1.IGNITION SWITCH EXPRESSION

a. The type of ignition switch used on this model differs according to the specifications of the vehicle. The expressions listed in the table below are used in this section.

Expression	Ignition Switch (Position)	Engine Switch (Condition)
Ignition Switch off	LOCK	Off
Ignition Switch ACC	ACC	On (ACC)
Ignition Switch ON	ON	On (IG)
Engine Start	START	Start

2.INITIALIZATION

NOTICE:

Perform reset memory (AT initialization) when replacing the automatic transmission assembly, engine assembly or ECM (Click here).

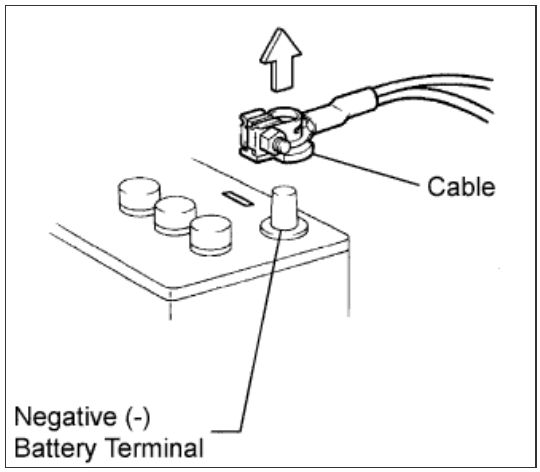
HINT:

Initialization cannot be completed only by disconnecting the cable from the battery terminal.

3.FOR USING INTELLIGENT TESTER

CAUTION:

Observe the following items for safety reasons:

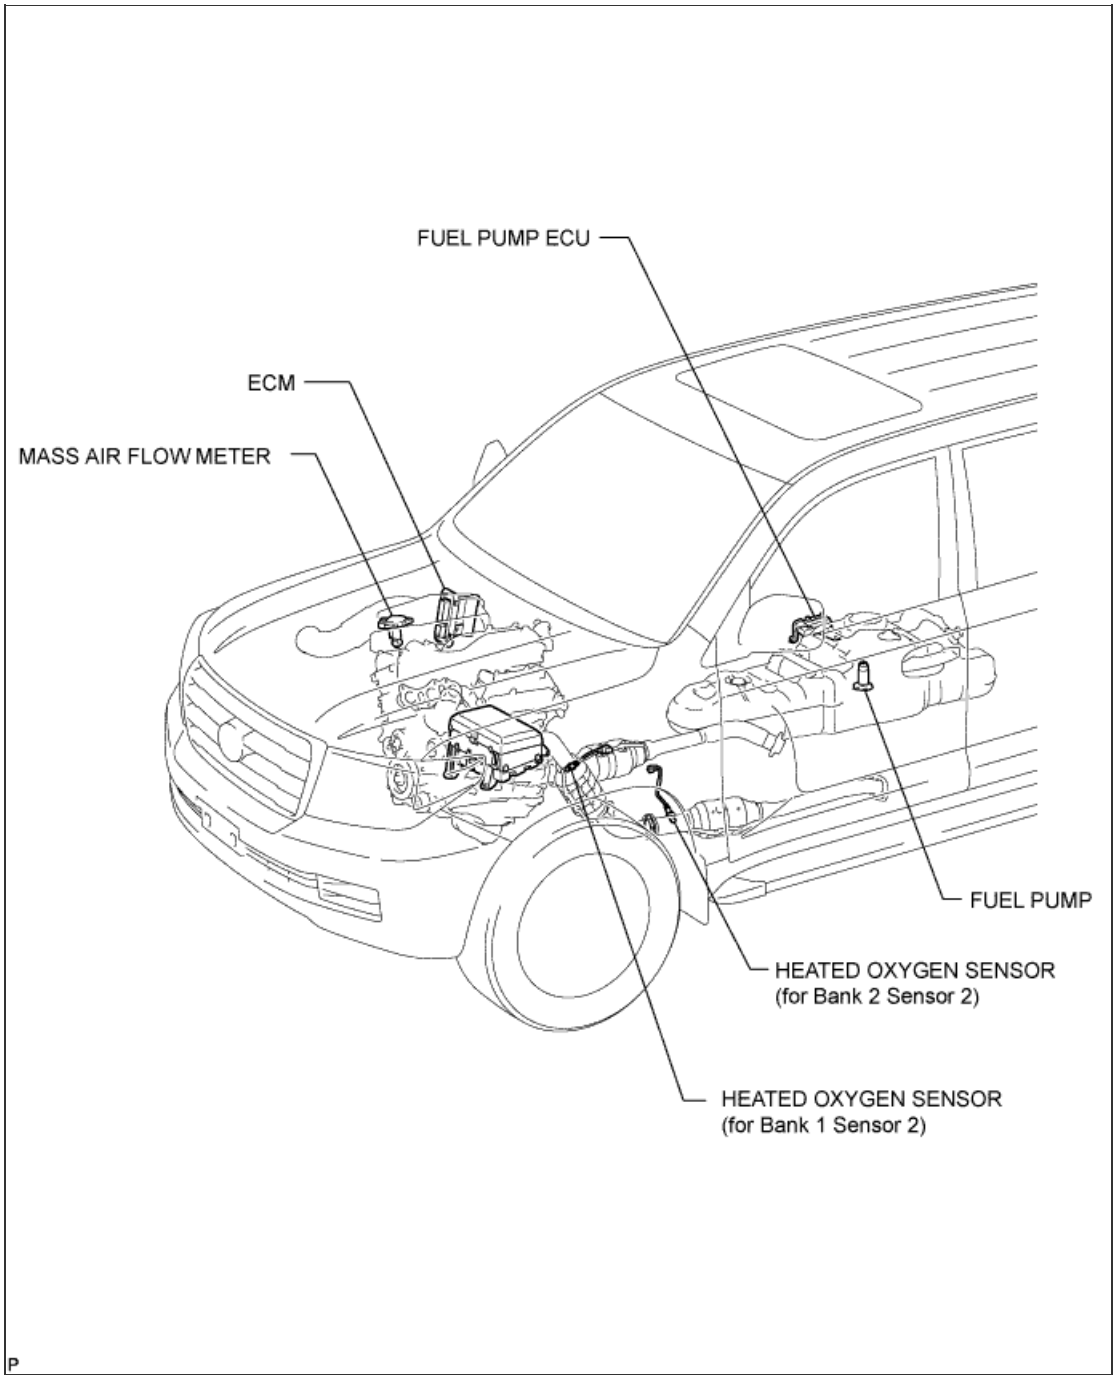


- Read its instruction books before using the tester.
- Prevent the tester cable from being caught on the pedals, shift lever and steering wheel when driving with the tester connected to the vehicle.
- When driving the vehicle for testing purposes using the tester, two persons are required. One person drives the vehicle, and the other operates the tester.

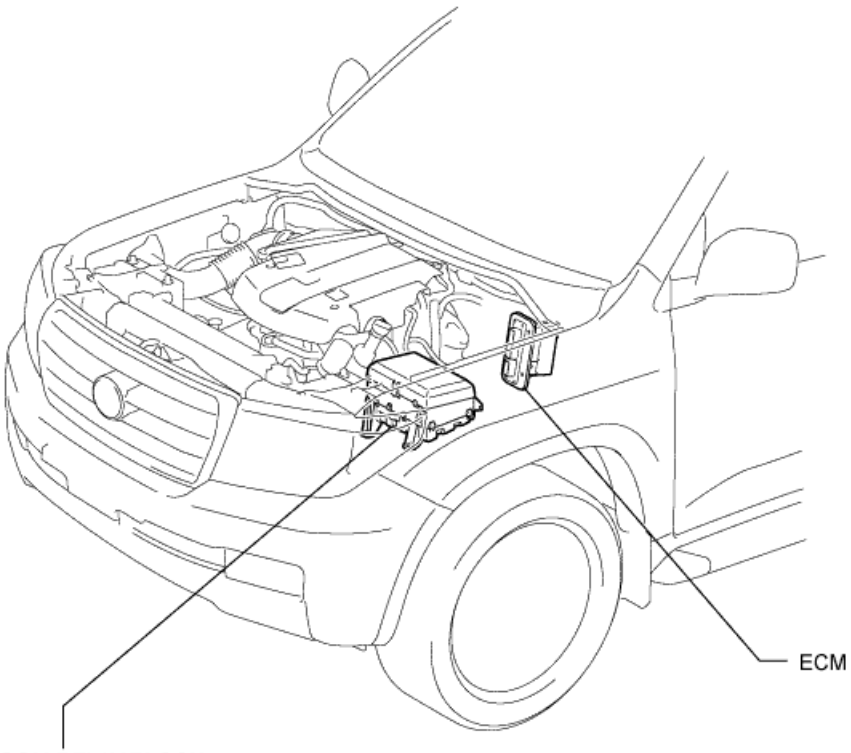
4.DISCONNECT AND RECONNECT CABLE OF NEGATIVE BATTERY TERMINAL

a. Before performing electronic work, disconnect the cable from the negative (-) battery terminal in order to prevent it from shorting and burning out.

b. Before disconnecting and reconnecting the battery cable, turn the ignition switch off and the headlight dimmer switch off. Then loosen the terminal nut completely. Do not damage the cable or terminal.

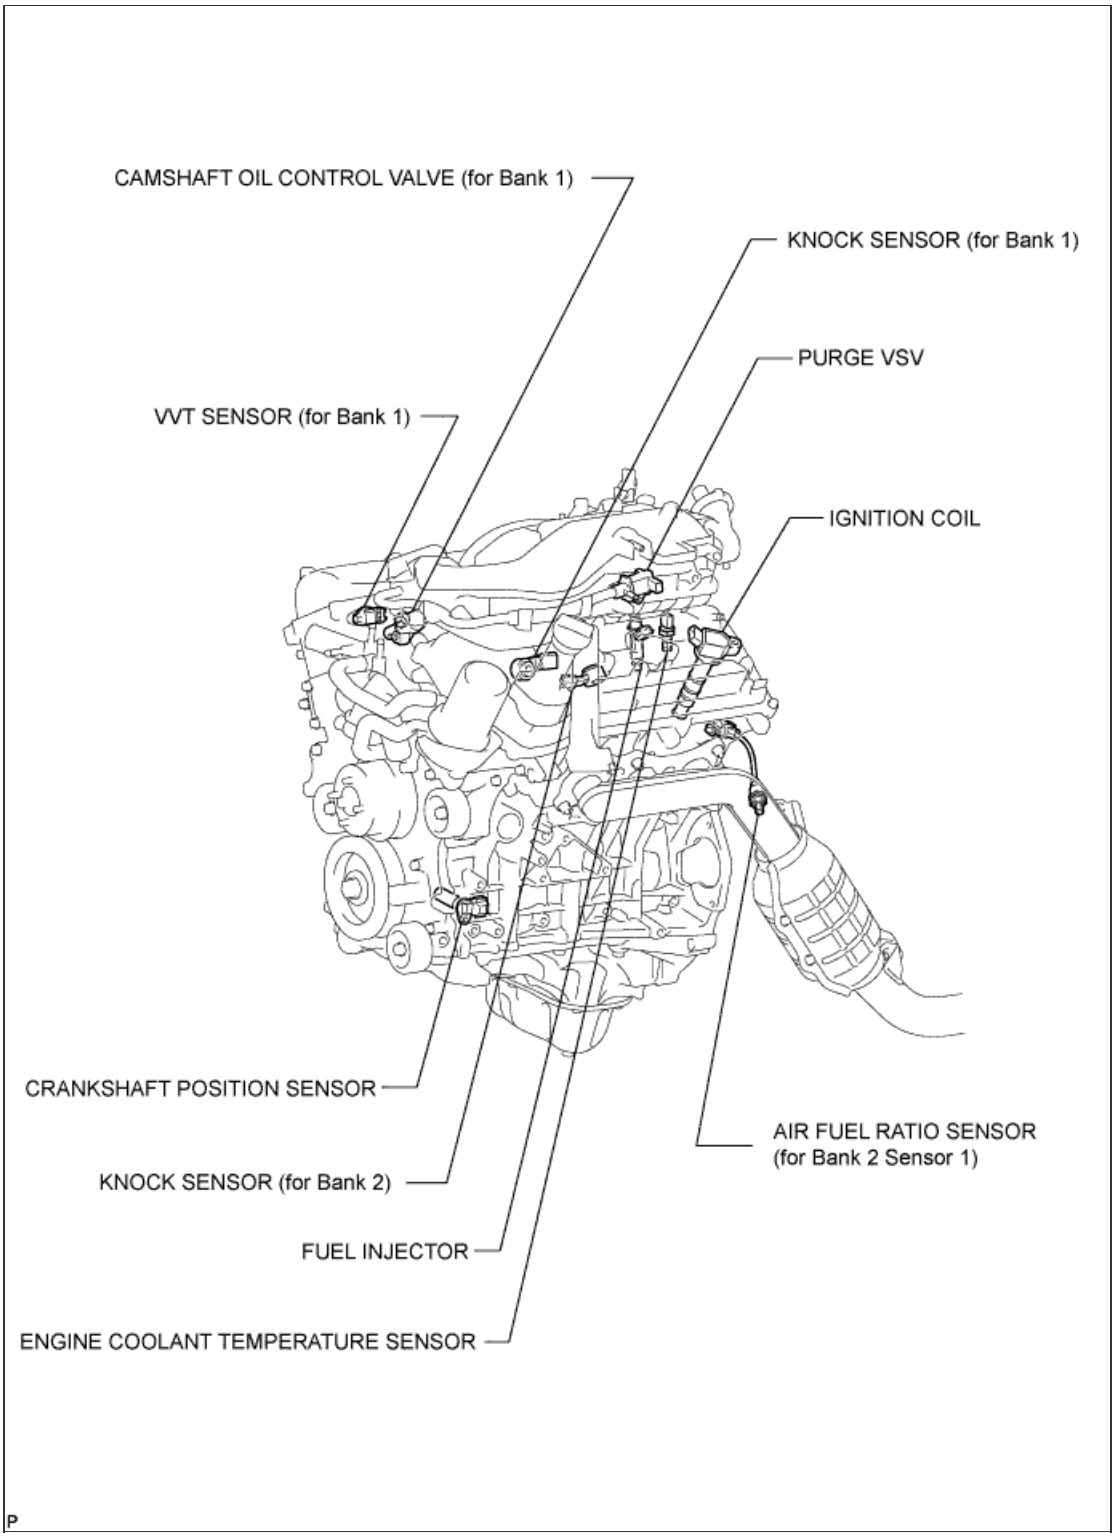


c. When the battery cable is disconnected, the clock and radio settings and stored DTCs are cleared. Therefore, before disconnecting the battery cable, make a note of the settings.



NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected.



for Preparation Click here

HINT:

Inspect the vehicle ECM using check mode. Intermittent problems are easier to detect with the intelligent tester when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. **Clear the DTCs (Click here).**
2. **Switch the ECM from normal mode to check mode using the intelligent tester (Click here).**
3. **Perform a simulation test.**
4. **Check and wiggle the harness(es), connector(s) and terminal(s).**

for Preparation Click here

When a malfunction is not confirmed by the DTC check, troubleshooting should be carried out in all circuits considered to be possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential when engine troubleshooting.

1.CHECK BATTERY VOLTAGE

NOTICE:

Carry out this check with the engine stopped and the ignition switch off.

Result

Result	Proceed to
11 V or higher	OK
Below 11 V	NG

NG. → CHARGE OR REPLACE BATTERY

OK ↓

2.CHECK WHETHER ENGINE CRANKS

NG. → PROCEED TO PROBLEM SYMPTOMS TABLE

OK ↓

3.CHECK WHETHER ENGINE STARTS

NG. → GO TO STEP 6

OK ↓

4.CHECK AIR FILTER

a. Visually check that the air filter is not excessively contaminated with dirt or oil.

NG. → REPLACE AIR FILTER

OK ↓

5.CHECK IDLING SPEED

NG. → TROUBLESHOOT IDLING SPEED AND PROCEED TO NEXT STEP

OK ↓

6.CHECK FUEL PRESSURE

NG. → TROUBLESHOOT FUEL PRESSURE AND PROCEED TO NEXT STEP

OK

7.CHECK FOR SPARK

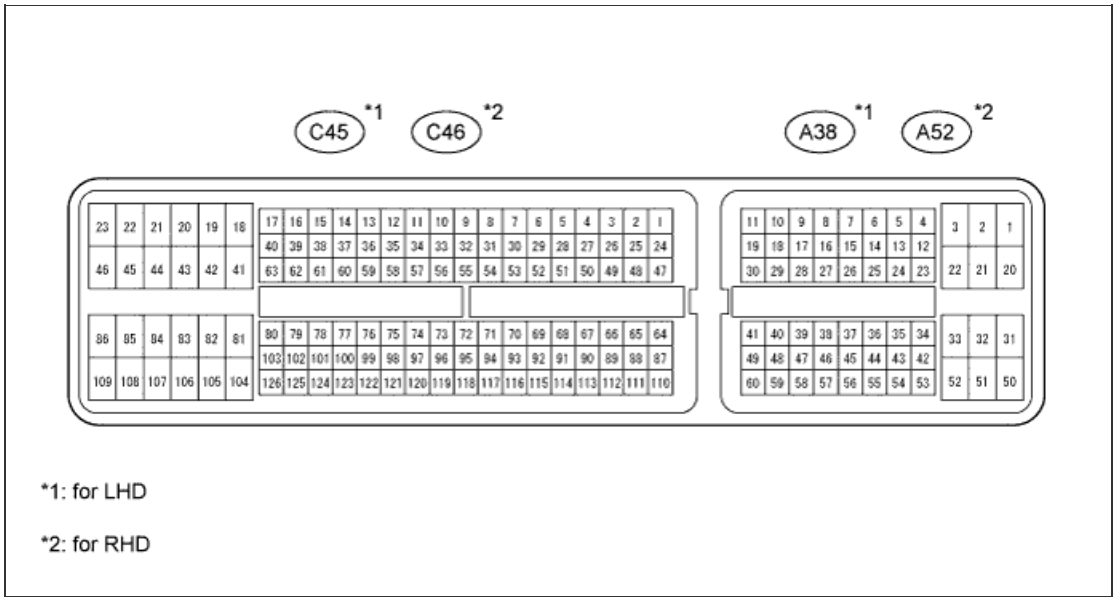
NG. → TROUBLESHOOT SPARK AND PROCEED TO NEXT STEP

OK

PROCEED TO PROBLEM SYMPTOMS TABLE

for Preparation Click here

HINT:



Use the table below to help determine the cause of problem symptoms. If multiple suspected areas are listed, the potential causes of the symptoms are listed in order of probability in the "Suspected Area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.

Measure the voltage according to the value(s) in the table below.

HINT:

The standard normal voltage between each pair of ECM terminals is shown in the table below. The appropriate conditions for checking each pair of terminals are also indicated.

The result of checks should be compared with the standard normal voltage for that pair of terminals, displayed in the Specified Condition column.

The illustration above can be used as a reference to identify the ECM terminal locations.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38*1-20 (BATT) - C45*1-81 (E1) A52*2-20 (BATT) - C46*2-81 (E1)	L - BR	Battery (for measuring the battery voltage and for the ECM memory)	Always	11 to 14 V
A38*1-3 (+BM) - C45*1-81 (E1) A52*2-3 (+BM) - C46*2-81 (E1)	P-B - BR	Power source of throttle actuator	Always	11 to 14 V
A38*1-28 (IGSW) - C45*1-81 (E1) A52*2-28 (IGSW) - C46*2-81 (E1)	B - BR	Ignition switch	Ignition switch ON	11 to 14 V
A38*1-2 (+B) - C45*1-81 (E1) A52*2-2 (+B) - C46*2-81 (E1)	B - BR	Power source of ECM	Ignition switch ON	11 to 14 V
A38*1-1 (+B2) - C45*1-81 (E1) A52*2-1 (+B2) - C46*2-81 (E1)	B - BR	Power source of ECM	Ignition switch ON	11 to 14 V
C45*1-58 (OC1+) - C45*1-57 (OC1-) C46*2-58 (OC1+) - C46*2-57 (OC1-)	L-B - R-B	Camshaft timing oil control valve (OCV) (bank 1)	Ignition switch ON	Pulse generation (See waveform 1)
C45*1-52 (OC2+) - C45*1-51 (OC2-) C46*2-52 (OC2+) - C46*2-51 (OC2-)	B - B-L	Camshaft timing oil control valve (OCV) (bank 2)	Ignition switch ON	Pulse generation (See waveform 1)
A38*1-44 (MREL) - C45*1-81 (E1) A52*2-44 (MREL) - C46*2-81 (E1)	W-R - BR	EFI relay	Ignition switch ON	11 to 14 V
C45*1-115 (VCV1) - C45*1-78 (ETHW) C46*2-115 (VCV1) - C46*2-78 (ETHW)	L - BR	Power source of sensor (specific voltage)	Ignition switch ON	4.5 to 5.5 V
C45*1-113 (VCV2) - C45*1-74 (ETHA) C46*2-113 (VCV2) - C46*2-74 (ETHA)	L - BR	Power source of sensor (specific voltage)	Ignition switch ON	4.5 to 5.5 V
C45*1-72 (VG) - C45*1-73 (E2G)	L-Y - G-W	Mass air flow meter	Idling, shift lever in P or N,	0.5 to 3.0 V

C46*2-72 (VG) - C46*2-73 (E2G)			A/C switch off	
C45*1-71 (THA) - C45*1-74 (ETHA) C46*2-71 (THA) - C46*2-74 (ETHA)	Y-B - BR	Intake air temperature sensor	Idling, intake air temperature 20°C (68°F)	0.5 to 3.4 V
C45*1-79 (THW) - C45*1-78 (ETHW) C46*2-79 (THW) - C46*2-78 (ETHW)	G-B - BR	Engine coolant temperature sensor	Idling, engine coolant temperature 80°C (176°F)	0.2 to 1.0 V
C45*1-96 (VCTA) - C45*1-97 (ETA) C46*2-96 (VCTA) - C46*2-97 (ETA)	L - B	Power source of throttle position sensor (specific voltage)	Ignition switch ON	4.5 to 5.5 V
C45*1-98 (VTA1) - C45*1-97 (ETA) C46*2-98 (VTA1) - C46*2-97 (ETA)	R-Y - B	Throttle position sensor (for engine control)	Ignition switch ON, throttle valve fully closed	0.5 to 1.1 V
			Ignition switch ON, throttle valve fully open	3.2 to 4.8 V
C45*1-99 (VTA2) - C45*1-97 (ETA) C46*2-99 (VTA2) - C46*2-97 (ETA)	Y-B - B	Throttle position sensor (for sensor malfunction detection)	Ignition switch ON, throttle valve fully closed	2.1 to 3.1 V
			Ignition switch ON, throttle valve fully open	4.6 to 5.0 V
A38*1-55 (VPA) - A38*1-59 (EPA) A52*2-55 (VPA) - A52*2-59 (EPA)	R - W-L	Accelerator pedal position sensor (for engine control)	Ignition switch ON, accelerator pedal fully released	0.5 to 1.1 V
			Ignition switch ON, accelerator pedal fully depressed	2.6 to 4.5 V
A38*1-56 (VPA2) - A38*1-60 (EPA2) A52*2-56 (VPA2) - A52*2-60 (EPA2)	GR-G - BR	Accelerator pedal position sensor (for sensor malfunction detection)	Ignition switch ON, accelerator pedal fully released	1.2 to 2.0 V
			Ignition switch ON, accelerator pedal fully depressed	3.4 to 5.0 V
A38*1-57 (VCPA) - A38*1-59 (EPA) A52*2-57 (VCPA) - A52*2-59 (EPA)	L-W - W-L	Power source of accelerator pedal position sensor (for VPA)	Ignition switch ON	4.5 to 5.5 V

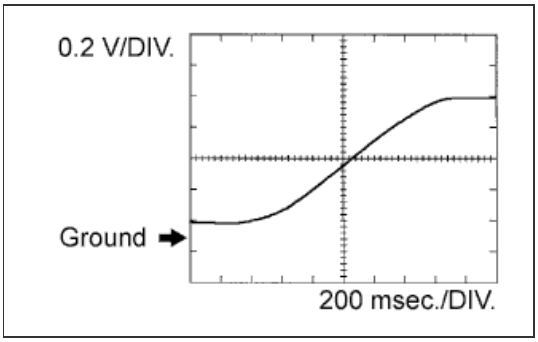
- ***2: for RHD**
- ***3: The ECM terminal voltage is constant regardless of the output voltage from the sensor.**

WAVEFORM 1

Camshaft Oil Control Valve (OCV)

ECM Terminal Name	Between OC1+ and OC1- or OC2+ and OC2-
Tester Range	5 V/DIV., 1 msec./DIV.,
Condition	Idling



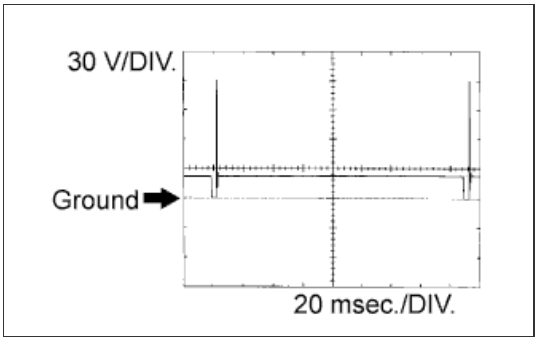
WAVEFORM 2

Heated Oxygen Sensor

ECM Terminal Name	Between OX1B and EX1B or OX2B and EX2B
Tester Range	0.2 V/DIV., 200 msec./DIV.
Condition	Engine speed maintained at 2500 rpm for 2 minutes after warming up engine

HINT:

In the Data List, item O2S B1S2 or O2S B2S2 shows the ECM input values from the heated oxygen sensor.

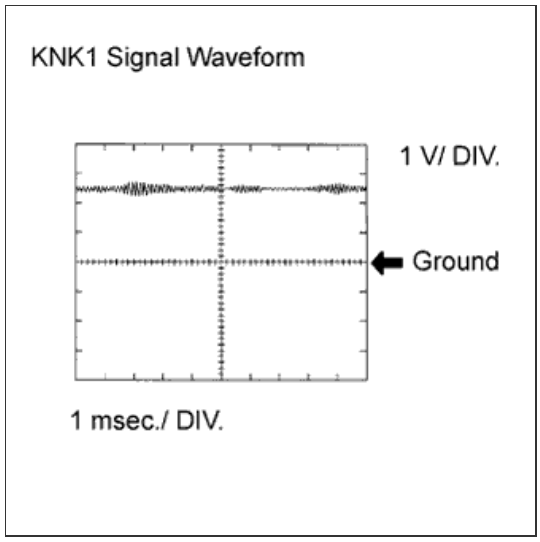


WAVEFORM 3

Fuel Injector

ECM Terminal Name	Between #10 (to #60) and E01
Tester Range	30 V/DIV., 20 msec./DIV.
Condition	Idling

HINT:



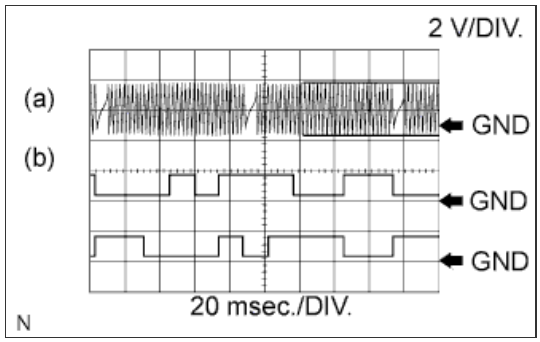
The wavelength becomes shorter as the engine speed increases.

WAVEFORM 4

Knock Sensor

ECM Terminal Name	Between KNK1 and EKNK or KNK2 and EKN2
Tester Range	1 V/DIV., 0.01 to 1 msec./DIV.
Condition	Engine speed maintained at 4000 rpm after warming up engine

HINT:



- **The wavelength becomes shorter as the engine speed increases.**
- **The waveforms and amplitudes displayed on the tester differ slightly depending on the vehicle.**

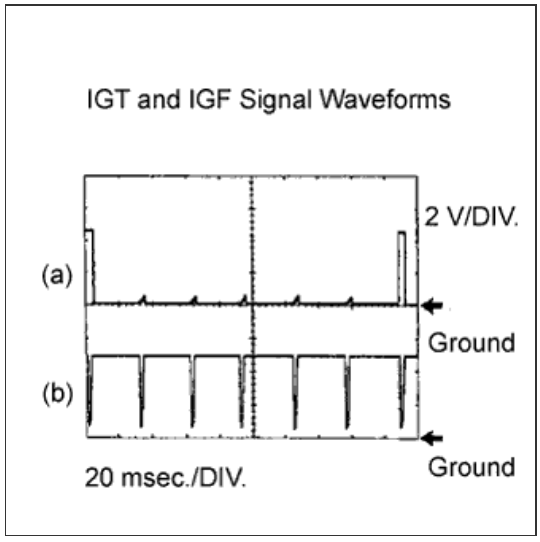
WAVEFORM 5

a. Crankshaft position sensor

b. VVT sensor

ECM Terminal Name	(a) Between NE+ and NE- (b) Between VV1+ and VV1- or VV2+ and VV2-
Tester Range	2 V/DIV., 20 msec./DIV.
Condition	Idling

HINT:



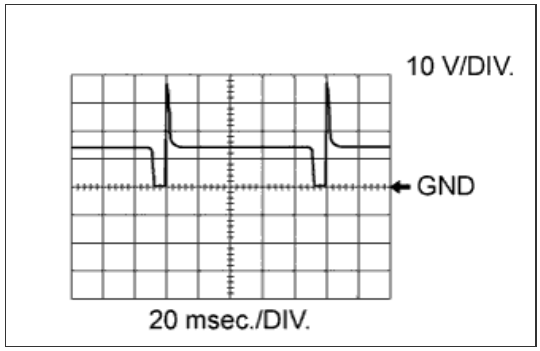
The wavelength becomes shorter as the engine speed increases.

WAVEFORM 6

a. Igniter IGT signal (from ECM to igniter)

b. Igniter IGF signal (from igniter to ECM)

ECM Terminal Name	(a) Between IGT (1 to 6) and E1 (b) Between IGF1 and E1
Tester Range	2 V/DIV., 20 msec./DIV.
Condition	Idling



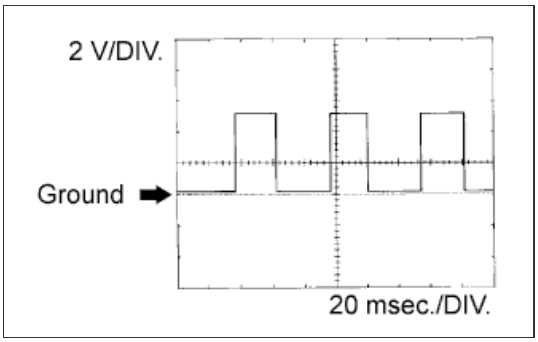
HINT:

The wavelength becomes shorter as the engine speed increases.

WAVEFORM 7

Purge VSV

ECM Terminal Name	Between PRG and E1
Tester Range	10 V/DIV., 10 to 100 msec./DIV.
Condition	Idling



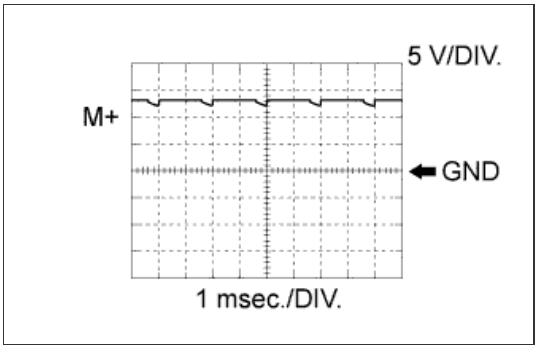
HINT:

If the waveform is not similar to the illustration, check the waveform again after idling for 10 minutes or more.

WAVEFORM 8

Vehicle Speed Signal

ECM Terminal Name	Between SPD and E1
Tester Range	2 V/DIV., 20 msec./DIV.
Condition	Ignition switch ON, wheel rotated slowly



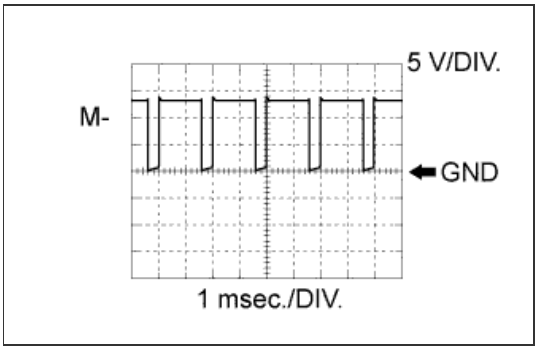
HINT:

The wavelength becomes shorter as the vehicle speed increases.

WAVEFORM 9

Throttle Actuator Positive Terminal

ECM Terminal Name	Between M+ and ME01
Tester Range	5 V/DIV., 1 msec./DIV.
Condition	Idling with warm engine



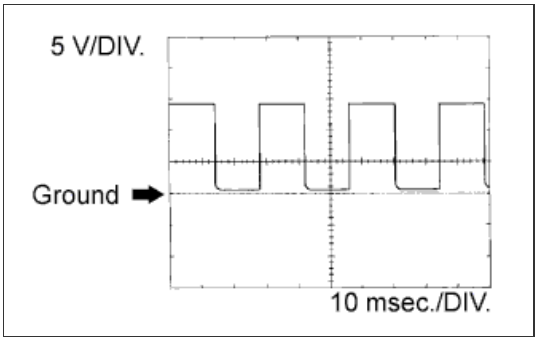
HINT:

The duty ratio varies depending on the throttle actuator operation.

WAVEFORM 10

Throttle Actuator Negative Terminal

ECM Terminal Name	Between M- and ME01
Tester Range	5 V/DIV., 1 msec./DIV.
Condition	Idling with warm engine



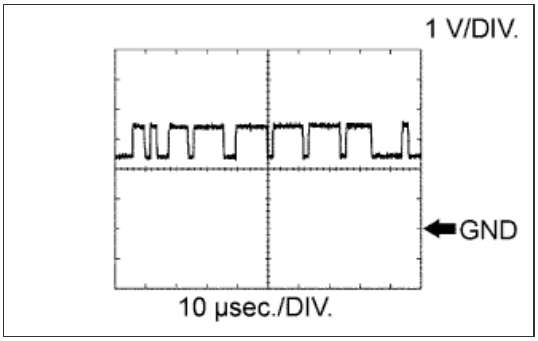
HINT:

The duty ratio varies depending on the throttle actuator operation.

WAVEFORM 11

Engine Speed Signal

ECM Terminal Name	Between TACH and E1
Tester Range	5 V/DIV., 10 msec./DIV.
Condition	Idling



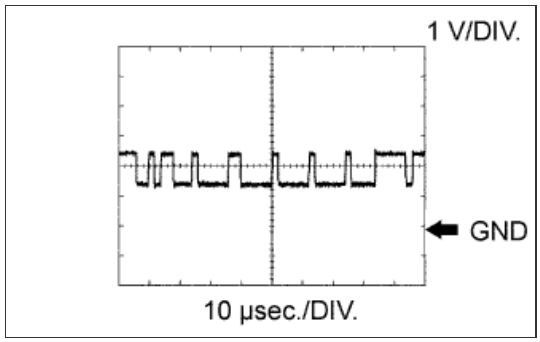
HINT:

The wavelength becomes shorter as the engine speed increases.

WAVEFORM 12

CAN Communication Signal (Reference)

ECM Terminal Name	Between CANH and E1
Tester Range	1 V/DIV., 10 µsec./DIV.
Condition	Ignition switch ON



HINT:

The wavelength varies depending on the CAN communication signal.

WAVEFORM 13

CAN Communication Signal (Reference)

ECM Terminal Name	Between CANL and E1
Tester Range	1 V/DIV., 10 µsec./DIV.
Condition	Ignition switch ON

HINT:

The wavelength varies depending on the CAN communication signal.

M-OBD

When troubleshooting Multiplex On-Board Diagnostic (M-OBD) vehicle, the vehicle must be connected to the intelligent tester. Various data output from the ECM can then be read.
OBD regulations require that the vehicle on-board computer illuminates the MIL on the instrument panel when the computer detects a malfunction in:

1. The emission control system/components.
2. The powertrain control components (which affect vehicle emissions).
3. The computer.

In addition, the applicable DTCs are stored in the ECM memory. If the malfunction does not recur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain recorded in the ECM memory.

NORMAL MODE AND CHECK MODE

The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic is used to ensure accurate detection of malfunctions. Check mode is also available as an option for technicians. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the ability of the system to detect malfunctions, including intermittent problems (intelligent tester only).

2 TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the next subsequent drive cycle, the MIL is illuminated (2nd trip).

FREEZE FRAME DATA

The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was moving or stationary, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

BATTERY VOLTAGE

Standard voltage:
11 to 14 V

If voltage is below 11 V, replace or recharge the battery before proceeding.

MIL (Malfunction Indicator Lamp)

a. The MIL is illuminated when the ignition switch is first turned to ON (the engine is not running).

b. The MIL should turn off when the engine is started. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.

HINT:

If the MIL is not illuminated when the ignition switch is first turned to ON, check the MIL circuit (Click here).

ALL READINESS

HINT:

- **With "All Readiness" you can check whether or not the DTC judgment has been completed by using the intelligent tester.**
- **You should check "All Readiness" after simulating malfunction symptoms or for validation after finishing repairs.**

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Perform the DTC judgment driving pattern to run the DTC judgment.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

g. Input the DTCs to be confirmed.

h. Check the DTC judgment result.

Result

Tester Display	Description
NORMAL	• DTC judgment completed • System normal
ABNORMAL	• DTC judgment completed • System abnormal
INCOMPLETE	• DTC judgment not completed • You should perform driving pattern after confirming DTC enabling conditions
N/A	• Unable to perform DTC judgment • Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

for Preparation Click here

NOTICE:

When the diagnosis system is changed from the normal mode to check mode or vice versa, all DTCs and freeze frame data stored in normal mode are cleared. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

- **DTCs which are stored in the ECM can be output to the intelligent tester. The intelligent tester can display the current and pending DTCs.**
- **Some DTCs are not stored if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.**

CHECK DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Check the DTC(s) and freeze frame data, and then write them down.

f. Check the details of the DTC(s) (Click here).

CLEAR DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Clear the DTCs.

CLEAR DTC (Without using the intelligent tester)

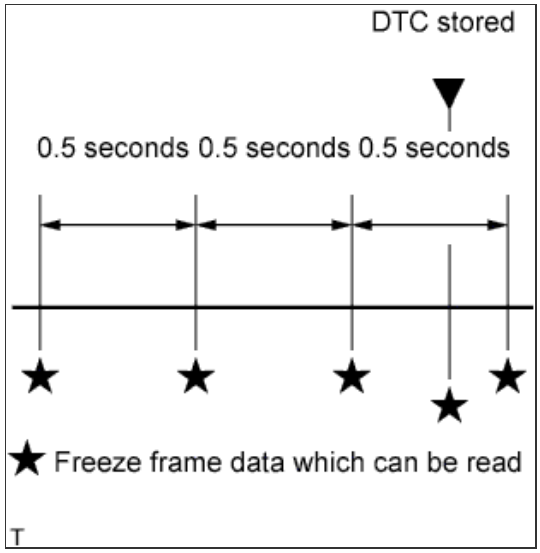
a. Perform either of the following operations:

i. Disconnect the cable from the negative (-) battery terminal for more than 1 minute.

ii. Remove the EFI MAIN and ETCS fuses from the engine room relay block located inside the engine compartment for more than 1 minute.

for Preparation Click here

DESCRIPTION



Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, it can help determine if the vehicle was moving or stationary, the engine was warmed up or not, the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

HINT:

If it is impossible to duplicate the problem even though a DTC is output, confirm the freeze frame data.

The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the intelligent tester, 5 separate sets of freeze frame data can be checked.

- 3 data sets before the DTC was stored.
- 1 data set when the DTC was stored.
- 1 data set after the DTC was stored.
  These data sets can be used to simulate the condition of the vehicle around the time of the occurrence of the malfunction. The data may assist in identifying the cause of the malfunction, and in judging whether it was temporary or not.

LIST OF FREEZE FRAME DATA

LABEL (Tester Display)	Measurement Item	Diagnostic Note
Vehicle Speed	Vehicle speed	The speed indicated on the speedometer.
Engine Speed	Engine speed	-
Calculate Load	Calculated load	The load calculated by the ECM.
Vehicle Load	Vehicle load	-
MAF	Airflow rate from MAF meter	If the value is approximately 0.0 g/sec.: • The mass air flow meter power source circuit is open or shorted. • The VG circuit is open or shorted. If the value is 160.0 g/sec. or more: • The E2G circuit is open.
Atmosphere Pressure	Atmosphere pressure	-
Coolant Temp	Engine coolant temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
Intake Air	Intake air temperature	If the value is -40°C (-40°F), the sensor circuit is open. If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
Engine Run Time	Accumulated engine running time	-
Initial Engine Coolant Temp	Initial engine coolant temperature	-
Initial Intake Air Temp	Initial intake air temperature	-
Battery Voltage	Battery voltage	-
Accel Sens. No.1 Volt %	Absolute Accelerator Pedal Position (APP) No.	-

	1	
Accel Sens. No.2 Volt %	Absolute APP No. 2	-
Throttle Sensor Volt %	Absolute throttle position	-
Throttl Sensor #2 Volt %	Absolute throttle sensor positioning #2	-
Throttle Sensor Position	Throttle sensor positioning	-
Throttle Motor DUTY	Throttle actuator	-
Injector (Port)	Injection period of No. 1 cylinder	-
Injection Volum (Cylinder1)	Injection volume	-
Fuel Pump/Speed Status	Fuel pump/speed status	-
EVAP (Purge) VSV	EVAP purge VSV duty ratio	-
Evap Purge Flow	Ratio of evaporative purge flow to intake air volume	-
Purge Density Learn Value	Learning value of purge density	-
EVAP Purge VSV	EVAP purge VSV	-
Target Air-Fuel Ratio	Ratio compared to stoichiometric level	-
AF Lambda B1S1	Fuel trim at A/F sensor (bank 1 sensor 1)	-
AF Lambda B2S1	Fuel trim at A/F sensor (bank 2 sensor 1)	-
AFS Voltage B1S1	Air fuel ratio (A/F) sensor output voltage	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS Voltage B2S1	A/F sensor output voltage	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS Current B1S1	A/F sensor current (bank 1 sensor 1)	-
AFS Current B2S1	A/F sensor current	-
O2S B1S2	Heated oxygen sensor output voltage	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
O2S B2S2	Heated oxygen sensor output voltage	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
Short FT #1	Short-term fuel trim	Short-term fuel compensation is used to maintain the air fuel ratio at the stoichiometric air fuel ratio.
Long FT #1	Long-term fuel trim	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Total FT #1	Total fuel trim	-
Short FT #2	Short-term fuel trim	Short-term fuel compensation is used to maintain the air fuel ratio at the stoichiometric air fuel ratio.
Long FT #2	Long-term fuel trim	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Total FT #2	Total fuel trim	-
Fuel System Status #1	Fuel system status (bank 1)	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for

		fuel control, is malfunctioning.
Fuel System Status #2	Fuel system status (bank 2)	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
IGN Advance	Ignition advance	-
Knock Feedback Value	Feedback value of knocking	-
Knock Correct Learn Value	Correction learning value of knocking	-
ACIS VSV	VSV for Acoustic Control Induction System (ACIS)	-
VVT Control Status #1	VVT control status	-
VVT Control Status #2	VVT control status	-
Catalyst Temp B1S1	Estimated catalyst temperature (bank 1 sensor 1)	-
Catalyst Temp B2S1	Estimated catalyst temperature (bank 2 sensor 1)	-
Catalyst Temp B1S2	Estimated catalyst temperature (bank 1 sensor 2)	-
Catalyst Temp B2S2	Estimated catalyst temperature (bank 2 sensor 2)	-
Starter Signal	Starter switch signal	-
Starter Control	Starter switch status	-
Power Steering Signal Record	Power steering switch	-
Starter Relay	Starter relay status	-
Power Steer. Sig. Record	Power steering signal (history)	-
ACC Relay	ACC relay status	-
Neutral Position SW Signal	Park/Neutral Position (PNP) switch signal	-
Stop Light Switch	Stop light switch	-
A/C Signal	A/C signal	-
Closed Throttle Position SW	Closed throttle position switch	-
Fuel Cut Condition	Fuel cut condition	-
Immobiliser Communication	Immobiliser communication	-
Electrical Load Signal	Electrical load signal	-
Time after DTC Cleared	Cumulative time after DTC cleared	-
Distance from DTC Cleared	Accumulated distance from DTC cleared	-
Warmup Cycle Cleared DTC	Warm-up cycle after DTC cleared	-
TC and TE1	TC and CG (TE1) terminals of DLC3	-
Ignition Trig. Count	Ignition	-
Cylinder #1 Misfire Count	Cylinder #1 misfire count	Displayed only while idling.
Cylinder #2 Misfire Count	Cylinder #2 misfire count	Displayed only while idling.
Cylinder #3 Misfire Count	Cylinder #3 misfire count	Displayed only while idling.
Cylinder #4 Misfire Count	Cylinder #4 misfire count	Displayed only while idling.
Cylinder #5 Misfire Count	Cylinder #5 misfire count	Displayed only while idling.
Cylinder #6 Misfire Count	Cylinder #6 misfire count	Displayed only while idling.
All Cylinders Misfire Count	All cylinders misfire count	Displayed only while idling.
Misfire RPM	Misfire RPM	-
Misfire Load	Misfire load	-
Misfire Margin	Misfire monitoring	-
ACT VSV	A/C cut status for Active Test	-
Idle Fuel Cut	Fuel cut idle	ON: when the throttle valve is fully closed and the engine speed is more than 3500 rpm.

FC TAU	Fuel cut during very light load	Fuel cut is being performed under a very light load to prevent the engine combustion from becoming incomplete.

HINT:

Intelligent tester:

Compared to the normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect the malfunctions that cannot be detected in normal mode.

NOTICE:

All the stored DTCs and freeze frame data are cleared if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the ignition switch is turned from ON to ACC or off while in check mode. Before changing modes, always check and note any DTCs and freeze frame data.

CHECK MODE PROCEDURE

a. Check and ensure the following conditions:

   i. Battery positive voltage 11 V or higher.

   ii. Throttle valve fully closed.

   iii. Transmission in the P or N position.

   iv. A/C switch off.

b. Turn the ignition switch off.

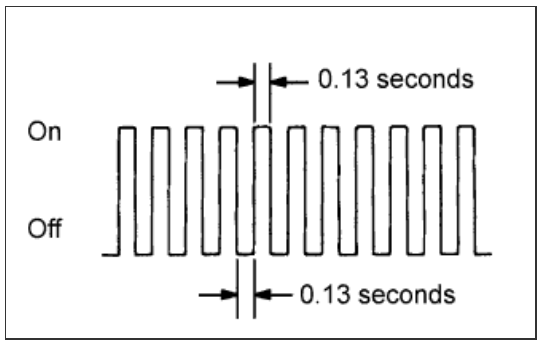
c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON.

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / Check Mode.

g. Switch the ECM from normal mode to check mode.



h. Make sure the MIL flashes as shown in the illustration.

i. Start the engine.

j. Make sure the MIL turns off.

k. Simulate the conditions of the malfunction described by the customer.

l. Check the DTCs and freeze frame data using the tester.

for Preparation Click here

If any of the following DTCs are stored, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily.

DTCs	Component	Fail-Safe Operation	Fail-Safe Deactivation Condition
P0011 and P0021	Variable Valve Timing (VVT) System	• Idle up (control of combustion worsening) • Stopping fuel cut control	Pass condition detected
P0031, P0032, P0051 and P0052	Air Fuel Ratio (A/F) Sensor Heater	The ECM turns off the A/F sensor heater.	Ignition switch off
P0037, P0038, P0057 and P0058	Heated Oxygen (HO2) Sensor Heater	The ECM turns off the HO2 sensor heater.	Ignition switch off
P0102, P0103	Mass Air Flow (MAF) Meter	The ECM calculates the ignition timing according to the engine speed and throttle valve position.	Pass condition detected
P0110, P0112 and P0113	Intake Air Temperature (IAT) Sensor	The ECM estimates the IAT to be 20°C (68°F).	Pass condition detected
P0115, P0117 and P0118	Engine Coolant Temperature (ECT) Sensor	The ECM estimates the ECT to be 80°C (176°F).	Pass condition detected
P0120, P0121, P0122, P0123, P0220, P0222, P0223, P0604, P0606, P060A, P060D, P060E, P0657, P2102, P2103, P2111, P2112, P2118, P2119 and P2135	Electronic Throttle Control System (ETCS)	The ECM cuts off the throttle actuator current and the throttle valve returns to 6° throttle position by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at minimal speed.*1	Pass condition detected and then ignition switch turned off
P0300, P0301, P0302, P0303, P0304, P0305 and P0306*2	• Fuel Injector • Electronic Throttle Control System (ETCS)	When a misfire occurs, fuel cut is performed for catalyst overheat malfunction prevention. • During normal load and normal engine speed (MIL is blinking): - Fuel cut is performed on the malfunctioning cylinder. • During high load and high engine speed (MIL is blinking): - Throttle valve opening angle control is performed. - All cylinder fuel cut or malfunctioning cylinder fuel cut.	Pass condition detected and then ignition switch turned off
P0327, P0328, P0332 and P0333	Knock Sensor	The ECM sets the ignition timing to maximum retard.	Ignition switch off
P0351 to P0356	Igniter	The ECM cuts the fuel.	Pass condition detected
P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138	Accelerator Pedal Position (APP) Sensor	The APP sensor has 2 sensor circuits: Main and Sub. If either of the circuits malfunctions, the ECM controls the engine using the other circuit. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.	Pass condition detected and then ignition switch turned off

HINT:

- ***1: The vehicle can be driven slowly when the accelerator pedal is depressed firmly and slowly. If the accelerator pedal is**

depre ed ickl the vehicle a peed p and lo o n erraticall

- * : Mi fire related fail-safe operations occur when catalyst overheat malfunctions occur.

DATA LIST

HINT:

Using the intelligent tester to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. This non-intrusive inspection can be very useful because intermittent conditions or signals may be discovered before parts or wiring is disturbed. Reading the Data List information early in troubleshooting is one way to save diagnostic time

NOTICE:

In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

a. Warm up the engine.

b. Turn the ignition switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON.

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data.

g. Check the values by referring to the table below.

Engine and ECT

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
Vehicle Speed	Vehicle speed: Min.: 0 km/h, Max.: 255 km/h	Actual vehicle speed	The speed indicated on the speedometer.
Engine Speed	Engine speed: Min.: 0 rpm, Max.: 16383.75 rpm	650 to 750 rpm: Idling	-
Calculate Load	Load calculated by ECM: Min.: 0%, Max.: 100%	11.4 to 16.4%: Idling 13.1 to 18.9%: Running without load (2000 rpm)	-
Vehicle Load	Vehicle load: Min.: 0%, Max.: 25700%	Actual vehicle load	The load percentage in terms of the maximum intake airflow amount.
MAF	Airflow rate from MAF meter: Min.: 0 g/sec., Max.: 655.35 g/sec.	3.2 to 4.7 g/sec.: Idling 13.1 to 18.9 g/sec.: 2000 rpm	If the value is approximately 0.0 g/sec.: • The mass air flow meter power source circuit is open or shorted. • The VG circuit is open or shorted. If the value is 271.0 g/sec. or more: • The E2G circuit is open.
Atmospheric Pressure	Atmospheric pressure: Min.: 0 kPa, Max.: 255 kPa	Equivalent to atmospheric pressure (absolute pressure)	-
Coolant Temp	Engine coolant temperature: Min.: -40°C, Max.: 140°C	80 to 100°C (176 to 212°F): After warming up	• If the value is -40°C (-40°F), the sensor circuit is open. • If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
Intake Air	Intake air temperature: Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	• If the value is -40°C (-40°F), the sensor circuit is open. • If the value is 140°C (284°F) or higher, the sensor circuit is shorted.
Engine Run Time	Engine run time: Min.: 0 s Max.: 65535 s	Time after engine start	-

Initial Engine Coolant Temp	Initial engine coolant temperature: Min.: -40°C, Max.: 120°C	Coolant temperature when engine started	Service data.
Initial Intake Air Temp	Initial intake air temperature: Min.: -40°C, Max.: 120°C	Intake air temperature when engine started	Service data.
Battery Voltage	Battery voltage: Min.: 0, Max.: 65.535 V	11 to 14 V: Idling	-
Accel Sens. No.1 Volt %	Accelerator Pedal Position (APP) No. 1: Min.: 0%, Max.: 100%	10 to 22%: Accelerator pedal released 54 to 86%: Accelerator pedal fully depressed	-
Accel Sens. No.2 Volt %	APP No. 2: Min.: 0%, Max.: 100%	12 to 42%: Accelerator pedal released 66 to 98%: Accelerator pedal fully depressed	-
Accel Sensor Out No.1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 4.98 V	-	-
Accel Sensor Out No.2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 4.98 V	-	-
Accel Sensor Out No.1	APP sensor No. 1 voltage: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: Accelerator pedal released 2.6 to 4.5 V: Accelerator pedal fully depressed	-
Accel Sensor Out No.2	APP sensor No. 2 voltage: Min.: 0 V, Max.: 5 V	1.2 to 2.0 V: Accelerator pedal released 3.4 to 5.0 V: Accelerator pedal fully depressed	-
Accelerator Idle Position	Whether or not accelerator pedal position sensor detecting idle: ON or OFF	ON: Idling	-
Accel Fully Close #1 (AD)	Accelerator fully closed value No. 1 (AD): Min.: 0 V, Max.: 4.98 V	-	The ETCS service data.
Accel Fully Close Learn #1	Accelerator fully closed learning value No. 1: Min.: 0 deg., Max.: 124.512 deg.	-	The ETCS service data.
Accel Fully Close Learn #2	Accelerator fully closed learning value No. 2: Min.: 0 deg., Max.: 124.512 deg.	-	The ETCS service data.
Throttle Sensor Volt %	Absolute throttle position sensor: Min.: 0%, Max.: 100%	• 10 to 22%: Throttle fully closed • 64 to 96%: Throttle fully open	Read the value with the non-intrusive operation (Active Test).
Throttl Sensor #2 Volt %	Absolute throttle sensor positioning #2: Min.: 0%, Max.: 100%	-	The calculated value based on VTA2.
ST1	Brake pedal signal: ON or OFF	ON: Brake pedal released	-
System Guard	System guard: ON or OFF	-	-
Open Side Malfunction	Open side malfunction: ON or OFF	-	-
Throttle Idle Position	Whether or not throttle position sensor detecting idle: ON or OFF	ON: Idling	-
Throttle Require Position	Throttle requirement position: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: Idling	-

Throttle Sensor Position*2	Throttle sensor positioning: Min.: 0%, Max.: 100%	0%: Accelerator pedal released 50 to 80%: Accelerator pedal fully depressed	Recognition value for throttle opening angle on ECM..
Throttle Position No.1	Throttle position sensor No. 1 output voltage: Min.: 0 V, Max.: 4.98 V	-	-
Throttle Position No.2	Throttle position sensor No. 2 output voltage: Min.: 0 V, Max.: 4.98 V	-	-
Throttle Position No.1	Throttle position No. 1: Min.: 0 V, Max.: 5 V	0.5 to 1.1 V: Throttle fully closed 3.2 to 4.8 V: Throttle fully open	-
Throttle Position No.2	Throttle position No. 2: Min.: 0 V, Max.: 5 V	2.1 to 3.1V: Throttle fully closed 4.6 to 5.0 V: Throttle fully open	-
Throttle Position Command	Throttle position command value: Min.: 0 V, Max.: 4.9804 V	0.5 to 4.8 V	The ETCS service data.
Throttle Sens Open Pos #1	Throttle sensor opener position No. 1: Min.: 0 V, Max.: 4.9804 V	0.6 to 1.4 V	The ETCS service data.
Throttle Sens Open Pos #2	Throttle sensor opener position No. 2: Min.: 0 V, Max.: 4.9804 V	1.7 to 2.5 V	The ETCS service data.
Throttle Sens Open #1 (AD)	Throttle sensor opener position No. 1 (AD): Min.: 0 V, Max.: 4.98 V	0.5 to 4.8 V	The ETCS service data.
Throttle Motor	Whether or not throttle actuator control permitted: ON or OFF	ON: Ignition switch ON. OFF: ETCS has failed	-
Throttle Motor Current	Throttle actuator current: Min.: 0 A, Max.: 20 A	0 to 3.0 A: Idling	The ETCS service data.
Throttle Motor DUTY	Throttle actuator: Min.: 0%, Max.: 100%	10 to 22%: Idling after engine warmed up	The ETCS service data.
Throttle Motor Open Duty	Throttle actuator opening duty ratio: Min.: 0%, Max.: 100%	0 to 40%: Idling	The ETCS service data.
Throttle Motor Close Duty	Throttle actuator closed duty ratio: Min.: 0%, Max.: 100%	0 to 40%: Idling	The ETCS service data.
Throttle Motor Duty (Open)	Throttle actuator duty ratio (open): Min.: 0%, Max.: 100%	-	-
Throttle Motor Duty (Close)	Throttle actuator duty ratio (close): Min.: 0%, Max.: 100%	-	-
Throttle Fully Closed Learn	Throttle valve fully closed (learned value): Min.: 0 V, Max.: 5 V	0.4 to 1.0 V (Accelerator pedal released)	-
ETCS Actuator Power	Whether or not electric throttle control system power input: ON or OFF	ON: Ignition switch ON and system normal OFF: ETCS has failed	-
+BM Voltage	+BM voltage: Min.: 0, Max.: 19.922	11 to 14: Ignition switch ON and system normal	-
Actuator Power Supply	Actuator power supply: ON or OFF	ON: Idling	-
Clutch Current	Clutch current: Min.: 0 A, Max.: 2.49 A	-	-
Fail Safe Drive	Whether or not fail-safe function executed: ON or OFF	ON: ETCS has failed OFF: ETCS normal	The ETCS service data.
Fail Safe Drive (Main CPU)	Whether or not fail-safe function executed: ON or OFF	ON: ETCS has failed OFF: ETCS normal	The ETCS service data.

Injector (Port)	Injection period of No. 1 cylinder: Min.: 0 ms, Max.: 32.64 ms	1.6 to 2.4 msec.: Idling	-
Injection Volum (Cylinder 1)	Injection volume (Cylinder 1): Min.: 0 ml, Max.: 2.048 ml	0.005 to 0.015 ml: Idling	The quantity of fuel injection volume for 10 times.
Fuel Pump/Speed Status	Fuel pump/status: ON or OFF	-	Active Test support data.
EVAP (Purge) VSV	EVAP (Purge) VSV control duty: Min.: 0%, Max.: 100%	0 to 100%: Idling	The order signal from the ECM.
Evap Purge Flow	Purge flow: Min.: 0%, Max.: 102.4%	0 to 100%: Idling	Service data.
Purge Destiny Learn Value	Learning value of purge density: Min.: -50, Max.: 350	-35 to 1: Idling	Service data.
EVAP Purge VSV	VSV status for EVAP control: ON or OFF	-	-
Target Air-Fuel Ratio	Air fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: Idling	-
AF Lambda B1S1	Short-term fuel trim associated with bank 1 sensor 1: Min.: 0, Max.: 1.999	Value less than 1 (0.000 to 0.999) = Rich Stoichiometric air fuel ratio = 1 Value more than 1 (1.001 to 1.999) = Lean	-
AF Lambda B2S1	Short-term fuel trim associated with bank 2 sensor 1: Min.: 0, Max.: 1.999	Value less than 1 (0.000 to 0.999) = Rich Stoichiometric air fuel ratio = 1 Value more than 1 (1.001 to 1.999) = Lean	-
AFS Voltage B1S1	A/F sensor output voltage bank 1 sensor 1: Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS Voltage B2S1	A/F sensor output voltage bank 2 sensor 1: Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS Current B1S1	A/F sensor output current bank 1 sensor 1: Min.: -128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
AFS Current B2S1	A/F sensor output current bank 2 sensor 1: Min.: -128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
O2S B1S2	Heated oxygen sensor output voltage bank 1 sensor 2: Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving at 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
O2S B2S2	Heated oxygen sensor output voltage bank 2 sensor 2: Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving at 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output voltage of the sensor.
Short FT #1	Short-term fuel trim of bank 1: Min.: -100%, Max.: 99.2%	-20 to 20%	Short-term fuel compensation is used to maintain the air fuel ratio at the stoichiometric air fuel ratio.
Long FT #1	Long-term fuel trim of bank 1: Min.: -100%, Max.: 99.2%	-30 to 30%	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Total FT #1	Total fuel trim of bank 1: Min.: -0.5, Max.: 0.496	-0.2 to 0.2: Idling	-
	Short-term fuel trim of bank 2:		Short-term fuel compensation is used to maintain the air fuel ratio at the

Short FT #2	Min.: -100%, Max.: 99.2%	-20 to 20%	stoichiometric air fuel ratio.
Long FT #2	Long-term fuel trim of bank 2: Min.: -100%, Max.: 99.2%	-30 to 30%	Overall fuel compensation is carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Total FT #2	Total fuel trim of bank 2: Min.: -0.5, Max.: 0.496	-0.2 to 0.2: Idling	-
Fuel System Status #1	Fuel system status (bank 1): OL or CL or OLDrive or OLFault or CLFault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
Fuel System Status #2	Fuel system status (bank 2): OL or CL or OLDrive or OLFault or CLFault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
IGN Advance	Ignition timing advance for No. 1 cylinder: Min.: -64 deg., Max.: 63.5 deg.	BTDC 7 to 24°: Idling	-
Knock Feedback Value	Feedback value of knocking: Min: -64°CA, Max.: 1984°CA	-22 to 0°CA: Driving at 70 km/h (44 mph)	Service data.
Knock Correct Learn Value	Correction learning value of knocking: Min: -64°CA, Max.: 1984°CA	0 to 22°CA: Driving at 70 km/h (44 mph)	Service data.
ACIS VSV	VSV status for ACIS control: ON or OFF	-	-
VVT Control Status #2	VVT control (bank 2) status: ON or OFF	-	-
VVT Control Status #1	VVT control (bank 2) status: ON or OFF	-	-
VVT Aim Angle #1*1	VVT aim angle (bank 1): Min.: 0%, Max.: 100%	0 to 100%: Idling	The VVT duty signal value during the intrusive operation.
VVT Change Angle #1*1	VVT change angle (bank 1): Min.: 0°FR, Max.: 60°FR	0 to 56°FR: Idling	The displacement angle during the intrusive operation.
VVT OCV Duty #1*1	VVT OCV operation duty (bank 1): Min.: 0%, Max.: 100%	0 to 100%: Idling	The requested duty value for the intrusive operation.
VVT Aim Angle #2*1	VVT aim angle (bank 2): Min.: 0%, Max.: 100%	0 to 100%: Idling	The VVT duty signal value during the intrusive operation.
VVT Aim Angle #2*1	VVT change angle (bank 2): Min.: 0°FR, Max.: 60°FR	0 to 56°FR: Idling	The displacement angle during the intrusive operation.
VVT OCV Duty #2*1	VVT OCV operation duty (bank 2): Min.: 0%, Max.: 100%	0 to 100%: Idling	The requested duty value for the intrusive operation.
Catalyst Temp B1S1	Catalyst temperature (bank 1 sensor 1): Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp	Catalyst temperature (bank 2 sensor 1):		

B2S1	Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp B1S2	Catalyst temperature (bank 1 sensor 2): Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp B2S2	Catalyst temperature (bank 2 sensor 2): Min.: -40°C, Max.: 6513.5°C	-	-
Starter Signal	Starter signal: ON or OFF	ON: Cranking	-
Starter Control	Starter switch status: ON or OFF	ON: Cranking	-
Power Steering Signal Record	Power steering switch: ON or OFF	ON: Power steering operation	-
Starter Relay	Starter relay status: ON or OFF	ON: Cranking	-
Power Steer. Sig. Record	Power steering signal (history): ON or OFF	ON: When steering wheel first turned after battery terminals connected	This signal status is usually on until the cables are disconnected from the battery terminals.
ACC Relay	ACC relay status: ON or OFF	ON: Cranking	-
Neutral Position SW Signal	PNP switch status ON or OFF	ON: P or N position	-
Stop Light Switch	Stop light switch status: ON or OFF	ON: Brake pedal depressed	-
A/C Signal	A/C switch status: ON or OFF	ON: A/C ON	-
Closed Throttle Position SW	Closed throttle position switch: ON or OFF	ON: Throttle fully closed OFF: Throttle open	-
Fuel Cut Condition	Fuel cut condition: ON or OFF	ON: Fuel cut operating	-
Immobiliser Communication	Immobiliser communication: ON or OFF	ON: Normal	-
Electrical Load Signal	Electrical load signal: ON or OFF	ON: Headlights or defogger turned on	-
Check Mode	Check mode: ON or OFF	ON: Check mode on	(Click here)

# Codes (Include History)	Number of emission related DTCs	0: No emission related DTC stored	-
MIL	MIL status: ON or OFF	ON: MIL on	-
MIL ON Run Distance	MIL on run distance: Min.: 0 km Max.: 65535 km	Distance after DTC stored	-
Running Time from MIL ON	Running time from MIL on: Min.: 0 min. Max.: 65535 min.	Equivalent to running time after MIL on	-
Time after DTC Cleared	Time after DTC cleared: Min.: 0 min. Max.: 65535 min.	Equivalent to time after DTCs cleared	-
Distance from DTC Cleared	Distance after DTC cleared: Min.: 0 km, Max.: 65535 km	Equivalent to drive distance after DTCs cleared	-
Warmup Cycle Cleared DTC	Warm-up cycle after DTC cleared: Min.: 0, Max.: 255	-	The number of warm-up cycles after the DTC(s) are cleared.
OBD Requirements	OBD requirement	OBD2	-
Number of Emission DTC	Emission related DTCs	-	The number of emission related DTCs.
	TC and CG (TE1)		

TC and TE1	terminals of DLC3: ON or OFF	-	Active Test support data.
Ignition Trig. Count	Ignition counter: Min.: 0, Max.: 600	0 to 600	-
Cylinder #1 to 6 Misfire Count	Misfire count of cylinder 1 to 6: Min.: 0, Max.: 255	0	This item displayed only when idling.
All Cylinders Misfire Count	All cylinders misfire count: Min.: 0, Max.: 255	0 to 35	-
Misfire RPM	Engine speed for first misfire range: Min.: 0 rpm, Max.: 6375 rpm	0 rpm: Misfire 0	-
Misfire Load	Engine load for first misfire range: Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	-
Misfire Margin	Misfire monitoring: Min.: -100%, Max.: 99.22%	-100 to 99.22%	Misfire detecting margin.
ACT VSV	A/C cut status for Active Test: ON or OFF	-	Active Test support data.
Idle Fuel Cut	Fuel cut idle: ON or OFF	ON: Fuel cut operating	Idle Fuel Cut is "ON" when the throttle valve is fully closed and the engine speed is more than 2800 rpm.
FC TAU	Fuel cut TAU (Fuel cut during very light load): ON or OFF	ON: Fuel cut operating	Fuel cut is being performed under a very light load to prevent the engine combustion from becoming incomplete.
Model Code	Model code	-	The identifying model code: GRJ2#
Engine Type	Engine type	-	The identifying engine type: 1GRFE
Cylinder Number	Cylinder number: Min.: 0, Max.: 255	-	The identifying cylinder number: 6
Transmission Type	Transmission type	-	The identifying transmission type: 5AT
Destination	Destination	-	The identifying destination: W
Model Year	Model year: Min.: 1900, Max.: 2155	-	The identifying model year: 200#
System Identification	System identification	-	The identifying engine system: Gasoline (gasoline engine)
Engine Speed of Cyl #1	Engine speed for cylinder 1: Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #2	Engine speed for cylinder 2: Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #3	Engine speed for cylinder 3: Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #4	Engine speed for cylinder 4: Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #5	Engine speed for cylinder 5: Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
Engine Speed of Cyl #6	Engine speed for cylinder 6: Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.
	Engine speed for all		

Av Engine Speed of All Cyl	cylinders: Min.: 0 rpm, Max.: 25600 rpm	-	Output only when Check the Cylinder Compression is performed using the Active Test.

HINT:

- **Normal Condition: If no idling conditions are specified, the shift lever should be in N or P, and the A/C switch and all accessory switches should be off.**
- ***1: Data List values are only displayed when performing the following Active Tests: Control the VVT Linear (Bank1), Control the VVT Linear (Bank2), Control the VVT Exhaust Linear (Bank1) and Control the VVT Exhaust Linear (Bank2). For other Active Tests, the Data List value will be 0.**
- ***2: Excluding throttle valve opening percentage due to Idle Speed Control (ISC).**

ACTIVE TEST

HINT:

Using the intelligent tester to perform the Active Tests allows relays, VSVs and actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing Active Tests early in troubleshooting is one way to save diagnostic time. Data List information can be displayed while performing Active Tests.

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test.

e. According to the display on the tester, perform the "Active Test".

Engine and ECT

Tester Display	Test Part	Control Range	Diagnostic Note
Control the Injection Volume	Change injection volume	-12.5 to 24.8%	• All the injectors are tested at the same time. • Perform the test at less than 3000 rpm. • The injection volume can be changed in 1% graduations within the control range.
Control the Injection Volume for A/F Sensor	Change injection volume	Lower by 12.5% or increase by 24.8%	• Perform the test at less than 3000 rpm. • Control the Injection Volume for A/F Sensor enables the checking and graphing of the A/F (Air Fuel ratio) sensor and Heated Oxygen (HO2) sensor voltage outputs. • To conduct the test, enter the following menus: Active Test / Control the Injection Volume for A/F Sensor / Data List / A/F Control System / AFS Voltage B1S1 and O2S B1S2.
Activate the VSV for Intake Control	Activate VSV for intake control	ON/OFF	-
Activate the VSV for Evap Control	Activate purge VSV control	ON/OFF	-
Control the A/C Cut Signal	Control the A/C cut signal	ON/OFF	-
Control the Fuel Pump / Speed	Activate fuel pump (C/OPN Relay)	ON/OFF	The test is possible when the following conditions are met: • The ignition switch is ON. • The engine is stopped.
Connect the TC and TE1	Turn on and off TC and CG (TE1) connection	ON/OFF	• ON: TC and TE1 are connected. • OFF: TC and TE1 are disconnected.
Control the Idle Fuel Cut Prohibit	Prohibit idling fuel cut control	ON/OFF	The idling fuel-cut is turned on when the throttle valve is fully closed and the engine speed is more than 2800 rpm.
Activate the Starter Relay	Activate starter relay	ON/OFF	-
Activate the ACC Cut Relay	Activate ACC cut relay	ON/OFF	The test is possible when the following conditions are met: • The ignition switch is ON. • The engine is stopped.
Control the ETCS			

Open/Close Slow Speed	Throttle actuator	Close/Open	The test is possible when the following conditions are met: • The ignition switch is ON. • The engine is stopped. • The accelerator pedal is fully depressed (APP: 58 degrees or more).
Control the ETCS Open/Close Fast Speed	Throttle actuator	Close/Open	
Control the VVT Linear (Bank1)	Control VVT (bank 1)	Between -128 and 127%	• The engine stalls or idles roughly when the VVT actuator is operated by 100%. • The test is possible during idle.
Control the VVT System (Bank1)	Turn on and off OCV (Oil Control Valve)	ON/OFF	• The engine stalls or idles roughly when the OCV is turned on. • The engine runs or idles normally when the OCV is off.
Control the VVT Linear (Bank2)	Control VVT (bank 2)	Between -128 and 127%	• The engine stalls or idles roughly when the VVT actuator is operated by 100%. • The test is possible during idle.
Control the VVT System (Bank2)	Turn on and off OCV (Oil Control Valve)	ON/OFF	• The engine stalls or idles roughly when the OCV is turned on. • The engine runs or idles normally when the OCV is off.
Control the Cylinder #1 Fuel Cut	No. 1 cylinder injector fuel cut	ON/OFF	The test is possible while the vehicle is stopped and the engine is idling.
Control the Cylinder #2 Fuel Cut	No. 2 cylinder injector fuel cut	ON/OFF	
Control the Cylinder #3 Fuel Cut	No. 3 cylinder injector fuel cut	ON/OFF	
Control the Cylinder #4 Fuel Cut	No. 4 cylinder injector fuel cut	ON/OFF	
Control the Cylinder #5 Fuel Cut	No. 5 cylinder injector fuel cut	ON/OFF	
Control the Cylinder #6 Fuel Cut	No. 6 cylinder injector fuel cut	ON/OFF	
Control the All Cylinder Fuel Cut	All cylinder fuel cut	ON/OFF	
Check the Cylinder Compression*	Check the cylinder compression pressure	ON/OFF	The fuel injection and ignition stop in all the cylinders.

HINT:

*: When cranking the engine, the Active Test measures the speed of each cylinder.

In this Active Test, the fuel of all cylinders is cut, and cranking occurs for approximately 10 seconds. At this time, the speed of each cylinder is measured. If the speed of one cylinder is higher than the other cylinders, the compression pressure of that cylinder is determined to be lower than the other cylinders.

1. Warm up the engine.
2. Turn the ignition switch off.
3. Connect the intelligent tester to the DLC3.
4. Turn the ignition switch to ON and turn the tester on.
5. Enter the following menus: Powertrain / Engine and ECT / Active Test / Check the Cylinder Compression.

   HINT:

   If the results are not displayed normally, select the display items from the Data List before performing the Active Test. Enter the following menus: Powertrain / Engine and ECT / Data List / Compression / Engine Speed of Cyl #1, Engine Speed of Cyl #2, Engine Speed of Cyl #3, Engine Speed of Cyl #4, Engine Speed of Cyl #5, Engine Speed of Cyl #6 and Av Engine Speed of All Cyl.

6. While the engine is not running, press the RIGHT or LEFT button to change the Check the Cylinder Compression to on.

   HINT:

   After performing the above procedure, Check the Cylinder Compression will start. Fuel injection for all cylinders is prohibited, and each cylinder engine speed measurement will enter standby mode.

7. Crank the engine for about 10 seconds.
8. Monitor the engine speed (Engine Speed of Cyl #1 to #6, Av Engine Speed of All Cyl) displayed on the tester.

   HINT:

At first, the tester display will show each cylinder engine speed measurement to be extremely high. After approximately 10 seconds of engine cranking, each cylinder engine speed measurement will change to the actual engine speed.

NOTICE:

- **After the Check the Cylinder Compression is turned on, it will automatically turn off after 255 seconds.**
- **When the Check the Cylinder Compression test is off and the engine is cranked, the engine will start.**
- **If the Check the Cylinder Compression test needs to be performed after it is turned on and performed once, press EXIT to return to the Active Test menu screen. Then perform the Check the Cylinder Compression test again.**
- **Use a fully-charged battery.**

for Preparation Click here

HINT:

Parameters listed in the chart may be different than your readings depending on the type of instruments and other factors.

If any DTCs are displayed during a check mode DTC check, check the circuit for the DTCs listed in the table below. For details of each DTC, refer to the "See page" indicated.

*1: MIL flashes when a catalyst damaged misfire is detected.

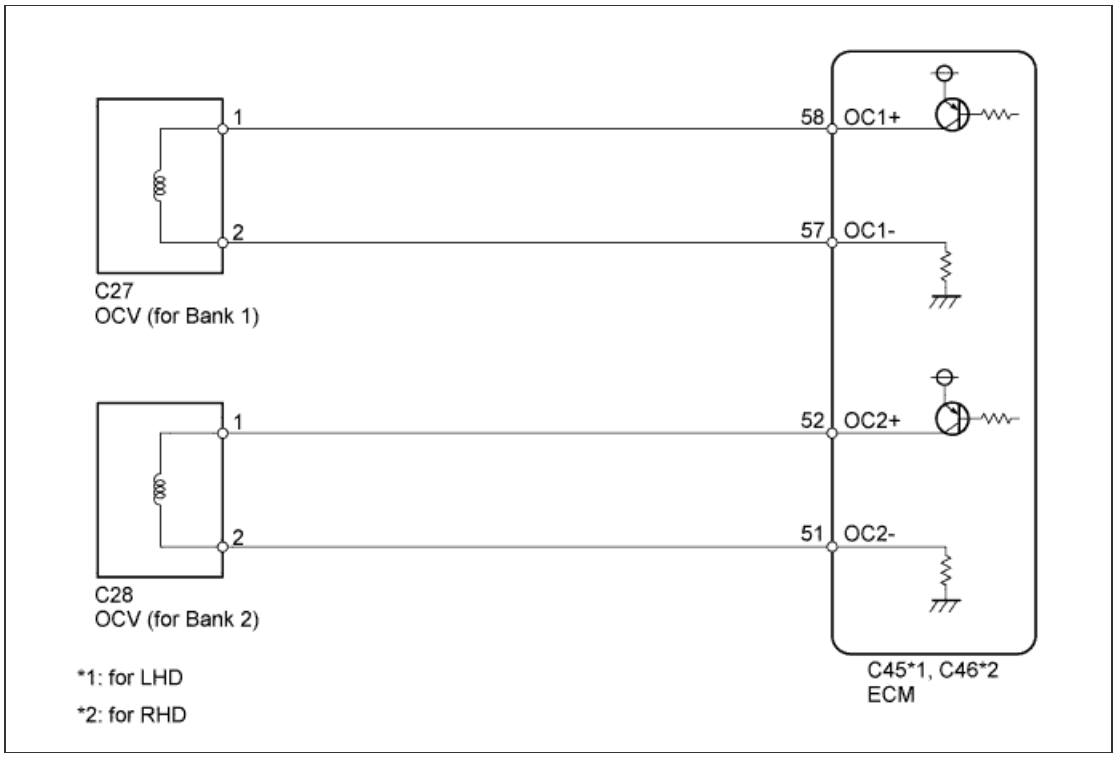
DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

The VVT (Variable Valve Timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The camshaft Oil Control Valve (OCV) is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.



DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the camshaft Oil Control Valve (OCV) (for Bank 1) circuit (1 trip detection logic).	• Open or short in camshaft Oil Control Valve (OCV) (for Bank 1) circuit • OCV (for Bank 1) • ECM
P0020	An open or short in the OCV (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for Bank 2) circuit • OCV (for Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear the DTC after recording the freeze frame data and DTC.

b. Turn the ignition switch off.

c. Allow the engine to idle and check for DTC.

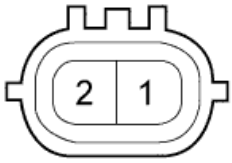
d. Check that P0010 or P0020 is output.

OK:
P0010 or P0020 is output.

NG → CHECK FOR INTERMITTENT PROBLEMS (Click here)

OK

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY



a. Disconnect the camshaft Oil Control Valve (OCV) connector.

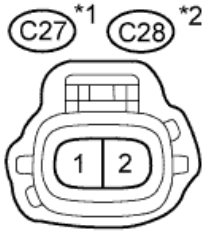
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

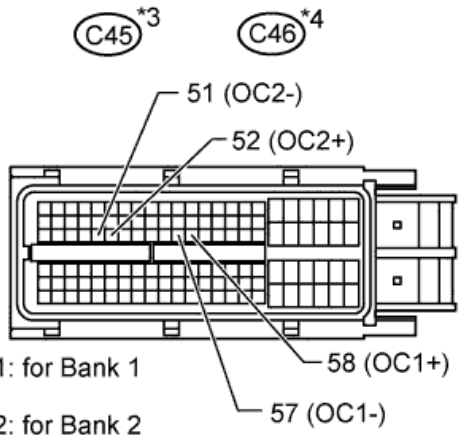
Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)



OK

3.CHECK HARNESS AND CONNECTOR (CAMSHAFT OIL CONTROL VALVE [OCV] - ECM)



a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Oil Control Valve)

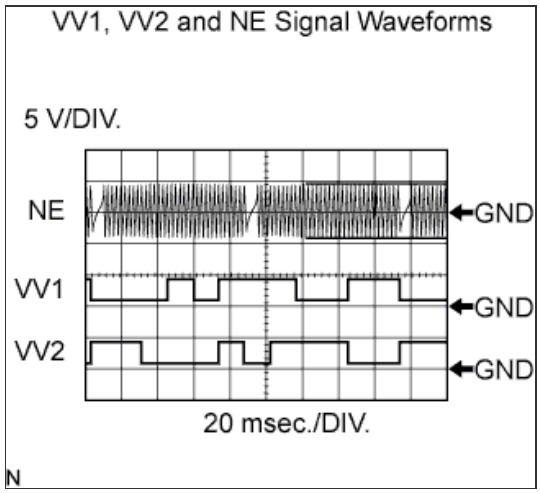
DTC P0348 Camshaft Position Sensor "A" Circuit High Input (Bank 2)

for Preparation Click here

DESCRIPTION

The Variable Valve Timing (VVT) sensor (VV1, 2 signal) of the intake camshaft consists of a magnet and MRE (Magnetic Resistance Element).
The VVT camshaft drive gear has a sensor plate with 3 teeth on its outer circumference. When the gear rotates, changes occur in the air gaps between the sensor plate and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the gear rotation data to pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft angle sensor plate has 34 teeth. The pickup coil generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

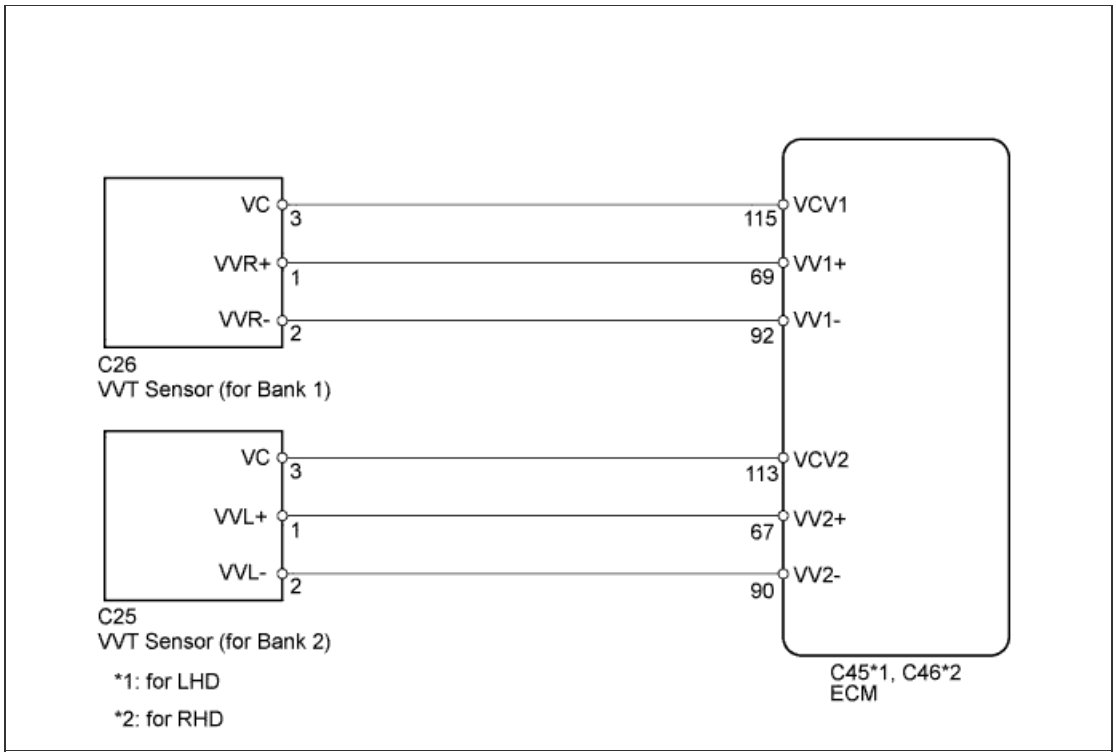


DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the ignition switch ON (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor circuit • VVT sensor • Camshaft timing gear assembly • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P0343 P0348	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

Reference: Inspection using an oscilloscope

HINT:

- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**



Item	Content
Terminal	NE+ - NE- VV1+ - VV1- VV2+ - VV2-
Equipment Setting	5 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

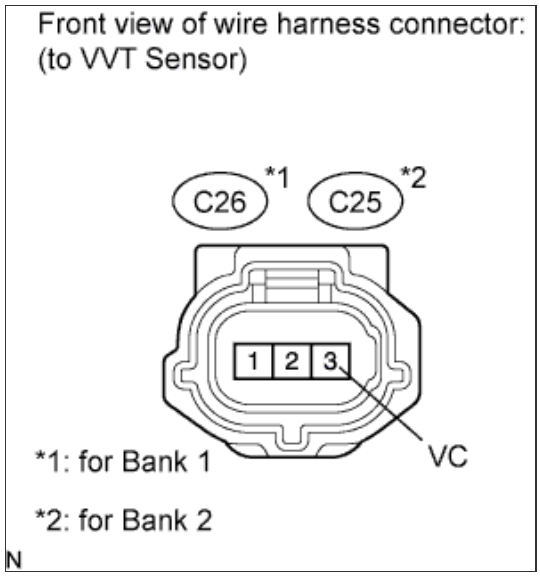
If no signal is transmitted by the VVT sensor despite the engine running, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK VVT SENSOR (SENSOR POWER SOURCE)

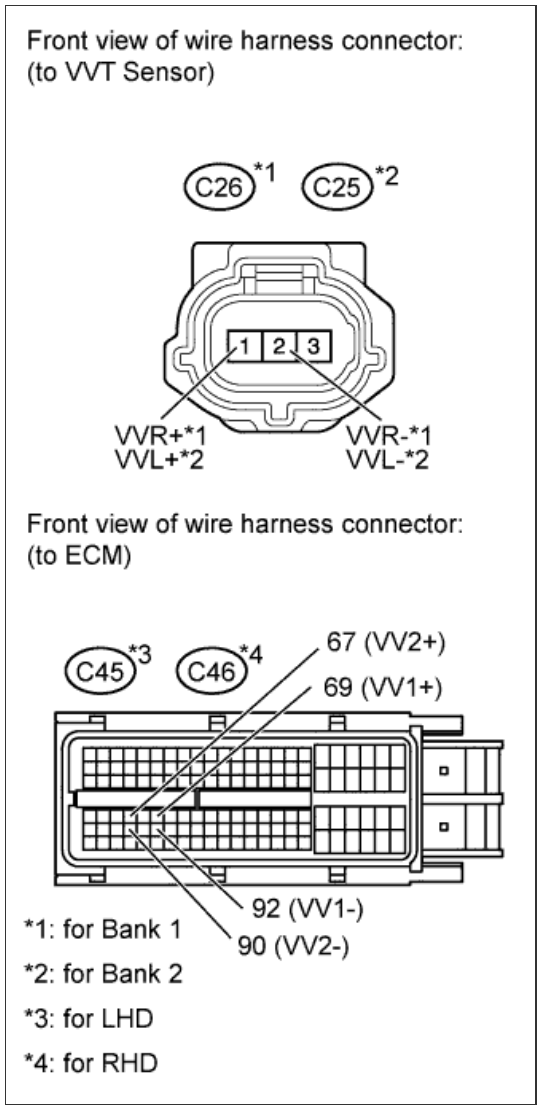
a. Disconnect the VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C25-3 (VC) - Body ground	Always	4.5 to 5.0 V
C26-3 (VC) - Body ground	Always	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR - ECM)

a. Disconnect the VVT sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C45-69 (VV1+)	Always	Below 1 Ω
C26-2 (VVR-) - C45-92 (VV1-)	Always	Below 1 Ω
C25-1 (VVL+) - C45-67 (VV2+)	Always	Below 1 Ω
C25-2 (VVL-) - C45-90 (VV2-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C46-69 (VV1+)	Always	Below 1 Ω

Tester Connection	Condition	Specified Condition
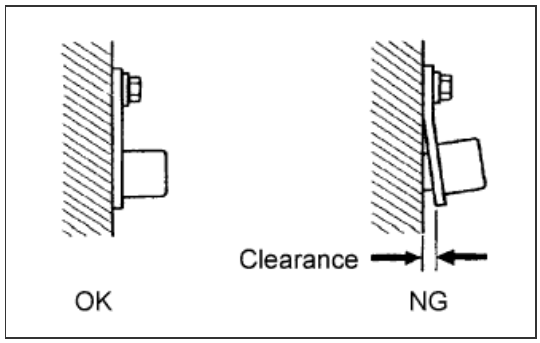
C26-1 (VVR+) or C46-69 (VV1+) - Body ground	Always	10 kΩ or higher
C26-2 (VVR-) or C46-92 (VV1-) - Body ground	Always	10 kΩ or higher
C25-1 (VVL+) or C46-67 (VV2+) - Body ground	Always	10 kΩ or higher
C25-2 (VVL-) or C46-90 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

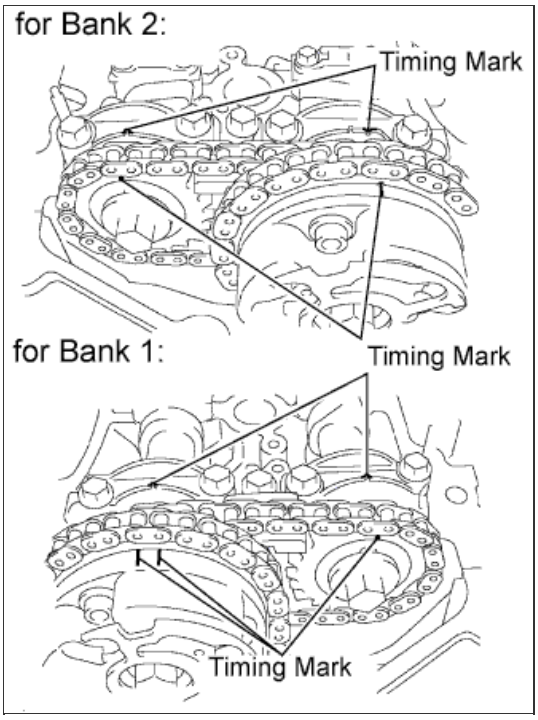
3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK



4.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.CHECK CAMSHAFT TIMING GEAR ASSEMBLY (TEETH OF PLATE)

a. Check the teeth of the signal plate.

OK:
Sensor plate teeth do not have any cracks or deformation.

NG → REPLACE CAMSHAFT TIMING GEAR ASSEMBLY (Click here)

OK

6.REPLACE VVT SENSOR

a. Replace the VVT sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read the DTCs.

Result

Result	Proceed to
No output	A
P0340, P0342, P0343, P0345, P0347 or P0348	B

HINT:

If the engine does not start, replace the ECM.

B	REPLACE ECM (Click here)

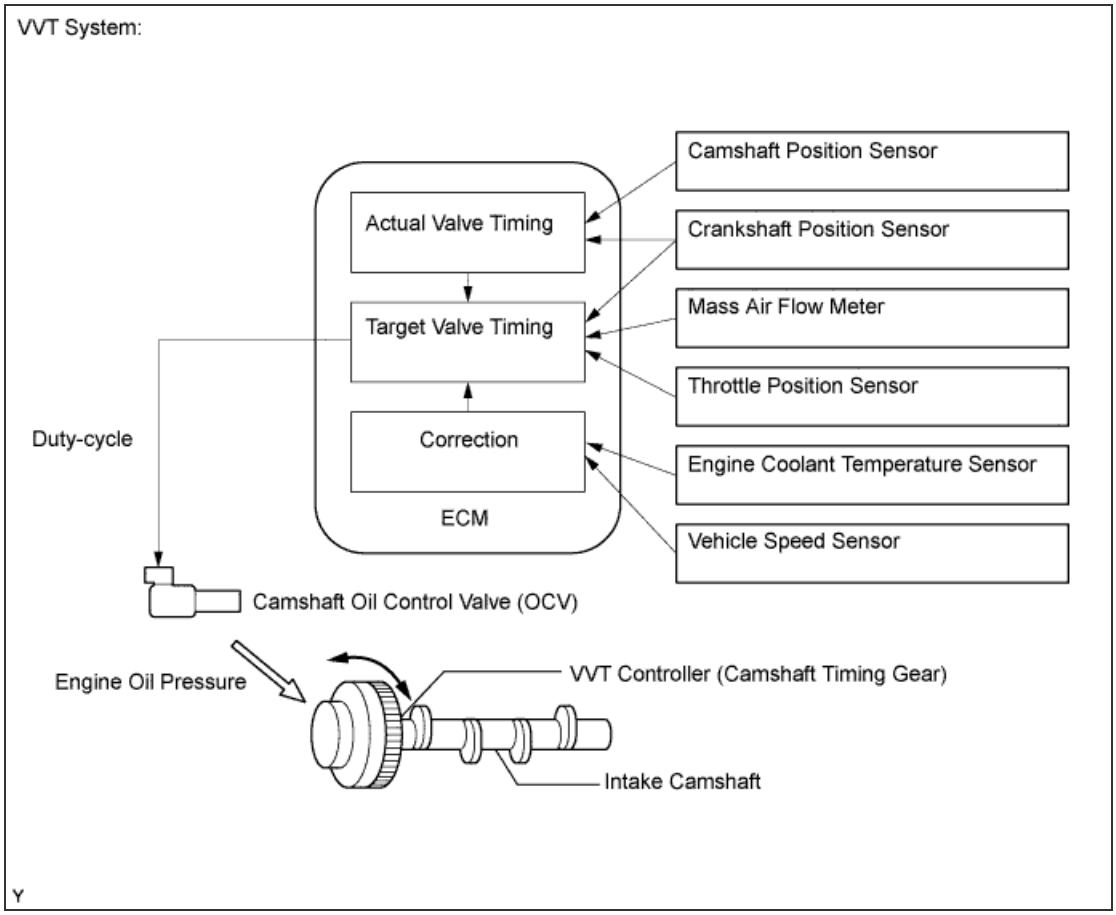
END



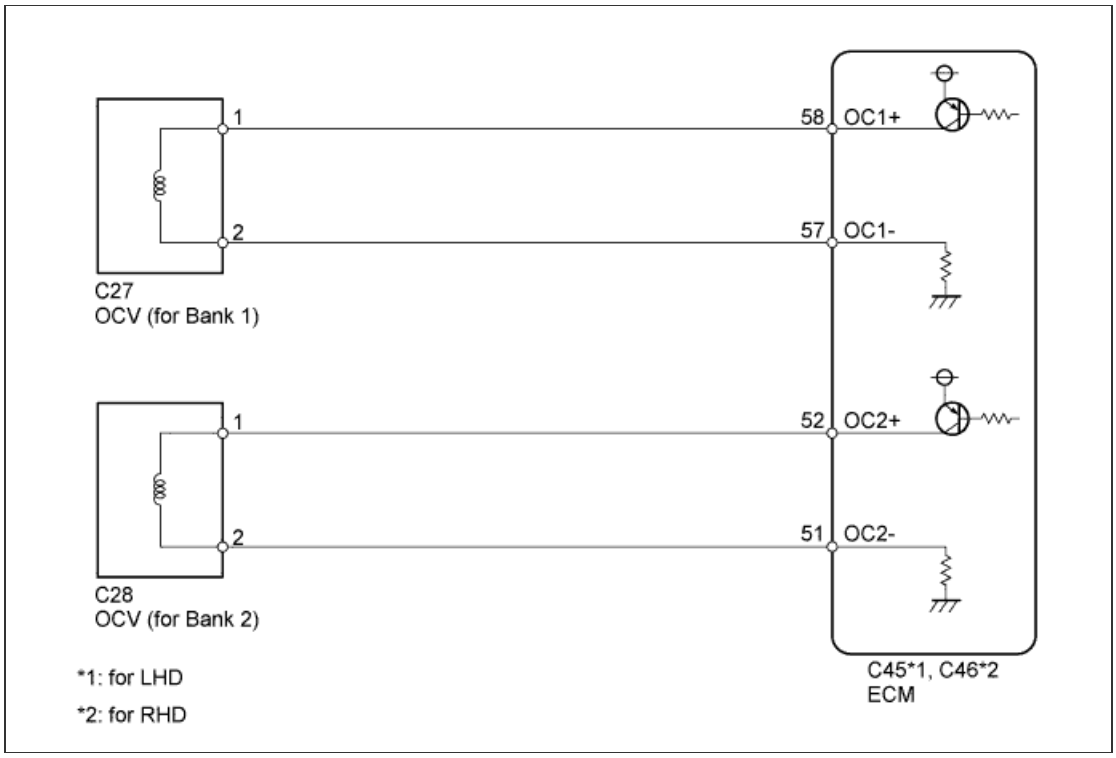
DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

The VVT (Variable Valve Timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The camshaft Oil Control Valve (OCV) is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.



DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the camshaft Oil Control Valve (OCV) (for Bank 1) circuit (1 trip detection logic).	• Open or short in camshaft Oil Control Valve (OCV) (for Bank 1) circuit • OCV (for Bank 1) • ECM
P0020	An open or short in the OCV (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for Bank 2) circuit • OCV (for Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear the DTC after recording the freeze frame data and DTC.

b. Turn the ignition switch off.

c. Allow the engine to idle and check for DTC.

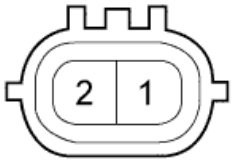
d. Check that P0010 or P0020 is output.

OK:
P0010 or P0020 is output.

NG → CHECK FOR INTERMITTENT PROBLEMS (Click here)

OK

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY



a. Disconnect the camshaft Oil Control Valve (OCV) connector.

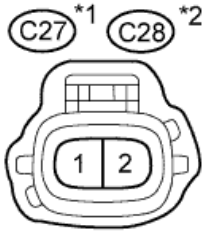
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

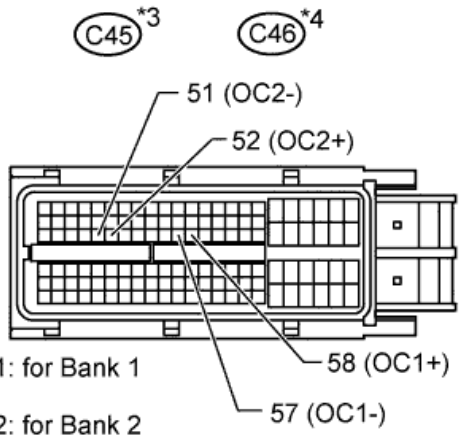
Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)



OK

3.CHECK HARNESS AND CONNECTOR (CAMSHAFT OIL CONTROL VALVE [OCV] - ECM)



a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

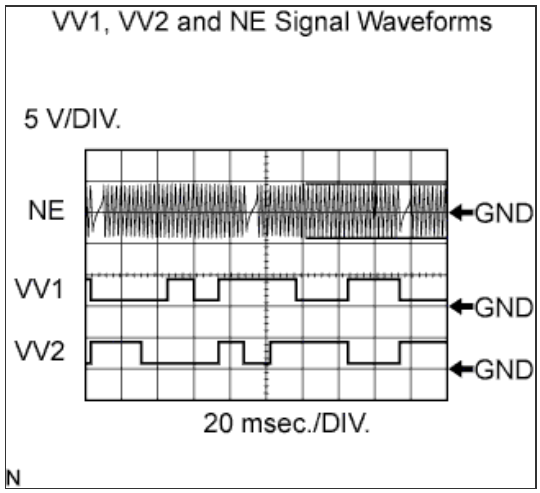
for Preparation Click here

DESCRIPTION

The Variable Valve Timing (VVT) sensor (VV1, 2 signal) of the intake camshaft consists of a magnet and MRE (Magnetic Resistance Element).
The VVT camshaft drive gear has a sensor plate with 3 teeth on its outer circumference. When the gear rotates, changes occur in the air gaps between the sensor plate and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the gear rotation data to pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft angle sensor plate has 34 teeth. The pickup coil generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

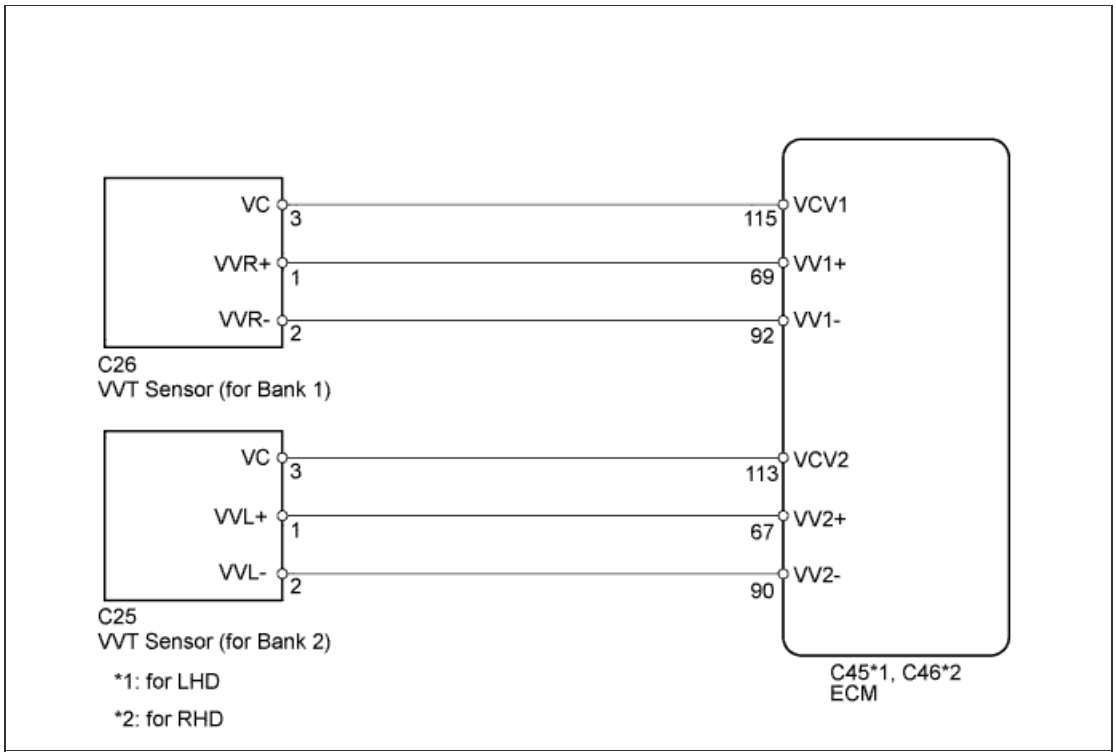


DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the ignition switch ON (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor circuit • VVT sensor • Camshaft timing gear assembly • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P0343 P0348	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

Reference: Inspection using an oscilloscope

HINT:

- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**



Item	Content
Terminal	NE+ - NE- VV1+ - VV1- VV2+ - VV2-
Equipment Setting	5 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

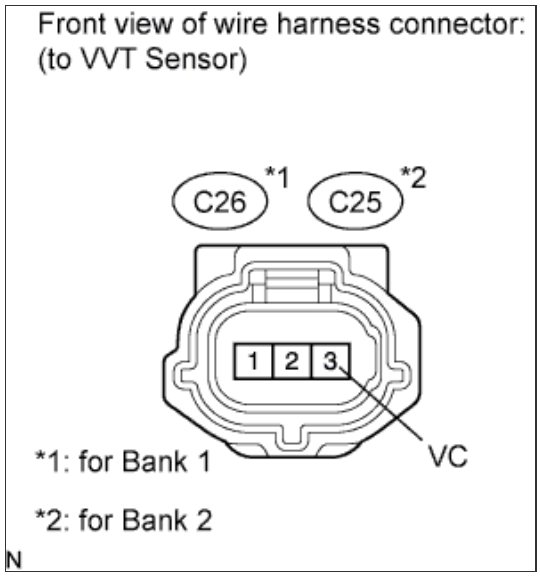
If no signal is transmitted by the VVT sensor despite the engine running, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK VVT SENSOR (SENSOR POWER SOURCE)

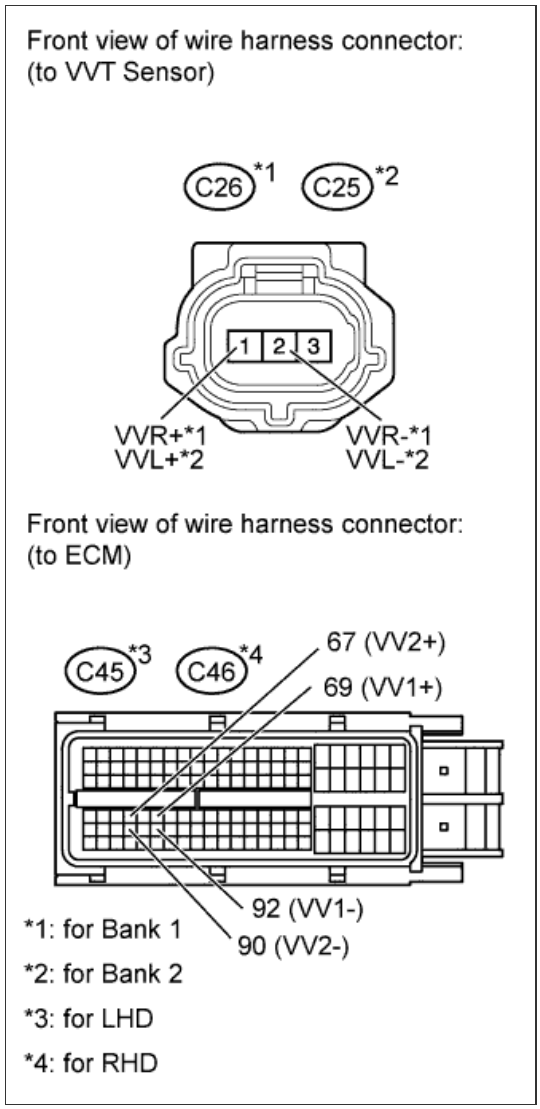
a. Disconnect the VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C25-3 (VC) - Body ground	Always	4.5 to 5.0 V
C26-3 (VC) - Body ground	Always	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR - ECM)

a. Disconnect the VVT sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C45-69 (VV1+)	Always	Below 1 Ω
C26-2 (VVR-) - C45-92 (VV1-)	Always	Below 1 Ω
C25-1 (VVL+) - C45-67 (VV2+)	Always	Below 1 Ω
C25-2 (VVL-) - C45-90 (VV2-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C46-69 (VV1+)	Always	Below 1 Ω
C26-2 (VVR-) - C46-92 (VV1-)	Always	Below 1 Ω
C25-1 (VVL+) - C46-67 (VV2+)	Always	Below 1 Ω
C25-2 (VVL-) - C46-90 (VV2-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

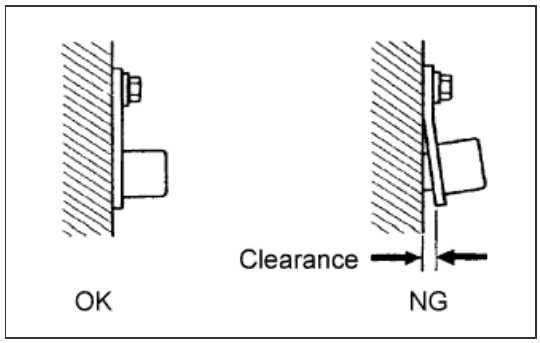
for LHD

Tester Connection	Condition	Specified Condition

C26-1 (VVR+) or C45-69 (VV1+) - Body ground	Always	10 kΩ or higher
C26-2 (VVR-) or C45-92 (VV1-) - Body ground	Always	10 kΩ or higher
C25-1 (VVL+) or C45-67 (VV2+) - Body ground	Always	10 kΩ or higher
C25-2 (VVL-) or C45-90 (VV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) or C46-69 (VV1+) - Body ground	Always	10 kΩ or higher
C26-2 (VVR-) or C46-92 (VV1-) - Body ground	Always	10 kΩ or higher
C25-1 (VVL+) or C46-67 (VV2+) - Body ground	Always	10 kΩ or higher
C25-2 (VVL-) or C46-90 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

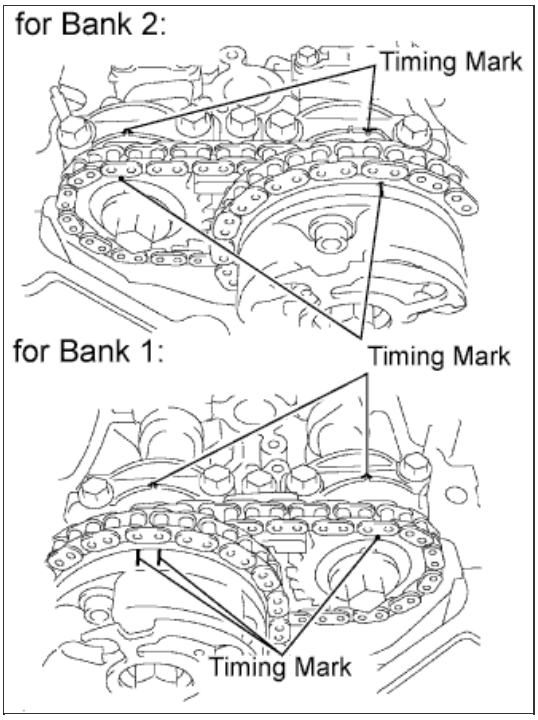
3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK



4.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.CHECK CAMSHAFT TIMING GEAR ASSEMBLY (TEETH OF PLATE)

a. Check the teeth of the signal plate.

OK:
Sensor plate teeth do not have any cracks or deformation.

NG → REPLACE CAMSHAFT TIMING GEAR ASSEMBLY (Click here)

OK

6.REPLACE VVT SENSOR

a. Replace the VVT sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read the DTCs.

DTC P0011 Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)

DTC P0012 Camshaft Position "A" - Timing Over-Retarded (Bank 1)

DTC P0021 Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)

DTC P0022 Camshaft Position "A" - Timing Over-Retarded (Bank 2)

for Preparation Click here

DESCRIPTION

Refer to DTC P0010 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	Valve timing is not adjusted in valve timing advance range (1 trip detection logic)	• Valve timing • Camshaft Oil Control Valve (OCV) • OCV filter • Camshaft timing gear assembly • ECM
P0012 P0022	Valve timing is not adjusted in valve timing retard range (2 trip detection logic)	

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the camshaft Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores a DTC.

Example:
A DTC is stored when conditions 1 and 2 are met:

1. It takes 5 seconds or more to change the valve timing by 5°CA.
2. After the above condition 1 is met, the OCV is forcibly activated 63 times or more (when the vehicle is idling, this takes approximately 100 seconds).

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the camshaft Oil Control Valve (OCV) using the tester.

OK

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → Go to step 4

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle for more than 10 minutes.

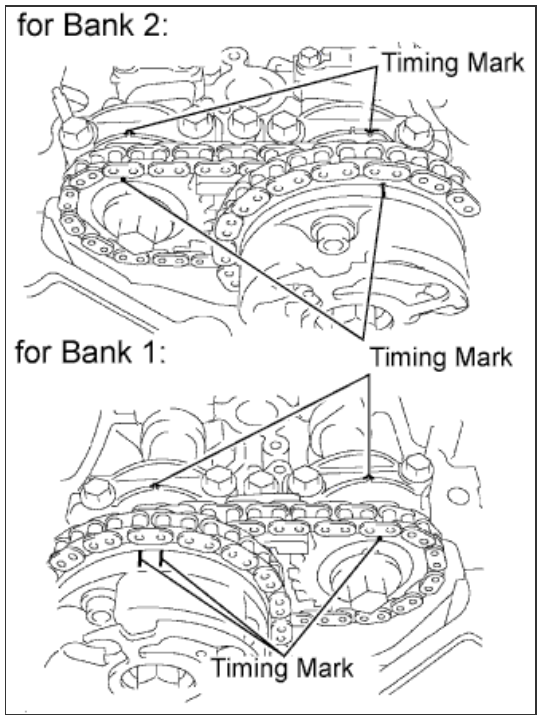
g. Read the DTCs using the tester.

OK:
No DTC output.

NG → Go to step 4

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)



4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

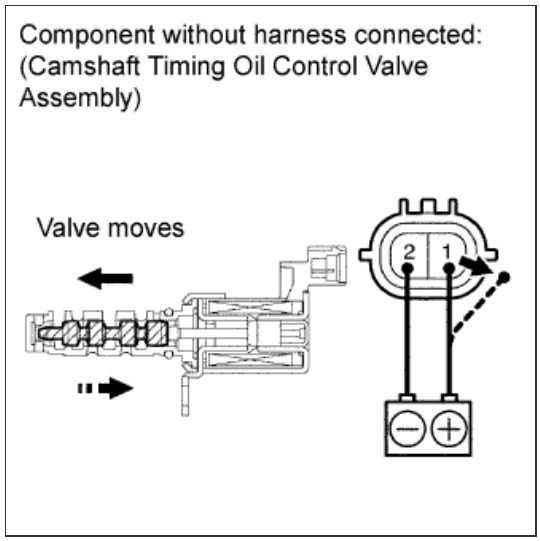
OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV (Click here).



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

c. Apply positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.

OK:
Valve moves quickly.

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

a. Replace the camshaft timing gear assembly (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle for more than 10 minutes.

g. Read output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

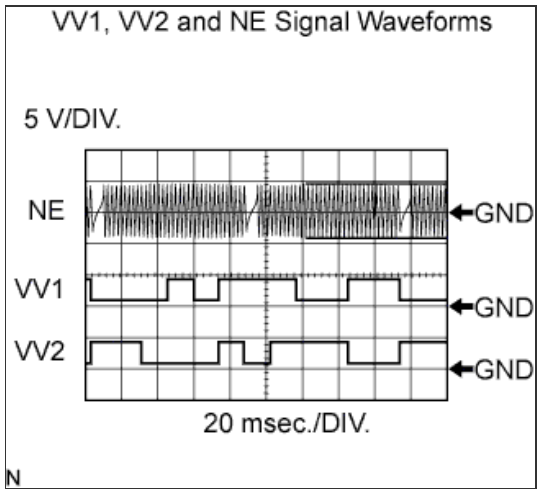
DESCRIPTION

The Variable Valve Timing (VVT) sensor (VV1, 2 signal) of the intake camshaft consists of a magnet and MRE (Magnetic Resistance Element).
The VVT camshaft drive gear has a sensor plate with 3 teeth on its outer circumference. When the gear rotates, changes occur in the air gaps between the sensor plate and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the gear rotation data to pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft angle sensor plate has 34 teeth. The pickup coil generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

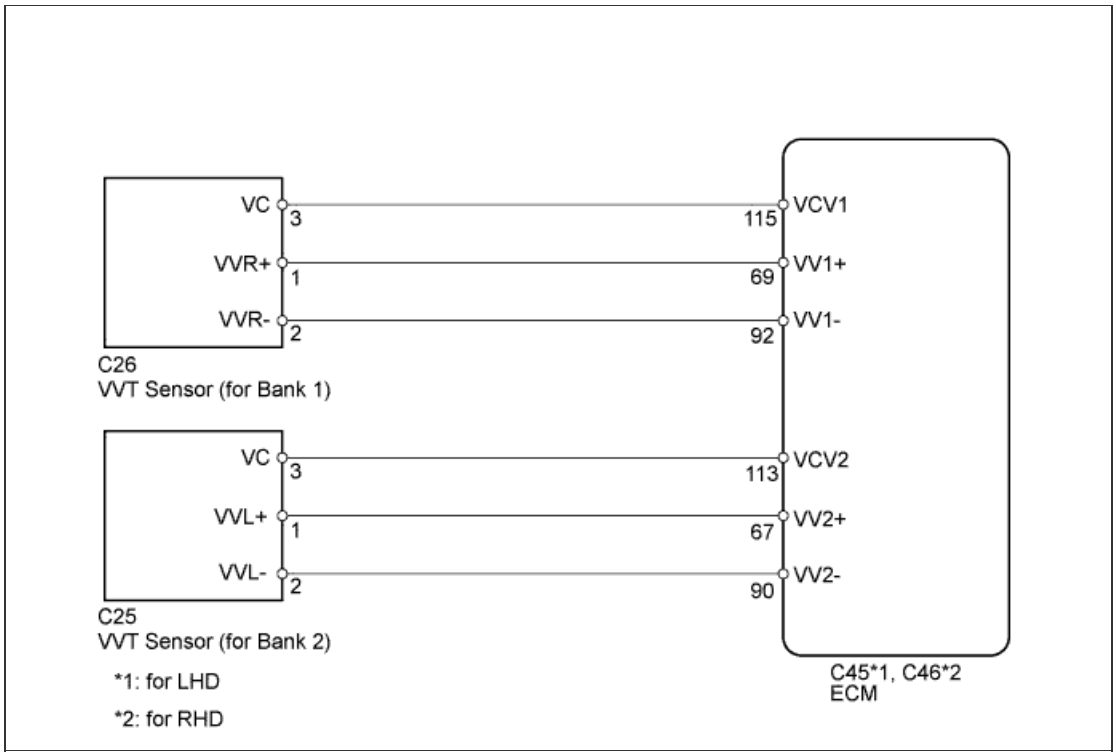


DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the ignition switch ON (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor circuit • VVT sensor • Camshaft timing gear assembly • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P0343 P0348	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

Reference: Inspection using an oscilloscope

HINT:

- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**



Item	Content
Terminal	NE+ - NE- VV1+ - VV1- VV2+ - VV2-
Equipment Setting	5 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

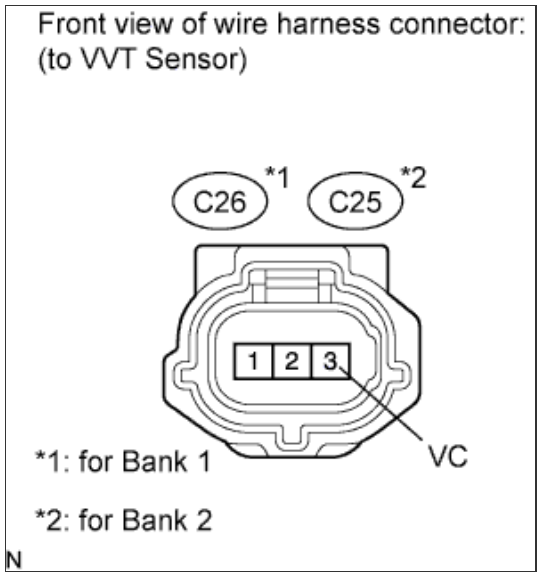
If no signal is transmitted by the VVT sensor despite the engine running, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK VVT SENSOR (SENSOR POWER SOURCE)

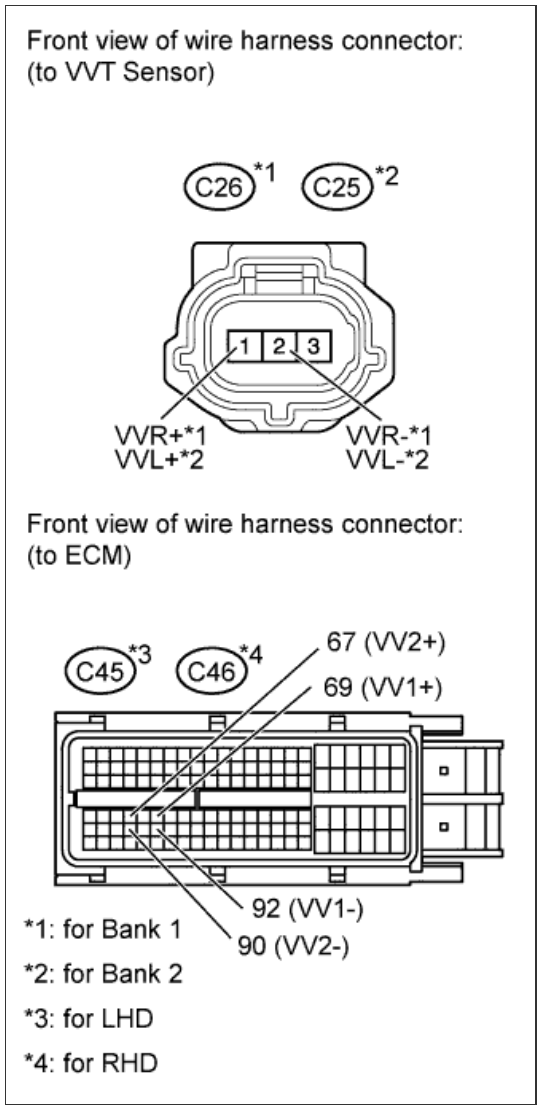
a. Disconnect the VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C25-3 (VC) - Body ground	Always	4.5 to 5.0 V
C26-3 (VC) - Body ground	Always	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR - ECM)

a. Disconnect the VVT sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C45-69 (VV1+)	Always	Below 1 Ω
C26-2 (VVR-) - C45-92 (VV1-)	Always	Below 1 Ω
C25-1 (VVL+) - C45-67 (VV2+)	Always	Below 1 Ω
C25-2 (VVL-) - C45-90 (VV2-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C46-69 (VV1+)	Always	Below 1 Ω
C26-2 (VVR-) - C46-92 (VV1-)	Always	Below 1 Ω
C25-1 (VVL+) - C46-67 (VV2+)	Always	Below 1 Ω
C25-2 (VVL-) - C46-90 (VV2-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition

C26-1 (VVR+) or C45-69 (VV1+) - Body ground	Always	10 kΩ or higher
C26-2 (VVR-) or C45-92 (VV1-) - Body ground	Always	10 kΩ or higher
C25-1 (VVL+) or C45-67 (VV2+) - Body ground	Always	10 kΩ or higher
C25-2 (VVL-) or C45-90 (VV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
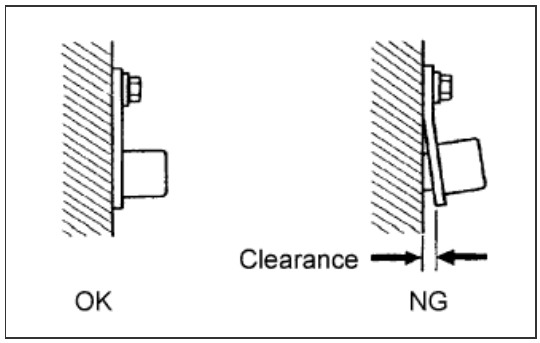
C26-1 (VVR+) or C46-69 (VV1+) - Body ground	Always	10 kΩ or higher
C26-2 (VVR-) or C46-92 (VV1-) - Body ground	Always	10 kΩ or higher
C25-1 (VVL+) or C46-67 (VV2+) - Body ground	Always	10 kΩ or higher
C25-2 (VVL-) or C46-90 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.CHECK CAMSHAFT TIMING GEAR ASSEMBLY (TEETH OF PLATE)

a. Check the teeth of the signal plate.

OK:
Sensor plate teeth do not have any cracks or deformation.

NG → REPLACE CAMSHAFT TIMING GEAR ASSEMBLY (Click here)

OK

6.REPLACE VVT SENSOR

a. Replace the VVT sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

DTC P0011 Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)

DTC P0012 Camshaft Position "A" - Timing Over-Retarded (Bank 1)

DTC P0021 Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 2)

DTC P0022 Camshaft Position "A" - Timing Over-Retarded (Bank 2)

for Preparation Click here

DESCRIPTION

Refer to DTC P0010 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	Valve timing is not adjusted in valve timing advance range (1 trip detection logic)	• Valve timing • Camshaft Oil Control Valve (OCV) • OCV filter • Camshaft timing gear assembly • ECM
P0012 P0022	Valve timing is not adjusted in valve timing retard range (2 trip detection logic)	

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the camshaft Oil Control Valve (OCV) and the VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores a DTC.

Example:
A DTC is stored when conditions 1 and 2 are met:

1. It takes 5 seconds or more to change the valve timing by 5°CA.
2. After the above condition 1 is met, the OCV is forcibly activated 63 times or more (when the vehicle is idling, this takes approximately 100 seconds).

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

c. Apply positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.

OK:
Valve moves quickly.

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

a. Replace the camshaft timing gear assembly (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle for more than 10 minutes.

g. Read output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (**Click here**)

OK

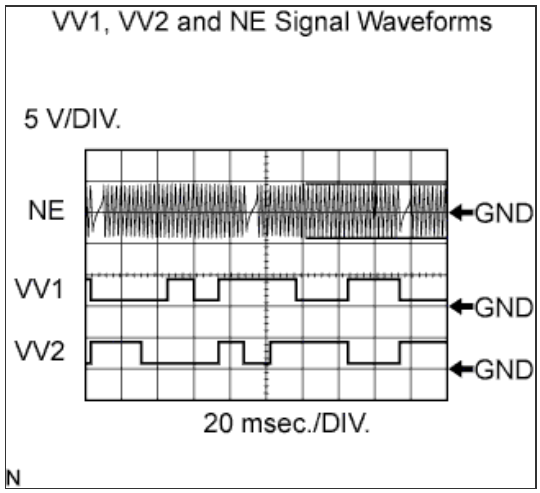
for Preparation Click here

DESCRIPTION

The Variable Valve Timing (VVT) sensor (VV1, 2 signal) of the intake camshaft consists of a magnet and MRE (Magnetic Resistance Element).
The VVT camshaft drive gear has a sensor plate with 3 teeth on its outer circumference. When the gear rotates, changes occur in the air gaps between the sensor plate and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the gear rotation data to pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft angle sensor plate has 34 teeth. The pickup coil generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

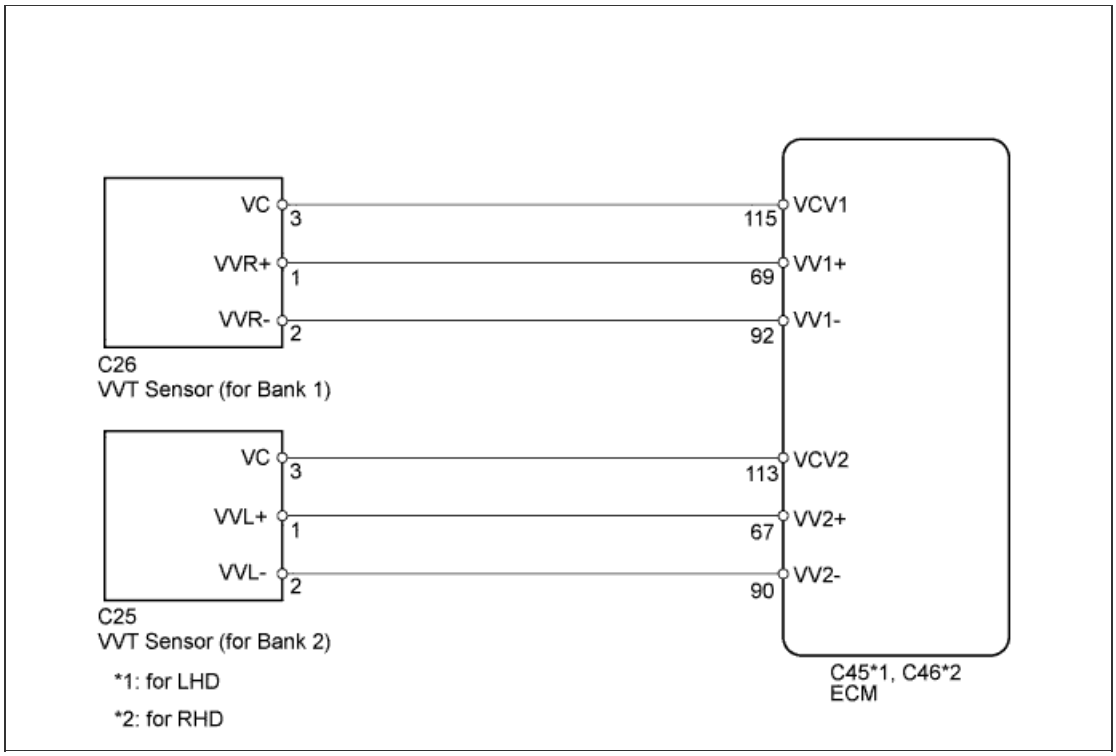


DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the ignition switch ON (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor circuit • VVT sensor • Camshaft timing gear assembly • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	
P0343 P0348	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	

Reference: Inspection using an oscilloscope

HINT:

- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**



Item	Content
Terminal	NE+ - NE- VV1+ - VV1- VV2+ - VV2-
Equipment Setting	5 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

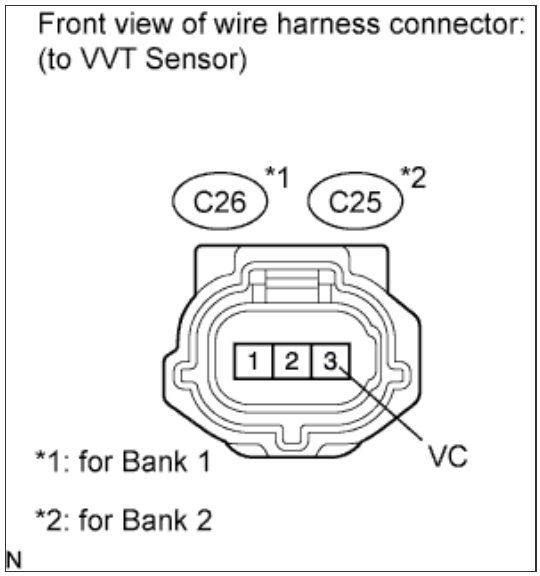
If no signal is transmitted by the VVT sensor despite the engine running, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.



1.CHECK VVT SENSOR (SENSOR POWER SOURCE)

a. Disconnect the VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C25-3 (VC) - Body ground	Always	4.5 to 5.0 V
C26-3 (VC) - Body ground	Always	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR - ECM)

a. Disconnect the VVT sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C45-69 (VV1+)	Always	Below 1 Ω
C26-2 (VVR-) - C45-92 (VV1-)	Always	Below 1 Ω
C25-1 (VVL+) - C45-67 (VV2+)	Always	Below 1 Ω
C25-2 (VVL-) - C45-90 (VV2-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C26-1 (VVR+) - C46-69 (VV1+)	Always	Below 1 Ω
C26-2 (VVR-) - C46-92 (VV1-)	Always	Below 1 Ω
C25-1 (VVL+) - C46-67 (VV2+)	Always	Below 1 Ω
C25-2 (VVL-) - C46-90 (VV2-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition

C26-1 (VVR+) or C45-69 (VV1+) - Body ground	Always	10 kΩ or higher
C26-2 (VVR-) or C45-92 (VV1-) - Body ground	Always	10 kΩ or higher
C25-1 (VVL+) or C45-67 (VV2+) - Body ground	Always	10 kΩ or higher
C25-2 (VVL-) or C45-90 (VV2-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
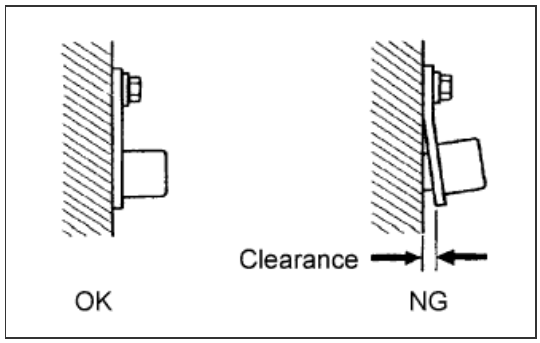
C26-1 (VVR+) or C46-69 (VV1+) - Body ground	Always	10 kΩ or higher
C26-2 (VVR-) or C46-92 (VV1-) - Body ground	Always	10 kΩ or higher
C25-1 (VVL+) or C46-67 (VV2+) - Body ground	Always	10 kΩ or higher
C25-2 (VVL-) or C46-90 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

5.CHECK CAMSHAFT TIMING GEAR ASSEMBLY (TEETH OF PLATE)

a. Check the teeth of the signal plate.

OK:
Sensor plate teeth do not have any cracks or deformation.

NG → REPLACE CAMSHAFT TIMING GEAR ASSEMBLY (Click here)

OK

6.REPLACE VVT SENSOR

a. Replace the VVT sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read the DTCs.

Result

Result	Proceed to
No output	A
P0340, P0342, P0343, P0345, P0347 or P0348	B

DTC P0016 Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DTC P0018 Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)

for Preparation Click here

DESCRIPTION

Refer to DTC P0335 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviations in the crankshaft and camshaft position sensor 1 signals (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft Oil Control Valve (OCV) • OCV filter • Camshaft timing gear assembly • ECM
P0018	Deviations in the crankshaft and camshaft position sensor 2 signals (2 trip detection logic).	

MONITOR DESCRIPTION

The ECM optimizes the valve timing by using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the camshaft Oil Control Valve (OCV) and the VVT controller.
The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft. The ECM calibrates the intake valve timing by setting the intake camshaft to the most retarded angle while the engine is idling. The ECM closes the OCV to retard the cam. The ECM stores this value as the VVT learning value. When the difference between the target and actual intake valve timings is 5°CA (Crankshaft Angle) or less, the ECM stores it.
If the VVT learning value matches the following conditions, the ECM determines the existence of a malfunction in the VVT system, and stores the DTC.

- VVT learning value: Less than 22.5°CA, or more than 45.2°CA.
- The above condition continues for 18 seconds or more.

This DTC indicates that the intake camshaft has been installed toward the crankshaft at an incorrect angle, caused by factors such as the timing chain having jumped a tooth.
This monitor begins to run after the engine has idled for 5 minutes.

WIRING DIAGRAM

Refer to DTC P0335 (Click here).
Refer to DTC P0340 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0016, P0017, P0018 OR P0019)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read the DTCs.

Result

Result	Proceed to
P0016, P0018	A

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the camshaft Oil Control Valve (OCV) using the tester.

OK

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → **Go to step 4**

OK

3.ADJUST VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
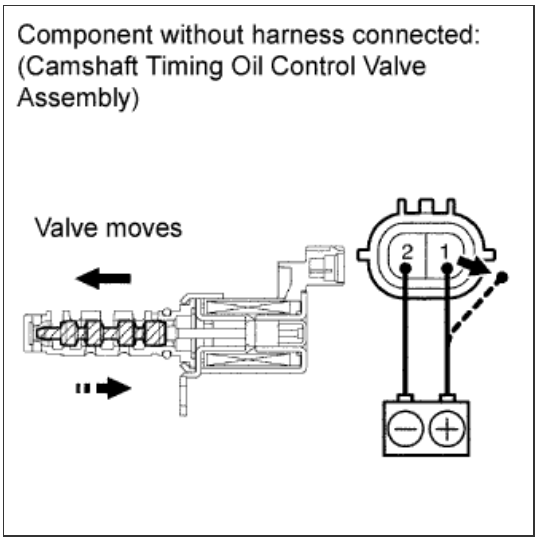
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NEXT → **Go to step 7**

4.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV (Click here).



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

c. Apply positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.

OK:
Valve moves quickly.

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

5.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

6.REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

a. Replace the camshaft timing gear assembly (Click here).

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. In order to clear the ECM learned values for valve timing, disconnect the cable from the negative (-) battery terminal for 1 minute.

b. Connect the cable to the negative (-) battery terminal.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Clear the DTCs (Click here).

f. Start the engine and idle it for 5 minutes.

g. Drive the vehicle in an urban area for approximately 10 minutes.

h. Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.

i. Read the DTCs.

Result:
DTCs are not output.

NG → REPLACE ECM (Click here)

OK
END

DESCRIPTION

HINT:

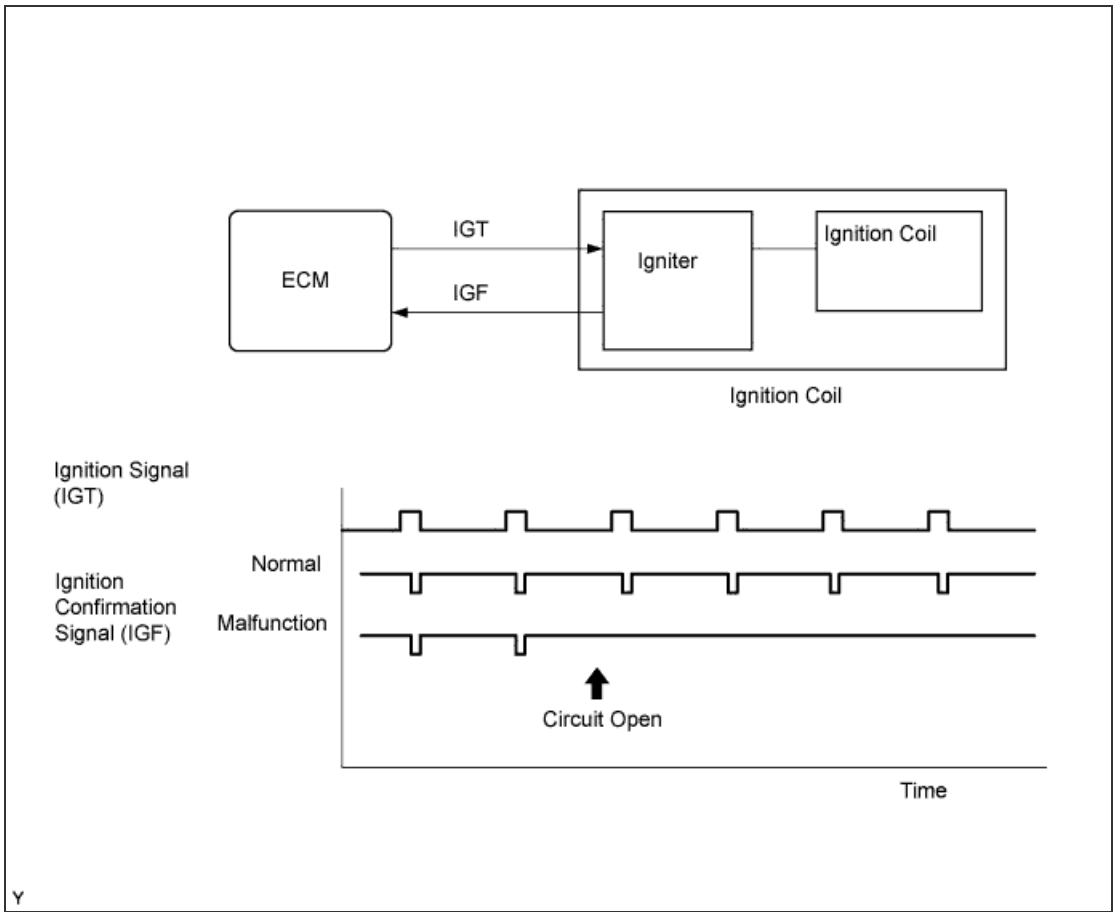
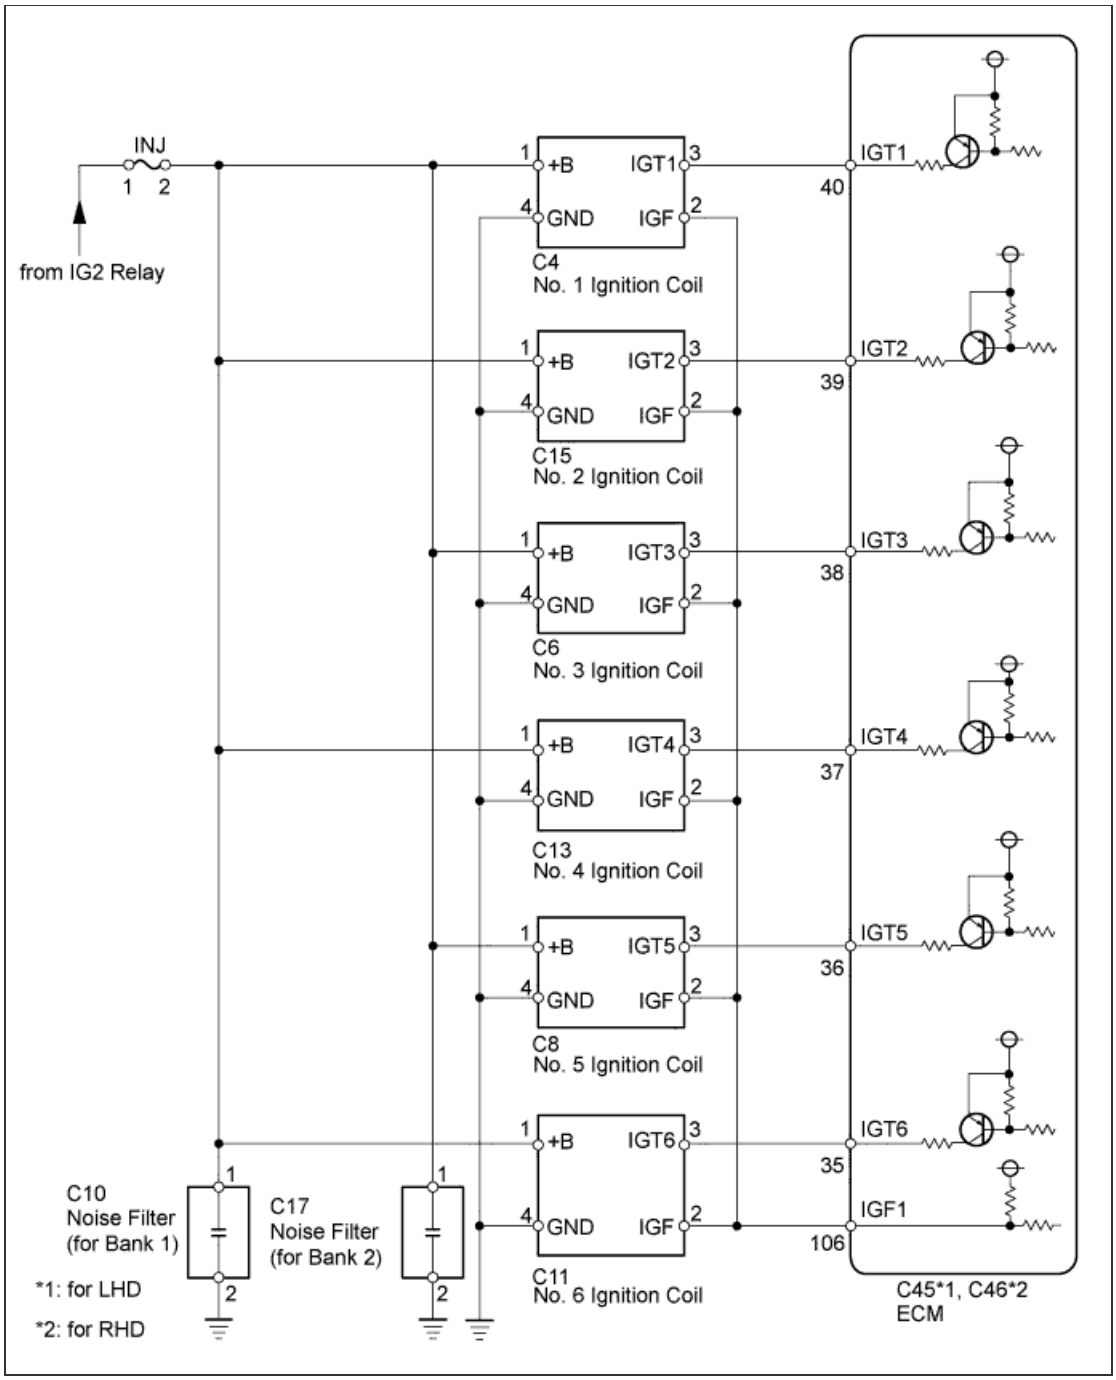
- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil, and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.



DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil and ECM • No. 1 to No. 6 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 6) and E1, and IGF1 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 - E1 CH2: IGF1 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω

REPLACE ECM (Click here)

DTC P0016 Crankshaft Position - Camshaft Position Correlation (Bank 1 Sensor A)

DTC P0018 Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor A)

for Preparation Click here

DESCRIPTION

Refer to DTC P0335 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviations in the crankshaft and camshaft position sensor 1 signals (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft Oil Control Valve (OCV) • OCV filter • Camshaft timing gear assembly • ECM
P0018	Deviations in the crankshaft and camshaft position sensor 2 signals (2 trip detection logic).	

MONITOR DESCRIPTION

The ECM optimizes the valve timing by using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, the camshaft Oil Control Valve (OCV) and the VVT controller.
The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft. The ECM calibrates the intake valve timing by setting the intake camshaft to the most retarded angle while the engine is idling. The ECM closes the OCV to retard the cam. The ECM stores this value as the VVT learning value. When the difference between the target and actual intake valve timings is 5°CA (Crankshaft Angle) or less, the ECM stores it.
If the VVT learning value matches the following conditions, the ECM determines the existence of a malfunction in the VVT system, and stores the DTC.

- VVT learning value: Less than 22.5°CA, or more than 45.2°CA.
- The above condition continues for 18 seconds or more.

This DTC indicates that the intake camshaft has been installed toward the crankshaft at an incorrect angle, caused by factors such as the timing chain having jumped a tooth.
This monitor begins to run after the engine has idled for 5 minutes.

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the camshaft Oil Control Valve (OCV) using the tester.

OK

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Engine idles roughly or stalls (soon after OCV switched from OFF to ON)

NG → **Go to step 4**

OK

3.ADJUST VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
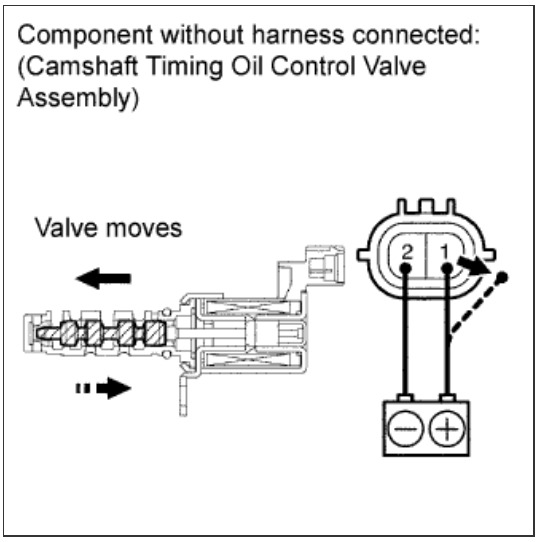
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NEXT → **Go to step 7**

4.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Remove the OCV (Click here).



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

c. Apply positive battery voltage to terminal 1 and negative battery voltage to terminal 2. Check the valve operation.

OK:
Valve moves quickly.

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

5.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

6.REPLACE CAMSHAFT TIMING GEAR ASSEMBLY

a. Replace the camshaft timing gear assembly (Click here).

NEXT

7.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. In order to clear the ECM learned values for valve timing, disconnect the cable from the negative (-) battery terminal for 1 minute.

b. Connect the cable to the negative (-) battery terminal.

c. Connect the intelligent tester to the DLC3.

d. Turn the ignition switch to ON and turn the tester on.

e. Clear the DTCs (Click here).

f. Start the engine and idle it for 5 minutes.

g. Drive the vehicle in an urban area for approximately 10 minutes.

h. Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.

i. Read the DTCs.

Result:
DTCs are not output.

NG → REPLACE ECM (Click here)

OK
END

DESCRIPTION

HINT:

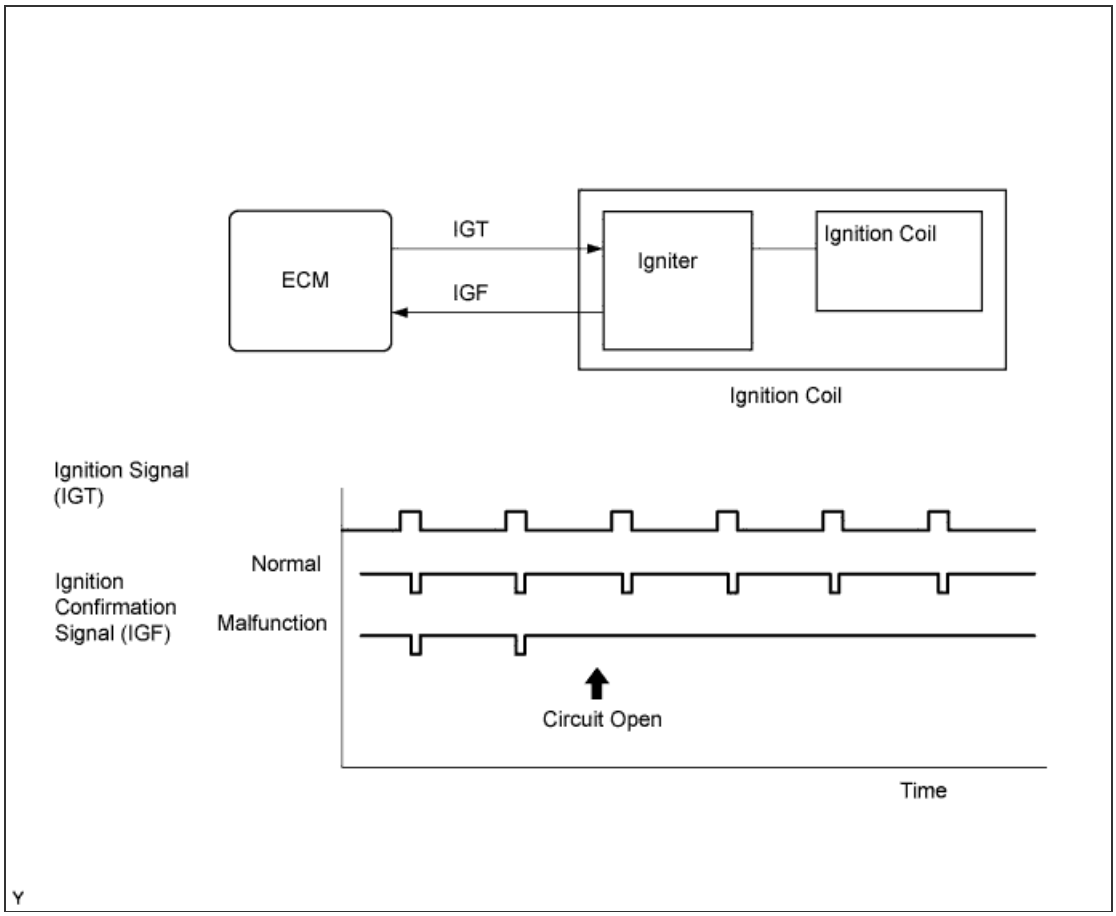
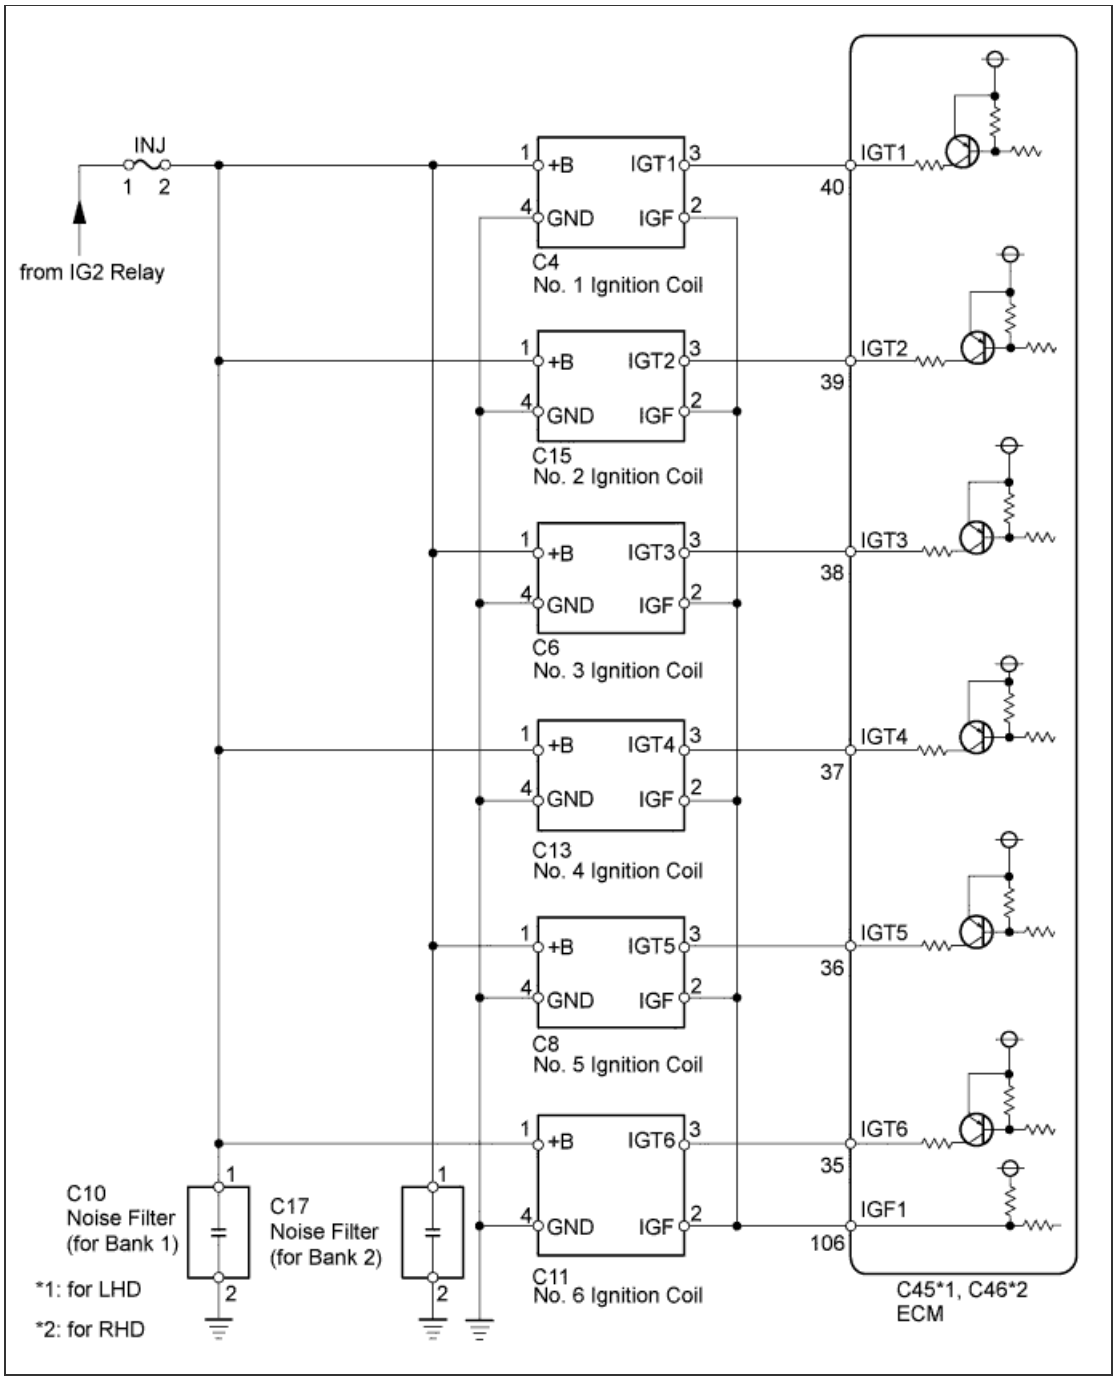
- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil, and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.



DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil and ECM • No. 1 to No. 6 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 6) and E1, and IGF1 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 - E1 CH2: IGF1 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
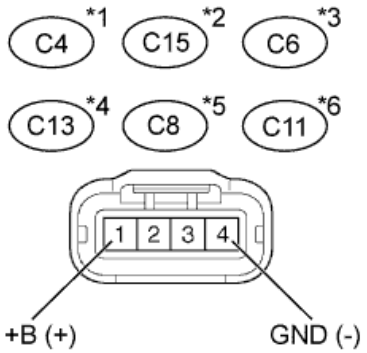
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω



C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage (Check for Open):

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Ignition switch ON	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Ignition switch ON	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Ignition switch ON	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Ignition switch ON	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Ignition switch ON	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Ignition switch ON	11 to 14 V

REPLACE ECM (Click here)

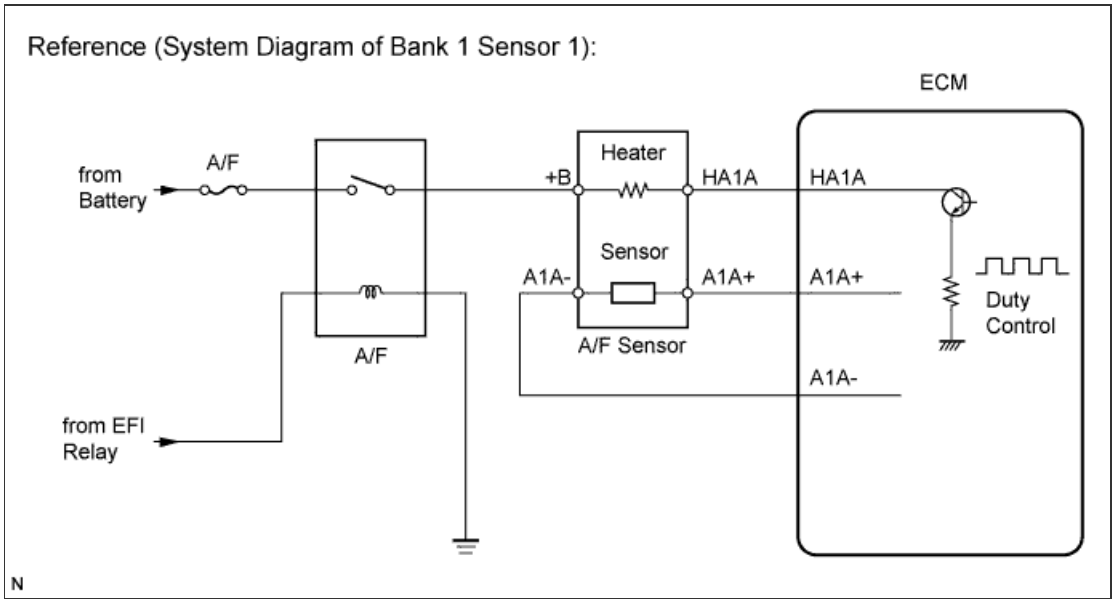
DTC P0031 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC P0032 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **When either of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **Although the DTC titles say the oxygen sensor, these DTCs relate to the Air Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor heater circuit • A/F sensor heater (for Bank 1, 2 Sensor 1) • Integration relay (A/F relay) • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Bank 1, 2 Sensor 1) • Integration relay (A/F relay) • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel Ratio (A/F) sensor to regulate the air fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate, as a result, the ECM is unable to regulate air fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores a DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
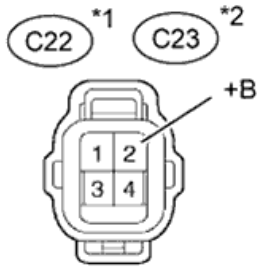
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher



NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF A/F SENSOR)

a. Measure the voltage according to the value(s) in the table below.

Front view of wire harness connector:
(to A/F Sensor)

*1: for Bank 1

*2: for Bank 2

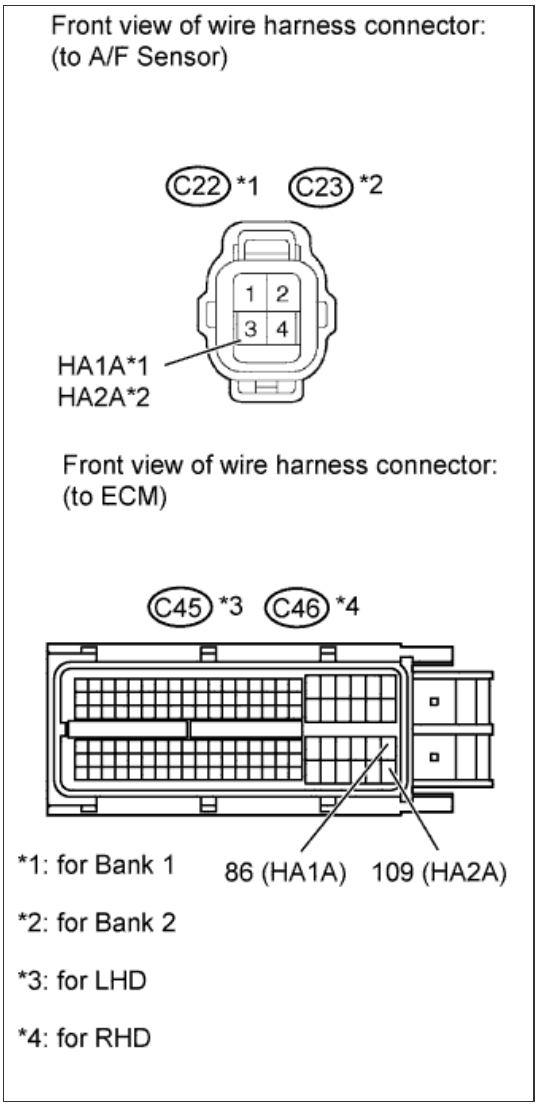
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 5

OK

3.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) -		10 kΩ or

Body ground	Always	higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine.

f. Allow the engine to idle for 1 minute or more.

g. Enter the following menus: Powertrain / Engine and ECT / DTC.

h. Read the DTCs.

