitude, pressure drops by 1 kPa. Varies by weather (high atmospheric pressure, low atmospheric pressure).

OK	Go to step 8
NG	Go to step 2



2.CHECK HARNESS AND CONNECTOR (MANIFOLD ABSOLUTE PRESSURE SENSOR - ECM)

a. Disconnect the manifold absolute pressure sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Manifold Absolute Pressure Sensor)

Front view of wire harness connector:
(to ECM)

*1: for LHD

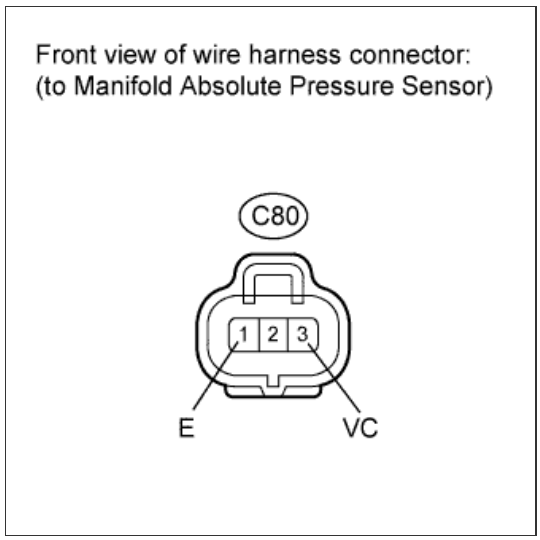
C80-1 (E) or C46-75 (E2) - Body ground	Always	10 kΩ or higher

NG → Go to step 7

OK



3.CHECK ECM TERMINAL VOLTAGE (VC TERMINAL)

a. Disconnect the manifold absolute pressure sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C80-3 (VC) - C80-1 (E)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 6

OK

4.REPLACE MANIFOLD ABSOLUTE PRESSURE SENSOR

a. Replace the manifold absolute pressure sensor (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON and turn the tester on.

e. After the engine is started, race the engine for 1 second.

f. Enter the following menus: Powertrain / Engine / DTC.

g. Read the DTCs.

Result:

Display (DTC output)	Proceed to
P0105, P0107 and/or P0108	A
No output	B

B → END

A

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 8

7.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

8.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 3 seconds and turn the tester on.

e. After the engine is started, race the engine for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0105, P0107 and/or P0108.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, race the engine for 1 minute and then idle the engine for 5 minutes.

DESCRIPTION

The variable nozzle vane type turbocharger consists primarily of a compressor wheel, turbine wheel, nozzle vane, unison ring, DC motor and nozzle vane position sensor.

The nozzle vane position sensor consists of a Hall IC and a magnetic yoke that rotates in unison with the movement of the linkage that actuates the nozzle vane. The nozzle vane position sensor converts the changes in the magnetic flux that are caused by the rotation of the DC motor (hence, the rotation of the magnetic yoke) into electric signals, and outputs them to the turbo motor driver. The turbo motor driver determines the actual nozzle vane position from the electric signals in order to calculate the target nozzle vane position.

HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

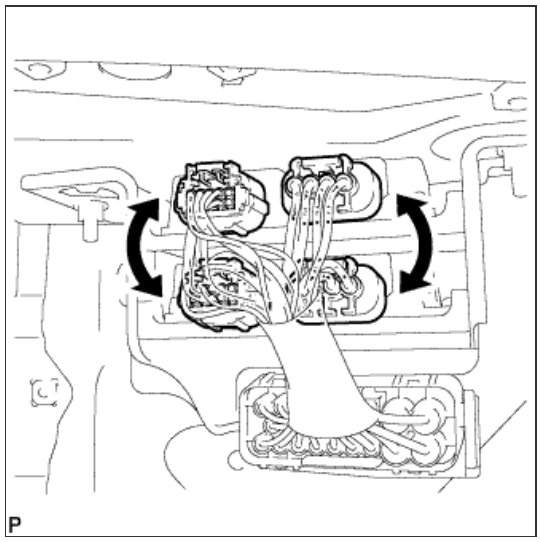
HINT:

Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

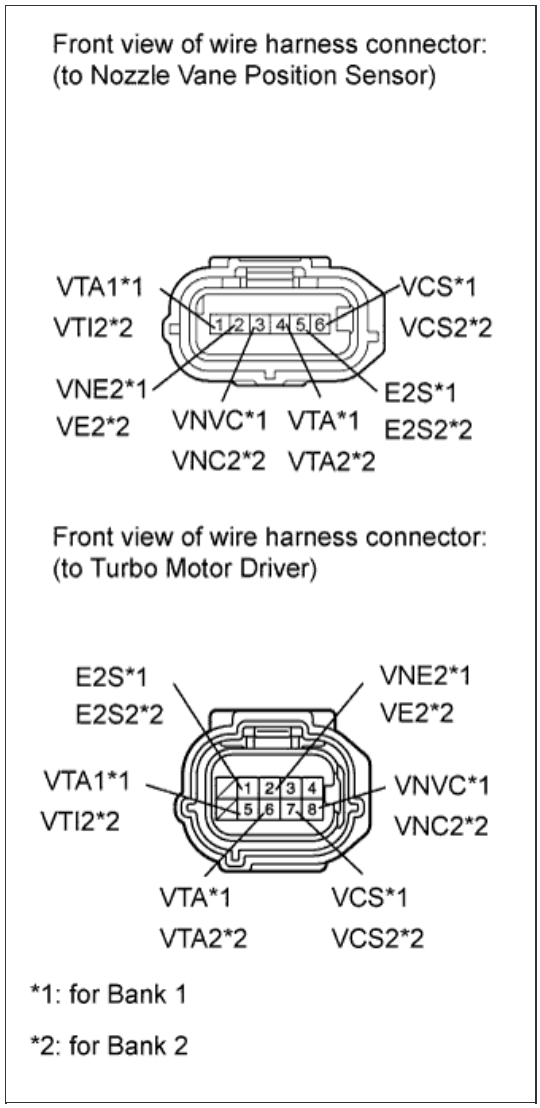
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω
Turbo motor driver connector-8 (VNVC) - Nozzle vane position sensor connector-3 (VNVC)	Always	Below 1 Ω

DTC P0105 Manifold Absolute Pressure / Barometric Pressure Circuit

DTC P0107 Manifold Absolute Pressure / Barometric Pressure Circuit Low Input

DTC P0108 Manifold Absolute Pressure / Barometric Pressure Circuit High Input

for Preparation Click here

DESCRIPTION

The manifold absolute pressure sensor detects the intake manifold pressure by using its built-in sensor unit. The ECM determines the basic injection duration and injection advance timing based on the voltage output by the manifold absolute pressure sensor.
The manifold absolute pressure sensor monitors the absolute pressure inside the intake manifold (default is 0 kPa [0 mmHg, 0 in.Hg]). As a result the ECM controls the air-fuel ratio at the proper level under any driving conditions.

P0105

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

HINT:

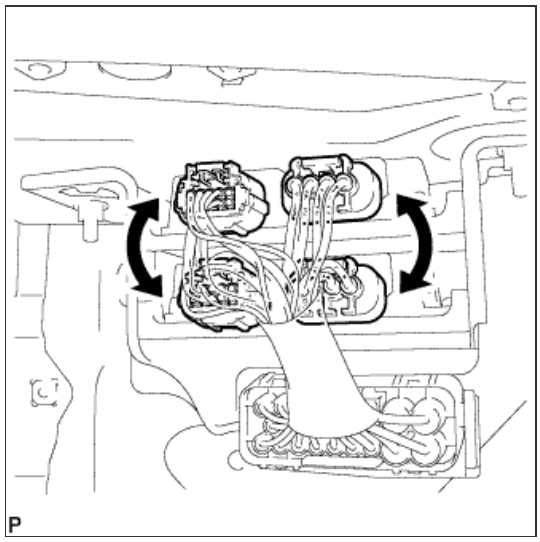
Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

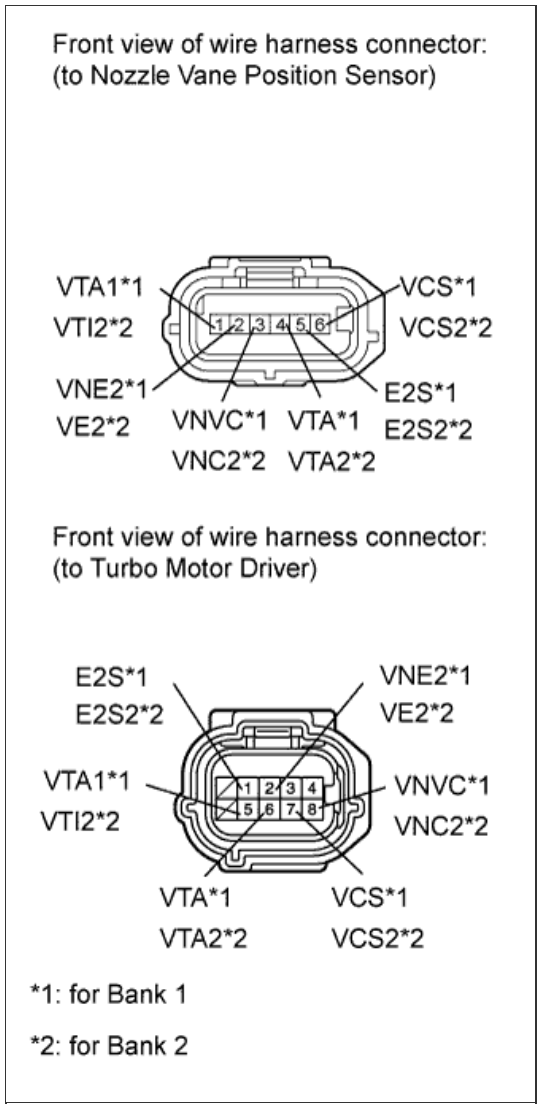
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω
Turbo motor driver connector-8 (VNVC) - Nozzle vane position sensor connector-3 (VNVC)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA) - Nozzle vane position sensor connector-4 (VTA)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S) - Nozzle vane position sensor connector-5 (E2S)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS) - Nozzle vane position sensor connector-6 (VCS)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) - Nozzle vane position sensor connector-1 (VTI2)	Always	Below 1 Ω
Turbo motor driver connector-2 (VE2) - Nozzle vane position sensor	Always	Below 1 Ω

connector-2 (VE2)		
Turbo motor driver connector-8 (VNC2) - Nozzle vane position sensor connector-3 (VNC2)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA2) - Nozzle vane position sensor connector-4 (VTA2)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S2) - Nozzle vane position sensor connector-5 (E2S2)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS2) - Nozzle vane position sensor connector-6 (VCS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) or Nozzle vane position sensor connector-1 (VTA1) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VNE2) or Nozzle vane position sensor connector-2 (VNE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNVC) or Nozzle vane position sensor connector-3 (VNVC) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA) or Nozzle vane position sensor connector-4 (VTA) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S) or Nozzle vane position sensor connector-5 (E2S) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS) or Nozzle vane position sensor connector-6 (VCS) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) or Nozzle vane position sensor connector-1 (VTI2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VE2) or Nozzle vane position sensor connector-2 (VE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNC2) or Nozzle vane position sensor connector-3 (VNC2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA2) or Nozzle vane position sensor connector-4 (VTA2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S2) or Nozzle vane position sensor connector-5 (E2S2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS2) or Nozzle vane position sensor connector-6 (VCS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 5

OK

3.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (NOZZLE VANE POSITION SENSOR)

a. Replace the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

4.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

6.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

DESCRIPTION

The variable nozzle vane type turbocharger consists primarily of a compressor wheel, turbine wheel, nozzle vane, unison ring, DC motor and nozzle vane position sensor.

The nozzle vane position sensor consists of a Hall IC and a magnetic yoke that rotates in unison with the movement of the linkage that actuates the nozzle vane. The nozzle vane position sensor converts the changes in the magnetic flux that are caused by the rotation of the DC motor (hence, the rotation of the magnetic yoke) into electric signals, and outputs them to the turbo motor driver. The turbo motor driver determines the actual nozzle vane position from the electric signals in order to calculate the target nozzle vane position.

P1258

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTI2 and VTA2 voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P1259

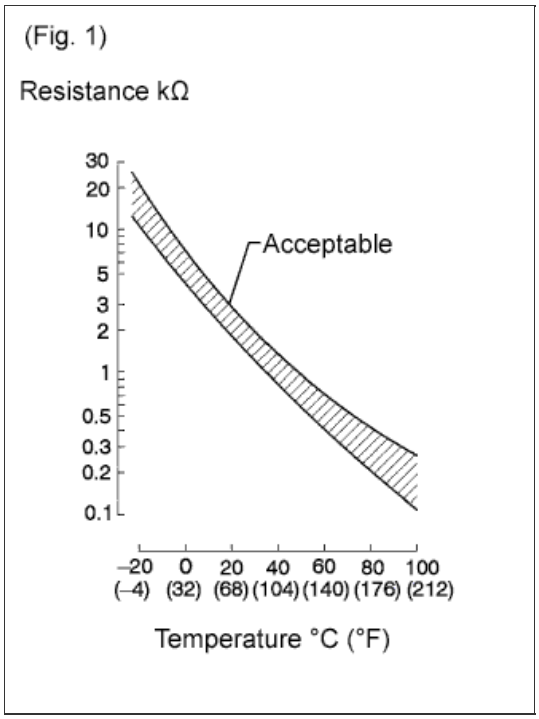
DTC P0110 Intake Air Temperature Circuit

DTC P0112 Intake Air Temperature Circuit Low Input



DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

The intake air temperature sensor is built into the Mass Air Flow (MAF) meter and senses the intake air temperature.
A thermistor built into the sensor changes its resistance value according to the intake air temperature.
The lower the intake air temperature, the greater the thermistor resistance value. The higher the intake air temperature, the lower the thermistor resistance value (See Fig. 1).
The intake air temperature sensor is connected to the ECM.
The 5 V power source voltage in the ECM is applied to the intake air temperature sensor from terminal THA via resistor R.
Resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes in accordance with changes in the intake air temperature, the potential at terminal THA also changes. Based on this signal, the ECM increases the fuel injection volume to improve driveability with a cold engine.

(Fig. 1)

P0110

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open or short in the intake air temperature (IAT) sensor for 0.5 seconds (1 trip detection logic).	• Open or short in intake air temperature (IAT) sensor circuit • IAT sensor (built into mass air flow meter) • ECM

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 1 second	VTI2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1260

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTI2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1262

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1263

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2563

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTA1 and VTA voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P2564

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2565

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2588

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
		• Nozzle vane position sensor (turbocharger sub-assembly)

Ignition switch ON for 1 second	VTA voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2589

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

HINT:

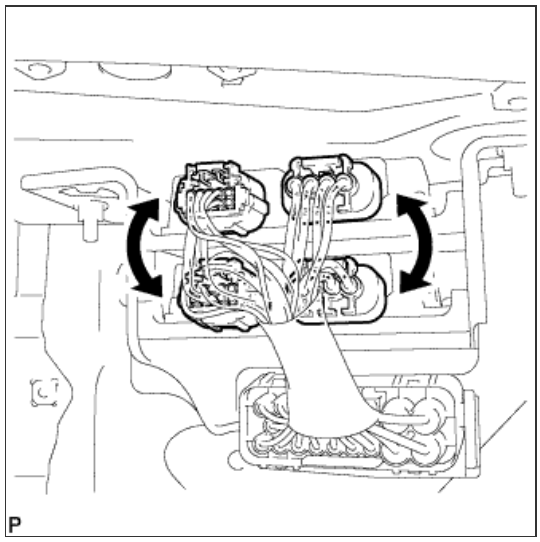
Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

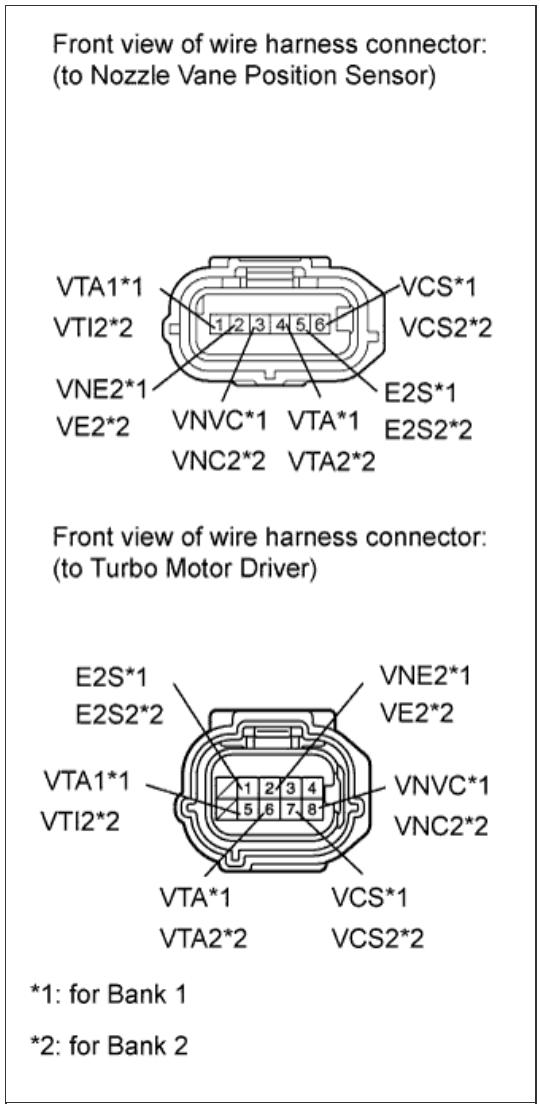
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω
Turbo motor driver connector-8 (VNVC) - Nozzle vane position sensor connector-3 (VNVC)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA) - Nozzle vane position sensor connector-4 (VTA)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S) - Nozzle vane position sensor connector-5 (E2S)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS) - Nozzle vane position sensor connector-6 (VCS)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) - Nozzle vane position sensor connector-1 (VTI2)	Always	Below 1 Ω
Turbo motor driver connector-2 (VE2) - Nozzle vane position sensor	Always	Below 1 Ω

connector-2 (VE2)		
Turbo motor driver connector-8 (VNC2) - Nozzle vane position sensor connector-3 (VNC2)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA2) - Nozzle vane position sensor connector-4 (VTA2)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S2) - Nozzle vane position sensor connector-5 (E2S2)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS2) - Nozzle vane position sensor connector-6 (VCS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) or Nozzle vane position sensor connector-1 (VTA1) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VNE2) or Nozzle vane position sensor connector-2 (VNE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNVC) or Nozzle vane position sensor connector-3 (VNVC) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA) or Nozzle vane position sensor connector-4 (VTA) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S) or Nozzle vane position sensor connector-5 (E2S) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS) or Nozzle vane position sensor connector-6 (VCS) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) or Nozzle vane position sensor connector-1 (VTI2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VE2) or Nozzle vane position sensor connector-2 (VE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNC2) or Nozzle vane position sensor connector-3 (VNC2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA2) or Nozzle vane position sensor connector-4 (VTA2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S2) or Nozzle vane position sensor connector-5 (E2S2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS2) or Nozzle vane position sensor connector-6 (VCS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 5

OK

3.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (NOZZLE VANE POSITION SENSOR)

a. Replace the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

4.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

6.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

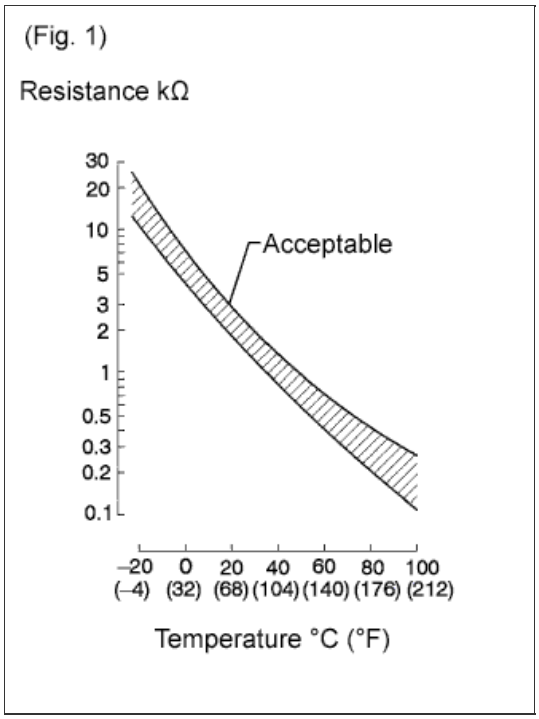
END

DTC P0110 Intake Air Temperature Circuit

DTC P0112 Intake Air Temperature Circuit Low Input



DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

The intake air temperature sensor is built into the Mass Air Flow (MAF) meter and senses the intake air temperature.
A thermistor built into the sensor changes its resistance value according to the intake air temperature.
The lower the intake air temperature, the greater the thermistor resistance value. The higher the intake air temperature, the lower the thermistor resistance value (See Fig. 1).
The intake air temperature sensor is connected to the ECM.
The 5 V power source voltage in the ECM is applied to the intake air temperature sensor from terminal THA via resistor R.
Resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes in accordance with changes in the intake air temperature, the potential at terminal THA also changes. Based on this signal, the ECM increases the fuel injection volume to improve driveability with a cold engine.

(Fig. 1)

P0110

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open or short in the intake air temperature (IAT) sensor for 0.5 seconds (1 trip detection logic).	• Open or short in intake air temperature (IAT) sensor circuit • IAT sensor (built into mass air flow meter) • ECM

P0112

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Short in the IAT sensor for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into mass air flow meter) • ECM

P0113

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open in the IAT sensor for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into mass air flow meter)

		• ECM

140°C (284°F) or higher	Short circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **If DTCs relating to different systems are stored, and they share terminal E2 as their ground, check this ground circuit first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (INTAKE AIR TEMPERATURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Intake Air.

d. Read the value.

OK:
Same as actual intake air temperature.

Result

Result	Proceed to
-40°C (-40°F)	A
140°C (284°F) or higher	B
OK (same as actual intake air temperature)	C

HINT:

- **If there is an open circuit, the tester indicates -40°C (-40°F).**
- **If there is a short circuit, the tester indicates 140°C (284°F) or more.**

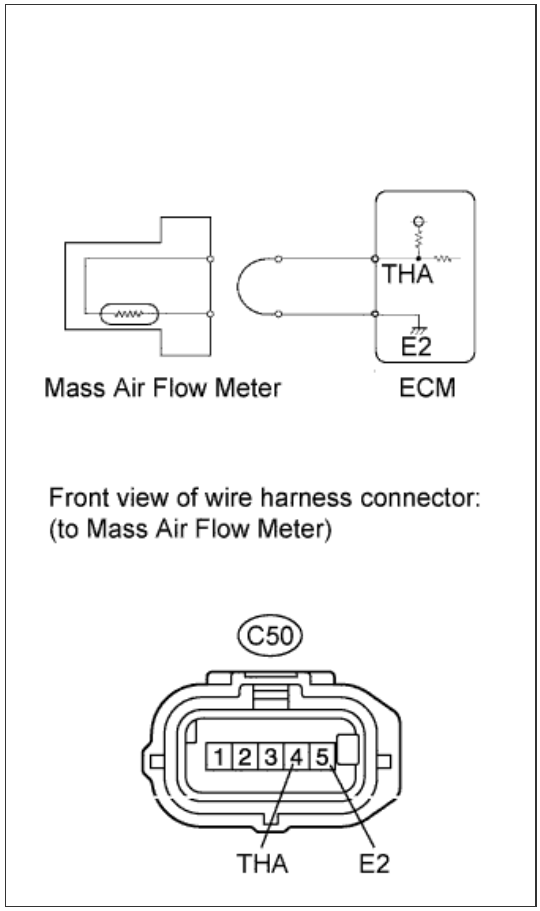
B	Go to step 4
C	Go to step 11

A

2.READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)

a. Disconnect the mass air flow meter connector.

b. Connect terminals 4 (THA) and 5 (E2) of the mass air flow meter wire harness side connector.



c. Connect the intelligent tester to the DLC3.

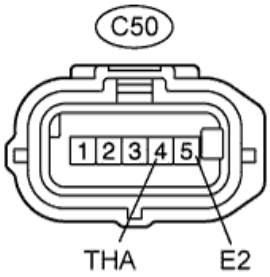
d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / Data List / Intake Air.

f. Read the value.

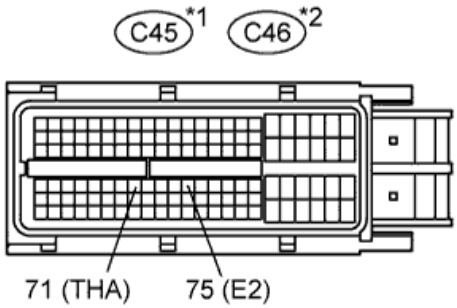
OK:
140°C (284°F) or higher

OK	Go to step 7
NG	Go to step 3



3.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Mass Air Flow Meter)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

DESCRIPTION

The variable nozzle vane type turbocharger consists primarily of a compressor wheel, turbine wheel, nozzle vane, unison ring, DC motor and nozzle vane position sensor.

The nozzle vane position sensor consists of a Hall IC and a magnetic yoke that rotates in unison with the movement of the linkage that actuates the nozzle vane. The nozzle vane position sensor converts the changes in the magnetic flux that are caused by the rotation of the DC motor (hence, the rotation of the magnetic yoke) into electric signals, and outputs them to the turbo motor driver. The turbo motor driver determines the actual nozzle vane position from the electric signals in order to calculate the target nozzle vane position.

P1258

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTI2 and VTA2 voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P1259

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 1 second	VTI2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1260

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTI2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1262

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1263

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2563

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTA1 and VTA voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P2564

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2565

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2588

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
		• Nozzle vane position sensor (turbocharger sub-assembly)

Ignition switch ON for 1 second	VTA voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2589

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

HINT:

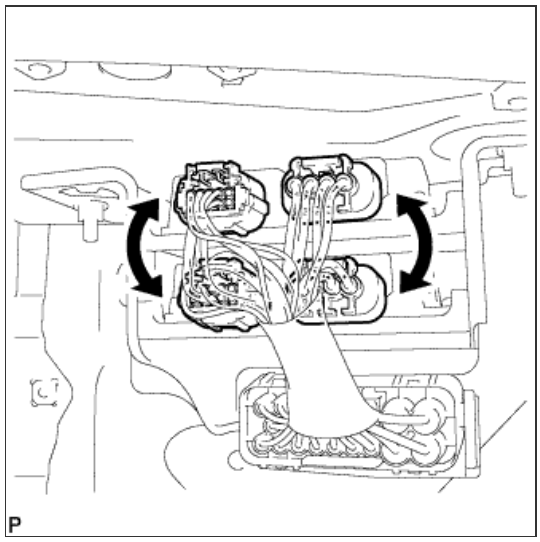
Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

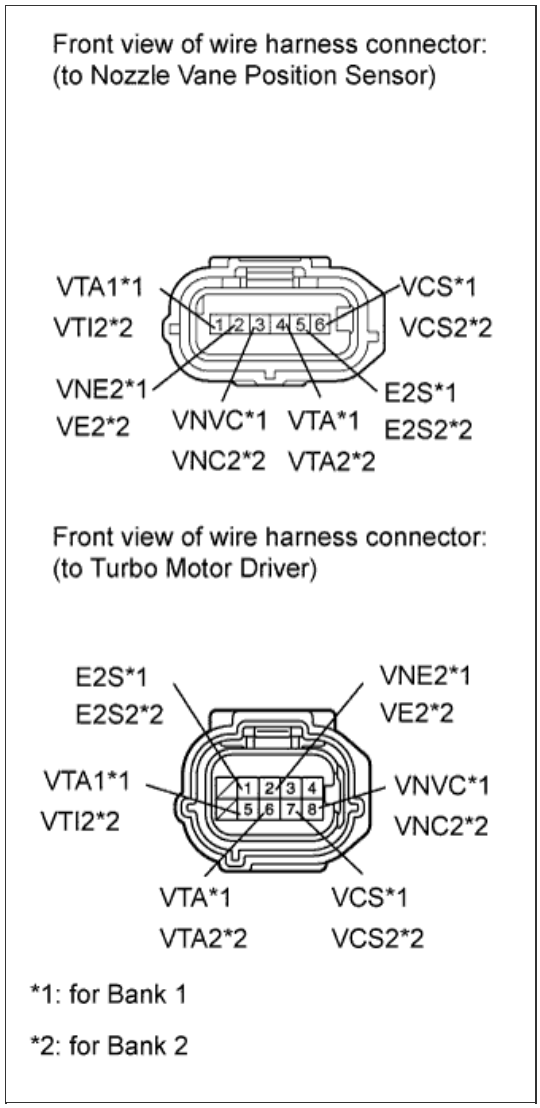
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω
Turbo motor driver connector-8 (VNVC) - Nozzle vane position sensor connector-3 (VNVC)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA) - Nozzle vane position sensor connector-4 (VTA)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S) - Nozzle vane position sensor connector-5 (E2S)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS) - Nozzle vane position sensor connector-6 (VCS)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) - Nozzle vane position sensor connector-1 (VTI2)	Always	Below 1 Ω
Turbo motor driver connector-2 (VE2) - Nozzle vane position sensor	Always	Below 1 Ω

connector-2 (VE2)		
Turbo motor driver connector-8 (VNC2) - Nozzle vane position sensor connector-3 (VNC2)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA2) - Nozzle vane position sensor connector-4 (VTA2)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S2) - Nozzle vane position sensor connector-5 (E2S2)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS2) - Nozzle vane position sensor connector-6 (VCS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) or Nozzle vane position sensor connector-1 (VTA1) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VNE2) or Nozzle vane position sensor connector-2 (VNE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNVC) or Nozzle vane position sensor connector-3 (VNVC) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA) or Nozzle vane position sensor connector-4 (VTA) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S) or Nozzle vane position sensor connector-5 (E2S) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS) or Nozzle vane position sensor connector-6 (VCS) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) or Nozzle vane position sensor connector-1 (VTI2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VE2) or Nozzle vane position sensor connector-2 (VE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNC2) or Nozzle vane position sensor connector-3 (VNC2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA2) or Nozzle vane position sensor connector-4 (VTA2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S2) or Nozzle vane position sensor connector-5 (E2S2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS2) or Nozzle vane position sensor connector-6 (VCS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 5

OK

3.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (NOZZLE VANE POSITION SENSOR)

a. Replace the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

4.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

6.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

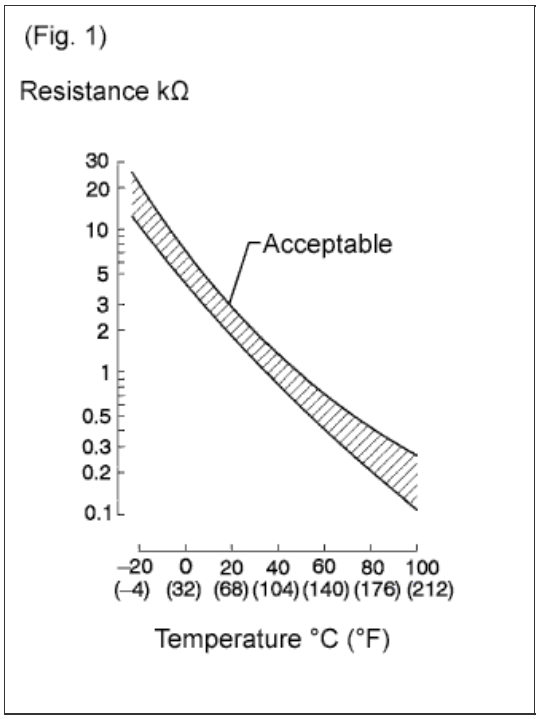
DTC P0110 Intake Air Temperature Circuit

DTC P0112 Intake Air Temperature Circuit Low Input



DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

The intake air temperature sensor is built into the Mass Air Flow (MAF) meter and senses the intake air temperature.
A thermistor built into the sensor changes its resistance value according to the intake air temperature.
The lower the intake air temperature, the greater the thermistor resistance value. The higher the intake air temperature, the lower the thermistor resistance value (See Fig. 1).
The intake air temperature sensor is connected to the ECM.
The 5 V power source voltage in the ECM is applied to the intake air temperature sensor from terminal THA via resistor R.
Resistor R and the intake air temperature sensor are connected in series. When the resistance value of the intake air temperature sensor changes in accordance with changes in the intake air temperature, the potential at terminal THA also changes. Based on this signal, the ECM increases the fuel injection volume to improve driveability with a cold engine.

(Fig. 1)

P0110

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open or short in the intake air temperature (IAT) sensor for 0.5 seconds (1 trip detection logic).	• Open or short in intake air temperature (IAT) sensor circuit • IAT sensor (built into mass air flow meter) • ECM

P0112

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Short in the IAT sensor for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into mass air flow meter) • ECM

P0113

  - **Lack of power**
- **When DTC P0110, P0112 or P0113 is stored, check the intake air temperature by entering the following menus: Powertrain / Engine / Data List / Intake Air.**

Reference

Temperature Displayed	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **If DTCs relating to different systems are stored, and they share terminal E2 as their ground, check this ground circuit first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (INTAKE AIR TEMPERATURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Intake Air.

d. Read the value.

OK:
Same as actual intake air temperature.

Result

Result	Proceed to
-40°C (-40°F)	A
140°C (284°F) or higher	B
OK (same as actual intake air temperature)	C

HINT:

- **If there is an open circuit, the tester indicates -40°C (-40°F).**
- **If there is a short circuit, the tester indicates 140°C (284°F) or more.**

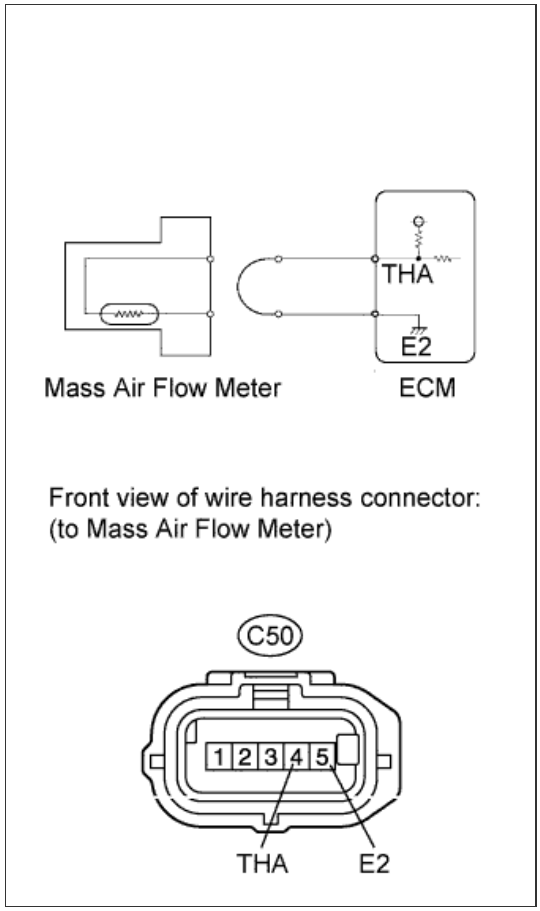
B	Go to step 4
C	Go to step 11

A

2.READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)

a. Disconnect the mass air flow meter connector.

b. Connect terminals 4 (THA) and 5 (E2) of the mass air flow meter wire harness side connector.



c. Connect the intelligent tester to the DLC3.

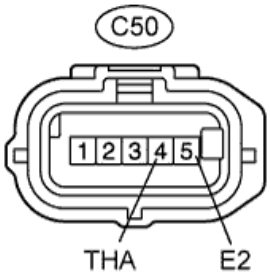
d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / Data List / Intake Air.

f. Read the value.

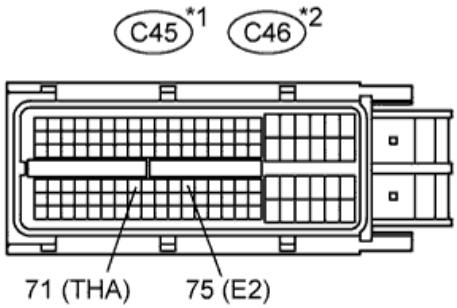
OK:
140°C (284°F) or higher

OK	Go to step 7
NG	Go to step 3



3.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Mass Air Flow Meter)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C50-4 (THA) - C45-71 (THA)	Always	Below 1 Ω
C50-5 (E2) - C45-75 (E2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
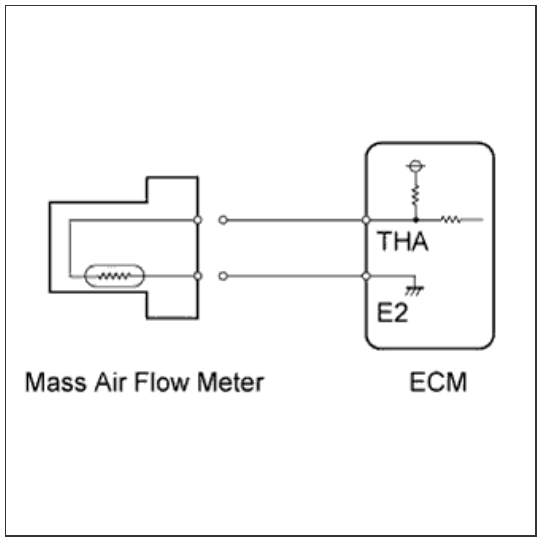
C50-4 (THA) - C46-71 (THA)	Always	Below 1 Ω
C50-5 (E2) - C46-75 (E2)	Always	Below 1 Ω

OK	Go to step 9
NG	Go to step 8

4.READ VALUE USING INTELLIGENT TESTER (CHECK FOR SHORT IN WIRE HARNESS)

a. Disconnect the mass air flow meter connector.



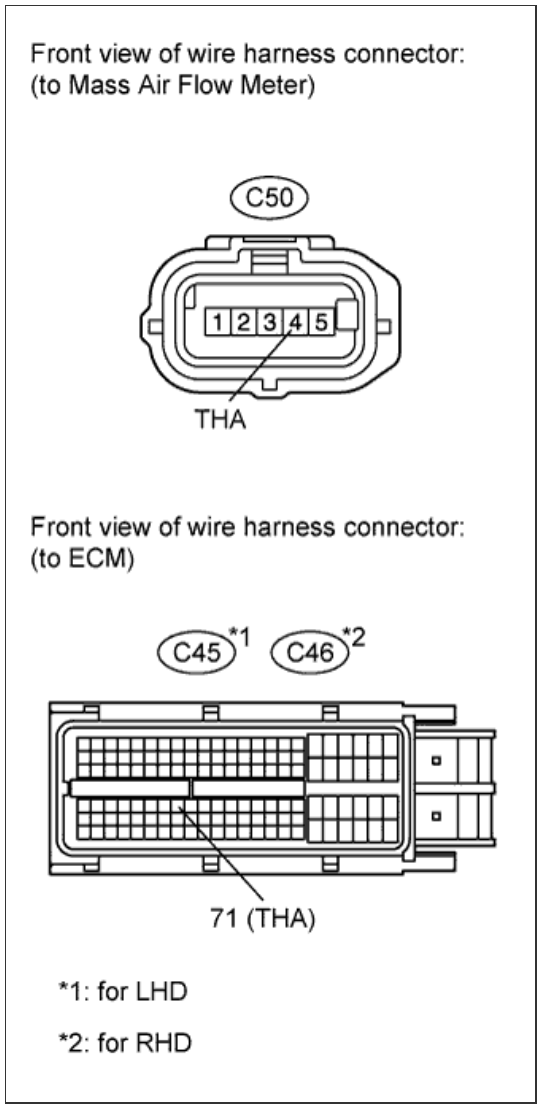
b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Enter the following menus: Powertrain / Engine / Data List / Intake Air.

e. Read the value.

OK:
-40°C (-40°F)



OK	Go to step 10
NG	Go to step 5

5.CHECK HARNESS AND CONNECTOR (MASS AIR FLOW METER - ECM)

a. Disconnect the mass air flow meter connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Short):

for LHD

		Specified

Tester Connection	Condition	Condition
C50-4 (THA) or C45-71 (THA) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C50-4 (THA) or C46-71 (THA) - Body ground	Always	10 kΩ or higher

NG → Go to step 8

OK

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 11

7.CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE MASS AIR FLOW METER

a. Replace the mass air flow meter (Click here).

NEXT → Go to step 11

8.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 11

9.CONFIRM GOOD CONNECTION TO ECM. IF OK, REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 11

10.REPLACE MASS AIR FLOW METER

a. Replace the mass air flow meter (Click here).

NEXT

11.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 1 second.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

DESCRIPTION

The variable nozzle vane type turbocharger consists primarily of a compressor wheel, turbine wheel, nozzle vane, unison ring, DC motor and nozzle vane position sensor.

The nozzle vane position sensor consists of a Hall IC and a magnetic yoke that rotates in unison with the movement of the linkage that actuates the nozzle vane. The nozzle vane position sensor converts the changes in the magnetic flux that are caused by the rotation of the DC motor (hence, the rotation of the magnetic yoke) into electric signals, and outputs them to the turbo motor driver. The turbo motor driver determines the actual nozzle vane position from the electric signals in order to calculate the target nozzle vane position.

P1258

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTI2 and VTA2 voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P1259

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 1 second	VTI2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1260

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTI2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1262

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1263

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2563

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTA1 and VTA voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P2564

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2565

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2588

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
		• Nozzle vane position sensor (turbocharger sub-assembly)

Ignition switch ON for 1 second	VTA voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2589

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

HINT:

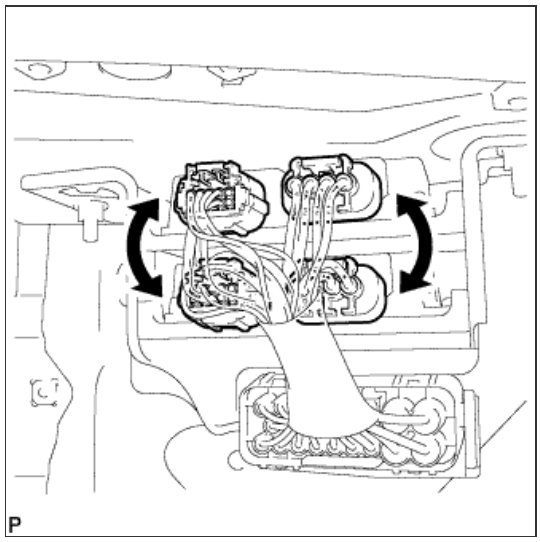
Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

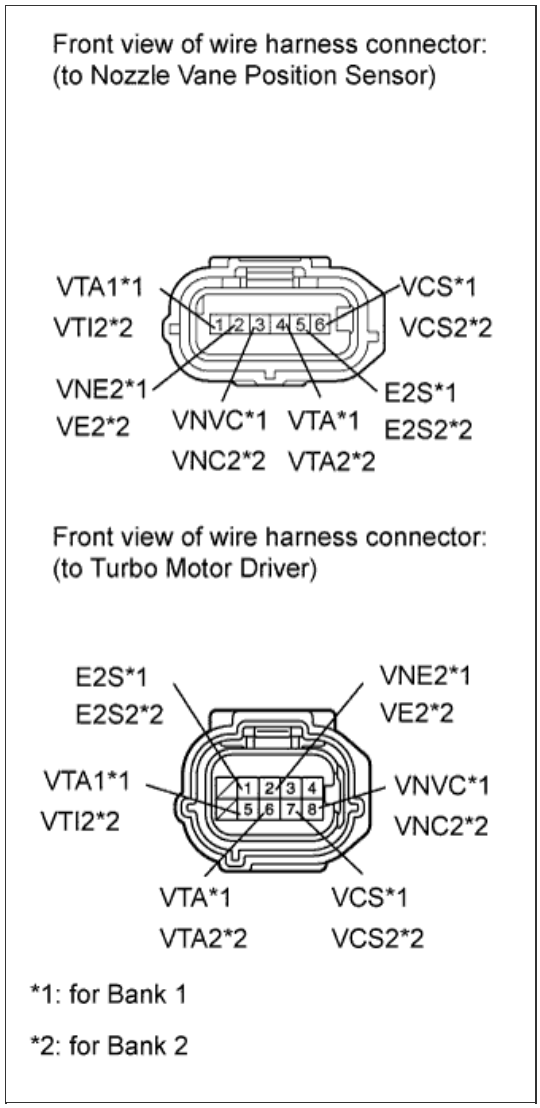
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω
Turbo motor driver connector-8 (VNVC) - Nozzle vane position sensor connector-3 (VNVC)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA) - Nozzle vane position sensor connector-4 (VTA)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S) - Nozzle vane position sensor connector-5 (E2S)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS) - Nozzle vane position sensor connector-6 (VCS)	Always	Below 1 Ω

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) - Nozzle vane position sensor connector-1 (VTI2)	Always	Below 1 Ω
Turbo motor driver connector-2 (VE2) - Nozzle vane position sensor	Always	Below 1 Ω

connector-2 (VE2)		
Turbo motor driver connector-8 (VNC2) - Nozzle vane position sensor connector-3 (VNC2)	Always	Below 1 Ω
Turbo motor driver connector-6 (VTA2) - Nozzle vane position sensor connector-4 (VTA2)	Always	Below 1 Ω
Turbo motor driver connector-1 (E2S2) - Nozzle vane position sensor connector-5 (E2S2)	Always	Below 1 Ω
Turbo motor driver connector-7 (VCS2) - Nozzle vane position sensor connector-6 (VCS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) or Nozzle vane position sensor connector-1 (VTA1) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VNE2) or Nozzle vane position sensor connector-2 (VNE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNVC) or Nozzle vane position sensor connector-3 (VNVC) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA) or Nozzle vane position sensor connector-4 (VTA) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S) or Nozzle vane position sensor connector-5 (E2S) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS) or Nozzle vane position sensor connector-6 (VCS) - Body ground	Always	10 kΩ or higher

for Bank 2

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTI2) or Nozzle vane position sensor connector-1 (VTI2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-2 (VE2) or Nozzle vane position sensor connector-2 (VE2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-8 (VNC2) or Nozzle vane position sensor connector-3 (VNC2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-6 (VTA2) or Nozzle vane position sensor connector-4 (VTA2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-1 (E2S2) or Nozzle vane position sensor connector-5 (E2S2) - Body ground	Always	10 kΩ or higher
Turbo motor driver connector-7 (VCS2) or Nozzle vane position sensor connector-6 (VCS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 5

OK

3.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (NOZZLE VANE POSITION SENSOR)

a. Replace the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

4.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

6.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

END

DTC P0115 Engine Coolant Temperature Circuit

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

A thermistor is built into the Engine Coolant Temperature (ECT) sensor and it changes its resistance value according to the engine coolant temperature. The structure of the sensor and connection to the ECM is the same as the intake air temperature sensor.

HINT:

If DTC P0115, P0117 or P0118 is stored, the ECM operates the fail-safe function in which the ECT is assumed to be 80 C (176).

P0115

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open or short in the engine coolant temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in engine coolant temperature (ECT) sensor circuit • ECT sensor • ECM

P0117

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor circuit • ECT sensor • ECM

P0118

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

Related Data List

DTC No.	Data List

DESCRIPTION

The variable nozzle vane type turbocharger consists primarily of a compressor wheel, turbine wheel, nozzle vane, unison ring, DC motor and nozzle vane position sensor.

The nozzle vane position sensor consists of a Hall IC and a magnetic yoke that rotates in unison with the movement of the linkage that actuates the nozzle vane. The nozzle vane position sensor converts the changes in the magnetic flux that are caused by the rotation of the DC motor (hence, the rotation of the magnetic yoke) into electric signals, and outputs them to the turbo motor driver. The turbo motor driver determines the actual nozzle vane position from the electric signals in order to calculate the target nozzle vane position.

P1258

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTI2 and VTA2 voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P1259

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area

Ignition switch ON for 1 second	VTI2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1260

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTI2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1262

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P1263

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA2 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2563

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	The difference between VTA1 and VTA voltage is 0.8 V or more for 0.5 seconds (1 trip detection logic).	Nozzle vane position sensor (turbocharger sub-assembly)

P2564

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2565

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA1 voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2588

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
		• Nozzle vane position sensor (turbocharger sub-assembly)

Ignition switch ON for 1 second	VTA voltage is 0.5 V or less for 0.5 seconds (1 trip detection logic).	• Open or short in nozzle vane position sensor circuit • Turbo motor driver

P2589

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	VTA voltage is 4.5 V or more for 0.5 seconds (1 trip detection logic).	• Nozzle vane position sensor (turbocharger sub-assembly) • Open or short in nozzle vane position sensor circuit • Turbo motor driver

HINT:

If DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589 is stored, the following symptoms may appear:

Stuck open malfunction:

- Lack of power
- Vehicle surge or hesitation under light or medium load
- White smoke

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT TURBO MOTOR DRIVER (for Bank 1 and Bank 2)

a. Remove the rear fender splash shield sub-assembly RH.

b. Remove the front fender liner LH.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Read the DTCs.

HINT:

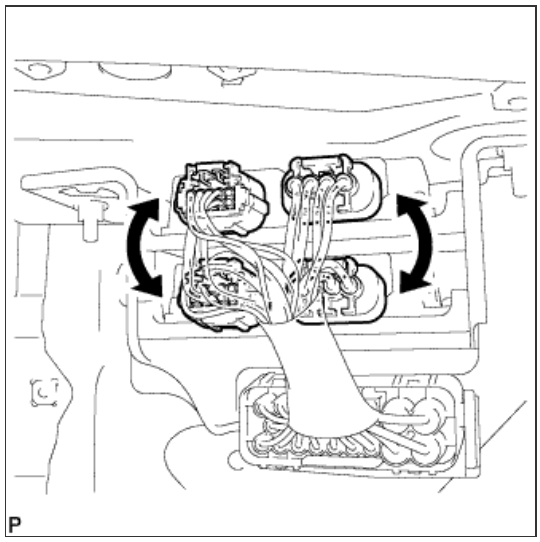
Record the output DTCs.

g. Clear the DTCs (Click here).

h. Turn the ignition switch off.

i. Interchange the connectors for the turbo motor driver of bank 1 and bank 2.



j. Turn the ignition switch to ON for 1 second.

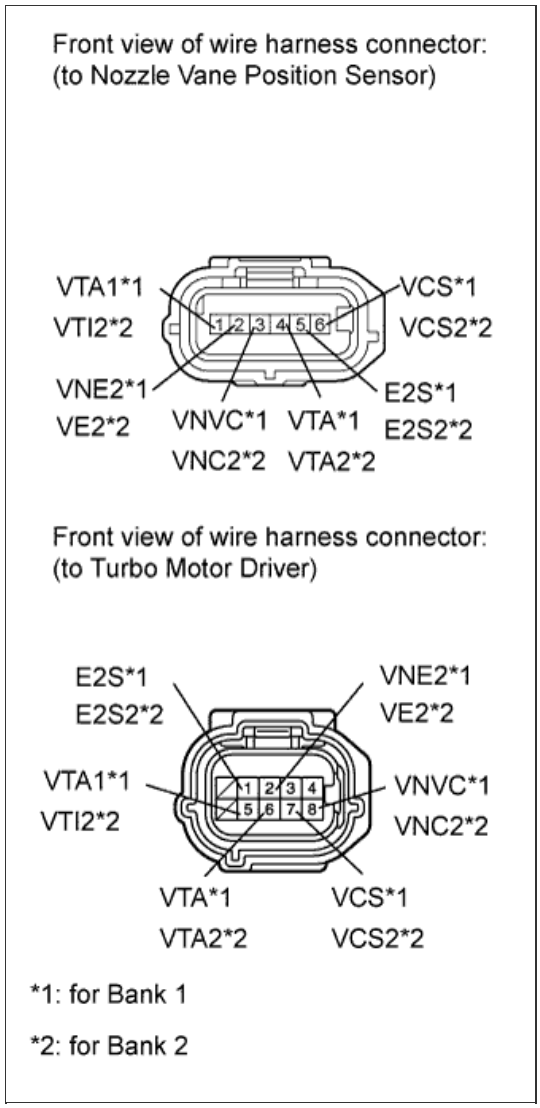
k. Enter the following menus: Powertrain / Engine / DTC.

l. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
DTCs change	B
DTCs do not change	A

B → Go to step 4



A

2.CHECK HARNESS AND CONNECTOR (TURBO MOTOR DRIVER - NOZZLE VANE POSITION SENSOR)

a. Disconnect the nozzle vane position sensor connector.

b. Disconnect the turbo motor driver connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1

Tester Connection	Condition	Specified Condition
Turbo motor driver connector-5 (VTA1) - Nozzle vane position sensor connector-1 (VTA1)	Always	Below 1 Ω
Turbo motor driver connector-2 (VNE2) - Nozzle vane position sensor connector-2 (VNE2)	Always	Below 1 Ω

3.REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (NOZZLE VANE POSITION SENSOR)

a. Replace the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

4.REPLACE TURBO MOTOR DRIVER (for Bank 1 or Bank 2)

a. Replace the turbo motor driver (for Bank 1 or Bank 2) (Click here).