Result

Result	Proceed to

CHECK FOR INTERMITTENT PROBLEMS (Click here)

5.INSPECT INTEGRATION NO.1 RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
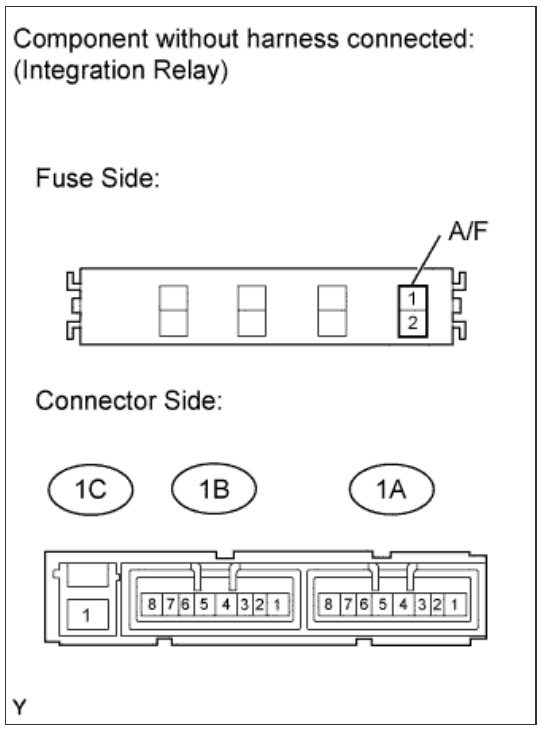
A/F fuse	Always	Below 1 Ω



iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

NG → REPLACE INTEGRATION NO.1 RELAY

OK

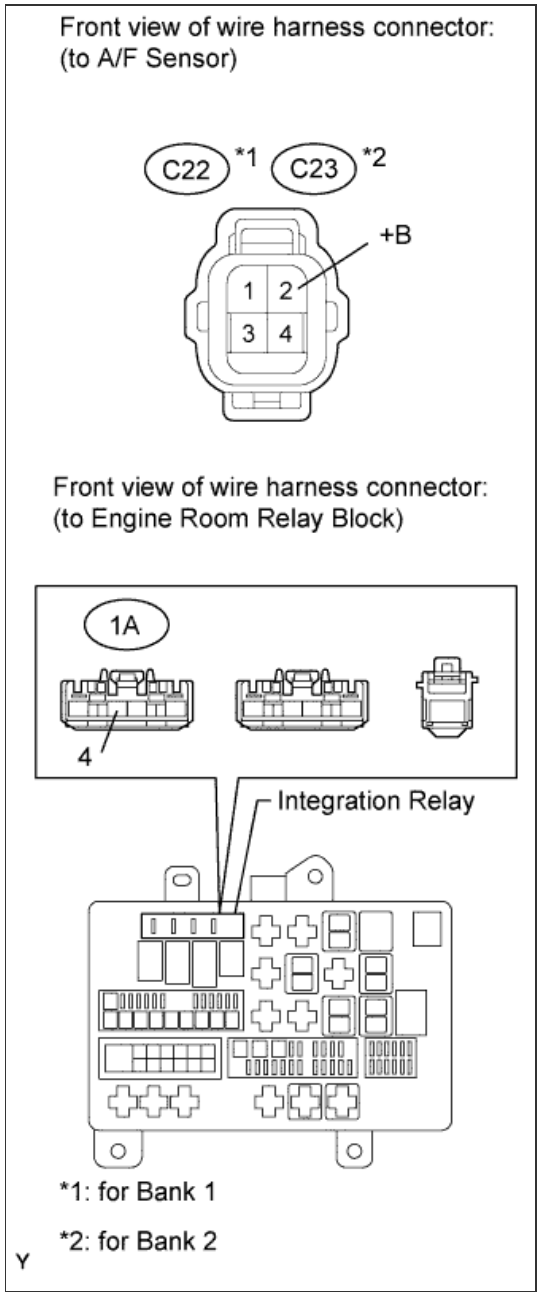
6.CHECK HARNESS AND CONNECTOR (A/F SENSOR - INTEGRATION RELAY)

a. Remove the integration relay from the engine room relay block.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C22-2 (+B) - 1A-4	Always	Below 1 Ω
C23-2 (+B) - 1A-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C22-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C23-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

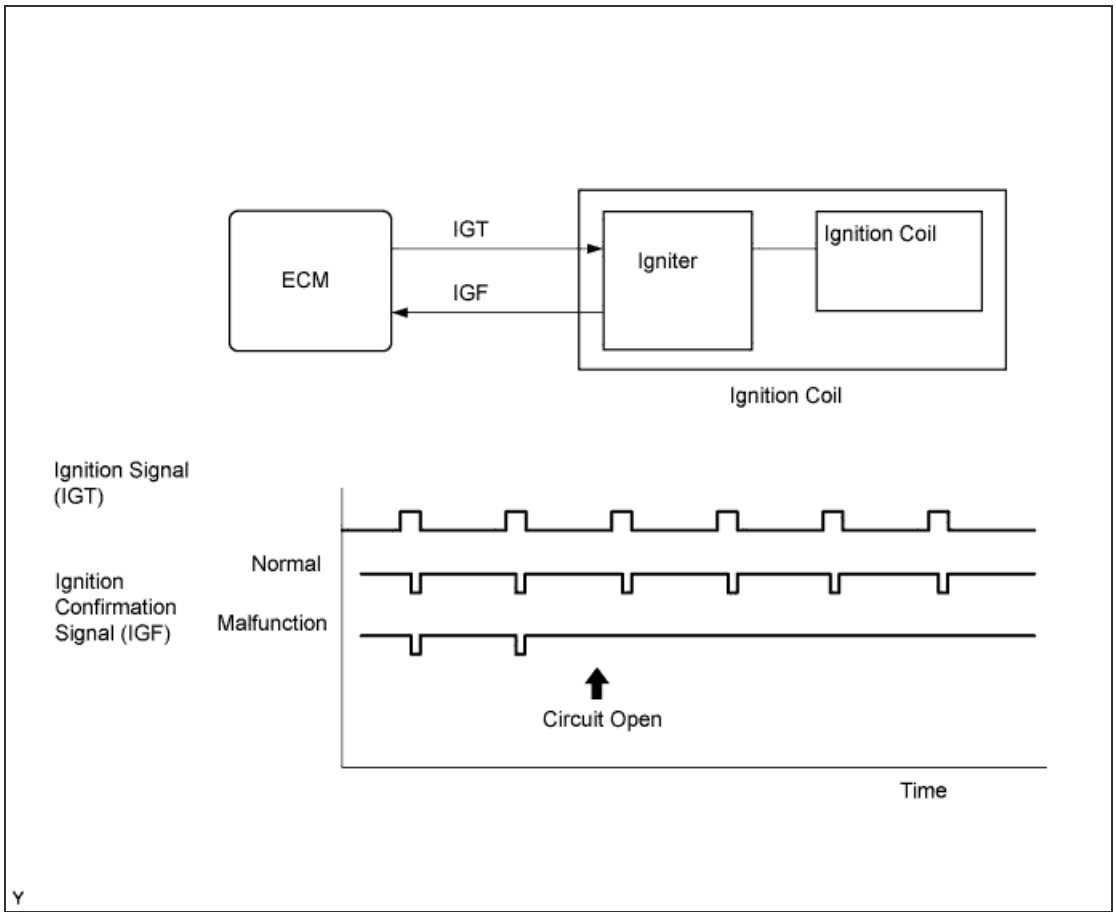
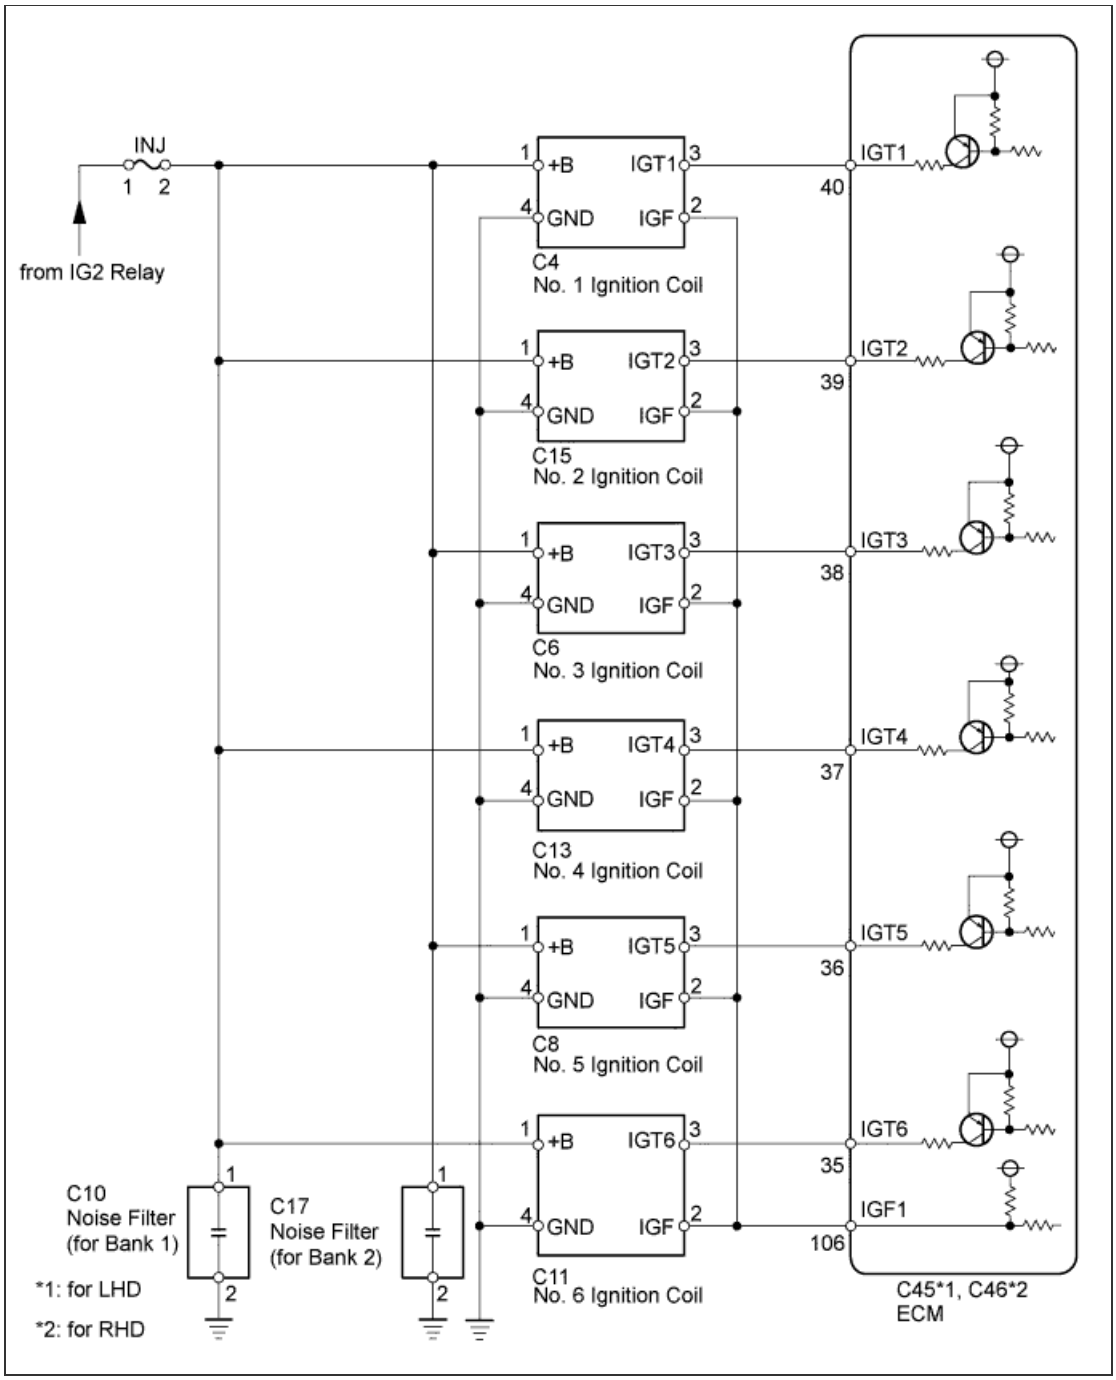
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil, and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.



DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil and ECM • No. 1 to No. 6 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 6) and E1, and IGF1 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 - E1 CH2: IGF1 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

REPLACE ECM (Click here)

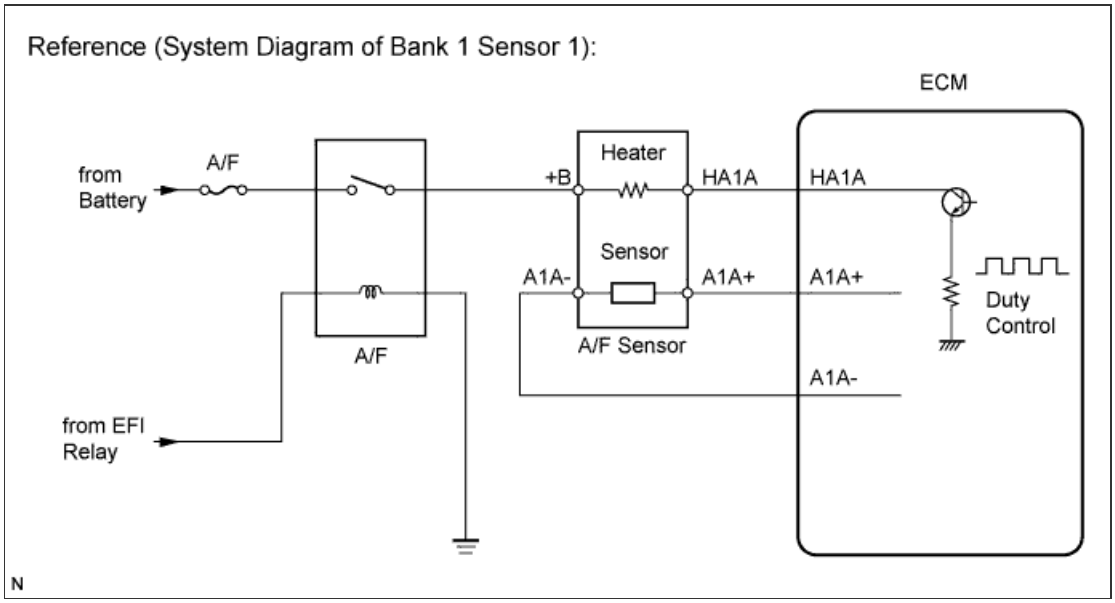
DTC P0031 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC P0032 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **When either of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **Although the DTC titles say the oxygen sensor, these DTCs relate to the Air Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor heater circuit • A/F sensor heater (for Bank 1, 2 Sensor 1) • Integration relay (A/F relay) • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Bank 1, 2 Sensor 1) • Integration relay (A/F relay) • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel Ratio (A/F) sensor to regulate the air fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate, as a result, the ECM is unable to regulate air fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores a DTC.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
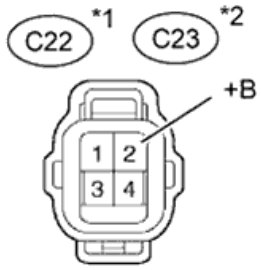
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher



NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF A/F SENSOR)

a. Measure the voltage according to the value(s) in the table below.

Front view of wire harness connector:
(to A/F Sensor)

*1: for Bank 1

*2: for Bank 2

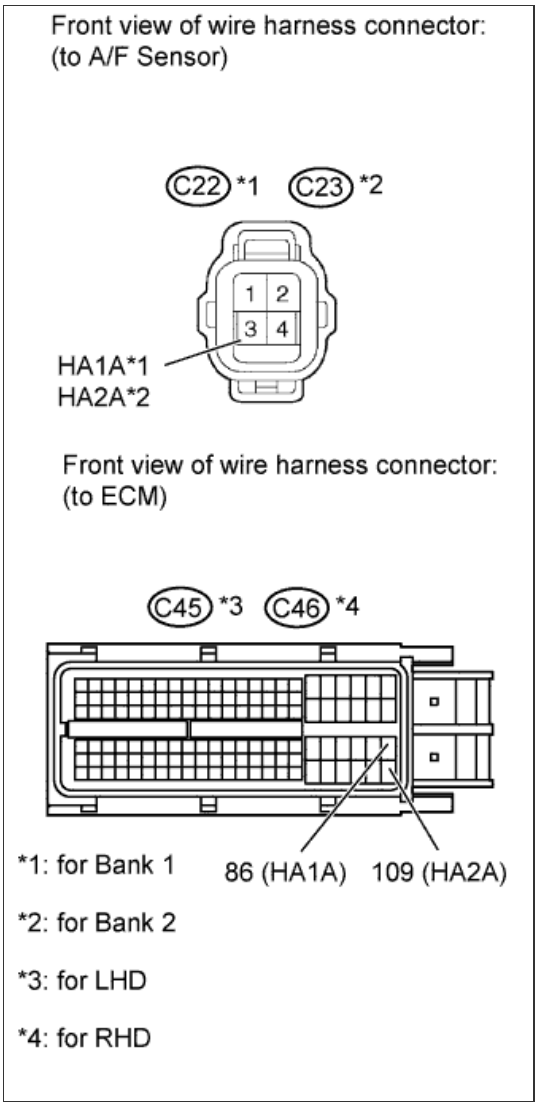
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 5

OK

3.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) -		10 kΩ or

Body ground	Always	higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine.

f. Allow the engine to idle for 1 minute or more.

g. Enter the following menus: Powertrain / Engine and ECT / DTC.

h. Read the DTCs.

CHECK FOR INTERMITTENT PROBLEMS (Click here)

5.INSPECT INTEGRATION NO.1 RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
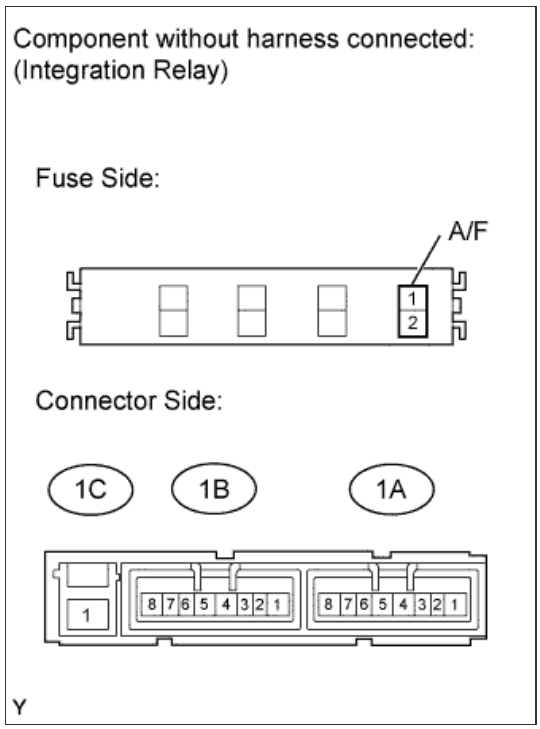
A/F fuse	Always	Below 1 Ω



iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

NG → REPLACE INTEGRATION NO.1 RELAY

OK

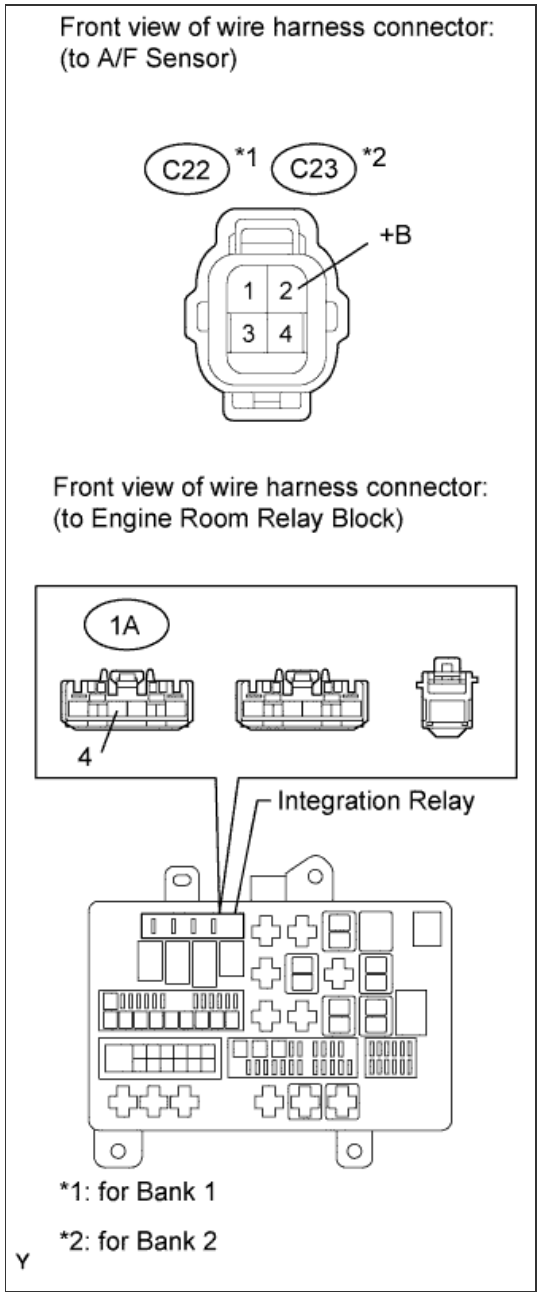
6.CHECK HARNESS AND CONNECTOR (A/F SENSOR - INTEGRATION RELAY)

a. Remove the integration relay from the engine room relay block.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C22-2 (+B) - 1A-4	Always	Below 1 Ω
C23-2 (+B) - 1A-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C22-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C23-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

DESCRIPTION

HINT:

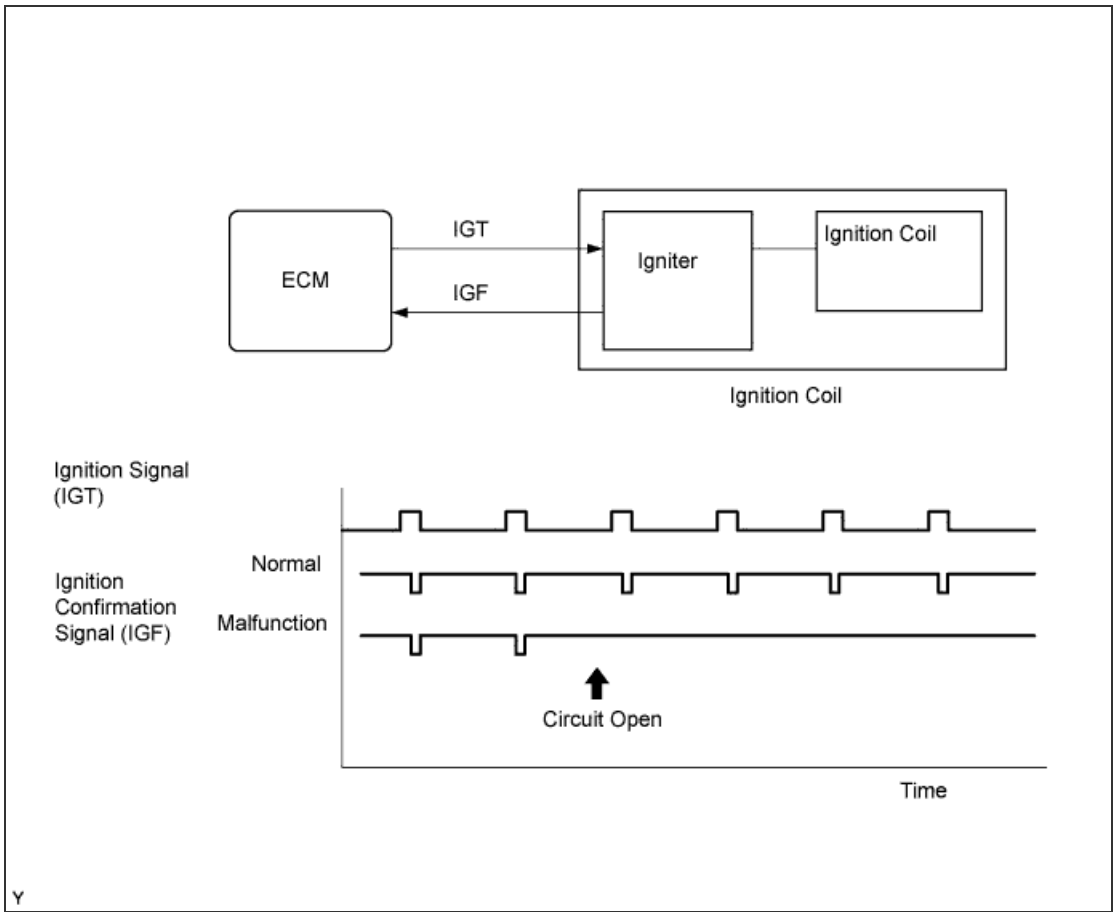
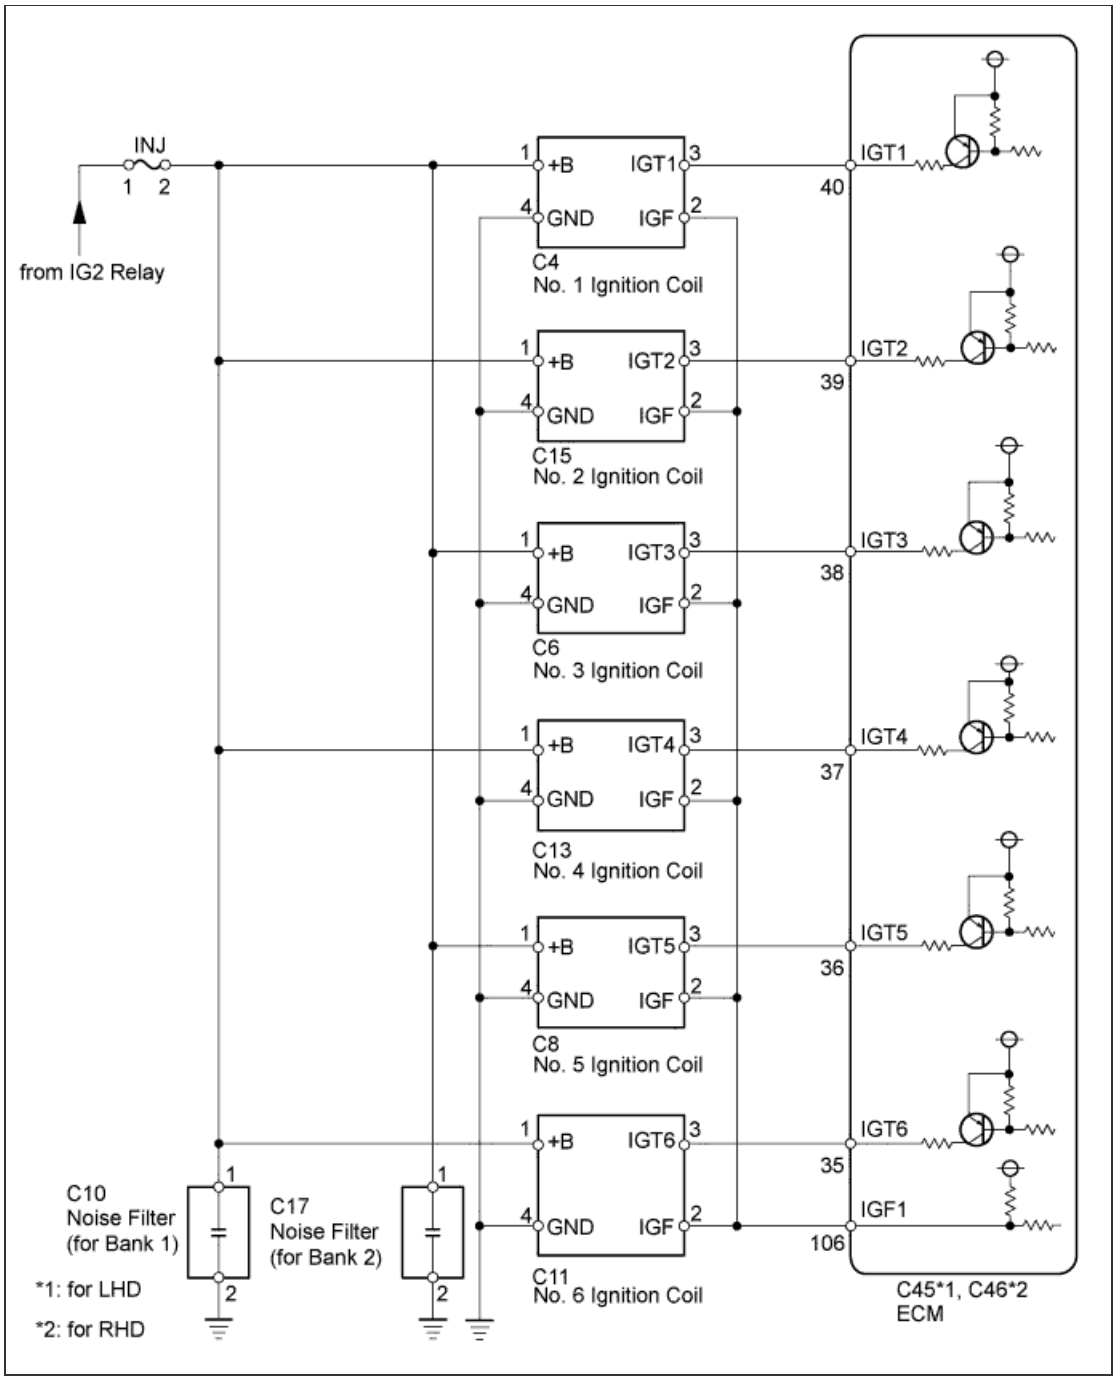
- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil, and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.



DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil and ECM • No. 1 to No. 6 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 6) and E1, and IGF1 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 - E1 CH2: IGF1 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel Ratio (A/F) sensor to regulate the air fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate, as a result, the ECM is unable to regulate air fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores a DTC.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
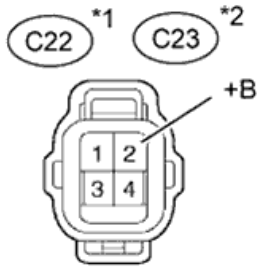
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher



NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF A/F SENSOR)

a. Measure the voltage according to the value(s) in the table below.

Front view of wire harness connector:
(to A/F Sensor)

*1: for Bank 1

*2: for Bank 2

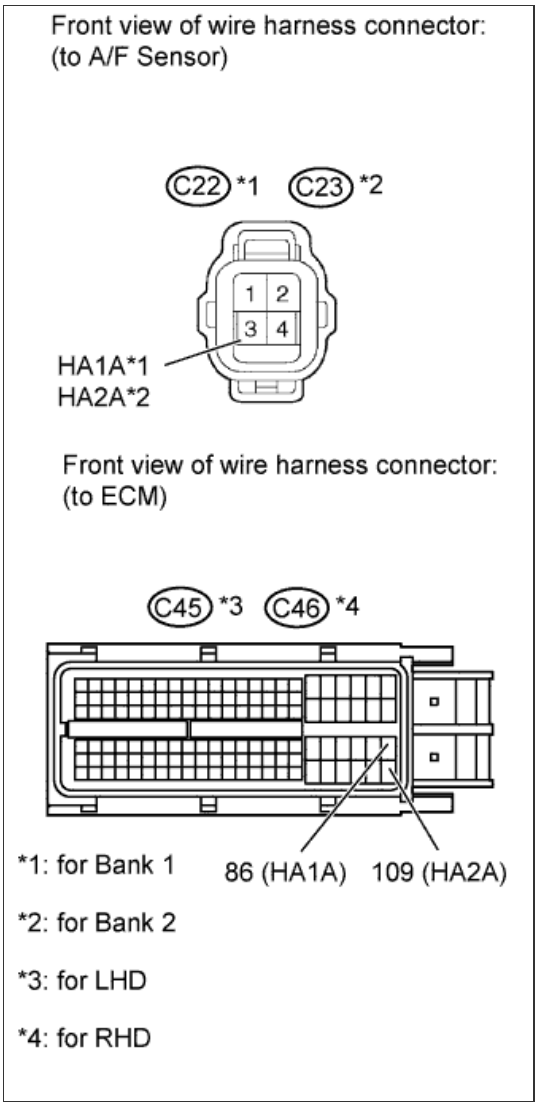
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 5

OK

3.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) -		10 kΩ or

Body ground	Always	higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine.

f. Allow the engine to idle for 1 minute or more.

g. Enter the following menus: Powertrain / Engine and ECT / DTC.

h. Read the DTCs.

Result

Result	Proceed to
No output	A
P0031, P0032, P0051 or P0052	B

B → REPLACE ECM (Click here)

A

CHECK FOR INTERMITTENT PROBLEMS (Click here)

5.INSPECT INTEGRATION NO.1 RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
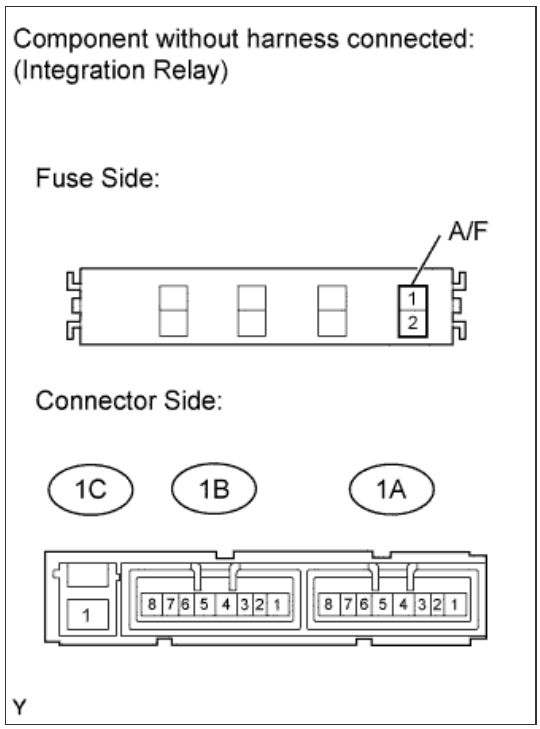
A/F fuse	Always	Below 1 Ω



iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω

NG → REPLACE INTEGRATION NO.1 RELAY

OK

6.CHECK HARNESS AND CONNECTOR (A/F SENSOR - INTEGRATION RELAY)

a. Remove the integration relay from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C22-2 (+B) - 1A-4	Always	Below 1 Ω
C23-2 (+B) - 1A-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C22-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher
C23-2 (+B) or 1A-4 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

DESCRIPTION

HINT:

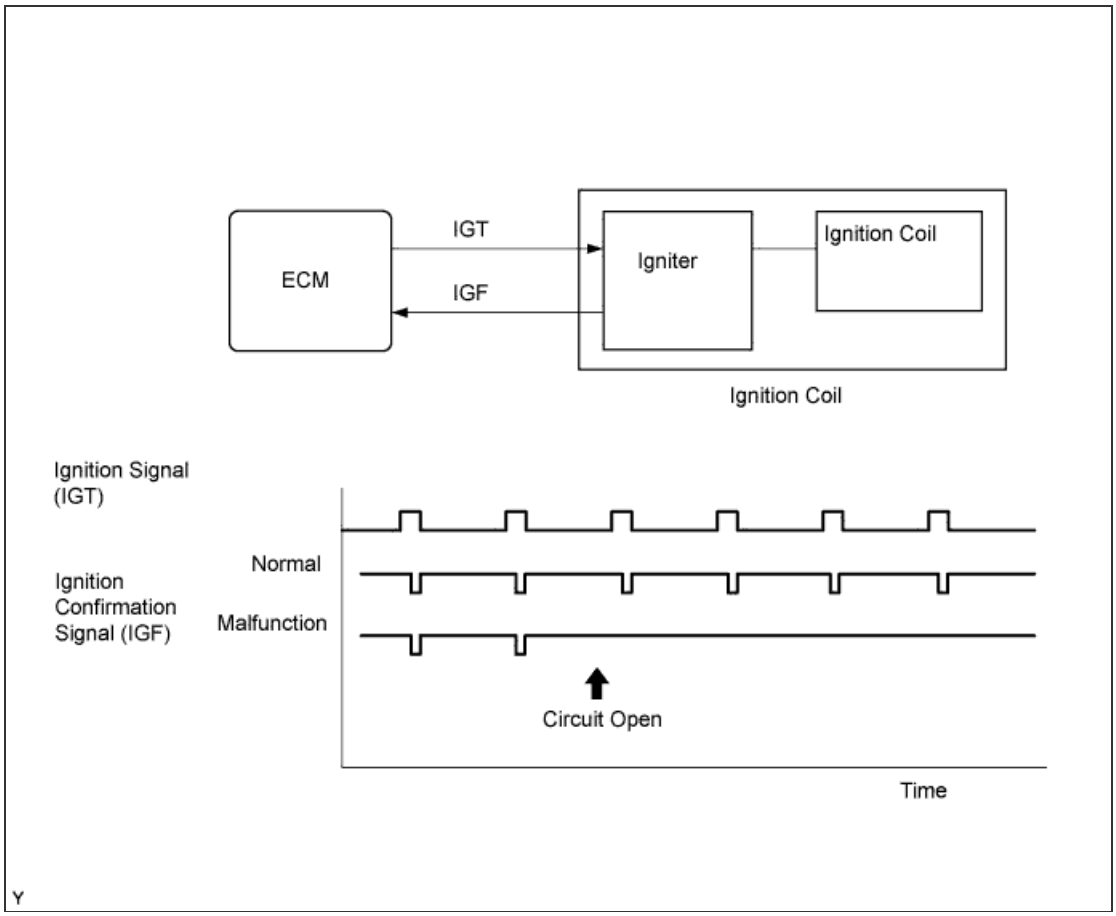
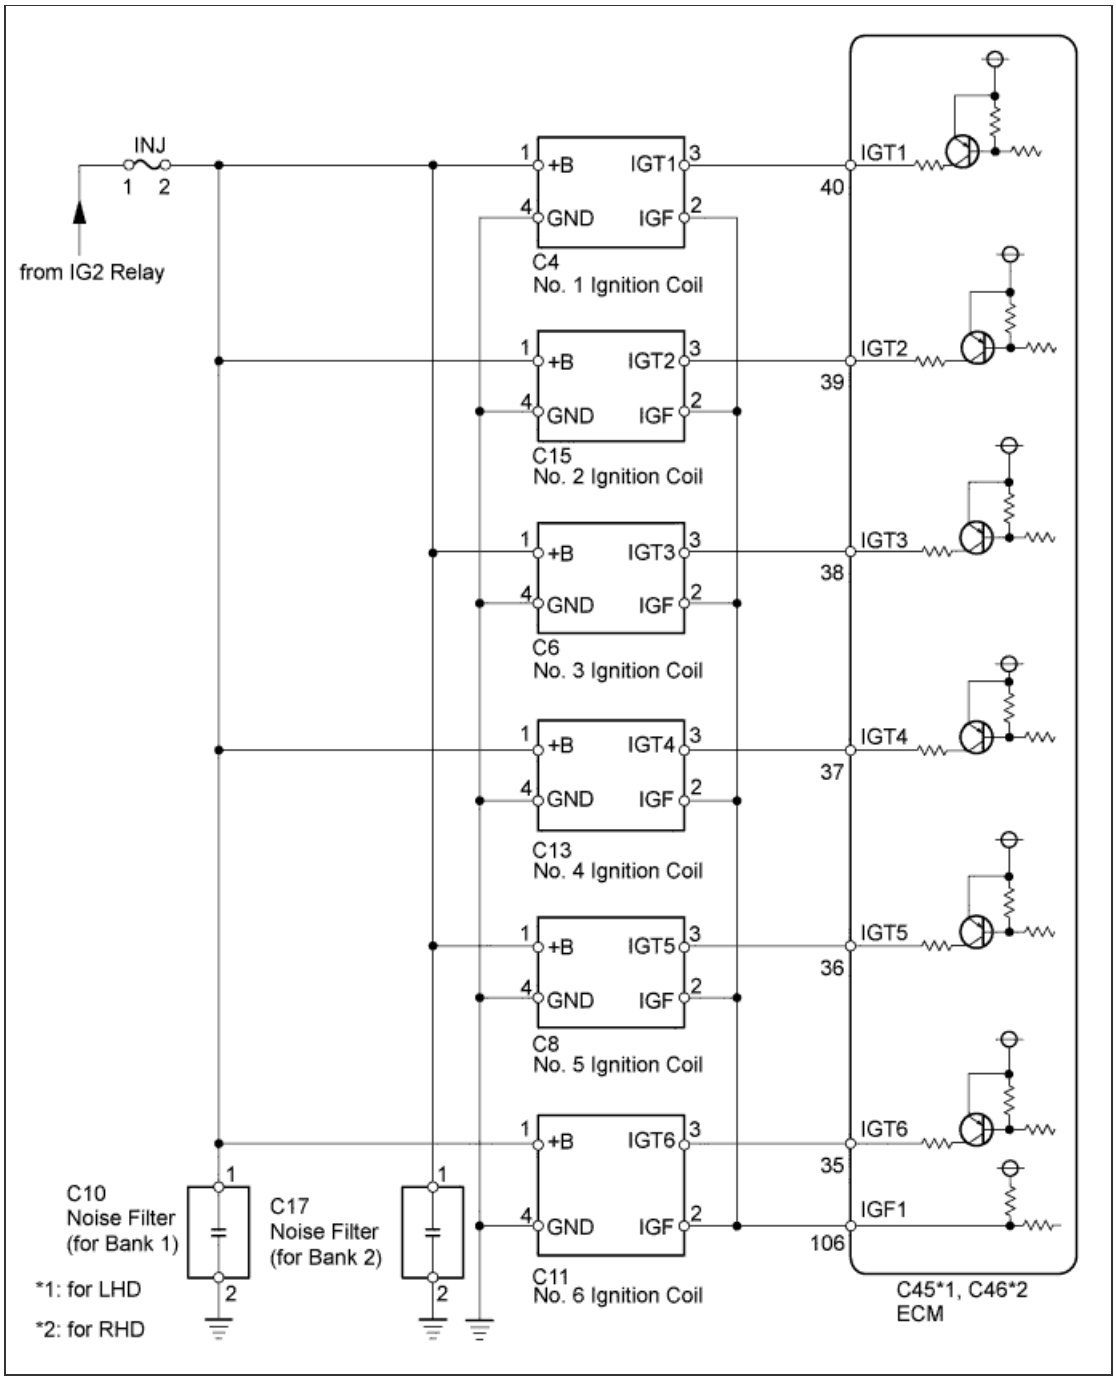
- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil, and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.



DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil and ECM • No. 1 to No. 6 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 6) and E1, and IGF1 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 - E1 CH2: IGF1 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

REPLACE ECM (Click here)

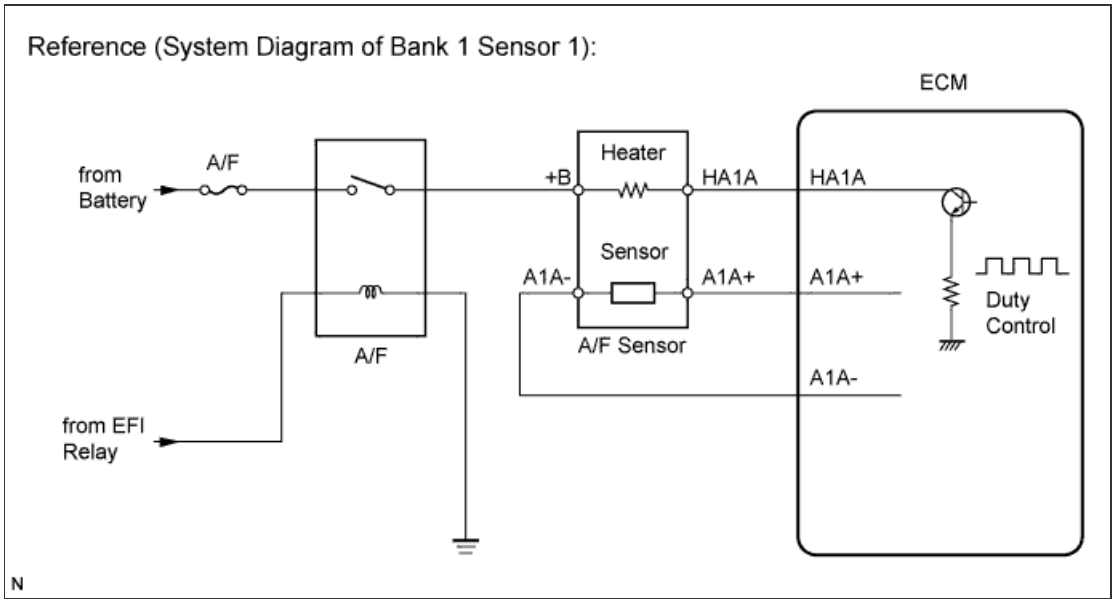
DTC P0031 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 1 Sensor 1)

DTC P0032 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 1 Sensor 1)

DTC P0051 Oxygen (A/F) Sensor Heater Control Circuit Low (Bank 2 Sensor 1)

DTC P0052 Oxygen (A/F) Sensor Heater Control Circuit High (Bank 2 Sensor 1)

for Preparation Click here



DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **When either of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the A/F sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **Although the DTC titles say the oxygen sensor, these DTCs relate to the Air Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The A/F sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0031 P0051	The Air Fuel ratio (A/F) sensor heater current is below 0.8 A (1 trip detection logic).	• Open in Air Fuel Ratio (A/F) sensor heater circuit • A/F sensor heater (for Bank 1, 2 Sensor 1) • Integration relay (A/F relay) • ECM
P0032 P0052	An Air Fuel ratio (A/F) sensor heater current failure (1 trip detection logic).	• Short in A/F sensor heater circuit • A/F sensor heater (for Bank 1, 2 Sensor 1) • Integration relay (A/F relay) • ECM

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The ECM uses information from the Air Fuel Ratio (A/F) sensor to regulate the air fuel ratio and keep it close to the stoichiometric level. This maximizes the ability of the Three-Way Catalytic Converter (TWC) to purify the exhaust gases.

The A/F sensor detects oxygen levels in the exhaust gas and transmits the information to the ECM. The inner surface of the sensor element is exposed to the outside air. The outer surface of the sensor element is exposed to the exhaust gas. The sensor element is made of platinum coated zirconia and includes an integrated heating element.
The zirconia element generates a small voltage when there is a large difference in the oxygen concentrations between the exhaust gas and outside air. The platinum coating amplifies this voltage generation.
The A/F sensor is more efficient when heated. When the exhaust gas temperature is low, the sensor cannot generate useful voltage signals without supplementary heating. The ECM regulates the supplementary heating using a duty-cycle approach to adjust the average current in the sensor heater element. If the heater current is outside the normal range, the signal transmitted by the A/F sensor becomes inaccurate, as a result, the ECM is unable to regulate air fuel ratio properly.
When the current in the A/F sensor heater is outside the normal operating range, the ECM interprets this as a malfunction in the sensor heater and stores a DTC.

WIRING DIAGRAM

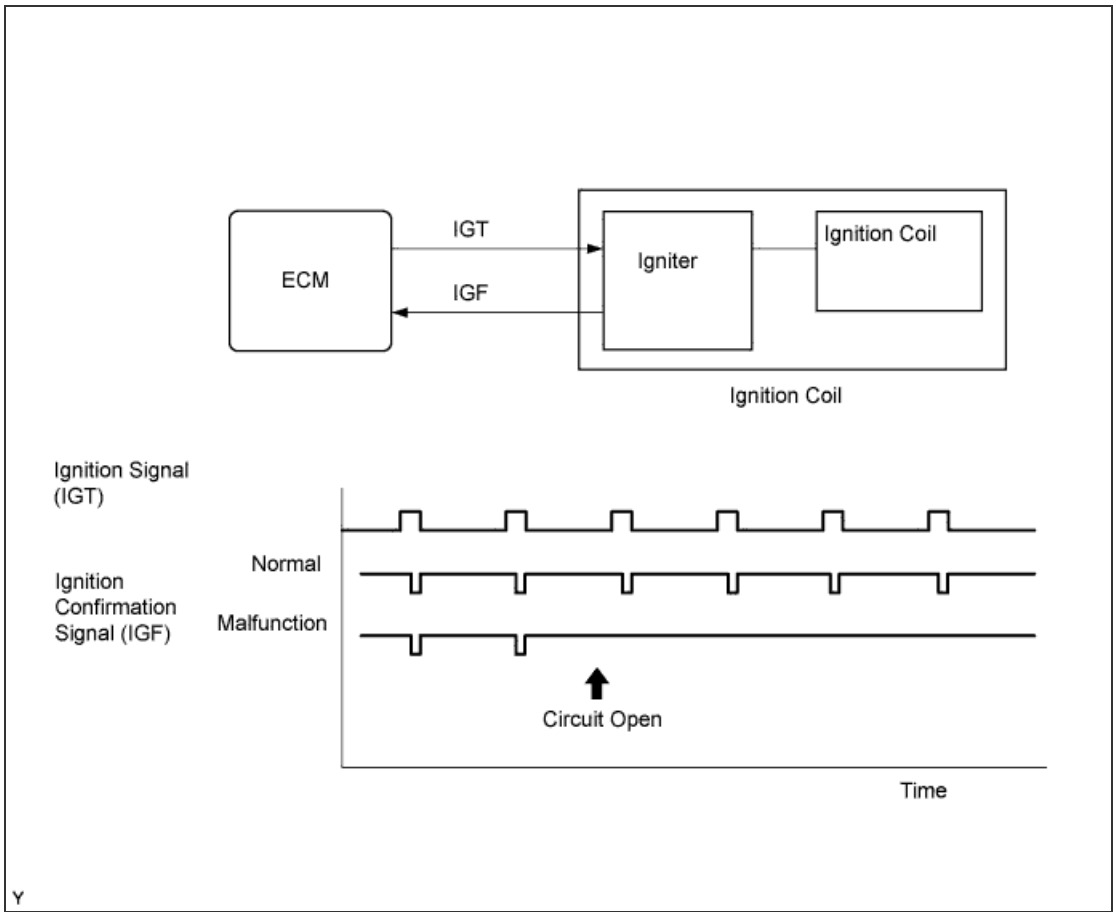
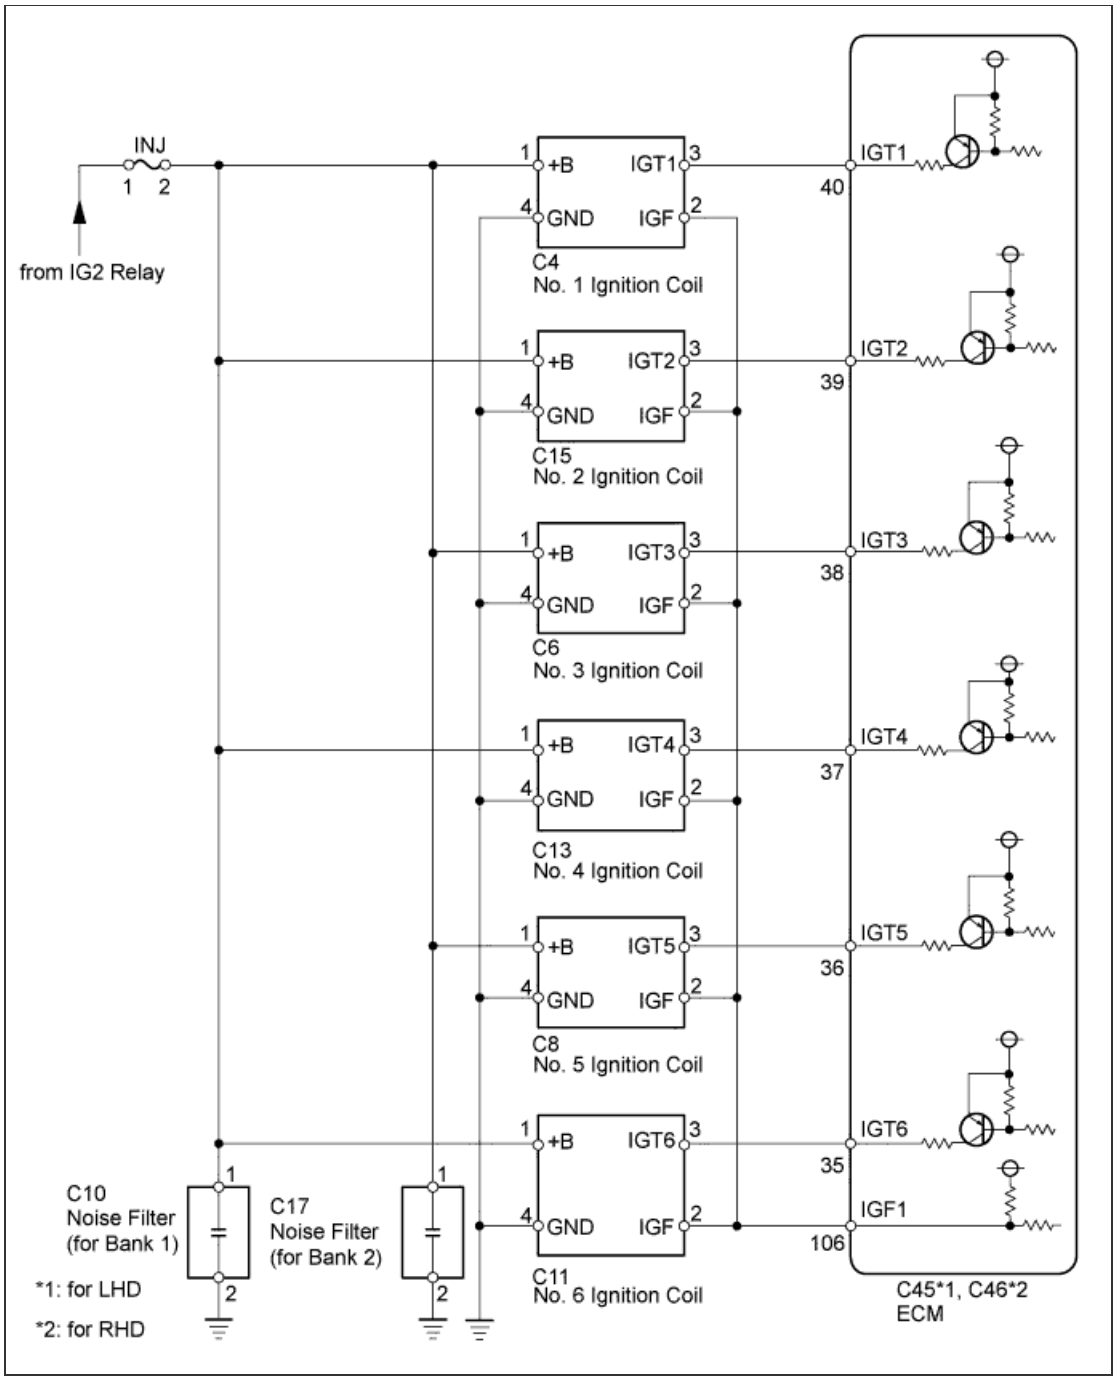
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil, and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.



DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 6) between ignition coil and ECM • No. 1 to No. 6 ignition coils • ECM

Reference: Inspection using an oscilloscope.
While cranking or idling the engine, check the waveform between terminals IGT (1 to 6) and E1, and IGF1 and E1 of the ECM connector.



Item	Content
Terminal	CH1: IGT1, IGT2, IGT3, IGT4, IGT5, IGT6 - E1 CH2: IGF1 - E1
Equipment Setting	2 V/DIV. 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)

a. Disconnect the ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
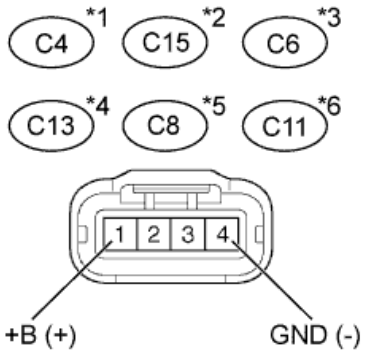
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω



C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage (Check for Open):

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Ignition switch ON	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Ignition switch ON	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Ignition switch ON	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Ignition switch ON	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Ignition switch ON	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Ignition switch ON	11 to 14 V

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)

DTC P0141 Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)

DTC P0161 Oxygen Sensor Heater Circuit Malfunction (Bank 2 Sensor 2)

for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **When any of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is below 0.3 A (1 trip detection logic).	• **Open in Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0038 P0058	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is higher than 2 A (1 trip detection logic).	• **Short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0141 P0161	The cumulative heater resistance correction value exceeds the acceptable threshold (2 trip detection logic).	• **Open or short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):

The ECM monitors the current applied to the HO2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM will determine that there is an open circuit in the heater. If the current is above the threshold value, the ECM will determine that there is a short circuit in the heater.

Example:

The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

Heated oxygen sensor heater performance (P0141 and P0161):

After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using the battery voltage and the current applied to the heater. If the resistance is above the threshold value, the ECM will determine that there is a malfunction in the HO2 sensor heater and store DTCs P0141 and P0161.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for Bank 1 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

for Bank 2 Sensor 2

Tester Connection	Condition	Specified Condition
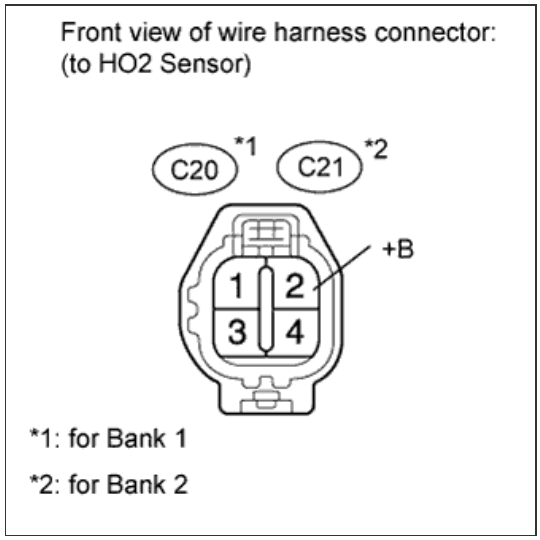
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω



1 (HT2B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Measure the voltage according to the value(s) in the table below.

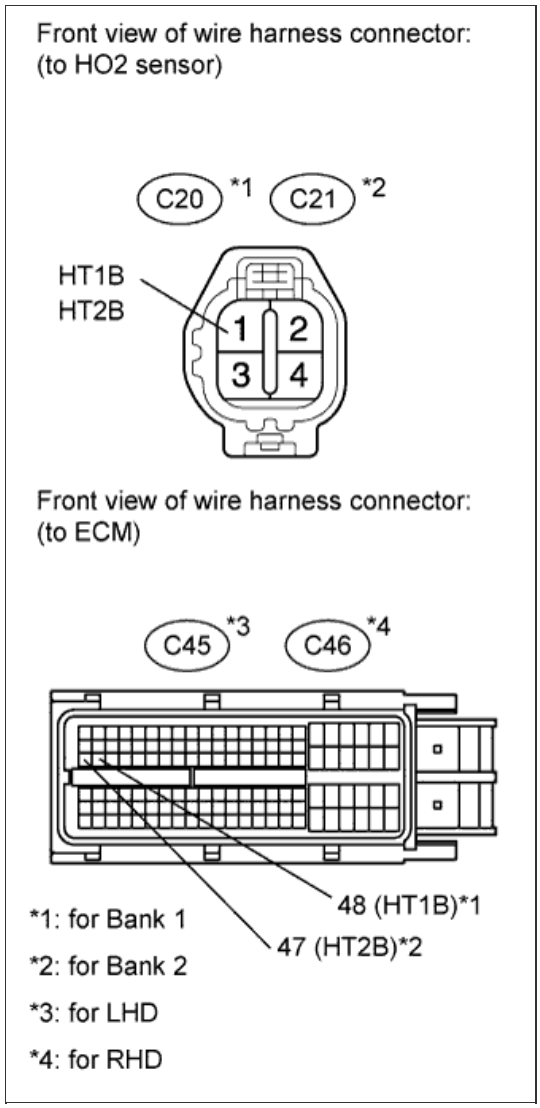
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C21-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 4

OK

3.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) -		10 kΩ or

Body ground	Always	higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

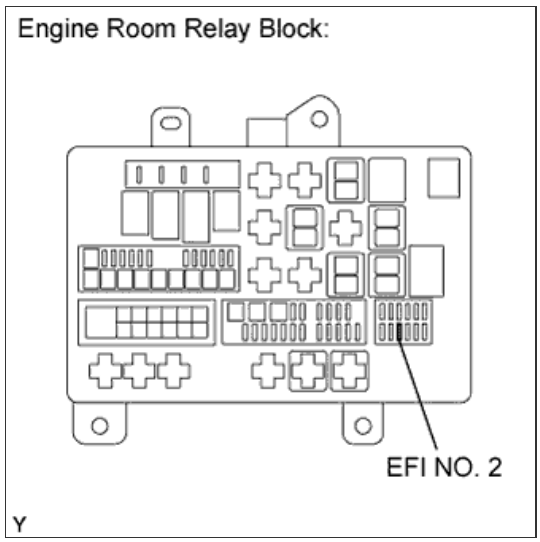
REPLACE ECM (Click here)



4.INSPECT FUSE (EFI NO. 2)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C20-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω
C21-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C20-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher
C21-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

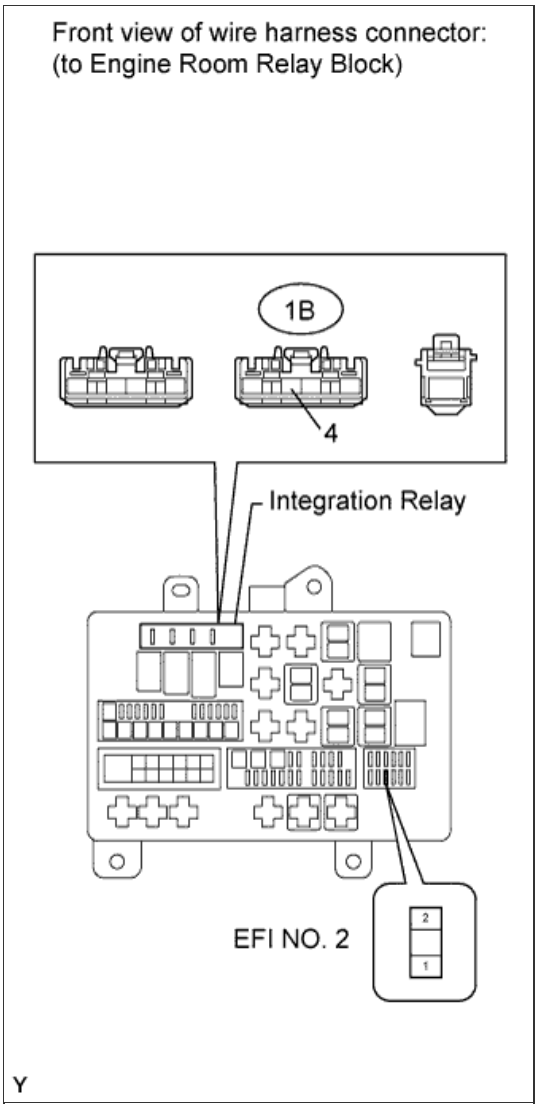
6.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Remove the integration relay from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) or 1B-4 - Body ground	Always	10 kΩ or higher

NG → REPLACE ENGINE ROOM RELAY BLOCK

OK

CHECK ECM POWER SOURCE CIRCUIT (Click here)

DTC P0420 Catalyst System Efficiency Below Threshold (Bank 1)

DTC P0430 Catalyst System Efficiency Below Threshold (Bank 2)

for Preparation Click here

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM.
In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air fuel ratio to lean or rich levels. If a rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and sets a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is smaller than the standard value under active air fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • A/F sensor (bank 1 sensor 1) • HO2 sensor (bank 1 sensor 2) • Exhaust manifold (bank 1)(with TWC: front catalyst) • Front exhaust pipe assembly (with TWC: rear catalyst)
P0430	The OSC value is smaller than the standard value under active air fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • A/F sensor (bank 2 sensor 1) • HO2 sensor (bank 2 sensor 2) • Exhaust manifold (bank 2)(with TWC: front catalyst) • Front No. 2 exhaust pipe assembly (with TWC: rear catalyst)

HINT:

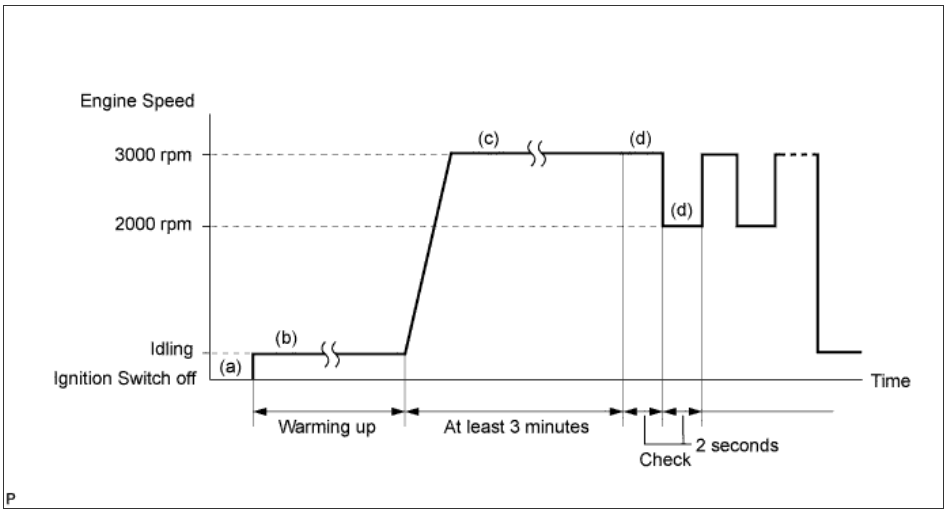
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that does not include cylinder No. 1.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**



CATALYST LOCATION

CONDITIONING FOR SENSOR TESTING

HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched OFF until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While alternately running the engine at 3000 rpm for 2 seconds and 2000 rpm for 2 seconds, check the waveforms of the A/F and HO2 sensors using the intelligent tester.

HINT:

- **If either voltage output of the Air Fuel Ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air fuel ratio may be extremely lean or rich. In such cases, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1	+25%	Rich	Less than 3.1 V

(A/F)			
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 AND/OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read DTCs.

Result

Display (DTC Output)	Proceed to
P0420 and/or P0430	A
P0420 and/or P0430 and other DTCs	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (CONTROL THE INJECTION VOLUME FOR A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.

e. Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS, Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4

Result:

Status AFS Voltage B1S1 or AFS Voltage B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F and HO2 Sensors Condition	Misfire	Main Suspected Trouble Area	Proceed to
Lean/Rich	Lean/Rich	Normal	-	• **Three-Way Catalytic Converter (TWC)** • **Gas leakage from exhaust system**	A
Lean	Lean/Rich	A/F sensor malfunction	-	• **A/F sensor**	B
Rich	Lean/Rich	A/F sensor malfunction	-	• **A/F sensor**	
Lean/Rich	Lean	HO2 sensor malfunction	-	• **HO2 sensor** • **Gas leakage from exhaust system**	C
Lean/Rich	Rich	HO2 sensor malfunction	-	• **HO2 sensor** • **Gas leakage from exhaust system**	
Lean	Lean	Actual air fuel ratio lean	May occur	• **Extremely rich or lean actual air fuel ratio** • **Gas leakage from exhaust system**	A
Rich	Rich	Actual air fuel ratio rich	-	• **Extremely rich or lean actual air fuel ratio** • **Gas leakage from exhaust system**	

Lean: During Control the Injection Volume for A/F sensor, the A/F sensor output voltage (AFS) is consistently more than 3.4 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During Control the Injection Volume for A/F sensor, the AFS is consistently less than 3.1 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During Control the Injection Volume for A/F sensor of the Active Test, the output voltage of the HO2 sensor alternates correctly.

B → REPLACE AIR FUEL RATIO SENSOR (Click here)

DTC P0161 Oxygen Sensor Heater Circuit Malfunction (Bank 2 Sensor 2)

for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **When any of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is below 0.3 A (1 trip detection logic).	• **Open in Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0038 P0058	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is higher than 2 A (1 trip detection logic).	• **Short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0141 P0161	The cumulative heater resistance correction value exceeds the acceptable threshold (2 trip detection logic).	• **Open or short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):

The ECM monitors the current applied to the HO2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM will determine that there is an open circuit in the heater. If the current is above the threshold value, the ECM will determine that there is a short circuit in the heater.

Example:

The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

Heated oxygen sensor heater performance (P0141 and P0161):

After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using the battery voltage and the current applied to the heater. If the resistance is above the threshold value, the ECM will determine that there is a malfunction in the HO2 sensor heater and store DTCs P0141 and P0161.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for Bank 1 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

for Bank 2 Sensor 2

Tester Connection	Condition	Specified Condition
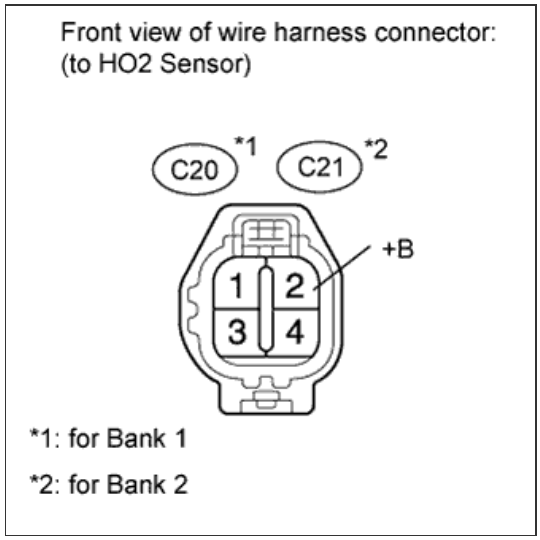
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω



1 (HT2B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Measure the voltage according to the value(s) in the table below.

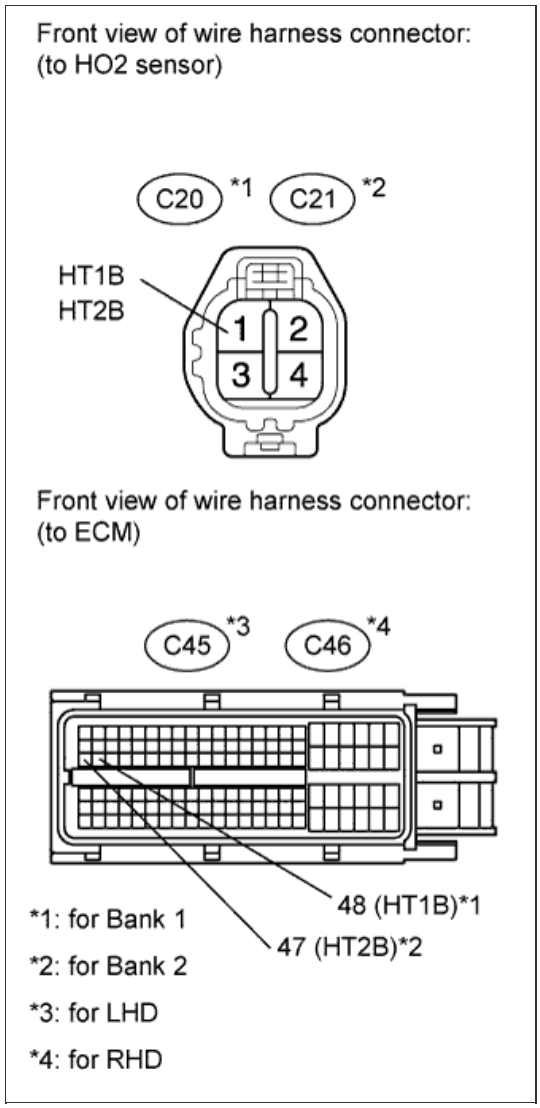
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C21-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 4

OK

3.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) -		10 kΩ or

Body ground	Always	higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

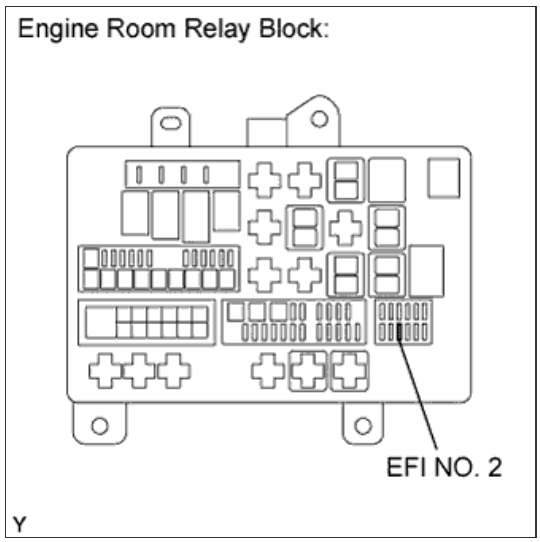
REPLACE ECM (Click here)



4.INSPECT FUSE (EFI NO. 2)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C20-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω
C21-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C20-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher
C21-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

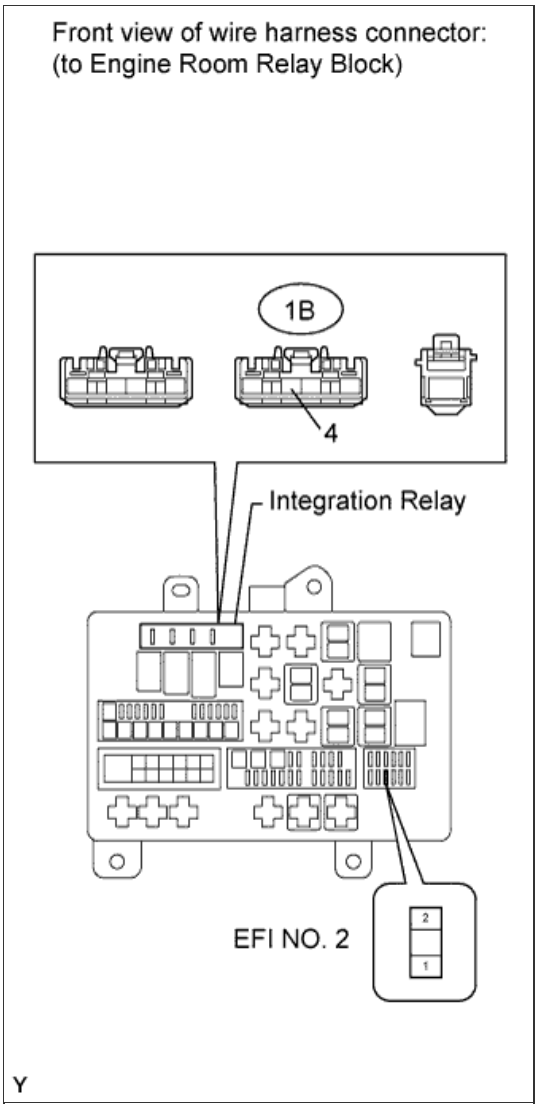
6.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Remove the integration relay from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) or 1B-4 - Body ground	Always	10 kΩ or higher

NG → REPLACE ENGINE ROOM RELAY BLOCK

OK

CHECK ECM POWER SOURCE CIRCUIT (Click here)

DTC P0420 Catalyst System Efficiency Below Threshold (Bank 1)

DTC P0430 Catalyst System Efficiency Below Threshold (Bank 2)

for Preparation Click here

MONITOR DESCRIPTION

The ECM uses sensors mounted in front of and behind the Three-Way Catalytic Converter (TWC) to monitor its efficiency.
The first sensor, the Air Fuel Ratio (A/F) sensor, sends pre-catalyst information to the ECM. The second sensor, the Heated Oxygen (HO2) sensor, sends post-catalyst information to the ECM.
In order to detect any deterioration in the TWC, the ECM calculates the Oxygen Storage Capacity (OSC) of the TWC. This calculation is based on the voltage output of the HO2 sensor while performing active air fuel ratio control.
The OSC value is an indication of the oxygen storage capacity of the TWC. When the vehicle is being driven with a warm engine, active air fuel ratio control is performed for approximately 15 to 20 seconds. When it is performed, the ECM deliberately sets the air fuel ratio to lean or rich levels. If a rich-lean cycle of the HO2 sensor is long, the OSC becomes greater. There is a direct correlation between the OSCs of the HO2 sensor and the TWC.
The ECM uses the OSC value to determine the state of the TWC. If any deterioration has occurred, it illuminates the MIL and sets a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0420	The OSC value is smaller than the standard value under active air fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • A/F sensor (bank 1 sensor 1) • HO2 sensor (bank 1 sensor 2) • Exhaust manifold (bank 1)(with TWC: front catalyst) • Front exhaust pipe assembly (with TWC: rear catalyst)
P0430	The OSC value is smaller than the standard value under active air fuel ratio control (2 trip detection logic).	• Gas leakage from exhaust system • A/F sensor (bank 2 sensor 1) • HO2 sensor (bank 2 sensor 2) • Exhaust manifold (bank 2)(with TWC: front catalyst) • Front No. 2 exhaust pipe assembly (with TWC: rear catalyst)

HINT:

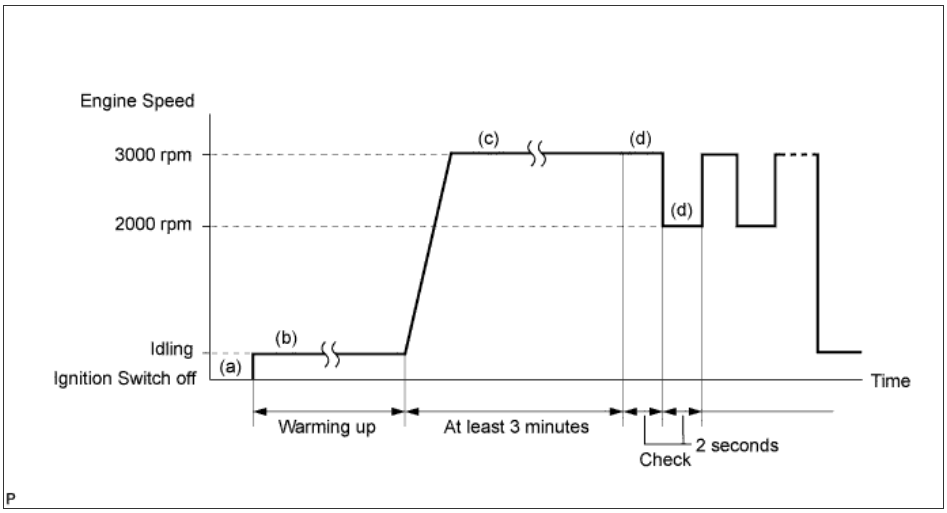
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that does not include cylinder No. 1.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**



CATALYST LOCATION

CONDITIONING FOR SENSOR TESTING

HINT:

Perform the operation with the engine speeds and time durations described below prior to checking the waveforms of the A/F and HO2 sensors. This is in order to activate the sensors sufficiently to obtain the appropriate inspection results.

(a) Connect the intelligent tester to the DLC3.
(b) Start the engine and warm it up with all the accessories switched OFF until the engine coolant temperature stabilizes.
(c) Run the engine at an engine speed of between 2500 rpm and 3000 rpm for at least 3 minutes.
(d) While alternately running the engine at 3000 rpm for 2 seconds and 2000 rpm for 2 seconds, check the waveforms of the A/F and HO2 sensors using the intelligent tester.

HINT:

- **If either voltage output of the Air Fuel Ratio (A/F) or Heated Oxygen (HO2) sensor does not fluctuate, or there is noise in the waveform of either sensor, the sensor may be malfunctioning.**
- **If the voltage outputs of both the sensors remain lean or rich, the air fuel ratio may be extremely lean or rich. In such cases, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
- **If the Three-Way Catalytic Converter (TWC) has deteriorated, the HO2 sensor (located behind the TWC) voltage output fluctuates up and down frequently, even under normal driving conditions (active air fuel ratio control is not performed).**

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1	+25%	Rich	Less than 3.1 V

(A/F)			
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0420 AND/OR P0430)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read DTCs.

Result

Display (DTC Output)	Proceed to
P0420 and/or P0430	A
P0420 and/or P0430 and other DTCs	B

HINT:

If any DTCs other than P0420 or P0430 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (CONTROL THE INJECTION VOLUME FOR A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.

e. Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS, Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4

Result:

Status AFS Voltage B1S1 or AFS Voltage B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F and HO2 Sensors Condition	Misfire	Main Suspected Trouble Area	Proceed to
Lean/Rich	Lean/Rich	Normal	-	• **Three-Way Catalytic Converter (TWC)** • **Gas leakage from exhaust system**	A
Lean	Lean/Rich	A/F sensor malfunction	-	• **A/F sensor**	B
Rich	Lean/Rich	A/F sensor malfunction	-	• **A/F sensor**	
Lean/Rich	Lean	HO2 sensor malfunction	-	• **HO2 sensor** • **Gas leakage from exhaust system**	C
Lean/Rich	Rich	HO2 sensor malfunction	-	• **HO2 sensor** • **Gas leakage from exhaust system**	
Lean	Lean	Actual air fuel ratio lean	May occur	• **Extremely rich or lean actual air fuel ratio** • **Gas leakage from exhaust system**	A
Rich	Rich	Actual air fuel ratio rich	-	• **Extremely rich or lean actual air fuel ratio** • **Gas leakage from exhaust system**	

Lean: During Control the Injection Volume for A/F sensor, the A/F sensor output voltage (AFS) is consistently more than 3.4 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During Control the Injection Volume for A/F sensor, the AFS is consistently less than 3.1 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During Control the Injection Volume for A/F sensor of the Active Test, the output voltage of the HO2 sensor alternates correctly.

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **When any of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is below 0.3 A (1 trip detection logic).	• **Open in Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0038 P0058	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is higher than 2 A (1 trip detection logic).	• **Short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0141 P0161	The cumulative heater resistance correction value exceeds the acceptable threshold (2 trip detection logic).	• **Open or short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):

The ECM monitors the current applied to the HO2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM will determine that there is an open circuit in the heater. If the current is above the threshold value, the ECM will determine that there is a short circuit in the heater.

Example:

The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

Heated oxygen sensor heater performance (P0141 and P0161):

After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using the battery voltage and the current applied to the heater. If the resistance is above the threshold value, the ECM will determine that there is a malfunction in the HO2 sensor heater and store DTCs P0141 and P0161.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for Bank 1 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

for Bank 2 Sensor 2

Tester Connection	Condition	Specified Condition
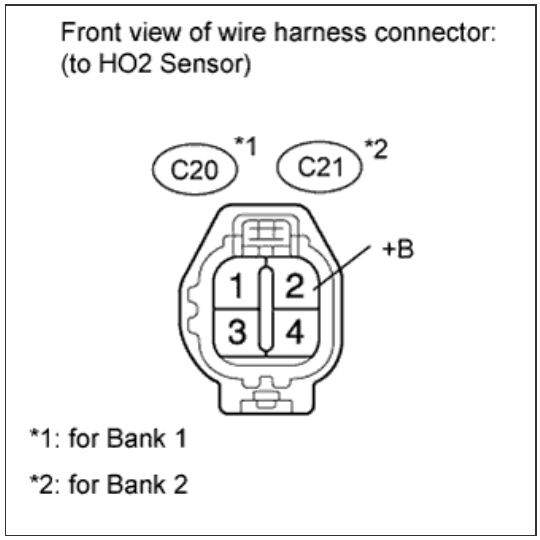
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω



1 (HT2B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Measure the voltage according to the value(s) in the table below.

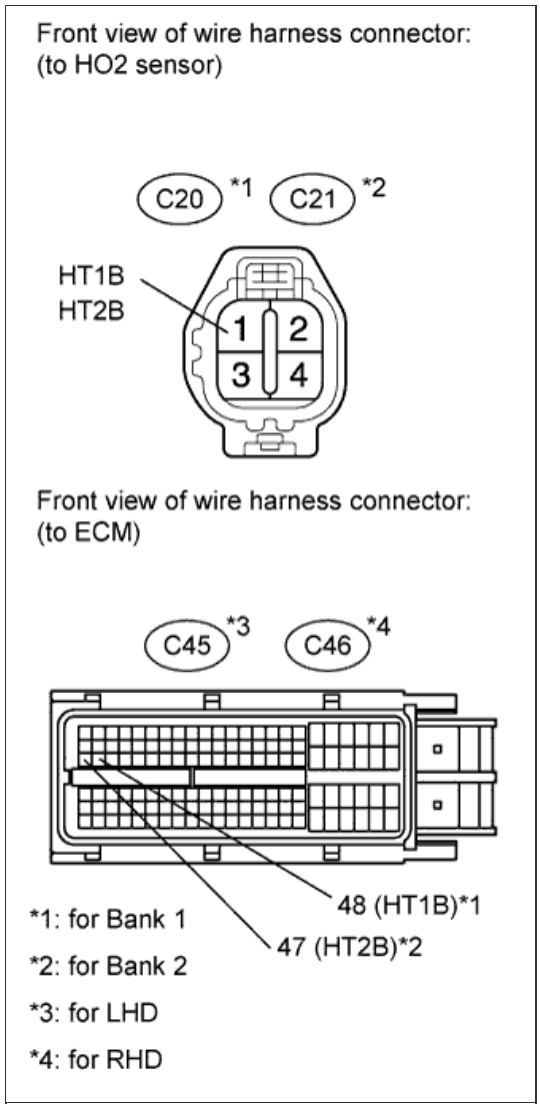
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C21-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 4

OK

3.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) -		10 kΩ or

Body ground	Always	higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

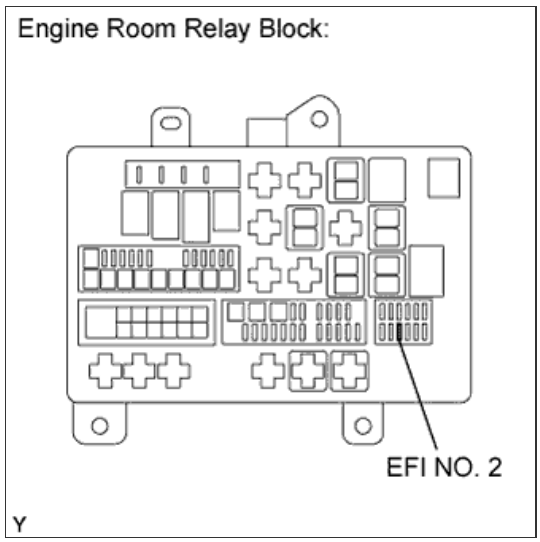
REPLACE ECM (Click here)



4.INSPECT FUSE (EFI NO. 2)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C20-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω
C21-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C20-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher
C21-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

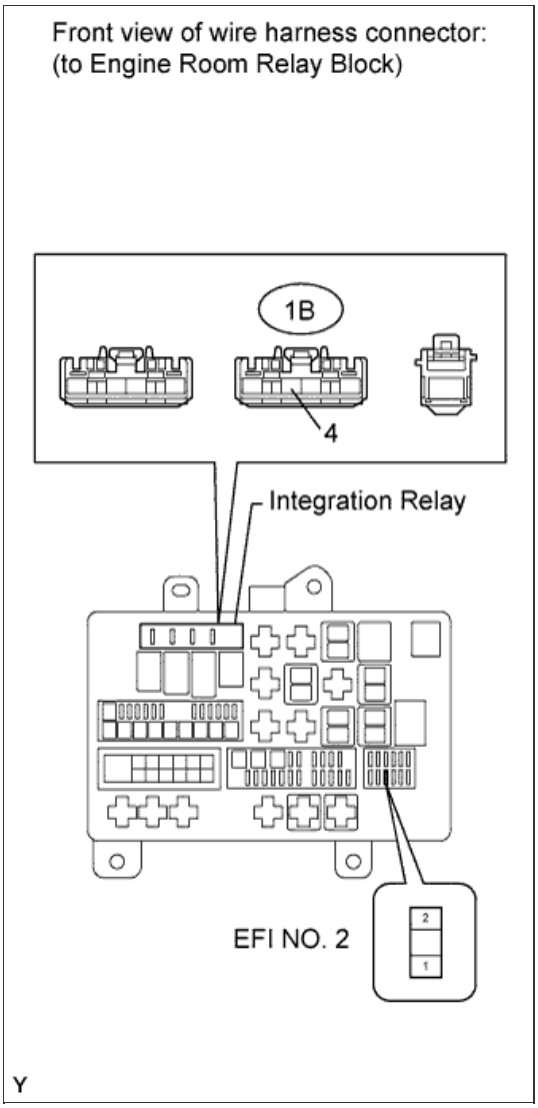
6.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Remove the integration relay from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) or 1B-4 - Body ground	Always	10 kΩ or higher

NG → REPLACE ENGINE ROOM RELAY BLOCK

OK

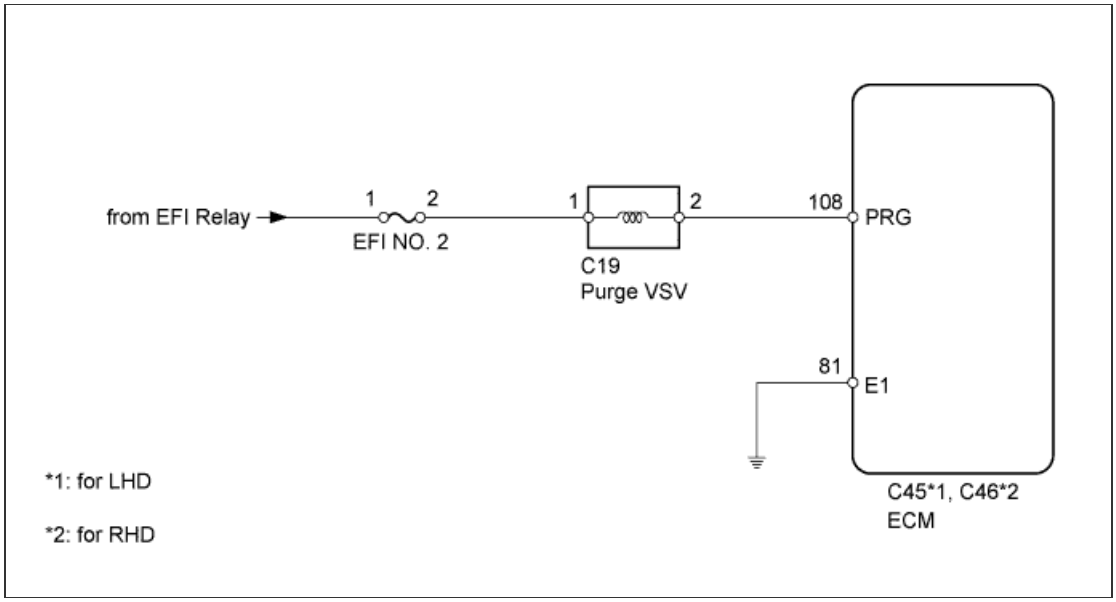
CHECK ECM POWER SOURCE CIRCUIT (Click here)

DTC P0443 Evaporative Emission Control System Purge Control Valve Circuit



for Preparation Click here

DESCRIPTION

To reduce HC emissions, evaporated fuel from the fuel tank is routed through a charcoal canister to the intake manifold for combustion in the cylinders. The ECM changes the duty signals to the purge VSV so that the intake amount of HC emissions is appropriate for driving conditions (engine load, engine speed, vehicle speed, etc.) after the engine is warmed up.

DTC Code	DTC Detection Condition	Trouble Area
P0443	The terminal voltage of the ECM output circuit does not correspond with the drive signals from the ECM to the purge VSV (1 trip detection logic).	• Open or short in purge VSV circuit • Purge VSV • ECM

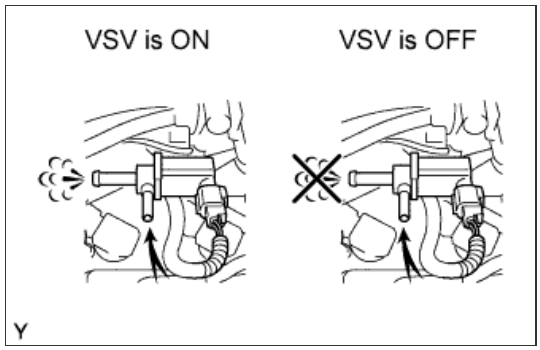
WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine conditions when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (ACTIVATE THE VSV FOR EVAP CONTROL)



a. Connect the intelligent tester to the DLC3.

b. Remove the vacuum hose of the purge VSV from the charcoal canister.

c. Start the engine and turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Activate the VSV for Evap Control.

e. When the purge VSV is operated using the intelligent tester, check whether the disconnected hose applies suction to your finger.

OK:

Tester Operation	Specified Condition
VSV is ON	Disconnected hose applies suction to finger
VSV is OFF	Disconnected hose applies no suction to finger

OK → CHECK FOR INTERMITTENT PROBLEMS (Click here)

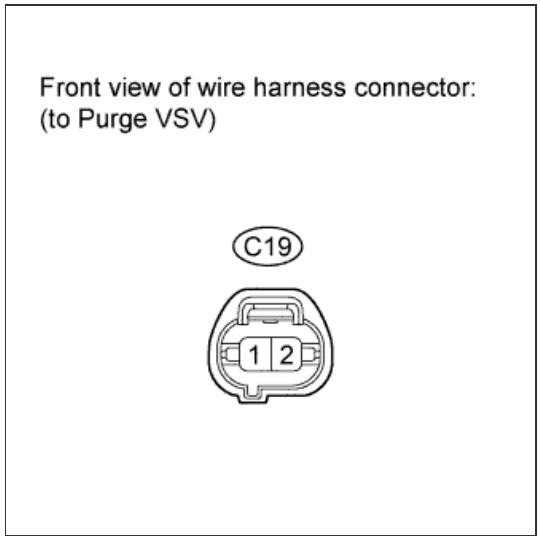
NG

2.INSPECT PURGE VSV

a. Inspect the purge VSV (Click here).

NG → REPLACE PURGE VSV (Click here)

OK



3.INSPECT PURGE VSV (POWER SOURCE VOLTAGE)

a. Disconnect the purge VSV connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C19-1 - Body ground	Ignition switch ON	11 to 14 V

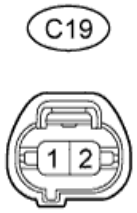
OK → Go to step 5

NG

4.CHECK HARNESS AND CONNECTOR (PURGE VSV - EFI NO. 2 FUSE)

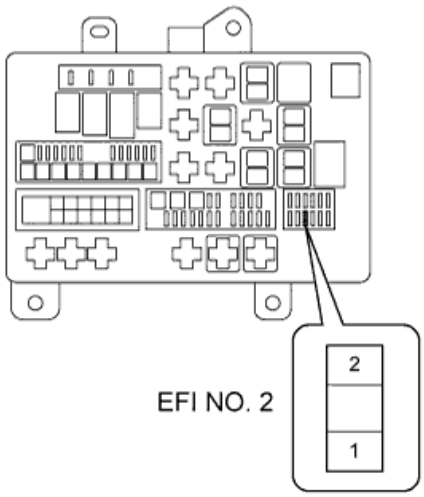
a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.



Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C19-1 - EFI NO. 2 fuse (2)	Always	Below 1 Ω



Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C19-1 or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

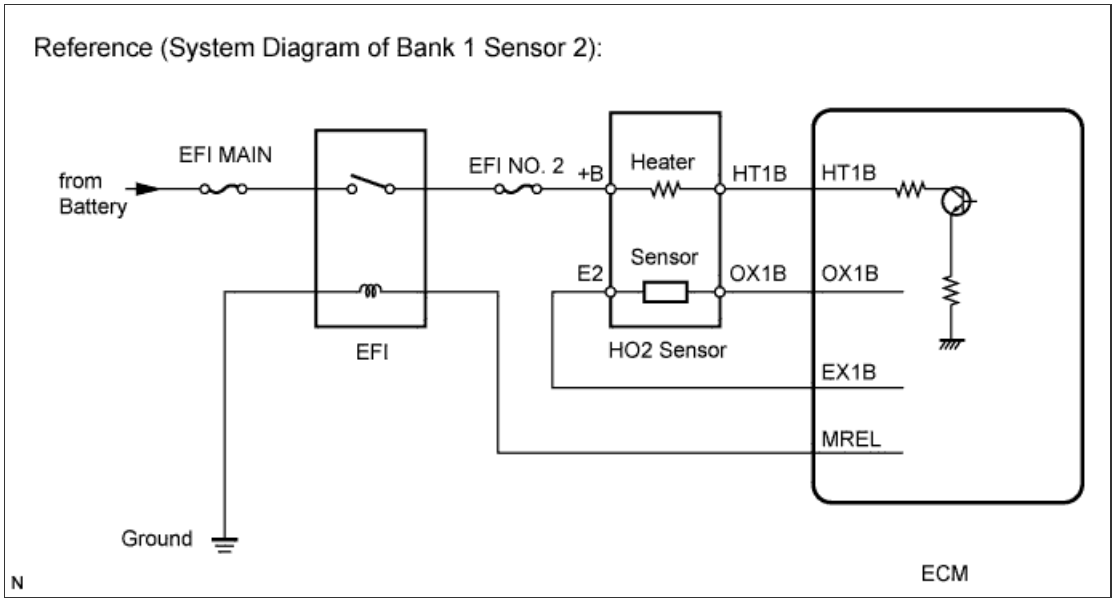
DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)

DTC P0141 Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)

DTC P0161 Oxygen Sensor Heater Circuit Malfunction (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **When any of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is below 0.3 A (1 trip detection logic).	• **Open in Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0038 P0058	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is higher than 2 A (1 trip detection logic).	• **Short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0141 P0161	The cumulative heater resistance correction value exceeds the acceptable threshold (2 trip detection logic).	• **Open or short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):

The ECM monitors the current applied to the HO2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM will determine that there is an open circuit in the heater. If the current is above the threshold value, the ECM will determine that there is a short circuit in the heater.

Example:

The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

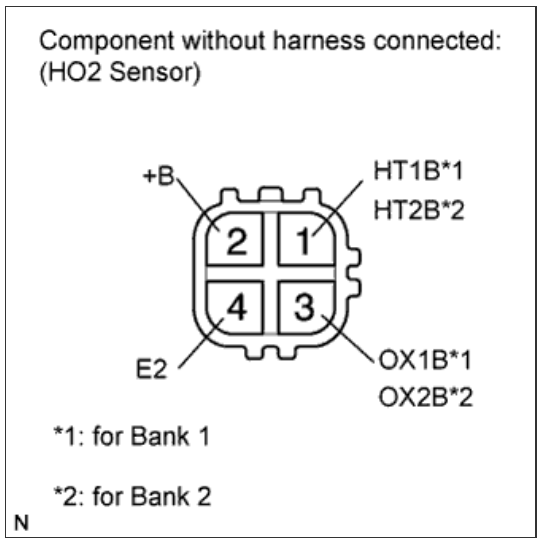
Heated oxygen sensor heater performance (P0141 and P0161):

After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using the battery voltage and the current applied to the heater. If the resistance is above the threshold value, the ECM will determine that there is a malfunction in the HO2 sensor heater and store DTCs P0141 and P0161.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

INSPECTION PROCEDURE



HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

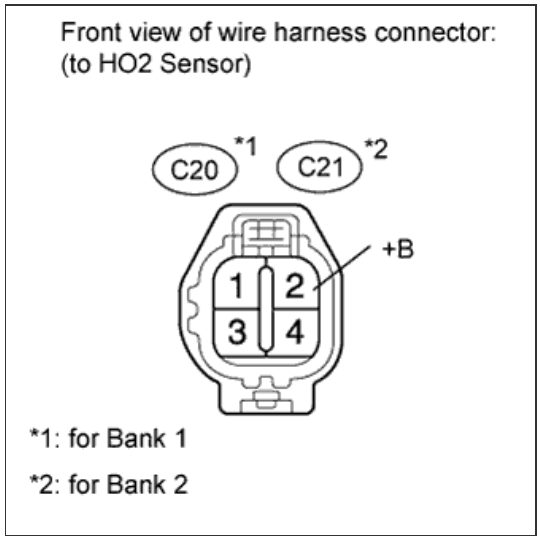
Standard Resistance:

for Bank 1 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

for Bank 2 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω



1 (HT2B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Measure the voltage according to the value(s) in the table below.

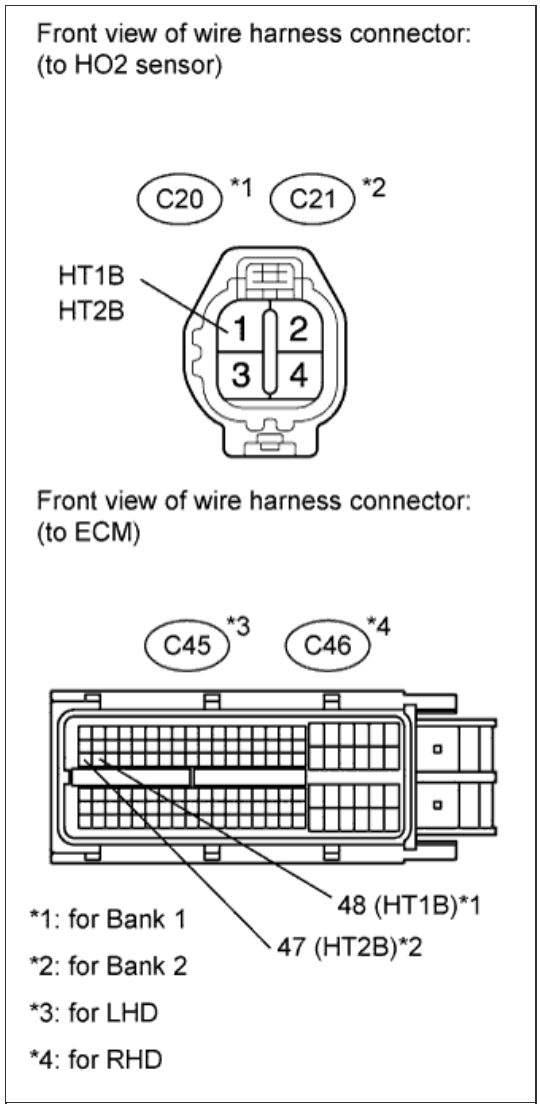
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C21-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 4

OK

3.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

for RHD

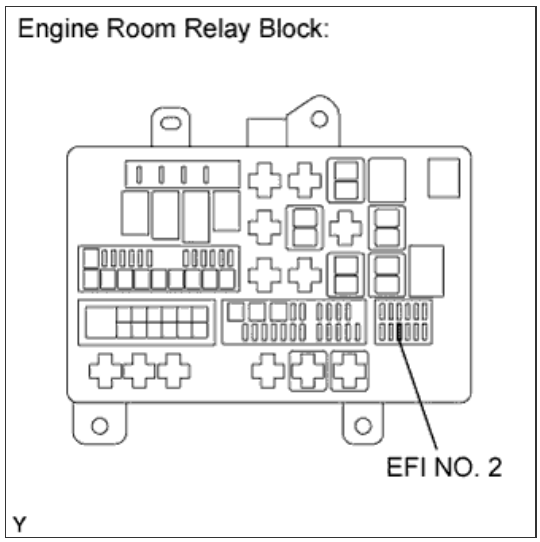
Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) -		10 kΩ or

Body ground	Always	higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)



4.INSPECT FUSE (EFI NO. 2)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

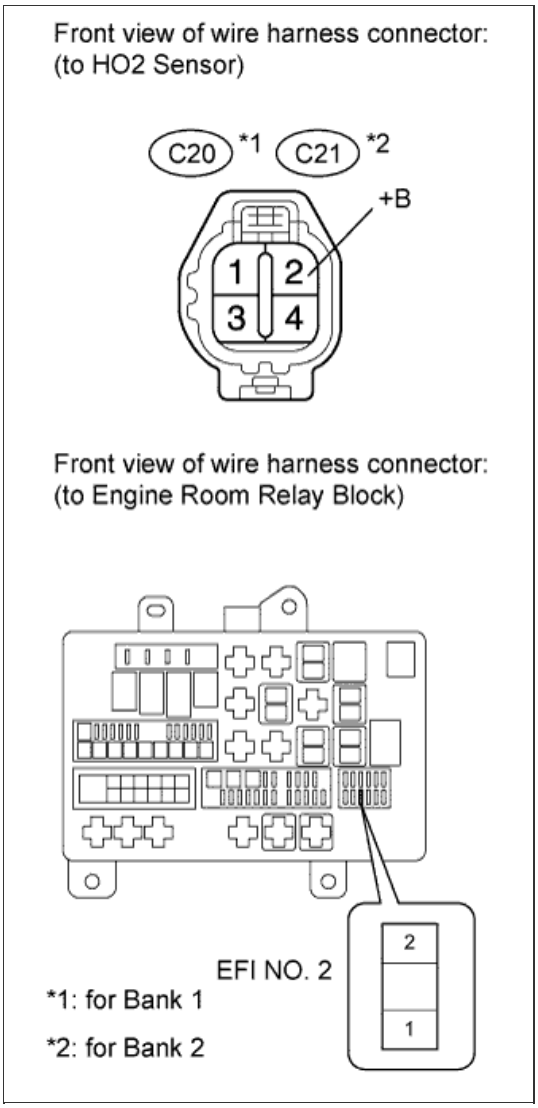
Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C20-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω
C21-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C20-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher
C21-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

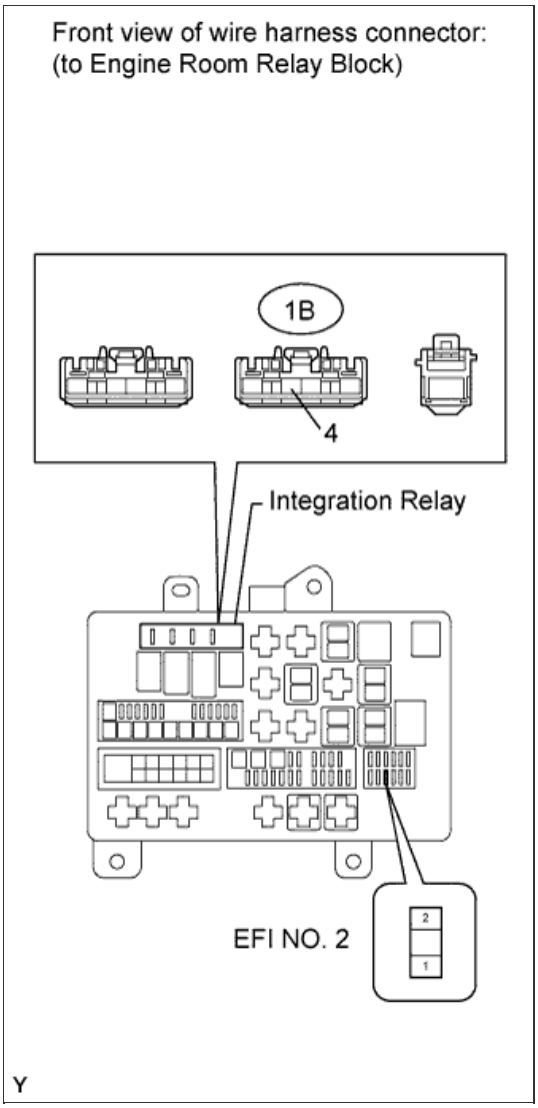
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Remove the integration relay from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

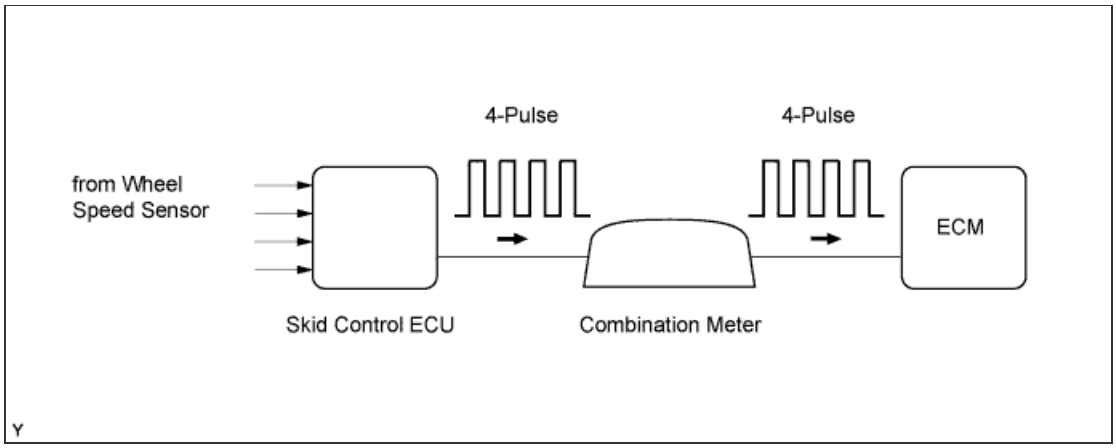
Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) or 1B-4 - Body ground	Always	10 kΩ or higher

NG → REPLACE ENGINE ROOM RELAY BLOCK

OK



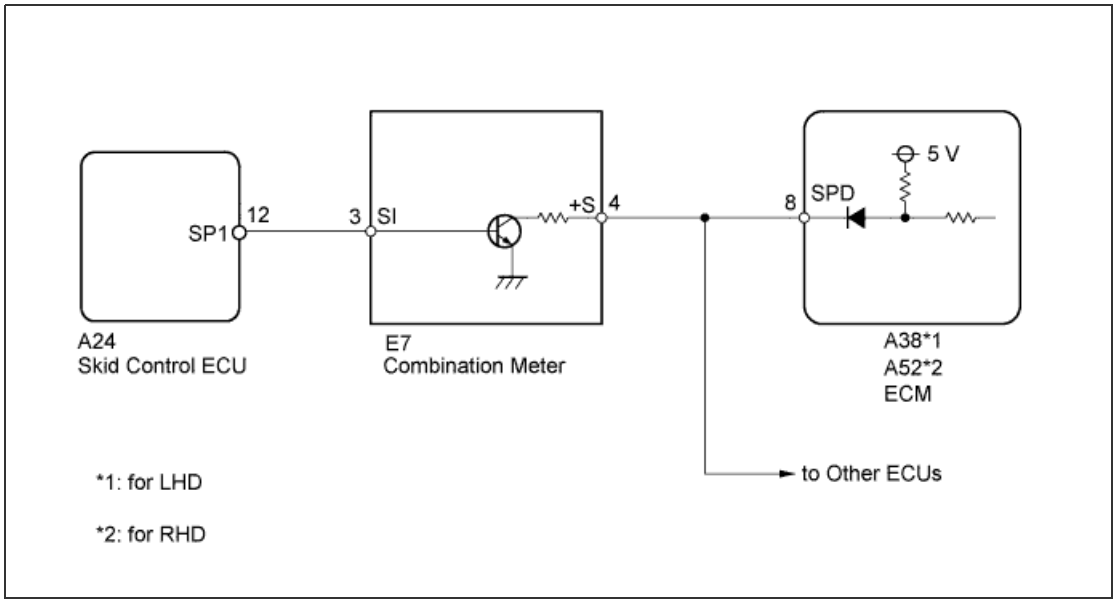
CHECK ECM POWER SOURCE CIRCUIT (Click here)

DTC P0500 Vehicle Speed Sensor "A"

for Preparation Click here

DESCRIPTION

The speed sensor detects the wheel speed and sends the appropriate signals to the skid control ECU. The skid control ECU converts these wheel speed signals into a 4-pulse signal and outputs it to the ECM via the combination meter. The ECM determines the vehicle speed based on the frequency of these pulse signals.



DTC Code	DTC Detection Condition	Trouble Area
P0500	While the vehicle is being driven, no vehicle speed sensor signal is transmitted to the ECM (2 trip detection logic).	• Open or short in speed signal circuit • Combination meter • ECM

MONITOR DESCRIPTION

The ECM assumes that the vehicle is being driven when the indicated engine speed is more than 2300 rpm and 30 seconds have elapsed since the Park/Neutral Position (PNP) switch was turned off. If there is no speed signal from the combination meter despite these conditions being met, the ECM interprets this as a malfunction in the speed signal circuit. The ECM then illuminates the MIL and stores the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When

troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK OPERATION OF SPEEDOMETER

a. Drive the vehicle and check whether the operation of the speedometer in the combination meter is normal.

HINT:

- **The vehicle speed sensor is operating normally if the speedometer reading is normal.**
- **If the speedometer does not operate, check it by following the procedure described in Speedometer Malfunction.**

NG → **GO TO MALFUNCTION IN SPEEDOMETER (Click here)**

OK

2.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Vehicle Speed.

e. Drive the vehicle.

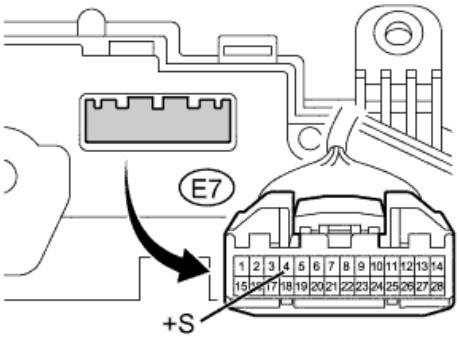
f. Read the value displayed on the tester.

OK:
Vehicle speeds displayed on tester and speedometer display are equal.

NG → **Go to step 3**

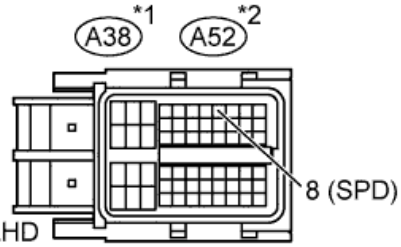
OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)



3.CHECK HARNESS AND CONNECTOR (COMBINATION METER ASSEMBLY - ECM)

a. Disconnect the combination meter connector.



b. Disconnect the ECM connector.

c. Measure the resistance according the value(s) in the table below.

Front view of wire harness connector:
(to Combination Meter)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) - A38-8 (SPD)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) - A52-8 (SPD)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) or A38-8 (SPD) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
E7-4 (+S) or A52-8 (SPD) - Body ground	Always	10 kΩ or higher

HINT:

If the wire has a short, check the speed signal circuit in other systems related to the vehicle speed signal (e.g. tire pressure warning system, audio system, etc.).

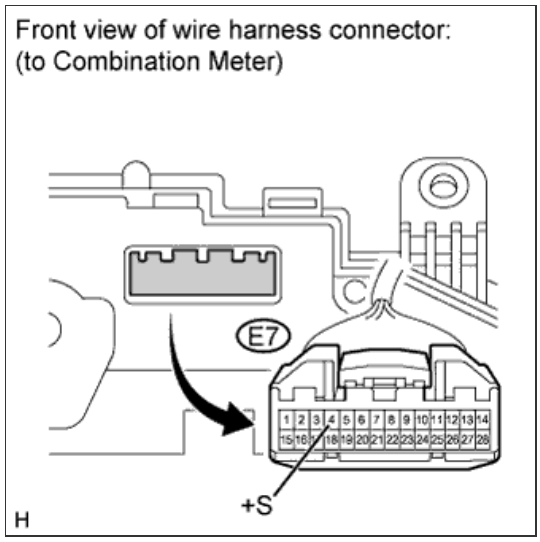
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (OTHER SYSTEMS RELATED TO SPEED SIGNAL)

OK

4.CHECK COMBINATION METER ASSEMBLY (+S VOLTAGE)

a. Disconnect the combination meter connector.

HINT:



Disconnect the ECU connectors on the other systems related to the speed signal (but the ECM connectors must be connected).

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
E7-4 (+S) - Body ground	Ignition switch ON	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

5.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL OUTPUT WAVEFORM)

a. Remove the combination meter.

b. Connect the combination meter connector.

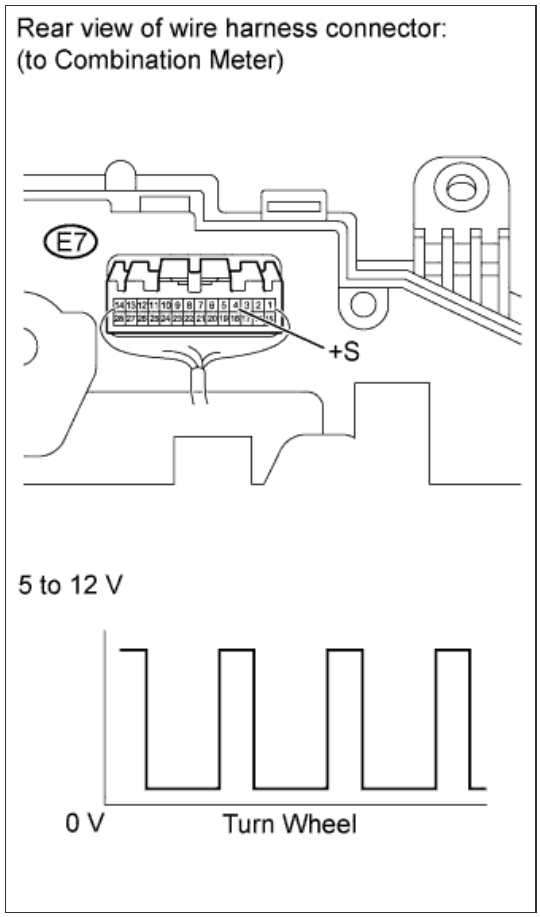
c. Move the shift lever to the N.

d. Jack up the vehicle.

e. Turn the ignition switch to ON.

f. Check the voltage between the terminal of the combination meter and the body ground while a wheel is turned slowly.

Standard Voltage:



Tester Connection	Switch condition	Specified Condition
E7-4 (+S) - Body ground	Ignition switch ON	Voltage generated intermittently

HINT:

- **The output voltage should fluctuate up and down, similarly to the diagram, when a wheel is turned slowly.**
- **A voltage of 12 V or 5 V is output from each ECU and then input to the combination meter assembly.**

HINT:

The output voltage should fluctuate up and down, similarly to the diagram, when a wheel is turned slowly.

NG → Go to step 6

OK

REPLACE ECM (Click here)

6.CHECK COMBINATION METER ASSEMBLY (SPD SIGNAL INPUT WAVEFORM)

a. Remove the combination meter.

b. Connect the combination meter connector.

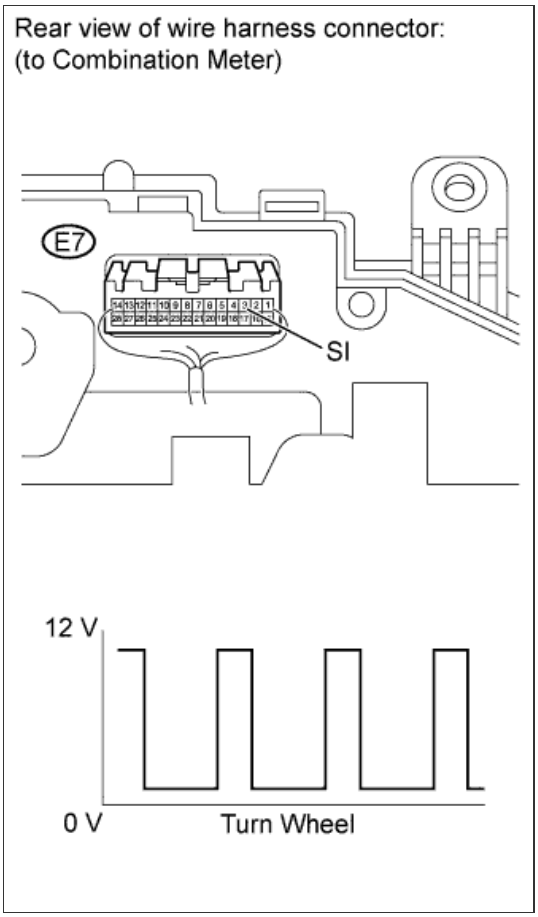
c. Move the shift lever to the N.

d. Jack up the vehicle.

e. Turn the ignition switch to ON.

f. Check the voltage between the terminal of the combination meter and the body ground while a wheel is turned slowly.

Standard Voltage:



Tester Connection	Switch condition	Specified Condition
E7-4 (+S) - Body ground	Ignition switch ON	Voltage generated intermittently

HINT:

The output voltage should fluctuate up and down, similarly to the diagram, when a wheel is turned slowly.

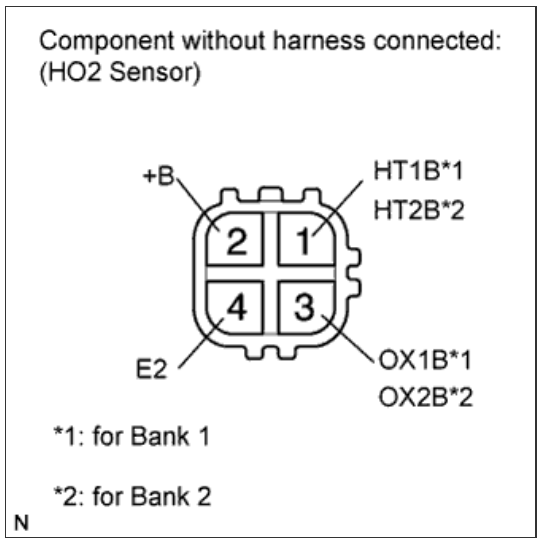
INSPECTION PROCEDURE



HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

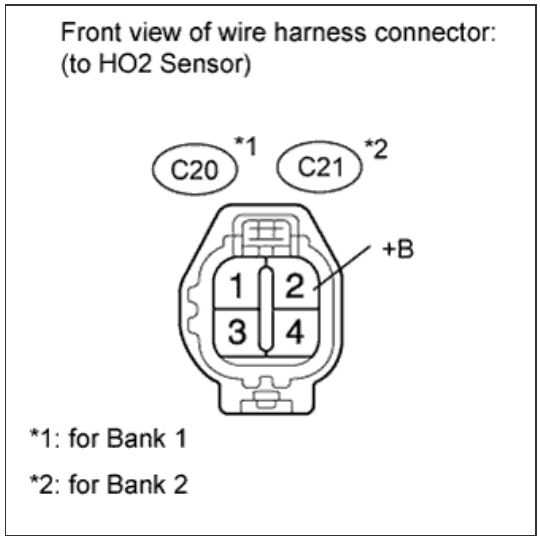
Standard Resistance:

for Bank 1 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

for Bank 2 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω



1 (HT2B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Measure the voltage according to the value(s) in the table below.

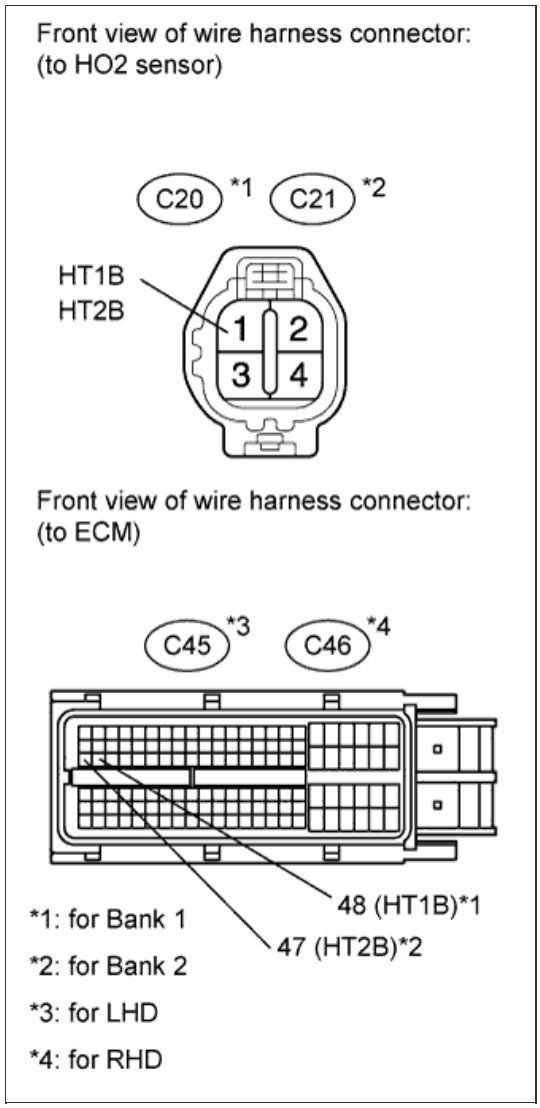
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C21-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 4

OK

3.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

for RHD

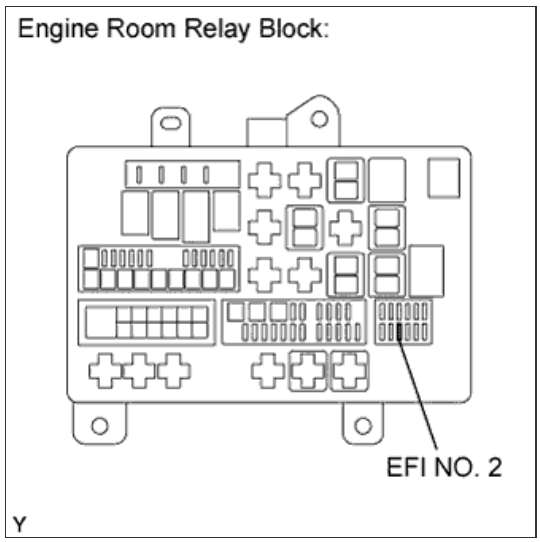
Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) -		10 kΩ or

Body ground	Always	higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)



4.INSPECT FUSE (EFI NO. 2)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

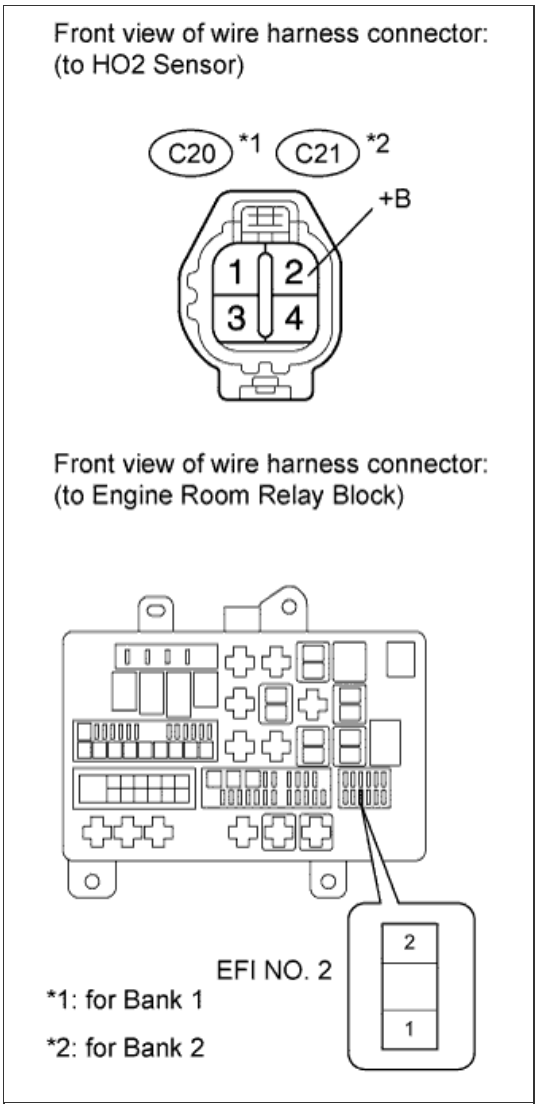
Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C20-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω
C21-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C20-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher
C21-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

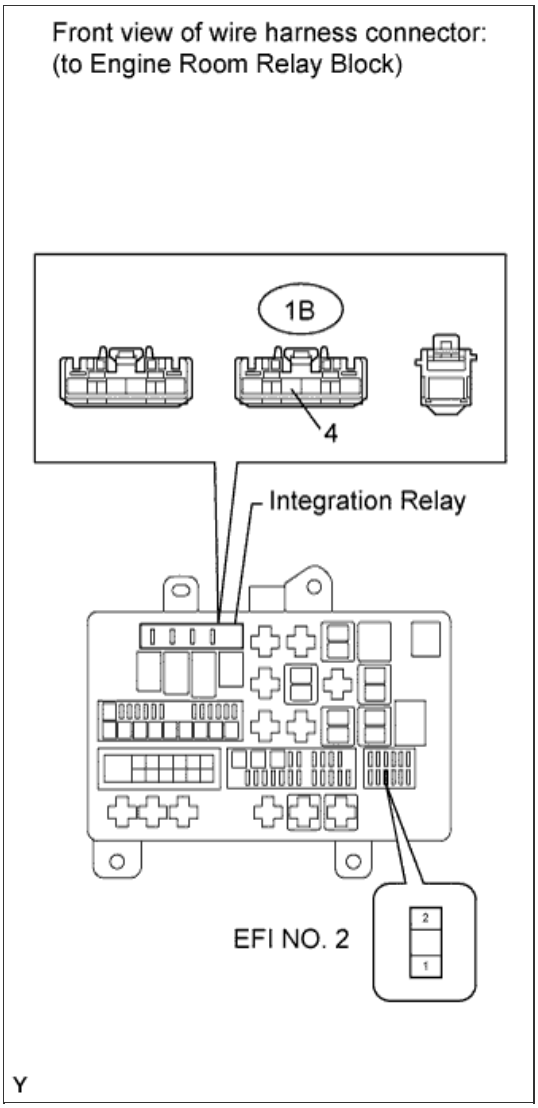
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Remove the integration relay from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) or 1B-4 - Body ground	Always	10 kΩ or higher

NG → REPLACE ENGINE ROOM RELAY BLOCK

OK

CHECK ECM POWER SOURCE CIRCUIT (Click here)

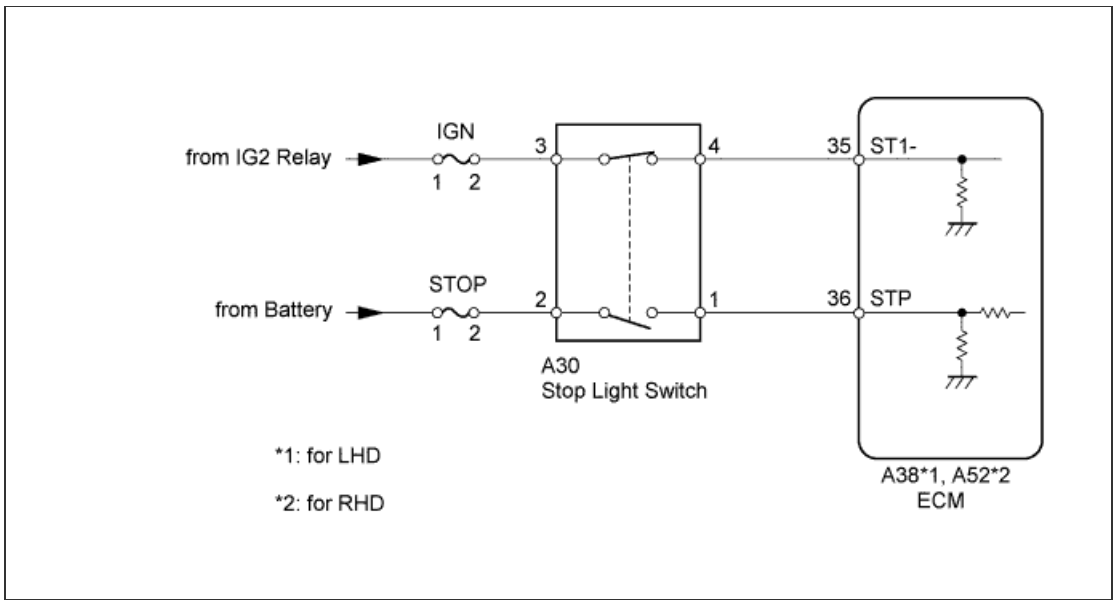
DTC P0504 Brake Switch "A" / "B" Correlation

for Preparation Click here

DESCRIPTION

The stop light switch is a duplex system that transmits two signals: STP and ST1-. These two signals are used by the ECM to monitor whether or not the brake system is working properly. If the signals, which indicate the brake pedal is being depressed and released, are detected simultaneously, the ECM interprets this as a malfunction in the stop light switch and stores the DTC.

HINT:



The normal signal conditions are as shown in the table below.

Signal (ECM Terminal)	Brake Pedal Released	In Transition	Brake Pedal Depressed
STP	OFF	ON	ON
ST1-	ON	ON	OFF

- [OFF] denotes ground potential.
- [ON] denotes battery potential (+B).
- On the intelligent tester, both the Data List items Stop Light Switch and ST1 are ON when the brake pedal is depressed because the characteristics of ST1 indication are the opposite of the Stop Light Switch indication.

DTC Code	DTC Detection Condition	Trouble Area
P0504	Conditions (a), (b) and (c) continue for 0.5 seconds or more (1 trip detection logic): (a) The ignition switch is ON. (b) The brake pedal is released. (c) The STP signal is OFF when the ST1- signal is OFF.	• Short in stop light switch signal circuit • STOP fuse • IGN fuse • Stop light switch • ECM

WIRING DIAGRAM

INSPECTION PROCEDURE

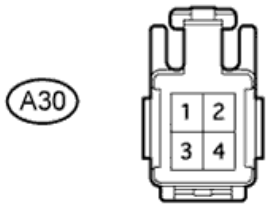
HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **STP signal conditions can be checked using the intelligent tester.**
    1. **Connect the intelligent tester to the DLC3.**
    2. **Turn the ignition switch to ON.**
    3. **Turn the tester on.**
    4. **Enter the following menus: Powertrain / Engine and ECT / Data List / Stop Light Switch.**

5. Check the STP signal when the brake pedal is depressed and released.

Brake Pedal Operation	Specified Condition
Depressed	STP signal ON
Released	STP signal OFF

1.CHECK STOP LIGHT SWITCH ASSEMBLY (TERMINAL B VOLTAGE)



a. Disconnect the stop light switch connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

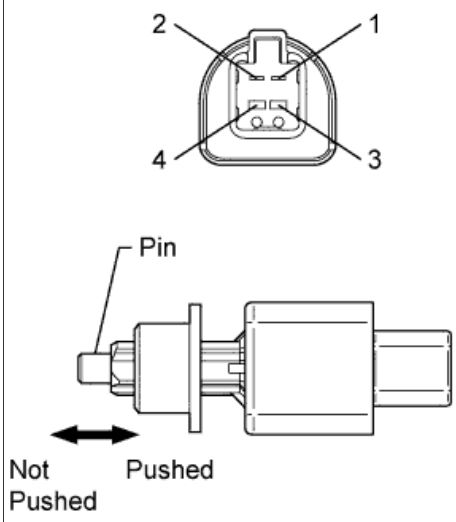
Tester Connection	Condition	Specified Condition
A30-2 - Body ground	Always	11 to 14 V
A30-3 - Body ground	Ignition switch ON	11 to 14 V

Front view of wire harness connector:
(to Stop Light Switch)

NG → Go to step 4

OK

2.INSPECT STOP LIGHT SWITCH ASSEMBLY



a. Remove the stop light switch.

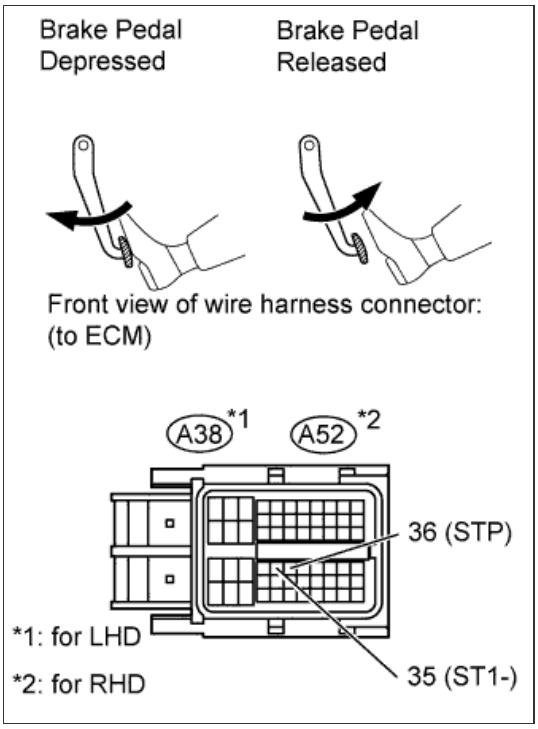
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Switch Condition	Specified Condition
1 - 2	Switch pin not pushed	Below 1 Ω
	Switch pin pushed	10 kΩ or higher
3 - 4	Switch pin not pushed	10 kΩ or higher
	Switch pin pushed	Below 1 Ω

Component without harness connected:
(Stop Light Switch)

NG → REPLACE STOP LIGHT SWITCH ASSEMBLY (Click here)



OK

3.CHECK ECM (STP AND ST1 - VOLTAGE)

a. Disconnect the ECM connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Condition	Specified Condition
A38-35 (ST1-) - Body ground	Brake pedal released	11 to 14 V
	Brake pedal depressed	0 to 3 V
A38-36 (STP) - Body ground	Brake pedal released	0 to 3 V
	Brake pedal depressed	11 to 14 V

for RHD

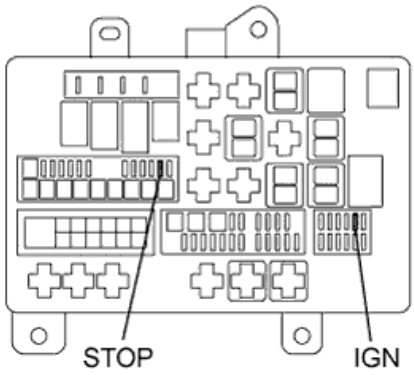
Tester Connection	Condition	Specified Condition
A52-35 (ST1-) - Body ground	Brake pedal released	11 to 14 V
	Brake pedal depressed	0 to 3 V
A52-36 (STP) - Body ground	Brake pedal released	0 to 3 V
	Brake pedal depressed	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

4.INSPECT FUSE (STOP, IGN)



a. Remove the STOP and IGN fuses from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
STOP fuse	Always	Below 1 Ω
IGN fuse		

Engine Room Relay Block:

Y

NG → CHECK FOR SHORTS IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR

DTC P0037 Oxygen Sensor Heater Control Circuit Low (Bank 1 Sensor 2)

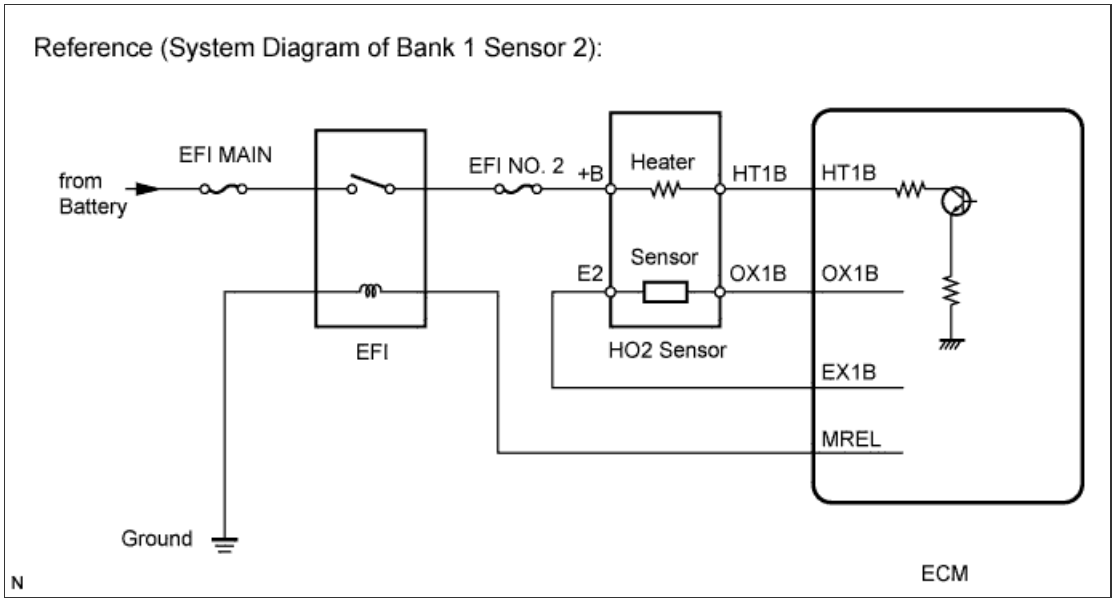
DTC P0038 Oxygen Sensor Heater Control Circuit High (Bank 1 Sensor 2)

DTC P0057 Oxygen Sensor Heater Control Circuit Low (Bank 2 Sensor 2)

DTC P0058 Oxygen Sensor Heater Control Circuit High (Bank 2 Sensor 2)

DTC P0141 Oxygen Sensor Heater Circuit Malfunction (Bank 1 Sensor 2)

DTC P0161 Oxygen Sensor Heater Circuit Malfunction (Bank 2 Sensor 2)



for Preparation Click here

DESCRIPTION

Refer to DTC P0136 (Click here).

HINT:

- **Sensor 2 refers to the sensor mounted behind the Three-Way Catalytic Converter (TWC) and located far from the engine assembly.**
- **When any of these DTCs are stored, the ECM enters fail-safe mode. The ECM turns off the Heated Oxygen (HO2) sensor heater in fail-safe mode. Fail-safe mode continues until the ignition switch is turned off.**
- **The ECM provides a pulse width modulated control circuit to adjust the current through the heater. The HO2 sensor heater circuit uses a relay on the +B side of the circuit.**

DTC Code	DTC Detection Condition	Trouble Area
P0037 P0057	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is below 0.3 A (1 trip detection logic).	• **Open in Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0038 P0058	The Heated Oxygen (HO2) sensor heater (bank 1, 2 sensor 2) current is higher than 2 A (1 trip detection logic).	• **Short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**
P0141 P0161	The cumulative heater resistance correction value exceeds the acceptable threshold (2 trip detection logic).	• **Open or short in HO2 sensor heater (bank 1, 2 sensor 2) circuit** • **HO2 sensor heater (bank 1, 2 sensor 2)** • **EFI NO. 2 fuse** • **ECM**

HINT:

- **Bank 1 refers to the bank that includes the No. 1 cylinder.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Sensor 1 refers to the sensor closest to the engine assembly.**
- **Sensor 2 refers to the sensor farthest away from the engine assembly.**

MONITOR DESCRIPTION

The sensing portion of the Heated Oxygen (HO2) sensor has a zirconia element which is used to detect the oxygen concentration in the exhaust gas. If the zirconia element is at the appropriate temperature, and the difference between the oxygen concentrations surrounding the inside and outside surfaces of the sensor is large, the zirconia element generates voltage signals. In order to increase the oxygen concentration detecting capacity of the zirconia element, the ECM supplements the heat from the exhaust with heat from a heating element inside the sensor.

Heated oxygen sensor heater range check (P0037, P0038, P0057 and P0058):

The ECM monitors the current applied to the HO2 sensor heater to check the heater for malfunctions. If the current is below the threshold value, the ECM will determine that there is an open circuit in the heater. If the current is above the threshold value, the ECM will determine that there is a short circuit in the heater.

Example:

The ECM stores DTC P0038 or P0058 when the current in the HO2 sensor heater is higher than 2 A. Conversely, when the heater current is below 0.3 A, DTC P0037 or P0057 is stored.

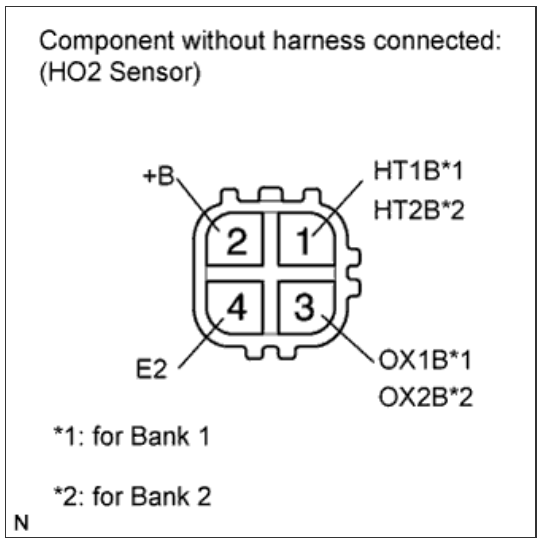
Heated oxygen sensor heater performance (P0141 and P0161):

After the accumulated heater ON time exceeds 100 seconds, the ECM calculates the heater resistance using the battery voltage and the current applied to the heater. If the resistance is above the threshold value, the ECM will determine that there is a malfunction in the HO2 sensor heater and store DTCs P0141 and P0161.

WIRING DIAGRAM

Refer to DTC P0136 (Click here).

INSPECTION PROCEDURE



HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen (HO2) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

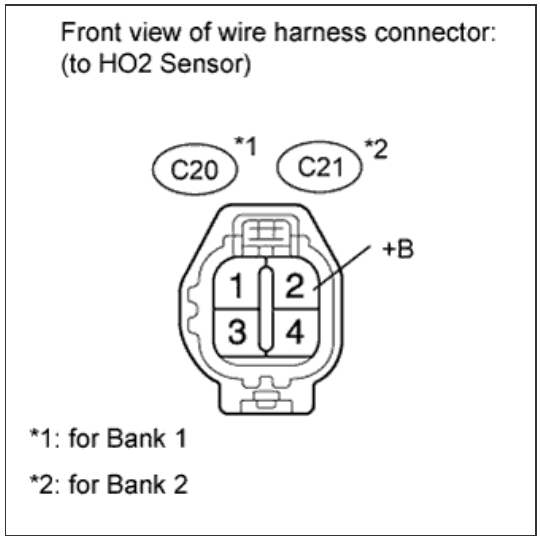
Standard Resistance:

for Bank 1 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

for Bank 2 Sensor 2

Tester Connection	Condition	Specified Condition
1 (HT2B) - 2 (+B)	20°C (68°F)	11 to 16 Ω



1 (HT2B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

2.CHECK TERMINAL VOLTAGE (+B OF HO2 SENSOR)

a. Measure the voltage according to the value(s) in the table below.

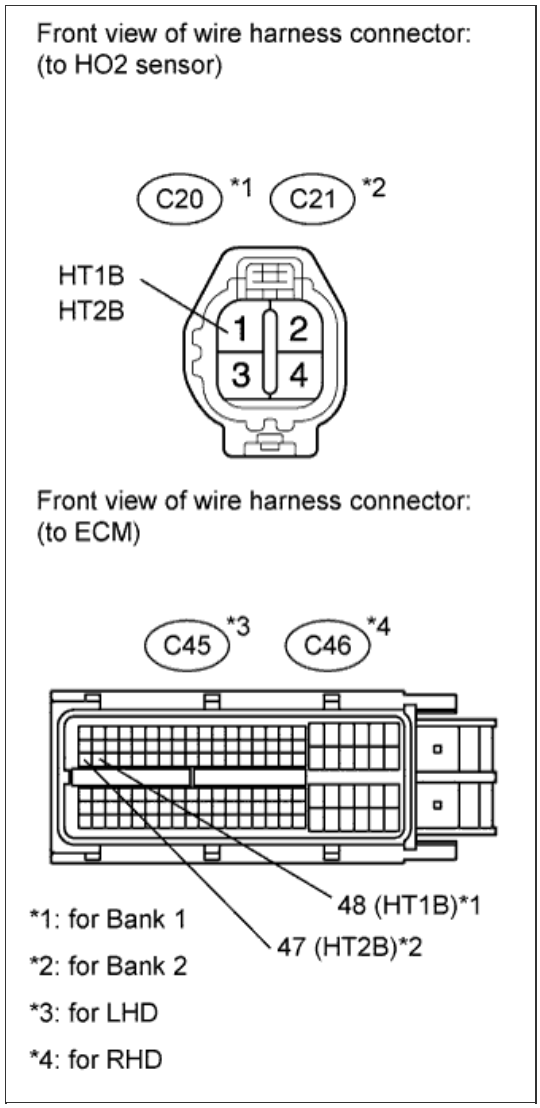
Standard Voltage:

for Bank 1 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C20-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

for Bank 2 Sensor 1

Tester Connection	Switch Condition	Specified Condition
C21-2 (+B) - Body ground	Ignition switch ON	11 to 14 V



NG → Go to step 4

OK

3.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

for RHD

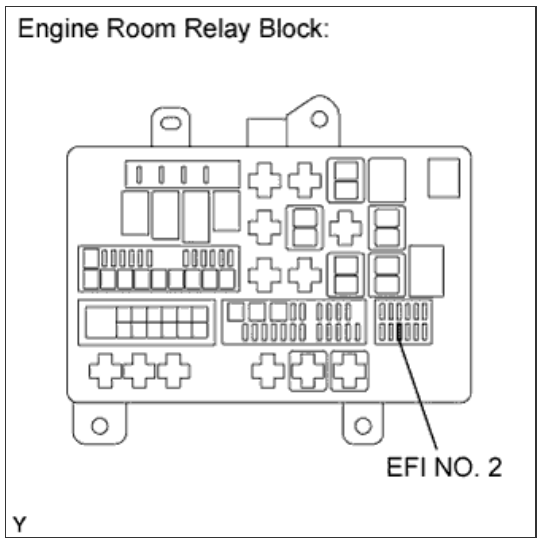
Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) -		10 kΩ or

Body ground	Always	higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)



4.INSPECT FUSE (EFI NO. 2)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

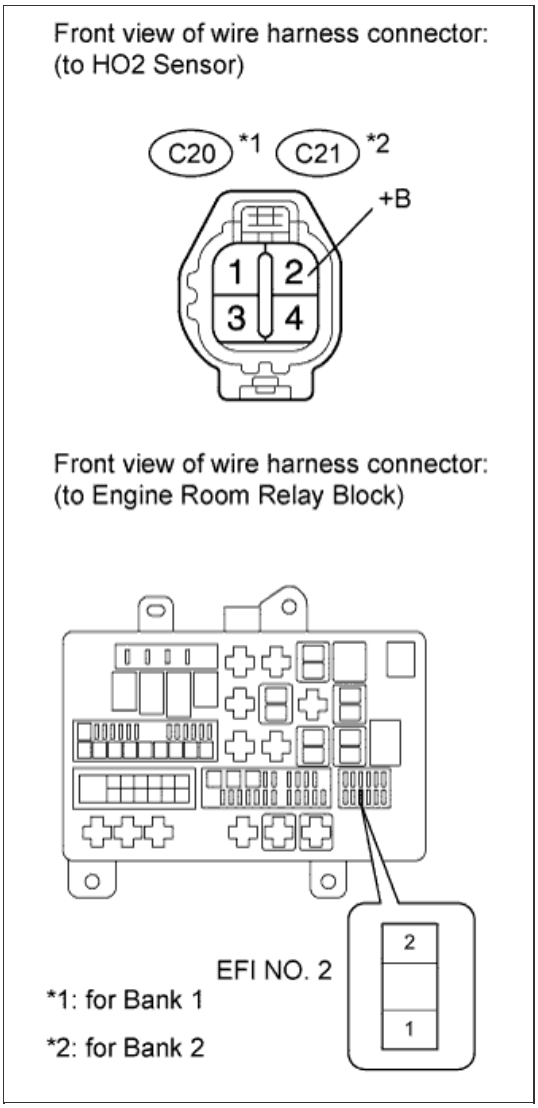
Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C20-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω
C21-2 (+B) - EFI NO. 2 fuse (2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C20-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher
C21-2 (+B) or EFI NO. 2 fuse (2) - Body ground	Always	10 kΩ or higher

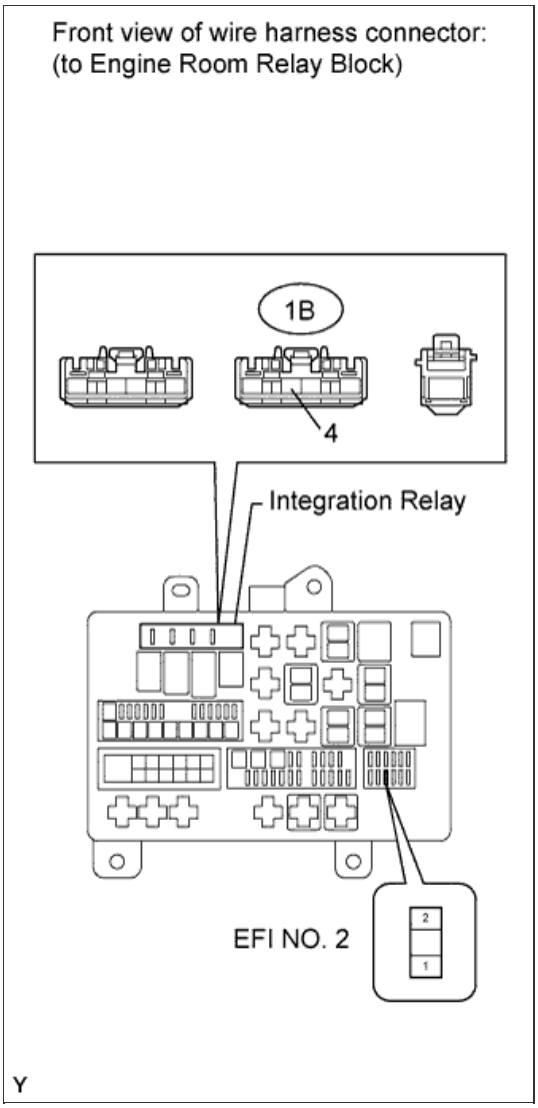
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

6.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - EFI NO. 2 FUSE)

a. Remove the EFI NO. 2 fuse from the engine room relay block.

b. Remove the integration relay from the engine room relay block.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
EFI NO. 2 fuse (1) or 1B-4 - Body ground	Always	10 kΩ or higher

NG → REPLACE ENGINE ROOM RELAY BLOCK

OK

CHECK ECM POWER SOURCE CIRCUIT (Click here)

DTC P0505 Idle Control System Malfunction

for Preparation Click here

DESCRIPTION

The idling speed is controlled by the ETCS (Electronic Throttle Control System). The ETCS is comprised of: 1) a one-valve-type throttle body; 2) the throttle actuator, which operates the throttle valve; 3) the Throttle Position (TP) sensor, which detects the opening angle of the throttle valve; 4) the Accelerator Pedal Position (APP) sensor, which detects the accelerator pedal position; and 5) the ECM, which controls the ETCS. Based on the target idling speed, the ECM controls the throttle actuator to provide the proper throttle valve opening angle.

DTC Code	DTC Detection Conditions	Trouble Areas
P0505	The idling speed continues to vary greatly from the target idling speed (2 trip detection logic).	• ETCS • Air induction system • PCV hose connection • ECM

INSPECTION PROCEDURE

HINT:

- **The following conditions may also cause DTC P0505 to be stored:**
  1. **The floor carpet overlapping onto the accelerator pedal, causing the accelerator pedal to be slightly depressed and therefore the throttle valve position to be slightly open.**
  2. **The accelerator pedal being not fully released.**
- **Read freeze frame data using the intelligent tester. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was moving or stationary, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0505)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P0505	A
P0505 and other DTCs	B

HINT:

If any DTCs other than P0505 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

3.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage.

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK ↓

4.CHECK THROTTLE VALVE

a. Check the throttle valve condition.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

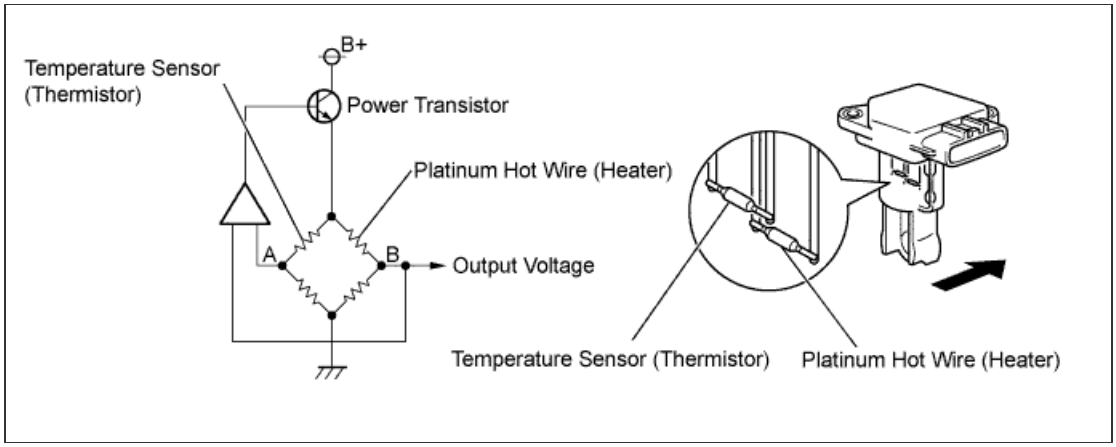
NG → REPLACE THROTTLE WITH MOTOR BODY ASSEMBLY (Click here)

OK ↓

REPLACE ECM (Click here)

DTC P0102 Mass or Volume Air Flow Circuit Low Input

DTC P0103 Mass or Volume Air Flow Circuit High Input



for Preparation Click here

DESCRIPTION

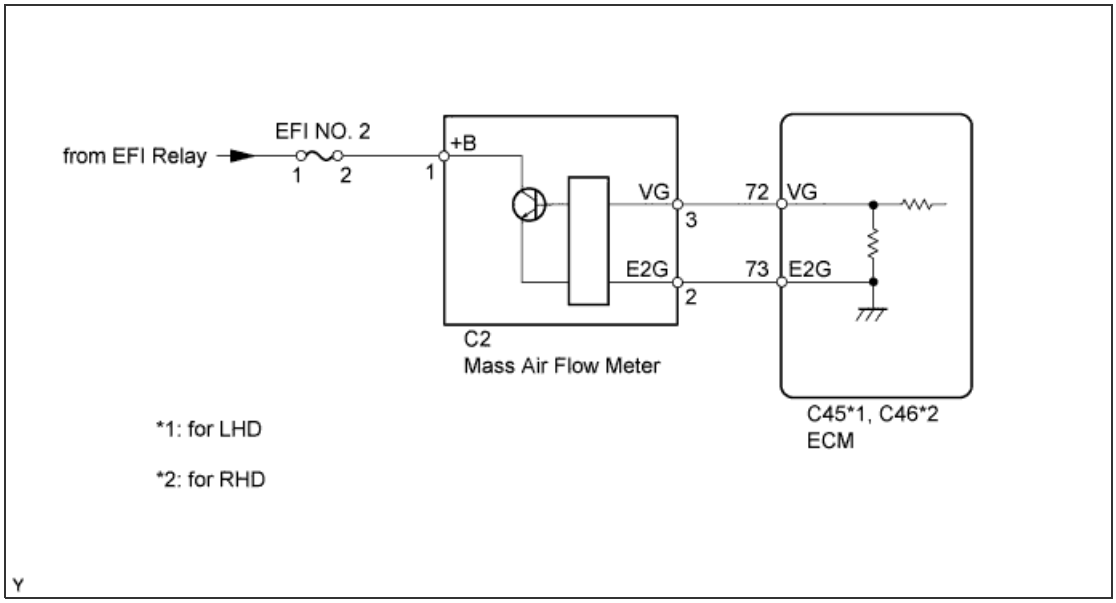
The Mass Air Flow (MAF) meter is a sensor that measures the amount of air flowing through the throttle valve.
The ECM uses this information to determine the fuel injection time and to provide the appropriate air fuel ratio.
Inside the MAF meter, there is a heated platinum wire which is exposed to the flow of intake air.
By applying a specific electrical current to the wire, the ECM heats it to a given temperature. The flow of incoming air cools both the wire and an internal thermistor, affecting their resistance. To maintain a constant current value, the ECM varies the voltage applied to the wire and internal thermistor. The voltage level is proportional to the airflow through the sensor, and the ECM uses it to calculate the intake air volume.
The circuit is constructed so that the platinum hot wire and the temperature sensor create a bridge circuit, and the power transistor is controlled so that the potentials of A and B remain equal to maintain the predetermined temperature.

HINT:

When any of these DTCs are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is calculated by the ECM, according to the engine speed and throttle valve position. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0102	The Mass Air Flow (MAF) meter voltage is below 0.2 V for 3 seconds (1 trip detection logic).	• Open or short in Mass Air Flow (MAF) meter circuit • MAF meter • ECM
P0103	The MAF meter voltage is higher than 4.9 V for 3 seconds (1 trip detection logic).	• Open or short in MAF meter circuit • MAF meter • ECM

HINT:



When any of these DTCs are output, check the airflow rate by entering the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.

Mass Airflow Rate (g/sec.)	Malfunction
Approximately 0.0	• **Open in Mass Air Flow (MAF) meter power source circuit** • **Open or short in VG circuit**
271.0 or more	Open in E2G circuit

MONITOR DESCRIPTION

If there is a defect in the MAF meter or an open or short circuit, the voltage level deviates from the normal operating range. The ECM interprets this deviation as a malfunction in the MAF meter and stores a DTC.
Example:
When the sensor output voltage remains below 0.2 V, or higher than 4.9 V, for more than 3 seconds, the ECM stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored 3 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (MASS AIRFLOW RATE)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / MAF.

e. Read the values displayed on the tester.

Result

Mass Airflow Rate (g/sec.)	Proceed to
0.0	A
271.0 or more	B
Between 1.0 and 270.0*	C

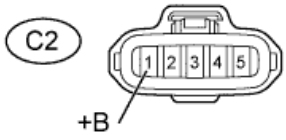
HINT:

*: The value must change when the throttle valve is open or closed with the engine running.

B	Go to step 6
C	CHECK FOR INTERMITTENT PROBLEMS (Click here)

A

2.INSPECT MASS AIR FLOW METER (POWER SOURCE VOLTAGE)



a. Disconnect the Mass Air Flow (MAF) meter connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

REPLACE ECM (Click here)

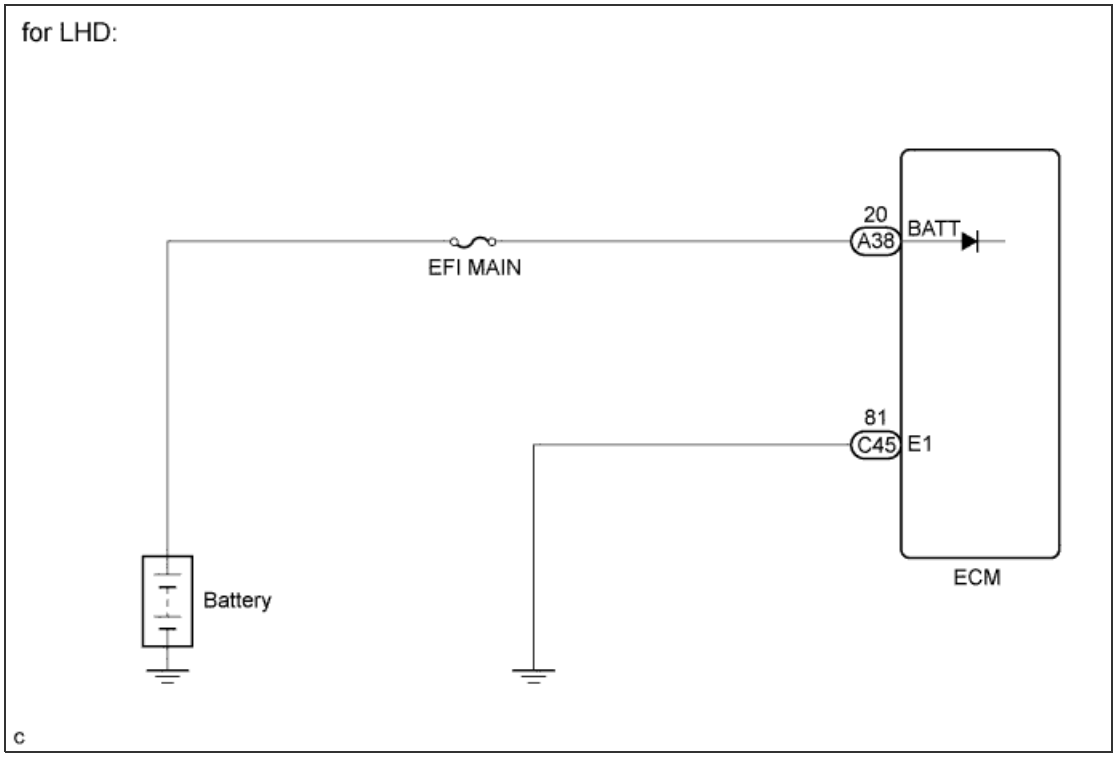
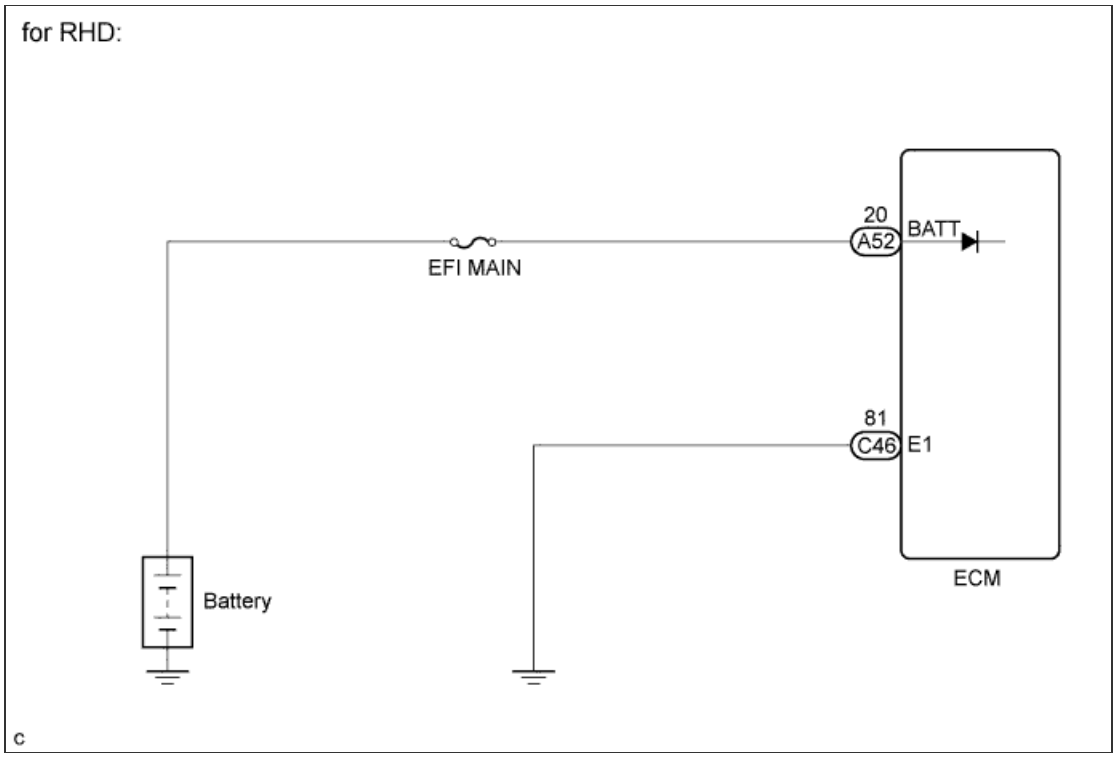
for Preparation Click here

DESCRIPTION



The battery supplies electricity to the ECM even when the ignition switch is off. This power allows the ECM to store data such as DTC history, freeze frame data and fuel trim values. If the battery voltage falls below a minimum level, the memory is cleared and the ECM determines that there is a malfunction in the power supply circuit. When the engine is next started, the ECM illuminates the MIL and stores the DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0560	An open in the ECM back up power source circuit (1 trip detection logic).	• Open in back up power source circuit • Battery • Battery terminals • EFI MAIN fuse • ECM

HINT:

If DTC P0560 is stored, the ECM does not store other DTCs or the data stored in the ECM is partly cleared.

REPLACE ECM (Click here)

DTC P0604 Random Access Memory (RAM)

for Preparation Click here

DESCRIPTION

The ECM continuously monitors its internal memory status. This self-check ensures that the ECM is functioning properly. It is diagnosed by internal "mirroring" of the main CPU and sub CPU to detect Random Access Memory (RAM) errors. If outputs from these CPUs are different and deviate from the standard, the ECM will illuminate the MIL and store a DTC immediately.

DTC Code	DTC Detection Condition	Trouble Area
P0604	ECM RAM errors.	ECM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear the DTC (Click here).

b. Turn the ignition switch off.

c. Disconnect the cable from the negative (-) battery terminal and wait for 1 minute.

d. Connect the cable to the negative (-) battery terminal.

e. Turn the ignition switch to ON.

f. Connect the intelligent tester to the DLC3.

g. Turn the tester on.

h. Enter the following menus: Powertrain / Engine and ECT / DTC.

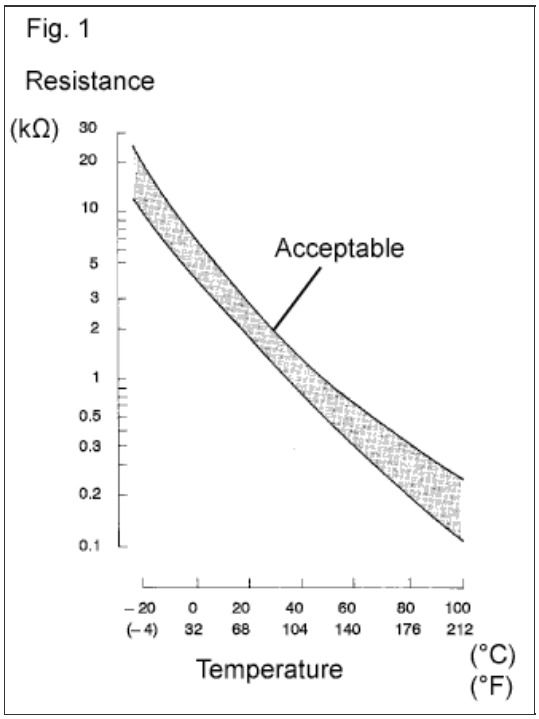
i. Check for DTC.

OK:
P0604 is not output.