NEXT → Go to step 6

5.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

6.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P1258, P1259, P1260, P1262, P1263, P2563, P2564, P2565, P2588 and/or P2589.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

DTC P0115 Engine Coolant Temperature Circuit

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

A thermistor is built into the Engine Coolant Temperature (ECT) sensor and it changes its resistance value according to the engine coolant temperature. The structure of the sensor and connection to the ECM is the same as the intake air temperature sensor.

HINT:

If DTC P0115, P0117 or P0118 is stored, the ECM operates the fail-safe function in which the ECT is assumed to be 80 C (176).

P0115

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open or short in the engine coolant temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in engine coolant temperature (ECT) sensor circuit • ECT sensor • ECM

P0117

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor circuit • ECT sensor • ECM

P0118

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 0.5 seconds	Open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

DTC P1495 Intake Air Temperature Sensor 1 Circuit

DTC P1496 Intake Air Temperature Sensor 1 Circuit Low

DTC P1497 Intake Air Temperature Sensor 1 Circuit High

for Preparation Click here

DESCRIPTION

The Intake Air Temperature (IAT) sensor is built into the charge air cooler and senses the IAT. A built-in thermistor in the sensor changes its resistance value according to the intake air temperature. The lower the intake air temperature, the greater the thermistor resistance value. The higher the intake air temperature, the lower the thermistor resistance value (See Fig. 1).
The sensor is connected to the ECM. The 5 V power source voltage in the ECM is applied to the sensor rom terminal THIA via resistor R. Resistor R and the sensor are connected in series. When the resistance value o the sensor changes in accordance with changes in the IAT, the potential at terminal THIA also changes. Based on this signal, the ECM corrects the el injection volume to improve driveability with a cold engine.

DTC P0116 Engine Coolant Temperature Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

A thermistor is built into the Engine Coolant Temperature (ECT) sensor and it changes its resistance value according to the engine coolant temperature. The structure of the sensor and connection to the ECM is the same as the intake air temperature sensor.

P0116

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
City driving for 10 minutes or more	If the engine coolant temperature is between -40°C (-40°F) and 60°C (140°F) at engine start and conditions (a) and (b) are met (2 trip detection logic): (a) Vehicle is driven at varying speeds (accelerating and decelerating) for 10 seconds. (b) Engine coolant temperature remains within 3°C (5.4°F) of the engine starting temperature.	Engine coolant temperature sensor
	If the engine coolant temperature is more than 60°C (140°F) at engine start and conditions (a) and (b) are met (6 trip detection logic): (a) Vehicle is driven at varying speeds (accelerating and decelerating) for 10 seconds. (b) Engine coolant temperature remains within 1°C (1.8°F) of the engine starting temperature.	

Related Data List

DTC No.	Data List
P0116	Coolant Temp

HINT:

- **If DTC P0116 is stored, the following symptoms may appear:**
  - **Misfire**
  - **Combustion noise**
  - **Black smoke**
  - **White smoke**
  - **Lack of power**

MONITOR DESCRIPTION

The engine coolant temperature sensor is used to monitor the engine coolant temperature. The engine coolant temperature sensor has a thermistor that varies its resistance depending on the temperature of the engine coolant. When the coolant temperature is low the resistance of the thermistor increases. When the temperature is high the resistance drops. The variations in resistance are reflected in the voltage output from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the engine coolant temperature. When the sensor voltage output varies slightly the ECM interprets this as a fault in the engine coolant temperature sensor and sets a DTC.
Examples:

1. Upon starting the engine the engine coolant temperature is between -40°C (-40°F) and 60°C (140°F). If after driving for a few minutes the engine coolant temperature still remains within 3°C (5.4°F) of the starting temperature a DTC is stored (2 trip detection logic).
2. Upon starting the engine the engine coolant temperature is more than 60°C (140°F). If after driving for a few minutes the engine coolant temperature still remains within 1°C (1.8°F) of the starting temperature a DTC is stored (6 trip detection logic).

INSPECTION PROCEDURE

HINT:

- **If DTCs P0115, P0117 and P0118 are stored simultaneously, the engine coolant temperature sensor circuit may have an open or short. Perform troubleshooting for these DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result

Result	Proceed to

P0116 is output	A
P0116 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

DTC P1495 Intake Air Temperature Sensor 1 Circuit

DTC P1496 Intake Air Temperature Sensor 1 Circuit Low

DTC P1497 Intake Air Temperature Sensor 1 Circuit High

for Preparation Click here

DESCRIPTION

The Intake Air Temperature (IAT) sensor is built into the charge air cooler and senses the IAT. A built-in thermistor in the sensor changes its resistance value according to the intake air temperature. The lower the intake air temperature, the greater the thermistor resistance value. The higher the intake air temperature, the lower the thermistor resistance value (See Fig. 1).
The sensor is connected to the ECM. The 5 V power source voltage in the ECM is applied to the sensor rom terminal THIA via resistor R. Resistor R and the sensor are connected in series. When the resistance value o the sensor changes in accordance with changes in the IAT, the potential at terminal THIA also changes. Based on this signal, the ECM corrects the el injection volume to improve driveability with a cold engine.

P1495

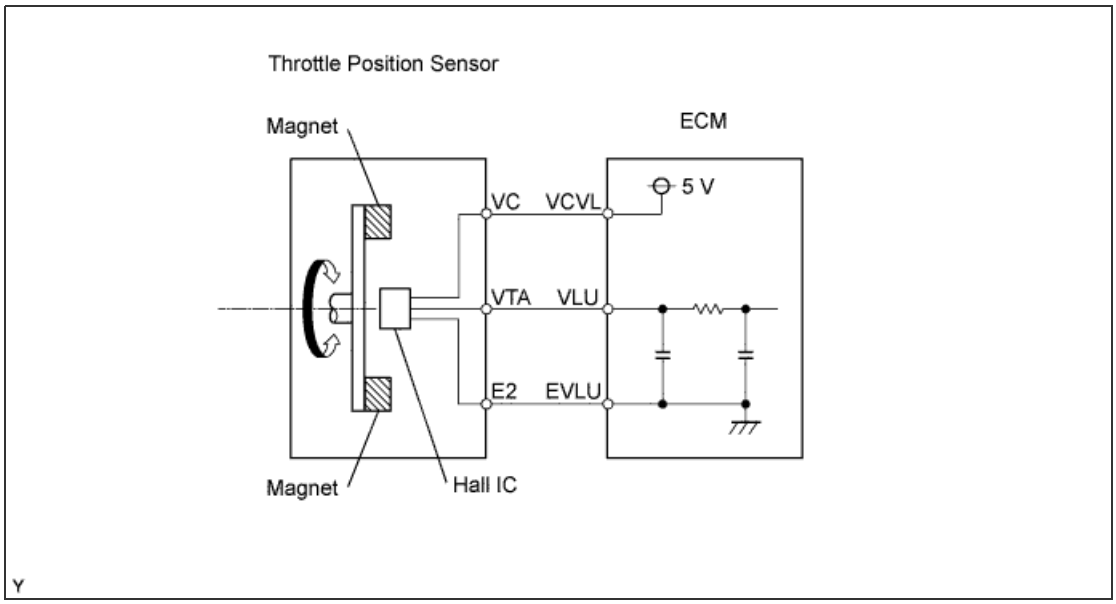
DTC P0222 Throttle / Pedal Position Sensor / Switch "B" Circuit Low Input

DTC P0223 Throttle / Pedal Position Sensor / Switch "B" Circuit High Input



for Preparation Click here

DESCRIPTION

The throttle position sensor is mounted on the diesel throttle body and detects the opening angle of the throttle valve. This sensor is an electronic sensor and uses Hall-effect elements.

When the throttle valve is fully closed, a voltage of approximately 0.7 V is applied to terminal VLU of the ECM. The voltage applied to terminal VLU of the ECM increases in proportion to the opening angle of the throttle valve and becomes approximately 3.5 to 4.0 V when the throttle valve is fully opened.

The ECM determines the vehicle driving conditions from the signals input to its VLU terminal. The data is one of the inputs used for EGR control, etc.

P0122

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	Throttle position sensor (for Bank 1) output (VLU) is less than 0.2 V for 3 seconds (1 trip detection logic).	• Throttle position sensor (for Bank 1) • Open or short in VLU circuit • Open in VC circuit • ECM

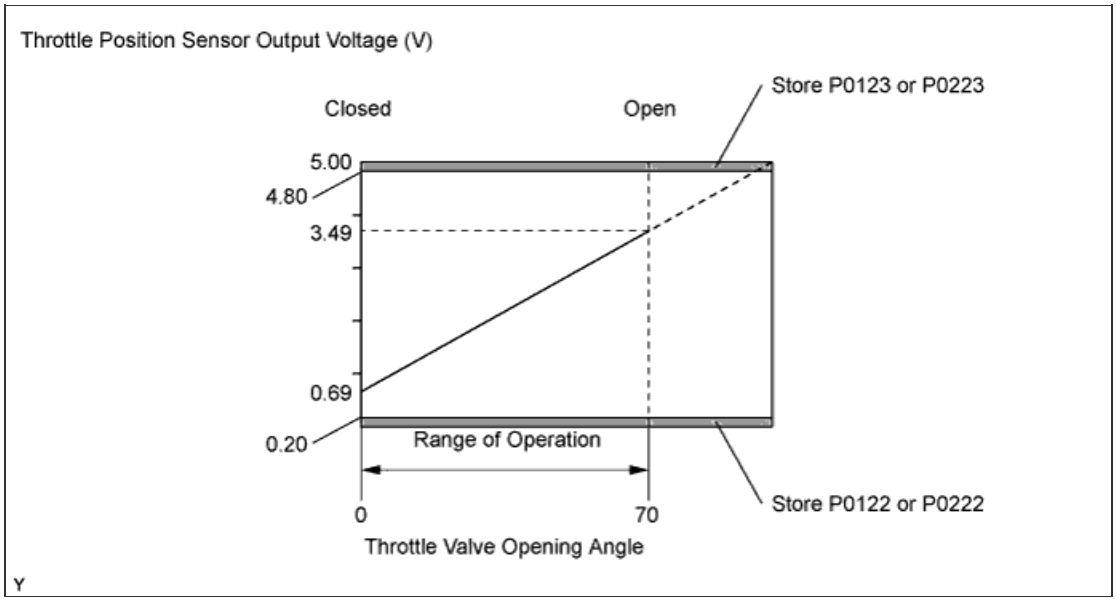
seconds	(1 trip detection logic).	circuit • Open in VC circuit • ECM

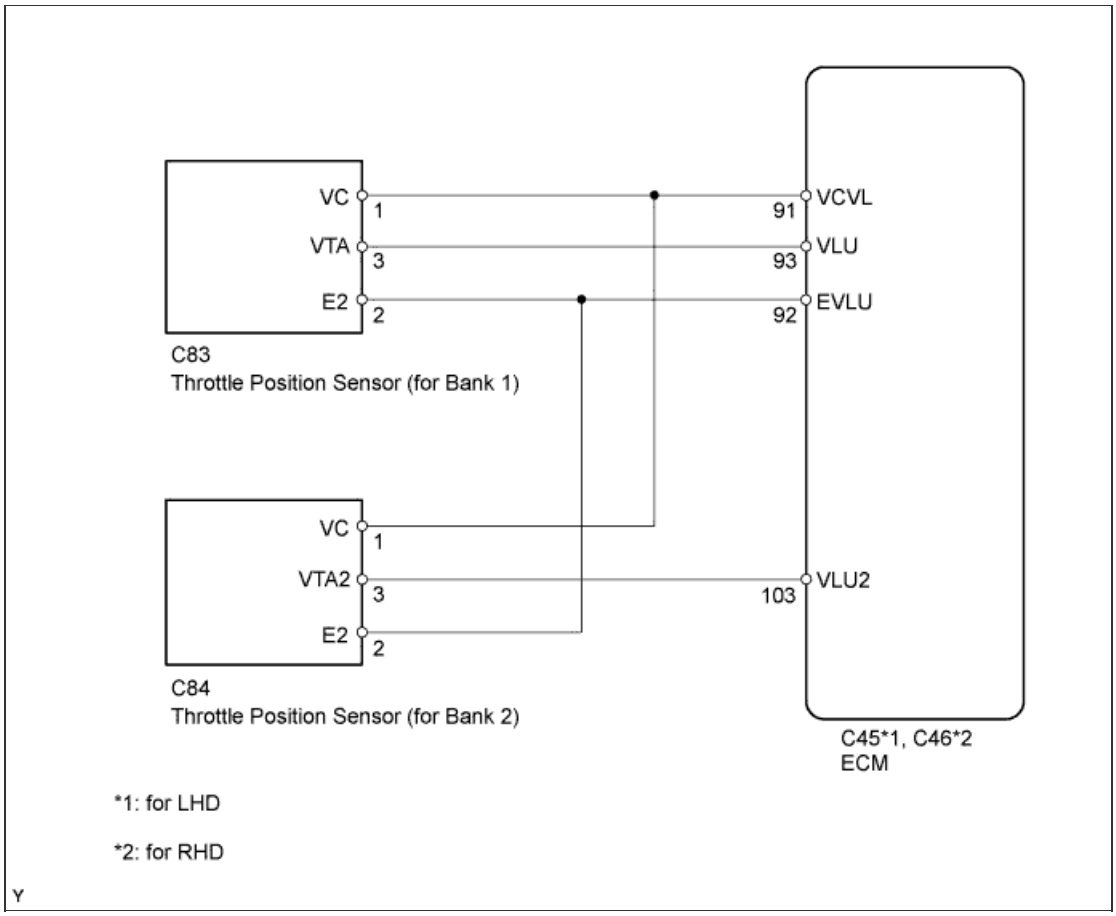
P0223

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	Throttle position sensor (for Bank 2) output (VLU2) is more than 4.8 V for 3 seconds (1 trip detection logic).	• Throttle position sensor (for Bank 2) • Open in E2 circuit • VC and VLU2 circuits are short-circuited • ECM



HINT:

If DTC P0122, P0123, P0222 and/or P0223 is stored, the following symptoms may appear:



- Intake booming noise
- Black smoke
- Lack of power
- Vibration at engine stop
- Turbo overspeed, turbo damage

MONITOR DESCRIPTION

When the output voltage of the throttle position sensor deviates from the normal operating range (between 0.2 V and 4.8 V) for more than 3 seconds, the ECM interprets this as a malfunction of the sensor circuit and illuminates the MIL.

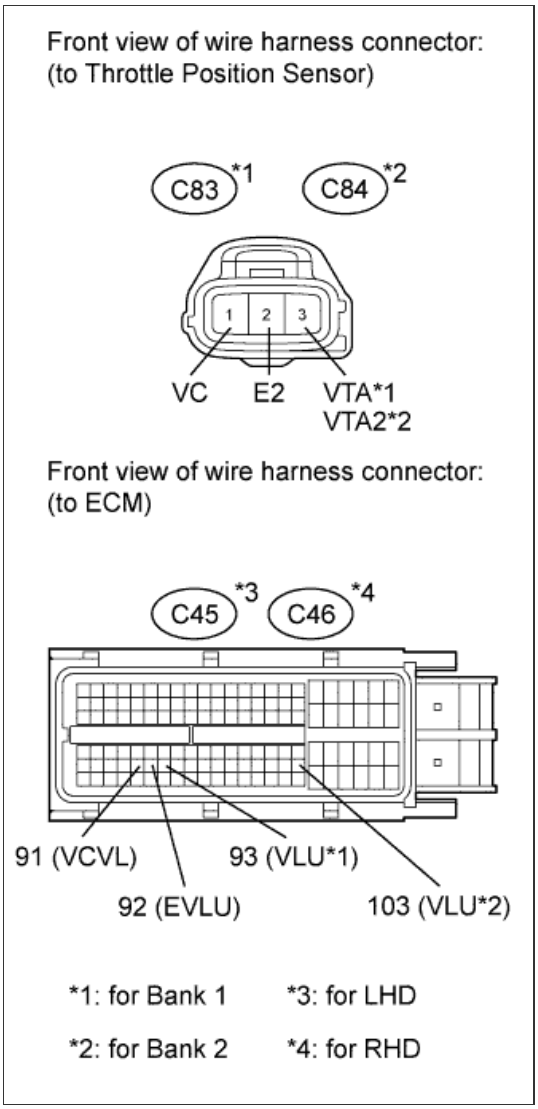
WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:



Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)

a. Disconnect the throttle position sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1 (LHD)

Tester Connection	Condition	Specified Condition

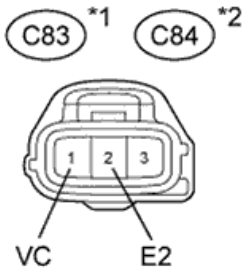
C84-2 (E2) or C46-92 (EVLU) - Body ground	Always	10 kΩ or higher

NG → Go to step 6



OK

2.CHECK ECM TERMINAL VOLTAGE (VC TERMINAL)

a. Disconnect the throttle position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Front view of wire harness connector:
(to Throttle Position Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Voltage:

for Bank 1

Tester Connection	Switch Condition	Specified Condition
C83-1 (VC) - C83-2 (E2)	Ignition switch ON	4.5 to 5.5 V

for Bank 2

Tester Connection	Switch Condition	Specified Condition
C84-1 (VC) - C84-2 (E2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 5

OK

3.REPLACE DIESEL THROTTLE BODY ASSEMBLY (for Bank 1 or Bank 2)

a. Replace the diesel throttle body assembly (for Bank 1 or Bank 2) (Click here).

NEXT

4.READ VALUE USING INTELLIGENT TESTER

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Enter the following menus: Powertrain / Engine / Data List / Actual Throttle position or Actual Throttle position #2.

e. Check the movement of the throttle valve when idling the engine after starting it from ignition switch ON.

OK

Condition	Tester Display
Ignition switch ON	-5 to 5%
Idling	0 to 90%

OK → END

NG → Go to step 5

5.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 7

6.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 3 seconds.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

DTC P1601 Injector Correction Circuit Malfunction (EEPROM)

for Preparation Click here

DESCRIPTION

P1601

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 seconds	When either condition below is met (1 trip detection logic) • uel in ector compensation code is not registered. • Wrong in ector compensation code is registered.	• Fuel in ector compensation code • ECM

NOTICE:

- **When a fuel injector is replaced, the new fuel injector compensation code must be input into the ECM. When the ECM is replaced, all of the existing fuel injector compensation codes must be input into the new ECM.**
- **Fuel injector compensation codes are unique, 30-digit, alphanumeric values printed on the head portion of each fuel injector. If an incorrect fuel injector compensation code is input into the ECM, the engine assembly may rattle or engine idling may become rough. In addition, engine failure may occur and the life of the engine may be shortened.**

HINT:

When replacing the ECM with a new one, if the in ector compensation codes are not entered, DTC P1 will be stored.

When replacing the ECM with a new one, input all fuel injector compensation codes into the new ECM as follows:

a. Prior to replacing the ECM, use the intelligent tester to read and save each fuel in ector compensation code from the original ECM (Click here).

b. After installing a new ECM, input the saved compensation codes into the new ECM using the tester (Click here).

c. Turn the ignition switch off and then turn the tester off.

d. Wait for at least 30 seconds.

e. Turn the ignition switch to ON and then turn the tester on.

f. Clear DTC P1 stored in the ECM using the tester (Click here).

HINT:

- **Each fuel injector has different fuel injection characteristics. In order to optimize the fuel injections, the ECM uses the compensation codes to balance the different fuel injections between each injector.**
- **When you first turn ON the ignition switch after replacing the ECM or a fuel injector(s), DTC P1601 is stored. If a fuel injector was replaced, the compensation code for the new fuel injector will need to be registered in the ECM. If the ECM was replaced, the compensation codes for the fuel injectors must be registered to the new ECM. Manually clear the DTC upon completion of compensation code registration.**

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

ead freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK FUEL INJECTOR COMPENSATION CODE

a. ead the fuel in ector compensation codes (Click here).

OK:
Compensation codes stored in the ECM match compensation codes of the installed fuel injectors.

NG → Go to step 3

OK

2.REPLACE ECM

a. eplace the ECM (Click here).

NEXT → Go to step 4

3.PERFORM REGISTRATION OF FUEL INJECTOR COMPENSATION CODE

a. Perform registration of the fuel in ector compensation code (Click here).

NEXT

4.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON for 1 second.

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC udgment has been carried out.

i. Enter the following menus Powertrain / Engine / Utility / All eadiness.

ii. Input DTC P1

iii. Check that TATU is NO AL. If TATU is INCOMPLETE or UNKNOWN, idle the engine.

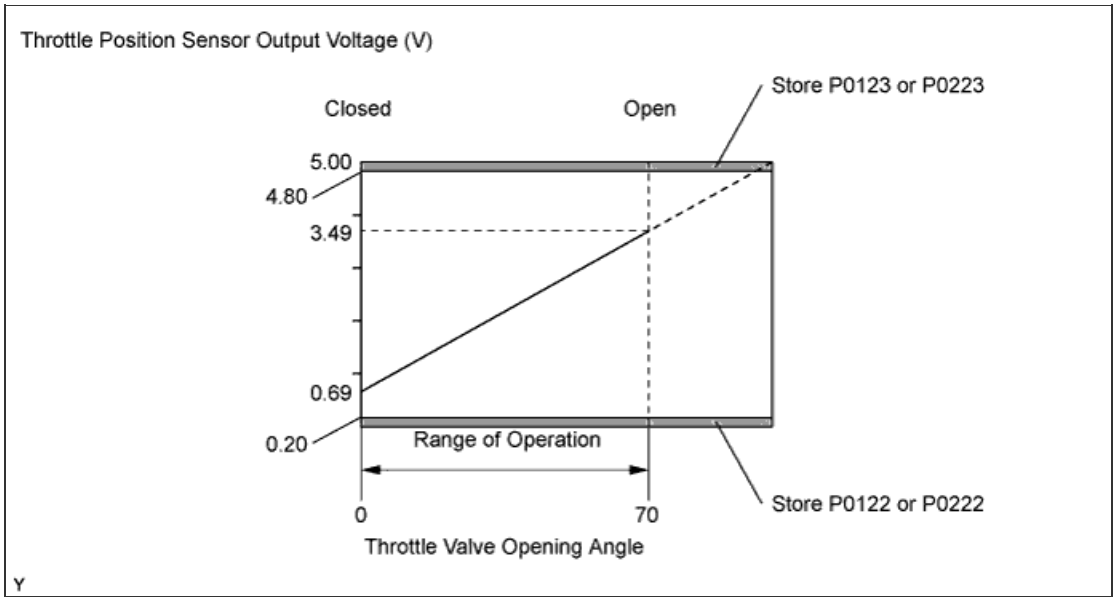
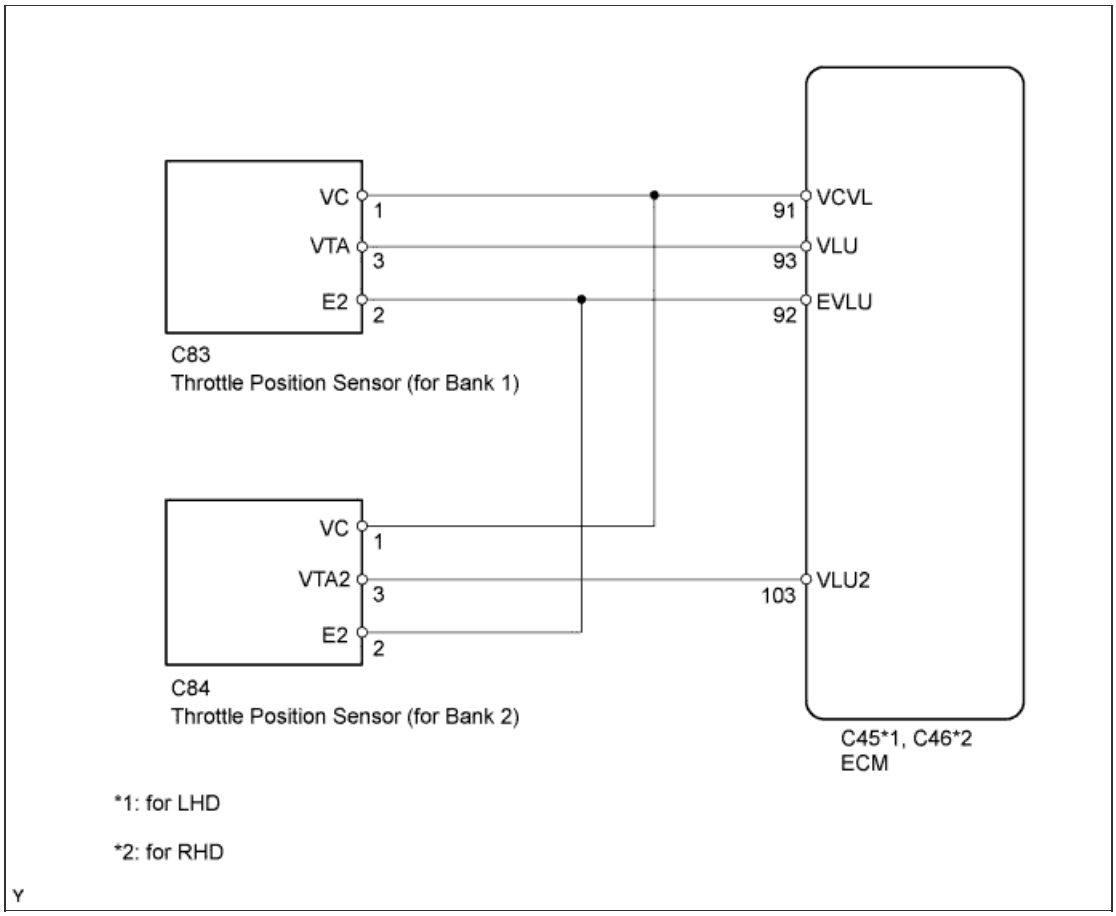
Ignition switch ON for 3 seconds	Throttle position sensor (for Bank 2) output (VLU2) is more than 4.8 V for 3 seconds (1 trip detection logic).	• Throttle position sensor (for Bank 2) • Open in E2 circuit • VC and VLU2 circuits are short-circuited • ECM



HINT:

If DTC P0122, P0123, P0222 and/or P0223 is stored, the following symptoms may appear:



- Intake booming noise
- Black smoke
- Lack of power
- Vibration at engine stop
- Turbo overspeed, turbo damage

MONITOR DESCRIPTION

When the output voltage of the throttle position sensor deviates from the normal operating range (between 0.2 V and 4.8 V) for more than 3 seconds, the ECM interprets this as a malfunction of the sensor circuit and illuminates the MIL.

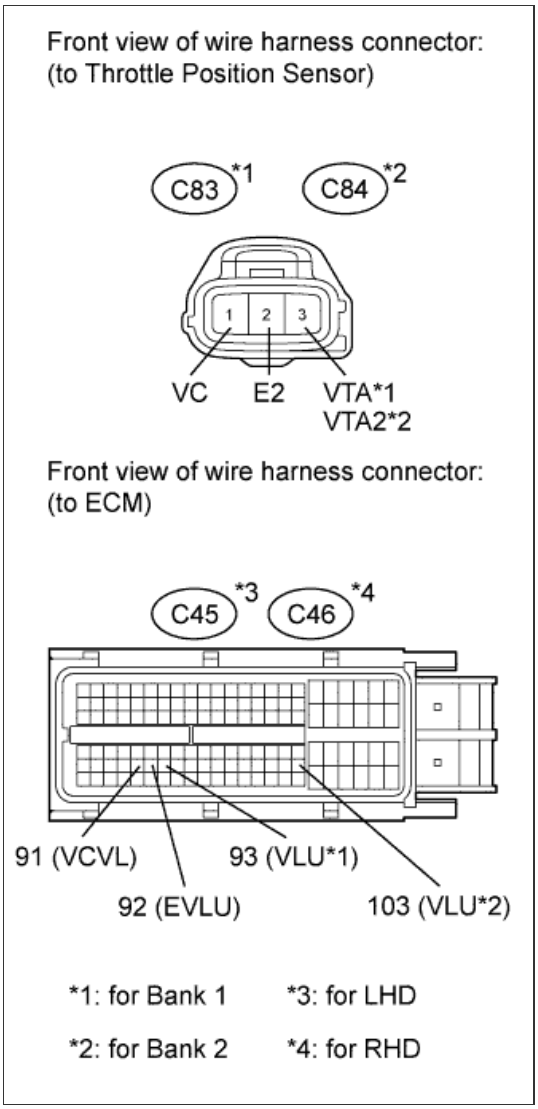
WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:



Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)

a. Disconnect the throttle position sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for Bank 1 (LHD)

Tester Connection	Condition	Specified Condition
C83-1 (VC) - C45-91 (VCVL)	Always	Below 1 Ω
C83-3 (VTA) - C45-93 (VLU)	Always	Below 1 Ω
C83-2 (E2) - C45-92 (EVLU)	Always	Below 1 Ω

for Bank 2 (LHD)

Tester Connection	Condition	Specified Condition
C84-1 (VC) - C45-91 (VCVL)	Always	Below 1 Ω
C84-3 (VTA2) - C45-103 (VLU2)	Always	Below 1 Ω
C84-2 (E2) - C45-92 (EVLU)	Always	Below 1 Ω

for Bank 1 (RHD)

Tester Connection	Condition	Specified Condition
C83-1 (VC) - C46-91 (VCVL)	Always	Below 1 Ω
C83-3 (VTA) - C46-93 (VLU)	Always	Below 1 Ω
C83-2 (E2) - C46-92 (EVLU)	Always	Below 1 Ω

for Bank 2 (RHD)

Tester Connection	Condition	Specified Condition
C84-1 (VC) - C46-91 (VCVL)	Always	Below 1 Ω

C84-3 (VTA2) - C46-103 (VLU2)	Always	Below 1 Ω
C84-2 (E2) - C46-92 (EVLU)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for Bank 1 (LHD)

Tester Connection	Condition	Specified Condition
C83-1 (VC) or C45-91 (VCVL) - Body ground	Always	10 kΩ or higher
C83-3 (VTA) or C45-93 (VLU) - Body ground	Always	10 kΩ or higher
C83-2 (E2) or C45-92 (EVLU) - Body ground	Always	10 kΩ or higher

for Bank 2 (LHD)

Tester Connection	Condition	Specified Condition
C84-1 (VC) or C45-91 (VCVL) - Body ground	Always	10 kΩ or higher
C84-3 (VTA2) or C45-103 (VLU2) - Body ground	Always	10 kΩ or higher
C84-2 (E2) or C45-92 (EVLU) - Body ground	Always	10 kΩ or higher

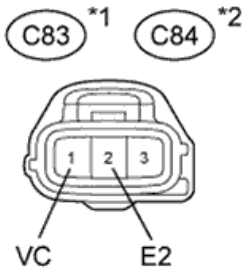
for Bank 1 (RHD)

Tester Connection	Condition	Specified Condition
C83-1 (VC) or C46-91 (VCVL) - Body ground	Always	10 kΩ or higher
C83-3 (VTA) or C46-93 (VLU) - Body ground	Always	10 kΩ or higher
C83-2 (E2) or C46-92 (EVLU) - Body ground	Always	10 kΩ or higher

for Bank 2 (RHD)

Tester Connection	Condition	Specified Condition
C84-1 (VC) or C46-91 (VCVL) - Body ground	Always	10 kΩ or higher
C84-3 (VTA2) or C46-103 (VLU2) - Body ground	Always	10 kΩ or higher
C84-2 (E2) or C46-92 (EVLU) - Body ground	Always	10 kΩ or higher

NG → Go to step 6



OK

2.CHECK ECM TERMINAL VOLTAGE (VC TERMINAL)

a. Disconnect the throttle position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Front view of wire harness connector:
(to Throttle Position Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Voltage:

for Bank 1

Tester Connection	Switch Condition	Specified Condition
C83-1 (VC) - C83-2 (E2)	Ignition switch ON	4.5 to 5.5 V

for Bank 2

Tester Connection	Switch Condition	Specified Condition
C84-1 (VC) - C84-2 (E2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 5

OK

3.REPLACE DIESEL THROTTLE BODY ASSEMBLY (for Bank 1 or Bank 2)

a. Replace the diesel throttle body assembly (for Bank 1 or Bank 2) (Click here).

NEXT

4.READ VALUE USING INTELLIGENT TESTER

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Enter the following menus: Powertrain / Engine / Data List / Actual Throttle position or Actual Throttle position #2.

e. Check the movement of the throttle valve when idling the engine after starting it from ignition switch ON.

OK

Condition	Tester Display
Ignition switch ON	-5 to 5%
Idling	0 to 90%

OK → END

NG → Go to step 5

5.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 7

6.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON for 3 seconds.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END

DTC P1604 Startability Malfunction

for Preparation Click here

DESCRIPTION

This DTC is stored if the engine does not start or continues to crash without starting for certain period of time. This DTC is also stored if the vehicle has run out of fuel. It is necessary to check whether there was enough fuel in the fuel tank before inspection.

P1604

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After engine is started	Both conditions are met for 2 seconds or more*1 (1 trip detection logic): • STA signal is input to the ECM. • Engine speed is 500 rpm or less. *1: The time required for DTC detection may be as much as 30 seconds depending on the engine coolant temperature and atmospheric pressure.	• Battery • Entry and start system • Engine immobiliser system • Irregular fuel • Lack of fuel • Suction control valve (fuel supply pump assembly) • Injector assembly • Fuel filter element sub-assembly • Glow system • Injector driver • Engine coolant temperature sensor • Intake system • Exhaust system • Engine damaged, seized up • Loss of compression • Pressure discharge valve (common rail assembly) • Fuel pressure sensor (common rail assembly) • EGR system • Diesel throttle system
	After starting the engine (engine speed is 500 rpm or more), the engine speed drops to 200 rpm or less within 2 seconds*2 (1 trip detection logic). *2: This DTC may be stored when the engine stalls due to clutch misoperation.	

Related Data List

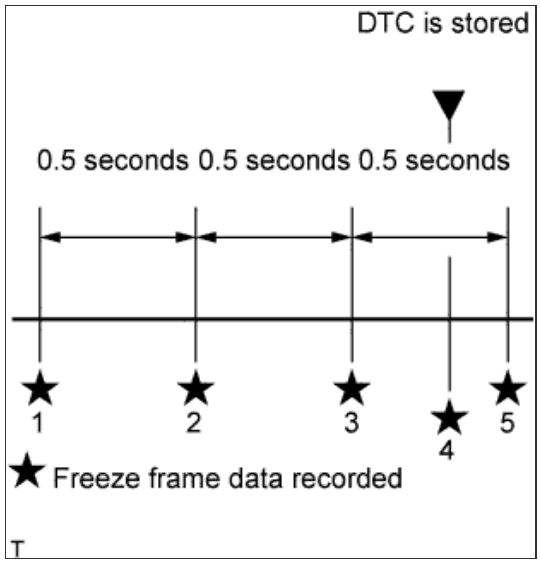
P1604	• MAP • MAF • Intake Air • Coolant Temp • Battery Voltage • Starter Signal • Engine Speed of Cyl 1 (to) • Immobiliser Communication • Target Common Rail Pressure • Fuel Press • Target Pump SCV Current • Injection Feedback Val 1 (to) • Injection Volume • Actual Throttle Position • Throttle Motor Duty 1, 2 • Target EGR Valve Position • Actual EGR Valve Pos. • EGR Close Lrn. Status • Pre Glow • After Glow



INSPECTION PROCEDURE

HINT:

- **In contrast to normal malfunction diagnosis for components, circuits and systems, DTC P1604 is used to determine the malfunctioning area from the problem symptoms and freeze frame data when the user mentions problems such as starting difficulty.**
  As these DTCs can be stored as a result of certain user actions, even if these DTCs are output, if the customer makes no mention

of problems, clear these DTCs without performing any troubleshooting and return the vehicle to the customer.

- **When confirming the freeze frame data, be sure to check all 5 data sets of freeze frame data.**
- **The fourth set of freeze frame data is the data recorded when the DTC is stored.**

In order to start the engine, the starting system, glow system, fuel system and the components related to compression must be functioning properly.

The cause of the problem can be narrowed down by checking if the engine cranks normally.

Starting system (when cranking is abnormal)

a. The engine cannot be started if a sufficient cranking speed cannot be obtained. The following are possible causes of an insufficient cranking speed.

i. Problem with the entry and start system (Engine does not crank).

ii. Problem with the immobiliser system (Engine does not crank).

iii. Problem with the battery (Cranking speed is low).

iv. Problem with the starter (Cranking speed is low).

Glow system (when cranking is normal)

a. When there is a problem with the glow system, the intake air temperature does not rise adequately and the fuel combustion temperature is not reached. Therefore, there is no initial combustion or it takes time for the engine to start. The following are possible causes.

i. Engine coolant temperature sensor malfunction.

ii. Glow plug malfunction.

HINT:

If the glow plug has deteriorated, the engine may be less likely to start when the outside temperature is lower than 0°C.

iii. Glow relay malfunction.

Fuel system (when cranking is normal)

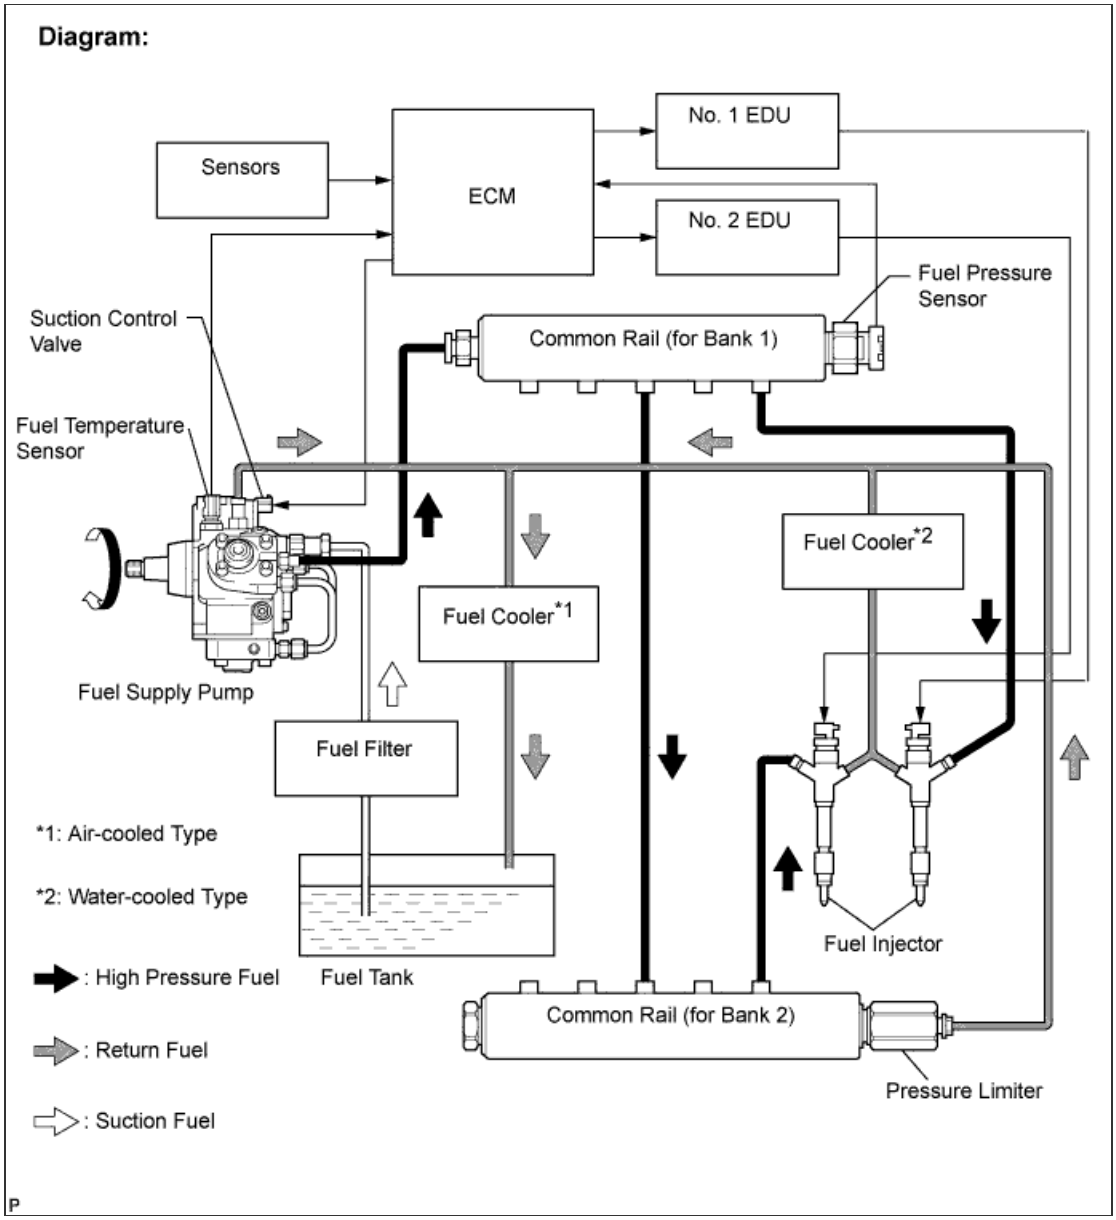
a. The engine cannot be started if fuel is not supplied. A minimum fuel pressure of 25000 kPa or higher must be supplied to start the engine. The following are possible causes of insufficient fuel pressure.

i. Fuel line clog.

ii. Lack of fuel.

iii. Fuel frozen.

iv. Low quality fuel.



v. Air in fuel pipe.

vi. Fuel filter element sub-assembly clog.

vii. Problem with fuel supply pump assembly.

viii. Problem with common rail assembly.

ix. Problem with injector assemblies.

Engine assembly

a. There may be a problem with the engine unit itself if there is no problem with cranking, the glow system or fuel system.

i. Engine friction too high.

ii. Insufficient compression.

1.READ OUTPUT DTC (RECORD STORED DTC AND FREEZE FRAME DATA) (PROCEDURE 1)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Record the stored DTCs and freeze frame data.

HINT:

Freeze frame data shows the actual engine conditions when engine starting trouble occurred.

NEXT

2.CHECK FOR ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P1604)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read the DTCs.

Result

Result	Proceed to
P1604 is output	A
P1604 and other DTCs are output	B

HINT:

If any DTCs other than DTC P1604 are output, troubleshoot those DTCs first.

DESCRIPTION

The throttle position sensor is mounted on the diesel throttle body and detects the opening angle of the throttle valve. This sensor is an electronic sensor and uses Hall-effect elements.

When the throttle valve is fully closed, a voltage of approximately 0.7 V is applied to terminal VLU of the ECM. The voltage applied to terminal VLU of the ECM increases in proportion to the opening angle of the throttle valve and becomes approximately 3.5 to 4.0 V when the throttle valve is fully opened.

The ECM determines the vehicle driving conditions from the signals input to its VLU terminal. The data is one of the inputs used for EGR control, etc.

P0122

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 3 seconds	Throttle position sensor (for Bank 1) output (VLU) is less than 0.2 V for 3 seconds (1 trip detection logic).	• Throttle position sensor (for Bank 1) • Open or short in VLU circuit • Open in VC circuit • ECM

DESCRIPTION

HINT:

- **This is the repair procedure for the accelerator pedal position sensor.**
- **This electrical throttle system does not use a throttle cable.**
- **This accelerator pedal position sensor is a non-contact type.**

The accelerator pedal position sensor is mounted on the accelerator pedal and detects the opening angle of the accelerator pedal. Since this sensor is electronically controlled with Hall-effect elements, accurate control and reliability can be obtained. It has 2 sensors to detect the accelerator position and a malfunction of the accelerator pedal position sensor.
In the accelerator pedal position sensor, the voltage applied to pedal terminals VPA and VPA2 of the ECM changes between 0 V and 5 V in proportion to the opening angle of the accelerator pedal. The VPA is a signal to indicate the actual accelerator pedal opening angle which is used for the engine control, and the VPA2 is a signal to indicate information about the opening angle which is used for detecting malfunctions. The ECM judges the current opening angle of the accelerator pedal using signals from terminals VPA and VPA2, and the ECM controls the throttle motor based on these signals.

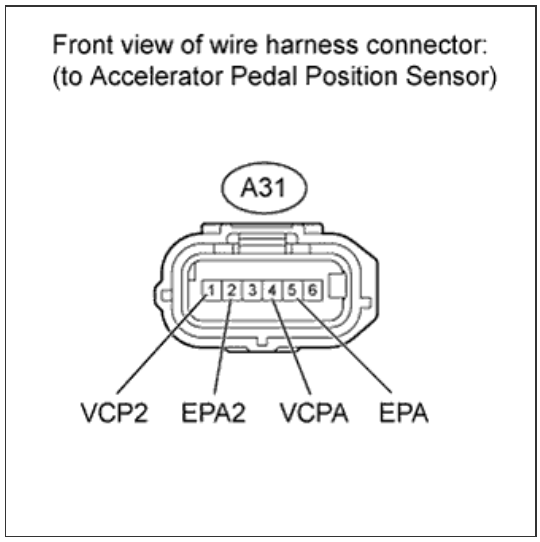
NG → Go to step 7

OK



3.INSPECT ECM TERMINAL VOLTAGE (VCPA AND VCP2 TERMINALS)

a. Disconnect the accelerator pedal position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Ignition switch ON	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 6

OK

4.REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

a. Replace the accelerator pedal rod assembly (Click here).

NEXT

5.CHECK IF OUTPUT DTC RECURS

a. Connect the intelligent tester to the DLC3.

b. Clear the DTC (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON.

e. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

f. Read the DTCs.

Result

Result	Proceed to
P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138 are output again	A
No output	B

B → END

A

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 8

7.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

8.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON.

f. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

g. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

3.INSPECT ECM TERMINAL VOLTAGE (VCPA AND VCP2 TERMINALS)

a. Disconnect the accelerator pedal position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Ignition switch ON	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 6

OK

4.REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

a. Replace the accelerator pedal rod assembly (Click here).

NEXT

5.CHECK IF OUTPUT DTC RECURS

a. Connect the intelligent tester to the DLC3.

b. Clear the DTC (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON.

e. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

f. Read the DTCs.

Result

Result	Proceed to
P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138 are output again	A
No output	B

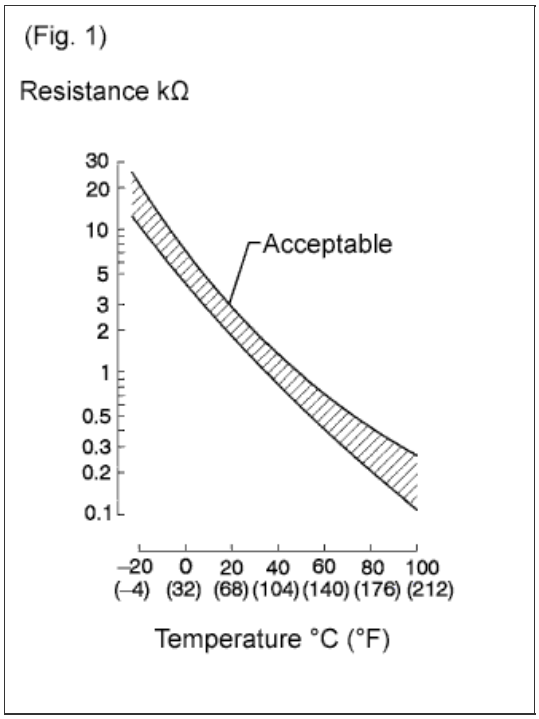
DTC P0183 Fuel Temperature Sensor "A" Circuit High Input

for Preparation Click here



DESCRIPTION

The fuel temperature sensor monitors the fuel temperature. The fuel temperature sensor has a thermistor that varies its resistance depending on the fuel temperature. When the fuel temperature is low, the resistance of the thermistor is high. When the temperature is high, the resistance is low. The variations of resistance are communicated to the ECM as changes of voltage (See Fig. 1).

The fuel temperature sensor is connected to the ECM. The 5 V power source voltage in the ECM is applied to the fuel temperature sensor from terminal THF via resistor R.

Resistor R and the fuel temperature sensor are connected in series. When the resistance value of the fuel temperature sensor changes due to a change of fuel temperature, the voltage at terminal THF also changes. Based on this signal, the ECM corrects the pressure control compensation of the fuel supply pump and determines if there are errors.

(Fig. 1)

DESCRIPTION

HINT:

- **This is the repair procedure for the accelerator pedal position sensor.**
- **This electrical throttle system does not use a throttle cable.**
- **This accelerator pedal position sensor is a non-contact type.**

The accelerator pedal position sensor is mounted on the accelerator pedal and detects the opening angle of the accelerator pedal. Since this sensor is electronically controlled with Hall-effect elements, accurate control and reliability can be obtained. It has 2 sensors to detect the accelerator position and a malfunction of the accelerator pedal position sensor.
In the accelerator pedal position sensor, the voltage applied to pedal terminals VPA and VPA2 of the ECM changes between 0 V and 5 V in proportion to the opening angle of the accelerator pedal. The VPA is a signal to indicate the actual accelerator pedal opening angle which is used for the engine control, and the VPA2 is a signal to indicate information about the opening angle which is used for detecting malfunctions. The ECM judges the current opening angle of the accelerator pedal using signals from terminals VPA and VPA2, and the ECM controls the throttle motor based on these signals.

DESCRIPTION

HINT:

- **This is the repair procedure for the accelerator pedal position sensor.**
- **This electrical throttle system does not use a throttle cable.**
- **This accelerator pedal position sensor is a non-contact type.**

The accelerator pedal position sensor is mounted on the accelerator pedal and detects the opening angle of the accelerator pedal. Since this sensor is electronically controlled with Hall-effect elements, accurate control and reliability can be obtained. It has 2 sensors to detect the accelerator position and a malfunction of the accelerator pedal position sensor.
In the accelerator pedal position sensor, the voltage applied to pedal terminals VPA and VPA2 of the ECM changes between 0 V and 5 V in proportion to the opening angle of the accelerator pedal. The VPA is a signal to indicate the actual accelerator pedal opening angle which is used for the engine control, and the VPA2 is a signal to indicate information about the opening angle which is used for detecting malfunctions. The ECM judges the current opening angle of the accelerator pedal using signals from terminals VPA and VPA2, and the ECM controls the throttle motor based on these signals.

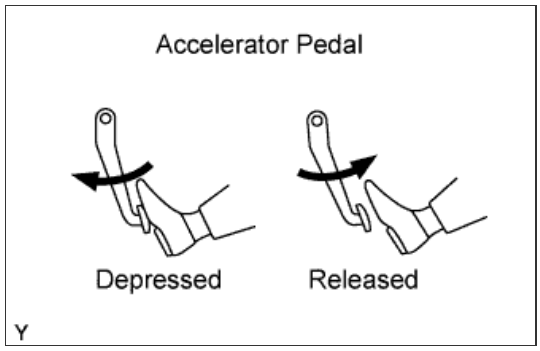
INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR PEDAL POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Accel Sens. No.1 Volt % and Accel Sens. No.2 Volt %.

d. Read the values.