NG → **REPLACE ECM (Click here)**

OK →

CHECK FOR INTERMITTENT PROBLEMS (Click here)



DTC P0110 Intake Air Temperature Circuit Malfunction

DTC P0112 Intake Air Temperature Circuit Low Input

DTC P0113 Intake Air Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

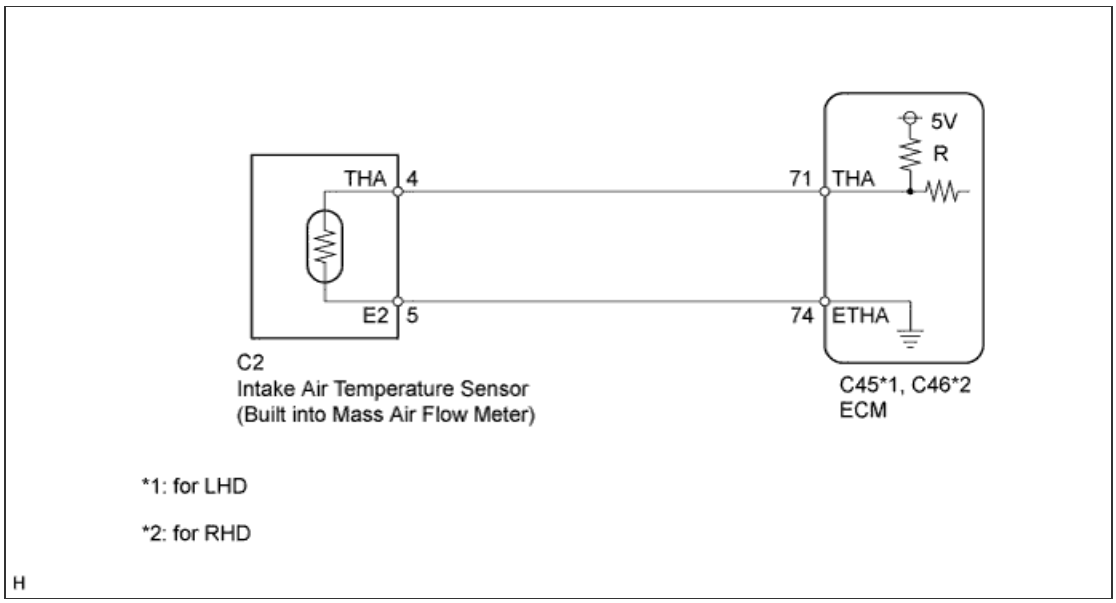
The Intake Air Temperature (IAT) sensor, mounted on the Mass Air Flow (MAF) meter, monitors the IAT. The IAT sensor has a built-in thermistor with a resistance that varies according to the temperature of the intake air. When the IAT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are transmitted to the ECM as voltage changes (see Fig. 1).
The IAT sensor is powered by a 5 V supply from the THA terminal of the ECM, via resistor R.
Resistor R and the IAT sensor are connected in series. When the resistance value of the IAT sensor changes, according to changes in the IAT, the voltage at terminal THA also varies. Based on this signal, the ECM increases the fuel injection volume when the engine is cold to improve driveability.

HINT:

When any of DTCs P0110, P0112 and P0113 are stored, the ECM enters fail-safe mode. During fail-safe mode, the IAT is estimated to be 20°C (68°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0110	An open or short in the Intake Air Temperature (IAT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Intake Air Temperature (IAT) sensor circuit • IAT sensor (built into Mass Air Flow (MAF) meter) • ECM
P0112	A short in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM
P0113	An open in the IAT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in IAT sensor circuit • IAT sensor (built into MAF meter) • ECM

HINT:



When any of these DTCs are output, check the IAT by entering the following menus: Powertrain / Engine and ECT / Data List / Intake Air.

Tester Display	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The ECM monitors the sensor voltage and uses this value to calculate the IAT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a malfunction in the IAT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the IAT sensor circuit, and stores DTC P0113. Conversely, if the output voltage is below 0.18 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0112.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

DTC P0115 Engine Coolant Temperature Circuit Malfunction

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

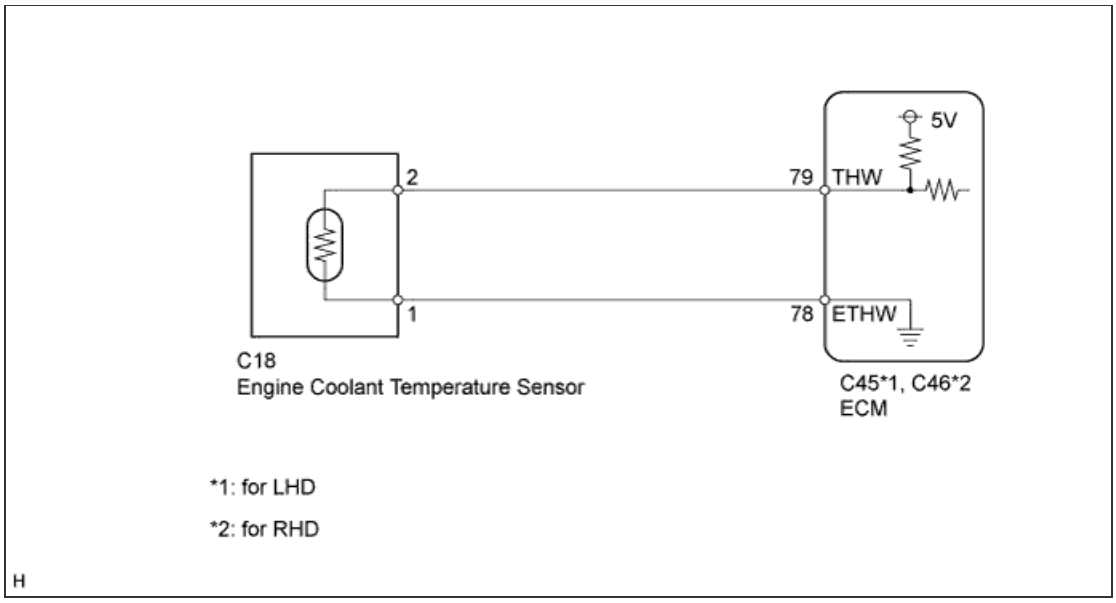
A thermistor, whose resistance value varies according to the Engine Coolant Temperature (ECT), is built into the Engine Coolant Temperature (ECT) sensor.
The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0115	An open or short in the Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Engine Coolant Temperature (ECT) sensor circuit • ECT sensor • ECM
P0117	A short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor • ECT sensor • ECM
P0118	An open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:



When any of these DTCs are output, check the ECT by entering the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

Tester Display	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and stores DTC P0118. Conversely, if the voltage output is below 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0117.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ VALUE USING INTELLIGENT TESTER (ENGINE COOLANT TEMPERATURE)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

e. Read the value displayed on the tester.

Result

Result	Proceed to
-40°C (-40°F)	A
140°C (284°F) or higher	B
Between 80°C and 100°C (176°F and 212°F) with warm engine	C

HINT:

- **If there is an open circuit, the intelligent tester indicates -40°C (-40°F).**
- **If there is a short circuit, the intelligent tester indicates 140°C (284°F) or higher.**

B	Go to step 4
C	CHECK FOR INTERMITTENT PROBLEMS (Click here)

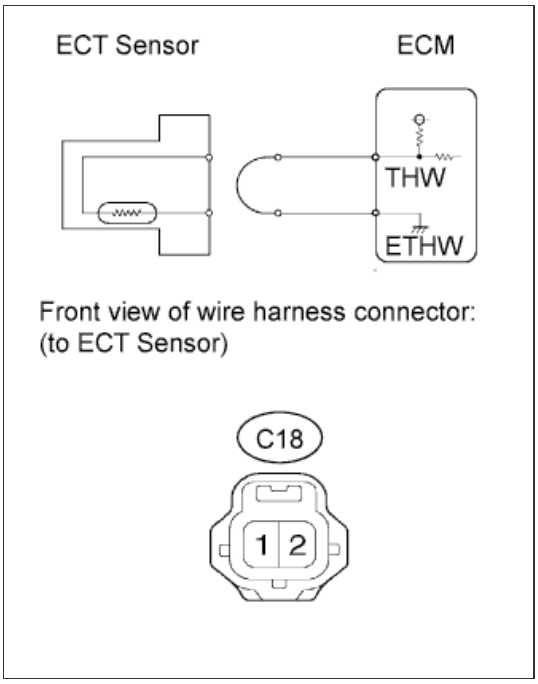
A

2.READ VALUE USING INTELLIGENT TESTER (CHECK FOR OPEN IN WIRE HARNESS)

a. Disconnect the Engine Coolant Temperature (ECT) sensor connector.

b. Connect terminals 1 and 2 of the ECT sensor connector on the wire harness side.

c. Connect the intelligent tester to the DLC3.



d. Turn the ignition switch to ON.

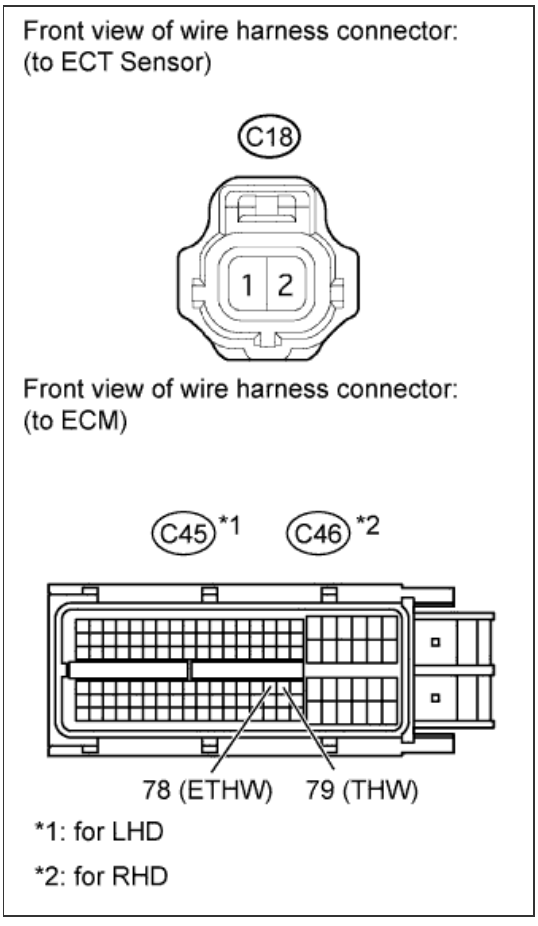
e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

g. Read the value displayed on the tester.

Standard value:
140°C (284°F) or higher.

NG → Go to step 3



OK

CONFIRM GOOD CONNECTION TO SENSOR. IF OK, REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

3.CHECK HARNESS AND CONNECTOR (ENGINE COOLANT TEMPERATURE SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C18-2 - C45-79 (THW)	Always	Below 1 Ω
C18-1 - C45-78 (ETHW)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C18-2 - C46-79 (THW)	Always	Below 1 Ω
C18-1 - C46-78 (ETHW)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

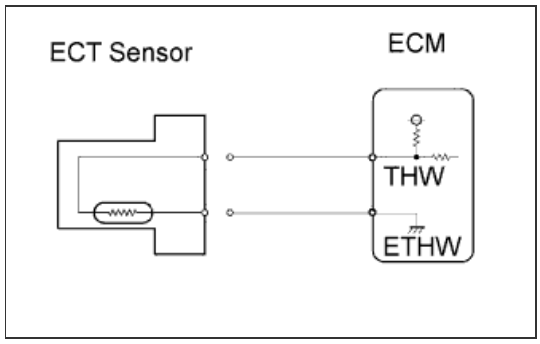
OK

CONFIRM GOOD CONNECTION TO ECM. IF OK, REPLACE ECM (Click here)

4.READ VALUE USING INTELLIGENT TESTER (CHECK FOR SHORT IN WIRE HARNESS)

a. Disconnect the ECT sensor connector.

b. Connect the intelligent tester to the DLC3.



c. Turn the ignition switch to ON.

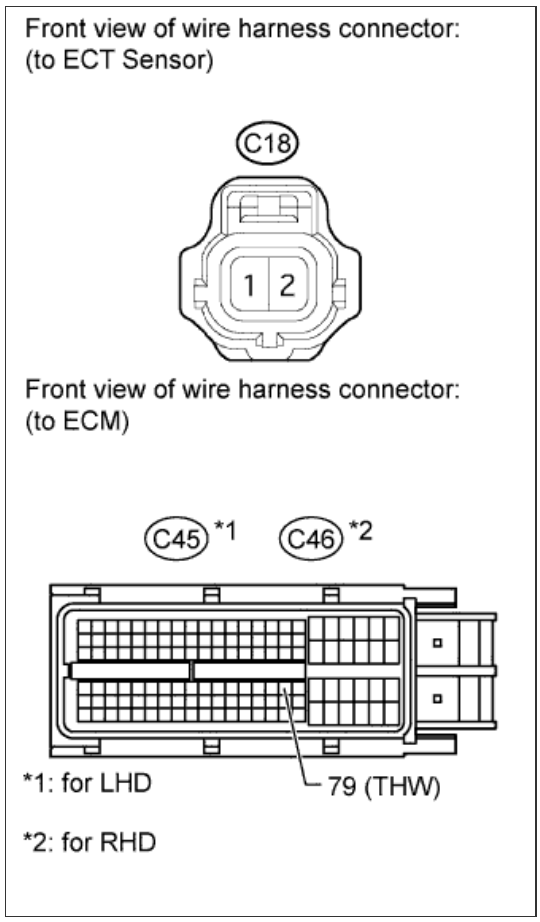
d. Turn the tester on.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

f. Read the value displayed on the tester.

Standard value:
-40°C (-40°F)

NG → Go to step 5



OK

REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

5.CHECK HARNESS AND CONNECTOR (ENGINE COOLANT TEMPERATURE SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C18-2 or C45-79 (THW) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C18-2 or C46-79 (THW) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK → REPLACE ECM (Click here)

DTC P060E Internal Control Module Throttle Position Performance

for Preparation Click here

DESCRIPTION

The ECM monitors the input signals of the Throttle Position (TP) sensor No. 1 and stop light switch. As the ECM monitors the input signals of the TP sensor No. 1 and the STP signals of the stop light switch, if the input signals and control signals are deviated, a DTC is stored.

DTC Code	DTC Detection Condition	Trouble Area
P060E	An ECM main CPU error.	ECM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear the DTC (Click here).

b. Turn the ignition switch off.

c. Disconnect the cable from the negative (-) battery terminal and wait for 1 minute.

d. Connect the cable to the negative (-) battery terminal.

e. Turn the ignition switch to ON.

f. Check for DTC.

OK:
P060E is not output.

NG → **REPLACE ECM (Click here)**

OK

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

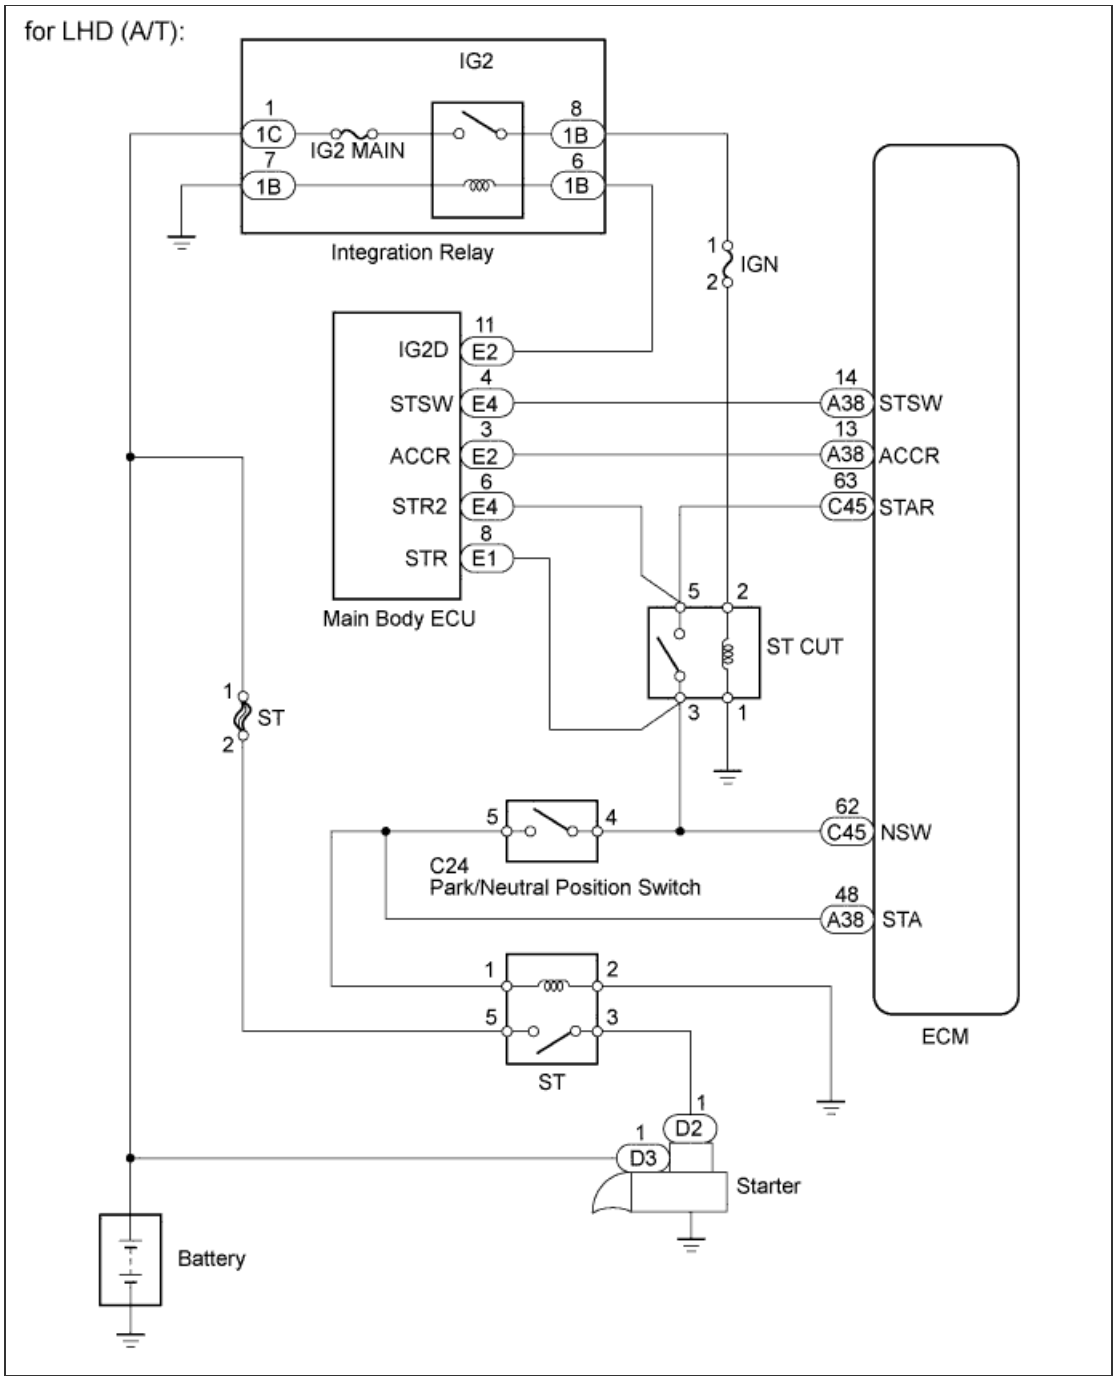
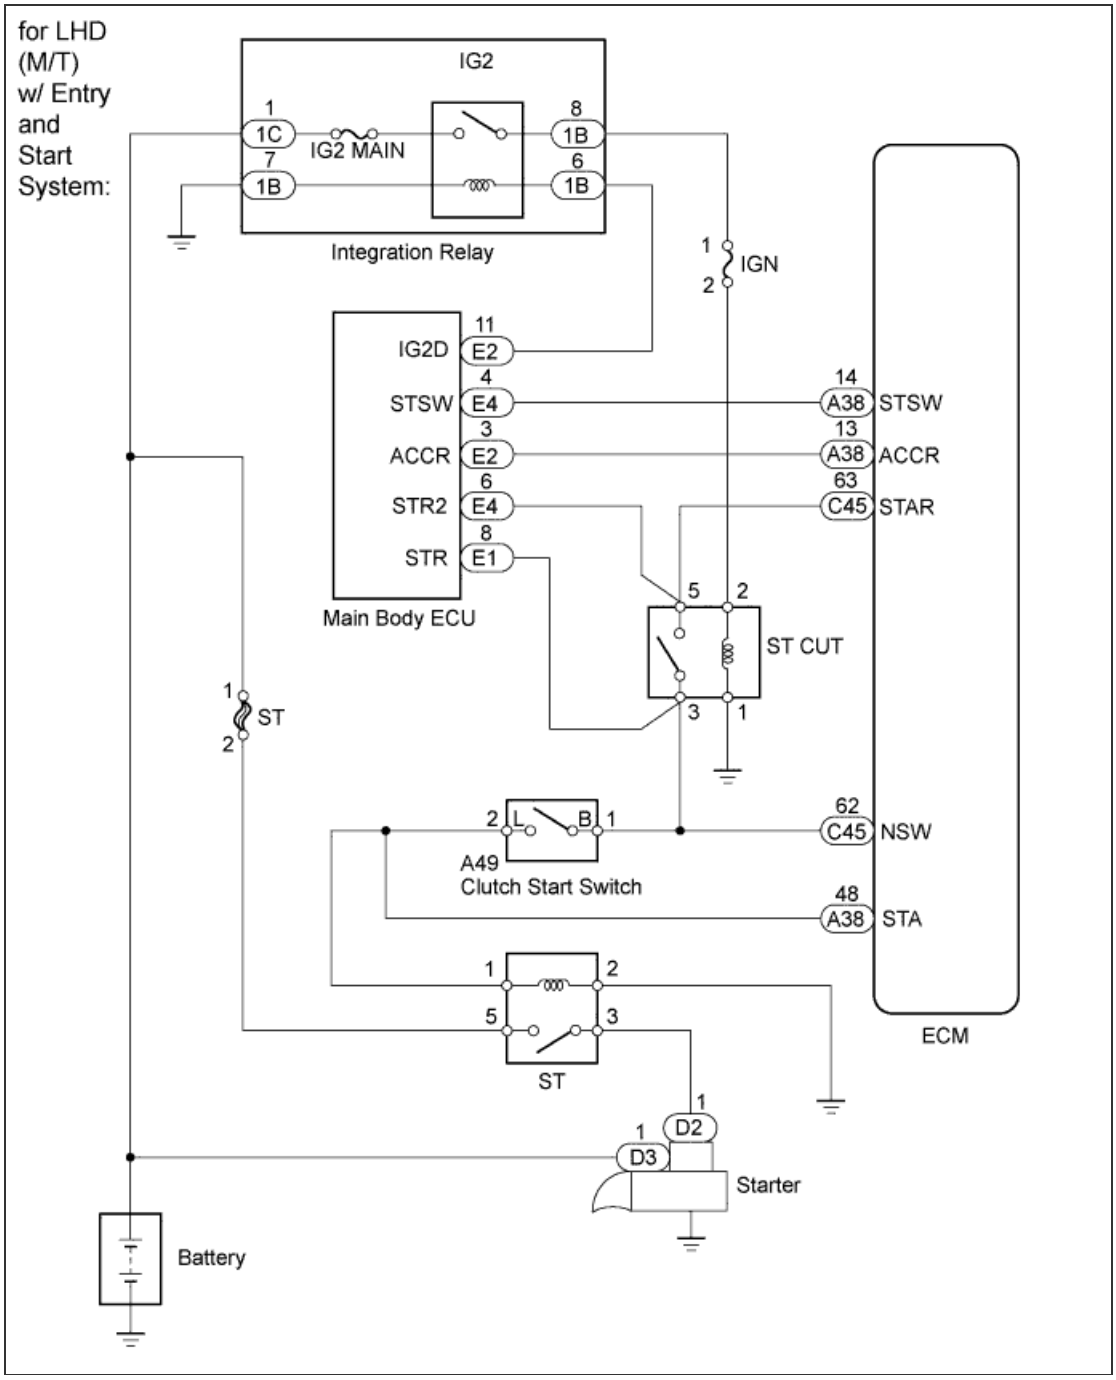
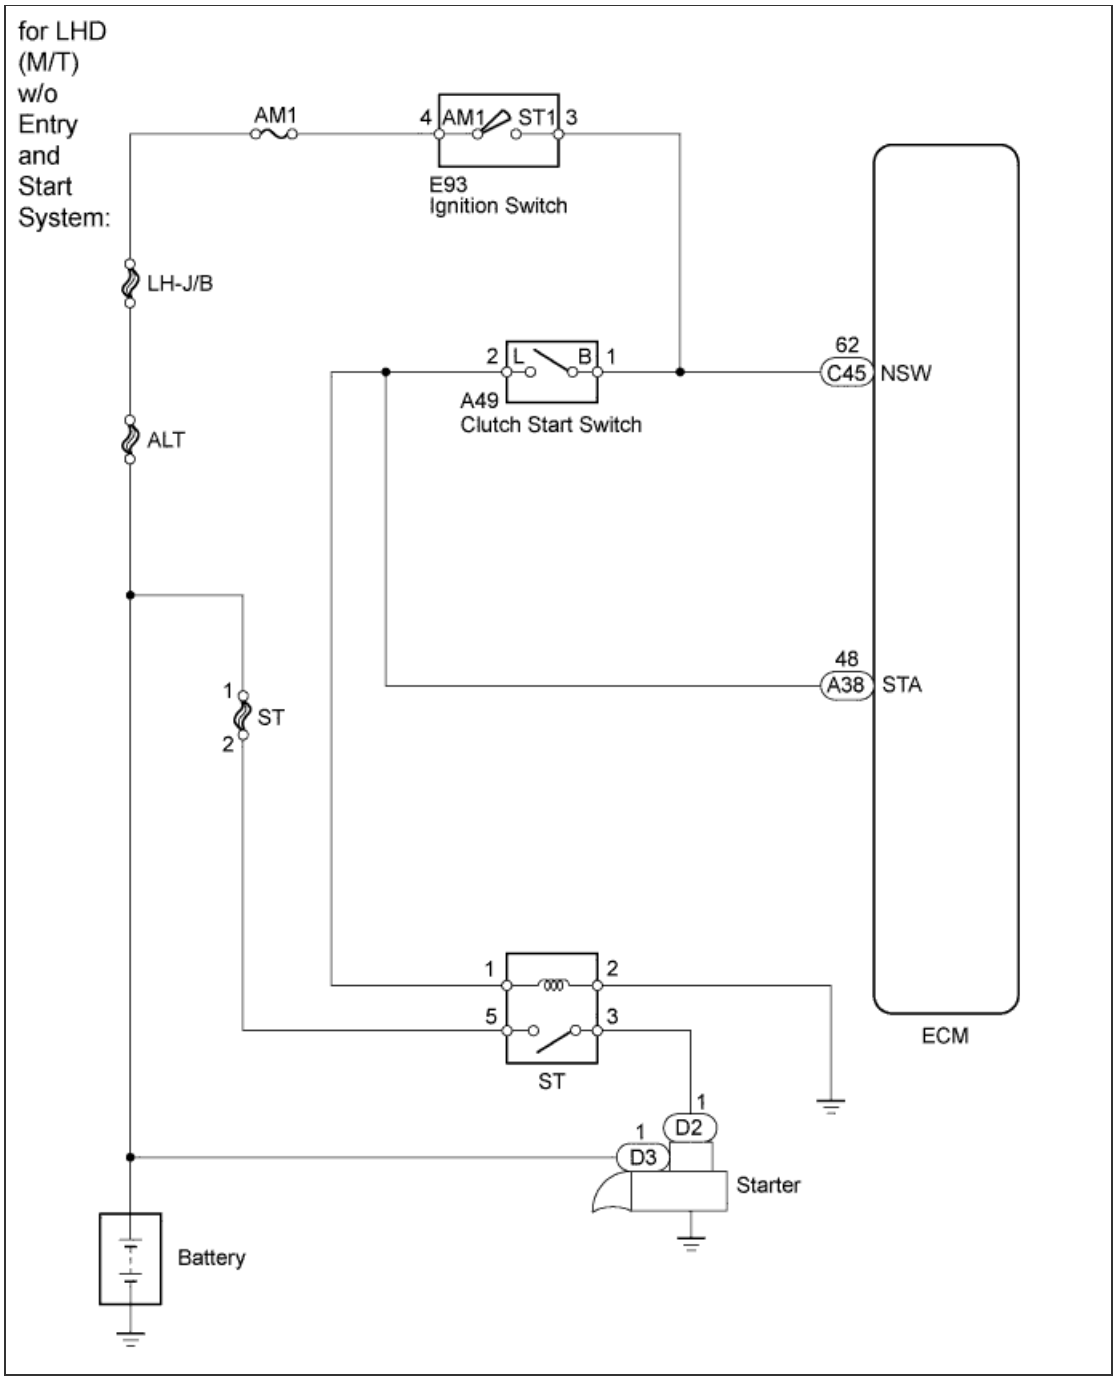
OK → REPLACE ECM (Click here)



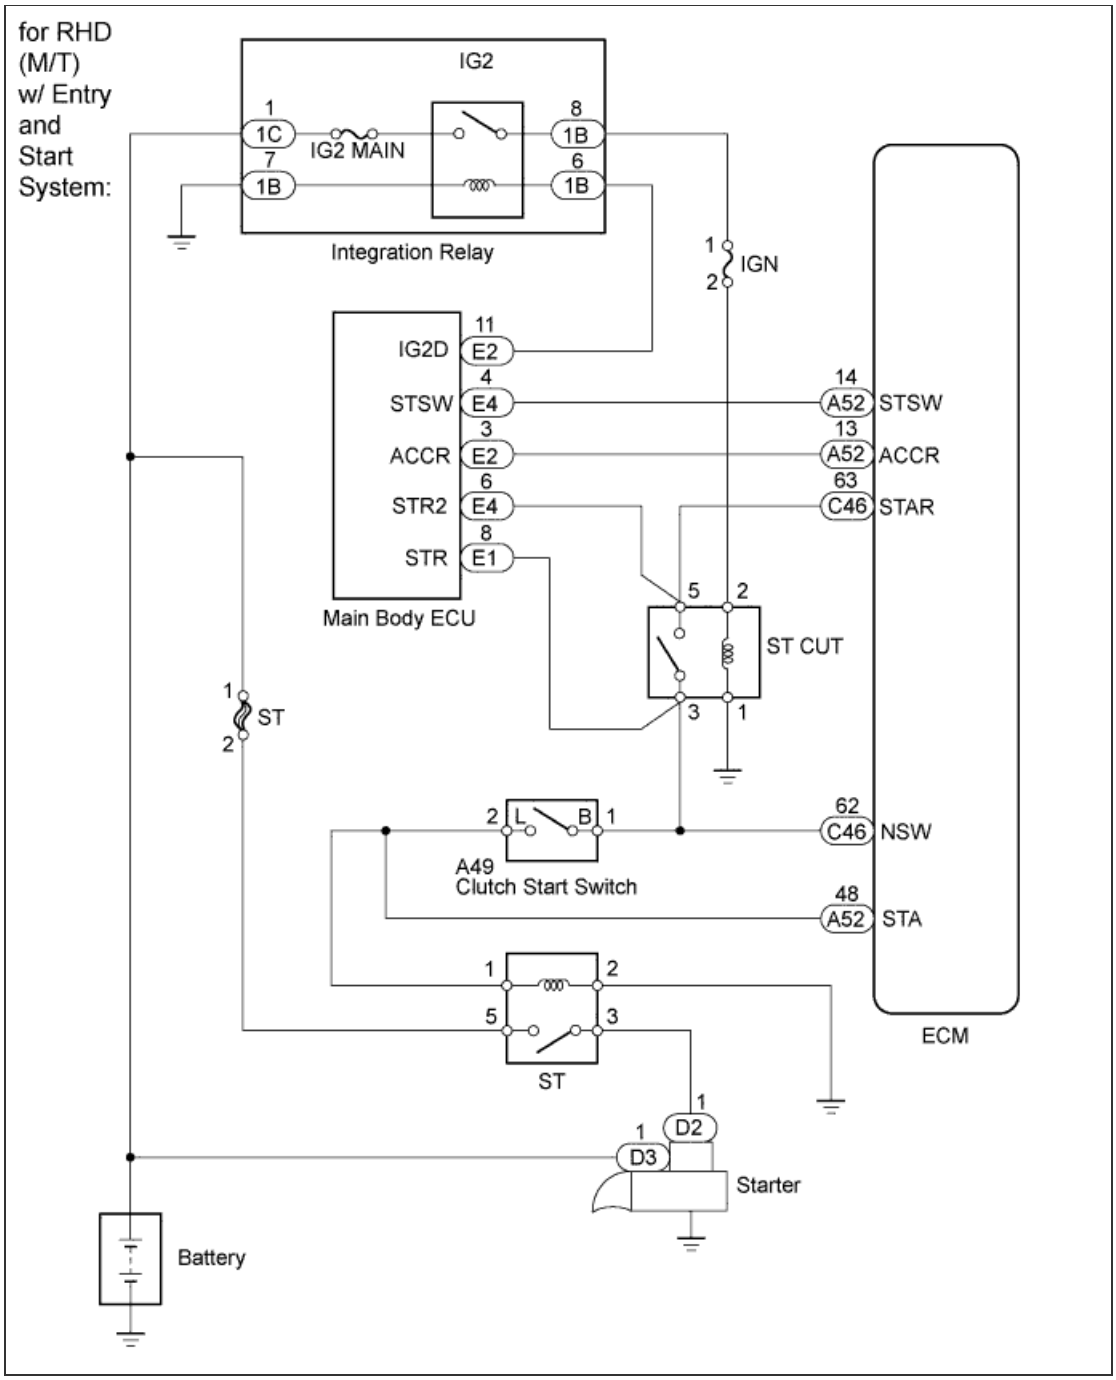
for Preparation Click here



DESCRIPTION



While the engine is being cranked, positive battery voltage is applied to terminal STA of the ECM. If the ECM detects the Starter Control (STA) signal while the vehicle is being driven, it determines that there is a malfunction in the STA circuit. The ECM then illuminates the MIL and stores the DTC. This monitor runs when the vehicle is driven at 20 km/h (12.4 mph) for over 20 seconds.



DTC Code	DTC Detection Condition	Trouble Area
P0617	When conditions (a), (b) and (c) are met, and a positive (+B) battery voltage of 10.5 V or higher is applied to the ECM for 20 seconds (1 trip detection logic). (a) The vehicle speed is 20 km/h (12.4 mph) or more. (b) The engine speed is 1000 rpm or more. (c) The STA signal is on.	• Park/Neutral Position (PNP) switch • ST relay circuit • Ignition switch • ECM

DTC P0115 Engine Coolant Temperature Circuit Malfunction

DTC P0117 Engine Coolant Temperature Circuit Low Input

DTC P0118 Engine Coolant Temperature Circuit High Input

for Preparation Click here

DESCRIPTION

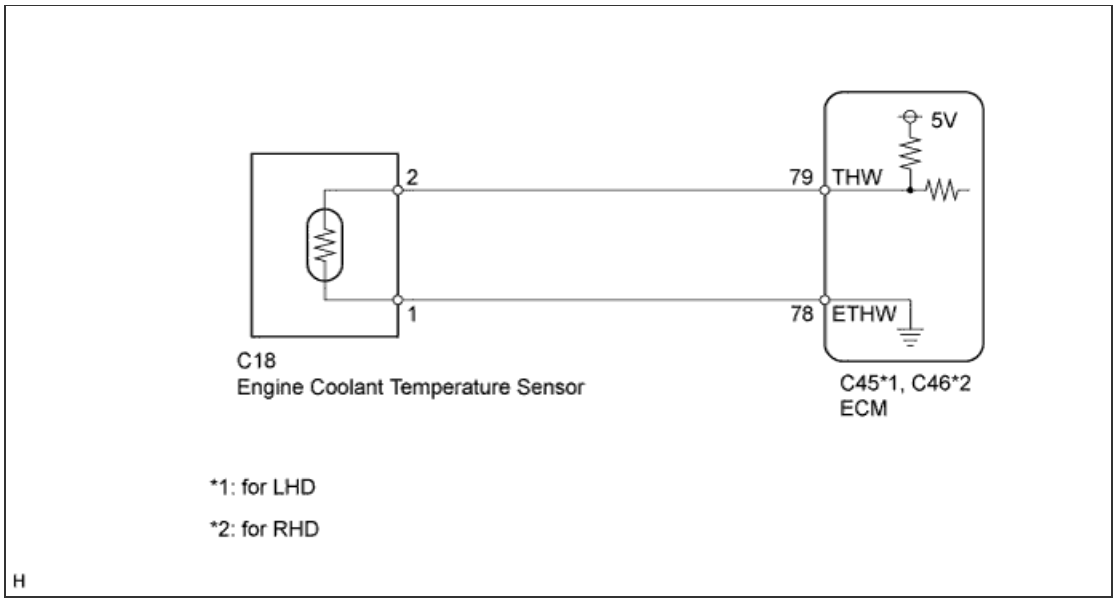
A thermistor, whose resistance value varies according to the Engine Coolant Temperature (ECT), is built into the Engine Coolant Temperature (ECT) sensor.
The structure of the sensor and its connection to the ECM are the same as those of the Intake Air Temperature (IAT) sensor.

HINT:

When any of DTCs P0115, P0117 and P0118 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECT is estimated to be 80°C (176°F) by the ECM. Fail-safe mode continues until a pass condition is detected.

DTC Code	DTC Detection Condition	Trouble Area
P0115	An open or short in the Engine Coolant Temperature (ECT) sensor circuit for 0.5 seconds (1 trip detection logic).	• Open or short in Engine Coolant Temperature (ECT) sensor circuit • ECT sensor • ECM
P0117	A short in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Short in ECT sensor • ECT sensor • ECM
P0118	An open in the ECT sensor circuit for 0.5 seconds (1 trip detection logic).	• Open in ECT sensor circuit • ECT sensor • ECM

HINT:



When any of these DTCs are output, check the ECT by entering the following menus: Powertrain / Engine and ECT / Data List / Coolant Temp.

Tester Display	Malfunction
-40°C (-40°F)	Open circuit
140°C (284°F) or higher	Short circuit

MONITOR DESCRIPTION

The Engine Coolant Temperature (ECT) sensor is used to monitor the ECT. The ECT sensor has a thermistor with a resistance that varies according to the temperature of the engine coolant. When the coolant temperature is low, the resistance in the thermistor increases. When the temperature is high, the resistance drops. These variations in resistance are reflected in the output voltage from the sensor. The ECM monitors the sensor voltage and uses this value to calculate the ECT. When the sensor output voltage deviates from the normal operating range, the ECM interprets this as a fault in the ECT sensor and stores a DTC.
Example:
If the sensor output voltage is higher than 4.91 V for 0.5 seconds or more, the ECM determines that there is an open in the ECT sensor circuit, and stores DTC P0118. Conversely, if the voltage output is below 0.14 V for 0.5 seconds or more, the ECM determines that there is a short in the sensor circuit, and stores DTC P0117.
If the malfunction is not repaired successfully, a DTC is stored 0.5 seconds after the engine is next started.

DTC P0657 Actuator Supply Voltage Circuit / Open

for Preparation Click here

DESCRIPTION

The ECM monitors the output voltage to the throttle actuator. This self-check ensures that the ECM is functioning properly. The output voltage is usually 0 V when the ignition switch is turned off. If the output voltage is higher than 7 volts when the ignition switch is turned off, the ECM will illuminate the MIL and store a DTC when the ignition switch is turned to ON.

DTC Code	DTC Detection Condition	Trouble Area
P0657	A throttle actuator power supply error.	ECM

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK DTC

a. Clear the DTC (Click here).

b. Turn the ignition switch off.

c. Disconnect the cable from the negative (-) battery terminal and wait for 1 minute.

d. Connect the cable to the negative (-) battery terminal.

e. Turn the ignition switch to ON for 10 seconds.

f. Turn the ignition switch off.

g. Turn the ignition switch to ON.

h. Connect the intelligent tester to the DLC3.

i. Turn the tester on.

j. Enter the following menus: Powertrain / Engine and ECT / DTC.

k. Check for DTC.

OK:
P0657 is not output.

NG → **REPLACE ECM (Click here)**

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

DTC P0116 Engine Coolant Temperature Circuit Range / Performance Problem

for Preparation Click here

DESCRIPTION

Refer to DTC P0115 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P0116	The Engine Coolant Temperature (ECT) is between 35°C and 60°C (95°F and 140°F) when the engine is started, and conditions (a) and (b) are met (2 trip detection logic): (a) The vehicle is driven at varying speeds (accelerated and decelerated). (b) The ECT remains within 3°C (5.4°F) of the initial ECT.	• Water inlet with thermostat • Engine Coolant Temperature (ECT) sensor

MONITOR DESCRIPTION

The ECT sensor is used to monitor the ECT. The ECT sensor has a built-in thermistor with a resistance that varies according to the temperature of the engine coolant. When the ECT is low, the resistance of the thermistor increases. When the temperature is high, the resistance drops. These variations in the resistance are reflected in the output voltage from the ECT sensor.
The ECM monitors the sensor voltage and uses this value to calculate the ECT. If the sensor output voltage deviates from the normal operating range, the ECM interprets this deviation as a malfunction in the ECT sensor and stores the DTC.
Example:
Upon starting the engine, the ECT is between 35°C and 60°C (95°F and 140°F). If after driving for 250 seconds, the ECT remains within 3°C (5.4°F) of the starting temperature, the DTC is stored (2 trip detection logic).

INSPECTION PROCEDURE

HINT:

- **If any of DTCs P0115, P0117, P0118 or P0125 are stored simultaneously with DTC P0116, the ECT sensor may have an open or a short circuit. Troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0116)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTC.

Result

Result	Proceed to
P0116	A
P0116 and other DTCs	B

B → GO TO DTC CHART (**Click here**)

A

2.INSPECT WATER INLET WITH THERMOSTAT

a. Remove the water inlet with thermostat (Click here).

b. Measure the valve opening temperature of the thermostat.

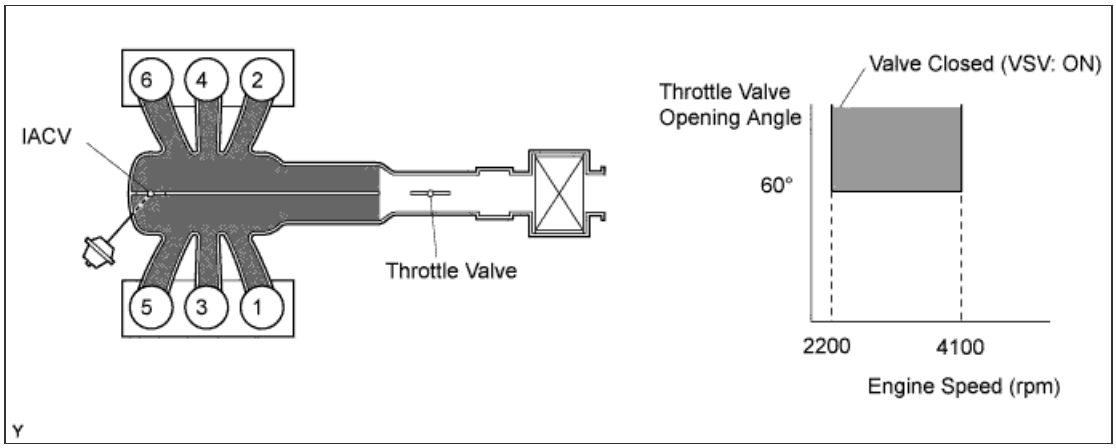
Standard value:
80 to 84°C (176 to 183°F)

HINT:

In addition to the above check, confirm that the valve is completely closed when the temperature is below the standard.

NG → REPLACE WATER INLET WITH THERMOSTAT (Click here)

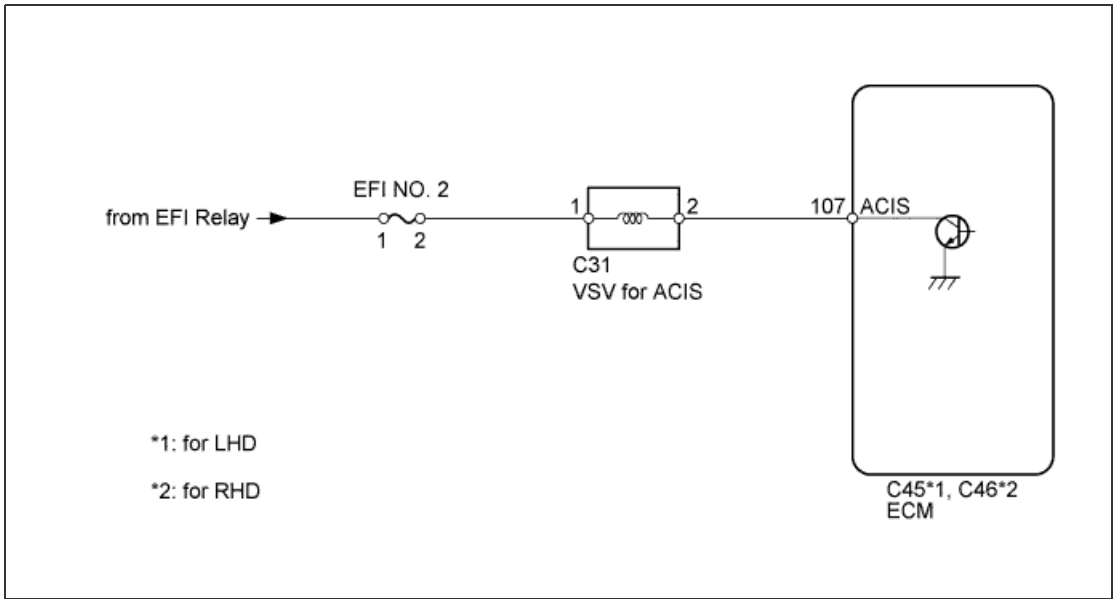
OK



REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

DTC P0660 Intake Manifold Tuning Valve Control Circuit / Open (Bank 1)

for Preparation Click here



DESCRIPTION

This circuit opens and closes the Intake Air Control Valve (IACV) in response to changes in the engine load in order to increase the intake efficiency (ACIS: Acoustic Control Induction System).
When the engine speed is between 2200 rpm and 4100 rpm and the throttle valve opening angle is 60° or more, the ECM supplies current to the VSV (ON status), to close the IACV. Under other conditions, the VSV is usually OFF and the IACV is open.

DTC Code	DTC Detection Condition	Trouble Area
P0660	Conditions (a) and (b) are met for 0.5 sec. or more (2 trip detection logic): (a) The voltage of terminal ACIS of the ECM is low when the VSV is OFF. (b) The engine has started.	• Open or short in VSV for ACIS circuit • VSV for ACIS • ECM

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
		• Throttle Position (TP) sensor (built into throttle

P0120	The output voltage of VTA1 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	body) • ECM

P0122	The output voltage of VTA1 is 0.2 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA1 circuit • Open in VC circuit • ECM
P0123	The output voltage of VTA1 is 4.535 V or higher for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA1 circuit • Open in E2 circuit • Short between VC and VTA1 circuits • ECM
P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

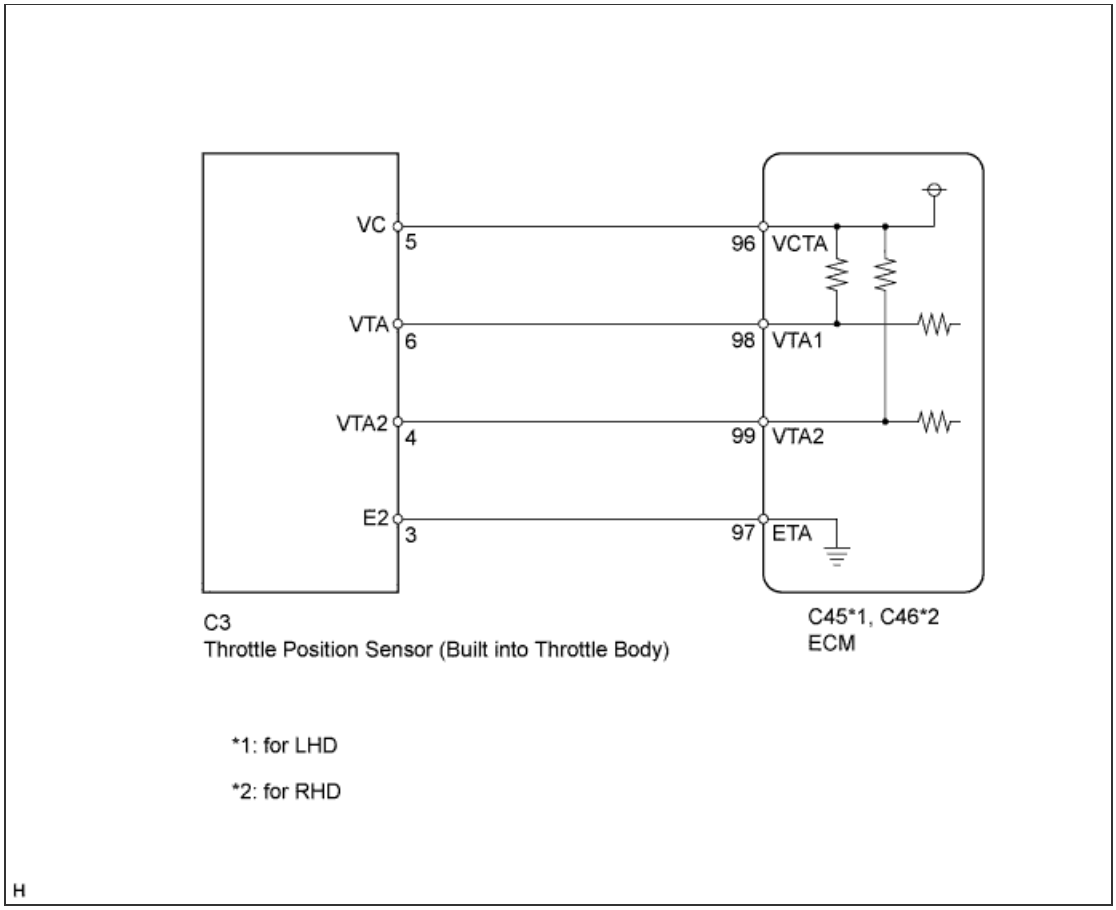
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

DTC P0724 Brake Switch "B" Circuit High

for Preparation Click here

DESCRIPTION

The stop light switch assembly is a duplex system that transmits 2 signals: STP and ST1-. These 2 signals are used by the ECM to monitor whether or not the brake system is working properly.
The purpose of this circuit is to prevent the engine from stalling while driving with the lock-up torque converter clutch on when the brakes are suddenly applied.
When the brake pedal is depressed, the stop light switch sends a signal to the ECM. Then the ECM cancels the operation of the lock-up clutch while braking is in progress.

DTC Code	DTC Detection Condition	Trouble Area
P0724	The stop light switch remains on even when vehicle is driven in a GO (30 km/h (18.63 mph) or more) and STOP (less than 3 km/h (1.86 mph)) pattern 5 times (2 trip detection logic).	• Short in stop light switch signal circuit • Stop light switch assembly • ECM

WIRING DIAGRAM

Refer to DTC P0504 (Click here).

INSPECTION PROCEDURE

HINT:

- **Using the intelligent tester to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. Reading the Data List information early in troubleshooting is one way to save diagnostic time.**
- **Read freeze frame data using the intelligent tester. The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was moving or stationary, whether the engine was warmed up or not, whether the air fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.**

1.READ VALUE USING INTELLIGENT TESTER (STOP LIGHT SWITCH)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine / Data List / Stop Light Switch.

e. Read the value displayed on the tester when the brake pedal is depressed and released.

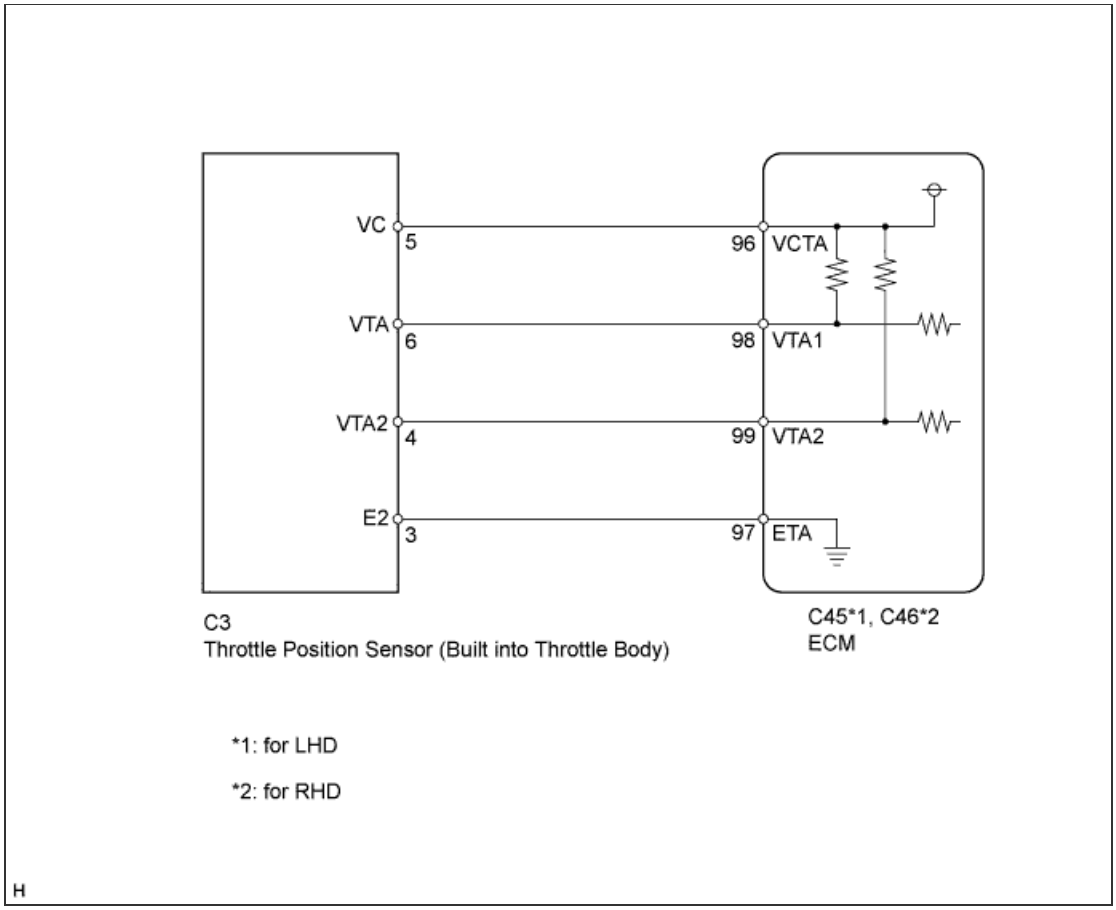
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
		• Throttle Position (TP) sensor (built into throttle

P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

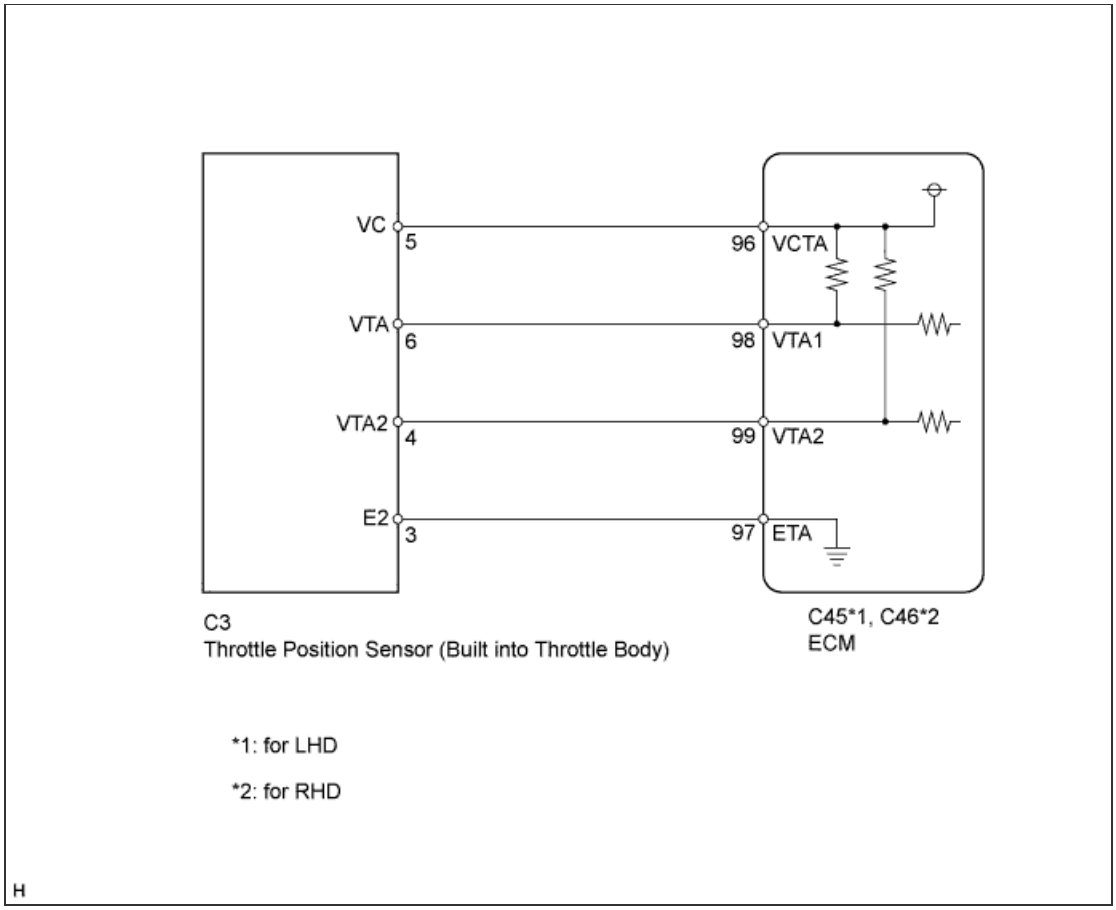
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

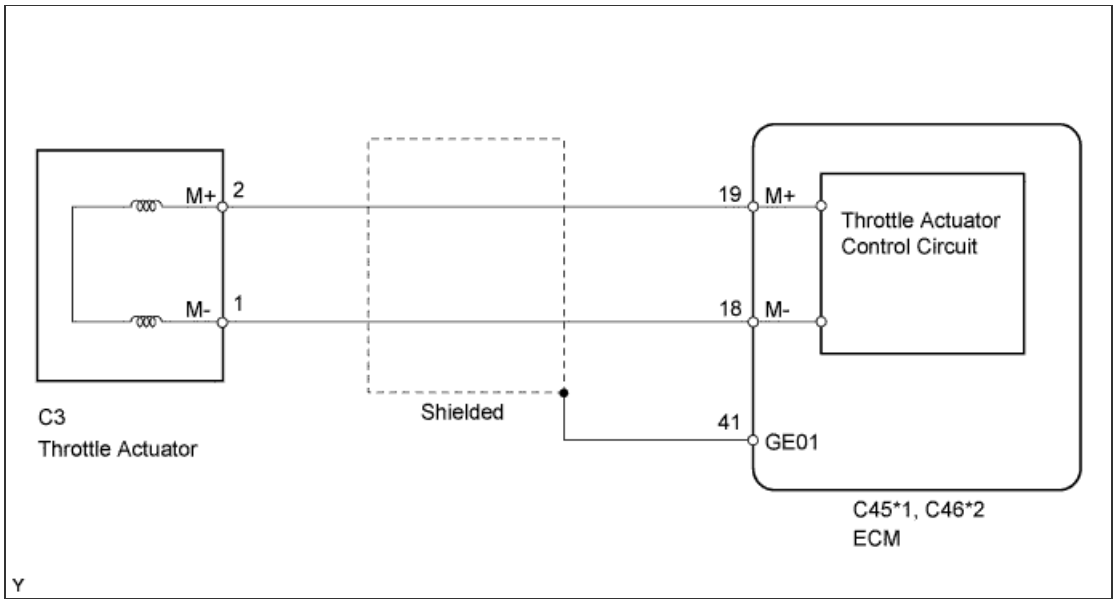
HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is 0.5 A or less.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions is met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores a DTC.



Example:

When the electrical current is 0.5 A or less and the throttle actuator duty ratio is 80% or more, the ECM interprets this as the current being outside the standard range, illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine has idled for 5 seconds after engine start.

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue running at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air fuel ratio correction, power increase correction and fuel-cut control.

HINT:

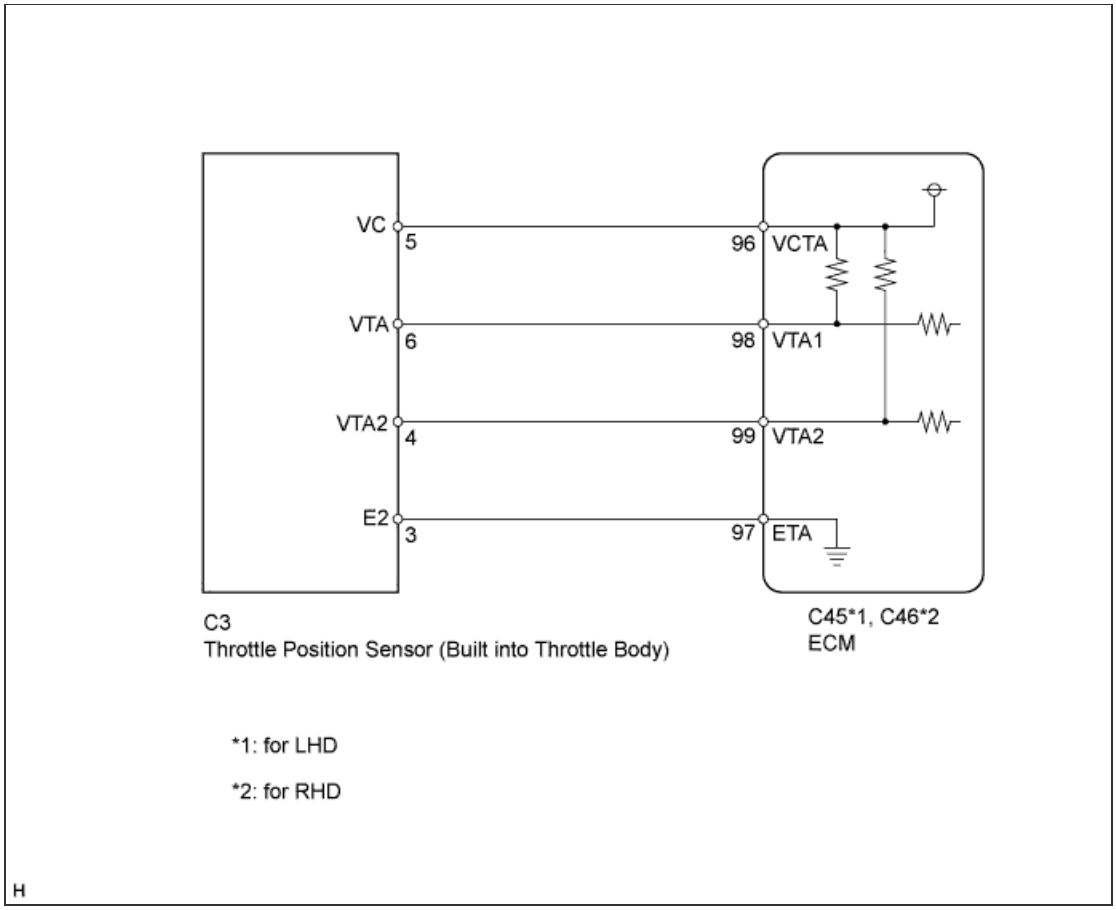
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

DTC P2102 Throttle Actuator Control Motor Circuit Low

DTC P2103 Throttle Actuator Control Motor Circuit High

for Preparation Click here

DESCRIPTION

The throttle actuator is operated by the ECM and opens and closes the throttle valve using gears.
The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

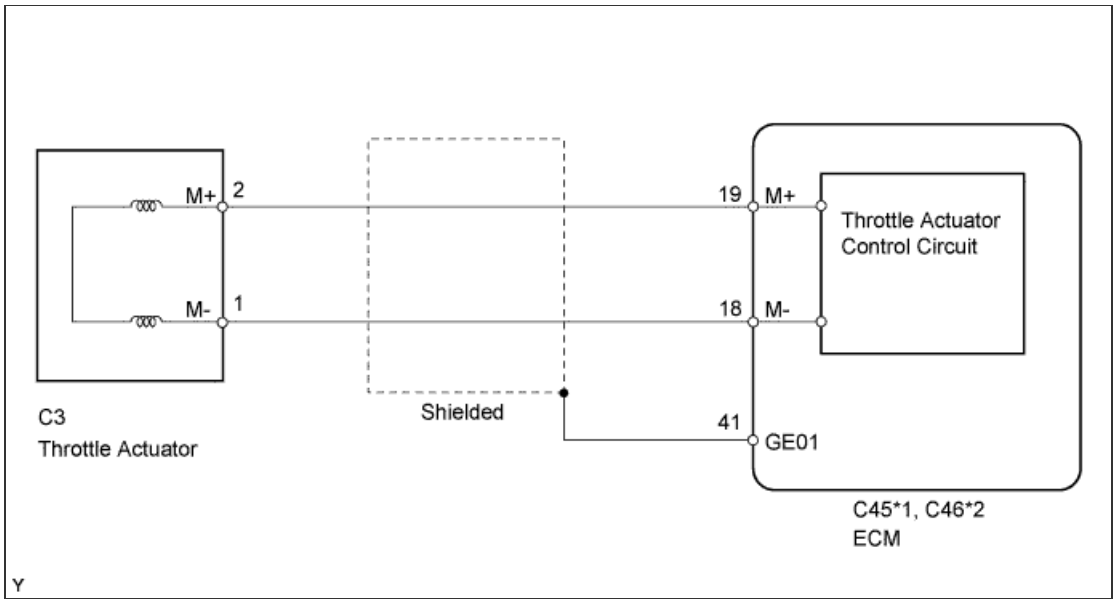
HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2102	Conditions (a) and (b) continue for 2.0 seconds (1 trip detection logic): (a) The throttle actuator duty ratio is 80% or more. (b) The throttle actuator current is 0.5 A or less.	• **Open in throttle actuator circuit** • **Throttle actuator** • **ECM**
P2103	Either of the following conditions is met (1 trip detection logic): • **A hybrid IC diagnosis signal failure.** • **A hybrid IC current limiter port failure.**	• **Short in throttle actuator circuit** • **Throttle actuator** • **Throttle valve** • **Throttle body assembly** • **ECM**

MONITOR DESCRIPTION

The ECM monitors the electrical current through the electronic actuator, and detects malfunctions and open circuits in the throttle actuator based on this value. If the current is outside the standard range, the ECM determines that there is a malfunction in the throttle actuator. In addition, if the throttle valve does not function properly (for example, stuck on), the ECM determines that there is a malfunction. The ECM then illuminates the MIL and stores a DTC.



Example:

When the electrical current is 0.5 A or less and the throttle actuator duty ratio is 80% or more, the ECM interprets this as the current being outside the standard range, illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the engine is quickly revved to a high rpm several times after the engine has idled for 5 seconds after engine start.

FAIL-SAFE

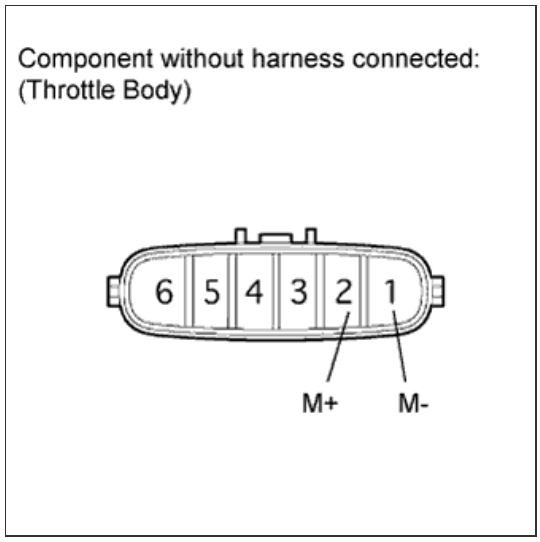
When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue running at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **The throttle actuator current (Throttle Motor Current) and the throttle actuator duty ratio (Throttle Motor Open Duty / Throttle Motor Close Duty) can be read using the intelligent tester. However, the ECM shuts off the throttle actuator current when the ETCS malfunctions.**



1.INSPECT THROTTLE BODY (RESISTANCE OF THROTTLE ACTUATOR)

a. Disconnect the throttle body connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air fuel ratio correction, power increase correction and fuel-cut control.

DTC Code	DTC Detection Condition	Trouble Area
		• Throttle Position (TP) sensor (built into throttle

P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

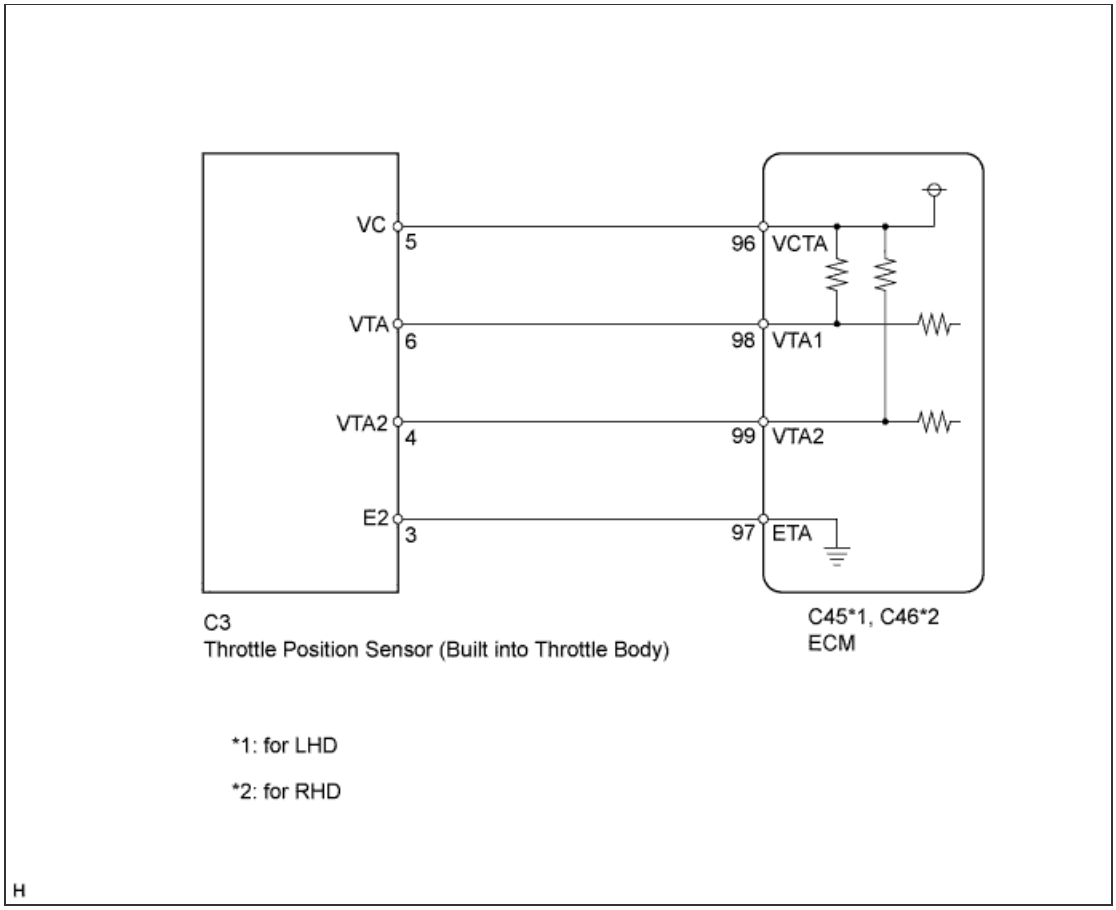
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

SYSTEM DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The ECM signals the throttle actuator to close, but the valve is stuck (1 trip detection logic).	• **Throttle actuator** • **Throttle body** • **Throttle valve** • **ECM**
P2112	The ECM signals the throttle actuator to open, but the valve is stuck (1 trip detection logic).	• **Throttle actuator** • **Throttle body** • **Throttle valve** • **ECM**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue running at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

HINT:

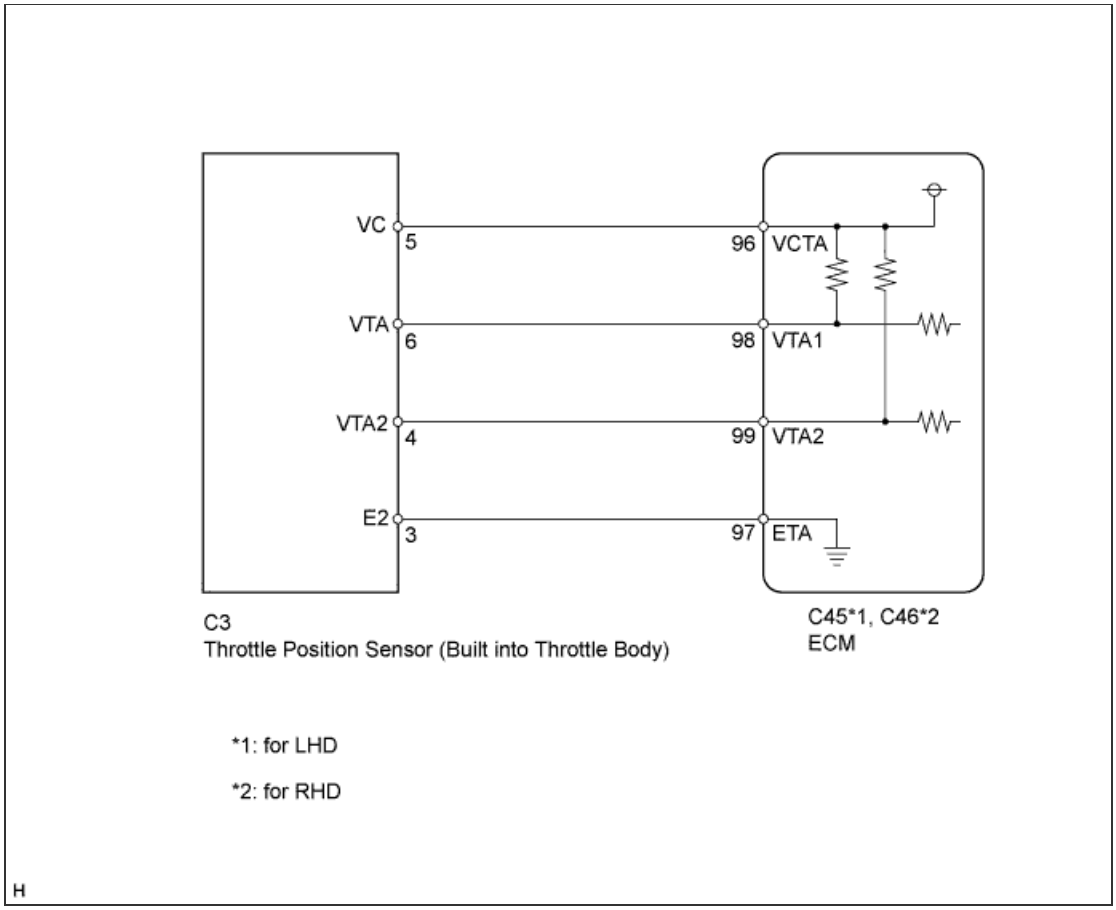
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

DTC P2111 Throttle Actuator Control System - Stuck Open

DTC P2112 Throttle Actuator Control System - Stuck Closed

for Preparation Click here

SYSTEM DESCRIPTION

The throttle actuator is operated by the ECM, and opens and closes the throttle valve using gears. The opening angle of the throttle valve is detected by the Throttle Position (TP) sensor, which is mounted on the throttle body. The TP sensor provides feedback to the ECM. This feedback allows the ECM to appropriately control the throttle actuator and monitor the throttle opening angle as the ECM responds to driver inputs.

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2111	The ECM signals the throttle actuator to close, but the valve is stuck (1 trip detection logic).	• **Throttle actuator** • **Throttle body** • **Throttle valve** • **ECM**
P2112	The ECM signals the throttle actuator to open, but the valve is stuck (1 trip detection logic).	• **Throttle actuator** • **Throttle body** • **Throttle valve** • **ECM**

MONITOR DESCRIPTION

The ECM determines that there is a malfunction in the ETCS when the throttle valve remains at a fixed angle despite a high drive current from the ECM. The ECM illuminates the MIL and stores a DTC.
If the malfunction is not repaired successfully, a DTC is stored when the accelerator pedal is fully depressed and released quickly (to fully open and close the throttle valve) after the engine is next started.

FAIL-SAFE

When either of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue running at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT THROTTLE BODY (VISUALLY CHECK THROTTLE VALVE)

a. Check for contamination between the throttle valve and the housing. If necessary, clean the throttle body. And check that the throttle valve moves smoothly.

OK:
Throttle valve is not contaminated with foreign objects and moves smoothly.

NG → **REPLACE THROTTLE BODY ASSEMBLY (Click here)**

OK

2.CHECK WHETHER DTC OUTPUT RECURS (DTC P2111 OR P2112)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine, and fully depress and release the accelerator pedal quickly (to fully open and close the throttle valve).

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read the DTCs.

DESCRIPTION

The TP sensor is mounted on the throttle body, and detects the opening angle of the throttle valve. This sensor is a non-contact type. It uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds.
The TP sensor has 2 sensor circuits, each of which transmits a signal, VTA1 and VTA2. VTA1 is used to detect the throttle valve angle and VTA2 is used to detect malfunctions in VTA1. The sensor signal voltages vary between 0 V and 5 V in proportion to the throttle valve opening angle, and are transmitted to the VTA terminals of the ECM.
As the valve closes, the sensor output voltage decreases and as the valve opens, the sensor output voltage increases. The ECM calculates the throttle valve opening angle according to these signals and controls the throttle actuator in response to driver inputs. These signals are also used in calculations such as air fuel ratio correction, power increase correction and fuel-cut control.

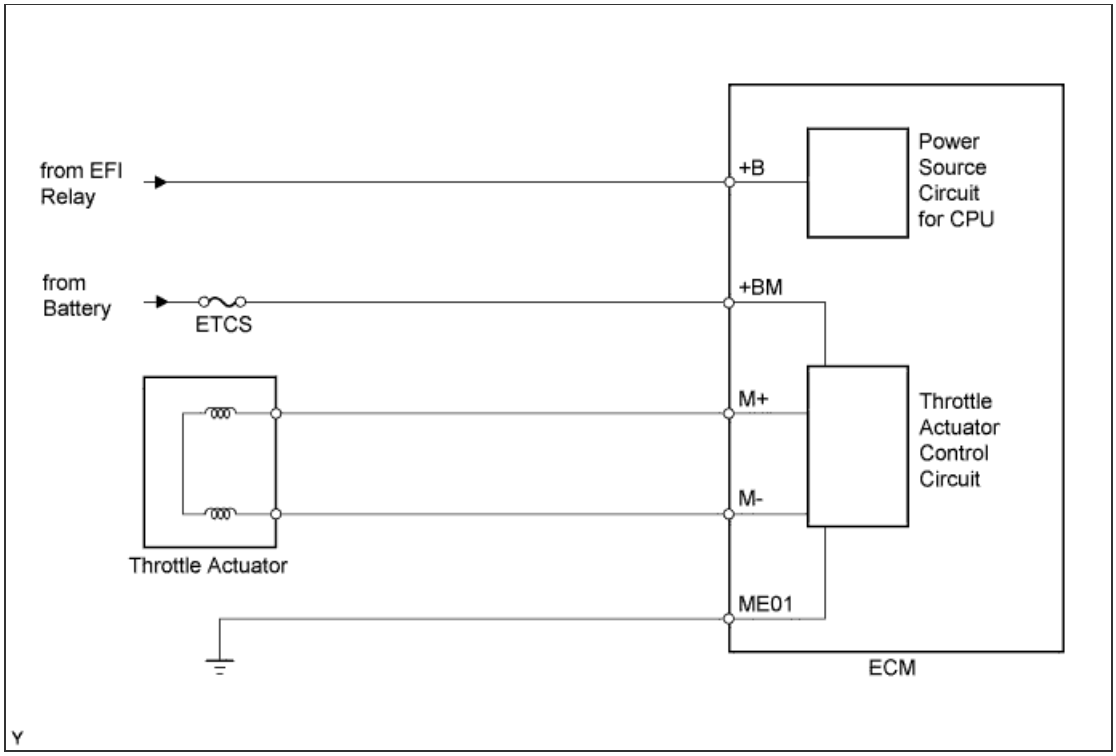
DTC P2118 Throttle Actuator Control Motor Current Range / Performance



for Preparation Click here

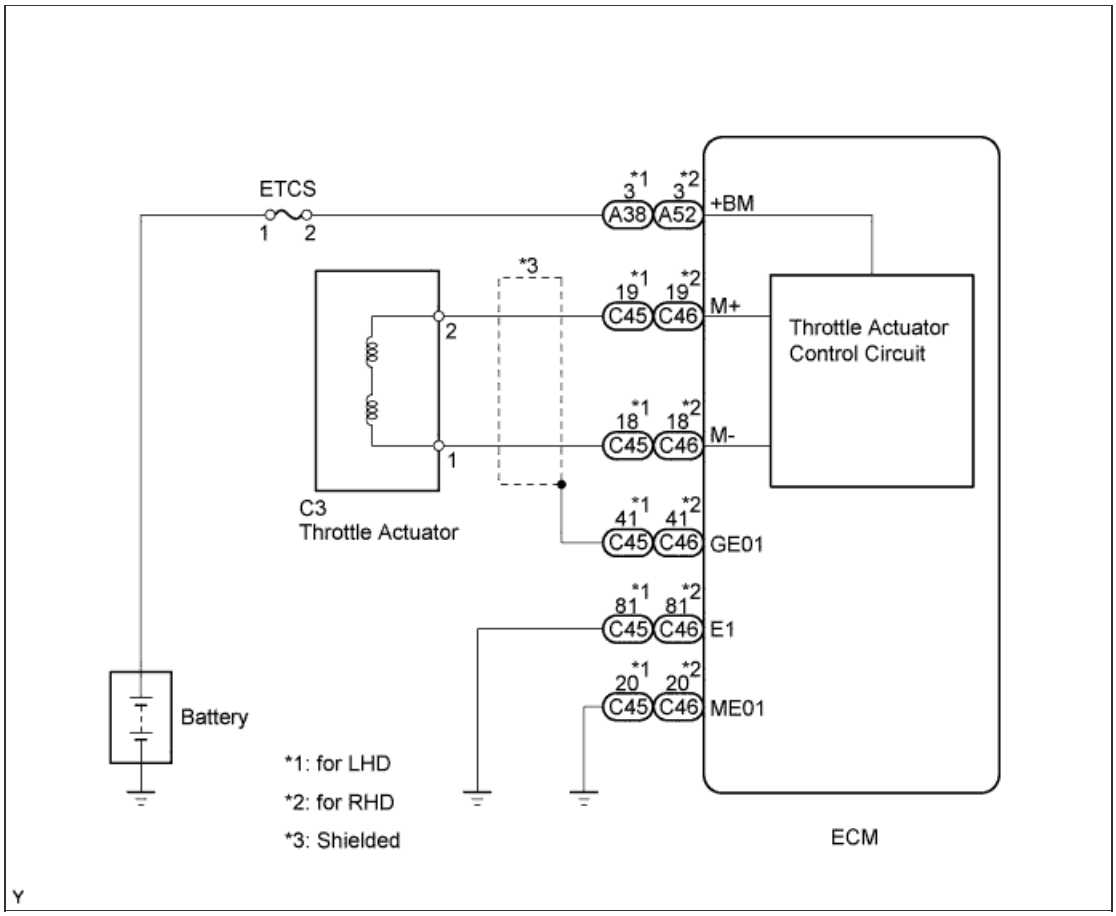
DESCRIPTION

The ETCS (Electronic Throttle Control System) has a dedicated power supply circuit. The voltage (+BM) is monitored and when it is low (below 4 V), the ECM determines that there is a malfunction in the ETCS and cuts off the current to the throttle actuator.
When the voltage becomes unstable, the ETCS itself becomes unstable. For this reason, when the voltage is low, the current to the throttle actuator is cut. If repairs are made and the system returns to normal, turn the ignition switch off. The ECM then allows the current to flow to the throttle actuator so that it can be restarted.

HINT:

The ETCS does not use a throttle cable.

DTC Code	DTC Detection Condition	Trouble Area
P2118	An open in the ETCS power source (+BM) circuit (1 trip detection logic).	• Open in ETCS power source circuit • Battery • Battery terminals • ETCS fuse • ECM



MONITOR DESCRIPTION

The ECM monitors the battery supply voltage applied to the throttle actuator.
When the power supply voltage (+BM) drops below 4 V for 0.8 seconds or more, the ECM interprets this as an open in the power supply circuit (+BM). The ECM illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored 5 seconds after the engine is next started.

FAIL-SAFE

When this DTC, or other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

P0220	The output voltage of VTA2 quickly fluctuates beyond the lower and upper malfunction thresholds for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • ECM
P0222	The output voltage of VTA2 is 1.75 V or less for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Short in VTA2 circuit • Open in VC circuit • ECM
P0223	The output voltage of VTA2 is 4.8 V or higher, and VTA1 is between 0.2 V and 2.02 V for 2 seconds when the accelerator pedal is depressed (1 trip detection logic).	• TP sensor (built into throttle body) • Open in VTA2 circuit • Open in E2 circuit • Short between VC and VTA2 circuits • ECM
P2135	Either condition (a) or (b) is met (1 trip detection logic): (a) The difference between the output voltages of VTA1 and VTA2 is 0.02 V or less for 0.5 seconds or more. (b) The output voltage of VTA1 is 0.2 V or less and VTA2 is 1.75 V or less for 0.4 seconds or more.	• Short between VTA1 and VTA2 circuits • TP sensor (built into throttle body) • ECM

HINT:

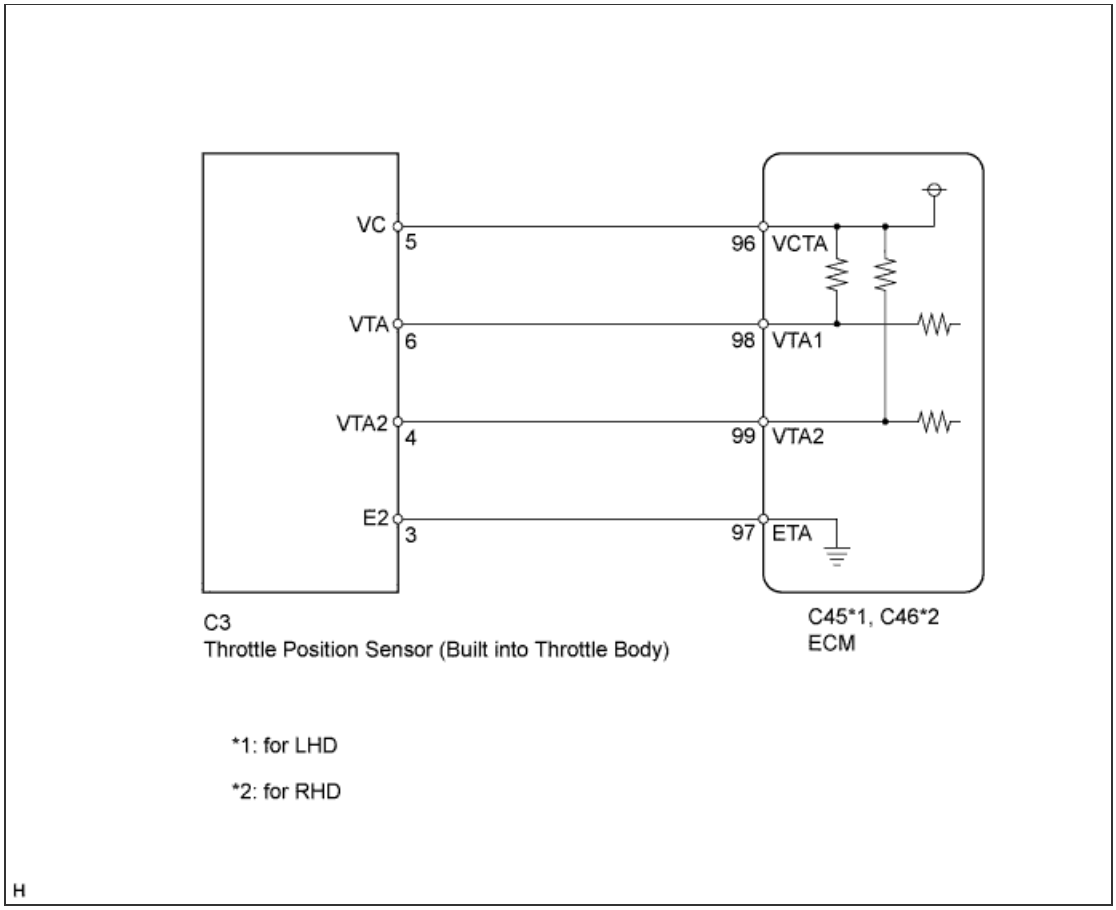
- **When any of these DTCs are output, check the throttle valve opening angle by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.**
- **Throttle Position No.1 is the VTA1 signal, and Throttle Position No.2 is the VTA2 signal.**

Reference (Normal Condition)

Tester Display	Accelerator Pedal Fully Released	Accelerator Pedal Fully Depressed
Throttle Position No.1	0.5 to 1.1 V	3.2 to 4.8 V
Throttle Position No.2	2.1 to 3.1 V	4.6 to 5.0 V

MONITOR DESCRIPTION

The ECM uses the Throttle Position (TP) sensor to monitor the throttle valve opening angle. There are several checks that the ECM performs to confirm the proper operation of the TP sensor.



- A specific voltage difference is expected between the sensor terminals, VTA1 and VTA2, for each throttle valve opening angle. If the difference between VTA1 and VTA2 is incorrect, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 each have a specific voltage range. If VTA1 or VTA2 is outside the normal operating range, the ECM interprets this as a malfunction in the sensor, and stores a DTC.
- VTA1 and VTA2 should never be close to the same voltage level. If VTA1 is within 0.02 V of VTA2, the ECM determines that there is a short circuit in the sensor, and stores a DTC.

If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

FAIL-SAFE

When any of these DTCs, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions are stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Throttle Position (TP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (THROTTLE POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Throttle Position No.1 and Throttle Position No.2.

d. Check the values displayed on the tester.

Result

Throttle Position No.1	Throttle Position No.2	Throttle Position No.1	Throttle Position No.2	Trouble Area Proceed to	
When Accelerator Pedal Released		When Accelerator Pedal Depressed			
0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	VC circuit open	A
4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	E2 circuit open	
0 to 0.2 V, or 4.5 to 5.0 V	2.1 to 3.1 V (Fail-safe)	0 to 0.2 V, or 4.5 to 5.0 V	2.1 to 3.1 V (Fail-safe)	VTA1 circuit open or ground short	
0.5 to 1.1 V (Fail-safe)	0 to 0.2 V, or 4.5 to 5.0 V	0.5 to 1.1 V (Fail-safe)	0 to 0.2 V, or 4.5 to 5.0 V	VTA2 circuit open or ground short	
0.5 to 1.1 V	2.1 to 3.1 V	3.2 to 4.8 V (Not fail-safe)	4.6 to 5.0 V (Not fail-safe)	TP sensor circuit normal	B

HINT:

- **DTC P0121 is stored when the voltages output from VTA1 and VTA2 are not consistent with the characteristics of the sensors. Therefore, check the Freeze Frame Data when this DTC is output. Use the following formula to confirm relative fluctuations in voltage.**

Features of sensor output

VTA2 x 0.8 is approximately equal to VTA1 + 1.11 V

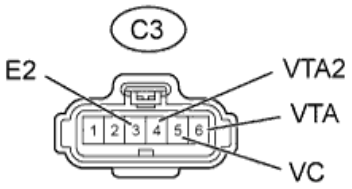
VTA1: Throttle Position No. 1

VTA2: Throttle Position No. 2

- **If DTC P0121 is output, proceed to the "CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)".**

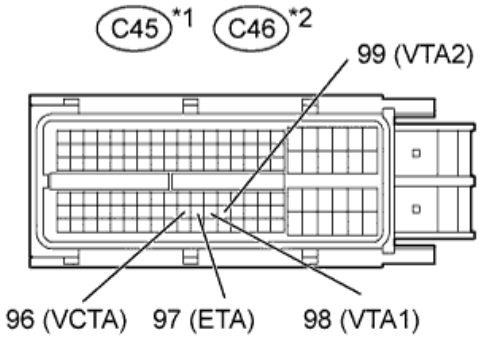
B	Go to step 5

A



2.CHECK HARNESS AND CONNECTOR (THROTTLE POSITION SENSOR - ECM)

a. Disconnect the throttle body connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Throttle Position Sensor)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C3-5 (VC) - C45-96 (VCTA)	Always	Below 1 Ω
C3-6 (VTA) - C45-98 (VTA1)	Always	Below 1 Ω

DTC P2119 Throttle Actuator Control Throttle Body Range / Performance

for Preparation Click here

SYSTEM DESCRIPTION

The Electronic Throttle Control System (ETCS) is composed of the throttle actuator, Throttle Position (TP) sensor, Accelerator Pedal Position (APP) sensor, and ECM. The ECM operates the throttle actuator to regulate the throttle valve in response to driver inputs. The TP sensor detects the opening angle of the throttle valve, and provides the ECM with feedback so that the throttle valve can be appropriately controlled by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P2119	The throttle valve opening angle continues to vary greatly from the target opening angle. (1 trip detection logic)	• Electronic Throttle Control System (ETCS) • ECM

MONITOR DESCRIPTION

The ECM determines the actual opening angle of the throttle valve from the TP sensor signal. The actual opening angle is compared to the target opening angle commanded by the ECM. If the difference between these two values is outside the standard range, the ECM interprets this as a malfunction in the ETCS. The ECM then illuminates the MIL and stores the DTC.
If the malfunction is not repaired successfully, the DTC is stored when the accelerator pedal is quickly released (to close the throttle valve) after the engine speed reaches 5000 rpm by fully depressing the accelerator pedal (fully open the throttle valve).

FAIL-SAFE

When this DTC, as well as other DTCs relating to ETCS (Electronic Throttle Control System) malfunctions, is stored, the ECM enters fail-safe mode. During fail-safe mode, the ECM cuts the current to the throttle actuator, and the throttle valve is returned to a 6° throttle angle by the return spring. The ECM then adjusts the engine output by controlling the fuel injection (intermittent fuel-cut) and ignition timing, in accordance with the accelerator pedal opening angle, to allow the vehicle to continue running at a minimal speed. If the accelerator pedal is depressed firmly and gently, the vehicle can be driven slowly.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is then turned off.

WIRING DIAGRAM

Refer to DTC P2102 (Click here).

INSPECTION PROCEDURE

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read the DTCs.

Result

Result	Proceed to
P2119	A
P2119 and other DTCs	B

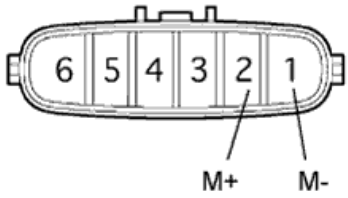
HINT:

If any DTCs other than P2119 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.INSPECT THROTTLE BODY ASSEMBLY (RESISTANCE OF THROTTLE ACTUATOR)



a. Disconnect the throttle body connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2 (M+) - 1 (M-)	20°C (68°F)	0.3 to 100 Ω

Component without harness connected:
(Throttle Body)

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

3.REPLACE ECM

a. Replace the ECM (Click here).

NEXT

4.CHECK WHETHER DTC OUTPUT RECURS (DTC P2119)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Allow the engine to idle for 15 seconds.

CAUTION:

Exercise extreme care and take precautions at procedure "A" and "B" below. Failure to do so may result in the vehicle unexpectedly rolling away.

f. Securely apply the parking brake and move the shift lever to D (procedure "A").

g. While depressing the brake pedal securely, fully depress the accelerator pedal for 5 seconds (procedure "B").

h. Enter the following menus: Powertrain / Engine and ECT / DTC.

i. Read the DTCs.

OK:
No DTC output.

HINT:

The output voltage of the throttle position sensor can be checked during procedure "B" using the intelligent tester. Variations in the output voltage indicate that the throttle actuator is in operation. To check the output voltage using the intelligent tester, enter the following menus: Powertrain / Engine and ECT /Data List / ETCS / Throttle Position No.1.

NG → REPLACE THROTTLE BODY ASSEMBLY (Click here)

OK

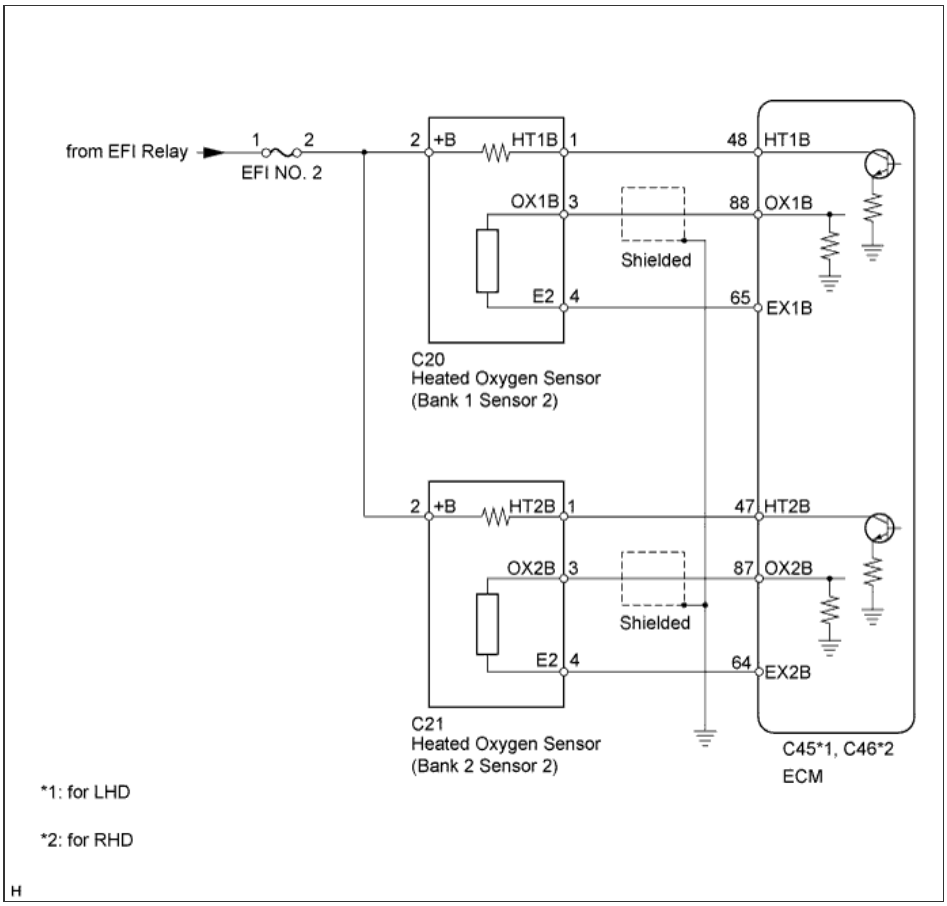
for Preparation Click here

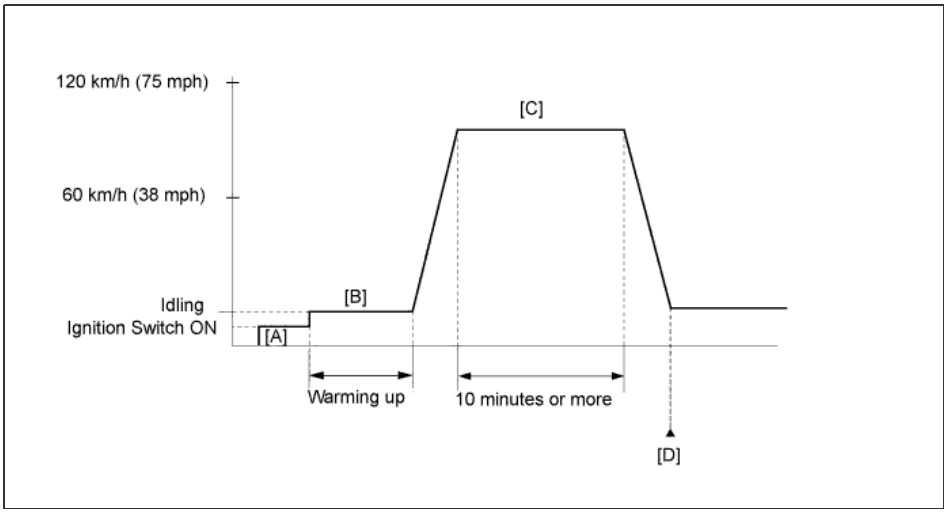
DESCRIPTION

HINT:



Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.

A three-way catalyst converter is used in order to convert the carbon monoxide, hydrocarbons, and nitrogen oxide, into less harmful substances. To allow the three-way catalytic converter to function effectively, it is necessary to keep the air fuel ratio of the engine near the stoichiometric air fuel ratio. For the purpose of helping the ECM to deliver accurate air fuel ratio control, a heated oxygen sensor is used.
The heated oxygen sensor is located behind the three-way catalytic converter, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air fuel ratio is richer than the stoichiometric air fuel level, the oxygen concentration in the exhaust gas becomes lean. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The heated oxygen sensor has the property of changing its output voltage drastically when the air fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the heated oxygen sensor to determine whether the air fuel ratio after the three-way catalytic converter is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the heated oxygen sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air fuel ratio control.



DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage does not decrease to below 0.21 V. 2. The heated oxygen sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Air fuel ratio (A/F) sensor (bank 1, 2 sensor 1) • Gas leak from exhaust system
P0137 P0157	• Low voltage (open): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is below 0.21 V. 2. The target air fuel ratio is rich.	• Open in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Gas leak from exhaust system
P0138 P0158	• High voltage (short): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is 0.59 V or higher. 2. The target air fuel ratio is lean.	• Short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • A/F sensor (bank 1, 2 sensor 1) • ECM

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3 [A].
2. Turn the tester on.
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [B].
4. Drive the vehicle at 60 to 120 km/h (38 to 75 mph) for at least 10 minutes [C].
5. Enter the following menus: Powertrain / Engine / Utility / All Readiness [D].
6. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
7. Check that DTC MONITOR is NORMAL. If DTC MONITOR is INCOMPLETE, perform the drive pattern again by accelerating the vehicle and using the second gear to decelerate the vehicle.

INSPECTION PROCEDURE

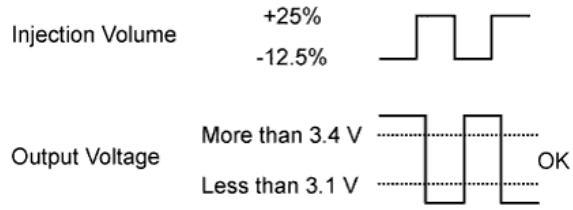
HINT:

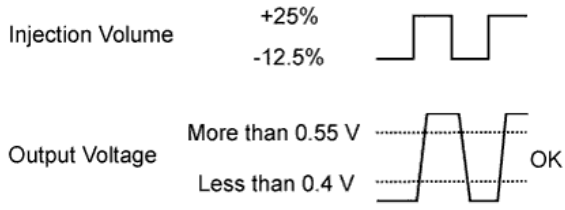
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

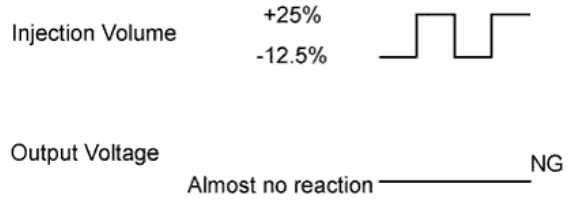
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

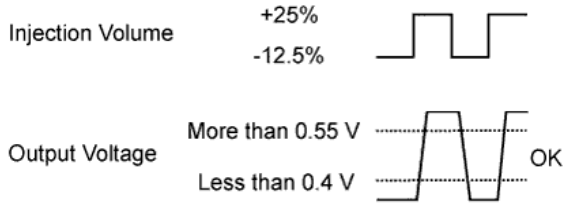
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent**

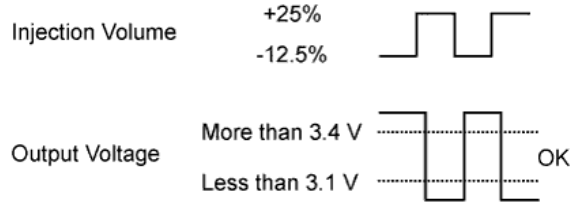
tester.

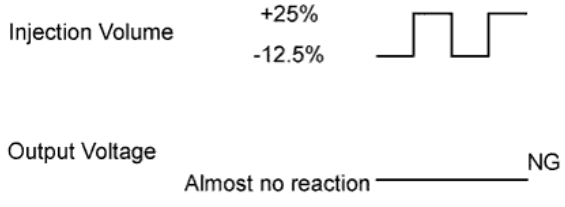


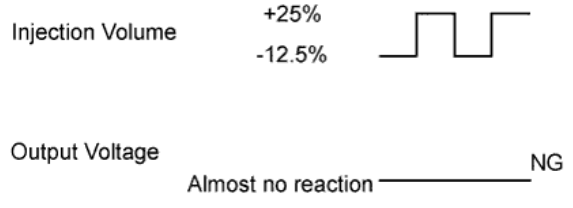


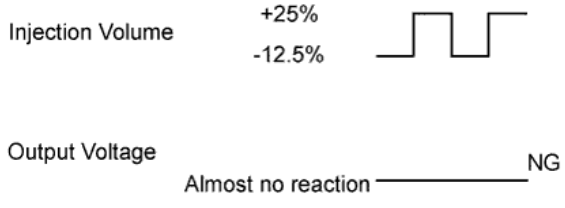












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC (DTC P0136, P0137, P0138, P0156, P0157 OR P0158)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0138 or P0158	A
P0137 or P0157	B
P0136 or P0156	C

B → Go to step 9

C → Go to step 7

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

e. Allow the engine to idle.

f. Read the heated oxygen sensor output voltage while idling.

Result:

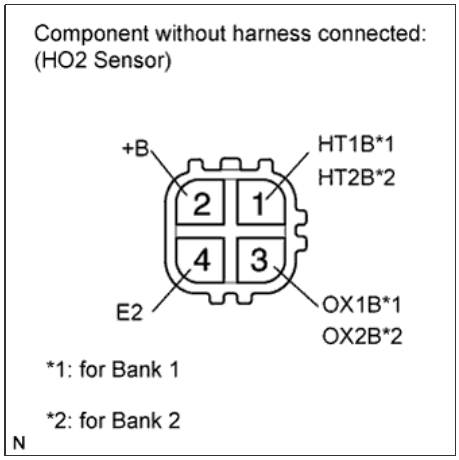
Result	Proceed to
Higher than 1.0 V	A
Below 1.0 V	B

B → Go to step 5

A

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

a. Disconnect the heated oxygen sensor connector.



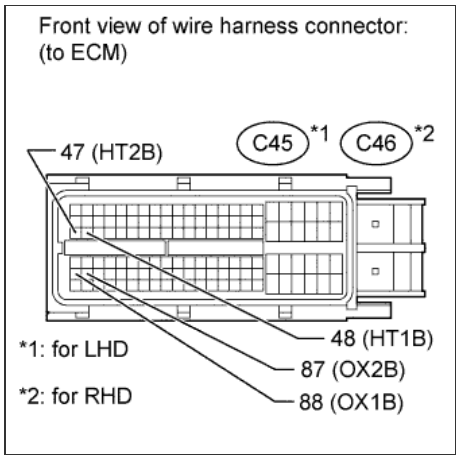
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Bank 1 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher

Standard Resistance (Bank 2 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C45-48 (HT1B) - C45-88 (OX1B)	Always	10 kΩ or higher
C45-47 (HT2B) - C45-87 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C46-48 (HT1B) - C46-88 (OX1B)	Always	10 kΩ or higher
C46-47 (HT2B) - C46-87 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - HEATED OXYGEN SENSOR)

OK → REPLACE ECM (Click here)

5.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

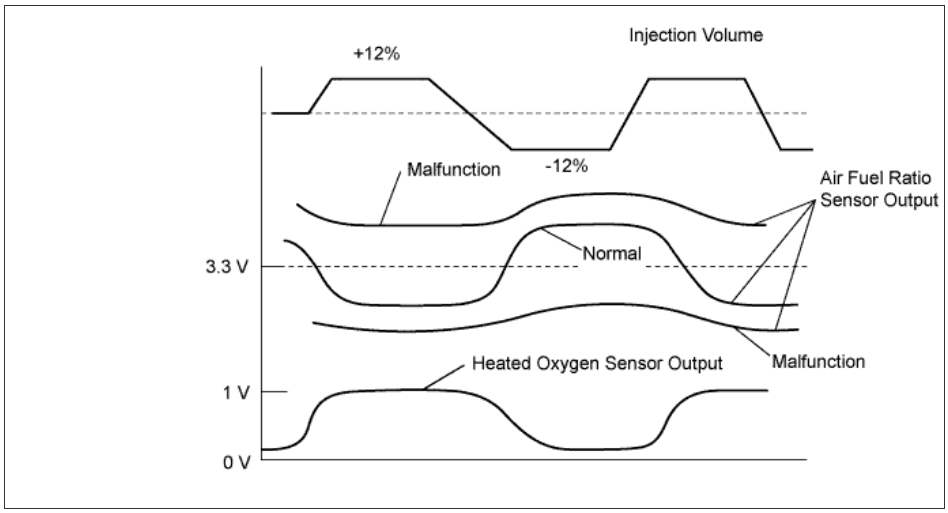
c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:



- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG	Go to step 15

OK

6.CHECK AIR FUEL RATIO SENSOR

HINT:

This air fuel ratio sensor test is to check the air fuel ratio sensor current during the fuel-cut operation. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

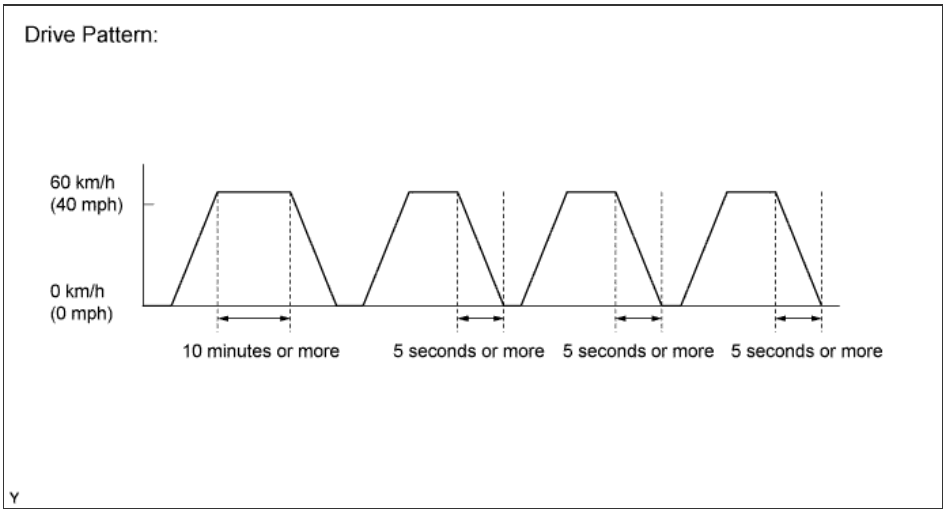
a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.

e. Clear DTCs.



f. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerate the vehicle to 60 km/h (40 mph) or more and then decelerate for 5 seconds or more. Repeat this process at least 3 times.

g. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Current B1S1.

h. Read the value of the air fuel ratio sensor current while the fuel-cut operation is performing.

Standard current:

Below 3.0 mA

HINT:

- **To measure the air fuel ratio sensor current precisely, perform the fuel-cut operation as long as possible.**
- **If it is difficult to measure the air fuel ratio sensor current, use the snapshot function of the intelligent tester.**

Result

Result	Proceed to
Outside standard range	A
Within standard range	B

OK	Go to step 12
NG	Go to step 15

7.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Start the engine.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

f. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

g. Read the output voltage of the heated oxygen sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.55 V or higher.

NG	Go to step 9
OK	

8.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

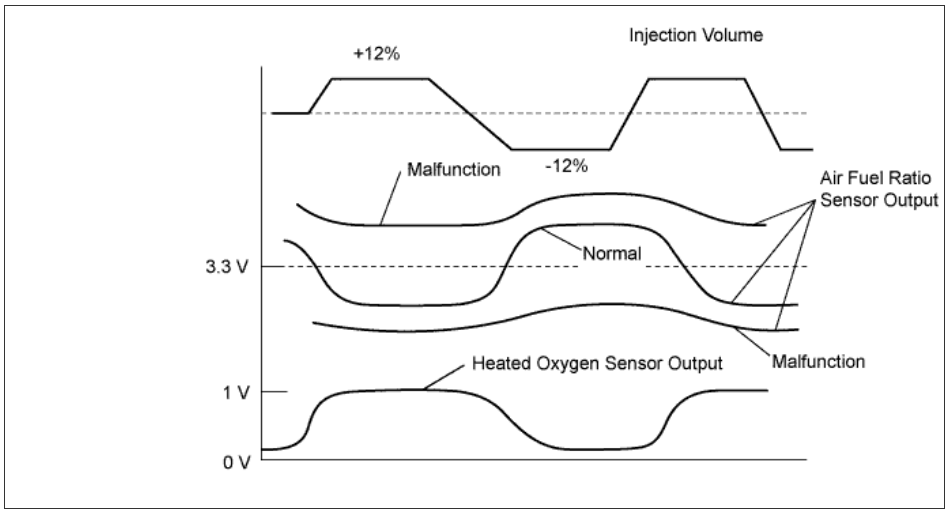
c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:



- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG → Go to step 15

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO AND REPAIR CAUSE (FUEL INJECTOR , FUEL PRESSURE, GAS LEAK FROM SYSTEM, ETC.)

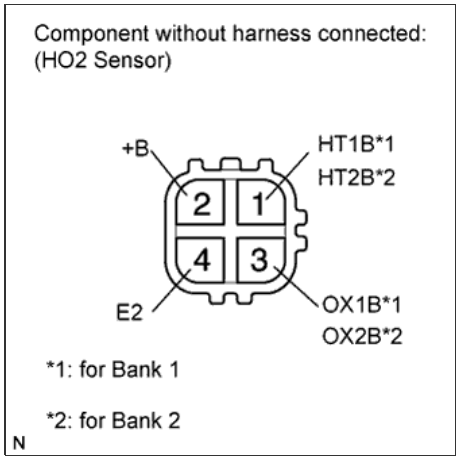
9.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leak.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK



10.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

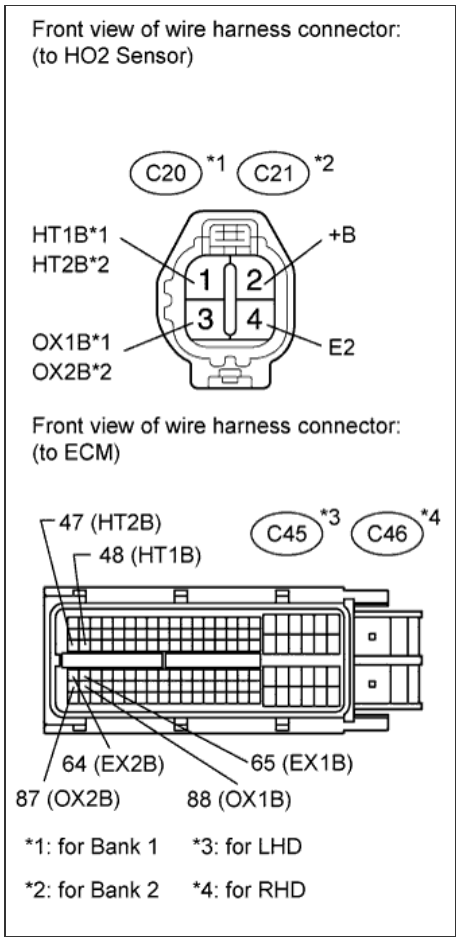
a. Disconnect the heated oxygen sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)



OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the heated oxygen sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

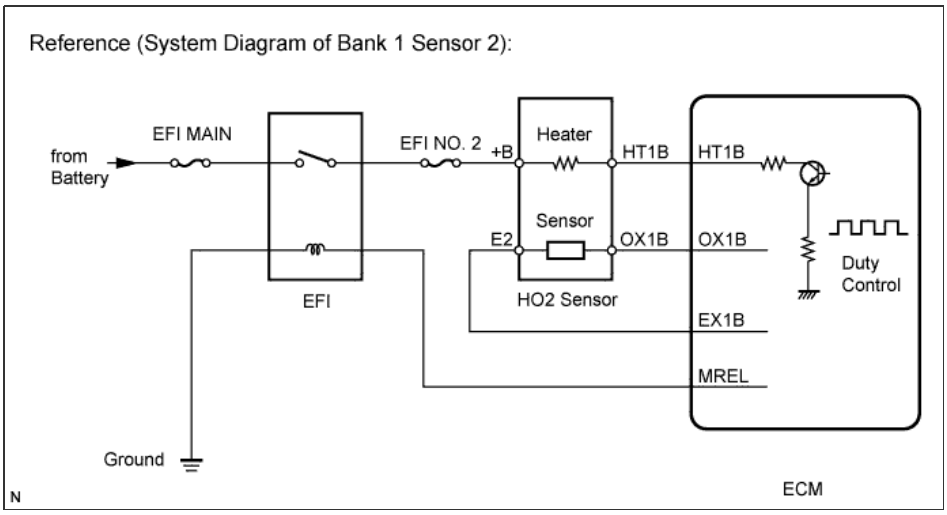
Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C45-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C45-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C45-64 (EX2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C46-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C46-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C46-64 (EX2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD



Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-88 (OX1B) - Body ground	Always	10 kΩ or higher

C20-4 (E2) or C45-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• Accelerator Pedal Position (APP) sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCPA circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

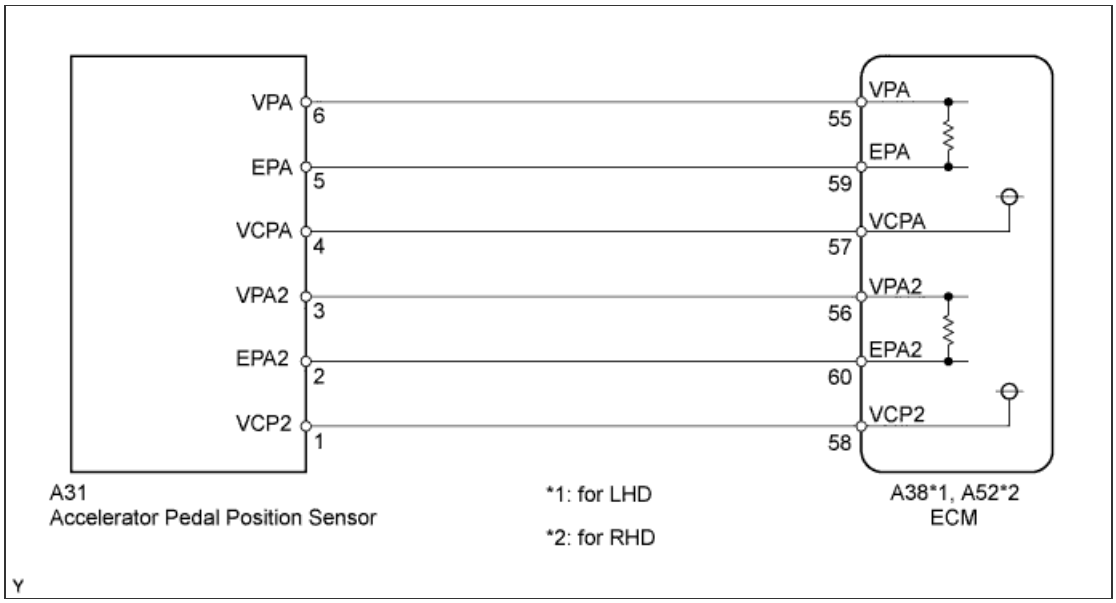
HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

Trouble Area	Accelerator Position No. 1 When Accelerator Pedal Released	Accelerator Position No. 2 When Accelerator Pedal Released	Accelerator Position No. 1 When Accelerator Pedal Depressed	Accelerator Position No. 2 When Accelerator Pedal Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

Accelerator pedal positions are expressed as voltages.



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is below the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

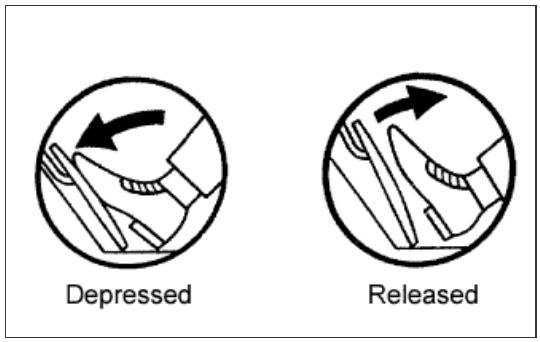
When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue to be driven. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

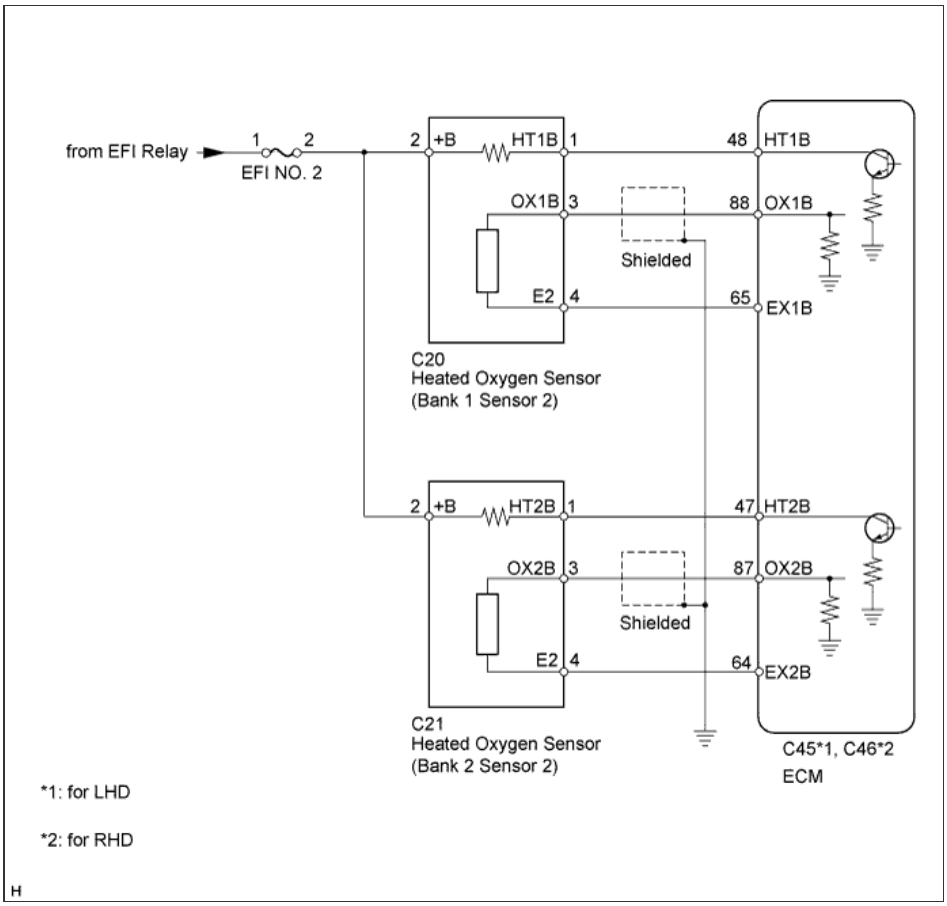
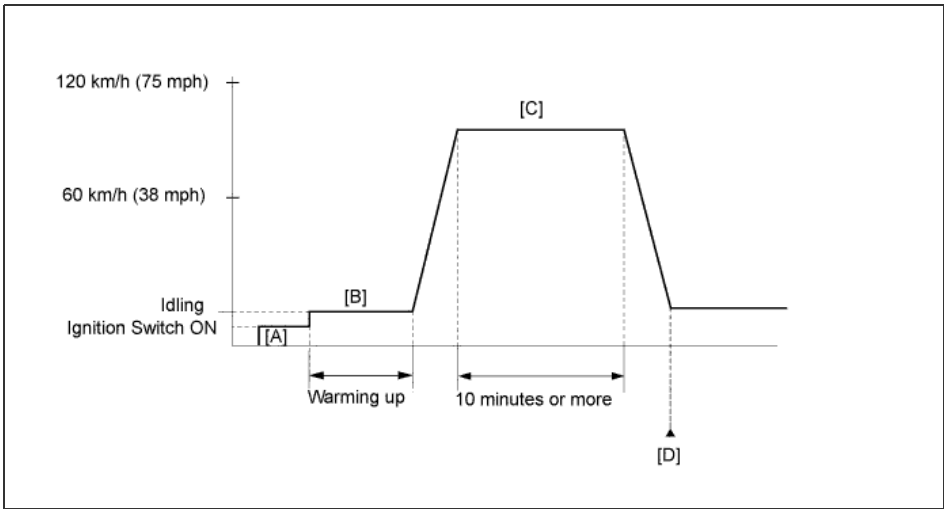
DESCRIPTION

HINT:



Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.

A three-way catalyst converter is used in order to convert the carbon monoxide, hydrocarbons, and nitrogen oxide, into less harmful substances. To allow the three-way catalytic converter to function effectively, it is necessary to keep the air fuel ratio of the engine near the stoichiometric air fuel ratio. For the purpose of helping the ECM to deliver accurate air fuel ratio control, a heated oxygen sensor is used.
The heated oxygen sensor is located behind the three-way catalytic converter, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air fuel ratio is richer than the stoichiometric air fuel level, the oxygen concentration in the exhaust gas becomes lean. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The heated oxygen sensor has the property of changing its output voltage drastically when the air fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the heated oxygen sensor to determine whether the air fuel ratio after the three-way catalytic converter is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the heated oxygen sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air fuel ratio control.



DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage does not decrease to below 0.21 V. 2. The heated oxygen sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Air fuel ratio (A/F) sensor (bank 1, 2 sensor 1) • Gas leak from exhaust system
P0137 P0157	• Low voltage (open): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is below 0.21 V. 2. The target air fuel ratio is rich.	• Open in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Gas leak from exhaust system
P0138 P0158	• High voltage (short): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is 0.59 V or higher. 2. The target air fuel ratio is lean.	• Short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • A/F sensor (bank 1, 2 sensor 1) • ECM

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3 [A].
2. Turn the tester on.
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [B].
4. Drive the vehicle at 60 to 120 km/h (38 to 75 mph) for at least 10 minutes [C].
5. Enter the following menus: Powertrain / Engine / Utility / All Readiness [D].
6. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
7. Check that DTC MONITOR is NORMAL. If DTC MONITOR is INCOMPLETE, perform the drive pattern again by accelerating the vehicle and using the second gear to decelerate the vehicle.

INSPECTION PROCEDURE

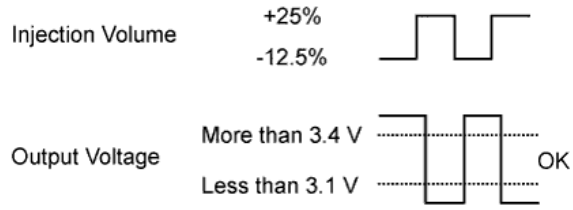
HINT:

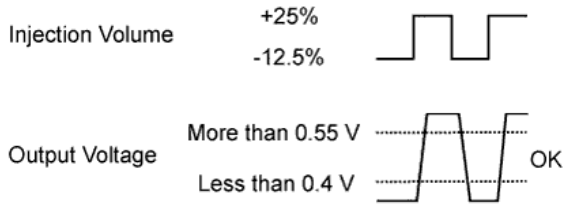
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

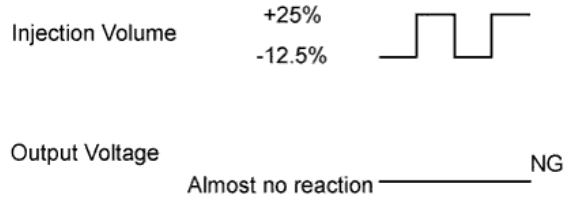
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

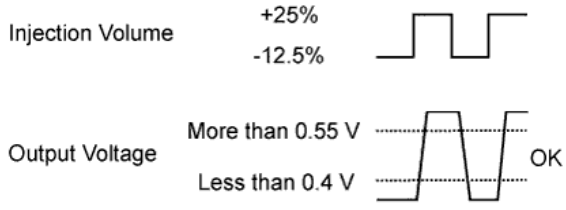
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent**

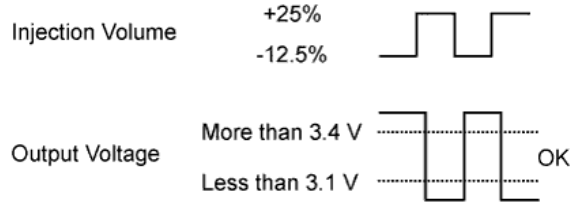
tester.

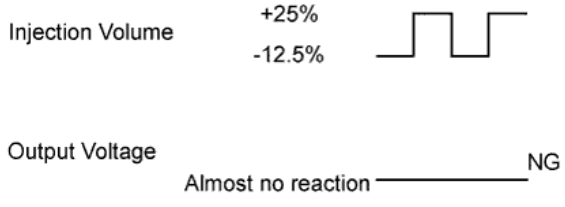


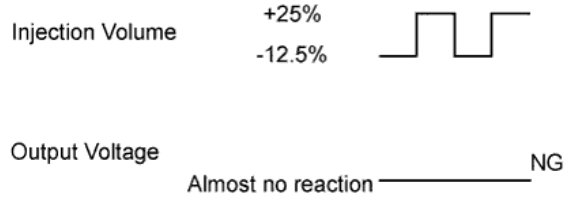


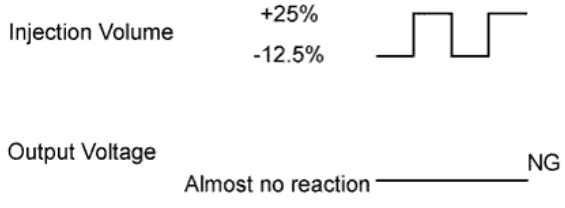












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC (DTC P0136, P0137, P0138, P0156, P0157 OR P0158)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0138 or P0158	A
P0137 or P0157	B
P0136 or P0156	C

B → Go to step 9

C → Go to step 7

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

e. Allow the engine to idle.

f. Read the heated oxygen sensor output voltage while idling.

Result:

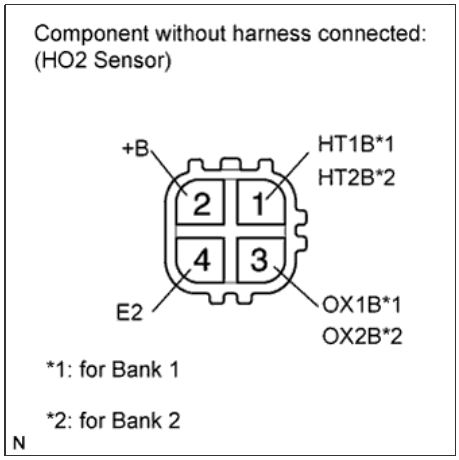
Result	Proceed to
Higher than 1.0 V	A
Below 1.0 V	B

B → Go to step 5

A

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

a. Disconnect the heated oxygen sensor connector.



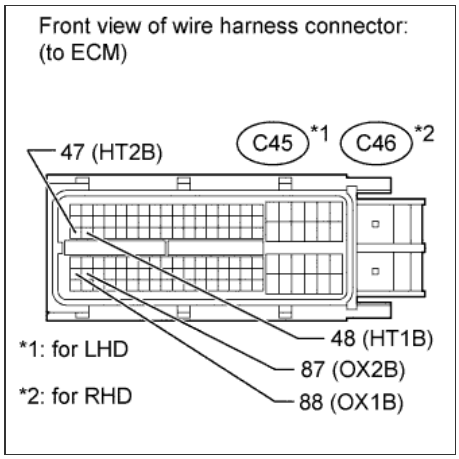
b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Bank 1 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher

Standard Resistance (Bank 2 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C45-48 (HT1B) - C45-88 (OX1B)	Always	10 kΩ or higher
C45-47 (HT2B) - C45-87 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C46-48 (HT1B) - C46-88 (OX1B)	Always	10 kΩ or higher
C46-47 (HT2B) - C46-87 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - HEATED OXYGEN SENSOR)

OK → REPLACE ECM (Click here)

5.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

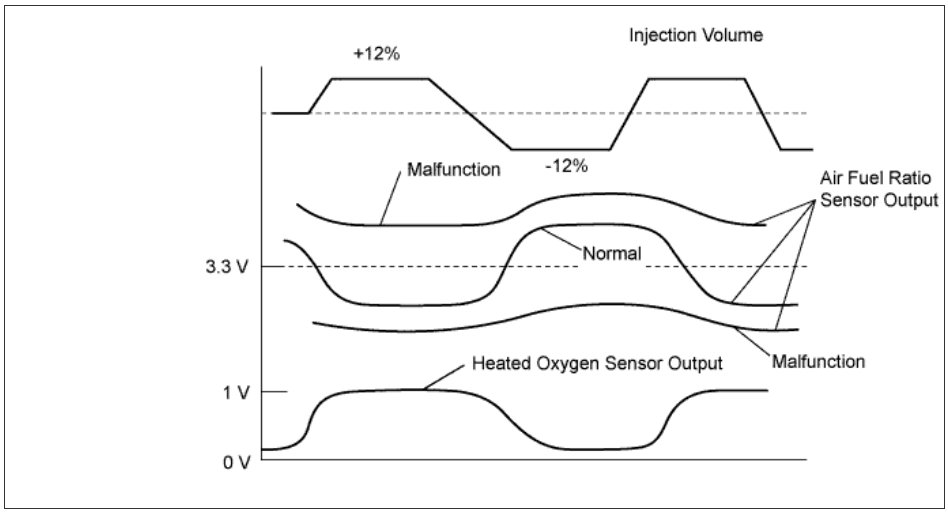
c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:



- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG	Go to step 15

OK

6.CHECK AIR FUEL RATIO SENSOR

HINT:

This air fuel ratio sensor test is to check the air fuel ratio sensor current during the fuel-cut operation. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

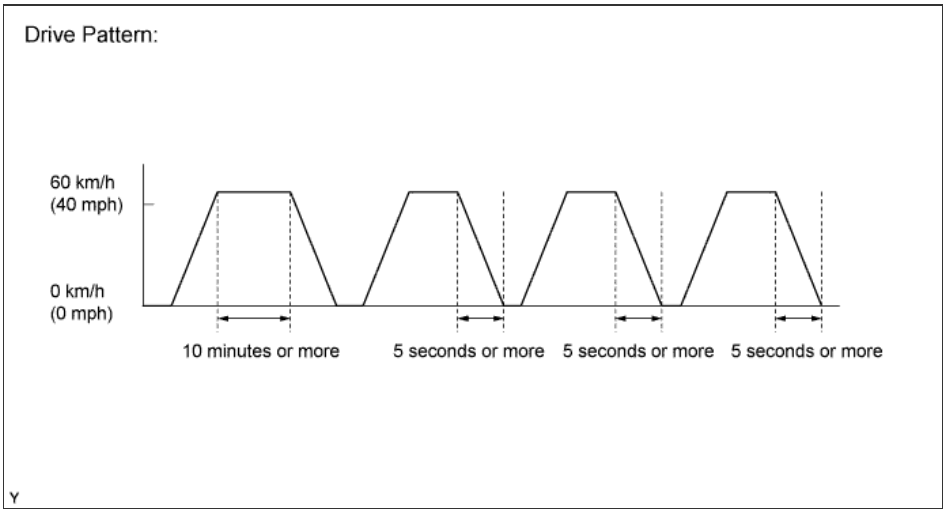
a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.

e. Clear DTCs.



f. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerate the vehicle to 60 km/h (40 mph) or more and then decelerate for 5 seconds or more. Repeat this process at least 3 times.

g. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Current B1S1.

h. Read the value of the air fuel ratio sensor current while the fuel-cut operation is performing.

Standard current:

Below 3.0 mA

HINT:

- **To measure the air fuel ratio sensor current precisely, perform the fuel-cut operation as long as possible.**
- **If it is difficult to measure the air fuel ratio sensor current, use the snapshot function of the intelligent tester.**

Result

Result	Proceed to
Outside standard range	A
Within standard range	B

OK	Go to step 12
NG	Go to step 15

7.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Start the engine.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

f. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

g. Read the output voltage of the heated oxygen sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.55 V or higher.

NG	Go to step 9
OK	

8.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG → Go to step 15

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO AND REPAIR CAUSE (FUEL INJECTOR , FUEL PRESSURE, GAS LEAK FROM SYSTEM, ETC.)

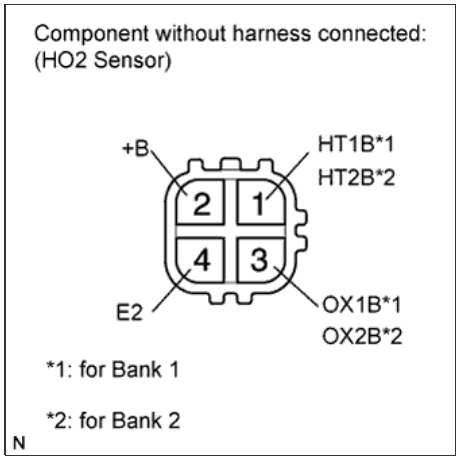
9.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leak.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK



10.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

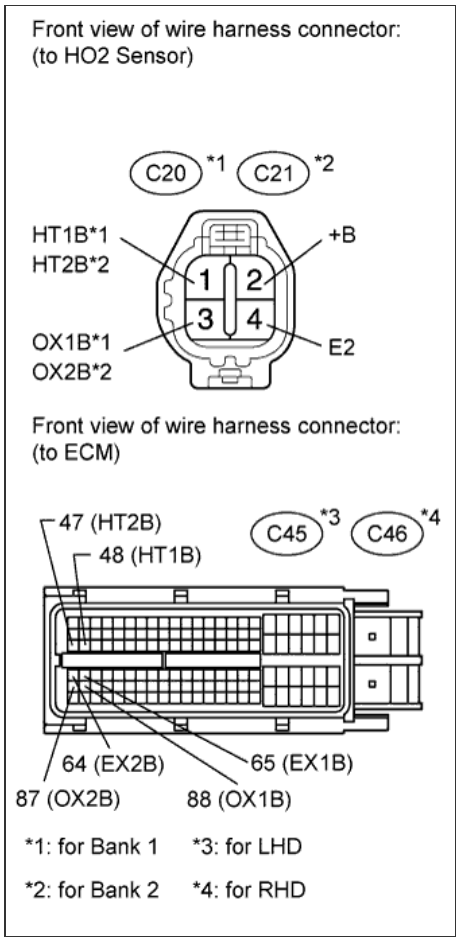
a. Disconnect the heated oxygen sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)



OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the heated oxygen sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

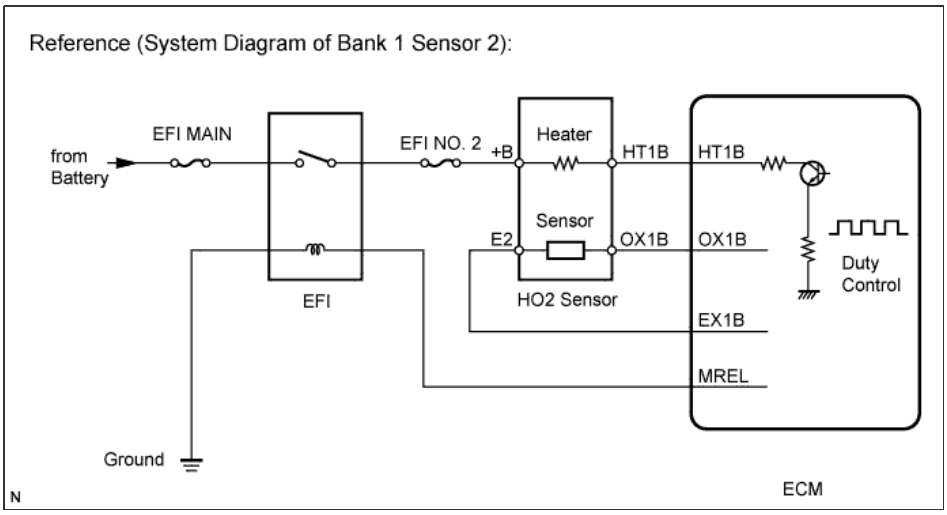
Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C45-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C45-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C45-64 (EX2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C46-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C46-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C46-64 (EX2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD



Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-88 (OX1B) - Body ground	Always	10 kΩ or higher

C20-4 (E2) or C45-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher
C21-3 (OX2B) or C45-87 (OX2B) - Body ground	Always	10 kΩ or higher
C21-4 (E2) or C45-64 (EX2B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) - Body ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• Accelerator Pedal Position (APP) sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCPA circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

Trouble Area	Accelerator Position No. 1 When Accelerator Pedal Released	Accelerator Position No. 2 When Accelerator Pedal Released	Accelerator Position No. 1 When Accelerator Pedal Depressed	Accelerator Position No. 2 When Accelerator Pedal Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

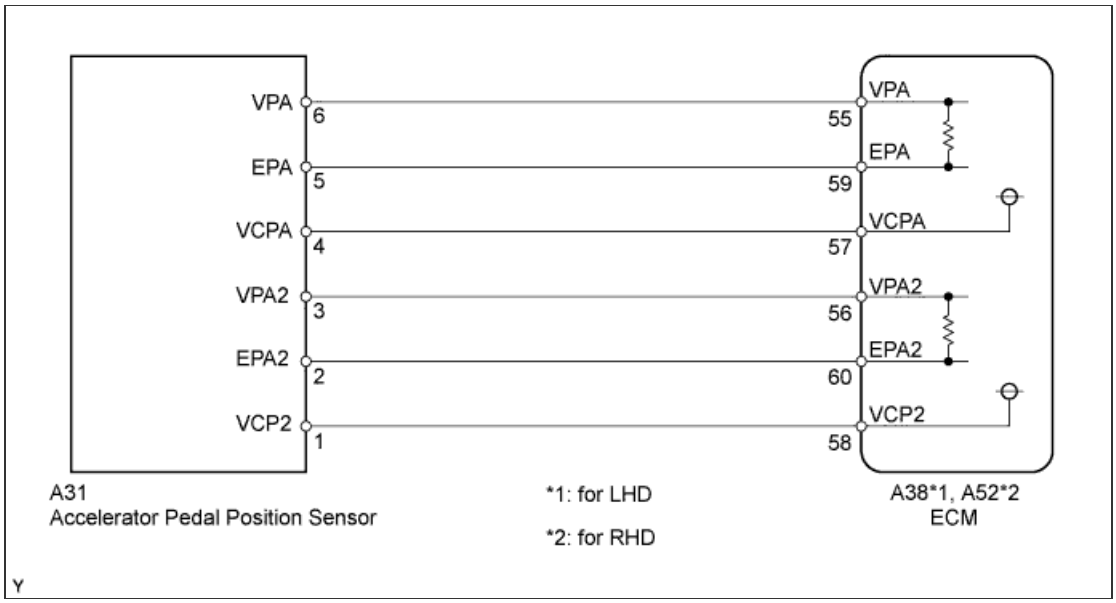
Accelerator pedal positions are expressed as voltages.



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is below the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue to be driven. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

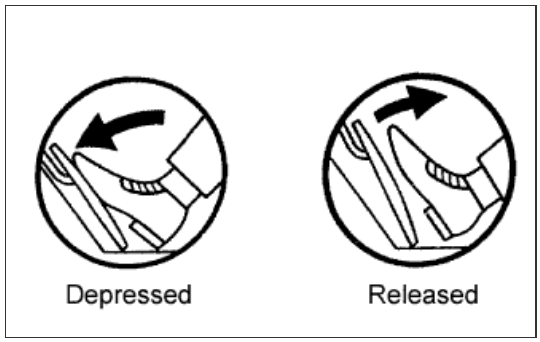
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

DESCRIPTION

HINT:

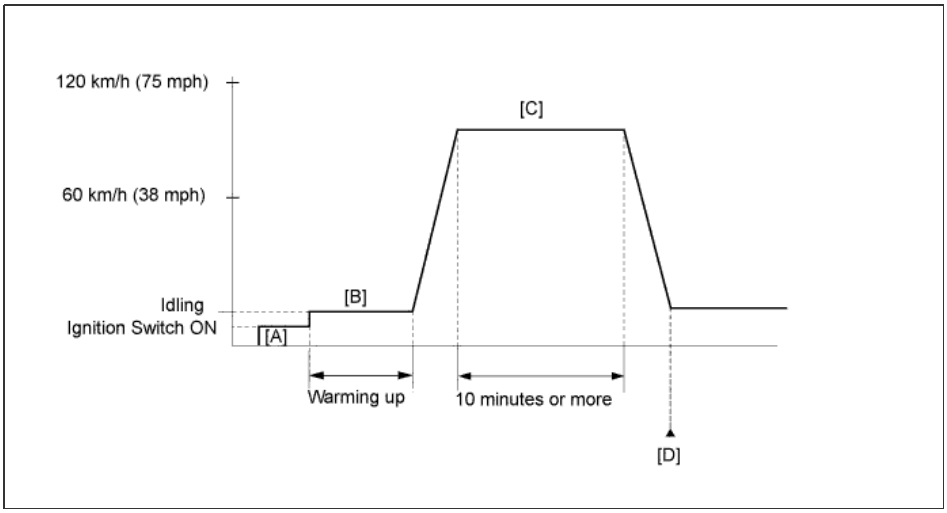
Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.

A three-way catalyst converter is used in order to convert the carbon monoxide, hydrocarbons, and nitrogen oxide, into less harmful substances. To allow the three-way catalytic converter to function effectively, it is necessary to keep the air fuel ratio of the engine near the stoichiometric air fuel ratio. For the purpose of helping the ECM to deliver accurate air fuel ratio control, a heated oxygen sensor is used.
The heated oxygen sensor is located behind the three-way catalytic converter, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air fuel ratio is richer than the stoichiometric air fuel level, the oxygen concentration in the exhaust gas becomes lean. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The heated oxygen sensor has the property of changing its output voltage drastically when the air fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the heated oxygen sensor to determine whether the air fuel ratio after the three-way catalytic converter is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the heated oxygen sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air fuel ratio control.



DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage does not decrease to below 0.21 V. 2. The heated oxygen sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Air fuel ratio (A/F) sensor (bank 1, 2 sensor 1) • Gas leak from exhaust system
P0137 P0157	• Low voltage (open): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is below 0.21 V. 2. The target air fuel ratio is rich.	• Open in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Gas leak from exhaust system
P0138 P0158	• High voltage (short): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is 0.59 V or higher. 2. The target air fuel ratio is lean.	• Short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • A/F sensor (bank 1, 2 sensor 1) • ECM

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3 [A].
2. Turn the tester on.
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [B].
4. Drive the vehicle at 60 to 120 km/h (38 to 75 mph) for at least 10 minutes [C].
5. Enter the following menus: Powertrain / Engine / Utility / All Readiness [D].
6. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
7. Check that DTC MONITOR is NORMAL. If DTC MONITOR is INCOMPLETE, perform the drive pattern again by accelerating the vehicle and using the second gear to decelerate the vehicle.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent**

tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC (DTC P0136, P0137, P0138, P0156, P0157 OR P0158)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

e. Allow the engine to idle.

f. Read the heated oxygen sensor output voltage while idling.

Result:

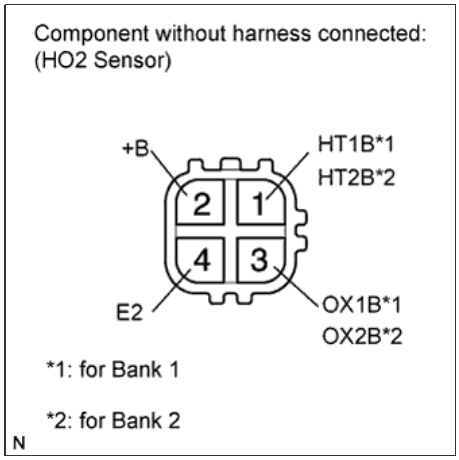
Result	Proceed to
Higher than 1.0 V	A
Below 1.0 V	B

B → Go to step 5

A

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

a. Disconnect the heated oxygen sensor connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Bank 1 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher

Standard Resistance (Bank 2 Sensor 2):

Tester Connection	Condition	Specified Condition
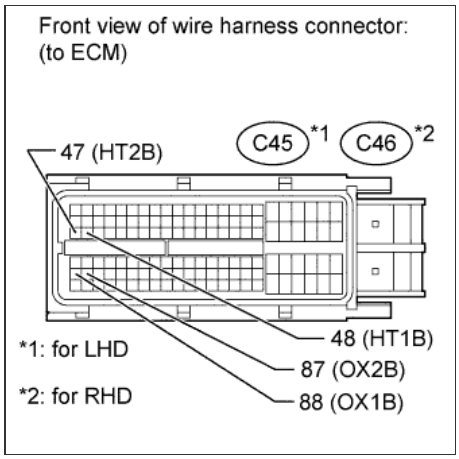
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C45-48 (HT1B) - C45-88 (OX1B)	Always	10 kΩ or higher
C45-47 (HT2B) - C45-87 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C46-48 (HT1B) - C46-88 (OX1B)	Always	10 kΩ or higher
C46-47 (HT2B) - C46-87 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - HEATED OXYGEN SENSOR)

OK → REPLACE ECM (Click here)

5.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG	Go to step 15

OK

6.CHECK AIR FUEL RATIO SENSOR

HINT:

This air fuel ratio sensor test is to check the air fuel ratio sensor current during the fuel-cut operation. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

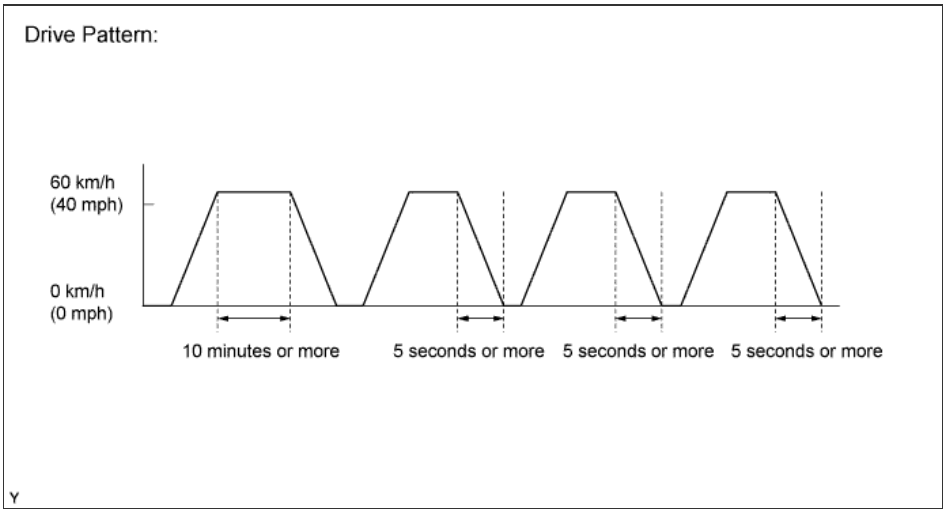
a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.

e. Clear DTCs.



f. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerate the vehicle to 60 km/h (40 mph) or more and then decelerate for 5 seconds or more. Repeat this process at least 3 times.

g. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Current B1S1.

h. Read the value of the air fuel ratio sensor current while the fuel-cut operation is performing.

Standard current:

Below 3.0 mA

HINT:

- **To measure the air fuel ratio sensor current precisely, perform the fuel-cut operation as long as possible.**
- **If it is difficult to measure the air fuel ratio sensor current, use the snapshot function of the intelligent tester.**

Result

Result	Proceed to
Outside standard range	A
Within standard range	B

OK	Go to step 12
NG	Go to step 15

7.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Start the engine.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

f. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

g. Read the output voltage of the heated oxygen sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.55 V or higher.

NG	Go to step 9
OK	

8.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG → Go to step 15

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO AND REPAIR CAUSE (FUEL INJECTOR , FUEL PRESSURE, GAS LEAK FROM SYSTEM, ETC.)

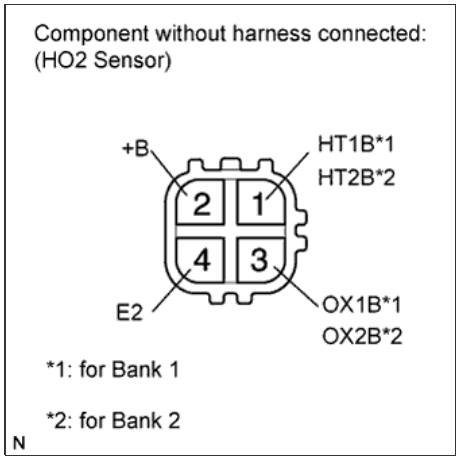
9.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leak.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK



10.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the heated oxygen sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C45-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C45-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C45-64 (EX2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C46-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C46-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C46-64 (EX2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-88 (OX1B) - Body ground	Always	10 kΩ or higher

C20-4 (E2) or C45-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher
C21-3 (OX2B) or C45-87 (OX2B) - Body ground	Always	10 kΩ or higher
C21-4 (E2) or C45-64 (EX2B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-88 (OX1B) - Body ground	Always	10 kΩ or higher
C20-4 (E2) or C46-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• Accelerator Pedal Position (APP) sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCPA circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

Trouble Area	Accelerator Position No. 1 When Accelerator Pedal Released	Accelerator Position No. 2 When Accelerator Pedal Released	Accelerator Position No. 1 When Accelerator Pedal Depressed	Accelerator Position No. 2 When Accelerator Pedal Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

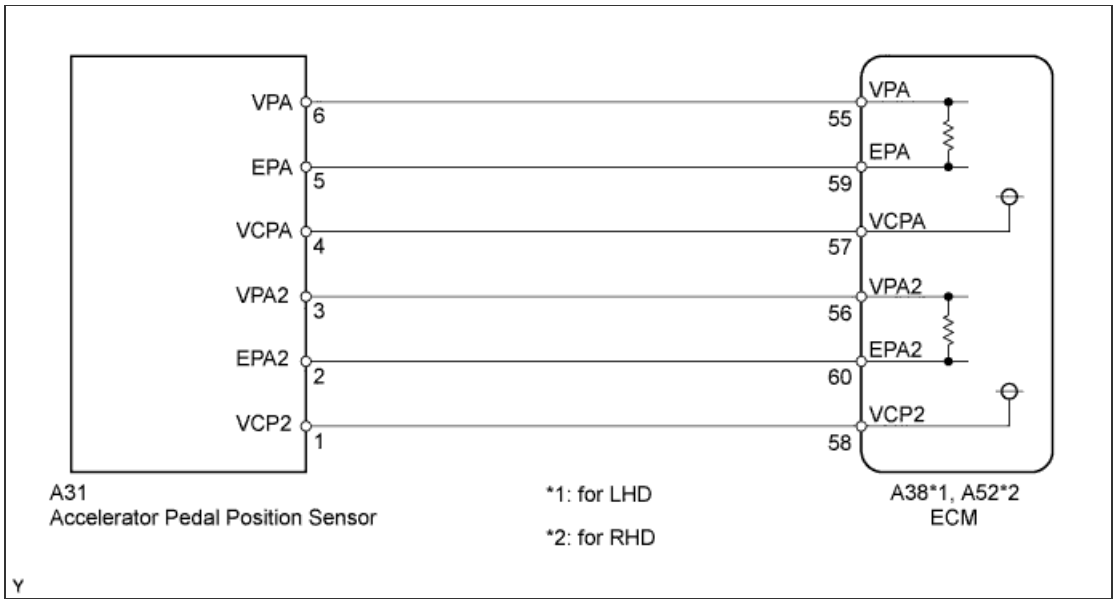
Accelerator pedal positions are expressed as voltages.



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is below the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue to be driven. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

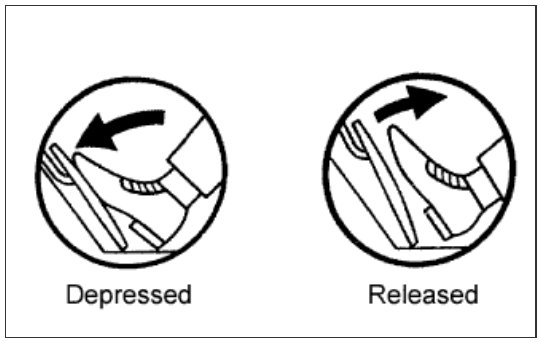
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

Result

Result	Proceed to
OK	A

DESCRIPTION

HINT:

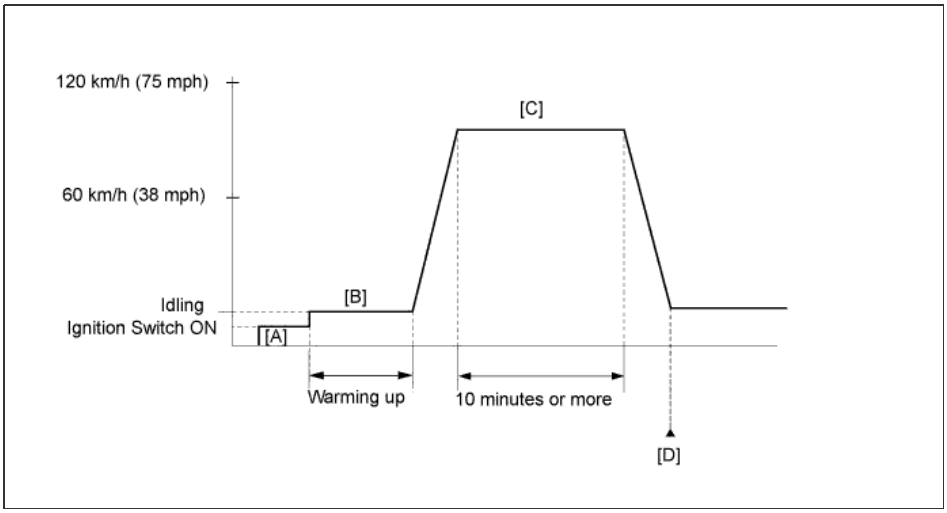
Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.

A three-way catalyst converter is used in order to convert the carbon monoxide, hydrocarbons, and nitrogen oxide, into less harmful substances. To allow the three-way catalytic converter to function effectively, it is necessary to keep the air fuel ratio of the engine near the stoichiometric air fuel ratio. For the purpose of helping the ECM to deliver accurate air fuel ratio control, a heated oxygen sensor is used.
The heated oxygen sensor is located behind the three-way catalytic converter, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air fuel ratio is richer than the stoichiometric air fuel level, the oxygen concentration in the exhaust gas becomes lean. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The heated oxygen sensor has the property of changing its output voltage drastically when the air fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the heated oxygen sensor to determine whether the air fuel ratio after the three-way catalytic converter is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the heated oxygen sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air fuel ratio control.



DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage does not decrease to below 0.21 V. 2. The heated oxygen sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Air fuel ratio (A/F) sensor (bank 1, 2 sensor 1) • Gas leak from exhaust system
P0137 P0157	• Low voltage (open): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is below 0.21 V. 2. The target air fuel ratio is rich.	• Open in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Gas leak from exhaust system
P0138 P0158	• High voltage (short): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is 0.59 V or higher. 2. The target air fuel ratio is lean.	• Short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • A/F sensor (bank 1, 2 sensor 1) • ECM

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3 [A].
2. Turn the tester on.
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [B].
4. Drive the vehicle at 60 to 120 km/h (38 to 75 mph) for at least 10 minutes [C].
5. Enter the following menus: Powertrain / Engine / Utility / All Readiness [D].
6. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
7. Check that DTC MONITOR is NORMAL. If DTC MONITOR is INCOMPLETE, perform the drive pattern again by accelerating the vehicle and using the second gear to decelerate the vehicle.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent**

tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC (DTC P0136, P0137, P0138, P0156, P0157 OR P0158)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0138 or P0158	A
P0137 or P0157	B
P0136 or P0156	C

B → Go to step 9

C → Go to step 7

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

e. Allow the engine to idle.

f. Read the heated oxygen sensor output voltage while idling.

Result:

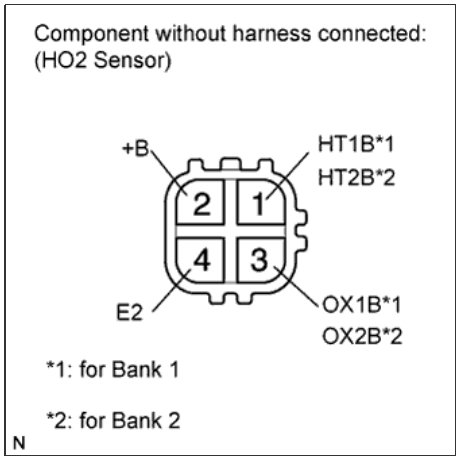
Result	Proceed to
Higher than 1.0 V	A
Below 1.0 V	B

B → Go to step 5

A

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

a. Disconnect the heated oxygen sensor connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Bank 1 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher

Standard Resistance (Bank 2 Sensor 2):

Tester Connection	Condition	Specified Condition
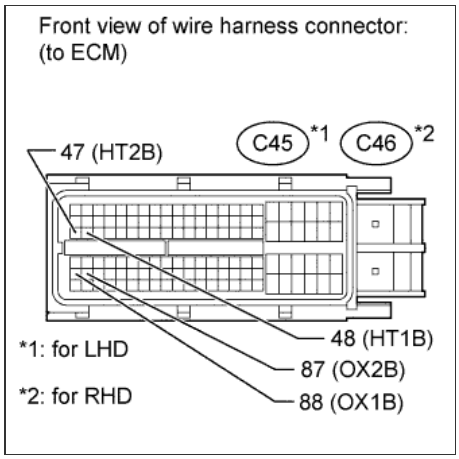
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C45-48 (HT1B) - C45-88 (OX1B)	Always	10 kΩ or higher
C45-47 (HT2B) - C45-87 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C46-48 (HT1B) - C46-88 (OX1B)	Always	10 kΩ or higher
C46-47 (HT2B) - C46-87 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - HEATED OXYGEN SENSOR)

OK → REPLACE ECM (Click here)

5.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG	Go to step 15

OK

6.CHECK AIR FUEL RATIO SENSOR

HINT:

This air fuel ratio sensor test is to check the air fuel ratio sensor current during the fuel-cut operation. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

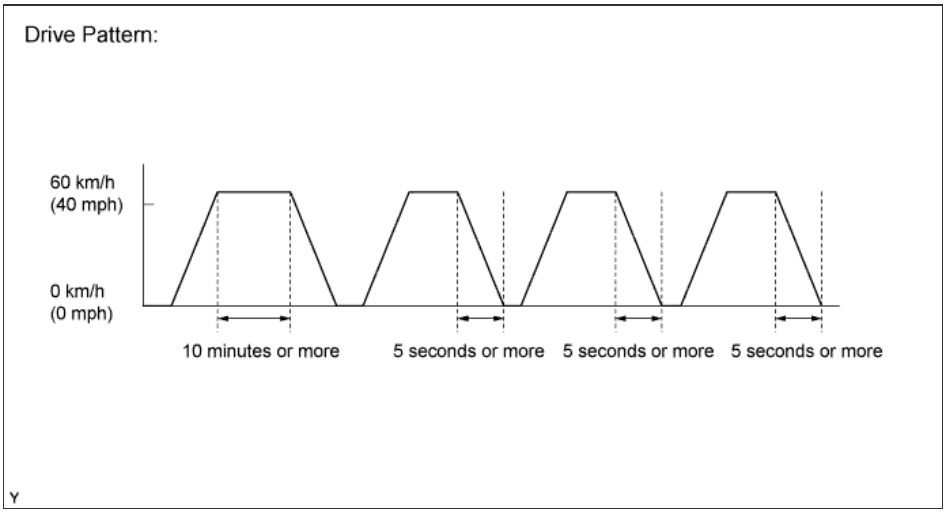
d. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.

e. Clear DTCs.



f. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerate the vehicle to 60 km/h (40 mph) or more and then decelerate for 5 seconds or more. Repeat this process at least 3 times.

g. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Current B1S1.

h. Read the value of the air fuel ratio sensor current while the fuel-cut operation is performing.

Standard current:

Below 3.0 mA

HINT:

- **To measure the air fuel ratio sensor current precisely, perform the fuel-cut operation as long as possible.**
- **If it is difficult to measure the air fuel ratio sensor current, use the snapshot function of the intelligent tester.**

Result

Result	Proceed to
Outside standard range	A
Within standard range	B

OK	Go to step 12
NG	Go to step 15

7.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Start the engine.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

f. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

g. Read the output voltage of the heated oxygen sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.55 V or higher.