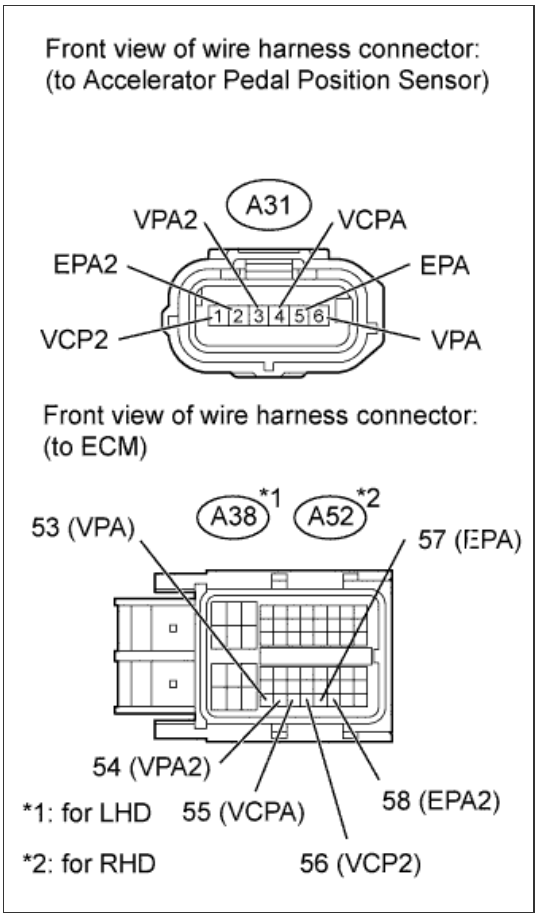
Standard:

Accelerator Pedal	Accel Sens. No.1 Volt %	Accel Sens. No.2 Volt %
Released	8 to 28%	30 to 55%
Depressed	51 to 86%	73 to 98%

Result

Result	Proceed to
NG	A
OK	B

B → Go to step 8



A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the accelerator pedal position sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) - A38-56 (VCP2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-58 (EPA2)	Always	Below 1 Ω
A31-3 (VPA2) - A38-54 (VPA2)	Always	Below 1 Ω
A31-4 (VCPA) - A38-55 (VCPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-57 (EPA)	Always	Below 1 Ω
A31-6 (VPA) - A38-53 (VPA)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) - A52-56 (VCP2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-58 (EPA2)	Always	Below 1 Ω
A31-3 (VPA2) - A52-54 (VPA2)	Always	Below 1 Ω
A31-4 (VCPA) - A52-55 (VCPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-57 (EPA)	Always	Below 1 Ω
A31-6 (VPA) - A52-53 (VPA)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) or A38-56 (VCP2) -		10 kΩ or

Body ground	Always	higher
A31-2 (EPA2) or A38-58 (EPA2) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-54 (VPA2) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-55 (VCPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-57 (EPA) - Body ground	Always	10 kΩ or higher
A31-6 (VPA) or A38-53 (VPA) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
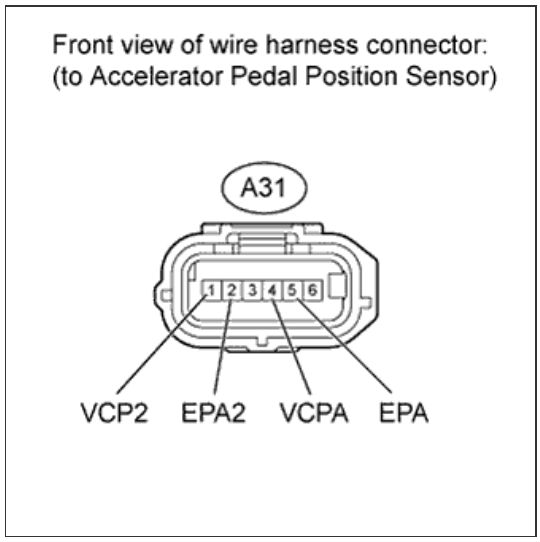
A31-1 (VCP2) or A52-56 (VCP2) - Body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-58 (EPA2) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-54 (VPA2) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-55 (VCPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-57 (EPA) - Body ground	Always	10 kΩ or higher
A31-6 (VPA) or A52-53 (VPA) - Body ground	Always	10 kΩ or higher

NG → Go to step 7

OK



3.INSPECT ECM TERMINAL VOLTAGE (VCPA AND VCP2 TERMINALS)

a. Disconnect the accelerator pedal position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Ignition switch ON	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 6

OK

4.REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

a. Replace the accelerator pedal rod assembly (Click here).

NEXT

5.CHECK IF OUTPUT DTC RECURS

a. Connect the intelligent tester to the DLC3.

b. Clear the DTC (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON.

e. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

f. Read the DTCs.

Result

Result	Proceed to
P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138 are output again	A
No output	B

B → END

A

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 8

7.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

8.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON.

f. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

g. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

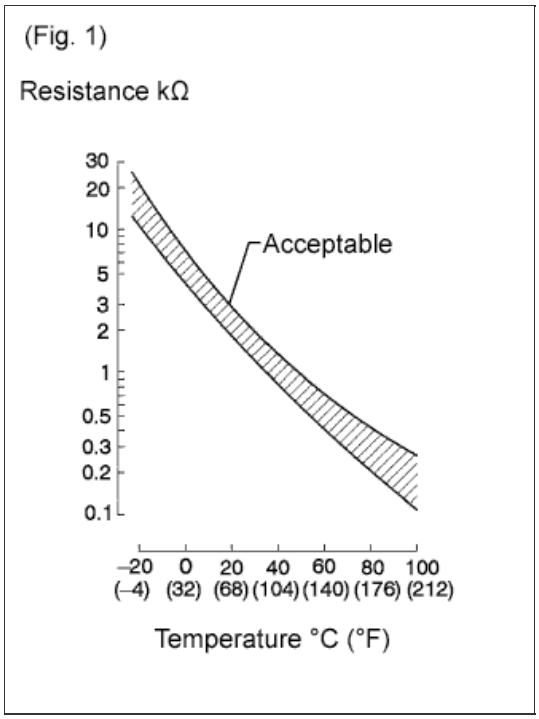
DTC P0180 Fuel Temperature Sensor "A" Circuit

DTC P0182 Fuel Temperature Sensor "A" Circuit Low Input

DTC P0183 Fuel Temperature Sensor "A" Circuit High Input

for Preparation Click here



DESCRIPTION

The fuel temperature sensor monitors the fuel temperature. The fuel temperature sensor has a thermistor that varies its resistance depending on the fuel temperature. When the fuel temperature is low, the resistance of the thermistor is high. When the temperature is high, the resistance is low. The variations of resistance are communicated to the ECM as changes of voltage (See Fig. 1).

The fuel temperature sensor is connected to the ECM. The 5 V power source voltage in the ECM is applied to the fuel temperature sensor from terminal THF via resistor R.

Resistor R and the fuel temperature sensor are connected in series. When the resistance value of the fuel temperature sensor changes due to a change of fuel temperature, the voltage at terminal THF also changes. Based on this signal, the ECM corrects the pressure control compensation of the fuel supply pump and determines if there are errors.

(Fig. 1)

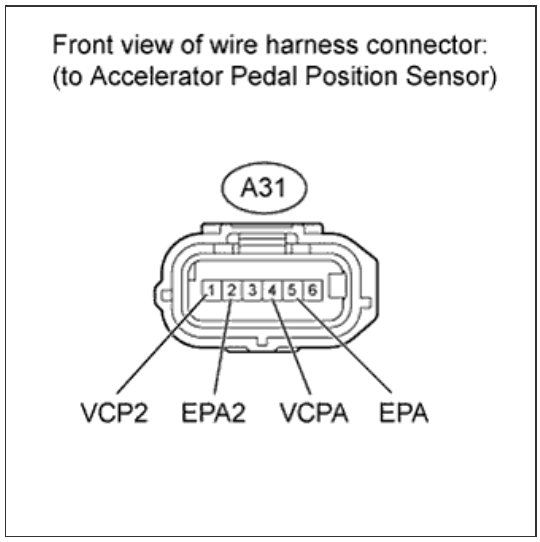
A31-6 (VPA) or A52-53 (VPA) - Body ground	Always	10 kΩ or higher

NG → Go to step 7

OK



3.INSPECT ECM TERMINAL VOLTAGE (VCPA AND VCP2 TERMINALS)

a. Disconnect the accelerator pedal position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Ignition switch ON	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 6

OK

4.REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

a. Replace the accelerator pedal rod assembly (Click here).

NEXT

5.CHECK IF OUTPUT DTC RECURS

a. Connect the intelligent tester to the DLC3.

b. Clear the DTC (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON.

e. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

f. Read the DTCs.

Result

Result	Proceed to
P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138 are output again	A
No output	B

B → END

A

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 8

7.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

8.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON.

f. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

g. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

DTC P0299 Turbocharger / Supercharger Underboost

for Preparation Click here

DESCRIPTION

HINT:

Refer to DTC P0046 (Click here).

Refer to DTC P00AF (Click here).

P0299

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Accelerate vehicle with accelerator halfway open or more starting from a speed of 120 km/h (192 mph) or more for 2 minutes (make sure gear is fixed and does not change)	The pressure is 55 kPa below the Target Boost Pressure for 40 seconds at an engine speed of 2800 to 4400 rpm (2 trip detection logic).	• Turbocharger sub-assembly • Turbo motor driver • Turbo motor driver power source • Extremely low battery voltage (P0560 output simultaneously) • Disconnected pipe between turbo and intake manifold • Disconnected MAP sensor hose • Throttle valve stuck closed • EGR does not close • Exhaust system or intake system modified (leading to increased pressure loss, etc.) • Manifold absolute pressure sensor • Injection system (reduction in fuel injection volume) • ECM

Related Data List

DTC No.	Data List
P0299	• Target Booster Pressure • MAP

HINT:

If DTC P0299 is stored, the following symptoms may appear:

- **Variable nozzle stuck open malfunction**
  - **Lack of power**
  - **Vehicle surge or hesitation under light or medium load**
  - **White smoke**

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Comparison of the Data List items MAP and Target Booster Pressure during acceleration under medium to high engine speeds can be used to determine the state of the problem.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0299)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result:

Display (DTC Output)	Proceed to
P0299 is output	A
P0299 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.CHECK INTAKE AND EXHAUST SYSTEM

a. Check the intake and exhaust system modifications.

OK:
No modifications.

NG → REPAIR OR REPLACE INTAKE AND EXHAUST SYSTEM

OK

3.INSPECT TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2)

a. Check the turbocharger sub-assembly (for Bank 1 or Bank 2) (Click here).

HINT:

Check if the VN is stuck, if there are abnormal noises from the turbo (impeller is damaged), if there is turbo shaft rattle, and if the turbo shaft rotates smoothly.

NG → REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (Click here)

OK

4.CHECK CONNECTION OF VACUUM HOSE

a. Check the vacuum hoses of manifold absolute pressure sensor connections.

NG → REPAIR OR REPLACE VACUUM HOSE

OK

5.READ VALUE USING INTELLIGENT TESTER (MAP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / MAP.

d. Read the value.

Standard Value:

Condition	Standard Value
Idling	90 to 102 kPa
3000 rpm	100 to 150 kPa

NG → REPLACE MANIFOLD ABSOLUTE PRESSURE SENSOR

OK

6.READ VALUE USING INTELLIGENT TESTER (ACTUAL THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Actual Throttle Position, Actual Throttle Position #2.

d. Read the value.

Standard Value:

Condition	Standard Value
Ignition switch ON	-5 to 5%
Idling	0 to 90%

NG → REPLACE DIESEL THROTTLE BODY ASSEMBLY (for Bank 1 or Bank 2)

OK

7.READ VALUE USING INTELLIGENT TESTER (ACTUAL EGR VALVE POS.)

HINT:

For vehicles without EGR valve, perform troubleshooting from the next step.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the EGR Step Position or Control the EGR Step Position #2 / Data List / Actual EGR Valve Pos. or Actual EGR Valve Pos. #2.

d. When changing the Active Test value from 0 to 100%, check that Actual EGR Valve Pos. or Actual EGR Valve Pos. #2 smoothly changes to the set opening angle.

Standard Value:
Value smoothly changes to within +/-10% of set opening angle.

HINT:

- **EGR valve closed: Actual EGR Valve Pos. is 0%.**
- **EGR valve open: Actual EGR Valve Pos. is 94.9%.**

e. Next, after the engine is warmed up, stop the engine and wait for 15 seconds. After that, start the engine again and idle it for 30 seconds. Then stop the engine and wait for 15 seconds. After starting the engine again, read the Data List values while idling.

Standard Value:

Tester Display	Standard Value
EGR Close Learn Val.	3.5 to 4.5 V
EGR Close Lrn. Val. #2	3.5 to 4.5 V

EGR Close Lrn. Status	ON

NG → REPLACE EGR VALVE ASSEMBLY (No. 1 or No. 2)

OK

8.READ VALUE USING INTELLIGENT TESTER (INJECTION FEEDBACK VAL #1 TO #8)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine and warm it up.

d. Enter the following menus: Powertrain / Engine / Data List / Injection Feedback Val #1 to #8.

e. Read the values.

Standard Value:

Item	Engine Speed*	Reference Value
Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st

HINT:

- ***: The A/C switch and all accessory switches should be OFF, and the engine should be fully warmed up.**
- **When the values are outside the standard range, deposits inside the fuel injector may be causing the problem.**

OK:
Values are within the standard range.

NG → REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER

OK

9.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine and warm it up.

e. Accelerate the vehicle with the accelerator halfway open or more starting from a speed of 120 km/h (192 mph) or more for 2 minutes (make sure the gear is fixed and does not change).

f. Enter the following menus: Powertrain / Engine / DTC / Pending.

g. Read the DTC.

Result

for Preparation Click here

DESCRIPTION

HINT:

- **This is the repair procedure for the accelerator pedal position sensor.**
- **This electrical throttle system does not use a throttle cable.**
- **This accelerator pedal position sensor is a non-contact type.**

The accelerator pedal position sensor is mounted on the accelerator pedal and detects the opening angle of the accelerator pedal. Since this sensor is electronically controlled with Hall-effect elements, accurate control and reliability can be obtained. It has 2 sensors to detect the accelerator position and a malfunction of the accelerator pedal position sensor.
In the accelerator pedal position sensor, the voltage applied to pedal terminals VPA and VPA2 of the ECM changes between 0 V and 5 V in proportion to the opening angle of the accelerator pedal. The VPA is a signal to indicate the actual accelerator pedal opening angle which is used for the engine control, and the VPA2 is a signal to indicate information about the opening angle which is used for detecting malfunctions. The ECM judges the current opening angle of the accelerator pedal using signals from terminals VPA and VPA2, and the ECM controls the throttle motor based on these signals.

WIRING DIAGRAM

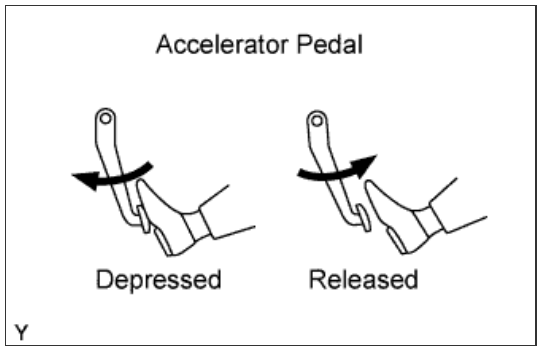
INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR PEDAL POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Accel Sens. No.1 Volt % and Accel Sens. No.2 Volt %.

d. Read the values.

Standard:

Accelerator Pedal	Accel Sens. No.1 Volt %	Accel Sens. No.2 Volt %
Released	8 to 28%	30 to 55%
Depressed	51 to 86%	73 to 98%

e. Turn the ignition switch to ON.

f. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

g. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

NEXT

END

DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent

for Preparation Click here

DESCRIPTION

The crankshaft position sensor system consists of a crankshaft position sensor plate and a pickup coil. The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of an iron core and magnet. The sensor plate rotates, and a pulse signal is created as each tooth passes by the pickup coil. The pickup coil generates 34 signals for each revolution. Based on these signals, the ECM calculates the crankshaft position and engine speed. Using these calculations, the common rail injection system is controlled.

P0335

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Crank or start engine	When one of the following conditions is met (for 5 seconds during cranking or 0.5 seconds during engine start) (1 trip detection logic): • No crankshaft position sensor signal is sent to the ECM while cranking.	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • No. 1 crankshaft position sensor plate (crankshaft) • ECM

P0339

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Engine running at 1000 rpm or more with vehicle stationary	No crankshaft position sensor signal is input to the ECM for 0.05 seconds or more, and conditions (a), (b) and (c) are met (1 trip detection logic): (a) Engine speed is 1000 rpm or more. (b) STA signal is off. (c) 3 seconds or more have elapsed after STA signal is switched from on to off.	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • No. 1 crankshaft position sensor plate (crankshaft) • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**
- **The Data List item Engine Speed is calculated from the output of the crankshaft position sensor.**
- **A DTC is also stored when the ground of a shielded wire is faulty.**

1.INSPECT CRANKSHAFT POSITION SENSOR

a. Disconnect the crankshaft position sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (NE+) - 2 (NE-)	Cold	1630 to 2740 Ω
1 (NE+) - 2 (NE-)	Hot	2065 to 3225 Ω

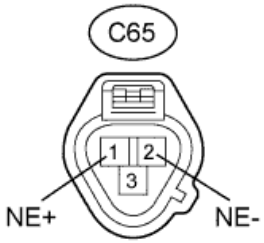
HINT:

In the table above, the terms "Cold" and "Hot" refer to the temperature of the coils in the sensor. "Cold" means approximately -10 to 50°C (14 to 122°F). "Hot" means approximately 50 to 100°C (122 to 212°F).

Component without harness connected:
(Crankshaft Position Sensor)

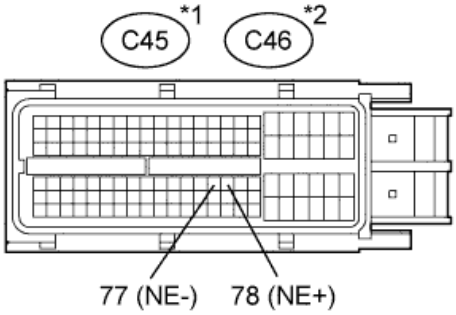
NG → Go to step 6

OK



2.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)

a. Disconnect the crankshaft position sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Crankshaft Position Sensor)

Front view of wire harness connector:

3.CHECK CRANKSHAFT POSITION SENSOR (SENSOR INSTALLATION)

a. Check the sensor installation.

OK:
Sensor is installed correctly.

NG → Go to step 8

OK

4.CHECK NO. 1 CRANKSHAFT POSITION SENSOR PLATE

a. Check the teeth of the sensor plate.

OK:
The sensor plate teeth do not have any cracks or deformation.

NG → Go to step 9

OK

5.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 10

6.REPLACE CRANKSHAFT POSITION SENSOR

a. Replace the crankshaft position sensor (Click here).

NEXT → Go to step 10

7.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 10

8.SECURELY REINSTALL SENSOR

a. Securely reinstall sensor (Click here).

NEXT → Go to step 10

9.REPLACE CRANKSHAFT

a. Replace the crankshaft (Click here).

NEXT

10.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine and run it at 1000 rpm or more.

e. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0335 and/or P0339.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, after increasing the engine speed to 1000 rpm for approximately 1 second, idle the engine for 5 minutes.

DESCRIPTION

HINT:

- **This is the repair procedure for the accelerator pedal position sensor.**
- **This electrical throttle system does not use a throttle cable.**
- **This accelerator pedal position sensor is a non-contact type.**

The accelerator pedal position sensor is mounted on the accelerator pedal and detects the opening angle of the accelerator pedal. Since this sensor is electronically controlled with Hall-effect elements, accurate control and reliability can be obtained. It has 2 sensors to detect the accelerator position and a malfunction of the accelerator pedal position sensor.
In the accelerator pedal position sensor, the voltage applied to pedal terminals VPA and VPA2 of the ECM changes between 0 V and 5 V in proportion to the opening angle of the accelerator pedal. The VPA is a signal to indicate the actual accelerator pedal opening angle which is used for the engine control, and the VPA2 is a signal to indicate information about the opening angle which is used for detecting malfunctions. The ECM judges the current opening angle of the accelerator pedal using signals from terminals VPA and VPA2, and the ECM controls the throttle motor based on these signals.

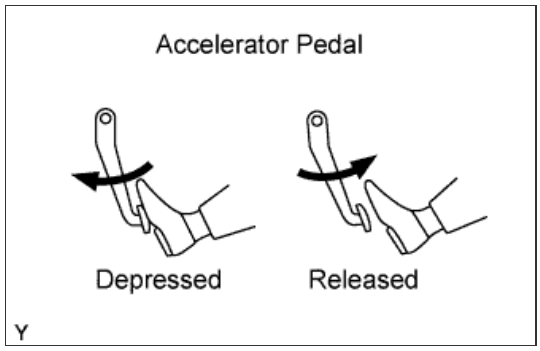
INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR PEDAL POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Accel Sens. No.1 Volt % and Accel Sens. No.2 Volt %.

d. Read the values.

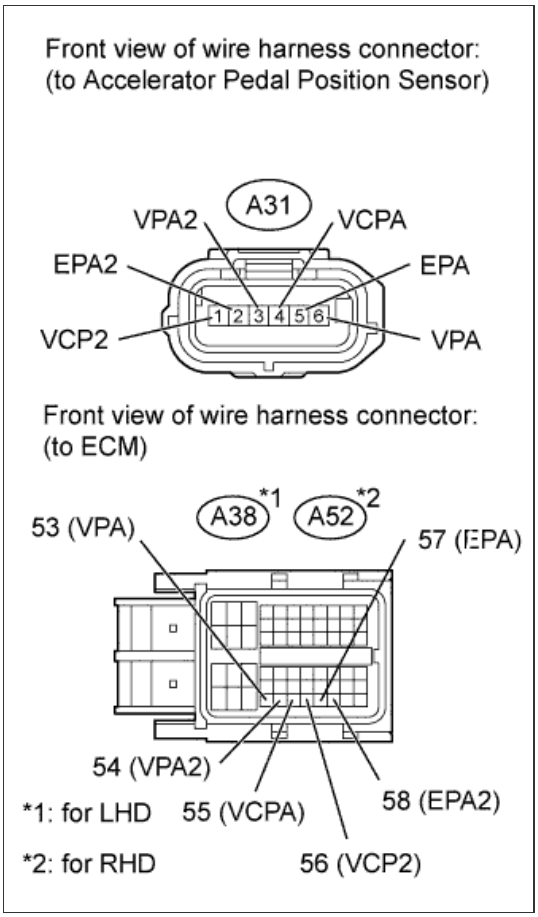
Standard:

Accelerator Pedal	Accel Sens. No.1 Volt %	Accel Sens. No.2 Volt %
Released	8 to 28%	30 to 55%
Depressed	51 to 86%	73 to 98%

Result

Result	Proceed to
NG	A
OK	B

B → Go to step 8



A

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the accelerator pedal position sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) - A38-56 (VCP2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-58 (EPA2)	Always	Below 1 Ω
A31-3 (VPA2) - A38-54 (VPA2)	Always	Below 1 Ω
A31-4 (VCPA) - A38-55 (VCPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-57 (EPA)	Always	Below 1 Ω
A31-6 (VPA) - A38-53 (VPA)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) - A52-56 (VCP2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-58 (EPA2)	Always	Below 1 Ω
A31-3 (VPA2) - A52-54 (VPA2)	Always	Below 1 Ω
A31-4 (VCPA) - A52-55 (VCPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-57 (EPA)	Always	Below 1 Ω
A31-6 (VPA) - A52-53 (VPA)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) or A38-56 (VCP2) -		10 kΩ or

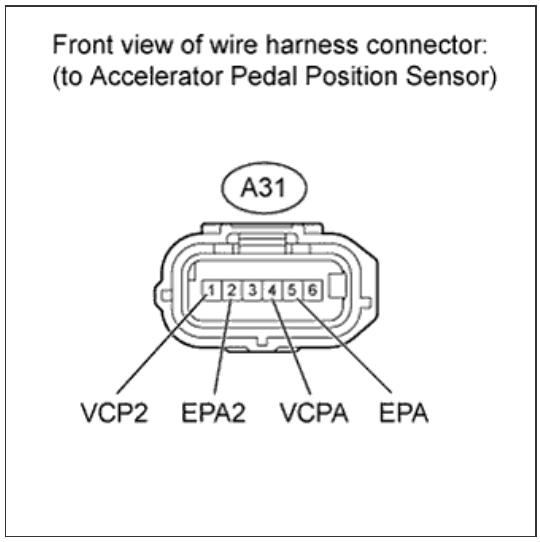
Body ground	Always	higher
A31-2 (EPA2) or A38-58 (EPA2) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-54 (VPA2) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-55 (VCPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-57 (EPA) - Body ground	Always	10 kΩ or higher
A31-6 (VPA) or A38-53 (VPA) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) or A52-56 (VCP2) - Body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-58 (EPA2) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-54 (VPA2) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-55 (VCPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-57 (EPA) - Body ground	Always	10 kΩ or higher
A31-6 (VPA) or A52-53 (VPA) - Body ground	Always	10 kΩ or higher

NG → Go to step 7

OK



3.INSPECT ECM TERMINAL VOLTAGE (VCPA AND VCP2 TERMINALS)

a. Disconnect the accelerator pedal position sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Ignition switch ON	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 6

OK

4.REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

a. Replace the accelerator pedal rod assembly (Click here).

NEXT

5.CHECK IF OUTPUT DTC RECURS

a. Connect the intelligent tester to the DLC3.

b. Clear the DTC (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch to ON.

e. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

f. Read the DTCs.

Result

Result	Proceed to
P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138 are output again	A
No output	B

B → END

A

6.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 8

7.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT

8.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Turn the ignition switch off and leave the vehicle for 15 seconds.

e. Turn the ignition switch to ON.

f. Fully close the accelerator pedal for 3 seconds, then hold it partway open for 3 seconds, then fully open it for 3 seconds.

g. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P2120, P2122, P2123, P2125, P2127, P2128 and/or P2138.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, idle the engine.

NEXT

END

DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent

for Preparation Click here

DESCRIPTION

The crankshaft position sensor system consists of a crankshaft position sensor plate and a pickup coil. The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of an iron core and magnet. The sensor plate rotates, and a pulse signal is created as each tooth passes by the pickup coil. The pickup coil generates 34 signals for each revolution. Based on these signals, the ECM calculates the crankshaft position and engine speed. Using these calculations, the common rail injection system is controlled.

P0335

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Crank or start engine	When one of the following conditions is met (for 5 seconds during cranking or 0.5 seconds during engine start) (1 trip detection logic): • No crankshaft position sensor signal is sent to the ECM while cranking.	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • No. 1 crankshaft position sensor plate (crankshaft) • ECM

P0339

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Engine running at 1000 rpm or more with vehicle stationary	No crankshaft position sensor signal is input to the ECM for 0.05 seconds or more, and conditions (a), (b) and (c) are met (1 trip detection logic): (a) Engine speed is 1000 rpm or more. (b) STA signal is off. (c) 3 seconds or more have elapsed after STA signal is switched from on to off.	• Open or short in crankshaft position sensor circuit • Crankshaft position sensor • No. 1 crankshaft position sensor plate (crankshaft) • ECM

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**
- **The Data List item Engine Speed is calculated from the output of the crankshaft position sensor.**
- **A DTC is also stored when the ground of a shielded wire is faulty.**

1.INSPECT CRANKSHAFT POSITION SENSOR

a. Disconnect the crankshaft position sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (NE+) - 2 (NE-)	Cold	1630 to 2740 Ω
1 (NE+) - 2 (NE-)	Hot	2065 to 3225 Ω

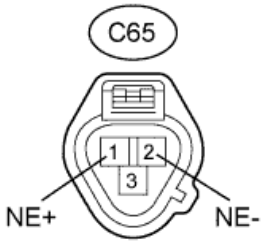
HINT:

In the table above, the terms "Cold" and "Hot" refer to the temperature of the coils in the sensor. "Cold" means approximately -10 to 50°C (14 to 122°F). "Hot" means approximately 50 to 100°C (122 to 212°F).

Component without harness connected:
(Crankshaft Position Sensor)

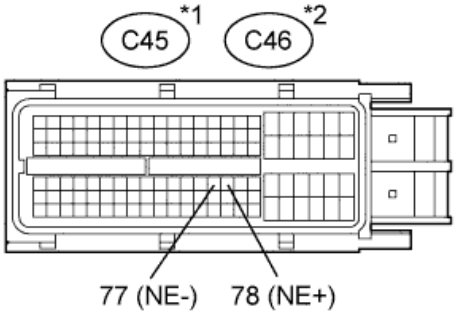
NG → Go to step 6

OK



2.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)

a. Disconnect the crankshaft position sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Crankshaft Position Sensor)

Front view of wire harness connector:

DTC P0340 Camshaft Position Sensor "A" Circuit (Bank 1 or Single Sensor)

for Preparation Click here

DESCRIPTION

The camshaft position sensor (G signal) consists of a magnet, iron core and pickup coil.
The G signal plate (timing sprocket) has one tooth on its outer circumference and is installed on the camshaft timing chain gear. When the timing gear rotates, the protrusion on the signal plate and the air gap on the pickup coil change, causing fluctuations in the magnetic field that generate a voltage in the pickup coil.
The NE signal plate has 34 teeth and is mounted on the crank angle sensor plate. The NE signal sensor generates 34 signals for every revolution. The ECM detects the standard crankshaft angle based on the G signal, and detects the actual crankshaft angle and engine speed based on the NE signal.

P0340

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Crank engine for 4 seconds (STA on)	STA on: No camshaft position sensor signal is sent to the ECM while cranking for 4 seconds or more (2 trip detection logic).	• Open or short in camshaft position sensor circuit • Camshaft position sensor • No. 2 camshaft timing sprocket • ECM
Idle engine for 1 second (STA off)	STA off: When either condition below is met for 1 second (1 trip detection logic): • G signal is not input with an engine speed of 500 rpm or more. • No camshaft position sensor signal is sent to the ECM with an engine speed of 500 to 3000 rpm 20 times or more.	

HINT:

If DTC P0340 is stored, the following symptoms may appear:

- Difficult starting
- Misfire
- Combustion noise
- Black smoke
- White smoke
- Lack of power

WIRING DIAGRAM

Refer to DTC P0335 (Click here).

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.INSPECT CAMSHAFT POSITION SENSOR

a. Disconnect the camshaft position sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Cold	835 to 1400 Ω
1 - 2	Hot	1060 to 1645 Ω

HINT:

In the table above, the terms "Cold" and "Hot" refer to the temperature of the coils in the sensor. "Cold" means approximately -10 to 50°C (14 to 122°F).

"Hot" means approximately 50 to 100°C (122 to 212°F).

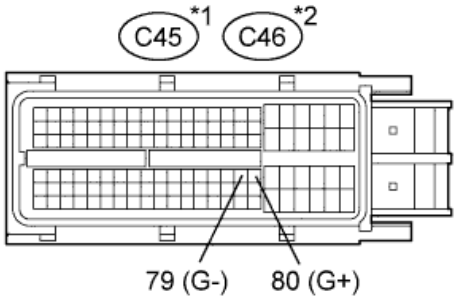
Component without harness connected:
(Camshaft Position Sensor)

NG → Go to step 6

OK

.CHECK HARNESS AND CONNECTOR (CAMSHAFT POSITION SENSOR - ECM)

a. Disconnect the camshaft position sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Camshaft Position Sensor)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition

C66-1 - C45-80 (G+)	Always	Below 1 Ω
C66-2 - C45-79 (G-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C66-1 - C46-80 (G+)	Always	Below 1 Ω
C66-2 - C46-79 (G-)	Always	Below 1 Ω

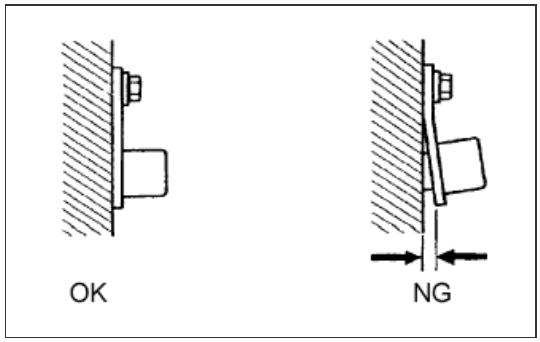
Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C66-1 or C45-80 (G+) - Body ground	Always	10 kΩ or higher
C66-2 or C45-79 (G-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C66-1 or C46-80 (G+) - Body ground	Always	10 kΩ or higher
C66-2 or C46-79 (G-) - Body ground	Always	10 kΩ or higher



NG → Go to step 7

OK

3.CHECK CAMSHAFT POSITION SENSOR (SENSOR INSTALLATION)

a. Check the sensor installation.

OK:
Sensor is installed correctly.

NG → Go to step 8

OK

4.CHECK NO. CAMSHAFT TIMING SPROCKET

a. Check the condition of the timing sprocket.

OK:
Timing sprocket does not have any cracks or deformation.

NG → Go to step 9

OK

5.REPLACE ECM

a. Replace the ECM (Click here).

NEXT → Go to step 10

6.REPLACE CAMSHAFT POSITION SENSOR

a. Replace the camshaft position sensor (Click here).

NEXT → Go to step 10

7.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 10

8.SECURELY REINSTALL SENSOR

a. Securely reinstall the sensor (Click here).

NEXT → Go to step 10

9.REPLACE NO. CAMSHAFT TIMING SPROCKET

a. Replace the No. 2 camshaft timing sprocket (Click here).

NEXT

10.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine and idle it for 2 seconds.

e. Enter the following menus: Powertrain / Engine / DTC.

f. Confirm that the DTC is not output again.

NEXT

END

DTC P2226 Barometric Pressure Circuit

DTC P2228 Barometric Pressure Circuit Low Input

DTC P2229 Barometric Pressure Circuit High Input

for Preparation Click here

DESCRIPTION

To detect atmospheric pressure, the built-in atmospheric pressure sensor in the ECM is used for the common rail system. Following the changes in the atmospheric pressure, the ECM corrects the injection volume, timing and duration, and adjusts the common rail internal fuel pressure in order to optimize engine combustion.

P2226

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	Atmospheric pressure sensor voltage is 1.4 V or less, or 4.0 V or more for 0.5 seconds (1 trip detection logic).	ECM

P2228

DTC P0400 Exhaust Gas Recirculation Flow

DTC P1248 Exhaust Gas Recirculation Flow Bank 2

for Preparation Click here

DESCRIPTION

The EGR system recirculates exhaust gases. The recirculated gas mingles with the intake air so that the EGR system can slow combustion speed and keep the combustion temperature down. This helps reduce NOx emissions.
In order to increase EGR circulation efficiency, the ECM adjusts the lift amount of the EGR valve and the throttle valve angle.

P0400 (No. 1 EGR valve malfunction)

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After warming up engine and idling for 60 seconds, maintain engine speed at 2500 rpm for 40 seconds, drive vehicle and perform engine break deceleration by fully closing accelerator when engine speed is 2000 rpm or more	The target and actual positions of the No. 1 EGR valve assembly are different for 30 seconds or more (1 trip detection logic).	• EGR valve stuck • EGR valve does not move smoothly • Open or short in EGR valve circuit • EGR valve deposit • EGR valve passage • ECM

P1248 (No. 2 EGR valve malfunction)

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
After warming up engine and idling for 60 seconds, maintain engine speed at 2500 rpm for 40 seconds, drive vehicle and perform engine break deceleration by fully closing accelerator when engine speed is 2000 rpm or more	The target and actual positions of the No. 1 EGR valve assembly are different for 30 seconds or more (1 trip detection logic).	• EGR valve stuck • EGR valve does not move smoothly • Open or short in EGR valve circuit • EGR valve deposit • EGR valve passage • ECM

P0400 (Flow malfunction)

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Decelerate from a speed of 50 km/h (80 mph) or more (release accelerator pedal for approximately 5 seconds)	Mass air flow rate is not changed when turning on the electric EGR control valve while decelerating (2 trip detection logic).	• EGR valve stuck • EGR valve does not move smoothly • Open or short in EGR valve

		circuit • EGR valve deposit • EGR valve passage • ECM

- **EGR valve closed: Actual EGR Valve Pos. is 0%**
- **EGR valve open: Actual EGR Valve Pos. is 94.9%**

NG → Go to step 6

OK

3.READ VALUE USING INTELLIGENT TESTER (EGR VALVE LEARNING VALUE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch from ON to off, and wait 5 seconds. Then turn the ignition switch to ON and the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / EGR Close Learn Val. or EGR Close Lrn. Val. #2, and EGR Lift Sensor Volt % or EGR Lift Sensor Volt % #2.

d. Check the value.

OK:

Tester Display	Standard value
EGR Close Learn Val.	3.5 to 4.5 V
EGR Close Lrn. Val. #2	3.5 to 4.5 V
EGR Lift Sensor Volt %	70 to 90%
EGR Lift Sensor Volt % #2	70 to 90%

HINT:

- **When EGR Close Lrn. Status is OFF (learning is incomplete) or EGR Close Lrn. Value is 3.5 V (lower limit), there is foreign matter stuck in the valve.**
- **The median value of EGR Close Lrn. Value is 4.0 V.**

NG → Go to step 10

OK

4.CHECK FOR DEPOSIT (EGR PASSAGE)

a. Check for any deposits.

OK:

No deposits.

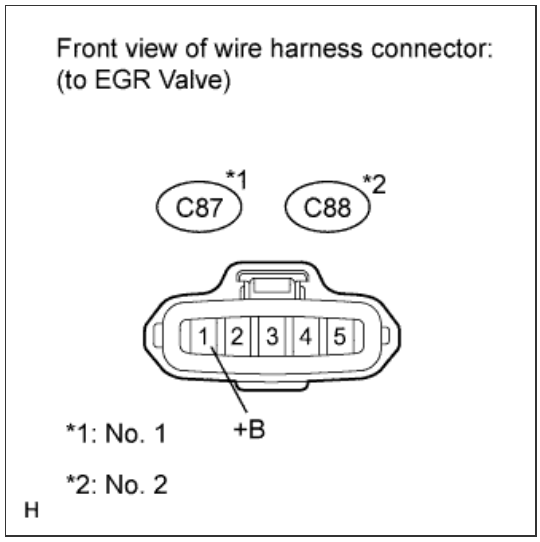
NG → Go to step 11

OK

5.CHECK FOR EXHAUST GAS LEAKS

a. Check for exhaust gas leaks.

OK:
No leaks.



OK → Go to step 9

NG → Go to step 12

6.INSPECT EGR VALVE ASSEMBLY (POWER SOURCE)

a. Disconnect the EGR valve connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

No. 1

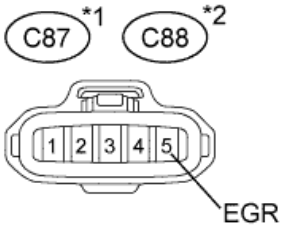
Tester Connection	Switch Condition	Specified Condition
C87-1 (+B) - Body ground	Ignition switch ON	11 to 14 V

No. 2

Tester Connection	Switch Condition	Specified Condition
C88-1 (+B) - Body ground	Ignition switch ON	11 to 14 V

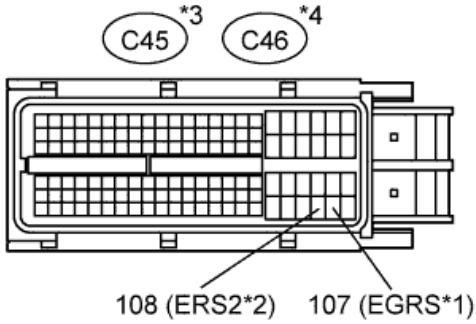
NG → Go to step 13

OK



7.CHECK HARNESS AND CONNECTOR (EGR VALVE ASSEMBLY - ECM)

a. Disconnect the EGR valve connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

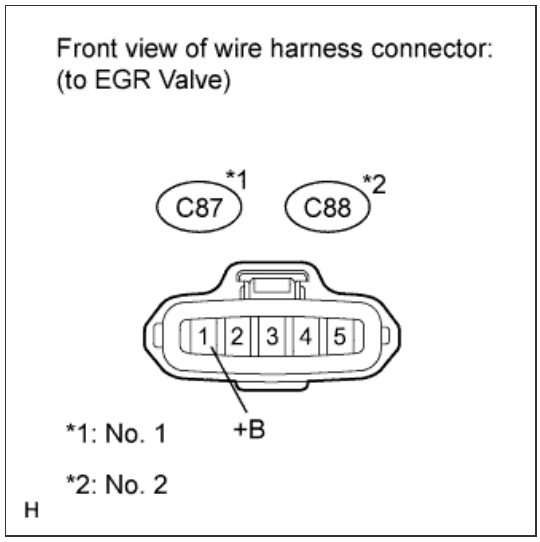
5.CHECK FOR EXHAUST GAS LEAKS

a. Check for exhaust gas leaks.

OK:
No leaks.



OK → Go to step 9

NG → Go to step 12

6.INSPECT EGR VALVE ASSEMBLY (POWER SOURCE)

a. Disconnect the EGR valve connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

No. 1

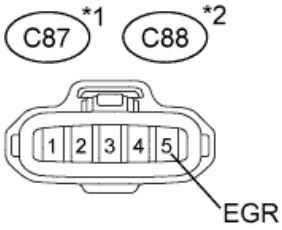
Tester Connection	Switch Condition	Specified Condition
C87-1 (+B) - Body ground	Ignition switch ON	11 to 14 V

No. 2

Tester Connection	Switch Condition	Specified Condition
C88-1 (+B) - Body ground	Ignition switch ON	11 to 14 V

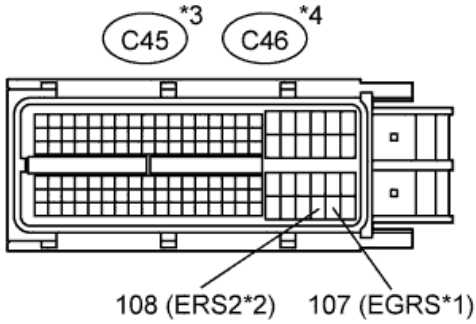
NG → Go to step 13

OK



7.CHECK HARNESS AND CONNECTOR (EGR VALVE ASSEMBLY - ECM)

a. Disconnect the EGR valve connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to EGR Valve)

Front view of wire harness connector:
(to ECM)

*1: No. 1

*2: No. 2

*3: for LHD

*4: for RHD

Standard Resistance (Check for Open):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-5 (EGR) - C45-107 (EGRS)	Always	Below 1 Ω

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-5 (EGR) - C45-108 (ERS2)	Always	Below 1 Ω

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-5 (EGR) - C46-107 (EGRS)	Always	Below 1 Ω

No. 2 (RHD)

Tester Connection	Condition	Specified Condition
C88-5 (EGR) - C46-108 (ERS2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-5 (EGR) or C45-107 (EGRS) - Body ground	Always	10 kΩ or higher

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-5 (EGR) or C45-108 (ERS2) - Body ground	Always	10 kΩ or higher

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-5 (EGR) or C46-107 (EGRS) - Body ground	Always	10 kΩ or higher

No. 2 (RHD)

Tester Connection	Condition	Specified Condition
C88-5 (EGR) or C46-108 (ERS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 14

OK

8.REPLACE EGR VALVE ASSEMBLY (No. 1 or No. 2)

a. Replace the EGR valve assembly (No. 1 or No. 2) (Click here).

NEXT

9.CHECK WHETHER DTC OUTPUT RECURS

a. Clear the DTCs (Click here).

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. After warming up the engine and idling for 60 seconds, maintain the engine speed at 2500 rpm for 40 seconds, decelerate from a speed of 50 km/h (80 mph) or more (release accelerator pedal for approximately 5 seconds).

g. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0400 and/or P1248.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, after warming up the engine and idling for 60 seconds, maintain the engine speed at 2500 rpm for 40 seconds, decelerate from a speed of 50 km/h (80 mph) or more (release accelerator pedal for approximately 5 seconds).

Result

Result	Proceed to
NORMAL	A
ABNORMAL	B

A → END

B → Go to step 15

10.REMOVE FOREIGN OBJECT AND CLEAN EGR VALVE (No. 1 or No. 2)

NEXT → Go to step 16

11.REPAIR OR REPLACE MALFUNCTIONING PARTS, COMPONENT AND AREA

NEXT → Go to step 16

12.REPAIR EXHAUST GAS LEAKAGE POINT

NEXT → Go to step 16

13.REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - EGR VALVE CONNECTOR)

NEXT → Go to step 16

14.REPAIR OR REPLACE HARNESS OR CONNECTOR

NEXT → Go to step 16

15.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

16.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Connect the intelligent tester to the DLC3.

b. Clear the DTCs (Click here).

c. Turn the ignition switch off.

d. Start the engine.

e. After warming up the engine and idling for 60 seconds, maintain the engine speed at 2500 rpm for 40 seconds, decelerate from a speed of 50 km/h (80 mph) or more (release accelerator pedal for approximately 5 seconds).

f. Confirm that the DTC is not output again.

HINT:

Perform the following procedure using the tester to determine whether or not the DTC judgment has been carried out.

i. Enter the following menus: Powertrain / Engine / Utility / All Readiness.

ii. Input DTC P0400 and/or P1248.

iii. Check that STATUS is NORMAL. If STATUS is INCOMPLETE or UNKNOWN, after warming up the engine and idling for 60 seconds, maintain the engine speed at 2500 rpm for 40 seconds, decelerate from a speed of 50 km/h (80 mph) or more (release accelerator pedal for approximately 5 seconds).

DTC P2226 Barometric Pressure Circuit

DTC P2228 Barometric Pressure Circuit Low Input

DTC P2229 Barometric Pressure Circuit High Input

for Preparation Click here

DESCRIPTION

To detect atmospheric pressure, the built-in atmospheric pressure sensor in the ECM is used for the common rail system. Following the changes in the atmospheric pressure, the ECM corrects the injection volume, timing and duration, and adjusts the common rail internal fuel pressure in order to optimize engine combustion.

P2226

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	Atmospheric pressure sensor voltage is 1.4 V or less, or 4.0 V or more for 0.5 seconds (1 trip detection logic).	ECM

P2228

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	Atmospheric pressure sensor voltage is 1.4 V or less for 0.5 seconds (1 trip detection logic).	ECM

P2229

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 1 second	Atmospheric pressure sensor voltage is 4.0 V or more for 0.5 seconds (1 trip detection logic).	ECM

Related Data List

DTC No.	Data List
P2226	• Atmosphere Pressure • MAP
P2228	
P2229	

HINT:

- **When the ignition switch is ON, the intake air pipe pressure is approximately equal to atmospheric pressure.**
- **Under standard atmospheric pressure conditions, the output of the atmospheric pressure sensor is 101 kPa. For every 100 m increase in altitude, pressure drops by 1 kPa. Varies by weather (high atmospheric pressure, low atmospheric pressure).**
- **If DTC P2226, P2228 and/or P2229 is stored, the following symptoms may appear:**
  - **Misfire**
  - **Combustion noise**
  - **Black smoke**
  - **White smoke**

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2226, P2228 OR P2229)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result

Result	Proceed to
P2226, P2228 or P2229 is output	A

DTC P0408 Exhaust Gas Recirculation Sensor "B" Circuit High

for Preparation Click here

DESCRIPTION

The EGR valve position sensor is mounted on the EGR valve and used for detecting the lift amount of the valve. The lift amount detected by the sensor is provided to the ECM as feedback. The ECM then regulates the lift amount of the valve in accordance with engine running conditions.

P0405

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 1 EGR valve position sensor output voltage is less than 0.1 V for 5 seconds (1 trip detection logic).	• Open in No. 1 EGR valve position sensor circuit • No. 1 EGR valve (EGR valve position sensor) • ECM

P0406

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 1 EGR valve position sensor output voltage is more than 4.9 V for 5 seconds (1 trip detection logic).	• Short in No. 1 EGR valve position sensor circuit • No. 1 EGR valve (EGR valve position sensor) • ECM

P0407

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 2 EGR valve position sensor output voltage is less than 0.1 V for 5 seconds (1 trip detection logic).	• Open in No. 2 EGR valve position sensor circuit • No. 2 EGR valve (EGR valve position sensor) • ECM

P0408

DTC Detection Drive Pattern	DTC Detection Condition	Trouble Area
Ignition switch ON for 5 seconds	No. 2 EGR valve position sensor output voltage is more than 4.9 V for 5 seconds (1 trip detection logic).	• Short in No. 2 EGR valve position sensor circuit • No. 2 EGR valve (EGR valve position sensor) • ECM

MONITOR DESCRIPTION

When the output voltage of the EGR valve position sensor deviates from the normal operating range of 0.1 to 4.9 V for more than 5 seconds, the ECM interprets this as a malfunction of the sensor circuit, and illuminates the MIL.

WIRING DIAGRAM

Refer to DTC P0400 (Click here).

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, and other data from the time the malfunction occurred.**
- **Data List items "EGR Lift Sensor Volt %" and "EGR Lift Sensor Volt % #2" are values calculated by converting the EGR position sensor output voltage of 0 to 5 V to a percentage from 0 to 100%.**

1.CHECK HARNESS AND CONNECTOR (POWER SOURCE)

a. Disconnect the EGR valve connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

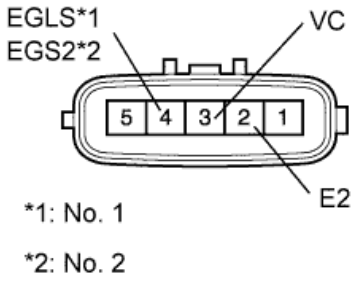
No. 1

Tester Connection	Switch Condition	Specified Condition
C87-3 (VC) - C87-2 (E2)	Ignition switch ON	4.5 to 5.5 V

No. 2

Tester Connection	Switch Condition	Specified Condition
C88-3 (VC) - C88-2 (E2)	Ignition switch ON	4.5 to 5.5 V

NG → Go to step 3



OK

2.INSPECT EGR VALVE ASSEMBLY (No. 1 or No. 2) (POSITION SENSOR)

a. Disconnect the EGR valve connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(EGR Valve)

*1: No. 1

*2: No. 2

Standard Resistance:

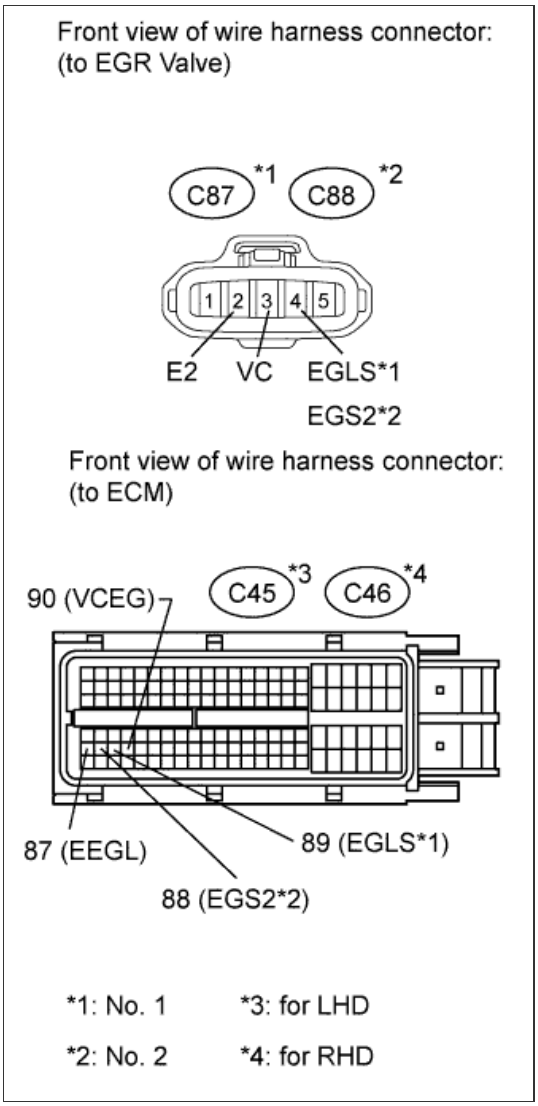
No. 1

Tester Connection	Condition	Specified Condition
3 (VC) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ
4 (EGLS) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ

No. 2

Tester Connection	Condition	Specified Condition
3 (VC) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ
4 (EGS2) - 2 (E2)	20°C (68°F)	2.45 to 4.55 kΩ

NG → Go to step 5



OK

3.CHECK HARNESS AND CONNECTOR (EGR VALVE POSITION SENSOR - ECM)

a. Disconnect the EGR valve connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) - C45-90 (VCEG)	Always	Below 1 Ω
C87-4 (EGLS) - C45-89 (EGLS)	Always	Below 1 Ω
C87-2 (E2) - C45-87 (EEGL)	Always	Below 1 Ω

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) - C45-90 (VCEG)	Always	Below 1 Ω
C88-4 (EGS2) - C45-88 (EGS2)	Always	Below 1 Ω
C88-2 (E2) - C45-87 (EEGL)	Always	Below 1 Ω

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) - C46-90 (VCEG)	Always	Below 1 Ω
C87-4 (EGLS) - C46-89 (EGLS)	Always	Below 1 Ω
C87-2 (E2) - C46-87 (EEGL)	Always	Below 1 Ω

No. 2 (RHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) - C46-90 (VCEG)	Always	Below 1 Ω
C88-4 (EGS2) - C46-88 (EGS2)	Always	Below 1 Ω

C88-2 (E2) - C46-87 (EEGL)	Always	Below 1 Ω

Standard Resistance (Check for Short):

No. 1 (LHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) or C45-90 (VCEG) - Body ground	Always	10 kΩ or higher
C87-4 (EGLS) or C45-89 (RGLS) - Body ground	Always	10 kΩ or higher

No. 2 (LHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) or C45-90 (VCEG) - Body ground	Always	10 kΩ or higher
C88-4 (EGS2) or C45-88 (EGS2) - Body ground	Always	10 kΩ or higher

No. 1 (RHD)

Tester Connection	Condition	Specified Condition
C87-3 (VC) or C46-90 (VCEG) - Body ground	Always	10 kΩ or higher
C87-4 (EGLS) or C46-89 (EGLS) - Body ground	Always	10 kΩ or higher

No. 2 (RHD)

Tester Connection	Condition	Specified Condition
C88-3 (VC) or C46-90 (VCEG) - Body ground	Always	10 kΩ or higher
C88-4 (EGS2) or C46-88 (EGS2) - Body ground	Always	10 kΩ or higher

NG → Go to step 6

OK

4.REPLACE ECM

DESCRIPTION

Faults and Symptoms of Common Rail Diesel Components

a. Engine Control

Mass Air Flow Meter

Component	Mass air flow meter
Main fault	Decrease in performance (foreign matter is stuck)
Symptoms	Lack of power, black smoke
Data List	MAF
HINT: The maximum fuel injection volume is controlled according to the output from the mass air flow meter.	