NG	Go to step 9
OK	

8.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG → Go to step 15

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO AND REPAIR CAUSE (FUEL INJECTOR , FUEL PRESSURE, GAS LEAK FROM SYSTEM, ETC.)

9.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leak.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK

10.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the heated oxygen sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C45-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C45-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C45-64 (EX2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C46-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C46-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C46-64 (EX2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-88 (OX1B) - Body ground	Always	10 kΩ or higher

C20-4 (E2) or C45-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher
C21-3 (OX2B) or C45-87 (OX2B) - Body ground	Always	10 kΩ or higher
C21-4 (E2) or C45-64 (EX2B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-88 (OX1B) - Body ground	Always	10 kΩ or higher
C20-4 (E2) or C46-65 (EX1B) - Body ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• Accelerator Pedal Position (APP) sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCPA circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

Trouble Area	Accelerator Position No. 1 When Accelerator Pedal Released	Accelerator Position No. 2 When Accelerator Pedal Released	Accelerator Position No. 1 When Accelerator Pedal Depressed	Accelerator Position No. 2 When Accelerator Pedal Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

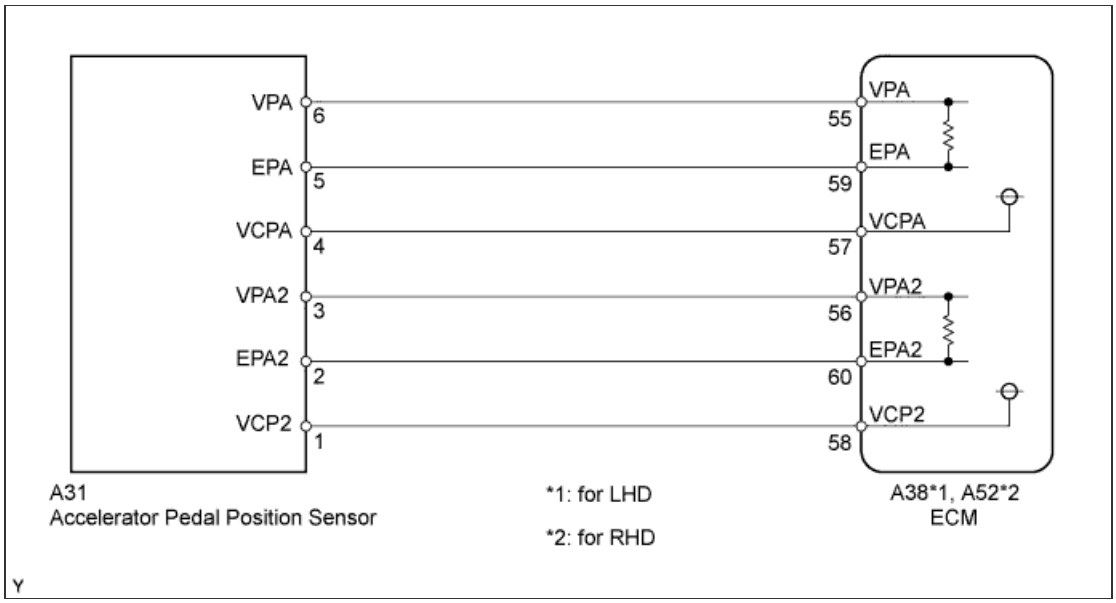
Accelerator pedal positions are expressed as voltages.



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is below the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue to be driven. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

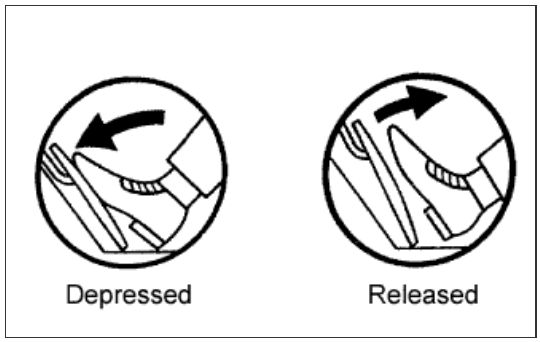
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

Result

Result	Proceed to
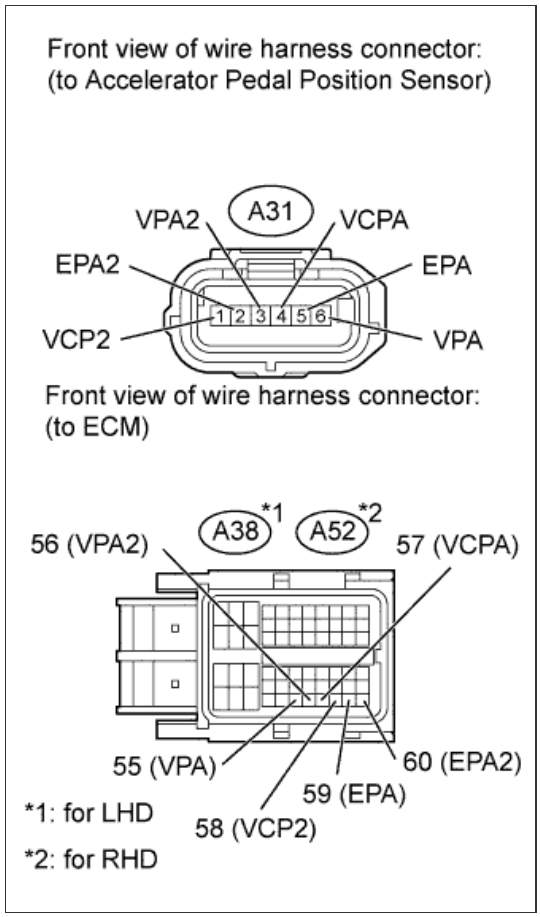
OK	A
NG	B

A → Go to step 5



B

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the Accelerator Pedal Position (APP) sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-59 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-58 (VCP2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-59 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-58 (VCP2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) or A38-55 (VPA) -		10 kΩ or

Body ground	Always	higher
A31-5 (EPA) or A38-59 (EPA) - Body ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

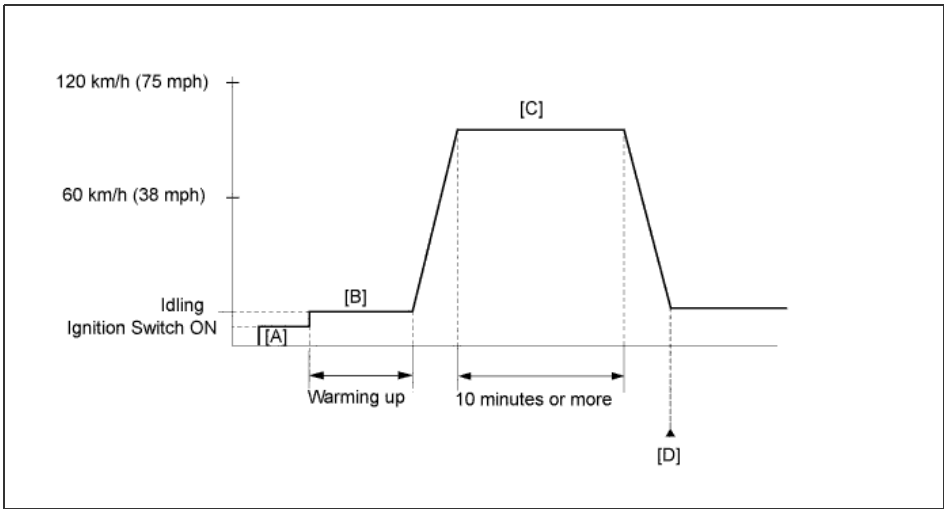
Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.

A three-way catalyst converter is used in order to convert the carbon monoxide, hydrocarbons, and nitrogen oxide, into less harmful substances. To allow the three-way catalytic converter to function effectively, it is necessary to keep the air fuel ratio of the engine near the stoichiometric air fuel ratio. For the purpose of helping the ECM to deliver accurate air fuel ratio control, a heated oxygen sensor is used.
The heated oxygen sensor is located behind the three-way catalytic converter, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air fuel ratio is richer than the stoichiometric air fuel level, the oxygen concentration in the exhaust gas becomes lean. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The heated oxygen sensor has the property of changing its output voltage drastically when the air fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the heated oxygen sensor to determine whether the air fuel ratio after the three-way catalytic converter is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the heated oxygen sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air fuel ratio control.



DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage does not decrease to below 0.21 V. 2. The heated oxygen sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Air fuel ratio (A/F) sensor (bank 1, 2 sensor 1) • Gas leak from exhaust system
P0137 P0157	• Low voltage (open): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is below 0.21 V. 2. The target air fuel ratio is rich.	• Open in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Gas leak from exhaust system
P0138 P0158	• High voltage (short): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is 0.59 V or higher. 2. The target air fuel ratio is lean.	• Short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • A/F sensor (bank 1, 2 sensor 1) • ECM

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3 [A].
2. Turn the tester on.
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [B].
4. Drive the vehicle at 60 to 120 km/h (38 to 75 mph) for at least 10 minutes [C].
5. Enter the following menus: Powertrain / Engine / Utility / All Readiness [D].
6. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
7. Check that DTC MONITOR is NORMAL. If DTC MONITOR is INCOMPLETE, perform the drive pattern again by accelerating the vehicle and using the second gear to decelerate the vehicle.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent**

tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC (DTC P0136, P0137, P0138, P0156, P0157 OR P0158)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0138 or P0158	A
P0137 or P0157	B
P0136 or P0156	C

B → Go to step 9

C → Go to step 7

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

e. Allow the engine to idle.

f. Read the heated oxygen sensor output voltage while idling.

Result:

Result	Proceed to
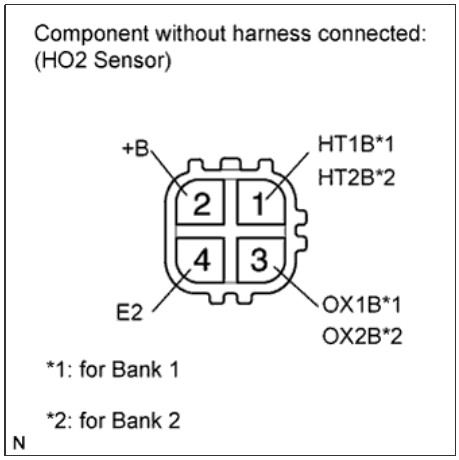
Higher than 1.0 V	A
Below 1.0 V	B

B → Go to step 5

A

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

a. Disconnect the heated oxygen sensor connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Bank 1 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher

Standard Resistance (Bank 2 Sensor 2):

Tester Connection	Condition	Specified Condition
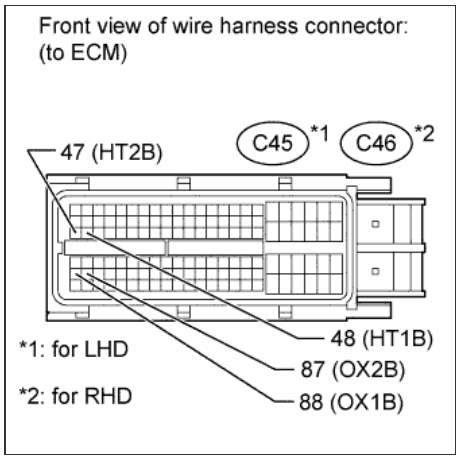
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C45-48 (HT1B) - C45-88 (OX1B)	Always	10 kΩ or higher
C45-47 (HT2B) - C45-87 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C46-48 (HT1B) - C46-88 (OX1B)	Always	10 kΩ or higher
C46-47 (HT2B) - C46-87 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - HEATED OXYGEN SENSOR)

OK → REPLACE ECM (Click here)

5.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG	Go to step 15

OK

6.CHECK AIR FUEL RATIO SENSOR

HINT:

This air fuel ratio sensor test is to check the air fuel ratio sensor current during the fuel-cut operation. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

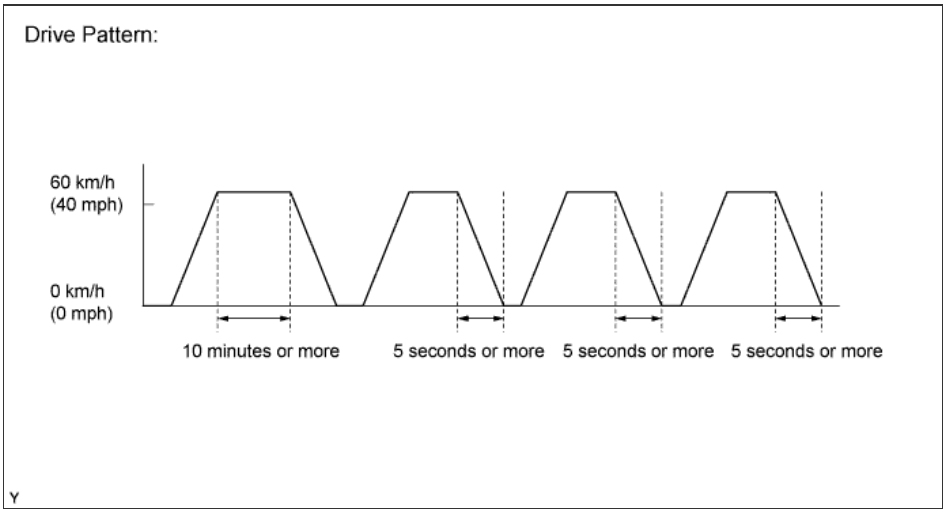
d. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.

e. Clear DTCs.



f. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerate the vehicle to 60 km/h (40 mph) or more and then decelerate for 5 seconds or more. Repeat this process at least 3 times.

g. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Current B1S1.

h. Read the value of the air fuel ratio sensor current while the fuel-cut operation is performing.

Standard current:

Below 3.0 mA

HINT:

- **To measure the air fuel ratio sensor current precisely, perform the fuel-cut operation as long as possible.**
- **If it is difficult to measure the air fuel ratio sensor current, use the snapshot function of the intelligent tester.**

Result

Result	Proceed to
Outside standard range	A
Within standard range	B

OK	Go to step 12
NG	Go to step 15

7.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Start the engine.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

f. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

g. Read the output voltage of the heated oxygen sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.55 V or higher.

NG	Go to step 9
OK	

8.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG → Go to step 15

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO AND REPAIR CAUSE (FUEL INJECTOR , FUEL PRESSURE, GAS LEAK FROM SYSTEM, ETC.)

9.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leak.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK

10.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the heated oxygen sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C45-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C45-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C45-64 (EX2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C46-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C46-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C46-64 (EX2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-88 (OX1B) - Body ground	Always	10 kΩ or higher

C20-4 (E2) or C45-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher
C21-3 (OX2B) or C45-87 (OX2B) - Body ground	Always	10 kΩ or higher
C21-4 (E2) or C45-64 (EX2B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C46-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C46-88 (OX1B) - Body ground	Always	10 kΩ or higher
C20-4 (E2) or C46-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C46-47 (HT2B) - Body ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• Accelerator Pedal Position (APP) sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCPA circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

Trouble Area	Accelerator Position No. 1 When Accelerator Pedal Released	Accelerator Position No. 2 When Accelerator Pedal Released	Accelerator Position No. 1 When Accelerator Pedal Depressed	Accelerator Position No. 2 When Accelerator Pedal Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

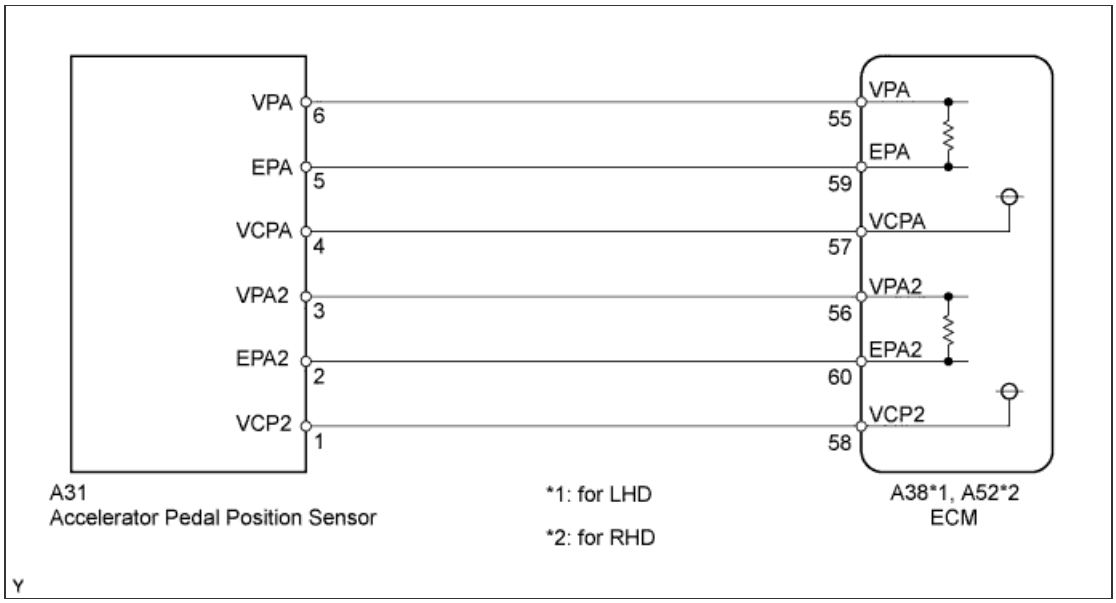
Accelerator pedal positions are expressed as voltages.



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is below the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue to be driven. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

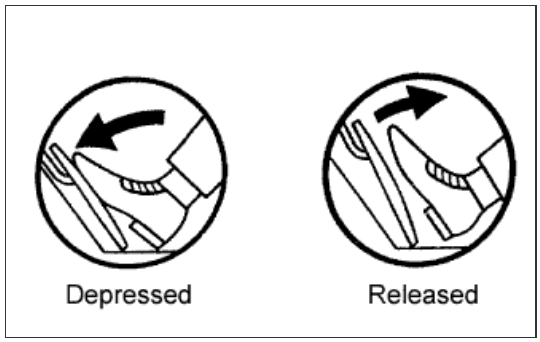
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

Result

Result	Proceed to
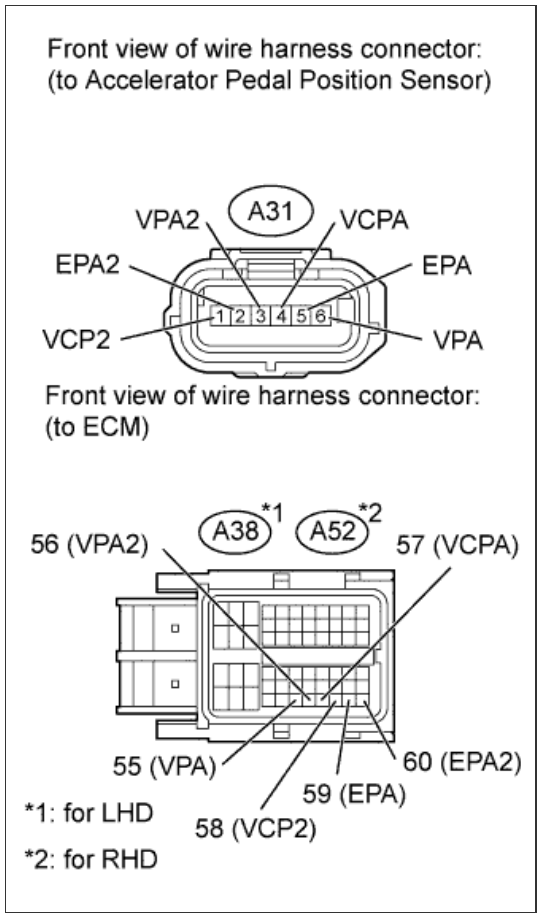
OK	A
NG	B

A → Go to step 5



B

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the Accelerator Pedal Position (APP) sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-59 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-58 (VCP2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-59 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-58 (VCP2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) or A38-55 (VPA) -		10 kΩ or

Body ground	Always	higher
A31-5 (EPA) or A38-59 (EPA) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - Body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - Body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-58 (VCP2) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) or A52-55 (VPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-59 (EPA) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-57 (VCPA) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-56 (VPA2) - Body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-60 (EPA2) - Body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A52-58 (VCP2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

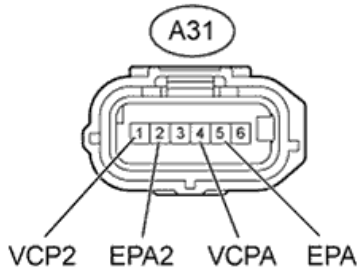
3.CHECK ECM (VCPA AND VCP2 VOLTAGE)



a. Disconnect the APP sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
A31-4 (VCPA) - A31-5 (EPA)	Ignition switch ON	4.5 to 5.5 V
A31-1 (VCP2) - A31-2 (EPA2)	Ignition switch ON	4.5 to 5.5 V

Front view of wire harness connector:
(to Accelerator Pedal Position Sensor)

NG → REPLACE ECM (Click here)

OK

4.REPLACE ACCELERATOR PEDAL ROD ASSEMBLY

a. Replace the accelerator pedal rod assembly (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (ACCELERATOR PEDAL POSITION SENSOR DTCS)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 15 seconds.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read the DTCs.

DESCRIPTION

HINT:

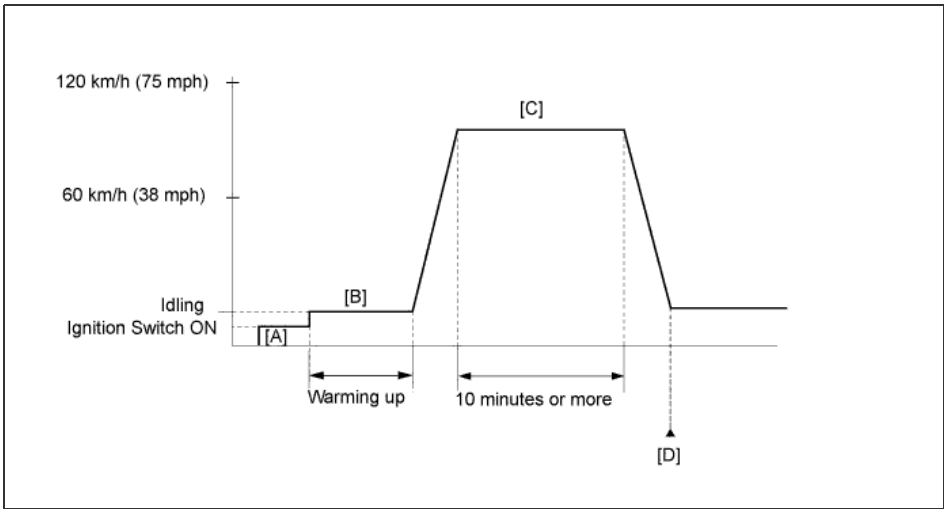
Sensor 2 refers to the sensor mounted behind the three-way catalytic converter and located far from the engine assembly.

A three-way catalyst converter is used in order to convert the carbon monoxide, hydrocarbons, and nitrogen oxide, into less harmful substances. To allow the three-way catalytic converter to function effectively, it is necessary to keep the air fuel ratio of the engine near the stoichiometric air fuel ratio. For the purpose of helping the ECM to deliver accurate air fuel ratio control, a heated oxygen sensor is used.
The heated oxygen sensor is located behind the three-way catalytic converter, and detects the oxygen concentration in the exhaust gas. Since the sensor is integrated with the heater that heats the sensing portion, it is possible to detect the oxygen concentration even when the intake air volume is low (the exhaust gas temperature is low).
When the air fuel ratio becomes lean, the oxygen concentration in the exhaust gas is rich. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is lean (low voltage, i.e. below 0.45 V).
Conversely, when the air fuel ratio is richer than the stoichiometric air fuel level, the oxygen concentration in the exhaust gas becomes lean. The heated oxygen sensor informs the ECM that the post-three way catalytic converter air fuel ratio is rich (high voltage, i.e. higher than 0.45 V). The heated oxygen sensor has the property of changing its output voltage drastically when the air fuel ratio is close to the stoichiometric level.
The ECM uses the supplementary information from the heated oxygen sensor to determine whether the air fuel ratio after the three-way catalytic converter is rich or lean, and adjusts the fuel injection time accordingly. Thus, if the heated oxygen sensor is working improperly due to internal malfunctions, the ECM is unable to compensate for deviations in the primary air fuel ratio control.



DTC Code	DTC Detection Condition	Trouble Area
P0136 P0156	• Abnormal voltage output: During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage does not decrease to below 0.21 V. 2. The heated oxygen sensor voltage does not increase to higher than 0.59 V.	• Open or short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Air fuel ratio (A/F) sensor (bank 1, 2 sensor 1) • Gas leak from exhaust system
P0137 P0157	• Low voltage (open): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is below 0.21 V. 2. The target air fuel ratio is rich.	• Open in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • HO2 sensor heater (bank 1, 2 sensor 2) • Gas leak from exhaust system
P0138 P0158	• High voltage (short): During active air fuel ratio control, the following conditions (a) and (b) are met for a certain period of time (2 trip detection logic): 1. The heated oxygen sensor voltage output is 0.59 V or higher. 2. The target air fuel ratio is lean.	• Short in HO2 sensor (bank 1, 2 sensor 2) circuit • HO2 sensor (bank 1, 2 sensor 2) • A/F sensor (bank 1, 2 sensor 1) • ECM

WIRING DIAGRAM

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3 [A].
2. Turn the tester on.
3. Warm up the engine until the engine coolant temperature is 75°C (167°F) or higher [B].
4. Drive the vehicle at 60 to 120 km/h (38 to 75 mph) for at least 10 minutes [C].
5. Enter the following menus: Powertrain / Engine / Utility / All Readiness [D].
6. Input DTCs: P0136, P0137, P0138, P0156, P0157 and P0158.
7. Check that DTC MONITOR is NORMAL. If DTC MONITOR is INCOMPLETE, perform the drive pattern again by accelerating the vehicle and using the second gear to decelerate the vehicle.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent**

tester.

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.READ OUTPUT DTC (DTC P0136, P0137, P0138, P0156, P0157 OR P0158)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Read DTCs.

Result

Result	Proceed to
P0138 or P0158	A
P0137 or P0157	B
P0136 or P0156	C

B → Go to step 9

C → Go to step 7

A

2.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

e. Allow the engine to idle.

f. Read the heated oxygen sensor output voltage while idling.

Result:

Result	Proceed to
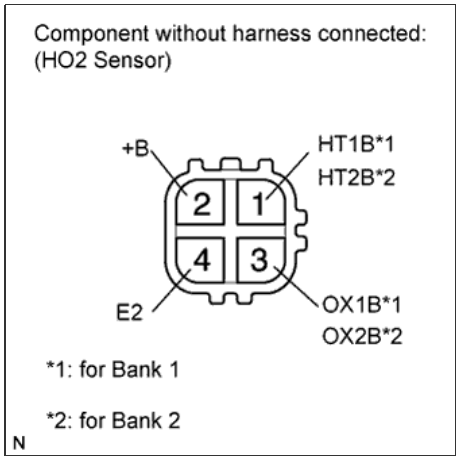
Higher than 1.0 V	A
Below 1.0 V	B

B → Go to step 5

A

3.INSPECT HEATED OXYGEN SENSOR (CHECK FOR SHORT)

a. Disconnect the heated oxygen sensor connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Bank 1 Sensor 2):

Tester Connection	Condition	Specified Condition
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX1B)	Always	10 kΩ or higher

Standard Resistance (Bank 2 Sensor 2):

Tester Connection	Condition	Specified Condition
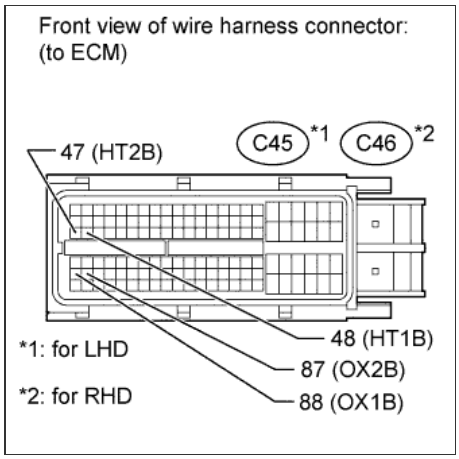
2 (+B) - 4 (E2)	20°C (68°F)	10 kΩ or higher
2 (+B) - 3 (OX2B)	Always	10 kΩ or higher



NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

4.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

for LHD

Tester Connection	Condition	Specified Condition
C45-48 (HT1B) - C45-88 (OX1B)	Always	10 kΩ or higher
C45-47 (HT2B) - C45-87 (OX2B)	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C46-48 (HT1B) - C46-88 (OX1B)	Always	10 kΩ or higher
C46-47 (HT2B) - C46-87 (OX2B)	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (ECM - HEATED OXYGEN SENSOR)

OK → REPLACE ECM (Click here)

5.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG	Go to step 15

OK

6.CHECK AIR FUEL RATIO SENSOR

HINT:

This air fuel ratio sensor test is to check the air fuel ratio sensor current during the fuel-cut operation. When the sensor is normal, the sensor current will indicate below 3 mA in this test.

a. Connect an intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

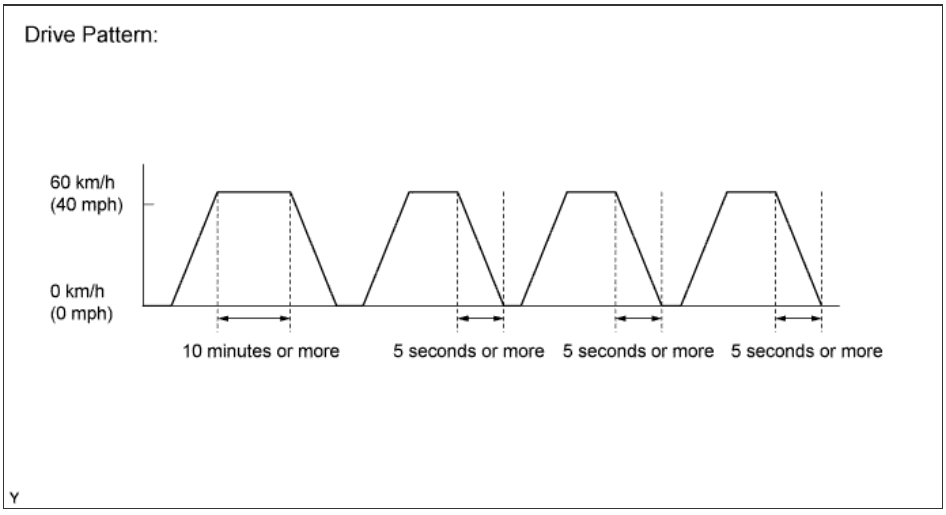
d. Enter the following menus: Powertrain / Engine and ECT / DTC / Clear.

e. Clear DTCs.



f. Drive the vehicle by the drive pattern as listed below:

i. Warm up the engine.

ii. Drive the vehicle at 60 km/h (40 mph) or more for 10 minutes or more.

iii. Stop the vehicle.

iv. Accelerate the vehicle to 60 km/h (40 mph) or more and then decelerate for 5 seconds or more. Repeat this process at least 3 times.

g. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Current B1S1.

h. Read the value of the air fuel ratio sensor current while the fuel-cut operation is performing.

Standard current:

Below 3.0 mA

HINT:

- **To measure the air fuel ratio sensor current precisely, perform the fuel-cut operation as long as possible.**
- **If it is difficult to measure the air fuel ratio sensor current, use the snapshot function of the intelligent tester.**

Result

Result	Proceed to
Outside standard range	A
Within standard range	B

OK	Go to step 12
NG	Go to step 15

7.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF HEATED OXYGEN SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Start the engine.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / O2S B1S2.

f. After warming up the engine, run the engine at an engine speed of 2500 rpm for 3 minutes.

g. Read the output voltage of the heated oxygen sensor when the engine speed is suddenly increased.

HINT:

Quickly accelerate the engine to 4000 rpm 3 times using the accelerator pedal.

Standard voltage:
Fluctuates between 0.4 V or less and 0.55 V or higher.

NG	Go to step 9
OK	

8.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (INJECTION VOLUME)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Enter the following menus: Powertrain / Engine / Active Test / Control the Injection Volume.

f. Change the fuel injection volume using the tester, and monitor the voltage output of the air fuel ratio sensor and heated oxygen sensor displayed on the tester.

HINT:

- **Change the fuel injection volume within the range of -12% and +12%. The injection volume can be changed in 1% graduations within this range.**
- **The air fuel ratio sensor is displayed as AFS Voltage B1S1, and the heated oxygen sensor is displayed as O2S B1S2 on the intelligent tester.**

Result:

Tester Display (Sensor)	Voltage Variation	Proceed to
AFS Voltage B1S1 (A/F)	Alternates between higher than and below 3.3 V	OK
AFS Voltage B1S1 (A/F)	Remains at higher than 3.3 V	NG
AFS Voltage B1S1 (A/F)	Remains at below 3.3 V	NG

HINT:

A normal heated oxygen sensor voltage (O2S B1S2) reacts in accordance with increases and decreases in fuel injection volumes. When the air fuel ratio sensor voltage remains at either less or higher than 3.3 V despite the heated oxygen sensor indicating a normal reaction, the air fuel ratio sensor is malfunctioning.

NG → Go to step 15

OK

CHECK EXTREMELY RICH OR LEAN ACTUAL AIR FUEL RATIO AND REPAIR CAUSE (FUEL INJECTOR , FUEL PRESSURE, GAS LEAK FROM SYSTEM, ETC.)

9.CHECK FOR EXHAUST GAS LEAK

a. Check for exhaust gas leakage.

OK:
No gas leak.

NG → REPAIR OR REPLACE EXHAUST GAS LEAK POINT

OK

10.INSPECT HEATED OXYGEN SENSOR (HEATER RESISTANCE)

a. Disconnect the heated oxygen sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B)	20°C (68°F)	11 to 16 Ω
1 (HT1B) - 4 (E2)	Always	10 kΩ or higher

NG → REPLACE HEATED OXYGEN SENSOR (Click here)

OK

11.CHECK HARNESS AND CONNECTOR (HEATED OXYGEN SENSOR - ECM)

a. Disconnect the heated oxygen sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C45-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C45-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C45-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C45-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C45-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C45-64 (EX2B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) - C46-48 (HT1B)	Always	Below 1 Ω
C20-3 (OX1B) - C46-88 (OX1B)	Always	Below 1 Ω
C20-4 (E2) - C46-65 (EX1B)	Always	Below 1 Ω
C21-1 (HT2B) - C46-47 (HT2B)	Always	Below 1 Ω
C21-3 (OX2B) - C46-87 (OX2B)	Always	Below 1 Ω
C21-4 (E2) - C46-64 (EX2B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C20-1 (HT1B) or C45-48 (HT1B) - Body ground	Always	10 kΩ or higher
C20-3 (OX1B) or C45-88 (OX1B) - Body ground	Always	10 kΩ or higher

C20-4 (E2) or C45-65 (EX1B) - Body ground	Always	10 kΩ or higher
C21-1 (HT2B) or C45-47 (HT2B) - Body ground	Always	10 kΩ or higher

DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• Accelerator Pedal Position (APP) sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCPA circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

Trouble Area	Accelerator Position No. 1 When Accelerator Pedal Released	Accelerator Position No. 2 When Accelerator Pedal Released	Accelerator Position No. 1 When Accelerator Pedal Depressed	Accelerator Position No. 2 When Accelerator Pedal Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

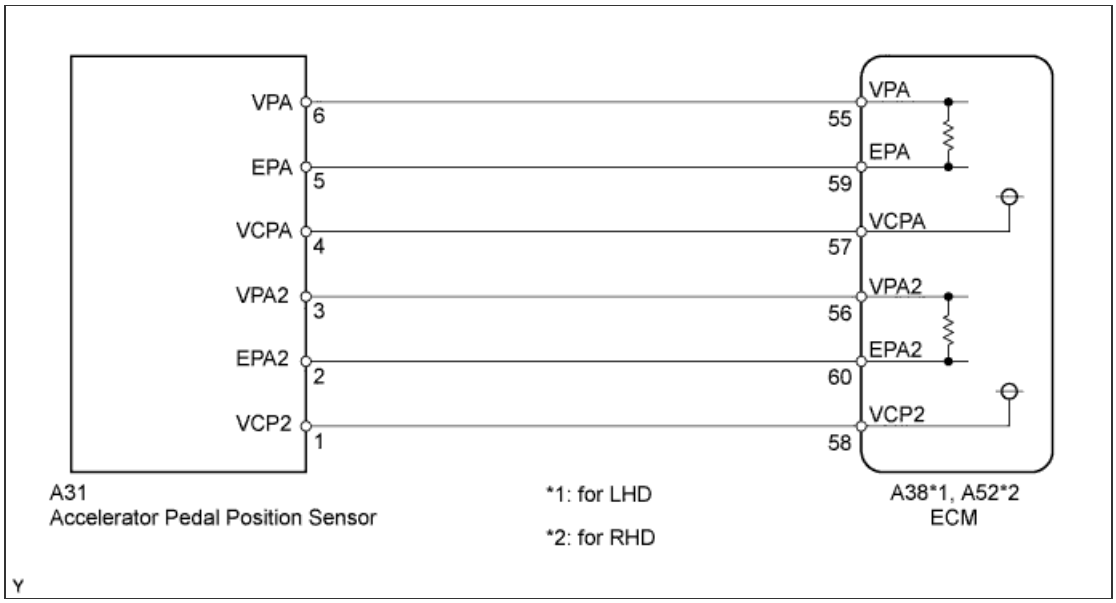
Accelerator pedal positions are expressed as voltages.



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is below the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue to be driven. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

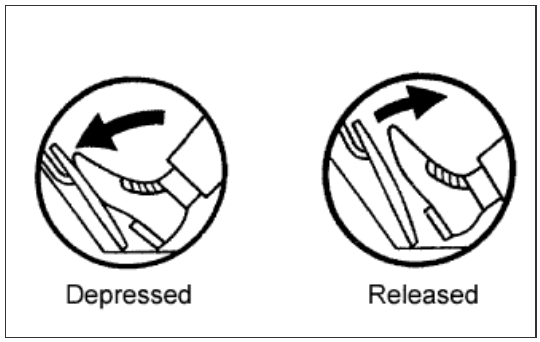
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

Result

Result	Proceed to
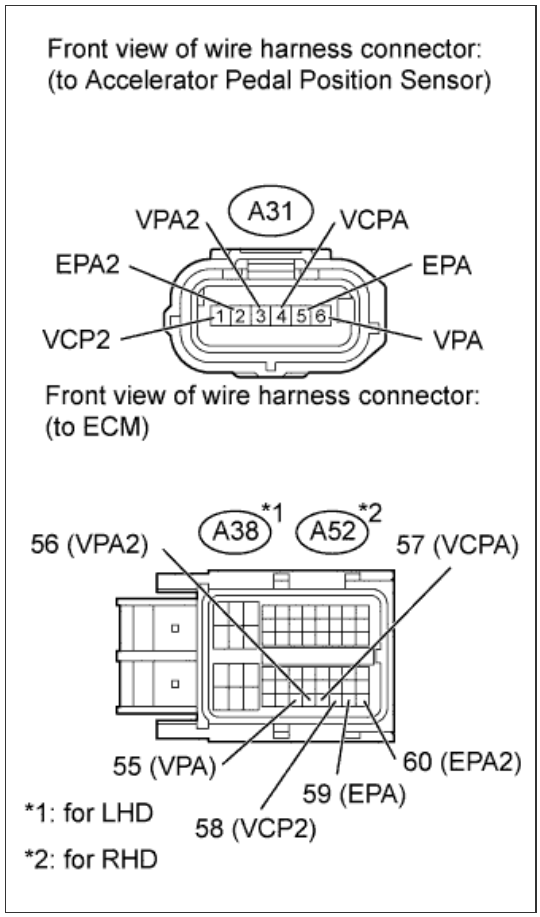
OK	A
NG	B

A → Go to step 5



B

2.CHECK HARNESS AND CONNECTOR (ACCELERATOR PEDAL POSITION SENSOR - ECM)

a. Disconnect the Accelerator Pedal Position (APP) sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A38-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A38-59 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A38-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A38-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A38-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A38-58 (VCP2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) - A52-55 (VPA)	Always	Below 1 Ω
A31-5 (EPA) - A52-59 (EPA)	Always	Below 1 Ω
A31-4 (VCPA) - A52-57 (VCPA)	Always	Below 1 Ω
A31-3 (VPA2) - A52-56 (VPA2)	Always	Below 1 Ω
A31-2 (EPA2) - A52-60 (EPA2)	Always	Below 1 Ω
A31-1 (VCP2) - A52-58 (VCP2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) or A38-55 (VPA) -		10 kΩ or

Body ground	Always	higher
A31-5 (EPA) or A38-59 (EPA) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A38-57 (VCPA) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A38-56 (VPA2) - Body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A38-60 (EPA2) - Body ground	Always	10 kΩ or higher
A31-1 (VCP2) or A38-58 (VCP2) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
A31-6 (VPA) or A52-55 (VPA) - Body ground	Always	10 kΩ or higher
A31-5 (EPA) or A52-59 (EPA) - Body ground	Always	10 kΩ or higher
A31-4 (VCPA) or A52-57 (VCPA) - Body ground	Always	10 kΩ or higher
A31-3 (VPA2) or A52-56 (VPA2) - Body ground	Always	10 kΩ or higher
A31-2 (EPA2) or A52-60 (EPA2) - Body ground	Always	10 kΩ or higher

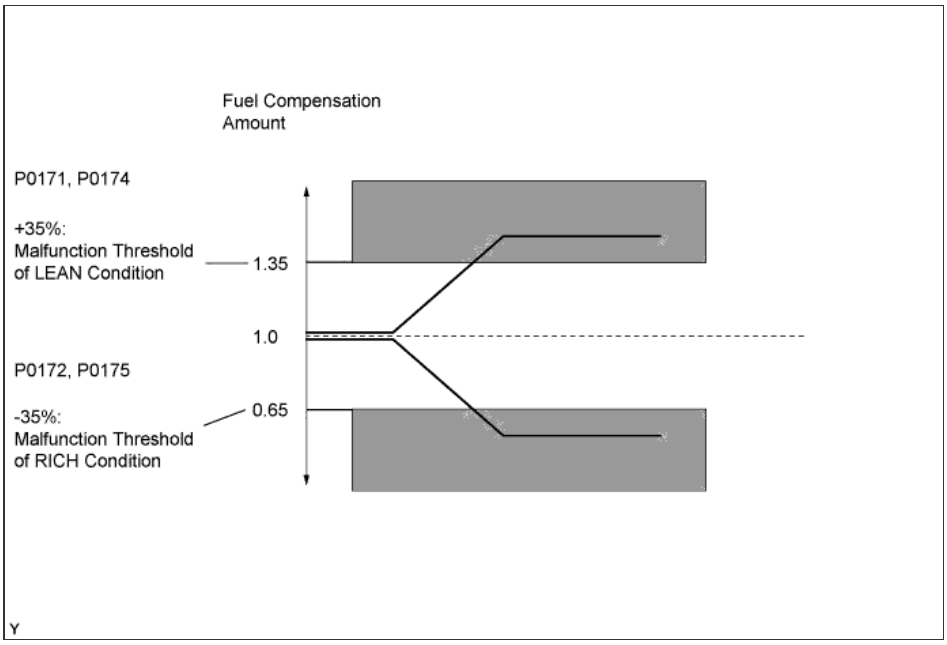
DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trim.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air fuel ratio at stoichiometric levels. The signal from the Air Fuel Ratio (A/F) sensor indicates whether the air fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.
If both the short-term and long-term fuel trim are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air fuel ratio becomes lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learned value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learned value of the air fuel ratio).
If the average fuel trim learned value exceeds the malfunction thresholds, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
If the average fuel trim learned value is more than +35% or less than -35%, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1	Injection Volume: +25% / -12.5 Output Voltage: More than 3.4 V / Less than 3.1 V → OK	Injection Volume: +25% / -12.5 Output Voltage: More than 0.55 V / Less than 0.4 V → OK	-
	Injection Volume: +25% / -12.5	Injection Volume: +25% / -12.5	• A/F sensor • A/F sensor

2			• heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P0171, P0172, P0174 or P0175	A
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

3.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage.

OK:

No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

4.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

e. Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.

HINT:

- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4

Result:

Status AFS Voltage B1S1 or AFS Voltage B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F Sensor Condition	Misfire	Suspected Trouble Area	Proceed to
Lean/Rich	Lean/Rich	Normal	-	-	C
Lean	Lean	Actual air fuel ratio lean	May occur	• PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor	A
Rich	Rich	Actual air fuel ratio rich	-	• Injector blockage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor	
Lean	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	

Lean: During Control the Injection Volume for A/F Sensor, the A/F sensor output voltage (AFS) is consistently more than 3.4 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During Control the Injection Volume for A/F Sensor, the AFS is consistently less than 3.1 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During Control the Injection Volume for A/F Sensor of the Active Test, the output voltage of the heated oxygen sensor alternates correctly.

B → Go to step 11

C → Go to step 15

A

5.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

6.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

7.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

8.CHECK FOR EXHAUST GAS LEAK

a. Inspect for exhaust gas leakage from the exhaust manifold sub-assembly and exhaust pipes.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK

9.CHECK SPARK AND IGNITION

a. Check the ignition system (Click here).

HINT:

If the spark plugs or ignition system malfunctions, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK

10.INSPECT FUEL INJECTOR ASSEMBLY (INJECTION AND VOLUME)

a. Inspect the fuel injector assembly (Click here).

HINT:

If the injectors malfunction, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the A/F sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for Bank 1 Sensor 1):

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω

~~1 (HA1A) - 4 (A1A-)~~	~~Always~~	~~10 kΩ or higher~~

Standard Resistance (for Bank 2 Sensor 1):

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room junction block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A- 2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

Fuse Side:

Connector Side:

Y

NG → REPLACE INTEGRATION RELAY

OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the A/F sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester on.
(c) Clear DTCs (Click here).
(d) Switch the ECM from normal mode to check mode using the intelligent tester (Click here).
(e) Start the engine and warm it up with all the accessories switched OFF.
(f) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) and at an engine speed of between 1400 rpm and 3200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL is illuminated during step (f).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16.CHECK WHETHER DTC OUTPUT RECURS (DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

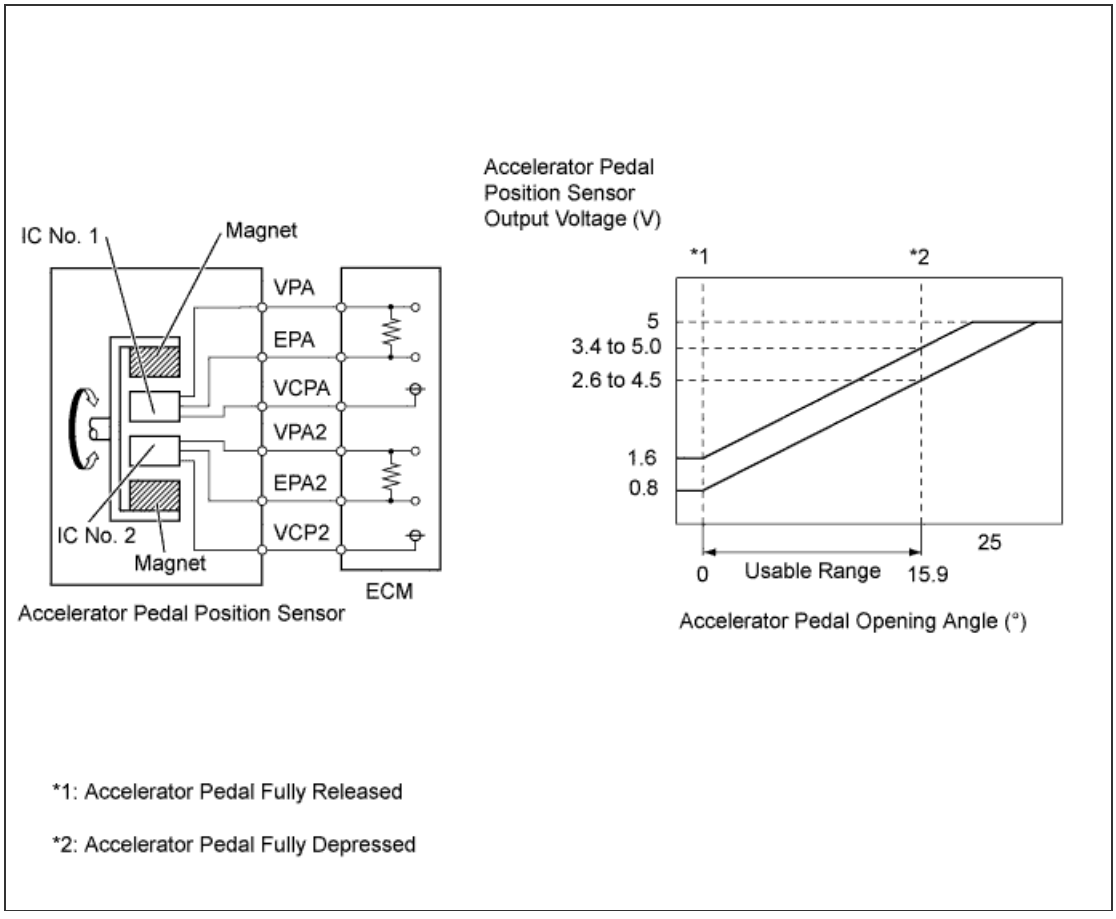
for Preparation Click here



DESCRIPTION

HINT:

This ETCS (Electronic Throttle Control System) does not use a throttle cable.

The Accelerator Pedal Position (APP) sensor is mounted on the accelerator pedal bracket and has 2 sensor circuits: VPA (main) and VPA2 (sub). This sensor is a non-contact type and uses Hall-effect elements in order to yield accurate signals even in extreme driving conditions, such as at high speeds as well as very low speeds. The voltage, which is applied to terminals VPA and VPA2 of the ECM, varies between 0.5 V and 4.5 V in proportion to the operating angle of the accelerator pedal (throttle valve). A signal from VPA indicates the actual accelerator pedal opening angle (throttle valve opening angle) and is used for engine control. A signal from VPA2 conveys the status of the VPA circuit and is used to check the APP sensor itself.

The ECM monitors the actual accelerator pedal opening angle (throttle valve opening angle) through the signals from VPA and VPA2, and controls the throttle actuator according to these signals.

DTC Code	DTC Detection Condition	Trouble Area
P2120	VPA fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• Accelerator Pedal Position (APP) sensor • ECM

P2122	VPA is 0.4 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCPA circuit • Open or ground short in VPA circuit • ECM
P2123	VPA is 4.8 V or higher for 2.0 seconds or more (1 trip detection logic).	• APP sensor • Open in EPA circuit • ECM
P2125	VPA2 fluctuates rapidly beyond the upper and lower malfunction thresholds for 0.5 seconds or more (1 trip detection logic).	• APP sensor • ECM
P2127	VPA2 is 1.2 V or less for 0.5 seconds or more when the accelerator pedal is fully released (1 trip detection logic).	• APP sensor • Open in VCP2 circuit • Open or ground short in VPA2 circuit • ECM
P2128	Conditions (a) and (b) continue for 2.0 seconds or more (1 trip detection logic): (a) VPA2 is 4.8 V or higher. (b) VPA is between 0.4 V and 3.45 V.	• APP sensor • Open in EPA2 circuit • ECM
P2138	Condition (a) or (b) continues for 2.0 seconds or more (1 trip detection logic): (a) The difference between VPA and VPA2 is 0.02 V or less. (b) VPA is 0.4 V or less and VPA2 is 1.2 V or less.	• Short between VPA and VPA2 circuits • APP sensor • ECM

HINT:

When any of these DTCs are output, check the APP sensor voltage by entering the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

Trouble Area	Accelerator Position No. 1 When Accelerator Pedal Released	Accelerator Position No. 2 When Accelerator Pedal Released	Accelerator Position No. 1 When Accelerator Pedal Depressed	Accelerator Position No. 2 When Accelerator Pedal Depressed
VCP circuit open	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V	0 to 0.2 V
Open or ground short in VPA circuit	0 to 0.2 V	1.2 to 2.0 V	0 to 0.2 V	3.4 to 5.0 V
Open or ground short in VPA2 circuit	0.5 to 1.1 V	0 to 0.2 V	2.6 to 4.5 V	0 to 0.2 V
EPA circuit open	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V	4.5 to 5.0 V
Normal condition	0.5 to 1.1 V	1.2 to 2.0 V	2.6 to 4.5 V	3.4 to 5.0 V

HINT:

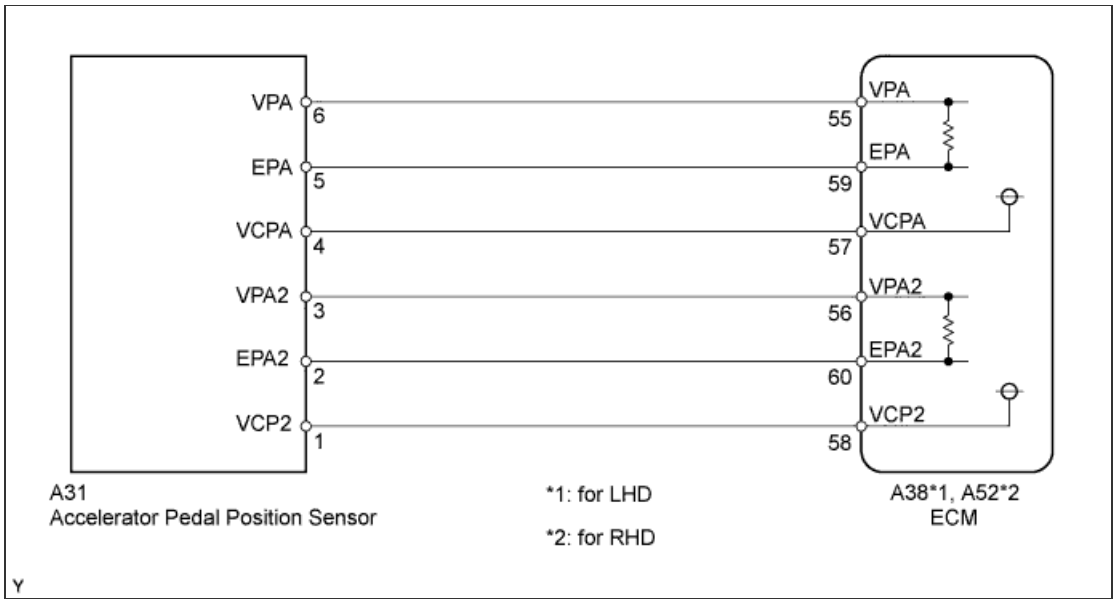
Accelerator pedal positions are expressed as voltages.



MONITOR DESCRIPTION

When either output voltage of VPA or VPA2 deviates from the standard range, or the difference between the output voltages of the 2 sensor circuits is below the threshold, the ECM determines that there is a malfunction in the APP sensor. The ECM then illuminates the MIL and stores a DTC.
Example:
When the output voltage of VPA drops below 0.4 V for more than 0.5 seconds when the accelerator pedal is fully depressed, DTC P2122 is stored.
If the malfunction is not repaired successfully, a DTC is stored 2 seconds after the engine is next started.

FAIL-SAFE

When any of DTCs P2120, P2121, P2122, P2123, P2125, P2127, P2128 and P2138 are stored, the ECM enters fail-safe mode. If either of the 2 sensor circuits malfunctions, the ECM uses the remaining circuit to calculate the accelerator pedal position to allow the vehicle to continue to be driven. If both of the circuits malfunction, the ECM regards the accelerator pedal as being released. As a result, the throttle valve is closed and the engine idles.
Fail-safe mode continues until a pass condition is detected, and the ignition switch is turned off.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

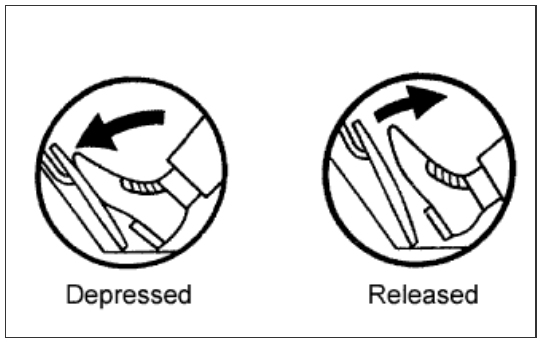
- **These DTCs relate to the Accelerator Pedal Position (APP) sensor.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

Result

Result	Proceed to
OK	A

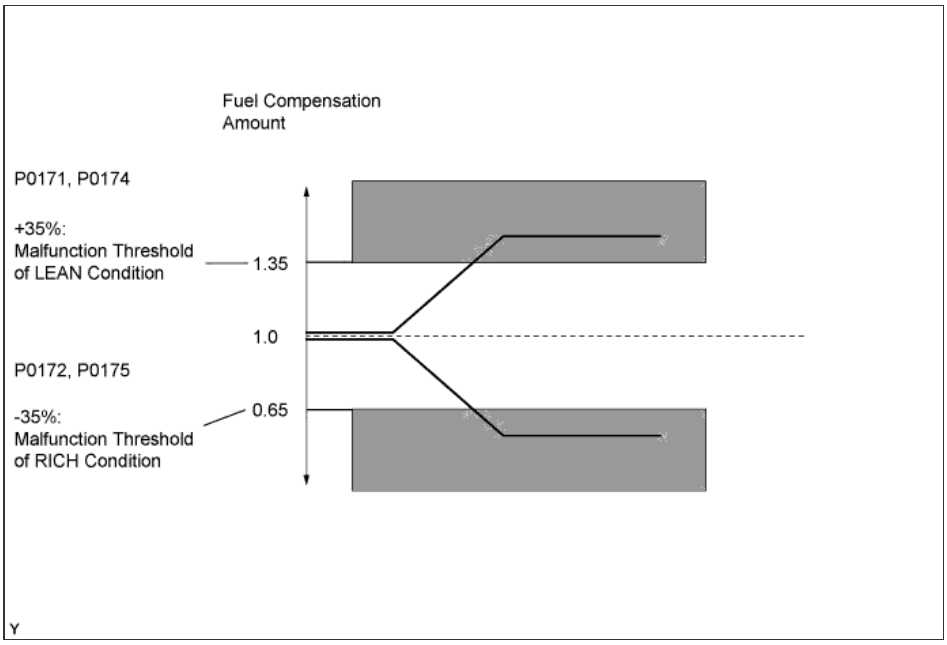
DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trim.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air fuel ratio at stoichiometric levels. The signal from the Air Fuel Ratio (A/F) sensor indicates whether the air fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.
If both the short-term and long-term fuel trim are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air fuel ratio becomes lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learned value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learned value of the air fuel ratio).
If the average fuel trim learned value exceeds the malfunction thresholds, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
If the average fuel trim learned value is more than +35% or less than -35%, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1	Injection Volume: +25% / -12.5 Output Voltage: More than 3.4 V / Less than 3.1 V → OK	Injection Volume: +25% / -12.5 Output Voltage: More than 0.55 V / Less than 0.4 V → OK	-
	Injection Volume: +25% / -12.5	Injection Volume: +25% / -12.5	• A/F sensor • A/F sensor

2			• heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P0171, P0172, P0174 or P0175	A
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

3.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage.

OK:

No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

4.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

e. Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.

HINT:

- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4

Result:

Status AFS Voltage B1S1 or AFS Voltage B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F Sensor Condition	Misfire	Suspected Trouble Area	Proceed to
Lean/Rich	Lean/Rich	Normal	-	-	C
Lean	Lean	Actual air fuel ratio lean	May occur	• PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor	A
Rich	Rich	Actual air fuel ratio rich	-	• Injector blockage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor	
Lean	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	

Lean: During Control the Injection Volume for A/F Sensor, the A/F sensor output voltage (AFS) is consistently more than 3.4 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During Control the Injection Volume for A/F Sensor, the AFS is consistently less than 3.1 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During Control the Injection Volume for A/F Sensor of the Active Test, the output voltage of the heated oxygen sensor alternates correctly.

B → Go to step 11

C → Go to step 15

A

5.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

6.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

7.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

8.CHECK FOR EXHAUST GAS LEAK

a. Inspect for exhaust gas leakage from the exhaust manifold sub-assembly and exhaust pipes.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK

9.CHECK SPARK AND IGNITION

a. Check the ignition system (Click here).

HINT:

If the spark plugs or ignition system malfunctions, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK

10.INSPECT FUEL INJECTOR ASSEMBLY (INJECTION AND VOLUME)

a. Inspect the fuel injector assembly (Click here).

HINT:

If the injectors malfunction, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

11.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the A/F sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for Bank 1 Sensor 1):

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω

~~1 (HA1A) - 4 (A1A-)~~	~~Always~~	~~10 kΩ or higher~~

Standard Resistance (for Bank 2 Sensor 1):

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room junction block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A- 2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

Fuse Side:

Connector Side:

Y

NG → REPLACE INTEGRATION RELAY

OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the A/F sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester on.
(c) Clear DTCs (Click here).
(d) Switch the ECM from normal mode to check mode using the intelligent tester (Click here).
(e) Start the engine and warm it up with all the accessories switched OFF.
(f) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) and at an engine speed of between 1400 rpm and 3200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL is illuminated during step (f).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16.CHECK WHETHER DTC OUTPUT RECURS (DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
No output	A
P0171, P0172, P0174 or P0175	B

A

END

for Preparation Click here

DESCRIPTION

Refer to DTC P2120 (Click here).

DTC Code	DTC Detection Condition	Trouble Area
P2121	Either of following conditions 1 or 2 met for 0.5 seconds (1 trip detection logic) 1. Difference between VPA and VPA2 is less than 0.4 V, or more than 1.2 V. (learned value of accelerator off position) 2. Difference between VPA and VPA2 is greater than or equal to the specified value.	• Accelerator Pedal Position (APP) sensor • ECM

MONITOR DESCRIPTION

When the difference between the output voltages of VPA and VPA2 deviates from the standard, the ECM determines that the accelerator pedal position sensor is malfunctioning. The ECM turns on the MIL and stores the DTC.

FAIL-SAFE

The accelerator pedal position sensor has two (main and sub) sensor circuits. If a malfunction occurs in either of the sensor circuits, the ECM detects the abnormal signal voltage difference between the two sensor circuits and switches to limp mode. In limp mode, the functioning circuit is used to calculate the accelerator pedal opening angle to allow the vehicle to continue to be driven. If both circuits malfunction, the ECM regards the opening angle of the accelerator pedal as being fully closed. In this case, the throttle valve remains closed as if the engine is idling.
If a pass condition is detected and then the ignition switch is turned off, the fail-safe operation stops and the system returns to a normal condition.

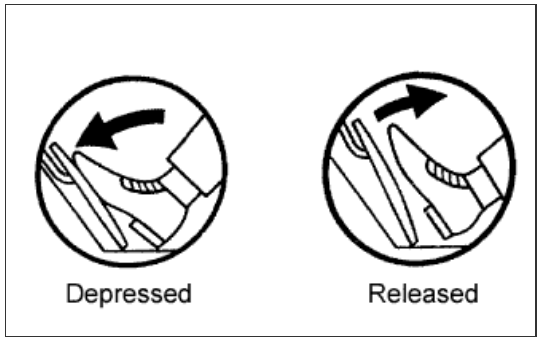
WIRING DIAGRAM

Refer to DTC P2120 (Click here).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **This DTC relates to the Accelerator Pedal Position (APP) sensor.**



1.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No.1 and Accelerator Position No.2.

d. Read the value displayed on the tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2

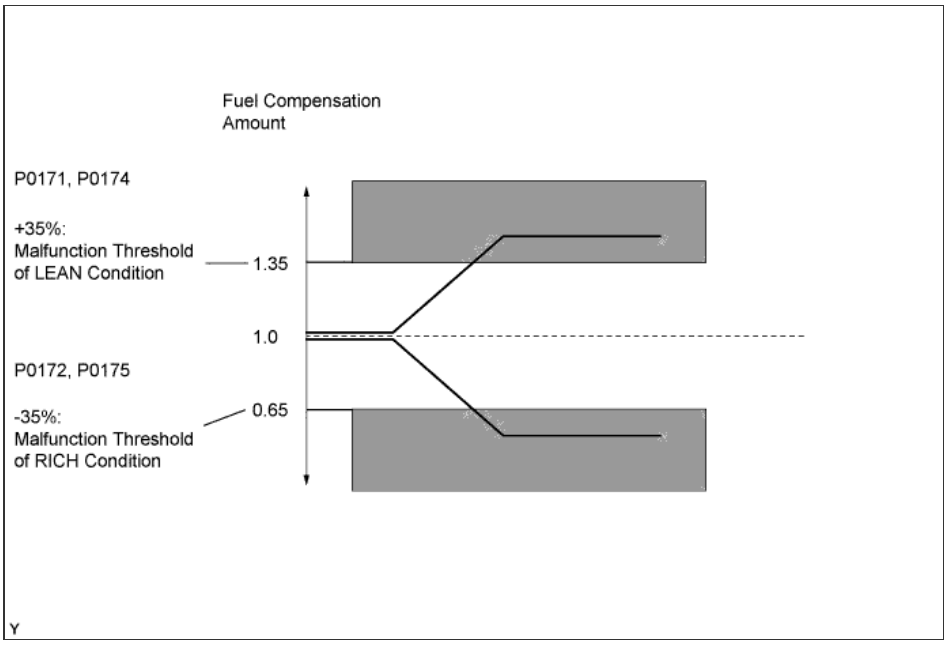
DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trim.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air fuel ratio at stoichiometric levels. The signal from the Air Fuel Ratio (A/F) sensor indicates whether the air fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.
If both the short-term and long-term fuel trim are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air fuel ratio becomes lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learned value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learned value of the air fuel ratio).
If the average fuel trim learned value exceeds the malfunction thresholds, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
If the average fuel trim learned value is more than +35% or less than -35%, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

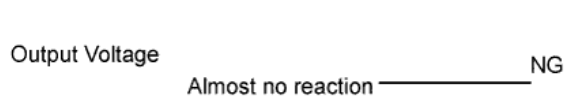
HINT:

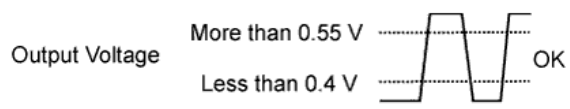
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

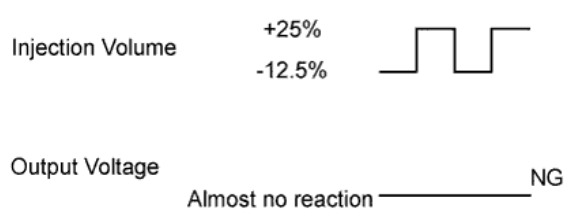
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

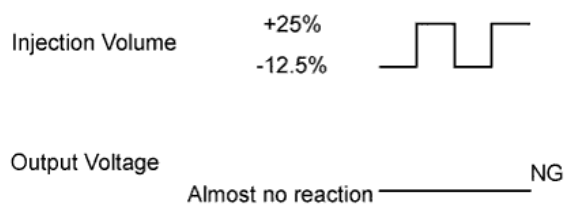
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

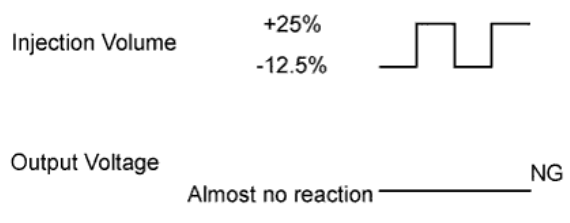
HINT:











- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1	Injection Volume: +25% / -12.5 Output Voltage: More than 3.4 V / Less than 3.1 V → OK	Injection Volume: +25% / -12.5 Output Voltage: More than 0.55 V / Less than 0.4 V → OK	-
	Injection Volume: +25% / -12.5	Injection Volume: +25% / -12.5	• A/F sensor • A/F sensor

2			• heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P0171, P0172, P0174 or P0175	A
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

3.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage.

OK:

No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

4.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

e. Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.

HINT:

- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4

Result:

Status AFS Voltage B1S1 or AFS Voltage B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F Sensor Condition	Misfire	Suspected Trouble Area	Proceed to
Lean/Rich	Lean/Rich	Normal	-	-	C
Lean	Lean	Actual air fuel ratio lean	May occur	• PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor	A
Rich	Rich	Actual air fuel ratio rich	-	• Injector blockage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor	
Lean	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	

Lean: During Control the Injection Volume for A/F Sensor, the A/F sensor output voltage (AFS) is consistently more than 3.4 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During Control the Injection Volume for A/F Sensor, the AFS is consistently less than 3.1 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During Control the Injection Volume for A/F Sensor of the Active Test, the output voltage of the heated oxygen sensor alternates correctly.

B → Go to step 11

C → Go to step 15

A

5.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

6.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

7.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

8.CHECK FOR EXHAUST GAS LEAK

a. Inspect for exhaust gas leakage from the exhaust manifold sub-assembly and exhaust pipes.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK

9.CHECK SPARK AND IGNITION

a. Check the ignition system (Click here).

HINT:

If the spark plugs or ignition system malfunctions, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK

10.INSPECT FUEL INJECTOR ASSEMBLY (INJECTION AND VOLUME)

a. Inspect the fuel injector assembly (Click here).

HINT:

If the injectors malfunction, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

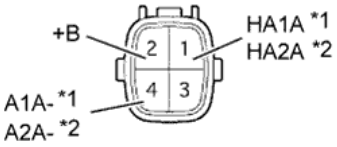
OK

11.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the A/F sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for Bank 1 Sensor 1):



Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω

~~1 (HA1A) - 4 (A1A-)~~	~~Always~~	~~10 kΩ or higher~~

Standard Resistance (for Bank 2 Sensor 1):

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room junction block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

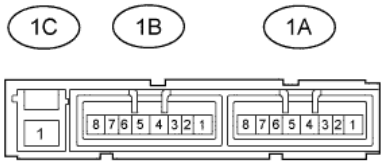
Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A- 2 and 1A-3	Below 1 Ω

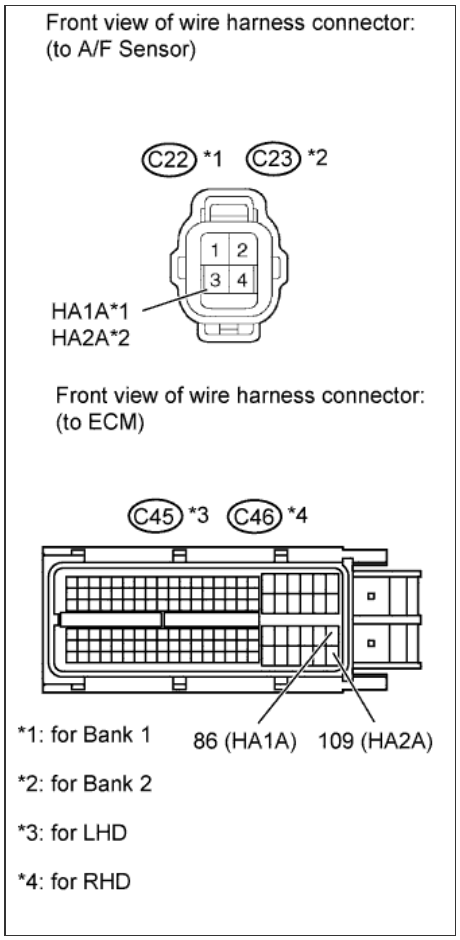
Component without harness connected:
(Integration Relay)

Fuse Side:

Connector Side:

Y

NG → REPLACE INTEGRATION RELAY



OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

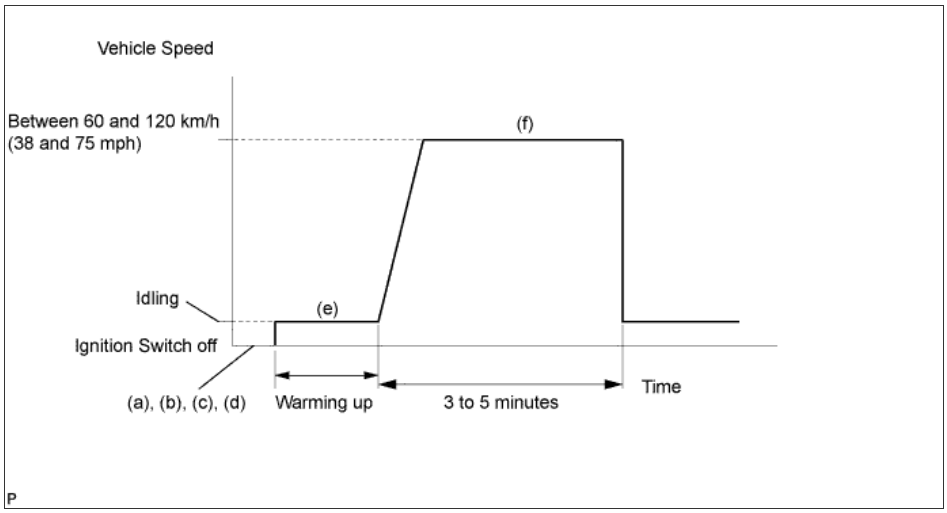
for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR



OK

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the A/F sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester on.
(c) Clear DTCs (Click here).
(d) Switch the ECM from normal mode to check mode using the intelligent tester (Click here).
(e) Start the engine and warm it up with all the accessories switched OFF.
(f) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) and at an engine speed of between 1400 rpm and 3200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL is illuminated during step (f).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16.CHECK WHETHER DTC OUTPUT RECURS (DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to

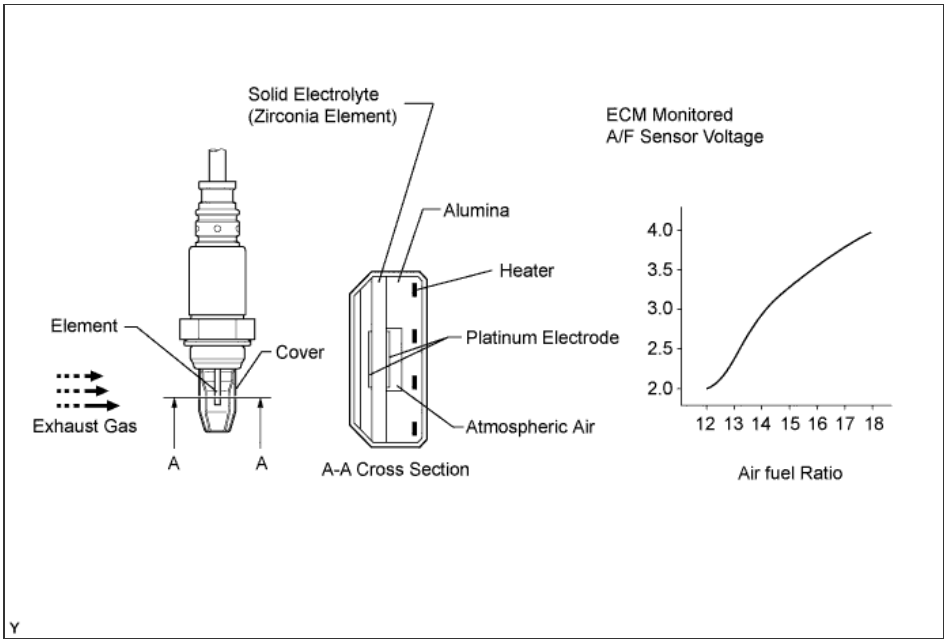
DTC P2198 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)



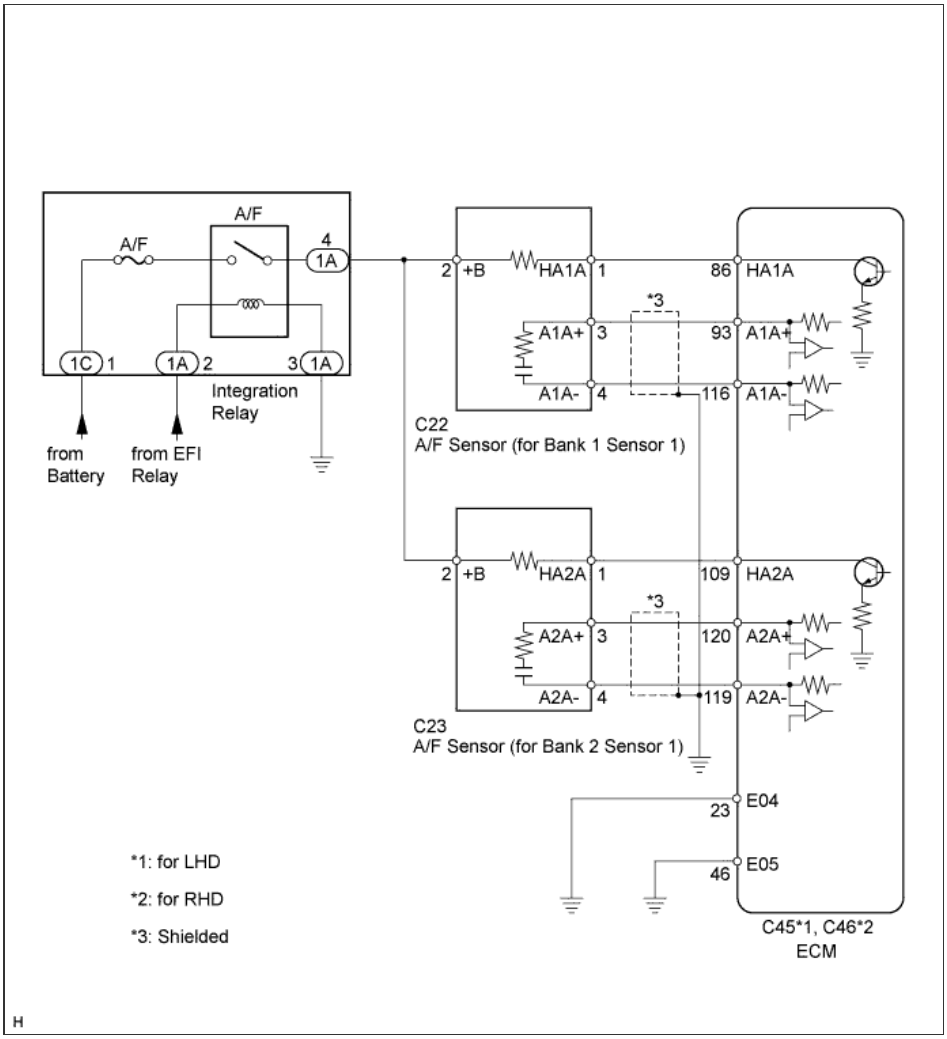
for Preparation Click here

DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor generates a voltage* that corresponds to the actual air fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air fuel ratio. The ECM determines the deviation from the stoichiometric air fuel ratio, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air fuel ratio accurately.
The A/F sensor is the planar type and is integrated with a heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate oxygen concentration detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.
In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.
*: The value changes inside the ECM. Since the A/F sensor is a current output element, the current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

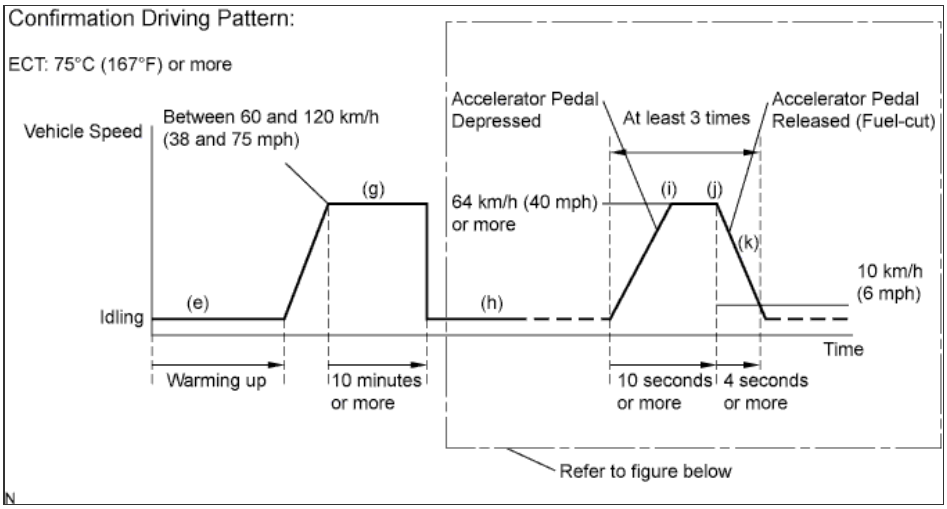


DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The Air Fuel Ratio (A/F) sensor voltage is more than 3.8 V. (b) The Heated Oxygen (HO2) sensor voltage is 0.15 V or more.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Integration relay • Air induction system circuits • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is 3.6 mA or more for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is less than 2.8 V. (b) The HO2 sensor voltage is less than 0.6 V.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Air induction system • Integration relay • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is less than 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

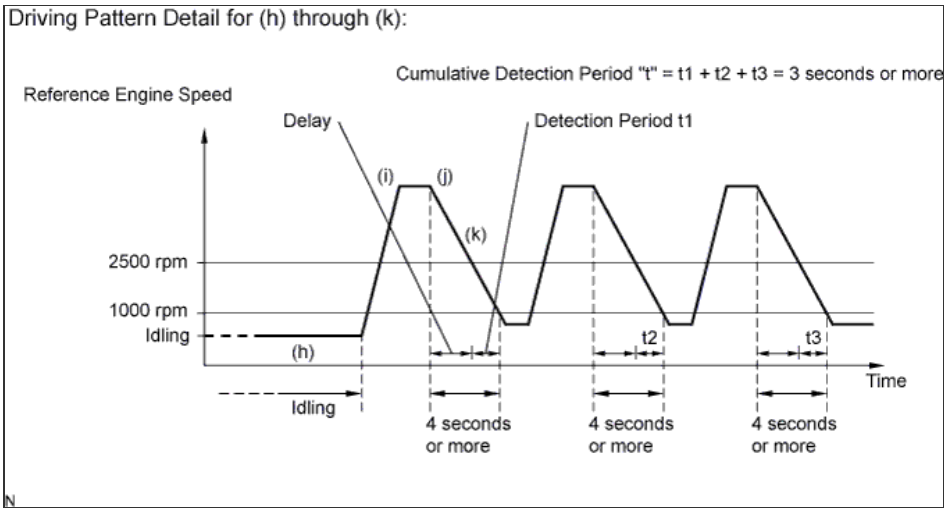
HINT:

- **DTCs P2195 and P2196 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that includes cylinder No. 2.**
- **When any of these DTCs are stored, check the A/F sensor voltage output by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Voltage B1S1 or AFS Voltage B2S1.**
- **The short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+, A2A+, A1A- and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor voltage output cannot be confirmed without using the intelligent tester.**
- **If a A/F sensor malfunction is detected, the ECM stores a DTC.**

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN



CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

HINT:

This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the intelligent tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus to check the fuel-cut status: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Shift the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation (refer to the following HINT).

HINT:

Fuel-cut is performed when the following conditions are met:

- **The accelerator pedal is fully released.**
- **The engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in Data List.

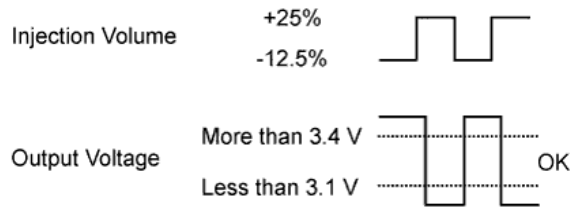
INSPECTION PROCEDURE

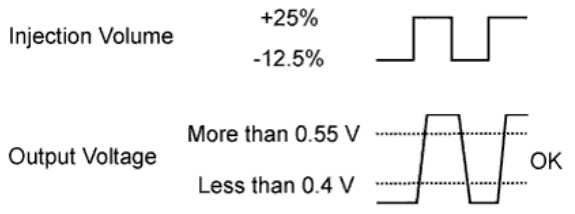
HINT:

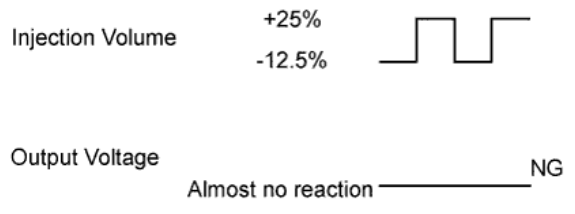
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the air fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

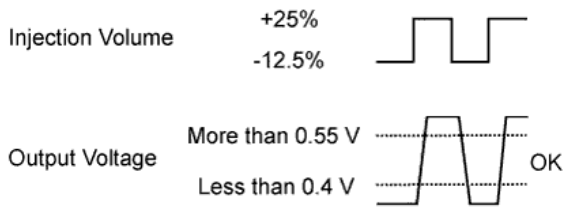
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

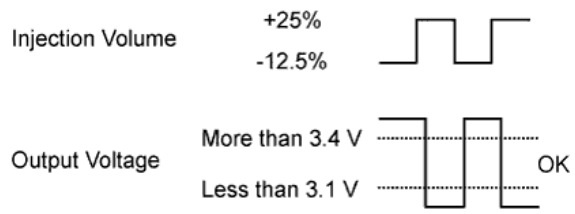
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

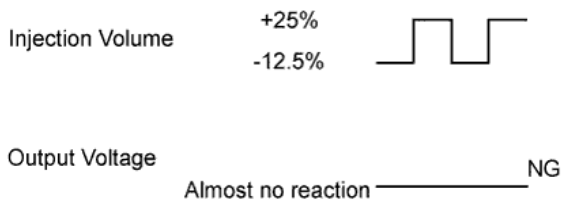


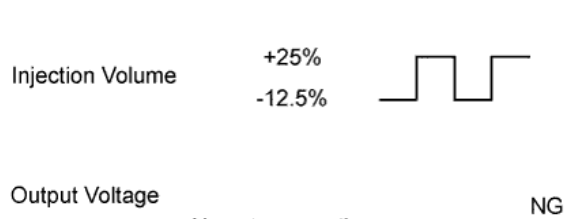


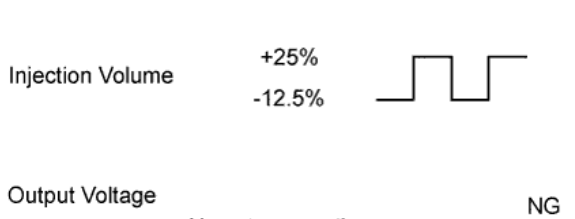












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

Result

Display (DTC Output)	Proceed to
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:

If any DTCs other than P2195, P2196, P2197 or P2198 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Clear DTCs (Click here).

d. Drive the vehicle in accordance with the drive pattern described in the CONFIRMATION DRIVING PATTERN.

e. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor.

f. Check that the status of O2 Sensor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

g. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Details / RANGE B1 S1.

h. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.4 mA, or 3.6 mA or more)	B

B → Go to step 20

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the intelligent tester on.

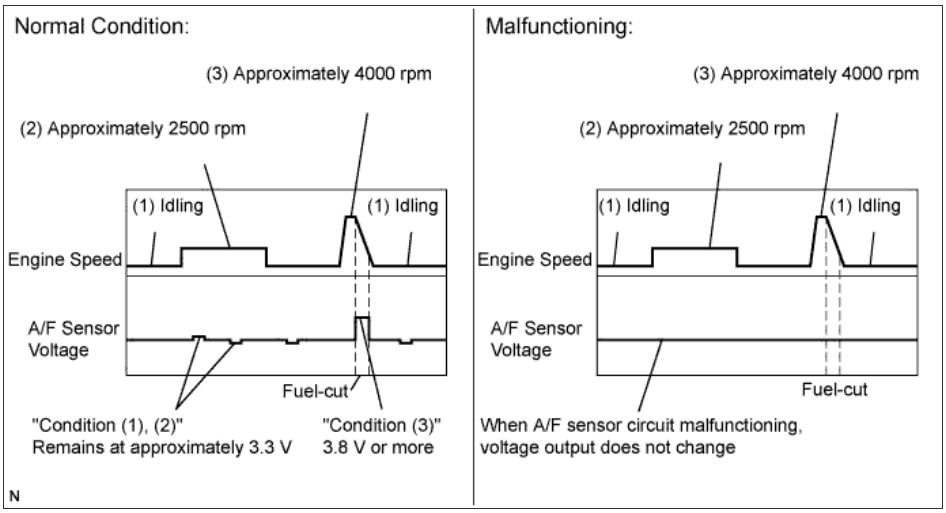
d. Warm up the air fuel ratio (A/F) sensor at an engine speed of 2500 rpm for 90 seconds.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS Voltage B1S1 or AFS Voltage B2S1 and Engine Speed.

f. Check the A/F sensor voltage three times, once in each of the following conditions:

i. Engine idling (check for at least 30 seconds)

ii. Engine running at an engine speed of approximately 2500 rpm (without any sudden changes in engine speed)



iii. Engine speed raised to 4000 rpm and then accelerator pedal quickly released so that the throttle valve is fully closed.

Standard:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Changes at approximately 3.3 V	Between 3.1 V and 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

HINT:

For more information, see the diagrams below.

HINT:

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learned value to perform fuel cut. If the battery cable has been disconnected and reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage.**

NG → Go to step 10

OK

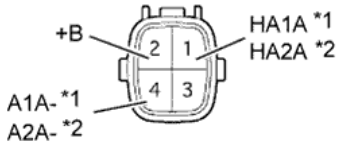
NO → CHECK FOR INTERMITTENT PROBLEMS (Click here)

YES



DTC CAUSED BY RUNNING OUT OF FUEL

10.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

11.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

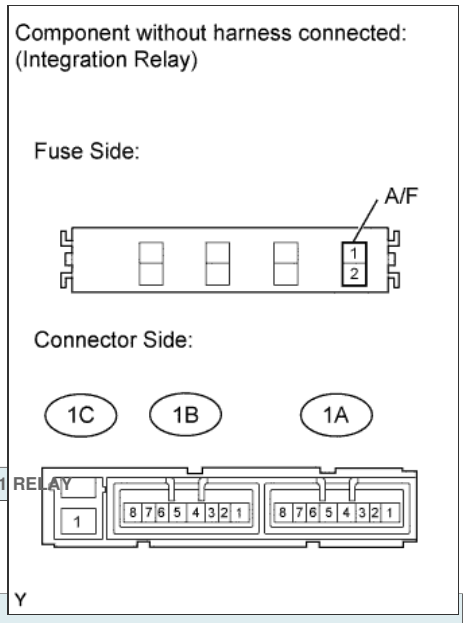
b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω



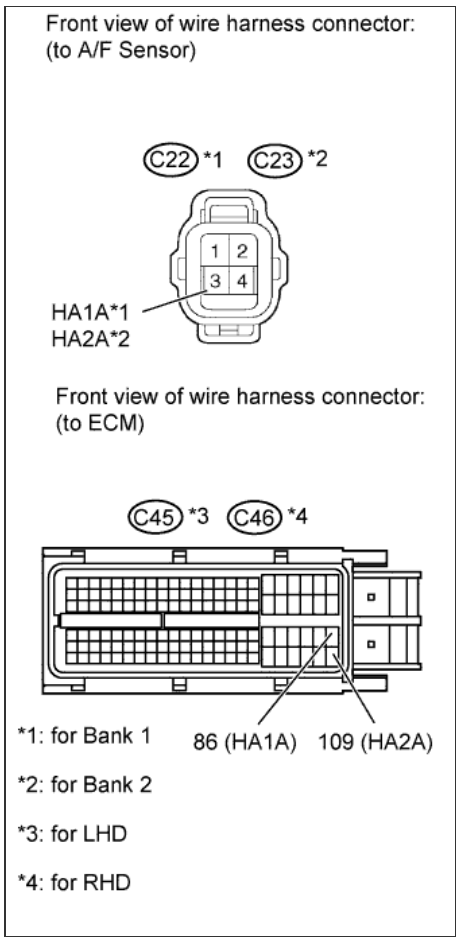
iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω



NG → REPLACE INTEGRATION NO.1 RELAY

OK

12.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body		

ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

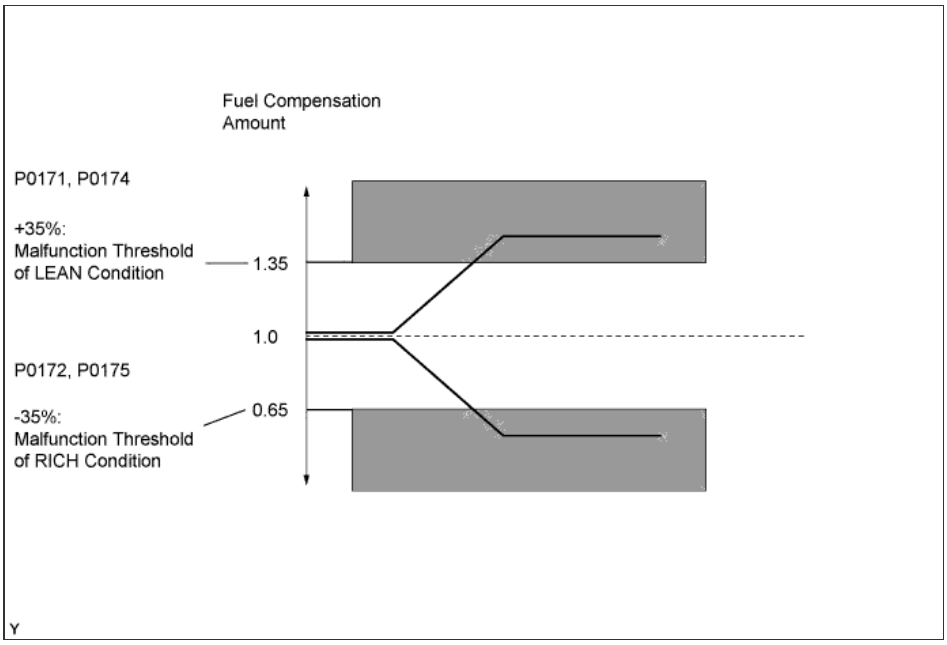
DESCRIPTION

The fuel trim is related to the feedback compensation value, not to the basic injection time. The fuel trim consists of both the short-term and long-term fuel trim.
The short-term fuel trim is fuel compensation that is used to constantly maintain the air fuel ratio at stoichiometric levels. The signal from the Air Fuel Ratio (A/F) sensor indicates whether the air fuel ratio is rich or lean compared to the stoichiometric ratio. This triggers a reduction in the fuel injection volume if the air fuel ratio is rich and an increase in the fuel injection volume if it is lean.
Factors such as individual engine differences, wear over time and changes in operating environment cause short-term fuel trim to vary from the central value. The long-term fuel trim, which controls overall fuel compensation, compensates for long-term deviations in the fuel trim from the central value caused by the short-term fuel trim compensation.
If both the short-term and long-term fuel trim are lean or rich beyond predetermined values, it is interpreted as a malfunction, and the ECM illuminates the MIL and sets a DTC.



DTC Code	DTC Detection Condition	Trouble Area
P0171 P0174	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the lean side (2 trip detection logic).	• Air induction system • Injector blockage • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • PCV valve and hose • PCV hose connections • ECM
P0172 P0175	With a warm engine and stable air fuel ratio feedback, the fuel trim is considerably in error to the rich side (2 trip detection logic).	• Injector leakage or blockage • MAF meter • ECT sensor • Ignition system • Fuel pressure • Gas leakage from exhaust system • Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor heater (bank 1, 2 sensor 1) • Integration relay (A/F relay) • A/F sensor heater circuits • ECM

HINT:

- **When DTC P0171 or P0174 is stored, the actual air fuel ratio is on the lean side. When DTC P0172 or P0175 is stored, the actual air fuel ratio is on the rich side.**
- **If the vehicle runs out of fuel, the air fuel ratio becomes lean and DTC P0171 or P0174 may be stored. The MIL is then illuminated.**
- **When the total of the short-term and long-term fuel trim values is within the malfunction threshold (and the engine coolant temperature is more than 75°C [167°F]), the system is functioning normally.**

MONITOR DESCRIPTION

Under closed-loop fuel control, fuel injection volumes that deviate from those estimated by the ECM cause changes in the long-term fuel trim compensation value. The long-term fuel trim is adjusted when there are persistent deviations in the short-term fuel trim values. Deviations from the ECM's estimated fuel injection volumes also affect the average fuel trim learned value, which is a combination of the average short-term fuel trim (fuel feedback compensation value) and the average long-term fuel trim (learned value of the air fuel ratio).
If the average fuel trim learned value exceeds the malfunction thresholds, the ECM interprets this as a fault in the fuel system and stores a DTC.
Example:
If the average fuel trim learned value is more than +35% or less than -35%, the ECM interprets this as a fuel system malfunction.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

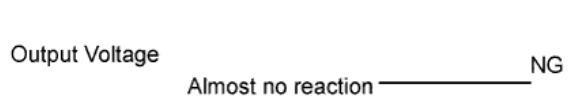
HINT:

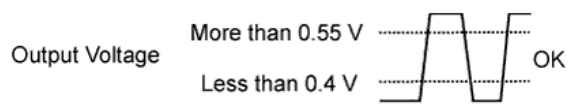
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

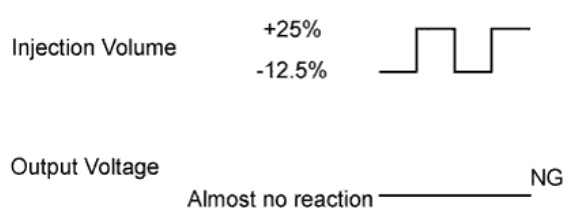
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

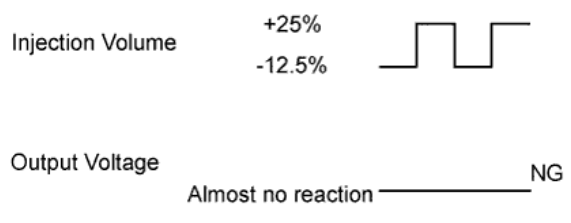
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

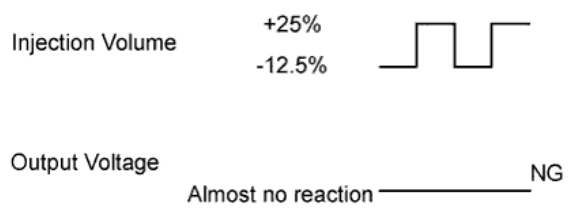
HINT:











- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1	Injection Volume: +25% / -12.5 Output Voltage: More than 3.4 V / Less than 3.1 V → OK	Injection Volume: +25% / -12.5 Output Voltage: More than 0.55 V / Less than 0.4 V → OK	-
	Injection Volume: +25% / -12.5	Injection Volume: +25% / -12.5	• A/F sensor • A/F sensor

2			• heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P0171, P0172, P0174 or P0175	A
P0171, P0172, P0174 or P0175 and other DTCs	B

HINT:

If any DTCs other than P0171, P0172, P0174 or P0175 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:

PCV hose is connected correctly and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

3.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage.

OK:

No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

4.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (A/F CONTROL)

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor.

e. Perform the Control the Injection Volume for A/F Sensor operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).

f. Monitor the voltage outputs of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.

HINT:

- **The Control the Injection Volume for A/F Sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Standard:

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4

Result:

Status AFS Voltage B1S1 or AFS Voltage B2S1	Status O2S B1S2 or O2S B2S2	A/F Condition and A/F Sensor Condition	Misfire	Suspected Trouble Area	Proceed to
Lean/Rich	Lean/Rich	Normal	-	-	C
Lean	Lean	Actual air fuel ratio lean	May occur	• PCV valve and hose • PCV hose connections • Injector blockage • Gas leakage from exhaust system • Air induction system • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor	A
Rich	Rich	Actual air fuel ratio rich	-	• Injector blockage or blockage • Gas leakage from exhaust system • Ignition system • Fuel pressure • MAF meter • ECT sensor	
Lean	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	B
Rich	Lean/Rich	A/F sensor malfunction	-	• A/F sensor	

Lean: During Control the Injection Volume for A/F Sensor, the A/F sensor output voltage (AFS) is consistently more than 3.4 V, and the HO2 sensor output voltage (O2S) is consistently less than 0.4 V.
Rich: During Control the Injection Volume for A/F Sensor, the AFS is consistently less than 3.1 V, and the O2S is consistently more than 0.55 V.
Lean/Rich: During Control the Injection Volume for A/F Sensor of the Active Test, the output voltage of the heated oxygen sensor alternates correctly.

B → Go to step 11

C → Go to step 15

A

5.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

6.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

7.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK

8.CHECK FOR EXHAUST GAS LEAK

a. Inspect for exhaust gas leakage from the exhaust manifold sub-assembly and exhaust pipes.

OK:
No gas leakage.

NG → REPAIR OR REPLACE EXHAUST SYSTEM

OK

9.CHECK SPARK AND IGNITION

a. Check the ignition system (Click here).

HINT:

If the spark plugs or ignition system malfunctions, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPAIR OR REPLACE IGNITION SYSTEM

OK

10.INSPECT FUEL INJECTOR ASSEMBLY (INJECTION AND VOLUME)

a. Inspect the fuel injector assembly (Click here).

HINT:

If the injectors malfunction, engine misfires may occur. The misfire count can be read using the intelligent tester. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Cylinder #1 Misfire Rate (to Cylinder #6 Misfire Rate).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

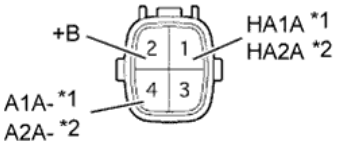
OK

11.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the A/F sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (for Bank 1 Sensor 1):



Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω

~~1 (HA1A) - 4 (A1A-)~~	~~Always~~	~~10 kΩ or higher~~

Standard Resistance (for Bank 2 Sensor 1):

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

12.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room junction block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

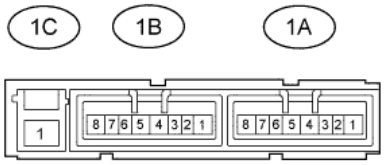
Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	No battery voltage applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A- 2 and 1A-3	Below 1 Ω

Component without harness connected:
(Integration Relay)

Fuse Side:

Connector Side:

Y

NG → REPLACE INTEGRATION RELAY

OK

13.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the A/F sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

14.REPLACE AIR FUEL RATIO SENSOR

a. Replace the A/F sensor (Click here).

NEXT

15.PERFORM CONFIRMATION DRIVING PATTERN

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON and turn the intelligent tester on.
(c) Clear DTCs (Click here).
(d) Switch the ECM from normal mode to check mode using the intelligent tester (Click here).
(e) Start the engine and warm it up with all the accessories switched OFF.
(f) Drive the vehicle at between 60 km/h and 120 km/h (38 mph and 75 mph) and at an engine speed of between 1400 rpm and 3200 rpm for 3 to 5 minutes.

HINT:

If the system is still malfunctioning, the MIL is illuminated during step (f).

NOTICE:

If the conditions in this test are not strictly followed, no malfunction will be detected.

NEXT

16.CHECK WHETHER DTC OUTPUT RECURS (DTC P0171, P0172, P0174 OR P0175)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

d. Read the DTCs.

DESCRIPTION

HINT:

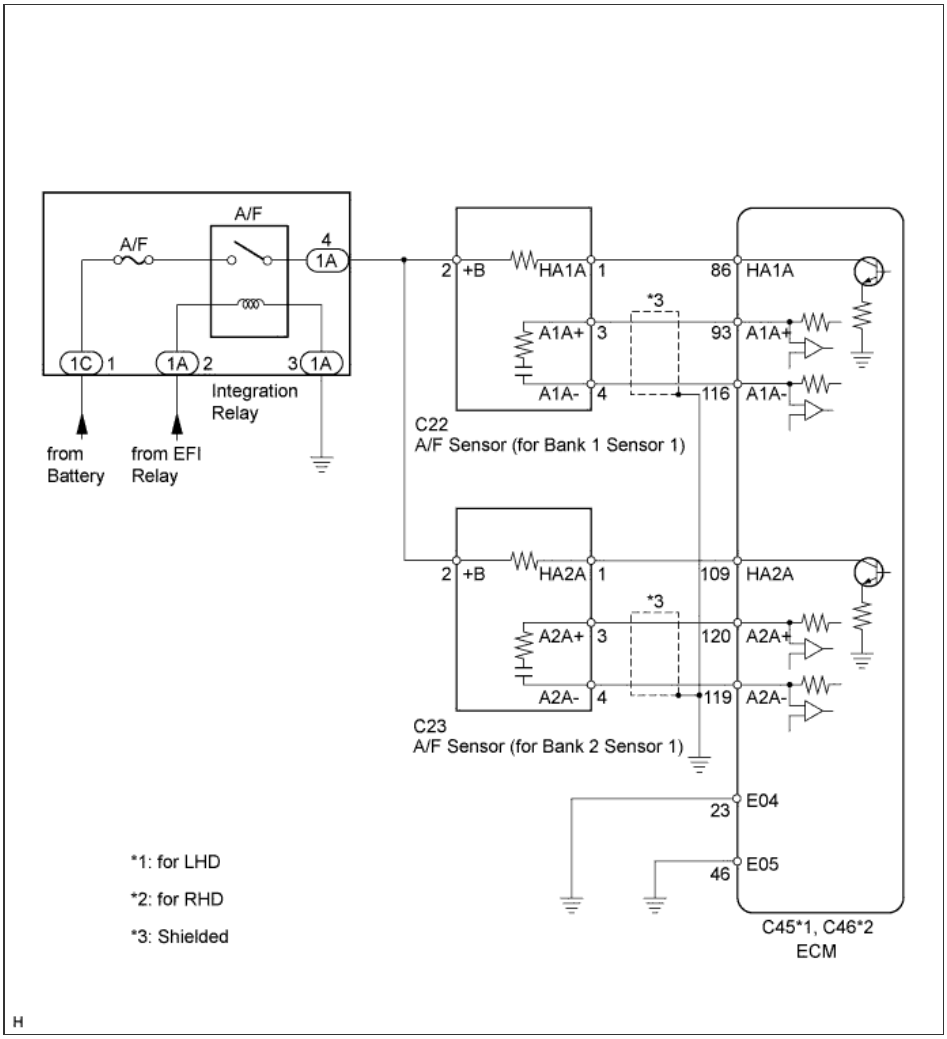
- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor generates a voltage* that corresponds to the actual air fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air fuel ratio. The ECM determines the deviation from the stoichiometric air fuel ratio, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air fuel ratio accurately.
The A/F sensor is the planar type and is integrated with a heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate oxygen concentration detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.
In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.
*: The value changes inside the ECM. Since the A/F sensor is a current output element, the current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.



DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The Air Fuel Ratio (A/F) sensor voltage is more than 3.8 V. (b) The Heated Oxygen (HO2) sensor voltage is 0.15 V or more.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Integration relay • Air induction system circuits • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is 3.6 mA or more for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is less than 2.8 V. (b) The HO2 sensor voltage is less than 0.6 V.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Air induction system • Integration relay • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is less than 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

HINT:

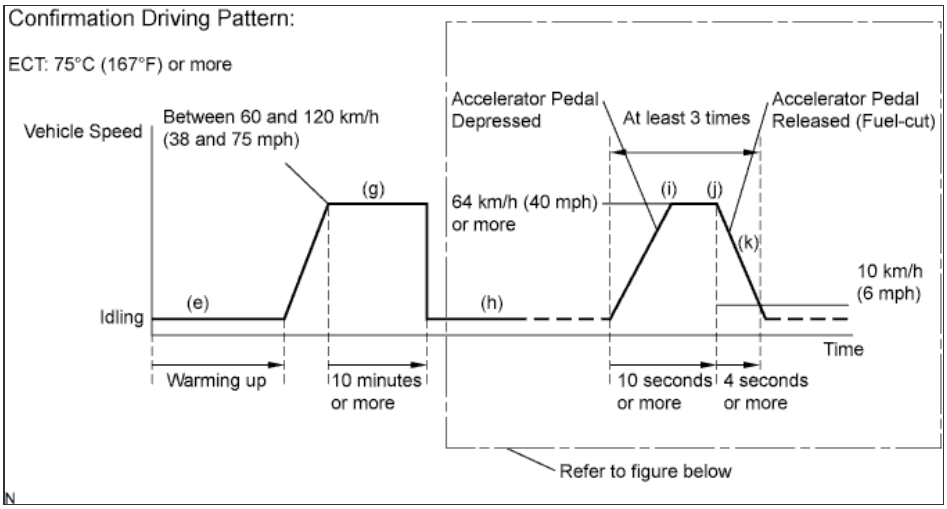
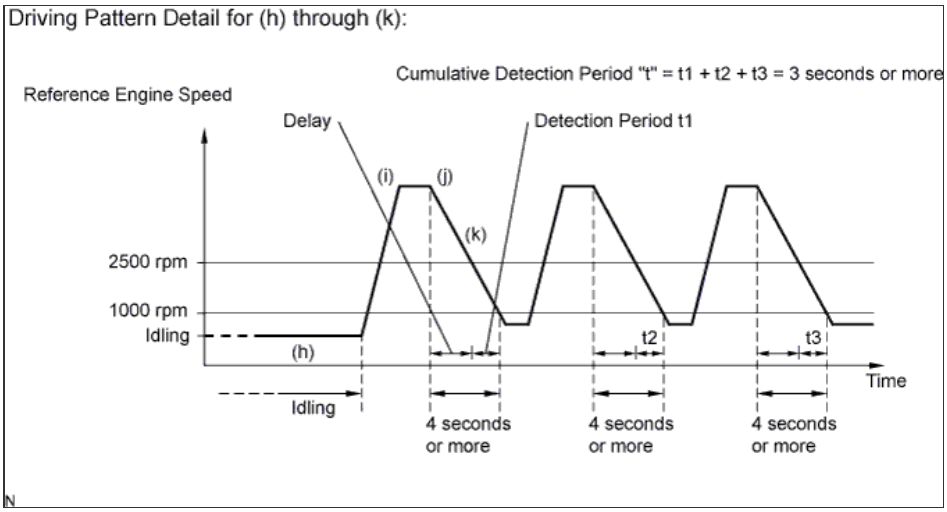
- **DTCs P2195 and P2196 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that includes cylinder No. 2.**
- **When any of these DTCs are stored, check the A/F sensor voltage output by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Voltage B1S1 or AFS Voltage B2S1.**
- **The short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+, A2A+, A1A- and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor voltage output cannot be confirmed without using the intelligent tester.**
- **If a A/F sensor malfunction is detected, the ECM stores a DTC.**

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN



CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

HINT:

This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the intelligent tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus to check the fuel-cut status: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Shift the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation (refer to the following HINT).

HINT:

Fuel-cut is performed when the following conditions are met:

- **The accelerator pedal is fully released.**
- **The engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in Data List.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the air fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

Result

Display (DTC Output)	Proceed to
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:

If any DTCs other than P2195, P2196, P2197 or P2198 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Clear DTCs (Click here).

d. Drive the vehicle in accordance with the drive pattern described in the CONFIRMATION DRIVING PATTERN.

e. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor.

f. Check that the status of O2 Sensor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

g. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Details / RANGE B1 S1.

h. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.4 mA, or 3.6 mA or more)	B

B → Go to step 20

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the intelligent tester on.

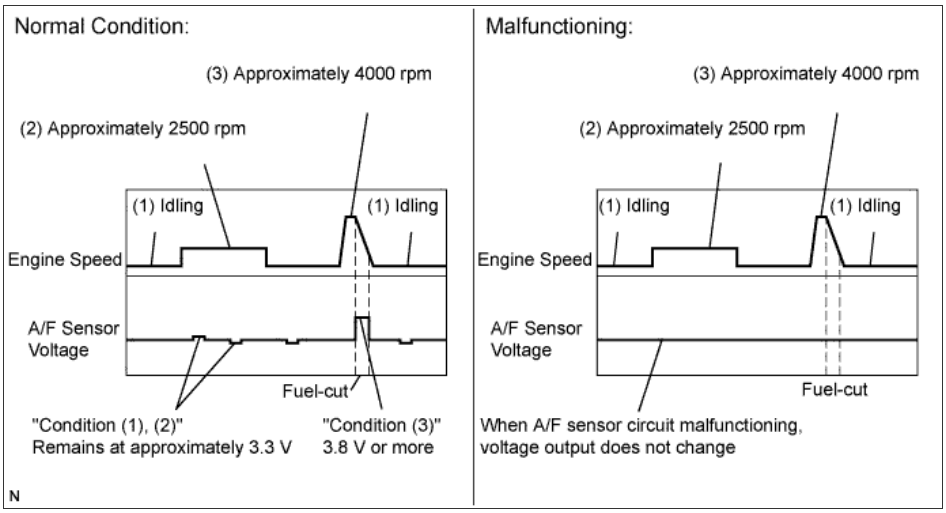
d. Warm up the air fuel ratio (A/F) sensor at an engine speed of 2500 rpm for 90 seconds.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS Voltage B1S1 or AFS Voltage B2S1 and Engine Speed.

f. Check the A/F sensor voltage three times, once in each of the following conditions:

i. Engine idling (check for at least 30 seconds)

ii. Engine running at an engine speed of approximately 2500 rpm (without any sudden changes in engine speed)



iii. Engine speed raised to 4000 rpm and then accelerator pedal quickly released so that the throttle valve is fully closed.

Standard:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Changes at approximately 3.3 V	Between 3.1 V and 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

HINT:

For more information, see the diagrams below.

HINT:

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learned value to perform fuel cut. If the battery cable has been disconnected and reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage.**

NG → Go to step 10

OK

4.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (DTC P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P2195, P2196, P2197 or P2198	A
No output	B

B → Go to step 9

A

6.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

7.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS (DTC P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

d. Read DTCs.

Result

Display (DTC Output)	Proceed to
No output	A
P2195, P2196, P2197 or P2198	B

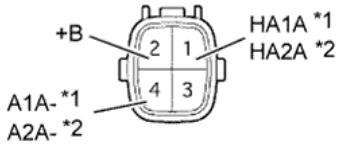
B → REPLACE ECM AND PERFORM CONFIRMATION DRIVING PATTERN

A

9.CONFIRM IF VEHICLE HAS RUN OUT OF FUEL IN PAST

NO → CHECK FOR INTERMITTENT PROBLEMS (Click here)

YES



DTC CAUSED BY RUNNING OUT OF FUEL

10.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

11.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
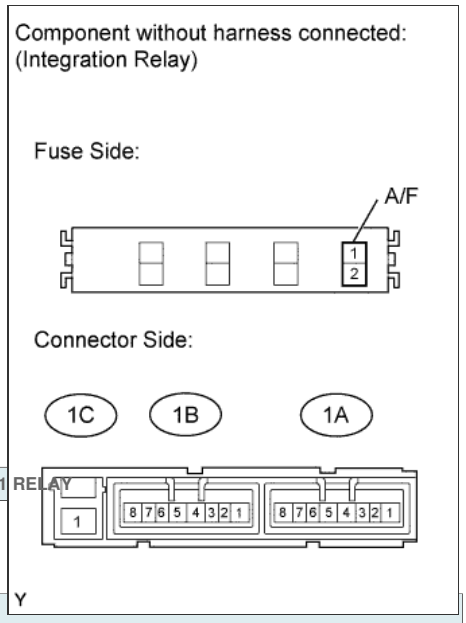
A/F fuse	Always	Below 1 Ω



iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
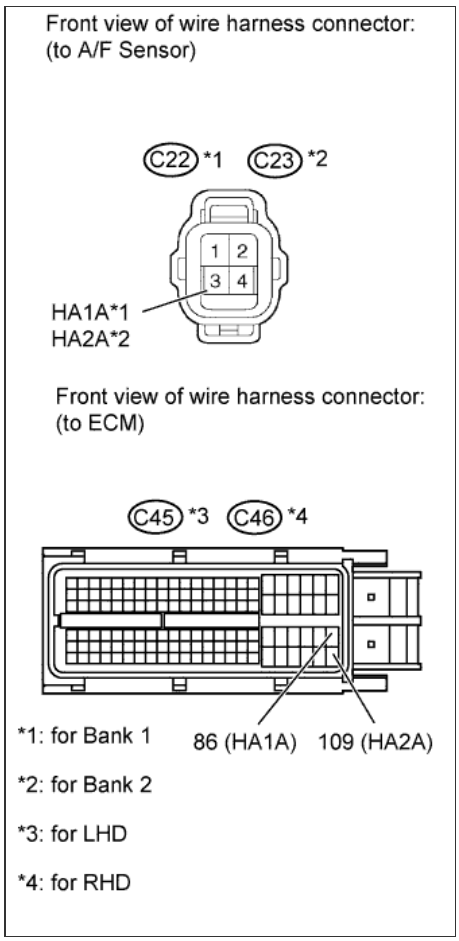
1A-4 - 1C-1	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω



NG → REPLACE INTEGRATION NO.1 RELAY

OK

12.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body		

ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK ↓

13.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage.

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

15.INSPECT FUEL INJECTOR

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

16.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT ↓

17.PERFORM CONFIRMATION DRIVING PATTERN

END

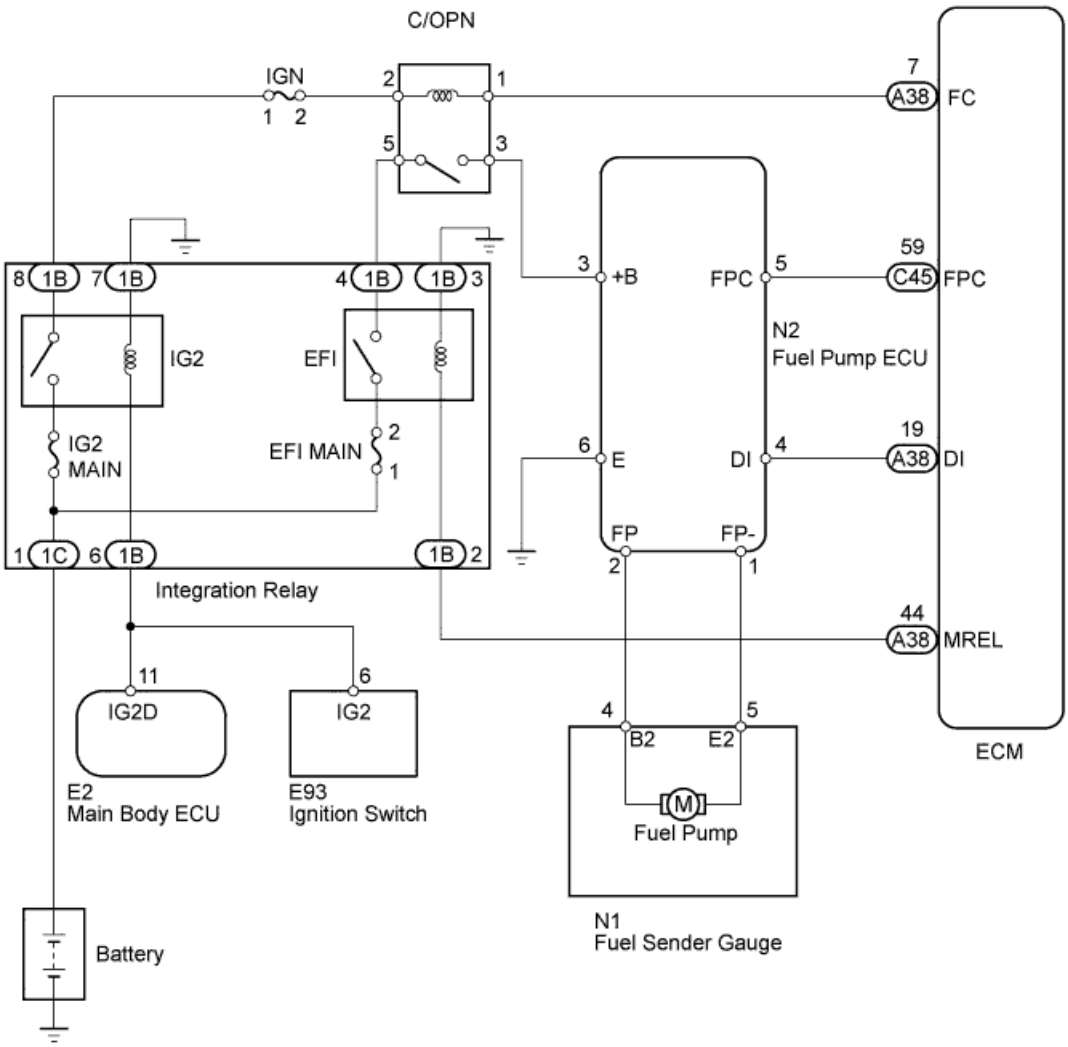
DTC P0230 Fuel Pump Primary Circuit

for Preparation Click here

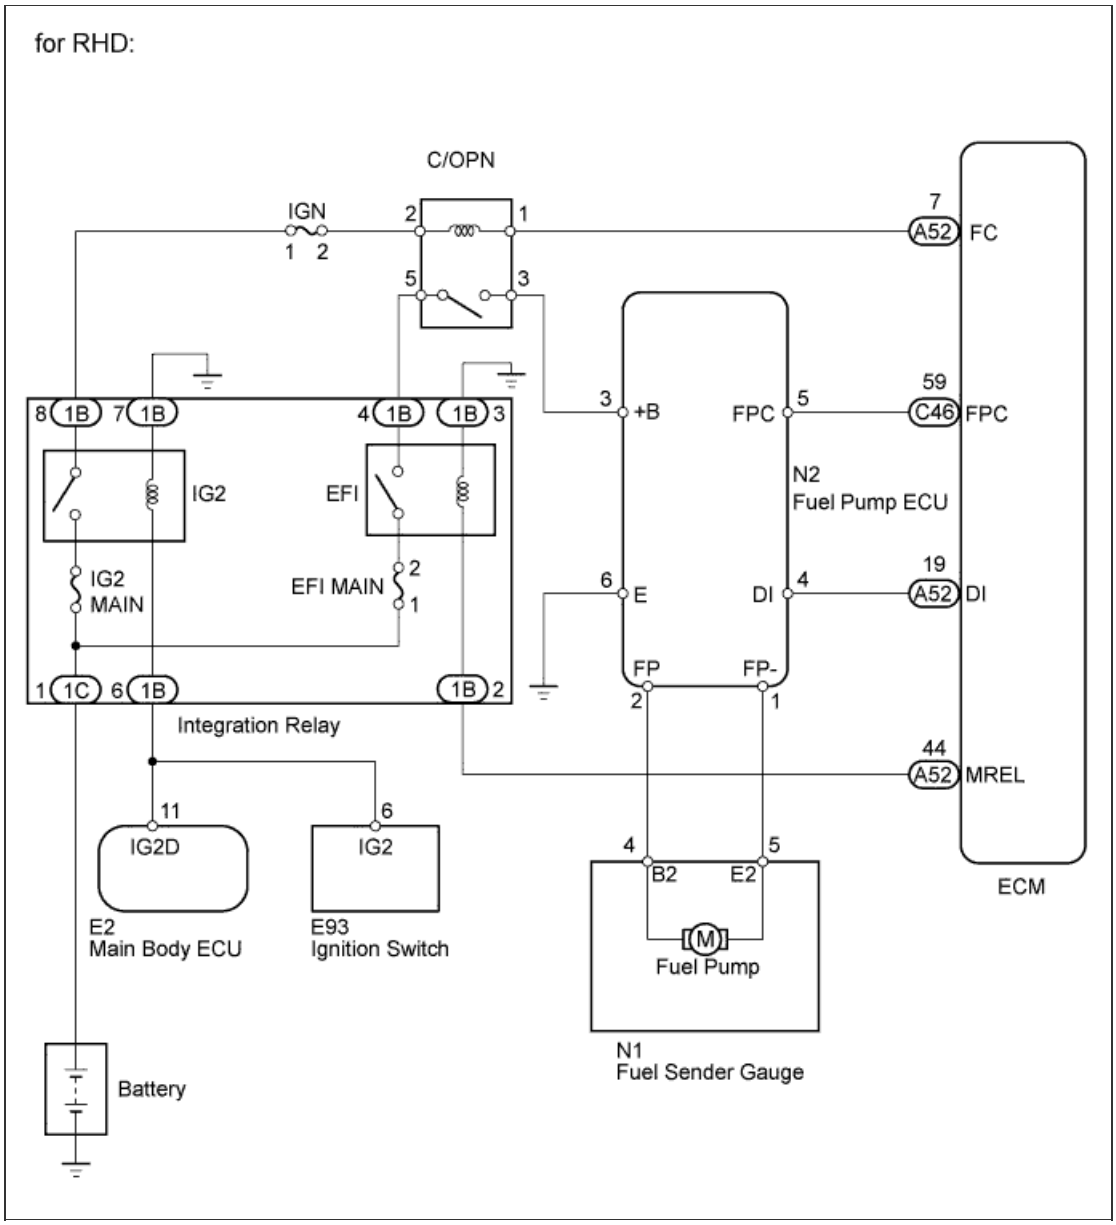
DESCRIPTION

When a malfunction in the fuel pump circuit is detected, DTC P0230 is stored.
The fuel pump circuit consists of the ECM, fuel pump and fuel pump ECU (which operates the fuel pump). Based on the engine output, the ECM determines the fuel pump speed. The speed is then converted to a duty signal and sent to the fuel pump ECU. Based on the signal sent from the ECM, the fuel pump ECU adjusts the fuel pump operation speed between 3 settings. The fuel pump ECU also has a self-diagnosis function. Based on the fuel pump circuit condition, the fuel pump ECU outputs a diagnostic signal (DI) to the ECM, and the ECM determines if there is a malfunction in the fuel pump circuit.

DTC Code	DTC Detection Condition	Trouble Area



P0230	When either condition below is met (1 trip detection logic):
	• When the fuel pump is operating:
	  • The remaining fuel is 17 L or more.
	  • The DI terminal output is low.
	• When the fuel pump is not operating:
	  • The DI terminal output is high.
		• Open or short in fuel pump circuit
		• Fuel pump
		• Fuel pump ECU
		• ECM



MONITOR DESCRIPTION

To monitor the fuel pump circuit, the ECM checks the fuel pump control signal (FPC) and diagnostic signal (DI). The FPC voltage varies between approximately 0 V to approximately 12 V (duty signal). Based on the condition of the fuel pump ECU malfunction, the DI voltage varies between approximately 0 V and approximately 12 V. The ECM then compares the variance of the FPC voltage and DI voltage, and determines if the fuel pump circuit is malfunctioning. When the ECM determines that the fuel pump circuit is malfunctioning, a DTC is stored immediately.

INSPECTION PROCEDURE

This troubleshooting procedure is based on the premise that the engine is started. If the engine is not started, proceed to the Problem Symptoms Table (Click here).

1.CHECK DTC OUTPUT

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Enter the following menus: Body / (desired system) / DTC.

d. Read the DTC.

Result

Result	Proceed to
DTC B1500 is not output	A
DTC B1500 is output	B

B → GO TO DTC B1500 (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

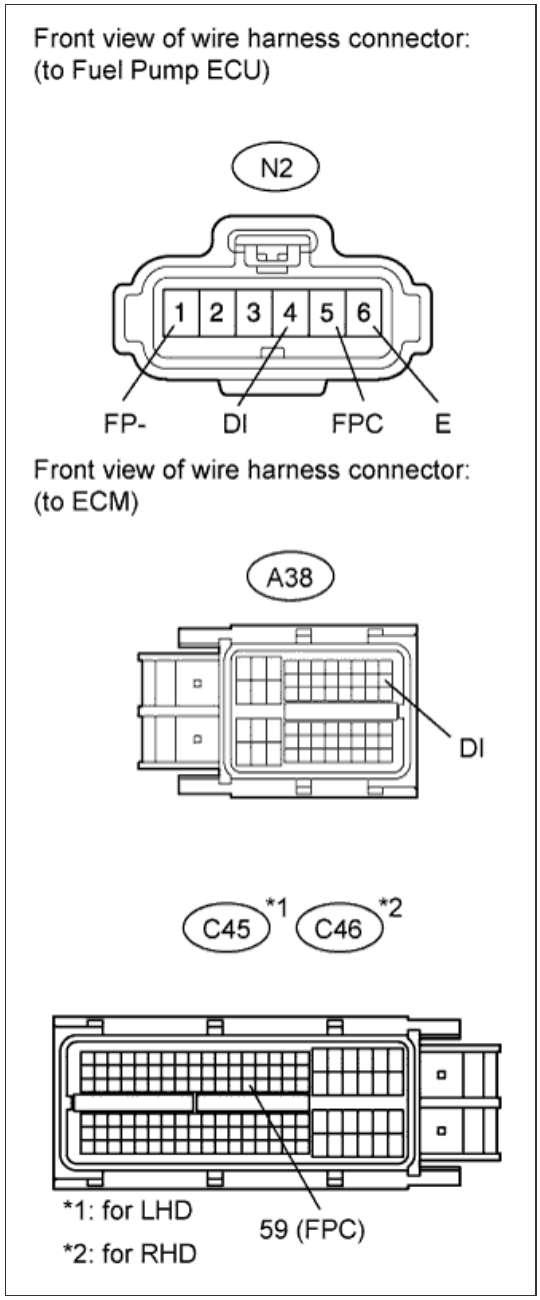
c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the fuel pump / Speed.

d. Check whether operating sounds can be heard while operating the relay using the tester.

OK:

Operating sounds can be heard from circuit opening relay.

NG → Go to step 6



OK

3.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM, BODY GROUND)

a. Disconnect the fuel pump ECU connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - C45-59 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A38-19 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - C46-59 (FPC)	Always	Below 1 Ω

N2-4 (DI) - A52-19 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
N2-1 (FP-) - Body ground	Always	10 kΩ or higher
N2-5 (FPC) or C45-59 (FPC) - Body ground	Always	10 kΩ or higher
N2-4 (DI) or A38-19 (DI) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
N2-1 (FP-) - Body ground	Always	10 kΩ or higher
N2-5 (FPC) or C46-59 (FPC) - Body ground	Always	10 kΩ or higher
N2-4 (DI) or A52-19 (DI) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.REPLACE FUEL PUMP ECU

a. Replace the fuel pump ECU (Click here).

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS

a. Check that there are 17 liters or more of fuel remaining.

b. Connect the intelligent tester to the DLC3.

c. Turn the ignition switch to ON.

d. Turn the tester on.

e. Clear the DTCs (Click here).

f. Start the engine and idle it for 5 minutes.

g. Drive the vehicle in an urban area for approximately 10 minutes.

h. Enter the following menus: Powertrain / Engine and ECT / DTC.

i. Read the DTCs.

Result

Result	Proceed to
No output	A
DTC P0230 is output	B

B → REPLACE ECM (**Click here**)

A

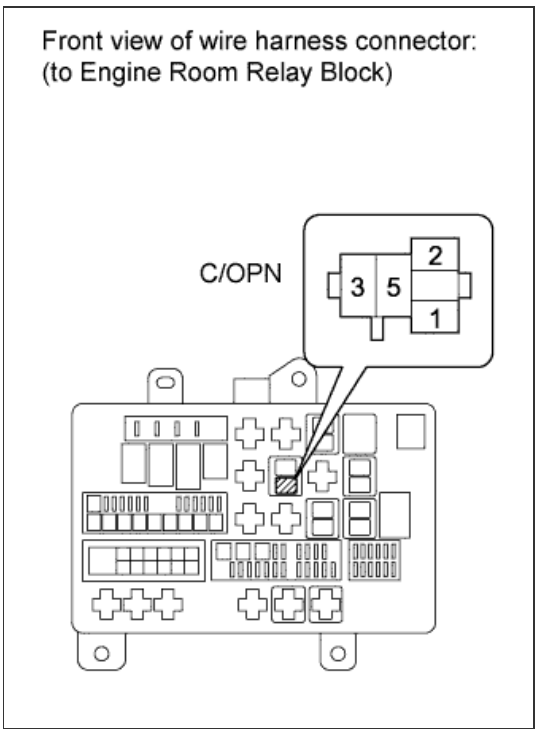
END

6.INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Inspect the circuit opening relay (C/OPN) (Click here).

NG → REPLACE CIRCUIT OPENING RELAY (C/OPN)

OK



7.INSPECT CIRCUIT OPENING RELAY (C/OPN) (POWER SOURCE VOLTAGE)

a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Measure the voltage according to the value(s) in the table below.

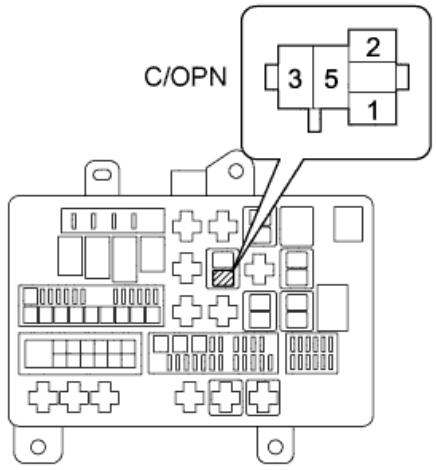
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C/OPN relay (2) - Body ground	Ignition switch ON	11 to 14 V
C/OPN relay (5) - Body ground	Ignition switch ON	11 to 14 V

NG → Go to step 14

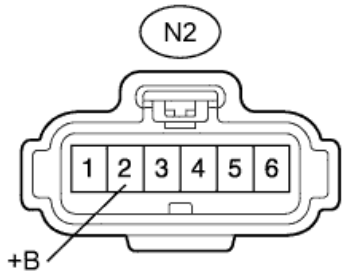
OK

8.CHECK HARNESS AND CONNECTOR (C/OPN RELAY - ECM, FUEL PUMP ECU)



a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Disconnect the fuel pump ECU connector.



c. Disconnect the ECM connector.

d. Measure the resistance according to the value(s) in the table below.

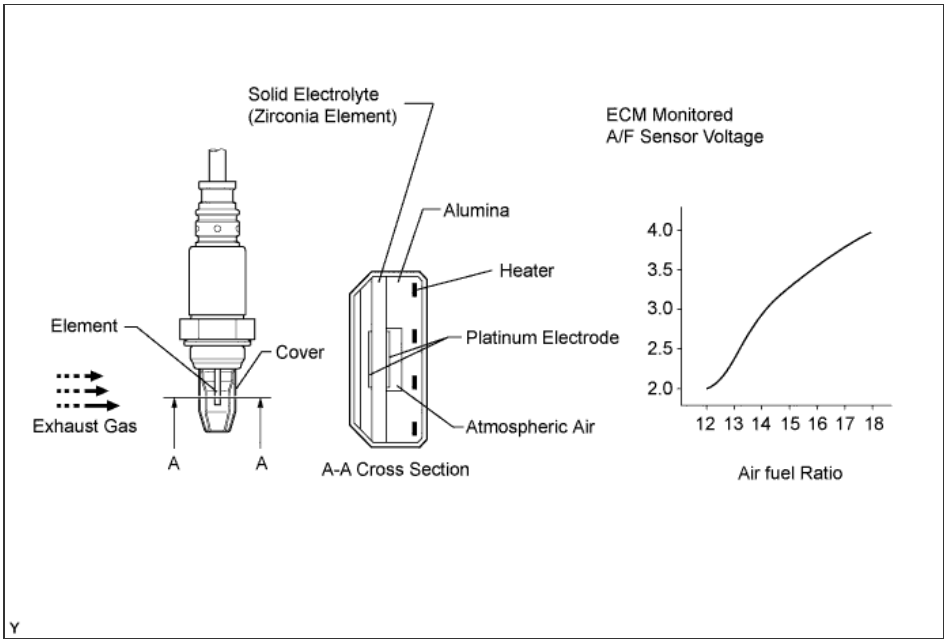
DTC P2198 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)



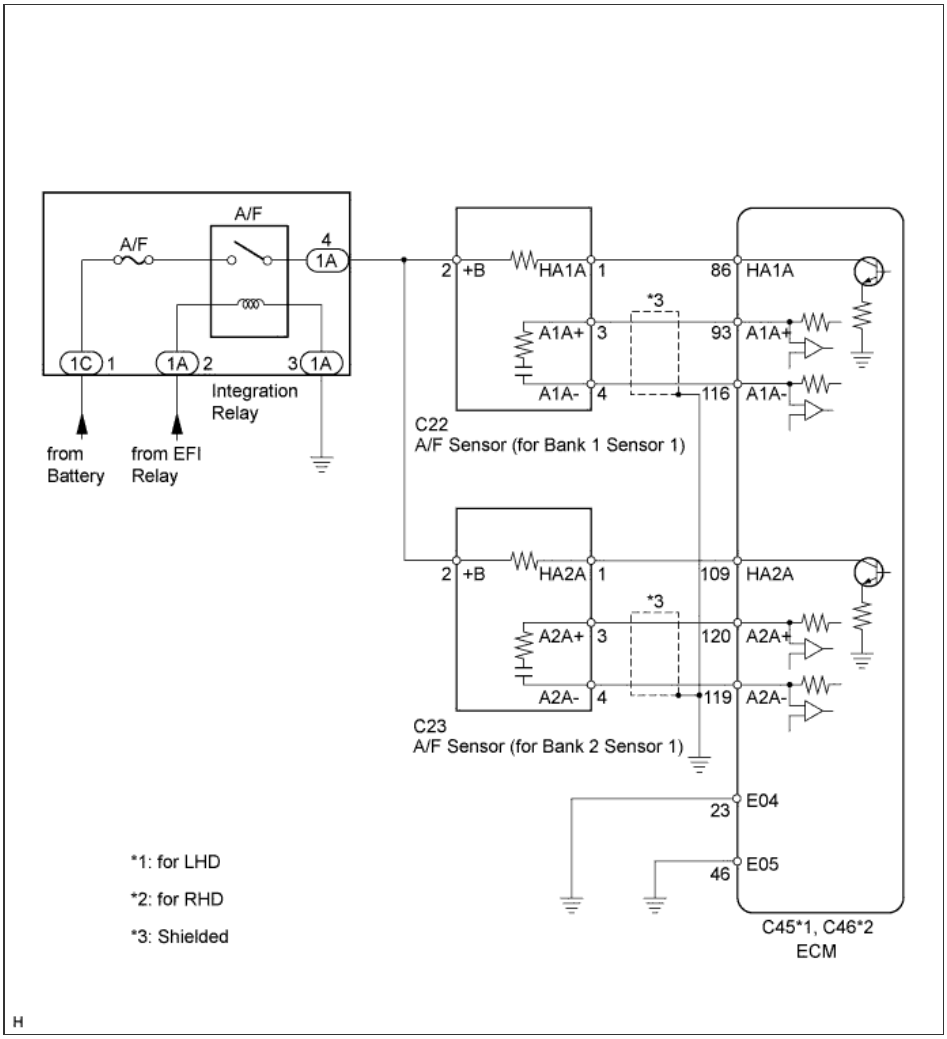
for Preparation Click here

DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor generates a voltage* that corresponds to the actual air fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air fuel ratio. The ECM determines the deviation from the stoichiometric air fuel ratio, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air fuel ratio accurately.
The A/F sensor is the planar type and is integrated with a heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate oxygen concentration detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.
In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.
*: The value changes inside the ECM. Since the A/F sensor is a current output element, the current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

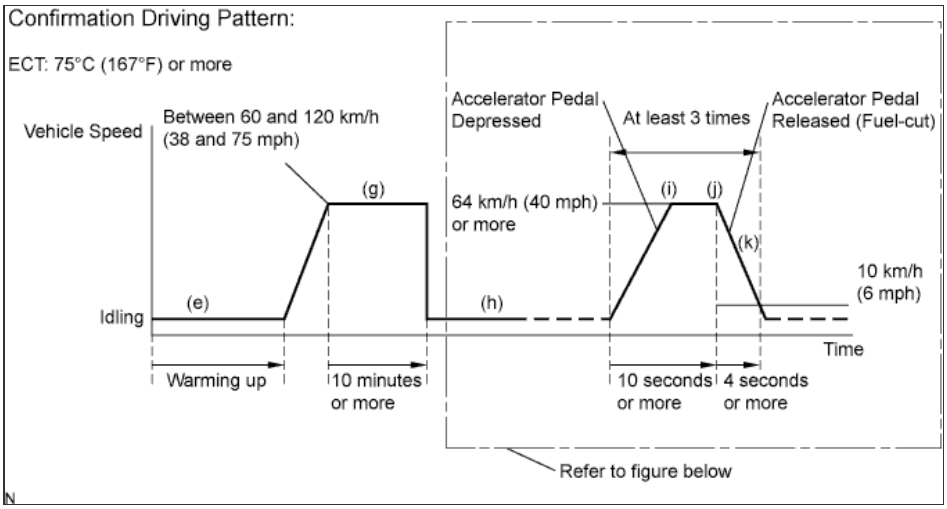


DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The Air Fuel Ratio (A/F) sensor voltage is more than 3.8 V. (b) The Heated Oxygen (HO2) sensor voltage is 0.15 V or more.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Integration relay • Air induction system circuits • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is 3.6 mA or more for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is less than 2.8 V. (b) The HO2 sensor voltage is less than 0.6 V.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Air induction system • Integration relay • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is less than 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

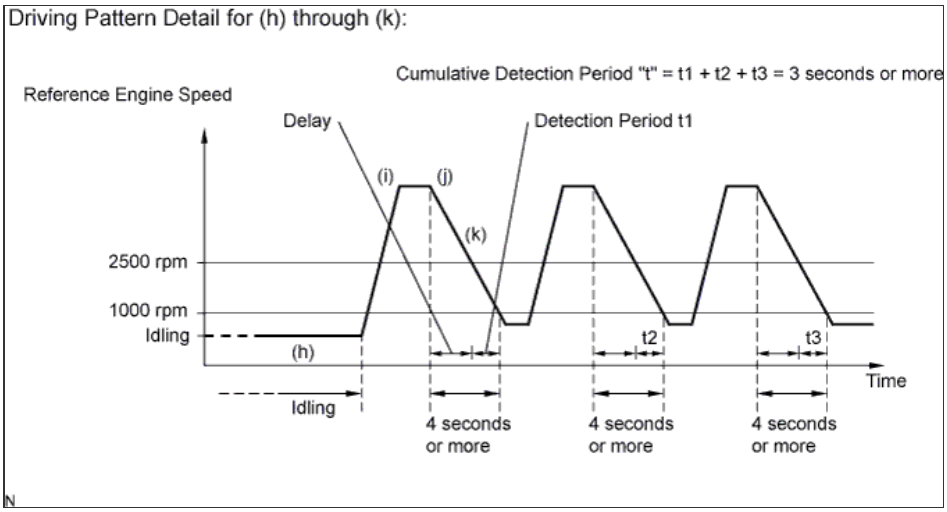
HINT:

- **DTCs P2195 and P2196 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that includes cylinder No. 2.**
- **When any of these DTCs are stored, check the A/F sensor voltage output by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Voltage B1S1 or AFS Voltage B2S1.**
- **The short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+, A2A+, A1A- and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor voltage output cannot be confirmed without using the intelligent tester.**
- **If a A/F sensor malfunction is detected, the ECM stores a DTC.**

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN



CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

HINT:

This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the intelligent tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus to check the fuel-cut status: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Shift the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation (refer to the following HINT).

HINT:

Fuel-cut is performed when the following conditions are met:

- **The accelerator pedal is fully released.**
- **The engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in Data List.

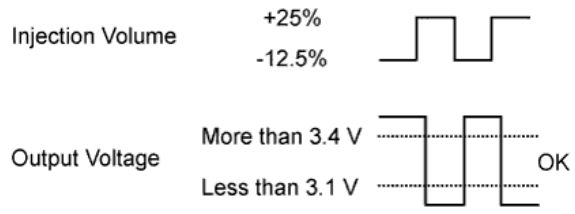
INSPECTION PROCEDURE

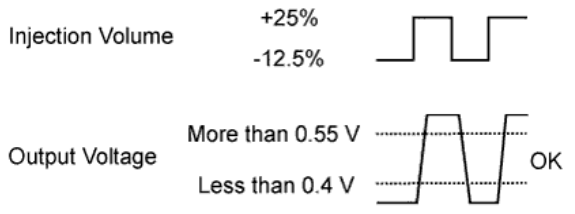
HINT:

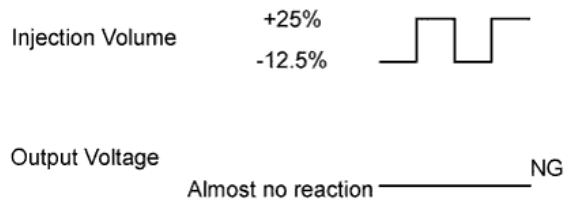
Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the air fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

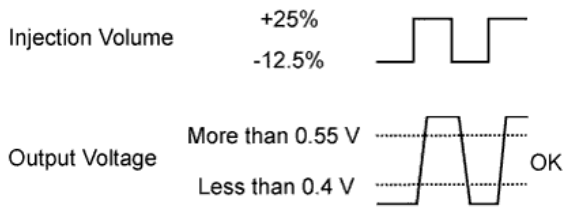
The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

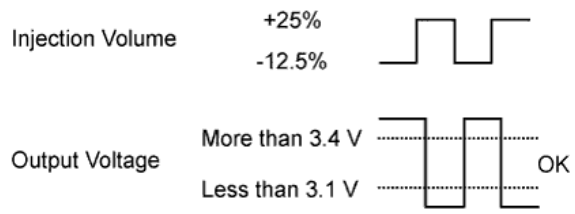
1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

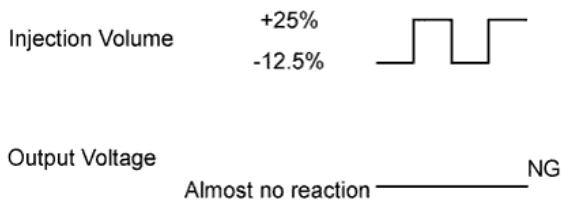


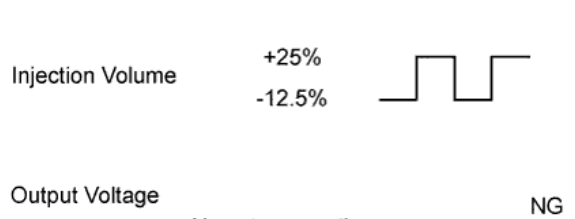


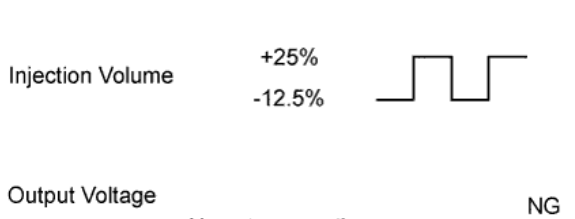












HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

Result

Display (DTC Output)	Proceed to
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:

If any DTCs other than P2195, P2196, P2197 or P2198 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Clear DTCs (Click here).

d. Drive the vehicle in accordance with the drive pattern described in the CONFIRMATION DRIVING PATTERN.

e. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor.

f. Check that the status of O2 Sensor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

g. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Details / RANGE B1 S1.

h. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.4 mA, or 3.6 mA or more)	B

B → Go to step 20

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the intelligent tester on.

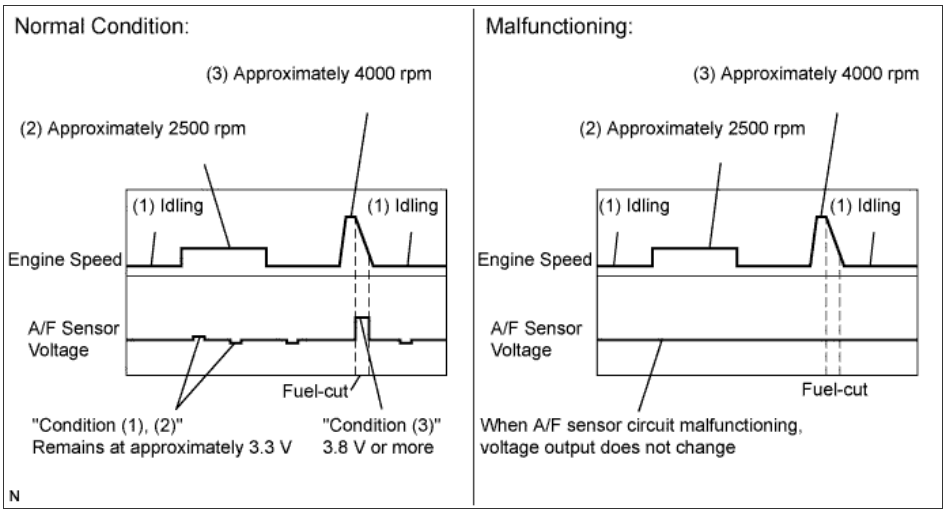
d. Warm up the air fuel ratio (A/F) sensor at an engine speed of 2500 rpm for 90 seconds.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS Voltage B1S1 or AFS Voltage B2S1 and Engine Speed.

f. Check the A/F sensor voltage three times, once in each of the following conditions:

i. Engine idling (check for at least 30 seconds)

ii. Engine running at an engine speed of approximately 2500 rpm (without any sudden changes in engine speed)



iii. Engine speed raised to 4000 rpm and then accelerator pedal quickly released so that the throttle valve is fully closed.

Standard:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Changes at approximately 3.3 V	Between 3.1 V and 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

HINT:

For more information, see the diagrams below.

HINT:

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learned value to perform fuel cut. If the battery cable has been disconnected and reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage.**

NG → Go to step 10

OK

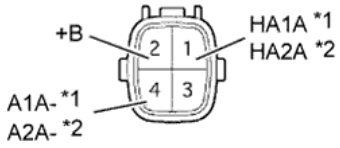
NO → CHECK FOR INTERMITTENT PROBLEMS (Click here)

YES



DTC CAUSED BY RUNNING OUT OF FUEL

10.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

11.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

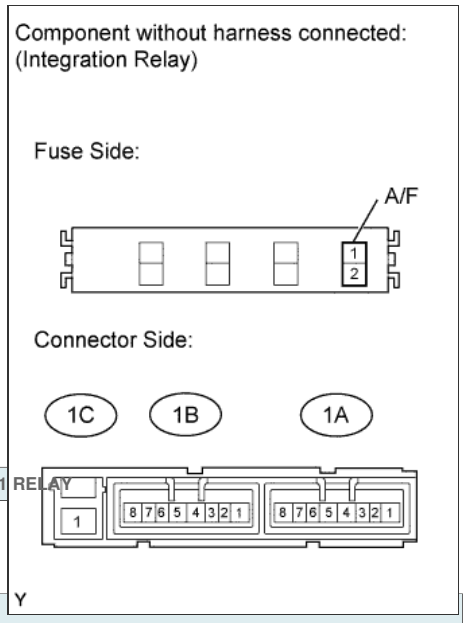
b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω



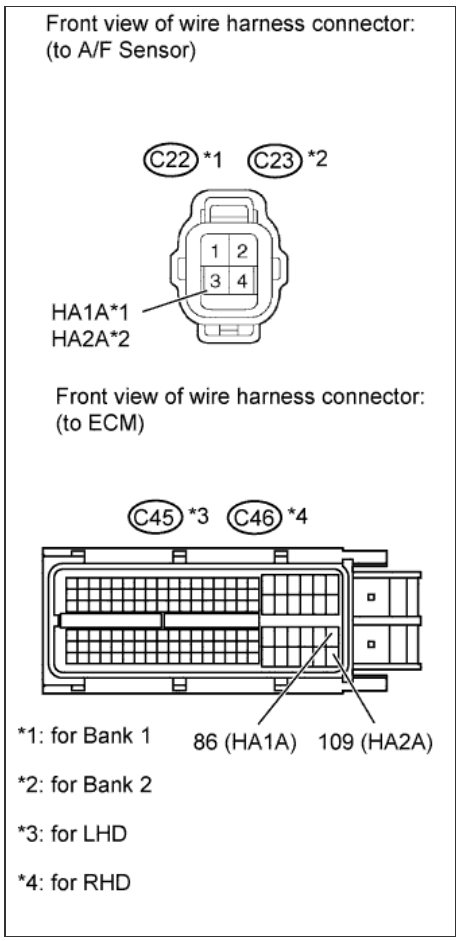
iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω



NG → REPLACE INTEGRATION NO.1 RELAY

OK

12.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body		

ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

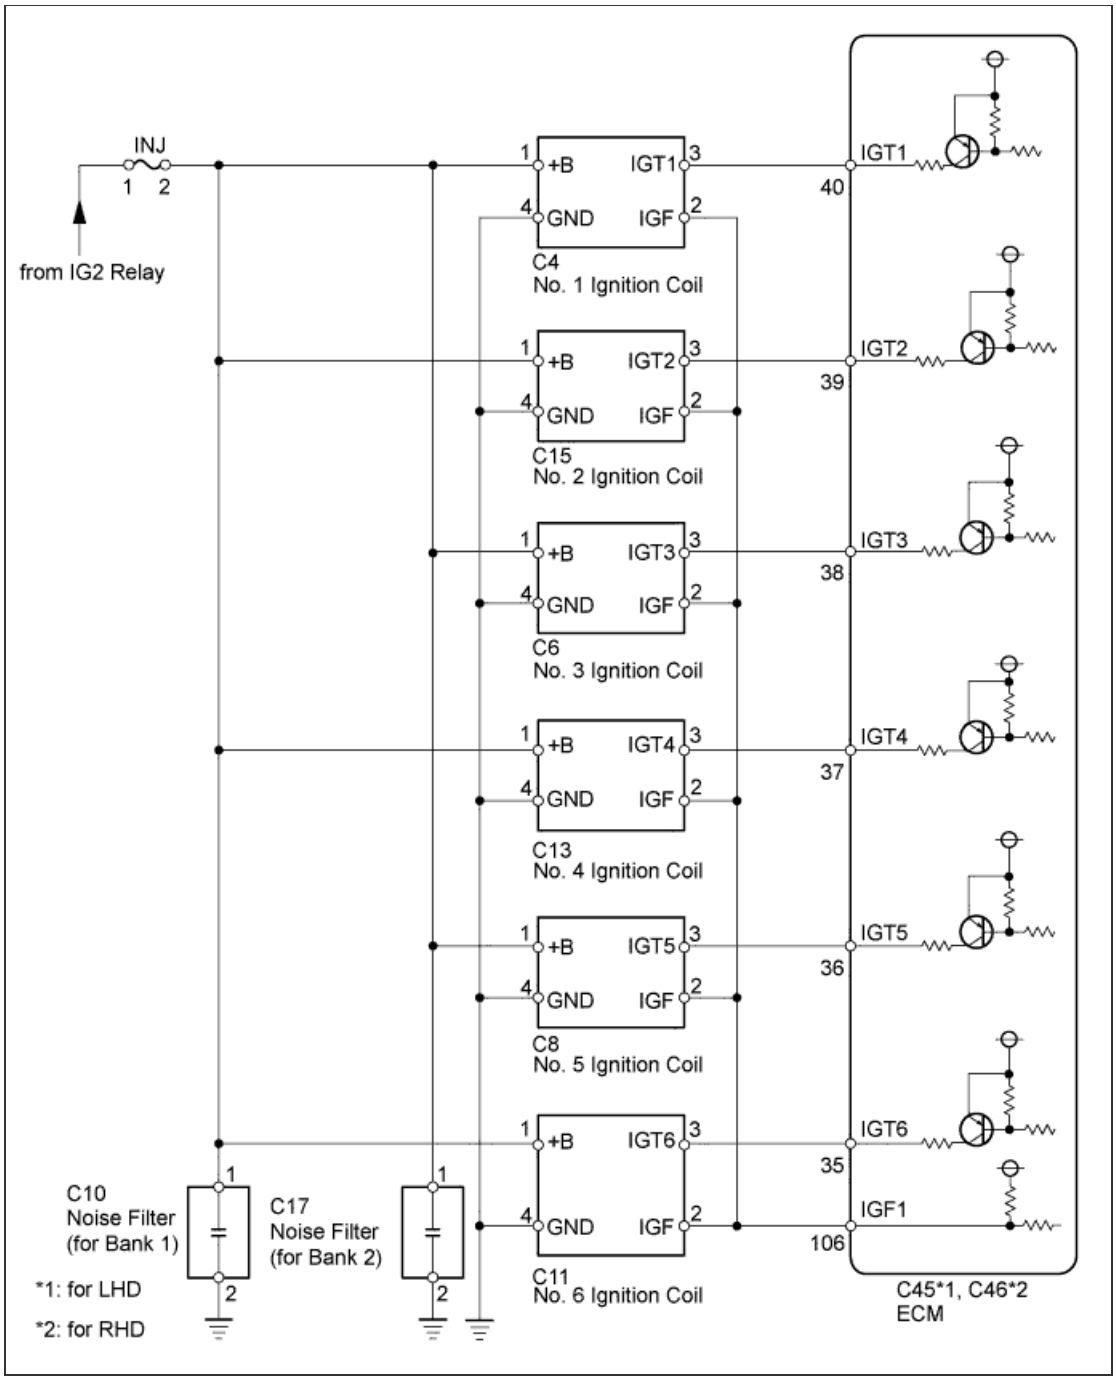
DTC P0304 Cylinder 4 Misfire Detected

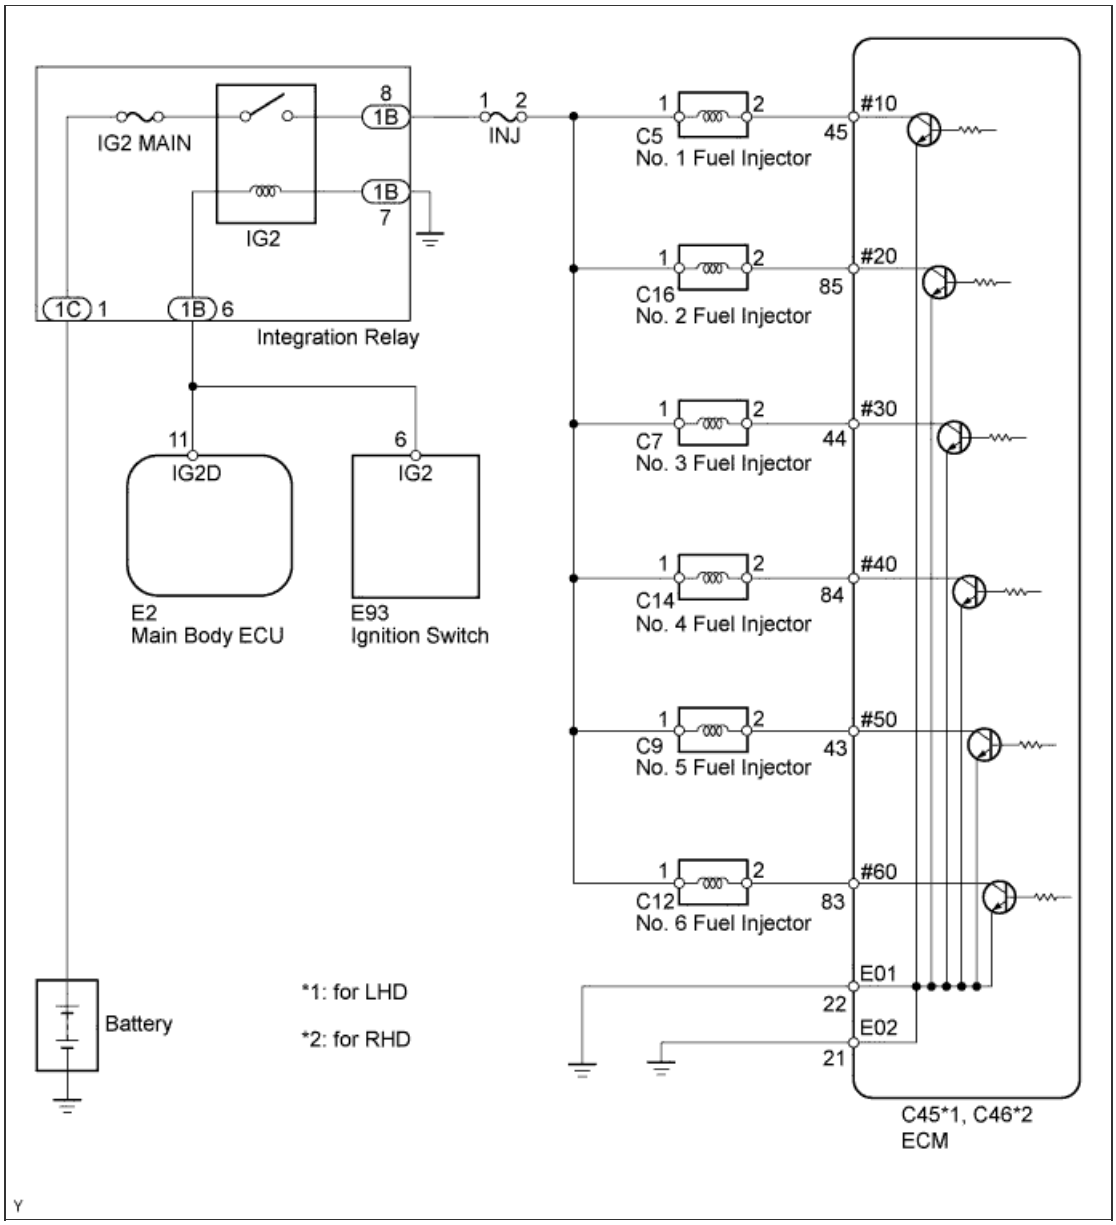
DTC P0305 Cylinder 5 Misfire Detected

DTC P0306 Cylinder 6 Misfire Detected

for Preparation Click here

DESCRIPTION





When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire count. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the VVT sensor and the Crankshaft Position (CKP) sensor. The VVT sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, the ECM illuminates the MIL and stores a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connections • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder occurs and one of following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the intelligent tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the intelligent tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire count of each cylinder (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count) with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
7. If no misfire counts are displayed, drive the vehicle several times at the engine speed and engine load, etc., recorded in the freeze frame data.

HINT:

- **In order to store misfire DTCs, drive the vehicle at the engine speed and engine load, etc., recorded in the freeze frame data for the time specified in the table below.**

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the ignition switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data are cleared.

9. Record the DTC(s), freeze frame data and misfire count.
10. Turn the ignition switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors can be considered to be a possible cause of the problem:**
    1. **There was insufficient fuel volume in the tank.**
    2. **Improper fuel was used.**
    3. **The spark plugs have been contaminated.**
- **After finishing repairs, check the misfire counts of the cylinders (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count).**
- **Be sure to confirm that no misfiring cylinder DTCs are stored again by conducting the confirmation driving pattern after finishing repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speeds. If misfires occur only in high engine speed areas, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
    1. **Clear the DTCs (Click here).**
    2. **Start the engine and conduct the confirmation driving pattern.**
    3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
    4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
    5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not stored.**
- **When one of Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire may have occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

HINT:

Write down the DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is correctly connected and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4.READ VALUE USING INTELLIGENT TESTER

(a) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5 and #6.
(b) Read the value for Cylinder #1 Misfire Count to Cylinder #6 Misfire Count displayed on the intelligent tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Start the engine and let it idle.
(2) Move the shift lever to D.
(3) Check the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count.
(4) If misfire counts are still not displayed, perform steps (c) and (d).
(c) Drive the vehicle with the Misfire RPM and Misfire Load noted in the "Read value using intelligent tester (Misfire RPM and Misfire Load)" procedures above.
(d) Read the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count or DTCs displayed on the intelligent tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data's record of Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

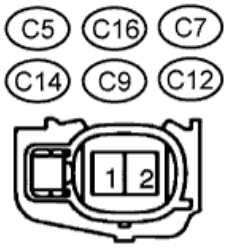
NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

8.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

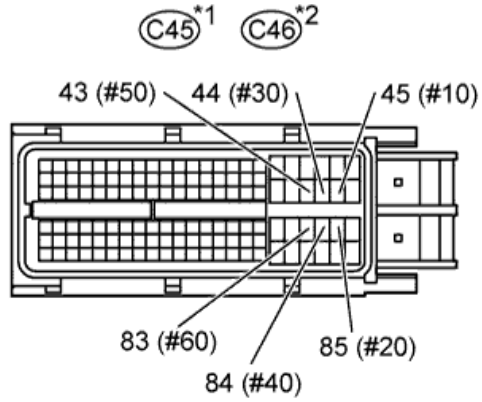
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Injector)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance:

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND/OR #60 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
C45-45 (#10) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-85 (#20) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V

C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

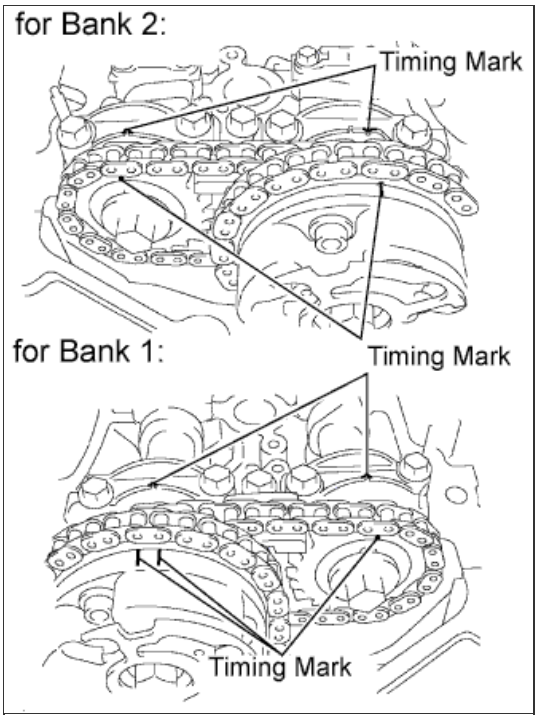
12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK



13.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING

OK

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY

OK

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

REPLACE ECM (Click here)

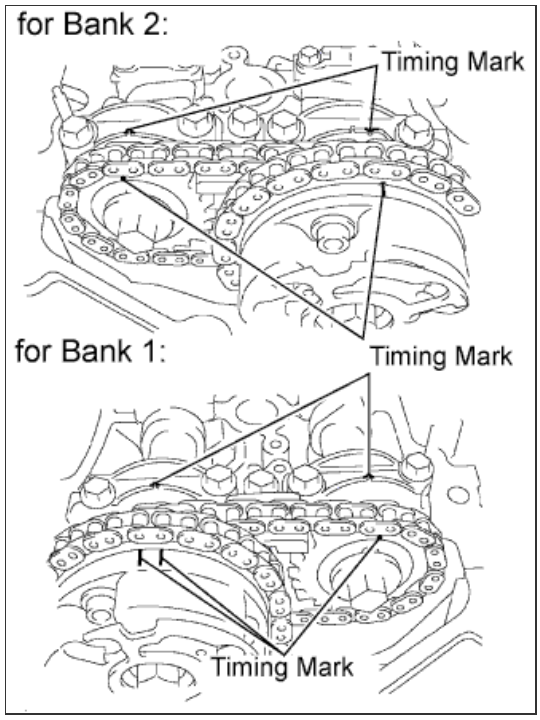
17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK



18.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING**

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → **CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY**

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.