Intake System

Component	Intake system
Symptom: Main fault	• Lack of power (No black smoke): Air filter blockage, Air duct is crushed/leaking • Black smoke (No lack of power): Leakage between the turbo and the intake manifold
Data List	• MAP (inside intake air pressure) • Target Booster Pressure When the accelerator is fully depressed, if the MAP is 20 kPa lower than Target Booster Pressure for more than 5 seconds then a lack of power will be felt.

Turbocharger System

Component	Turbocharger system
Main fault	• Air leak in the turbocharged air passage • Turbo motor driver not operating well • Turbocharger (turbine, bearing)
Symptoms	Lack of power (when vehicle starting, when heavy load) (Black smoke is not emitted when racing while vehicle stopped)
Data List	MAP (inside intake air pressure), Target Booster Pressure • When the accelerator is fully depressed, if MAP is 20 kPa lower than Target Booster Pressure for more than 5 seconds then a lack of power will be felt. • With the ignition switch ON or idling, MAP = Atmospheric Pressure (standard atmospheric pressure = 101 kPa). When the engine speed is about 1500 rpm or more, the turbocharger starts to take effect and the MAP becomes higher than atmospheric pressure. • Atmospheric pressure increases 1 kPa each time altitude increases by 100 m, and is also affected by the current weather conditions. VN Turbo Command • 0%: Fully open vanes (drive rod contracts) • Over 90%: Fully closed (drive rod expands and turbo operates effectively)
Diagnostic Point	• Using the Active Test "Test the Turbo Charger Step Motor", check the drive rod movement. • Check the drive rod movement when the ignition switch is turned from ON to off.

Exhaust System

Component	Exhaust system
Main fault	Blockage
Symptoms	Lack of power (high engine speed, when heavy load)
Data List	MAP (inside intake air pressure) When the accelerator is fully depressed, if the MAP is 20 kPa lower than Target Booster Pressure for more than 5 seconds then a lack of power will be felt.

Glow System

Component	Glow system
Main fault	Open circuit, glow plug relay fault
Symptoms	Difficult to start, rough idle, knocking, white smoke (when cold)
Data List	Check the glow plug indicator light
Diagnostic Point	Try to measure the resistance of the glow plug

Battery

Component	Battery
Main fault	Battery is depleted
Symptoms	Difficult to start (cannot crank, crank speed is low), horn is quiet.
Data List	Battery Voltage When cranking, battery voltage is less than 5 V

Engine - 1

Component	Engine
Main fault	Damaged, Seized up
Symptoms	Cannot crank, crank speed is low, strange noise

Engine - 2

Component	Engine
Main fault	Loss of compression
Symptoms	Rough idle (lack of power always)
Data List	Engine Speed of Cyl • When cranking during the "Check the Cylinder Compression" Active Test, if there is a high speed cylinder, approx. 100 rpm more than the other cylinders, that cylinder may loose compression. Injection Feedback Val • If Injection Feedback Val is more than 3 mm^3/st, the cylinder may have a fault.

Start System

Component	Entry and Start system
Main fault	Starter system malfunction
Symptoms	Difficult to start
Data List	Starter Signal • Ignition switch (STA) operation ON: Starter is operating OFF: Starter is not operating

Immobiliser system

Component	Engine immobiliser system
Main fault	Engine immobiliser system/Problem Symptoms Table (Click here)
Symptoms	Engine does not start
Data List	Immobiliser Communication • ON: Normal • OFF: GND short or immobiliser is set Engine Immobiliser System/Data List (Click here)

b. Diesel Injection

Fuel Supply Pump

Component	Fuel supply pump
Main fault	-
Symptoms	Difficult to start, engine stalling, rough idle, lack of power
Data List	Fuel Press, Target Common Rail Pressure, Target Pump SCV Current • At a stable condition (e.g. Idling), Fuel Press is within +/-5000 kPa of "Target Common Rail Pressure". • If the fuel pressure is 20000 kPa below the target pressure then a lack of power will be felt. • If the fuel pressure is below 25000 kPa then idling will be rough. **HINT:**

	• **The fuel pressure changes at engine starting, but is approx. 25000 kPa at engine start after the engine is warmed up.** • **When Target Pump SCV Current is 3000 mA or more, the suction control valve has a tendency to become stuck.**
Diagnostic Trouble Code	Even if Fuel Press is less than Target Common Rail Pressure, a DTC will not be stored.

Fuel Filter

Component	Fuel filter
Main fault	Blockage
Symptoms	Difficult to start, engine stalling, rough idle, lack of power
Data List	Fuel Press, Target Common Rail Pressure • At a stable condition (e.g. Idling), the fuel pressure is within +/-5000 kPa of "Target Common Rail Pressure ". • If the fuel pressure is 20000 kPa below the target pressure then a lack of power will be felt. • If the fuel pressure is below 25000 kPa then idling will be rough. **HINT:** The fuel pressure changes at engine starting, but is approx. 25000 kPa at engine start after the engine is warmed up.
Diagnostic Trouble Code	Even if Fuel Press is less than Target Common Rail Pressure, a DTC will not be stored.

Fuel Injector

Component	Fuel injector
Main fault	Blockage
Symptoms	Rough idle, lack of power, black smoke, white smoke, knocking
Data List	Injection Feedback Val • When an Injection Feedback Val is more than 3 mm ^{3}/st, the cylinder is not normal. This can be read after idling for 1 minute with the engine warmed up (engine coolant temperature is more than 70°C (158°F)).

Pressure Limiter

Component	Pressure limiter
Main fault	Does not completely close
Symptoms	Difficult to start, engine stall, rough idle, lack of power

Injector Driver (EDU)

Component	Injector Driver (EDU)
Main fault	Circuit fault: The fuel injector does not open.
Symptoms	Difficult to start, rough idle, lack of power, black smoke, white smoke, knocking
Data List	Same as fuel injector
Diagnostic Trouble Code	When the EDU has a fault, some DTCs may be stored.

Fuel Pressure Sensor

Component	Fuel pressure sensor
Main fault	Open circuit, Decrease in performance (foreign matters is stuck)
Symptoms	Difficult to start, rough idle, engine stall, lack of power
Data List	Fuel Press, Target Common Rail Pressure • Slowly raise the engine speed from idling to 3000 rpm with the vehicle stopped, and check that Fuel Press follows Target Common Rail Pressure. If the fuel pressure sensor malfunctions, the actual fuel pressure may deviate from the target fuel pressure. (However, the value may not deviate even when a malfunction is present).
Diagnostic Trouble Code	When the fuel pressure sensor has a fault, some DTCs may be stored.

Irregular Fuel

Component	Irregular fuel
Main fault	-
Symptoms	Difficult to start, rough idle (especially when cold)

c. Diesel EGR

EGR System

Component	EGR system
Main fault	• Does not move smoothly • Does not close completely
Symptoms	• Rough idle • EGR valve stuck closed: A loud turbocharger sound. • EGR valve stuck open: Difficult to start (does not stall), black smoke, lack of power (if there is an excess in the quantity of EGR and there is a heavy load, when the vehicle starts moving, a lack of power will be felt).
Data List	Actual EGR Valve Pos., Target EGR Pos. • Generally, Actual EGR Valve Pos. = Target EGR Pos. +/-5% (fully closed 0%, fully open 100%) • Using EGR valve Active Test, check whether Actual EGR Valve Pos. follows Target EGR Pos. (The engine coolant temperature and intake air temperature should be considered when a malfunction occurs). • EGR valve is fully closed when the ignition switch is ON (engine stopped). • EGR valve opens to halfway point at idling after engine warmed up. EGR Close Lrn. Val., EGR Close Lrn. Status • Leaving the vehicle idling, when EGR Close Lrn. Status is OK, the normal range of EGR Close Lrn. Val. is 3.5 to 4.5 V. • In cases when EGR Close Lrn. Status. is NG or EGR Close Lrn. Val. is out of the normal range (3.5 to 4.5 V), it is possible that the EGR valve cannot completely close.

d. Diesel Throttle

Diesel Throttle System

Component	Diesel throttle system
Main fault	Stuck, does not move smoothly
Symptoms	• Stuck closed: Lack of power, difficult to start, rough idle, engine stall, black smoke. It may occur when stuck almost fully closed. • Stuck open: Turbocharger sound increases. When the engine is stopped, engine vibrations may occur.
Data List	• Actual Throttle Position, Actual Throttle Position #2 0%: Fully open 100%: Fully closed • Throttle Motor Duty Normally operates at 50 +/-20%. If outside the range of 50 +/-40% for a few seconds, the throttle may not be sliding properly. 0%: Open diesel throttle 100%: Close diesel throttle • When ignition switch is ON (engine stopped), diesel throttle is fully open. When idling, diesel throttle is at halfway point. When ignition switch is turned from ON to off, temporarily closed fully.

Data List Related to Starting Trouble

NOTICE:

The Data List values in the table are the results of checking one vehicle under a specific condition (engine coolant temperature, intake air temperature, atmosphere pressure etc.). That is why use these values for reference only.

a. Engine Control

MAP

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
	• When MAP is low, there will be difficulty starting. • With ignition switch ON or idling, MAP is nearly equal to Atmosphere Pressure (standard	When MAP is low, the following conditions are possible: • The diesel throttle is nearly fully closed. • Intake system blocked (turbocharger	• When the ignition switch is ON or the vehicle is idling, MAP (intake manifold absolute pressure) and Atmosphere Pressure are mostly the same (standard atmospheric pressure = 101 kPa). Above approx. 1500 rpm, the turbo becomes effective, and the pressure becomes higher than atmospheric pressure. • Inspect while comparing with "Target Booster Pressure".

MAP	atmospheric pressure = 101 kPa).	system also). • Exhaust system blocked.	• With the accelerator fully open, if the actual Manifold Absolute Pressure (MAP) is low compared to the target booster pressure by at least 20 kPa for 5 seconds or more, a feeling of insufficient power will occur.
	Results of real-vehicle check: • Ignition switch ON: 99 kPa • Cranking: 99 kPa • Idling (warm up the engine): 99 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 113 kPa • Driving with the accelerator fully open at 2000 rpm: 143 kPa • Driving with the accelerator fully open at 3000 rpm: 209 kPa		

MAF

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
MAF	-	• MAF meter • MAF meter circuit • Intake system clogging, leaking • Exhaust system clogging • Turbocharger sub-assembly • Leaking or clogging of turbocharger passages • EGR valve does not close	• Based on the MAF, the ECM controls the fuel injection volume, injection timing, EGR, etc. • If the value is always approximately 0 g/sec.: • Mass air flow meter power source circuit is open. • VG circuit is open or shorted. • If the value is always 200 g/sec. or more: • EVG circuit is open.
	Results of real-vehicle check: w/ EGR • Ignition switch ON: 1.54 g/sec. • Cranking: 15 g/sec. • Idling (warm up the engine): 9 g/sec. (2 minutes after starting the vehicle) • Running without load (2500 rpm): 80 g/sec. • Driving with the accelerator fully open at 2000 rpm: 110 g/sec. • Driving with the accelerator fully open at 3000 rpm: 230 g/sec.		
	HINT: The maximum fuel injection volume is controlled according to the output from the mass air flow meter.		

Intake Air

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Intake Air	-	Intake air temperature sensor.	• After a long soak, the engine coolant temperature, intake air temperature, and ambient air temperature are approximately equal. • If the value is -40°C (-40°F) or 140°C (284°F), the sensor circuit is open or shorted.
	-		

Coolant Temp

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Coolant Temp	• Engine coolant temperature is approximately equal to intake air temperature after leaving overnight. After warm-up: Engine coolant temperature is 70°C (158°F) or more. • In cases when the engine coolant temperature output is obviously higher than the actual engine coolant temperature, when it is cold, there will be difficulty starting due to problems with glow plugs or insufficient fuel injection. • In cases when the engine coolant	Engine coolant temperature sensor	• If the value is -40°C (-40°F) or 140°C (284°F), the sensor circuit is open or shorted. • After a long soak, the coolant temperature, intake air

	temperature sensor output is obviously lower than the actual engine coolant temperature, when it is warm, there will be difficulty starting (black smoke will also occur) due to an excess of injected fuel.		temperature, and ambient air temperature are approximately equal.
	-		

Battery Voltage

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Battery Voltage	When cranking, in cases when Battery Voltage becomes less than 5 V, the battery is depleted.	Battery	If 11 V or less, characteristics of some electrical components change.
	Results of real-vehicle check: • Ignition switch ON: 12.5 V • Cranking (with engine warmed up): 9.0 V • Idling (warm up the engine): 13.4 V • Running without load (2500 rpm): 13.5 V • Driving with the accelerator fully open at 2000 rpm: 13 V • Driving with the accelerator fully open at 3000 rpm: 13.2 V		

Starter Signal

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note

Starter Signal	Operation of ignition switch (STA)
	ON: Starter is operating
	OFF: Starter is not operating
		Entry and Start system	• Ignition switch (STA) output:
			  • ON: Starter is operating
			  • OFF: Starter is not operating

	-		

Engine Speed of Cyl #1 (to #8)

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Engine Speed of Cyl #1 (to #8)	When cranking, the engine speed of each cylinder is the same under normal conditions. When a cylinder is approximately 100 rpm higher than the other cylinders, it is conceivable that the compression of that cylinder is being lost. **HINT:** This data is output only when the Active Test "Check the Cylinder Compression" is performed.	-	• Output only when the Active Test "Check the Cylinder Compression" is performed. • With this Active Test, the fuel injection is stopped. • Indicates the speed of each cylinder when cranking. Example - Normal: "Engine speed" of all cylinders is approximately equal. No. 1 cylinder compression low: "Engine speed of Cyl#1" = approximately 300 rpm, "Engine speed of Cyl #2 to #8 cylinder" = approximately 200 rpm.
	-		

Immobiliser Communication

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Immobiliser Communication	Engine immobiliser system/Data List (Click here)	Engine immobiliser system/Problem Symptoms Table (Click here)	When there is a malfunction in the immobiliser system, a DTC is stored (Click here)
	-		

b. Diesel Injection

Target Common Rail Pressure

Data List	Judgment of Data List	Faulty	Diagnosis Note

	Values	Component	
Target Common Rail Pressure	-	-	• Inspect the (actual) fuel pressure, comparing it against the common rail target value. • Considered normal when the actual fuel pressure is within +/-5000 kPa of the target fuel pressure under stable conditions.
	Results of real-vehicle check: • Ignition switch ON: 32000 kPa • Cranking: 29000 kPa • Idling (warm up the engine): 32000 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 62000 kPa • Running without load (3500 rpm): 80200 kPa • Driving with the accelerator fully open at 2000 rpm: 95000 kPa • Driving with the accelerator fully open at 3000 rpm: 155000 kPa		

Fuel Press

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Fuel Press	• In a stable operating condition (e.g. idling), Fuel Press is Target Common Rail Pressure +/-5000 kPa. • During cranking, if Fuel Press is lower than 25000 kPa, there may be difficulty starting. (Take care as there is a response lag when the pressure rises). • When Fuel Press is lower than 25000 kPa, rough idling will occur.	• If there is a fault with the fuel supply pump (lack of discharge quantity) or pressure limiter (will not fully close), the fuel pressure will drop. Also, a blocked fuel filter, leakage from fuel pipes, and lack of fuel will also make the fuel pressure drop. • If air mixes with the fuel, the fuel pressure will shift away from the target fuel pressure. • When there is a fault with the fuel supply pump, there is a possibility of lack of power, engine stall, rough idle and difficulty starting.	• Fuel press is the actual common rail fuel pressure. • Inspect by comparing Fuel Press with Target Common Rail Pressure. • The ECM uses Fuel Press for feedback control of Target Fuel Pressure via the supply pump. The injection amount is determined based on the injection timing and fuel pressure. Also, the spray pattern is selected based on the fuel pressure.
	Results of real-vehicle check: • Ignition switch ON: 0 kPa • Cranking: 29000 kPa • Idling (warm up the engine): 32000 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 62000 kPa • Driving with the accelerator fully open at 2000 rpm: 92000 kPa • Driving with the accelerator fully open at 3000 rpm: 155000 kPa		

Target Pump SCV Current

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
		• With this data, component fault not	• ECU-calculated value for the

Target Pump SCV Current	Idling after warming up, roughly 923 to 1123 mA. When this value is large, the pump is trying to increase the fuel discharge rate.	specified, use this data as a reference. • If the current is 3000 mA or more, there is a possibility the suction control valve is stuck.	suction control valve actuation target current. • Value is large when a high fuel pressure is desired. • When this deviates from the standard value, it indicates that for some reason, even though the pump is running hard, the actual fuel pressure is inconsistent with the target fuel pressure.
	Results of real-vehicle check: • Ignition switch ON: 0 mA • Cranking: 1200 mA • Running without load (2500 rpm): 1300 mA • Driving with the accelerator fully open at 2000 rpm: 1440 mA • Driving with the accelerator fully open at 3000 rpm: 1560 mA		

Injection Feedback Val #1 (to #8)

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Injection Feedback Val #1 (to #8)	• When idling after the engine is warmed up, the fuel quantity of each fuel injector is corrected to make each cylinder engine speed equal. • Cylinders more than 3 mm^3/st may have a fault. **HINT:** Read the value after one minute of idling after warm up (engine coolant temperature above 70°C (158°F)). This value is only calculated when idling.	• Fault with a fuel injector or lack of compression of a cylinder with a large Injection Feedback Val. • Do a compression Active Test. If there is a cylinder that is around 100 rpm more than the other cylinder, there is a possibility that the compression of that cylinder is being lost. • If all the cylinder speeds are even according to the compression Active Test result, then the fuel injector of the cylinder may have a fault. • With fuel injector faults, other than difficulty starting, there is a possibility of rough idling, lack of power, black smoke, white smoke and knocking.	• When idling after warm up, the injection amount for each cylinder is corrected to optimize the difference of each cylinder engine speed. Example: For cylinders that are slowing the engine speed compared to other cylinders, the injection volume is increased. • "Injection Feedback Val" more than 3.0 mm^3/st: Injector breakdown or insufficient compression is causing poor combustion.
	-		

Injection Volume

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Injection Volume	-	-	After warming up the engine, when Injection Volume during idling is 10 mm^3/st or more, there is tendency for the injector to clog.
	Results of real-vehicle check: • Cranking: 21 mm^3/st (Note: Varies depending on coolant temperature) • Idling (warm up the engine): 6 mm^3/st • Running without load (2500 rpm): 9 mm^3/st • Running without load (4700 rpm): 16 mm^3/st • Driving with the accelerator fully open at 2000 rpm: 50 mm^3/st • Driving with the accelerator fully open at 3000 rpm: 70 mm^3/st		

c. Diesel Throttle

Actual Throttle Position, Actual Throttle Position #2

		Faulty	

Data List	Judgment of Data List Values	Component	Diagnosis Note
Actual Throttle Position Actual Throttle Position #2	• When the ignition switch is turned to ON (engine stopped), the diesel throttle is fully open. When the ignition switch is turned from ON to off, the diesel throttle will be fully closed temporarily. • With the diesel throttle stuck almost fully closed, there is a possibility of rough idling, engine stall, black smoke, difficulty starting and lack of power.	Diesel throttle body	Actual Throttle Position is the closing percentage of the throttle valve. • Fully closed: 100% • Fully open: 0% **HINT:** There is no connection with the accelerator. However, under full load, the throttle is usually fully open (0%).
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 84% • Running without load (2500 rpm): 32% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%		

Throttle Motor Duty #1, Throttle Motor Duty #2

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Throttle Motor Duty #1 Throttle Motor Duty #2	• Normally operates at 50 +/-20%. • If 50 +/-40% continues for a few seconds, it is conceivable that the throttle valve is not sliding properly. • 0%: Drive throttle to open side • 100%: Drive throttle to closed side	-	• When this value is large but the actual opening angle does not move smoothly, there is an unable to close malfunction. • If this value is small but the actual opening angle does not move smoothly, there is an unable to open malfunction. • Usually this value is at approx. 50 +/-20%, but momentary jumps outside this range do occur. • If a duty is outside 50 +/-40% for several seconds, it will be judged that the diesel throttle does not move properly and the MIL will be illuminated.
	Results of real-vehicle check: • Ignition switch ON: 61.5% • Cranking: 63% • Idling (warm up the engine): 37% • Running without load (2500 rpm): 53% • Driving with the accelerator fully open at 2000 rpm: 62.5% • Driving with the accelerator fully open at 3000 rpm: 64%		

d. Diesel EGR

Target EGR Valve Pos., Target EGR Valve Pos. #2

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Target EGR Valve Pos. Target EGR Valve Pos. #2	-	-	• Fully open: 100% • Fully closed: 0% • Used for comparison to "Actual EGR Valve Pos".
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 43% • Running without load (2500 rpm): 22% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%		

Actual EGR Valve Pos., Actual EGR Valve Pos. #2

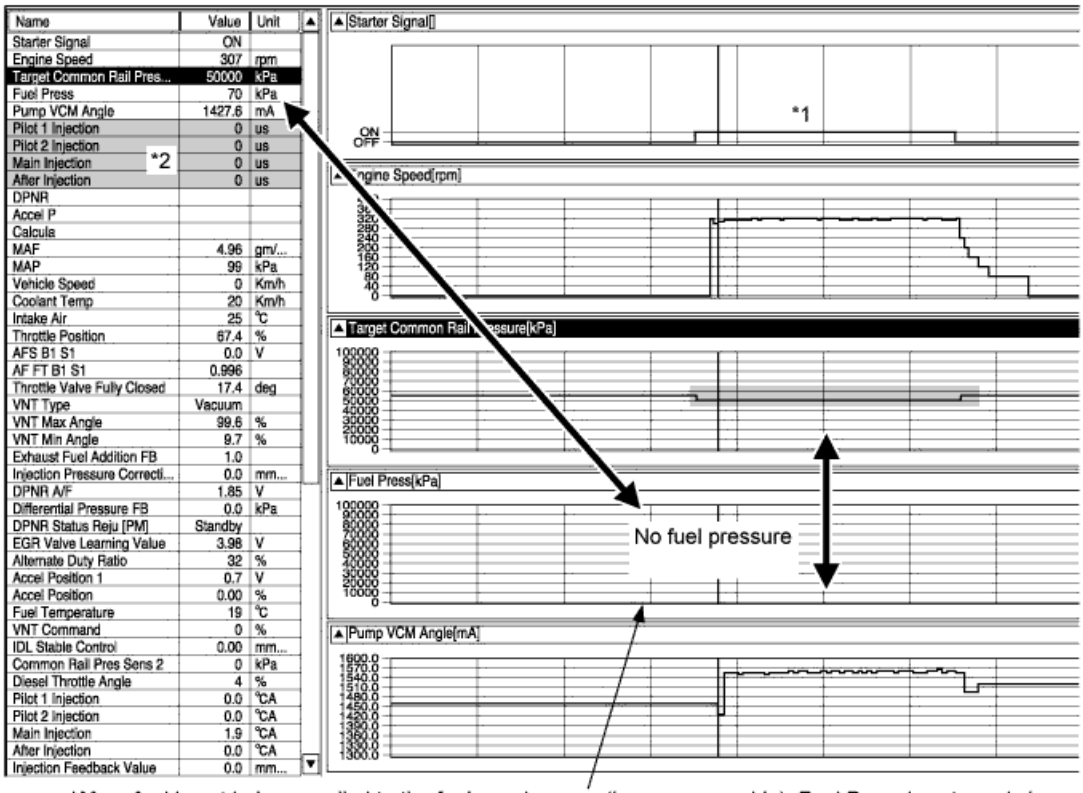
Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
	• Generally Actual		

Actual EGR Valve Pos. Actual EGR Valve Pos. #2	EGR Valve Pos. = Target EGR Pos. (Fully closed = 0%, Fully open = 100%) • The EGR valve Active Test can be used to check whether the Actual EGR Valve Pos. = Target EGR Pos.	EGR valve assembly	• Inspect while comparing to "Target EGR Valve Pos.". • Sometimes the malfunction only occurs around a certain temperature, so refer to the engine coolant temperature and outside temperature at the time the malfunction occurred.
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 84% • Running without load (2500 rpm): 34% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%		

EGR Close Lrn. Status

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
EGR Close Lrn. Status	• "OK" means the fully closed position learning has completed normally. • When NG, the learned fully closed position may be outside of the normal range.	-	After disconnecting and reconnecting the battery cable, if the ignition switch has not been turned off once, learning may not be completed.
	-		

EGR Close Lrn. Val.



Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
EGR Close Lrn. Val.	Leave the vehicle idling, with the EGR Close Lrn. Status OK, the normal range of EGR Close Lrn. Val. is within 3.5 to 4.5 V. In cases when EGR Close Lrn. Status is NG or EGR Close Lrn. Val. is at the maximum or minimum (3.5 to 4.5 V) of normal range, it is possible that the EGR valve is not completely closed or a foreign object is lodged in the EGR valve seat area.	-	• This value is the EGR position sensor output voltage. • As the maximum and minimum settings are 3.5 V and 4.5 V, if the value becomes stuck at either of these, there is a malfunction in the lift sensor or the valve position is shifted (due to foreign matter, etc.).
	-		

Actual Examples of Malfunction

HINT:

- **The purpose of the following examples is help you to understand the relationship between each data list item when a certain malfunction occurs. Understanding this relationship helps you to find the real root cause easier.**
- **The following are examples of actual malfunctions of a common rail diesel engine.**
- **Use them for reference when diagnosing malfunctions.**
- **These are not data from the Land Cruiser 1VD-FTV**

a. Fuel is not being supplied to supply pump (Low pressure fuel line clogged)

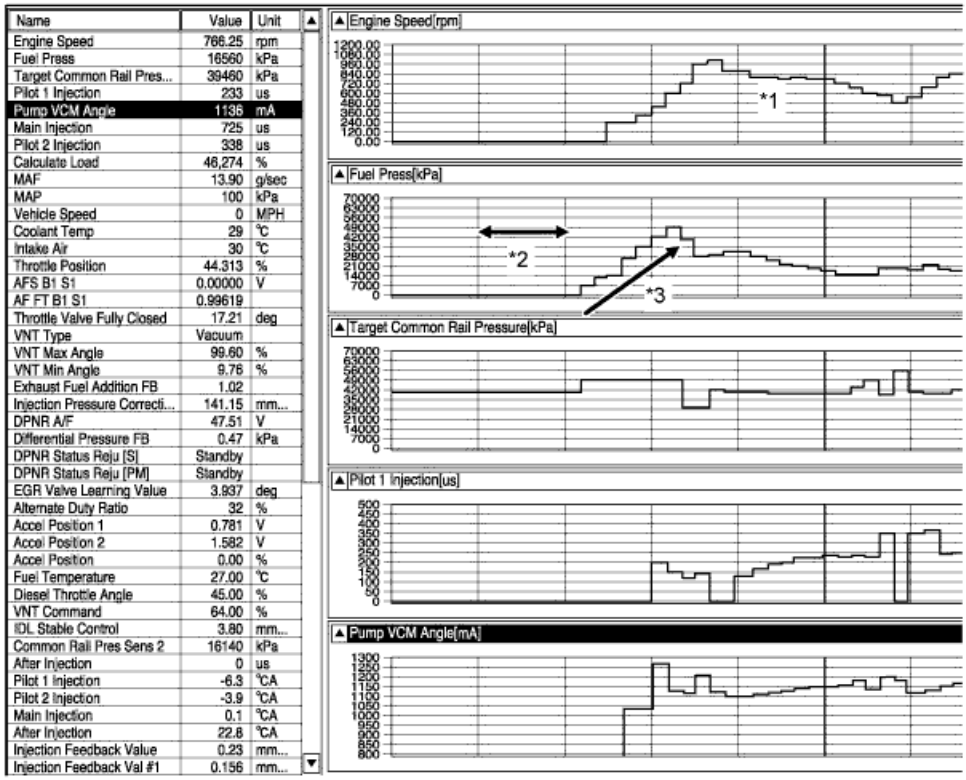
When fuel is not being supplied to the fuel supply pump (low pressure side), Fuel Press is extremely low.

HINT:

*1: Engine is being cranked

*2: ECM does not send IJT signal

- All Data List items are OK, but Fuel Press remains 0 kPa.



- As long as the fuel pressure remains below 10000 kPa, the ECM stops sending IJT signals to the EDU and that is why actual injection duration remains 0 µsecond.

Areas that need to be inspected:

Check the fuel line from the tank to the fuel filter and from the filter to the fuel supply pump.

P

b. Fuel is not being injected (Injectors are leaking)

Name	Value	Unit
Engine Speed	766.25	rpm
Fuel Press	16560	kPa
Target Common Rail Pres...	39460	kPa
Pilot 1 Injection	233	us
Pump VCM Angle	1136	mA
Main Injection	725	us
Pilot 2 Injection	338	us
Calculate Load	46.274	%
MAF	13.90	g/sec
MAP	100	kPa
Vehicle Speed	0	MPH
Coolant Temp	29	°C
Intake Air	30	°C
Throttle Position	44.313	%
AFS B1 S1	0.00000	V
AF FT B1 S1	0.99619	
Throttle Valve Fully Closed	17.21	deg
VNT Type	Vacuum	
VNT Max Angle	99.60	%
VNT Min Angle	9.76	%
Exhaust Fuel Addition FB	1.02	
Injection Pressure Correcti...	141.15	mm...
DPNR A/F	47.51	V
Differential Pressure FB	0.47	kPa
DPNR Status Reju [S]	Standby	
DPNR Status Reju [PM]	Standby	
EGR Valve Learning Value	3.937	deg
Alternate Duty Ratio	32	%
Accel Position 1	0.781	V
Accel Position 2	1.582	V
Accel Position	0.00	%
Fuel Temperature	27.00	°C
Diesel Throttle Angle	45.00	%
VNT Command	64.00	%
IDL Stable Control	3.80	mm...
Common Rail Pres Sens 2	16140	kPa
After Injection	0	us
Pilot 1 Injection	-6.3	°CA
Pilot 2 Injection	-3.9	°CA
Main Injection	0.1	°CA
After Injection	22.8	°CA
Injection Feedback Value	0.23	mm...
Injection Feedback Val #1	0.156	mm...

HINT:

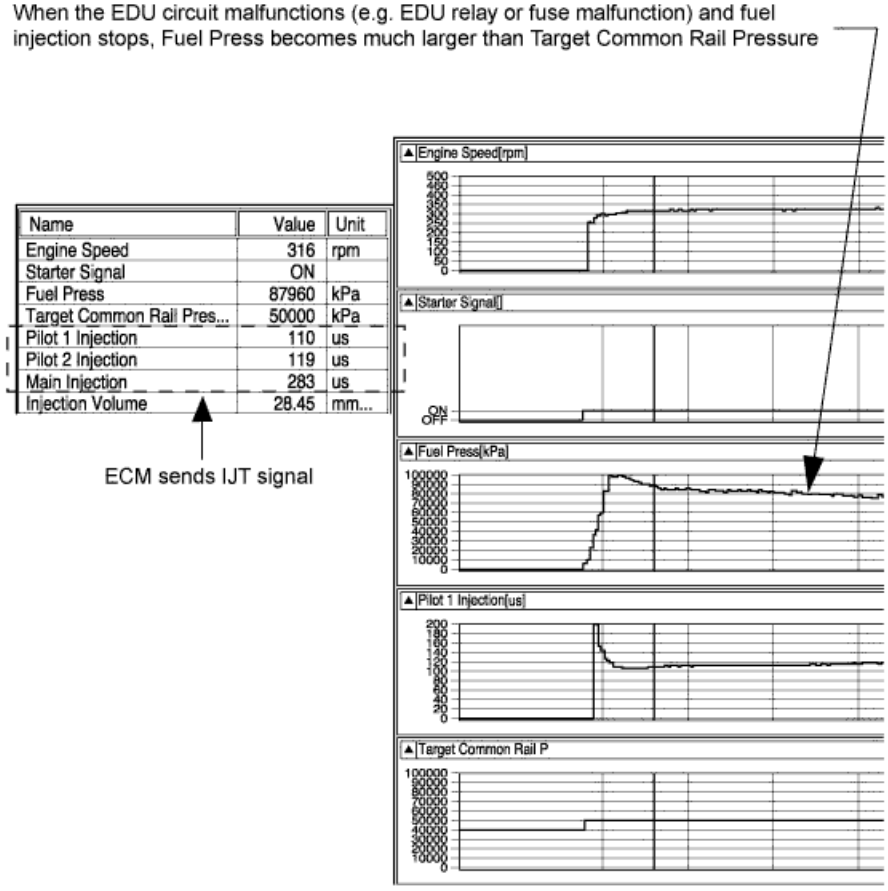
*1: Engine is running unstabie

*2: 0.5 second

*3: Pressure is increasing slowly

- All Data List items are OK but Fuel Press does not increase or increases very slowly.

- As long as the fuel pressure remains below 10000 kPa, the ECM stops sending IJT signals to the EDU. From the moment fuel pressure exceeds 25000 kPa, fuel injection will take place and the engine starts.



Areas that may be malfunctioning:

- One or more injectors are leaking and fuel returns via the leakage pipe to the tank.

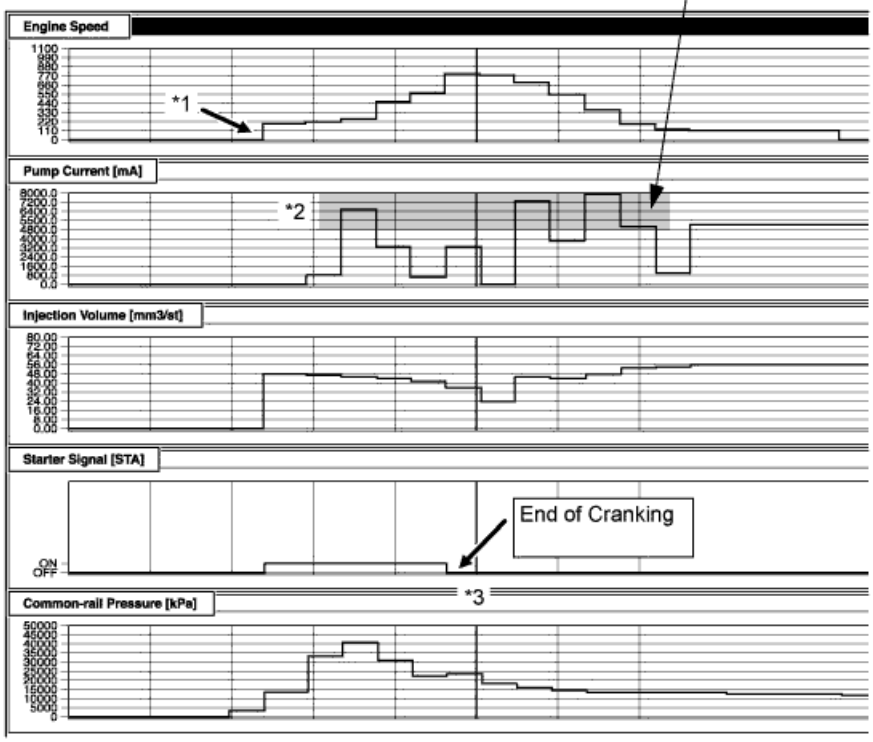
P

c. Fuel is not being injected (EDU circuit malfunction)

When the EDU circuit malfunctions (e.g. EDU relay or fuse malfunction) and fuel injection stops, Fuel Press becomes much larger than Target Common Rail Pressure

HINT:

- All Data List items are OK.
- If Fuel Press exceeds the target value, this indicates that the fuel supply pump operates properly.
- Pilot 1 and 2 Injection and Main Injection signals confirm that the ECM sends IJT signals to the EDU.
- No injection → No fuel smell



Areas that need to be inspected:

- Check EDU circuits (power source, IJT, IJF signal circuit).
- Check the fuel injectors.

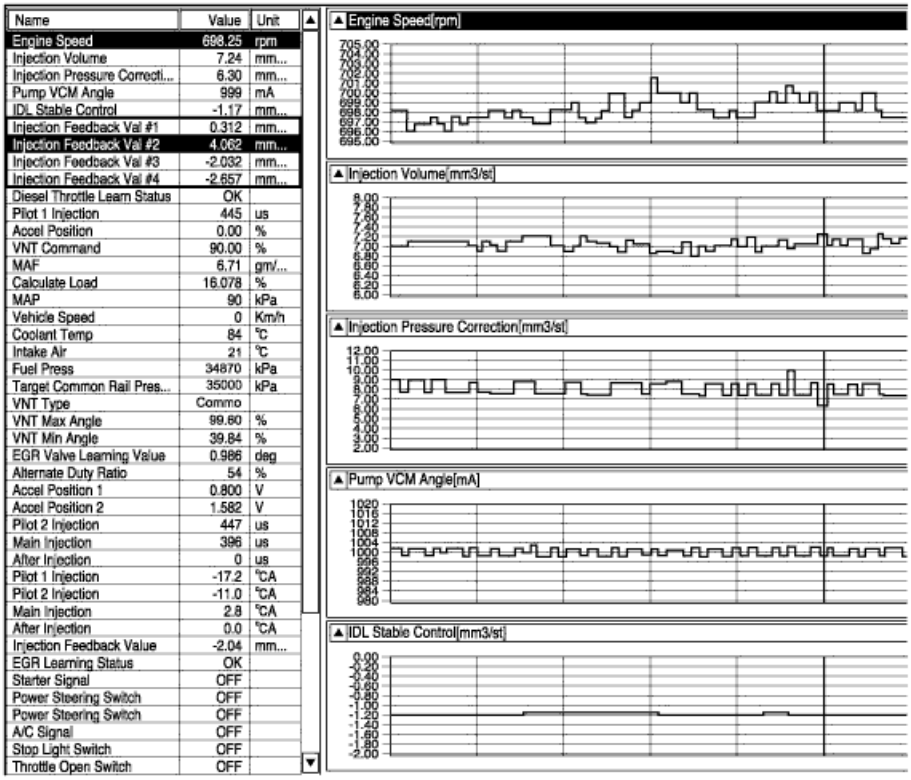
P

d. Fuel supply pump malfunction (Suction control valve momentary sticking)

When Target Pump SCV Current is 3000 mA or more, the suction control valve plunger may be stuck

HINT:

*1: Start of cranking



*2: In order to reach Target Common Rail Pressure high current is applied to the SCV valve

*3: After cranking has finished, common rail pressure drops below 25000 kPa (despite the high SCV current). This pressure is insufficient to open the injectors and that is why ECM stops injecting and engine finally stalls

- When the suction control valve is stuck, Fuel Press increases slowly during cranking, and the difference between Target Common Rail Pressure and Fuel Press remains large. In order for Fuel Press to reach the Target Common Rail Pressure value, the ECM must increase Target Pump SCV Current.

P

e. Increased opening delay of injectors (Internal contamination)

Name	Value	Unit
Engine Speed	698.25	rpm
Injection Volume	7.24	mm...
Injection Pressure Correcti...	6.30	mm...

Accel Position 2	1.582	V
Pilot 2 Injection	447	us
Main Injection	396	us
After Injection	0	us
Pilot 1 Injection	-17.2	°CA
Pilot 2 Injection	-11.0	°CA
Main Injection	2.8	°CA
After Injection	0.0	°CA
Injection Feedback Value	-2.04	mm...
EGR Learning Status	OK	
Starter Signal	OFF	
Power Steering Switch	OFF	
Power Steering Switch	OFF	
A/C Signal	OFF	
Stop Light Switch	OFF	
Throttle Open Switch	OFF	

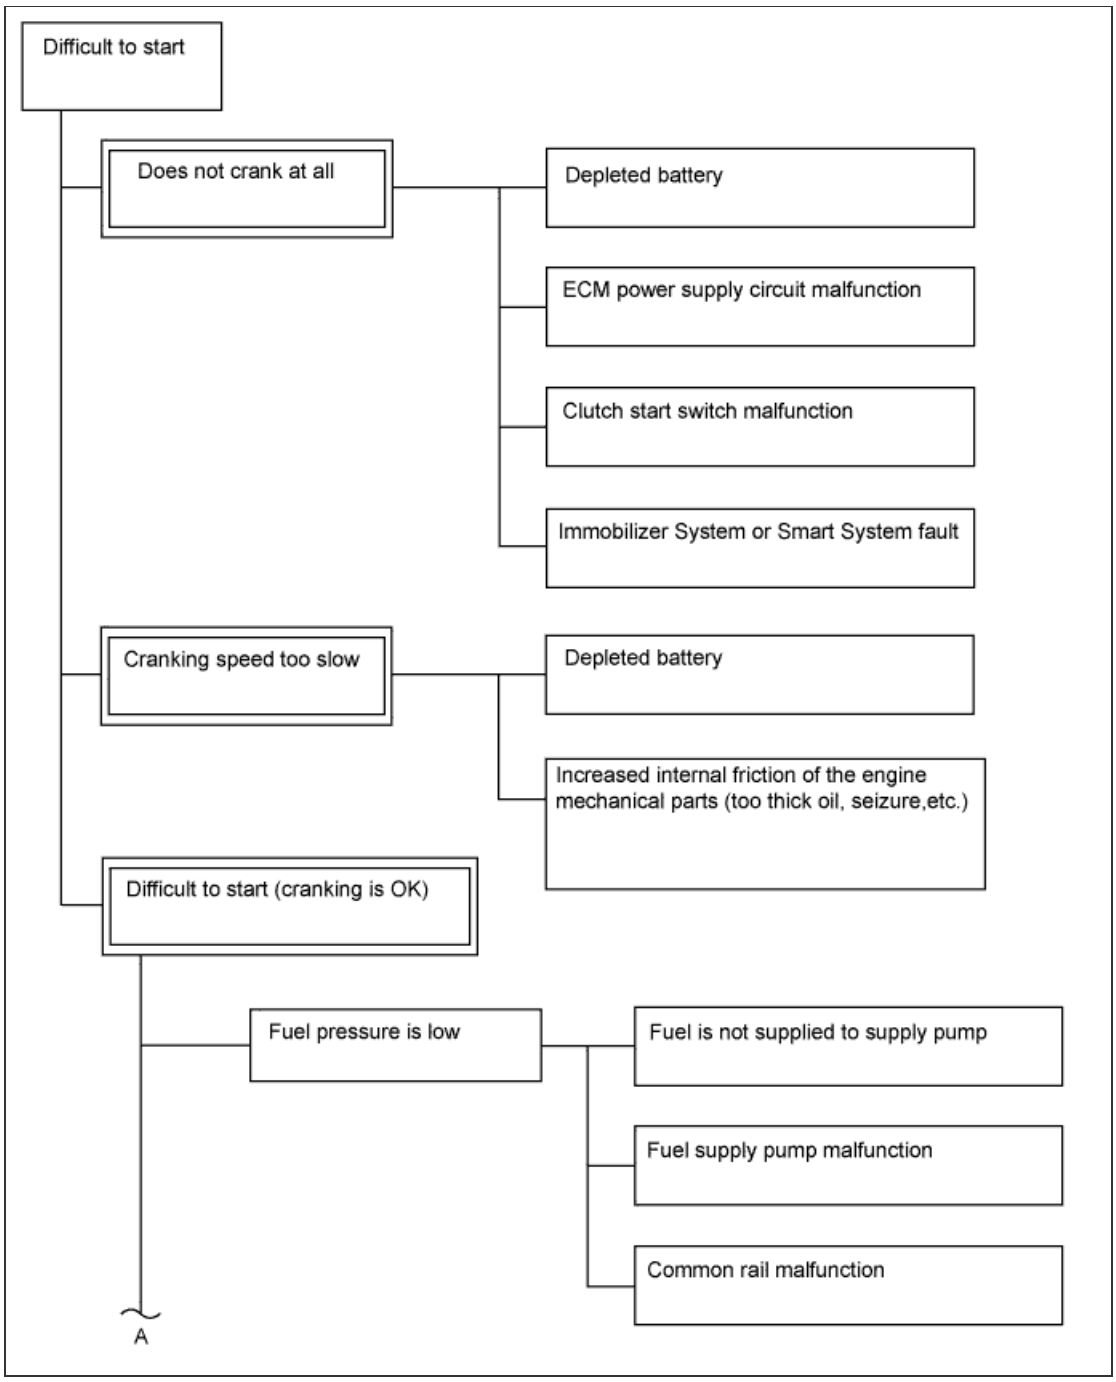
HINT:

- If a fuel injector has internal contamination, the engine will not run smoothly. At this time, Injection Feedback Val # of the corresponding cylinder is 3 mm3/st or more.

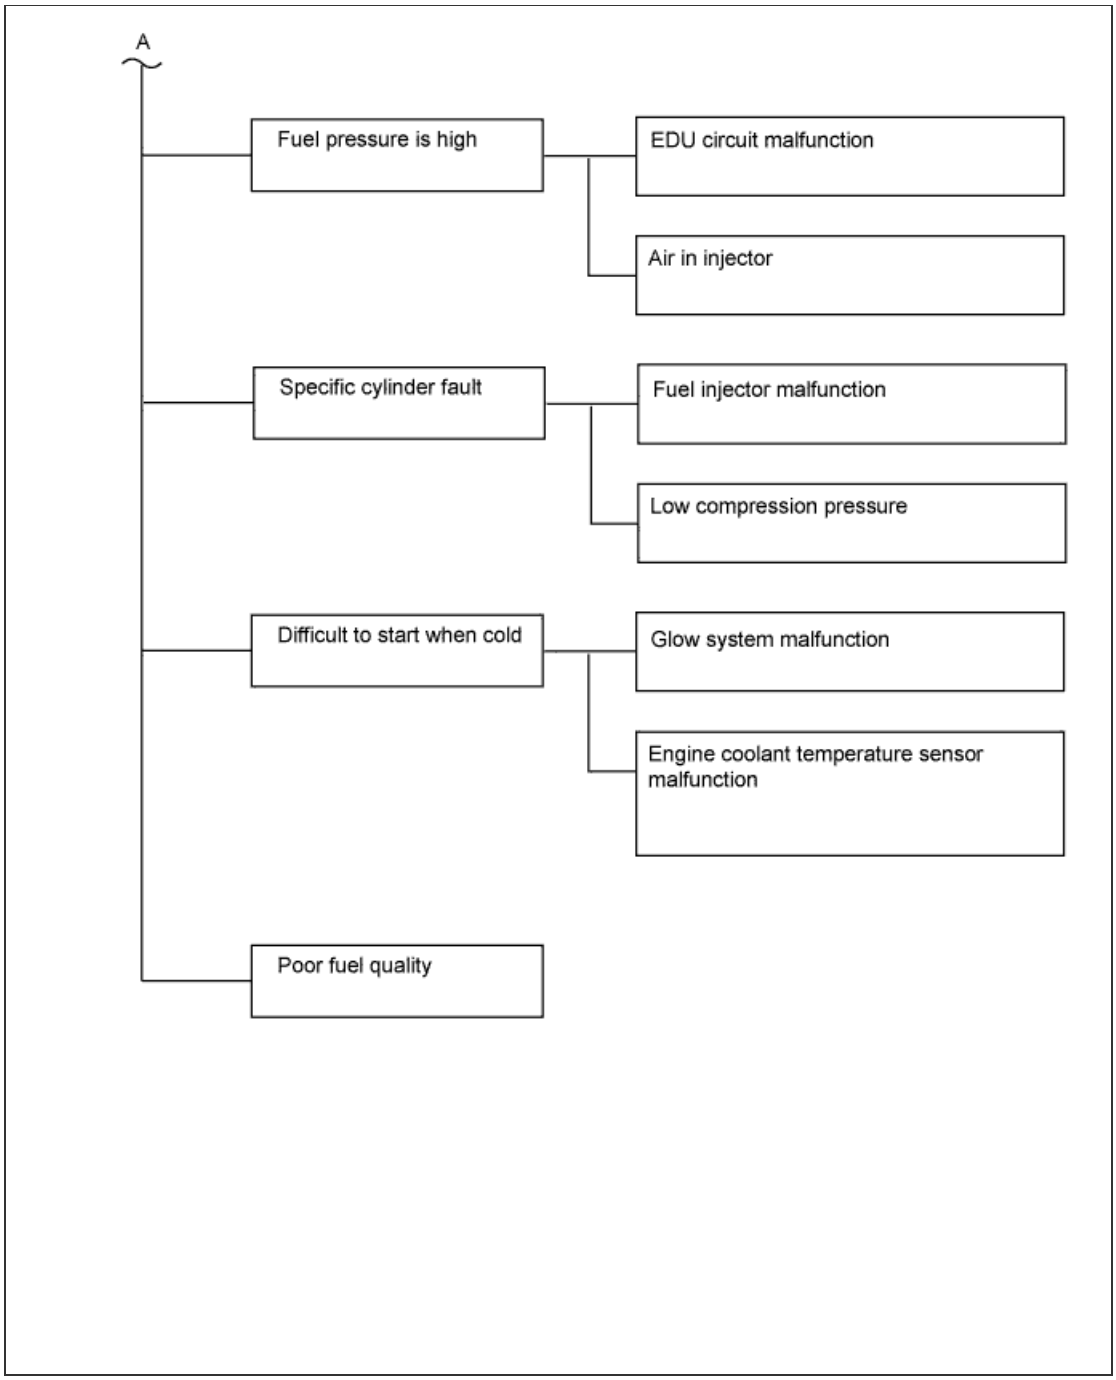
- If the fuel injectors are contaminated, the response of the internal moving parts (plunger, command piston and nozzle) will be delayed. Such a delayed response results in an insufficient amount of fuel being injected. Once the engine has started, this problem usually causes irregular idling and loud knocking.

Inspection method:

Determine the malfunctioning injector(s) by using Control the Cylinder # Fuel Cut and replace the malfunctioning fuel injector.



P



INSPECTION PROCEDURE

Explanation of Symptom

Starting Trouble	For good starting it is essential to have: • Sufficient cranking speed. • Properly operating engine preheating system. • Good quality fuel. The fuel is ignited by the heat which is generated with compression pressure. With problems such as a depleted battery, the crankshaft speed can become low, or if the engine compression is leaking, the compression pressure will not rise and there will be difficulty starting. When the engine is cold, even if there is compression heat, it will escape from the combustion chamber. For this reason, when the engine is started when it is cold, the glow plugs heat the compressed air. Also after starting the engine, by charging the glow plugs for a fixed time set according to the engine coolant temperature, diesel knocking and white smoke are prevented. The quantity of fuel injected is determined by the fuel pressure and also the amount of time the fuel injector is open.

Trouble Area Chart According to Problem Cause

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**
- **After replacing the fuel injector, the ECM needs registration (Click here).**

HINT:

- **Specified values in the following troubleshooting flowchart are for reference only. Variations in the Data List values may occur depending on the measuring conditions or the vehicle age. Do not assume the vehicle is normal when the Data List outputs standard values. There may be concealed factors of the malfunction.**

1.CHECK ENGINE CRANKING CONDITION

a. Check the engine cranking condition.

Result

Result	Proceed to
Does not crank at all.	A
Low cranking speed. **HINT:**	B

When cranking speed is low, especially when the temperature is low, check if the engine oil grade matches the recommendation.	
Cranking is OK.	C

B → CHECK BATTERY CONDITION (Click here)

C → Go to step 8

A

2.CHECK BATTERY CONDITION

a. Check battery condition (Click here).

NG → REPLACE BATTERY

OK

3.CHECK COMMUNICATION BETWEEN INTELLIGENT TESTER AND ECM

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Check if the normal starting screen appears (check whether communication with the ECM is possible).

HINT:

Use a tester that is able to communicate with other vehicles.

OK:

Communication is possible (Vehicle can be recognized).

NG → GO TO ECM POWER SOURCE CIRCUIT (Click here)

OK

4.READ VALUE USING INTELLIGENT TESTER (CLUTCH SWITCH)

HINT:

This inspection is not necessary for A/T vehicles.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / All Data / Clutch Switch.

d. Read the value displayed on the tester.

Standard Value:

Tester Display	Condition	Specified Condition
Clutch Switch	Clutch pedal depressed	ON

Result:

Result	Proceed to
OK	A
NG (for LHD)	B

NG (for RHD)	C

B → REPLACE CLUTCH START SWITCH (for LHD) (Click here)

C → REPLACE CLUTCH START SWITCH (for RHD) (Click here)

A

5.READ ALL OUTPUT DTCS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Utility / All Codes.

Result

Result	Proceed to
No DTC is output	A
DTCs related to engine are output	B

B → GO TO RELATED DTC

A

6.INSPECT SMART START SYSTEM (IN CASE OF VEHICLES EQUIPPED WITH SMART ENTRY AND START SYSTEM)

Check if the "Door Control Transmitter" functions of each key functions properly.

HINT:

- **Check if the engine starts properly with another key.**
- **If the doors can not be opened/closed by using the "Door Control Transmitter" function of the key, the battery inside the key may be depleted. In such a case the engine can not be started by pushing the ENGINE START/STOP button.**
- **When the door control transmitter battery is depleted, the engine can only be started by holding the door control transmitter against the ENGINE START/STOP button.**
- **If the inspection result is that the problem only occurs in certain locations or times of day, the possibility of wave interference is high. Also, added vehicle components may cause wave interference. If any component installed, remove them and perform the operation check.**
  Near broadcasting stations, large screens, airports, transformer stations, gasoline stations, etc., the door control transmitter may not operate due to electric wave interference.

NEXT

7.INSPECT CRANKING HOLDING FUNCTION CIRCUIT

HINT:

Check that "Starter Signal" in the Data List changes to ON when the engine is started.

a. Inspect the cranking holding function circuit (Click here).

NEXT

END

8.CHECK INITIALIZATION (FUEL SUPPLY PUMP)

When the engine does not start or another problem such as rough idling is present, perform initialization and check to see if the problem symptoms disappear. If the problem symptoms do not disappear, perform the next procedure.

HINT:

When replacing the ECM, the supply pump initialization must be performed (Click here).

NEXT

9.READ OUTPUT DTC (RELATED TO ENGINE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

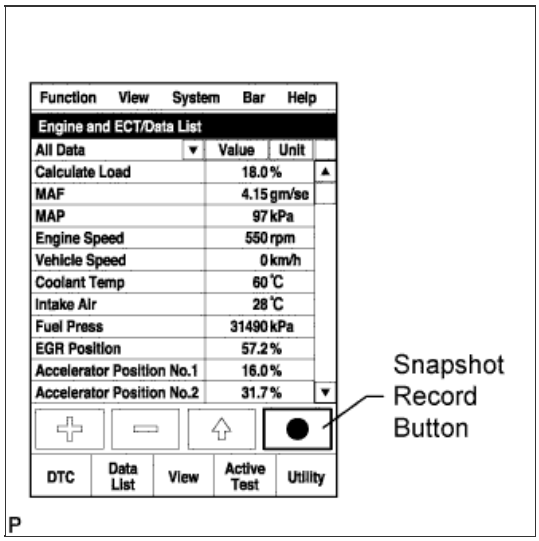
d. Read the DTCs.

Result

Result	Proceed to
No DTC is output	A
DTCs related to engine are output	B

B → REPAIR OR REPLACE ENGINE CONTROL SYSTEM ACCORDING TO DTC OUTPUT (Click here)

A

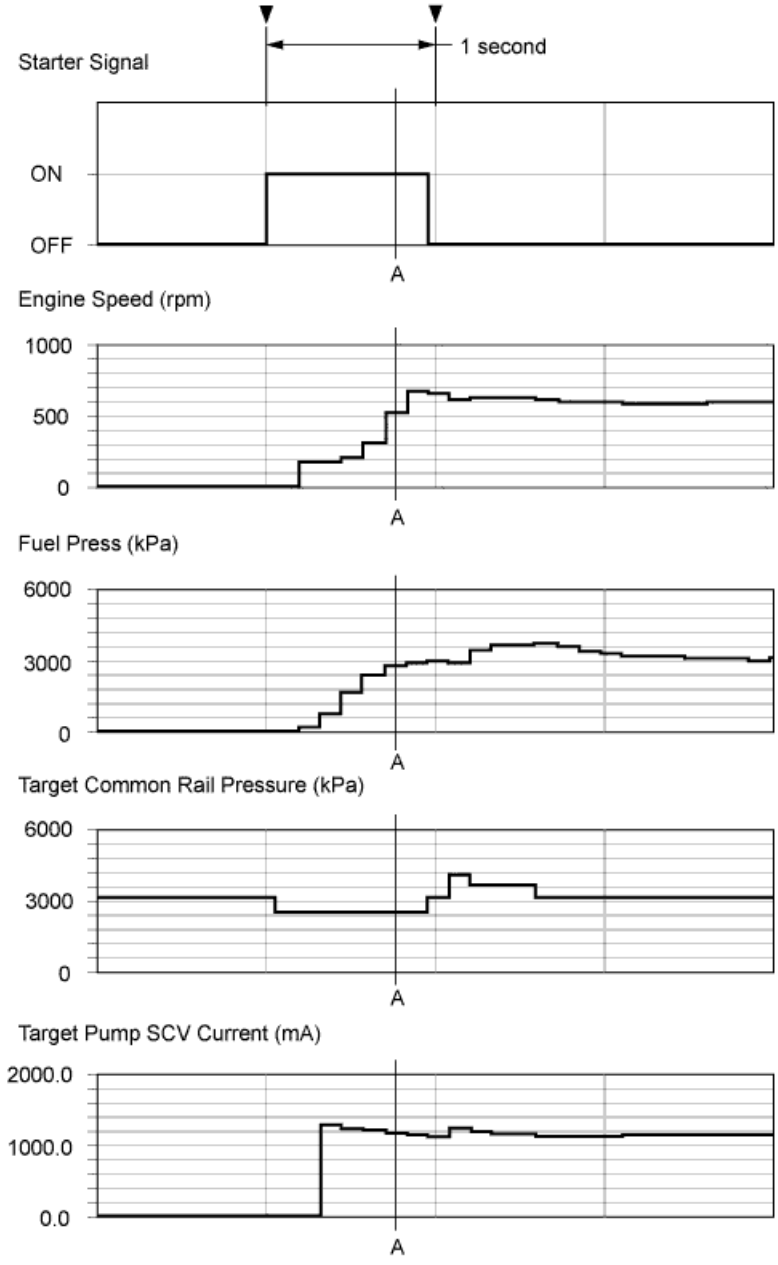


10.TAKE DATA LIST DURING STARTING AND IDLING

a. Connect the intelligent tester to the DLC3.

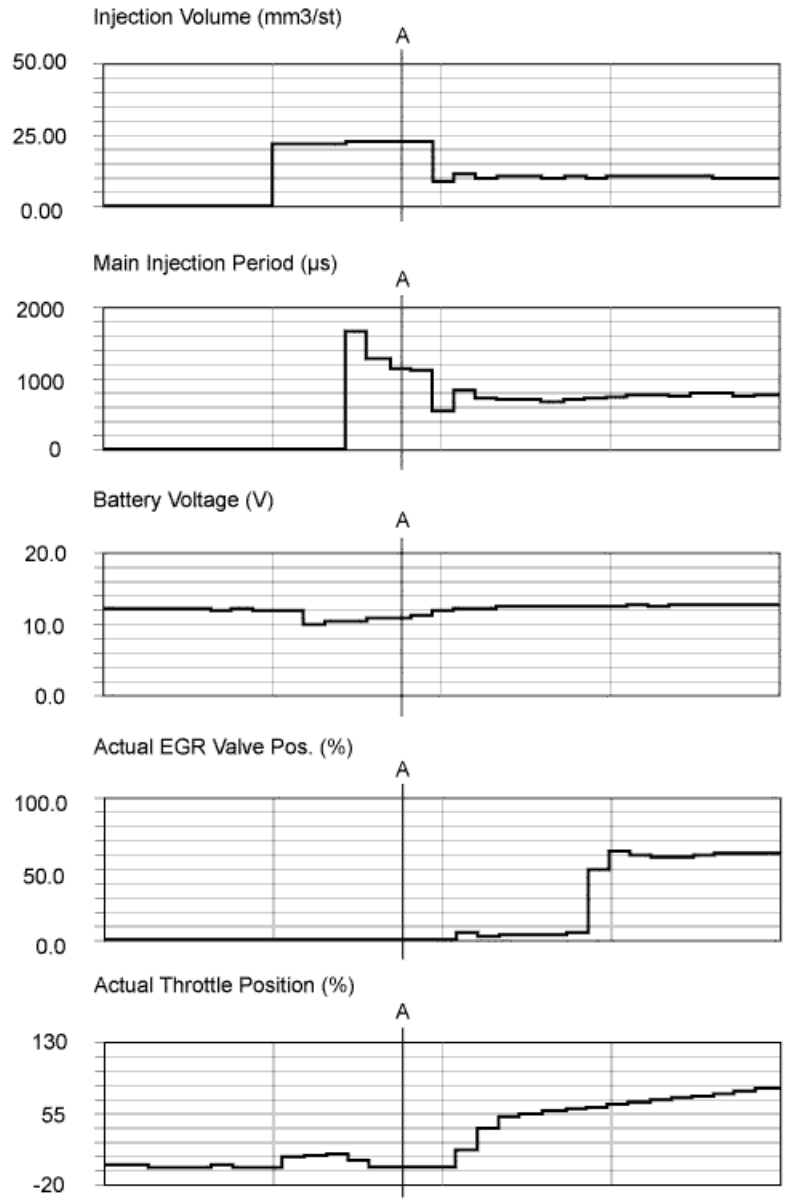
b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / All Data.



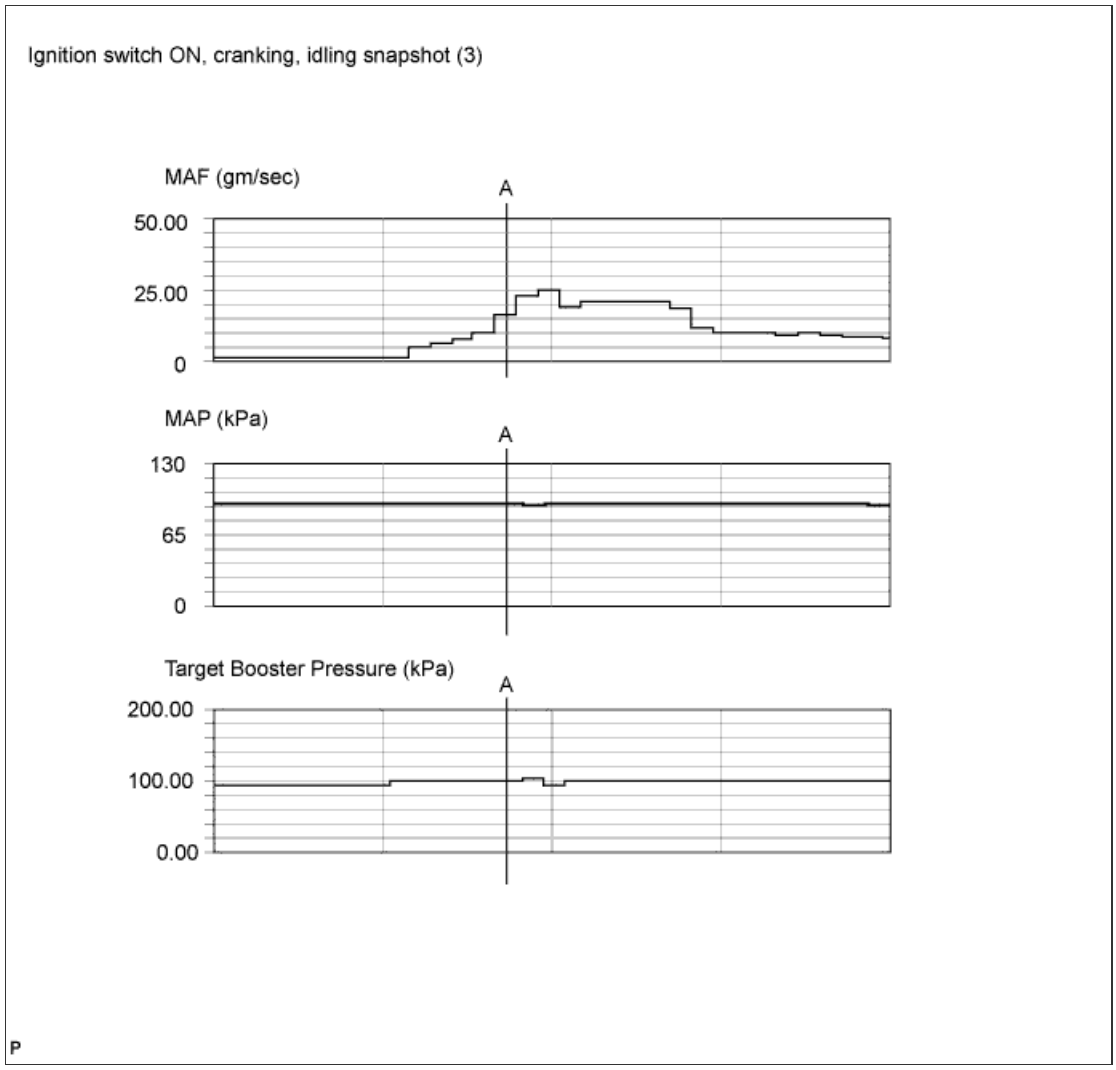
d. Take a snapshot of the following Data Lists with the intelligent tester during "Ignition switch ON (5 seconds) → Starting → Idling (10 seconds)".

HINT:



- **A**

Ignition switch ON, cranking, idling snapshot (1)



P

Ignition switch ON, cranking, idling snapshot (2)

P

snapshot can be used to compare vehicle data from the time of the malfunction to normal data and is very useful for troubleshooting. The data in the illustration below is that of a normal vehicle, but as the data varies between individual vehicles, this data should only be used for reference.

- **When there is trouble starting with a cold engine, take the snapshot when the engine is cold. Then warm up the engine (engine coolant temperature 70°C (158°F) or more) and after idling the vehicle for 1 minute (A/C off, electrical load off), take a snapshot of the data for 15 seconds while idling.**
- **Graphs like the ones shown below can be displayed by transferring the stored snapshot from the tester to a PC. Intelligent Viewer must be installed on the PC.**

Injection Feedback Val #5	-0.4	mm^3/st
Injection Feedback Val #6	0.3	mm^3/st
Injection Feedback Val #7	0.0	mm^3/st
Injection Feedback Val #8	-0.5	mm^3/st
Target EGR Pos. Target EGR Pos. #2	43.5	%
Coolant Temp	78	°C

HINT:

Actual Examples of Malfunction (See "Diagnostic Help" menu)

- **Starting is not possible**
  - **Fuel is not supplied to supply pump.**

Fuel Press: Approximately 1000 kPa or less during cranking.

- **Fuel is not being injected due to EDU circuit malfunction.**
  Fuel Press: 80000 to 90000 kPa during cranking.
- **Air in injectors.**
  Fuel Press: 60000 to 70000 kPa during cranking.

- **Cranking time is long**
  - **Suction control valve is stuck.**
    Target Pump SCV Current intermittently reaches 3000 mA or more. The suction control valve plunger intermittently becomes stuck. If there is difficult to start when the engine is cold, cool the engine and inspect it.
    Injector clogging or internal contamination:
  - **Injector clogging or internal contamination:**
    Injection Feedback Val # of one or more of the cylinders is 3 mm ^{3}/st or more.
    Injection Feedback Val # can be read when the engine is idling after being warmed up.

NEXT

11.CHECK SNAPSHOT (FUEL PRESS, TARGET COMMON RAIL PRESSURE ETC.)

a. Check Fuel Press and Target Common Rail Pressure in the snapshot taken when the engine was starting.

Result

Result	Proceed to
2 seconds after Starter Signal turns from OFF to ON, Fuel Press is less than "Target Common Rail Pressure -5000 kPa" **HINT:** As long as the fuel pressure remains below 5000 kPa, the ECM stops sending the injection open signal (IJT) to the EDU, and then the actual injection duration remains 0 microseconds.	A
2 seconds after Starter Signal turns from OFF to ON, Fuel Press is 5000 kPa or more higher than Target Common Rail Pressure	B
2 seconds after Starter Signal turns from OFF to ON, Fuel Press is within +/-5000 kPa of Target Common Rail Pressure	C

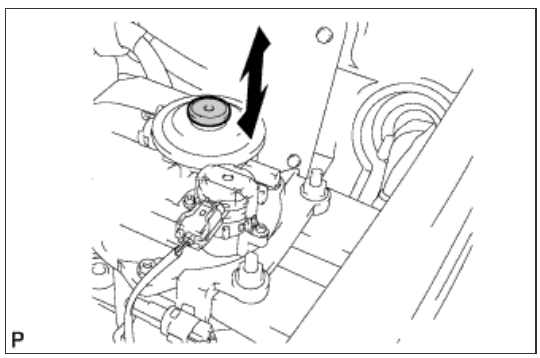
HINT:

Fuel pressure is about 20000 to 35000 kPa when engine cranking and engine coolant temperature 0°C (32°F) or more.

Fuel pressure increases rapidly during cranking.

B → Go to step 31

C → Go to step 19



A

12.BLEED AIR FROM FUEL SYSTEM

a. Using the hand pump as indicated by the arrow in the illustration, bleed air from the fuel system. Continue pumping until pumping becomes difficult.

HINT:

When the fuel pressure during cranking is extremely low (1000 kPa or less), it is possible that fuel is not being supplied to the supply pump.

NEXT

13.CHECK IF FUEL IS BEING SUPPLIED TO FUEL SUPPLY PUMP

a. Disconnect the inlet hose from the fuel supply pump.

b. Operate the priming pump and check that fuel is being supplied to the fuel supply pump.

OK:
Fuel is properly supplied to the fuel supply pump when the priming pump is operated.

HINT:

- **When lack on fuel, fuel pressure drops.**
- **Inspect for fuel filter clogging.**
  (Check that the fuel filter is not clogged)

NG → CHECK AND REPLACE CLOGGED FUEL PIPE (INCLUDING FUEL FREEZING) (FUEL TANK - FUEL SUPPLY PUMP)

OK

14.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the difficulty starting has been successfully repaired by starting the engine.

HINT:

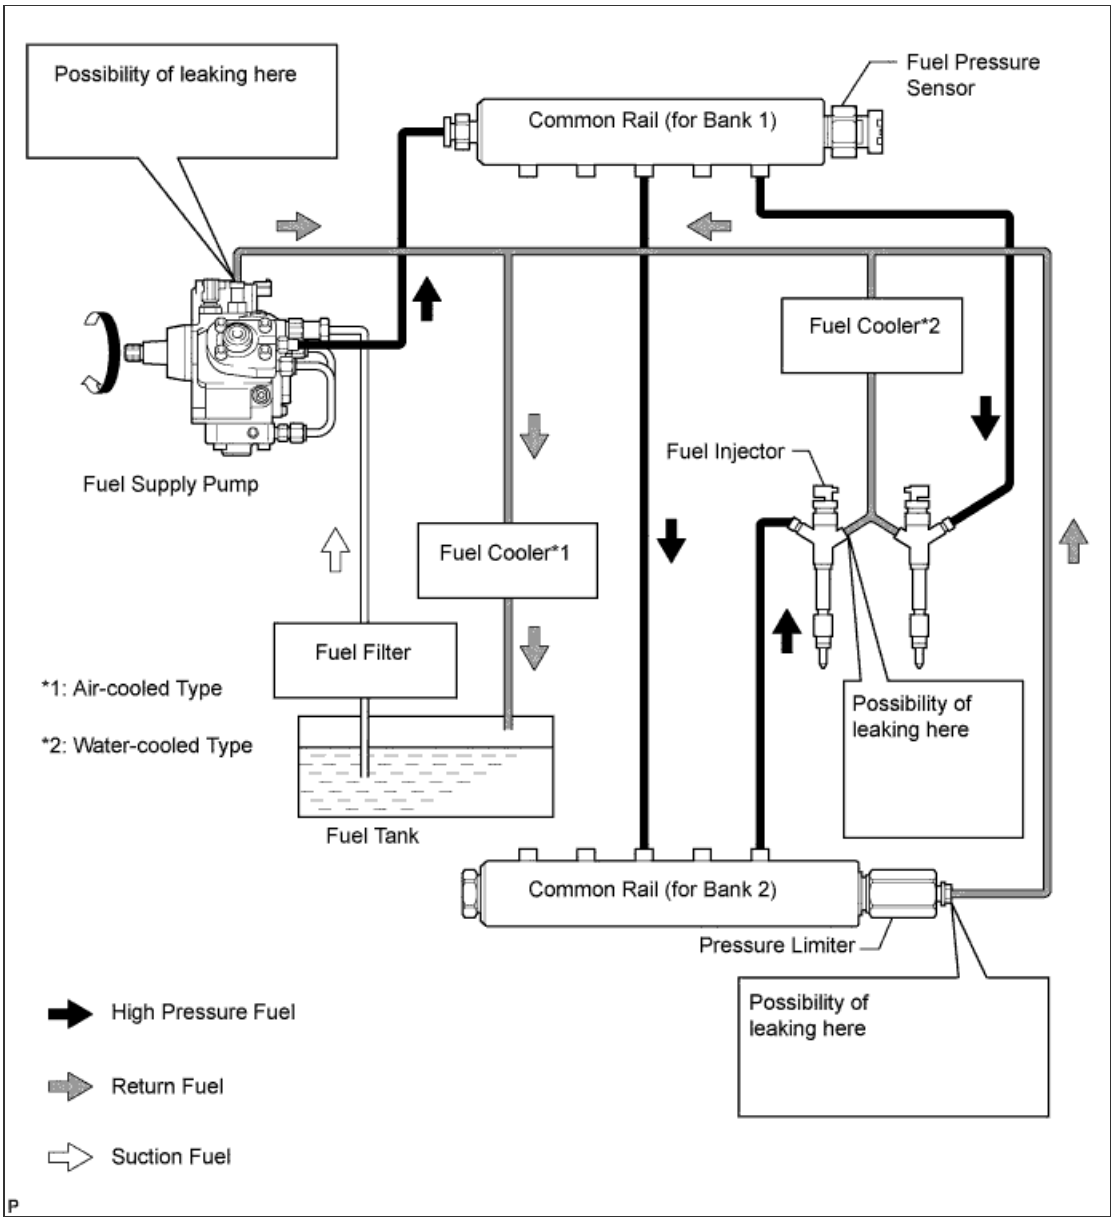
Fuel pressure during cranking is within +/-5000 kPa of target fuel pressure.

OK:
Malfunction has been repaired successfully.

NG → Go to step 15

OK

END



15.CHECK FUEL LEAK (FUEL SUPPLY PUMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester ON.

c. Enter the following menus: Powertrain / Engine / Data List / Fuel Press.

d. Pinch the supply pump return hose and check that Fuel Press during cranking increases.

Result

Result	Proceed to
Fuel Press increases	A
No change	B

A → REPLACE FUEL SUPPLY PUMP (Click here)

B

16.CHECK FUEL LEAK (PRESSURE LIMITER (COMMON RAIL (for Bank 2))

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester ON.

c. Enter the following menus: Powertrain / Engine / Data List / Fuel Press.

d. Pinch the pressure limiter return hose and check that Fuel Press during cranking increases.

Result

Result	Proceed to
Fuel Press increases	A
No change	B

A → REPLACE COMMON RAIL (for Bank 2) (Click here)

B

17.REPLACE FUEL SUPPLY PUMP

a. Replace fuel supply pump (Click here).

NEXT

18.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the difficulty starting has been successfully repaired by starting the engine.

HINT:

Fuel pressure during cranking is within +/-5000 kPa of target fuel pressure.

NEXT

END

19.CHECK SNAPSHOT (TARGET PUMP SCV CURRENT)

a. Check Target Pump SCV Current in the snapshot taken when the engine was starting.

Result:

Result	Proceed to
Target Pump SCV Current is 3000 mA or more	A
Target Pump SCV Current is less than 3000 mA	B

A → REPLACE FUEL SUPPLY PUMP (Click here)

B

20.CHECK DATA LIST

a. Check Injection Feedback Val # and Injection Volume in the snapshot taken when the engine was idling.

Result:

Result	Proceed to
Injection Feedback Val #1 to #8 is outside the range of +/-3 mm ^{3}/st **HINT:** There may be malfunction in the corresponding cylinder.	A
Injection Feedback Val #1 to #8 is within the range of +/-3 mm ^{3}/st and Injection Volume is more than 10 mm^3/st	B*
Injection Feedback Val #1 to #8 is within the range +/-3 mm ^{3}/st and Injection Volume is 10 mm ^{3}/st or less	C

HINT:

*: When case "B" occurs usually symptoms may be noticeable, such as difficult starting, rough idling, knocking or black smoke at high common rail pressure.

B → REPLACE FUEL INJECTORS OF ALL CYLINDERS (Click here)

C	Go to step 25

A

21.PERFORM ACTIVE TEST USING INTELLIGENT TESTER

HINT:

Use this Active Test to determine the malfunctioning cylinder.

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1 to #8 Fuel Cut.

HINT:

- **If the engine idle speed does not change when a fuel injector is disabled, the cylinder being tested is malfunctioning.**
- **If the cylinder being tested is normal, there will be a significant change in idle speed when the fuel injection is stopped for that cylinder.**

NEXT

22.PERFORM ACTIVE TEST USING INTELLIGENT TESTER

HINT:

Use this Active Test to help determine whether a cylinder has compression loss or not.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Check the Cylinder Compression / Data List / Compression / Engine Speed of Cyl #1 to #8.

d. Check the engine speed during the Active Test.

OK:
If the values of Engine Speed Cyl #1 to #8 are within +/-10 rpm of each other.

HINT:

When cranking, if the speed of a cylinder is approximately 100 rpm more than the other cylinders, there is probably a loss of compression in that cylinder.

OK	Go to step 24
NG	Go to step 23

23.CHECK CYLINDER COMPRESSION PRESSURE OF MALFUNCTIONING CYLINDER

HINT:

Measure the compression of the cylinder that had a high speed during the Active Test "Check the Cylinder Compression".

a. Check the cylinder compression pressure (Click here).

NG	CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

24.REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER

HINT:

The injector is determined to be faulty as the corresponding cylinder is malfunctioning, but has no compression loss.

NEXT

END

25.CHECK TEMPERATURE WHEN STARTING TROUBLE OCCURS

a. Check the temperature when starting trouble occurs.

Result

Result	Proceed to
Difficult to start only for cold engine.	A
Difficult to start both for cold and warmed up engine.	B

B → Go to step 29

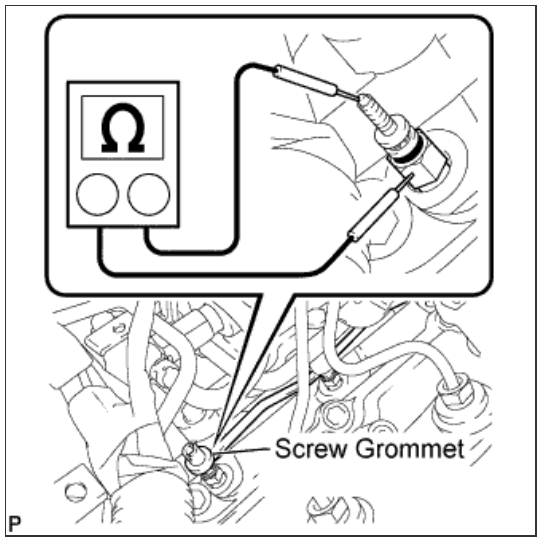
A

26.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK



27.INSPECT GLOW PLUG ASSEMBLY (RESISTANCE)

a. Disconnect the glow plug connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
Glow plug terminal - Body ground	20°C (68°F)	Approximately 1 Ω

HINT:

If any of the glow plugs has an open circuit, the engine power will be insufficient only when the engine is cold.

NOTICE:

- **Exercise extreme care not to damage the glow plug pipes. Damaging them could cause an open circuit or shorten the life of the glow plugs.**
- **Keep the glow plugs free of oil and fuel while cleaning.**
- **Wipe any oil off of the terminal and Bakelite washer with a clean, dry cloth during inspection.**
- **Do not apply more than 11 V to the glow plugs as it may cause an open circuit.**

NG → REPLACE GLOW PLUG ASSEMBLY (Click here)

OK

28.INSPECT INJECTOR COMPENSATION CODE

a. Read the injector compensation code (Click here).

OK:

Compensation codes stored in the ECM match compensation codes of the installed fuel injectors.

NG → PERFORM REGISTRATION FUEL INJECTOR COMPENSATION CODE (Click here)

OK

29.CHECK FUEL QUALITY

a. Check that fuel with cetane number is used.

NEXT

30.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the difficulty starting has been successfully repaired by starting the engine.

NEXT

END

31.CHECK SNAPSHOT

HINT:

When all Data List values are OK and Fuel Press is higher than Target Common Rail Pressure, perform the following inspection.

NEXT

32.INSPECT INJECTOR DRIVER (EDU POWER SOURCE)

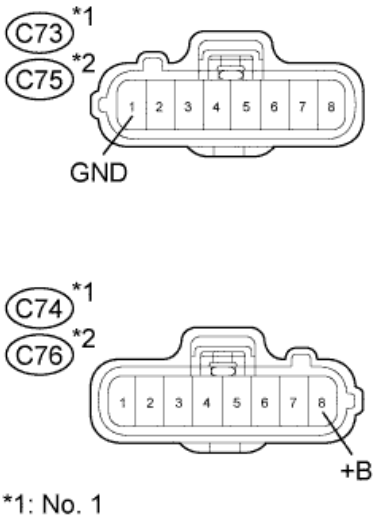
a. Disconnect the C73 and C74 No. 1 injector driver (EDU) connectors.

b. Disconnect the C75 and C76 No. 2 injector driver (EDU) connectors.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

No. 1



Tester Connection	Switch Condition	Specified Condition
C74-8 (+B) - C73-1 (GND)	Ignition switch ON	11 to 14 V

Standard Voltage:

No. 2

Tester Connection	Switch Condition	Specified Condition
C76-8 (+B) - C75-1 (GND)	Ignition switch ON	11 to 14 V

Front view of wire harness connector: (to EDU)

*1: No. 1

*2: No. 2

NG → GO TO INJECTOR CIRCUIT (Click here)

OK

33.INSPECT FUEL INJECTOR

HINT:

If there is no initial combustion during cranking, there may be air in the injectors.

NEXT

END

for Preparation Click here

INSPECTION PROCEDURE

NOTICE:

- **After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).**
- **After replacing a fuel supply pump, the ECM needs initialization (Click here).**
- **After replacing a fuel injector, the ECM needs registration (Click here).**

HINT:

Specified values in the following troubleshooting flowchart are for reference only. Variations in the Data List values may occur depending on the measuring conditions or the vehicle age. Do not assume the vehicle to be normal when the Data List outputs standard values. There may be concealed factors of the malfunction.

1.READ OUTPUT DTC (RELATED TO ENGINE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read the DTCs.

Result

Result	Proceed to
No DTC is output	A
DTCs related to the engine are output	B

B → REPAIR OR REPLACE ENGINE CONTROL SYSTEM ACCORDING TO DTC OUTPUT (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (INJECTION VOLUME AND INJECTION FEEDBACK VAL #1 TO #8)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List.

d. Select the following menu items in order and read the values.

- Injection Volume
- Injection Feedback Val #1, #2, #3, #4, #5, #6, #7 and #8

Standard Value:

Item	Engine Speed*	Reference Value
Injection Volume	Idling (No engine load)	3.0 to 10 mm^3/st
Injection Feedback Val #1 to #8	Idling (No engine load)	-3.0 to 3.0 mm^3/st

HINT:

*: If no idling conditions are specified, the shift lever should be in N, and the A/C switch and all accessory switches should be off.

NG → Go to step 11

OK

3.PERFORM ENGINE SPEED ACCELERATION

HINT:

If the exhaust gas contains excessive black smoke, perform the following operations.

a. Accelerate the engine to the maximum speed with no load 20 times.

b. Check the volume of black smoke in the exhaust gas.

Result

Result	Proceed to
Black smoke is not present	OK
Black smoke remains in the exhaust gas	NG

HINT:

Soot deposits in the exhaust system may cause excessive black smoke.

NG → Go to step 4

OK →

END

4.CHECK INTAKE AIR CONTROL SYSTEM AND EXHAUST SYSTEM

a. Inspect the engine condition (Click here).

NG → REPAIR OR REPLACE LOCATIONS WHERE MALFUNCTIONS EXIST

OK →

5.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK →

6.CHECK TURBOCHARGING PRESSURE

a. Check the turbocharging pressure (Click here).

OK:

The turbocharger pressure is within the standard range.

NG → REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (Click here)

OK →

7.READ VALUE USING INTELLIGENT TESTER (DATA LIST)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List.

d. Select the following menu items in order and read the values.

- Fuel Press
- Injection Volume

- Main Injection Period
- Pilot 2 Injection Period
- Injection Feedback Val #1, #2, #3, #4, #5, #6, #7 and #8

Reference:

Item	Engine Speed*	Reference Value
Fuel Press	Idling	27 to 37 MPa
Fuel Press	2000 rpm (no engine load)	50 to 70 MPa
Fuel Press	3000 rpm (no engine load)	52 to 76 MPa
Injection Volume	Idling	3.0 to 10 mm^3/st
Injection Volume	2000 rpm (no engine load)	3.5 to 11 mm^3/st
Injection Volume	3000 rpm (no engine load)	6.5 to 13 mm^3/st
Main Injection Period	Idling	430 to 730 µs
Pilot 2 Injection Period	Idling	390 to 490 µs
Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3

HINT:

*: If no idling conditions are specified, the shift lever should be in N, and the A/C switch and all accessory switches should be off.

Result

Result	Proceed to
Within reference value	A
One of Injection Feedback Val #1 to #8 is not within reference value	B
Other result	C

B → REPLACE MALFUNCTIONING FUEL INJECTOR (Click here)

C → Go to step 11

A

8.CHECK CYLINDER COMPRESSION PRESSURE

a. Check the cylinder compression pressure (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

9.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR - EDU)

a. Disconnect the fuel injector connectors.

b. Disconnect the No. 1 EDU connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

No. 1

Tester Connection	Condition	Specified Condition
C5-2 - C74-4 (INJ1)	Always	Below 1 Ω
C14-2 - C74-3 (INJ4)	Always	Below 1 Ω
C69-2 - C74-2 (INJ6)	Always	Below 1 Ω
C68-2 - C74-1 (INJ7)	Always	Below 1 Ω
C5-1 - C74-5 (COM1)	Always	Below 1 Ω
C14-1 - C74-5 (COM1)	Always	Below 1 Ω
C69-1 - C74-6 (COM2)	Always	Below 1 Ω

C68-1 - C74-6 (COM2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

No. 1

Tester Connection	Condition	Specified Condition
C5-2 or C74-4 (INJ1) - Body ground	Always	10 kΩ or higher
C14-2 or C74-3 (INJ4) - Body ground	Always	10 kΩ or higher
C69-2 or C74-2 (INJ6) - Body ground	Always	10 kΩ or higher
C68-2 or C74-1 (INJ7) - Body ground	Always	10 kΩ or higher
C5-1 or C74-5 (COM1) - Body ground	Always	10 kΩ or higher
C14-1 or C74-5 (COM1) - Body ground	Always	10 kΩ or higher
C69-1 or C74-6 (COM2) - Body ground	Always	10 kΩ or higher
C68-1 or C74-6 (COM2) - Body ground	Always	10 kΩ or higher

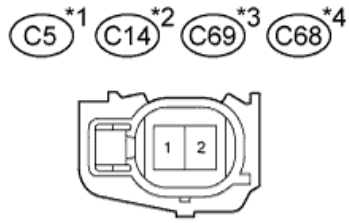
d. Disconnect the fuel injector connectors.

e. Disconnect the No. 2 EDU connector.

f. Measure the resistance according to the value(s) in the table below.

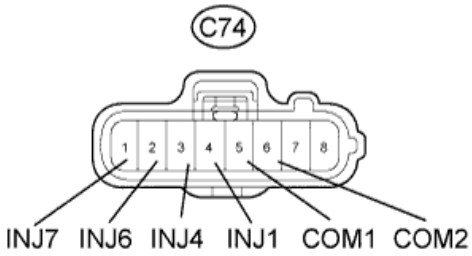
Standard Resistance (Check for Open):

No. 2



Tester Connection	Condition	Specified Condition
C70-2 - C76-4 (INJ2)	Always	Below 1 Ω
C9-2 - C76-3 (INJ5)	Always	Below 1 Ω
C67-2 - C76-1 (INJ3)	Always	Below 1 Ω
C54-2 - C76-2 (INJ8)	Always	Below 1 Ω
C70-1 - C76-5 (COM4)	Always	Below 1 Ω
C9-1 - C76-5 (COM4)	Always	Below 1 Ω
C67-1 - C76-6 (COM5)	Always	Below 1 Ω
C54-1 - C76-6 (COM5)	Always	Below 1 Ω

Standard Resistance (Check for Short):



No. 2

Tester Connection	Condition	Specified Condition
C70-2 or C76-4 (INJ2) - Body ground	Always	10 kΩ or higher
C9-2 or C76-3 (INJ5) - Body ground	Always	10 kΩ or higher
C67-2 or C76-1 (INJ3) - Body ground	Always	10 kΩ or higher
C54-2 or C76-2 (INJ8) - Body ground	Always	10 kΩ or higher
C70-1 or C76-5 (COM4) - Body ground	Always	10 kΩ or higher
C9-1 or C76-5 (COM4) - Body ground	Always	10 kΩ or higher
C67-1 or C76-6 (COM5) - Body ground	Always	10 kΩ or higher
C54-1 or C76-6 (COM5) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (CONTROL THE CYLINDER FUEL CUT)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1, #2, #3, #4, #5, #6, #7 and #8 Fuel Cut.

d. Check the engine idling condition while the fuel injection of each cylinder is cut using the tester.

Result

Engine Idling Condition	Proceed to
Becomes unstable	A
Does not change	B

HINT:

Replace the fuel injector mounted on the cylinder that causes no significant idle speed change.

B → REPLACE MALFUNCTIONING FUEL INJECTOR (Click here)

A

REPLACE INJECTOR DRIVER (No. 1 and/or No. 2) (Click here)

11.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine and warm it up.

d. Enter the following menus: Powertrain / Engine / Data List / Coolant Temp.

e. Read the value.

Standard Value:

Item	Inspection Condition	Reference Value
Coolant Temp	Idling with warm engine (A/C switch off)	75 to 90°C (167 to 194°F)

NG → Go to step 17

OK

12.READ VALUE USING INTELLIGENT TESTER (MAP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine and warm it up.

d. Enter the following menus: Powertrain / Engine / Data List / MAP.

e. Read the value.

OK:
Same value as the actual atmospheric pressure.

NG → Go to step 18

OK

13.READ VALUE USING INTELLIGENT TESTER (ENGINE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Engine Speed.

d. Read the value.

Standard Value:

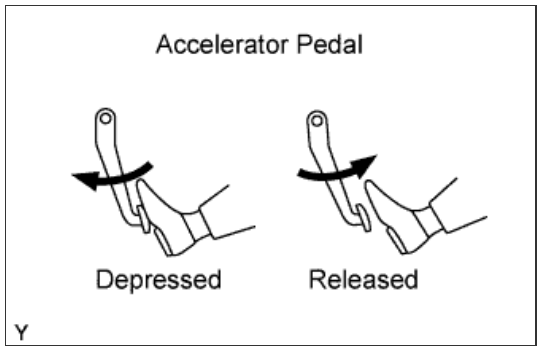
Item	Inspection Condition	Reference Value
Engine Speed	Idling with warm engine (A/C switch off)	• 500 to 600 rpm (M/T) • 550 to 650 rpm (A/T)

NG → Go to step 19

OK

14.READ VALUE USING INTELLIGENT TESTER (ACCEL SENS. NO.# VOLT %)

a. Connect the intelligent tester to the DLC3.



b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Accel Sens. No.1 Volt % and Accel Sens. No.2 Volt %.

d. Read the values.

Standard:

Accelerator Pedal	Accel Sens. No.1 Volt %	Accel Sens. No.2 Volt %
Released	8 to 28%	30 to 55%
Depressed	51 to 86%	73 to 98%

NG → Go to step 20

OK ↓

15.READ VALUE USING INTELLIGENT TESTER (INTAKE AIR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Inlet Air.

d. Read the value.

OK:
Same as air temperature near intake manifold.

NG → Go to step 21

OK ↓

16.READ VALUE USING INTELLIGENT TESTER (FUEL PRESS)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine and warm it up.

d. Enter the following menus: Powertrain / Engine / Data List / Fuel Press.

e. Read the value.

Standard Value:

Item	Inspection Condition	Reference Value
Fuel Press	Idling	27 to 37 MPa

NG → Go to step 22

OK ↓

REPLACE ECM (Click here)

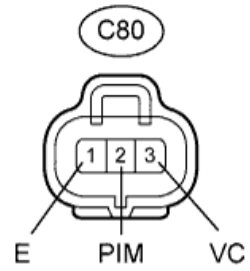
17.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

NG → **REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)**

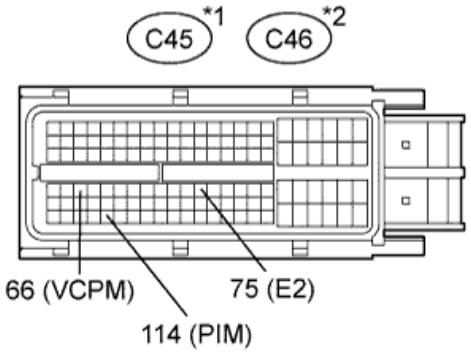
OK ↓

REPAIR OR REPLACE HARNESS OR CONNECTOR



18.CHECK HARNESS AND CONNECTOR (MANIFOLD ABSOLUTE PRESSURE SENSOR - ECM)

a. Disconnect the manifold absolute pressure sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Manifold Absolute Pressure Sensor)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C80-2 (PIM) - C45-114 (PIM)	Always	Below 1 Ω
C80-3 (VC) - C45-66 (VCPM)	Always	Below 1 Ω
C80-1 (E) - C45-75 (E2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C80-2 (PIM) - C46-114 (PIM)	Always	Below 1 Ω
C80-3 (VC) - C46-66 (VCPM)	Always	Below 1 Ω
C80-1 (E) - C46-75 (E2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition

C80-2 (PIM) or C45-114 (PIM)) - Body ground	Always	10 kΩ or higher
C80-3 (VC) or C45-66 (VCPM) - Body ground	Always	10 kΩ or higher
C80-1 (E) or C45-75 (E2) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C80-2 (PIM) or C46-114 (PIM)) - Body ground	Always	10 kΩ or higher
C80-3 (VC) or C46-66 (VCPM) - Body ground	Always	10 kΩ or higher
C80-1 (E) or C46-75 (E2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE MANIFOLD ABSOLUTE PRESSURE SENSOR (Click here)

19.INSPECT CRANKSHAFT POSITION SENSOR

a. Disconnect the crankshaft position sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (NE+) - 2 (NE-)	Cold	1630 to 2740 Ω
1 (NE+) - 2 (NE-)	Hot	2065 to 3225 Ω

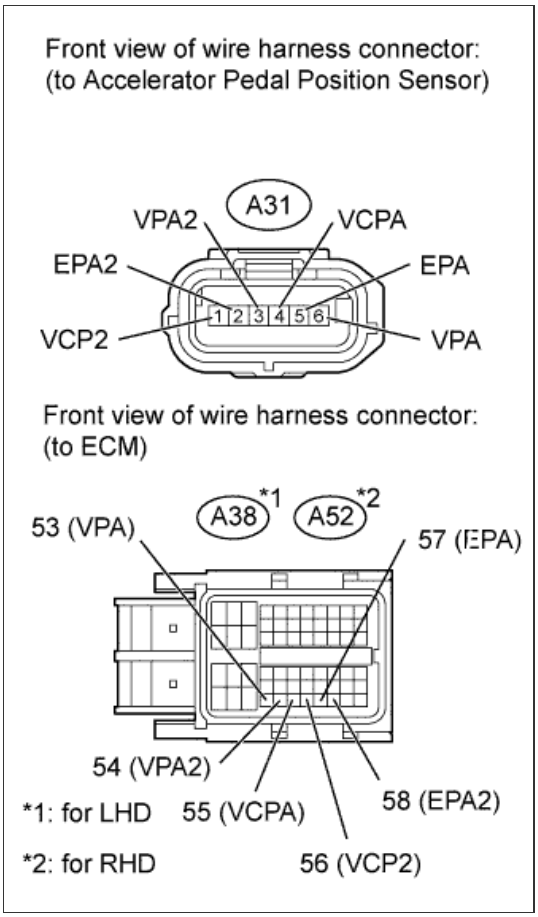
HINT:

In the table above, the terms "Cold" and "Hot" refer to the temperature of the coils in the sensor. "Cold" means approximately -10 to 50°C (14 to 122°F). "Hot" means approximately 50 to 100°C (122 to 212°F).

Component without harness connected:
(Crankshaft Position Sensor)

NG → REPLACE CRANKSHAFT POSITION SENSOR (Click here)

OK



REPAIR OR REPLACE HARNESS OR CONNECTOR

20.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the accelerator pedal position sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) - A38-56 (VCP2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-58 (EPA2)	Always	Below 1 Ω
A31-3 (VPA2) - A38-54 (VPA2)	Always	Below 1 Ω
A31-4 (VCPA) - A38-55 (VCPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-57 (EPA)	Always	Below 1 Ω
A31-6 (VPA) - A38-53 (VPA)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) - A52-56 (VCP2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-58 (EPA2)	Always	Below 1 Ω
A31-3 (VPA2) - A52-54 (VPA2)	Always	Below 1 Ω
A31-4 (VCPA) - A52-55 (VCPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-57 (EPA)	Always	Below 1 Ω
A31-6 (VPA) - A52-53 (VPA)	Always	Below 1 Ω

Standard Resistance (Check for Short):

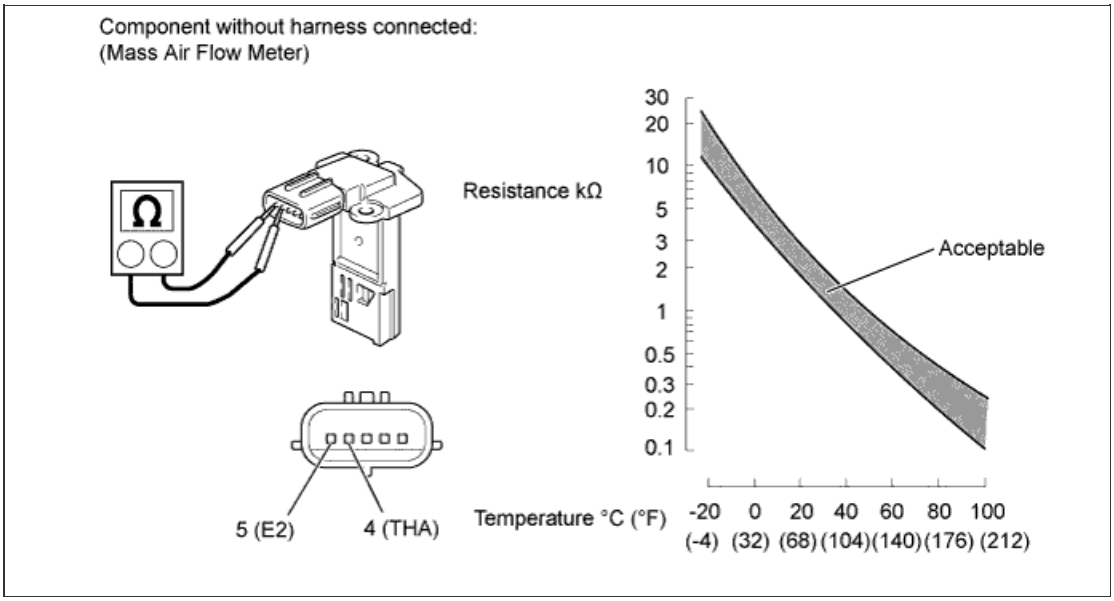
for LHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) or A38-56 (VCP2) -		10 kΩ or

Body ground	Always	higher
A31-2 (EPA2) or A38-58 (EPA2) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-54 (VPA2) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-55 (VCPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A38-57 (EPA) - Body ground	Always	10 kΩ or higher
A31-6 (VPA) or A38-53 (VPA) - Body ground	Always	10 kΩ or higher

for LHD

Tester Connection	Condition	Specified Condition
A31-1 (VCP2) or A52-56 (VCP2) - Body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-58 (EPA2) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-54 (VPA2) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-55 (VCPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-57 (EPA) - Body ground	Always	10 kΩ or higher
A31-6 (VPA) or A52-53 (VPA) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ACCELERATOR PEDAL ROD ASSEMBLY (ACCELERATOR PEDAL POSITION SENSOR) (Click here)

21.INSPECT INTAKE AIR TEMPERATURE SENSOR

a. Remove the mass air flow meter (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition

4 - 5	-20°C (-4°F)	13.6 to 18.4 kΩ
	20°C (68°F)	2.21 to 2.69 kΩ
	60°C (140°F)	0.49 to 0.67 kΩ

NG → REPLACE MASS AIR FLOW METER (Click here)

OK →

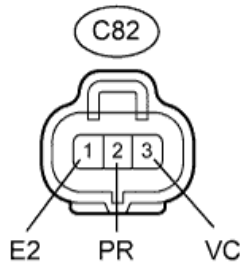
REPAIR OR REPLACE HARNESS OR CONNECTOR

22.INSPECT COMMON RAIL (for Bank 1) (FUEL PRESSURE SENSOR)

a. Inspect the fuel pressure sensor (Click here).

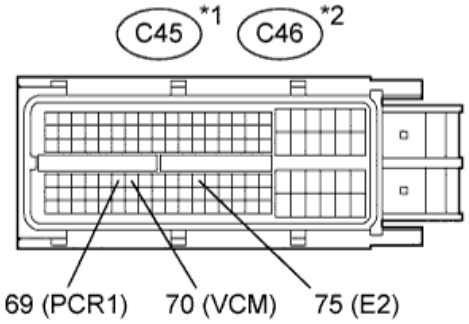
NG → REPLACE COMMON RAIL (for Bank 1) (Click here)

OK →



23.CHECK HARNESS AND CONNECTOR (FUEL PRESSURE SENSOR - ECM)

a. Disconnect the fuel pressure sensor connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Fuel Pressure Sensor)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition

C82-2 (PR) - C45-69 (PCR1)	Always	Below 1 Ω
C82-3 (VC) - C45-70 (VCM)	Always	Below 1 Ω
C82-1 (E2) - C45-75 (E2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C82-2 (PR) - C46-69 (PCR1)	Always	Below 1 Ω
C82-3 (VC) - C46-70 (VCM)	Always	Below 1 Ω
C82-1 (E2) - C46-75 (E2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C82-2 (PR) or C45-69 (PCR1) - Body ground	Always	10 kΩ or higher
C82-3 (VC) or C45-70 (VCM) - Body ground	Always	10 kΩ or higher
C82-1 (E2) or C45-75 (E2) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C82-2 (PR) or C46-69 (PCR1) - Body ground	Always	10 kΩ or higher
C82-3 (VC) or C46-70 (VCM) - Body ground	Always	10 kΩ or higher
C82-1 (E2) or C46-75 (E2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

24.REPLACE ECM

a. Replace the ECM (Click here).