With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

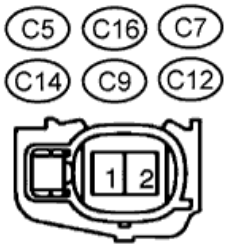
25.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

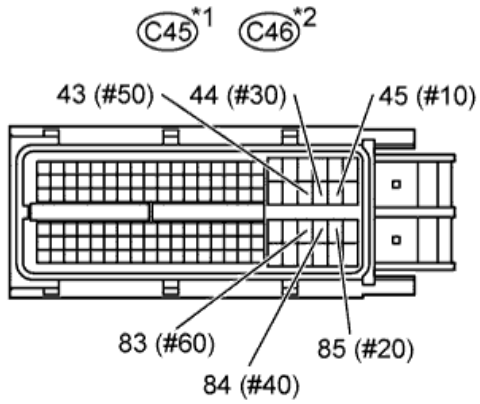
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (Click here)

OK

REPLACE ECM (Click here)

29.REPLACE SPARK PLUG WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:

Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.REPLACE IGNITION COIL WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed ignition coil with a ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

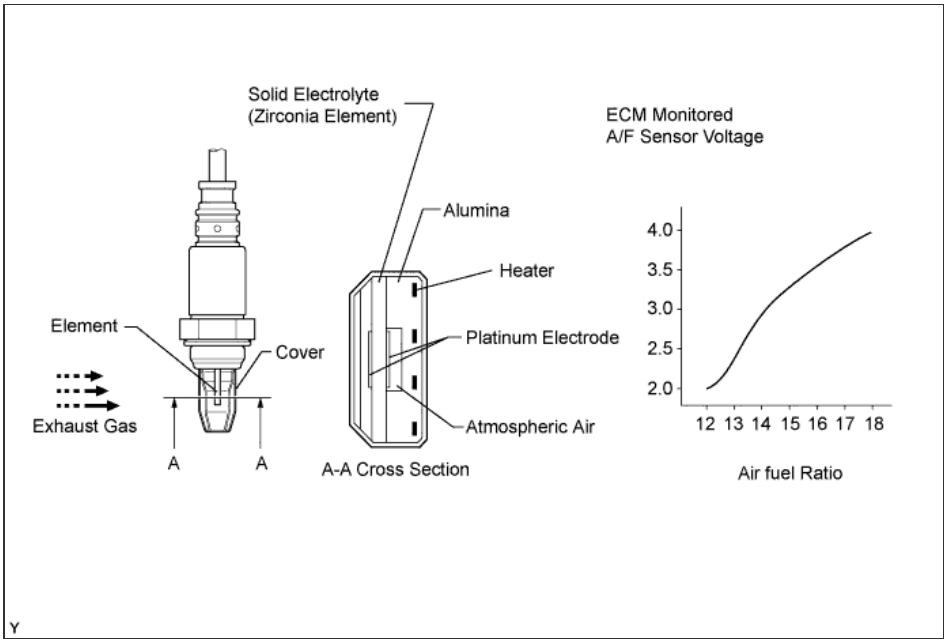
OK → REPLACE IGNITION COIL (Click here)

DTC P2195 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 1 Sensor 1)

DTC P2196 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 1 Sensor 1)

DTC P2197 Oxygen (A/F) Sensor Signal Stuck Lean (Bank 2 Sensor 1)

DTC P2198 Oxygen (A/F) Sensor Signal Stuck Rich (Bank 2 Sensor 1)



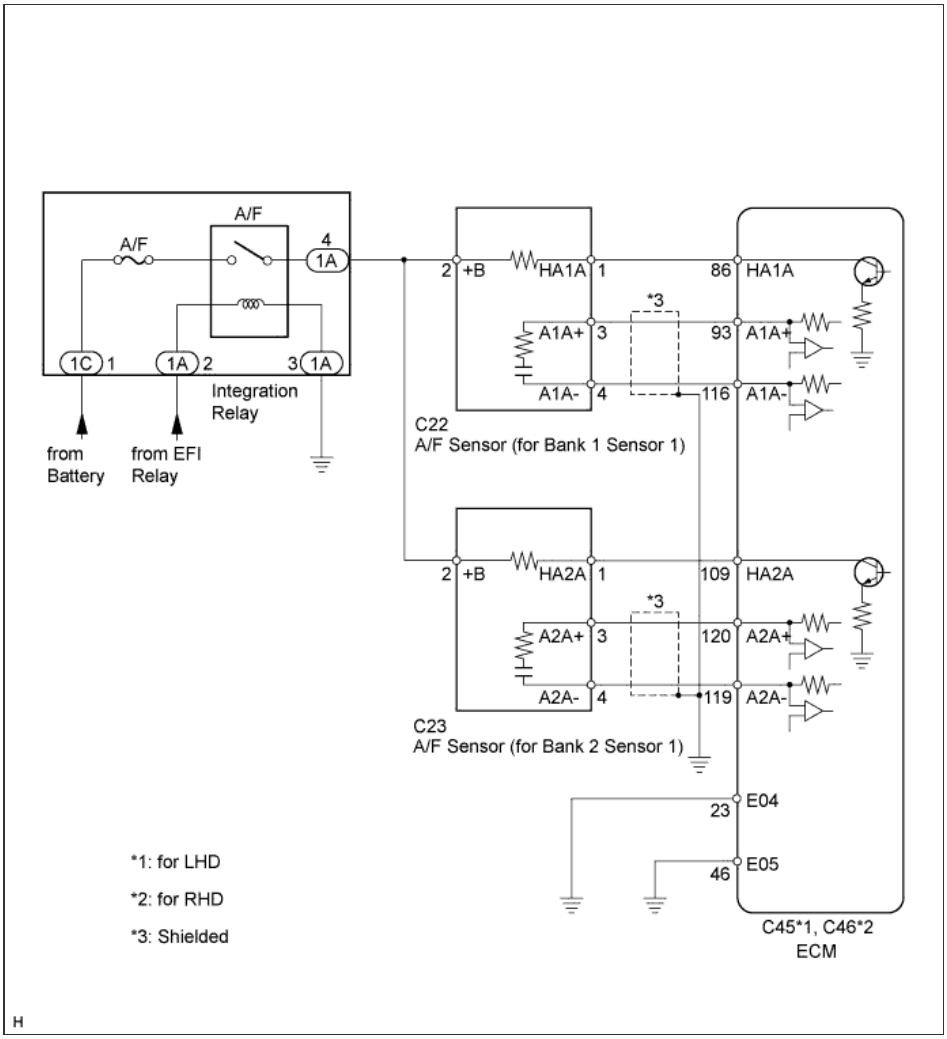
for Preparation Click here

DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel Ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor generates a voltage* that corresponds to the actual air fuel ratio. This sensor voltage is used to provide the ECM with feedback so that it can control the air fuel ratio. The ECM determines the deviation from the stoichiometric air fuel ratio, and regulates the fuel injection time. If the A/F sensor malfunctions, the ECM is unable to control the air fuel ratio accurately.
The A/F sensor is the planar type and is integrated with a heater, which heats the solid electrolyte (zirconia element). This heater is controlled by the ECM. When the intake air volume is low (the exhaust gas temperature is low), a current flows into the heater to heat the sensor in order to facilitate accurate oxygen concentration detection. In addition, the sensor and heater portions are the narrow type. The heat generated by the heater is conducted to the solid electrolyte through the alumina, therefore the sensor activation is accelerated.
In order to obtain a high purification rate of the carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) components in the exhaust gas, a TWC is used. For the most efficient use of the TWC, the air fuel ratio must be precisely controlled so that it is always close to the stoichiometric level.
*: The value changes inside the ECM. Since the A/F sensor is a current output element, the current is converted into a voltage inside the ECM. Any measurements taken at the A/F sensor or ECM connectors will show a constant voltage.

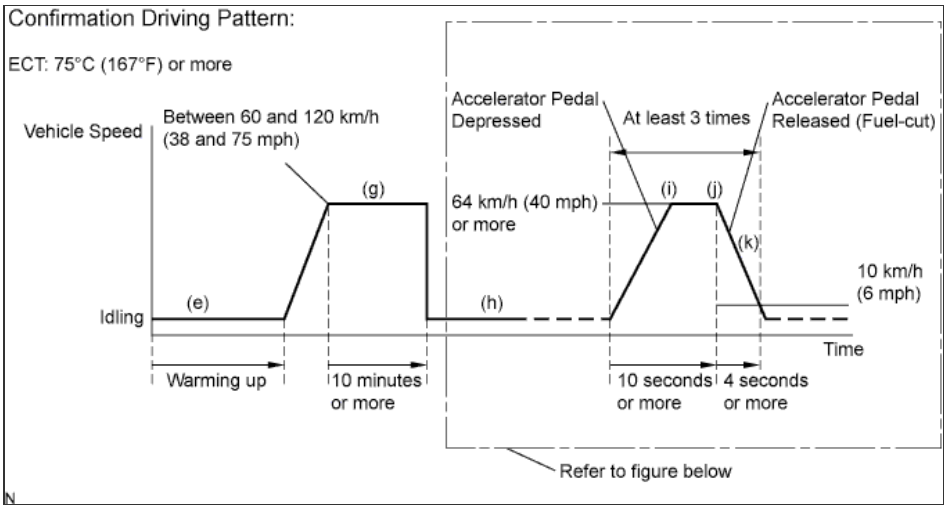


DTC Code	DTC Detection Condition	Trouble Area
P2195 P2197	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The Air Fuel Ratio (A/F) sensor voltage is more than 3.8 V. (b) The Heated Oxygen (HO2) sensor voltage is 0.15 V or more.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Integration relay • Air induction system circuits • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is 3.6 mA or more for 3 seconds (2 trip detection logic).	• A/F sensor • ECM
P2196 P2198	Conditions (a) and (b) continue for 2 seconds or more (2 trip detection logic): (a) The A/F sensor voltage is less than 2.8 V. (b) The HO2 sensor voltage is less than 0.6 V.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • A/F sensor (bank 1, 2 sensor 1) heater • A/F sensor heater circuits • Air induction system • Integration relay • Fuel pressure • Fuel injector • ECM
	While fuel-cut operation is performed (during vehicle deceleration), the air fuel ratio (A/F) sensor current is less than 1.4 mA for 3 seconds (2 trip detection logic).	• A/F sensor • ECM

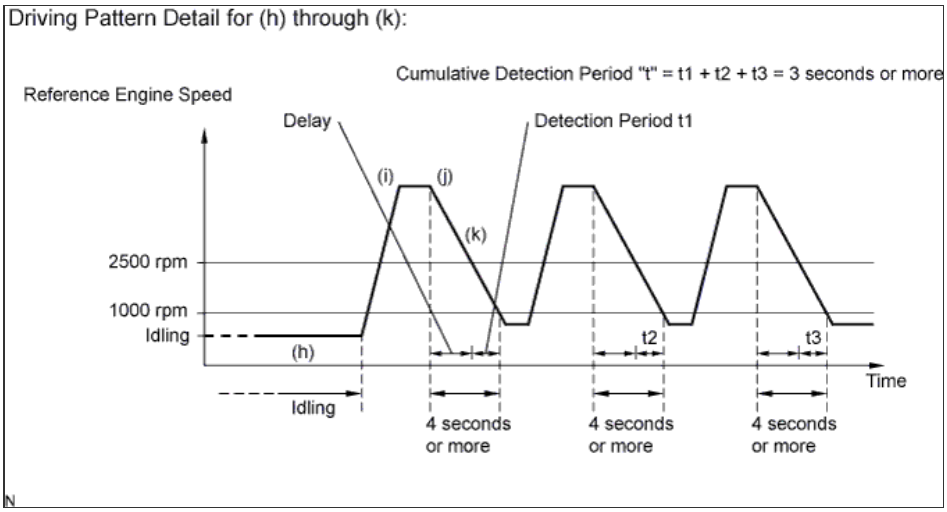
HINT:

- **DTCs P2195 and P2196 indicate malfunctions related to the bank 1 A/F sensor circuit.**
- **DTCs P2197 and P2198 indicate malfunctions related to the bank 2 A/F sensor circuit.**
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that includes cylinder No. 2.**
- **When any of these DTCs are stored, check the A/F sensor voltage output by entering the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / AFS Voltage B1S1 or AFS Voltage B2S1.**
- **The short-term fuel trim values can also be read using the intelligent tester.**
- **The ECM regulates the voltages at the A1A+, A2A+, A1A- and A2A- terminals of the ECM to a constant level. Therefore, the A/F sensor voltage output cannot be confirmed without using the intelligent tester.**
- **If a A/F sensor malfunction is detected, the ECM stores a DTC.**

WIRING DIAGRAM



CONFIRMATION DRIVING PATTERN



CAUTION:

Strictly observe posted speed limits, traffic laws, and road conditions when performing these drive patterns.

HINT:

This confirmation driving pattern is used in the "PERFORM CONFIRMATION DRIVING PATTERN" procedure of the following diagnostic troubleshooting procedure.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the intelligent tester on.
(d) Clear DTCs (Click here).
(e) Start the engine, and warm it up until the ECT reaches 75°C (167°F) or higher.
(f) Enter the following menus to check the fuel-cut status: Powertrain / Engine and ECT / Data List / All Data / Idle Fuel Cut.
(g) Drive the vehicle at between 60 km/h (38 mph) and 120 km/h (75 mph) for at least 10 minutes.
(h) Shift the transmission to 2nd gear.
(i) Drive the vehicle at the proper vehicle speed to perform fuel-cut operation (refer to the following HINT).

HINT:

Fuel-cut is performed when the following conditions are met:

- **The accelerator pedal is fully released.**
- **The engine speed is 2500 rpm or more (fuel injection returns at 1000 rpm).**

(j) Accelerate the vehicle to 64 km/h (40 mph) or more by depressing the accelerator pedal for at least 10 seconds.
(k) Soon after performing step (j) above, release the accelerator pedal for at least 4 seconds without depressing the brake pedal in order to execute fuel-cut control.
(l) Allow the vehicle to decelerate until the vehicle speed decreases to less than 10 km/h (6 mph).
(m) Repeat steps (h) through (k) above at least 3 times in one driving cycle.

HINT:

Completion of all O2S (A/F) Monitor is required to change the value in Data List.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the air fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2, or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

Result

Display (DTC Output)	Proceed to
P2195, P2196, P2197 or P2198	A
P2195, P2196, P2197 or P2198 and other DTCs	B

HINT:

If any DTCs other than P2195, P2196, P2197 or P2198 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (TEST VALUE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Clear DTCs (Click here).

d. Drive the vehicle in accordance with the drive pattern described in the CONFIRMATION DRIVING PATTERN.

e. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor.

f. Check that the status of O2 Sensor is Complete.
If the status is still Incomplete, drive the vehicle according to the driving pattern again.

g. Enter the following menus: Powertrain / Engine and ECT / Monitor / O2 Sensor / Details / RANGE B1 S1.

h. Check the test value of the A/F sensor output current during fuel-cut.

Result

Test Value	Proceed to
Within normal range (1.4 mA or more, and less than 3.6 mA)	A
Outside normal range (Less than 1.4 mA, or 3.6 mA or more)	B

B → Go to step 20

A

3.READ VALUE USING INTELLIGENT TESTER (OUTPUT VOLTAGE OF A/F SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the intelligent tester on.

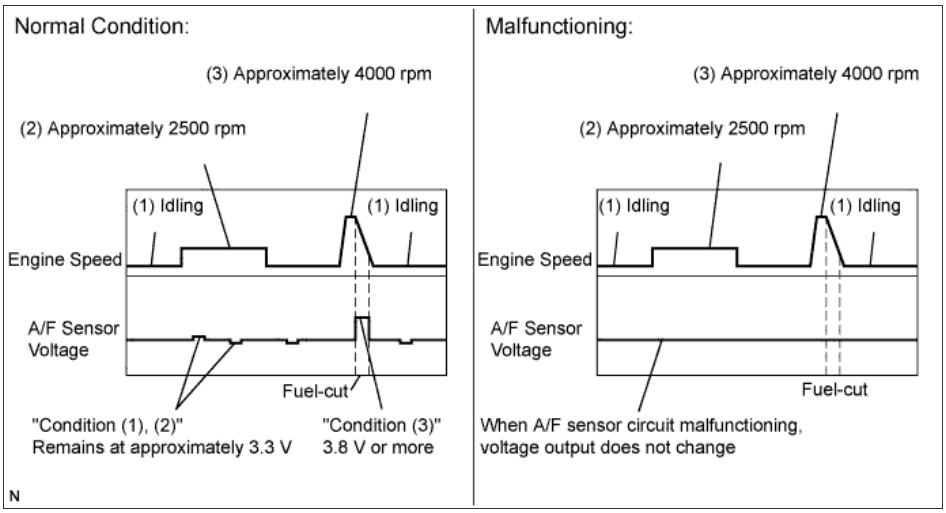
d. Warm up the air fuel ratio (A/F) sensor at an engine speed of 2500 rpm for 90 seconds.

e. Enter the following menus: Powertrain / Engine and ECT / Data List / A/F Control System / Snapshot / AFS Voltage B1S1 or AFS Voltage B2S1 and Engine Speed.

f. Check the A/F sensor voltage three times, once in each of the following conditions:

i. Engine idling (check for at least 30 seconds)

ii. Engine running at an engine speed of approximately 2500 rpm (without any sudden changes in engine speed)



iii. Engine speed raised to 4000 rpm and then accelerator pedal quickly released so that the throttle valve is fully closed.

Standard:

Condition	A/F Sensor Voltage Variation	Reference
(1) and (2)	Changes at approximately 3.3 V	Between 3.1 V and 3.5 V
(3)	Increases to 3.8 V or more	This occurs during engine deceleration (when fuel-cut performed)

HINT:

For more information, see the diagrams below.

HINT:

- **If the output voltage of the A/F sensor remains at approximately 3.3 V (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have an open circuit. (This will also happen if the A/F sensor heater has an open circuit.)**
- **If the output voltage of the A/F sensor remains at either approximately 3.8 V or more, or 2.8 V or less (see "Malfunctioning" diagram) under any conditions, including those above, the A/F sensor may have a short circuit.**
- **The ECM stops fuel injection (fuel cut) during engine deceleration. This causes a lean condition and results in a momentary increase in the A/F sensor output voltage.**
- **The ECM must establish a closed throttle valve position learned value to perform fuel cut. If the battery cable has been disconnected and reconnected, the vehicle must be driven over 16 km/h (10 mph) to allow the ECM to learn the closed throttle valve position.**
- **When the vehicle is driven:**
  The output voltage of the A/F sensor may be below 2.8 V during fuel enrichment. For the vehicle, this translates to a sudden increase in speed with the accelerator pedal fully depressed when trying to overtake another vehicle. The A/F sensor is functioning normally.
- **The A/F sensor is a current output element; therefore, the current is converted into a voltage inside the ECM. Measuring the voltage at the connectors of the A/F sensor or ECM will show a constant voltage.**

NG → Go to step 10

OK

4.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (DTC P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

d. Read the DTCs.

Result

Display (DTC Output)	Proceed to
P2195, P2196, P2197 or P2198	A
No output	B

B → Go to step 9

A

6.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

7.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS (DTC P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

d. Read DTCs.

Result

Display (DTC Output)	Proceed to
No output	A
P2195, P2196, P2197 or P2198	B

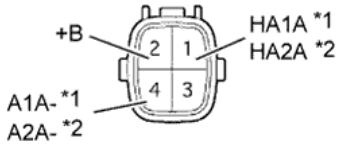
B → REPLACE ECM AND PERFORM CONFIRMATION DRIVING PATTERN

A

9.CONFIRM IF VEHICLE HAS RUN OUT OF FUEL IN PAST

NO → CHECK FOR INTERMITTENT PROBLEMS (Click here)

YES



DTC CAUSED BY RUNNING OUT OF FUEL

10.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher

NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

11.INSPECT INTEGRATION RELAY (A/F RELAY)

a. Remove the integration relay from the engine room relay block.

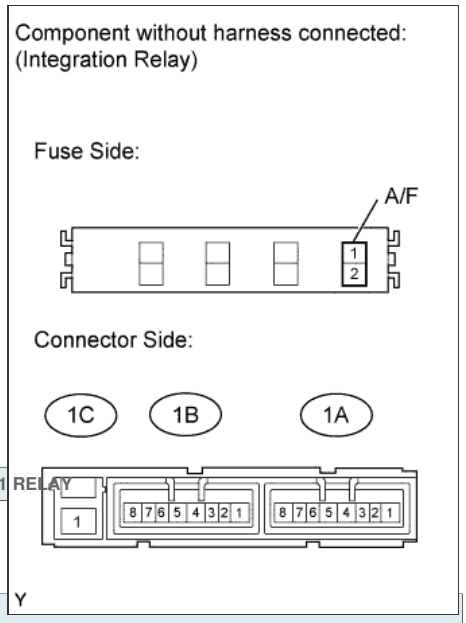
b. Inspect the A/F fuse.

i. Remove the A/F fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω



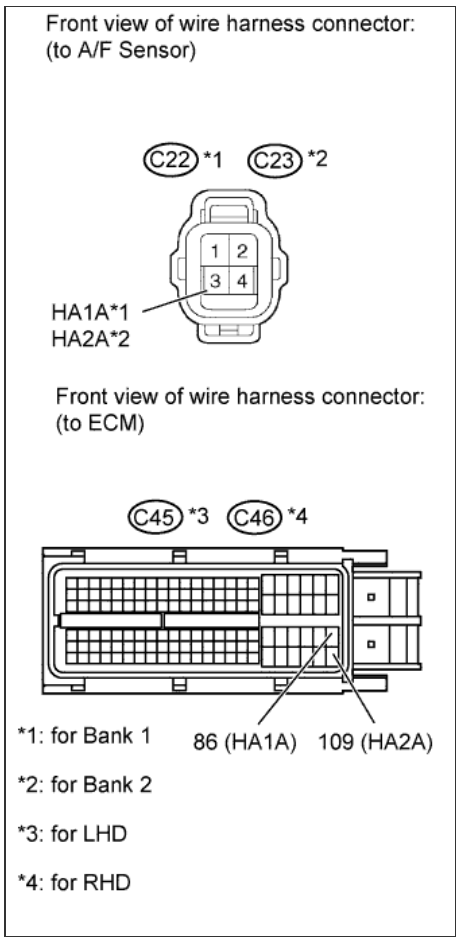
iii. Reinstall the A/F fuse.

c. Inspect the A/F relay.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1A-4 - 1C-1	Battery voltage not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage applied to terminals 1A-2 and 1A-3	Below 1 Ω



NG → REPLACE INTEGRATION NO.1 RELAY

OK

12.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body		

ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK ↓

13.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage.

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK ↓

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → REPAIR OR REPLACE FUEL SYSTEM

OK ↓

15.INSPECT FUEL INJECTOR

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR (**Click here**)

OK ↓

16.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT ↓

17.PERFORM CONFIRMATION DRIVING PATTERN

NEXT ↓

18.CHECK WHETHER DTC OUTPUT RECURS (DTC P2195, P2196, P2197 OR P2198)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

d. Read DTCs.

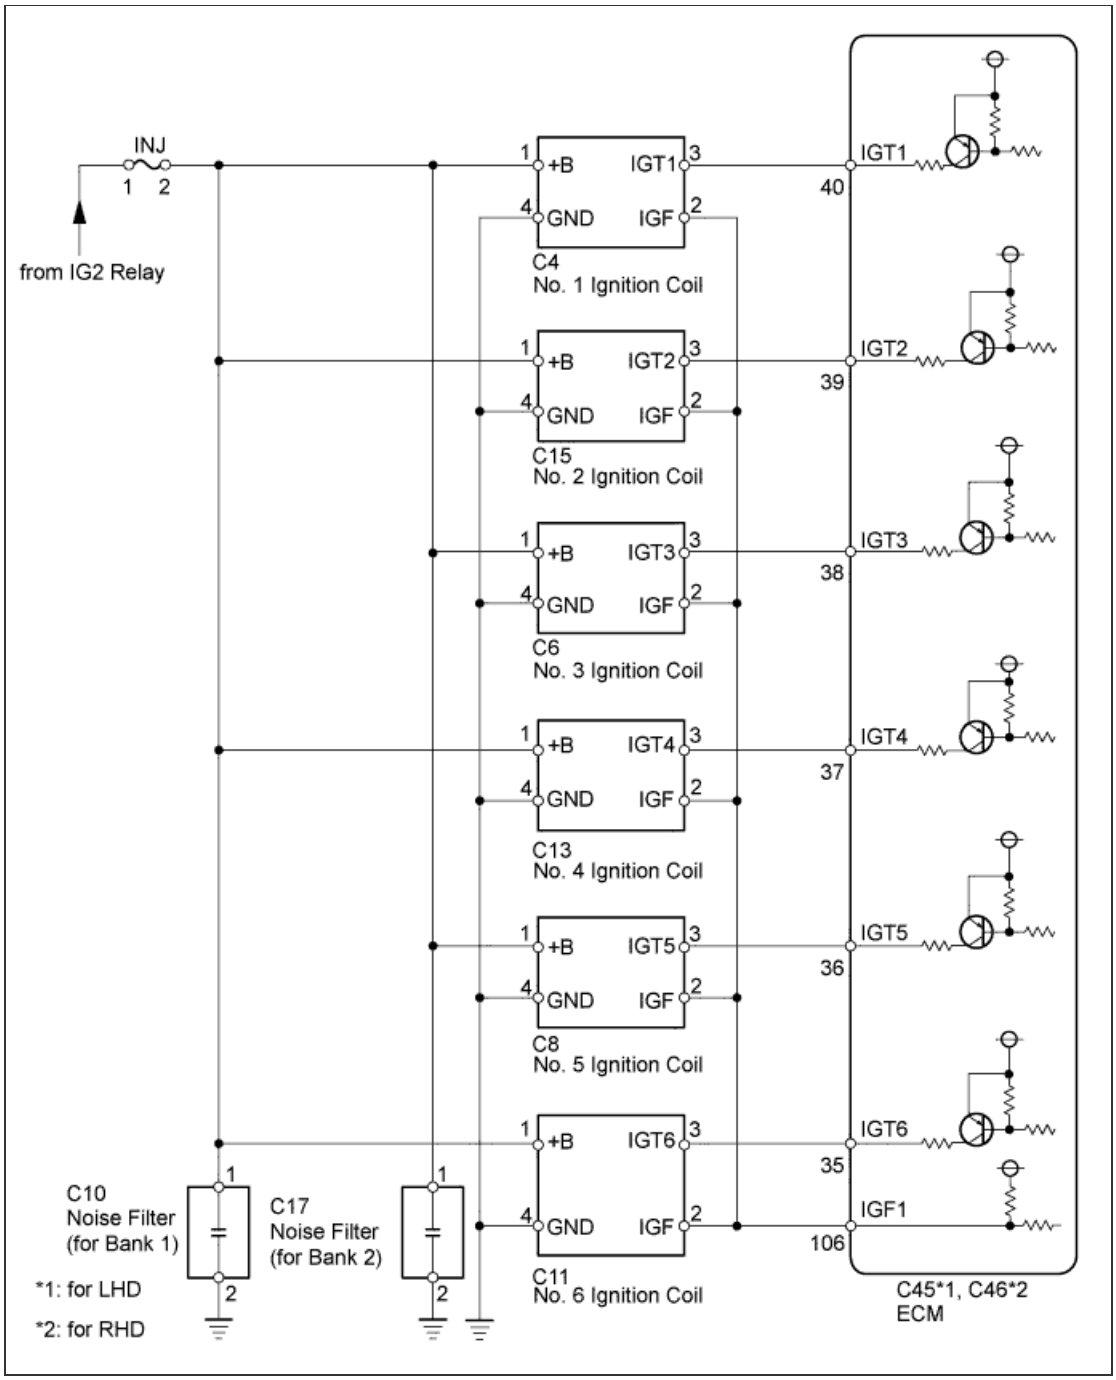
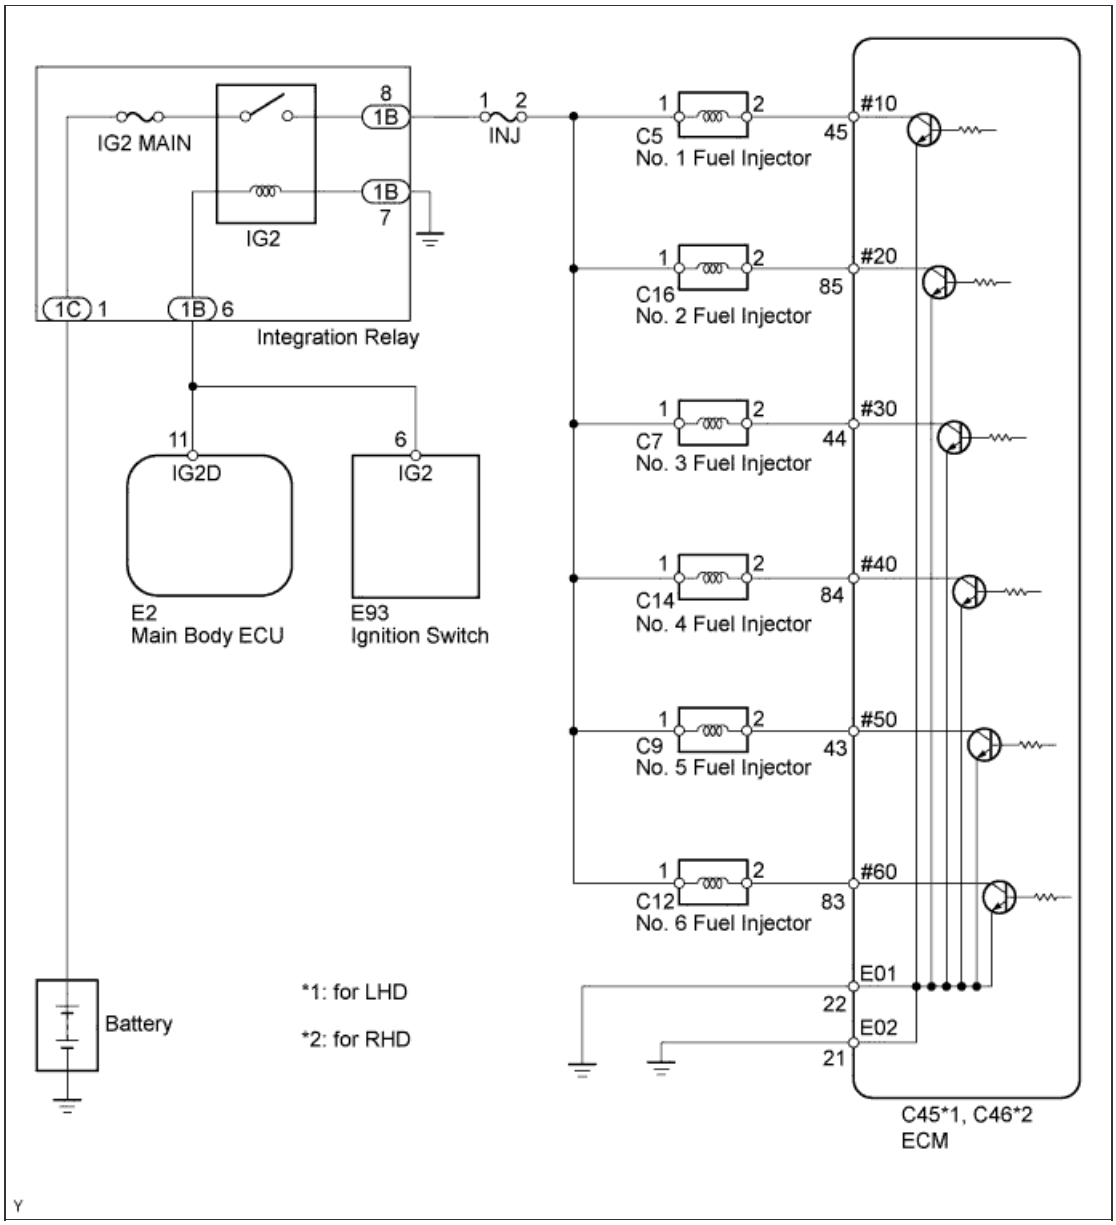
for Preparation Click here

DESCRIPTION





When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire count. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the VVT sensor and the Crankshaft Position (CKP) sensor. The VVT sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, the ECM illuminates the MIL and stores a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connections • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder occurs and one of following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the intelligent tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the intelligent tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire count of each cylinder (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count) with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
7. If no misfire counts are displayed, drive the vehicle several times at the engine speed and engine load, etc., recorded in the freeze frame data.

HINT:

- **In order to store misfire DTCs, drive the vehicle at the engine speed and engine load, etc., recorded in the freeze frame data for the time specified in the table below.**

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the ignition switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data are cleared.

9. Record the DTC(s), freeze frame data and misfire count.
10. Turn the ignition switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors can be considered to be a possible cause of the problem:**
    1. **There was insufficient fuel volume in the tank.**
    2. **Improper fuel was used.**
    3. **The spark plugs have been contaminated.**
- **After finishing repairs, check the misfire counts of the cylinders (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count).**
- **Be sure to confirm that no misfiring cylinder DTCs are stored again by conducting the confirmation driving pattern after finishing repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speeds. If misfires occur only in high engine speed areas, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
    1. **Clear the DTCs (Click here).**
    2. **Start the engine and conduct the confirmation driving pattern.**
    3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
    4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
    5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not stored.**
- **When one of Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire may have occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

HINT:

Write down the DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is correctly connected and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4.READ VALUE USING INTELLIGENT TESTER

(a) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5 and #6.
(b) Read the value for Cylinder #1 Misfire Count to Cylinder #6 Misfire Count displayed on the intelligent tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Start the engine and let it idle.
(2) Move the shift lever to D.
(3) Check the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count.
(4) If misfire counts are still not displayed, perform steps (c) and (d).
(c) Drive the vehicle with the Misfire RPM and Misfire Load noted in the "Read value using intelligent tester (Misfire RPM and Misfire Load)" procedures above.
(d) Read the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count or DTCs displayed on the intelligent tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data's record of Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

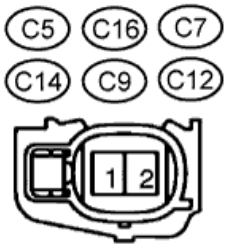
8.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

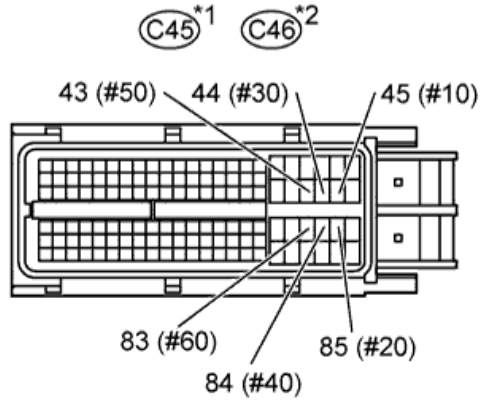
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

13.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING

OK

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY

OK

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

18.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING**

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → **CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY**

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.

With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

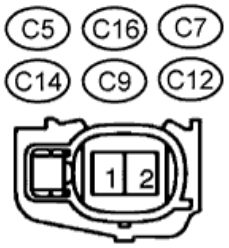
25.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

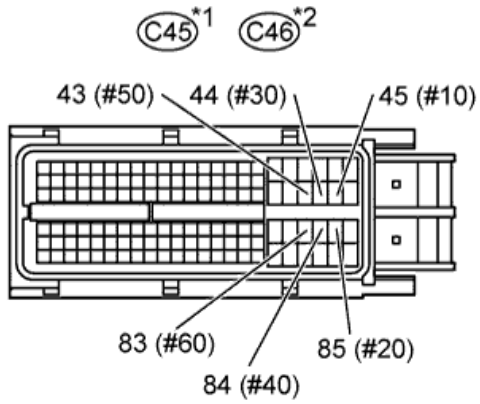
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND/OR #60 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
C45-45 (#10) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-85 (#20) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22	Ignition switch	

(E01)	ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (Click here)

OK

REPLACE ECM (Click here)

29.REPLACE SPARK PLUG WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:

Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.REPLACE IGNITION COIL WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed ignition coil with a ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK → REPLACE IGNITION COIL (Click here)

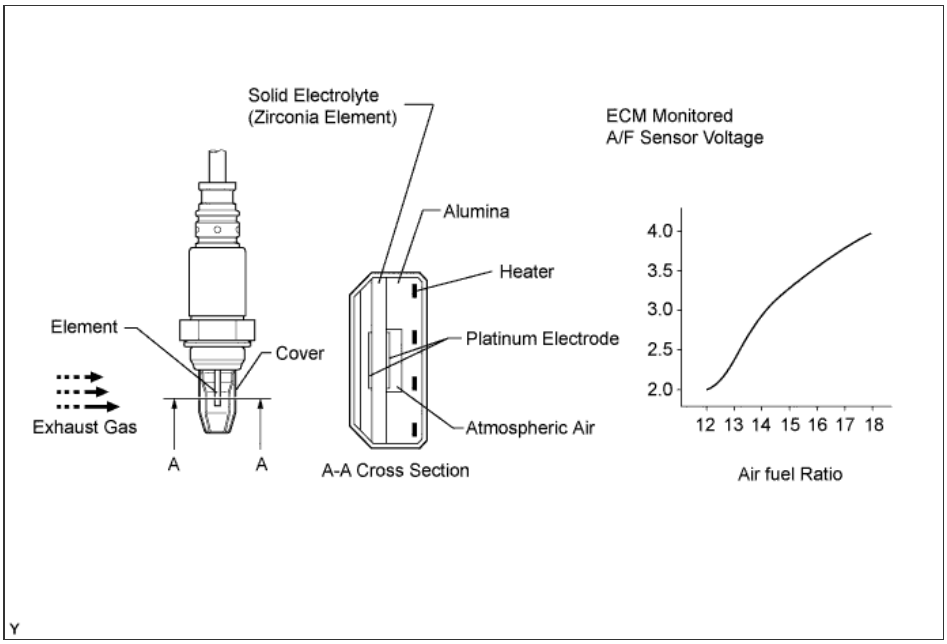
for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

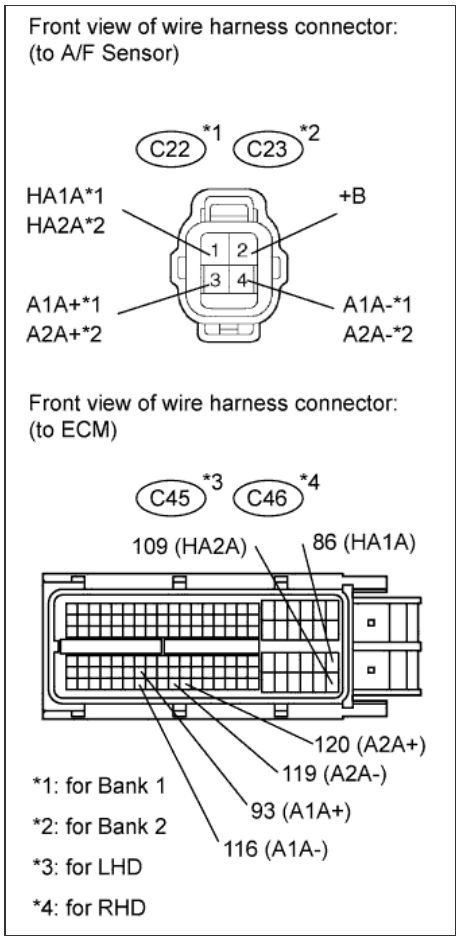
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.



Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-119 (A2A-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω

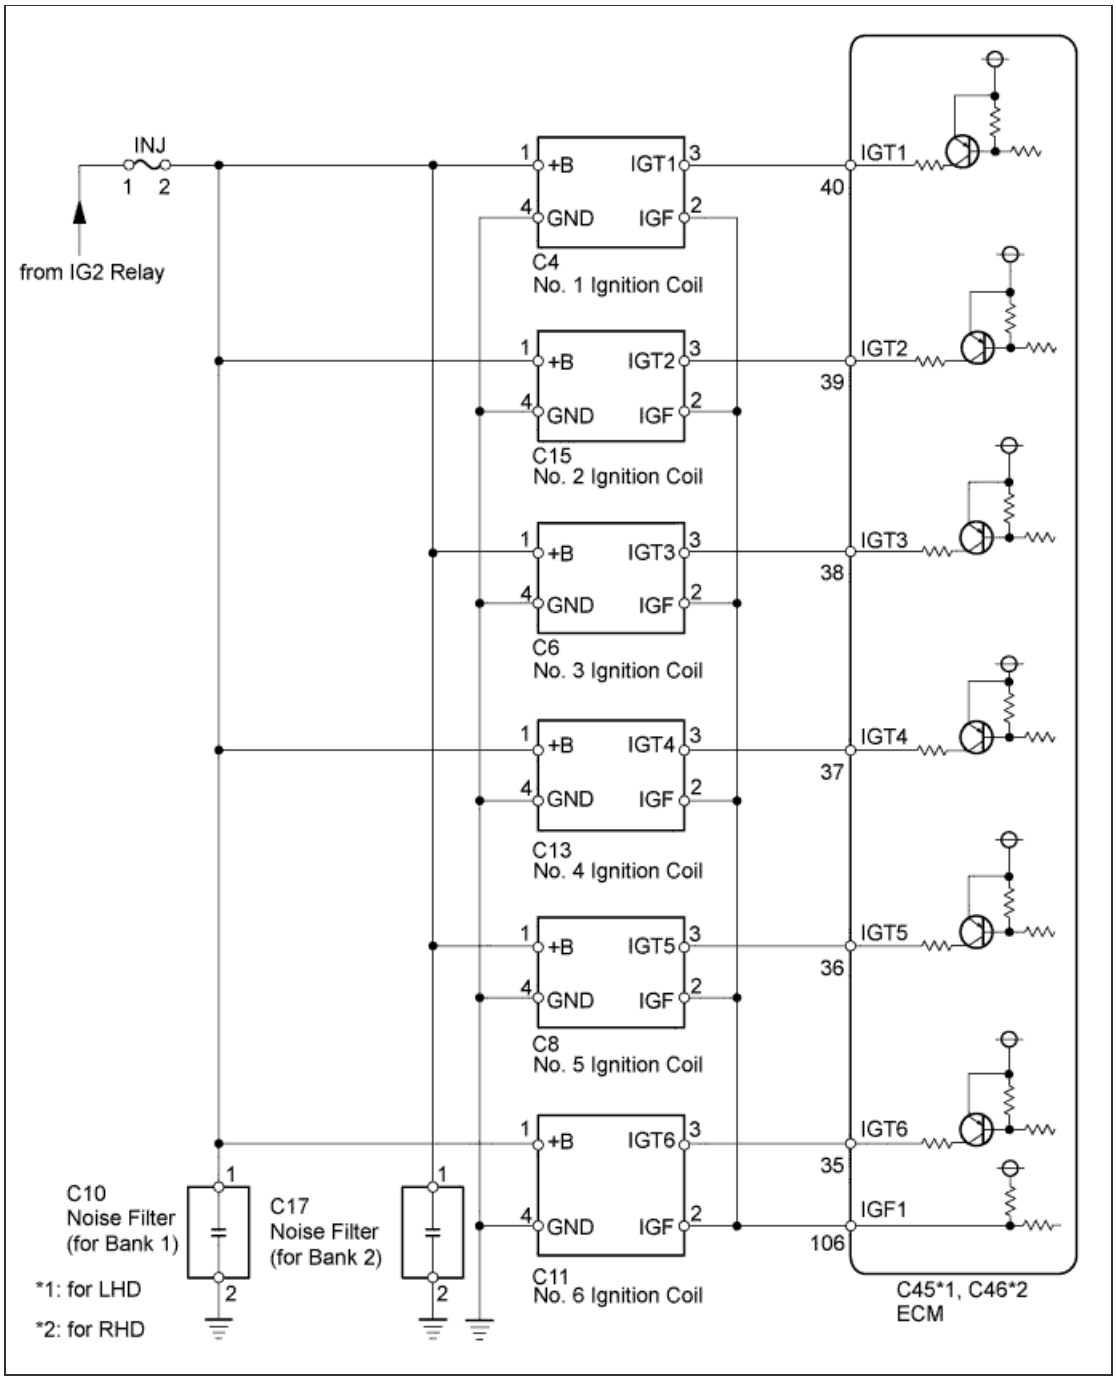
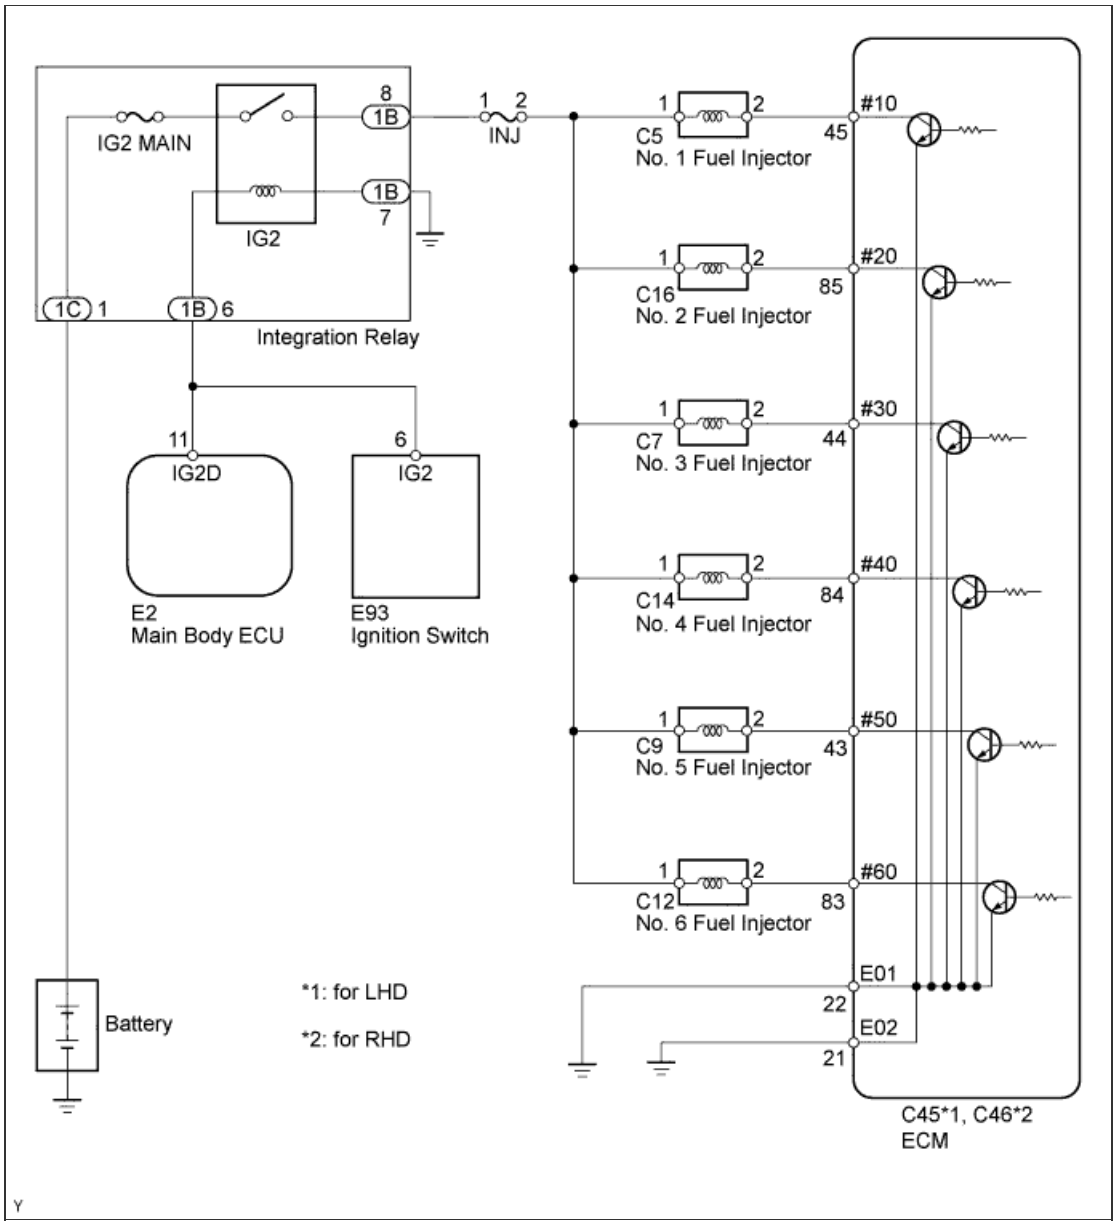
for Preparation Click here

DESCRIPTION





When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire count. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the VVT sensor and the Crankshaft Position (CKP) sensor. The VVT sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, the ECM illuminates the MIL and stores a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connections • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder occurs and one of following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the intelligent tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the intelligent tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire count of each cylinder (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count) with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
7. If no misfire counts are displayed, drive the vehicle several times at the engine speed and engine load, etc., recorded in the freeze frame data.

HINT:

- **In order to store misfire DTCs, drive the vehicle at the engine speed and engine load, etc., recorded in the freeze frame data for the time specified in the table below.**

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the ignition switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data are cleared.

9. Record the DTC(s), freeze frame data and misfire count.
10. Turn the ignition switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors can be considered to be a possible cause of the problem:**
    1. **There was insufficient fuel volume in the tank.**
    2. **Improper fuel was used.**
    3. **The spark plugs have been contaminated.**
- **After finishing repairs, check the misfire counts of the cylinders (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count).**
- **Be sure to confirm that no misfiring cylinder DTCs are stored again by conducting the confirmation driving pattern after finishing repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speeds. If misfires occur only in high engine speed areas, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
    1. **Clear the DTCs (Click here).**
    2. **Start the engine and conduct the confirmation driving pattern.**
    3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
    4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
    5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not stored.**
- **When one of Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire may have occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

HINT:

Write down the DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is correctly connected and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4.READ VALUE USING INTELLIGENT TESTER

(a) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5 and #6.
(b) Read the value for Cylinder #1 Misfire Count to Cylinder #6 Misfire Count displayed on the intelligent tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Start the engine and let it idle.
(2) Move the shift lever to D.
(3) Check the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count.
(4) If misfire counts are still not displayed, perform steps (c) and (d).
(c) Drive the vehicle with the Misfire RPM and Misfire Load noted in the "Read value using intelligent tester (Misfire RPM and Misfire Load)" procedures above.
(d) Read the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count or DTCs displayed on the intelligent tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data's record of Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

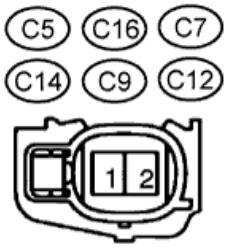
8.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

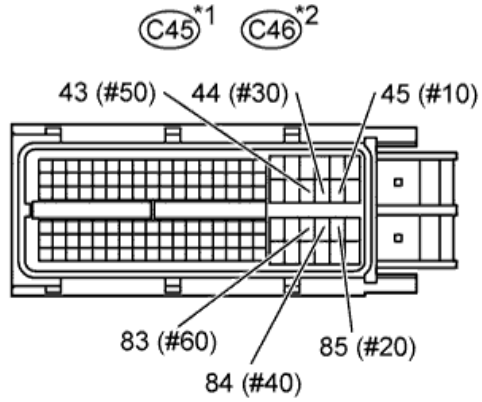
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Injector)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND/OR #60 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
C45-45 (#10) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-85 (#20) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V

C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

13.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING

OK

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY

OK

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

18.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING**

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → **CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY**

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.

With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

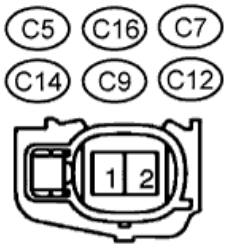
25.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

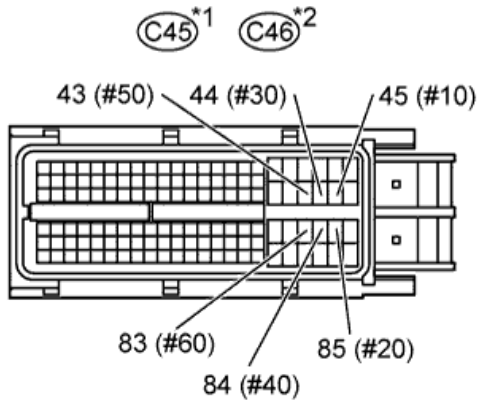
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (Click here)

OK

REPLACE ECM (Click here)

29.REPLACE SPARK PLUG WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:

Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.REPLACE IGNITION COIL WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed ignition coil with a ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK → REPLACE IGNITION COIL (Click here)

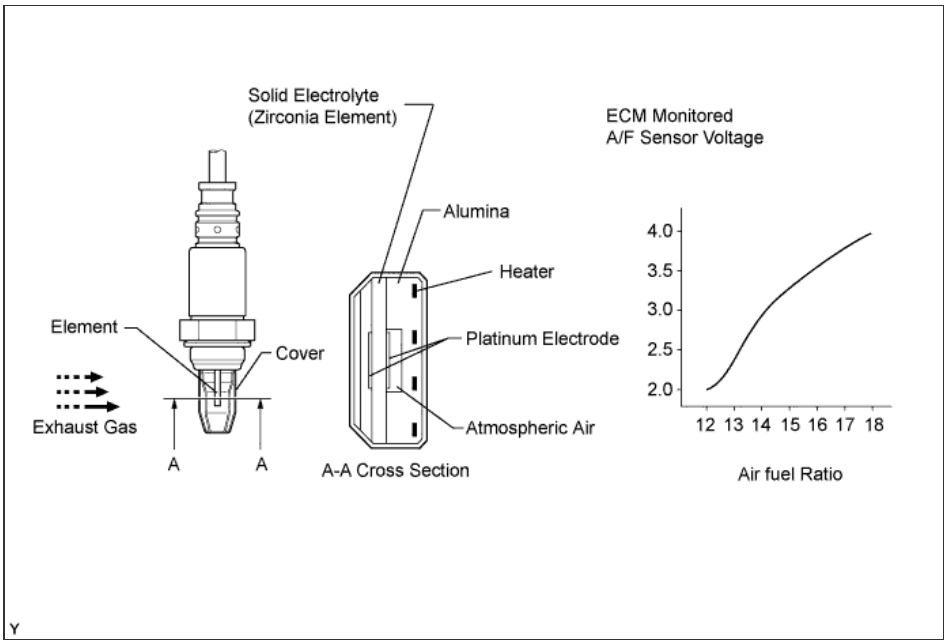
for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

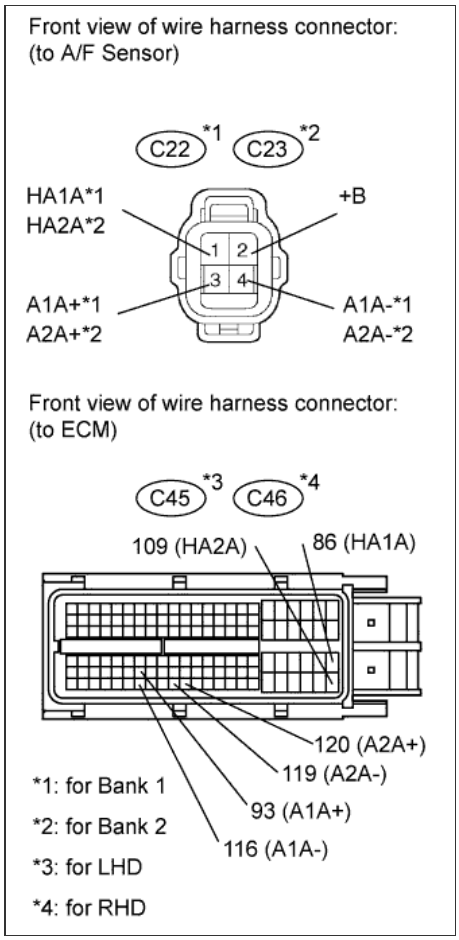
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.



Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-119 (A2A-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω

C22-3 (A1A+) - C46-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-119 (A2A-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-119 (A2A-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-119 (A2A-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

3.PERFORM CONFIRMATION DRIVING PATTERN

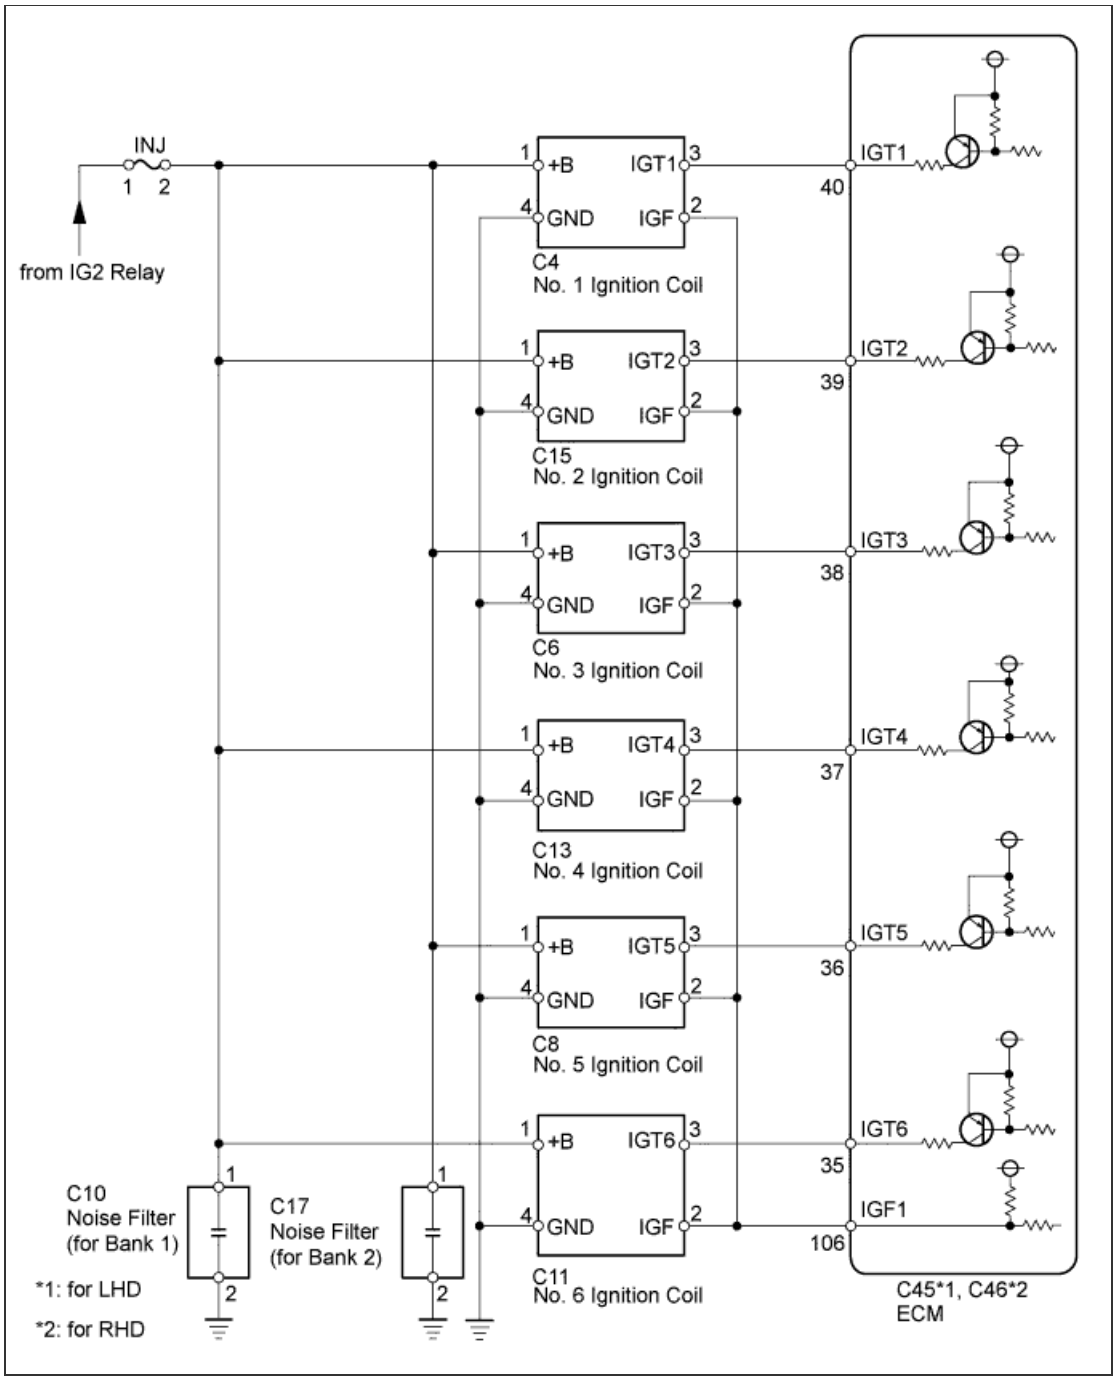
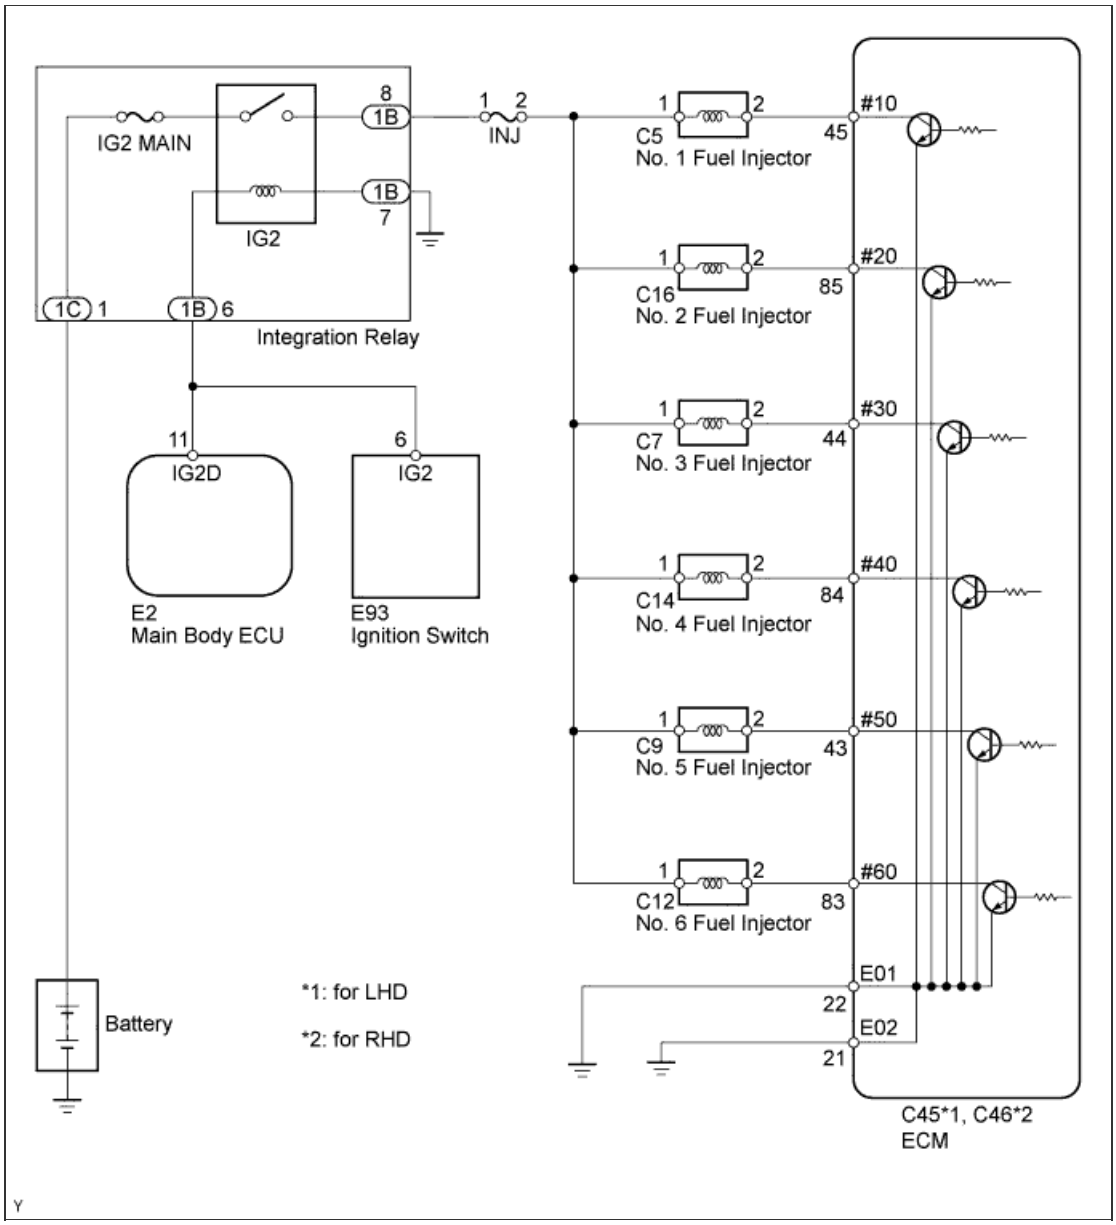
DTC P0305 Cylinder 5 Misfire Detected

DTC P0306 Cylinder 6 Misfire Detected

for Preparation Click here

DESCRIPTION





When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire count. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the VVT sensor and the Crankshaft Position (CKP) sensor. The VVT sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, the ECM illuminates the MIL and stores a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connections • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder occurs and one of following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the intelligent tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the intelligent tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire count of each cylinder (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count) with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
7. If no misfire counts are displayed, drive the vehicle several times at the engine speed and engine load, etc., recorded in the freeze frame data.

HINT:

- **In order to store misfire DTCs, drive the vehicle at the engine speed and engine load, etc., recorded in the freeze frame data for the time specified in the table below.**

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the ignition switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data are cleared.

9. Record the DTC(s), freeze frame data and misfire count.
10. Turn the ignition switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors can be considered to be a possible cause of the problem:**
    1. **There was insufficient fuel volume in the tank.**
    2. **Improper fuel was used.**
    3. **The spark plugs have been contaminated.**
- **After finishing repairs, check the misfire counts of the cylinders (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count).**
- **Be sure to confirm that no misfiring cylinder DTCs are stored again by conducting the confirmation driving pattern after finishing repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speeds. If misfires occur only in high engine speed areas, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
    1. **Clear the DTCs (Click here).**
    2. **Start the engine and conduct the confirmation driving pattern.**
    3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
    4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
    5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not stored.**
- **When one of Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire may have occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

HINT:

Write down the DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is correctly connected and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4.READ VALUE USING INTELLIGENT TESTER

(a) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5 and #6.
(b) Read the value for Cylinder #1 Misfire Count to Cylinder #6 Misfire Count displayed on the intelligent tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Start the engine and let it idle.
(2) Move the shift lever to D.
(3) Check the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count.
(4) If misfire counts are still not displayed, perform steps (c) and (d).
(c) Drive the vehicle with the Misfire RPM and Misfire Load noted in the "Read value using intelligent tester (Misfire RPM and Misfire Load)" procedures above.
(d) Read the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count or DTCs displayed on the intelligent tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data's record of Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

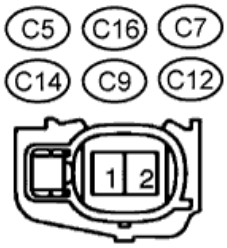
8.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

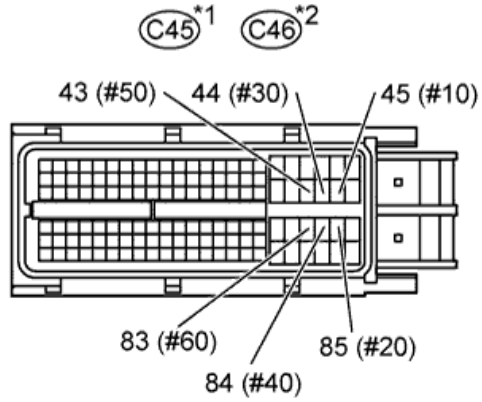
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

13.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING

OK

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY

OK

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

18.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING**

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → **CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY**

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.

With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

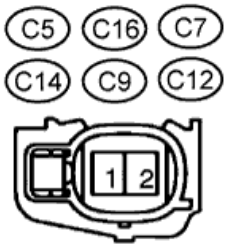
25.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

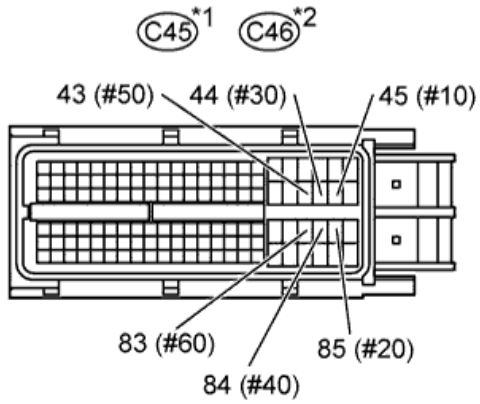
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector: (to Injector)

Front view of wire harness connector: (to ECM)

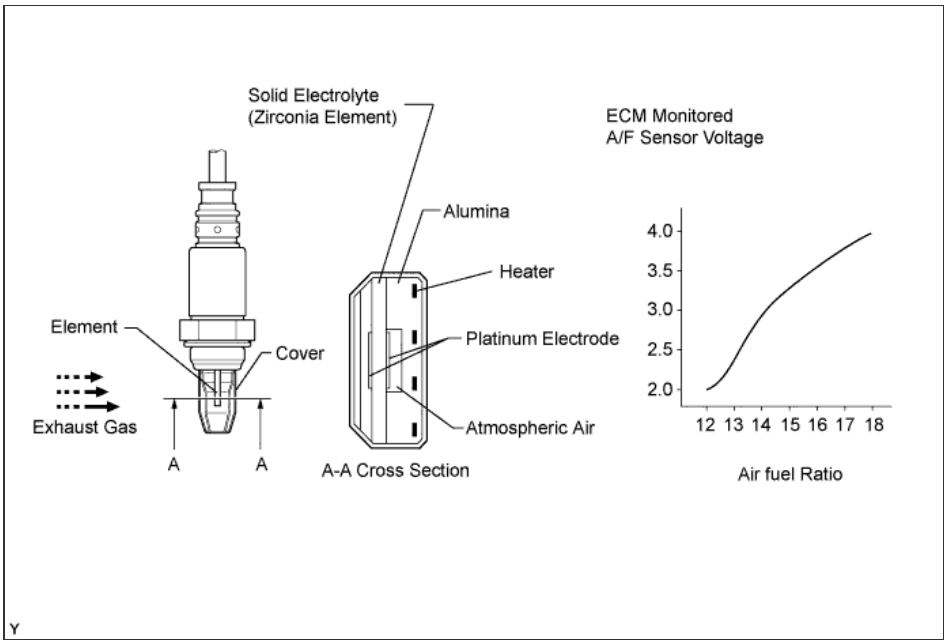
for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

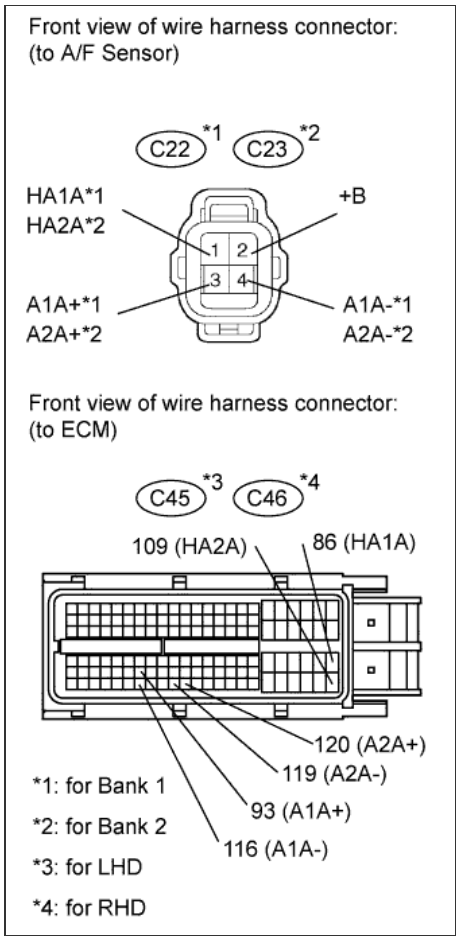
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.



Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

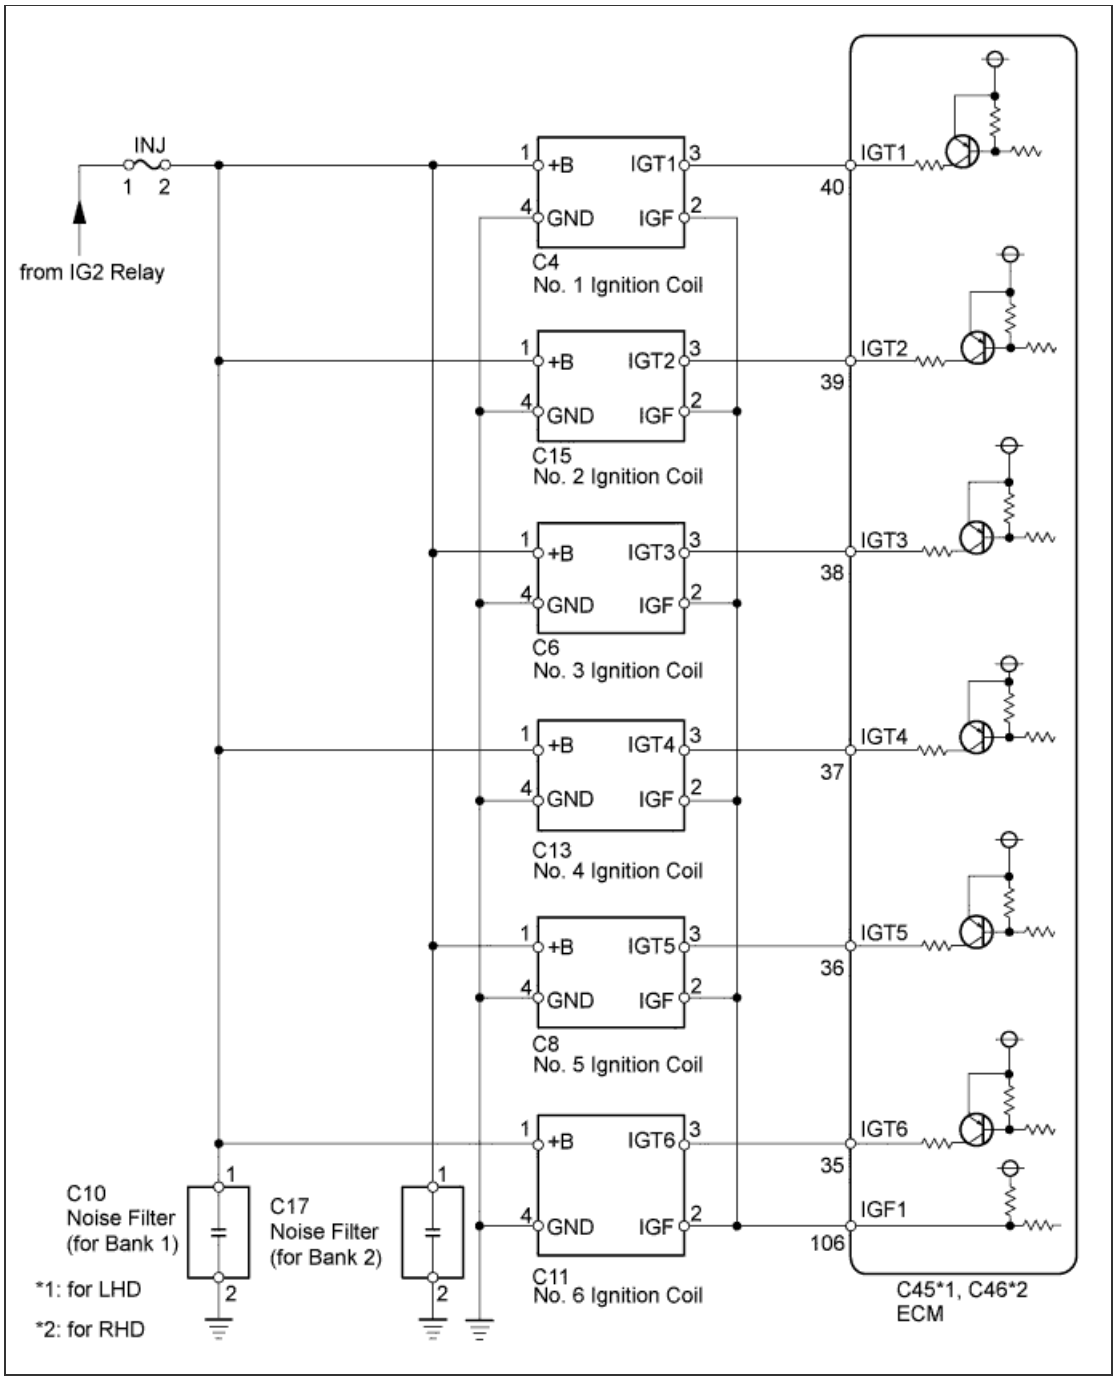
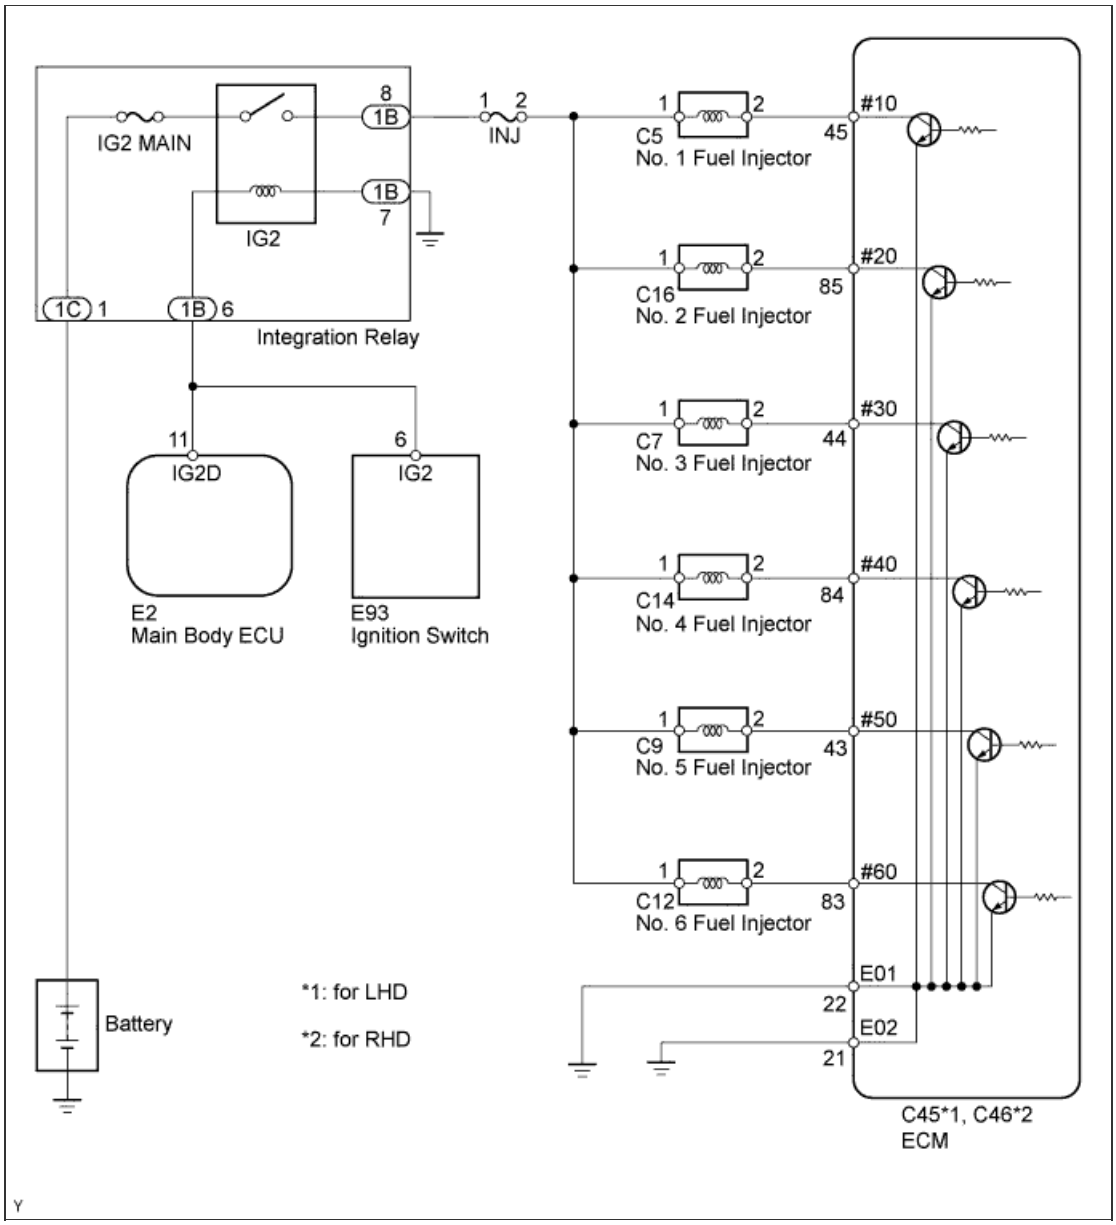
for Preparation Click here

DESCRIPTION





When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire count. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the VVT sensor and the Crankshaft Position (CKP) sensor. The VVT sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, the ECM illuminates the MIL and stores a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connections • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder occurs and one of following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the intelligent tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the intelligent tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire count of each cylinder (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count) with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
7. If no misfire counts are displayed, drive the vehicle several times at the engine speed and engine load, etc., recorded in the freeze frame data.

HINT:

- **In order to store misfire DTCs, drive the vehicle at the engine speed and engine load, etc., recorded in the freeze frame data for the time specified in the table below.**

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the ignition switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data are cleared.

9. Record the DTC(s), freeze frame data and misfire count.
10. Turn the ignition switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors can be considered to be a possible cause of the problem:**
    1. **There was insufficient fuel volume in the tank.**
    2. **Improper fuel was used.**
    3. **The spark plugs have been contaminated.**
- **After finishing repairs, check the misfire counts of the cylinders (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count).**
- **Be sure to confirm that no misfiring cylinder DTCs are stored again by conducting the confirmation driving pattern after finishing repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speeds. If misfires occur only in high engine speed areas, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
    1. **Clear the DTCs (Click here).**
    2. **Start the engine and conduct the confirmation driving pattern.**
    3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
    4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
    5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not stored.**
- **When one of Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire may have occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

HINT:

Write down the DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is correctly connected and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4.READ VALUE USING INTELLIGENT TESTER

(a) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5 and #6.
(b) Read the value for Cylinder #1 Misfire Count to Cylinder #6 Misfire Count displayed on the intelligent tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Start the engine and let it idle.
(2) Move the shift lever to D.
(3) Check the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count.
(4) If misfire counts are still not displayed, perform steps (c) and (d).
(c) Drive the vehicle with the Misfire RPM and Misfire Load noted in the "Read value using intelligent tester (Misfire RPM and Misfire Load)" procedures above.
(d) Read the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count or DTCs displayed on the intelligent tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data's record of Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

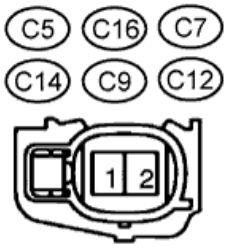
8.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

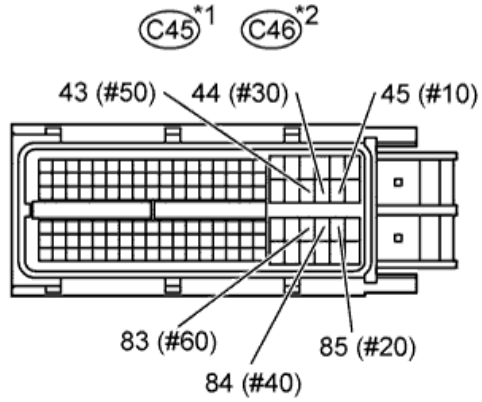
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Injector)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance:

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND/OR #60 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
C45-45 (#10) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-85 (#20) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V

C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

13.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING

OK

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY

OK

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

18.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING**

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → **CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY**

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.

With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

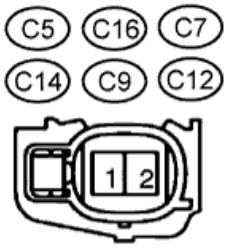
25.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

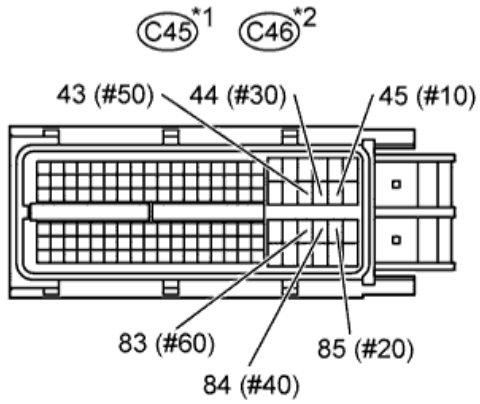
a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:



Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22	Ignition switch	

(E01)	ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (Click here)

OK

REPLACE ECM (Click here)

29.REPLACE SPARK PLUG WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:

Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.REPLACE IGNITION COIL WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed ignition coil with a ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK → REPLACE IGNITION COIL (Click here)

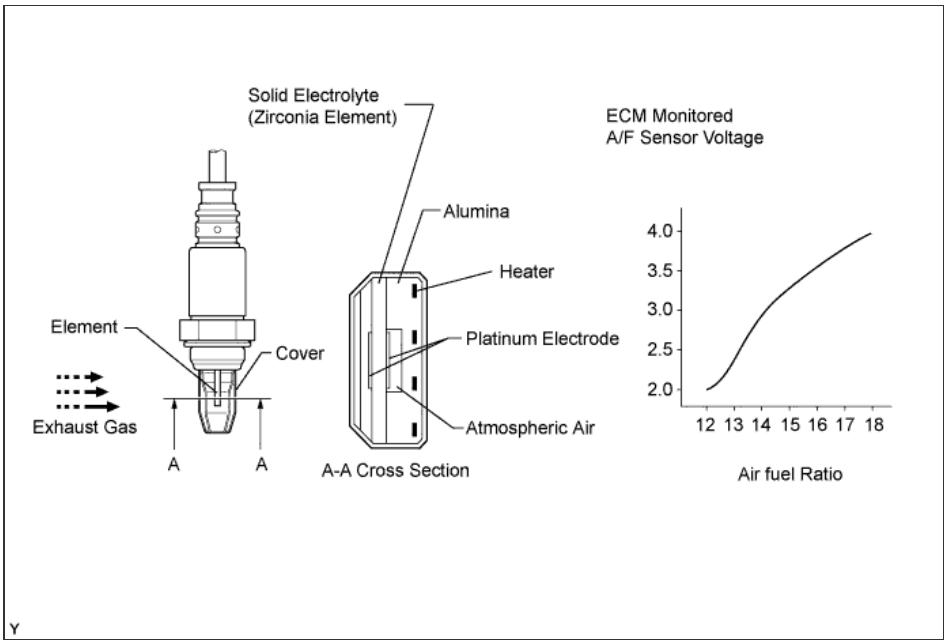
for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

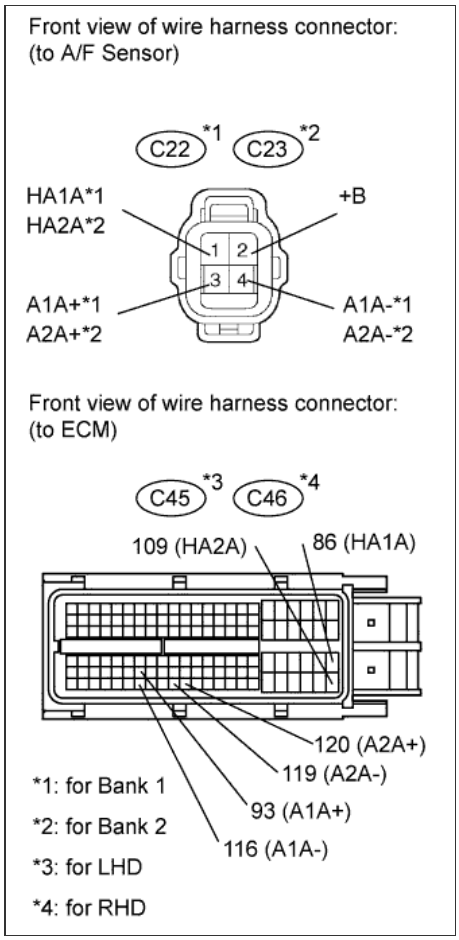
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.



Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-119 (A2A-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω

C22-3 (A1A+) - C46-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-119 (A2A-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-119 (A2A-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-119 (A2A-) - Body ground	Always	10 kΩ or higher

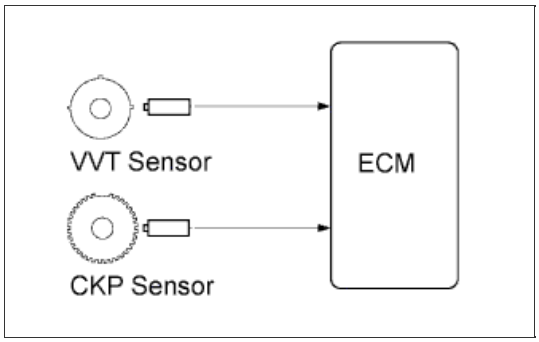
DTC P0300 Random / Multiple Cylinder Misfire Detected

DTC P0301 Cylinder 1 Misfire Detected

DTC P0302 Cylinder 2 Misfire Detected

DTC P0303 Cylinder 3 Misfire Detected



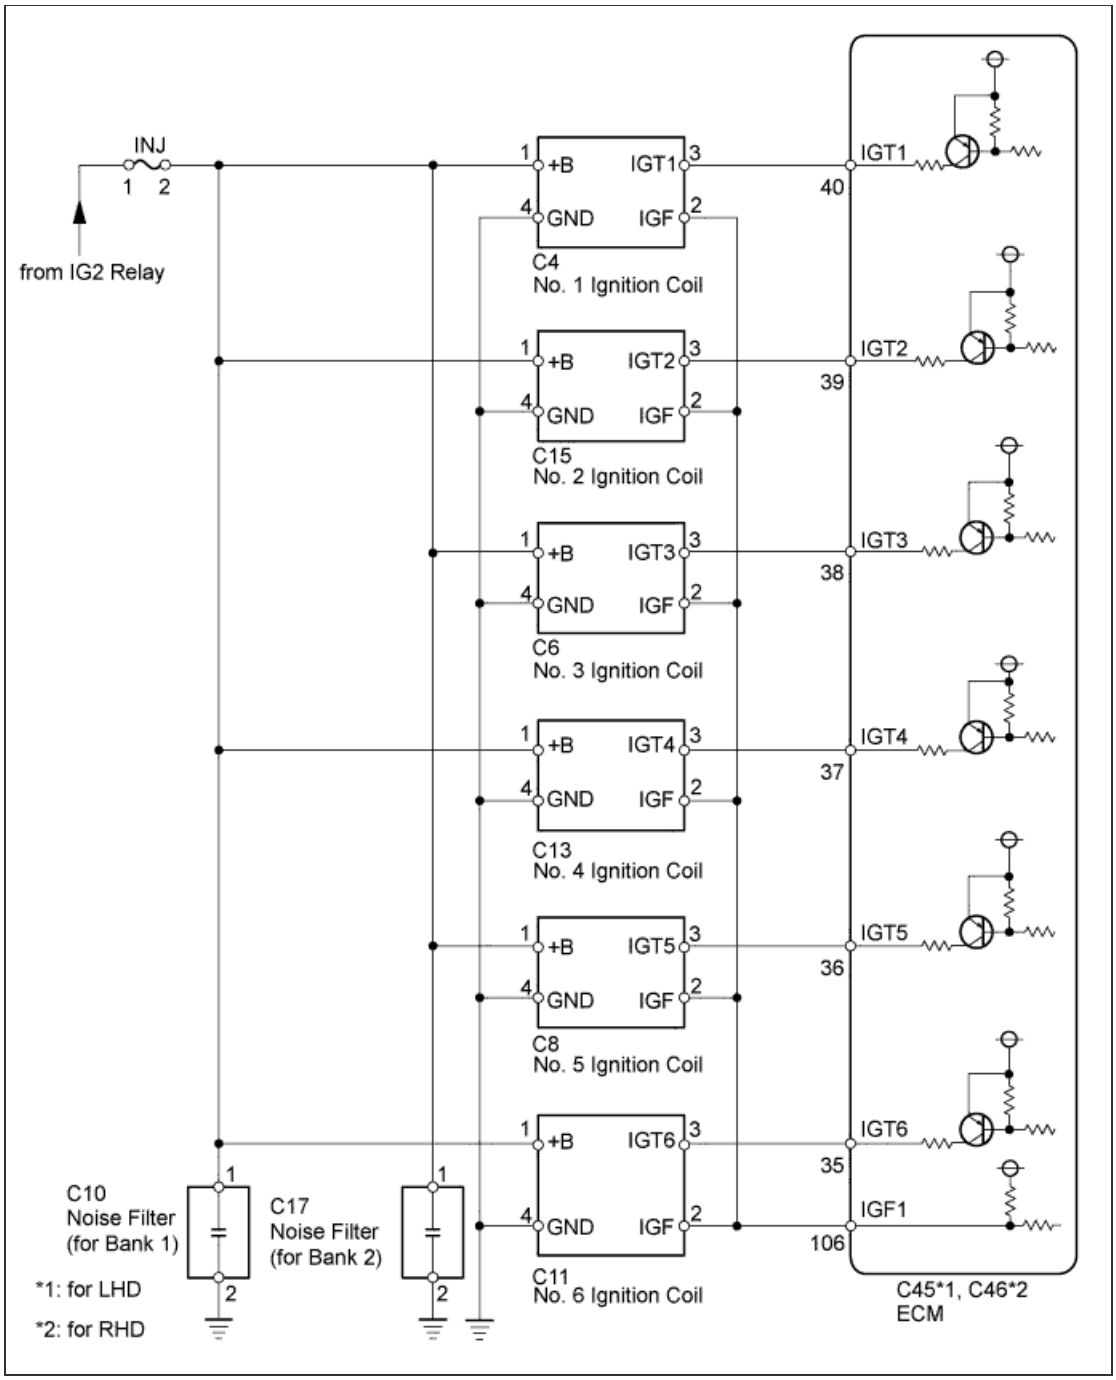
DTC P0304 Cylinder 4 Misfire Detected

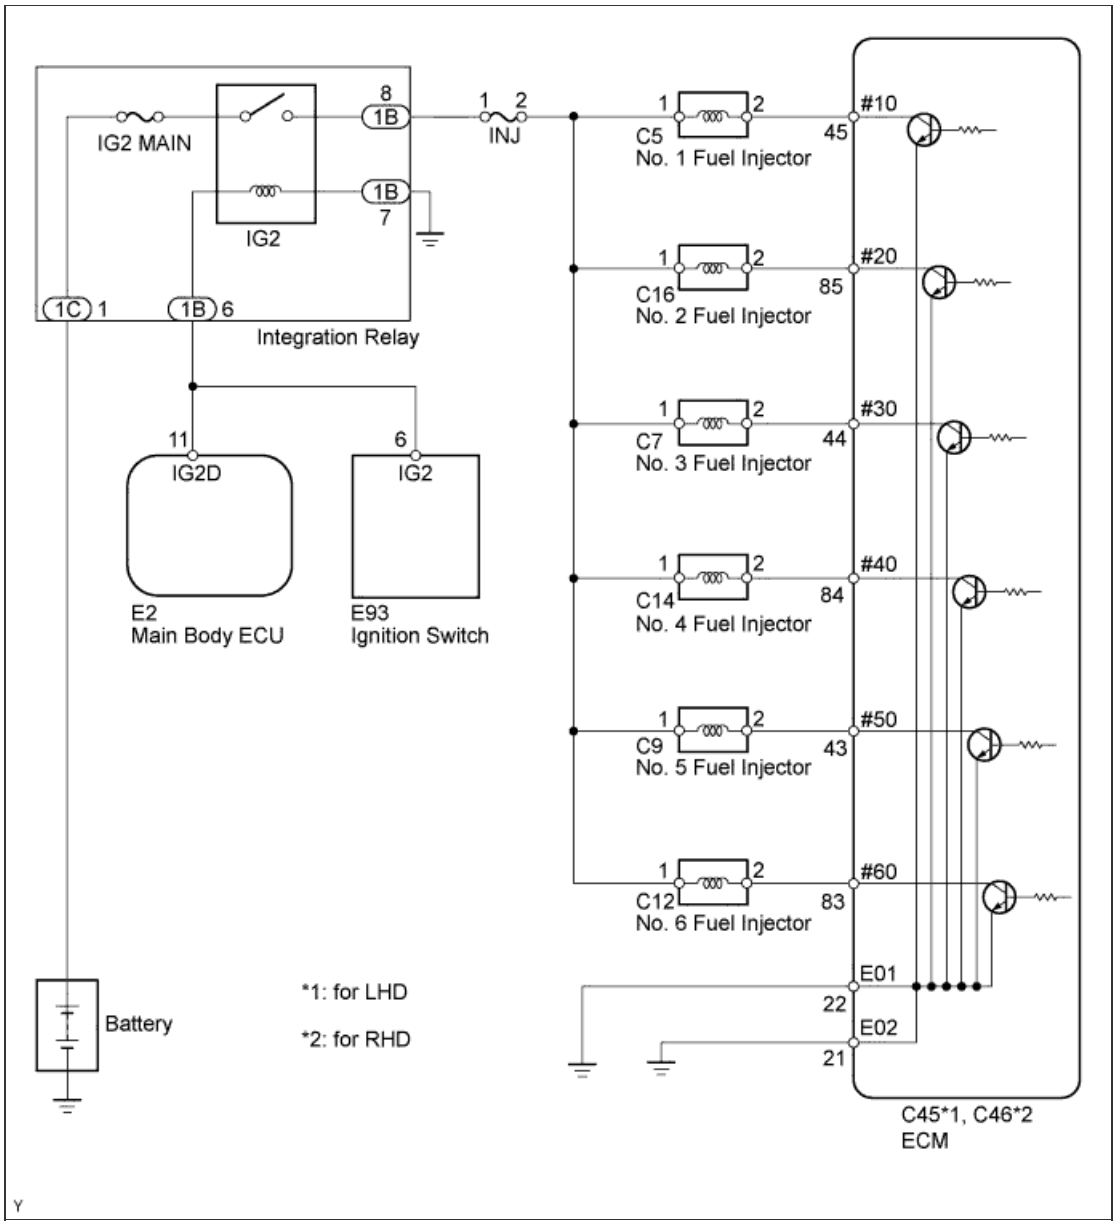
DTC P0305 Cylinder 5 Misfire Detected

DTC P0306 Cylinder 6 Misfire Detected

for Preparation Click here

DESCRIPTION





When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire count. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the VVT sensor and the Crankshaft Position (CKP) sensor. The VVT sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, the ECM illuminates the MIL and stores a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connections • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder occurs and one of following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the intelligent tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the intelligent tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire count of each cylinder (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count) with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
7. If no misfire counts are displayed, drive the vehicle several times at the engine speed and engine load, etc., recorded in the freeze frame data.

HINT:

- **In order to store misfire DTCs, drive the vehicle at the engine speed and engine load, etc., recorded in the freeze frame data for the time specified in the table below.**

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the ignition switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data are cleared.

9. Record the DTC(s), freeze frame data and misfire count.
10. Turn the ignition switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors can be considered to be a possible cause of the problem:**
    1. **There was insufficient fuel volume in the tank.**
    2. **Improper fuel was used.**
    3. **The spark plugs have been contaminated.**
- **After finishing repairs, check the misfire counts of the cylinders (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count).**
- **Be sure to confirm that no misfiring cylinder DTCs are stored again by conducting the confirmation driving pattern after finishing repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speeds. If misfires occur only in high engine speed areas, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
    1. **Clear the DTCs (Click here).**
    2. **Start the engine and conduct the confirmation driving pattern.**
    3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
    4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
    5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not stored.**
- **When one of Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire may have occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

HINT:

Write down the DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is correctly connected and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4.READ VALUE USING INTELLIGENT TESTER

(a) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5 and #6.
(b) Read the value for Cylinder #1 Misfire Count to Cylinder #6 Misfire Count displayed on the intelligent tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Start the engine and let it idle.
(2) Move the shift lever to D.
(3) Check the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count.
(4) If misfire counts are still not displayed, perform steps (c) and (d).
(c) Drive the vehicle with the Misfire RPM and Misfire Load noted in the "Read value using intelligent tester (Misfire RPM and Misfire Load)" procedures above.
(d) Read the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count or DTCs displayed on the intelligent tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data's record of Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

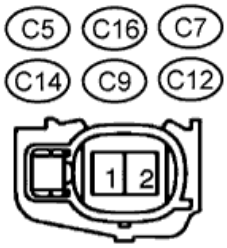
8.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Injector)

No. 6	C12-2 - Body ground	Always	10 kΩ or higher
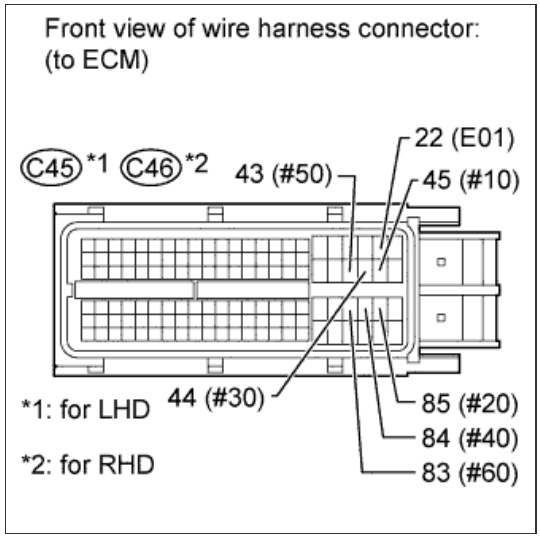
	C12-2 - C46-83 (#60)	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND/OR #60 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
C45-45 (#10) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-85 (#20) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V

C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

13.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING

OK

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY

OK

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

18.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING**

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → **CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY**

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.

With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

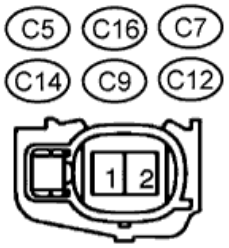
25.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector: (to Injector)

Front view of wire harness connector: (to ECM)

*1: for LHD

*2: for RHD

Standard Resistance:

for LHD

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND/OR #60 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
C45-45 (#10) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-85 (#20) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22	Ignition switch	

(E01)	ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (Click here)

OK

REPLACE ECM (Click here)

29.REPLACE SPARK PLUG WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:

Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.REPLACE IGNITION COIL WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed ignition coil with a ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK → REPLACE IGNITION COIL (Click here)

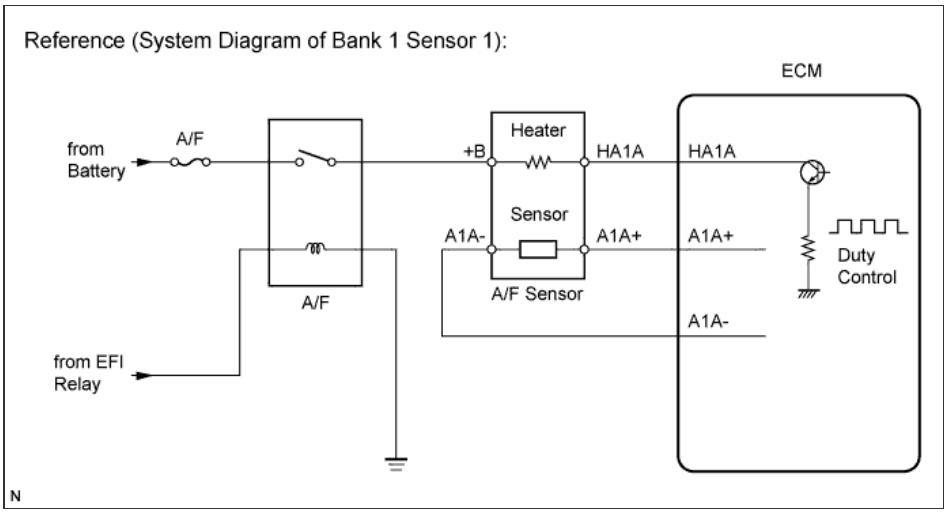
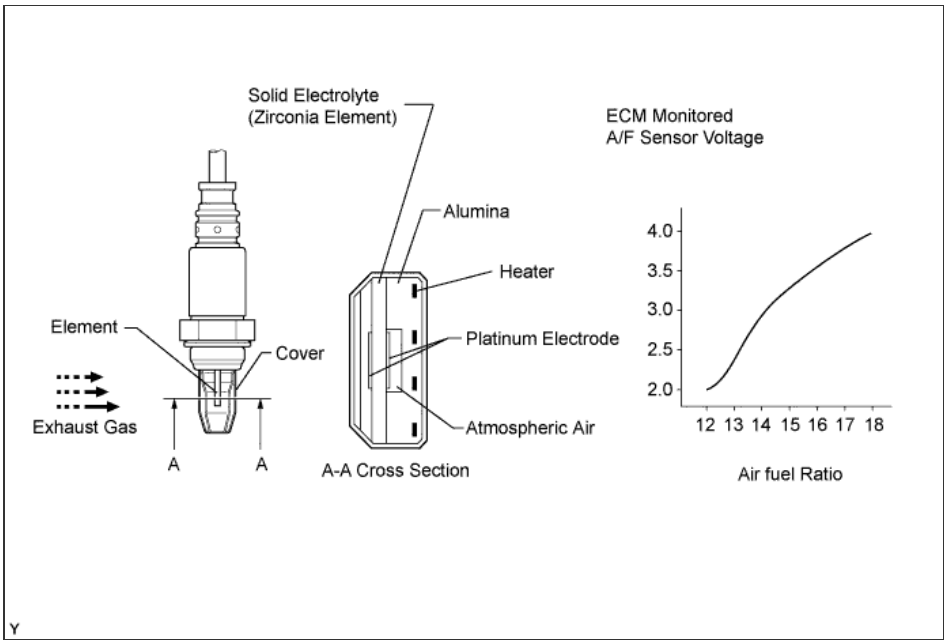
DTC P2255 Oxygen (A/F) Sensor Reference Ground Circuit Low (Bank 2 Sensor 1)

DTC P2256 Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 2 Sensor 1)



for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-119 (A2A-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω

C22-3 (A1A+) - C46-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-119 (A2A-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-119 (A2A-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-119 (A2A-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

3.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

4.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine.

e. Allow the engine to idle for 5 minutes or more.

f. Enter the following menus: Powertrain / Engine and ECT / DTC / Pending.

g. Read the pending DTCs.

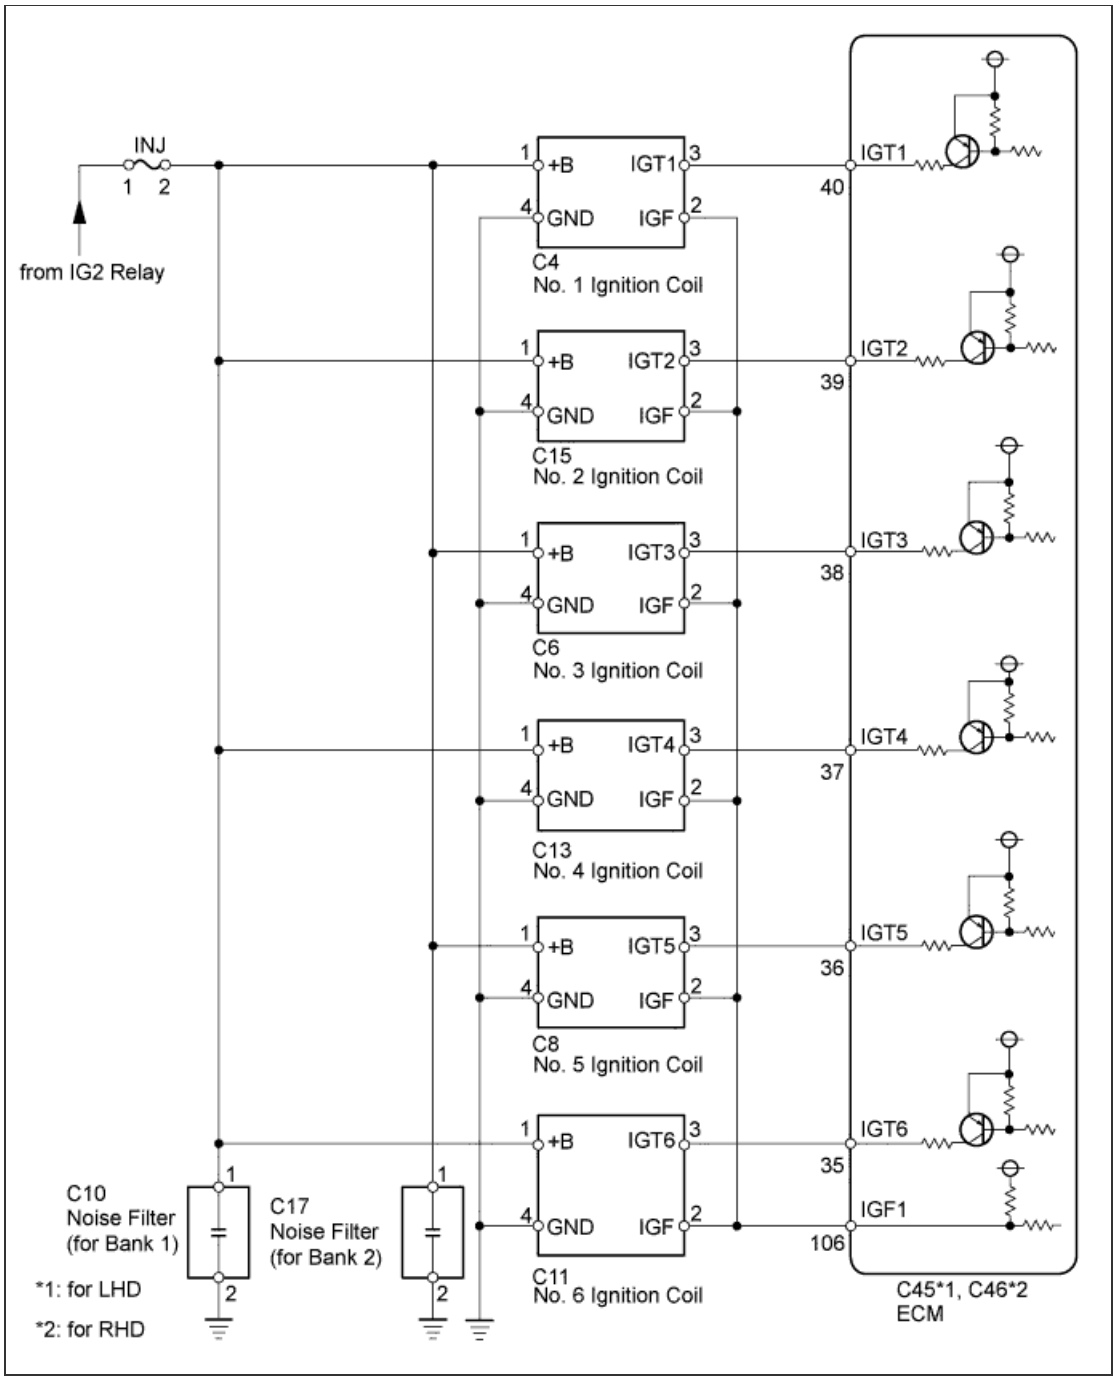
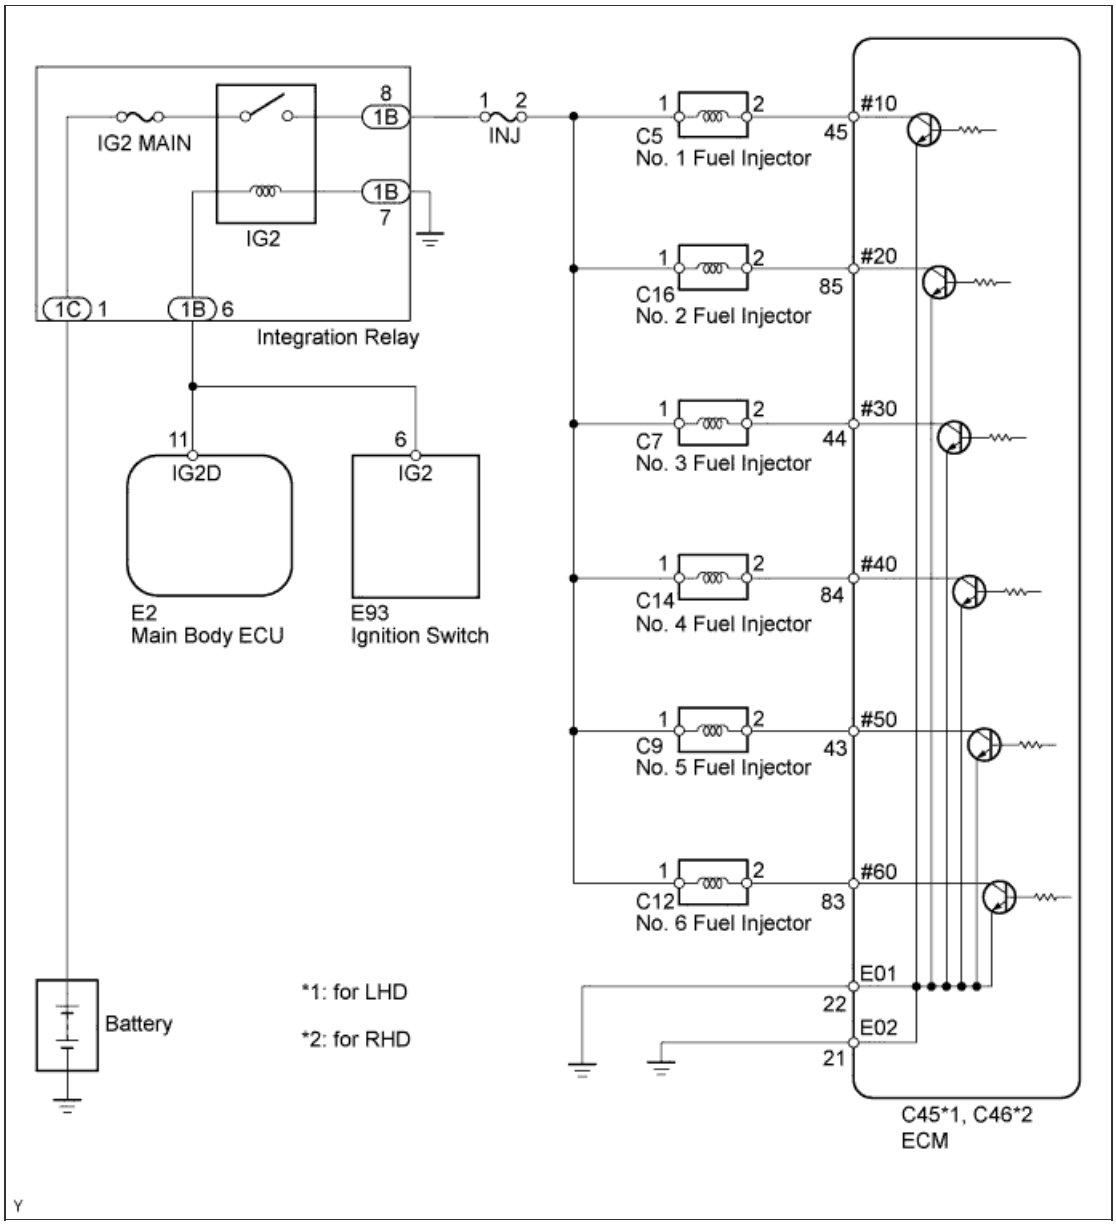
DTC P0305 Cylinder 5 Misfire Detected

DTC P0306 Cylinder 6 Misfire Detected

for Preparation Click here

DESCRIPTION





When the engine misfires, high concentrations of hydrocarbons (HC) enter the exhaust gas. High HC concentration levels can cause an increase in exhaust emission levels. Extremely high concentrations of HC can also cause increases in the Three-Way Catalytic Converter (TWC) temperature, which may cause damage to the TWC. To prevent this increase in emissions and to limit the possibility of thermal damage, the ECM monitors the misfire count. When the temperature of the TWC reaches the point of thermal degradation, the ECM blinks the MIL. To monitor misfires, the ECM uses both the VVT sensor and the Crankshaft Position (CKP) sensor. The VVT sensor is used to identify any misfiring cylinders and the CKP sensor is used to measure variations in the crankshaft rotation speed. Misfires are counted when the crankshaft rotation speed variations exceed predetermined thresholds. If the misfire count exceeds the threshold levels, the ECM illuminates the MIL and stores a DTC.

DTC Code	DTC Detection Condition	Trouble Area
P0300	Simultaneous misfiring of several cylinders occurs and one of the following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	• Open or short in engine wire harness • Connector connections • Vacuum hose connections • Ignition system • Injector • Fuel pressure • Mass Air Flow (MAF) meter • Engine Coolant Temperature (ECT) sensor • Compression pressure • Valve clearance • Valve timing • PCV valve and hose • PCV hose connections • Air induction system • ECM
P0301 P0302 P0303 P0304 P0305 P0306	Misfiring of specific cylinder occurs and one of following conditions below is detected (2 trip detection logic): • A misfire occurs that may damage the Three-Way Catalytic Converter (TWC) (MIL blinks). • An emission deterioration misfire occurs (MIL illuminates).	

When multiple DTCs for misfiring cylinders are stored, but DTC P0300 is not stored, it indicates that misfires have been detected in different cylinders at different times. DTC P0300 is only stored when several misfiring cylinders are detected at the same time.

CONFIRMATION DRIVING PATTERN

1. Connect the intelligent tester to the DLC3.
2. Turn the ignition switch to ON.
3. Turn the intelligent tester on.
4. Record the DTC(s) and freeze frame data.
5. Using the intelligent tester, switch the ECM from normal mode to check mode (Click here).
6. Read the misfire count of each cylinder (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count) with the engine idling. If any misfire count is displayed, skip the following confirmation driving pattern.
7. If no misfire counts are displayed, drive the vehicle several times at the engine speed and engine load, etc., recorded in the freeze frame data.

HINT:

- **In order to store misfire DTCs, drive the vehicle at the engine speed and engine load, etc., recorded in the freeze frame data for the time specified in the table below.**

Engine Speed	Duration
Idling	3.5 minutes or more
1000	3 minutes or more
2000	1.5 minutes or more
3000	1 minute or more

8. Check whether misfires have occurred by checking DTCs and freeze frame data.

HINT:

Do not turn the ignition switch off until the stored DTC(s) and freeze frame data have been recorded. When the ECM returns to normal mode (default), the stored DTC(s), freeze frame data and other data are cleared.

9. Record the DTC(s), freeze frame data and misfire count.
10. Turn the ignition switch off and wait for at least 5 seconds.

INSPECTION PROCEDURE

HINT:

- **If any DTCs other than misfire DTCs are output, troubleshoot those DTCs first.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **If the misfire does not recur when the vehicle is brought to the workshop, reproduce the conditions stored in the ECM as freeze frame data.**
- **If the misfire still cannot be reproduced even though the conditions stored in the ECM as freeze frame data have been reproduced, one of the following factors can be considered to be a possible cause of the problem:**
    1. **There was insufficient fuel volume in the tank.**
    2. **Improper fuel was used.**
    3. **The spark plugs have been contaminated.**
- **After finishing repairs, check the misfire counts of the cylinders (Cylinder #1 Misfire Count to Cylinder #6 Misfire Count).**
- **Be sure to confirm that no misfiring cylinder DTCs are stored again by conducting the confirmation driving pattern after finishing repairs.**
- **For 6 and 8 cylinder engines, the ECM intentionally does not store the specific misfiring cylinder DTCs at high engine speeds. If misfires occur only in high engine speed areas, only DTC P0300 is stored.**
  In the event of DTC P0300 being present, perform the following operations:
    1. **Clear the DTCs (Click here).**
    2. **Start the engine and conduct the confirmation driving pattern.**
    3. **Read the misfiring rates of each cylinder or DTC(s) using the intelligent tester.**
    4. **Repair the cylinder(s) that has a high misfiring rate or is indicated by the DTC.**
    5. **After finishing repairs, conduct the confirmation driving pattern again, in order to verify that DTC P0300 is not stored.**
- **When one of Short FT #1, Long FT #1, Short FT #2 or Long FT #2 in the freeze frame data is outside the range of +/-20%, the air fuel ratio may be Rich (-20% or less) or Lean (+20% or more).**
- **When the Coolant Temp in the freeze frame data is less than 75°C (167°F), the misfire may have occurred only while warming up the engine.**
- **An extremely imbalanced drive wheel can cause body vibration, which may cause misfire DTC(s) to be stored.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO MISFIRE CODES)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

HINT:

Write down the DTCs.

Result

Display (DTC Output)	Proceed to
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306	A
P0300, P0301, P0302, P0303, P0304, P0305 and/or P0306 and other DTCs	B

HINT:

If any DTCs other than P0300, P0301, P0302, P0303, P0304, P0305 and P0306 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.READ VALUE USING INTELLIGENT TESTER (MISFIRE RPM AND MISFIRE LOAD)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Misfire RPM and Misfire Load.

d. Read and note the Misfire RPM and Misfire Load values.

HINT:

The Misfire RPM and Misfire Load values indicate the vehicle conditions under which the misfire occurred.

NEXT

3.CHECK PCV HOSE CONNECTIONS

a. Check the PCV hose connections.

OK:
PCV hose is correctly connected and is not damaged.

NG → REPAIR OR REPLACE PCV HOSE

OK

4.READ VALUE USING INTELLIGENT TESTER

(a) Enter the following menus: Powertrain / Engine and ECT / Data List / Misfire / Cylinder #1 Misfire Count, #2, #3, #4, #5 and #6.
(b) Read the value for Cylinder #1 Misfire Count to Cylinder #6 Misfire Count displayed on the intelligent tester. If no misfire counts occur in any cylinders, perform the following procedures:
(1) Start the engine and let it idle.
(2) Move the shift lever to D.
(3) Check the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count.
(4) If misfire counts are still not displayed, perform steps (c) and (d).
(c) Drive the vehicle with the Misfire RPM and Misfire Load noted in the "Read value using intelligent tester (Misfire RPM and Misfire Load)" procedures above.
(d) Read the Cylinder #1 Misfire Count to Cylinder #6 Misfire Count or DTCs displayed on the intelligent tester.

Result

Misfire Count	Proceed to
Most misfires occur in only 1 or 2 cylinders	A
3 cylinders or more have equal misfire counts	B

HINT:

- **If it is difficult to reproduce misfires for each cylinder, check the Data List item called Misfire Margin. Try to find vehicle driving conditions that lower the Misfire Margin value. Values above 30% are considered normal.**
- **If the freeze frame data's record of the ECT is below 75°C (167°F), the misfire may be detected only when the engine is cold.**
- **If the freeze frame data's record of Engine Run Time is below 120 seconds, the misfire may be detected immediately after the engine is started.**

B → Go to step 17

A

5.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

6.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

7.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

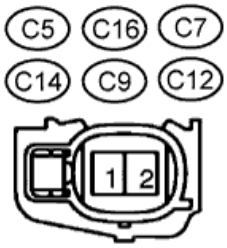
8.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

10.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (**Click here**)

OK

11.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (**Click here**)

OK

12.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → REPAIR OR REPLACE AIR INDUCTION SYSTEM

OK

13.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING

OK

14.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY

OK

15.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.
With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

16.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

REPLACE ECM (Click here)

17.CHECK AIR INDUCTION SYSTEM

a. Check the air induction system for vacuum leakage (Click here).

OK:
No leakage from air induction system.

NG → **REPAIR OR REPLACE AIR INDUCTION SYSTEM**

OK

18.CHECK VALVE TIMING

a. Remove the cylinder head cover (for bank 1, Click here, or for bank 2, Click here).

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears are aligned with the timing marks of the bearing cap as shown in the illustration.
If not, turn the crankshaft 1 revolution (360°), then align the marks as above.

OK:
Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING**

OK

19.CHECK FUEL PRESSURE

a. Check the fuel pressure (Click here).

NG → **CHECK FUEL PUMP, PRESSURE REGULATOR, FUEL PIPE LINE AND FILTER, AND REPLACE PARTS AS NECESSARY**

OK

20.READ VALUE USING INTELLIGENT TESTER (COOLANT TEMP)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Coolant Temp.

d. Read the Data List twice, when the engine is cold and when it is warmed up.

Standard:
With cold engine: Same as ambient air temperature.

With warm engine: 80 to 100°C (176 to 212°F).

NG → REPLACE ENGINE COOLANT TEMPERATURE SENSOR (Click here)

OK

21.INSPECT MASS AIR FLOW METER

a. Inspect the mass air flow meter (Click here).

NG → REPLACE MASS AIR FLOW METER (Click here)

OK

22.CHECK SPARK PLUG

a. Remove the ignition coil and the spark plug of the misfiring cylinder (Click here).

b. Measure the spark plug electrode gap (Click here).

NG → REPLACE SPARK PLUG (Click here)

OK

23.CHECK FOR SPARKS AND IGNITION

a. Disconnect the injector connectors to prevent the engine from starting.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

b. Remove the ignition coil from the cylinder head.

c. Install the spark plug to the ignition coil.

d. Attach the spark plug assembly to the cylinder head.

e. Crank the engine for less than 2 seconds and check for sparks.

OK:
Sparks jump across electrode gap.

f. Install the ignition coil.

g. Reconnect the injector connectors.

NG → Go to step 29

OK

24.CHECK CYLINDER COMPRESSION PRESSURE

a. Measure the cylinder compression pressure of the misfiring cylinder (Click here).

NG → CHECK ENGINE TO DETERMINE CAUSE OF LOW COMPRESSION

OK

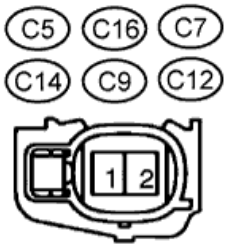
25.CHECK HARNESS AND CONNECTOR (ECM - INJECTOR)

a. Disconnect the injector connector (of the misfiring cylinder).

b. Disconnect the ECM connector.



c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Body ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Body ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Body ground	Ignition switch ON	11 to 14 V
No. 4	C14-1 - Body ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Body ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Body ground	Ignition switch ON	11 to 14 V

d. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector: (to Injector)

Front view of wire harness connector: (to ECM)

*1: for LHD

*2: for RHD

Standard Resistance:

for LHD

Cylinder	Tester Connection	Condition	Specified Condition
No. 1	C5-2 - Body ground	Always	10 kΩ or higher
	C5-2 - C45-45 (#10)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

26.INSPECT ECM TERMINAL OF MISFIRING CYLINDER (#10, #20, #30, #40, #50 AND/OR #60 VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
C45-45 (#10) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-85 (#20) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-44 (#30) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-84 (#40) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-43 (#50) - C45-22 (E01)	Ignition switch ON	11 to 14 V
C45-83 (#60) - C45-22 (E01)	Ignition switch ON	11 to 14 V

for RHD

Tester Connection	Switch Condition	Specified Condition
C46-45 (#10) - C46-22	Ignition switch	

(E01)	ON	11 to 14 V
C46-85 (#20) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-44 (#30) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-84 (#40) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-43 (#50) - C46-22 (E01)	Ignition switch ON	11 to 14 V
C46-83 (#60) - C46-22 (E01)	Ignition switch ON	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR (BATTERY - ECM)

OK

27.CHECK FUEL INJECTOR OF MISFIRING CYLINDER

a. Check the injector injection (whether fuel volume is large or small, and whether injection pattern is poor) (Click here).

NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK

28.CHECK VALVE CLEARANCE OF MISFIRING CYLINDER

a. Check the valve clearance (Click here).

NG → ADJUST VALVE CLEARANCE (Click here)

OK

REPLACE ECM (Click here)

29.REPLACE SPARK PLUG WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed spark plug with a spark plug that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:

Sparks jump across electrode gap.

NG → Go to step 30

OK

REPLACE SPARK PLUG (Click here)

30.REPLACE IGNITION COIL WITH NORMAL ONE AND CHECK SPARK OF MISFIRING CYLINDER

a. Replace the installed ignition coil with a ignition coil that functions normally.

b. Perform a spark test.

CAUTION:

Always disconnect all injector connectors.

NOTICE:

Do not crank the engine for more than 2 seconds.

i. Install the spark plug to the ignition coil and connect the ignition coil connector.

ii. Disconnect all the injector connectors.

iii. Ground the spark plug.

iv. Check if sparks occur while the engine is being cranked.

OK:
Sparks jump across electrode gap.

NG → REPLACE ECM (Click here)

OK → REPLACE IGNITION COIL (Click here)

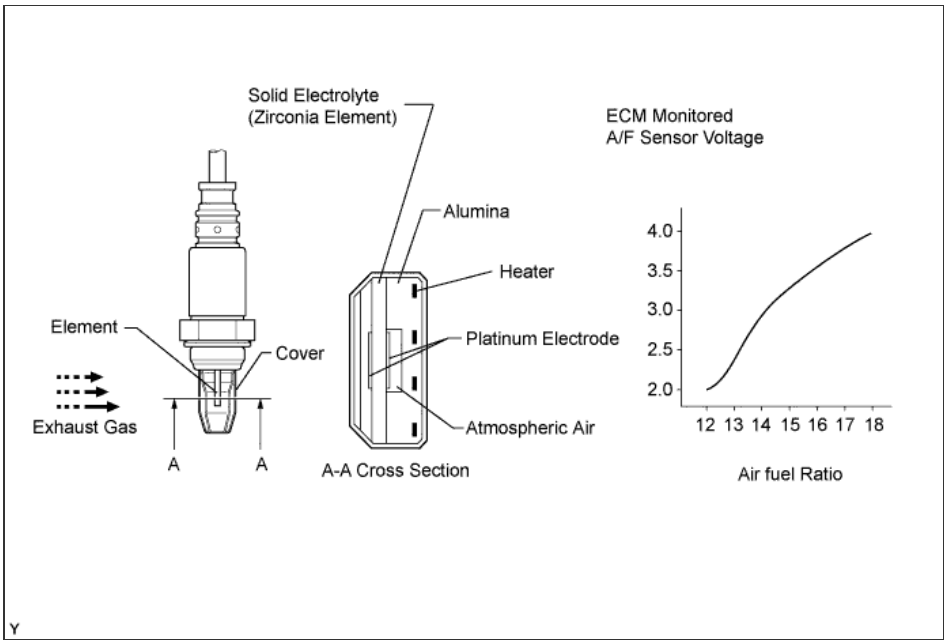
for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-119 (A2A-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition

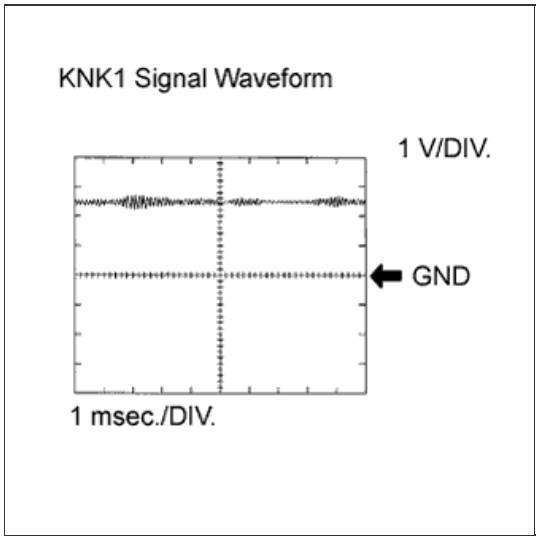
DTC P0333 Knock Sensor 2 Circuit High Input (Bank 2)

for Preparation Click here

DESCRIPTION



Flat type knock sensors (non-resonant type) have structures that can detect vibrations between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC Code	DTC Detection Condition	Trouble Area
P0327 P0332	The output voltage of the knock sensor is below 0.5 V (1 trip detection logic).	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	The output voltage of the knock sensor is higher than 4.5 V (1 trip detection logic).	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

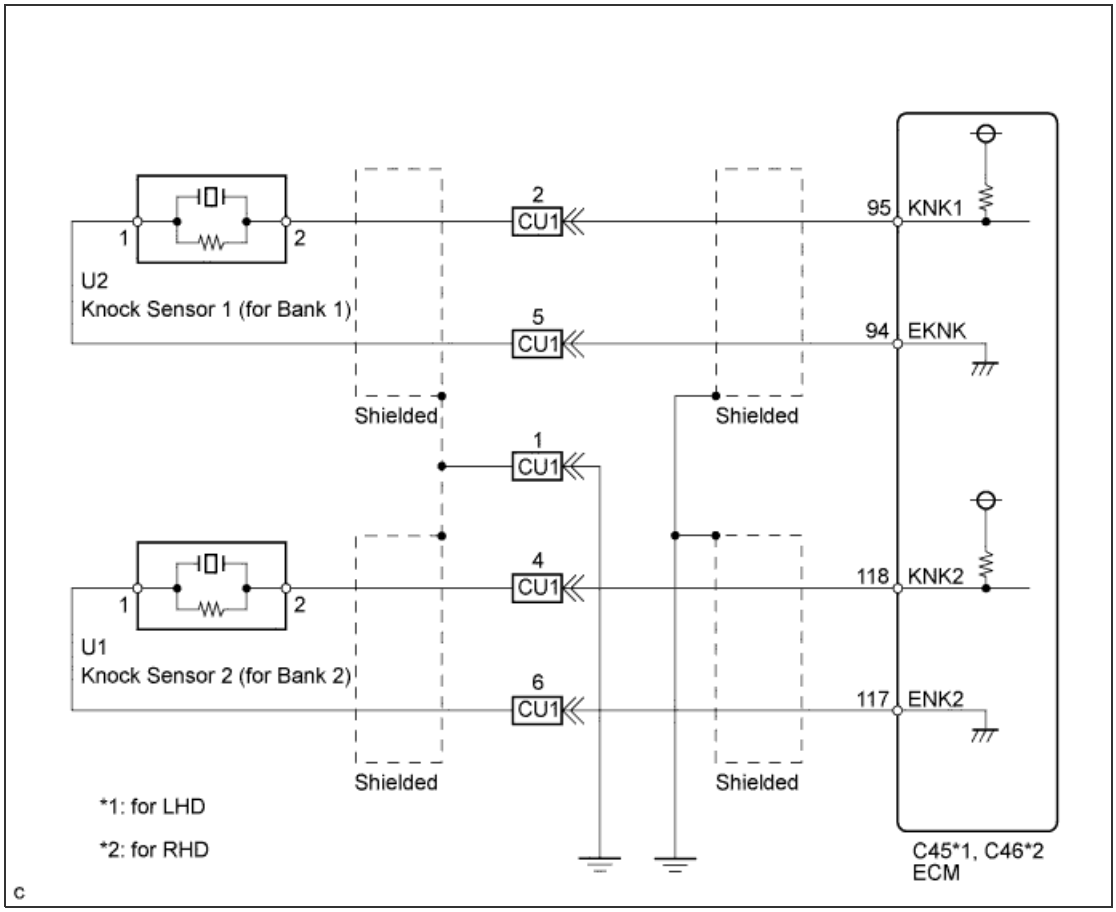
When any of DTCs P0327, P0328, P0332 and P0333 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the ignition switch is turned off.

Reference: Inspection using an oscilloscope



The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Engine speed maintained at 4000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and stores a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is stored 5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **DTCs P0327 and P0328 are for the bank 1 knock sensor circuit.**
- **DTCs P0332 and P0333 are for the bank 2 knock sensor circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ DTC OUTPUT (CHECK KNOCK SENSOR CIRCUIT)

a. Disconnect the CU1 connector.

b. Using lead wires, connect the connectors as follows:

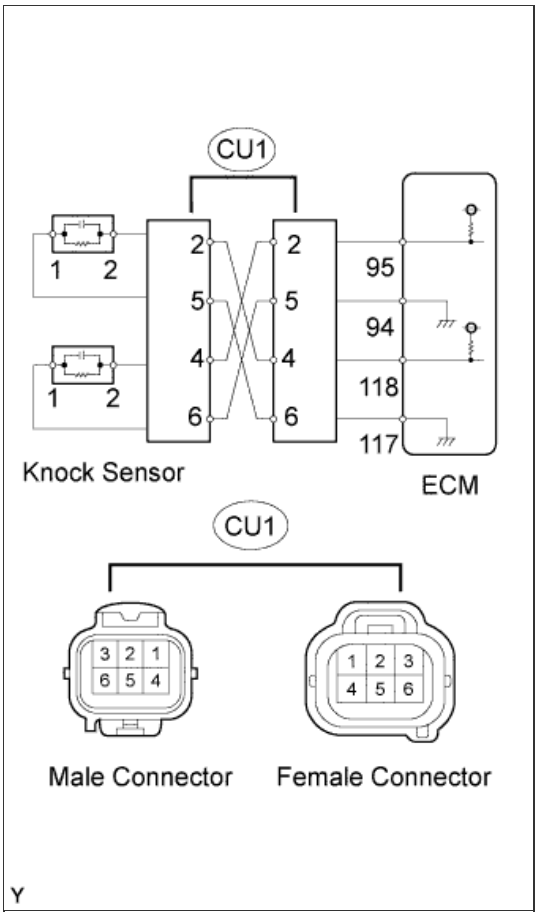
Male Connector - Female Connector
Terminal 2 - Terminal 4
Terminal 5 - Terminal 6
Terminal 4 - Terminal 2
Terminal 6 - Terminal 5

c. Warm up the engine.

d. Run the engine at 3000 rpm for 10 seconds or more.

e. Connect the intelligent tester to the DLC3.

f. Turn the tester on.



g. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

h. Read the DTCs.

Result

Result	Proceed to
DTC is same as when vehicle brought in (for example, P0327 and P0328 are output again, or	A

P0332 and P0333 are output again)	
DTC is different from when vehicle brought in (for example, P0327 and P0328 are output at first, but then P0332 and P0333 are output, or vice versa)	B

B → Go to step 4

A

2.CHECK HARNESS AND CONNECTOR (CONNECTOR - ECM)

a. Disconnect the CU1 connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
CU1 female connector 2 - C45-95 (KNK1)	Always	Below 1 Ω
CU1 female connector 5 - C45-94 (EKNK)	Always	Below 1 Ω
CU1 female connector 4 - C45-118 (KNK2)	Always	Below 1 Ω
CU1 female connector 6 - C45-117 (EKN2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition

5.CHECK HARNESS AND CONNECTOR (CONNECTOR - KNOCK SENSOR)

HINT:

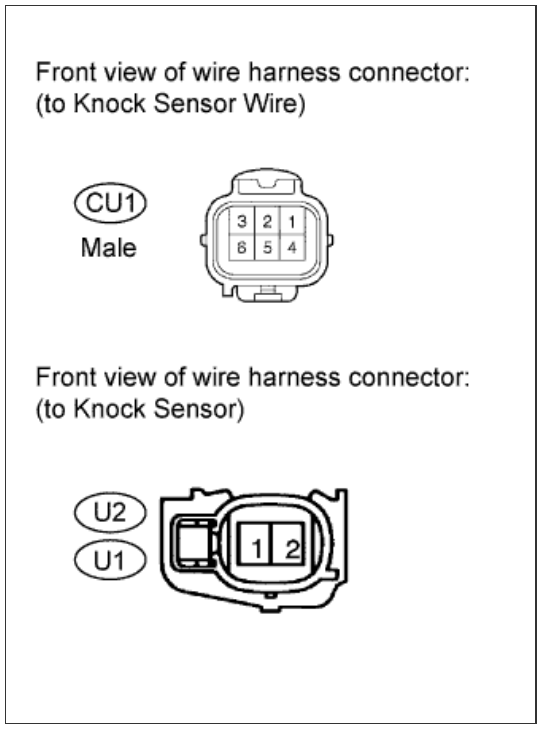
- **If DTC P0327 or P0328 has changed to P0332 or P0333, check the knock sensor circuit on the right bank side.**
- **If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the left bank side.**

a. Disconnect the CU1 connector.

b. Disconnect the knock sensor connectors.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
CU1 male connector 2 - U2-2	Always	Below 1 Ω
CU1 male connector 5 - U2-1	Always	Below 1 Ω
CU1 male connector 4 - U1-2	Always	Below 1 Ω
CU1 male connector 6 - U1-1	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
CU1 male		

connector 2 or U2-2 - Body ground	Always	10 kΩ or higher
CU1 male connector 5 or U2-1 - Body ground	Always	10 kΩ or higher
CU1 male connector 4 or U1-2 - Body ground	Always	10 kΩ or higher
CU1 male connector 6 or U1-1 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

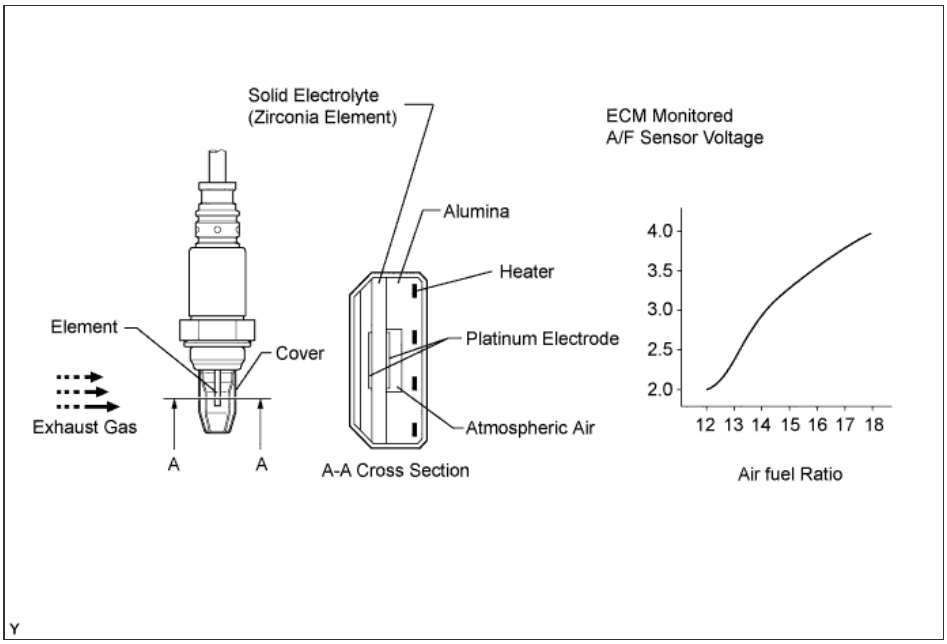
for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-119 (A2A-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition

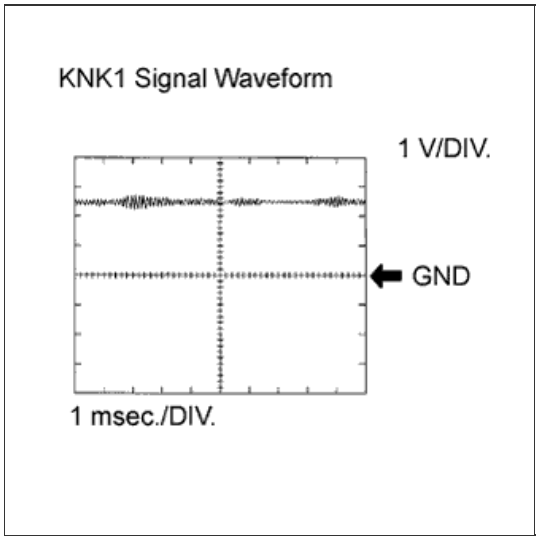
for Preparation Click here

DESCRIPTION



Flat type knock sensors (non-resonant type) have structures that can detect vibrations between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC Code	DTC Detection Condition	Trouble Area
P0327 P0332	The output voltage of the knock sensor is below 0.5 V (1 trip detection logic).	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	The output voltage of the knock sensor is higher than 4.5 V (1 trip detection logic).	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

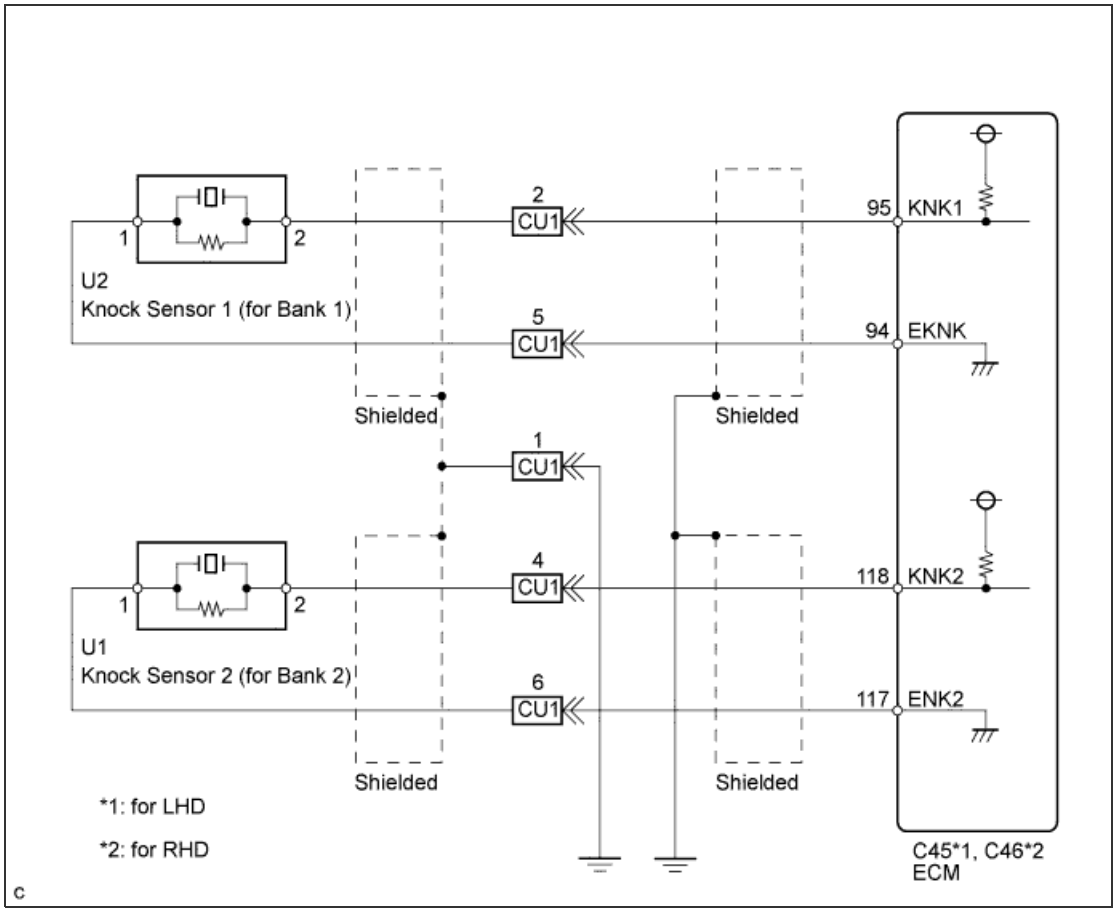
When any of DTCs P0327, P0328, P0332 and P0333 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the ignition switch is turned off.

Reference: Inspection using an oscilloscope



The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Engine speed maintained at 4000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and stores a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is stored 5 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **DTCs P0327 and P0328 are for the bank 1 knock sensor circuit.**
- **DTCs P0332 and P0333 are for the bank 2 knock sensor circuit.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ DTC OUTPUT (CHECK KNOCK SENSOR CIRCUIT)

a. Disconnect the CU1 connector.

b. Using lead wires, connect the connectors as follows:

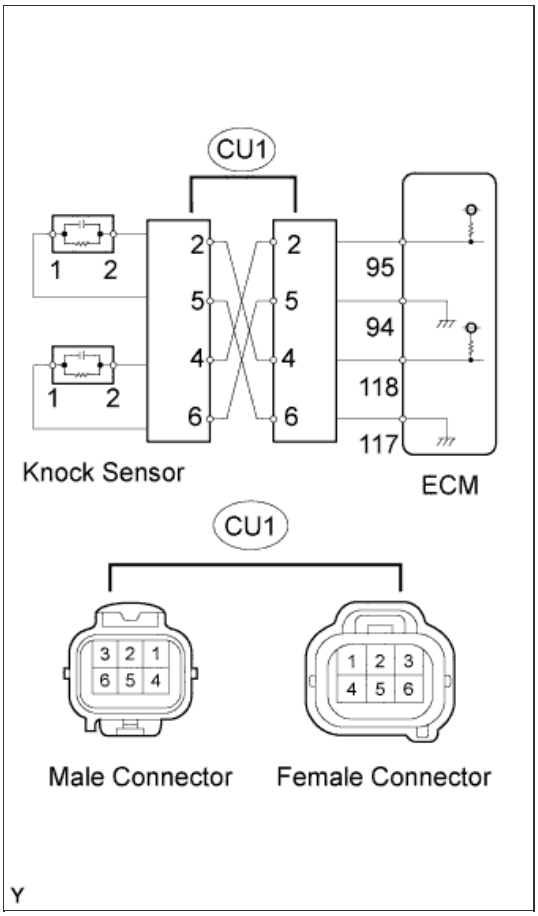
Male Connector - Female Connector
Terminal 2 - Terminal 4
Terminal 5 - Terminal 6
Terminal 4 - Terminal 2
Terminal 6 - Terminal 5

c. Warm up the engine.

d. Run the engine at 3000 rpm for 10 seconds or more.

e. Connect the intelligent tester to the DLC3.

f. Turn the tester on.



g. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

h. Read the DTCs.

Result

Result	Proceed to

DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

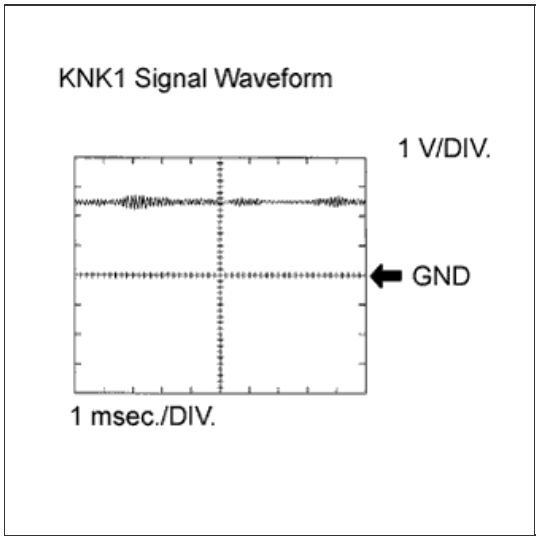
DTC P0333 Knock Sensor 2 Circuit High Input (Bank 2)

for Preparation Click here

DESCRIPTION



Flat type knock sensors (non-resonant type) have structures that can detect vibrations between approximately 6 kHz and 15 kHz.
A knock sensor is fitted onto the engine block to detect engine knocking.
The knock sensor contains a piezoelectric element which generates a voltage when it becomes deformed.
The voltage is generated when the engine block vibrates due to knocking. Any occurrence of engine knocking can be suppressed by delaying the ignition timing.

DTC Code	DTC Detection Condition	Trouble Area
P0327 P0332	The output voltage of the knock sensor is below 0.5 V (1 trip detection logic).	• Short in knock sensor circuit • Knock sensor • ECM
P0328 P0333	The output voltage of the knock sensor is higher than 4.5 V (1 trip detection logic).	• Open in knock sensor circuit • Knock sensor • ECM

HINT:

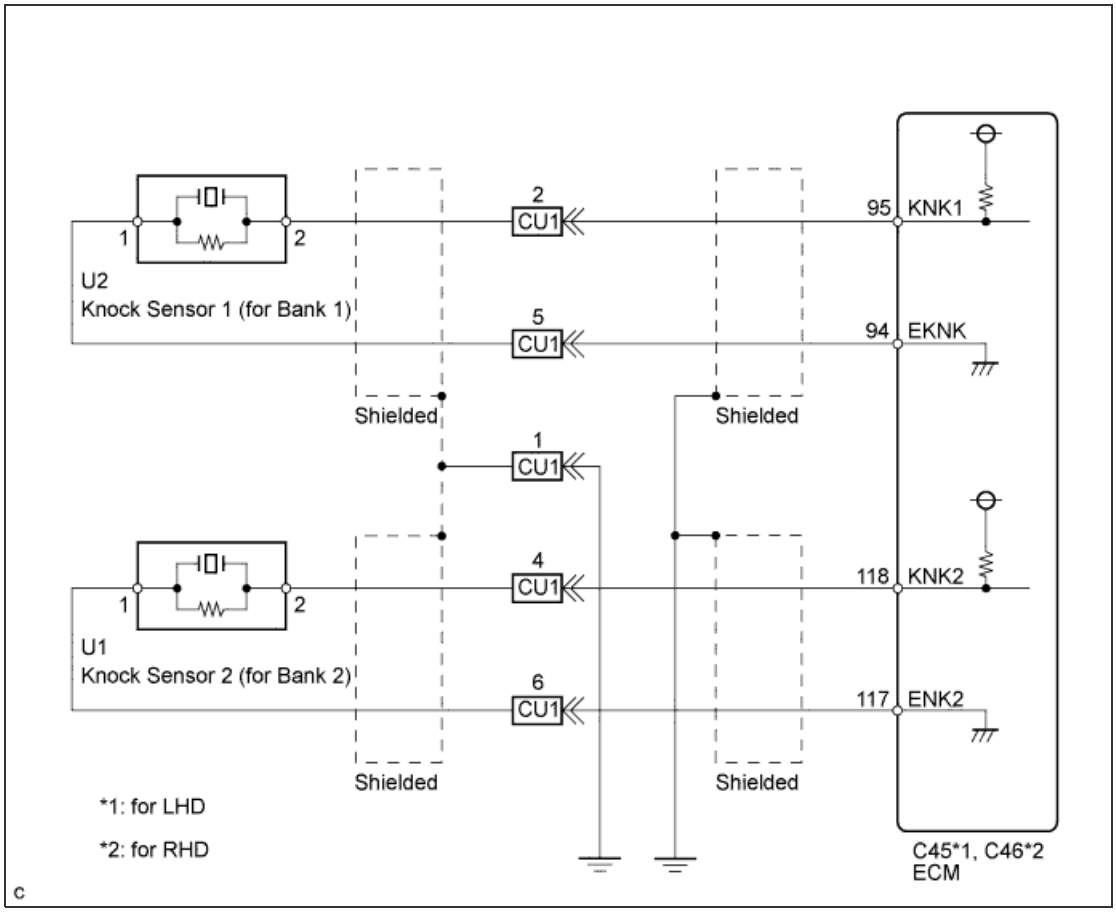
When any of DTCs P0327, P0328, P0332 and P0333 are stored, the ECM enters fail-safe mode. During fail-safe mode, the ignition timing is delayed to its maximum retardation. Fail-safe mode continues until the ignition switch is turned off.

Reference: Inspection using an oscilloscope



The correct waveform is as shown.

Item	Content
Terminal	KNK1 - EKNK KNK2 - EKN2
Equipment Setting	1 V/DIV. 1 msec./DIV.
Condition	Engine speed maintained at 4000 rpm with warm engine

MONITOR DESCRIPTION

If the output voltage transmitted by the knock sensor remains low or high for more than 1 second, the ECM interprets this as a malfunction in the sensor circuit, and stores a DTC.
The monitor for DTCs P0327, P0328, P0332 and P0333 begins to run when 5 seconds have elapsed since the engine was started.
If the malfunction is not repaired successfully, DTC P0327, P0328, P0332 or P0333 is stored 5 seconds after the engine is next started.

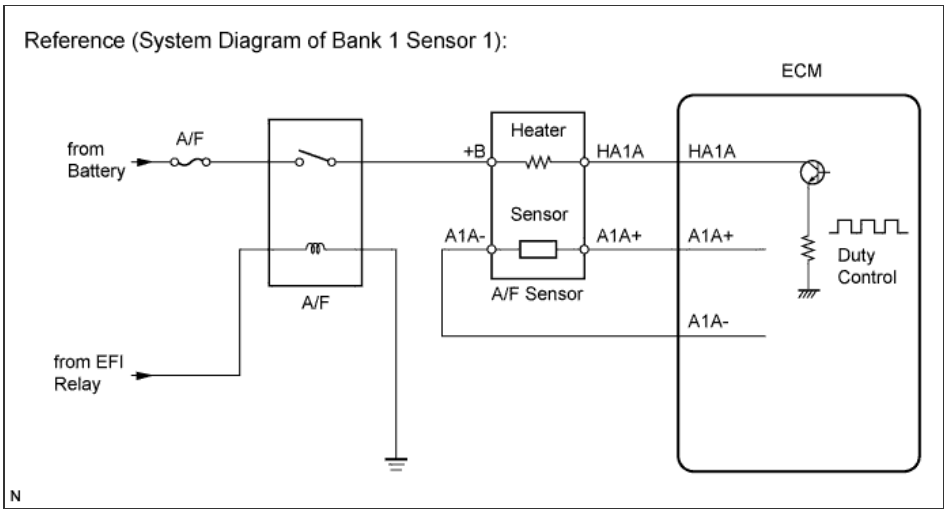
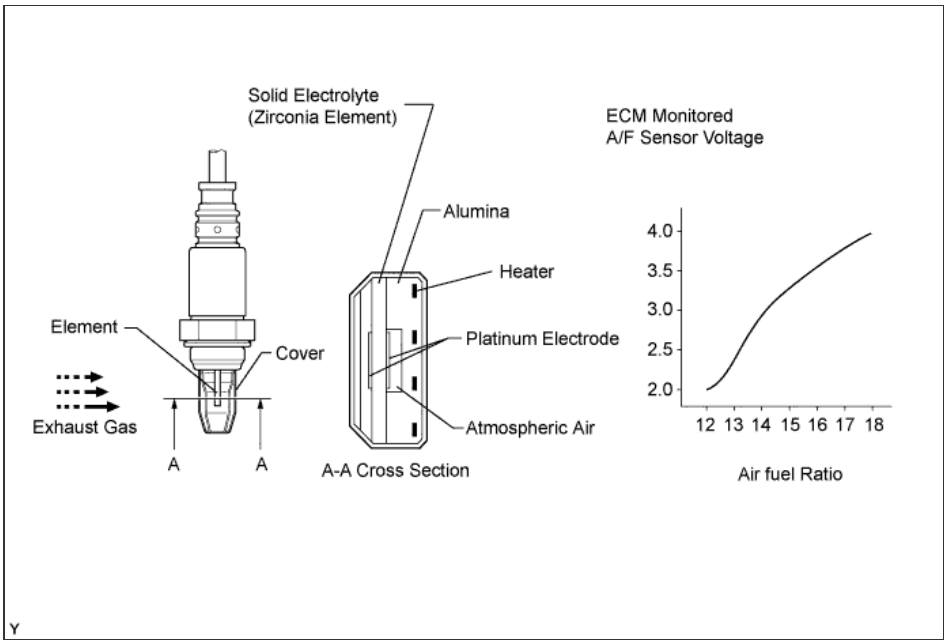
DTC P2256 Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 2 Sensor 1)



for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition

2.CHECK HARNESS AND CONNECTOR (CONNECTOR - ECM)

a. Disconnect the CU1 connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
CU1 female connector 2 - C45-95 (KNK1)	Always	Below 1 Ω
CU1 female connector 5 - C45-94 (EKNK)	Always	Below 1 Ω
CU1 female connector 4 - C45-118 (KNK2)	Always	Below 1 Ω
CU1 female connector 6 - C45-117 (EKN2)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
CU1 female connector 2 - C46-95 (KNK1)	Always	Below 1 Ω
CU1 female connector 5 - C46-94 (EKNK)	Always	Below 1 Ω
CU1 female connector 4 - C46-118 (KNK2)	Always	Below 1 Ω
CU1 female connector 6 - C46-117 (EKN2)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
CU1 female connector 2 or C45-95 (KNK1) - Body ground	Always	10 kΩ or higher
CU1 female connector 5 or C45-94 (EKNK) - Body ground	Always	10 kΩ or higher
CU1 female connector 4 or C45-118 (KNK2) - Body ground	Always	10 kΩ or higher
CU1 female connector 6 or C45-117 (EKN2) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
CU1 female connector 2 or C46-95 (KNK1) - Body ground	Always	10 kΩ or higher
CU1 female connector 5 or C46-94 (EKNK) - Body ground	Always	10 kΩ or higher
CU1 female connector 4 or C46-118 (KNK2) - Body ground	Always	10 kΩ or higher
CU1 female connector 6 or C46-117 (EKN2) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

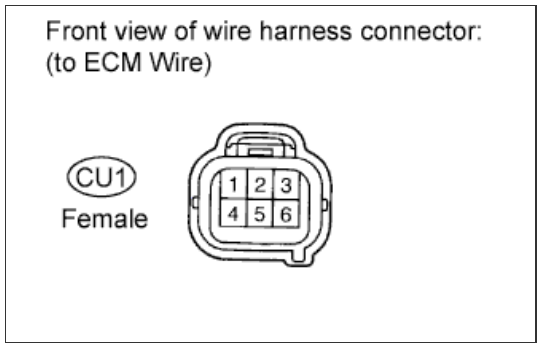
3.INSPECT ECM (VOLTAGE)



a. Disconnect the CU1 connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
CU1 female connector 2 - 5	Ignition switch ON	4.5 to 5.5 V

CU1 female connector 4 - 6	Ignition switch ON	4.5 to 5.5 V

NG → REPLACE ECM (Click here)

OK

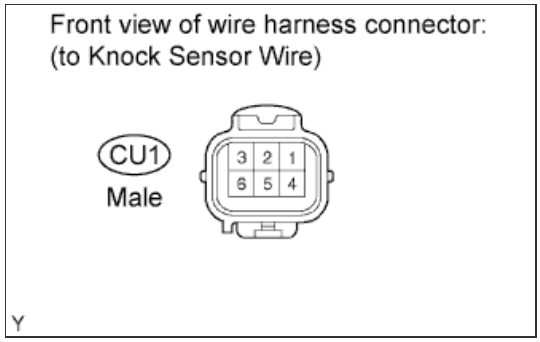
CHECK FOR INTERMITTENT PROBLEMS (Click here)



4.INSPECT KNOCK SENSOR

a. Disconnect the CU1 connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
CU1 male connector 2 - 5	20°C (68°F)	120 to 280 kΩ
CU1 male connector 4 - 6	20°C (68°F)	120 to 280 kΩ

NG → Go to step 5

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

5.CHECK HARNESS AND CONNECTOR (CONNECTOR - KNOCK SENSOR)

HINT:

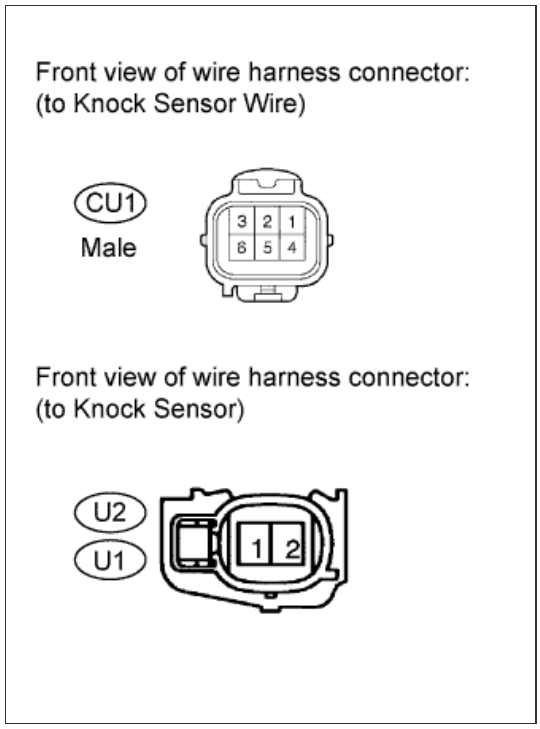
- **If DTC P0327 or P0328 has changed to P0332 or P0333, check the knock sensor circuit on the right bank side.**
- **If DTC P0332 or P0333 has changed to P0327 or P0328, check the knock sensor circuit on the left bank side.**

a. Disconnect the CU1 connector.

b. Disconnect the knock sensor connectors.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
CU1 male connector 2 - U2-2	Always	Below 1 Ω
CU1 male connector 5 - U2-1	Always	Below 1 Ω
CU1 male connector 4 - U1-2	Always	Below 1 Ω
CU1 male connector 6 - U1-1	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
CU1 male		

connector 2 or U2-2 - Body ground	Always	10 kΩ or higher
CU1 male connector 5 or U2-1 - Body ground	Always	10 kΩ or higher
CU1 male connector 4 or U1-2 - Body ground	Always	10 kΩ or higher
CU1 male connector 6 or U1-1 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE KNOCK SENSOR (Click here)

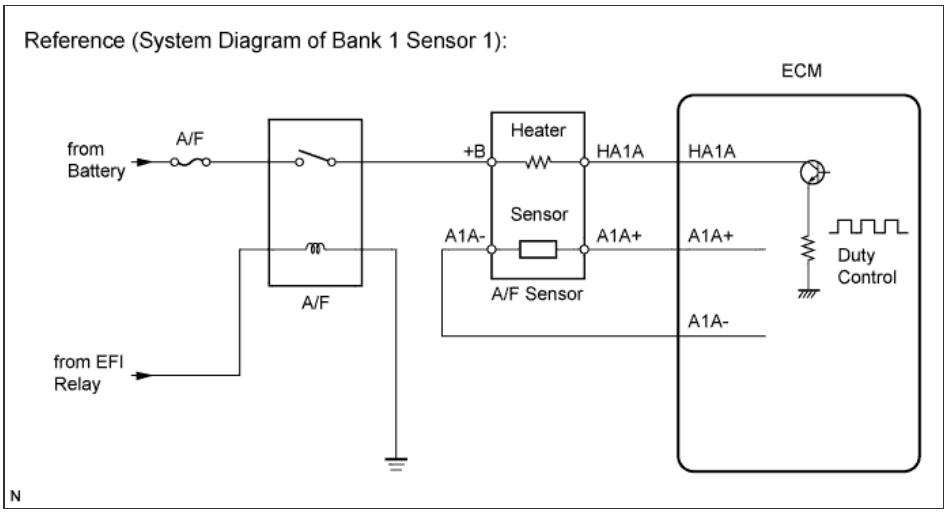
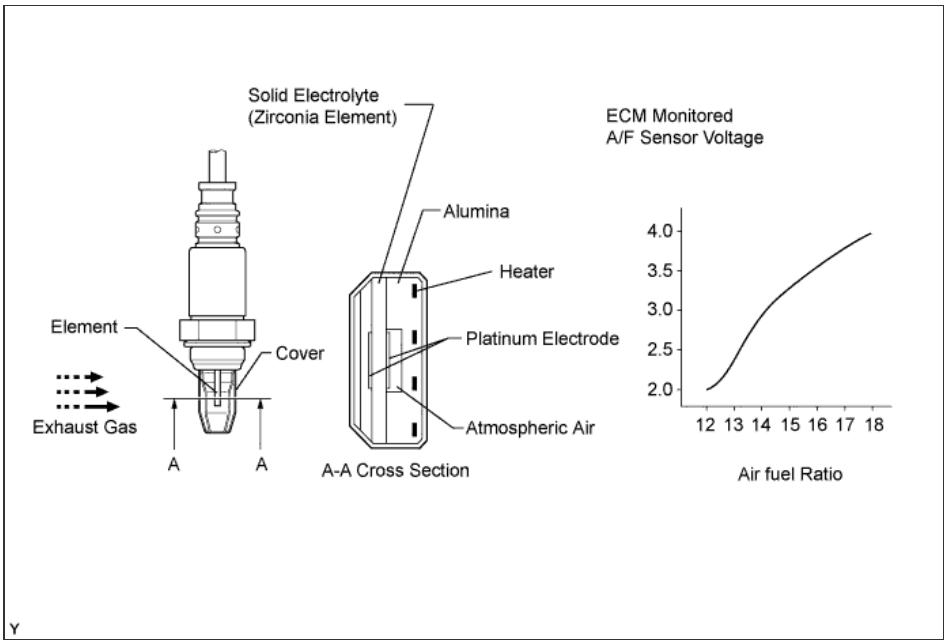
DTC P2256 Oxygen (A/F) Sensor Reference Ground Circuit High (Bank 2 Sensor 1)



for Preparation Click here



DESCRIPTION

HINT:

- **Although the DTC titles say oxygen sensor, these DTCs relate to the Air Fuel ratio (A/F) sensor.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

The A/F sensor, which is located between the exhaust manifold and catalyst, consists of alloyed metal elements and a heater.
Depending on the engine operating conditions, the heater heats the sensor elements to activate them. Battery voltage is applied to the heater, and the sensor ground is controlled by the ECM using a duty ratio.
The sensor elements convert the oxygen concentration in the exhaust gas into voltage values to output. Based on the voltage, the ECM determines the air fuel ratio and regulates the fuel injection volume depending on the air fuel ratio and engine operating conditions. The voltage changes between 0.6 V and 4.5 V while the engine is running. If the air fuel ratio is lean, which means the oxygen concentration in the exhaust gas is high, the voltage is high. If the air fuel ratio is rich, which means the oxygen concentration in the exhaust gas is low, the voltage is low.