NOTICE:

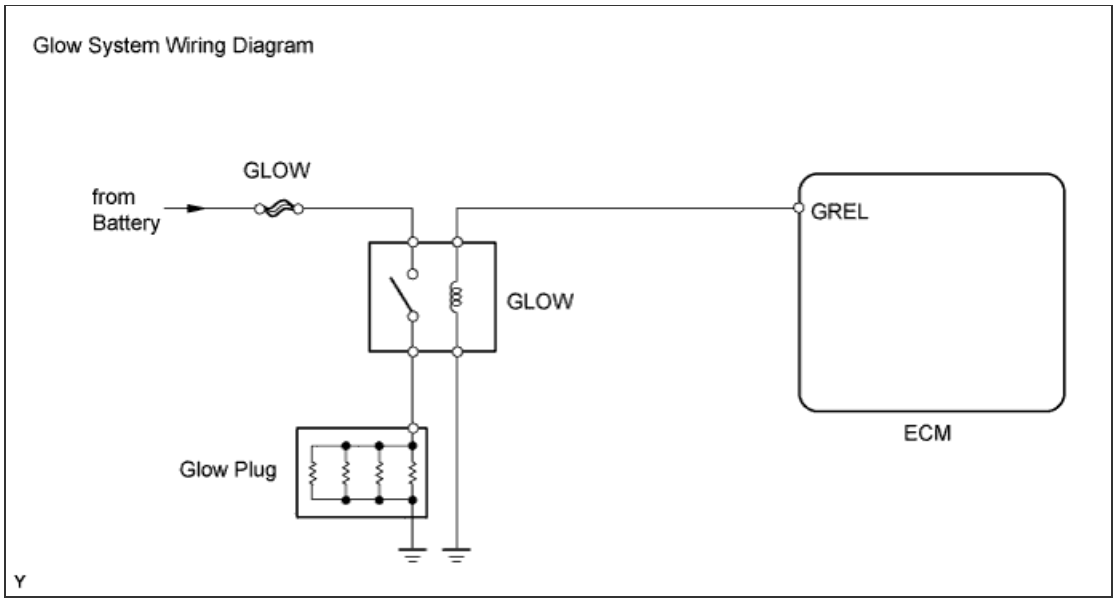
After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

b. Check if the engine starts smoothly or if the engine stalls.

OK:

The engine starts smoothly and does not stall.

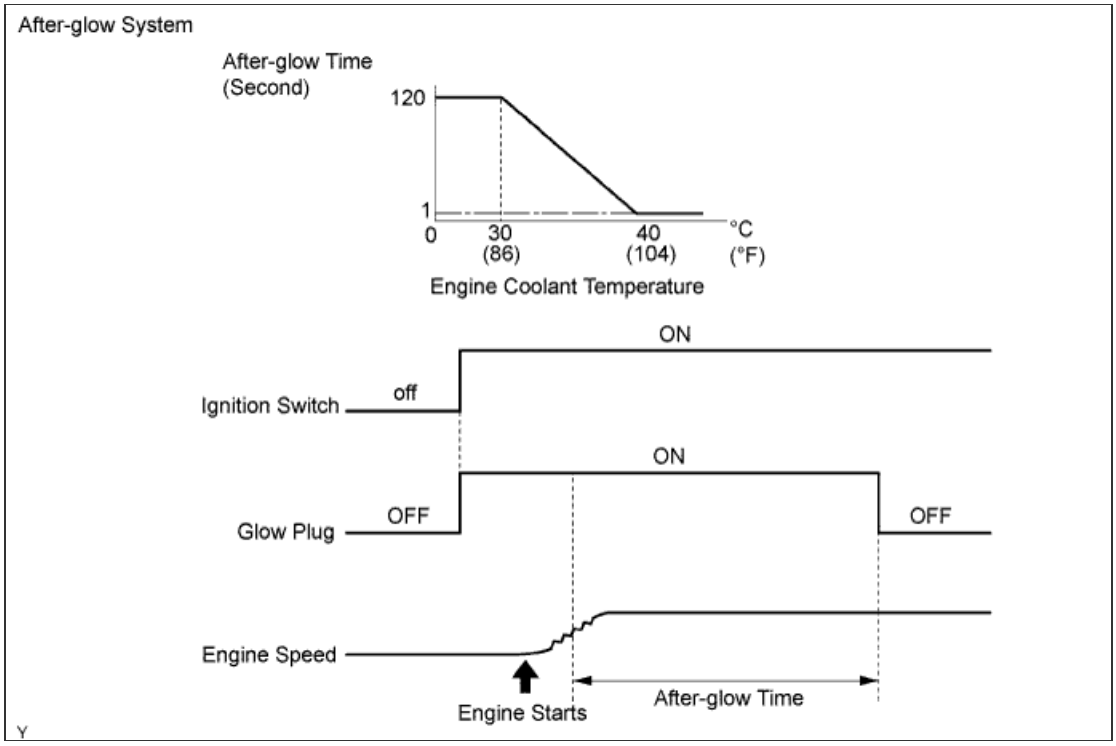
NG → REPLACE FUEL SUPPLY PUMP (**Click here**)



OK

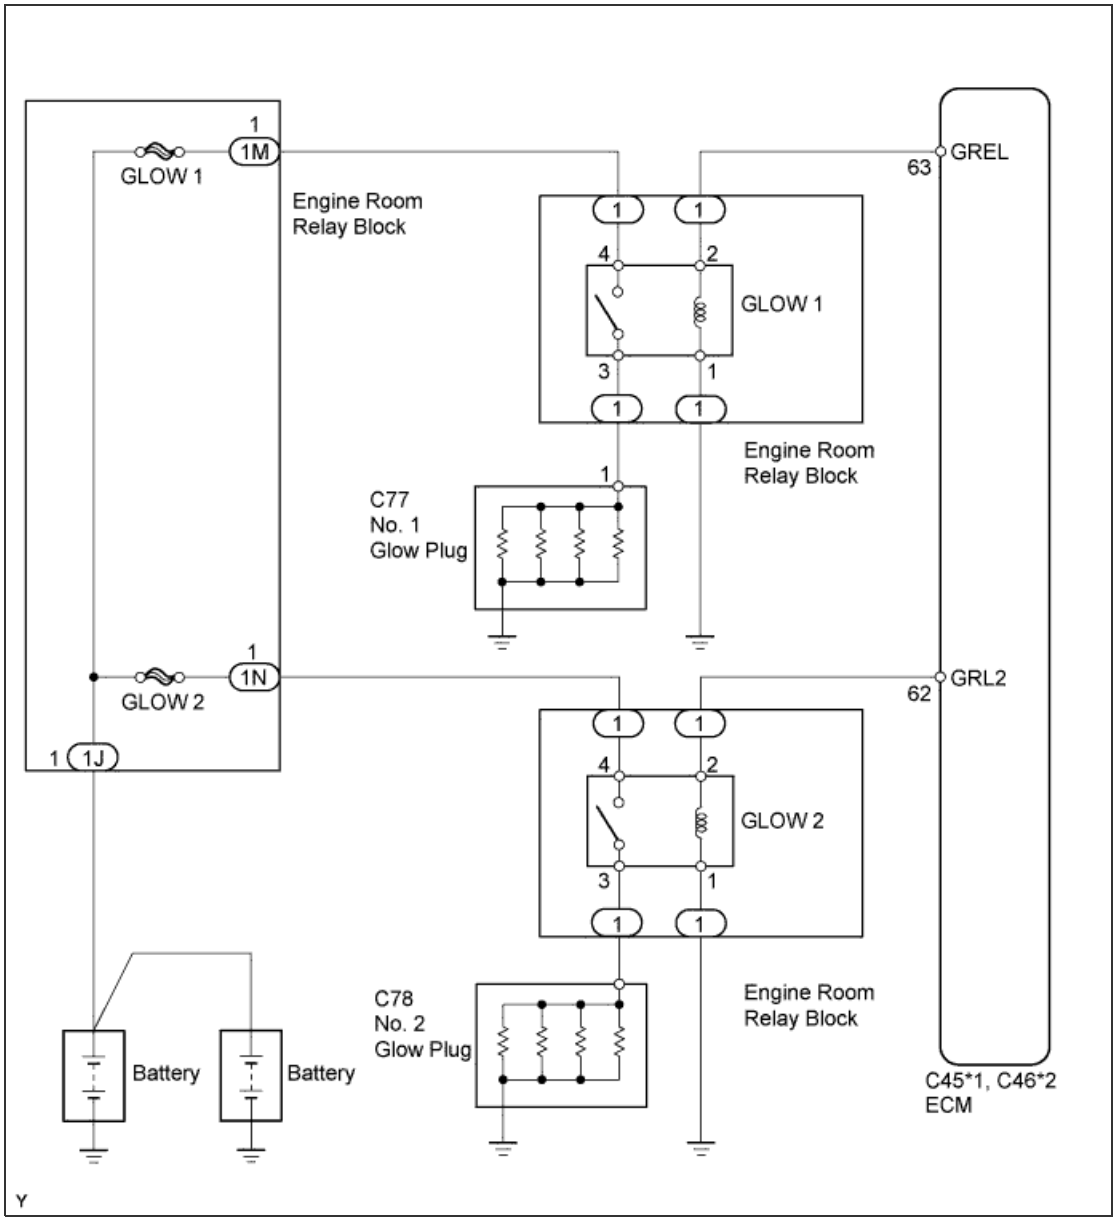
END

for Preparation Click here



DESCRIPTION

The glow plug is mounted inside the engine combustion chamber. To ensure efficient engine starting with a cold engine, the ECM calculates a time interval of the current that needs to flow through the glow plug depending on the starting engine coolant temperature when the ignition switch is turned to ON. The ECM then turns on the glow plug relay and permits current to flow through the glow plug based on the ECM calculated time. The glow plug is then heated, and enhances fuel combustion with a cold engine.
This DTC will be stored if the glow plug or the circuit is open.



HINT:

- **These troubleshooting procedures are for: 1) difficult engine starting in cold weather, and 2) difficulty driving/vehicle malfunctions in cold weather immediately after engine is started.**
- **After the engine is started, the ECM performs an "after-glow" for a certain period of time. In proportion to the actual engine coolant temperature, the time period varies. The after-glow reduces diesel engine knocking, white smoke emissions and engine noises when the engine is cold.**

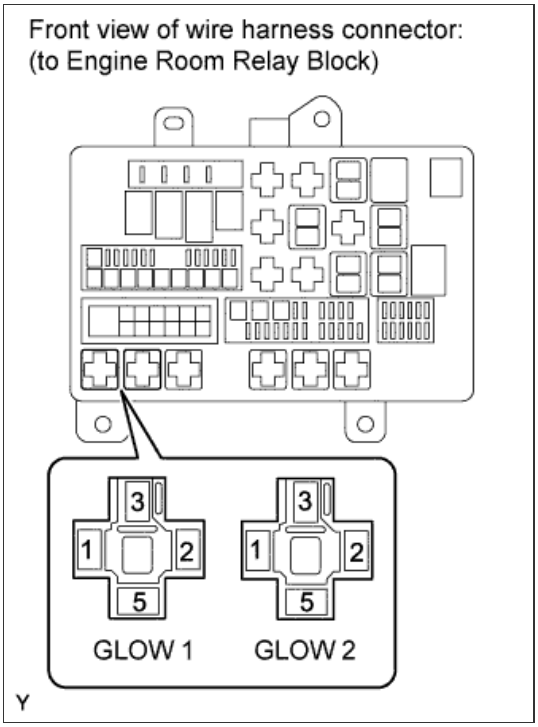
WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

1.CHECK ECM TERMINAL VOLTAGE (GREL TERMINAL)



a. Remove the GLOW 1 relay from the engine room relay block.

b. Remove the GLOW 2 relay from the engine room relay block.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
GLOW 1 relay (2) - Body ground	Ignition switch ON	11 to 14 V
GLOW 2 relay (2) - Body ground	Ignition switch ON	11 to 14 V

NG → Go to step 7

OK

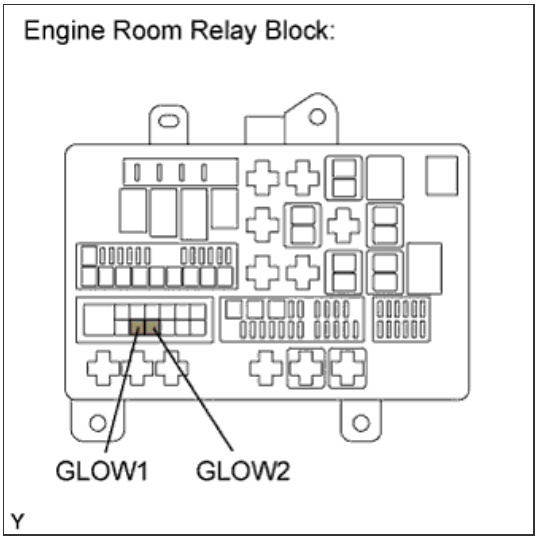
2.INSPECT GLOW RELAY (GLOW 1 or 2)

a. Inspect the GLOW 1 relay (Click here).

b. Inspect the GLOW 2 relay (Click here).

NG → REPLACE GLOW RELAY (GLOW 1 or 2)

OK



3.INSPECT FUSE (GLOW 1 and GLOW 2)

a. Remove the GLOW 1 and GLOW 2 fuses from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Component	Condition	Specified Condition
GLOW 1 H-fuse	Always	Below 1 Ω
GLOW 2 H-fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND COMPONENTS CONNECTED TO FUSE, AND REPLACE FUSE

OK

4.INSPECT GLOW PLUG ASSEMBLY (RESISTANCE)

a. Inspect the glow plug assembly (Click here).

NG → REPLACE GLOW PLUG ASSEMBLY (Click here)

OK

5.CHECK GLOW PLUG ASSEMBLY (INSTALLATION)

a. Check the glow plug installation (Click here).

OK:
Glow plugs are installed securely.

NG → TIGHTEN GLOW PLUG (Click here)

OK

6.CHECK HARNESS AND CONNECTOR (GLOW PLUG RELAY - GLOW PLUG - BATTERY AND BODY GROUND)

a. Remove the GLOW 1 relay from the engine room relay block.

b. Disconnect the C77 glow plug connector.

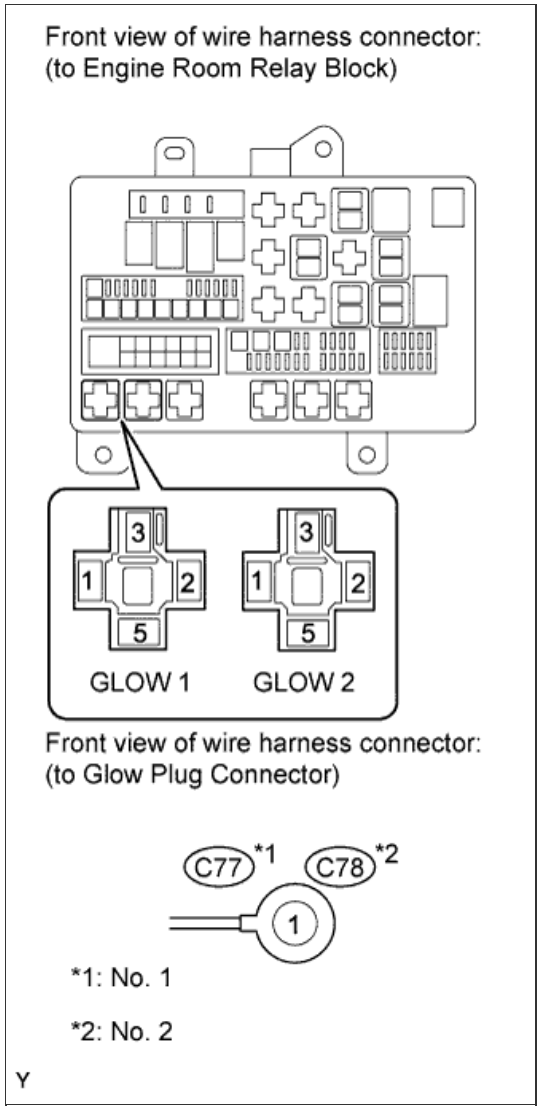
c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

No. 1

Tester Connection	Condition	Specified Condition
GLOW 1 relay (3) - C77-1	Always	Below 1 Ω
GLOW 1 relay (4) - Positive (+) battery terminal cable	Always	Below 1 Ω
GLOW 1 relay (1) - Body ground	Always	Below 1 Ω

d. Remove the GLOW 2 relay from the engine room relay block.



e. Disconnect the C78 glow plug connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

No. 2

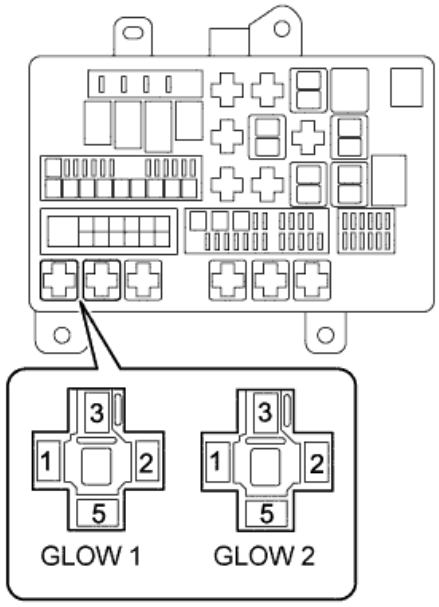
Tester Connection	Condition	Specified Condition
GLOW 2 relay (3) - C78-1	Always	Below 1 Ω
GLOW 2 relay (4) - Positive (+) battery terminal cable	Always	Below 1 Ω
GLOW 2 relay (1) - Body ground	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

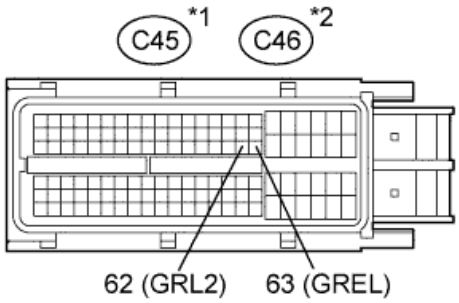
CHECK FOR INTERMITTENT PROBLEMS (Click here)

7.CHECK HARNESS AND CONNECTOR (GLOW PLUG RELAY - ECM AND BODY GROUND)



a. Remove the GLOW 1 relay from the engine room relay block.

b. Remove the GLOW 2 relay from the engine room relay block.



c. Disconnect the ECM connector.

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Engine Room Relay Block)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
GLOW 1 relay (2) - C45-63 (GREL)	Always	Below 1 Ω
GLOW 2 relay (2) - C45-62 (GRL2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
GLOW 1 relay (2) - C46-63 (GREL)	Always	Below 1 Ω

GLOW 2 relay (2) - C46-62 (GRL2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
GLOW 1 relay (2) or C45-63 (GREL) - Body ground	Always	10 kΩ or higher
GLOW 2 relay (2) or C45-62 (GRL2) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
GLOW 1 relay (2) or C46-63 (GREL) - Body ground	Always	10 kΩ or higher
GLOW 2 relay (2) or C46-62 (GRL2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

for Preparation Click here

DESCRIPTION

Malfunction Condition	Main Trouble Area	Related Trouble Area
• Rough idling or shuddering due to abnormal combustion • Shuddering when starting vehicle due to clutch system malfunctions	1. Fuel injector malfunctions • Fuel injector sliding malfunction • Fuel injector stuck closed • Fuel injector stuck open • Deposit in fuel injector • Fuel injector circuit malfunction 2. Clutch system malfunctions • Clutch system (shuddering when starting)	• Fuel injector compensation code • Fuel leak • Engine mounting insulator • Intake air system leakage • Intake air system blockage • EGR system • Throttle valve system • Fuel supply pump • Low quality fuel • Vehicle modifications • Fuel filter air bleed problem • Accessory problem (A/C, generator, etc.) • ECM

HINT:

- **Rough idling and excessive engine vibrations are checked in this troubleshooting procedure.**
- **Specified values in the following troubleshooting flowchart are for reference only. Variations in the Data List result values may occur depending on the measuring conditions or the vehicle age. Do not judge the vehicle to be normal even when the Data List values indicate a standard level. There are possibly some concealed factors of the malfunction.**
- **Check that the vehicle has not been modified in any way prior to the vehicle inspection.**

INSPECTION PROCEDURE

NOTICE:

- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**
- **After replacing the fuel injector, the ECM needs registration (Click here).**

HINT:

Before troubleshooting, conduct the following:

(a) Check the fuel quality.
(b) Check the fuel for air.
(c) Check the fuel system for blockages.
(d) Check the air filter.
(e) Check the engine oil.
(f) Check the engine coolant.
(g) Check the engine idling speed and the maximum engine speed.
(h) Check the vacuum pump.

1.CHECK MALFUNCTION CONDITION

a. Identify when shuddering occurs.

Result

Result	Proceed to
When idling	A
When engaging engine clutch at vehicle start	B (Clutch system shudders)

B → REPAIR OR REPLACE CLUTCH SYSTEM (Click here)

A

2.CHECK WIRE HARNESS AND CONNECTOR IN ENGINE COMPARTMENT

a. Check the wire harness and connector connections of common rail system components.

OK:

The wire harnesses and connectors are connected securely.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.PERFORM CONFIRMATION DRIVING PATTERN

HINT:

Drive the vehicle according to the driving pattern below to allow the ECM to store DTCs relating to malfunctions of the fuel system, EGR system, and throttle valve. If DTCs are stored, problem areas can be identified.

a. Enter Check Mode (Click here).

b. Fully warm up the engine.

c. Allow the engine to idle for 5 minutes or more.

d. Drive the vehicle at more than 40 km/h (25 mph) for 1 minute or more (procedure "A").

e. Decelerate and stop the vehicle (procedure "B").

f. Repeat procedure "A" and procedure "B" 4 times or more.

g. Stop the engine and wait for at least 10 seconds (procedure "C").

h. Repeat procedure "A" and procedure "C" described above to store DTCs relating to the EGR system and throttle valve.

i. Drive the vehicle at more than 70 km/h (43 mph) for at least 1 minute (to store DTCs relating to the fuel supply pump).

NEXT

4.READ OUTPUT DTC (RELATING TO ENGINE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read pending DTCs.

Result

Result	Proceed to
No DTCs are output	A
Engine related DTCs are output	B

B → GO TO DTC CHART (**Click here**)

A

5.READ VALUE USING INTELLIGENT TESTER (INJECTION FEEDBACK VAL AND INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine, warm it up and turn the tester on.

c. Select the following menu items in order and read the values.

- Injection Feedback Val #1 to #8
- Injection Volume

Standard Value:

Item	Engine Speed*	Standard Range	Description
			Value of fuel injector injection

Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st	volume compensates for differences in combustion condition of cylinders • Positive values indicate control which corrects combustion degradation • Negative values indicate control which corrects excessive combustion pressure • If problems exist, "Injection Feedback Val" may deviate from the -3.0 to 3.0 mm^3/st range
Injection Volume	Idling	3.0 to 10 mm^3/st	Injection volume value controlled by ECU • Controls NE signal, fuel temperature, engine coolant temperature, intake air temperature, boost pressure, atmospheric pressure, EGR volume, and MAF • If problems exist, "Injection Volume" may be outside the standard range

Result

Result	Proceed to
Standard range	A
Injection Feedback Val #1 to #8 and/or Injection Volume outside standard range	B

HINT:

*: The A/C switch and all accessory switches should be off with a fully warm engine.

B → Go to step 13

A

6.CHECK FUEL INJECTOR COMPENSATION CODE

a. Read the fuel injector compensation code (Click here).

HINT:

If the fuel injector compensation code is not correctly registered, it may cause malfunctions.

b. Check the fuel injector compensation code.

OK:

Compensation code of the installed fuel injector is the same as the code registered in the ECM.

NG → PERFORM REGISTRATION OF FUEL INJECTOR COMPENSATION CODE (Click here)

OK

7.RESET ECM

a. Disconnect the cable from the negative (-) battery terminal for at least 2 minutes.

b. Reconnect the cable to the negative (-) battery terminal.

c. Check whether the malfunction has been successfully repaired by performing a driving test using the freeze frame data recorded at the time the malfunction occurred.

OK:
Malfunction has been repaired successfully.

NG → Go to step 8

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

8.BASIC INSPECTION

a. Check the fuel quality.

b. Check the fuel for air.

c. Check the fuel system for blockages.

d. Check the air filter.

e. Check the engine oil.

f. Check the engine coolant.

g. Check the engine idling speed and the maximum engine speed.

h. Check the vacuum pump.

OK:
Each inspection result is normal.

NG → REPAIR OR REPLACE MALFUNCTIONING PARTS

OK ↓

9.CHECK ENGINE MOUNTING INSULATOR

a. Visually check that the engine mounting insulator is installed correctly and is not crooked or twisted.

OK:
No abnormalities.

NG → REPAIR OR REPLACE ENGINE MOUNTING INSULATOR FRONT (Click here)

OK ↓

10.CHECK INTAKE SYSTEM

a. Check for air leakage and blockage between the air cleaner and turbocharger, and between the turbocharger and intake manifold.

OK:
No air leakage or blockage.

NG → REPAIR OR REPLACE MALFUNCTIONING PARTS

OK ↓

11.CHECK EGR VALVE ASSEMBLY (No. 1 AND No. 2)

HINT:

For vehicles without EGR valve, perform troubleshooting from the next step.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the EGR Step Position or Control the EGR Step Position #2 / Data List / Actual EGR Valve Pos. or Actual EGR Valve Pos. #2.

d. When changing the Active Test value from 0 to 100%, check that Actual EGR Valve Pos. or Actual EGR Valve Pos. #2 smoothly changes to the set opening angle.

OK:
Value smoothly changes to within +/-10% of set opening angle.

HINT:

- **EGR valve closed: Actual EGR Valve Pos. is 0%**
- **EGR valve open: Actual EGR Valve Pos. is 94.9%**

NG → REPLACE EGR VALVE ASSEMBLY (No. 1 and/or No. 2) (Click here)

OK

12.READ VALUE USING INTELLIGENT TESTER (ACTUAL THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Actual Throttle Position and Actual Throttle Position #2.

d. Read the value.

OK:
Ignition switch ON:
-5 to 5%
Idling (warmed up engine):
0 to 90%
Accelerator pedal fully depressed:
-5 to 5%

Result

Result	Proceed to
NG	A
OK	B

B → Go to step 15

A

REPLACE DIESEL THROTTLE BODY ASSEMBLY (for Bank 1 or Bank 2) (Click here)

13.IDENTIFY MALFUNCTIONING CYLINDER INJECTOR

a. Follow the instructions in the table below according to the check result of the intelligent tester.

HINT:

This operation is based on the premise that the common rail pressure is normal.

Standard Value:

Item	Engine Speed*	Reference Value

Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st
Injection Volume	Idling	3.0 to 10 mm^3/st

HINT:

*: The A/C switch and all accessory switches should be off, and the engine should be fully warmed up.

Result

Injection Feedback Val #1 to #8	Injection Volume	Proceed to
3.0 mm^3/st or more, -3.0 mm^3/st or less	Less than 3.0 mm^3/st	A
	Between 3.0 to 10 mm^3/st (Normal)	B
	More than 10 mm^3/st	B
Between -3.0 and 3.0 mm^3/st	Less than 3.0 mm^3/st	-
	Between 3.0 to 10 mm^3/st (Normal)	Normal
	More than 10 mm^3/st	C*

HINT:

*: When the Injection Volume displayed on the tester is large despite the Fuel Press and Injection Feedback Val #1 to #8 in the Data List being normal, the fuel injector may be clogged. In this case, there may be deposits inside or outside the tip of the fuel injector.

Proceed to	Inspection Area	Description
A	Inspect and repair cylinder fuel injector with revised injection volume of less than 3.0 mm^3: • Perform power balance inspection and identify malfunctioning cylinder • Replace malfunctioning cylinder fuel injector	Fuel injector of cylinder with abnormal value injects excessively large quantity of fuel
B	Identify malfunctioning cylinders by conducting power balance inspection: • Perform power balance inspection to identify malfunctioning cylinders • Clean malfunctioning cylinder fuel injector, then check and repair it	Fuel injector of cylinder with abnormal value injects excessively large quantity of fuel • Fuel injection volume too low due to fuel injector nozzle being blocked by deposits • Compression of cylinder with abnormal value decreases • Fuel injector of cylinder with abnormal value injects excessively large quantity of fuel
C	Inspect and repair all cylinder fuel injectors: Clean all cylinder fuel injectors, and then inspect and repair them	All cylinder fuel injectors inject excessively small quantity of fuel: Injection volume too low due to all cylinder fuel injector nozzles being blocked by deposits

HINT:

- **Despite the fuel injector functioning normally, the indicated Injection Feedback Val #1 to #8 value may be outside the normal operating range due to compensation for other problems (such as low compression).**
- **Injection Feedback Val #1 to #8 is the value used to correct the injection volumes of each cylinder, in order to optimize (compensate for the unevenness between) all the cylinder combustion conditions. If any of the cylinders malfunction, the injection volumes for the normal cylinders are corrected simultaneously. As a result, the Injection Feedback Val #1 to #8 may deviate from the standard range.**

B	Go to step 15
C	Go to step 20

A

14.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL CUT FOR IDENTIFYING MALFUNCTIONING CYLINDER)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1, #2, #3, #4, #5, #6, #7 and #8 Fuel Cut.

d. Check the 8 cylinders in sequence to identify any faulty cylinders by performing the power balance inspection.

HINT:

- **If the engine idle speed does not change when a fuel injector is disabled, the cylinder being tested is malfunctioning.**
- **If the cylinder being tested is normal, there will be a significant change in idle speed when the fuel injection is stopped for that cylinder.**

NEXT

REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

15.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL CUT FOR IDENTIFYING MALFUNCTION)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1, #2, #3, #4, #5, #6, #7 and #8 Fuel Cut.

d. Check the 8 cylinders in sequence to identify any faulty cylinders by performing the power balance inspection.

HINT:

- **If the engine idle speed does not change when a fuel injector is disabled, the cylinder being tested is malfunctioning.**
- **If the cylinder being tested is normal, there will be a significant change in idle speed when the fuel injection is stopped for that cylinder.**

NEXT

16.CHECK CYLINDER COMPRESSION PRESSURE

a. Check the cylinder compression pressure (Click here).

NG → **CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION**

OK

17.CHECK MALFUNCTIONING CYLINDER INJECTOR FOR DEPOSITS

HINT:

If a fuel injector is contaminated with deposits, the injection volume deviates from the standard range. This may cause malfunctions.

a. Check the fuel injector for any deposits.

Result

Result	Proceed to
Deposits	A
No deposits	B

B → **REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)**

A

18.CLEAN FUEL INJECTOR

a. Wipe away deposits from the tips of the fuel injectors.

HINT:

Solvent or carbon removal agents help remove the deposits easily.

NOTICE:

Exercise extreme care not to damage the fuel injectors while wiping off the deposits.

NEXT

19.READ VALUE USING INTELLIGENT TESTER (INJECTION FEEDBACK VAL AND INJECTION VOLUME)

a. Reinstall the fuel injector to the cylinder head.

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Start the engine and warm it up.

e. Enter the following menus: Powertrain / Engine / Data List.

f. Select the following menu items in order and read the values.

- Injection Feedback Val #1 to #8
- Injection Volume

Standard Value:

Item	Engine Speed*	Reference Value
Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st
Injection Volume	Idling	3.0 to 10 mm^3/st

HINT:

*: The A/C switch and all accessory switches should be off, and the engine should be fully warmed up. When the values are outside the standard range, deposits inside the fuel injector may be causing the problem.

OK:
Values are within the standard range.

NG → REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

OK

END

20.CHECK FUEL INJECTORS FOR DEPOSITS

HINT:

If a fuel injector is contaminated with deposits, the fuel injection volume deviates from the standard range. This may cause malfunctions.

a. Check the fuel injector for any deposits.

Result

Result	Proceed to
Deposits	A
No deposits	B

B → REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

A

21.CLEAN FUEL INJECTOR

a. Wipe away deposits from the tips of the fuel injectors.

HINT:

Solvent or carbon removal agents help remove the deposits easily.

NOTICE:

Exercise extreme care not to damage the fuel injectors while wiping off the deposits.

NEXT

22.READ VALUE USING INTELLIGENT TESTER (INJECTION FEEDBACK VAL AND INJECTION VOLUME)

a. Reinstall the fuel injector to the cylinder head.

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Start the engine and warm it up.

e. Enter the following menus: Powertrain / Engine / Data List.

f. Select the following menu items in order and read the values.

- Injection Feedback Val #1 to #8
- Injection Volume

Standard Value:

Item	Engine Speed*	Reference Value
Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st
Injection Volume	Idling	3.0 to 10 mm^3/st

HINT:

*: The A/C switch and all accessory switches should be off, and the engine should be fully warmed up. When the values are outside the standard range, deposits inside the fuel injector may be causing the problem.

OK:

Values are within the standard range.

NG → **REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)**

OK

for Preparation Click here

DESCRIPTION

Malfunction Condition	Main Trouble Area	Related Trouble Area
• Knocking and abnormal sound due to extremely rich combustion • Abnormal sound due to friction between parts	1. Fuel injector malfunctions • Fuel injector sliding malfunction • Fuel injector stuck closed • Fuel injector stuck open • Deposits in fuel injector • Fuel injector circuit malfunction 2. Abnormal common rail pressure • Fuel supply pump • Fuel pulsation sound • Air in fuel 3. Friction between parts 4. Compression pressure	• Fuel injector compensation codes • Fuel leakage • Intake air system leakage • Intake air system blockage • EGR system • Throttle valve system • Fuel pressure sensor • Manifold absolute pressure sensor • Atmospheric pressure sensor (built into ECM) • Vehicle modifications • Low quality fuel • Lack of fuel • ECM

HINT:

- **Specified values in the following troubleshooting flowchart are for reference only. Variations in the Data List values may occur depending on the measuring conditions or the vehicle's age. Do not judge the vehicle to be normal even when the Data List values indicate a standard level. There are possibly some concealed factors of the malfunction.**
- **Check that the vehicle has not been modified in any way prior to the vehicle inspection.**

INSPECTION PROCEDURE

NOTICE:

- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**
- **After replacing a fuel injector, the ECM needs registration (Click here).**

HINT:

- **This troubleshooting procedure checks for knocking and rattling.**
- **Knocking is most likely to occur while the engine is idling.**

1.CHECK SOUND AREA

a. Find the source of the abnormal sound using a mechanic's stethoscope.

Result

Result	Proceed to
Sound from fuel supply pump	A
Sound from parts other than fuel supply pump	B

B → REPAIR OR REPLACE MALFUNCTIONING PARTS

A

2.CHECK HARNESS AND CONNECTOR IN ENGINE COMPARTMENT

a. Check the wire harness connections.

OK:
Wire harnesses are connected securely.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.PERFORM CONFIRMATION DRIVING PATTERN

HINT:

Drive the vehicle according to the driving pattern below to allow the ECM to store DTCs relating to malfunctions of the fuel system, EGR system and throttle valve. If DTCs are stored, problem areas can be identified.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter Check Mode (Click here).

d. Fully warm up the engine.

e. Allow the engine to idle for 5 minutes or more.

f. Drive the vehicle at more than 40 km/h (25 mph) for 1 minute or more (procedure "A").

g. Decelerate and stop the vehicle (procedure "B").

h. Repeat procedure "A" and procedure "B" 4 times or more.

i. Stop the engine and wait for at least 10 seconds (procedure "C").

j. Repeat procedure "A" and procedure "C" described above to store DTCs relating to the EGR system and throttle valve.

k. Drive the vehicle at more than 70 km/h (43 mph) for at least 1 minute (to store DTCs relating to the fuel supply pump).

NEXT

4.READ OUTPUT DTC (RELATING TO ENGINE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read pending DTCs.

Result

Result	Proceed to
No DTCs are output	A
Engine related DTCs are output	B

B → GO TO DTC CHART (**Click here**)

A

5.READ VALUE USING INTELLIGENT TESTER (INJECTION FEEDBACK VAL AND INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine, warm it up, and turn the tester on.

c. Select the following menu items in order and read the values.

- Injection Feedback Val #1 to #8
- Injection Volume

Standard Value:

Item	Engine Speed*	Standard Range	Description
			Value of fuel injector injection volume compensates for differences in combustion condition of cylinders

Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st	• Positive values indicate control which corrects combustion degradation • Negative values indicate control which corrects excessive combustion pressure • If problems exist, Injection Feedback Val may deviate from the -3.0 to 3.0 mm^3/st range
Injection Volume	Idling	3.0 to 10 mm^3/st	Fuel injection volume value controlled by ECU • Controls NE signal, fuel temperature, engine coolant temperature, intake air temperature, boost pressure, atmospheric pressure, EGR volume, and MAF • If problems exist, Injection Volume may be outside standard range

Result

Result	Proceed to
Standard range	A
Injection Feedback Val #1 to #8 and/or Injection Volume outside standard range	B

HINT:

*: The A/C switch and all accessory switches should be off, and the engine should be fully warmed up.

B → **Go to step 18**

A

6.CHECK FUEL INJECTOR COMPENSATION CODE

a. Read the fuel injector compensation code (Click here).

HINT:

If the fuel injector compensation code is not correctly registered, it may cause malfunctions (Click here).

b. Check the fuel injector compensation code.

OK:

Compensation code of the installed fuel injector is the same as the code registered in the ECM.

NG → REGISTER FUEL INJECTOR COMPENSATION CODE (**Click here**)

OK

7.RESET ECM

a. Disconnect the cable from the negative (-) battery terminal for at least 2 minutes.

b. Reconnect the cable to the negative (-) battery terminal.

c. Check whether the malfunction has been successfully repaired by performing a driving test using the freeze frame data recorded at the time the malfunction occurred.

OK:
Malfunction has been repaired successfully.

NG → Go to step 8

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

8.BASIC INSPECTION

a. Check the fuel quality.

b. Check the fuel for air.

c. Check the fuel system for blockages.

d. Check the air filter.

e. Check the engine oil.

f. Check the engine coolant.

g. Check the engine idling speed and the maximum engine speed.

h. Check the vacuum pump.

OK:
Each inspection result is normal.

NG → REPAIR OR REPLACE MALFUNCTIONING PARTS

OK ↓

9.CHECK INTAKE SYSTEM

a. Check for air leakage and blockage between the air cleaner and turbocharger, and between the turbocharger and intake manifold.

OK:
No air leakage or blockage.

NG → REPAIR OR REPLACE MALFUNCTIONING PARTS

OK ↓

10.CHECK EGR VALVE ASSEMBLY (No. 1 or No. 2)

HINT:

For vehicles without EGR valve, perform troubleshooting from the next step.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the EGR Step Position or Control the EGR Step Position #2 / Data List / Actual EGR Valve Pos. or Actual EGR Valve Pos. #2.

d. When changing the Active Test value from 0 to 100%, check that Actual EGR Valve Pos. or Actual EGR Valve Pos. #2 smoothly changes to the set opening angle.

OK:
Value smoothly changes to within +/-10% of set opening angle.

HINT:

- **EGR valve closed: Actual EGR Valve Pos. is 0%**
- **EGR valve open: Actual EGR Valve Pos. is 94.9%**

NG → REPLACE EGR VALVE ASSEMBLY (for No. 1 or No. 2) (Click here)

OK

11.READ VALUE USING INTELLIGENT TESTER (ACTUAL THROTTLE POSITION)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Actual Throttle Position and Actual Throttle Position #2.

d. Read the value.

OK:
Ignition switch ON:
-5 to 5%
Idling (Warmed up engine):
0 to 90%
Accelerator pedal fully depressed:
-5 to 5%

NG → REPLACE DIESEL THROTTLE BODY ASSEMBLY (for Bank 1 or Bank 2) (Click here)

OK

12.CHECK COMBUSTION SOUND

a. Confirm type of sound emitted.

Result

Result	Proceed to
Knocking	A
Mechanical sound other than knocking	B

B → Go to step 23

A

13.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL CUT FOR IDENTIFYING MALFUNCTION)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1, #2, #3, #4, #5, #6, #7 and #8 Fuel Cut.

d. Check the 8 cylinders in sequence to identify any faulty cylinders by performing the power balance inspection.

HINT:

- **While the engine is idling, if the idling stability variation is small despite cutting off the fuel injection, the cylinder is malfunctioning.**
- **With normal cylinders, the engine idles roughly when the fuel injection is cut off.**

NEXT

14.CHECK CYLINDER COMPRESSION PRESSURE

a. Check the cylinder compression pressure (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

15.CHECK MALFUNCTIONING CYLINDER FUEL INJECTOR FOR DEPOSITS

HINT:

If a fuel injector is contaminated with deposits, the injection volume deviates from the standard range. This may cause malfunctions.

a. Check the fuel injector for any deposits.

Result

Result	Proceed to
Deposits	A
No deposits	B

B → REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

A

16.CLEAN FUEL INJECTOR

a. Wipe away deposits from the tips of the fuel injectors.

HINT:

Solvent or carbon removal agents help remove the deposits easily.

NOTICE:

Exercise extreme care not to damage the fuel injectors while wiping off the deposits.

NEXT

17.READ VALUE USING INTELLIGENT TESTER (INJECTION FEEDBACK VAL AND INJECTION VOLUME)

a. Reinstall the fuel injector to the cylinder head.

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Start the engine and warm it up.

e. Enter the following menus: Powertrain / Engine / Data List.

f. Select the following menu items in order and read the values.

- Injection Feedback Val #1 to #8
- Injection Volume

Standard Value:

Item	Engine Speed*	Reference Value
Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st
Injection Volume	Idling	3.0 to 10 mm^3/st

HINT:

- ***: The A/C switch and all accessory switches should be off, and the engine should be fully warmed up.**
- **When the values are outside the standard range, deposits inside the fuel injector may be causing the problem.**

OK:

Values are within the standard range.

NG → REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

OK → END

18.IDENTIFY MALFUNCTIONING CYLINDER FUEL INJECTOR

a. Follow the instructions in the table below according to the check result of the intelligent tester.

HINT:

This operation is based on the premise that the common rail pressure is normal.

Standard Value:

Item	Engine Speed*	Reference Value
Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st
Injection Volume	Idling	3.0 to 10 mm^3/st

HINT:

*: The A/C switch and all accessory switches should be off, and the engine should be fully warmed up.

Result

Injection Feedback Val #1 to #8	Injection Volume	Proceed to
3.0 mm^3/st or more, -3.0 mm^3/st or less	Less than 3.0 mm^3/st	A
	Between 3.0 and 10 mm^3/st (Normal)	B
	More than 10 mm^3/st	B
Between -3.0 and 3.0 mm^3/st	Less than 3.0 mm^3/st	-
	Between 3.0 and 10 mm^3/st (Normal)	Normal
	More than 10 mm^3/st	C*

HINT:

*: When the Injection Volume displayed on the tester is large despite the Fuel Press and Injection Feedback Val #1 to #8 in the Data List being normal, the fuel injector may be clogged. In this case, there may be deposits inside or outside the tip of the fuel injector.

Proceed to	Inspection Area	Description
A	Inspect and repair cylinder fuel injector with revised injection volume of less than 3.0 mm^3: • Perform power balance inspection and identify malfunctioning cylinder • Replace malfunctioning cylinder fuel injector	Fuel injector of cylinder with abnormal value injects excessively large quantity of fuel
B	Identify malfunctioning cylinders by conducting power balance inspection: • Perform power balance inspection to identify malfunctioning cylinders • Clean malfunctioning cylinder fuel injector, then check and repair it	Fuel injector of cylinder with abnormal value injects excessively large quantity of fuel • Injection volume too low due to fuel injector nozzle being blocked by deposits • Compression of cylinder with abnormal value decreases • Fuel injector of cylinder with abnormal value injects excessively large quantity of fuel
C	Inspect and repair all cylinder fuel injectors: Clean all cylinder fuel injectors, and then inspect and repair them	All cylinder fuel injectors inject excessively small quantity of fuel: Injection volume too low due to all cylinder fuel injector nozzles being blocked by deposits

HINT:

- **Despite the fuel injector functioning normally, the indicated Injection Feedback Val #1 to #8 value may be outside the normal operating range due to compensation for other problems (such as low compression).**
- **Injection Feedback Val #1 to #8 is the value used to correct the injection volumes of each cylinder, in order to optimize (compensate for the unevenness between) all the cylinder combustion conditions. If any of the cylinders malfunction, the injection volumes for the normal cylinders are corrected simultaneously. As a result, the Injection Feedback Val #1 to #8 may deviate from the standard range.**

B	Go to step 15
C	Go to step 20

A

19.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL CUT FOR IDENTIFYING MALFUNCTIONING CYLINDER)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1, #2, #3, #4, #5, #6, #7 and #8 Fuel Cut.

d. Check the 8 cylinders in sequence to identify any faulty cylinders by performing the power balance inspection.

HINT:

- **If the engine idle speed does not change when a fuel injector is disabled, the cylinder being tested is malfunctioning.**
- **If the cylinder being tested is normal, there will be a significant change in idle speed when the fuel injection is stopped for that cylinder.**

NEXT

REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

20.CHECK FUEL INJECTORS FOR DEPOSITS

HINT:

If a fuel injector is contaminated with deposits, the injection volume deviates from the standard range. This may cause malfunctions.

a. Check the fuel injector for any deposits.

Result

Result	Proceed to
Deposits	A
No Deposits	B

B	REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

A

21.CLEAN FUEL INJECTOR

a. Wipe away deposits from the tips of the fuel injectors.

HINT:

Solvent or carbon removal agents help remove the deposits easily.

NOTICE:

Exercise extreme care not to damage the fuel injectors while wiping off the deposits.

NEXT

22.READ VALUE USING INTELLIGENT TESTER (INJECTION FEEDBACK VAL AND INJECTION VOLUME)

a. Reinstall the fuel injector to the cylinder head.

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Start the engine and warm it up.

e. Enter the following menus: Powertrain / Engine / Data List.

f. Select the following menu items in order and read the values displayed on the tester respectively.

- Injection Feedback Val #1 to #8
- Injection Volume

Standard Value:

Item	Engine Speed*	Reference Value
Injection Feedback Val #1 to #8	Idling	-3.0 to 3.0 mm^3/st
Injection Volume	Idling	3.0 to 10 mm^3/st

HINT:

- ***: The A/C switch and all accessory switches should be off, and the engine should be fully warmed up.**
- **When the values are outside the standard range, deposits inside the fuel injector may be causing the problem.**

OK:
Values are within the standard range.

NG → REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER (Click here)

OK → END

23.CHECK SOUND AREA

a. Find the source of the abnormal sound using a mechanic's stethoscope.

Result

Result	Proceed to
Sound from fuel supply pump	A
Sound from parts other than fuel supply pump	B

B → REPAIR OR REPLACE MALFUNCTIONING PARTS

A

24.BLEED AIR FROM FUEL SYSTEM

a. To bleed air from the priming pump, pump the priming pump until it becomes hard and cannot be pumped any more.

NEXT

25.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the knocking has been successfully repaired by performing a driving test.

OK:
Malfunction has been repaired successfully.

NEXT
END

for Preparation Click here

DESCRIPTION

Description

Malfunction Condition	Main Trouble Area	Related Trouble Area
• Lack of power caused by abnormal injection volume (fuel supply pump malfunction or fuel injector malfunction etc.) • Lack of power caused by intake air volume shortage (turbocharger malfunction, front exhaust pipe or exhaust manifold converter blocked)	1. Fuel injector malfunctions • Fuel injector sliding malfunction • Fuel injector stuck closed • Fuel injector stuck open • Deposits in fuel injector 2. Abnormal common rail pressure • Fuel supply pump 3. Abnormal intake air volume • Turbocharger sub-assembly • Front exhaust pipe blockage • Exhaust manifold converter blockage • Diesel throttle does not open • EGR valve does not close 4. Shift position switch malfunction	• Intake air system leakage • Intake air system blockage • Fuel filter element is clogged • Fuel is not supplied to supply pump • Fuel injector compensation code • Mass air flow meter • Manifold absolute pressure sensor • Vehicle modifications • Glow (Poor acceleration when engine is cold) • Low quality fuel • Shift position switch • ECM

HINT:

- **Specified values in the following troubleshooting flowchart are for reference only. Variations in the Data List values may occur depending on the measuring conditions or the vehicle age. Do not judge the vehicle to be normal even when the Data List values indicate a standard level. There are possibly some concealed factors of the malfunction.**
- **Check that the vehicle has not been modified in any way prior to the vehicle inspection.**
- **This troubleshooting procedure checks for the cause of an obvious lack of engine power (e.g. the vehicle speed does not reach the target speed in the high speed range) while the vehicle is being driven.**

Faults and Symptoms of Common Rail Diesel Components

a. Engine Control

Mass Air Flow Meter

Component	Mass air flow meter
Main fault	Decrease in performance (foreign matter is stuck)
Symptoms	Lack of power, black smoke
Data List	MAF
HINT: The maximum fuel injection volume is controlled according to the output from the mass air flow meter.	

Intake System

Component	Intake system

Symptom: Main fault	• Lack of power (No black smoke): Air filter blockage, Air duct is crushed/leaking • Black smoke (No lack of power): Leakage between the turbo and the intake manifold
Data List	• MAP (inside intake air pressure) • Target Booster Pressure When the accelerator is fully depressed, if the MAP is 20 kPa lower than Target Booster Pressure for more than 5 seconds then a lack of power will be felt.

Turbocharger System

Component	Turbocharger system
Main fault	• Air leak in the turbocharged air passage • Turbo motor driver not operating well • Turbocharger (turbine, bearing)
Symptoms	Lack of power (when vehicle starting, when heavy load) (Black smoke is not emitted when racing while vehicle stopped)
Data List	MAP (inside intake air pressure), Target Booster Pressure • When the accelerator is fully depressed, if MAP is 20 kPa lower than Target Booster Pressure for more than 5 seconds then a lack of power will be felt. • With the ignition switch ON or idling, MAP = Atmospheric Pressure (standard atmospheric pressure = 101 kPa). When the engine speed is about 1500 rpm or more, the turbocharger starts to take effect and the MAP becomes higher than atmospheric pressure. • Atmospheric pressure increases 1 kPa each time altitude increases by 100 m, and is also affected by the current weather conditions. VN Turbo Command • Using the Active Test "Test the Turbo Charger Step Motor", check the drive rod movement. • Check the drive rod movement when the ignition switch is turned from ON to off.
Diagnostic Point	• Use Active Test of Test the Turbo Charger Step Motor, check the drive rod's movement. • Check the drive rod's movement when turning the ignition switch off from idling.

Exhaust System

Component	Exhaust system
Main fault	Blockage
Symptoms	Lack of power (high engine speed, when heavy load)
Data List	MAP (inside intake air pressure), Target Booster Pressure When the accelerator is fully depressed, if the MAP is 20 kPa lower than Target Booster Pressure for more than 5 seconds then a lack of power will be felt.

Glow System

Component	Glow system
Main fault	Open circuit, glow plug relay fault
Symptoms	Difficult to start, rough idle, knocking, white smoke (when cold)
Data List	Check the glow plug indicator light
Diagnostic Point	Try to measure the resistance of the glow plug

Engine - 1

Component	Engine
Main fault	Damaged, Seized up
Symptoms	Cannot crank, crank speed is low, strange noise

Engine - 2

Component	Engine
Main fault	Loss of compression
Symptoms	Rough idle (lack of power always)
Data List	Engine Speed of Cyl# • When cranking during the "Check the Cylinder Compression" Active Test, if there is a high speed cylinder, approx. 100 rpm more than the other cylinders, that cylinder loose compression. Injection Feedback Val

	• If Injection Feedback Val is more than 3 mm ^{3}/st, the cylinder may have a fault.

b. Diesel Injection

Fuel Supply Pump

Component	Fuel supply pump
Main fault	-
Symptoms	Difficult to start, engine stalling, rough idle, lack of power
Data List	Fuel Press, Target Common Rail Pressure, Target Pump SCV Current • At a stable condition (e.g. Idling), Fuel Press is within +/-5000 kPa of "Target Common Rail Pressure". • If the fuel pressure is 20000 kPa below the target pressure then a lack of power will be felt. • If the fuel pressure is below 25000 kPa then idling will be rough. • If Target Pump SCV Current is 3000 mA or more, the suction control valve may be stuck. **HINT:** • **The fuel pressure changes at engine starting, but is approx. 25000 kPa at engine start after the engine is warmed up.** • **When Target Pump SCV Current is 3000 mA or more, the suction control valve has a tendency to become stuck.**
Diagnostic Trouble Code	Even if Fuel Press is less than Target Common Rail Pressure, a DTC will not be stored.

Fuel Filter

Component	Fuel filter
Main fault	Blockage
Symptoms	Difficult to start, engine stalling, rough idle, lack of power
Data List	Fuel Press, Target Common Rail Pressure • At a stable condition (e.g. Idling), the fuel pressure is within +/-5000 kPa of "Target Common Rail Pressure ". • If the fuel pressure is 20000 kPa below the target pressure then a lack of power will be felt. • If the fuel pressure is below 25000 kPa then idling will be rough. **HINT:** The fuel pressure changes at engine starting, but is approx. 25 MPa at engine start after the engine is warmed up.
Diagnostic Trouble Code	Even if Fuel Press is less than Target Common Rail Pressure, a DTC will not be stored.

Fuel Injector

Component	Fuel injector
Main fault	Blockage
Symptoms	Rough idle, lack of power, black smoke, white smoke, knocking
Data List	Injection Feedback Val • When an Injection Feedback Val is more than 3 mm ^{3}/st, the cylinder is not normal. This can be read after idling for 1 minute with the engine warmed up (engine coolant temperature is more than 70°C (158°F)).

Pressure Limiter

Component	Pressure limiter
Main fault	Does not completely close
Symptoms	Difficult to start, engine stall, rough idle, lack of power

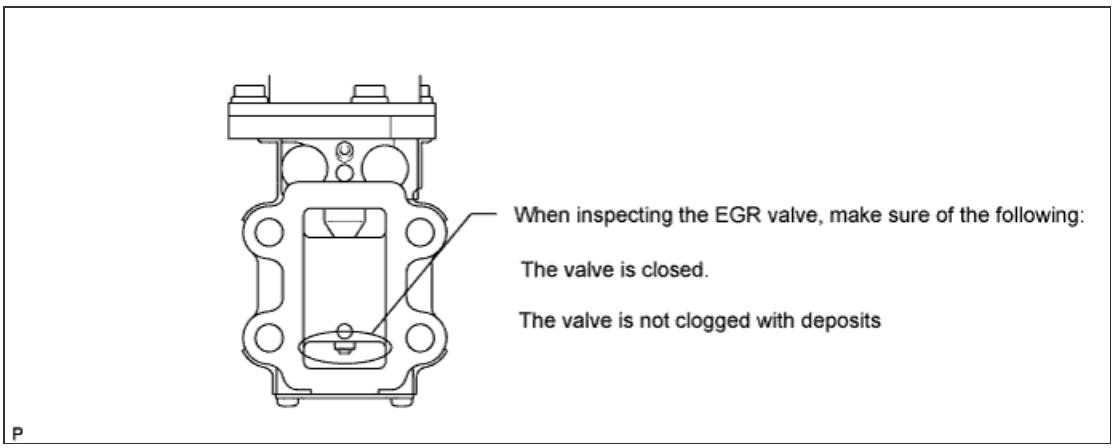
Injector Driver (EDU)

Component	Injector Driver (EDU)
Main fault	Circuit fault: The fuel injector does not open.
Symptoms	Difficult to start, rough idle, lack of power, black smoke, white smoke, knocking
Data List	Same as fuel injector
Diagnostic Trouble Code	When the EDU has a fault, some DTCs may be storedr.

Fuel Pressure Sensor

Component	Fuel pressure sensor
Main fault	Open circuit, decrease in performance (foreign matter is stuck)
Symptoms	Difficult to start, rough idle, engine stall, lack of power
Data List	Fuel Press, Target Common Rail Pressure • At a stable condition (e.g. Idling), Fuel Press is within +/-5000 kPa of "Target Common Rail Pressure".
Diagnostic Code	When the fuel pressure sensor has a fault, some DTCs may be stored.

Irregular Fuel



Component	Irregular fuel
Main fault	-
Symptoms	Difficult to start, rough idle (especially when cold)

c. Diesel EGR

EGR System

Component	EGR system
Main fault	• Does not move smoothly • Does not close fully
Symptoms	• Rough Idle • EGR valve stuck closed: A loud turbocharger sound. • EGR valve stuck open: Difficult to start (does not stall), black smoke, lack of power, jerking (If there is an excess in the quantity of EGR and there is a heavy load, when the vehicle starts moving, a lack of power will be felt. Also, when racing the engine, there will be some black smoke).
Data List	Actual EGR Valve Pos., Target EGR Pos. • Generally, Actual EGR Valve Pos. = Target EGR Pos. +/-5% (fully closed 0%, fully open 100%) • Using EGR valve Active Test, check whether Actual EGR Valve Pos. follows Target EGR Pos. (The engine coolant temperature and intake air temperature should be considered when a malfunction occurs). • EGR valve is fully closed when the ignition switch is ON (engine stopped). • EGR valve opens to a halfway point at idling after engine warmed up. • When the EGR valve does not close, MAF (Mass Air Flow) decreases when the vehicle is accelerated at full throttle. MAP also decreases in comparison to Target Booster Pressure, however there is not a large difference. EGR Close Lrn. Val., EGR Close Lrn. Status • In cases when EGR Close Lrn. Status. is NG or EGR Close Lrn. Val. is out of the normal range (3.5 to 4.5 V), it is possible that the EGR valve cannot completely close.

Inspect EGR valve assembly

d. Diesel Throttle

Diesel Throttle System

Component	Diesel throttle system
Main fault	Stuck, does not move smoothly
Symptoms	• Stuck closed: Lack of power, difficult to start, rough idle, engine stall, black smoke. It may occur when stuck almost fully closed. • Stuck open: Turbocharger sound increases. When the engine is stopped, engine vibrations may occur.
Data List	• Actual Throttle Position (fully closed 100%, fully open 0%) • Throttle Motor Duty Normally operates at 50 +/-20%. If outside the range of 50 +/-40% for a few seconds, the throttle may not be sliding properly. 0%: Open diesel throttle 100%: Close diesel throttle • When ignition switch is ON (engine stopped), diesel throttle is fully open. When idling, diesel throttle is at halfway point. When ignition switch is turned ON to off, temporarily closed fully.

Data List Related to Lack of Power

NOTICE:

The Data List values in the table are the results of checking one vehicle after warmed up. Only use these values for reference.

a. Engine Control

Engine Speed

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Engine Speed	• Idling: 500 to 600 rpm (M/T) • Idling: 550 to 650 rpm (A/T)	Crankshaft position sensor	When the crankshaft position sensor is malfunctioning, "Engine Speed" is approximately 0 or varies greatly from the actual engine speed.

MAP

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
MAP	MAP (inside intake air pressure) • When the accelerator is fully depressed, if MAP is 20 kPa lower than Target Booster Pressure for more than 5 seconds, a lack of power will be felt. • With the ignition switch ON or vehicle idling, MAP is nearly equal to Atmospheric Pressure (standard atmospheric pressure = 101 kPa). Atmospheric pressure increases 1 kPa each time altitude increases by 100 m, and is also affected by the current weather conditions). When the engine speed is about 1500 rpm or more, the turbocharger starts to take effect and MAP becomes higher than atmospheric pressure. The Data List item "Atmosphere Pressure" displays the output of the atmospheric pressure sensor. VN Turbo Command • 0%: Fully open vanes (drive rod contracts) • Over 90%: Fully closed vanes (drive rod expands)	• Turbocharger fault • Diesel throttle does not open • Intake system blocked • Exhaust system blocked	• Inspect while comparing with "Target Booster Pressure". • With the accelerator fully open, if the actual Manifold Absolute Pressure (MAP) is low compared to the target booster pressure by at least 20 kPa for 5 seconds or more, a feeling of insufficient power will occur.
	Results of real-vehicle check: • Ignition switch ON: 99 kPa • Cranking: 99 kPa • Idling (warm up the engine): 99 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 113 kPa • Running without load (4000 rpm): 150 kPa • Driving with the accelerator fully open at 2000 rpm: 143 kPa • Driving with the accelerator fully open at 3000 rpm: 209 kPa		

MAF

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note

MAF	-	• MAF meter
		• MAF meter circuit
		• Intake system clogging, leaking
		• Exhaust system clogging
		• Turbocharger sub-assembly
		• Leaking or clogging of turbocharger passages
		• EGR valve does not close
			• Based on MAF, the ECM controls the fuel injection volume, injection timing, EGR, etc.
			• If the value is always approximately 0 g/sec.:
			  • Mass air flow meter power source circuit is open.
			  • VG circuit is open or shorted.
			• If the value is always 200 g/sec. or more:
			  • EVG circuit is open.

	Results of real-vehicle check: w/ EGR • Ignition switch ON: 1.54 g/sec. • Cranking: 15 g/sec. • Idling (warm up the engine): 9 g/sec. (2 minutes after starting the vehicle) • Running without load (2500 rpm): 80 g/sec. • Driving with the accelerator fully open at 2000 rpm: 110 g/sec. • Driving with the accelerator fully open at 3000 rpm: 230 g/sec.		
	HINT: The maximum fuel injection volume is controlled according to the output from the mass air flow meter.		

Intake Air

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Intake Air	After a long soak, the engine coolant temperature, intake air temperature, and ambient air temperature are approximately equal.	Intake air temperature sensor	• If the value is -40°C (-40°F) or 140°C (284°F), the sensor circuit is open or shorted.
	-		

Coolant Temp

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Coolant Temp	• Engine coolant temperature is approximately equal to intake air temperature after leaving overnight. After warm-up: Engine coolant temperature is 70°C (158°F) or more. • In cases when the engine coolant temperature sensor output is obviously higher than the actual engine coolant temperature, when it is cold, there will be difficulty starting due to problems with glow plugs or insufficient fuel injection. • In cases when the engine coolant temperature sensor output is obviously lower than the actual engine coolant temperature, when it is warm, there will be difficulty starting (black smoke will also occur) due to an excess of injected fuel.	Engine coolant temperature sensor	If the value is -40°C (-40°F) or 140°C (284°F), the sensor circuit is open or shorted.
	-		

b. Diesel Injection

Target Common Rail Pressure

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
	-	-	• Inspect the (actual) fuel pressure, comparing it against the common rail target value. • Considered normal when the actual fuel pressure is within +/-5000 kPa of the target fuel pressure under stable conditions.

Target Common Rail Pressure	Results of real-vehicle check: • Ignition switch ON: 32000 kPa • Cranking: 29000 kPa • Idling (warm up the engine): 32000 kPa (2 minutes after starting the vehicle) • Running without load (2500 rpm): 62000 kPa • Running without load (3500 rpm): 80200 kPa • Driving with the accelerator fully open at 2000 rpm: 95000 kPa • Driving with the accelerator fully open at 3000 rpm: 155000 kPa

Fuel Press

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Fuel Press	• In a stable operating condition (e.g. idling), Fuel Press is Target Common Rail Pressure +/-5000 kPa. • When the Fuel Press is 20000 kPa lower than Target Common Rail Pressure, a lack of power will be felt. • When Fuel Press is lower than 25000 kP, rough idling will occur.	• If there is a the fuel supply pump (lack of discharge quantity) or pressure limiter (will not fully close) breakdown, the fuel pressure will drop. Also, a blocked fuel filter, leakage from fuel pipes, and an empty fuel tank will also make the fuel pressure drop. • When there is a fault with the fuel supply pump, there is a possibility of lack of power, starting trouble, engine stall, rough idle, etc.	• Fuel Press is the actual common rail fuel pressure. • Inspect by comparing the fuel pressure with Target Fuel Pressure. • The ECM uses Fuel Press for feedback control of Target Fuel Pressure via the supply pump. The injection amount is determined based on the injection timing and fuel pressure. Also, the spray pattern is selected based on the fuel pressure.
	Results of real-vehicle check: • Ignition switch ON: 0 kPa • Cranking: 29000 kPa • Idling (warm up the engine): 32000 kPa • Running without load (2500 rpm): 62000 kPa • Driving with the accelerator fully open at 2000 rpm: 92000 kPa • Driving with the accelerator fully open at 3000 rpm: 155000 kPa		

Target Pump SCV Current

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Target Pump SCV Current	• Idling after warming up, around 923 to 1123 mA. When this value is large, the fuel supply pump is trying to increase the fuel discharge rate. • If the value becomes 3000 mA or more, the suction control valve	With this data, component fault not specified, use this data as a reference	• ECU-calculated value for the suction control valve actuation target current. • Value is large when a high fuel pressure is desired. • When this deviates from the standard value, it indicates that for some reason, even though the pump is running hard, the actual fuel pressure is

	may become stuck.		inconsistent with the target fuel pressure.
	Results of real-vehicle check: • Ignition switch ON: 0 mA • Cranking: 1200 mA • Running without load (2500 rpm): 1300 mA • Driving with the accelerator fully open at 2000 rpm: 1440 mA • Driving with the accelerator fully open at 3000 rpm: 1560 mA		

Injection Feedback Val #1 (to #8)

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Injection Feedback Val #1 (to #8)	Injection Feedback Val: • When idling after the engine is warmed up, to make each cylinder engine speed equal, the fuel quantity of each fuel injector is corrected. • Cylinders more than 3 mm^3/st may have a fault. **HINT:** Read the value after one minute of idling after warm up (engine coolant temperature above 70°C (158°F)). This value is only calculated when idling.	• "Breakdown of injector or lack of compression" of a cylinder with an irregular Injection Feedback Val # value. • Do a compression Active Test. If there is a cylinder that is around 100 rpm more than the other cylinders, there is a possibility that that cylinder has a fault. • If all the cylinder speeds are even according to the compression Active Test result, then consider the injector of the cylinder that has a fault. • With fuel injector faults, there is a possibility of rough idling, lack of power, difficulty starting, black smoke, white smoke and knocking.	With Injection Feedback Val, find the malfunctioning cylinders. However, before replacing the injector, identify the malfunctioning cylinders with a power balance test.
	-		

Injection Volume

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Injection Volume	• Diagnose the fuel injector faults from the Injection Feedback Val #, Injection Volume at idling. • When Injection Volume is more than 10 mm^3/st at idle with the engine warmed up and Injection Feedback Val # of all cylinders is less than 2.0 mm^3/st, the following malfunctions are possible: - All cylinder fuel injectors are slightly blocked. - Fuel filter is blocked. - Poor quality fuel, increase in engine friction.	All cylinders	-
	Results of real-vehicle check: • Cranking: 21 mm^3/st • Idling (warm up the engine): 6 mm^3/st • Running without load (2500 rpm): 9 mm^3/st • Running without load (4700 rpm): 16 mm^3/st • Driving with the accelerator fully open at 2000 rpm: 50 mm^3/st • Driving with the accelerator fully open at 3000 rpm: 70 mm^3/st		

c. Diesel Throttle

Actual Throttle Position, Actual Throttle Position #2

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
			Actual Throttle Position is the closing percentage of the throttle valve.

Actual Throttle Position Actual Throttle Position #2	• When the ignition switch is turned to ON (engine stopped), the diesel throttle is fully open, when the ignition switch is turned from ON to off, it will be fully closed temporarily. • During idling, the throttle is open partway. • When stuck closed (almost fully closed), there is a possibility of lack of power, rough idling, engine stall, and black smoke.	Throttle valve	• Fully closed: 100% • Fully open: 0% **HINT:** There is no connection with the accelerator. However, under full load, the throttle is usually fully open (0%).
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 84% • Running without load (2500 rpm): 32% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%		

Throttle Motor Duty #1, Throttle Motor Duty #2

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Throttle Motor Duty #1 Throttle Motor Duty #2	Normally operates at 50 +/-20%. If 50 +/-40% continues for a few seconds, it is conceivable that the throttle valve is not sliding properly and the MIL will be illuminated. 0%: Drive diesel throttle to open side 100%: Drive diesel throttle to closed side	• Throttle valve • ECM	• When this value is large but the actual opening angle does not move smoothly, there is an unable to close malfunction. • If this value is small but the actual opening angle does not move smoothly, there is an unable to open malfunction. • Usually this value is at approx. 50 +/-20%, but momentary jumps outside this range do occur.
	Results of real-vehicle check: • Ignition switch ON: 61.5% • Cranking: 63% • Idling (warm up the engine): 37% • Running without load (2500 rpm): 53% • Driving with the accelerator fully open at 2000 rpm: 62.5% • Driving with the accelerator fully open at 3000 rpm: 64%		

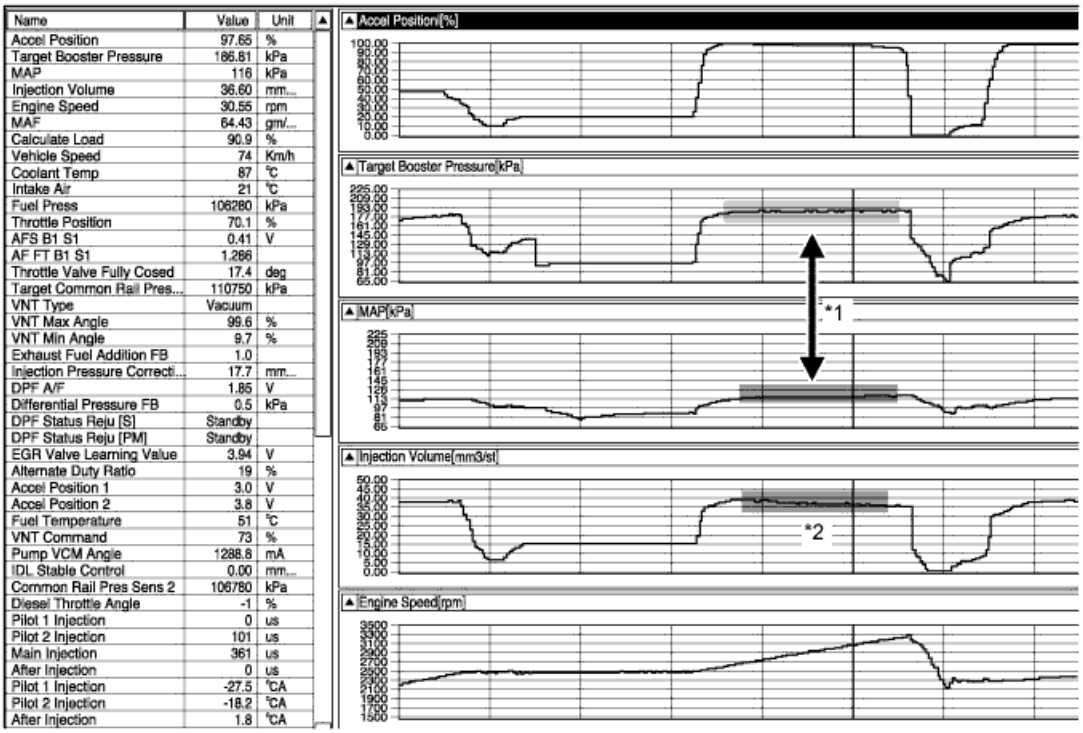
d. Diesel EGR

Target EGR Valve Pos., Target EGR Valve Pos. #2

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
Target EGR Valve Pos. Target EGR Valve Pos. #2	-	-	• Fully open: 100% • Fully closed: 0% • Used for comparison to "Actual EGR Valve Pos".
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 43% • Running without load (2500 rpm): 22% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%		

Actual EGR Valve Pos., Actual EGR Valve Pos. #2

Data List	Judgment of Data List Values	Faulty Component	Diagnosis Note
	Generally Actual EGR Valve Pos. = Target EGR Pos. +/-5% (completely closed = 0%, completely open = 100%) The EGR valve Active Test can be used to check whether the Actual EGR Valve Pos. = Target EGR Pos. (Take into consideration the temperature of the intake air and the coolant temperature when the malfunction occurs). Sometimes the malfunction only occurs around a certain	EGR valve	Inspect while comparing to "Target EGR Valve Pos.".



Actual EGR Valve Pos. Actual EGR Valve Pos. #2	temperature. Take into consideration the temperature of the intake air and the coolant temperature when the malfunction occurs.		
	Results of real-vehicle check: • Ignition switch ON: 0% • Cranking: 0% • Idling (warm up the engine): 84% • Running without load (2500 rpm): 34% • Driving with the accelerator fully open at 2000 rpm: 0% • Driving with the accelerator fully open at 3000 rpm: 0%		

Actual Examples of Malfunction

HINT:

- **The purpose of the following examples is to help you to understand the relationship between each data list item when a certain malfunction occurs. Understanding this relationship helps you to find the real root cause easier.**
- **The following are examples of actual malfunctions of a common rail diesel engine.**
- **Use them for reference when diagnosing malfunctions.**
- **These are not data of the Land Cruiser 1VD-FTV**

a. Lack of power caused by overly low boost pressure

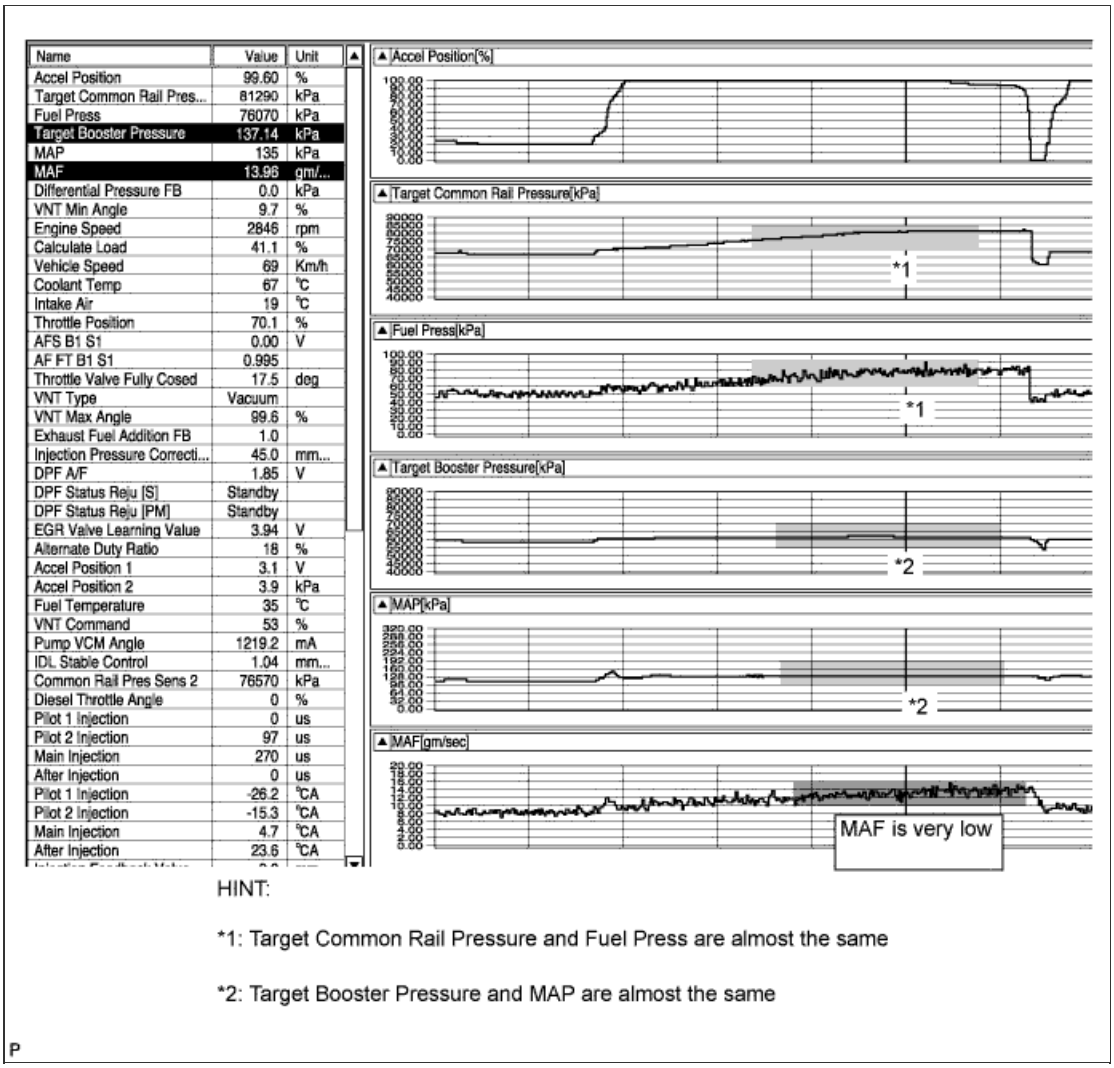
Pilot 2 Injection	-18.2	°CA
After Injection	1.8	°CA

HINT:



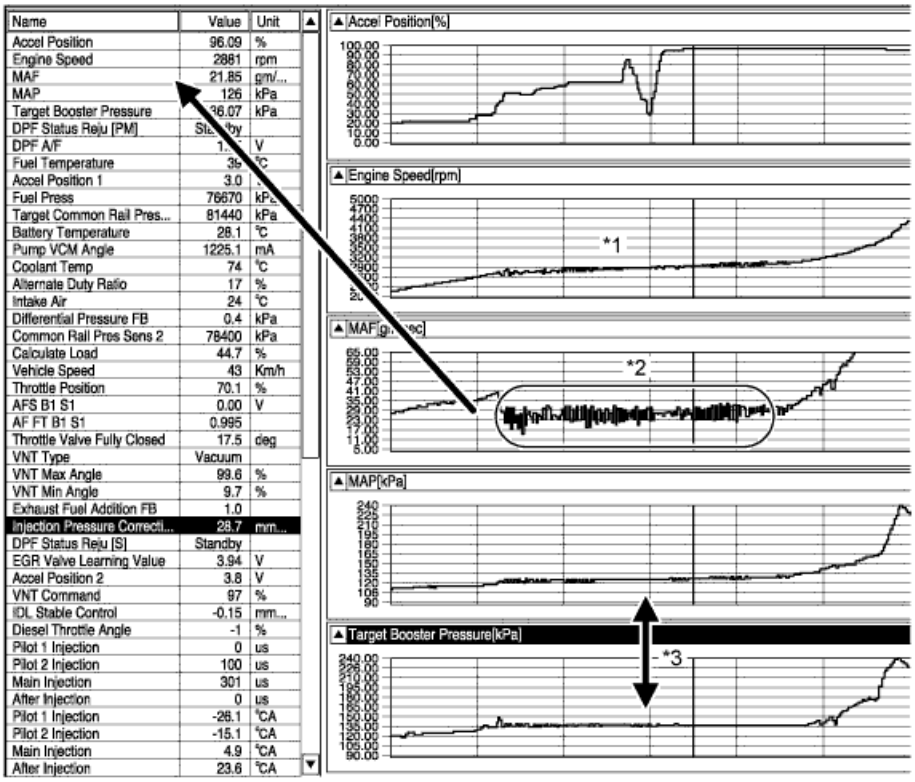
*1: -70 kPa difference

*2: Injection Volume greatly reduced

By observing the difference between MAP and Target Booster Pressure, the lack of power due to a decrease in mass air flow can be seen. A decrease in mass air flow occurs due to a turbo malfunction, clogging or leaking in the intake system pipes and hoses, or clogging in the exhaust system. (In this example, the hose of the variable nozzle assembly of the turbo is disconnected).

P

b. Lack of power caused by overly low MAF



In this example, the MAF (Mass Air Flow) value decreases greatly due to foreign matter being stuck to the MAF sensor and causes a lack of power. The maximum fuel injection volume value is limited by the MAF value. As a result, there is a lack of power due to a lack of injection volume.

In this case, even when the accelerator is fully open, the calculated load is low. (Calculated Load = Injection Volume / Maximum Injection Volume at Current Engine Speed)

Basically the Manifold Absolute Pressure (MAP) is approximately equal to the Target Booster Pressure and this indicates that the turbo charger functions properly.

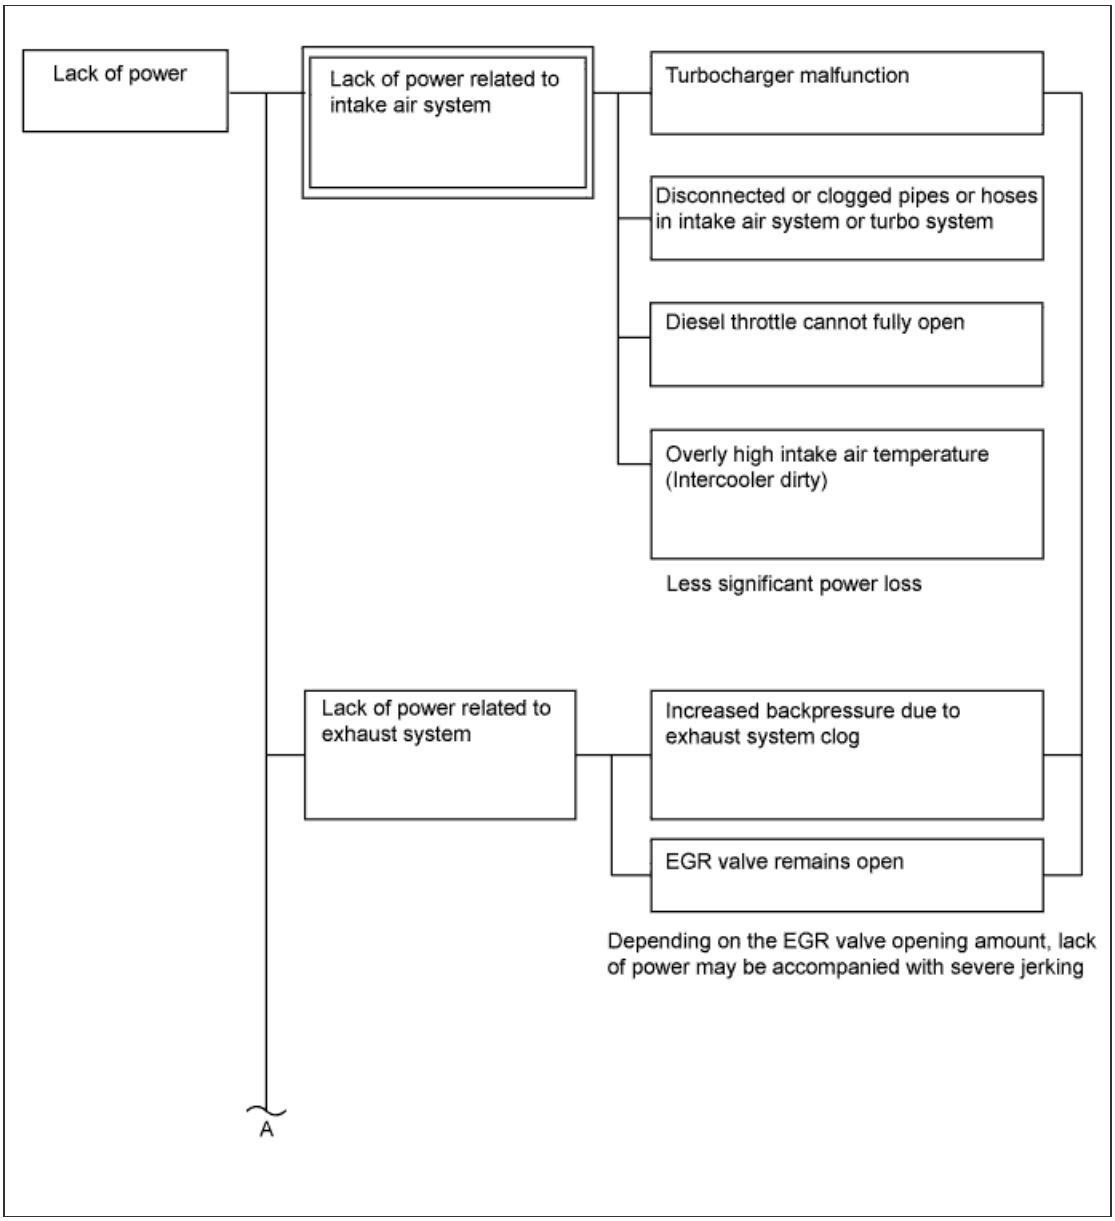
c. EGR valve stuck in open position

HINT:

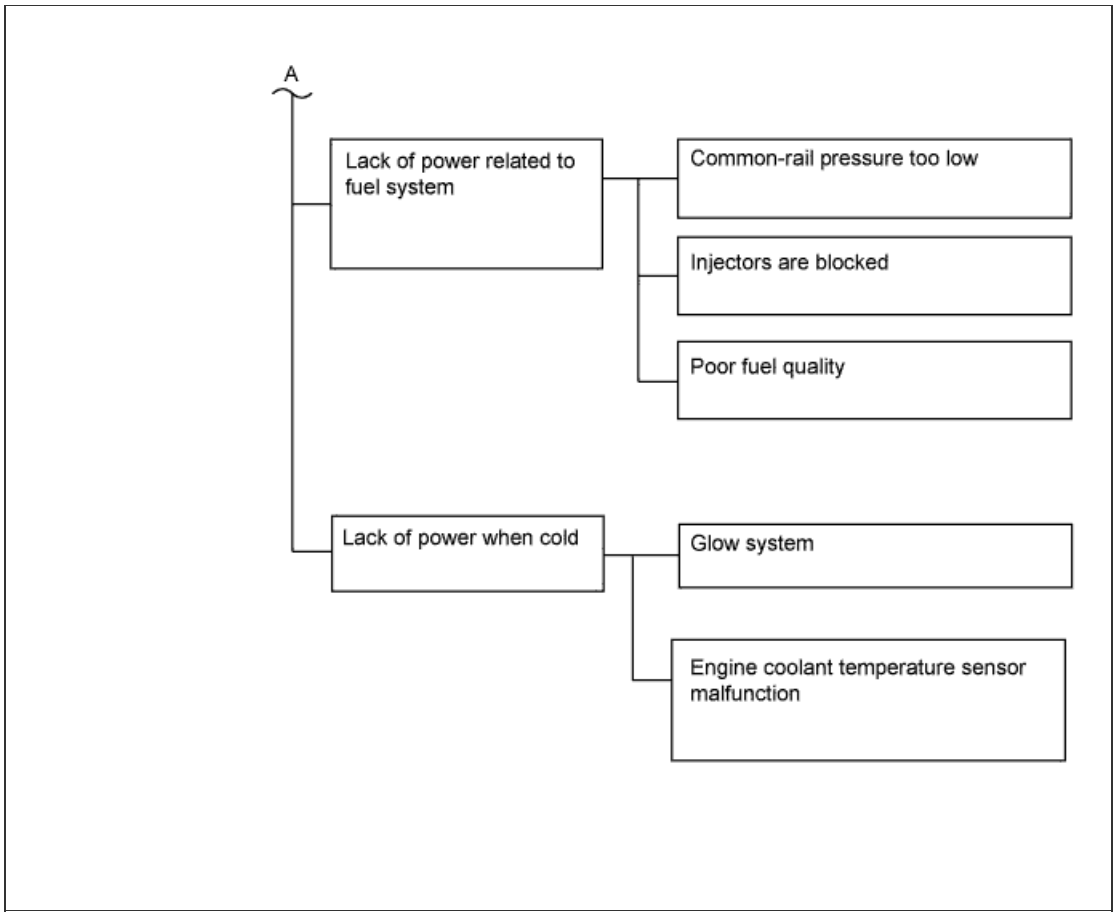
*1: Severe jerking *2: Very unstable and low MAF signal

*3: Signal difference (-10 kPa)

P



In this example, the EGR valve stuck in open position. Even with the accelerator pedal fully depressed, the EGR does not fully closed and the MAF signal is low.
Therefore, the fuel injection volume becomes limited and there is a lack of power. Jerking is also evident. At this time, even while accelerating with the accelerator fully open, the calculated load is low. (Calculated Load = Current Injection Volume / Maximum Injection Volume at Current Engine Speed)
Basically the Manifold Absolute Pressure (MAP) is approximately equal to the Target Booster Pressure and this indicates that the turbo charger functions properly.



INSPECTION PROCEDURE

Explanation of Symptom

Lack of Power	The power of the diesel engine is determined by the quantity of injected fuel and the quantity of intake air. The quantity of injected fuel is determined by the fuel pressure and the amount of time the injector is open for. Basically, the fuel pressure is controlled to reach the target fuel pressure. The throttle valve does not restrict air flow volume, so the manifold absolute pressure is almost the same as atmospheric pressure when idling. At more than approximately 1500 rpm, the turbo starts to operate causing the manifold absolute pressure to become higher than atmospheric pressure. The manifold absolute pressure is controlled to reach the Target Booster Pressure. Also, When accelerating the vehicle at full throttle, the throttle is fully open and the EGR valve is fully closed, preserving the mass air flow.

Trouble Area Chart According to Problem Cause

Lack of power
Lack of power related to intake air system
Turbocharger malfunction
Disconnected or clogged pipes or hoses in intake air system or turbo system
Diesel throttle cannot fully open
Overly high intake air temperature (Intercooler dirty)
Less significant power loss
Lack of power related to exhaust system
Increased backpressure due to exhaust system clog
EGR valve remains open
Depending on the EGR valve opening amount, lack of power may be accompanied with severe jerking
A

NOTICE:

- **After replacing the fuel supply pump, the ECM needs initialization (Click here).**
- **After replacing the fuel injector, the ECM needs registration (Click here).**

HINT:

Before troubleshooting, conduct the following:

1. **Check the fuel quality.**
2. **Check the fuel for air.**
3. **Check the fuel system for blockages.**
4. **Check the air filter.**
5. **Check the engine oil.**
6. **Check the engine coolant.**
7. **Check the engine idling speed and the maximum engine speed.**

1.READ OUTPUT DTC (RELATED TO ENGINE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / DTC.

d. Read pending DTCs.

Result

Result	Proceed to
No DTCs are output	A
Engine related DTCs are output	B

B → **GO TO DTC CHART (Click here)**

A

2.READ VALUE USING INTELLIGENT TESTER

HINT:

This inspection is not necessary for A/T vehicles.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Low Gear Switch.

d. Check the Data List when the shift lever is moved to 1 or any position other than 1.

OK

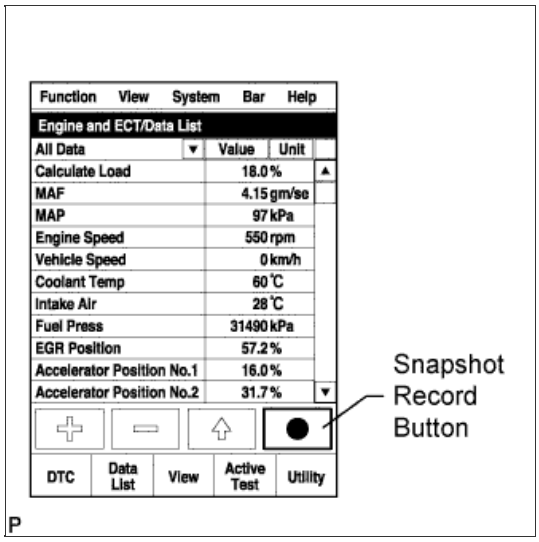
Data List	Shift Position	Specified Condition
Low Gear Switch	1	ON
Low Gear Switch	Not in 1	OFF

NG → REPLACE SHIFT POSITION SWITCH (Click here)

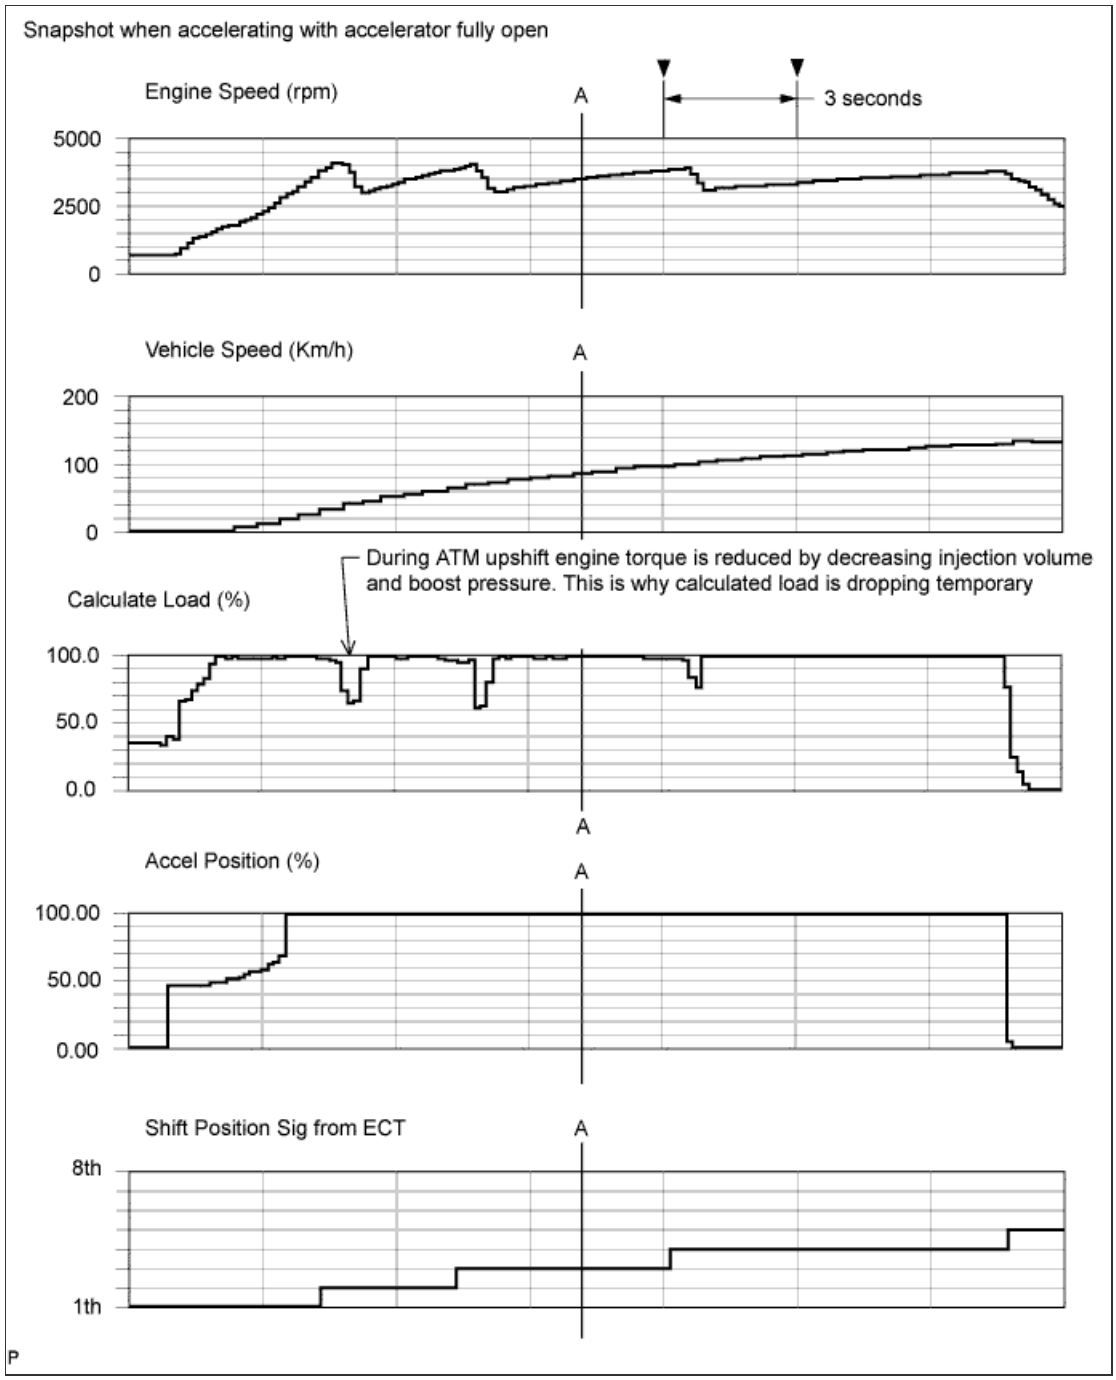
OK

3.TAKE DATA LIST DURING LACK OF POWER

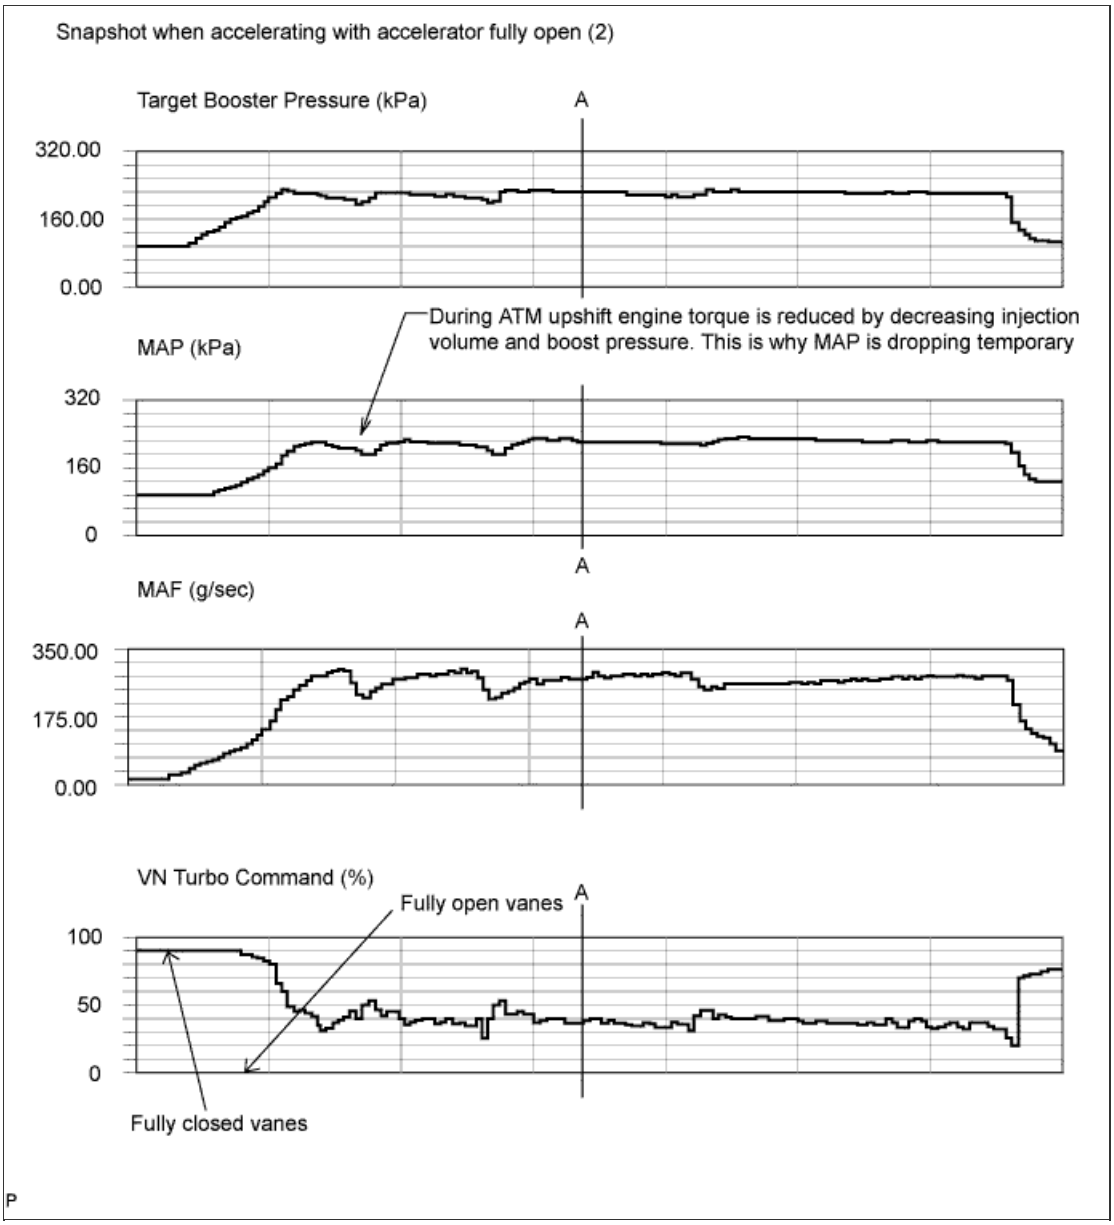
a. Connect the intelligent tester to the DLC3.



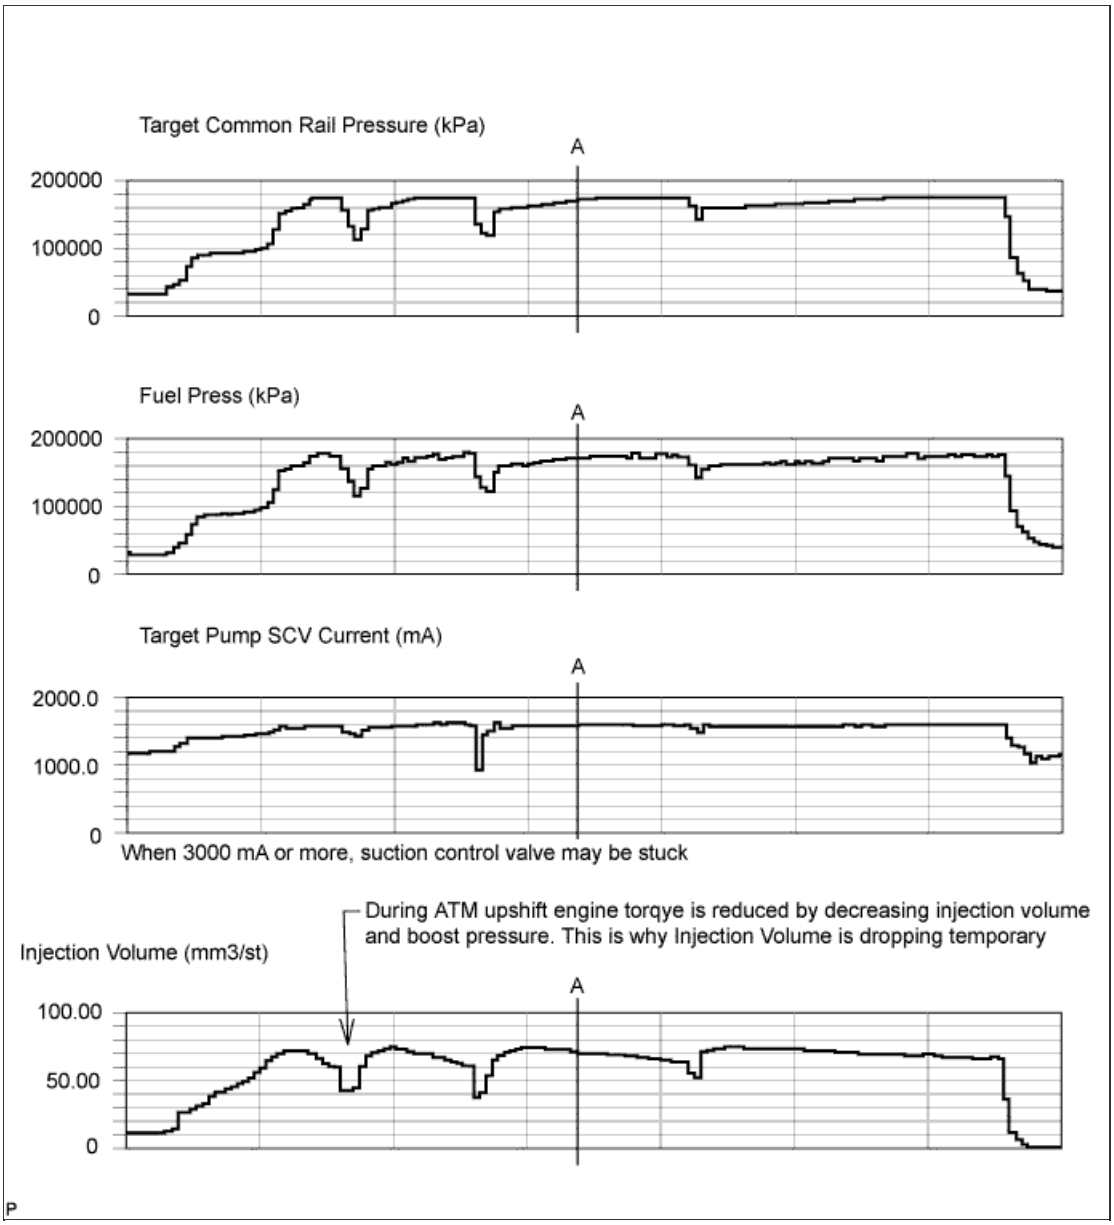
b. Start the engine and turn the tester on.



c. Enter the following menus: Powertrain / Engine / Data List / All Data.



d. Take a snapshot of the following Data Lists with the intelligent tester during lack of power.



HINT:

snapshot can be used to compare vehicle data from the time of the malfunction to normal data and is very useful for troubleshooting. The data in the illustration below is that of a normal vehicle, but as the data varies between individual vehicles, this data should only be used for reference.

- **Graphs like the ones shown below can be displayed by transferring the stored snapshot from the tester to a PC. Intelligent Viewer must be installed on the PC.**
- **Move the shift lever to D and accelerate the vehicle with the accelerator fully open. (Obey all laws and regulations, and pay attention to driving conditions while driving the vehicle). Then, check the Data List with the engine warmed up and idling.**

Reference Values with Engine Speed at 3500 rpm (Point A)

Actual Examples of Malfunction (See "Diagnostic Help" menu)

- **Lack of power caused by overly low boost pressure**
- **Lack of power caused by overly low MAF**
- **EGR valve stuck in open position**

NEXT

4.CHECK SNAPSHOT

a. Check the condition of the vehicle using the snapshot taken during the lack of power.