DTC Code	DTC Detection Condition	Trouble Area
P2237 P2240	An open in the circuit between terminals A1A+/A2A+ and A1A-/A2A- of the A/F sensor while the engine is running (2 trip detection logic).	• Open in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2238 P2241	Any of the following conditions are met (2 trip detection logic): • The A/F sensor output drops while the engine is running. • The voltage at terminal A1A+/A2A+ is 0.5 V or less. • The voltage difference between terminals A1A+/A2A+ and A1A-/A2A- is 0.1 V or less.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2239 P2242	The A1A+/A2A+ voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2252 P2255	The A1A-/A2A- voltage is 0.5 V or less (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM
P2253 P2256	The A1A-/A2A- voltage is higher than 4.5 V (2 trip detection logic).	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor (bank 1, 2 sensor 1) • ECM

MONITOR DESCRIPTION

These DTCs are stored when there is an open or short in the A/F sensor circuit, or if A/F sensor output drops. To detect these problems, the voltage of the A/F sensor is monitored when turning the ignition switch to ON, and the admittance (admittance is an electrical term that indicates the ease of flow of current) is checked while driving. If the voltage of the A/F sensor is between 0.6 V and 4.5 V, it is considered normal. If the voltage is out of the specified range, or the admittance is less than the standard value, the ECM will determine that there is a malfunction in the A/F sensor. If the same malfunction is detected in next driving cycle, the MIL will be illuminated and a DTC will be stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

CONFIRMATION DRIVING PATTERN

1. Start the engine and wait for 5 minutes or more.

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**
5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume).**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	more than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	more than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	less than 0.4 V

NOTICE:

The Air Fuel ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Turn the ignition switch to ON.

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C22-2 (+B) - Body ground	Ignition switch ON	11 to 14 V
C23-2 (+B) - Body ground	Ignition switch ON	11 to 14 V

d. Turn the ignition switch off.

e. Disconnect the ECM connector.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C22-3 (A1A+) - C45-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C45-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C45-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C45-119 (A2A-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω

C22-3 (A1A+) - C46-93 (A1A+)	Always	Below 1 Ω
C22-4 (A1A-) - C46-116 (A1A-)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω
C23-3 (A2A+) - C46-120 (A2A+)	Always	Below 1 Ω
C23-4 (A2A-) - C46-119 (A2A-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C45-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C45-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C45-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C45-119 (A2A-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C22-3 (A1A+) or C46-93 (A1A+) - Body ground	Always	10 kΩ or higher
C22-4 (A1A-) or C46-116 (A1A-) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher
C23-3 (A2A+) or C46-120 (A2A+) - Body ground	Always	10 kΩ or higher
C23-4 (A2A-) or C46-119 (A2A-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.REPLACE AIR FUEL RATIO SENSOR

a. Replace the air fuel ratio sensor (Click here).

NEXT

3.PERFORM CONFIRMATION DRIVING PATTERN

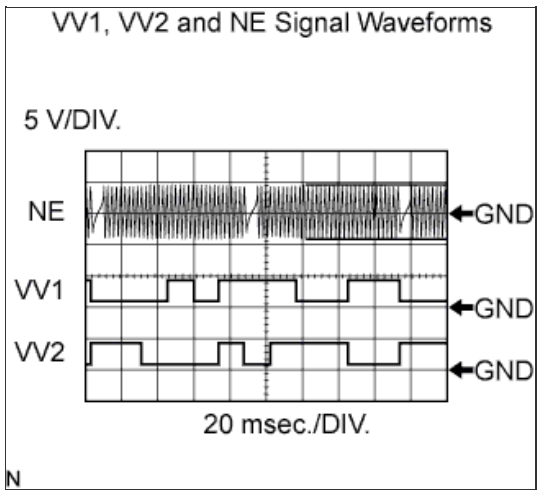
DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent

for Preparation Click here

DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil.
The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of wound copper wire, an iron core and magnet. The sensor plate rotates and, as each tooth passes by the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per revolution. Based on these signals, the ECM calculates the crankshaft position and engine speed. Using these calculations, the fuel injection time and ignition timing are controlled.



DTC Code	DTC Detection Condition	Trouble Area
P0335	When either condition below is met: • No Crankshaft Position (CKP) sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in Crankshaft Position (CKP) sensor circuit • CKP sensor • Crankshaft (crank angle sensor plate) • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) The engine speed is 1000 rpm or more. (b) The starter signal is off. (c) 3 seconds or more have elapsed since the starter signal switched from on to off.	• Open or short in CKP sensor circuit • CKP sensor • Crankshaft (crank angle sensor plate) • ECM

Reference: Inspection using an oscilloscope.

HINT:

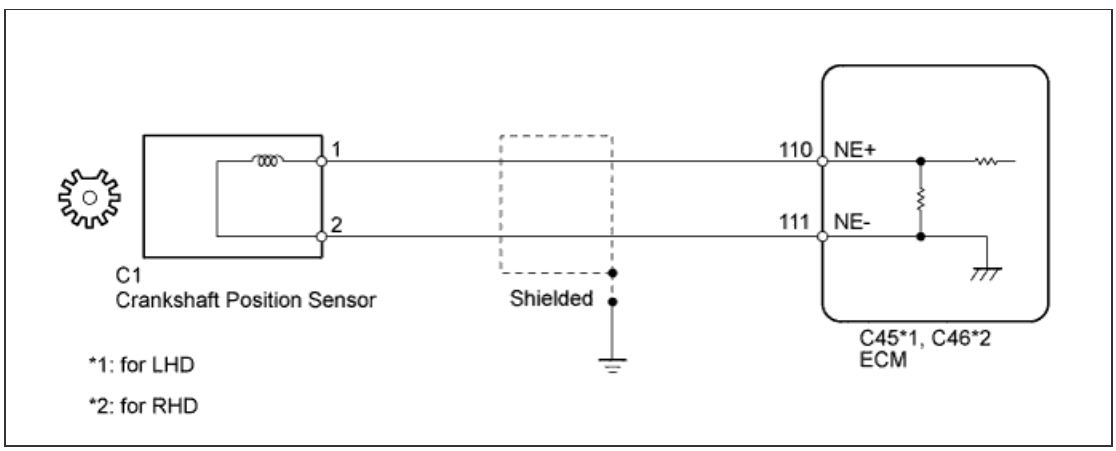
- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**
- **Grounding failure of the shielded wire may cause noise in the waveforms.**



Item	Content
Terminal	VV1+ - VV1- VV2+ - VV2- NE+ - NE-
Equipment Setting	5 V/DIV., 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine running, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Check the engine speed. The engine speed can be checked by using the intelligent tester. To check, follow the operation below:**
  1. **Connect the intelligent tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.**
     The engine speed may be indicated as zero despite the engine running normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as lower than the actual engine speed if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.

e. Start the engine.

f. Read the values displayed on the tester while the engine is running.

OK:
Correct values are displayed.

HINT:

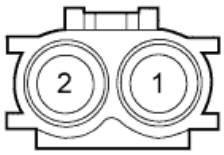
- **To check the engine speed change, display the graph on the tester.**
- **If the engine does not start, check the engine speed while cranking.**
- **If the engine speed indicated on the tester remains at zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.**

NG → Go to step 2

OK →

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)



a. Disconnect the Crankshaft Position (CKP) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Cold	1630 to 2740 Ω
1 - 2	Hot	2065 to 3225 Ω

Component without harness connected:
(Crankshaft Position Sensor)

HINT:

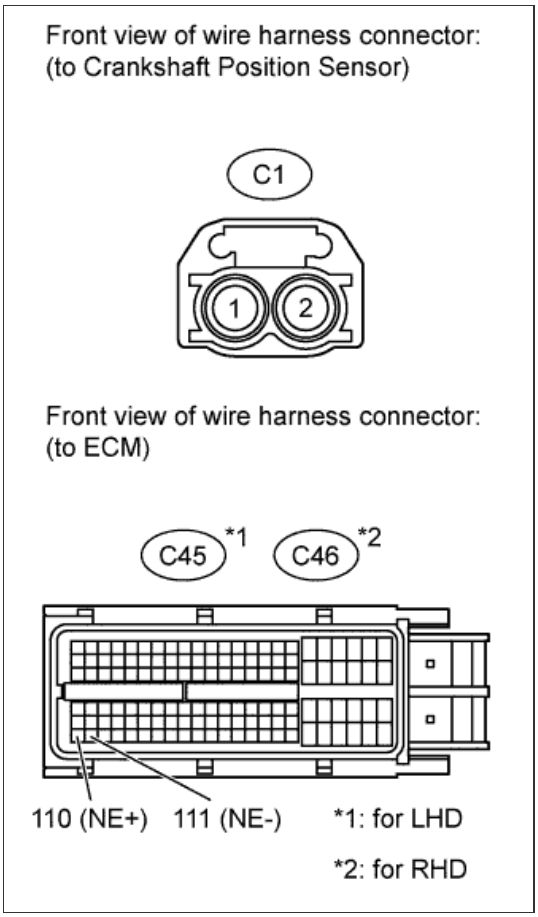
The terms "Cold" and "Hot" refer to the temperature of the sensor. Cold means approximately -10 to 50°C (14 to 122°F). Hot means approximately 50 to 100°C (122 to 212°F).

NG → REPLACE CRANKSHAFT POSITION SENSOR (Click here)



OK →

3.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)

a. Disconnect the CKP sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C1-1 - C45-110 (NE+)	Always	Below 1 Ω
C1-2 - C45-111 (NE-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C1-1 - C46-110 (NE+)	Always	Below 1 Ω
C1-2 - C46-111 (NE-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C1-1 or C45-110 (NE+) - Body ground	Always	10 kΩ or higher
C1-2 or C45-111 (NE-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C1-1 or C46-110 (NE+) - Body ground	Always	10 kΩ or higher
C1-2 or C46-111 (NE-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

a. Check the CKP sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

5.CHECK CRANK ANGLE SENSOR PLATE (TEETH OF SENSOR PLATE)

a. Check the teeth of the sensor plate.

OK:
Sensor plate does not have any cracks or deformation.

DTC P2A00 A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

DTC P2A03 A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **DTC P2A00 indicates malfunctions related to the bank 1 A/F sensor.**
- **DTC P2A03 indicates malfunctions related to the bank 2 A/F sensor.**
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that includes cylinder No. 2.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

DTC Code	DTC Detection Condition	Trouble Area
P2A00 P2A03	The calculated value for the air fuel ratio (A/F) sensor response rate deterioration level is less than threshold.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor • A/F sensor heater • ECM

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the A/F sensor response monitor.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the intelligent tester on.
(d) Clear DTCs (Click here).
(e) Enter the following menus: Powertrain / Engine / Utility / Monitor Status.
(f) Check that O2S (A/FS) Monitor is Incmpl.
(g) Start the engine and warm it up.
(h) Drive the vehicle at a constant speed between 40 km/h and 120 km/h (25 mph and 75 mph) for 3 minutes.
(i) Check that O2S (A/FS) Monitor is Compl. If the Monitor Status is Incmpl, perform the driving pattern again increasing the vehicle speed and using second gear to decelerate the vehicle.
(j) Enter the following menus: Powertrain / Engine / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**

5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **DTC P2A00 or P2A03 may be also stored, when the air fuel ratio is stuck rich or lean.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00 AND/OR P2A03)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

Result

Display (DTC Output)	Proceed to

2.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
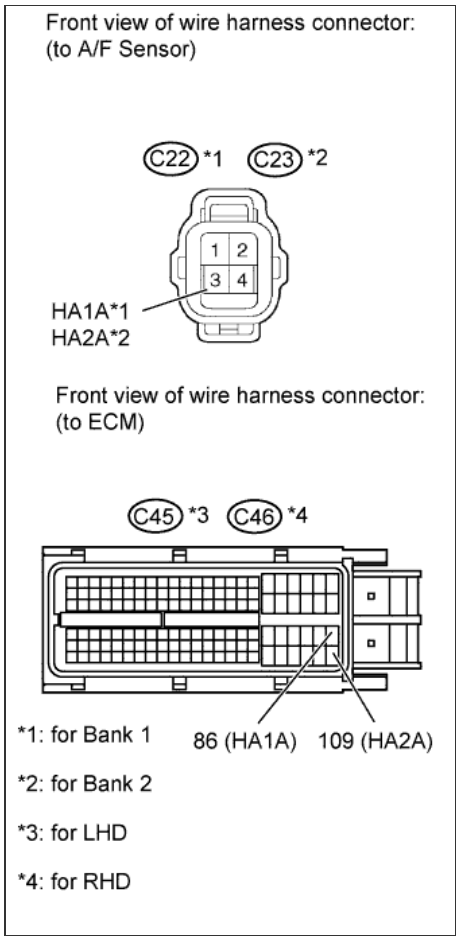
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher



NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

3.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher

C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.PERFORM CONFIRMATION DRIVING PATTERN

NEXT

5.CHECK WHETHER DTC OUTPUT RECURS (DTC P2A00 AND/OR P2A03)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the intelligent tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes / Pending.

d. Read DTCs.

Result

Display (DTC Output)	Proceed to
P2A00 and/or P2A03	A

DTC P0335 Crankshaft Position Sensor "A" Circuit

DTC P0339 Crankshaft Position Sensor "A" Circuit Intermittent

for Preparation Click here

DESCRIPTION

The Crankshaft Position (CKP) sensor system consists of a CKP sensor plate and a pickup coil.
The sensor plate has 34 teeth and is installed on the crankshaft. The pickup coil is made of wound copper wire, an iron core and magnet. The sensor plate rotates and, as each tooth passes by the pickup coil, a pulse signal is created. The pickup coil generates 34 signals per revolution. Based on these signals, the ECM calculates the crankshaft position and engine speed. Using these calculations, the fuel injection time and ignition timing are controlled.

DTC Code	DTC Detection Condition	Trouble Area
P0335	When either condition below is met: • No Crankshaft Position (CKP) sensor signal is sent to the ECM while cranking (1 trip detection logic). • No CKP sensor signal is sent to the ECM at an engine speed of 600 rpm or more (1 trip detection logic).	• Open or short in Crankshaft Position (CKP) sensor circuit • CKP sensor • Crankshaft (crank angle sensor plate) • ECM
P0339	Under conditions (a), (b) and (c), no CKP sensor signal is sent to the ECM for 0.05 seconds or more (1 trip detection logic): (a) The engine speed is 1000 rpm or more. (b) The starter signal is off. (c) 3 seconds or more have elapsed since the starter signal switched from on to off.	• Open or short in CKP sensor circuit • CKP sensor • Crankshaft (crank angle sensor plate) • ECM

Reference: Inspection using an oscilloscope.

HINT:

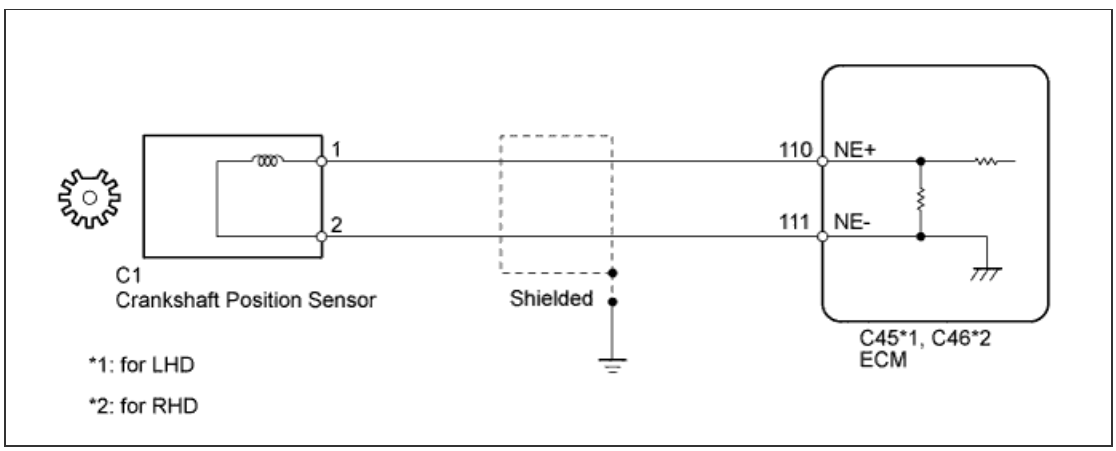
- **The correct waveform is as shown.**
- **VV1+ and VV2+ stand for the VVT sensor signal, and NE+ stands for the CKP sensor signal.**
- **Grounding failure of the shielded wire may cause noise in the waveforms.**



Item	Content
Terminal	VV1+ - VV1- VV2+ - VV2- NE+ - NE-
Equipment Setting	5 V/DIV., 20 msec./DIV.
Condition	Cranking or idling

MONITOR DESCRIPTION

If there is no signal from the CKP sensor despite the engine running, the ECM interprets this as a malfunction of the sensor.
If the malfunction is not repaired successfully, a DTC is stored 10 seconds after the engine is next started.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Check the engine speed. The engine speed can be checked by using the intelligent tester. To check, follow the operation below:**
  1. **Connect the intelligent tester to the DLC3.**
  2. **Start the engine.**
  3. **Turn the tester on.**
  4. **Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.**
     The engine speed may be indicated as zero despite the engine running normally. This is caused by a lack of NE signals from the Crankshaft Position (CKP) sensor. Alternatively, the engine speed may be indicated as lower than the actual engine speed if the CKP sensor output voltage is insufficient.
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.READ VALUE USING INTELLIGENT TESTER (ENGINE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Engine Speed.

e. Start the engine.

f. Read the values displayed on the tester while the engine is running.

OK:
Correct values are displayed.

HINT:

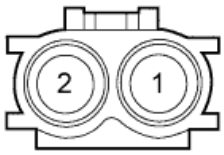
- **To check the engine speed change, display the graph on the tester.**
- **If the engine does not start, check the engine speed while cranking.**
- **If the engine speed indicated on the tester remains at zero (0), there may be an open or short in the Crankshaft Position (CKP) sensor circuit.**

NG → Go to step 2

OK →

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CRANKSHAFT POSITION SENSOR (RESISTANCE)



a. Disconnect the Crankshaft Position (CKP) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Cold	1630 to 2740 Ω
1 - 2	Hot	2065 to 3225 Ω

Component without harness connected:
(Crankshaft Position Sensor)

HINT:

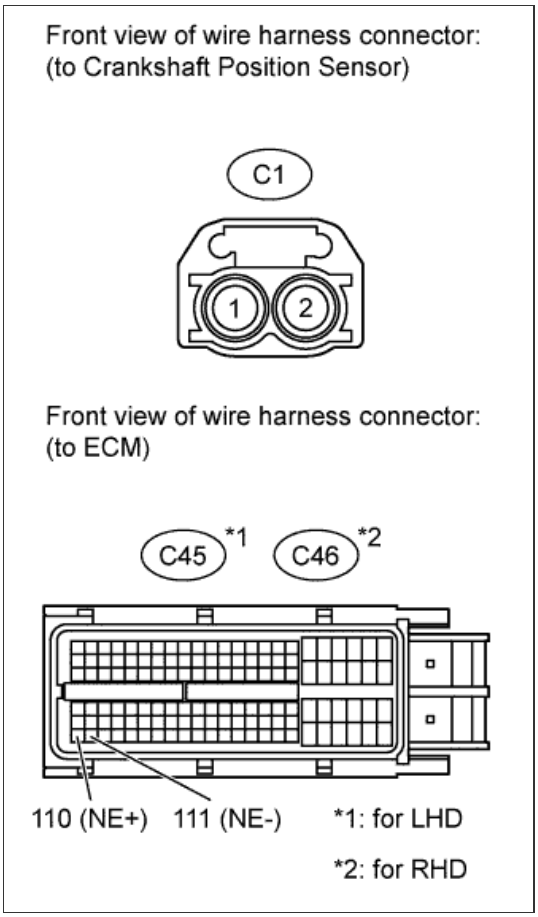
The terms "Cold" and "Hot" refer to the temperature of the sensor. Cold means approximately -10 to 50°C (14 to 122°F). Hot means approximately 50 to 100°C (122 to 212°F).

NG → REPLACE CRANKSHAFT POSITION SENSOR (Click here)



OK →

3.CHECK HARNESS AND CONNECTOR (CRANKSHAFT POSITION SENSOR - ECM)

a. Disconnect the CKP sensor connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C1-1 - C45-110 (NE+)	Always	Below 1 Ω
C1-2 - C45-111 (NE-)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C1-1 - C46-110 (NE+)	Always	Below 1 Ω
C1-2 - C46-111 (NE-)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C1-1 or C45-110 (NE+) - Body ground	Always	10 kΩ or higher
C1-2 or C45-111 (NE-) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C1-1 or C46-110 (NE+) - Body ground	Always	10 kΩ or higher
C1-2 or C46-111 (NE-) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK SENSOR INSTALLATION (CRANKSHAFT POSITION SENSOR)

a. Check the CKP sensor installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

5.CHECK CRANK ANGLE SENSOR PLATE (TEETH OF SENSOR PLATE)

a. Check the teeth of the sensor plate.

OK:
Sensor plate does not have any cracks or deformation.

NG → REPLACE CRANKSHAFT (Click here)

OK

6.REPLACE CRANKSHAFT POSITION SENSOR

a. Replace the crankshaft position sensor (Click here).

NEXT

7.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read the DTCs.

Result

Result	Proceed to
No output	A
P0335 or P0339	B

HINT:

If the engine does not start, replace the ECM.

B → REPLACE ECM (Click here)

A

END

DTC P2A00 A/F Sensor Circuit Slow Response (Bank 1 Sensor 1)

DTC P2A03 A/F Sensor Circuit Slow Response (Bank 2 Sensor 1)

for Preparation Click here

DESCRIPTION

Refer to DTC P2195 (Click here).

HINT:

- **DTC P2A00 indicates malfunctions related to the bank 1 A/F sensor.**
- **DTC P2A03 indicates malfunctions related to the bank 2 A/F sensor.**
- **Bank 1 refers to the bank that includes cylinder No. 1.**
- **Bank 2 refers to the bank that includes cylinder No. 2.**
- **Sensor 1 refers to the sensor mounted in front of the Three-Way Catalytic Converter (TWC) and located near the engine assembly.**

DTC Code	DTC Detection Condition	Trouble Area
P2A00 P2A03	The calculated value for the air fuel ratio (A/F) sensor response rate deterioration level is less than threshold.	• Open or short in A/F sensor (bank 1, 2 sensor 1) circuit • A/F sensor • A/F sensor heater • ECM

CONFIRMATION DRIVING PATTERN

HINT:

Performing this confirmation pattern will activate the A/F sensor response monitor.

(a) Connect the intelligent tester to the DLC3.
(b) Turn the ignition switch to ON.
(c) Turn the intelligent tester on.
(d) Clear DTCs (Click here).
(e) Enter the following menus: Powertrain / Engine / Utility / Monitor Status.
(f) Check that O2S (A/FS) Monitor is Incmpl.
(g) Start the engine and warm it up.
(h) Drive the vehicle at a constant speed between 40 km/h and 120 km/h (25 mph and 75 mph) for 3 minutes.
(i) Check that O2S (A/FS) Monitor is Compl. If the Monitor Status is Incmpl, perform the driving pattern again increasing the vehicle speed and using second gear to decelerate the vehicle.
(j) Enter the following menus: Powertrain / Engine / DTC / Pending.
(k) Check if any DTCs (any pending DTCs) are stored.

WIRING DIAGRAM

Refer to DTC P2195 (Click here).

INSPECTION PROCEDURE

HINT:

Malfunctioning areas can be identified by performing the Control the Injection Volume for A/F sensor function provided in the Active Test. The Control the Injection Volume for A/F sensor function can help to determine whether the Air Fuel Ratio (A/F) sensor, Heated Oxygen (HO2) sensor and other potential trouble areas are malfunctioning.

The following instructions describe how to conduct the Control the Injection Volume for A/F sensor operation using the intelligent tester.

1. **Connect the intelligent tester to the DLC3.**
2. **Start the engine and turn the intelligent tester on.**
3. **Warm up the engine at an engine speed of 2500 rpm for approximately 90 seconds.**
4. **On the intelligent tester, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F sensor.**

5. **Perform the Active Test operation with the engine idling (press the RIGHT or LEFT button to change the fuel injection volume.)**
6. **Monitor the output voltages of the A/F and HO2 sensors (AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2) displayed on the intelligent tester.**

HINT:

- **The Control the Injection Volume for A/F sensor operation lowers the fuel injection volume by 12.5% or increases the injection volume by 25%.**
- **Each sensor reacts in accordance with increases and decreases in the fuel injection volume.**

Tester Display (Sensor)	Injection Volume	Status	Voltage
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	+25%	Rich	Less than 3.1 V
AFS Voltage B1S1 or AFS Voltage B2S1 (A/F)	-12.5%	Lean	More than 3.4 V
O2S B1S2 or O2S B2S2 (HO2)	+25%	Rich	More than 0.55 V
O2S B1S2 or O2S B2S2 (HO2)	-12.5%	Lean	Less than 0.4 V

NOTICE:

The Air Fuel Ratio (A/F) sensor has an output delay of a few seconds and the Heated Oxygen (HO2) sensor has a maximum output delay of approximately 20 seconds.

Case	A/F Sensor (Sensor 1) Output Voltage	HO2 Sensor (Sensor 2) Output Voltage	Main Suspected Trouble Area
1			-
2			• A/F sensor • A/F sensor heater • A/F sensor circuit
3			• HO2 sensor • HO2 sensor heater • HO2 sensor circuit
4			• Injector • Fuel pressure • Gas leakage from exhaust system (Air fuel ratio extremely rich or lean)

- Following the Control the Injection Volume for A/F sensor procedure enables technicians to check and graph the voltage outputs of both the A/F and HO2 sensors.
- To display the graph, enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Injection Volume for A/F Sensor / A/F Control System / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S2.

HINT:

- **DTC P2A00 or P2A03 may be also stored, when the air fuel ratio is stuck rich or lean.**
- **A low A/F sensor voltage could be caused by a rich air-fuel mixture. Check for conditions that would cause the engine to run rich.**
- **A high A/F sensor voltage could be caused by a lean air-fuel mixture. Check for conditions that would cause the engine to run lean.**

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P2A00 AND/OR P2A03)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Trouble Codes.

e. Read DTCs.

Result

Display (DTC Output)	Proceed to
P2A00 and/or P2A03	A
P2A00 and/or P2A03 and other DTCs	B

HINT:

If any DTCs other than P2A00 or P2A03 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.INSPECT AIR FUEL RATIO SENSOR (HEATER RESISTANCE)

a. Disconnect the Air Fuel ratio (A/F) sensor connector.

b. Measure the resistance according to the value(s) in the table below.

Component without harness connected:
(A/F Sensor)

*1: for Bank 1

*2: for Bank 2

Standard Resistance:

for Bank 1 Sensor 1

Tester Connection	Condition	Specified Condition
1 (HA1A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA1A) - 4 (A1A-)	Always	10 kΩ or higher

for Bank 2 Sensor 1

Tester Connection	Condition	Specified Condition
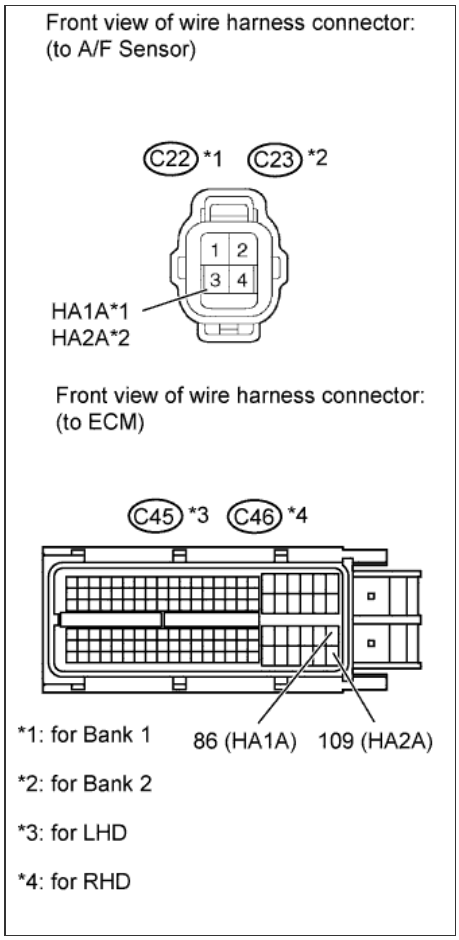
1 (HA2A) - 2 (+B)	20°C (68°F)	1.8 to 3.4 Ω
1 (HA2A) - 4 (A2A-)	Always	10 kΩ or higher



NG → REPLACE AIR FUEL RATIO SENSOR (Click here)

OK

3.CHECK HARNESS AND CONNECTOR (A/F SENSOR - ECM)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C45-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C45-109 (HA2A)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) - C46-86 (HA1A)	Always	Below 1 Ω
C23-1 (HA2A) - C46-109 (HA2A)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C45-86 (HA1A) - Body ground	Always	10 kΩ or higher

C23-1 (HA2A) or C45-109 (HA2A) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C22-1 (HA1A) or C46-86 (HA1A) - Body ground	Always	10 kΩ or higher
C23-1 (HA2A) or C46-109 (HA2A) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

DESCRIPTION

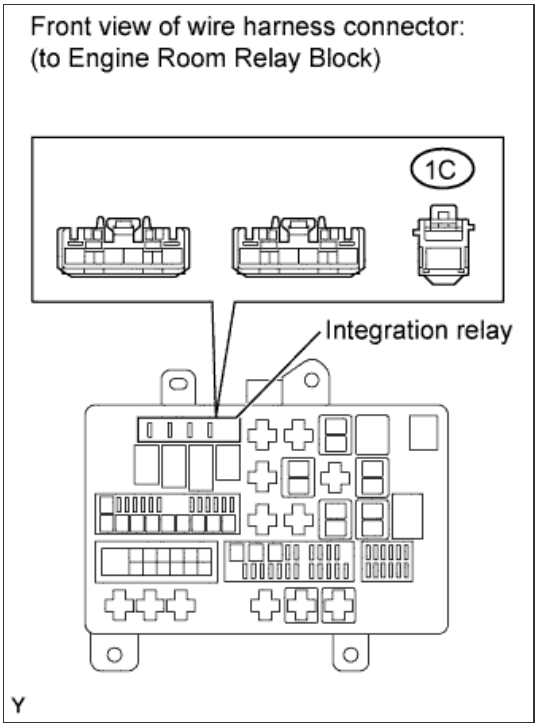
When the ignition switch is turned to ON, battery voltage is applied to the IGSW of the ECM. The output signal from the MREL terminal of the ECM causes a current to flow to the coil, closing the contacts of the integration relay (EFI relay) and supplying power to either terminal +B or +B2 of the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE



1.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - BATTERY)

a. Remove the integration relay from the engine room relay block.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
1C-1 - Body ground	Always	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.INSPECT INTEGRATION RELAY (EFI RELAY AND IG2 RELAY)

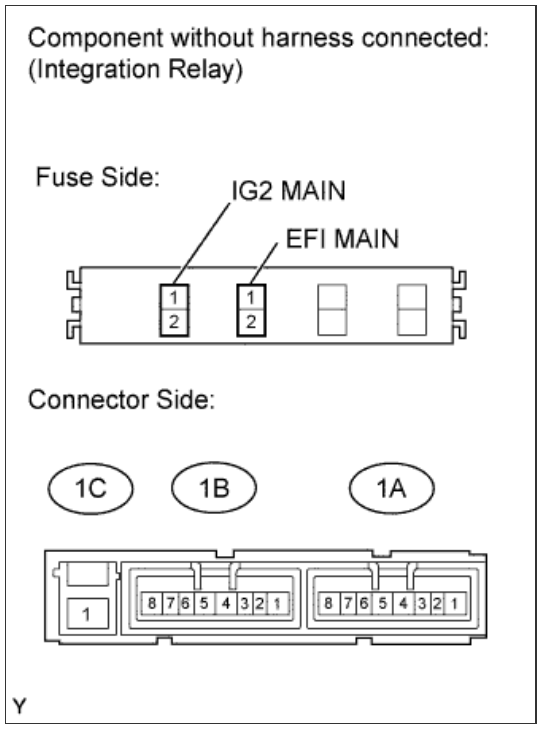
a. Remove the integration relay from the engine room relay block.

b. Inspect the EFI MAIN fuse and the IG2 MAIN fuse.

i. Remove the EFI MAIN fuse and IG2 MAIN fuse from the integration relay.

ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω
IG2 MAIN fuse	Always	Below 1 Ω

c. Inspect the EFI relay and the IG2 relay.

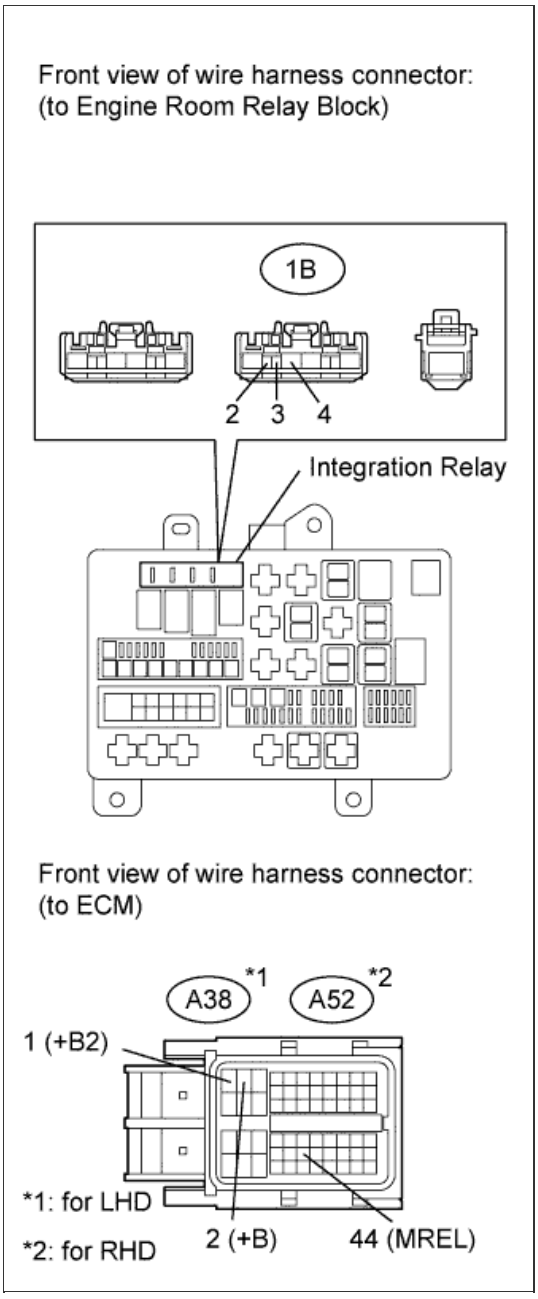
i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	Battery voltage is not applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage is applied to terminals 1B-2 and 1B-3	Below 1 Ω
1C-1 - 1B-8	Battery voltage is not applied to terminals 1B-7 and 1B-6	10 kΩ or higher
	Battery voltage is applied to terminals 1B-7 and 1B-6	Below 1 Ω

NG → REPLACE INTEGRATION RELAY

OK



3.CHECK HARNESS AND CONNECTOR (+B, +B2 AND MREL CIRCUIT)

a. Check the harness and the connectors between the integration relay and the ECM.

i. Remove the integration relay from the engine room relay block.

ii. Disconnect the ECM connector.

iii. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
A38-44 (MREL) - 1B-2	Always	Below 1 Ω
A38-2 (+B) - 1B-4	Always	Below 1 Ω
A38-1 (+B2) - 1B-4	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
A52-44 (MREL) - 1B-2	Always	Below 1 Ω
A52-2 (+B) - 1B-4	Always	Below 1 Ω
A52-1 (+B2) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
A38-44 (MREL) or 1B-2 - Body ground	Always	10 kΩ or higher

A38-2 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher
A38-1 (+B2) or 1B-4 - Body ground	Always	10 kΩ or higher

for RHD

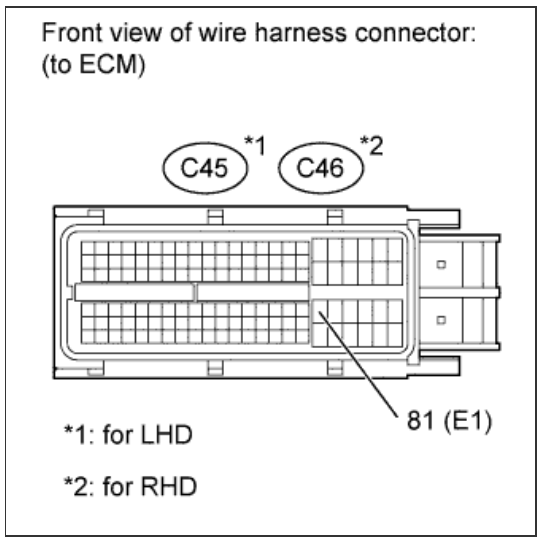
Tester Connection	Condition	Specified Condition
A52-44 (MREL) or 1B-2 - Body ground	Always	10 kΩ or higher
A52-2 (+B) or 1B-4 - Body ground	Always	10 kΩ or higher
A52-1 (+B2) or 1B-4 - Body ground	Always	10 kΩ or higher

b. Check the harness and connectors between the integration relay and body ground.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
1B-3 - Body ground	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

4.CHECK HARNESS AND CONNECTOR (ECM - BODY GROUND)

a. Disconnect the ECM connector.

b. Measure the resistance according to the value(s) in the table below.

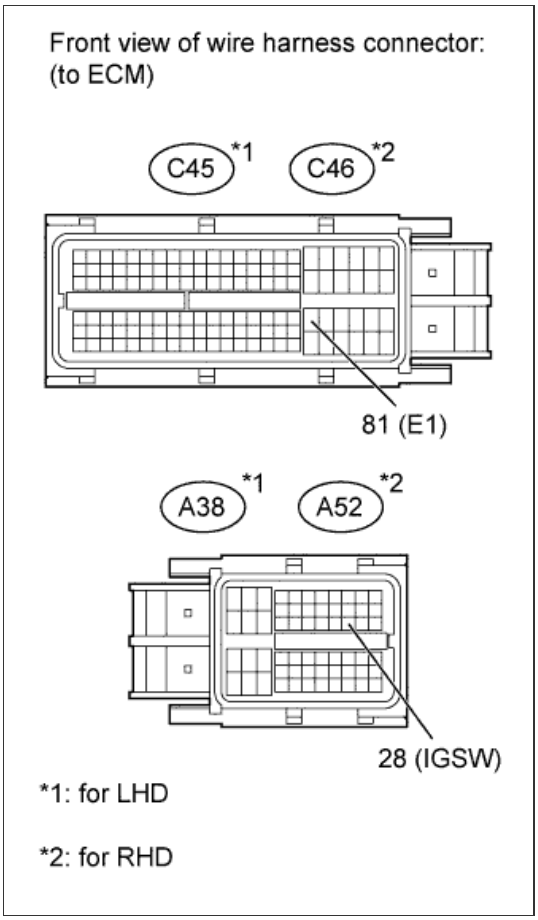
Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C45-81 (E1) - Body ground	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C46-81 (E1) - Body ground	Always	Below 1 Ω



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

5.INSPECT ECM (IGSW VOLTAGE)

a. Disconnect the ECM connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

for LHD

Tester Connection	Switch Condition	Specified Condition
A38-28 (IGSW) - C45-81 (E1)	Ignition switch ON	11 to 14 V

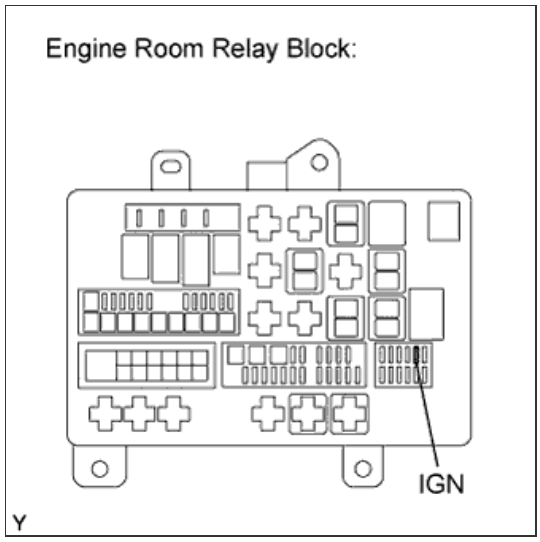
for RHD

Tester Connection	Switch Condition	Specified Condition
A52-28 (IGSW) - C46-81 (E1)	Ignition switch ON	11 to 14 V

NG → Go to step 6

OK

REPLACE ECM (Click here)



6.INSPECT FUSE (IGN)

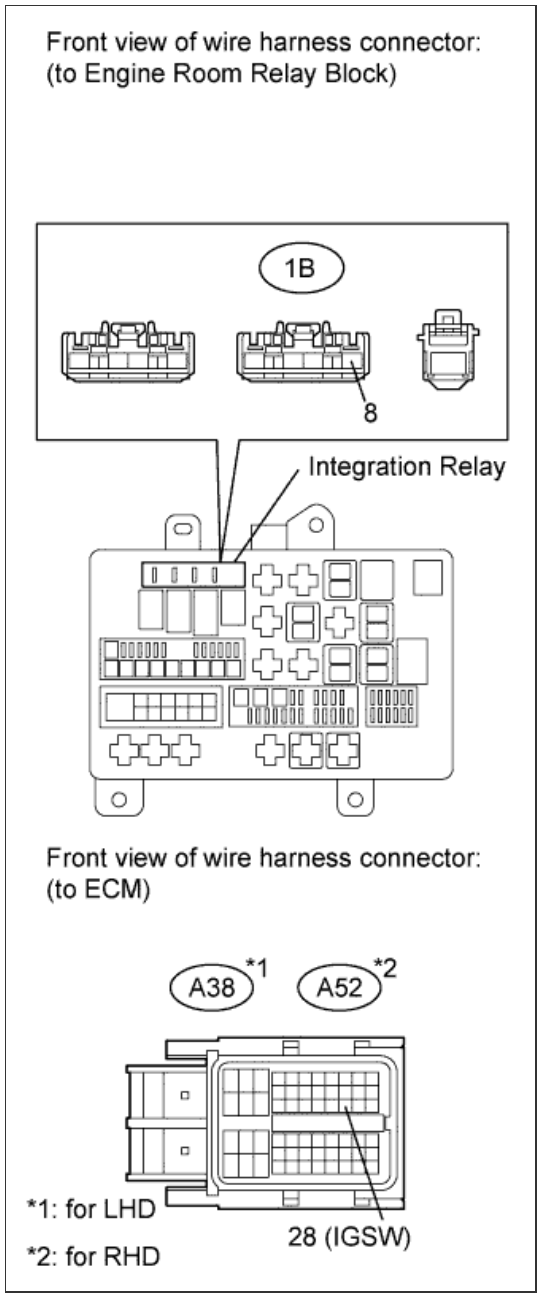
a. Remove the IGN fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
IGN fuse	Always	Below 1 Ω

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE



OK

7.CHECK HARNESS AND CONNECTOR (INTEGRATION RELAY - ECM, INTEGRATION RELAY - BODY GROUND)

a. Remove the integration relay from the engine room relay block.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
1B-8 - A38-28 (IGSW)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
1B-8 - A52-28 (IGSW)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
1B-8 or A38-28 (IGSW) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
1B-8 or A52-28 (IGSW) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

8.CHECK IF VEHICLE IS EQUIPPED WITH ENTRY AND START SYSTEM

Result

Result	Proceed to
w/ Entry and Start System	A
w/o Entry and Start System	B

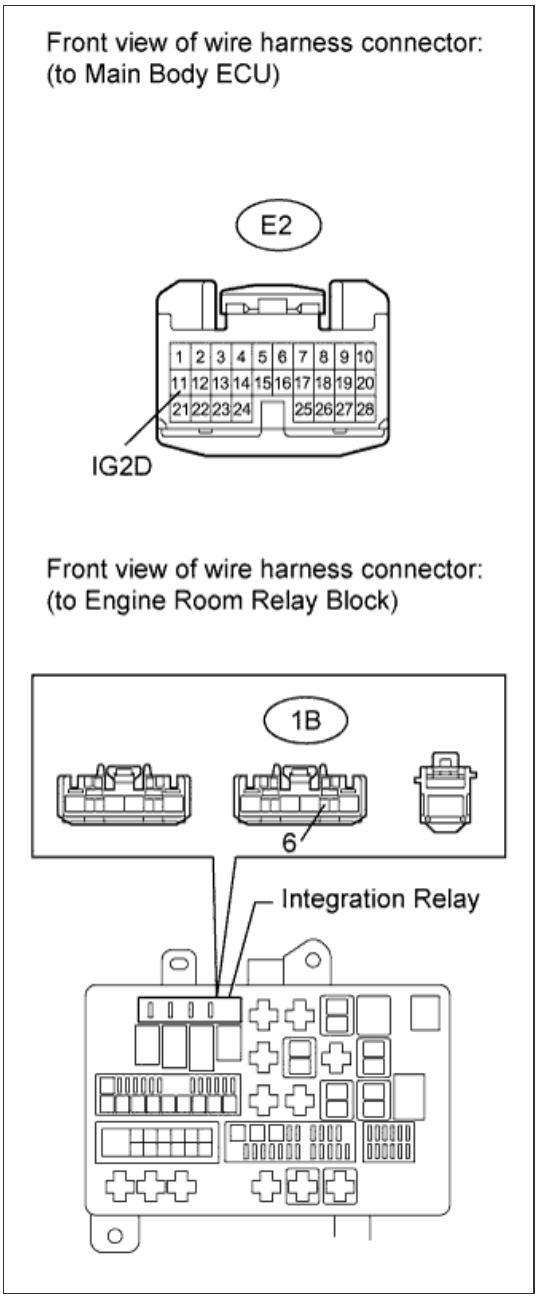
B → Go to step 11

A

9.CHECK HARNESS AND CONNECTOR (MAIN BODY ECU - ENGINE ROOM RELAY BLOCK)

a. Remove the integration relay from the engine room relay block.

b. Disconnect the E2 main body ECU connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
E2-11 (IG2D) - 1B-6	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
E2-11 (IG2D) or 1B-6 - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

10.CHECK ENTRY AND START SYSTEM (POWER SOURCE MODE DOES NOT CHANGE)

a. Check the entry and start system (Click here).

NG → REPAIR ENTRY AND START SYSTEM (Click here)

OK

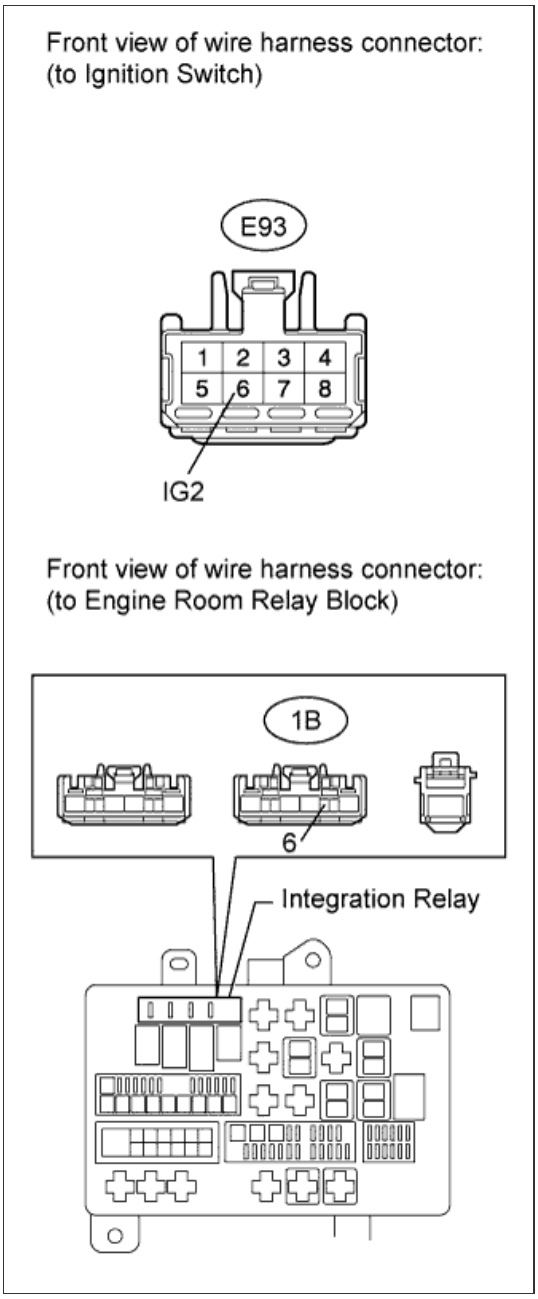
REPLACE ECM (Click here)

11.CHECK HARNESS AND CONNECTOR (IGNITION SWITCH - ENGINE ROOM RELAY BLOCK)

a. Remove the integration relay from the engine room relay block.

b. Disconnect the E93 ignition switch connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (Check for Open):

		Specified

Tester Connection	Condition	Condition
E93-6 (IG2) - 1B-6	Always	Below 1 Ω

Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
E93-6 (IG2) or 1B-6 - Body ground	Always	10 kΩ or higher

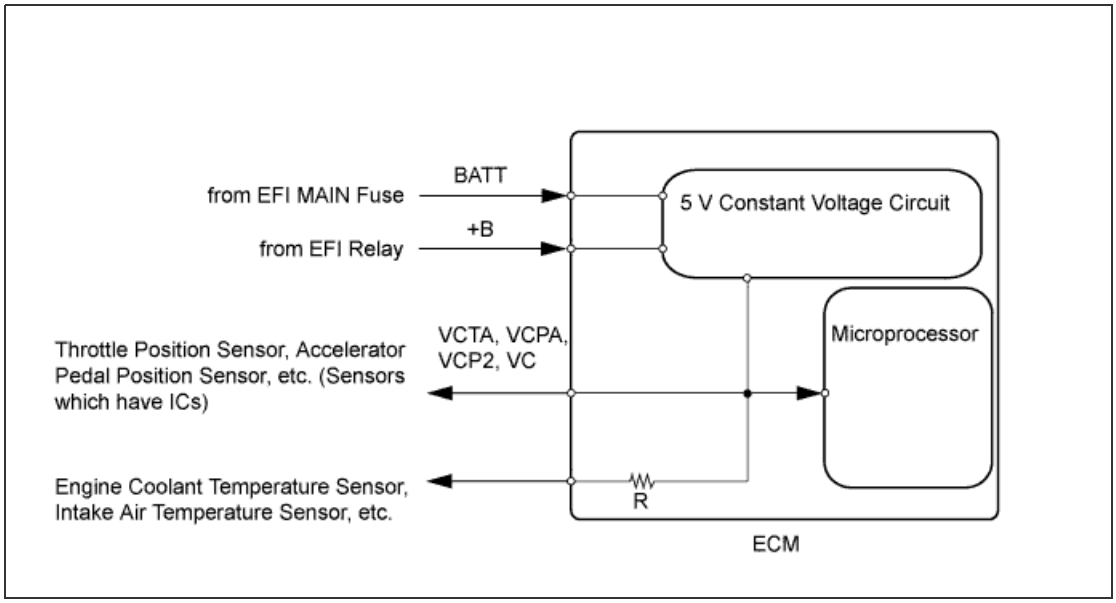
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

12.INSPECT IGNITION SWITCH ASSEMBLY

a. Inspect the ignition switch assembly (Click here).

NG → REPLACE IGNITION SWITCH ASSEMBLY (Click here)



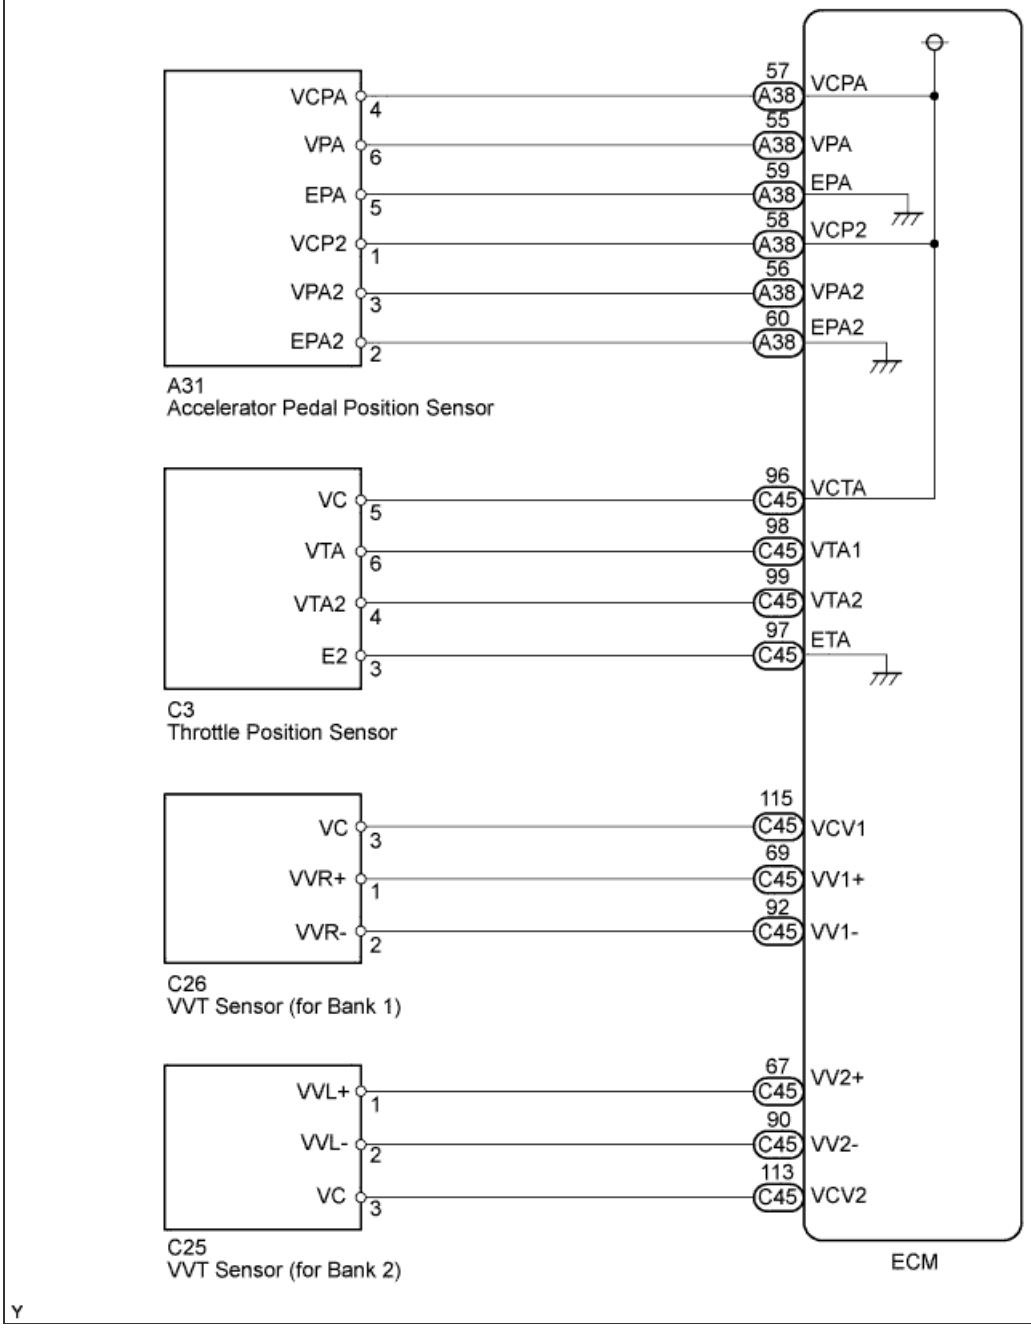
OK

REPAIR OR REPLACE HARNESS OR CONNECTOR (IGNITION SWITCH - BATTERY)

for Preparation Click here

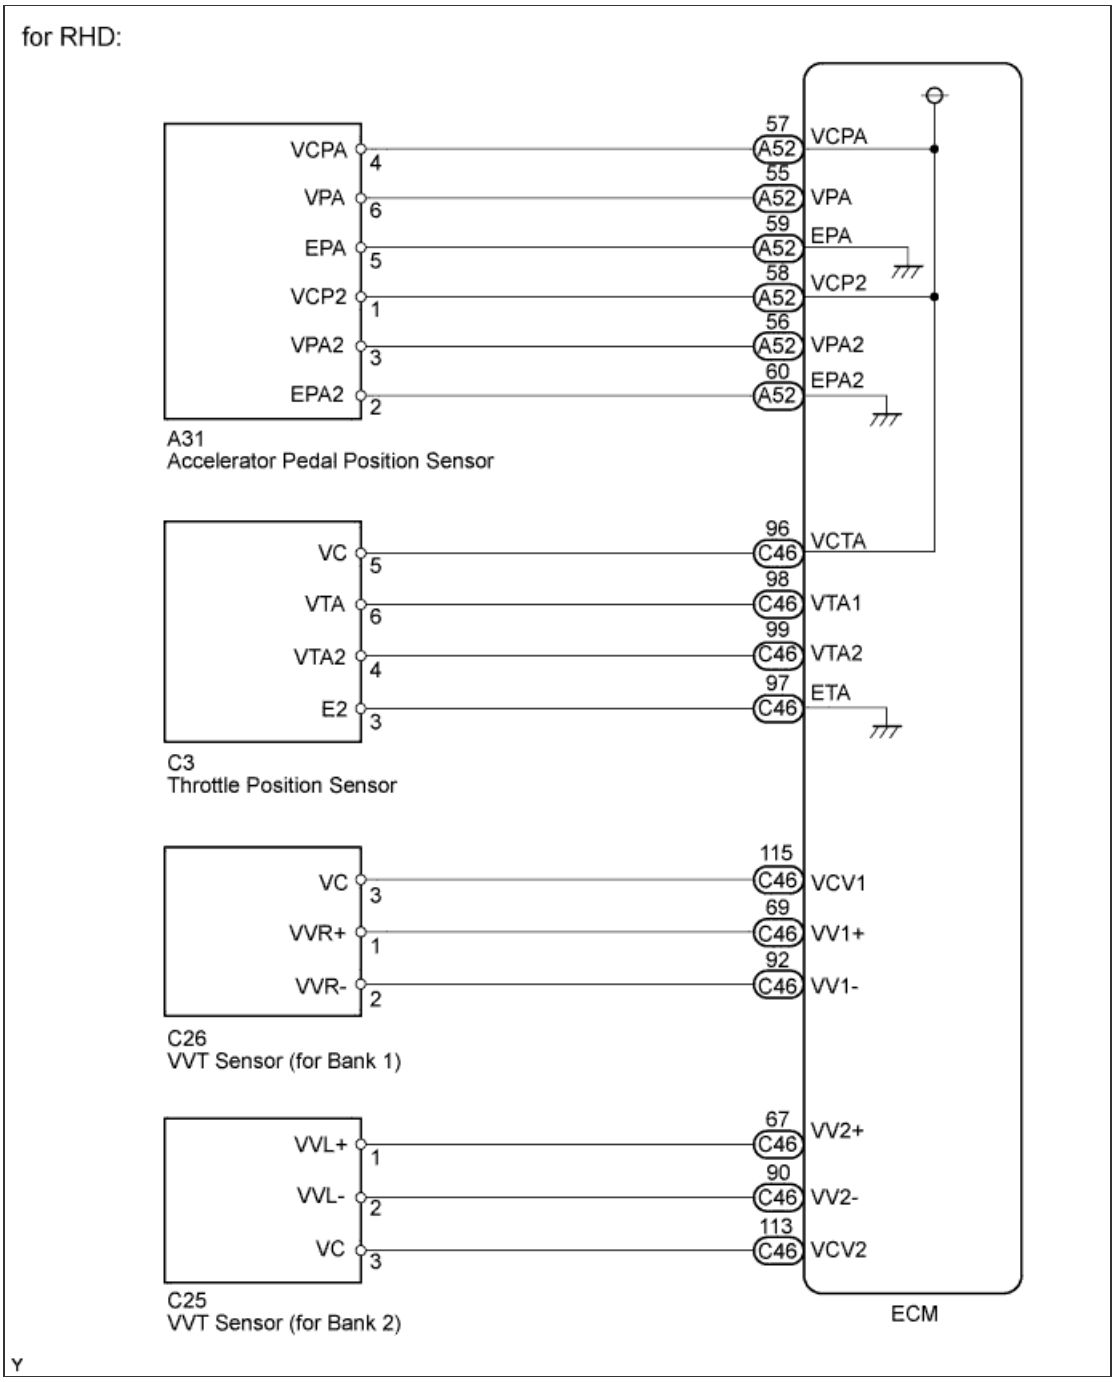
DESCRIPTION

The ECM constantly generates 5 V of power from the battery voltages supplied to the +B (BATT) terminal to operate the microprocessor. The ECM also provides this power to the sensors through the VC output circuit.



When the VC circuit is short-circuited, the microprocessor in the ECM and sensors that are supplied with power through the VC circuit are inactivated because the power is not supplied from the VC circuit. Under this condition, the system does not start up and the MIL does not illuminate even if the system malfunctions.

HINT:



Under normal conditions, the MIL is illuminated for several seconds when the ignition switch is first turned to ON. The MIL goes off when the engine is started.

INSPECTION PROCEDURE

HINT:

When viewed from the rear of the engine assembly, Bank 1 is on the right side and Bank 2 is on the left side.

1.CHECK MIL

a. Check that the Malfunction Indicator Lamp (MIL) lights up when turning the ignition switch to ON.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

A → SYSTEM OK

B

2.CHECK COMMUNICATION BETWEEN INTELLIGENT TESTER AND ECM

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and tester on.

c. Check the communication between the tester and ECM.

Result

Result	Proceed to
Communication is possible	A
Communication is not possible	B

A → GO TO MIL CIRCUIT (Click here)

B

3.CHECK MIL (THROTTLE BODY)

a. Disconnect the throttle body connector.

b. Turn the ignition switch to ON.

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

d. Reconnect the throttle body connector.

A → REPLACE THROTTLE BODY ASSEMBLY (Click here)

B

4.CHECK MIL (ACCELERATOR PEDAL POSITION SENSOR)

a. Disconnect the accelerator pedal position sensor connector.

b. Turn the ignition switch to ON.

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

d. Reconnect the accelerator pedal position sensor connector.

A → REPLACE ACCELERATOR PEDAL ASSEMBLY (Click here)

B

5.CHECK MIL (VVT SENSOR FOR BANK 1)

a. Disconnect the air cleaner assembly with element (Click here).

b. Disconnect the VVT sensor (bank 1) connector.

c. Turn the ignition switch to ON.

d. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

e. Reconnect the VVT sensor (bank 1) connector.

A → REPLACE VVT SENSOR (BANK 1) (Click here)

B

6.CHECK MIL (VVT SENSOR FOR BANK 2)

a. Disconnect the VVT sensor (bank 2) connector.

b. Turn the ignition switch to ON.

c. Check the MIL.

Result

Result	Proceed to
MIL illuminates	A
MIL does not illuminate	B

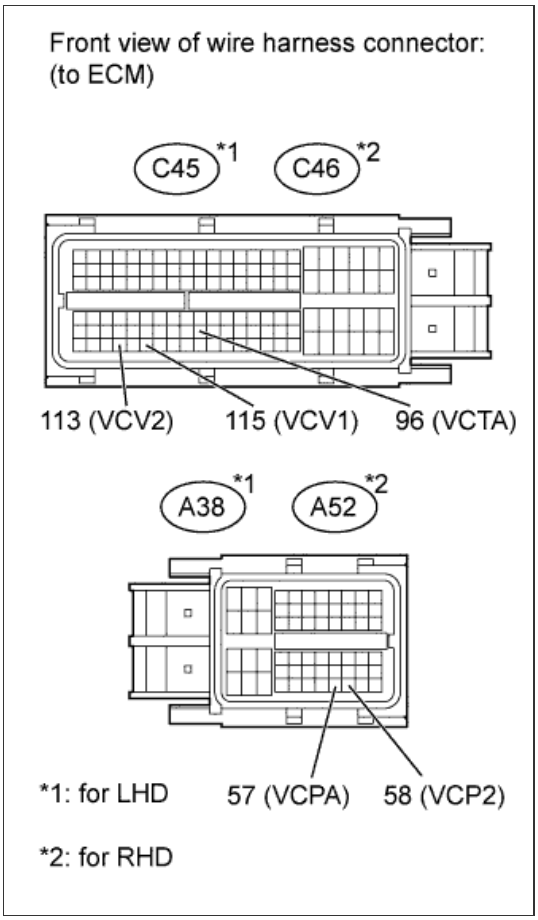
d. Reconnect the VVT sensor (bank 2) connector.

A → REPLACE VVT SENSOR (BANK 2) (Click here)

B

7.CHECK HARNESS AND CONNECTOR

a. Disconnect the throttle body connector.



b. Disconnect the accelerator pedal position sensor connector.

c. Disconnect the VVT sensor (bank 1) connector.

d. Disconnect the VVT sensor (bank 2) connector.

e. Disconnect the ECM connectors.

f. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
A38-57 (VCPA) - Body ground	Always	10 kΩ or higher
A38-58 (VCP2) - Body ground	Always	10 kΩ or higher
C45-96 (VCTA) - Body ground	Always	10 kΩ or higher
C45-115 (VCV1) - Body ground	Always	10 kΩ or higher
C45-113 (VCV2) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
A52-57 (VCPA) - Body ground	Always	10 kΩ or higher
A52-58 (VCP2) - Body ground	Always	10 kΩ or higher
C46-96 (VCTA) - Body ground	Always	10 kΩ or higher
C46-115 (VCV1) - Body ground	Always	10 kΩ or higher
C46-113 (VCV2) - Body ground	Always	10 kΩ or higher

g. Reconnect the ECM connectors.

h. Reconnect the throttle body connector.

i. Reconnect the accelerator pedal position sensor connector.

j. Reconnect the VVT sensor (bank 1) connector.

k. Reconnect the VVT sensor (bank 2) connector.

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

for Preparation Click here

DESCRIPTION

The fuel pump circuit consists of the ECM, fuel pump and fuel pump ECU (which operates the fuel pump). Based on the engine output, the ECM determines the fuel pump speed. The speed is then converted to a duty signal and sent to the fuel pump ECU. Based on the signal sent from the ECM, the fuel pump ECU adjusts the fuel pump operation speed between 3 settings.

WIRING DIAGRAM

Refer to DTC P0230 (Click here).

INSPECTION PROCEDURE

This troubleshooting procedure is based on the premise that the engine is started. If the engine is not started, proceed to the Problem Symptoms Table (Click here).

1.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (FUEL PUMP)

a. Connect the intelligent tester to the DLC3.

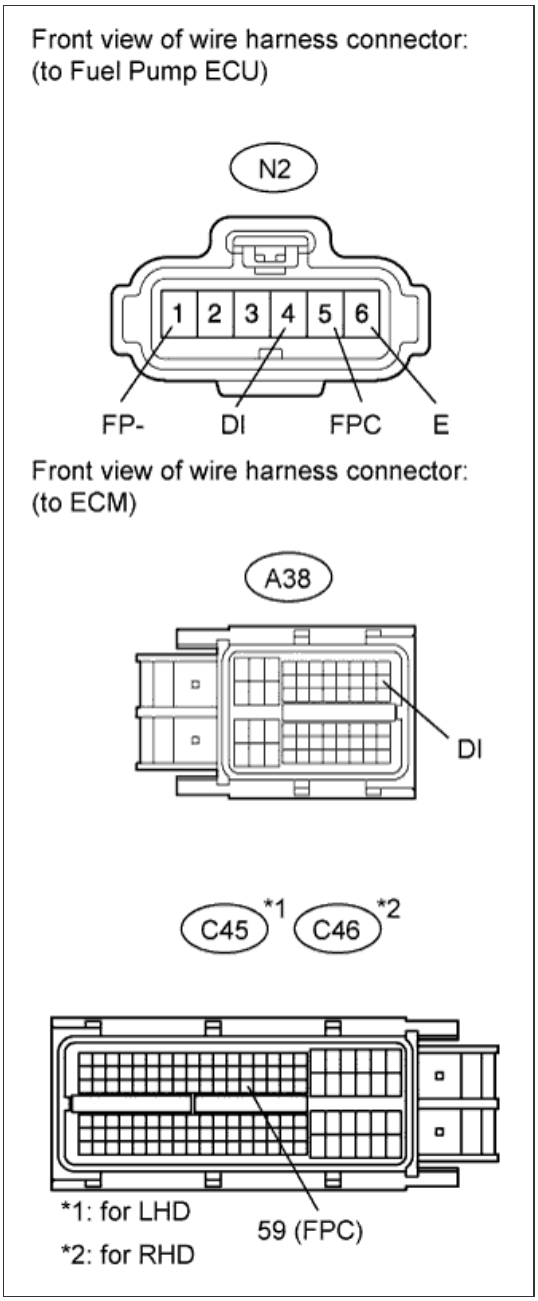
b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the Fuel Pump / Speed.

d. Check whether operating sounds can be heard while operating the relay using the tester.

OK:
Operating sounds can be heard from relay.

NG → **Go to step 5**



OK

2.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM, BODY GROUND)

a. Disconnect the fuel pump ECU connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - C45-59 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A38-19 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - C46-59 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A52-19 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
N2-1 (FP-) - Body ground	Always	10 kΩ or higher
N2-5 (FPC) or C45-59 (FPC) - Body ground	Always	10 kΩ or higher
N2-4 (DI) or A38-19 (DI) - Body		10 kΩ or

ground	Always	higher

for RHD

Tester Connection	Condition	Specified Condition
N2-1 (FP-) - Body ground	Always	10 kΩ or higher
N2-5 (FPC) or C46-59 (FPC) - Body ground	Always	10 kΩ or higher
N2-4 (DI) or A52-19 (DI) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.REPLACE FUEL PUMP ECU

a. Replace the fuel pump ECU (Click here).

NEXT

4.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check the fuel pump operation.

OK:
Malfunction has been repaired successfully.

NG → REPLACE ECM (**Click here**)

OK

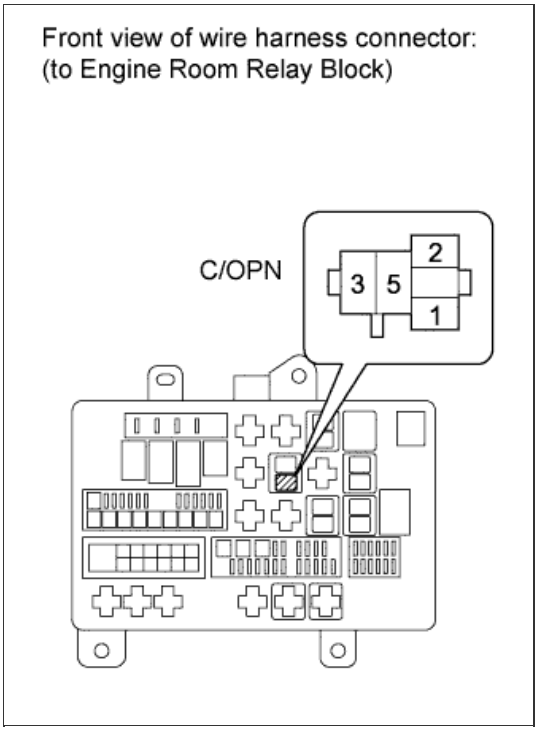
END

5.INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Inspect the circuit opening relay (C/OPN) (Click here).

NG → REPLACE CIRCUIT OPENING RELAY (C/OPN)

OK



6.INSPECT CIRCUIT OPENING RELAY (POWER SOURCE VOLTAGE)

a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Measure the voltage according to the value(s) in the table below.

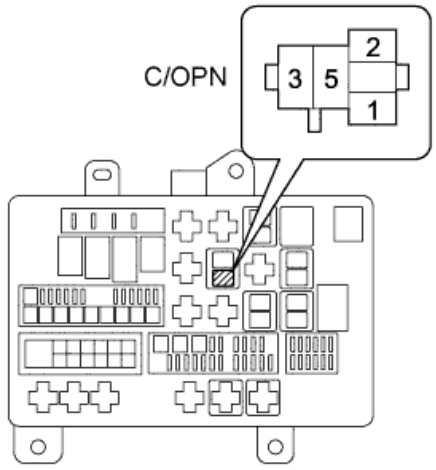
Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C/OPN relay (2) - Body ground	Ignition switch ON	11 to 14 V
C/OPN relay (5) - Body ground	Ignition switch ON	11 to 14 V

NG → Go to step 13

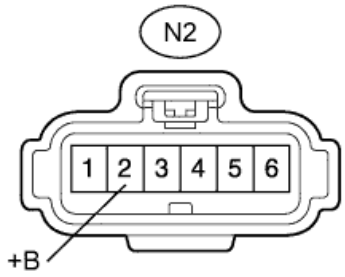
OK

7.CHECK HARNESS AND CONNECTOR (CIRCUIT OPENING RELAY (C/OPN) - ECU, FUEL PUMP ECU)



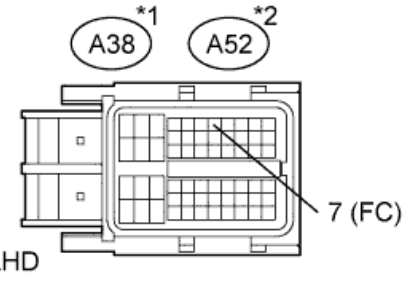
a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

b. Disconnect the fuel pump ECU connector.



c. Disconnect the ECM connector.

d. Measure the resistance according to the value(s) in the table below.



Front view of wire harness connector:
(to Engine Room Relay Block)

Front view of wire harness connector:
(to Fuel Pump ECU)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
C/OPN relay (1) - A38-7 (FC)	Always	Below 1 Ω
C/OPN relay (3) - N2-3 (+B)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
C/OPN relay (1) - A52-7 (FC)	Always	Below 1 Ω
C/OPN relay (3) - N2-3 (+B)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
C/OPN relay (1) or A38-7 (FC) - Body ground	Always	10 kΩ or higher
C/OPN relay (3) or N2-3 (+B) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
C/OPN relay (1) or A52-7 (FC) - Body ground	Always	10 kΩ or higher
C/OPN relay (3) or N2-3 (+B) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

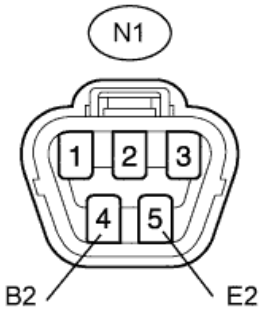
OK

8.CHECK HARNESS AND CONNECTOR (FUEL PUMP - FUEL PUMP ECU)

a. Disconnect the fuel sender gauge connector.

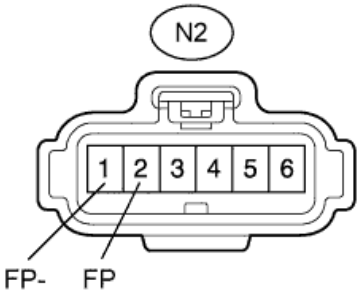
b. Disconnect the fuel pump ECU connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
N1-4 (B2) - N2-2 (FP)	Always	Below 1 Ω
N1-5 (E2) - N2-1 (FP-)	Always	Below 1 Ω



Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
N1-4 (B2) or N2-2 (FP) - Body ground	Always	10 kΩ or higher
N1-5 (E2) or N2-1 (FP-) - Body ground	Always	10 kΩ or higher

Front view of wire harness connector: (to Fuel Sender Gauge)

Front view of wire harness connector: (to Fuel Pump ECU)

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT FUEL PUMP

a. Inspect the fuel pump (for Single Tank Type) (Click here).

b. Inspect the fuel pump (for Double Tank Type) (Click here).

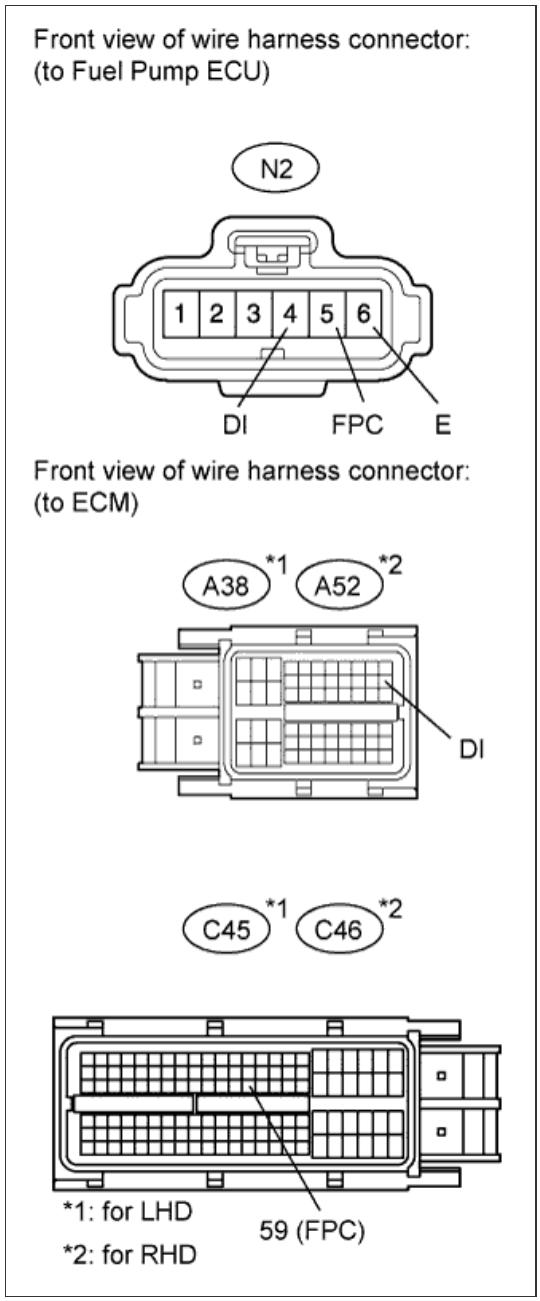
Result

Test Result	Proceed to
OK	A
NG (for Single Tank Type)	B

NG (for Double Tank Type)	C

B → REPLACE FUEL PUMP (Click here)

C → REPLACE FUEL PUMP (Click here)



A

10.CHECK HARNESS AND CONNECTOR (FUEL PUMP ECU - ECM, BODY GROUND)

a. Disconnect the fuel pump ECU connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - C45-59 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A38-19 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) - C46-59 (FPC)	Always	Below 1 Ω
N2-4 (DI) - A52-19 (DI)	Always	Below 1 Ω
N2-6 (E) - Body ground	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) or C45-59 (FPC) - Body ground	Always	10 kΩ or higher
N2-4 (DI) or A38-19 (DI) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
N2-5 (FPC) or C46-59 (FPC) - Body ground	Always	10 kΩ or higher
N2-4 (DI) or A52-19 (DI) - Body ground	Always	10 kΩ or higher

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

11.REPLACE FUEL PUMP ECU

a. Replace the fuel pump ECU (Click here).

NEXT

12.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check the fuel pump operation.

OK:

Malfunction has been repaired successfully.

NG → REPLACE ECM (Click here)

OK

END

13.CHECK HARNESS AND CONNECTOR (CIRCUIT OPENING RELAY (C/OPN) - IGN FUSE, INTEGRATION RELAY)

a. Remove the circuit opening relay (C/OPN) from the engine room relay block.

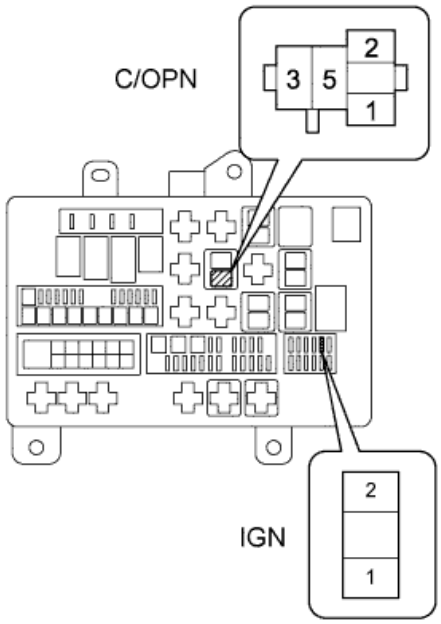
b. Remove the IGN fuse from the engine room relay block.

c. Remove the integration relay from the engine room relay block.

d. Disconnect the 1B integration relay connector.

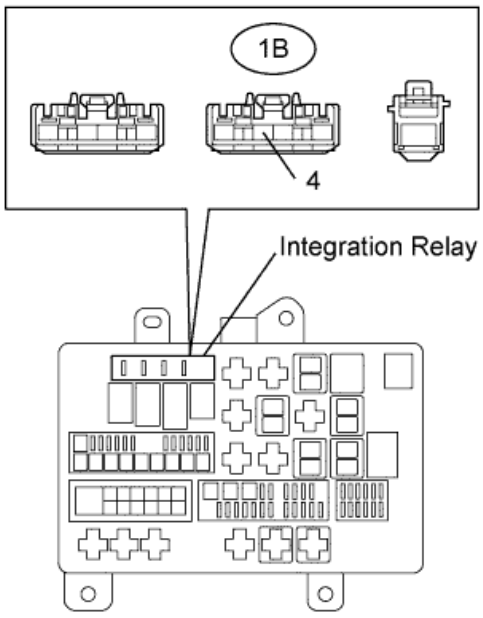
e. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):



Tester Connection	Condition	Specified Condition
C/OPN relay (2) - IGN fuse (2)	Always	Below 1 Ω
C/OPN relay (5) - 1B-4	Always	Below 1 Ω

Standard Resistance (Check for Short):



Tester Connection	Condition	Specified Condition
C/OPN relay (2) or		

IGN fuse (2) - Body ground	Always	10 kΩ or more
C/OPN relay (5) or 1B-4 - Body ground	Always	10 kΩ or more

Front view of wire harness connector:

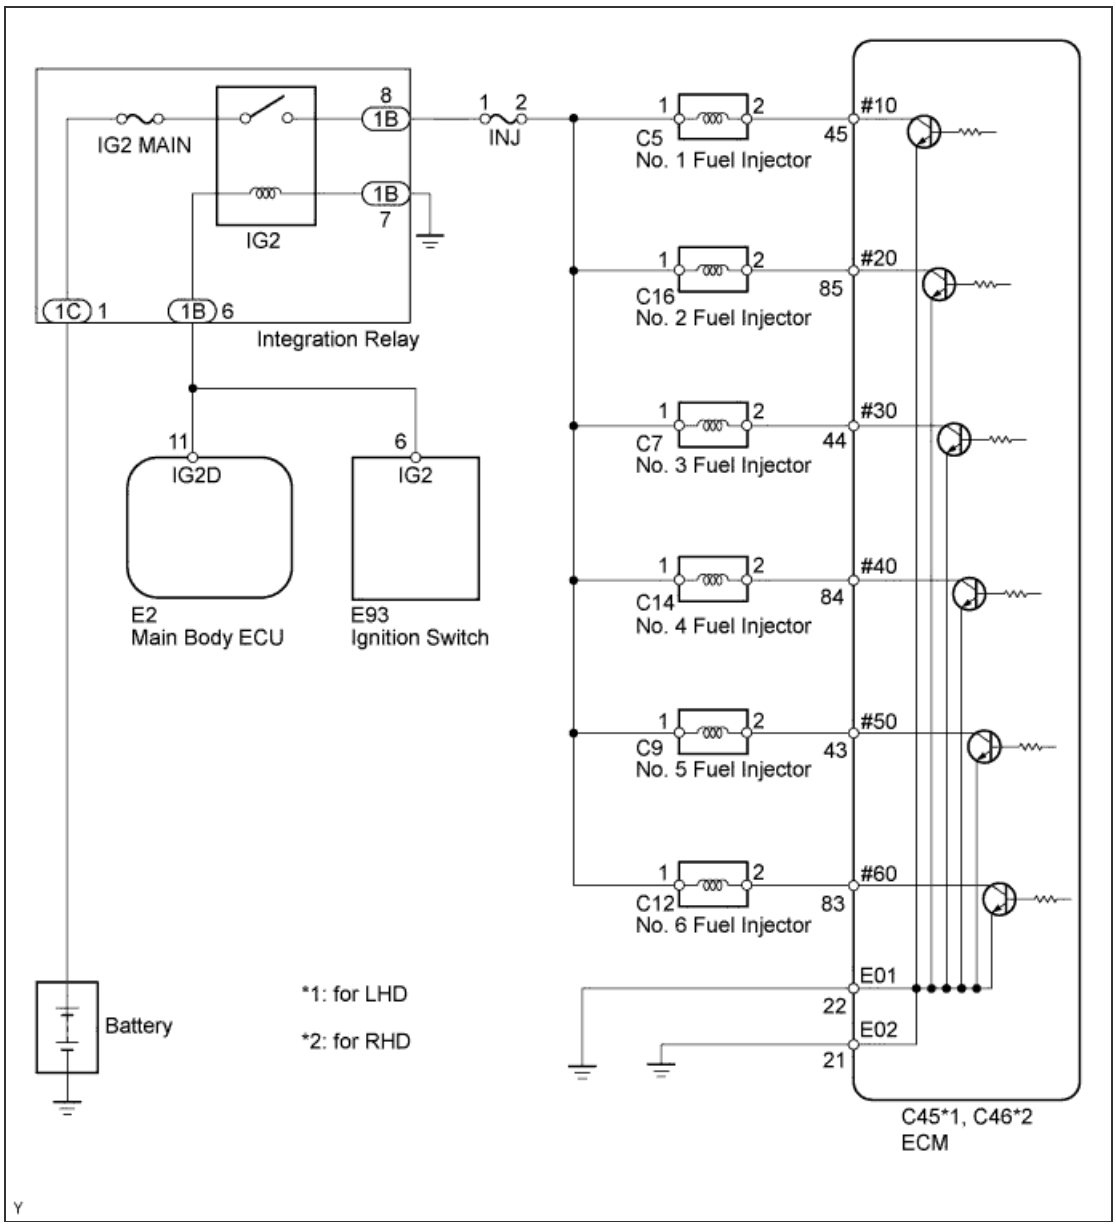
OK



GO TO ECM POWER SOURCE CIRCUIT (Click here)

for Preparation Click here

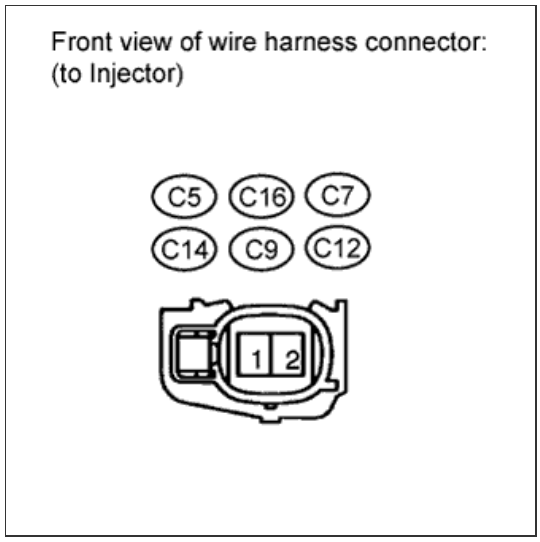
DESCRIPTION

The fuel injectors are located on the intake manifold. They inject fuel into the cylinders based on the signals from the ECM.

WIRING DIAGRAM

INSPECTION PROCEDURE

1.CHECK FUEL INJECTOR ASSEMBLY (POWER SOURCE)



a. Disconnect the fuel injector connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Cylinder	Tester Connection	Switch Condition	Specified Condition
No. 1	C5-1 - Ground	Ignition switch ON	11 to 14 V
No. 2	C16-1 - Ground	Ignition switch ON	11 to 14 V
No. 3	C7-1 - Ground	Ignition switch ON	11 to 14 V

No. 4	C14-1 - Ground	Ignition switch ON	11 to 14 V
No. 5	C9-1 - Ground	Ignition switch ON	11 to 14 V
No. 6	C12-1 - Ground	Ignition switch ON	11 to 14 V

NG → Go to step 4

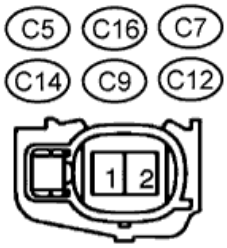
OK

2.INSPECT FUEL INJECTOR ASSEMBLY

a. Inspect the fuel injector (Click here).

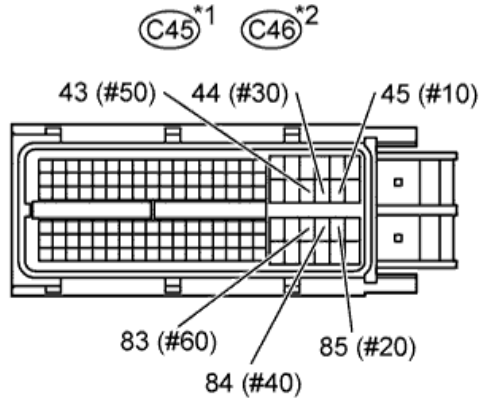
NG → REPLACE FUEL INJECTOR ASSEMBLY (Click here)

OK



3.CHECK HARNESS AND CONNECTOR (FUEL INJECTOR ASSEMBLY - ECM)

a. Disconnect the fuel injector connector.



b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Front view of wire harness connector:
(to Injector)

Front view of wire harness connector:
(to ECM)

*1: for LHD

*2: for RHD

Standard Resistance:

for LHD

No. 6	C12-2 - Body ground	Always	10 kΩ or higher
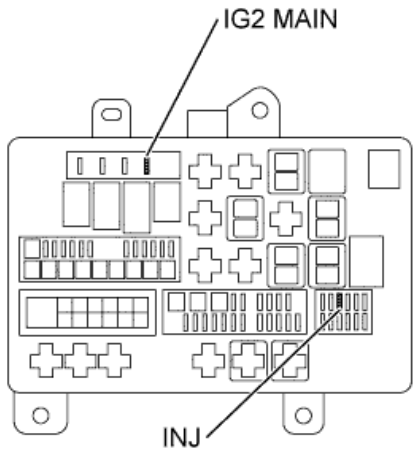
	C12-2 - C46-83 (#60)	Always	Below 1 Ω

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

REPLACE ECM (Click here)

4.INSPECT FUSE (INJ, IG2 MAIN)



a. Remove the INJ fuse and IG2 MAIN fuse from the engine room relay block.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
INJ fuse	Always	Below 1 Ω
IG2 MAIN fuse	Always	Below 1 Ω

Engine Room Relay Block:

NG → CHECK FOR SHORT IN ALL HARNESSES AND CONNECTORS CONNECTED TO FUSE AND REPLACE FUSE

OK

5.INSPECT INTEGRATION NO.1 RELAY (IG2)

a. Inspect the integration relay (Click here).

NG → REPLACE INTEGRATION NO.1 RELAY

OK

REPAIR OR REPLACE HARNESS OR CONNECTOR (INTEGRATION RELAY - FUEL INJECTOR ASSEMBLY)

for Preparation Click here

DESCRIPTION

While the engine is being cranked, current flows from terminal ST1 of the ignition switch*1 or terminal STAR of the main body ECU*2 to the park/neutral position switch (for automatic transmission) or clutch start switch (for manual transmission) and also flows to terminal STA of the ECM (STA Signal).

WIRING DIAGRAM

Refer to DTC P0617 (Click here).

INSPECTION PROCEDURE

1.READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / Starter Signal.

e. Read values.

f. Check the result when the ignition switch is turned to ON and when the engine is started.

OK:

Condition	Display (Starter Signal)
Ignition switch ON	OFF
Engine is started	ON

NG → Go to step 6

OK ↓

2.INSPECT STARTER RELAY (ST)

a. Inspect the starter relay (ST) (Click here).

NG → REPLACE STARTER RELAY (ST)

OK ↓

3.CHECK HARNESS AND CONNECTOR (ST RELAY - CLUTCH START SWITCH)

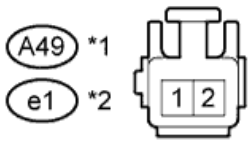
a. Disconnect the clutch start switch.

b. Remove the ST relay from the engine room relay block.

c. Measure the resistance according to the value(s) in the table below.

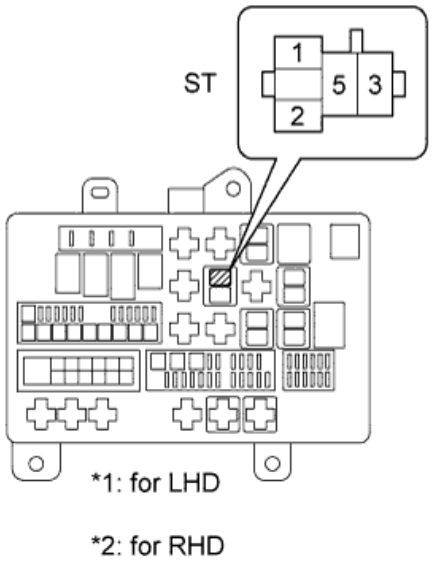
Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
ST relay (1) - A49-2*1	Always	Below 1 Ω
ST relay (1) - e1-2*2	Always	Below 1 Ω



Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
ST relay (1) or A49-2*1 - Body ground	Always	10 kΩ or higher



ST relay (1) or e1-2*2 - Body ground	Always	10 kΩ or higher

*1: for LHD

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK → REPAIR OR REPLACE HARNESS OR CONNECTOR (IGNITION SWITCH - BATTERY)

for Preparation Click here

DESCRIPTION

The cranking holding control system provides current to the starter when the ECM detects the ignition switch start signal (STSW). When the ECM performs a firing judgment, the system cuts current to the starter. When an ECM receives the STSW signal, it turns on the ST CUT relay, which prevents flickering of the combination meter, clock, audio system, etc. Also, the ECM sends a signal to the STAR terminal of the ECM. Then the STAR output signal travels through the Park/Neutral Position (PNP) switch to the ST relay, causing the starter to activate.
When the engine is cranking, the starter operation signal is sent to the STA terminal of the ECM.

WIRING DIAGRAM

Refer to DTC P0617 (Click here).

INSPECTION PROCEDURE

1.CHECK CRANKING

a. Check the cranking of the engine.

Result

Test Result	Proceed to
Cranking possible and holding control operates	A
Does not crank	B
Cranking possible but holding control does not operate (for automatic transmission)	C
Cranking possible but holding control does not operate (for manual transmission)	D

B → Go to step 2

C → Go to step 11

D → Go to step 17

A

PROCEED TO NEXT CIRCUIT INSPECTION SHOWN IN PROBLEM SYMPTOMS TABLE (Click here)

2.READ VALUE USING INTELLIGENT TESTER (STARTER SIGNAL)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON.

c. Turn the intelligent tester on.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / Starter Signal.

e. Read values.

f. Check the result when the ignition switch is turned to ON and when the engine is started.

OK:

Condition	Display (Starter Signal)
Ignition switch ON	OFF
Engine is started	ON

Result

Result	Proceed to
OK	A
NG (for automatic transmission)	B
NG (for manual transmission)	C

B → Go to step 7

C → Go to step 13

A

3.INSPECT STARTER RELAY (ST)

a. Inspect the starter relay (ST) (Click here).

NG → REPLACE STARTER RELAY (ST)

OK

4.CHECK HARNESS AND CONNECTOR (ST RELAY - PNP SWITCH, CLUTCH START SWITCH)

a. Disconnect the Park/Neutral Position (PNP) switch (for automatic transmission).

b. Disconnect the clutch start switch (for manual transmission).

c. Remove the ST relay from the engine room relay block.

d. Measure the resistance according to the value(s) in the table below.

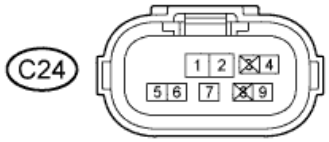
Standard Resistance (Check for Open):
for automatic transmission:

Tester Connection	Condition	Specified Condition
ST relay (1) - C24-5	Always	Below 1 Ω

Standard Resistance (Check for Short):
for automatic transmission:

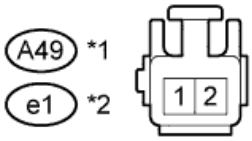
Tester Connection	Condition	Specified Condition
ST relay (1) or C24-5 - Body ground	Always	10 kΩ or higher

Standard Resistance (Check for Open):
for manual transmission:



Tester Connection	Condition	Specified Condition
ST relay (1) - A49-2*1	Always	Below 1 Ω
ST relay (1) - e1-2*2	Always	Below 1 Ω

Standard Resistance (Check for Short):
for manual transmission:



Tester Connection	Condition	Specified Condition
ST relay (1) or A49-2*1 - Body ground	Always	10 kΩ or higher
ST relay (1) or e1-2*2 - Body ground	Always	10 kΩ or higher

REPAIR OR REPLACE HARNESS OR CONNECTOR (STARTER - STARTER RELAY (ST), BATTERY)

7.INSPECT STARTER CUT RELAY (ST CUT)

a. Inspect the starter cut relay (ST CUT) (Click here).

NG → REPLACE STARTER CUT RELAY (ST CUT)

OK

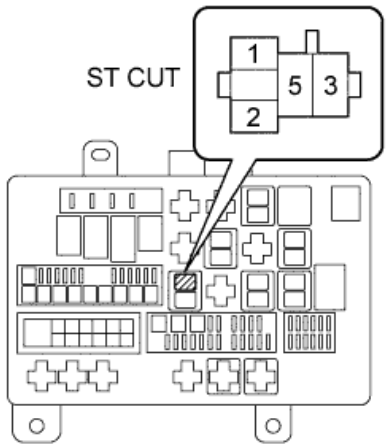
8.CHECK HARNESS AND CONNECTOR (ST CUT RELAY - PNP SWITCH, ECM)

a. Remove the starter cut relay (ST CUT) from the engine room relay block.

b. Disconnect the PNP switch connector.

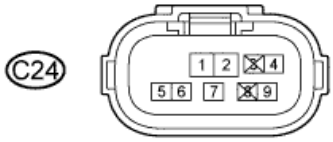
c. Disconnect the ECM connector.

d. Measure the resistance according to the value(s) in the table below.



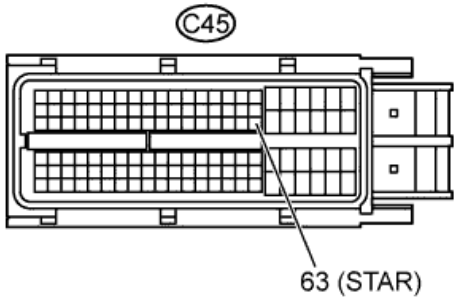
Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
ST CUT relay (5) - C45-63 (STAR)	Always	Below 1 Ω
ST CUT relay (3) - C24-4	Always	Below 1 Ω



Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
ST CUT relay (5) or C45-63 (STAR) - Body ground	Always	10 kΩ or higher
ST CUT relay (3) or C24-4 - Body ground	Always	10 kΩ or higher



Engine Room Relay Block

Front view of wire harness connector: (to PNP Switch)

Front view of wire harness connector: (to ECM)

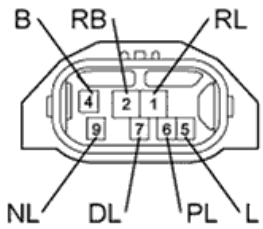
NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

9.INSPECT PARK/NEUTRAL POSITION SWITCH

a. Inspect the Park/Neutral Position (PNP) switch.

i. Disconnect the PNP switch connector.



ii. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
4 (B) - 5 (L)	Shift lever in P	Below 1 Ω

	Shift lever in N	Below 1 Ω

Component without harness connected:
(Park/Neutral Position Switch)

NG → REPLACE PARK/NEUTRAL POSITION SWITCH ASSEMBLY (Click here)

OK

10.CHECK HARNESS AND CONNECTOR (PNP SWITCH - ECM)

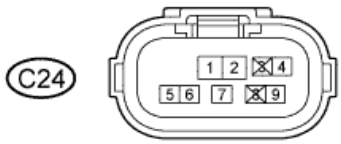
a. Disconnect the PNP switch connector.

b. Disconnect the ECM connector.

c. Measure the resistance according to the value(s) in the table below.

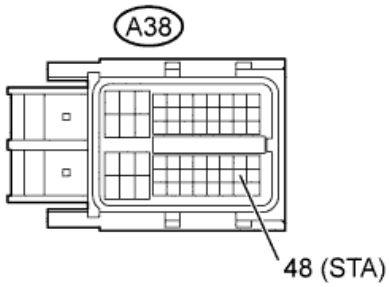
Standard Resistance (Check for Open):

Tester Connection	Condition	Specified Condition
C24-5 - A38-48 (STA)	Always	Below 1 Ω



Standard Resistance (Check for Short):

Tester Connection	Condition	Specified Condition
C24-5 or A38-48 (STA) - Body ground	Always	10 kΩ or higher



Result

Result	Proceed to
NG	A
OK	B

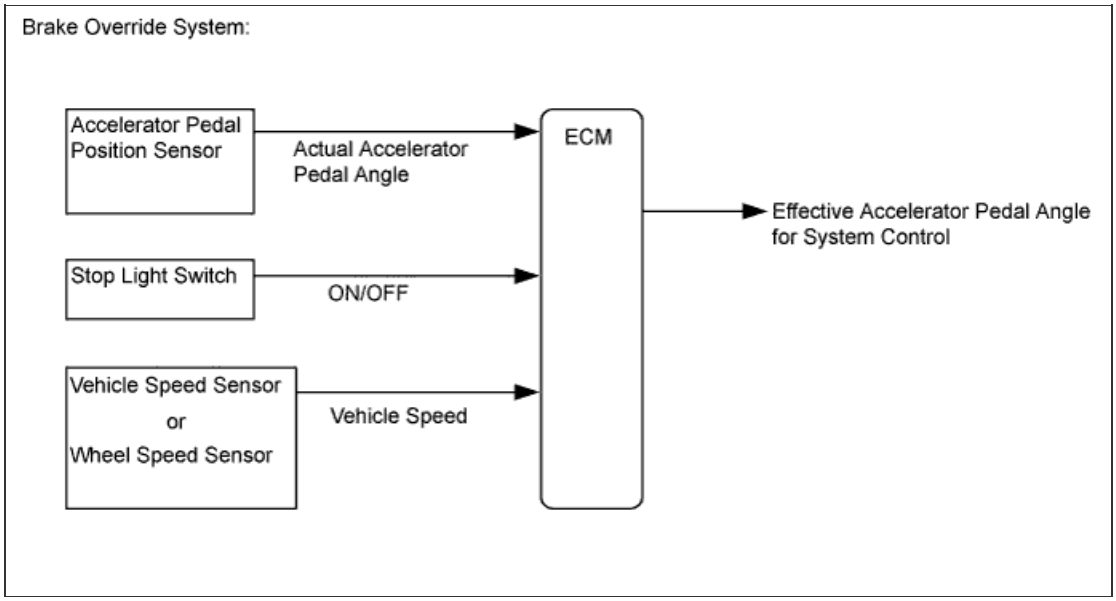
NEXT

20.CONFIRM WHETHER MALFUNCTION HAS BEEN SUCCESSFULLY REPAIRED

a. Check the starter operation.

OK:
Malfunction has been repaired successfully.

NG → GO TO ENTRY AND START SYSTEM (ENGINE DOES NOT START) (**Click here**)



OK

END

for Preparation Click here

DESCRIPTION

When the vehicle is being driven with the accelerator pedal depressed, depressing the brake pedal without releasing the accelerator pedal will activate the brake override system to restrict driving torque. The conditions for activating the brake override system as well as the items that are controlled are explained below.

Activation Conditions:

- Vehicle is running at or above the specified speed.
- The accelerator pedal is depressed beyond a specified level, and then the brake pedal is depressed.

NOTICE:

The vehicle may not enter the brake override system control due to the relation of the accelerator pedal angle and the vehicle's speed.

Items Controlled:

- Driving torque is restricted.

HINT:

During brake override system control, the value for the accelerator pedal angle (which is used for engine control) is forcibly reduced to a specified value. For this reason, the Data List value for Accelerator Position will be replaced with a specified value regardless of the actual accelerator pedal angle (Accel Sens. No. 1 Volt %, Accel Sens. No. 2 Volt %)

Deactivation Conditions:

- When the Stop Light Switch turns OFF or the actual accelerator pedal angle increases or decreases beyond the specified range.

INSPECTION PROCEDURE

Inspection Method

Drive at 10 km/h (6.25 mph), depress the accelerator pedal by 1/2 to 3/4 and keep it in that position. Under these conditions, if the engine speed decreases to 1000 rpm when the brake pedal is depressed, then the brake override system has been activated.

CAUTION:

When carrying out the inspection, use a place where you are able to carry it out safely and also pay close attention to your surroundings.

Also, when driving, make absolutely sure that all road traffic laws, such as speed limits, are observed.

HINT:

- **Under normal conditions, the Accelerator Position value changes in response to the Accel Sens. No. 1 Volt % value. For more information on the numerical values, refer to the Data List (Click here).**
- **If the Data List values of Accelerator Position and Accel Sens. No. 1 Volt % do not match, and the value of Accelerator Position changes but the value of Accel Sens. No. 1 Volt % is constant, this confirms that brake override system has activated. (Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.)**

NOTICE:

The brake override system restricts driving torque if the brake pedal is depressed when driving with the accelerator pedal depressed. If a customer reports experiencing loss of torque after the accelerator and brake pedals have both been intentionally depressed, explain to the customer that this is not a malfunction, and that the customer should avoid depressing both the accelerator and brake pedals at the same time.

Example: While operating the accelerator pedal, the customer uses their left foot to operate the brake pedal.

1.CHECK DTC OUTPUT

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Utility / All Codes.

d. Check DTCs.

Result

Result	Proceed to
No DTC output	A
DTC output	B

B → **GO TO DTC CHART**

A

2.READ VALUE USING INTELLIGENT TESTER (STOP LIGHT SWITCH AND ST1)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Stop Light Switch and ST1.

d. Check the Data List indication when the brake pedal is depressed and released.

OK:

Tester Display	Condition	Specified Condition
Stop Light Switch	Brake pedal released	OFF
	Brake pedal depressed	ON
ST1	Brake pedal released	OFF
	Brake pedal depressed	ON

NG → **INSPECT STOP LIGHT SWITCH ASSEMBLY (Click here)**

OK

3.INSPECT BRAKE PEDAL

a. Inspect and adjust the brake pedal (for LHD) (Click here).

b. Inspect and adjust the brake pedal (for RHD) (Click here)

HINT:

If the stop light switch turns ON too late, the start of brake override system control may be delayed; if it turns ON too soon, brake override system control may begin too early, so conduct inspection of the brake pedal and stop light switch assembly.

Result	Proceed to
OK	A
NG (for LHD)	B
NG (for RHD)	C

B → **REPAIR OR REPLACE BRAKE PEDAL (Click here)**

C → REPAIR OR REPLACE BRAKE PEDAL (Click here)

A

4.READ VALUE USING INTELLIGENT TESTER (ACCELERATOR PEDAL POSITION SENSOR)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / Data List / Accel Sens. No. 1 Volt % and Accel Sens. No. 2 Volt %.

d. Read the value displayed on the tester.

OK:

Tester Display	Condition	Specified Condition
Accel Sens. No. 1 Volt %	Accelerator Pedal Released → Depressed → Released	Values smoothly change following accelerator pedal operation
Accel Sens. No. 2 Volt %		

HINT:

For numerical values of Accel Sens. No. 1 Volt % and Accel Sens. No. 2 Volt %, refer to the Data List (Click here).

NG → REPLACE ACCELERATOR PEDAL SENSOR ASSEMBLY (Click here)

OK

5.READ VALUE USING INTELLIGENT TESTER (VEHICLE SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Data List / Vehicle Speed.

e. Read the value displayed on the tester.

Standard:

Tester Display	Condition	Specified Condition
Vehicle Speed	Vehicle stopped, engine running	0 km/h (0 mph)
	Vehicle running at constant speed between 16.1 to 64.4 km/h (10 to 40 mph)	No large fluctuations when driving at a constant speed

CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.

NG → GO TO VEHICLE SPEED SENSOR "A" (Click here)

OK

6.READ VALUE USING INTELLIGENT TESTER (FR, FL, RR, RL WHEEL SPEED)

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Start the engine.

d. Enter the following menus: Chassis / ABS/VSC/TRC / Data List / FR Wheel Speed, FL Wheel Speed, RR Wheel Speed and RL Wheel Speed.

e. Read the value displayed on the tester.

Standard:

Tester Display	Condition	Specified Condition
FR Wheel Speed FL Wheel Speed RR Wheel Speed RL Wheel Speed	Vehicle stopped, engine running	0 km/h (0 mph)
	Vehicle running at constant speed between 16.1 to 64.4 km/h (10 to 40 mph)	No large fluctuations when driving at a constant speed

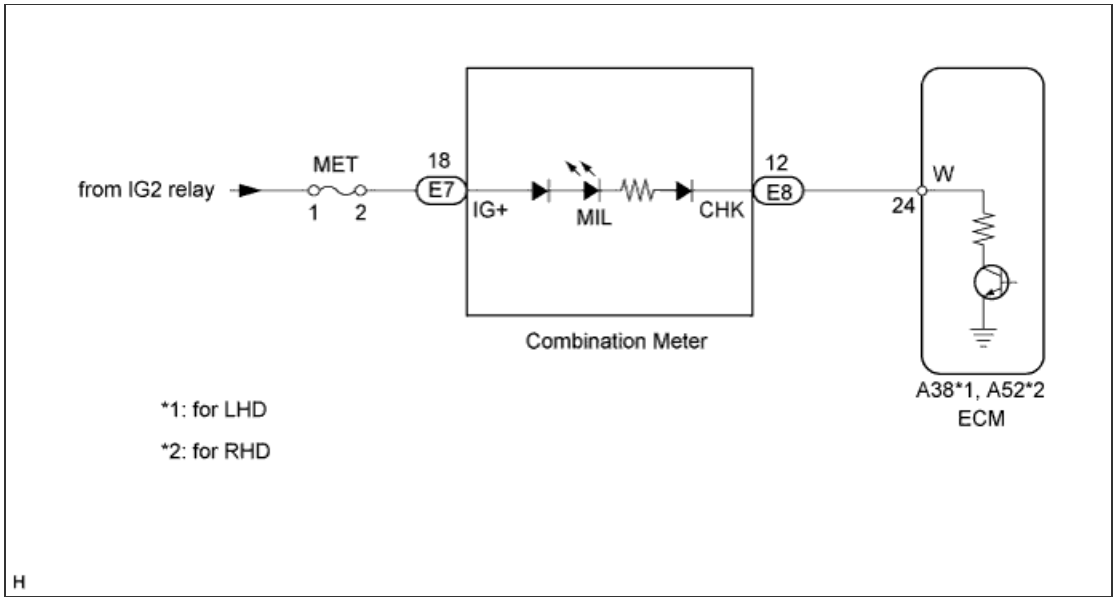
CAUTION:

When performing the confirmation driving pattern, obey all speed limits and traffic laws.

HINT:

Data can be captured relatively easily by using the snapshot function in the Data List. Confirm the data after performing the drive test.

NG → INSPECT FRONT OR REAR SPEED SENSOR



OK → END

for Preparation Click here

DESCRIPTION

The MIL (Malfunction Indicator Lamp) is used to indicate vehicle malfunction detections by the ECM. When the ignition switch is turned to ON, power is supplied to the MIL circuit, and the ECM provides the circuit ground which illuminates the MIL.
The MIL operation can be checked visually: When the ignition switch is first turned to ON, the MIL should be illuminated and should then turn off when the engine is started. If the MIL remains illuminated or is not illuminated, conduct the following troubleshooting procedure using the intelligent tester.

WIRING DIAGRAM

INSPECTION PROCEDURE

1.CHECK THAT MIL IS ILLUMINATED

a. Check that the MIL is illuminated.

Result

Result	Proceed to
MIL remains on	A
MIL does not illuminate	B

B → Go to step 5

A

2.CHECK WHETHER MIL TURNS OFF

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and turn the tester on.

c. Check for DTCs (Click here). If DTCs are output, write them down.

d. Clear the DTCs (Click here).

e. Check that the MIL turns off.

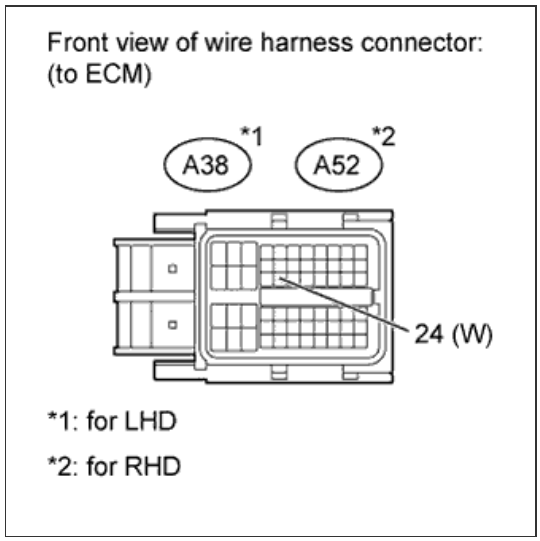
OK:
MIL turns off.

NG → Go to step 3

OK

REPAIR CIRCUITS INDICATED BY OUTPUT DTCS (Click here)

3.CHECK HARNESS AND CONNECTOR (CHECK FOR SHORT IN WIRE HARNESS)



a. Disconnect the ECM connector.

b. Turn the ignition switch to ON.

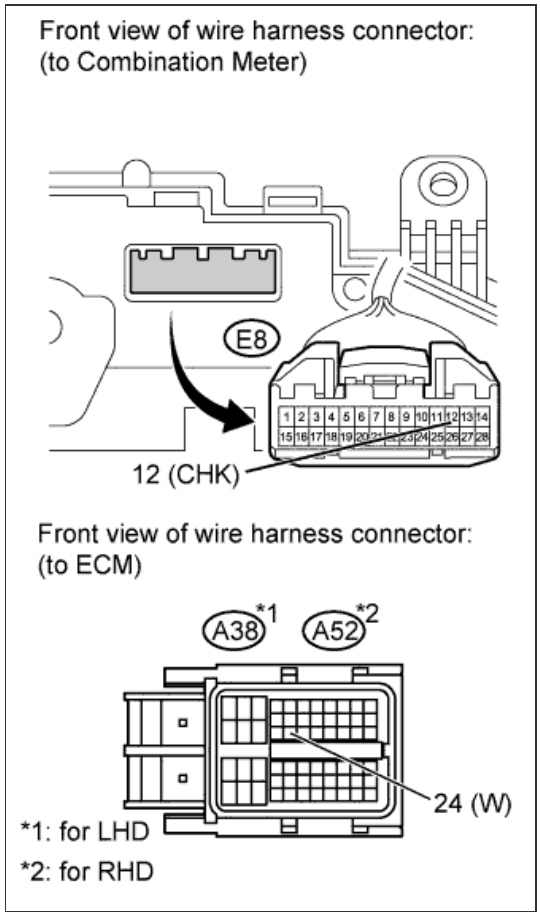
c. Check that the MIL is not illuminated.

OK:
MIL is not illuminated.

d. Reconnect the ECM connector.

NG → Go to step 4

OK



REPLACE ECM (Click here)

4.CHECK HARNESS AND CONNECTOR (COMBINATION METER - ECM)

a. Disconnect the ECM connector.

b. Disconnect the combination meter connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance (Check for Open):

for LHD

Tester Connection	Condition	Specified Condition
E8-5 (CHK) - A38-24 (W)	Always	Below 1 Ω

for RHD

Tester Connection	Condition	Specified Condition
E8-5 (CHK) - A52-24 (W)	Always	Below 1 Ω

Standard Resistance (Check for Short):

for LHD

Tester Connection	Condition	Specified Condition
E8-5 (CHK) or A38-24 (W) - Body ground	Always	10 kΩ or higher

for RHD

Tester Connection	Condition	Specified Condition
E8-5 (CHK) or A52-24 (W) - Body ground	Always	10 kΩ or higher

d. Reconnect the ECM connector.

e. Reconnect the combination meter connector.

Result

Result	Proceed to
OK (w/ Multi-information Display)	A
OK (w/o Multi-information Display)	B
NG	C

A → REPLACE COMBINATION METER ASSEMBLY (Click here)

B → REPLACE COMBINATION METER ASSEMBLY (Click here)

C → REPAIR OR REPLACE HARNESS OR CONNECTOR

5.CHECK THAT MIL IS ILLUMINATED

a. Check if the MIL is illuminated when the ignition switch is turned to ON.

OK:
MIL is illuminated.

NG → Go to step 6

OK → SYSTEM OK

6.CHECK THAT ENGINE STARTS

a. Turn the ignition switch to ON.

b. Start the engine.

Result

Result	Proceed to
Engine starts	A
Engine does not start*	B

HINT:

*: The intelligent tester cannot communicate with the ECM.

B → GO TO VC OUTPUT CIRCUIT (Click here)

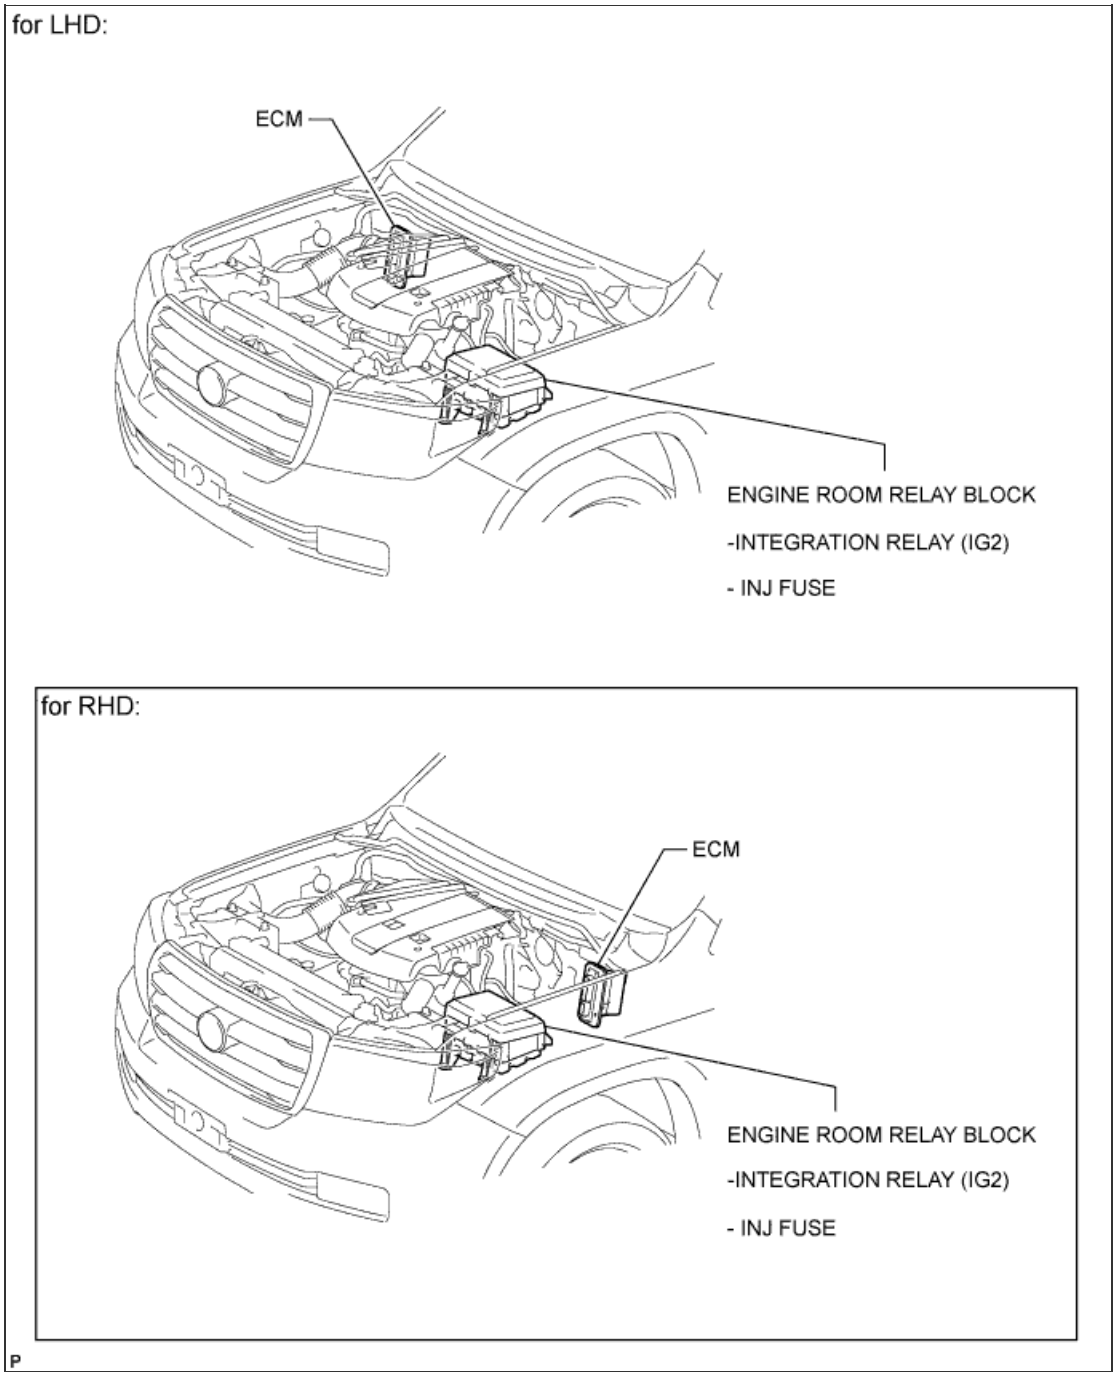
A

7.INSPECT COMBINATION METER ASSEMBLY (MIL CIRCUIT)

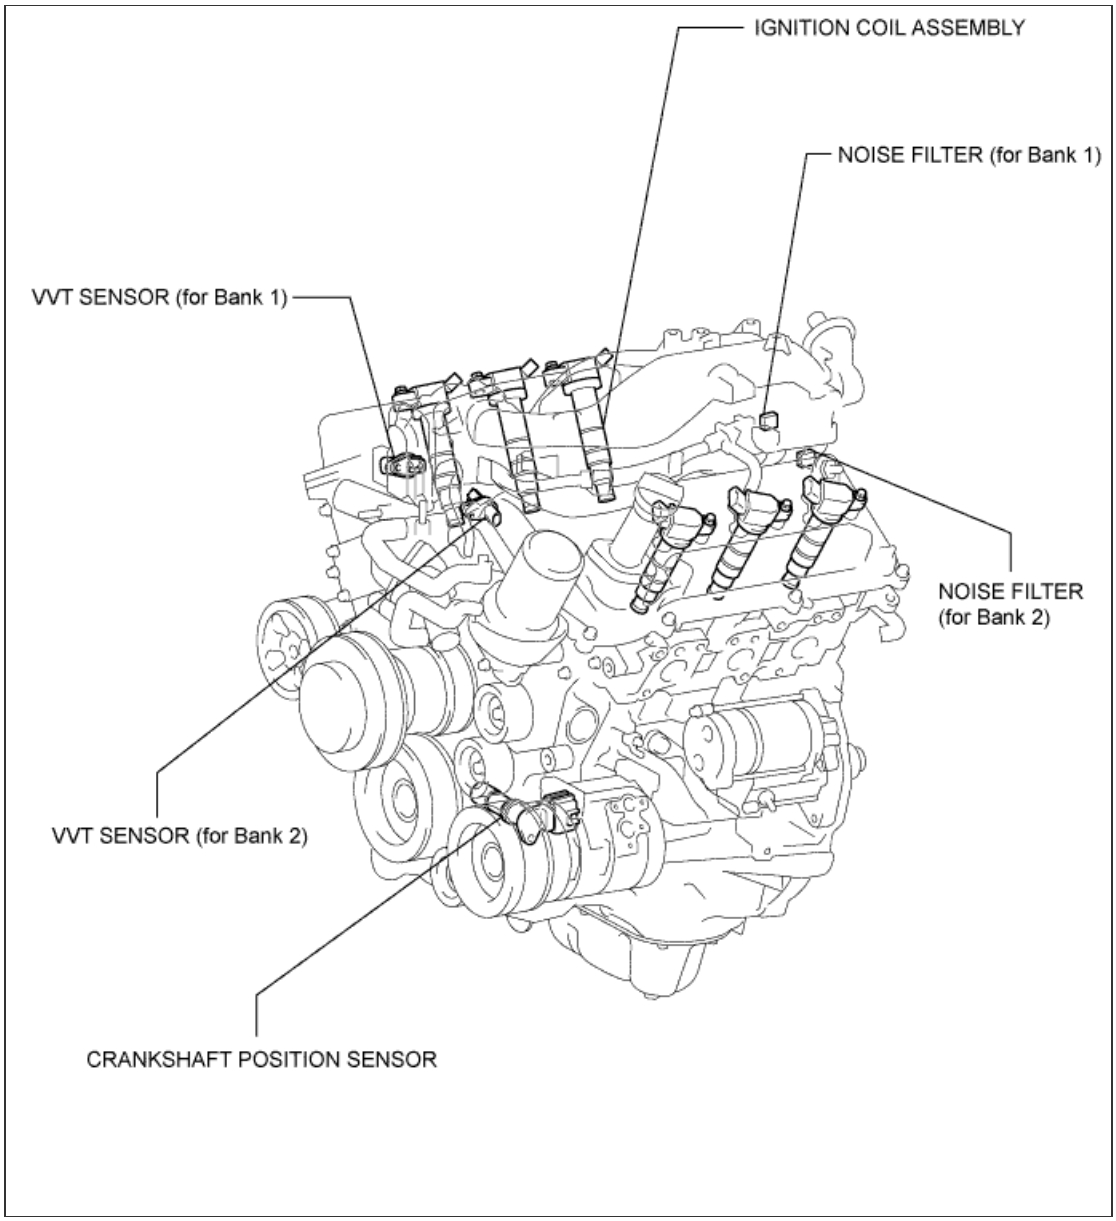
a. See the combination meter troubleshooting procedure (Click here).

Result

Result	Proceed to
OK	A
NG (w/ Multi-information Display)	B
NG (w/o Multi-information Display)	C



B → REPLACE COMBINATION METER ASSEMBLY (**Click here**)



C → REPLACE COMBINATION METER ASSEMBLY (**Click here**)

1. PERFORM SPARK TEST

a. Check for DTCs (Click here).

NOTICE:

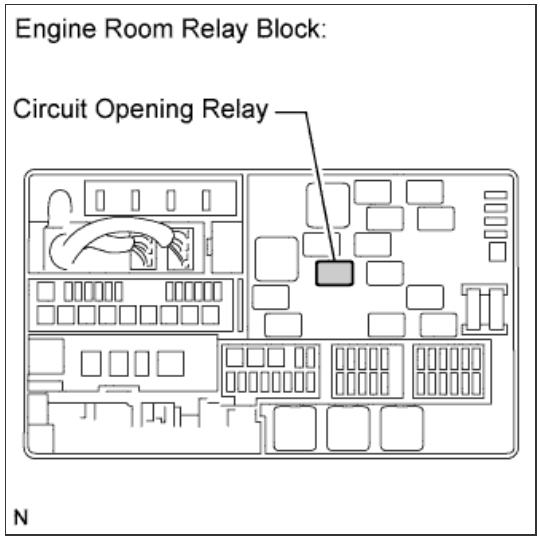
If any DTC is output, perform troubleshooting procedures for that DTC.

b. Check if sparks occur.

i. Remove the 6 spark plugs (Click here).

ii. Install the spark plug to the ignition coil and connect the ignition coil connector.

iii. Remove the engine room relay block cover.



iv. Remove the circuit opening relay (C/OPN).

v. Ground the spark plug.

vi. Visually check that sparks occur while the engine is being cranked.

NOTICE:

- **Be sure to ground the spark plug when checking.**
- **Replace the ignition coil if it receives an impact.**
- **Do not crank the engine for more than 2 seconds.**

c. Check that the wire harness side connector of the ignition coil with igniter is securely connected.

Result

Result	Proceed to
NG	Connect securely
OK	Go to next step

d. Perform a spark test on each ignition coil with igniter.

i. If there is a cylinder where sparks do not occur, replace its ignition coil with the ignition coil of a cylinder where sparks occur normally.

ii. Crank the engine and visually check that sparks occur at the cylinder with the normally operating ignition coil.

Result

Result	Proceed to
OK	Replace ignition coil with igniter
NG	Go to next step

e. Inspect the spark plug.

i. Replace the spark plug with a normal one.

ii. Perform spark test again.

Result

Result	Proceed to
OK	Replace spark plug
NG	Go to next step

f. Check power supply to ignition coil with igniter.

i. Turn the ignition switch on (IG).

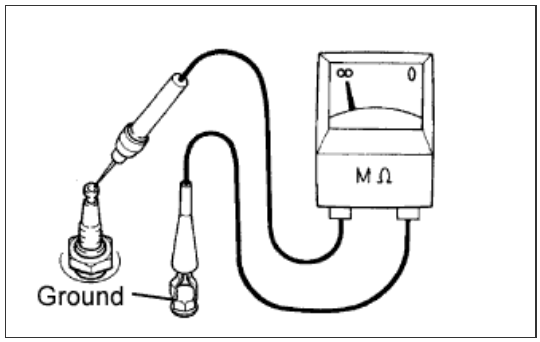
ii. Check that there is battery voltage at ignition coil positive (+) terminal.

Result

Result	Proceed to
NG	Check wiring between ignition switch and ignition coil with igniter
OK	Go to next step

g. Check the VVT sensor (Click here).

h. Check the crankshaft position sensor (Click here).



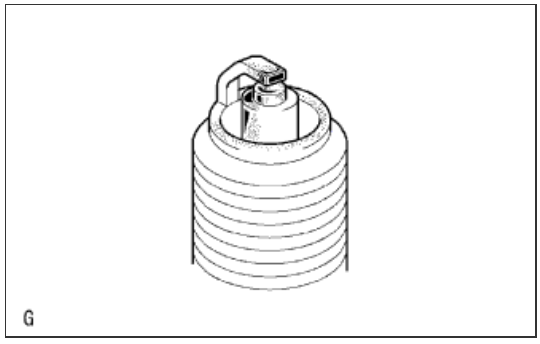
i. Install the 6 spark plugs (Click here).

j. Install the circuit opening relay.

k. Install the engine room relay block cover.

2. INSPECT SPARK PLUG

a. Check the electrode.



i. Using a megohmmeter, measure the insulation resistance.

Standard Insulation Resistance:

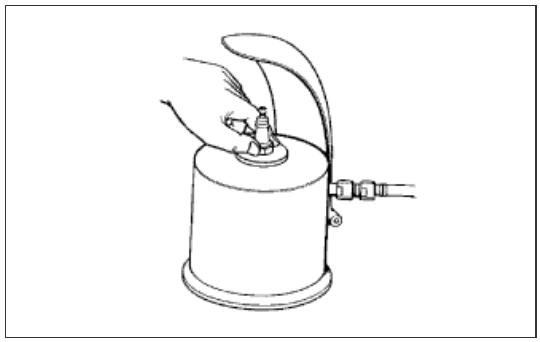
Tester Connection	Condition	Specified Condition
Spark Plug (terminal part) - Body Ground	Always	10 MΩ or higher

If a megohmmeter is not available, perform the following simple inspection.

b. Alternative inspection method:

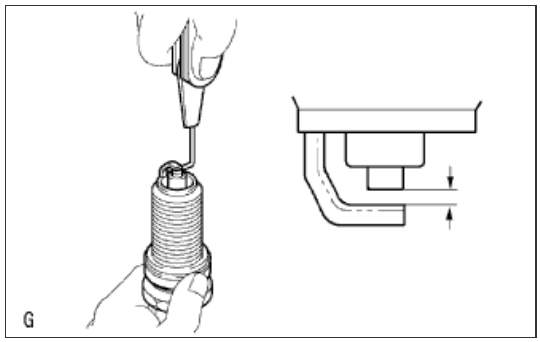
i. Quickly accelerate the engine to 4000 rpm 5 times.

ii. Remove the spark plug.



iii. Visually check the spark plug.
If the electrode is dry, the spark plug is functioning properly. If the electrode is damp, proceed to the next step.

c. Check the spark plug for any damage on its threads and insulator.
If there is damage, replace the spark plug. If not, reinstall the spark plug.

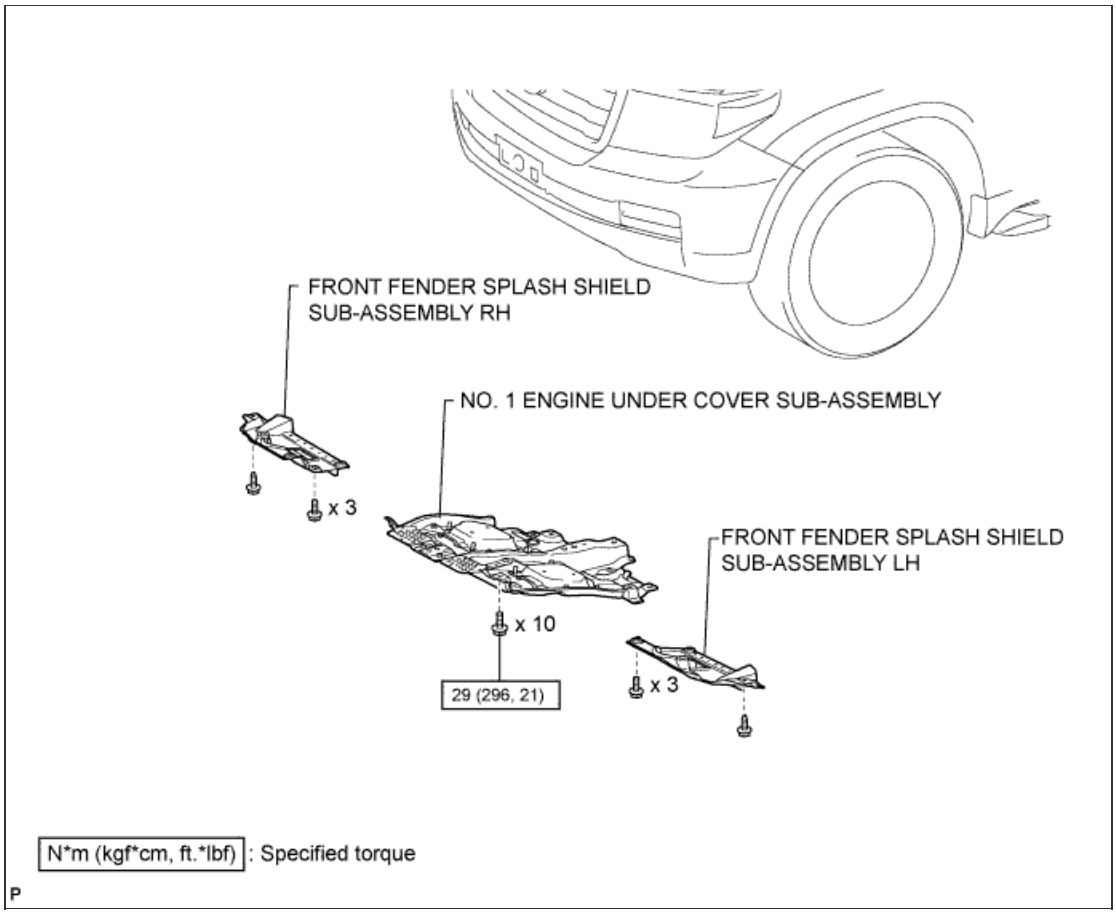


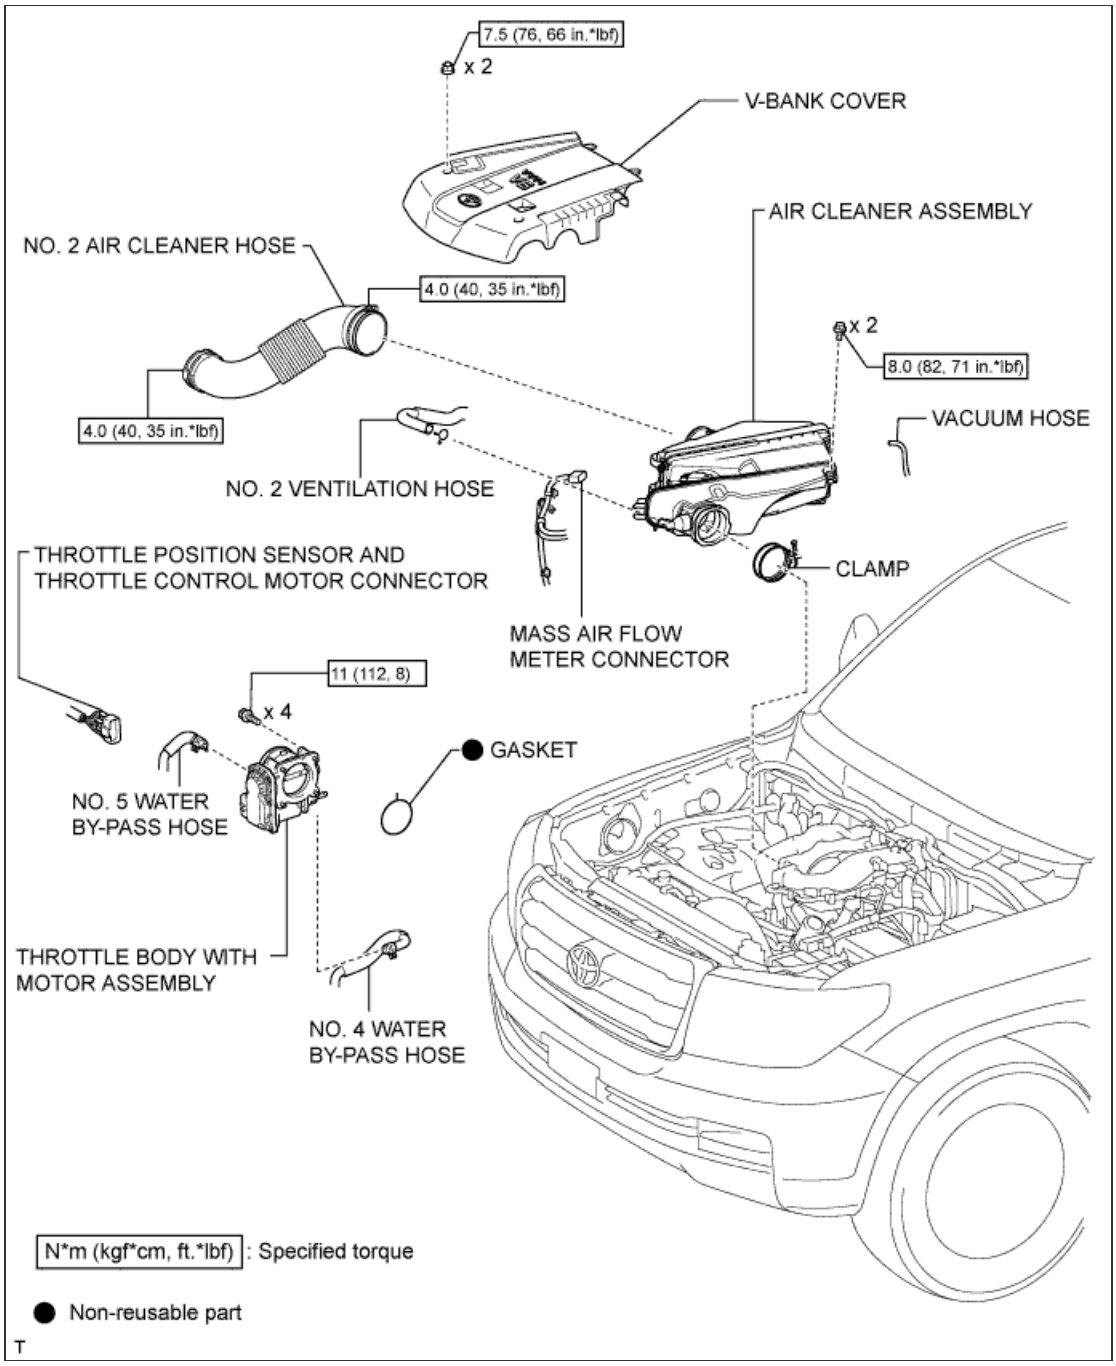
Recommended Spark Plug:

Manufacturer	Product
DENSO made	K20HR-U11
NGK made	LFR6C11

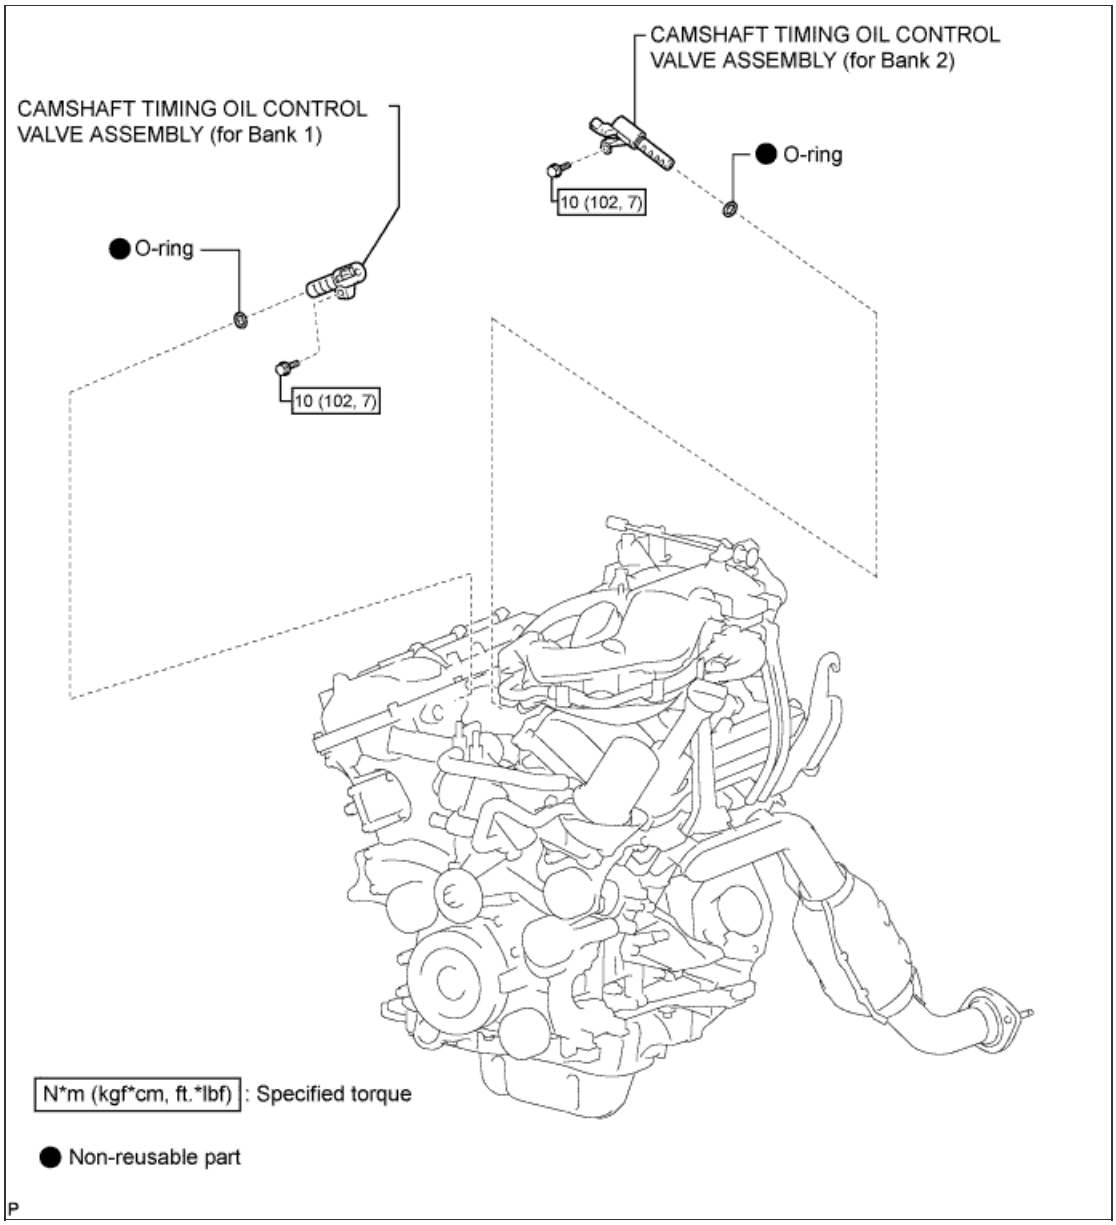
d. Clean the spark plugs.

e. Check the spark plug electrode gap.





Maximum electrode gap for used spark plug:
1.3 mm (0.0512 in.)



If the gap is more than the maximum, replace the spark plug.

Electrode gap for new spark plug:
1.0 to 1.1 mm (0.0394 to 0.0433 in.)

for Preparation Click here

1. INSPECT CAMSHAFT OIL CONTROL VALVE

a. Connect the intelligent tester to the DLC3.

b. Start the engine and turn the intelligent tester on.

c. Warm up the engine.

d. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT System (Bank 1) or Control the VVT System (Bank 2).

e. Check the engine speed while operating the Oil Control Valve (OCV) using the tester.

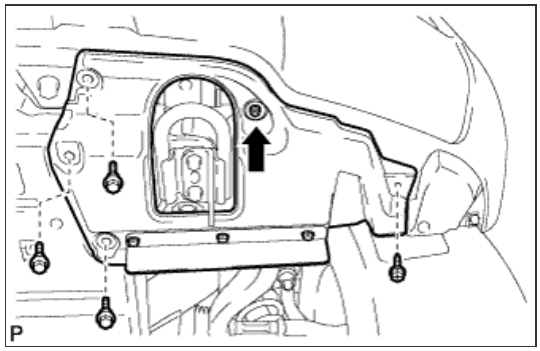
OK:

Tester Operation	Specified Condition
OCV OFF	Normal engine speed
OCV ON	Soon after OCV switched from OFF to ON, engine idles roughly or stalls

If the result is not as specified, check the oil control valve, wirings and camshaft timing gear.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and engine under cover.

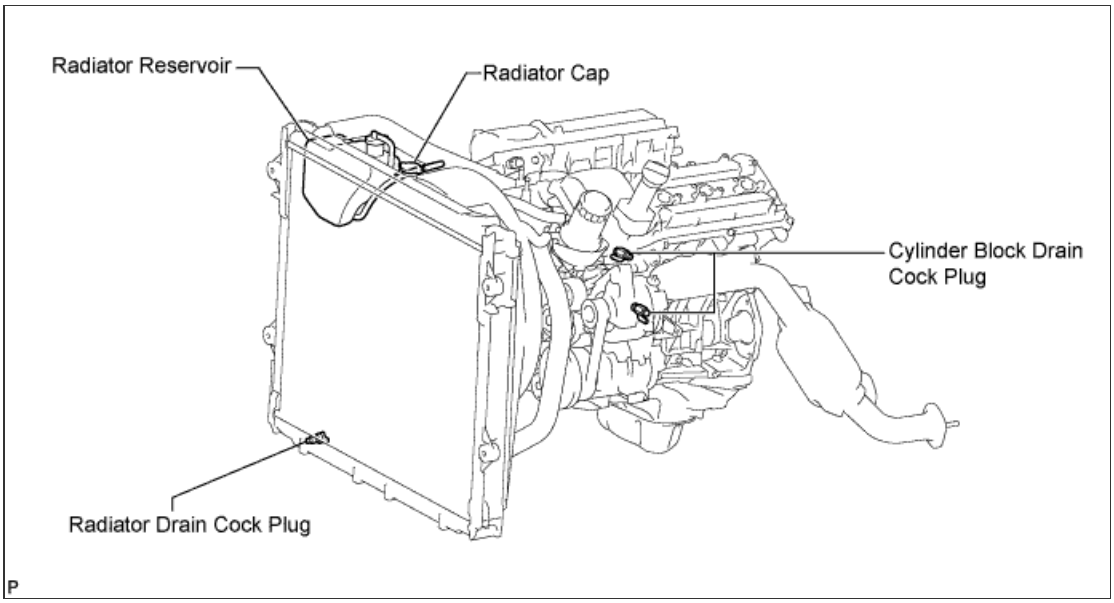
4. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.

b. Remove the radiator cap. Then drain the coolant.

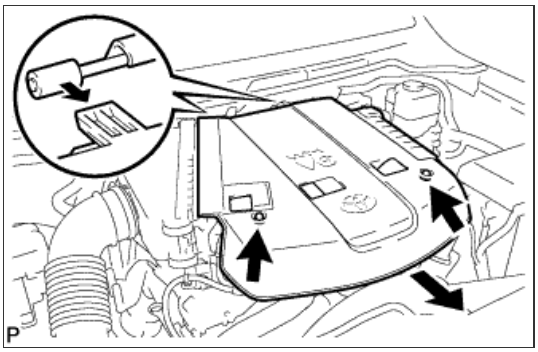


HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

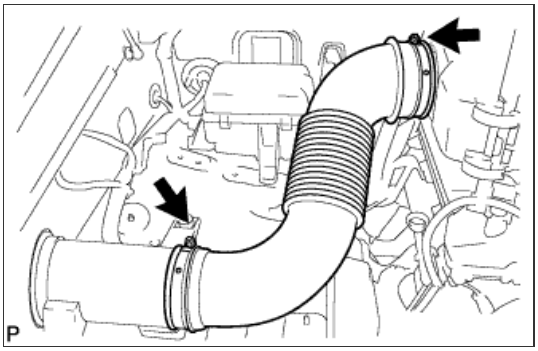
c. Tighten the 2 cylinder block drain cock plugs.

Torque:



13 N*m{ 133 kgf*cm , 10 ft.*lbf }

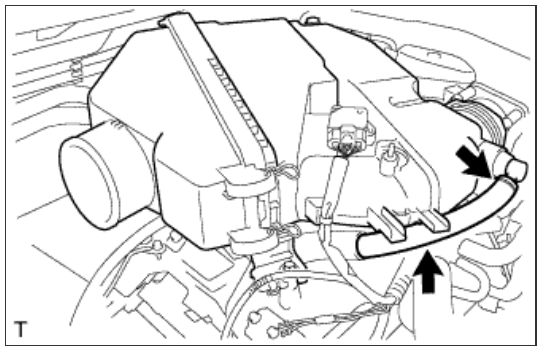
d. Tighten the radiator drain cock plug by hand.



5. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.

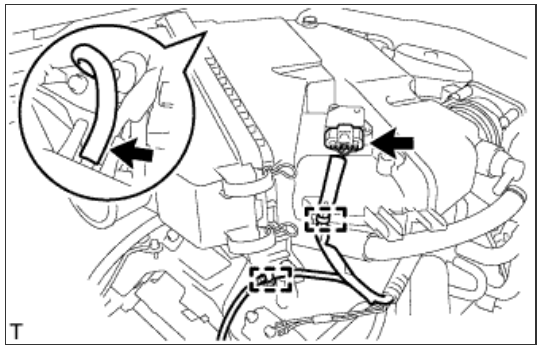
6. REMOVE NO. 2 AIR CLEANER HOSE



a. Loosen the 2 hose clamps and remove the air cleaner hose.

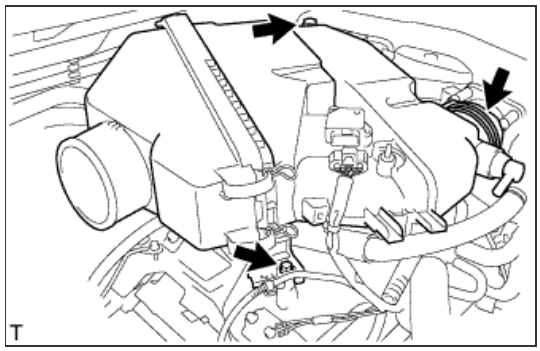
7. REMOVE AIR CLEANER ASSEMBLY

a. Disconnect the No. 2 ventilation hose.



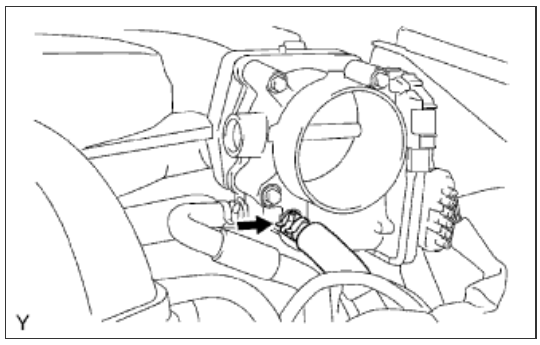
b. Detach the hose clamp.

c. Disconnect the vacuum hose.



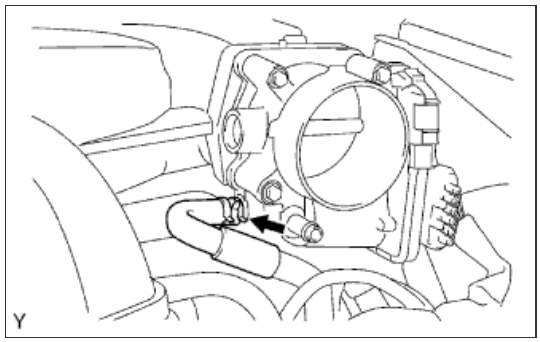
d. Disconnect the MAF meter connector.

e. Using a clip remover, detach the 2 wire harness clamps.



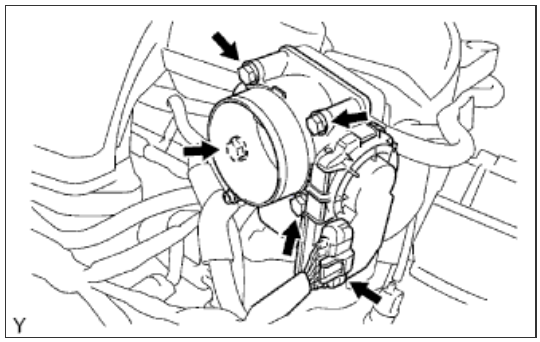
f. Loosen the hose clamp.

g. Remove the 2 bolts and air cleaner assembly.



8. REMOVE THROTTLE BODY WITH MOTOR ASSEMBLY

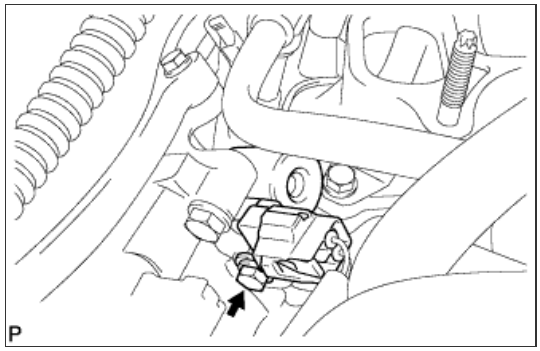
a. Disconnect the No. 5 water by-pass hose.



b. Disconnect the No. 4 water by-pass hose.

c. Disconnect the throttle position sensor and throttle control motor connector.

d. Remove the 4 bolts, then remove the throttle body with motor and gasket.

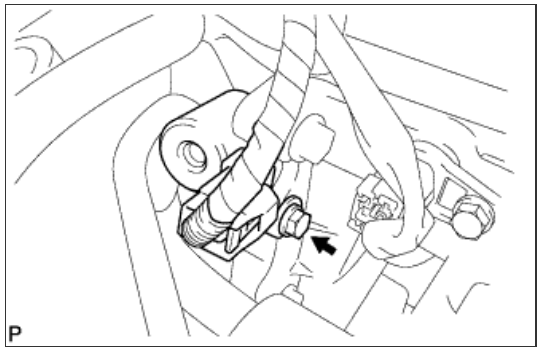


9. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Bank 1)

a. Disconnect the oil control valve connector.

b. Remove the bolt and oil control valve.

c. Remove the O-ring from the oil control valve.



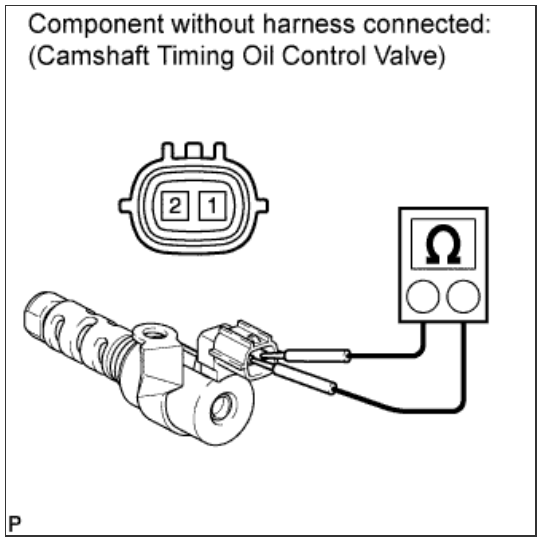
10. REMOVE CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Bank 2)

a. Disconnect the oil control valve connector.

b. Remove the bolt and oil control valve.

c. Remove the O-ring from the oil control valve.

for Preparation Click here



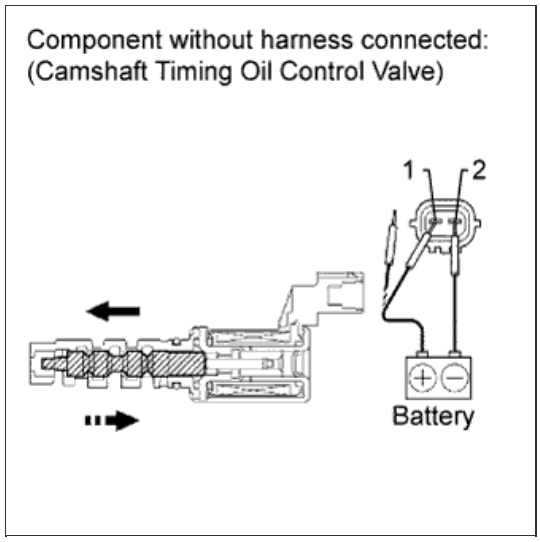
1. INSPECT CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

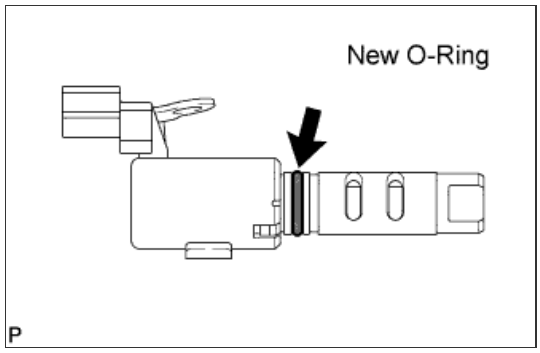
If the result is not as specified, replace the oil control valve assembly.



b. Connect the positive (+) lead of the battery to terminal 1 and the negative (-) lead to terminal 2, and check the movement of the valve.