Result

Result	Proceed to
Fuel Press is less than "Target Common Rail Pressure -20000 kPa" when accelerating with accelerator fully open	A
Target Pump SCV Current 3000 mA or more	B
One of the Injection Feedback Val #1 to 8 values is outside the range of +/-3 mm ^{3}/st when idling after warm up	C
Injection Feedback Val #1 to #8 is within the range of +/-3 mm ^{3}/st and the Injection Volume is more than 10 mm ^{3}/st when idling after warm up	D
None of the above conditions apply	E

A	**Go to step 17**
B	**REPLACE FUEL SUPPLY PUMP (Click here)**
C	**Go to step 30**
D	**REPLACE FUEL INJECTORS OF ALL CYLINDER (Click here)**

E

5.CHECK SNAPSHOT

a. Check the condition of the vehicle using the snapshot taken during the lack of power.

Result

Result	Proceed to
MAP is less than "Target Booster Pressure -20 kPa" (MAF is normal) when accelerating with accelerator fully open	A
MAF is low when accelerating with accelerator fully open (MAP is normal) • 3000 rpm: 150 g/sec or less • 3500 rpm: 160 g/sec or less • 4000 rpm: 160 g/sec or less **HINT:** • **If the MAF (Mass Air Flow) decreases, Calculate Load will be 80% or less when accelerating with the accelerator fully open.** • **During acceleration with the accelerator fully open, MAF (Mass Air Flow) is 40 g/sec or more less than the estimated MAF value* calculated based on MAP.**	B
MAP and MAF are both low when accelerating with the accelerator fully open	C
None of the above conditions apply	D

$$\text{Estimated MAF Value*} = \frac{\text{Engine speed (rpm)} \times \text{MAP (kPa)} \times \text{Engine Displacement (L)} \times K}{100 \times 60 \times 2}$$

Engine Desplacement = 4.461 (L)

$$K = \frac{1.225 \times (273 + 15)}{273 + \text{Intake Air Temperature (°C)}}$$

HINT:

Calculate the Estimated MAF Value by substituting Engine Speed (rpm), MAP (kPa) and Intake Air Temperature (°C) from the Snapshot recorded by Intelligent Tester earlier into the above formula.

B	Go to step 8
C	Go to step 10
D	Go to step 24

A

6.INSPECT VACUUM HOSE

a. Check the vacuum hose connection (manifold absolute pressure sensor).

OK:

Vacuum hose is connected securely.

NG → REPLACE VACUUM HOSE

OK

7.READ VALUE USING INTELLIGENT TESTER

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

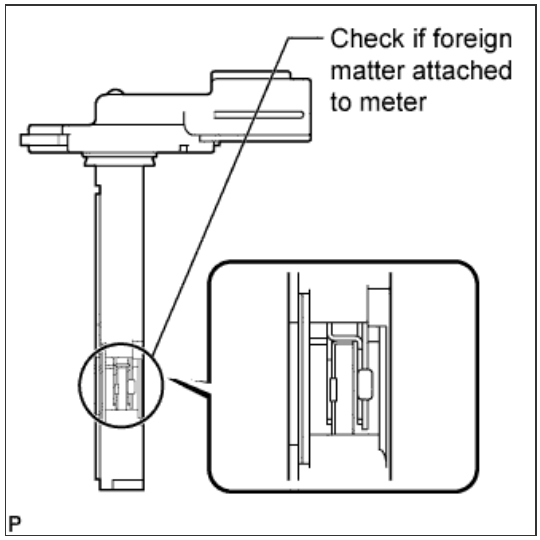
c. Enter the following menus: Powertrain / Engine / Data List / MAP and Atmosphere Pressure.

d. Compare MAP to Atmosphere Pressure when the ignition switch is ON (engine stopped).

HINT:

- **If MAP and Atmosphere Pressure have the same value, both are normal. If there is a difference of 10 kPa or more, compare the values to the atmospheric pressure for that day. The sensor whose deviation is the greatest is malfunctioning.**
- **Standard atmospheric pressure is 101 kPa. For every 100 m increase in altitude, pressure drops by 1 kPa. Varies by weather (high atmospheric pressure, low atmospheric pressure).**

Result



Result	Proceed to
Atmosphere Pressure is different from actual atmospheric pressure	A
MAP is different from actual atmospheric pressure	B
MAP and Atmosphere Pressure have the same value	C

A	REPLACE ECM (Click here)
B	REPLACE MANIFOLD ABSOLUTE PRESSURE SENSOR (Click here)
C	Go to step 10

8.INSPECT MASS AIR FLOW METER

a. Using a work light, check that the platinum filament (heater portion) in the mass air flow meter has no foreign matter attached.

Standard:
No foreign matter attached.

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON and turn the tester on.

d. Enter the following menus: Powertrain / Engine / Data List / MAF.

e. Read the value.

OK:
2 g/sec or less.

NG	REPLACE MASS AIR FLOW METER (Click here)

OK

9.INSPECT EGR VALVE ASSEMBLY (No. 1 or No. 2)

HINT:

For vehicles without EGR valve, perform troubleshooting from the next step.

a. Check the EGR valve condition using the snapshot taken when accelerating with the accelerator fully open.

Standard Value

Tester Display	Standard Value
Actual EGR Valve Pos.	0%
Actual EGR Valve Pos. #2	0%

b. Next, after the engine is warmed up, stop the engine and wait for 15 seconds. After that, start the engine again and idle it for 30 seconds.

Then stop the engine and wait for 15 seconds. After starting the engine again, read the Data List values while idling.

Standard Value

Tester Display	Standard Value
EGR Close Learn Val.	3.5 to 4.5 V
EGR Close Lrn. Val. #2	3.5 to 4.5 V
EGR Close Lrn. Status	ON

Result:

Result	Suspected Trouble Area	Proceed to
A: Actual EGR Valve Pos with the ignition switch ON and the engine stopped is 0%. During idling, EGR valve is partially open. (Basically, it smoothly follows Target EGR Position).	When A is not met: EGR valve is stuck	B
B: EGR Close Learn Val is within the standard value and EGR Close Lrn Status is ON.	When B is not met: EGR valve does not close	B
Both A and B are OK	-	A

HINT:

- **The 1VD engine has 2 EGR valves. Comparing the movements of the 2 valves can be a useful reference for diagnosing malfunctions. If 1 of the 2 valves becomes unable to close, the turbo will perform compensation control and a lack of power will not be felt but surging may be felt.**

B → REPLACE EGR VALVE ASSEMBLY (No. 1 or No. 2) (Click here)

A

10.READ VALUE USING INTELLIGENT TESTER

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Accel Position.

d. Read the value.

Standard Value:

Condition	Standard Value
Accelerator pedal released	0%
Accelerator pedal depressed	100%
Accelerator pedal released → depressed **HINT:** Make sure the Accel Position opening angle moves smoothly.	0 to 100%

NG → REPLACE ACCELERATOR PEDAL ROD ASSEMBLY (Click here)

OK

11.READ VALUE USING INTELLIGENT TESTER

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Actual Throttle Position, Actual Throttle Position #2.

d. Read the value.

Standard Value:

Condition	Standard Value
Ignition switch ON	-5 to 5 %
Idling (warmed up engine)	0 to 90%
Accelerator pedal fully depressed **HINT:** Make sure the Accel Position opening angle moves smoothly.	-5 to 5 %

HINT:

- **Fully open: 0%**
- **Fully close: 100%**
- **The 1VD engine has 2 throttles. Diagnosis of malfunctions can be performed by comparing the movements of the 2 diesel throttles. If the Throttle Motor Duty of an operating diesel throttle is not within 50 +/-40%, the throttle is not sliding properly.**

NG → REPLACE DIESEL THROTTLE BODY (for Bank 1 or Bank 2) (Click here)

OK

12.CHECK INTAKE SYSTEM

a. Check for air leakage and blockage between the air cleaner and turbocharger, and between the turbocharger and intake manifold.

HINT:

- **Check that the intercooler is not clogged with foreign matter.**
- **Check that there are no disconnected, pinched or leaking hoses or pipes.**
- **Check that there are no modifications made by the user.**

OK:
No leakage or blockage.

NG → REPAIR OR REPLACE MALFUNCTIONING PARTS

OK

13.CHECK TURBOCHARGER SUB-ASSEMBLY (MECHANICAL PROBLEM (for Bank 1 or Bank 2))

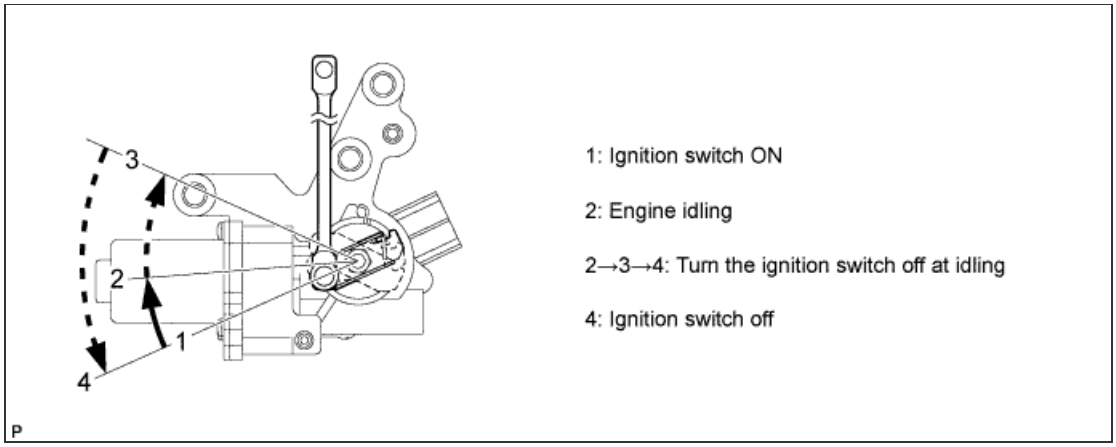
a. Disconnect the air cleaner hose.

b. Use a mirror to visually check the turbocharger for any mechanical problems.

c. When the engine is cold, check that the impeller of the turbocharger rotates smoothly, and confirm whether there is any damage to it.

OK:
Impeller rotates smoothly and is not damaged.

d. Reconnect the air cleaner hose.



NG → REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (Click here)

OK

14.INSPECT TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2)

a. Check the motor movement when turning the ignition switch to ON, when starting the engine and then when turning the ignition switch off.

OK:
Motor moves as shown in the illustration.

NG → REPLACE TURBOCHARGER SUB-ASSEMBLY (for Bank 1 or Bank 2) (Click here)

OK

15.CHECK MONOLITHIC CONVERTER ASSEMBLY (for Bank 1 or Bank 2)

a. Check that there are no clogs, dents, etc. in the monolithic converter assembly.

OK:
No clogs, dents, etc.

NG → REPLACE MONOLITHIC CONVERTER ASSEMBLY (for Bank 1 or Bank 2)

OK

16.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the lack of power has been successfully repaired.

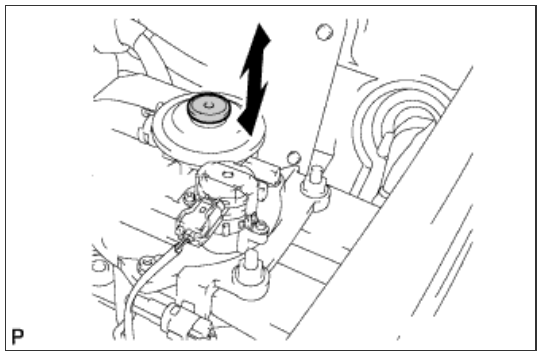
OK:
Malfunction has been repaired successfully.

HINT:

Symptoms may have appeared due to carbon deposits, etc.

NG → Go to step 34

OK



END

17.BLEED AIR FROM FUEL SYSTEM

a. Using the hand pump as indicated by the arrow in the illustration, bleed the fuel system. Continue pumping until pumping becomes difficult.

HINT:

When the fuel pressure during cranking is extremely low (1000 kPa or less), it is possible that fuel is not being supplied to the supply pump.

NEXT

18.CHECK IF FUEL IS BEING SUPPLIED TO FUEL SUPPLY PUMP

a. Disconnect the inlet hose from the fuel supply pump.

b. Operate the priming pump and check that fuel is being supplied to the fuel supply pump.

OK:
Fuel is properly supplied to the fuel supply pump when the priming pump is operated.

HINT:

- **When lack on fuel, fuel pressure drops.**
- **Inspect for fuel filter clogging.**
  (Check that the fuel filter is not clogged)

NG → CHECK AND REPLACE CLOGGED FUEL PIPE (INCLUDING FUEL FREEZING) (FUEL TANK - FUEL SUPPLY PUMP)

OK

19.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the lack of power has been successfully repaired.

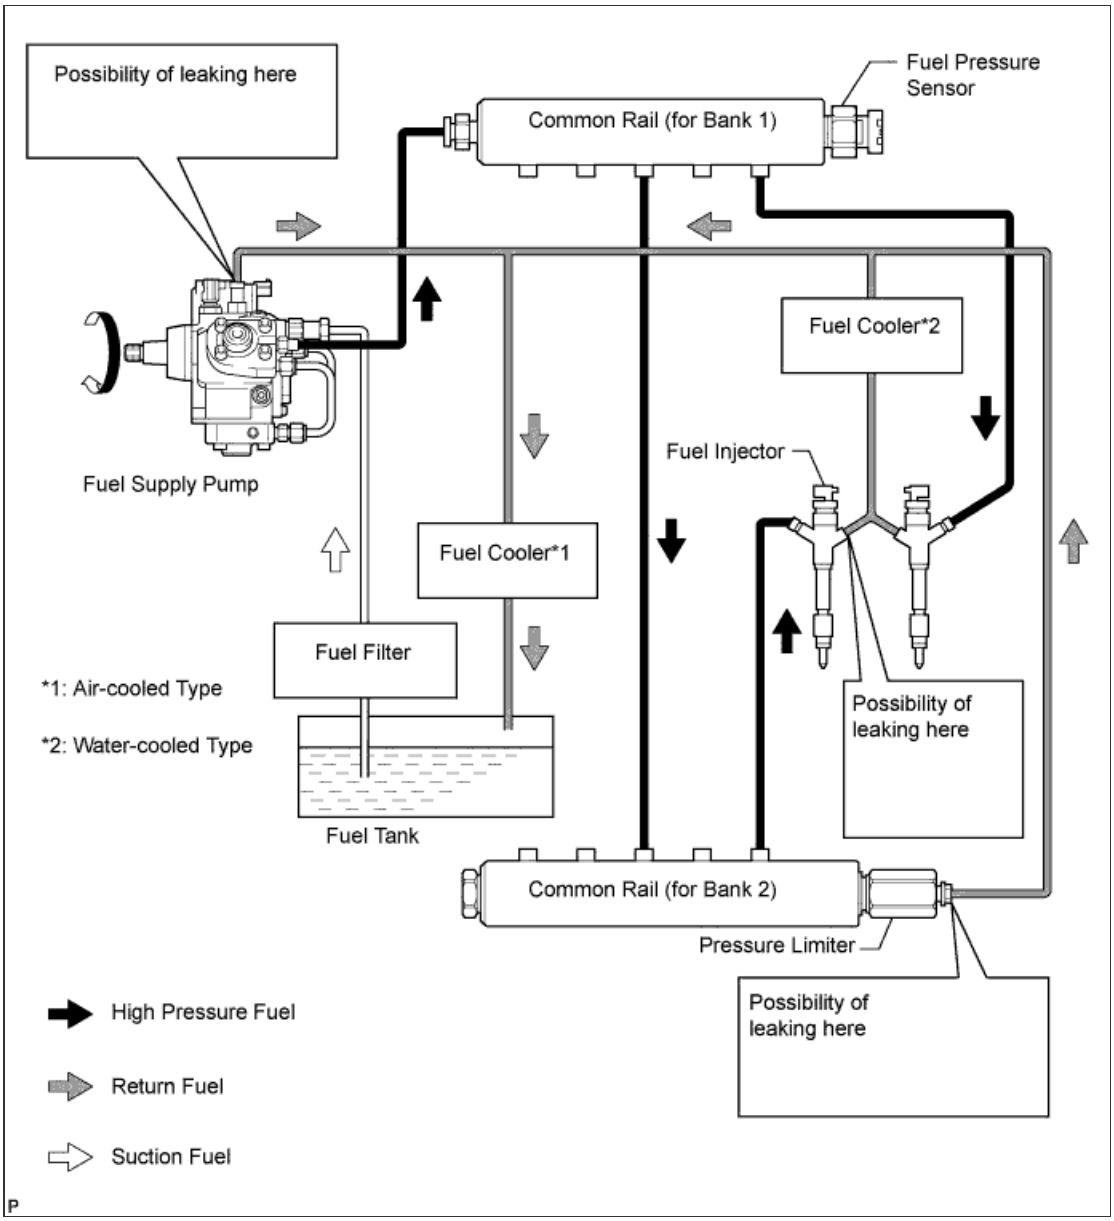
HINT:

The Fuel Press is within +/-5000 kPa of Target Common Rail Pressure.

OK:
Malfunction has been repaired successfully.

OK

END



20.CHECK FUEL LEAK (FUEL SUPPLY PUMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Fuel Press.

d. Pinch the fuel supply pump return hose and check that Fuel Press during cranking increases.

Result

Result	Proceed to
No change	A
Fuel Press increases	B

B → REPLACE FUEL SUPPLY PUMP (Click here)

A

21.CHECK FUEL LEAK (PRESSURE LIMITER) (COMMON RAIL (for Bank 2))

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Data List / Fuel Press.

d. Pinch the pressure limiter return hose and check that Fuel Press during cranking increases.

Result

Result	Proceed to
No change	A
Fuel Press increases	B

B → REPLACE COMMON RAIL (for Bank 2) (Click here)

A

22.REPLACE FUEL SUPPLY PUMP

a. Replace the fuel supply pump (Click here).

NEXT

23.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the lack of power has been successfully repaired.

HINT:

The Fuel Press is within +/-5000 kPa of Target Common Rail Pressure.

NEXT

END

24.CHECK TEMPERATURE WHEN LACK OF POWER OCCURS

a. Check the temperature when lack of power occurs.

Result

Result	Proceed to
Poor acceleration only when engine is cold	A
Poor acceleration when engine is cold and warm	B

B → Go to step 27

A

25.INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Inspect the engine coolant temperature sensor (Click here).

HINT:

After warming up the engine, the engine coolant temperature should be 70°C (158°F) or more. After leaving the vehicle overnight, the engine coolant temperature should be nearly equal to the intake air temperature.

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

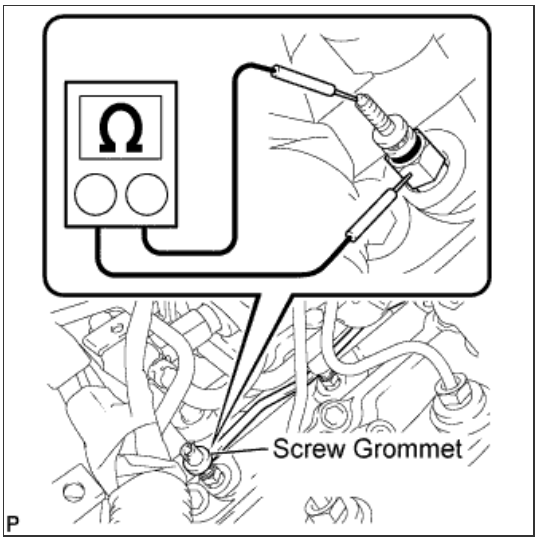
OK

26.INSPECT GLOW PLUG ASSEMBLY (RESISTANCE)

a. Disconnect the glow plug connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
Glow plug terminal - Body ground	20°C (68°F)	Approximately 1 Ω

HINT:

If any of the glow plugs has an open circuit, the engine power will be insufficient only when the engine is cold.

NOTICE:

- **Exercise extreme care not to damage the glow plug pipes. Damaging them could cause an open circuit, or shorten the life of the glow plugs,**
- **Keep the glow plugs free of oil and fuel while cleaning.**
- **Wipe any oil off of the terminal and Bakelite washer with a clean, dry cloth during inspection.**
- **Do not apply more than 11 V to the glow plugs as it may cause an open circuit.**

NG → REPLACE GLOW PLUG ASSEMBLY (Click here)

OK

27.INSPECT INJECTOR COMPENSATION CODE

a. Read the injector compensation code (Click here).

OK:
Compensation codes stored in the ECM match compensation codes of the installed fuel injectors.

NG → PERFORM REGISTRATION FUEL INJECTOR COMPENSATION CODE (Click here)

OK

28.CHECK FUEL QUALITY

a. Check that fuel with a low cetane number is used.

NEXT

29.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check whether the lack of power has been successfully repaired by starting the engine.

NEXT

END

30.PERFORM ACTIVE TEST USING INTELLIGENT TESTER

HINT:

Use this Active Test to determine the malfunctioning cylinder.

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Control the Cylinder #1 to #8 Fuel Cut.

HINT:

- **If the engine idle speed does not change when a fuel injector is disabled, the cylinder being tested is malfunctioning.**
- **If the cylinder being tested is normal, there will be a significant change in idle speed when the fuel injection is stopped for that cylinder.**

NEXT

31.PERFORM ACTIVE TEST USING INTELLIGENT TESTER

HINT:

Use this Active Test to help determine whether a cylinder has compression loss or not.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine / Active Test / Check the Cylinder Compression / Data List / Compression / Engine Speed of Cyl #1 to #8.

d. Check the engine speed during the Active Test.

OK:
If the values of Engine Speed Cyl #1 to #8 are within +/-10 rpm of each other.

HINT:

When cranking, if the speed of a cylinder is approximately 100 rpm more than the other cylinders, there is probably a loss of compression in that cylinder.

OK	Go to step 33
NG	Go to step 32

32.CHECK CYLINDER COMPRESSION PRESSURE OF MALFUNCTIONING CYLINDER

HINT:

Measure the compression of the cylinder that had a high speed during the Active Test "Check the Cylinder Compression".

a. Check the cylinder compression pressure (Click here).

NG	CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

33.REPLACE FUEL INJECTOR OF MALFUNCTIONING CYLINDER

HINT:

The injector is determined to be faulty as the corresponding cylinder is malfunctioning, but has no compression loss.

NEXT

END

34.CHECK INTAKE SYSTEM DEPOSIT

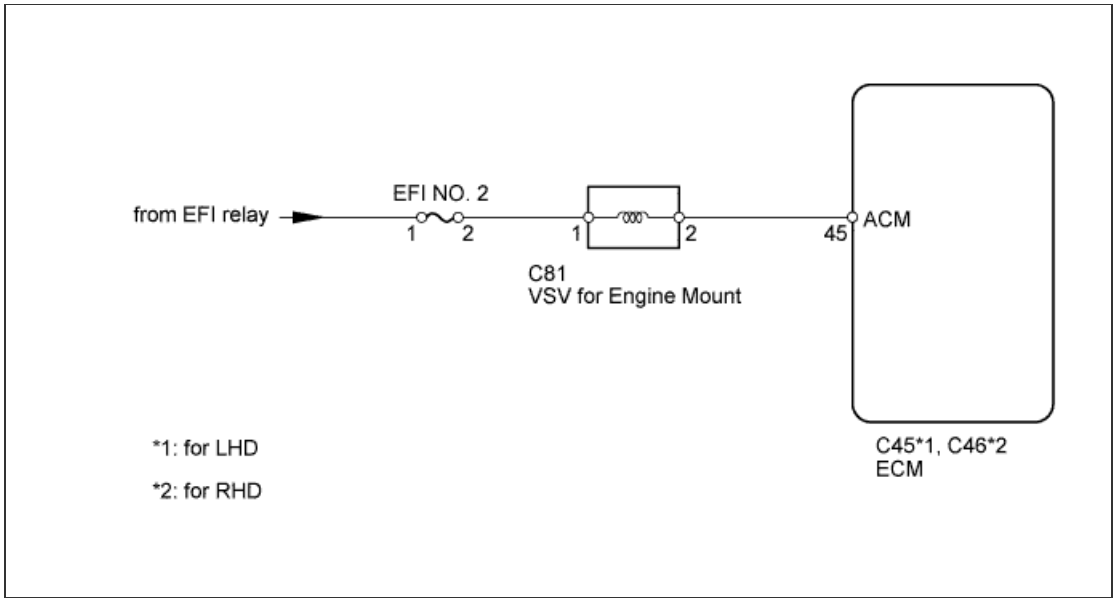
a. Check if 3 mm or more of carbon is accumulating on the intake manifold, cylinder head, etc. and if so, clean it off.

NEXT

35.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

HINT:

Symptoms may have appeared due to carbon deposits, etc.



NEXT
END

for Preparation Click here

DESCRIPTION

The Active Control Engine Mount (ACM) system decreases engine vibration at low engine speed using the VSV for engine mount. The VSV is controlled by a pulse signal transmitted to the VSV from the ECM. The frequency of this pulse signal is matched to the engine speed to decrease engine vibration.

WIRING DIAGRAM

INSPECTION PROCEDURE

NOTICE:

After replacing the ECM, the new ECM needs registration (Click here) and initialization (Click here).

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER

a. Warm up the engine.

b. Connect the intelligent tester to the DLC3.

c. Move the shift lever to N or P.

d. Enter the following menus: Powertrain / Engine / Active Test / Control the ACM Inhibit.

e. Hold the top part of the steering wheel, and turn the Active Test from OFF to ON. Check the engine vibration.

Result:

Engine Vibration	Proceed to
Increases	A
Does not increase	B

A → CHECK FOR INTERMITTENT PROBLEMS (Click here)

B

2.CHECK VACUUM

a. Check if the vacuum hose cap is missing, if the hose is damaged, and if the air and vacuum hoses have looseness, disconnection or blockage.

OK:

Vacuum hose cap is not missing and hoses are normal.

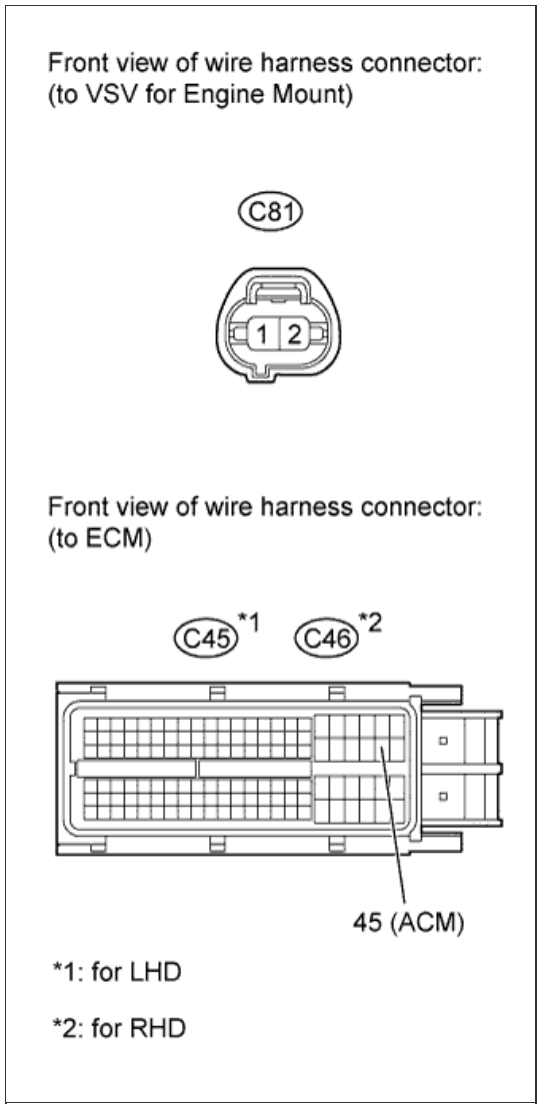
NG → REPLACE VACUUM HOSE

OK

3.INSPECT VSV FOR ENGINE MOUNT

a. Inspect the VSV for engine mount (Click here).

NG → REPLACE VSV FOR ENGINE MOUNT (Click here)



OK

4.CHECK HARNESS AND CONNECTOR (VSV FOR ENGINE MOUNT - ECM, EFI NO. 2 FUSE - VSV FOR ENGINE MOUNT)

a. Disconnect the VSV for engine mount connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C81-2 - C45-45 (ACM)	Always	Below 1 Ω

for RHD

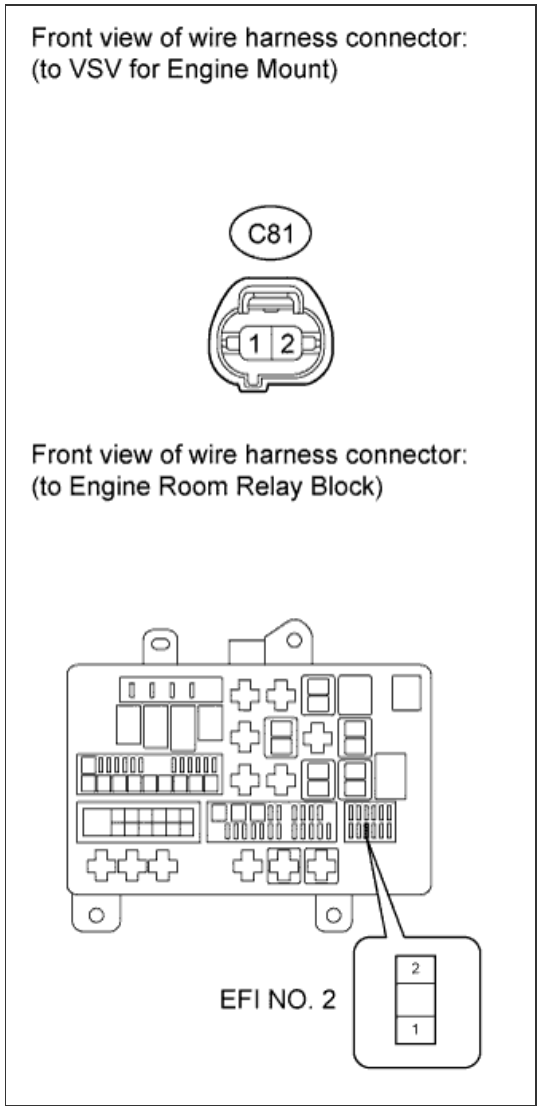
Tester Connection	Condition	Specified Condition
C81-2 - C46-45 (ACM)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C81-2 or C45-45 (ACM) - Body ground	Always	10 kΩ or higher

for RHD



Tester Connection	Condition	Specified Condition
C81-2 or C46-45 (ACM) - Body ground	Always	10 kΩ or higher

d. Remove the EFI NO. 2 fuse from the engine room relay block.

e. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (2) - C81-1	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

5.INSPECT ENGINE MOUNTING INSULATOR FRONT

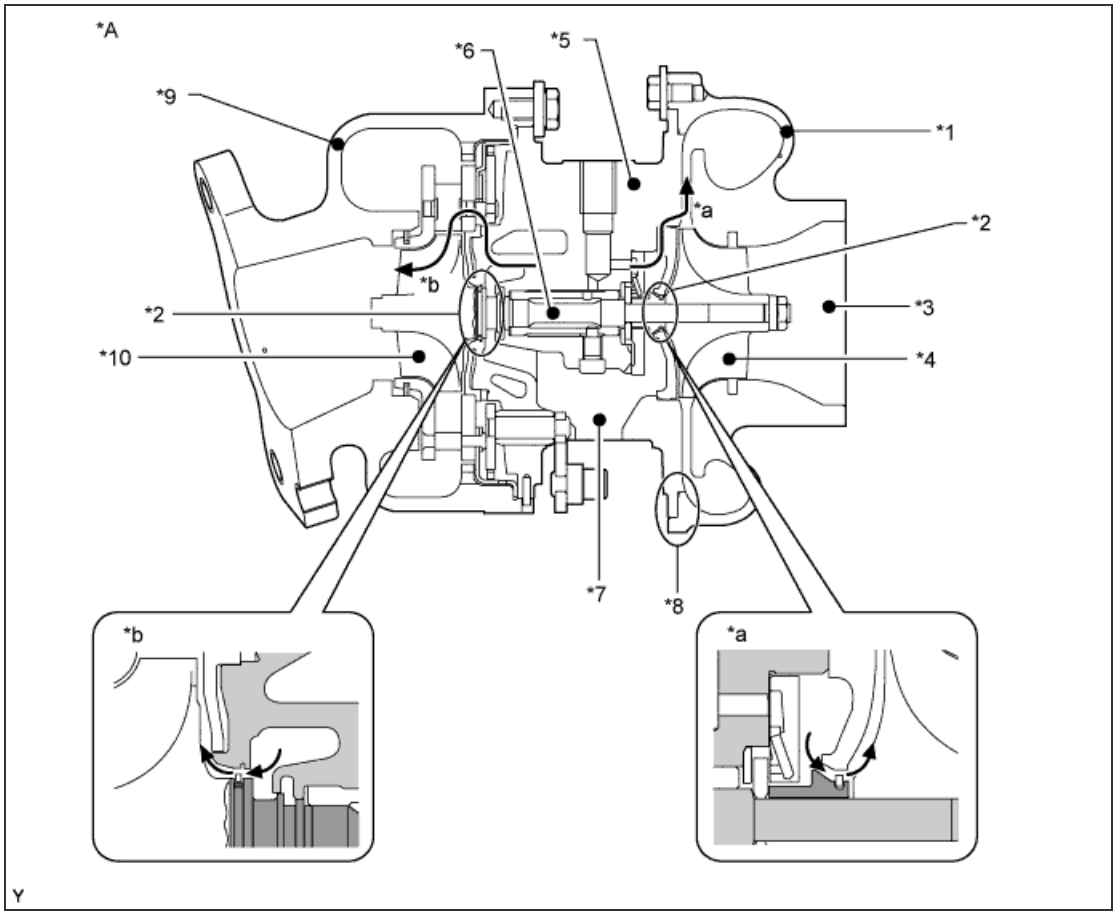
a. Inspect the engine mounting insulator front (Click here).

NG → REPLACE ENGINE MOUNTING INSULATOR FRONT (Click here)

OK

REPLACE ECM (Click here)

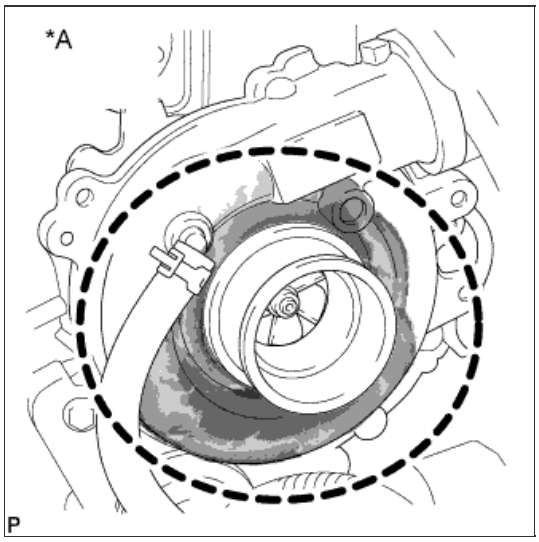
for Preparation Click here



DESCRIPTION

Description

Oil Leak Type	Description	Main Trouble Area
Internal oil leak (White smoke)	Oil leak from bearing housing to compressor housing (intake side) or turbine housing (exhaust side) through seal rings. Internal oil leak is not visible from outside of turbocharger. If oil leak occurs from turbine side seal, large amount of white smoke will be emitted from exhaust pipe.	• Compressor side seal ring • Turbine side seal ring • Clogging of oil drain • Shaft breakage • Shaft and bearing seizure • Compressor impeller damage • Low quality fuel
External oil leak	Oil leak from inside of turbocharger to outside of turbocharger (e.g. from FIPG seal, oil pipe flange or oil pipe union). Includes oil leak visible from outside of turbocharger.	• FIPG sealing part • Oil pipe flange • Oil pipe union • Hose connection of intake pipe

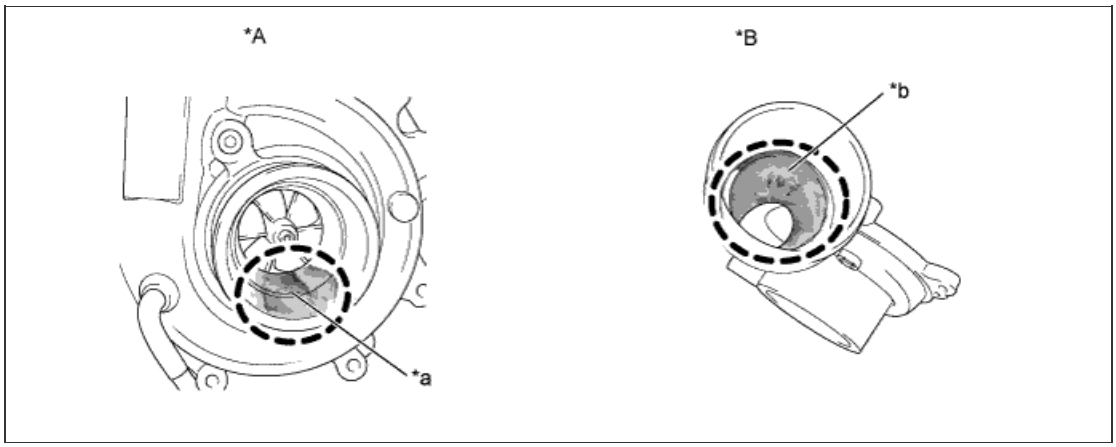


HINT:

- **Turbocharger oil leaks are classified into 2 types. One is an internal oil leak, and the other is an external oil leak.**
- **When oil leaks and smoke occur, sometimes the turbocharger is mistakenly replaced, even though the turbocharger is not the cause of the problem.**
- **When there are oil marks on the surface of the compressor housing, or oil in the compressor inlet or outlet, the problem may mistakenly be determined to be a turbocharger oil leak.**
- **Each part of the turbocharger is shown below.**

Text in Illustration

*A	DC Motor Type Turbocharger (No. 1)	-	-
*1	Compressor Housing	*2	Seal Ring
*3	Compressor Inlet	*4	Compressor Impeller
*5	Bearing Housing	*6	Turbine Shaft
*7	Oil Drain (Outlet)	*8	FIPG Sealing Part
*9	Turbine Housing	*10	Turbine Wheel
*a	Internal oil leak to compressor housing	*b	Internal oil leak to turbine housing

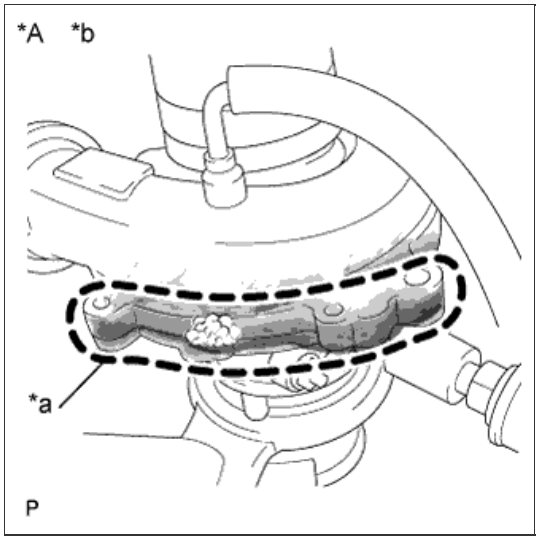


Text in Illustration

*A	Fig. 1	-	-

HINT:

- **Above illustration is an example.**
- **If the oil stain is similar to the one shown in the illustration (fig. 1), it may be oil spray from parts surrounding the turbocharger or oil leaking from the air cleaner hose. Therefore, this kind of oil stain on the outer surface of the turbocharger is not an oil leak from the turbocharger (external oil leak), and is not related to white smoke. For identification of an actual turbocharger outer oil leak, check only the sealing part shown below.**



Text in Illustration

*A	Fig. 2	*B	Fig. 3
*a	Oil existence at compressor inlet (Max. 5 cm^3)	*b	Oil existence at compressor outlet

HINT:

- **Above illustration is an example.**
- **A certain amount of oil is contained in the intake system because blow-by gas containing oil mist is returned to the intake system by the PCV. Therefore, the oil amount at the compressor inlet shown in the left figure (fig. 2) is normal and not an oil leak from the turbocharger (internal oil leak). Also, oil at the compressor outlet as shown in fig. 3 is normal.**
  In addition, the compressor impeller surface may blacken due to blow-by gas but this is not abnormal.
- **Oil mist contained in the PCV flows to the No. 2 turbocharger sub-assembly (for bank 2) because of the intake air piping route.**

Therefore, it is normal that a certain amount of oil exists at the compressor inlet and outlet of the No. 2 turbocharger sub-assembly.

HINT:

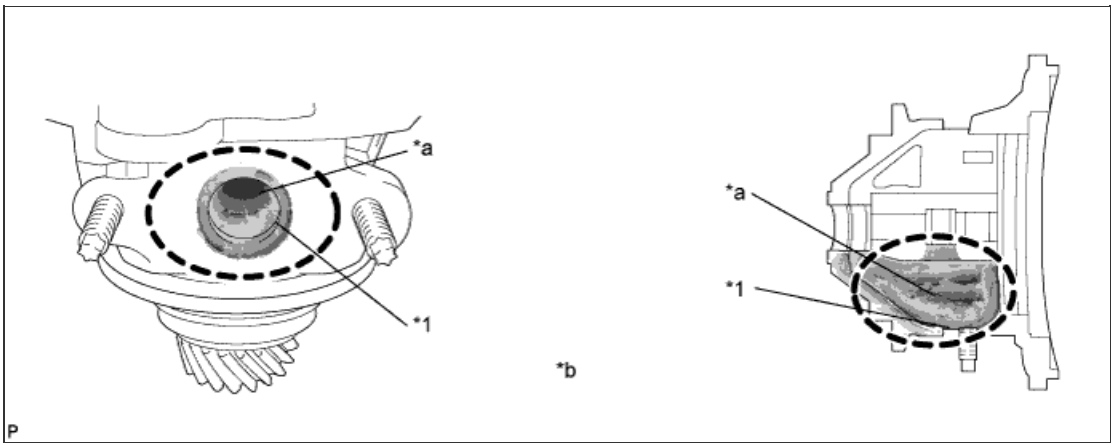
- **Above illustration is an example.**
- **This is an illustration (fig. 4) of an air leak test performed by applying soapy water to the area of the leak. Bubbles indicate the leak point.**

Faults and Symptoms of Turbocharger Parts

Compressor Side Seal Ring

Main fault	Seal ring breakage
Symptoms	• Oil leak to compressor housing • Excessive oil consumption
Note	• In case of compressor seal ring failure, large amount of oil would be found between compressor outlet and intercooler, and between intercooler and intake manifold, but not found at compressor inlet. • If large amount of oil is found at compressor inlet, it is not from turbocharger and may indicate a problem in the PCV system.

Turbine Side Seal Ring



Main fault	Seal ring breakage
Symptoms	• Oil leak to turbine housing • Large amount of white smoke from exhaust pipe • Excessive oil consumption
Note	• In case of turbine seal ring failure, large amount of white smoke would be emitted continuously. • If white smoke is emitted only just after engine start (and it disappears later), or small amount of white smoke is emitted intermittently, it is not from turbocharger. It is due to failure of other parts. • If wet oil is found at turbine inlet, it is not from turbocharger. It is due to problem in other parts.

Bearing Housing (Oil Drain Clogging)

Main fault	Oil drain clogging by coked oil
Symptoms	Large amount of white smoke from exhaust pipe

HINT:

- **Oil coking is caused by insufficient oil maintenance.**
- **If the oil drain is clogged by coked oil, oil cannot be drained smoothly, and it overflows from the bearing housing to the compressor housing and turbine housing. This results in a large amount of white smoke from the exhaust pipe.**
  If any solid (coked oil) is visually confirmed inside the bearing housing, it can be assumed to be the cause of internal oil leak.

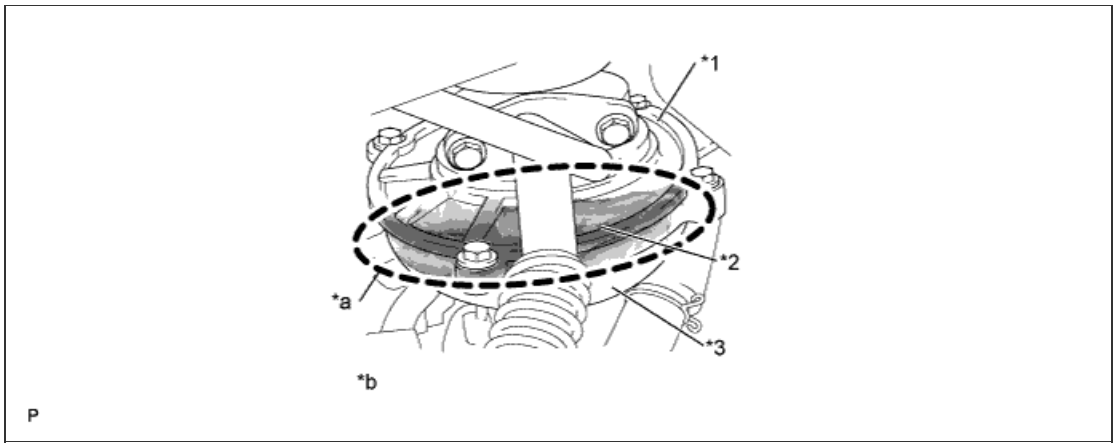
Text in Illustration

*1	Oil Drain	-	-
*a	Coked oil	*b	Oil drain clogged with coked oil

HINT:

Above illustration is an example.

Turbine Shaft



Main fault	• Breakage • Seizure
Symptoms	• Shaft does not rotate • Oil leak to compressor housing • Large amount of white smoke from exhaust pipe • Lack of power • Turbocharger noise changes
Note	• In case of turbine shaft failure, lack of power due to lack of boost pressure will be felt. • In cold conditions, shaft rotation can feel somewhat clingy due to viscosity of oil. Be sure not to mistake it for unsmooth shaft rotation.

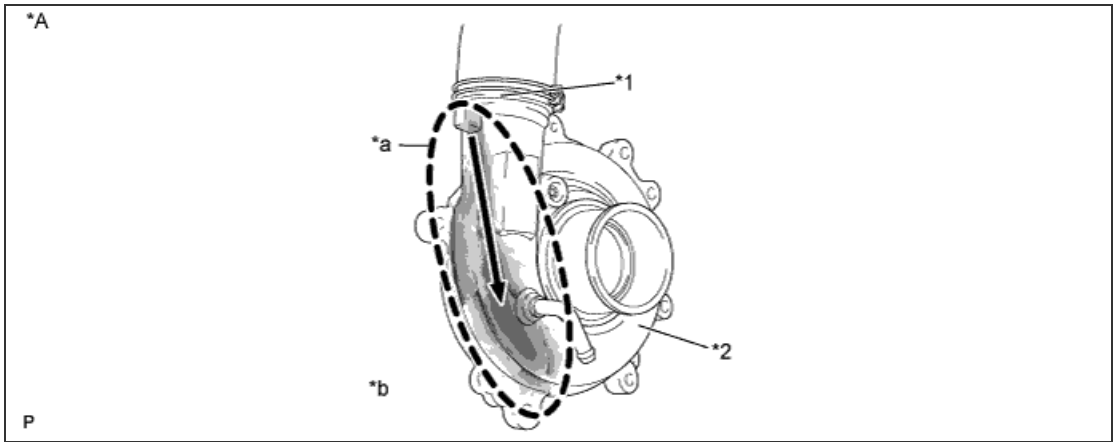
Compressor Impeller

Main fault	Breakage
Symptoms	• Shaft does not rotate • Oil leak to compressor housing • Lack of power
Note	• In case of compressor impeller failure, large amount of oil would be found between compressor outlet and intercooler, and between intercooler and intake manifold, but not found at compressor inlet. • Oil is blocked by boost pressure at compressor seal ring. Therefore, if boost pressure does not increase due to breakage of compressor impeller, oil flows out to compressor housing.

Compressor Housing FIPG Sealing Part

Symptoms	Oil leak from FIPG sealing part
Note	• If oil stain is separated from FIPG sealing part, it can be determined to be due to oil spray from other parts surrounding turbocharger. • If oil stain is traced to hose connection part, it can be determined to be due to hose connection failure.

Text in Illustration



*1	Compressor Back Plate	*2	FIPG Sealing Part
*3	Compressor Housing	-	-
*a	Oil Leak	*b	Oil Leak from FIPG Sealing Part

HINT:

Above illustration is an example.

Intake Hoses

Symptoms	Oil leak from hose connection between hose and compressor housing
Note	If oil stain is traced to hose connection part, it can be determined to be due to hose connection failure.

Text in Illustration

*A	Fig. 5	-	-
*1	Compressor Outlet	*2	Compressor Housing
*a	Trace of oil leak from hose connection part	*b	Oil leak from hose connection part

HINT:

Above illustration is an example.

INSPECTION PROCEDURE

1.CHECK TYPE OF OIL LEAK

a. Check whether the oil leak is an internal or external oil leak.

HINT:

White smoke is not related to an external oil leak.

Oil Leak Type	Description

Internal oil leak (White smoke)	Oil leak from bearing housing to compressor housing (intake side) or turbine housing (exhaust side) through seal rings. Internal oil leak is not visible from outside of turbocharger. If oil leak occurs from turbine side seal, large amount of white smoke will be emitted from exhaust pipe.
External oil leak	Oil leak from inside of turbocharger to outside of turbocharger (e.g. from FIPG seal, oil pipe flange or oil pipe union). Includes oil leaks visible from outside of turbocharger.

Result

Result	Proceed to
External oil leak	A
Internal oil leak	B

B → Go to step 3

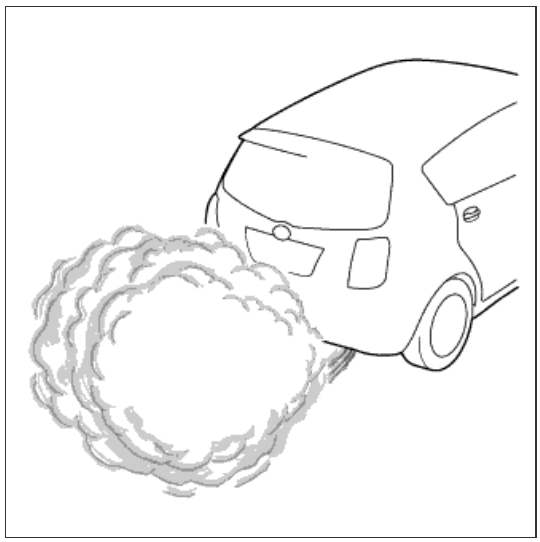
A

2.REPLACE THE PART WHICH IS LEAKING OIL

a. Replace the part which is leaking oil.

NEXT

END



3.CHECK WHETHER WHITE SMOKE IS EMITTED

a. Fully depress the accelerator pedal, and then release it.

b. Check whether white smoke is emitted or not when racing the engine.

CAUTION:

Be sure not to check for white smoke indoors.

Result

Result	Proceed to
White smoke is emitted	A
White smoke is not emitted	B

B → Go to step 14

A

4.READ OUTPUT DTC (RELATED TO ENGINE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester ON.

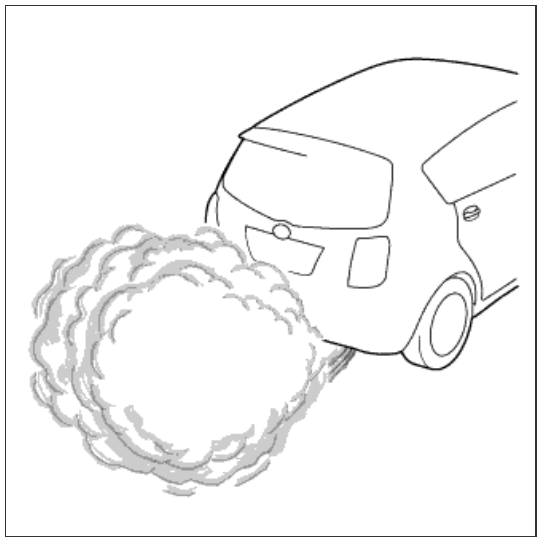
c. Enter the following menus: Powertrain / Engine / DTC.

d. Read DTCs.

Result

Result	Proceed to
No DTCs are output	A
DTCs related to engine are output	B

B → GO TO DTC CHART (Click here)



A

5.CHECK WHITE SMOKE (ACCORDING TO ENGINE CONDITION)

a. Remove the center exhaust pipe assembly.