OK:

Tester Connection	Condition	Specified Condition
1 - 2	Battery positive (+) voltage is applied	Valve moves in direction of left arrow shown in the illustration
	Battery positive (+) voltage is cut off	Valve moves in direction of right arrow shown in the illustration

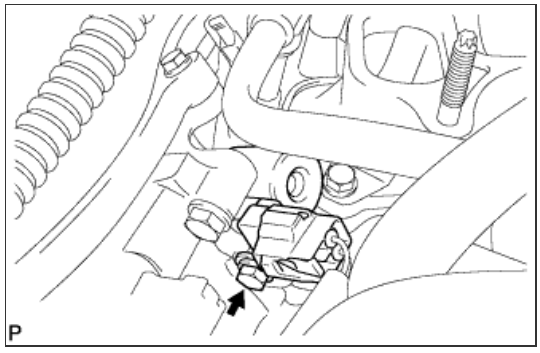


If the result is not as specified, replace the oil control valve assembly.
If the valve cannot return properly because of foreign matter, a small pressure leak in the advanced direction may occur and a DTC may be output.

for Preparation Click here

1. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Bank 1)

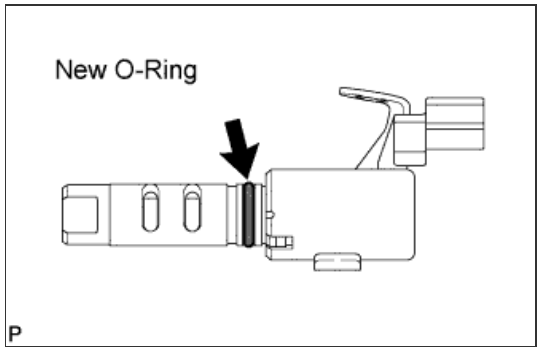
a. Apply a light coat of engine oil to a new O-ring and install it to the oil control valve.



b. Install the oil control valve with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

NOTICE:

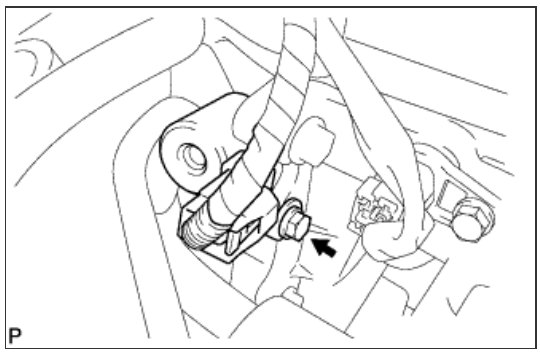


- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head).**
- **Be careful that the O-ring is not cracked when installing the oil control valve.**

c. Connect the camshaft timing oil control valve connector.

2. INSTALL CAMSHAFT TIMING OIL CONTROL VALVE ASSEMBLY (for Bank 2)

a. Apply a light coat of engine oil to a new O-ring and install it to the oil control valve.

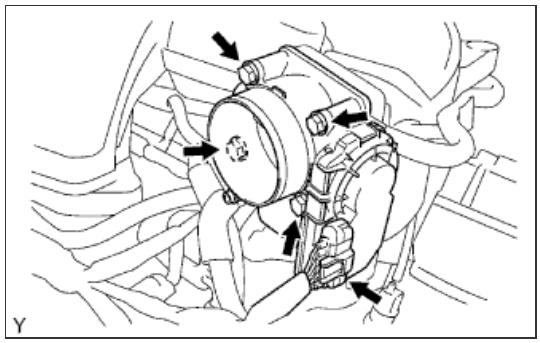


b. Install the oil control valve with the bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

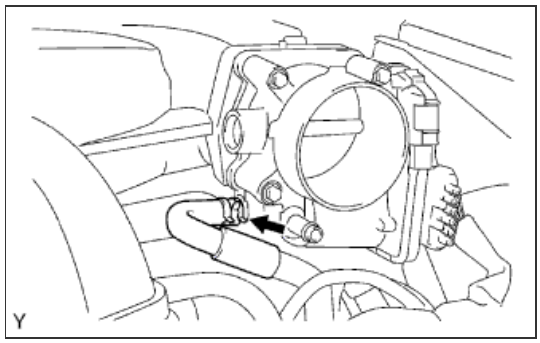
NOTICE:

- **Do not allow foreign matter to contact the oil seal face of the oil control valve (connecting surface with cylinder head).**
- **Be careful that the O-ring is not cracked when installing the oil control valve.**



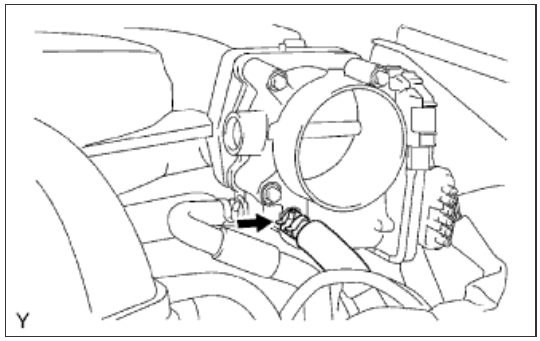
c. Connect the oil control valve connector.

3. INSTALL THROTTLE BODY WITH MOTOR ASSEMBLY



a. Install a new gasket and the throttle body with motor with the 4 bolts.

Torque:
11 N*m{ 112 kgf*cm , 8 ft.*lbf }



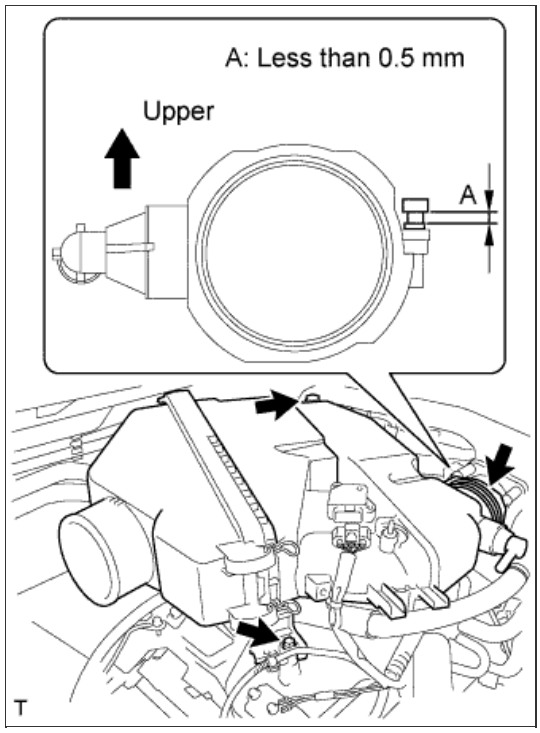
b. Connect the throttle position sensor and throttle control motor connector.

c. Connect the No. 4 water by-pass hose.

d. Connect the No. 5 water by-pass hose.

4. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner assembly with the 2 bolts.

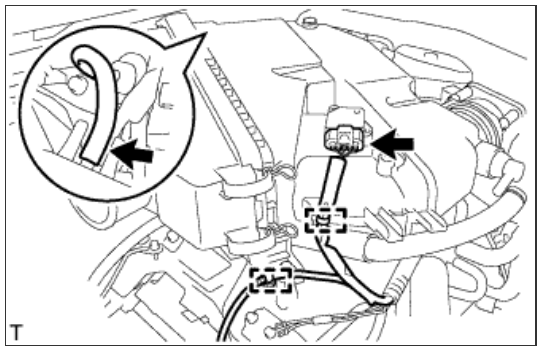


Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

b. Tighten the hose clamp.

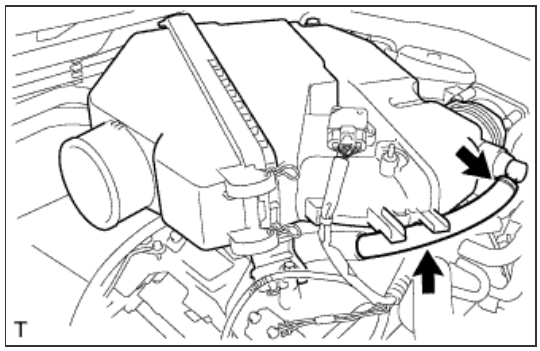
HINT:

Tighten the hose clamp until it reaches the specified protrusion height labeled A shown in the illustration.



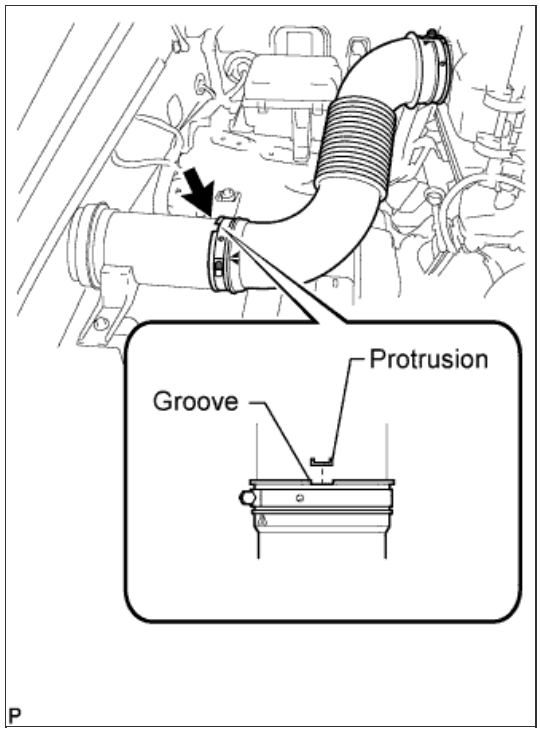
Standard protrusion height:
Less than 0.5 mm (0.0197 in.)

c. Connect the MAF meter connector.



d. Attach the 2 wire harness clamps.

e. Connect the vacuum hose.

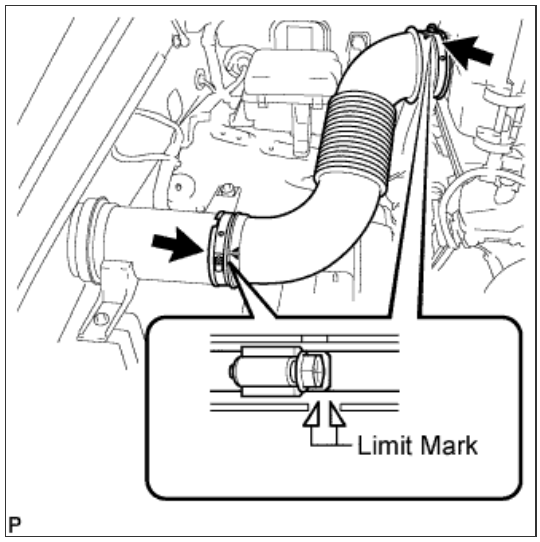


f. Attach the hose clamp.

g. Connect the No. 2 ventilation hose.

5. INSTALL NO. 2 AIR CLEANER HOSE

a. Align the protrusion of the pre-cleaner with the groove of the No. 2 air cleaner hose as shown in the illustration.



b. Tighten the 2 hose clamps.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

HINT:

Tighten the clamp until the end of the clamp band is within both limit marks.

6. ADD ENGINE COOLANT

a. Add engine coolant.

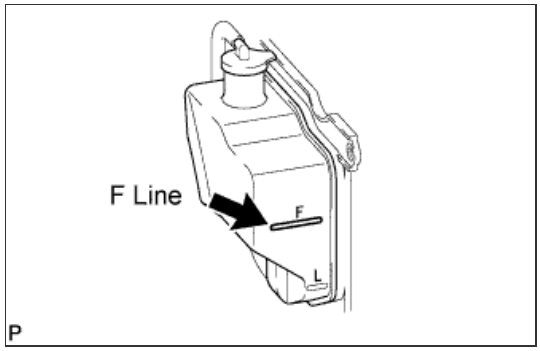
Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:



TO OTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

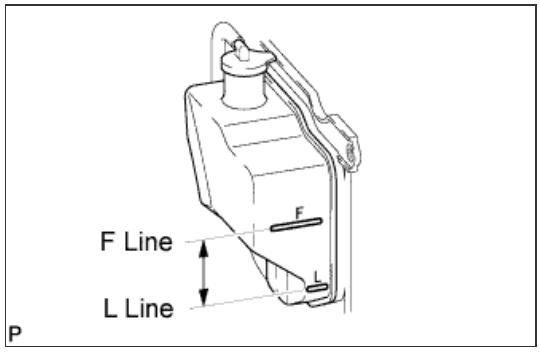
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

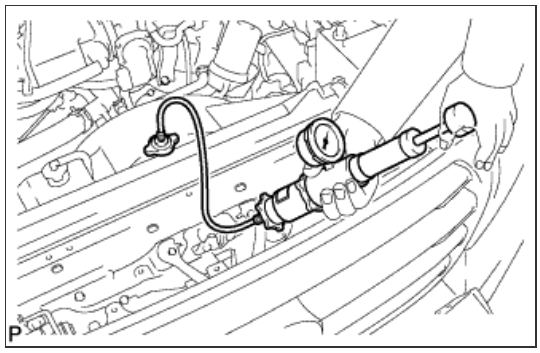
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

7. INSPECT FOR ENGINE COOLANT LEAK



CAUTION:

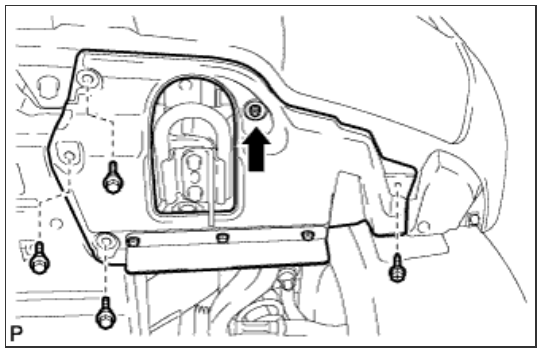
o not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

8. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the engine under cover with the 10 bolts.

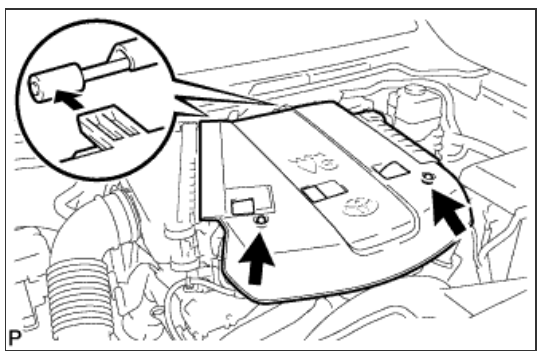
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

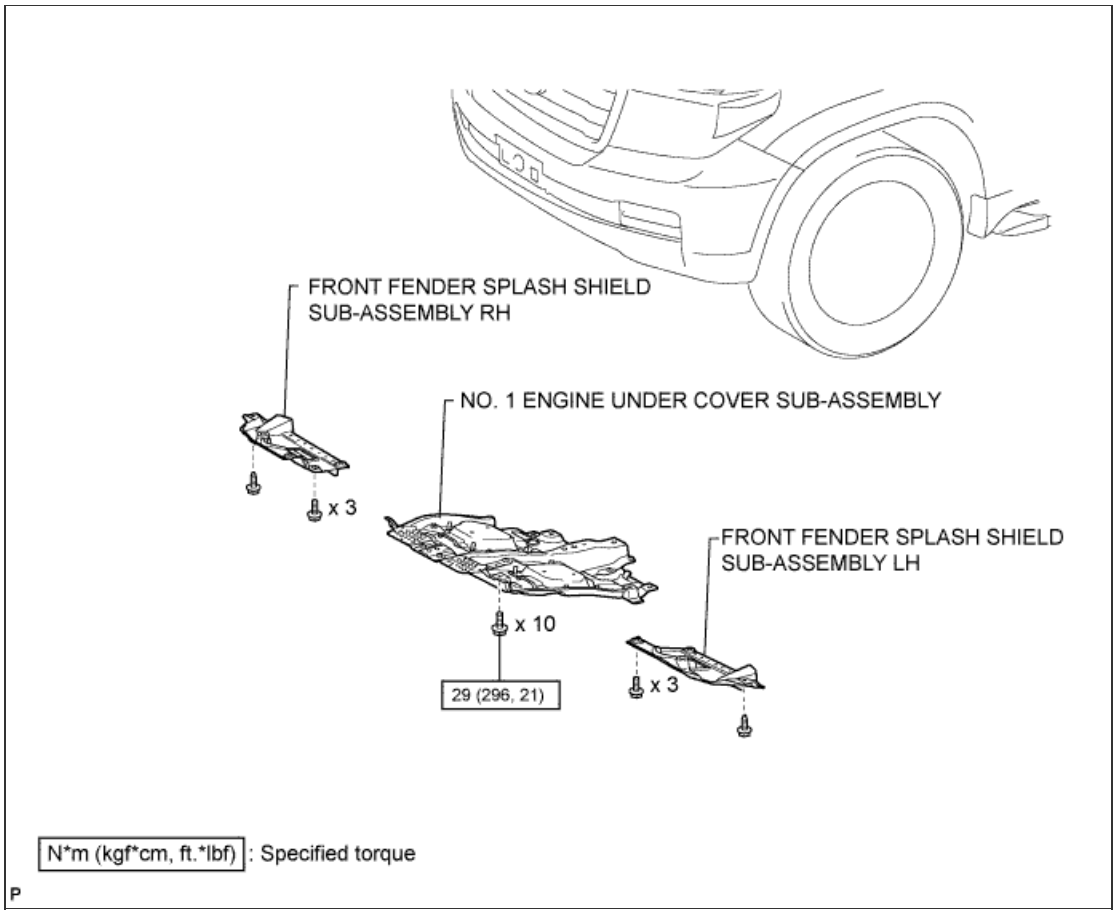
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

10. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

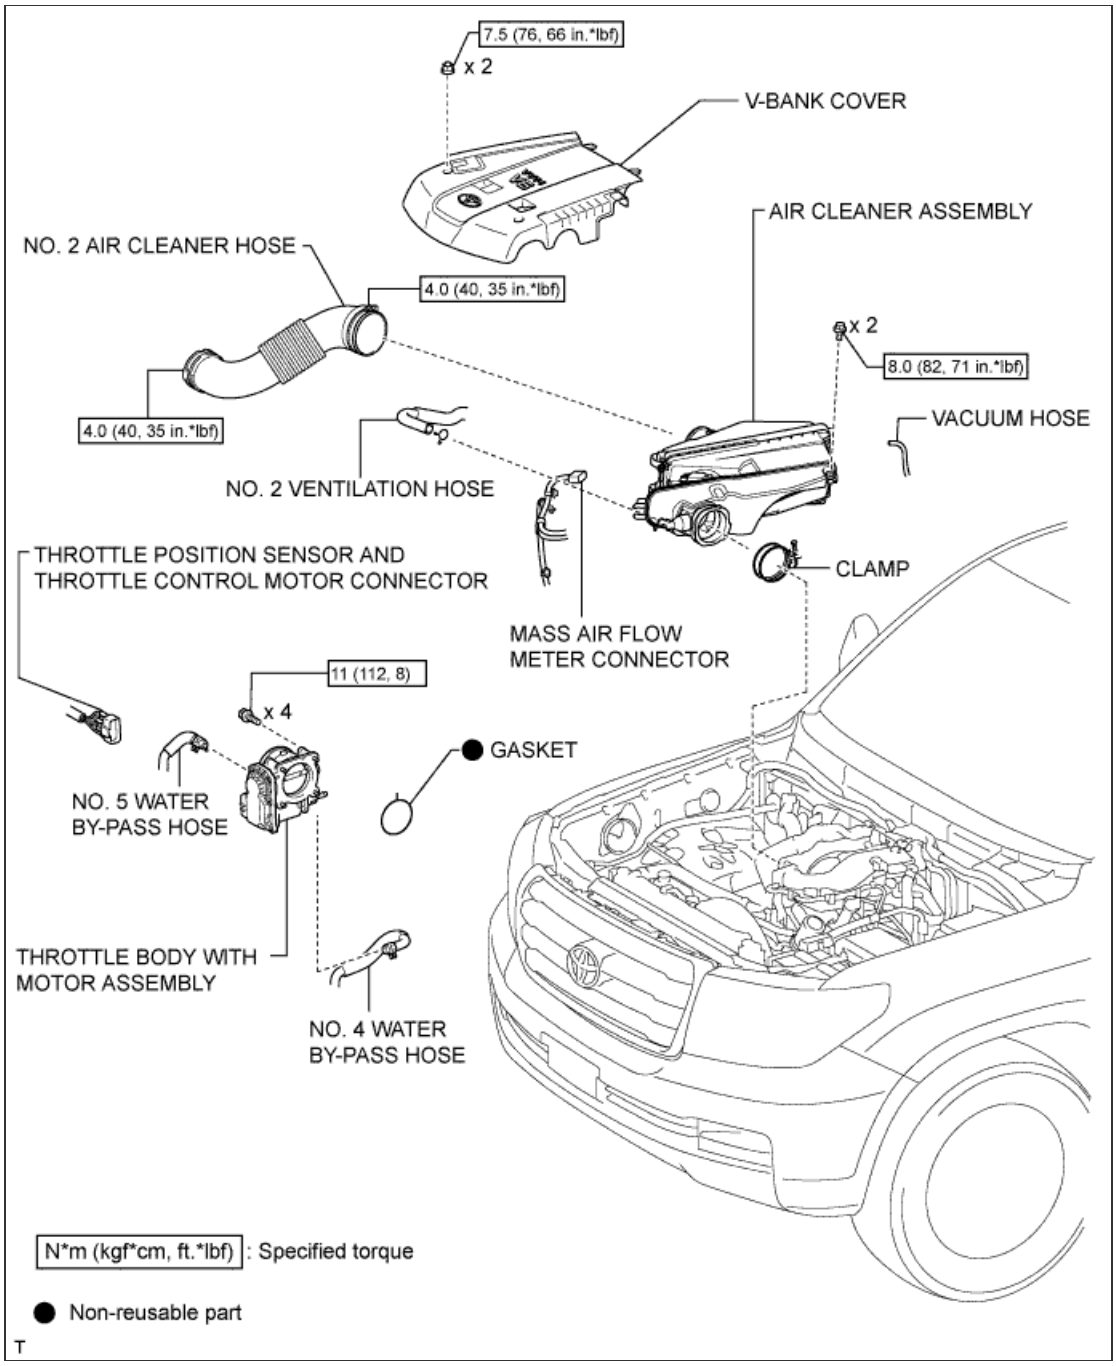


HINT:

Use the same procedures described for the LH side.



11. INSTALL V-BANK COVER



a. Install the V-bank cover with the 2 cap nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

for Preparation Click here

1. CHECK THROTTLE BODY WITH MOTOR ASSEMBLY

a. Check the throttle control motor operating sounds.

i. Turn the ignition switch on (IG).

ii. When depressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises emit from the motor. If friction noise exists, replace the throttle body.

b. Check the throttle position sensor.

i. Connect the intelligent tester to the DLC3.

ii. Turn the ignition switch on (IG).

iii. Turn the intelligent tester on.

iv. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Throttle Sensor Position.

v. Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of the "Throttle Sensor Position" is within the specification.

Standard throttle valve opening percentage:
60% or more

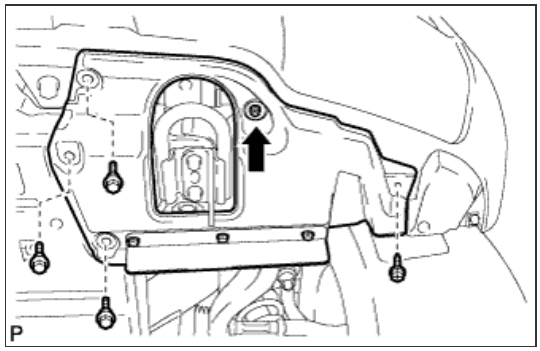
HINT:

When checking the standard throttle valve opening percentage, the shift lever should be in N.

If the percentage is less than 60%, replace the throttle body.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

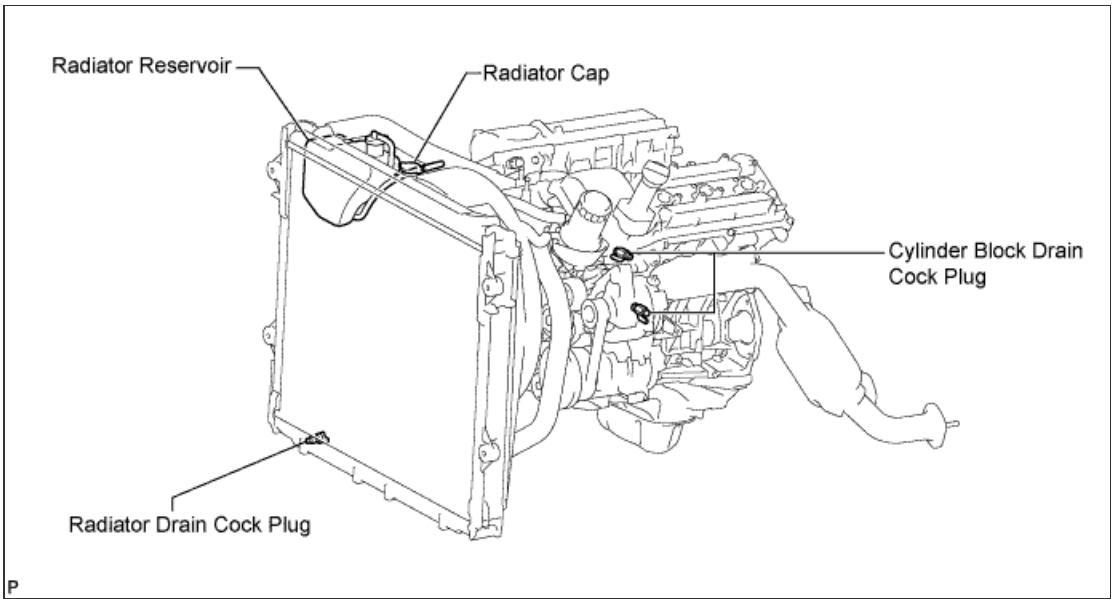
a. Remove the 10 bolts and engine under cover.

4. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.

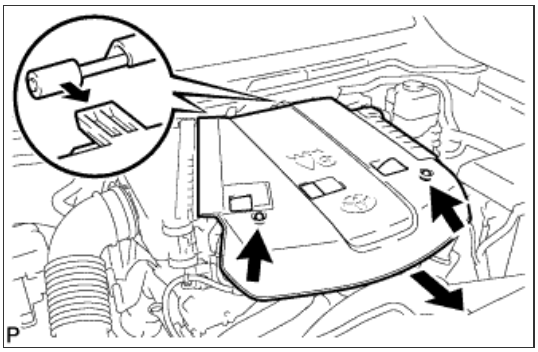


b. Remove the radiator cap. Then drain the coolant.

HINT:

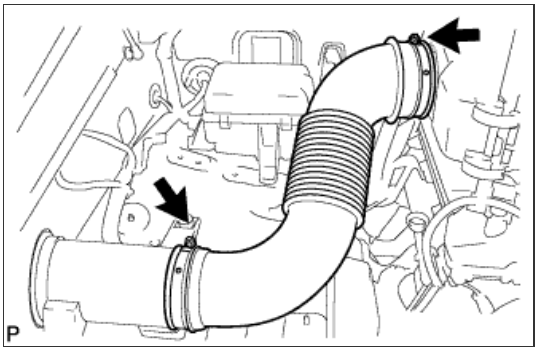
Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.



Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

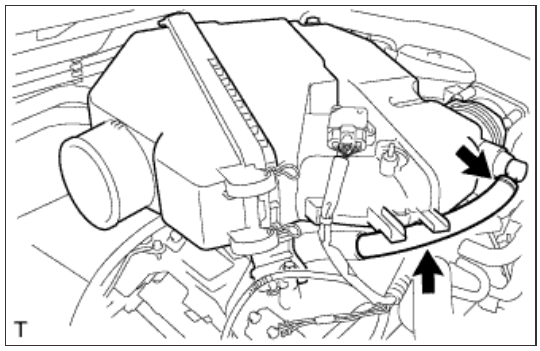
d. Tighten the radiator drain cock plug by hand.



5. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.

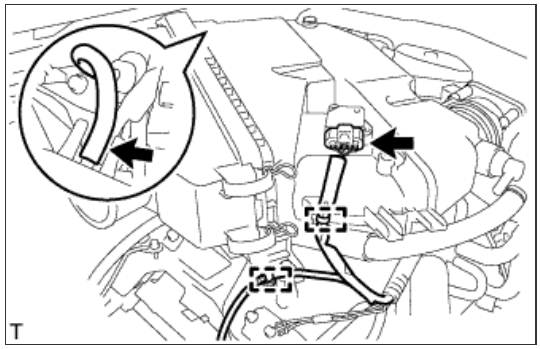
6. REMOVE NO. 2 AIR CLEANER HOSE



a. Loosen the 2 hose clamps and remove the air cleaner hose.

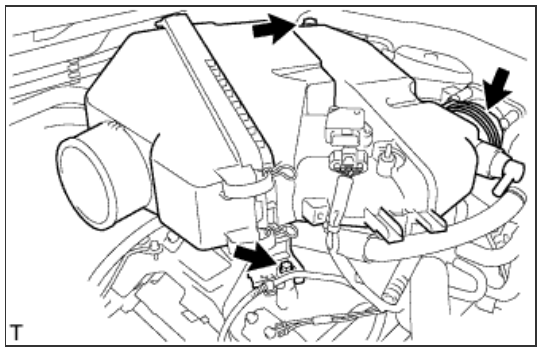
7. REMOVE AIR CLEANER ASSEMBLY

a. Disconnect the No. 2 ventilation hose.



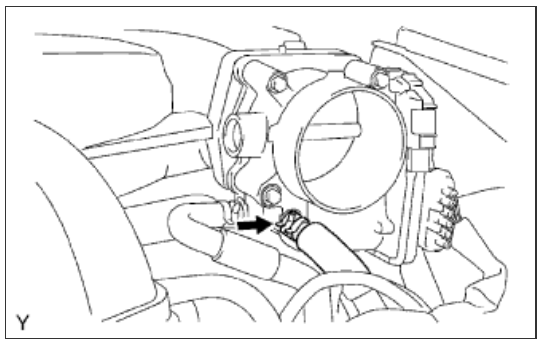
b. Detach the hose clamp.

c. Disconnect the vacuum hose.



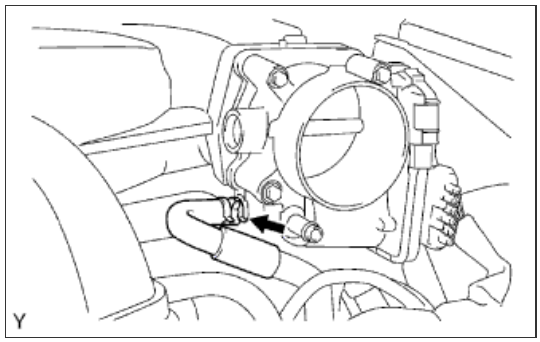
d. Disconnect the MAF meter connector.

e. Using a clip remover, detach the 2 wire harness clamps.



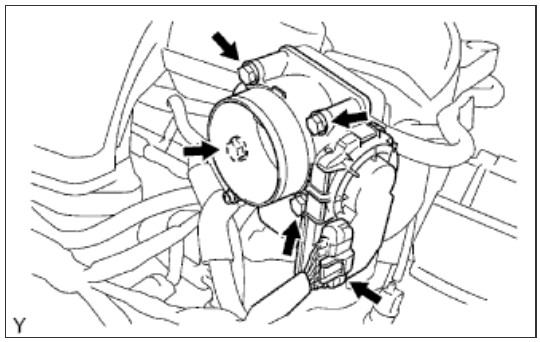
f. Loosen the hose clamp.

g. Remove the 2 bolts and air cleaner assembly.



8. REMOVE THROTTLE BODY WITH MOTOR ASSEMBLY

a. Disconnect the No. 5 water by-pass hose.

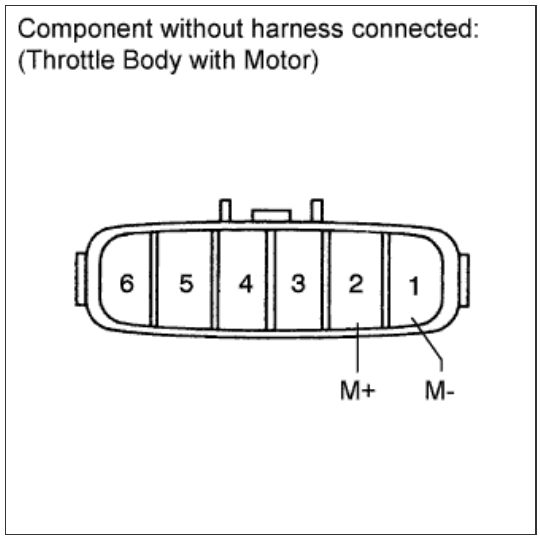


b. Disconnect the No. 4 water by-pass hose.

c. Disconnect the throttle position sensor and throttle control motor connector.

d. Remove the 4 bolts, then remove the throttle body with motor and gasket.

for Preparation Click here



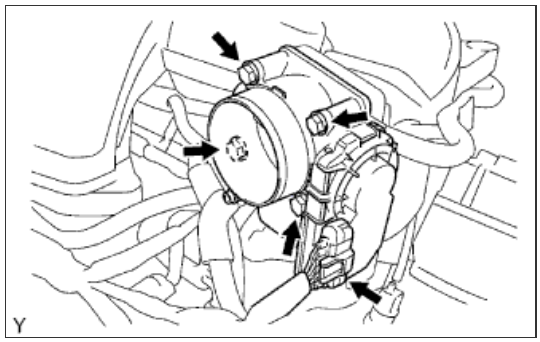
1. INSPECT THROTTLE BODY WITH MOTOR ASSEMBLY

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

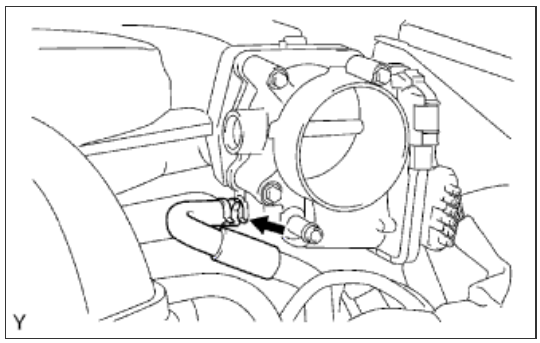
Tester Connection	Condition	Specified Condition
2 (M+) - 1 (M-)	20°C (68°F)	0.3 to 100 Ω

If the result is not as specified, replace the throttle body with motor assembly.



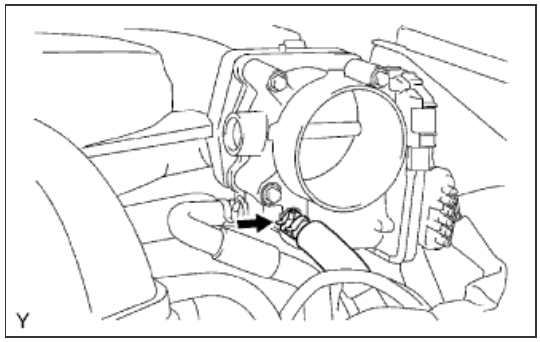
for Preparation Click here

1. INSTALL THROTTLE BODY WITH MOTOR ASSEMBLY



a. Install a new gasket and the throttle body with motor with the 4 bolts.

Torque:
11 N*m{ 112 kgf*cm , 8 ft.*lbf }



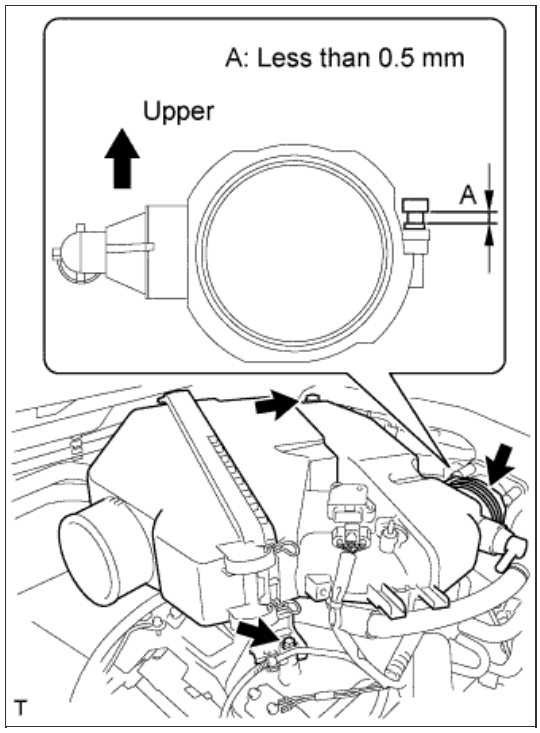
b. Connect the throttle position sensor and throttle control motor connector.

c. Connect the No. 4 water by-pass hose.

d. Connect the No. 5 water by-pass hose.

2. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner assembly with the 2 bolts.

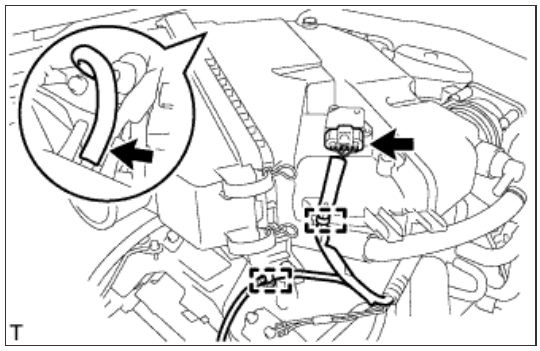


Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

b. Tighten the hose clamp.

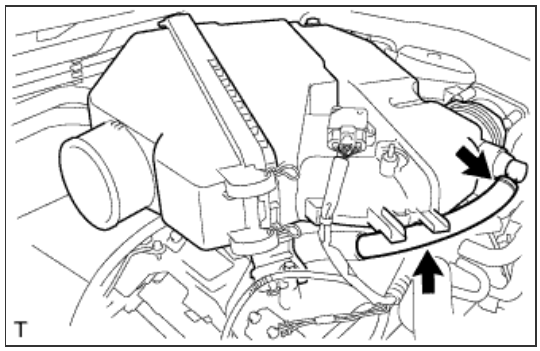
HINT:

Tighten the hose clamp until it reaches the specified protrusion height labeled A shown in the illustration.



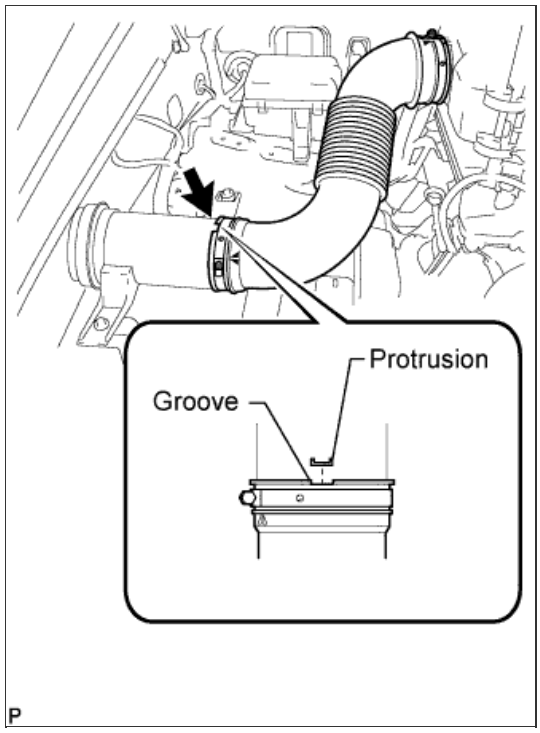
Standard protrusion height:
Less than 0.5 mm (0.0197 in.)

c. Connect the MAF meter connector.



d. Attach the 2 wire harness clamps.

e. Connect the vacuum hose.

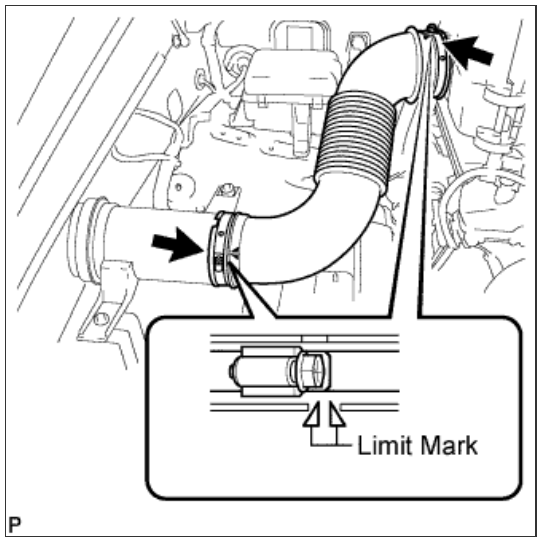


f. Attach the hose clamp.

g. Connect the No. 2 ventilation hose.

3. INSTALL NO. 2 AIR CLEANER HOSE

a. Align the protrusion of the pre-cleaner with the groove of the No. 2 air cleaner hose as shown in the illustration.



b. Tighten the 2 hose clamps.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

HINT:

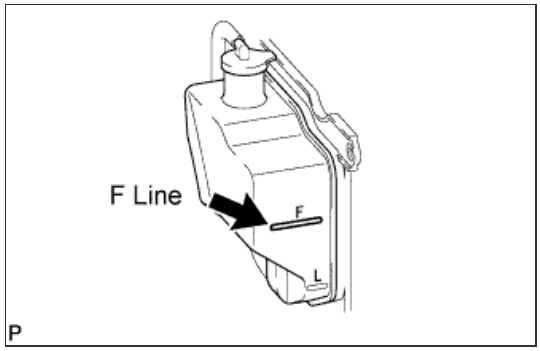
Tighten the clamp until the end of the clamp band is within both limit marks.

4. ADD ENGINE COOLANT

a. Add engine coolant.

Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)



NOTICE:

Do not substitute plain water for engine coolant.

HINT:

TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

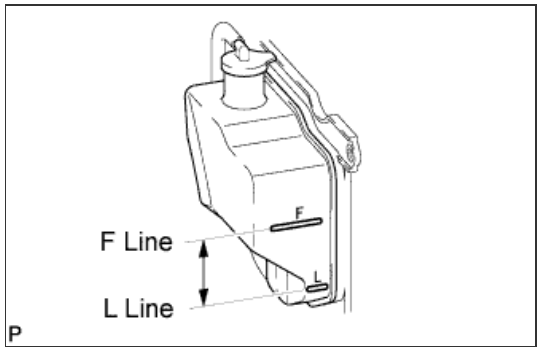
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

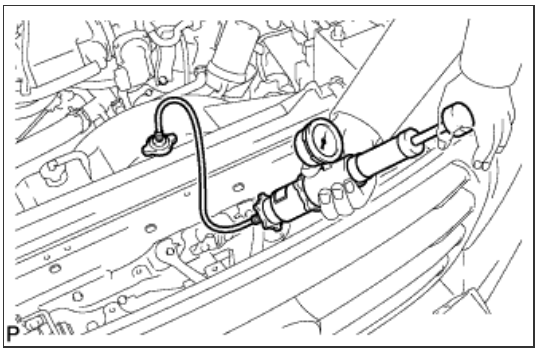
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

5. INSPECT FOR ENGINE COOLANT LEAK



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

6. CHECK THROTTLE BODY WITH MOTOR ASSEMBLY

a. Check the throttle control motor operating sounds.

i. Turn the ignition switch on (IG).

ii. When depressing the accelerator pedal, check the operating sound of the running motor. Make sure that no friction noises emit from the motor. If friction noise exists, replace the throttle body.

b. Check the throttle position sensor.

i. Connect the intelligent tester to the DLC3.

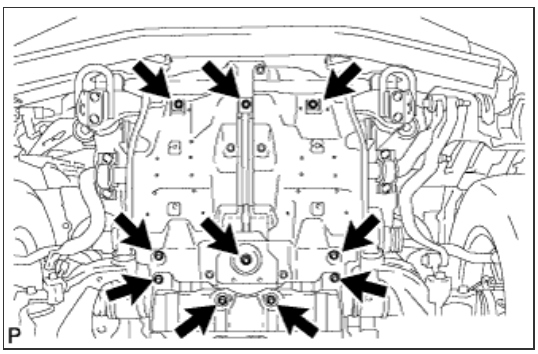
ii. Turn the ignition switch on (IG).

iii. Turn the intelligent tester on.

iv. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / Throttle Sensor Position.

v. Depress the accelerator pedal. When the throttle valve is fully opened, check that the value of the "Throttle Sensor Position" is within the specification.

Standard throttle valve opening percentage:
60% or more

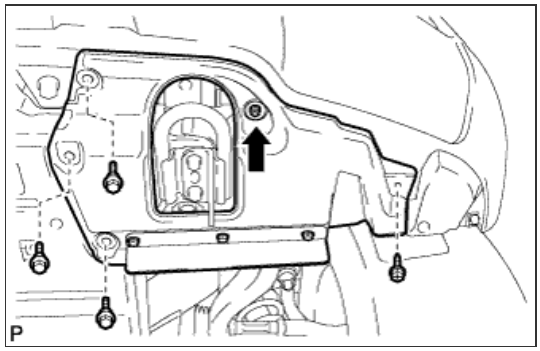


HINT:

When checking the standard throttle valve opening percentage, the shift lever should be in N.

If the percentage is less than 60%, replace the throttle body.

7. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



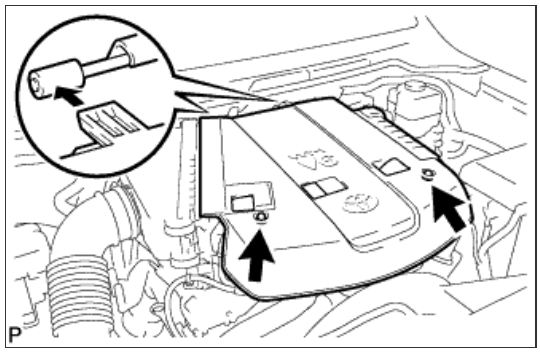
a. Install the under cover with the 10 bolts.

8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

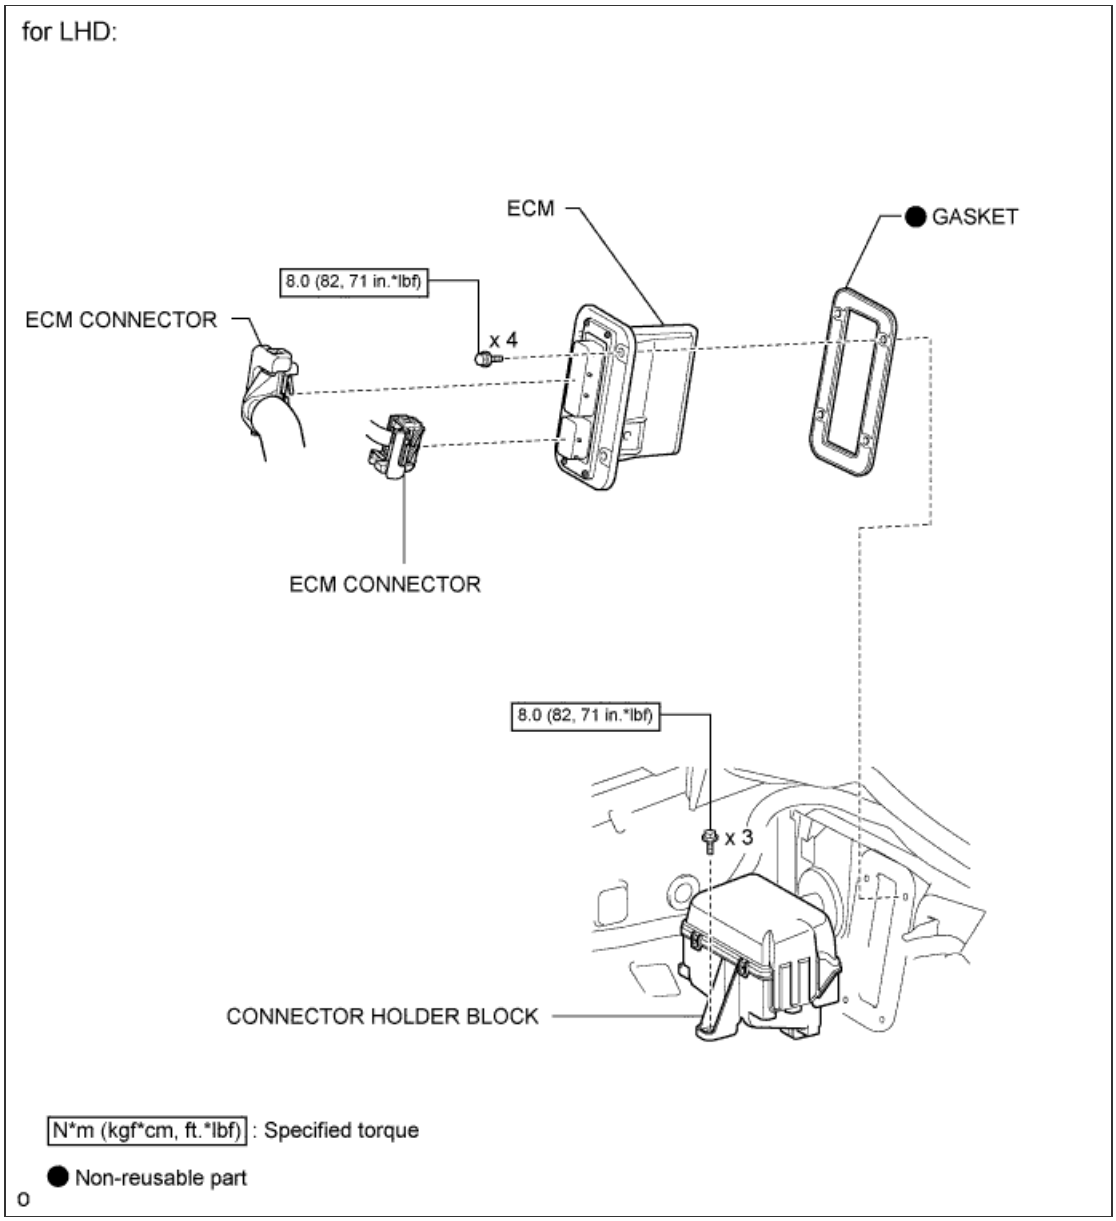
b. Install the 3 bolts and screw.

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



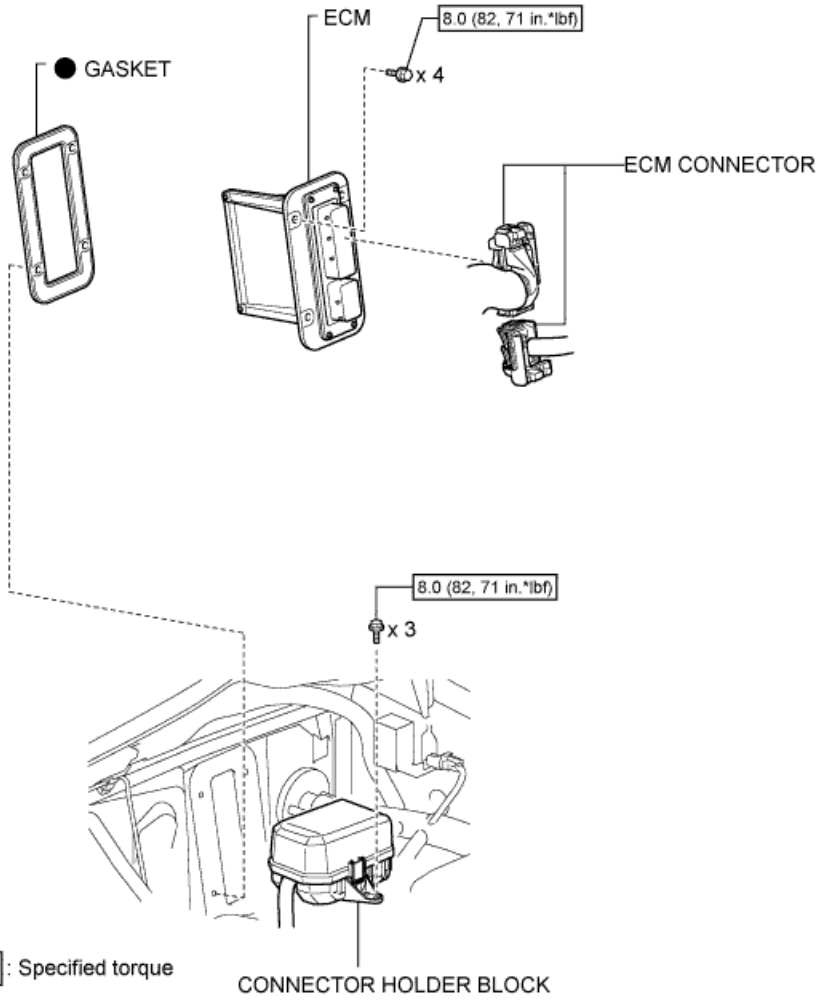
HINT:

Use the same procedures described for the LH side.



10. INSTALL V-BANK COVER

a. Install the V-bank cover with the 2 cap nuts.



Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

for Preparation Click here

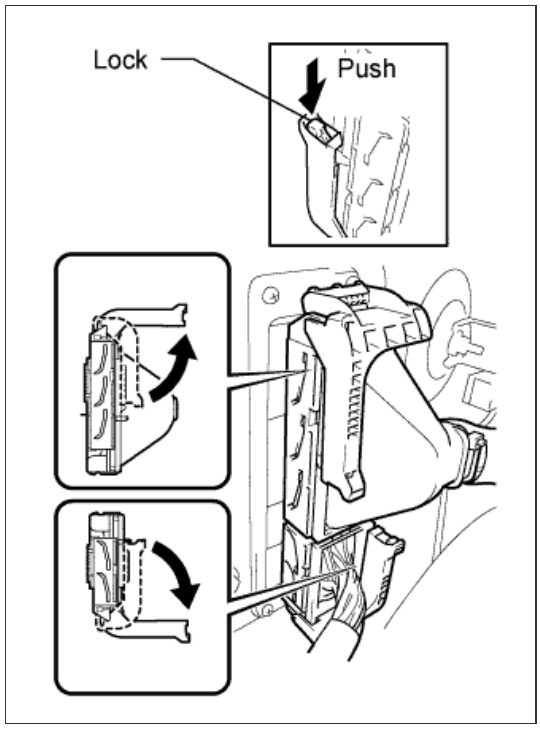
1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

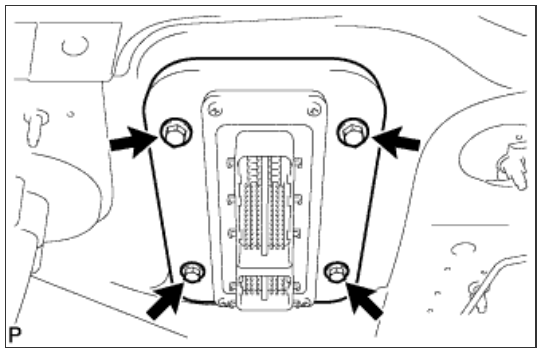
2. DISCONNECT CONNECTOR HOLDER BLOCK

a. Remove the 3 bolts and move the connector holder block so that the ECM can be removed in the next step.



3. REMOVE ECM

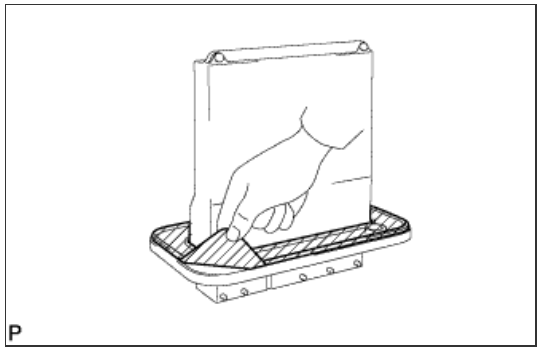
a. Raise the 2 levers while pushing the locks on the 2 levers.



NOTICE:

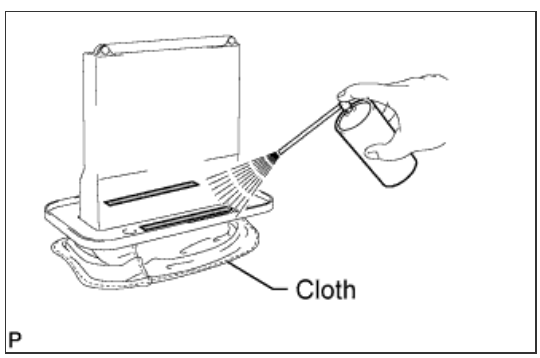
Make sure that the lock levers are raised 90° as shown in the illustration before disconnecting the ECM connectors. Failure to do this may cause the ECM connectors to break.

b. Disconnect the 2 connectors.

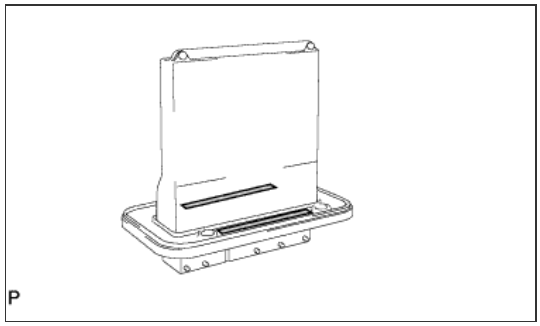


c. Remove the 4 bolts and ECM.

4. REMOVE GASKET



a. Peel off the gasket.



b. Spray gasket remover or equivalent on the remaining tape of the gasket.

NOTICE:

When using gasket remover or equivalent, cover the ECM connectors with a cloth.

c. Remove the tape of the gasket without using bladed objects.

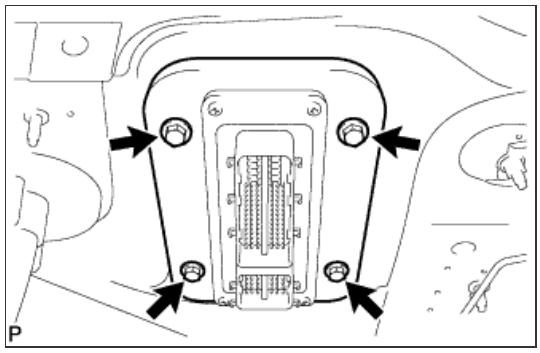
P

for Preparation Click here

1. INSTALL GASKET

a. Clean the ECM seal surface with non-residue solvent.

b. Attach a new gasket to the ECM.

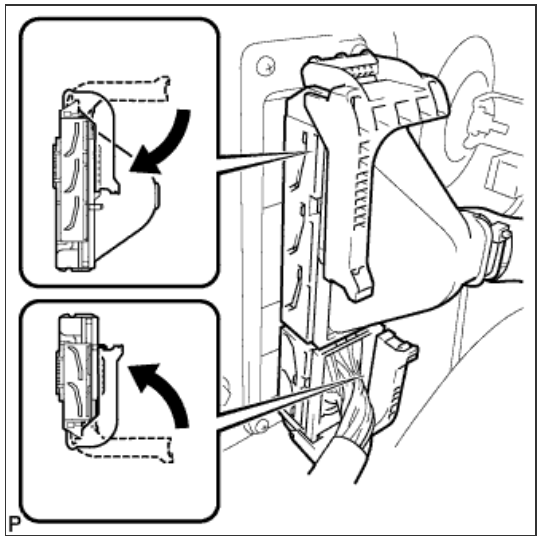


2. INSTALL ECM

a. Install the ECM with the 4 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

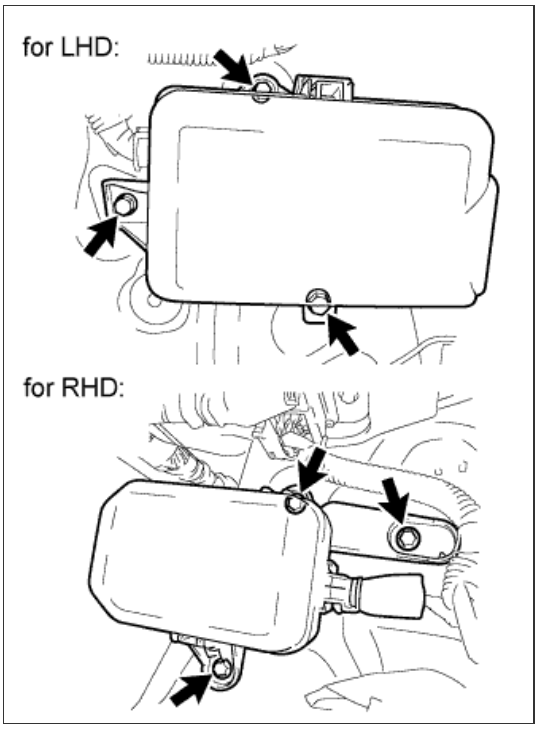
NOTICE:



- **Make sure the gasket is not folded or caught on any area of the surrounding part.**
- **Make sure there is no foreign matter caught between the gasket and surrounding part.**
- **Do not damage the gasket.**

b. Connect the 2 ECM connectors and push each lock lever down to lock the ECM connectors.

NOTICE:

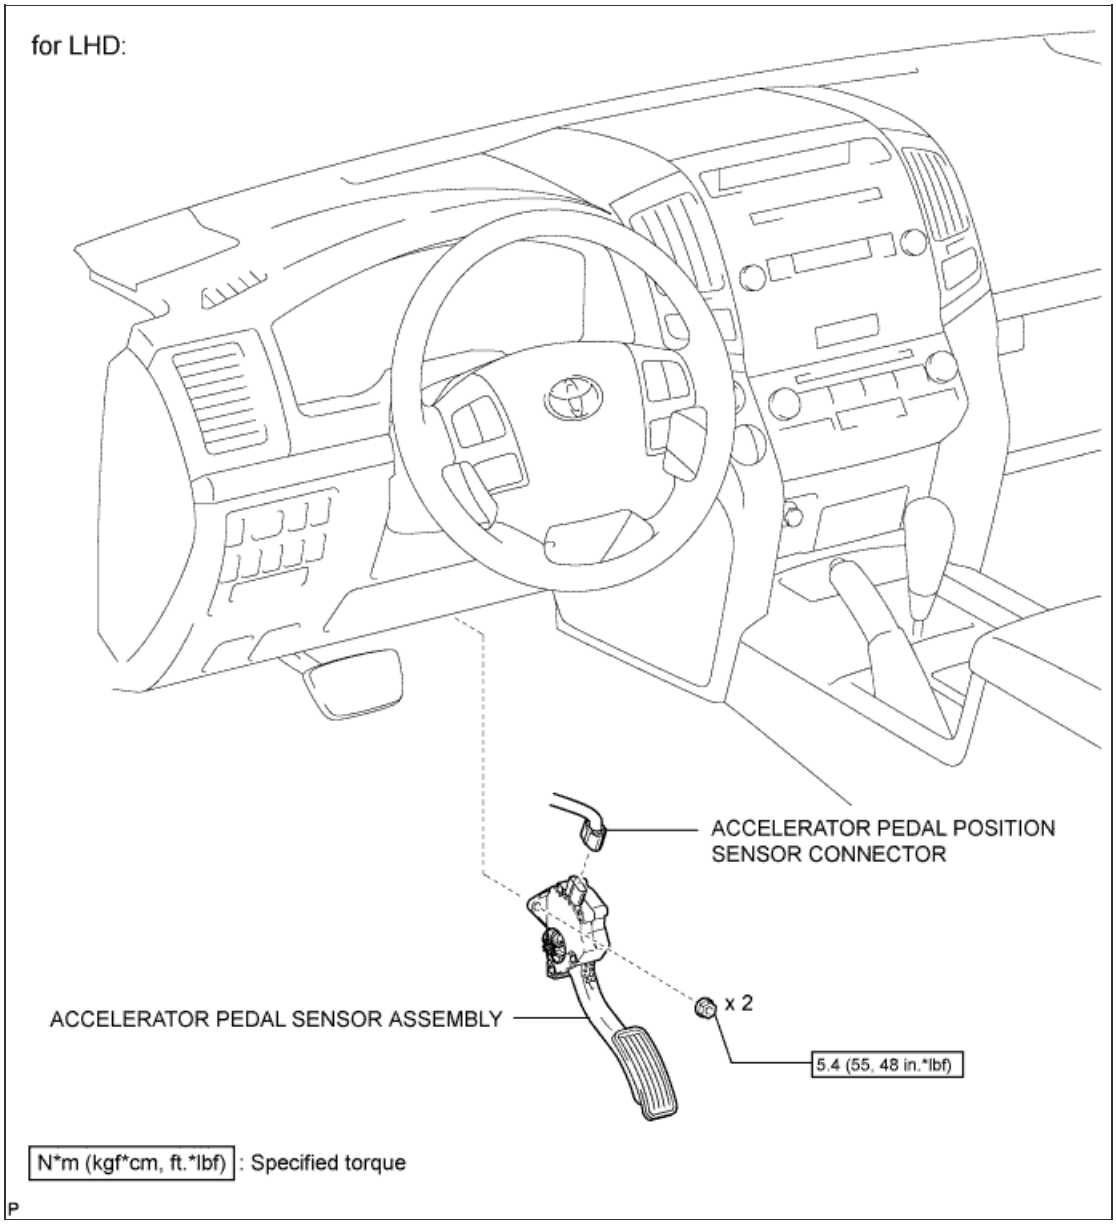


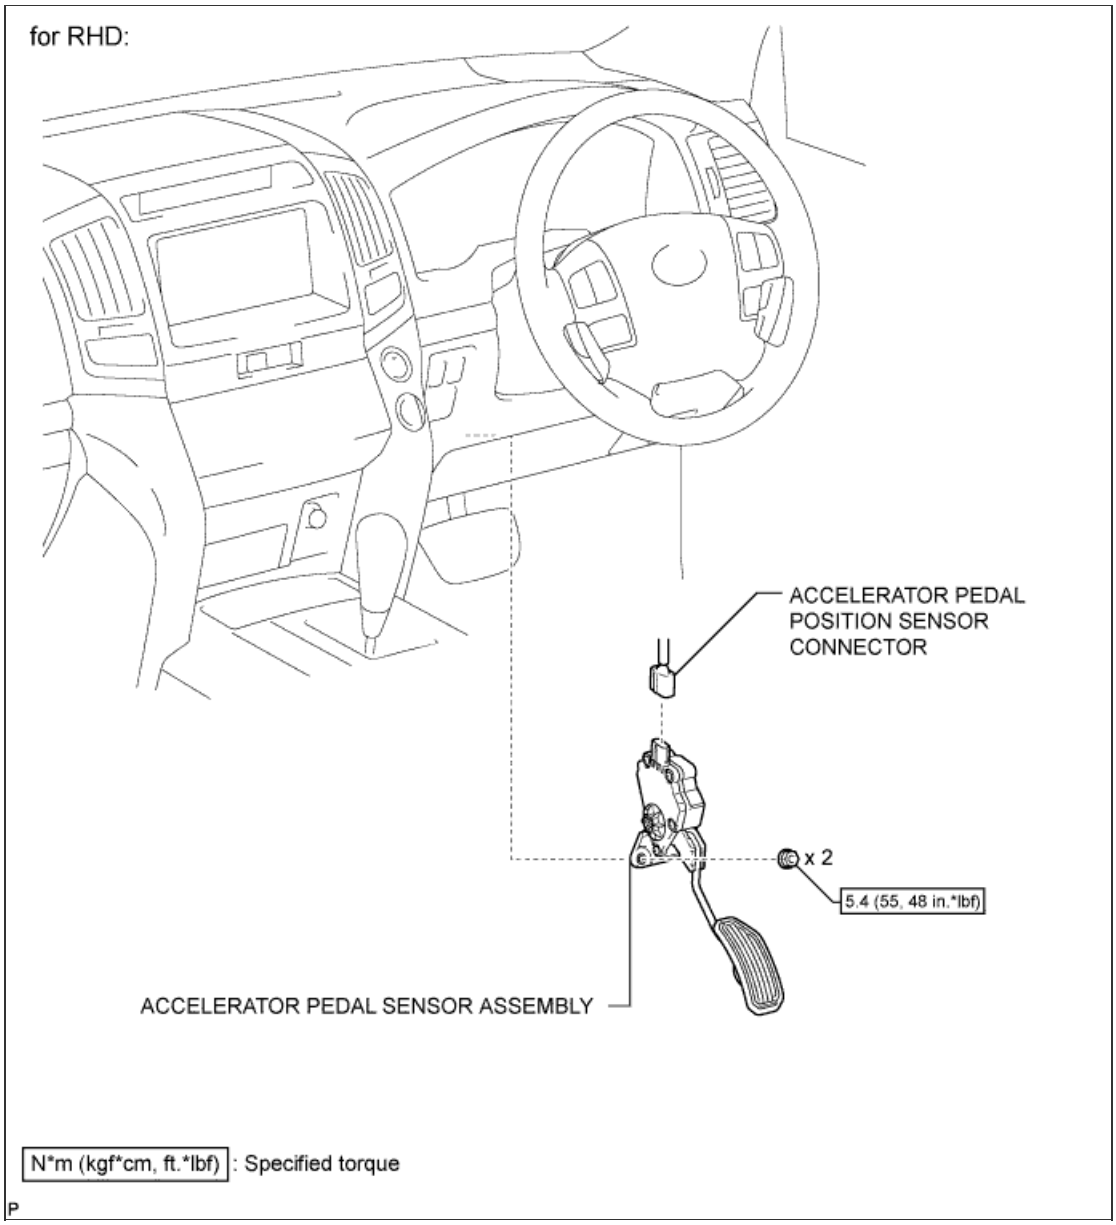
- **Be careful not to allow dirt, water, or other foreign matter to adhere to the connecting parts when connecting the connectors.**
- **Do not twist the wire harness when connecting the ECM connectors.**
- **Make sure that the lock levers are raised 90° before connecting the ECM connectors. Failure to do this may cause the lock lever and terminals to break.**
- **Make sure that the levers are securely locked.**

3. CONNECT CONNECTOR HOLDER BLOCK

a. Connect the connector holder block with the 3 bolts.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }





4. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

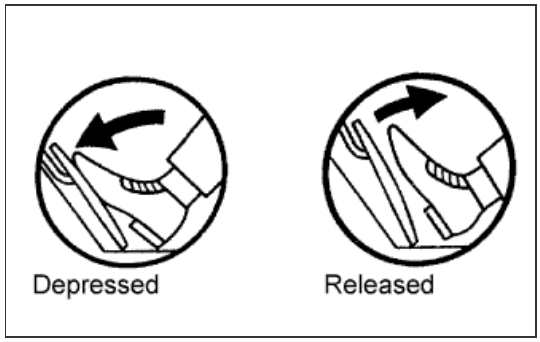
1. INSPECT ACCELERATOR PEDAL SENSOR ASSEMBLY

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch on (IG).

c. Turn the intelligent tester on.



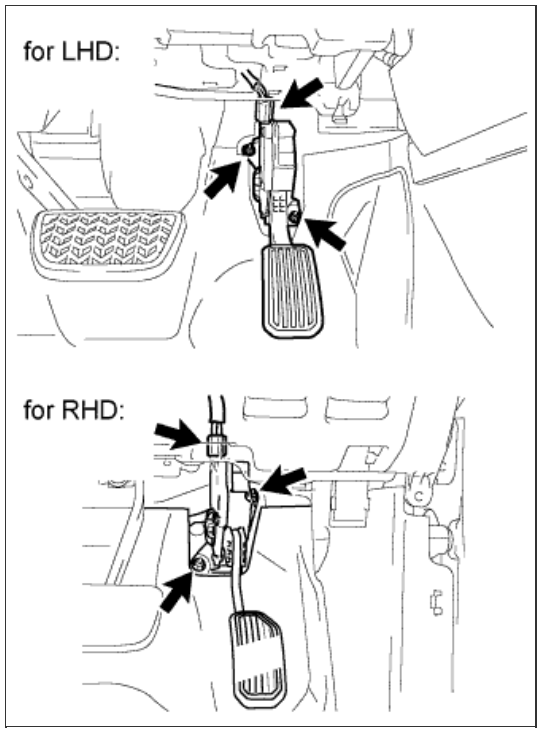
d. Enter the following menus: Powertrain / Engine and ECT / Data List / ETCS / Accelerator Position No. 1 and Accelerator Position No. 2.

e. Read the value displayed on the intelligent tester.

Standard Voltage:

Accelerator Pedal Operation	Accelerator Position No. 1	Accelerator Position No. 2
Released	0.5 to 1.1 V	1.2 to 2.0 V
Depressed	2.6 to 4.5 V	3.4 to 5.0 V

If the result is not as specified, check the accelerator pedal, wire harness or ECM.



for Preparation Click here

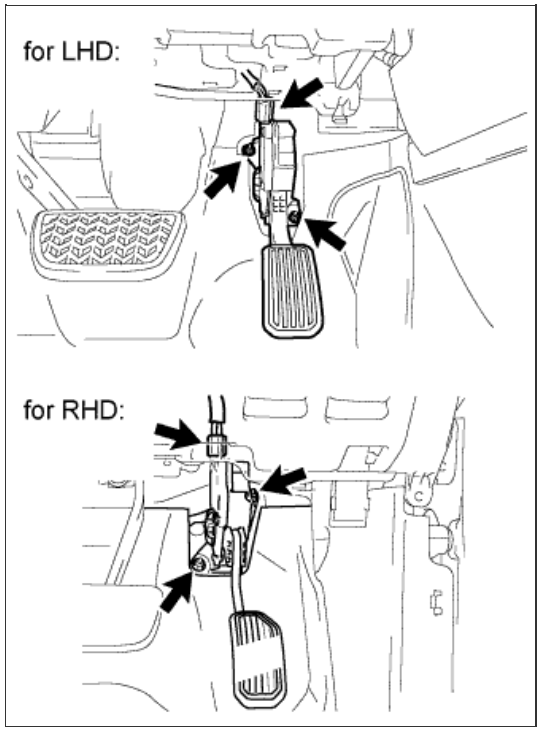
1. REMOVE ACCELERATOR PEDAL SENSOR ASSEMBLY

a. Disconnect the accelerator pedal position sensor connector.

b. Remove the 2 nuts and accelerator pedal sensor.

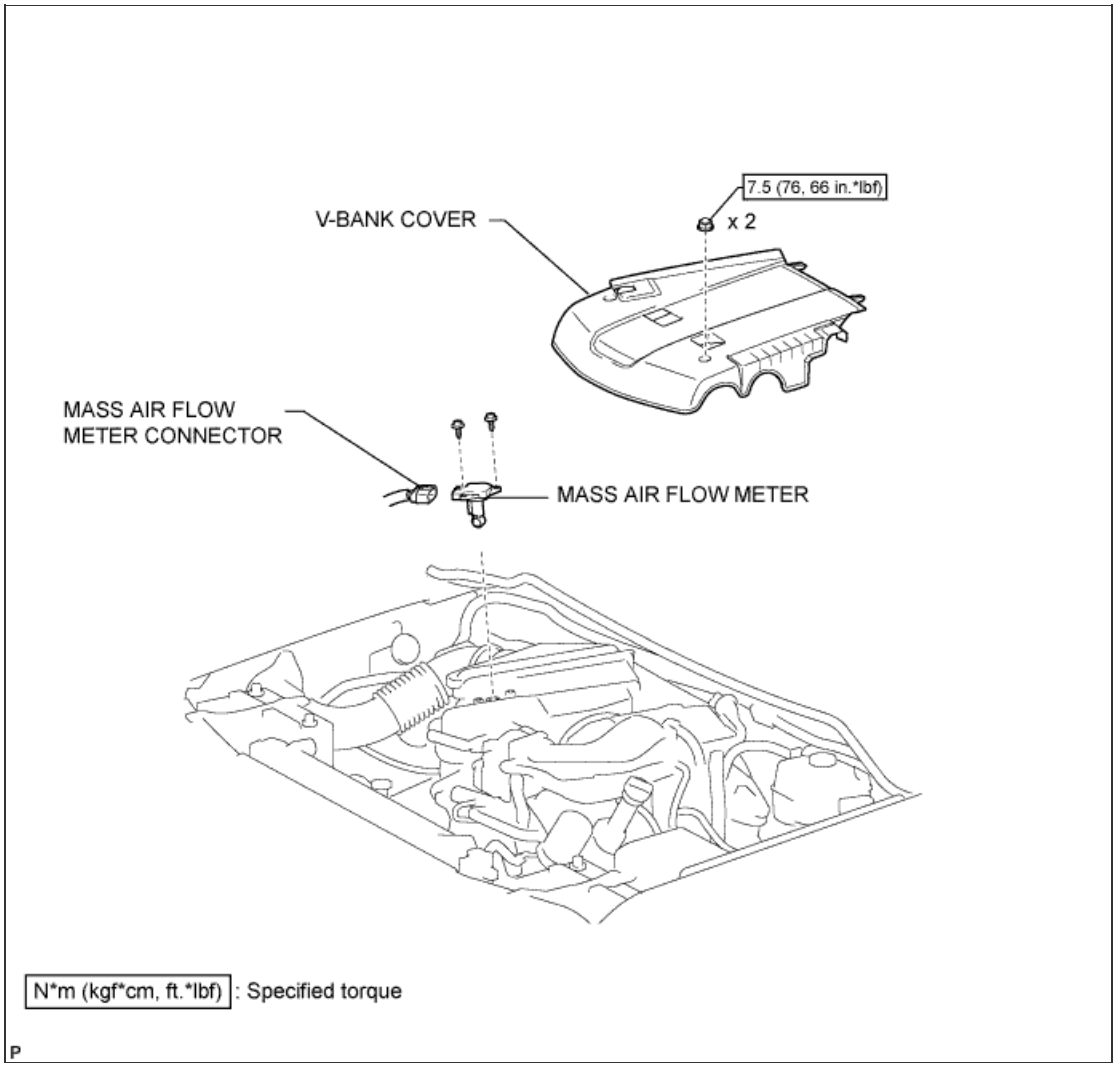
for Preparation Click here

1. INSTALL ACCELERATOR PEDAL SENSOR ASSEMBLY



NOTICE:

- **Avoid physical shocks to the accelerator pedal sensor assembly.**
- **Do not disassemble the accelerator pedal sensor assembly.**



a. Install the accelerator pedal sensor with the 2 nuts.

Torque:
5.4 N*m{ 55 kgf*cm , 48 in.*lbf }

b. Connect the accelerator pedal position sensor connector.

for Preparation [Click here]

for Preparation Click here

NOTICE:

- **Perform the MAF meter inspection according to the procedures below.**
- **Only replace the MAF meter when the MAF value in the Data List (with the engine stopped) is not within the normal operating range or there is foreign matter on the MAF meter platinum hot wire (heater).**

1. INSPECT MASS AIR FLOW METER

a. Read the value using the intelligent tester.

NOTICE:

- **Perform the inspection with the vehicle indoors and on a level surface.**
- **Perform the inspection of the MAF meter while it is installed to the air cleaner case (installed to the vehicle).**
- **During the test, do not use the exhaust air duct to apply suction to the exhaust pipe.**

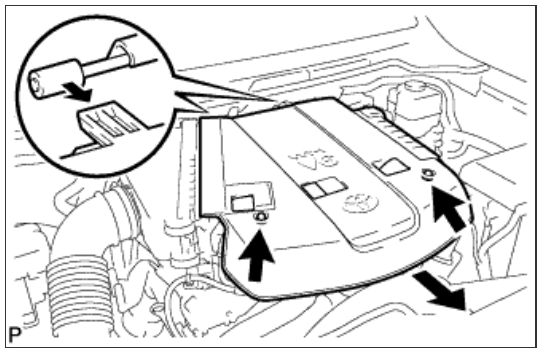
i. Turn the ignition switch on (IG).

ii. Turn the intelligent tester on.

iii. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data / MAF.

iv. Wait 30 seconds, and read the values on the intelligent tester.

Standard:

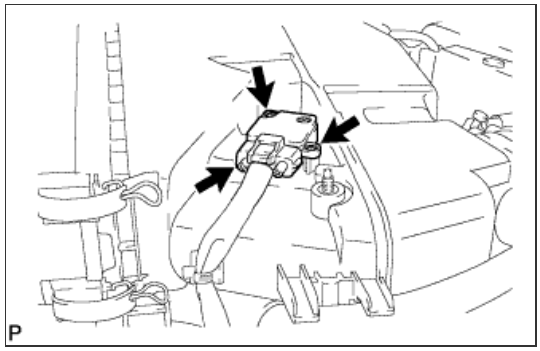


Item	Condition	Specified Condition
MAF	• Engine not running • 30 seconds after ignition switch is turned on (IG)	Less than 0.69 g/sec.

If the result is not as specified, replace the MAF meter.
If the result is within the specified range, inspect the MAF meter (Click here).

for Preparation Click here

1. REMOVE V-BANK COVER

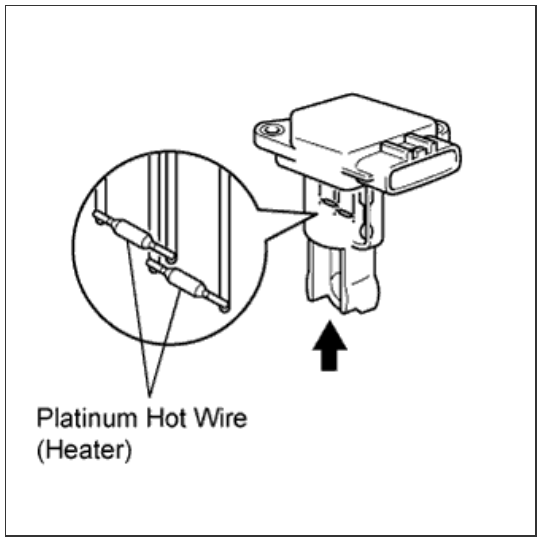


a. Remove the 2 cap nuts and V-bank cover.

2. REMOVE MASS AIR FLOW METER

a. Disconnect the MAF meter connector.

b. Remove the 2 screws and MAF meter.



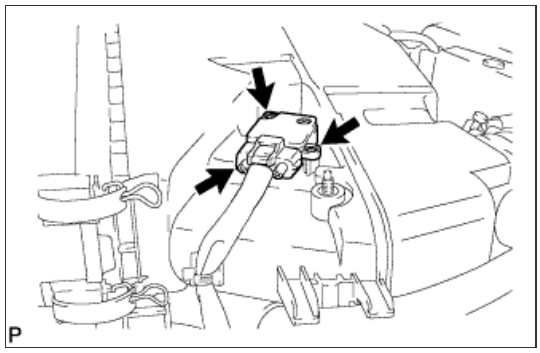
for Preparation Click here

1. INSPECT MASS AIR FLOW METER

a. Perform a visual check for any foreign matter on the platinum hot wire (heater) of the mass air flow meter shown in the illustration.

OK:
There is no foreign matter.

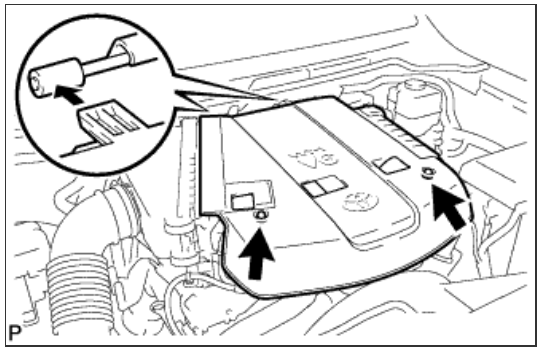
If the result is not as specified, replace the mass air flow meter.



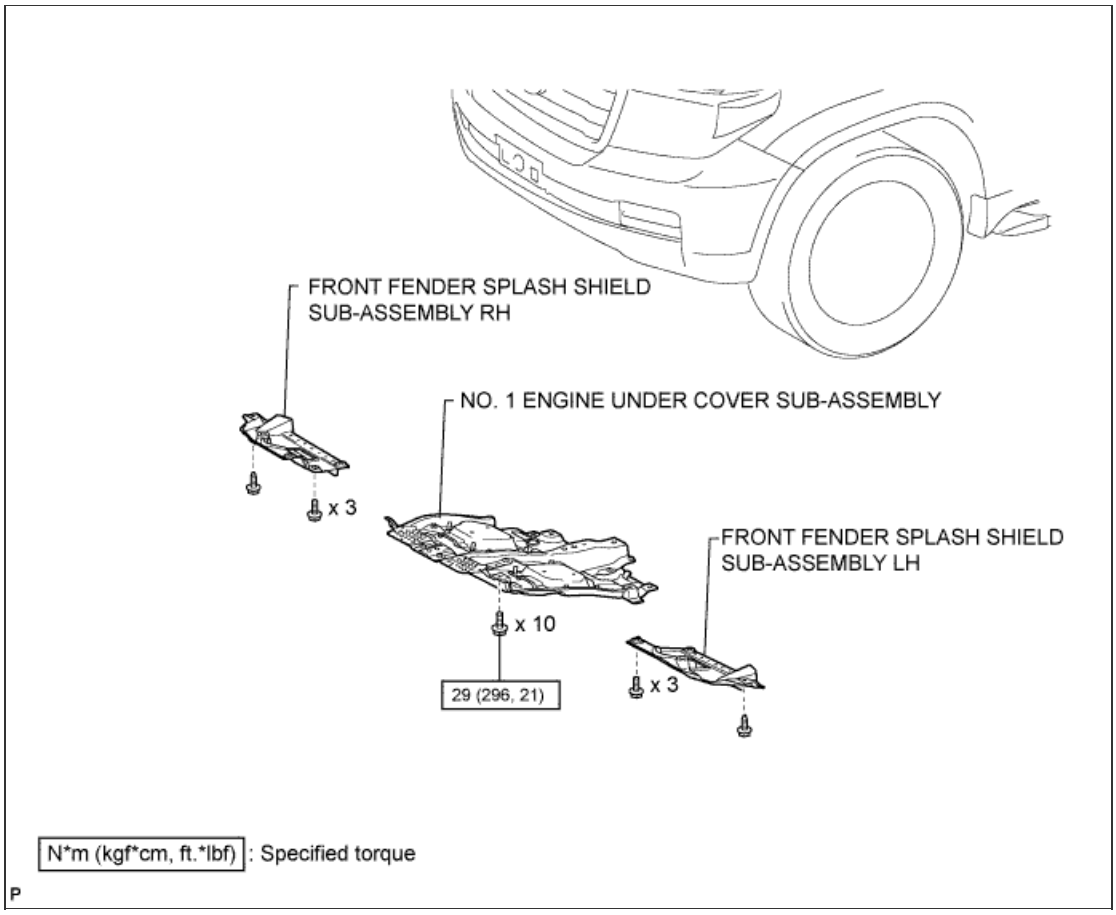
for Preparation Click here

1. INSTALL MASS AIR FLOW METER

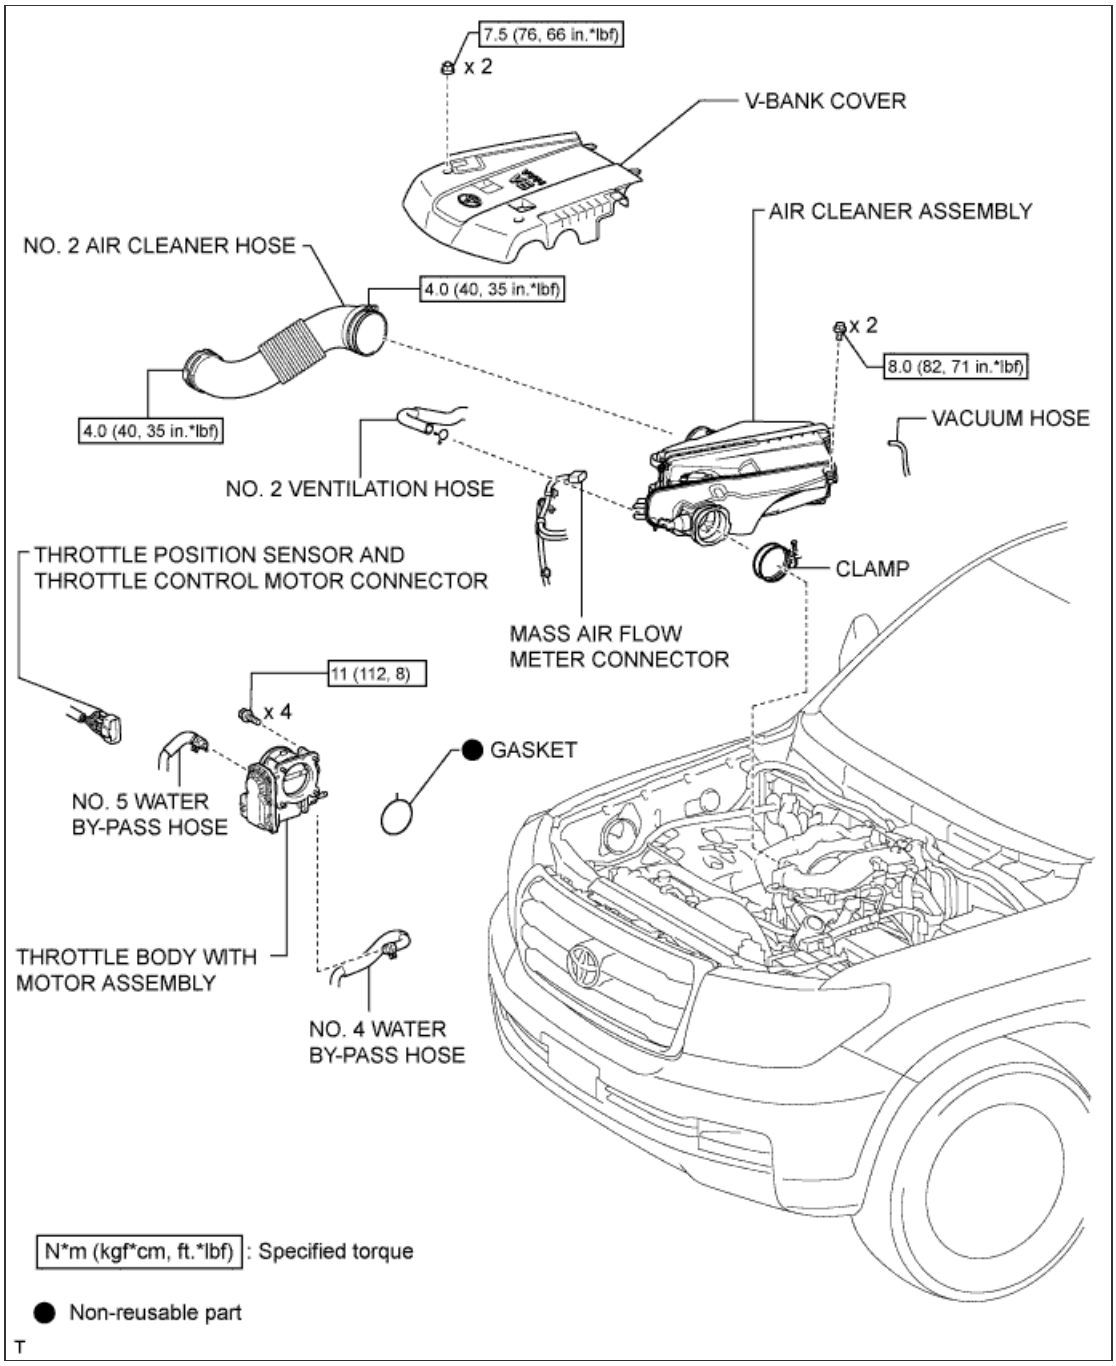
a. Install the MAF meter with the 2 screws.



b. Connect the MAF meter connector.



2. INSTALL V-BANK COVER



a. Install the V-bank cover with the 2 cap nuts.

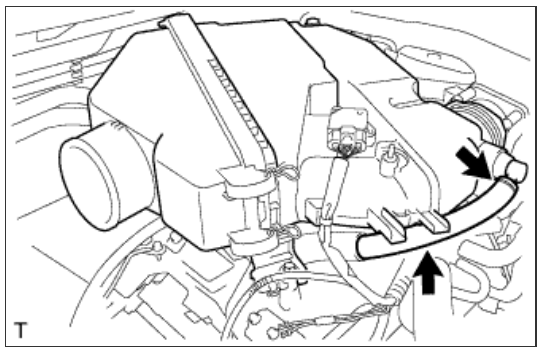
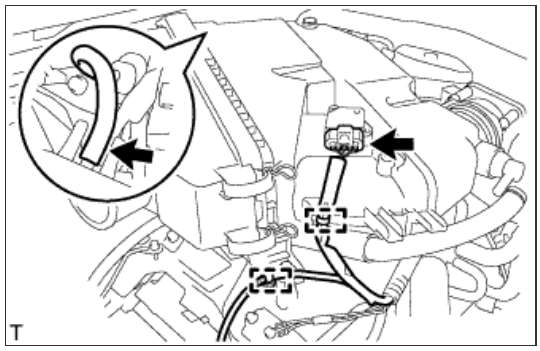
6. REMOVE NO. 2 AIR CLEANER HOSE



a. Loosen the 2 hose clamps and remove the air cleaner hose.

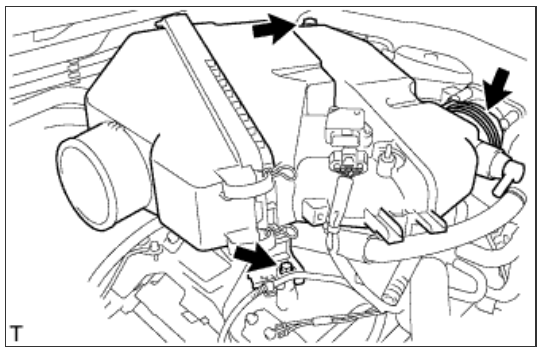
7. REMOVE AIR CLEANER ASSEMBLY

a. Disconnect the No. 2 ventilation hose.



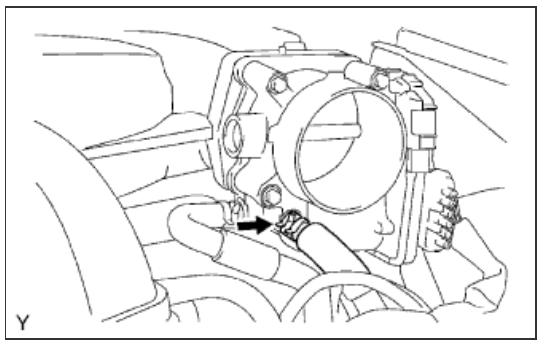
b. Detach the hose clamp.

c. Disconnect the vacuum hose.



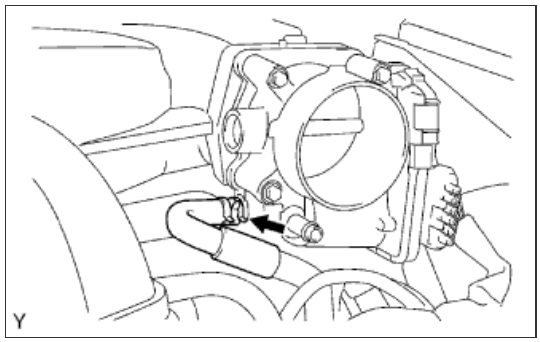
d. Disconnect the MAF meter connector.

e. Using a clip remover, detach the 2 wire harness clamps.



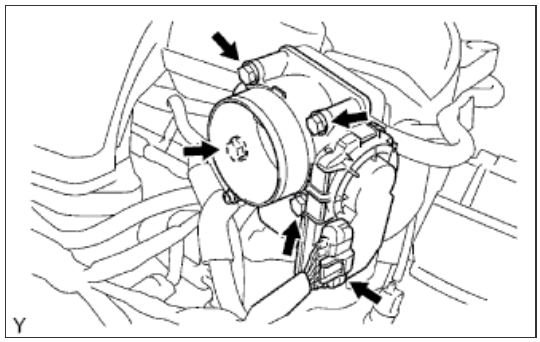
f. Loosen the hose clamp.

g. Remove the 2 bolts and air cleaner assembly.



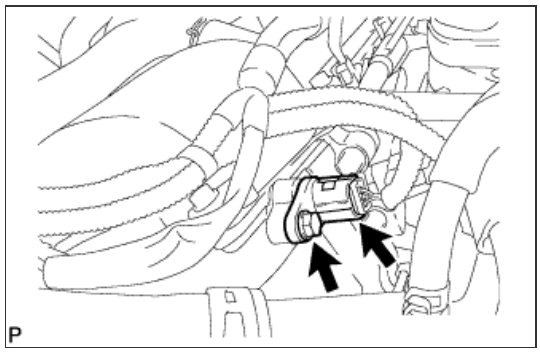
8. REMOVE THROTTLE BODY WITH MOTOR ASSEMBLY

a. Disconnect the No. 5 water by-pass hose.



b. Disconnect the No. 4 water by-pass hose.

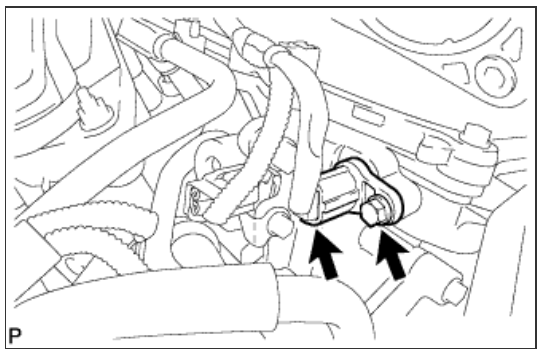
c. Disconnect the throttle position sensor and throttle control motor connector.



d. Remove the 4 bolts, then remove the throttle body with motor and gasket.

9. REMOVE VVT SENSOR (for Bank 1)

a. Disconnect the sensor connector.



b. Remove the bolt and sensor.

10. REMOVE VVT SENSOR (for Bank 2)

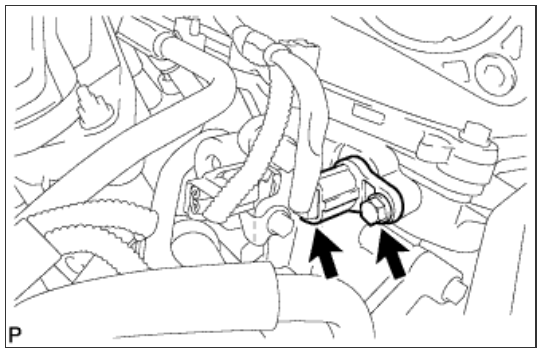
a. Disconnect the sensor connector.

b. Remove the bolt and sensor.

for Preparation Click here

1. INSTALL VVT SENSOR (for Bank 2)

a. Apply a light coat of engine oil to the O-ring of the VVT sensor.



NOTICE:

- **When reusing the sensor, inspect the O-ring.**
- **If the O-ring has scratches or cuts, replace the sensor.**

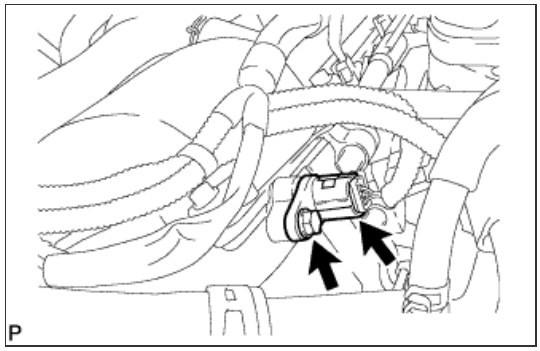
b. Install the VVT sensor with the bolt.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

c. Connect the sensor connector.

2. INSTALL VVT SENSOR (for Bank 1)

a. Apply a light coat of engine oil to the O-ring of the sensor.



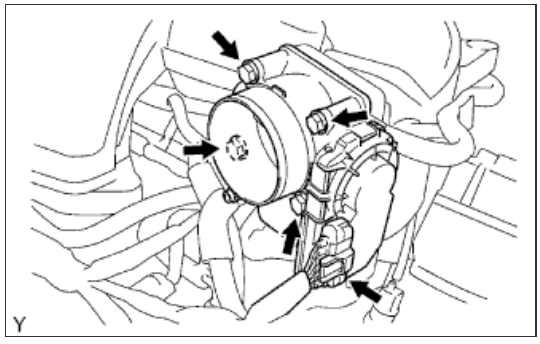
NOTICE:

- **When reusing the sensor, inspect the O-ring.**
- **If the O-ring has scratches or cuts, replace the sensor.**

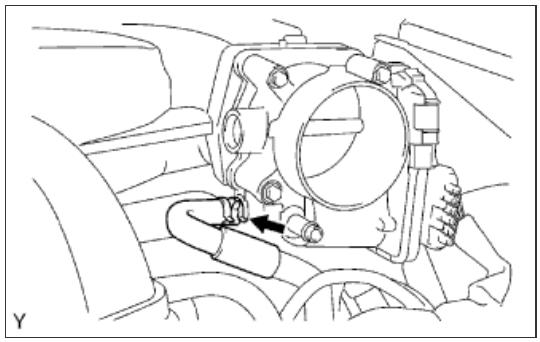
b. Install the sensor with the bolt.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

c. Connect the sensor connector.

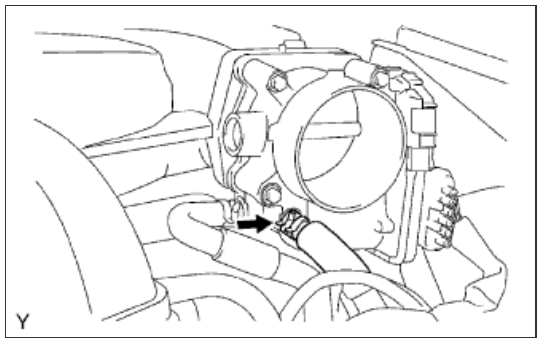


3. INSTALL THROTTLE BODY WITH MOTOR ASSEMBLY



a. Install a new gasket and the throttle body with motor with the 4 bolts.

Torque:
11 N*m{ 112 kgf*cm , 8 ft.*lbf }



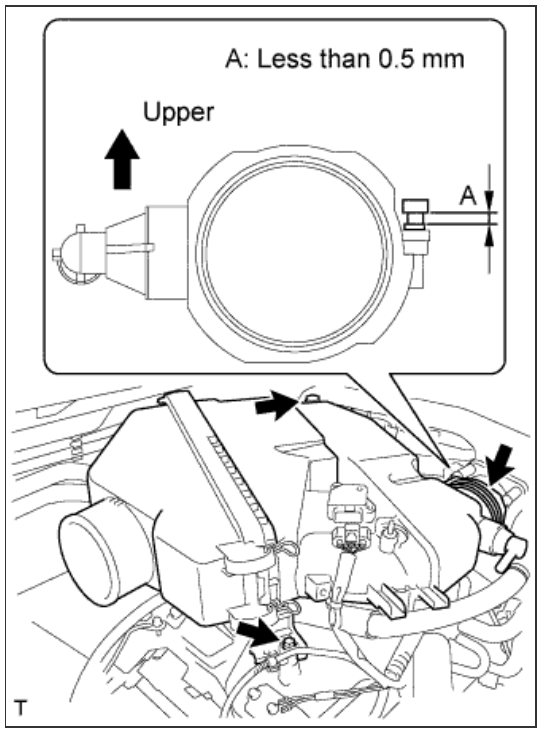
b. Connect the throttle position sensor and throttle control motor connector.

c. Connect the No. 4 water by-pass hose.

d. Connect the No. 5 water by-pass hose.

4. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner assembly with the 2 bolts.

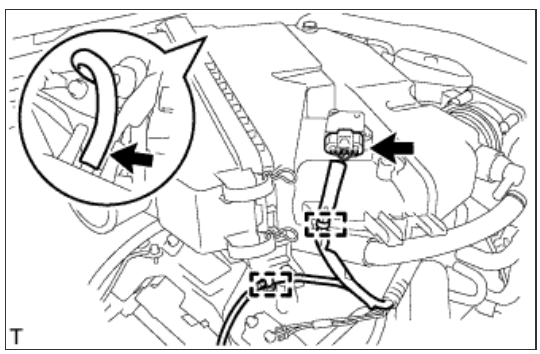


Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

b. Tighten the hose clamp.

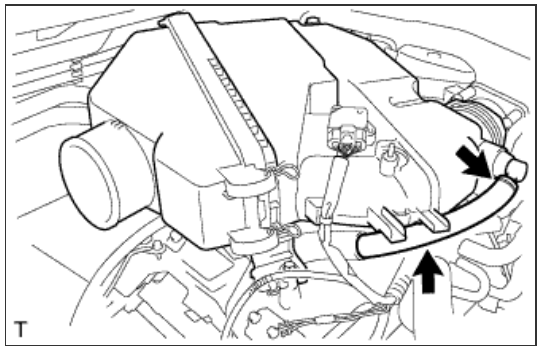
HINT:

Tighten the hose clamp until it reaches the specified protrusion height labeled A shown in the illustration.



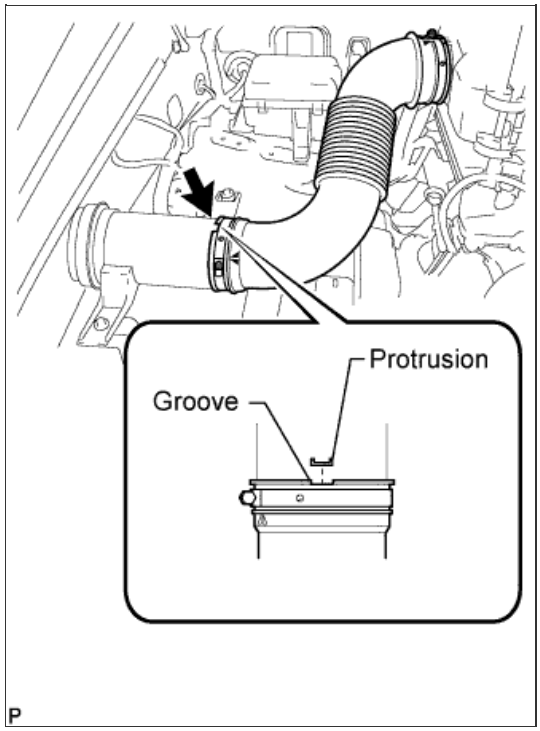
Standard protrusion height:
Less than 0.5 mm (0.0197 in.)

c. Connect the MAF meter connector.



d. Attach the 2 wire harness clamps.

e. Connect the vacuum hose.

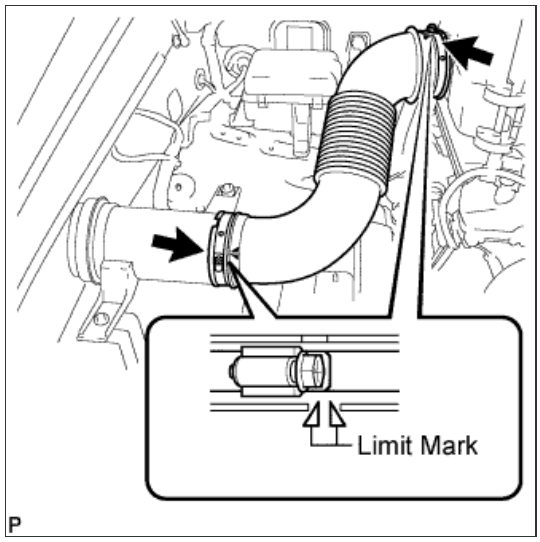


f. Attach the hose clamp.

g. Connect the No. 2 ventilation hose.

5. INSTALL NO. 2 AIR CLEANER HOSE

a. Align the protrusion of the pre-cleaner with the groove of the No. 2 air cleaner hose as shown in the illustration.



b. Tighten the 2 hose clamps.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

HINT:

Tighten the clamp until the end of the clamp band is within both limit marks.

6. ADD ENGINE COOLANT

a. Add engine coolant.

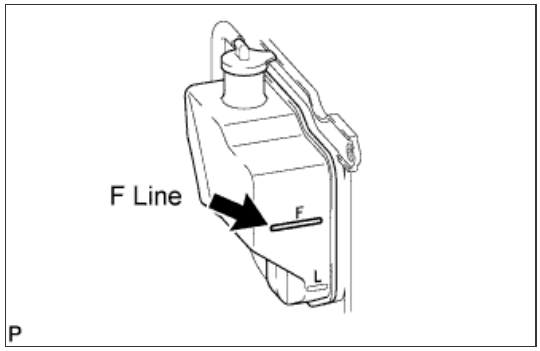
Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:



TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

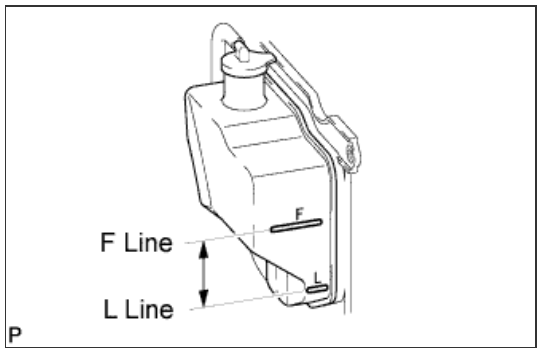
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

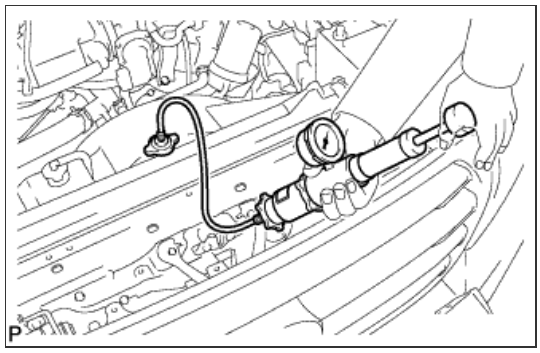
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

7. INSPECT FOR ENGINE COOLANT LEAK



CAUTION:

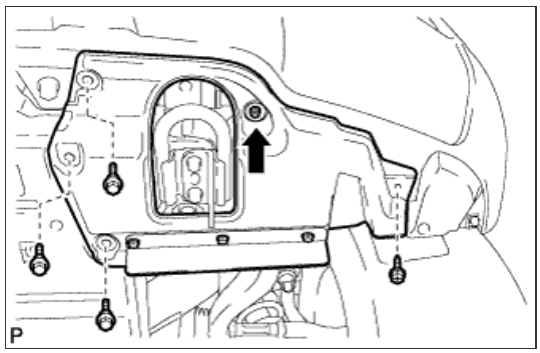
Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

8. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the engine under cover with the 10 bolts.

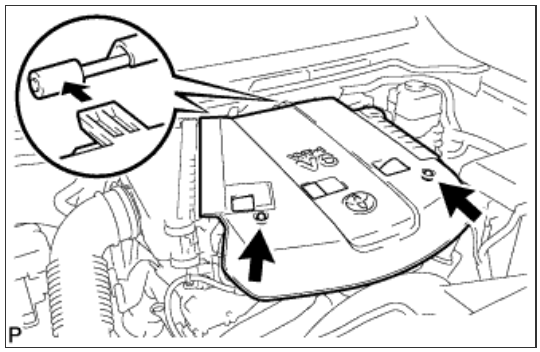
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

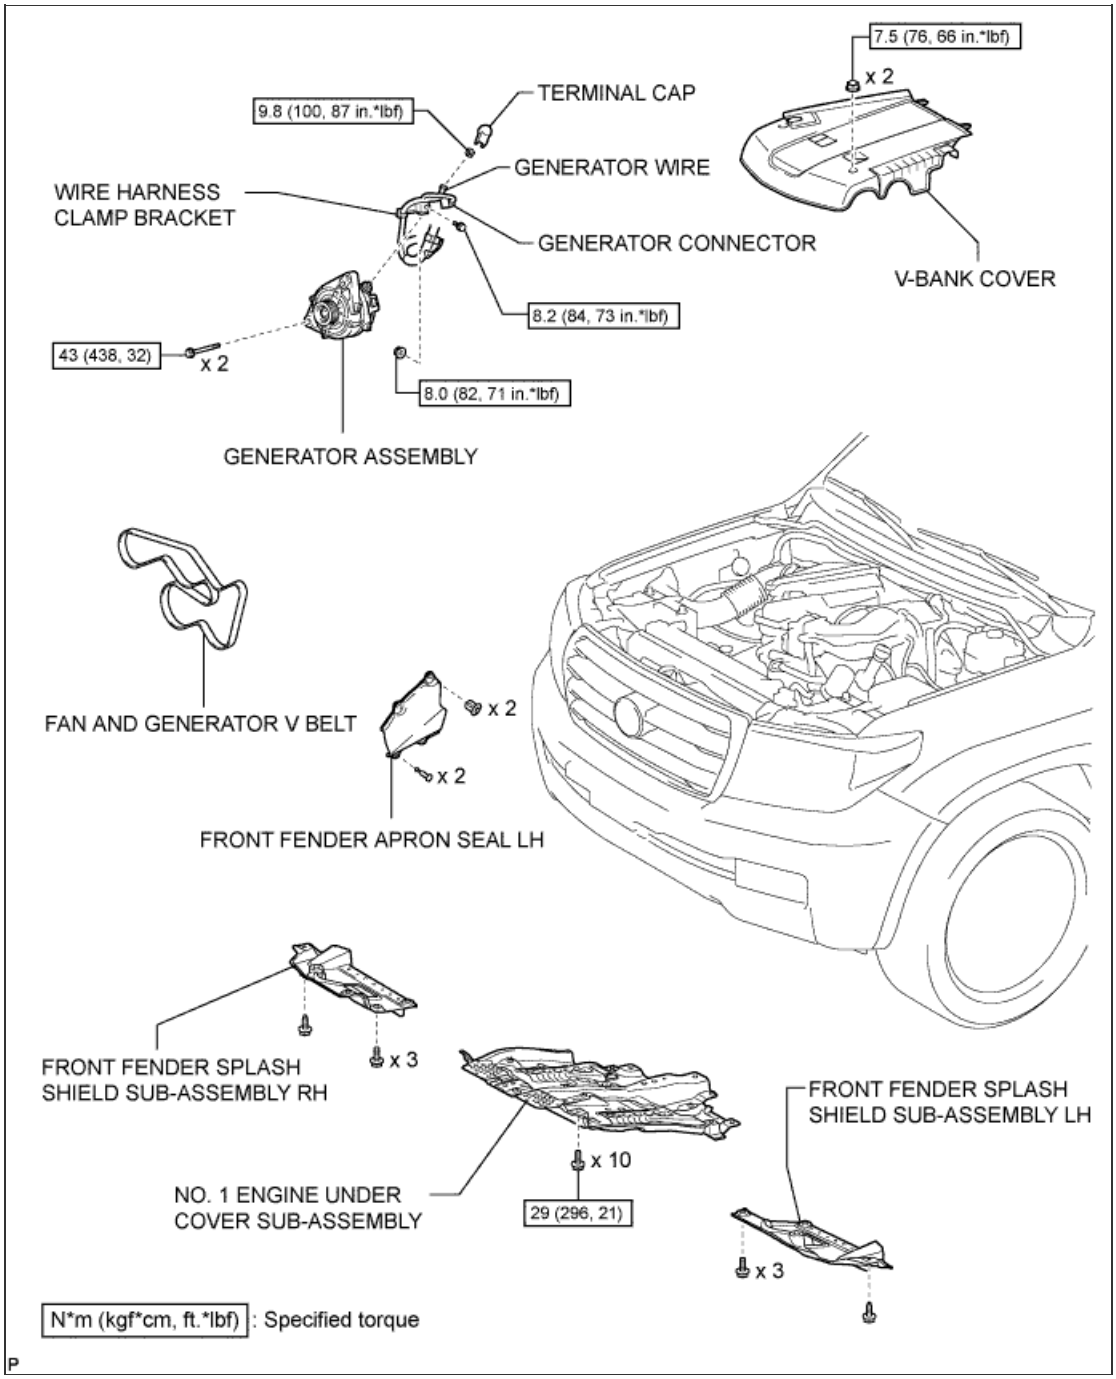
b. Install the 3 bolts and screw.

10. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

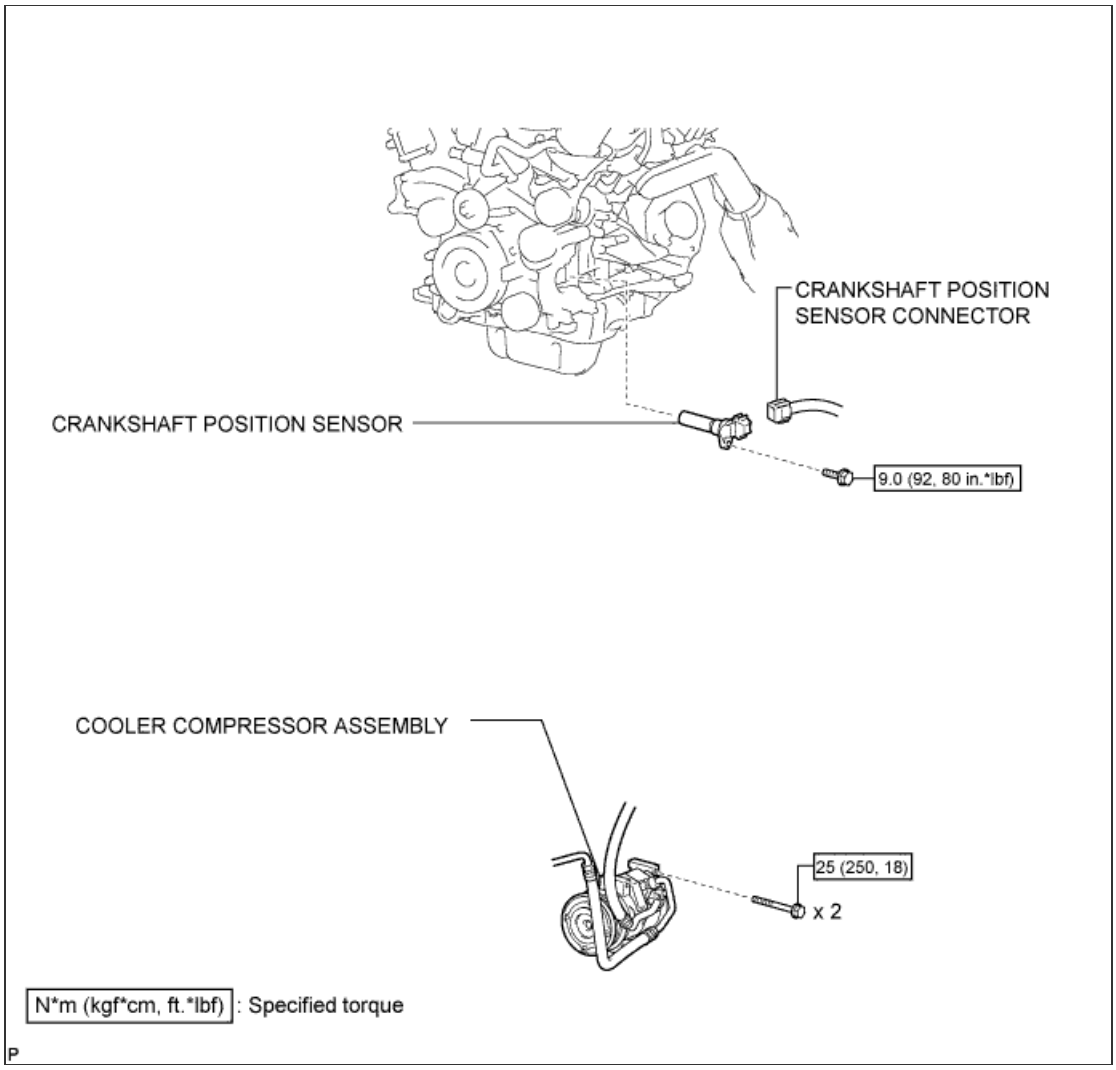


HINT:

Use the same procedures described for the LH side.



11. INSTALL V-BANK COVER



a. Install the V-bank cover with the 2 nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }

for Preparation [Click here]

CRANKSHAFT POSITION SENSOR CONNECTOR
CRANKSHAFT POSITION SENSOR

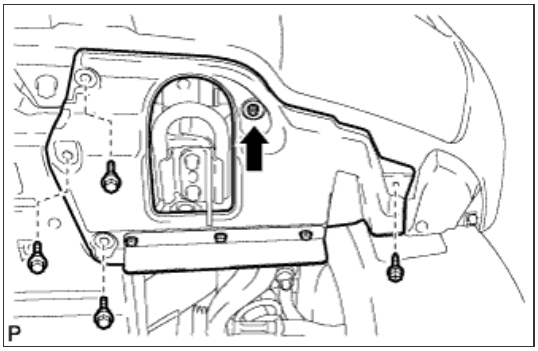
for Preparation Click here

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here)

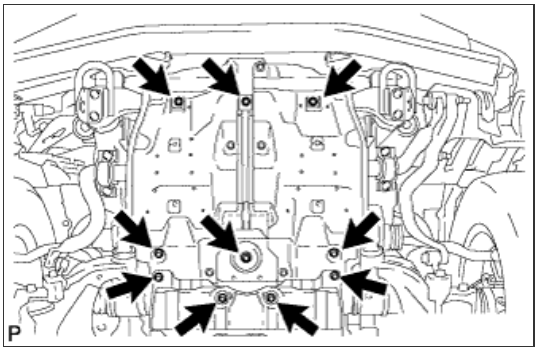
2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

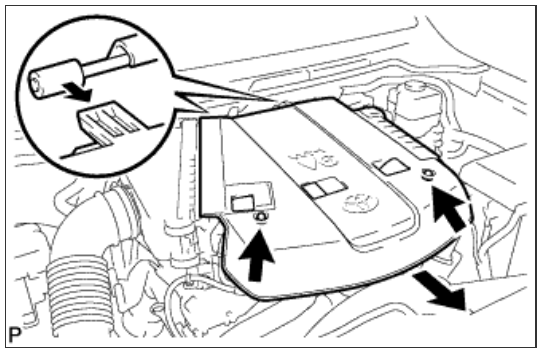
Use the same procedures described for the LH side.

3. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



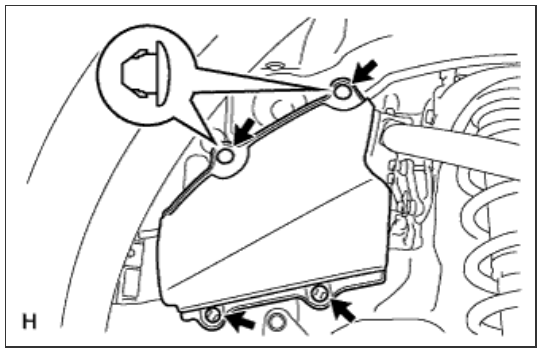
a. Remove the 3 bolts and screw.

b. urn the clip indicated by the arrow in the illustration to remove the fender splash shield.



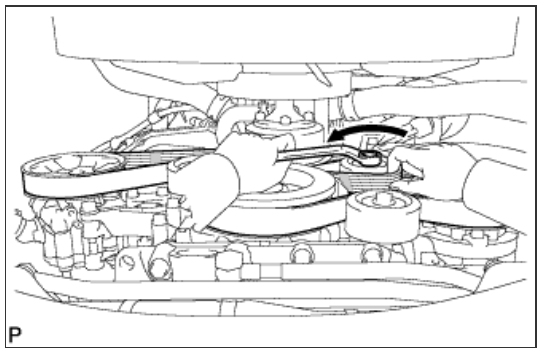
4. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and under cover.



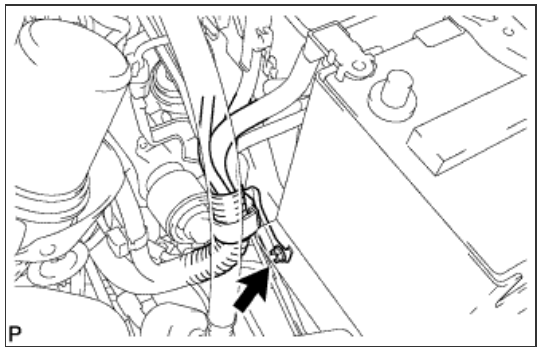
5. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and bank cover.



6. REMOVE FRONT FENDER APRON SEAL LH

a. Remove the clips and seal.

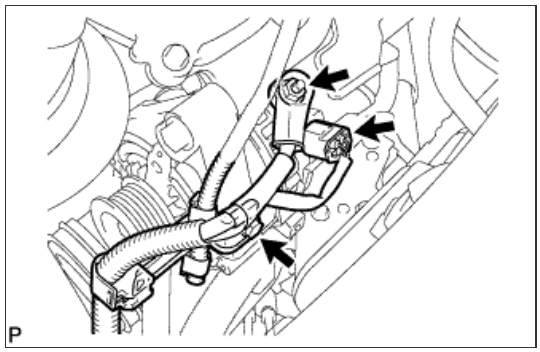


7. REMOVE FAN & GENERATOR V BELT

a. While releasing the belt tension by turning the belt tensioner counterclockwise, remove the fan and generator belt from the belt tensioner.

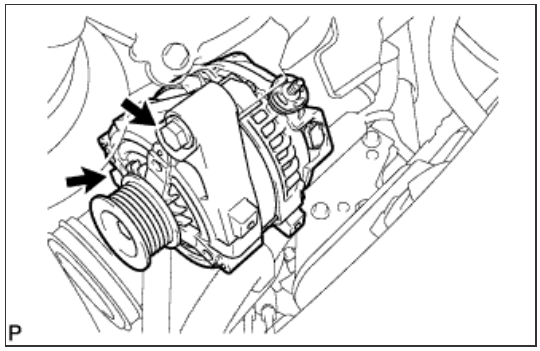
8. REMOVE GENERATOR ASSEMBLY

a. Remove the nut and disconnect the wire harness clamp bracket.



b. isconnect the generator connector.

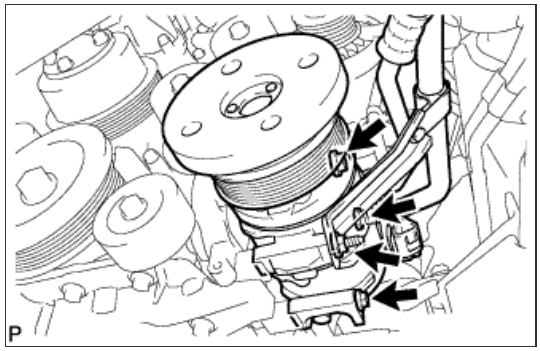
c. Remove the terminal cap.



d. Remove the nut and disconnect the generator wire.

e. Remove the wire harness clamp.

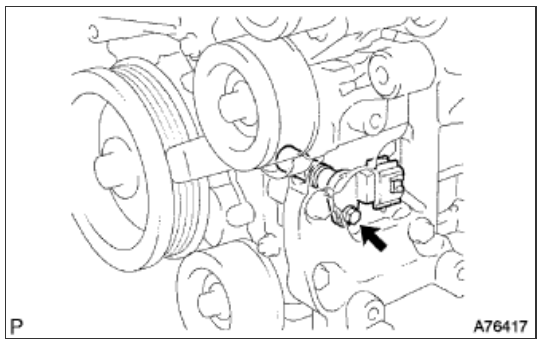
f. Remove the bolt and disconnect the wire harness clamp bracket.



g. Remove the 2 bolts and generator.

9. DISCONNECT COOLER COMPRESSOR ASSEMBLY

a. isconnect the cooler compressor connector.



b. Remove the nut, 3 bolts and stud bolt, and disconnect the cooler compressor.

10. REMOVE CRANKSHAFT POSITION SENSOR

a. isconnect the sensor connector.

b. Remove the bolt and sensor.

for Preparation Click here

1. INSPECT CRANKSHAFT POSITION SENSOR

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	Cold	1 to 2 Ω
	ot	20 to 3225 Ω

NOTICE:

In the table above, the terms Cold and ot refer to the temperature of the sensor. Cold as appro i ately -10 to 50 C (1 to 122). ot as appro i ately 50 to 100 C (122 to 212).

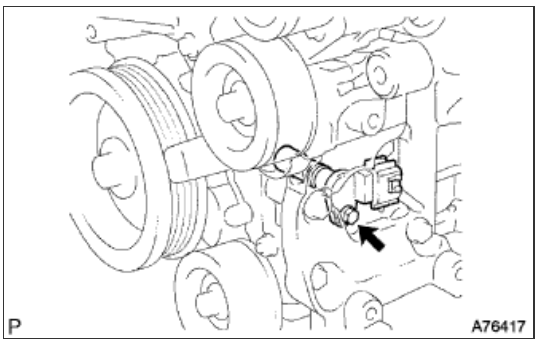
If the resistance is not as specified, replace the sensor.

Component without harness connected:
(Crankshaft Position Sensor)

for Preparation Click here

1. INSTALL CRANKSHAFT POSITION SENSOR

a. Apply a light coat of engine oil to the O-ring of the sensor.



NOTICE:

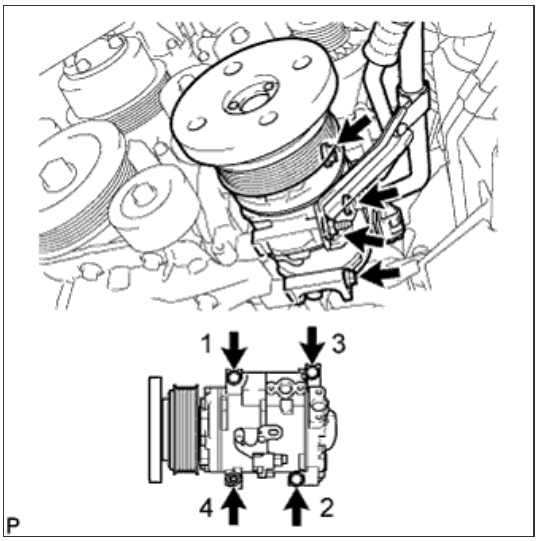
- **When reusing the sensor, inspect the O-ring.**
- **If the O-ring has scratches or cuts, replace the sensor.**

b. Install the sensor with the bolt.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

c. Connect the sensor connector.

2. CONNECT COOLER COMPRESSOR ASSEMBLY

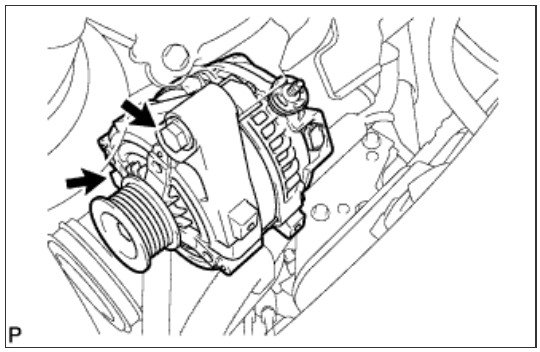


a. Fix the cooler compressor in place with the stud bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. Install the cooler compressor with the nut and 3 bolts in several steps in the sequence shown in the illustration.

Torque:
24 N*m{ 250 kgf*cm , 18 ft.*lbf }



c. Connect the cooler compressor connector.

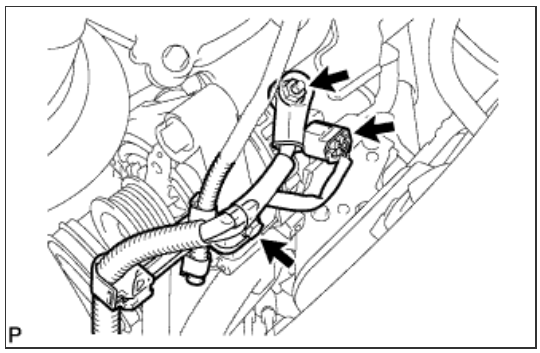
3. INSTALL GENERATOR ASSEMBLY

a. Install the generator with the 2 bolts.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

b. Connect the wire harness clamp bracket with the bolt.

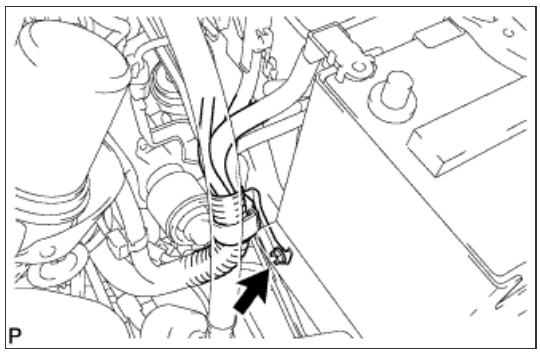
Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



c. Install the wire harness clamp to the bracket.

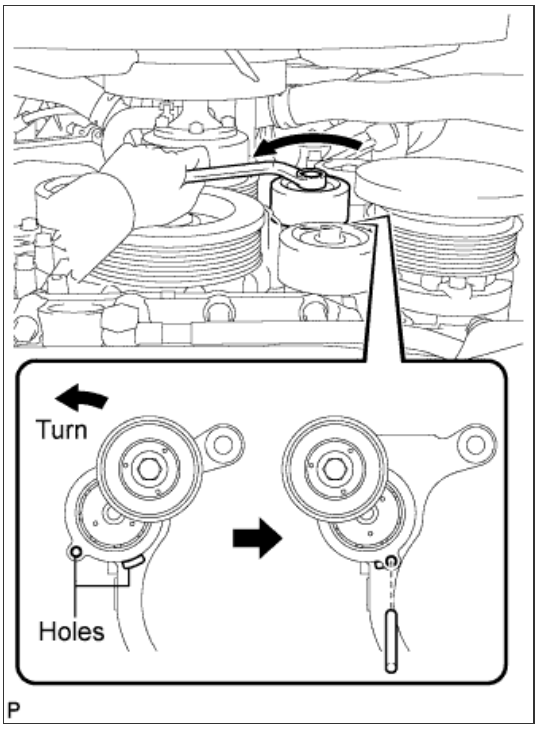
d. Connect the generator wire with the nut.

Torque:
9.8 N*m{ 100 kgf*cm , 87 in.*lbf }



e. Install the terminal cap.

f. Connect the generator connector.

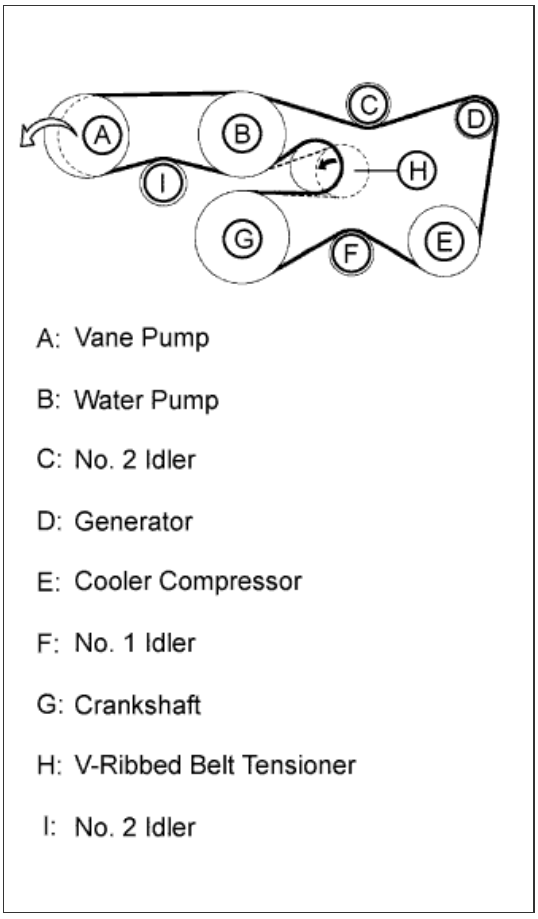


g. Connect the wire harness clamp bracket with the nut.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

4. INSTALL FAN & GENERATOR V BELT

a. While turning the belt tensioner counterclockwise, align the holes, and then insert a bar of φ6 mm (0.236 in.) into the holes to fix the belt tensioner in place.



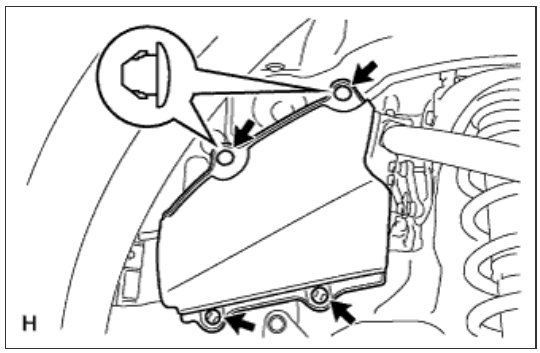
b. Install the fan and generator V belt.

HINT:

If it is hard to install the fan and generator V belt, perform the following procedures.

1. **Put the fan and generator V belt on all parts except the vane pump, as shown in the illustration.**
2. **While releasing the belt tension by turning the belt tensioner counterclockwise, put the fan and generator V belt on the vane pump.**

c. While turning the belt tensioner counterclockwise, remove the bar.



5. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

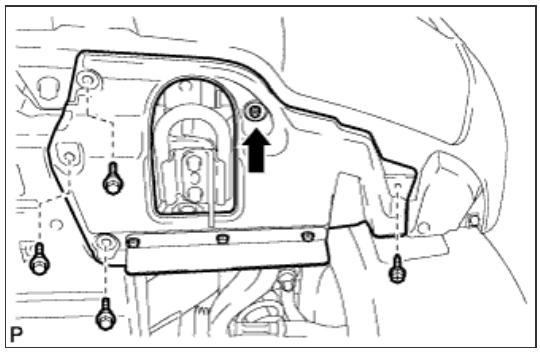
a. Install the engine under cover with the 10 bolts.

Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

6. INSTALL FRONT FENDER APRON SEAL LH

a. Install the seal with the 4 clips.

7. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH

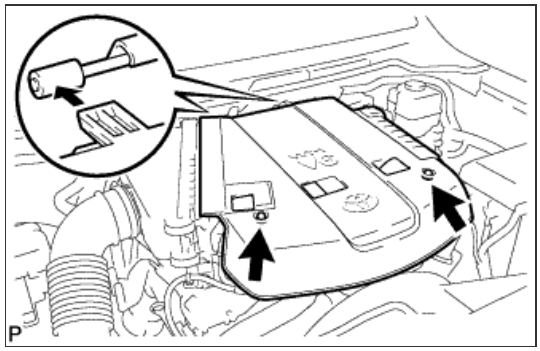


HINT:

Use the same procedures described for the LH side.

8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

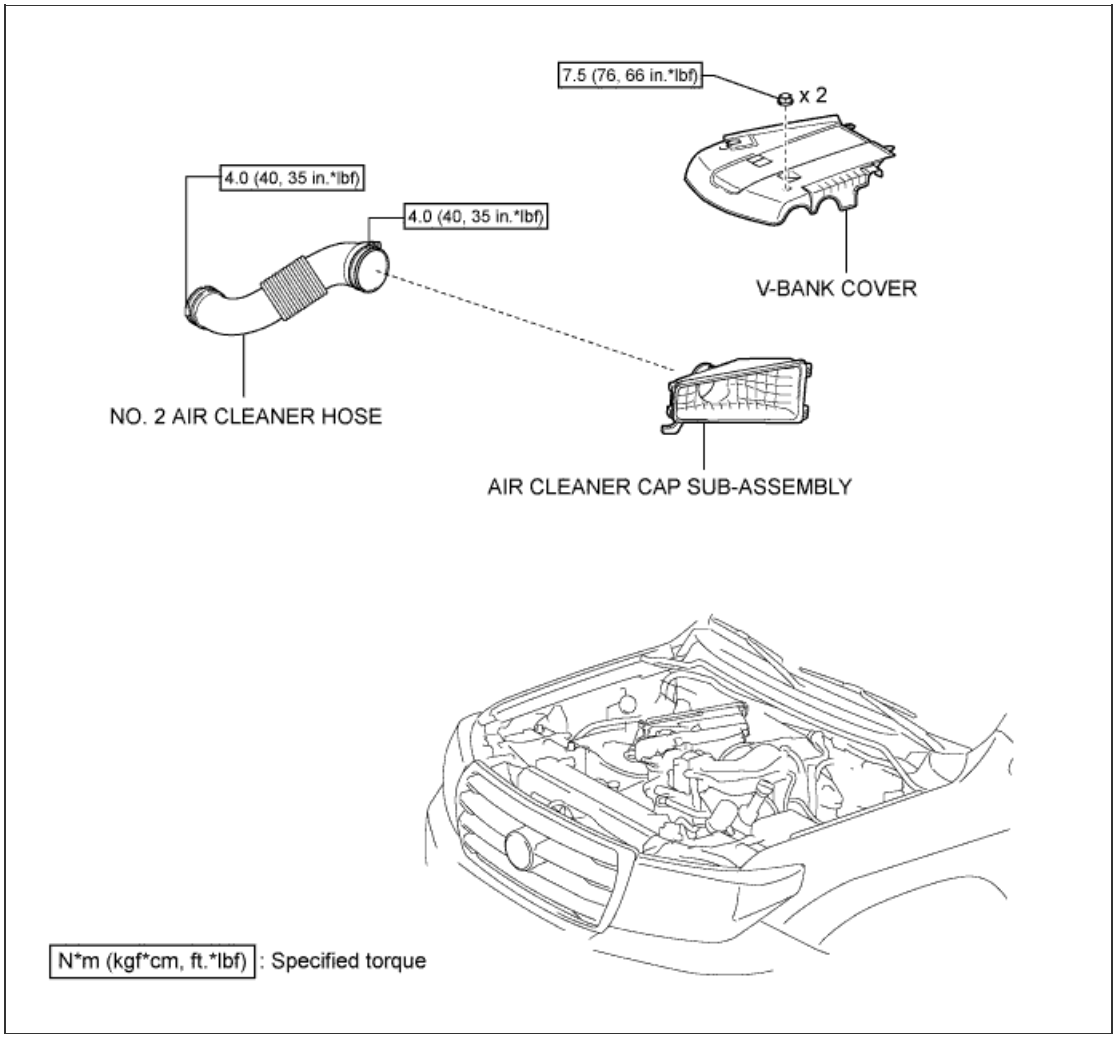


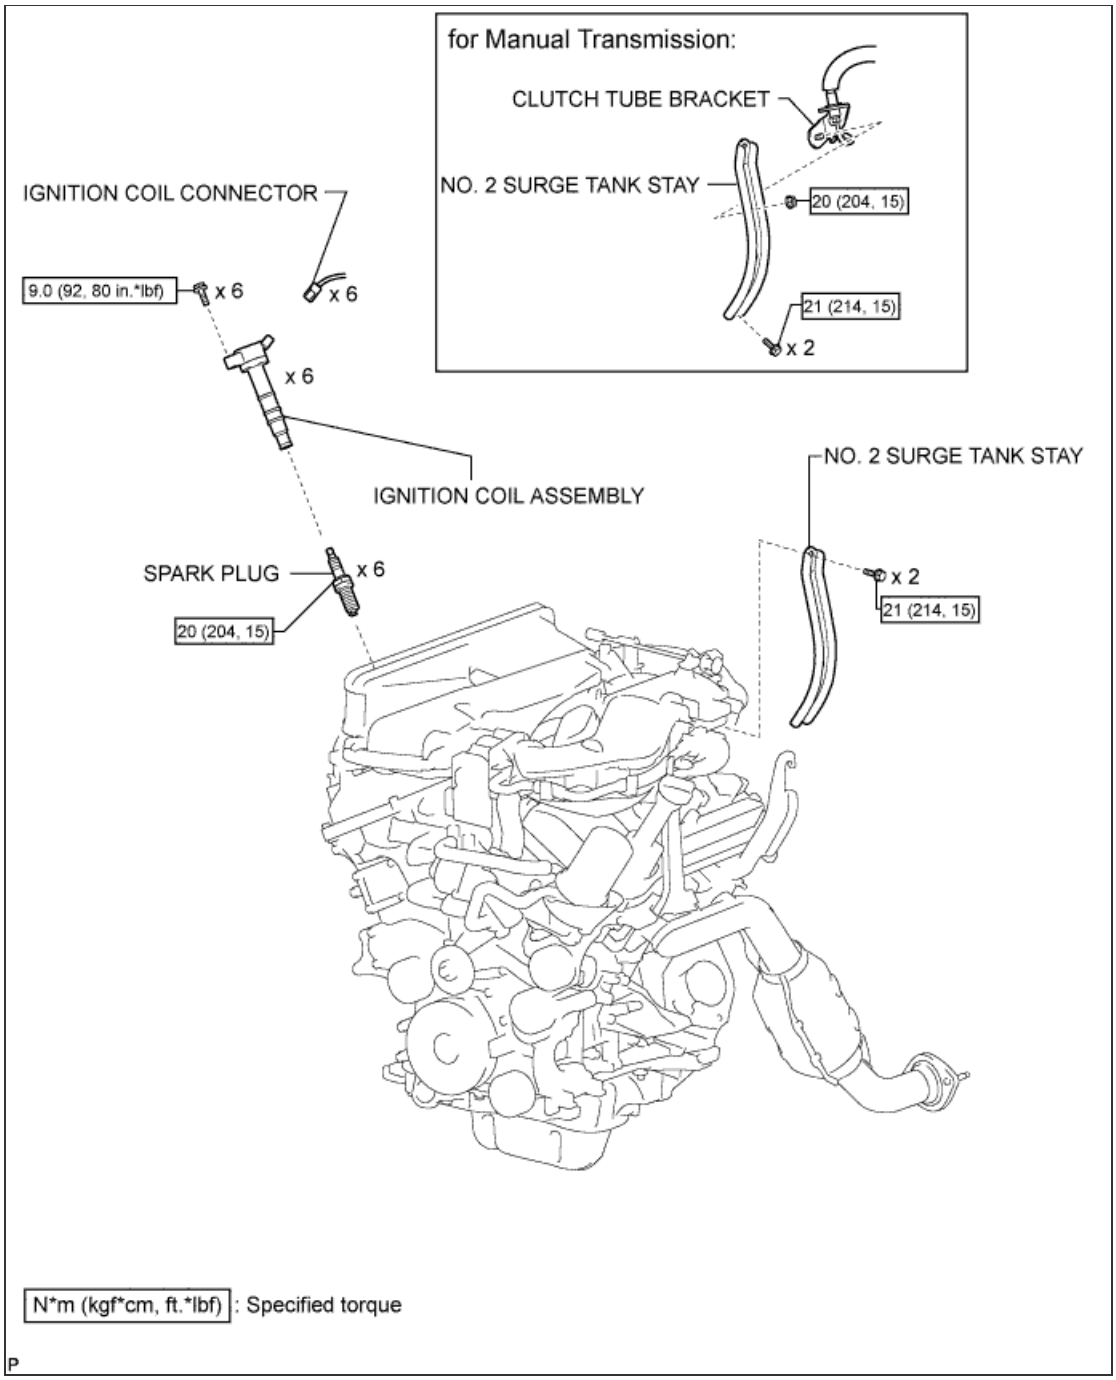
b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

9. INSTALL V-BANK COVER

a. Install the V-bank cover with the 2 cap nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }





10. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

for Preparation Click here

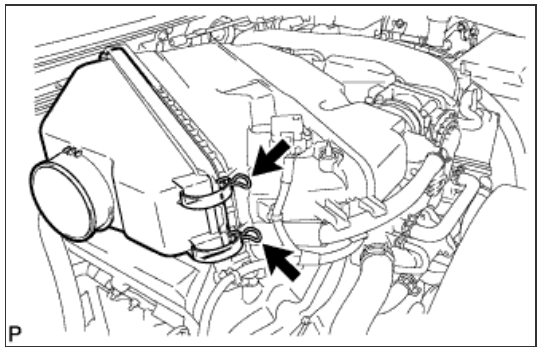
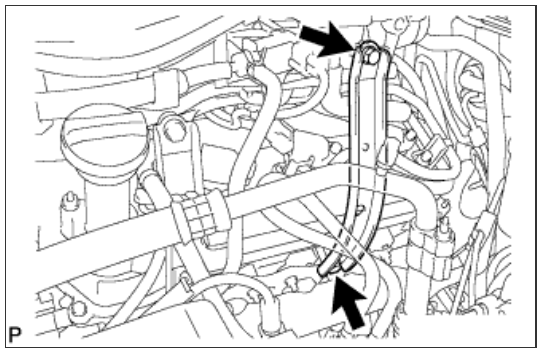
1. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and V-bank cover.



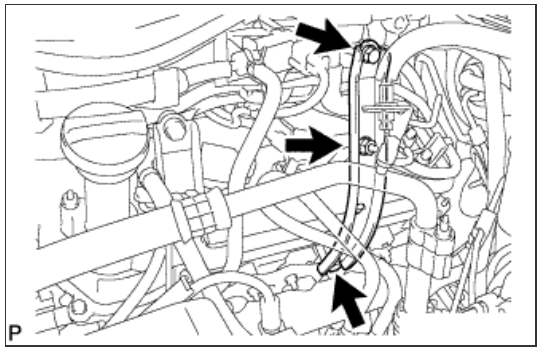
2. REMOVE NO. 2 AIR CLEANER HOSE

a. oosen the 2 hose clamps and remove the a cleaner hose.



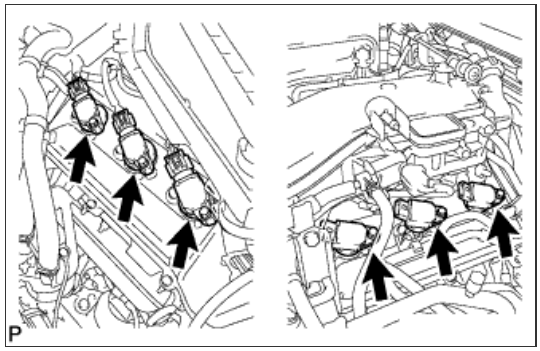
3. REMOVE AIR CLEANER CAP SUB-ASSEMBLY

a. Unfasten the 2 hook clamps and then remove the a cleaner cap.



4. REMOVE NO. 2 SURGE TANK STAY

a. for Automat dTransm ss on:
Remove the 2 bolts and o. 2 surge tank stay.



b. for Manual Transm ss on:
Remove the 2 bolts, nut and o. 2 surge tank stay.

5. REMOVE IGNITION COIL ASSEMBLY

a. D sconnect the 6 n t on co connectors.

b. Remove the 6 bolts and 6 n t on co s.

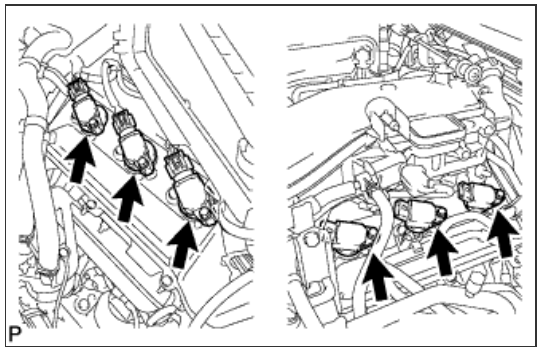
6. REMOVE SPARK PLUG

a. Remove the 6 spark plugs.

for Preparation Click here

1. INSTALL SPARK PLUG

a. Install the 6 spark plugs.



Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

2. INSTALL IGNITION COIL ASSEMBLY

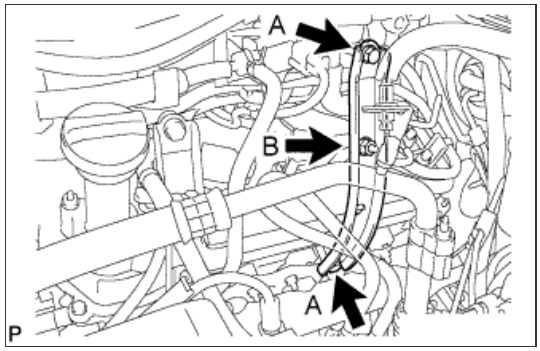
a. Install the 6 ignition coils with the 6 bolts.

Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

b. Connect the 6 ignition coil connectors.

3. INSTALL NO. 2 SURGE TANK STAY

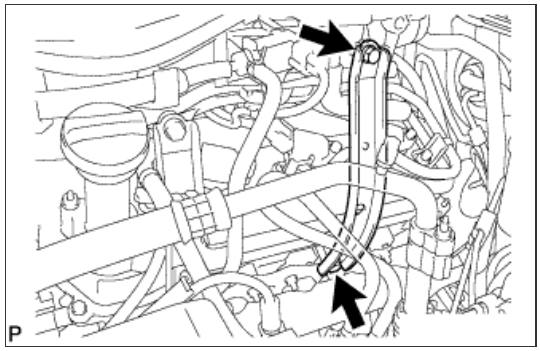
a. for Manual Transmission:



i. Temporarily install the No. 2 surge tank stay with the 2 bolts labeled A and nut labeled B.

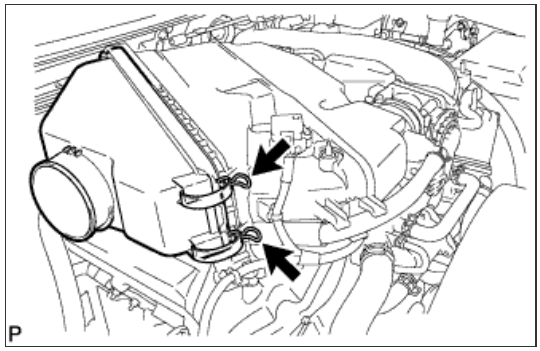
ii. Tighten the bolts labeled A.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



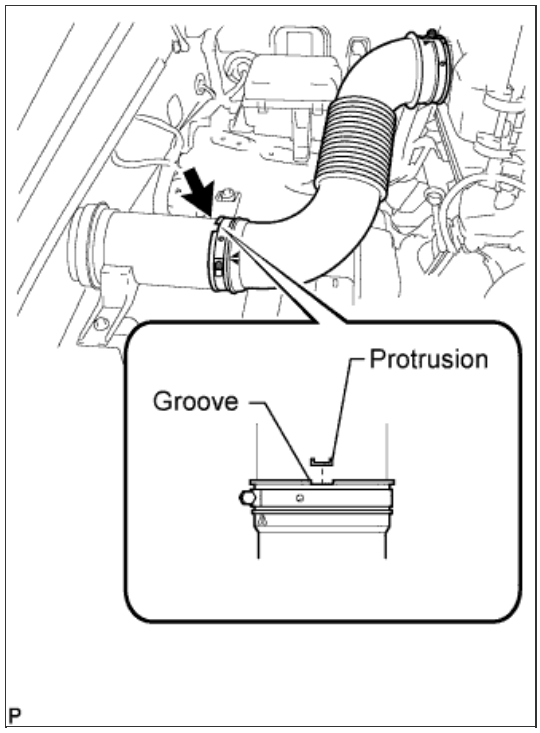
iii. Tighten the nut labeled B.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }



b. for Automatic Transmission:
Install the No. 2 surge tank stay with the 2 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

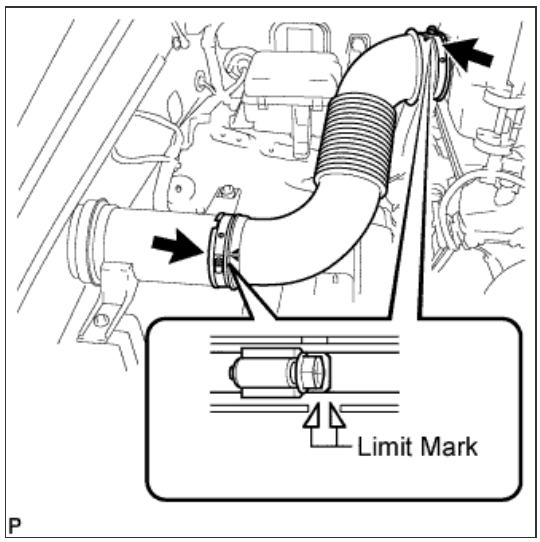


4. INSTALL AIR CLEANER CAP SUB-ASSEMBLY

a. Install the air cleaner cap and fasten the 2 hook clamps.

5. INSTALL NO. 2 AIR CLEANER HOSE

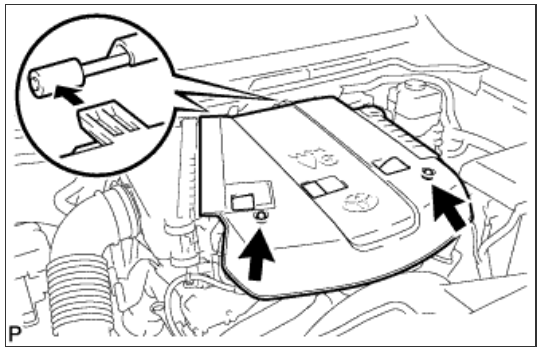
a. Align the protrusion of the pre-cleaner with the groove of the No. 2 air cleaner hose as shown in the illustration.



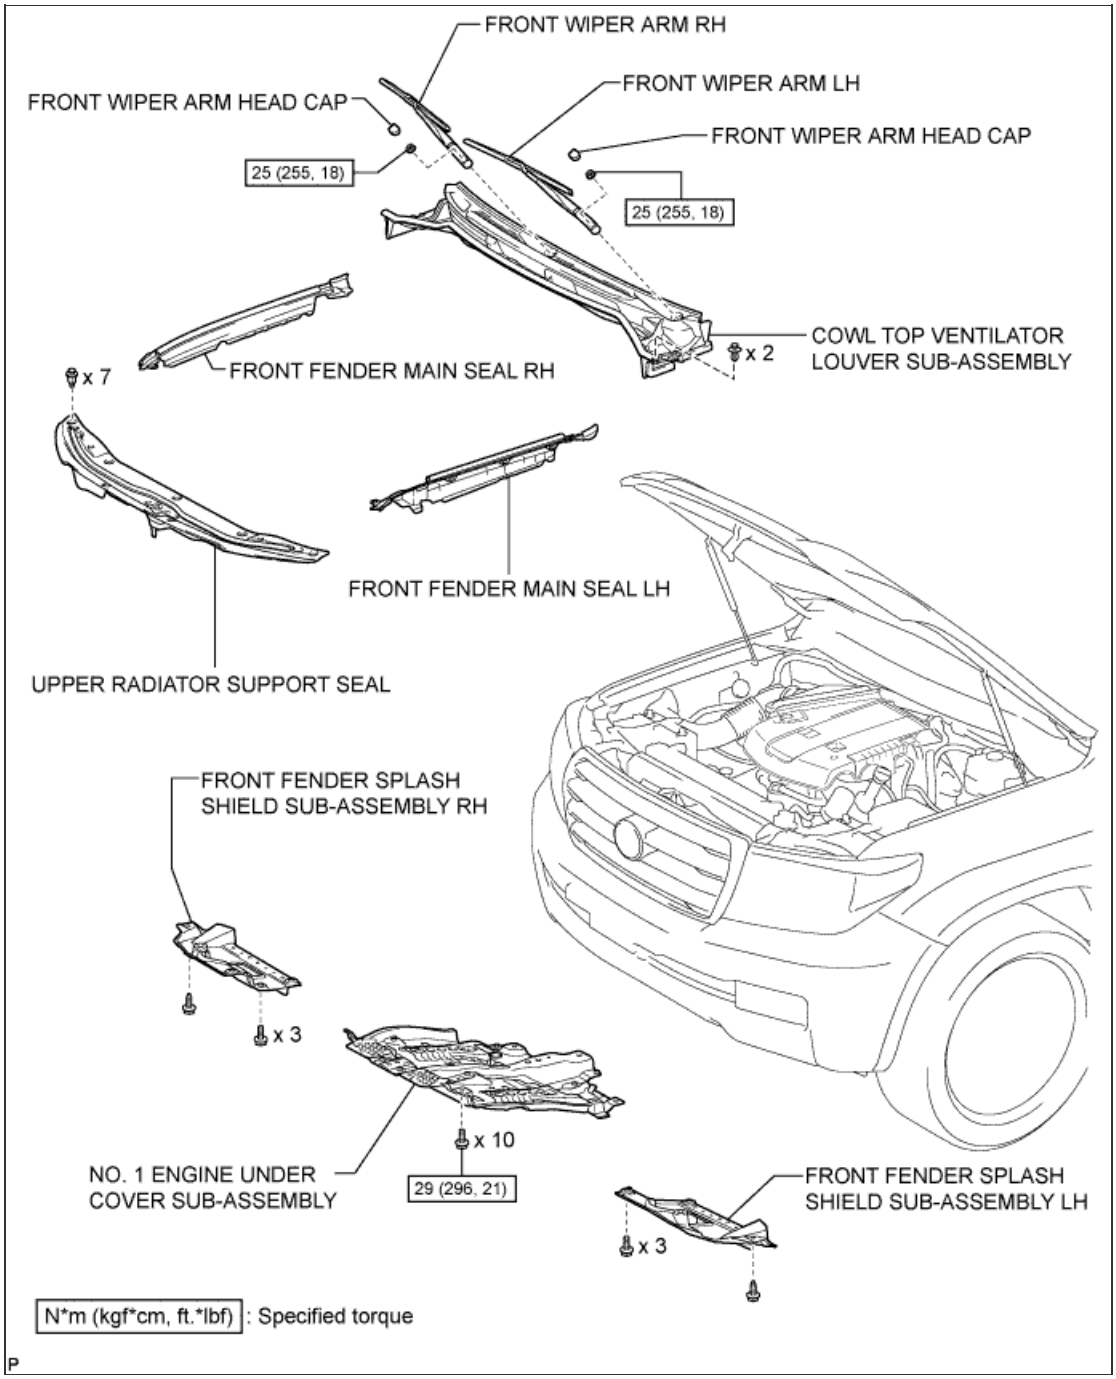
b. Tighten the 2 hose clamps.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

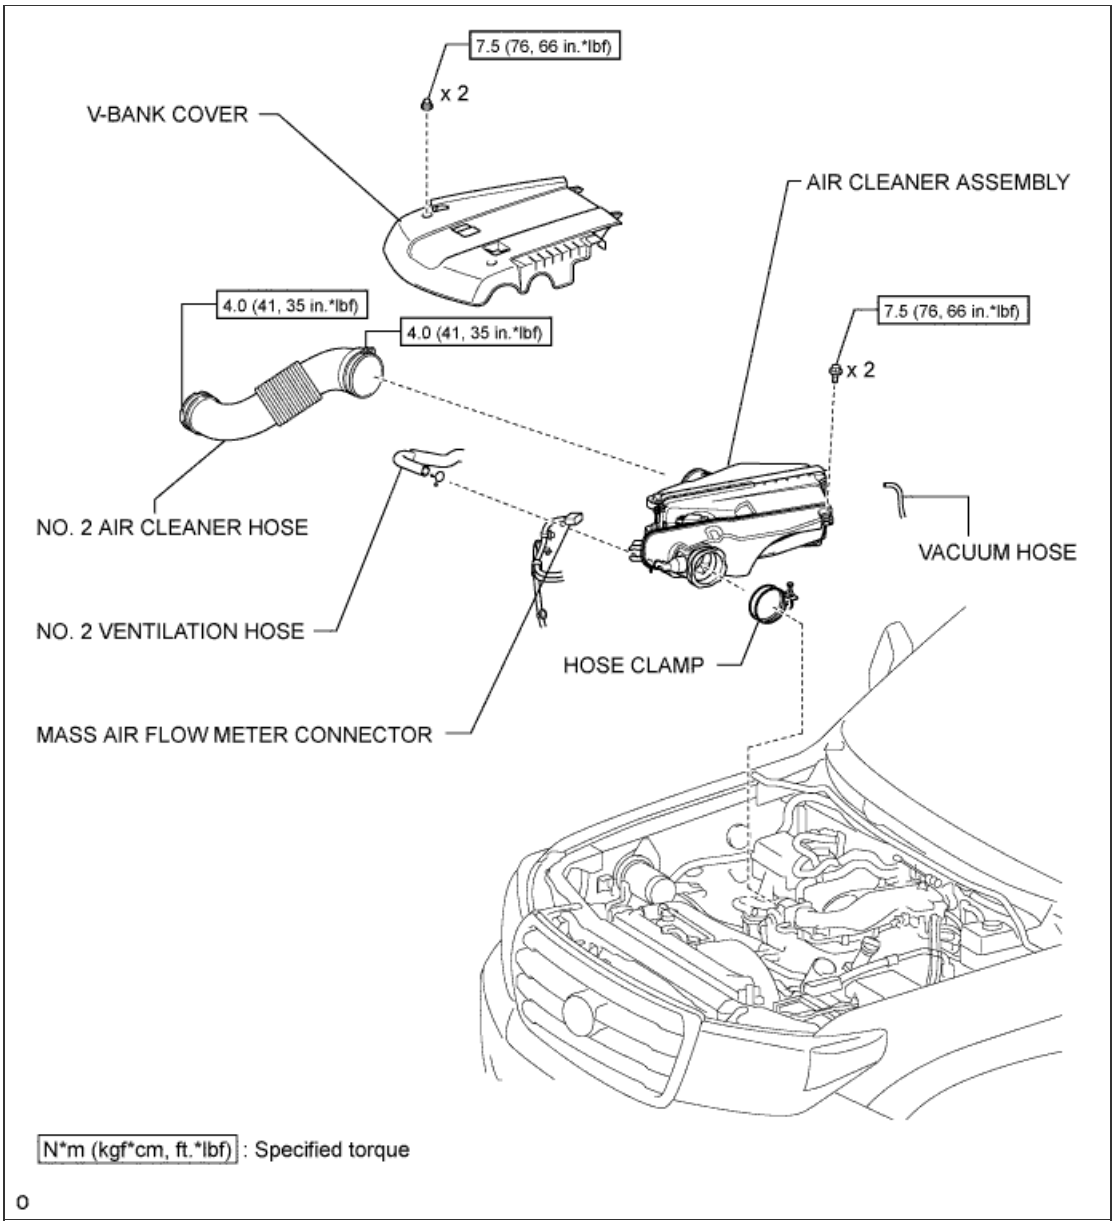
HINT:



Tighten the clamp until the end of the clamp band is within both limit marks.



6. INSTALL V-BANK COVER



a. Install the V-bank cover with the 2 cap nuts.

Torque:

ENGINE COOLANT TEMPERATURE SENSOR > REMOVAL

for Preparation Click here

1. DISCHARGE FUEL SYSTEM PRESSURE

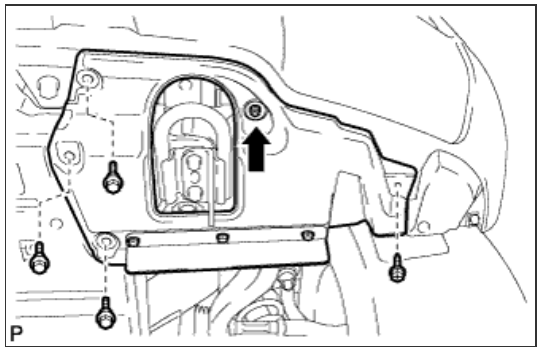
a. Discharge the fuel system pressure (Click here).

2. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

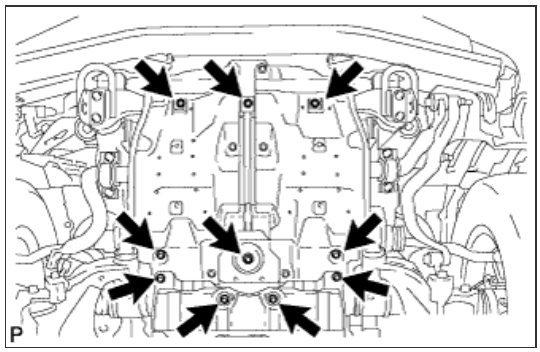
3. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



HINT:

Use the same procedures described for the LH side.

4. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH



a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

5. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

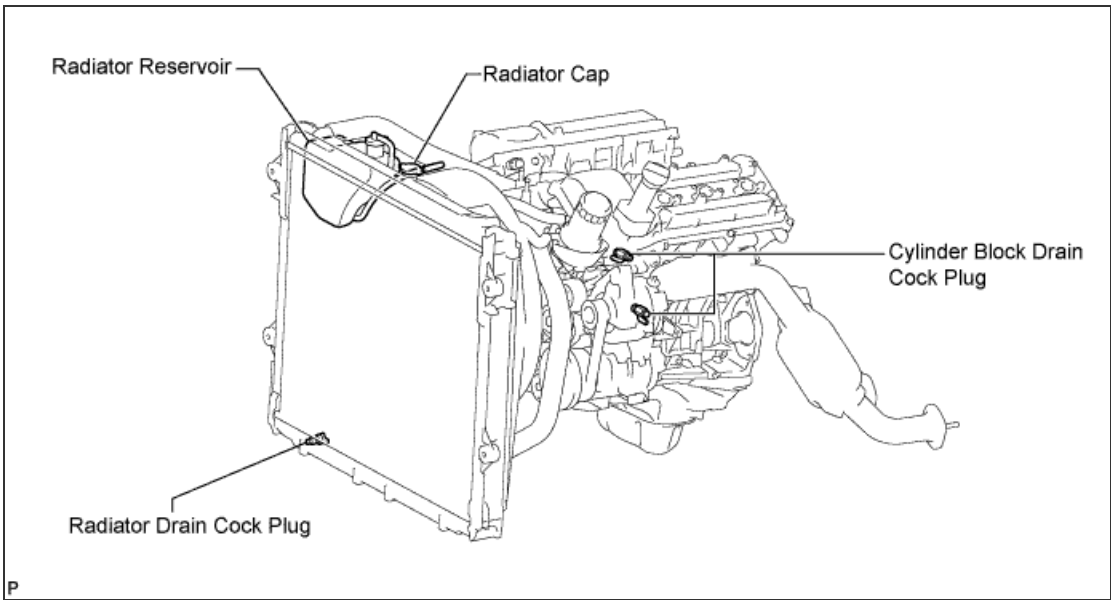
a. Remove the 10 bolts and under cover.

6. DRAIN ENGINE COOLANT

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Loosen the radiator drain cock plug and 2 cylinder block drain cock plugs.



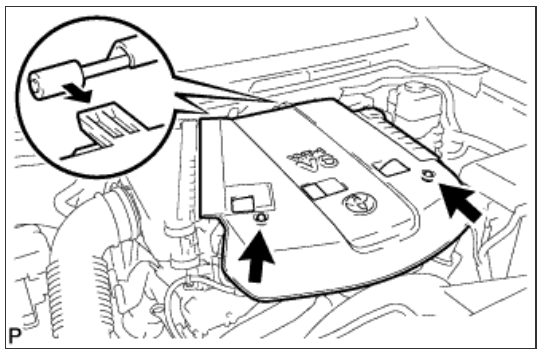
b. Remove the radiator cap. Then drain the coolant.

HINT:

Collect the coolant in a container and dispose of it according to the regulations in your area.

c. Tighten the 2 cylinder block drain cock plugs.

Torque:
13 N*m{ 133 kgf*cm , 10 ft.*lbf }

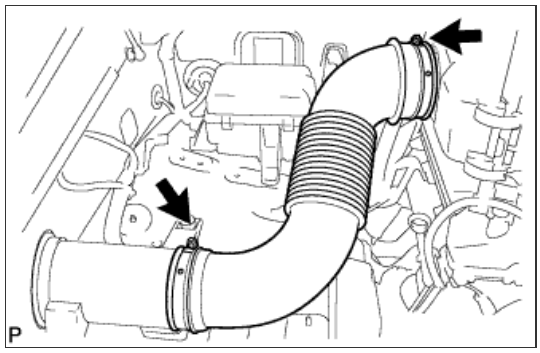


d. Tighten the radiator drain cock plug by hand.

7. REMOVE COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

a. Remove the cowl top ventilator louver (Click here).

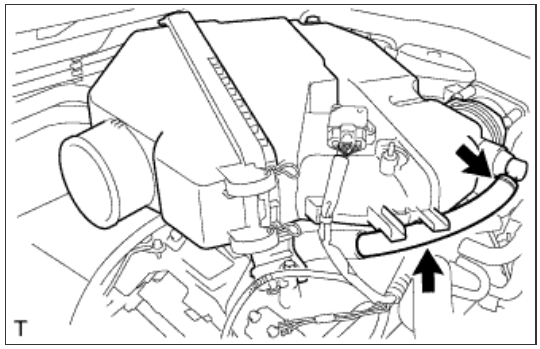
8. REMOVE V-BANK COVER



a. Remove the 2 nuts and V-bank cover.

9. REMOVE NO. 2 AIR CLEANER HOSE

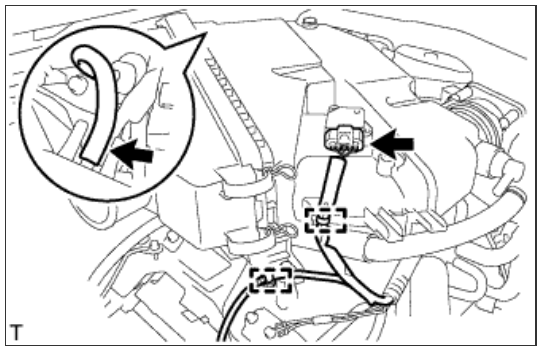
a. Loosen the 2 hose clamps and remove the air cleaner hose.



a. Loosen the 2 hose clamps and remove the air cleaner hose.

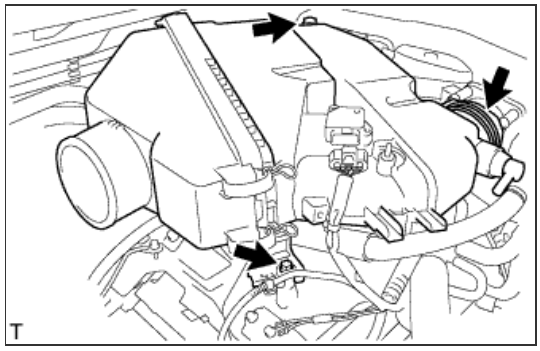
10. REMOVE AIR CLEANER ASSEMBLY

a. Disconnect the No. 2 ventilation hose.



b. Detach the hose clamp.

c. Disconnect the vacuum hose.

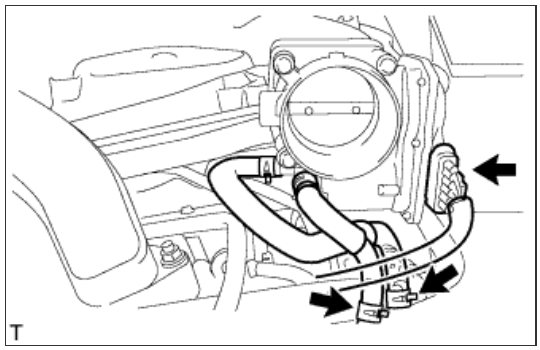


d. Disconnect the MAF meter connector.

e. Using a clip remover, detach the 2 wire harness clamps.

f. Loosen the hose clamp.

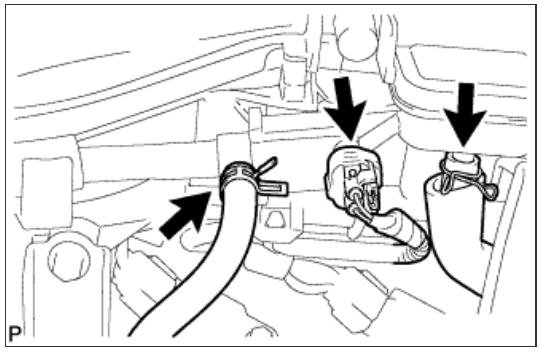
g. Remove the 2 bolts and air cleaner assembly.



11. REMOVE INTAKE AIR SURGE TANK

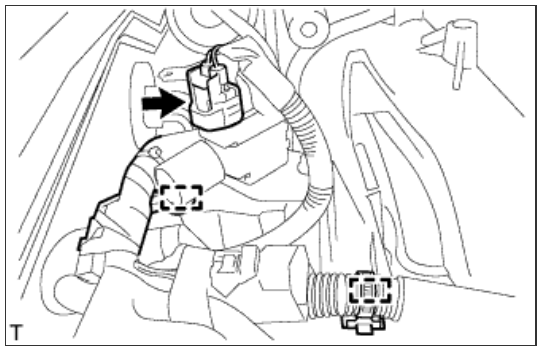
a. Disconnect the throttle body connector.

b. Disconnect the No. 4 water by-pass hose.



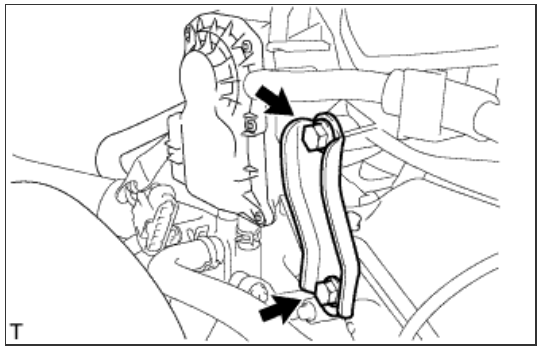
c. Disconnect the No. 5 water by-pass hose.

d. Disconnect the purge line hose.

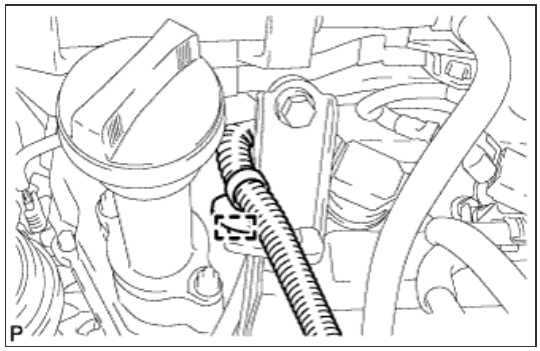


e. Disconnect the purge VSV connector.

f. Disconnect the No. 1 ventilation hose.

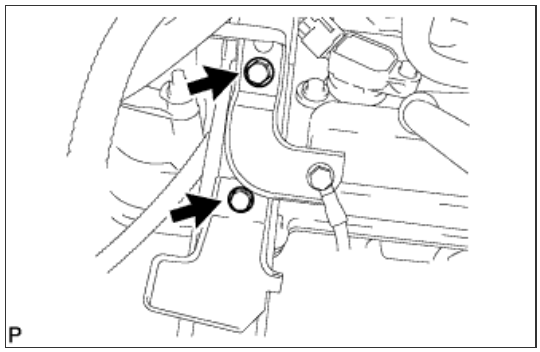


g. Disconnect the vacuum switching valve (for ACIS) connector.

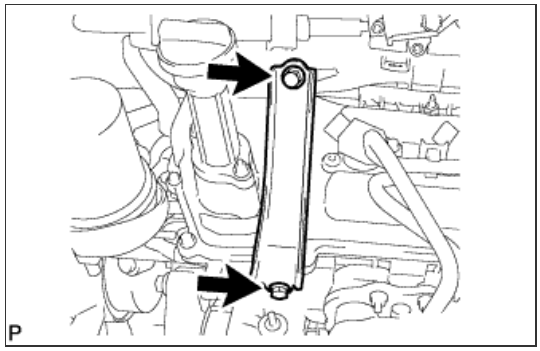


h. Using a clip remover, detach the 2 wire harness clamps.

i. Remove the 2 bolts and throttle body bracket.

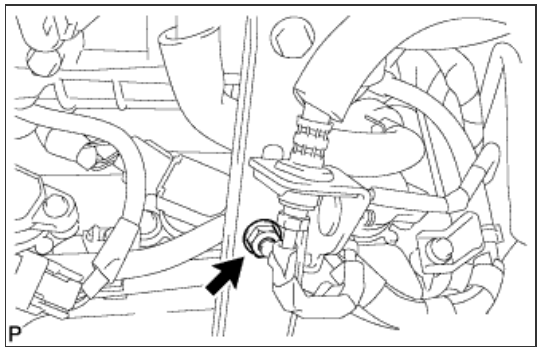


j. Using a clip remover, detach the wire harness clamp.

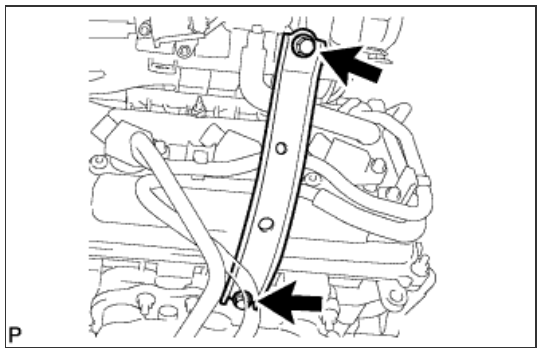


k. Remove the bolt and bracket from the No. 1 surge tank stay.

l. Remove the bolt and oil baffle plate.

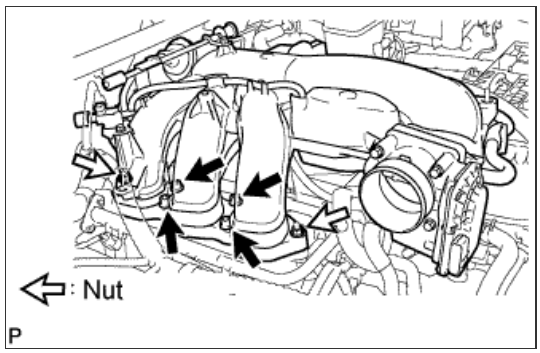


m. Remove the 2 bolts and No. 1 surge tank stay.



n. for Manual Transmission:

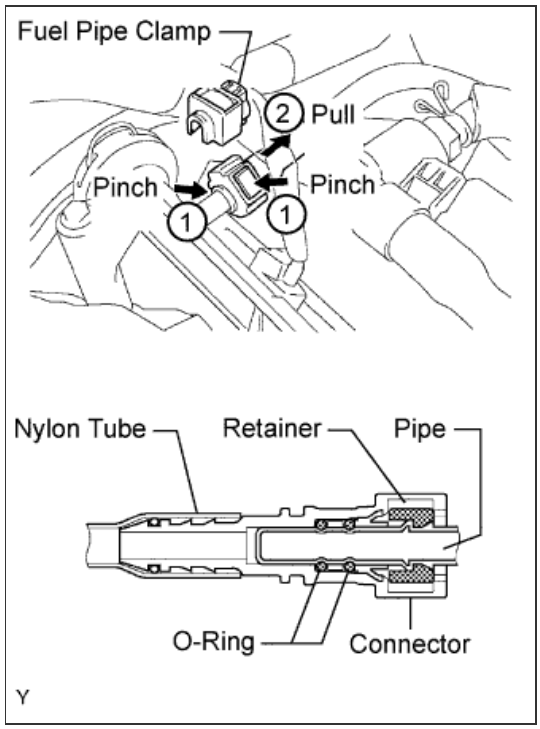
i. Remove the nut.



o. Remove the 2 bolts and No. 2 surge tank stay.

p. Remove the 2 nuts.

q. Using an 8 mm hexagon wrench, remove the 4 bolts. Then remove the intake air surge tank and gasket.



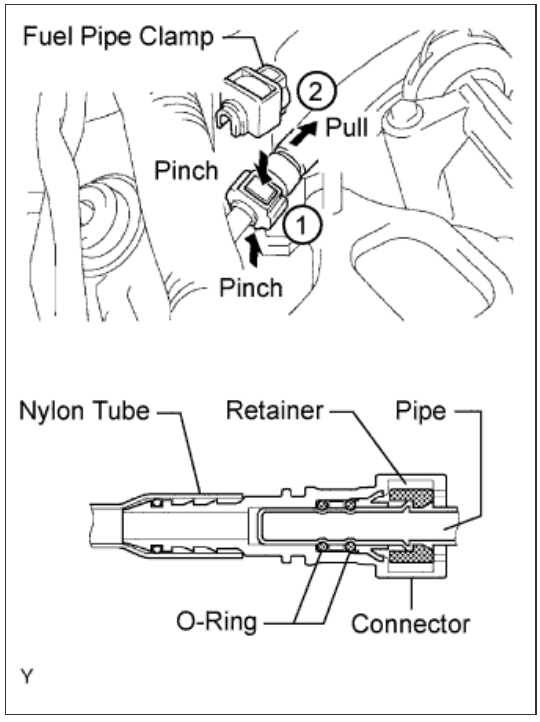
12. DISCONNECT NO. 1 FUEL PIPE SUB-ASSEMBLY

a. Remove the fuel pipe clamp.

b. Pinch the tube connector, and then pull the fuel pipe out of the delivery pipe as shown in the illustration.

NOTICE:

- **Remove any dirt and foreign objects from the fuel tube connector before performing this work.**
- **Do not allow any scratches or foreign objects on the parts when disconnecting, as the fuel tube connector has the O-ring that seals the pipe.**
- **Perform this work by hand. Do not use any tools.**
- **Do not forcibly bend, twist or turn the nylon tube.**
- **Keep the plug free from foreign objects.**
- **Protect the disconnected part by covering it with a plastic bag after disconnecting the fuel tube.**
- **If the fuel tube connector and pipe are stuck, push and pull to release them.**

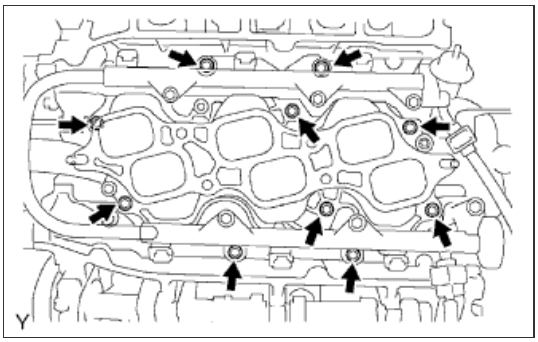


13. DISCONNECT NO. 2 FUEL PIPE SUB-ASSEMBLY

a. Remove the fuel pipe clamp.

b. Pinch the tube connector, and then pull the fuel pipe out of the pipe as shown in the illustration.

NOTICE:

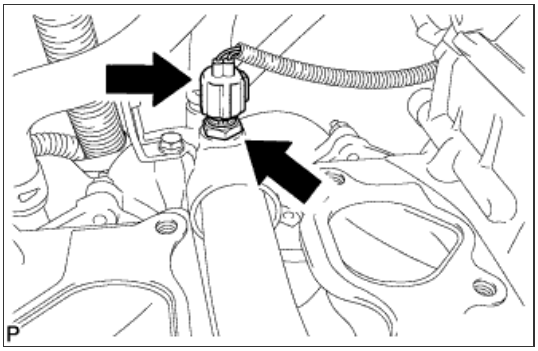


- **Remove any dirt and foreign objects from the fuel tube connector before performing this work.**
- **Do not allow any scratches or foreign objects on the parts when disconnecting, as the fuel tube connector has the O-ring that seals the pipe.**
- **Perform this work by hand. Do not use any tools.**
- **Do not forcibly bend, twist or turn the nylon tube.**
- **Keep the plug free from foreign objects.**
- **Protect the disconnected part by covering it with a plastic bag after disconnecting the fuel tube.**
- **If the fuel tube connector and pipe are stuck, push and pull to release them.**

14. REMOVE INTAKE MANIFOLD

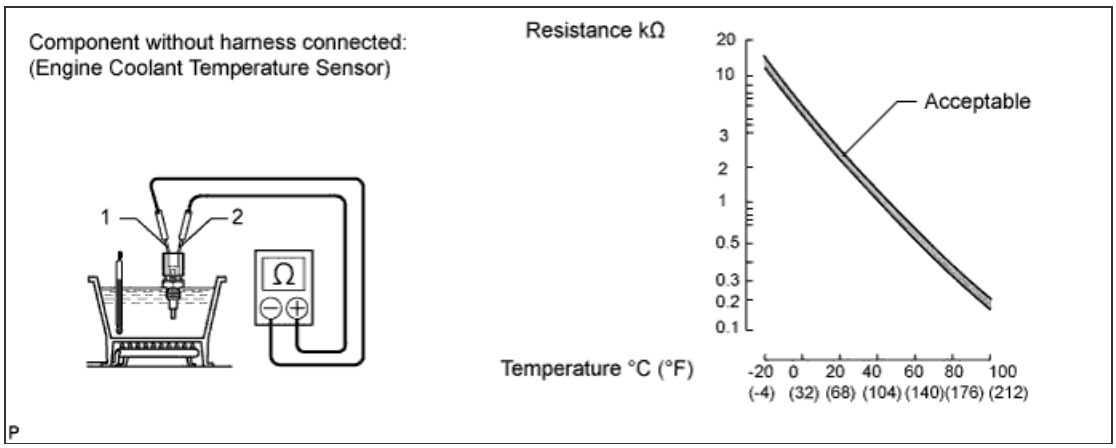
a. Disconnect the 6 fuel injector connectors.

b. Remove the 10 bolts, intake manifold and 2 gaskets.



15. REMOVE ENGINE COOLANT TEMPERATURE SENSOR

a. Disconnect the sensor connector.



b. Using a 19 mm deep socket wrench, remove the sensor.

c. Remove the gasket from the sensor.

for Preparation Click here

1. INSPECT ENGINE COOLANT TEMPERATURE SENSOR

a. Partially immerse the sensor in water and warm up the water.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

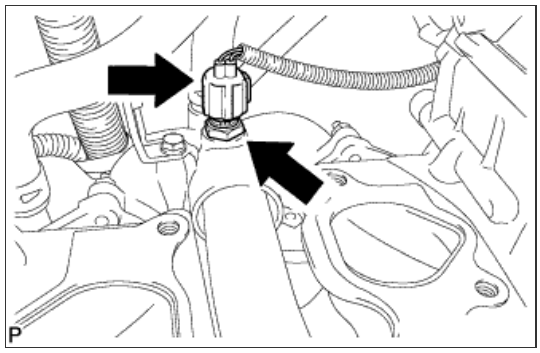
Tester Connection	Condition	Specified Condition
1 - 2	Approx. 20°C (68°F)	2.32 to 2.59 kΩ
	Approx. 80°C (176°F)	0.310 to 0.326 kΩ

If the result is not as specified, replace the sensor.

NOTICE:

When checking the sensor in water, keep the terminals dry. After the check, wipe the sensor dry.

for Preparation Click here



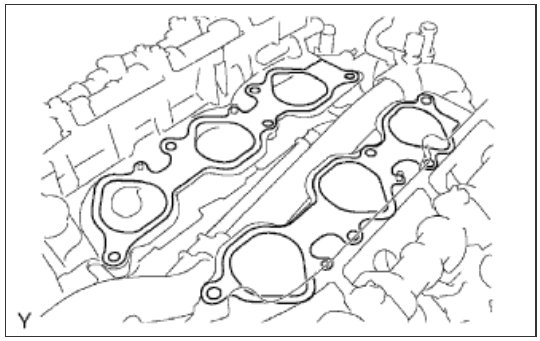
1. INSTALL ENGINE COOLANT TEMPERATURE SENSOR

a. Install a new gasket to the sensor.

b. Using a 19 mm deep socket wrench, install the sensor.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

c. Connect the sensor connector.

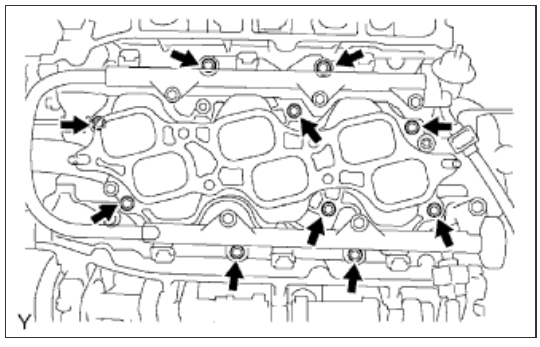


2. INSTALL INTAKE MANIFOLD

a. Set a new gasket on each cylinder head.

NOTICE:

- **Align the port holes of the gasket and cylinder head.**
- **Be careful of the installation direction.**



b. Set the intake manifold on the cylinder heads.

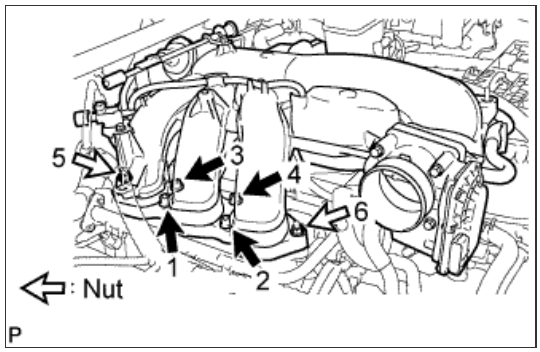
c. Install and uniformly tighten the 10 bolts in several passes.

Torque:
26 N*m{ 265 kgf*cm , 19 ft.*lbf }

d. Connect the 6 fuel injector connectors.

3. INSTALL INTAKE AIR SURGE TANK

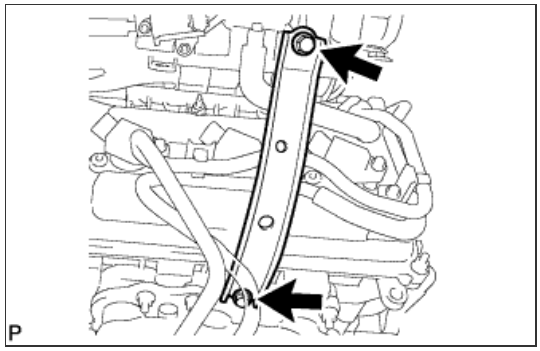
NOTICE:
Do not apply oil to the bolts and nuts listed below: :



Oil Application Prohibited Bolt/Nut
Bolt for surge tank and intake manifold
Nut for surge tank and intake manifold

a. Install a new gasket to the intake air surge tank.

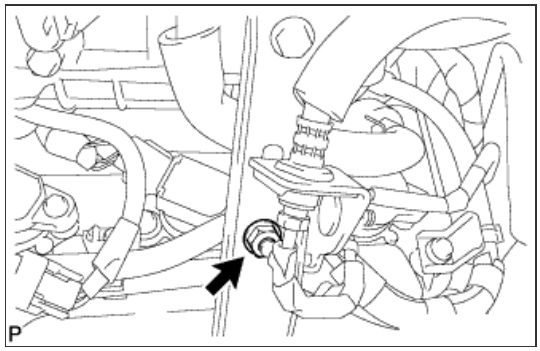
b. Using an 8 mm hexagon wrench, install the intake air surge tank with the 4 bolts



and 2 nuts in the order shown in the illustration.

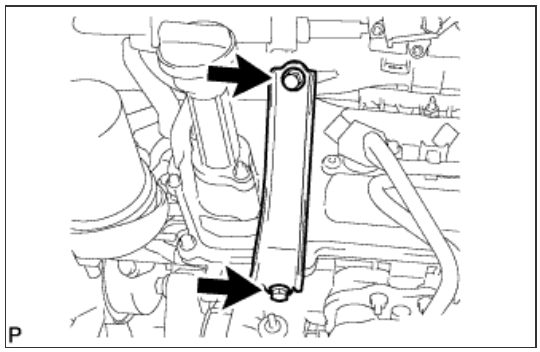
Torque:
28 N*m{ 286 kgf*cm , 21 ft.*lbf }

c. Install the No. 2 surge tank stay with the 2 bolts.



Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

d. for Manual Transmission:

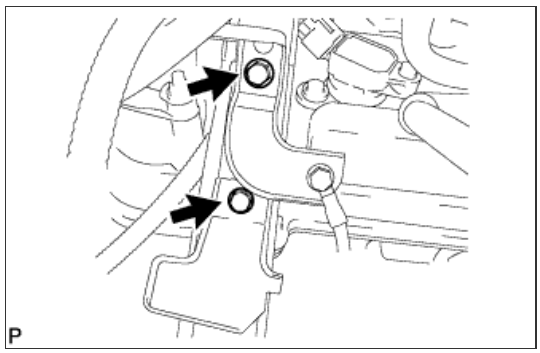


i. Install the bracket to the No. 2 surge tank stay with the nut.

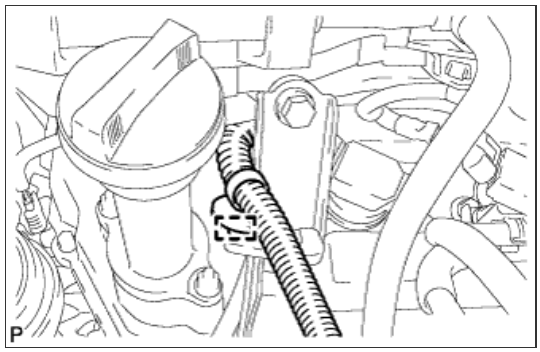
Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

e. Install the No. 1 surge tank stay with the 2 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }



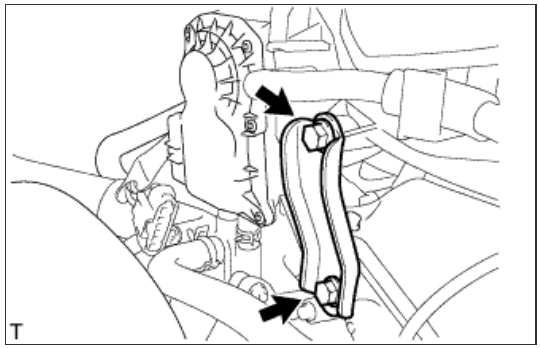
f. Install the oil baffle plate with the bolt.



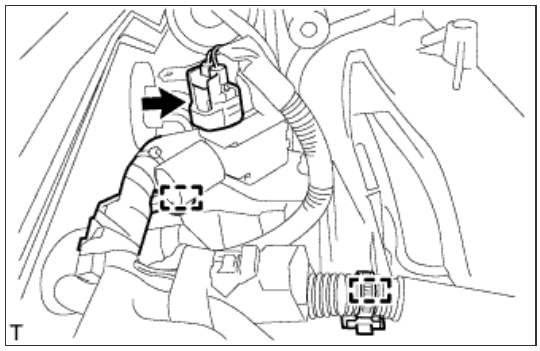
Torque:
9.0 N*m{ 92 kgf*cm , 80 in.*lbf }

g. Install the bracket to the No. 1 surge tank stay with the bolt.

Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }



h. Attach the wire harness clamp.

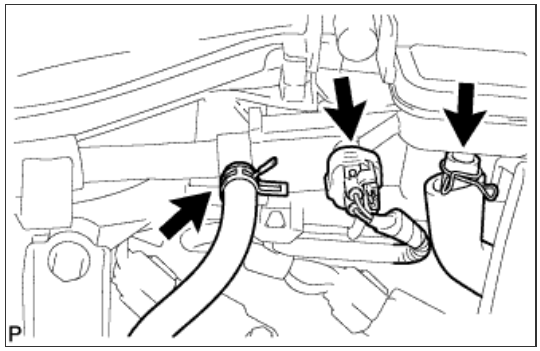


i. Install the throttle body bracket with the 2 bolts.

Torque:
21 N*m{ 214 kgf*cm , 15 ft.*lbf }

j. Connect the vacuum switching valve (for ACIS) connector.

k. Attach the 2 wire harness clamps.



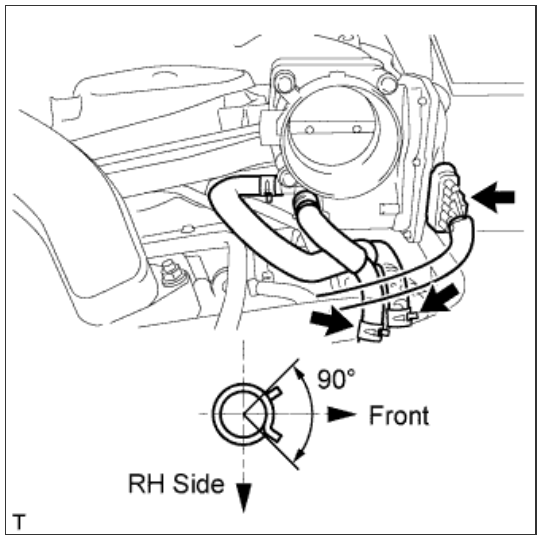
l. Connect the No. 1 ventilation hose.

m. Connect the purge VSV connector.

n. Connect the purge line hose.

HINT:

Connect the hose so that the direction of the hose clamp is as indicated in the illustration.

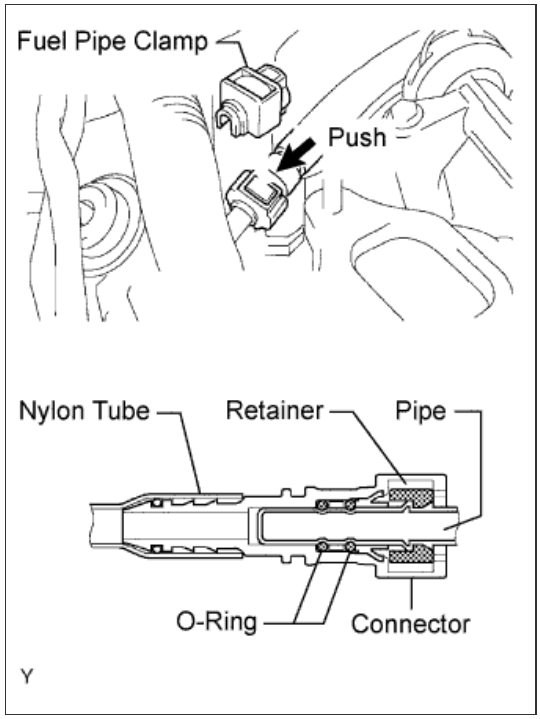


o. Connect the No. 4 and No. 5 water by-pass hose.

HINT:

Connect the hoses so that the direction of the hose clamps is as shown in the illustration.

p. Connect the throttle body connector.



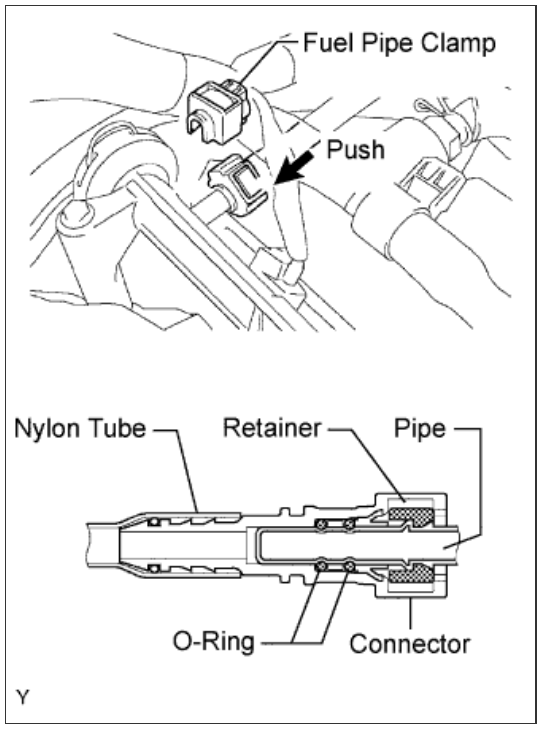
4. CONNECT NO. 2 FUEL PIPE SUB-ASSEMBLY

a. Push the tube connector into the pipe until the tube connector makes a "click" sound.

NOTICE:

- **Check if there is any damage or foreign objects on the connected part of the fuel pipe.**
- **After connecting, check that the pipe and connector are securely connected by pulling them.**

b. Install the fuel pipe clamp.



5. CONNECT NO. 1 FUEL PIPE SUB-ASSEMBLY

a. Push the tube connector into the pipe until the tube connector makes a "click" sound.

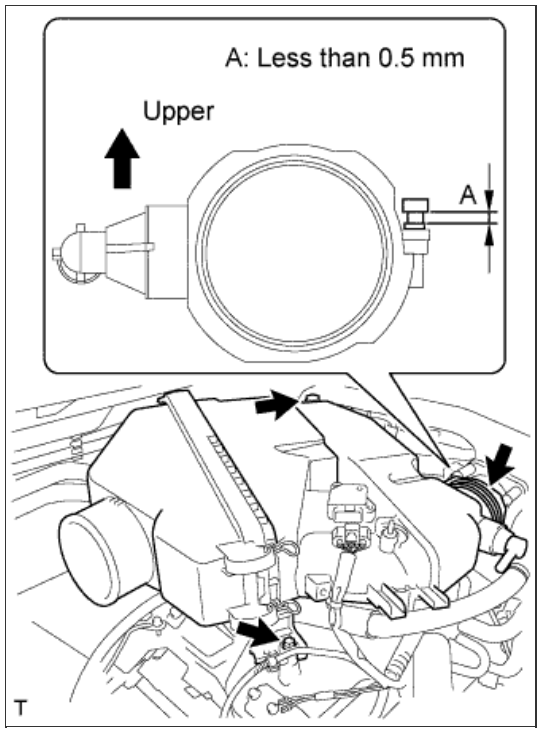
NOTICE:

- **Check if there is any damage or foreign objects on the connected part of the fuel pipe.**
- **After connecting, check that the pipe and connector are securely connected by pulling them.**

b. Install the fuel pipe clamp.

6. INSTALL AIR CLEANER ASSEMBLY

a. Install the air cleaner assembly with the 2 bolts.

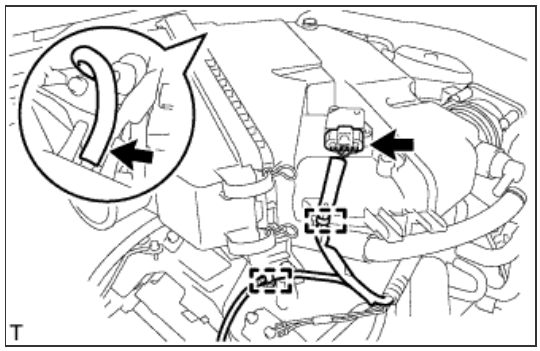


Torque:
8.0 N*m{ 82 kgf*cm , 71 in.*lbf }

b. Tighten the hose clamp.

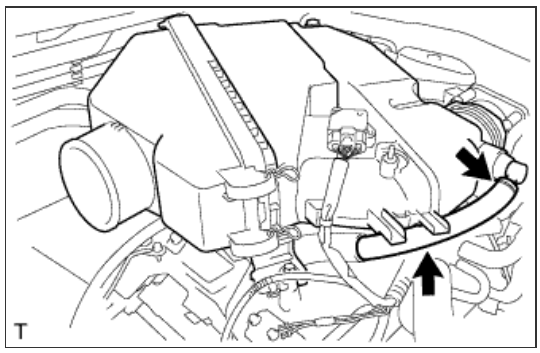
HINT:

Tighten the hose clamp until it reaches the specified protrusion height labeled A shown in the illustration.



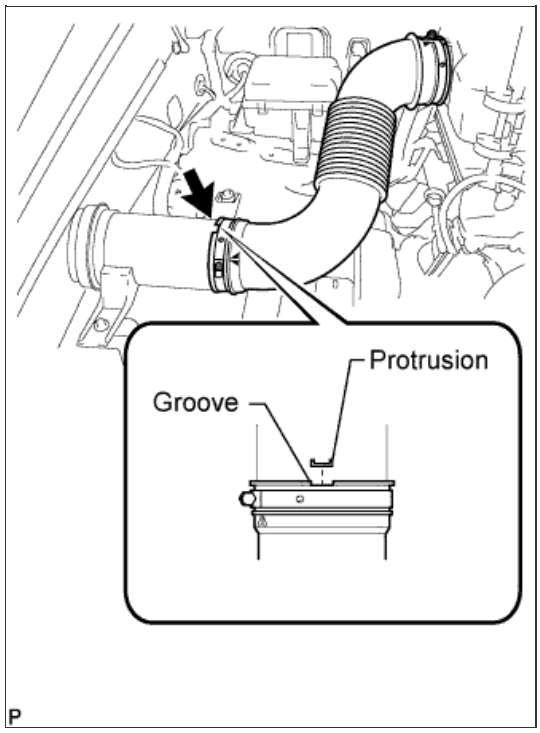
Standard protrusion height:
Less than 0.5 mm (0.0197 in.)

c. Connect the MAF meter connector.



d. Attach the 2 wire harness clamps.

e. Connect the vacuum hose.

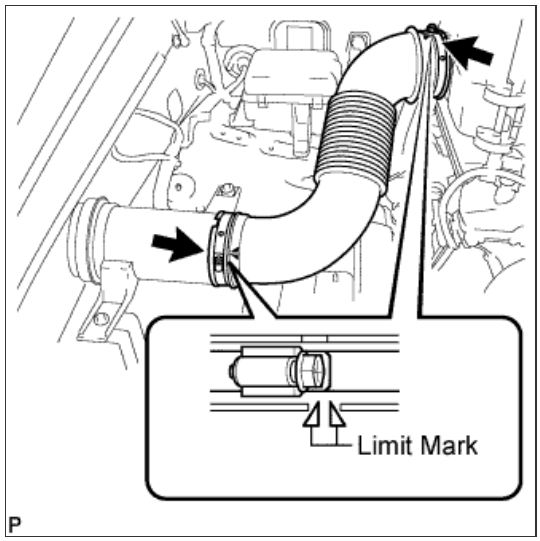


f. Attach the hose clamp.

g. Connect the No. 2 ventilation hose.

7. INSTALL NO. 2 AIR CLEANER HOSE

a. Align the protrusion of the pre-cleaner with the groove of the No. 2 air cleaner hose as shown in the illustration.



b. Tighten the 2 hose clamps.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

HINT:

Tighten the clamp until the end of the clamp band is within both limit marks.

8. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).

9. ADD ENGINE COOLANT

a. Add engine coolant.

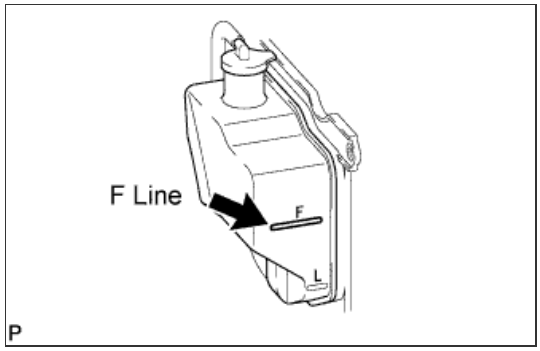
Standard Capacity:

Item		Specified condition
for Automatic transmission	w/o Rear Heater	11.2 liters (11.8 US qts, 9.9 Imp. qts)
	w/ Rear Heater	14.4 liters (15.2 US qts, 12.7 Imp. qts)
for Manual transmission	w/o Rear Heater	12.0 liters (12.7 US qts, 10.6 Imp. qts)
	w/ Rear Heater	14.6 liters (15.4 US qts, 12.8 Imp. qts)

NOTICE:

Do not substitute plain water for engine coolant.

HINT:



TOYOTA vehicles are filled with TOYOTA SLLC at the factory. In order to avoid damage to the engine cooling system and other technical problems, only use TOYOTA SLLC or similar high quality ethylene glycol based non-silicate, non-amine, non-nitrite, non-borate coolant with long-life hybrid organic acid technology (coolant with long-life hybrid organic acid technology consists of a combination of low phosphates and organic acids).

b. Slowly pour coolant into the radiator reservoir until it reaches the F line.

c. Install the reservoir cap.

d. Press the No. 1 and No. 2 radiator hoses several times by hand, and then check the coolant level. If the coolant level is low, add coolant.

e. Install the radiator cap.

f. Set the air conditioning as follows while warming up the engine.

Item	Condition
Fan speed	Any setting except off
Temperature	Toward WARM
Air conditioning switch	Off

g. Start the engine and warm it up until the thermostat opens.

HINT:

The thermostat opening timing can be confirmed by pressing the No. 2 radiator hose by hand, and checking when the engine coolant starts to flow inside the hose.

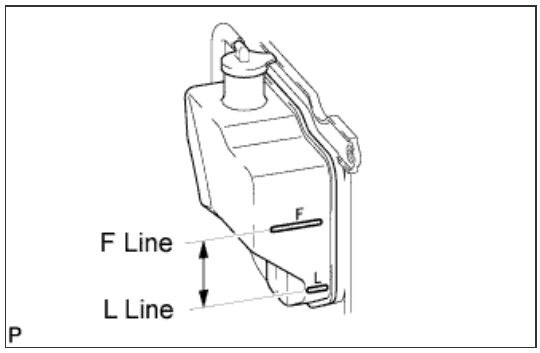
h. Maintain the engine speed at 2000 to 2500 rpm.

NOTICE:

- **Make sure that the radiator reservoir still has some coolant in it.**
- **Pay attention to the needle of the water temperature meter. Make sure that the needle does not show an abnormally high temperature.**
- **If there is not enough coolant, the engine may burn out or overheat.**
- **Immediately after starting the engine, if the radiator reservoir does not have any coolant, perform the following: 1) stop the engine, 2) wait until the coolant has cooled down, and 3) add coolant until the coolant is filled to the F line.**
- **Run the engine at 2000 rpm until the coolant level has stabilized.**

i. Press the No. 1 and No. 2 radiator hoses several times by hand to bleed air.

CAUTION:



- **Wear protective gloves. Heat areas on the parts may injure your hands.**
- **Be careful as the radiator hoses are hot.**
- **Keep your hands away from the fan.**

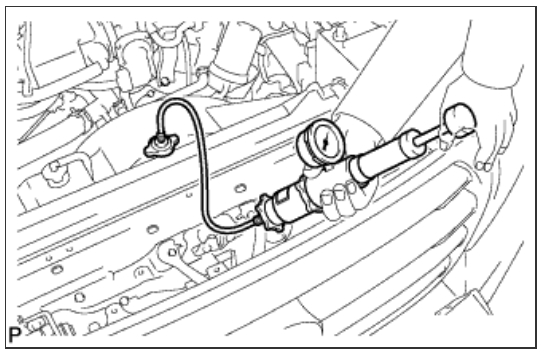
j. Stop the engine, and wait until the engine coolant cools down to ambient temperature.

CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

k. Check that the coolant level is between the F and L lines.
If the coolant level is below the L line, repeat all of the procedures above.
If the coolant level is above the F line, drain coolant so that the coolant level is between the F and L lines.

10. INSPECT FOR ENGINE COOLANT LEAK



CAUTION:

Do not remove the radiator cap while the engine and radiator are still hot. Pressurized, hot engine coolant and steam may be released and cause serious burns.

a. Fill the radiator with coolant and attach a radiator cap tester.

b. Warm up the engine.

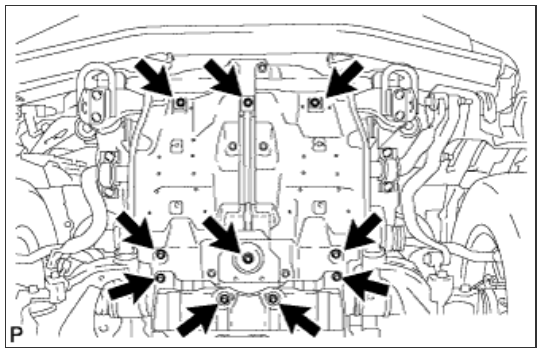
c. Using the radiator cap tester, increase the pressure inside the radiator to 123 kPa (1.3 kgf/cm^2, 18 psi), and check that the pressure does not drop.
If the pressure drops, check the hoses, radiator and water pump for leaks. If no external leaks are found, check the heater core, cylinder block and head.

11. INSPECT FOR FUEL LEAK

a. Connect the intelligent tester to the DLC3.

b. Turn the ignition switch to ON and intelligent tester on.

NOTICE:



Do not start the engine.

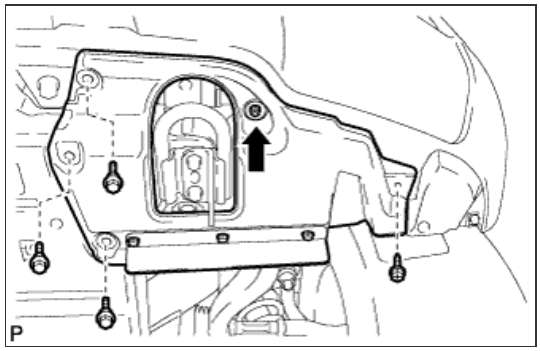
c. Enter the following menus: Powertrain / Engine and ECT / Active Test / Activate the Fuel Pump Speed Control.

d. Check that there are no fuel leaks after doing maintenance anywhere on the fuel system.

12. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Install the under cover with the 10 bolts.

13. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



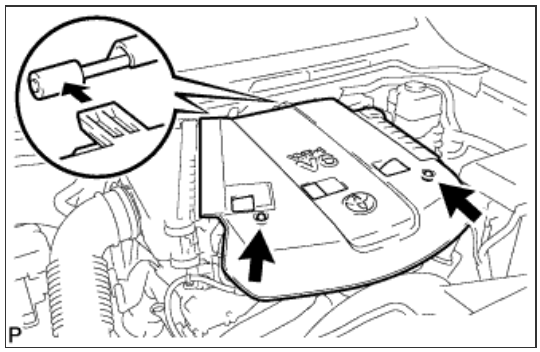
HINT:

Use the same procedures described for the LH side.

14. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

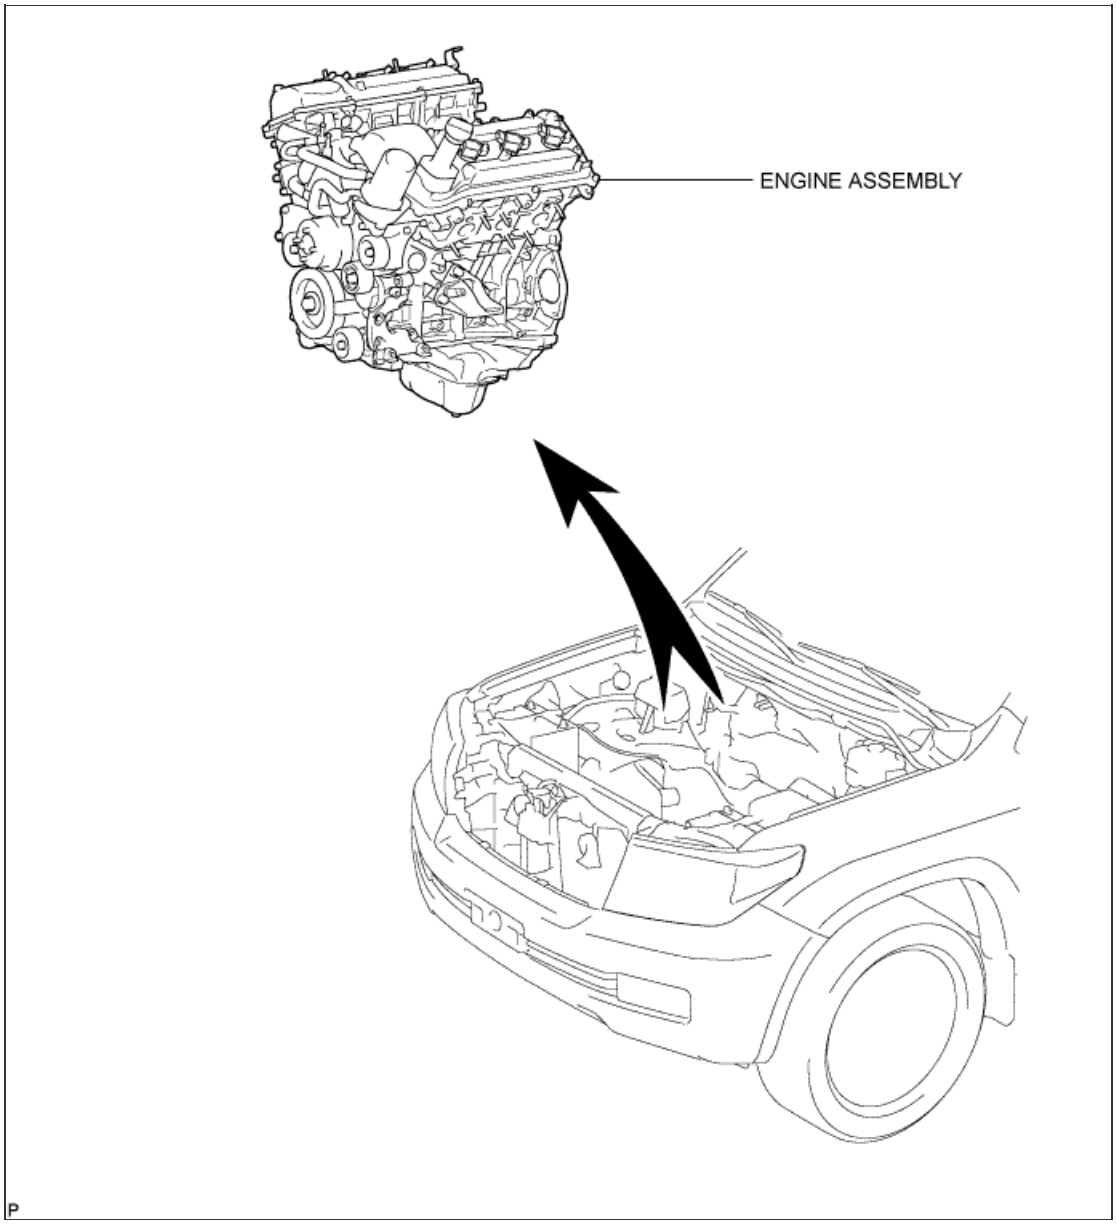
a. Push in the clip indicated by the arrow in the illustration to install the fender splash shield.

b. Install the 3 bolts and screw.

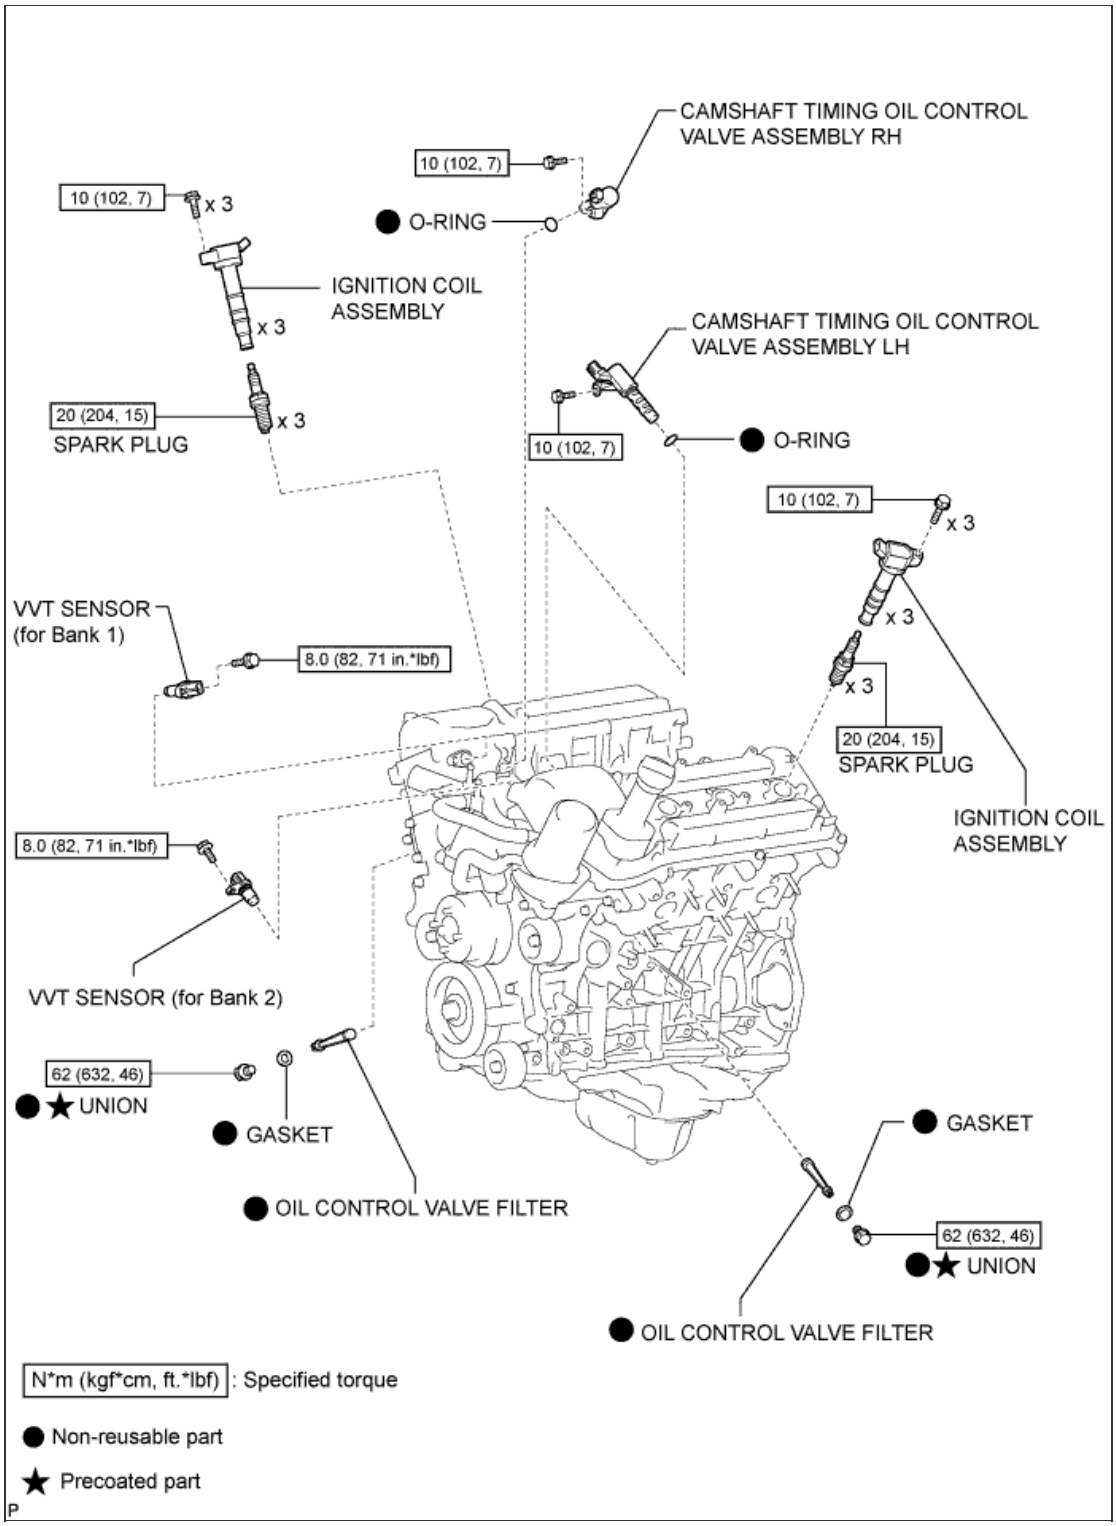


15. INSTALL COWL TOP VENTILATOR LOUVER SUB-ASSEMBLY

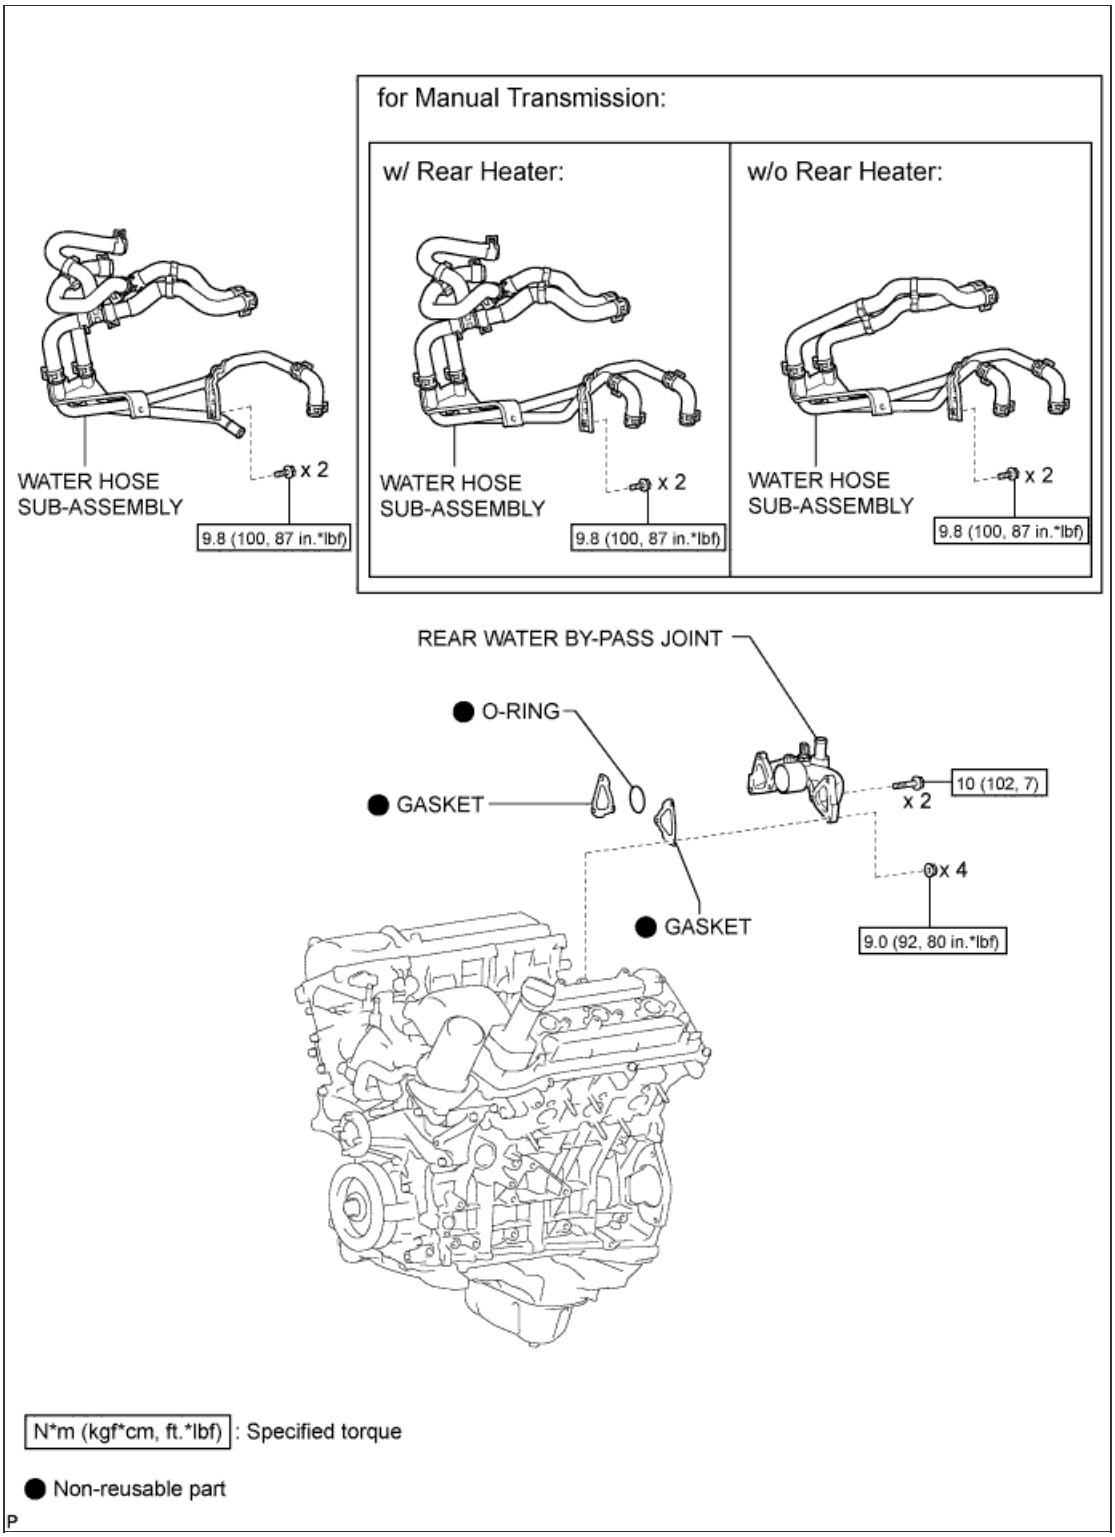
a. Install the cowl top ventilator louver (Click here).



16. INSTALL V-BANK COVER



a. Install the V-bank cover with the 2 nuts.



Torque:

1. DISCONNECT CABLE FROM NEGATIVE BATTERY TERMINAL

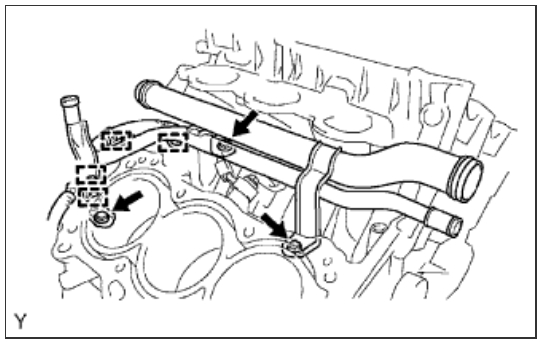
NOTICE:

When disconnecting the cable, so e syste s need to be initiali ed after the cable is reconnected (ick here).

2. REMOVE ENGINE ASSEMBLY

a. e ove the engine (ick here).

3. REMOVE CYLINDER HEAD SUB-ASSEMBLY RH (for Bank 1)

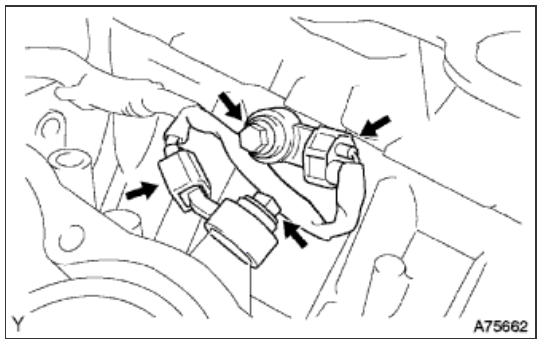


a. e ove the cylinder head (ick here).

4. REMOVE NO. 1 WATER OUTLET PIPE

a. Disconnect the wire harness cla s.

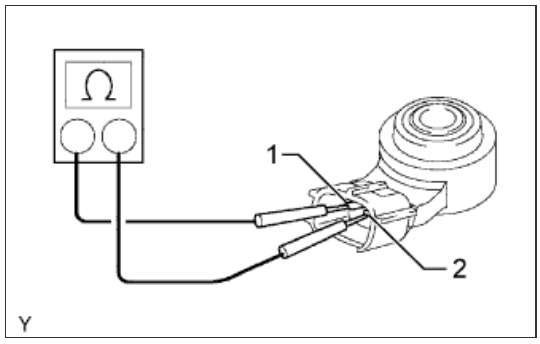
b. for 3 Bolts Type
e ove the 3 bolts and water o et pipe.



c. for 2 N s and Bolt Type
e ove the 2 n s, bolt and water o et pipe.

5. REMOVE KNOCK SENSOR

a. Disconnect the 2 sensor connectors.



b. e ove the 2 bolts and 2 sensors.

for Preparation Click here

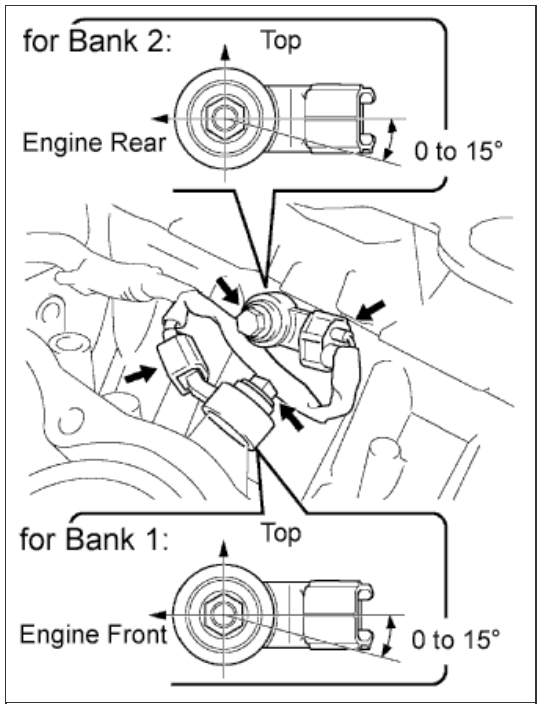
1. INSPECT KNOCK SENSOR

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	120 to 280 kΩ

the resistance is not as specified, replace the sensor.



for Preparation Click here

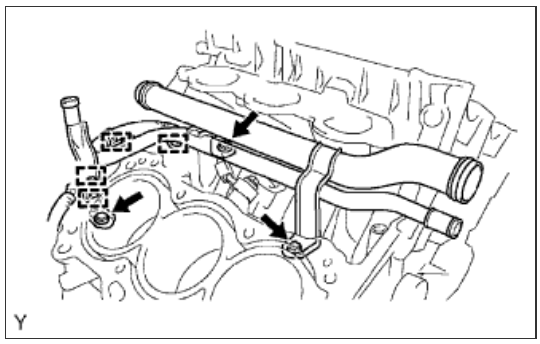
1. INSTALL KNOCK SENSOR

a. Install the 2 sensors with the 2 bolts as shown in the illustration.

Torque:
20 N*m{ 204 kgf*cm , 15 ft.*lbf }

b. Connect the 2 sensor connectors.

2. INSTALL NO. 1 WATER OUTLET PIPE



a. for 2 Nuts and Bolt Type
Install the water outlet pipe with the 2 nuts and bolt.

Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

b. for 3 Bolts Type
Install the water outlet pipe with the 3 bolts.

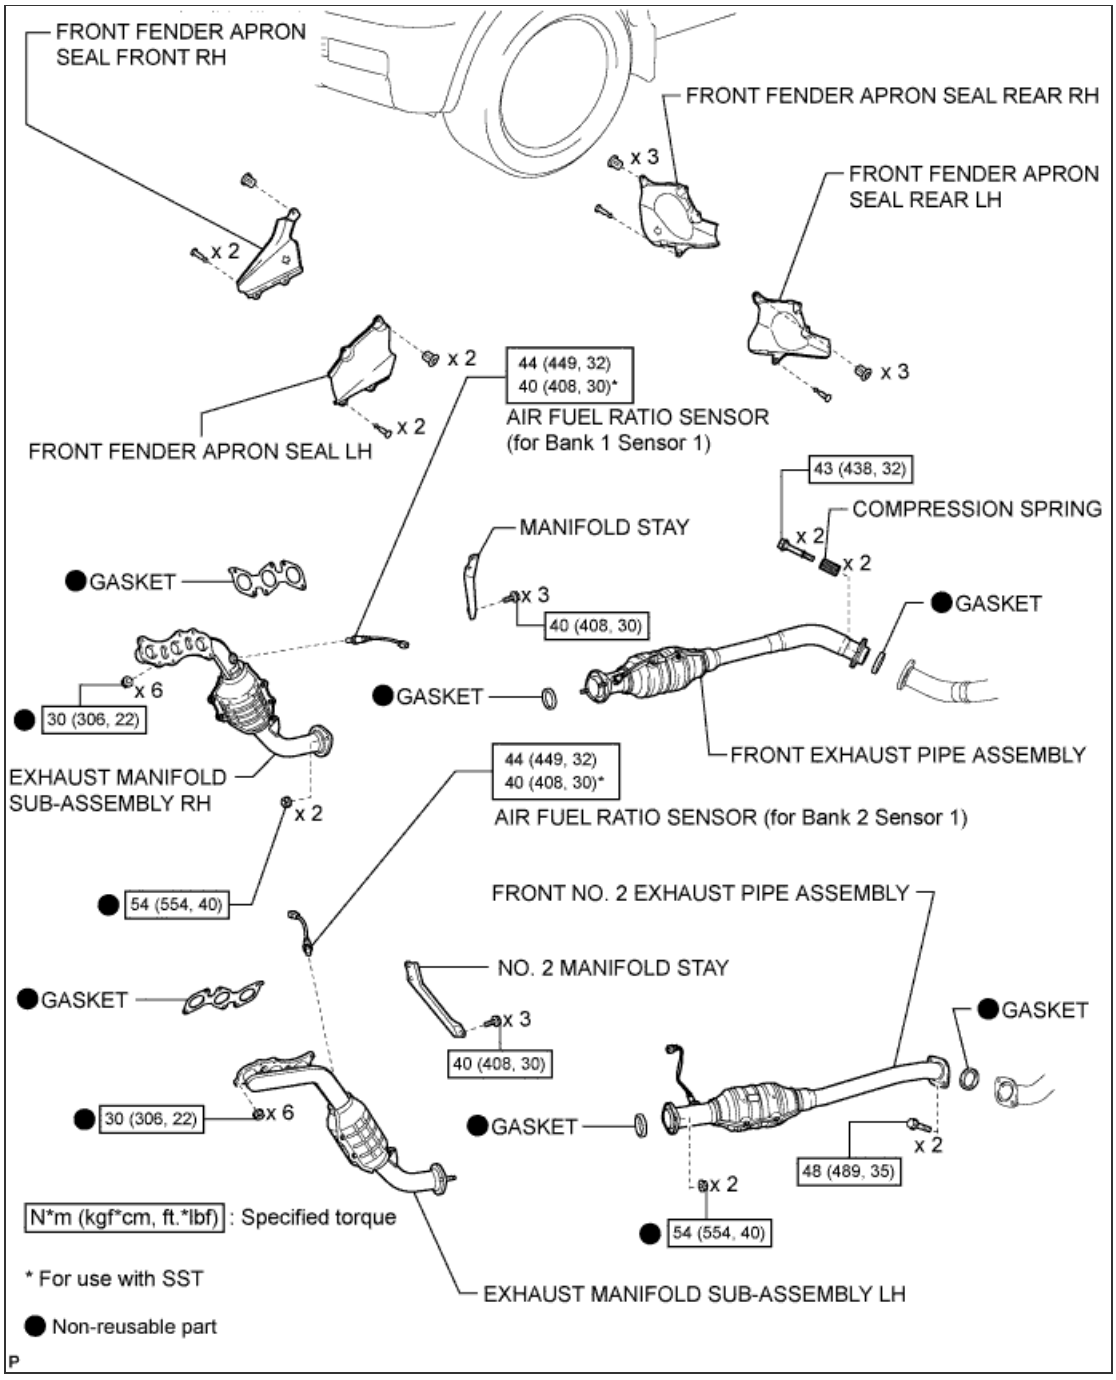
Torque:
10 N*m{ 102 kgf*cm , 7 ft.*lbf }

c. Connect the 4 wire harness clamps.

3. INSTALL CYLINDER HEAD SUB-ASSEMBLY RH (for Bank 1)

a. Install the cylinder head RH (Click here).

4. INSTALL ENGINE ASSEMBLY

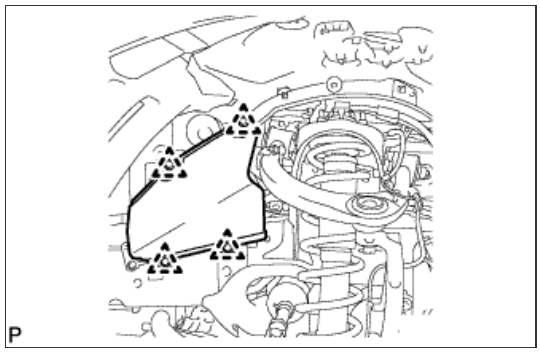


a. Install the engine (Click here).

5. CONNECT CABLE TO NEGATIVE BATTERY TERMINAL

NOTICE:

When disconnecting the cable, some systems need to be initialized after the cable is reconnected (Click here).



for Preparation Click here

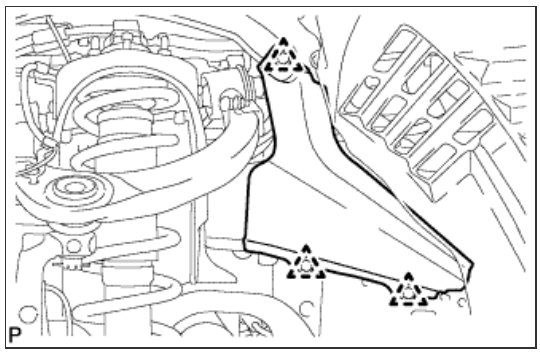
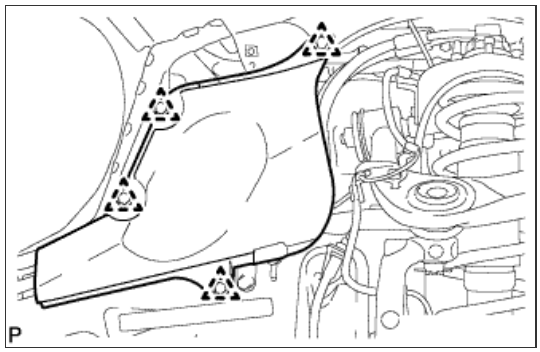
1. REMOVE FRONT FENDER APRON SEAL LH

a. Using a clip remover, remove clips and fender apron seal.



2. REMOVE FRONT FENDER APRON SEAL REAR LH

a. Using a clip remover, remove clips and fender apron seal.



3. REMOVE FRONT FENDER APRON SEAL FRONT RH

a. Using a clip remover, remove 3 clips and fender apron seal.

4. REMOVE FRONT FENDER APRON SEAL REAR RH

a. Using a clip remover, remove clips and fender apron seal.

5. REMOVE FRONT NO. 2 EXHAUST PIPE ASSEMBLY

a. Disconnec hea oxygen sensor connec

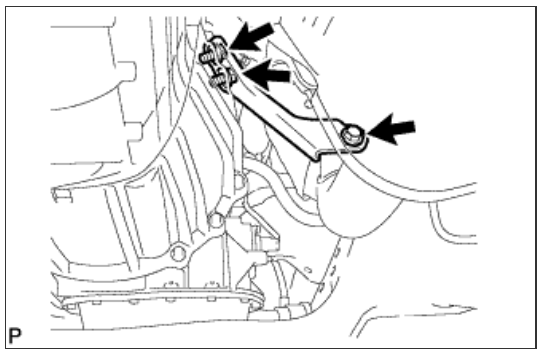
b. 2 bol s from cen exha s pipe.

c. Remove 2 bol s, 2 n s and fron o. 2 exha s pipe.

d. Remove 2 gaske s from fron o. 2 exha s pipe.

6. REMOVE FRONT EXHAUST PIPE ASSEMBLY

a. Disconnec hea oxygen sensor connec

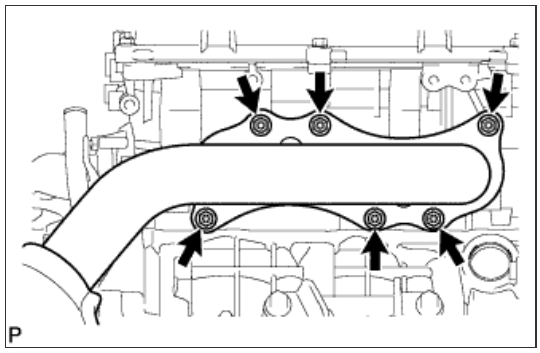


b. 2 bol s wi 2 compression springs from cen exha s pipe.

c. Remove 2 n s and fron exha s pipe.

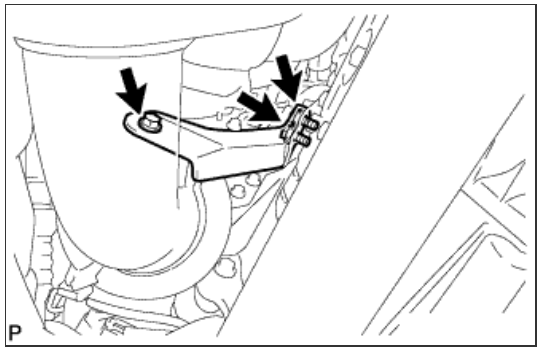
d. Remove 2 gaske s from fron exha s pipe.

7. REMOVE MANIFOLD STAY



a. Remove 3 bol s and o. 1 manifold s ay.

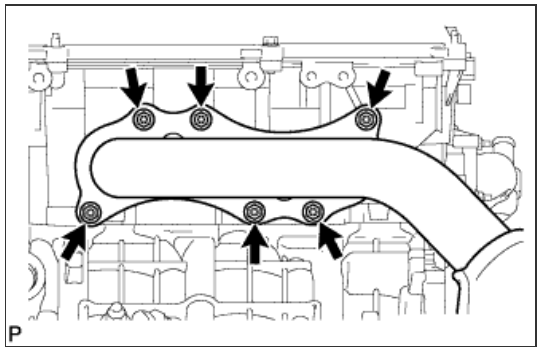
8. REMOVE EXHAUST MANIFOLD SUB-ASSEMBLY RH



a. Disconnec air f el ra io sensor connec

b. n s, exha s manifold and gaske from cylinder head R .

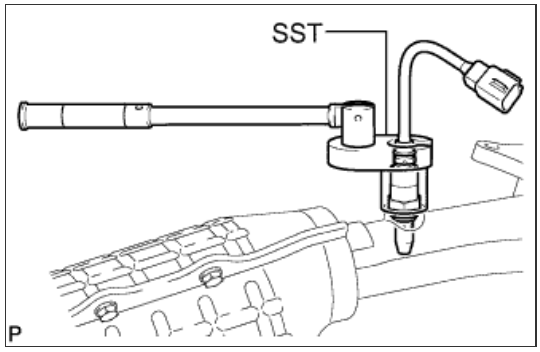
9. REMOVE NO. 2 MANIFOLD STAY



a. Remove 3 bol s and o. 2 manifold s ay.

10. REMOVE EXHAUST MANIFOLD SUB-ASSEMBLY LH

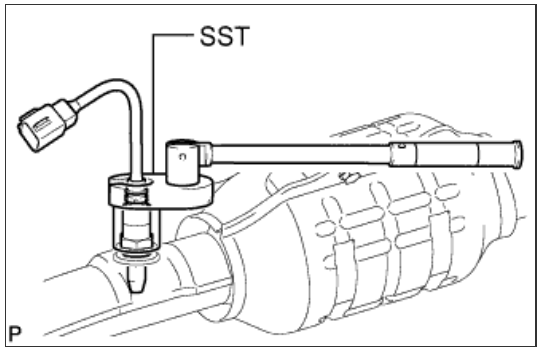
a. Disconnec air f el ra io sensor connec



b. n s, exha s manifold and gaske from cylinder head L .

11. REMOVE AIR FUEL RATIO SENSOR (for Bank 1 Sensor 1)

a. Using SS , remove sensor.



SST
09224-00010

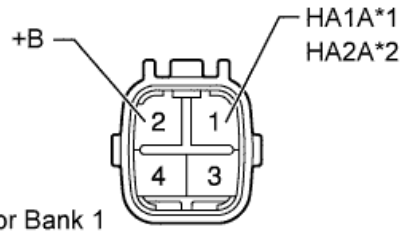
12. REMOVE AIR FUEL RATIO SENSOR (for Bank 2 Sensor 1)

a. Using SS , remove sensor.

SST
09224-00010

for Preparation Click here

1. INSPECT AIR FUEL RATIO SENSOR



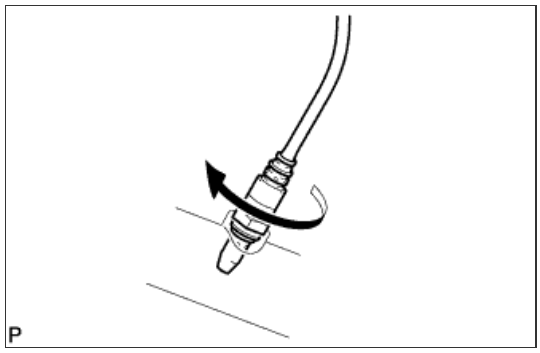
a. Measure the heater resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (2 (r Ban 1	20°C (68°F)	1.8 to 3.4 Ω
1 (2 (r Ban 2	20°C (68°F)	1.8 to 3.4 Ω

If the result is not as specified replace the air fuel ratio sensor.

Component without harness connected:
(Air Fuel Ratio Sensor)



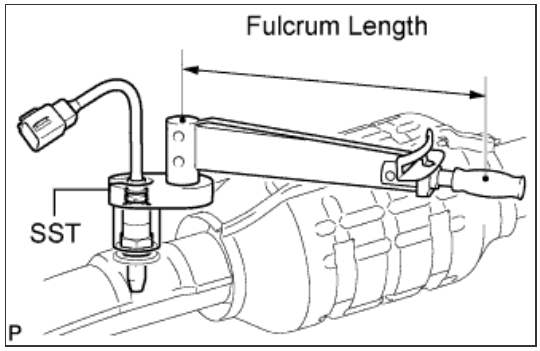
*1: for Bank 1

*2: for Bank 2

for Preparation Click here

1. INSTALL AIR FUEL RATIO SENSOR (for Bank 2 Sensor 1)

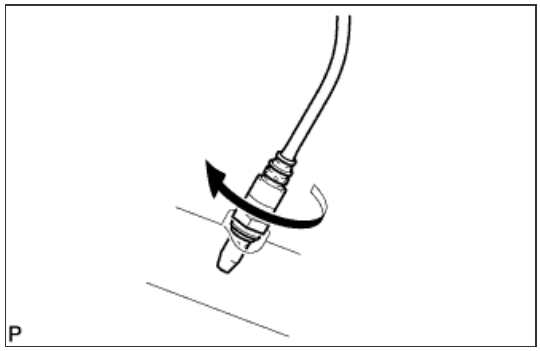
a. Temporarily install the sensor to the exhaust manifold by hand.



b. Using SST, tighten the sensor.

SST
09224-00010

Torque:
without SST:
44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }



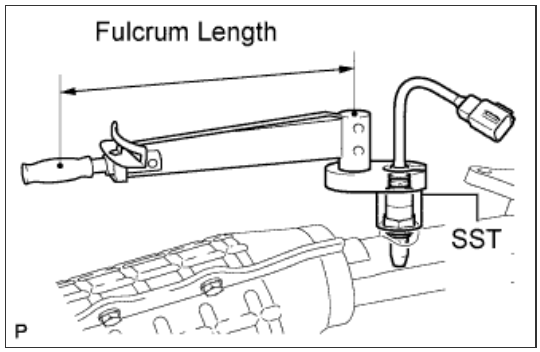
HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).**
- **Make sure SST and the wrench are connected in a straight line.**

2. INSTALL AIR FUEL RATIO SENSOR (for Bank 1 Sensor 1)

a. Temporarily install the sensor to the exhaust manifold by hand.

b. Using SST, tighten the sensor.



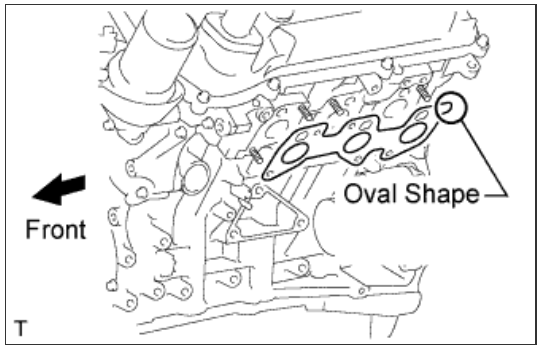
SST
09224-00010

Torque:
without SST:
44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:

40 N*m{ 408 kgf*cm , 30 ft.*lbf }

HINT:

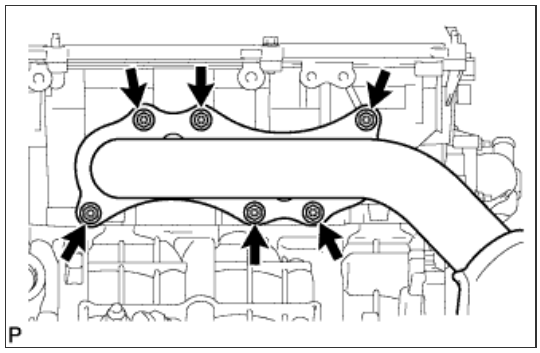
- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).**
- **Make sure SST and the wrench are connected in a straight line.**



3. INSTALL EXHAUST MANIFOLD SUB-ASSEMBLY LH

a. Set a new gasket to the cylinder head LH with the oval shape facing rearward.

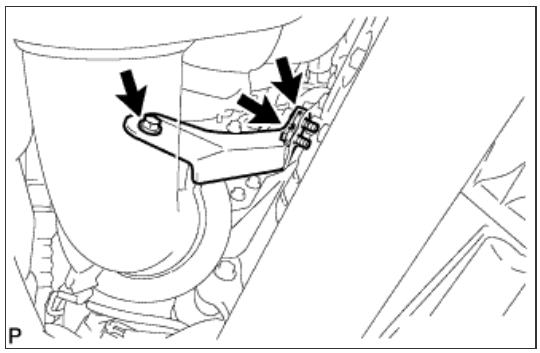
NOTICE:



Be careful of the installation direction.

b. Install the exhaust manifold with 6 new nuts.

Torque:
30 N*m{ 306 kgf*cm , 22 ft.*lbf }

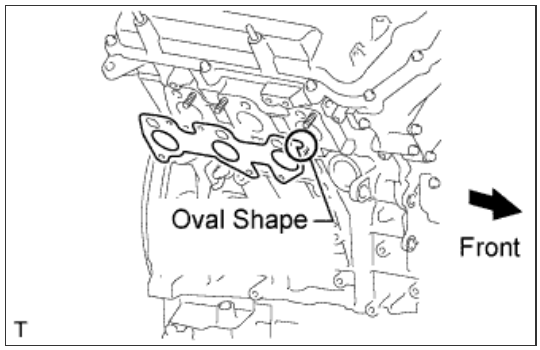


c. Connect the air fuel ratio sensor connector.

4. INSTALL NO. 2 MANIFOLD STAY

a. Install the No. 2 manifold stay with the 3 bolts.

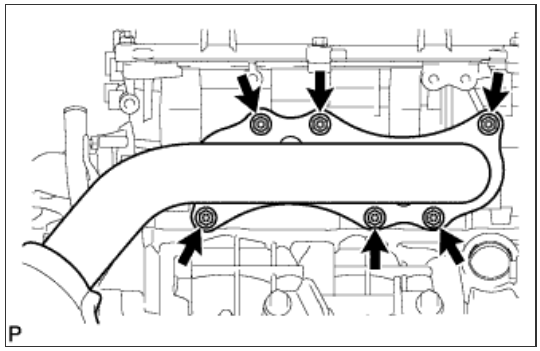
Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }



5. INSTALL EXHAUST MANIFOLD SUB-ASSEMBLY RH

a. Set a new gasket to the cylinder head RH with the oval shape facing forward.

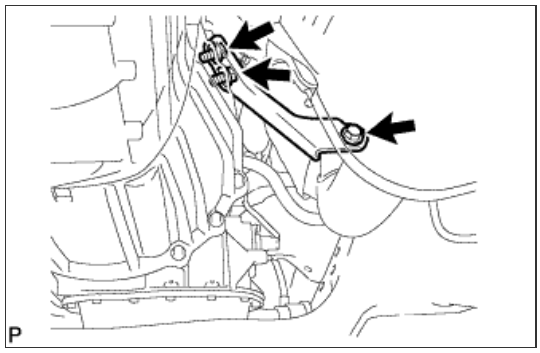
NOTICE:



Be careful of the installation direction.

b. Install the exhaust manifold with 6 new nuts.

Torque:
30 N*m{ 306 kgf*cm , 22 ft.*lbf }



c. Connect the air fuel ratio sensor connector.

6. INSTALL MANIFOLD STAY

a. Install the No. 1 manifold stay with the 3 bolts.

Torque:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

7. INSTALL FRONT EXHAUST PIPE ASSEMBLY

a. Install 2 new gaskets to the front exhaust pipe.

b. Install the front exhaust pipe to the exhaust manifold RH with 2 new nuts.

Torque:
54 N*m{ 554 kgf*cm , 40 ft.*lbf }

c. Install the 2 compression springs and 2 bolts to the center exhaust pipe.

Torque:
43 N*m{ 438 kgf*cm , 32 ft.*lbf }

d. Connect the heated oxygen sensor connector.

8. INSTALL FRONT NO. 2 EXHAUST PIPE ASSEMBLY

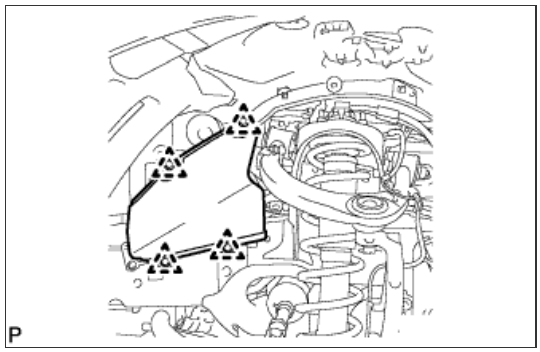
a. Install 2 new gaskets to the front No. 2 exhaust pipe.

b. Install the front No. 2 exhaust pipe to the exhaust manifold LH with 2 new nuts.

Torque:
54 N*m{ 554 kgf*cm , 40 ft.*lbf }

c. Install the 2 bolts to the center exhaust pipe.

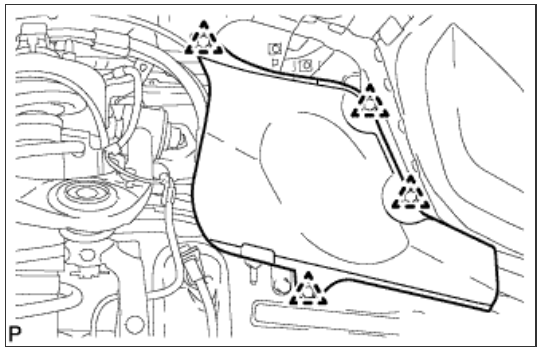
Torque:
48 N*m{ 489 kgf*cm , 35 ft.*lbf }



d. Connect the heated oxygen sensor connector.

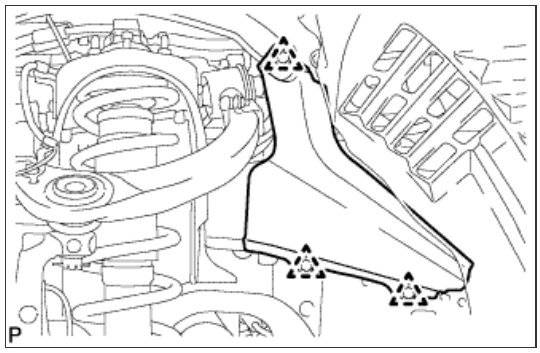
9. INSPECT FOR EXHAUST GAS LEAK

If gas is leaking, tighten the areas necessary to stop the leak. Replace damaged parts as necessary.



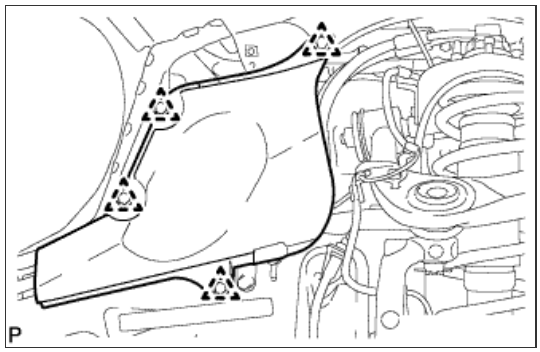
10. INSTALL FRONT FENDER APRON SEAL LH

a. Install the fender apron seal with the 4 clips.



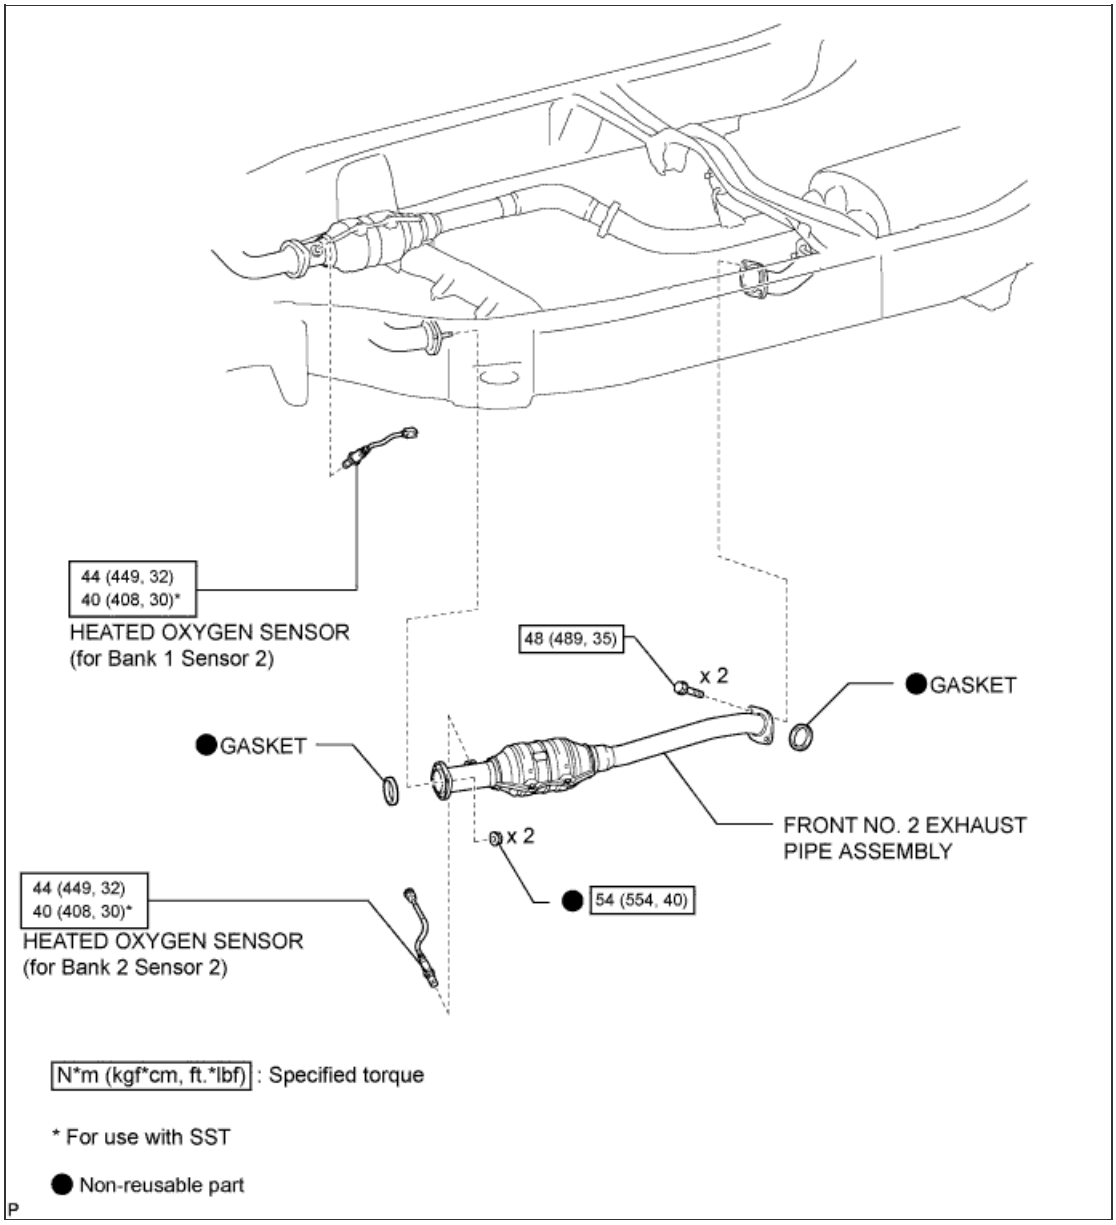
11. INSTALL FRONT FENDER APRON SEAL REAR LH

a. Install the fender apron seal with the 4 clips.



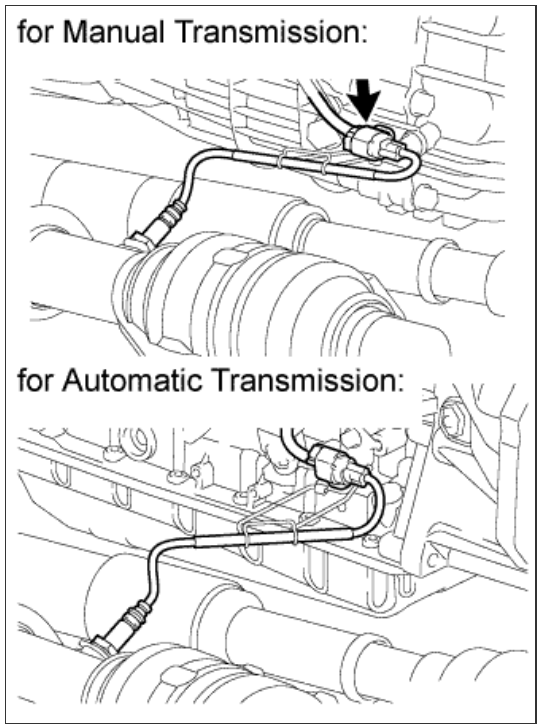
12. INSTALL FRONT FENDER APRON SEAL FRONT RH

a. Install the fender apron seal with the 3 clips.



13. INSTALL FRONT FENDER APRON SEAL REAR RH

a. Install the fender apron seal with the 4 clips.



for Preparation Click here

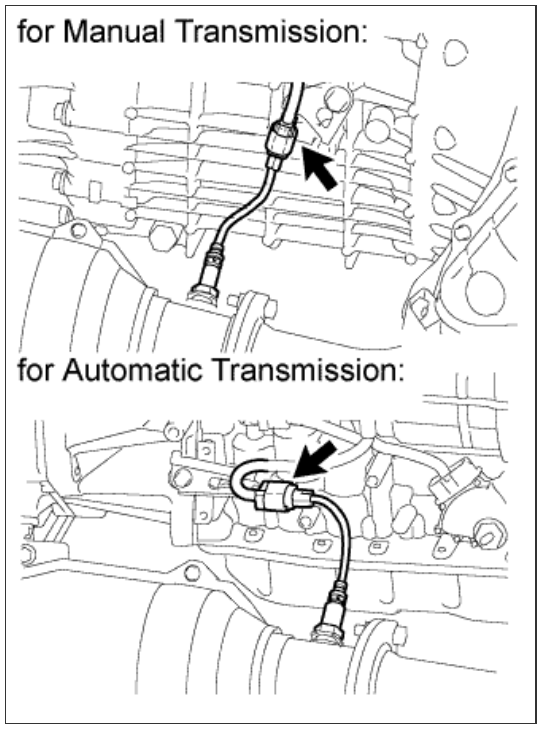
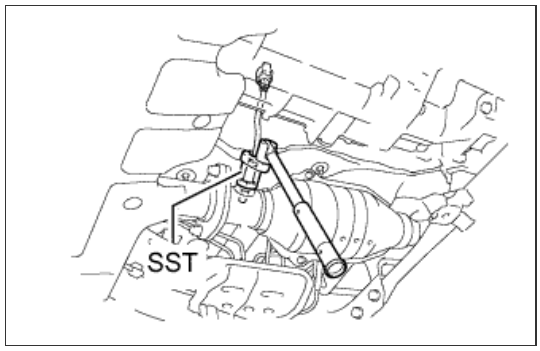
1. REMOVE FRONT NO. 2 EXHAUST PIPE ASSEMBLY

a. Disconnect the sensor connector



b. emove the 2 bo ts, 2 nuts and o2 e haust i assemb

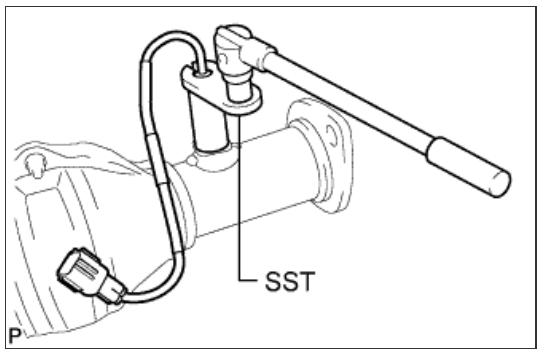
c. emove the 2 askets rom the ront o2 e haust i e



2. REMOVE HEATED OXYGEN SENSOR (for Bank 1 Sensor 2)

a. Disconnect the sensor connector.

b. Using SST, remove the sensor.



SST
0 22 10

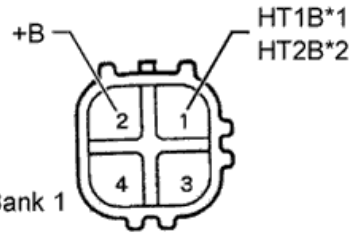
3. REMOVE HEATED OXYGEN SENSOR (for Bank 2 Sensor 2)

a. Using SST, remove the sensor.

SST
09224-00010

for Preparation Click here

1. INSPECT HEATED OXYGEN SENSOR



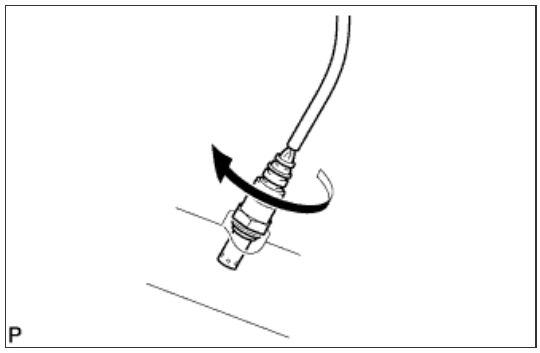
a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 (HT1B) - 2 (+B) for Bank 1	20°C (68°F)	11 to 16 Ω
1 (HT2B) - 2 (+B) for Bank 2	20°C (68°F)	11 to 16 Ω

If the result is not as specified, replace the sensor.

Component without harness connected:
(Heated Oxygen Sensor)



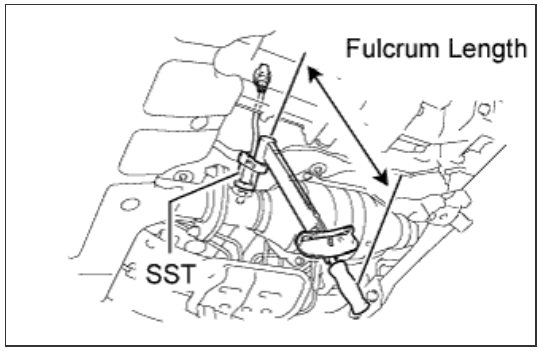
*1: for Bank 1

*2: for Bank 2

for Preparation Click here

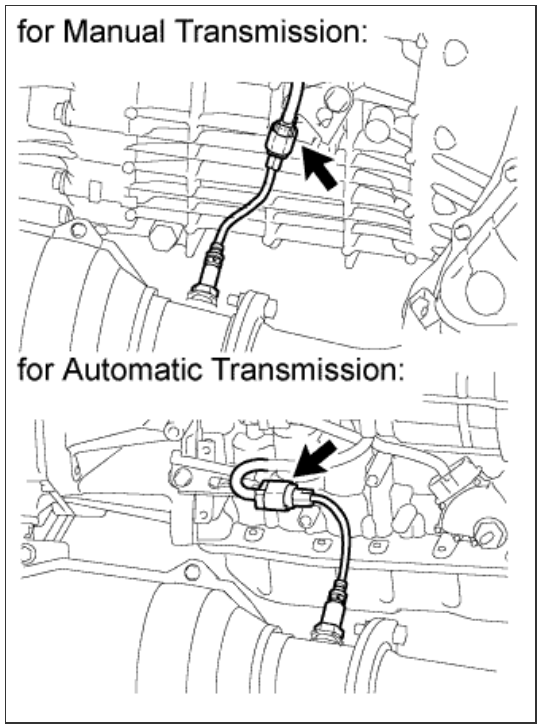
1. INSTALL HEATED OXYGEN SENSOR (for Bank 1 Sensor 2)

a. Temporarily install the sensor to the exhaust pipe by hand.



b. Using SST, tighten the sensor.

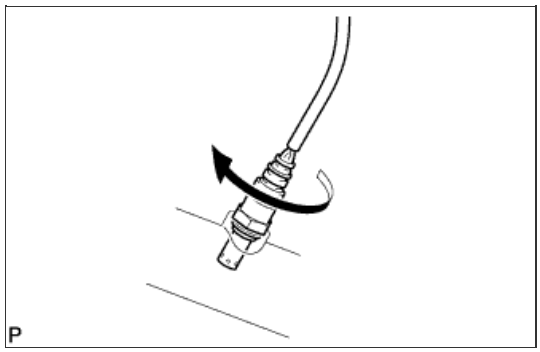
SST
09224-00010



Torque:
without SST:
44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

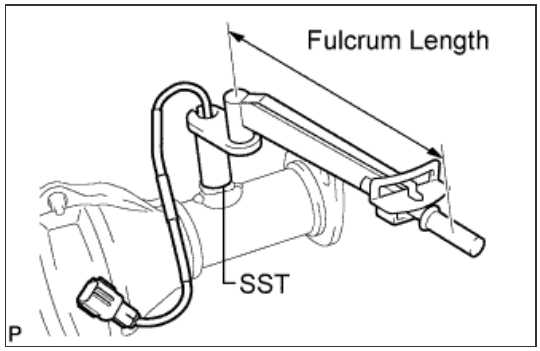
HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).**
- **Make sure SST and the wrench are connected in a straight line.**



c. Connect the sensor connector.

2. INSTALL HEATED OXYGEN SENSOR (for Bank 2 Sensor 2)



a. Temporarily install the sensor to the exhaust pipe by hand.

b. Using SST, tighten the sensor.

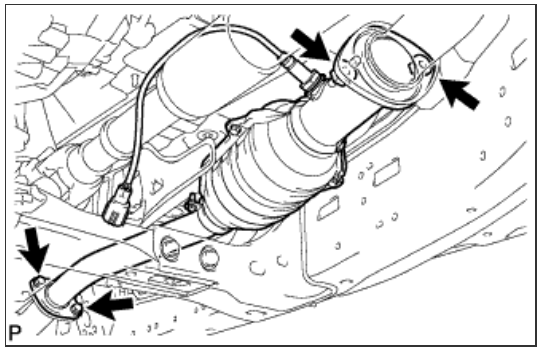
SST
09224-00010

Torque:
without SST:
44 N*m{ 449 kgf*cm , 32 ft.*lbf }
with SST:
40 N*m{ 408 kgf*cm , 30 ft.*lbf }

HINT:

- **Use a torque wrench with a fulcrum length of 30 cm (11.8 in.). If using a torque wrench with a length that is not 30 cm (11.8 in.), calculate the torque specification for the torque wrench and SST based on the "without SST" torque specification (Click here).**
- **Make sure SST and the wrench are connected in a straight line.**

3. INSTALL FRONT NO. 2 EXHAUST PIPE ASSEMBLY

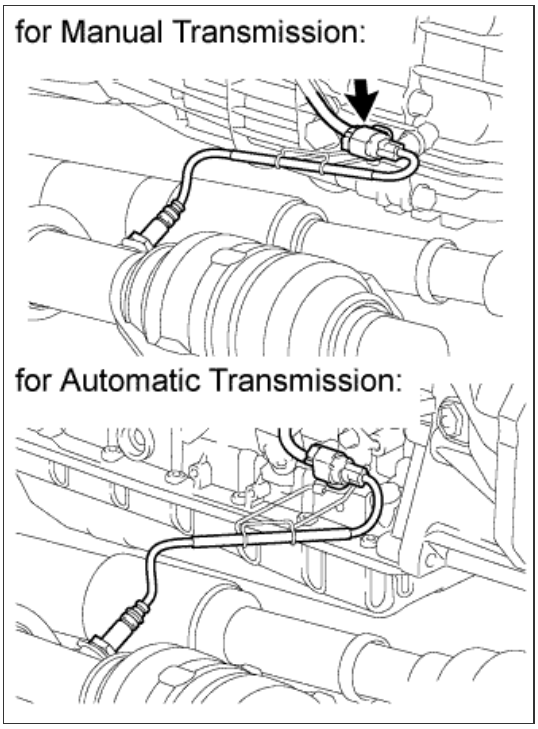


a. Install 2 new gaskets to the ront o2 exhaust pipe.

b. Connect the ront o2 exhaust pipe to the exhaust mani ol with 2 new nuts.

Torque:
54 N*m{ 554 kgf*cm , 40 ft.*lbf }

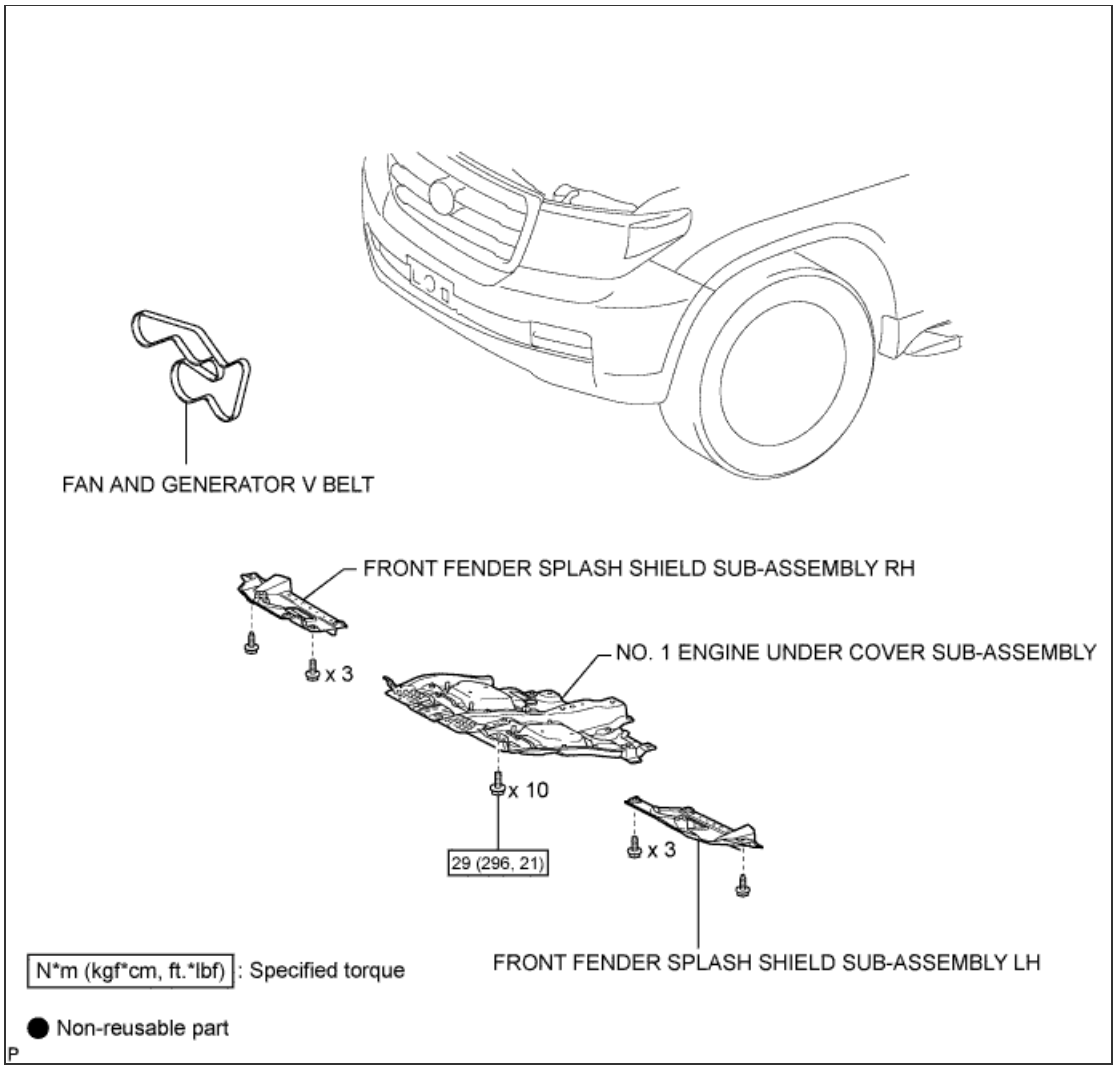
c. Connect the ront o2 exhaust pipe to the center exhaust pipe with the 2 bolts.



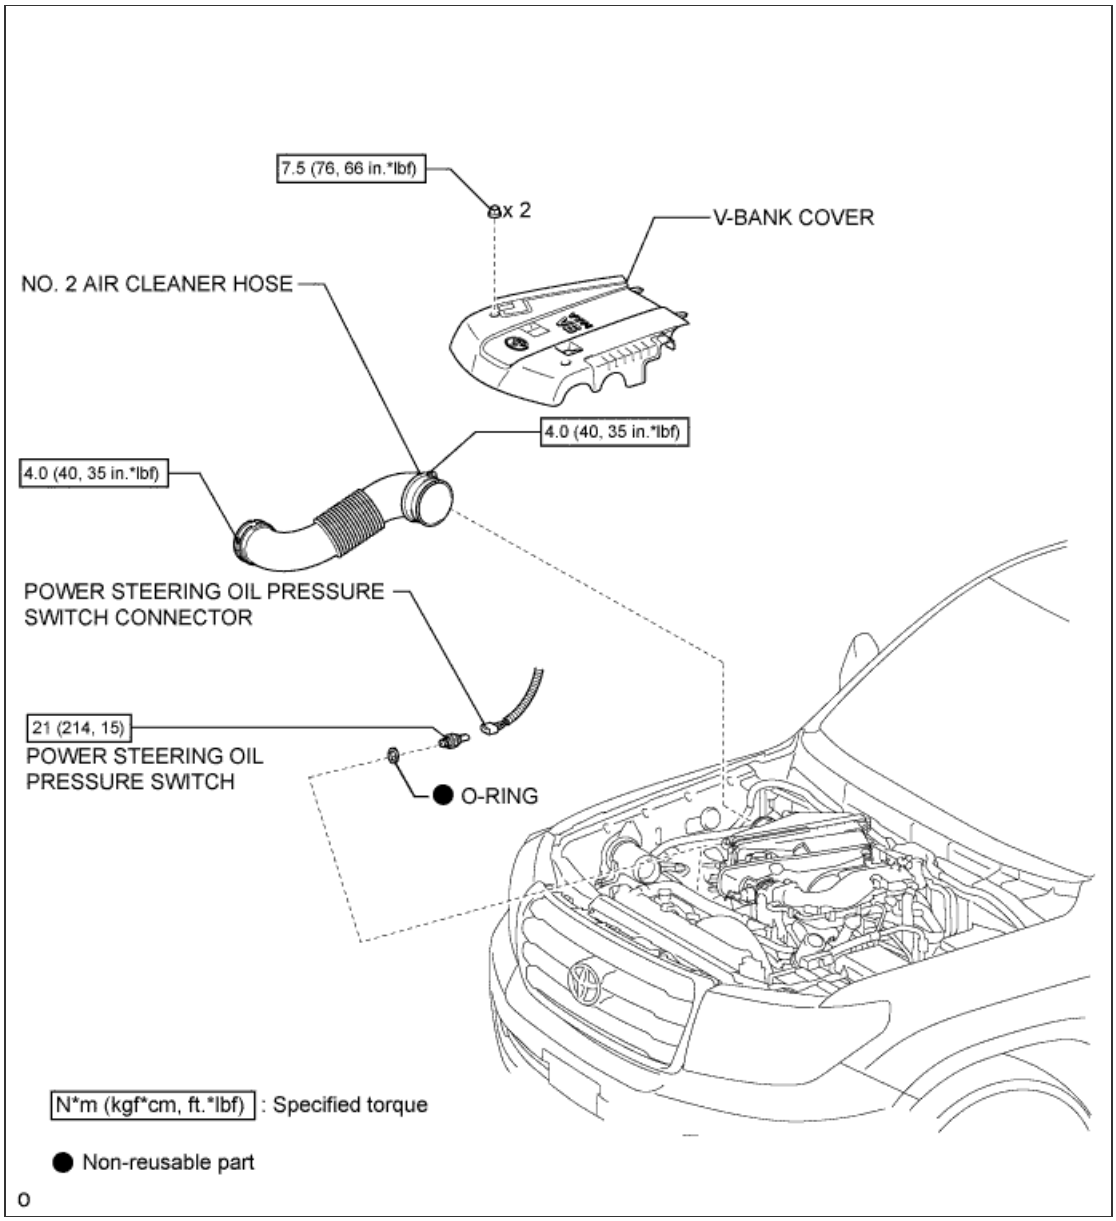
Torque:
48 N*m{ 489 kgf*cm , 35 ft.*lbf }

d. Connect the heated oxygen sensor connector.

HINT:



ol the wire harness to the bracket.



4. INSPECT FOR EXHAUST GAS LEAK

I gas is leaking, tighten the areas necessary to stop the leak. eplace damaged parts as necessary.

for Preparation Click here

1. INSPECT POWER STEERING OIL PRESSURE SWITCH

a. Check the oil pressure switch.

i. Connect the intelligent tester to the DLC3.

ii. Turn the ignition switch on (IG).

iii. Turn the intelligent tester on.

iv. Enter the following menus: Powertrain / Engine and ECT / Data List / Power Steering Switch.

v. Start the engine.

vi. Operate the steering wheel while idling, and read the value on the Techstream.

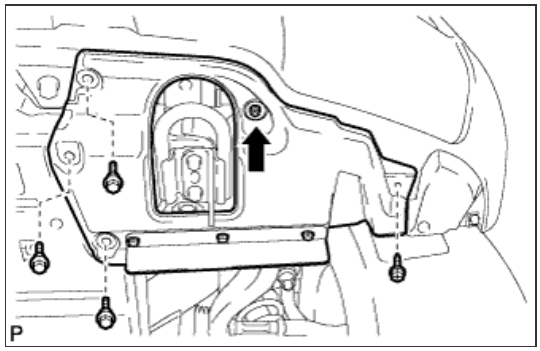
Standard:

Condition	Specified Condition
Power steering not operating	0 to 2 MPa
Power steering operating	Values change from above value

If not as specified, check for DTCs (Click here). If the power steering system inspection results are normal and a DTC is not output, replace the power steering oil pressure switch.
Inspect the power steering system (Click here). If the power steering system inspection results are normal and a DTC is not output, replace the power steering oil pressure switch.

for Preparation Click here

1. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



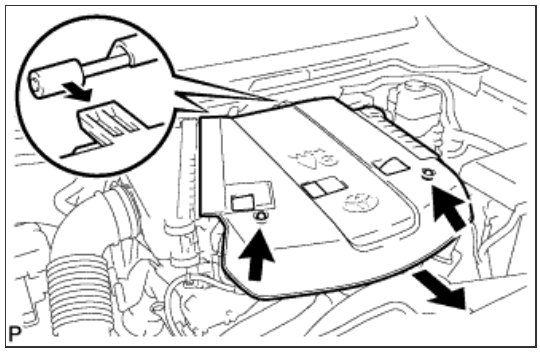
HINT:

Use the same procedures described for the LH side.

2. REMOVE FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

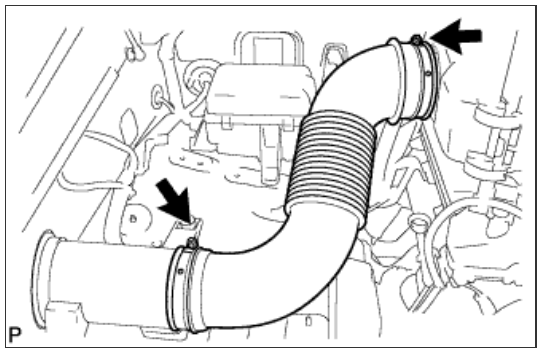
a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.



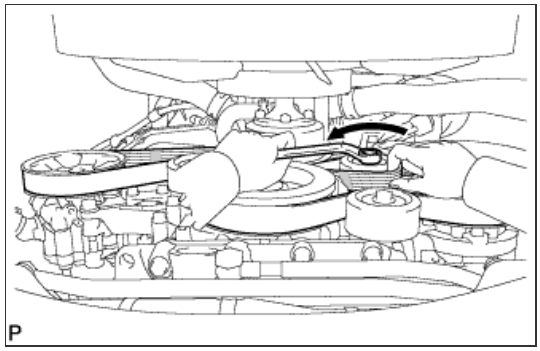
3. REMOVE NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY

a. Remove the 10 bolts and engine under cover.



4. REMOVE V-BANK COVER

a. Remove the 2 cap nuts and ban cover.

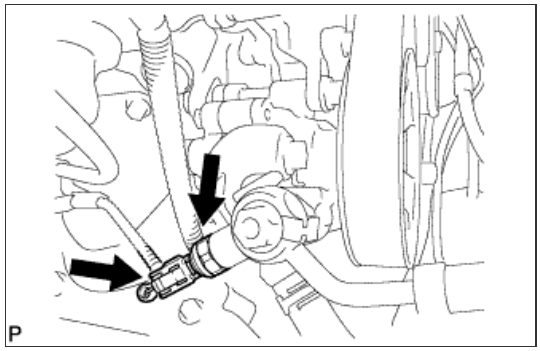


5. REMOVE NO. 2 AIR CLEANER HOSE

a. Loosen the 2 hose clamps and remove the air cleaner hose.

6. REMOVE FAN & GENERATOR V BELT

a. While releasing the belt tension by turning the belt tensioner countercloc wise, remove the fan and generator belt from the belt tensioner.



7. DRAIN POWER STEERING FLUID

8. REMOVE POWER STEERING OIL PRESSURE SWITCH

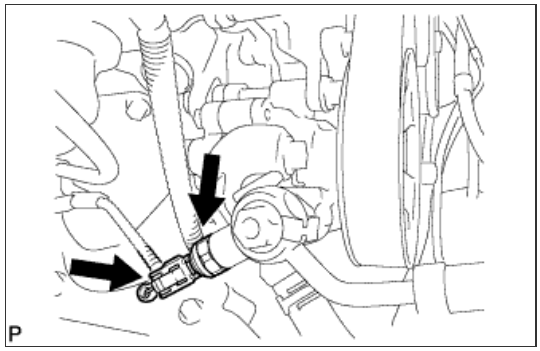
a. Disconnect the oil pressure switch connector.

b. Using a 1 mm deep soc et wrench, remove the oil pressure switch.

for Preparation Click here

1. INSTALL POWER STEERING OIL PRESSURE SWITCH

a. Install a new O-ring to the oil pressure switch.

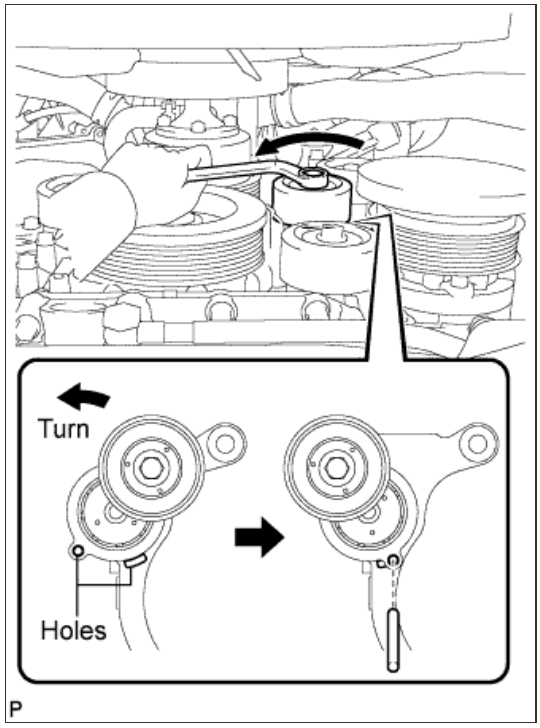


b. Apply a light coat of engine oil to the O-ring of the oil pressure switch.

c. Using a 19 mm deep socket wrench, install the oil pressure switch.

Torque:
21 N*m{ 210 kgf*cm , 15 ft.*lbf }

NOTICE:



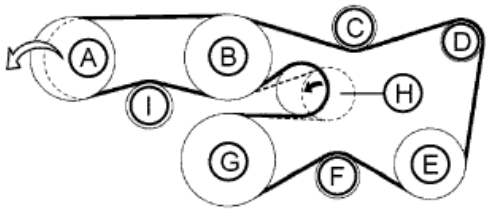
- **Do not allow foreign matter to contact the oil seal face of the power steering oil pressure switch (connecting surface with pressure feed tube).**
- **Be careful not to damage the O-ring when installing the power steering oil pressure switch**

d. Connect the oil pressure switch connector.

2. INSTALL FAN & GENERATOR V BELT

a. While turning the belt tensioner counterclockwise, align the holes, and then insert a bar of φ6 mm (0.236 in.) into the holes to fix the belt tensioner in place.

b. Install the fan and generator V belt.



HINT:

If it is hard to install the fan and generator V belt, perform the following procedures.

1. **Put the fan and generator V belt on all parts except the vane pump, as shown in the illustration.**

2. **While releasing the belt tension by turning the belt tensioner counterclockwise, put the fan and generator V belt on the vane pump.**

c. While turning the belt tensioner counterclockwise, remove the bar.

A: Vane Pump

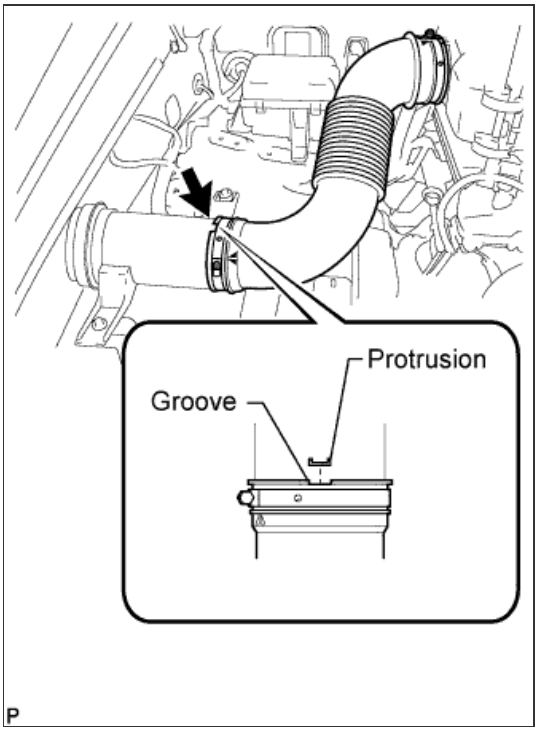
B: Water Pump

C: No. 2 Idler

D: Generator

E: Cooler Compressor

F: No. 1 Idler



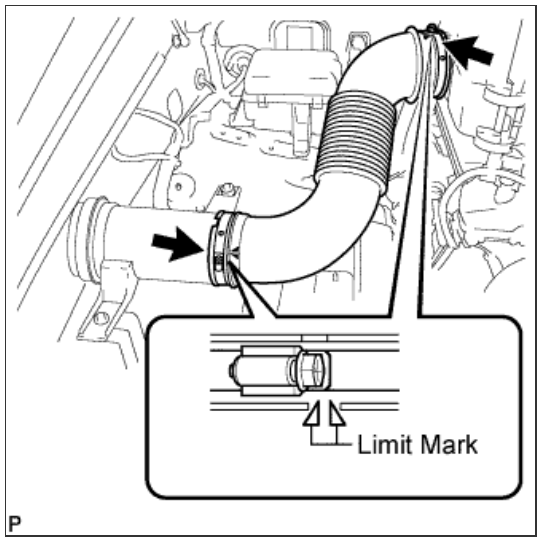
G: Crankshaft

H: V-Ribbed Belt Tensioner

I: No. 2 Idler

3. INSTALL NO. 2 AIR CLEANER HOSE

a. Align the protrusion of the pre-cleaner with the groove of the No. 2 air cleaner hose as shown in the illustration.



b. Tighten the 2 hose clamps.

Torque:
4.0 N*m{ 41 kgf*cm , 35 in.*lbf }

HINT:

Tighten the clamp until the end of the clamp band is within both limit marks.

4. ADD POWER STEERING FLUID

5. INSPECT FOR POWER STEERING FLUID LEAK

6. BLEED POWER STEERING FLUID

a. Check the fluid level.

b. Jack up the front of the vehicle and support it with stands.

c. Turn the steering wheel.

i. With the engine stopped, turn the wheel slowly from lock to lock several times.

d. Lower the vehicle.

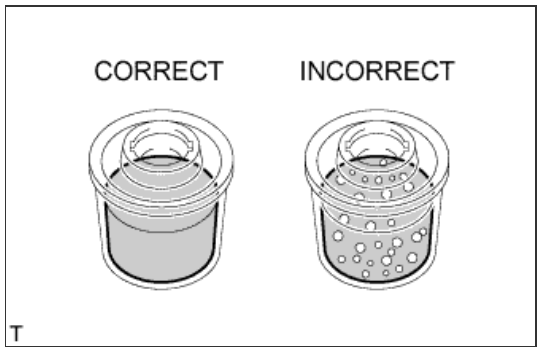
e. Start the engine.

f. Idle the engine for a few minutes.

g. Turn the steering wheel.

i. With the engine idling, turn the wheel left or right to the full lock position and keep it there for 2 to 3 seconds, then turn the wheel to the opposite full lock position and keep it there for 2 to 3 seconds. *1

ii. Repeat *1 several times.



NOTICE:

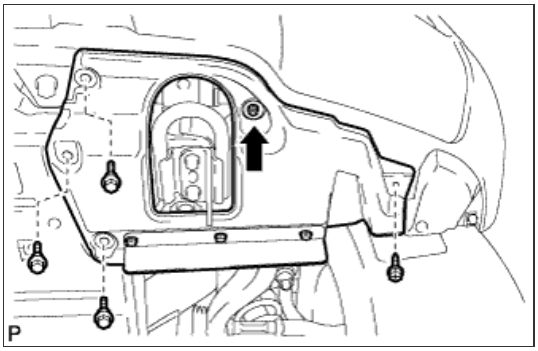
For vehicles with VGRS, if the steering wheel is turned from lock to lock repeatedly, the system may stop operating and the amount of rotation before the steering wheel locks may increase due to operation of the overheating prevention function. When the system temperature drops, the system operation automatically returns to normal.

h. Stop the engine.

i. Check for foaming or emulsification.
If the system has to be bled twice because of foaming or emulsification, check for fluid leaks in the system.

j. Check the fluid level.

7. INSTALL NO. 1 ENGINE UNDER COVER SUB-ASSEMBLY



a. Install the engine under cover with the 10 bolts.

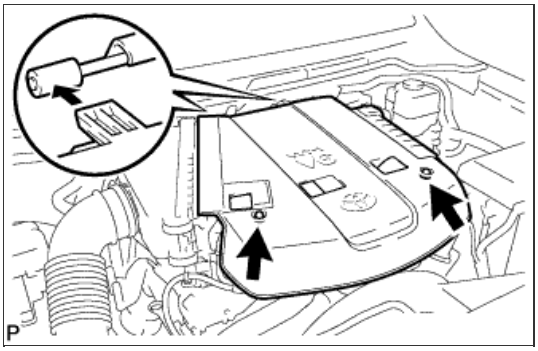
Torque:
29 N*m{ 296 kgf*cm , 21 ft.*lbf }

8. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY LH

a. Remove the 3 bolts and screw.

b. Turn the clip indicated by the arrow in the illustration to remove the fender splash shield.

9. INSTALL FRONT FENDER SPLASH SHIELD SUB-ASSEMBLY RH



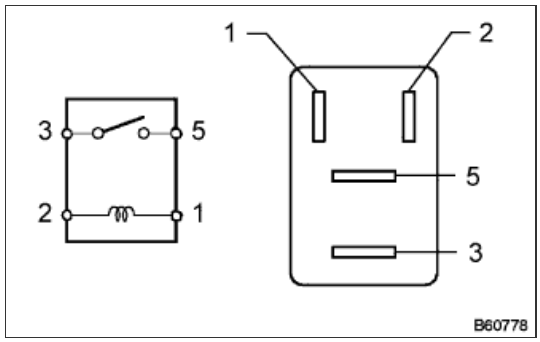
HINT:

Use the same procedures described for the LH side.

10. INSTALL V-BANK COVER

a. Install the V-bank cover with the 2 cap nuts.

Torque:
7.5 N*m{ 76 kgf*cm , 66 in.*lbf }



for Preparation Click here

1. INSPECT CIRCUIT OPENING RELAY (C/OPN)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage is not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage is applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

2. INSPECT INTEGRATION RELAY (IG2)

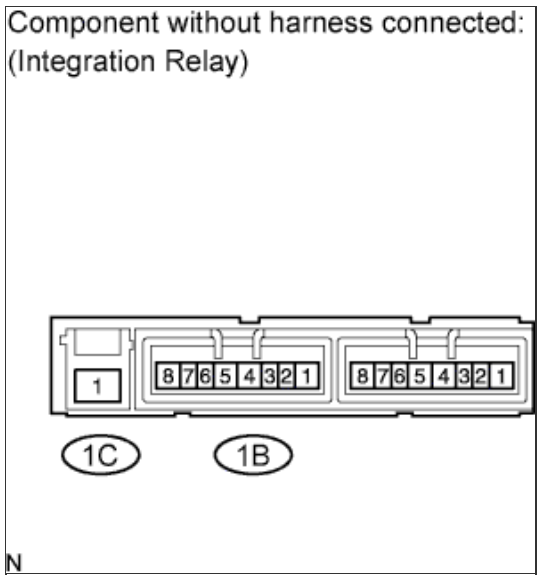
a. Measure the resistance of the IG2 MAIN fuse.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
IG2 MAIN fuse	Always	Below 1 Ω

If the result is not as specified, replace the IG2 MAIN fuse.



b. Measure the resistance of the ignition relay No. 2 (IG2) circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-8	Battery voltage is not applied to terminals 1B-6 and 1B-7	10 kΩ or higher
	Battery voltage is applied to terminals 1B-6 and 1B-7	Below 1 Ω

If the result is not as specified, replace the integration relay.

3. INSPECT INTEGRATION RELAY (EFI)

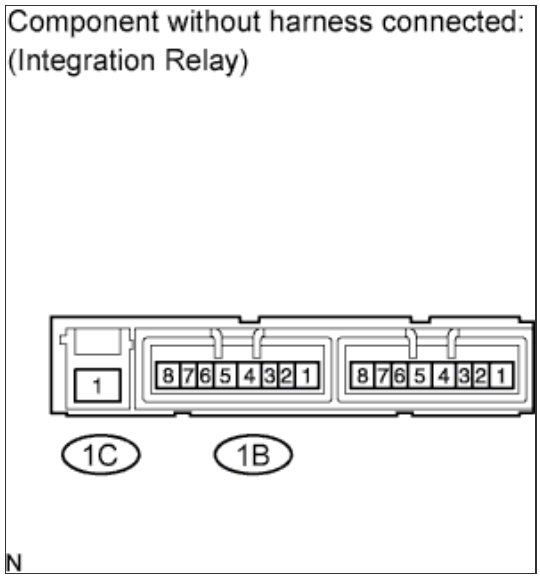
a. Measure the resistance of the EFI MAIN fuse.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
EFI MAIN fuse	Always	Below 1 Ω

If the result is not as specified, replace the EFI MAIN fuse.



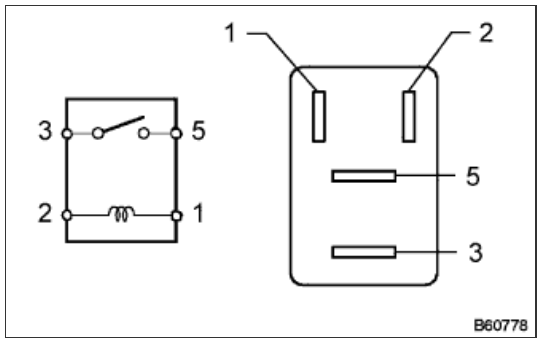
b. Measure the resistance of the EFI relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1B-4	Battery voltage is not applied to terminals 1B-2 and 1B-3	10 kΩ or higher
	Battery voltage is applied to terminals 1B-2 and 1B-3	Below 1 Ω

If the result is not as specified, replace the integration relay.



4. INSPECT EFI NO. 2 RELAY (EFI NO. 2)

a. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage is not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage is applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

5. INSPECT INTEGRATION RELAY (A/F)

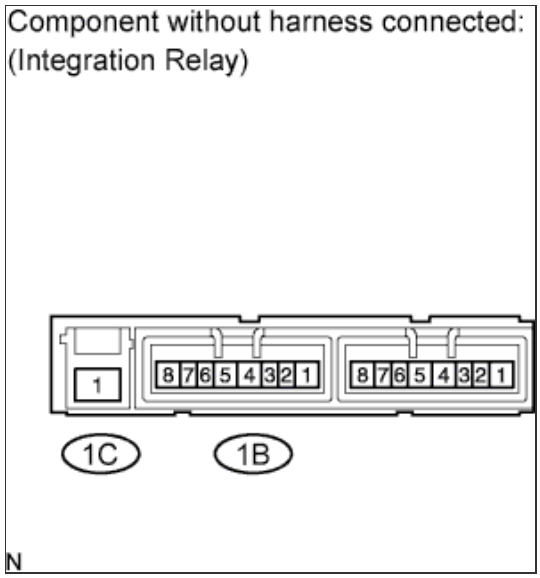
a. Measure the resistance of the A/F fuse.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

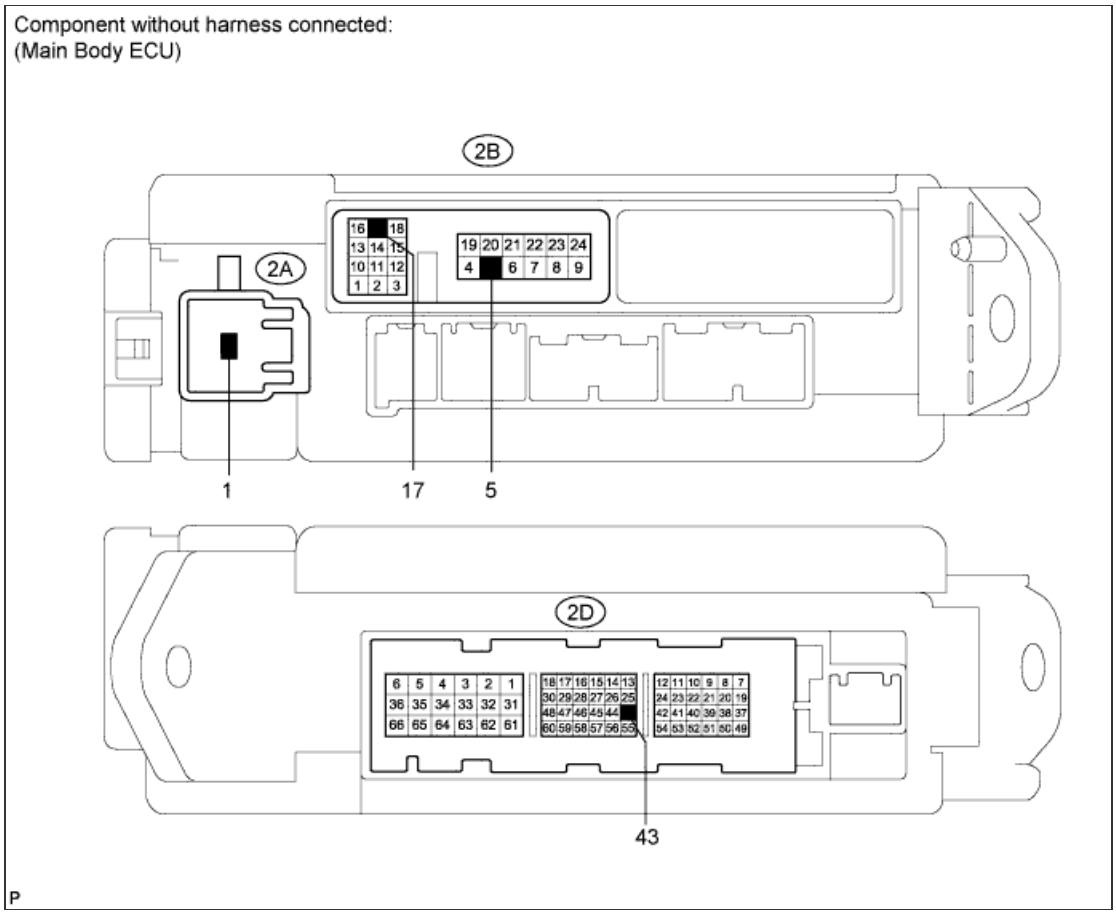
Tester Connection	Condition	Specified Condition
A/F fuse	Always	Below 1 Ω

If the result is not as specified, replace the A/F fuse.



b. Measure the resistance of the A/F sensor heater relay circuit.

i. Measure the resistance according to the value(s) in the table below.



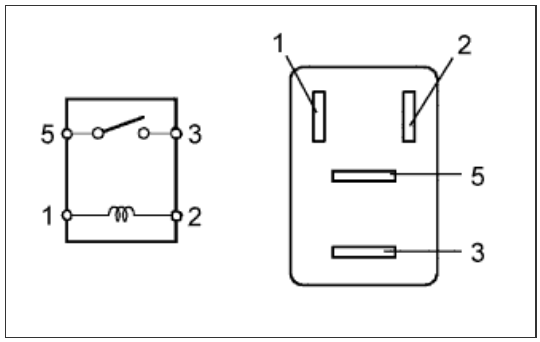
Standard Resistance:

Tester Connection	Condition	Specified Condition
1C-1 - 1A-4	Battery voltage is not applied to terminals 1A-2 and 1A-3	10 kΩ or higher
	Battery voltage is applied to terminals 1 A-2 and 1A-3	Below 1 Ω

If the result is not as specified, replace the integration relay.

6. INSPECT MAIN BODY ECU (IG1 NO. 1)

a. Measure the resistance according to the value(s) in the table below.



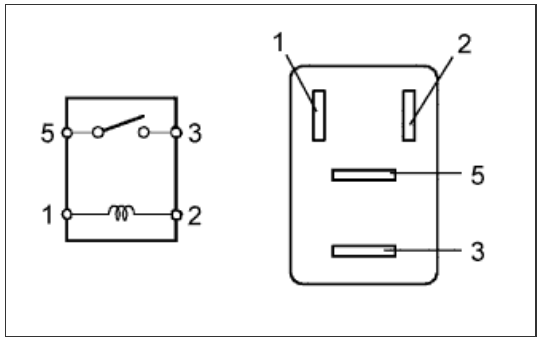
Standard Resistance:

Tester Connection	Condition	Specified Condition
2A-1 - 2B-17	Battery voltage is not applied to terminals 2B-5 and 2D-43	10 kΩ or higher
	Battery voltage is applied to terminals 2B-5 and 2D-43	Below 1 Ω

If the result is not as specified, replace the cowl side junction block LH.

7. INSPECT STARTER RELAY (ST)

a. Measure the resistance according to the value(s) in the table below.



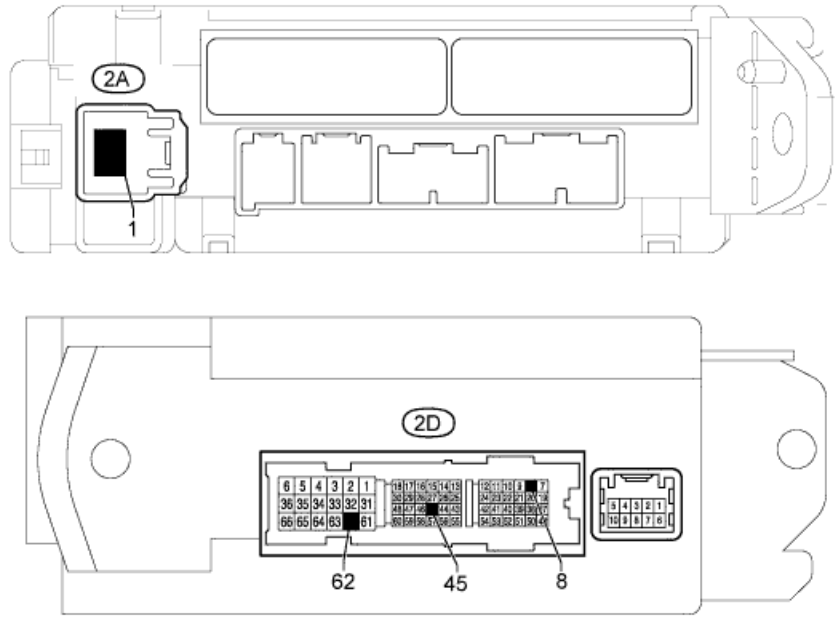
Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

8. INSPECT STARTER CUT RELAY (ST CUT)

a. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
3 - 5	Battery voltage not applied to terminals 1 and 2	10 kΩ or higher
	Battery voltage applied to terminals 1 and 2	Below 1 Ω

If the result is not as specified, replace the relay.

9. INSPECT MAIN BODY ECU (ACC RELAY)

Component without harness connected: (Main Body ECU)

P

a. Measure the resistance of the ACC relay circuit.

i. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
2A-1 - 2D-8	Battery voltage not applied between 2D-45 and 2D-62	10 kΩ or higher
	Battery voltage applied between 2D-45 and 2D-62	Below 1 Ω

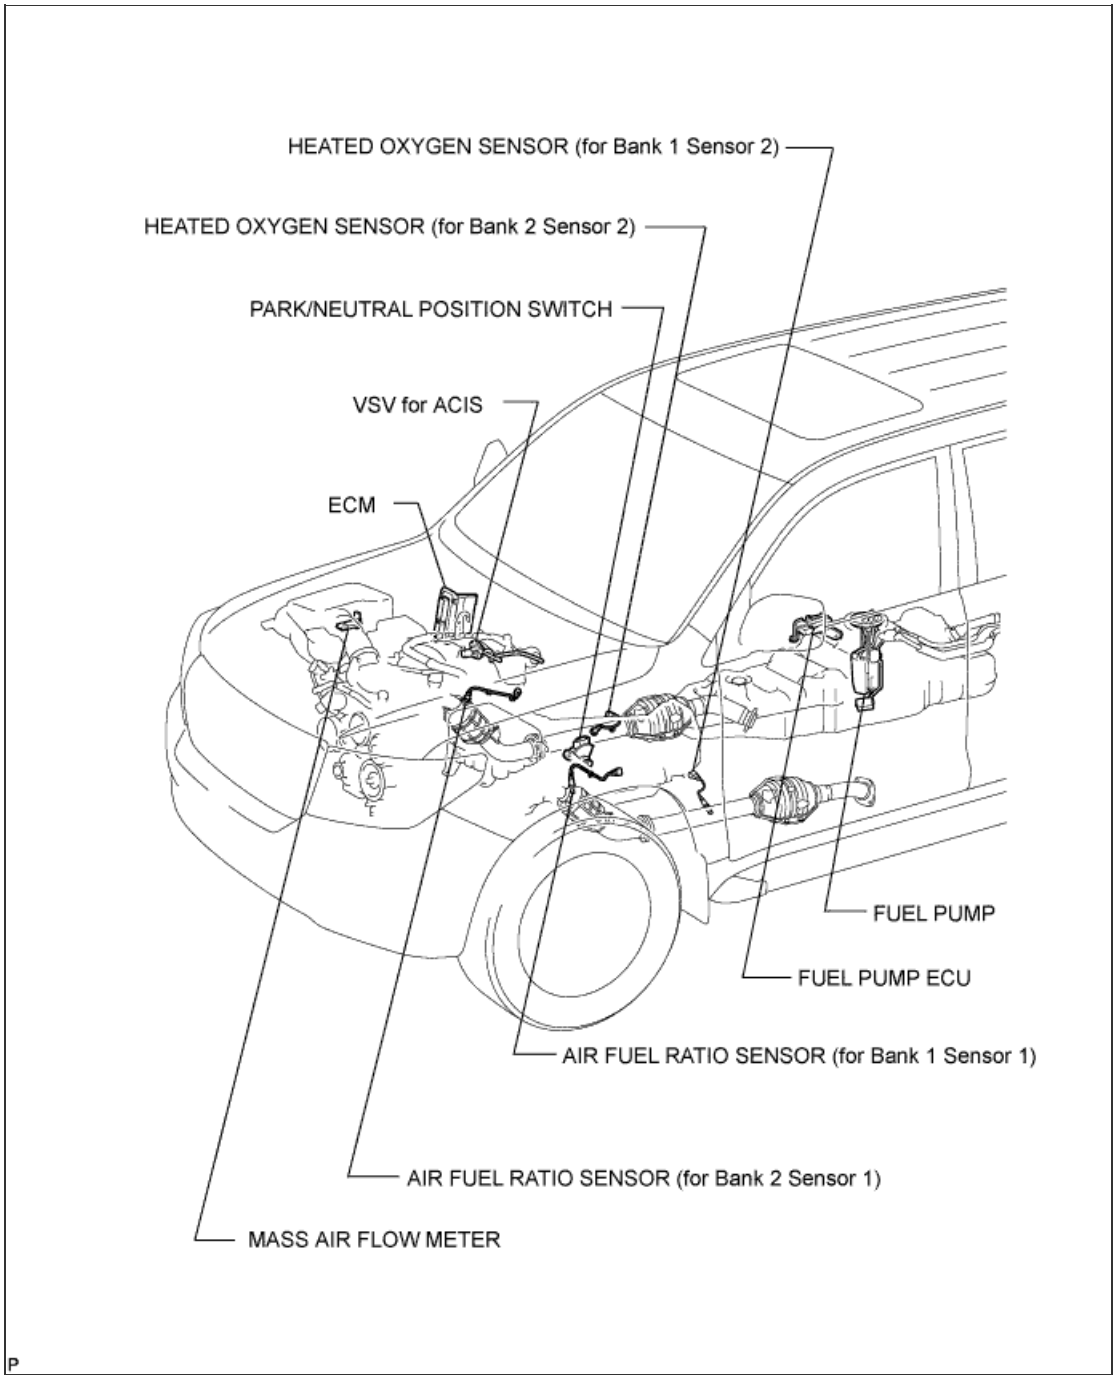
If the result is not as specified, replace the main body ECU.

for Preparation Click here

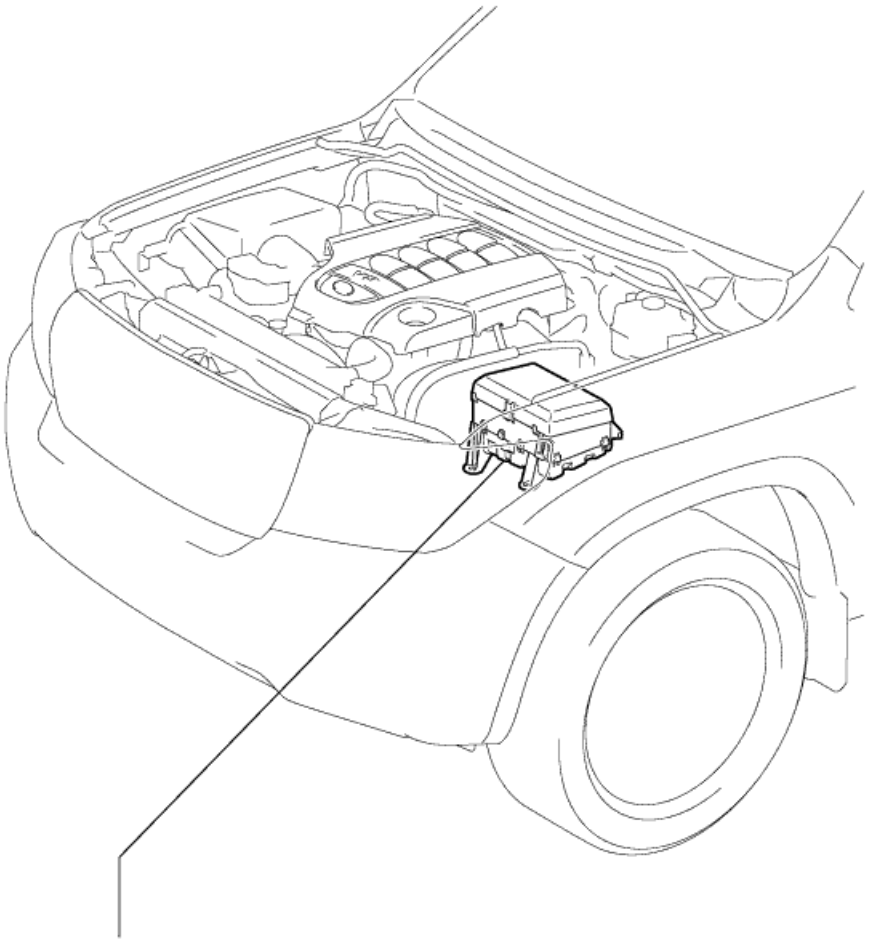
CAUTION:

When using the intelligent tester, observe the following items for safety reasons:

- **Read its instruction books before using the tester.**
- **Prevent the tester cable from being caught on the pedals, shift lever and steering wheel when driving with the tester connected to the vehicle.**
- **When driving the vehicle for testing purposes using the tester, 2 persons are required. One person drives the vehicle, and the other operates the tester.**



NOTICE:



Perform eset Memory (AT initialization) for VD when repla ing the automati transmission assembly, engine assembly or ECM (Cli here)

HINT:

eset Memory annot be ompleted by only removing the battery

NEXT

END

for Preparation Click here

HINT:

Inspect the vehicle ECM using check mode. Intermittent problems are easier to detect with the intelligent tester when the ECM is in check mode. In check mode, the ECM uses 1 trip detection logic, which is more sensitive to malfunctions than normal mode (default), which uses 2 trip detection logic.

1. **Clear the DTCs (Click here).**
2. **Switch the ECM from normal mode to check mode using the tester (Click here).**
3. **Perform a simulation test.**
4. **Check and wiggle the harness(es), connector(s) and terminal(s).**

for Preparation Click here

When a malfunction is not confirmed by the DTC check, troubleshooting should be carried out in all circuits considered to be possible causes of the problem. In many cases, by carrying out the basic engine check shown in the following flowchart, the location of the problem can be found quickly and efficiently. Therefore, using this check is essential when performing engine troubleshooting.

1.CHECK BATTERY VOLTAGE

NOTICE:

Conduct this check with the engine stopped and engine switch off.

Result

Result	Proceed to
11 V or higher	OK
Below 11 V	NG

NG. → CHARGE OR REPLACE BATTERY

OK ↓

2.CHECK WHETHER ENGINE WILL CRANK

NG. → PROCEED TO PROBLEM SYMPTOMS TABLE

OK ↓

3.CHECK WHETHER ENGINE STARTS

NG. → Go to step 6

OK ↓

4.CHECK AIR FILTER

a. Visually check that the air filter is not excessively contaminated with dirt or oil.

NG. → REPLACE AIR FILTER

OK ↓

5.CHECK IDLING SPEED

NG. → TROUBLESHOOT IDLING SPEED AND PROCEED TO NEXT STEP

OK ↓

6.CHECK FUEL PRESSURE

NG. → TROUBLESHOOT FUEL PRESSURE AND PROCEED TO NEXT STEP

OK

7.CHECK FOR SPARK

NG. → TROUBLESHOOT SPARK AND PROCEED TO NEXT STEP

OK

PROCEED TO PROBLEM SYMPTOMS TABLE

for Preparation Click here

HINT:

Use the table below to help determine the cause of problem symptoms. If multiple suspected areas are listed, the potential causes of the symptoms are listed in order of probability in the "Suspected Area" column of the table. Check each symptom by checking the suspected areas in the order they are listed. Replace parts as necessary.

CHECK ECM

HINT:

The standard normal voltage between each pair of ECM terminals is shown in the table below. The appropriate conditions for checking each pair of terminals are also indicated. The result of checks should be compared with the standard normal voltage for that pair of terminals, displayed in the Specified Condition column. The illustration above can be used as a reference to identify the ECM terminal locations.

Terminal No. (Symbol)	Wiring Color	Terminal Description	Condition	Specified Condition
A38-1 (BATT) - C45-81 (E1)	L - W-B	Battery (for measuring battery voltage and for ECM memory)	Always	11 to 14 V
C45-41 (+BM) - C45-81 (E1)	P - W-B	Power source of throttle actuator	Always	11 to 14 V
A38-28 (IGSW) - C45-81 (E1)	B - W-B	Engine switch	Engine switch on (IG)	11 to 14 V
A38-3 (+B) - C45-81 (E1)	B - W-B	Power source of ECM	Engine switch on (IG)	11 to 14 V
A38-2 (+B2) - C45-81 (E1)	B - W-B	Power source of ECM	Engine switch on (IG)	11 to 14 V
C45-58 (OC1+) - C45-57 (OC1-)	B - B-L	Camshaft oil control valve (OCV) (for Intake Side of Bank 1)	Idling	Pulse generation (See waveform 1)
C45-52 (OC2+) - C45-51 (OC2-)	L-B - R-B	Camshaft oil control valve (OCV) (for Intake Side of Bank 2)	Idling	Pulse generation (See waveform 1)
C45-56 (OE1+) - C45-55 (OE1-)	L-W - L-B	Camshaft oil control valve (OCV) (for Exhaust Side of Bank 1)	Idling	Pulse generation (See waveform 1)
C45-50 (OE2+) - C45-49 (OE2-)	L-R - L-B	Camshaft oil control valve (OCV) (for Exhaust Side of Bank 2)	Idling	Pulse generation (See waveform 1)
A38-34 (MREL) - C45-81 (E1)	W-R - W-B	EFI relay	Engine switch on (IG)	11 to 14 V
C45-74 (VG) - C45-75 (E2G)	L-Y - G-W	Mass air flow meter	Idling, Shift lever in P or N, A/C switch off	0.5 to 3.0 V
C45-73 (THA) - C45-97 (ETHW)	Y-B - BR	Intake air temperature sensor	Idling, Intake air temperature 20°C (68°F)	0.5 to 3.4 V
C45-76 (THW) - C45-98 (ETHA)	G-B - BR	Engine coolant temperature sensor	Idling, Engine coolant temperature 80°C (176°F)	0.2 to 1.0 V
C45-80 (VCTA) - C45-79 (ETA)	Y - B	Power source of throttle position sensor (specific voltage)	Engine switch on (IG)	4.5 to 5.5 V
C45-78 (VTA1) - C45-79 (ETA)	B-L - B	Throttle position sensor (for engine control)	Engine switch on (IG), Accelerator pedal fully released	0.5 to 1.1 V
			Engine switch on (IG), Accelerator pedal fully depressed	3.2 to 4.8 V

C45-77 (VTA2) - C45-79 (ETA)	B-R - B	Throttle position sensor (for sensor malfunction detection)	Engine switch on (IG), Accelerator pedal fully released	2.1 to 3.1 V
			Engine switch on (IG), Accelerator pedal fully depressed	4.6 to 5.0 V
A38-55 (VPA) - A38-58 (EPA)	R - W-L	Accelerator pedal position sensor (for engine control)	Engine switch on (IG), Accelerator pedal released	0.5 to 1.1 V
			Engine switch on (IG), Accelerator pedal fully depressed	2.6 to 4.5 V
A38-56 (VPA2) - A38-60 (EPA2)	GR-G - BR	Accelerator pedal position sensor (for sensor malfunctioning detection)	Engine switch on (IG), Accelerator pedal released	1.2 to 2.0 V
			Engine switch on (IG), Accelerator pedal fully depressed	3.4 to 5.0 V
A38-57 (VCPA) - A38-58 (EPA)	L-W - W-L	Power source of accelerator pedal position sensor (for VPA)	Engine switch on (IG)	4.5 to 5.5 V
A38-59 (VCP2) - A38-60 (EPA2)	V - BR	Power source of accelerator pedal position sensor (for VPA2)	Engine switch on (IG)	4.5 to 5.5 V
C45-22 (HA1A) - C45-23 (E04)	L - W-B	A/F sensor heater	Idling with warm engine	Pulse generation (See waveform 2)
			Engine switch on (IG)	11 to 14 V
C45-20 (HA2A) - C45-21 (E05)	G - W-B	A/F sensor heater	Idling with warm engine	Pulse generation (See waveform 2)
			Engine switch on (IG)	11 to 14 V
C45-126 (A1A+) - C45-81 (E1)	G - W-B	A/F sensor	Engine switch on (IG)	3.3 V*
C45-125 (A1A-) - C45-81 (E1)	R - W-B	A/F sensor	Engine switch on (IG)	2.9 V*
C45-103 (A2A+) - C45-81 (E1)	P - W-B	A/F sensor	Engine switch on (IG)	3.3 V*
C45-102 (A2A-) - C45-81 (E1)	L - W-B	A/F sensor	Engine switch on (IG)	2.9 V*
C45-45 (HT1B) - C45-46 (E03)	G-B - W-B	Heated oxygen sensor heater	Idling	Below 3.0 V
			Engine switch on (IG)	11 to 14 V
C45-44 (HT2B) - C45-46 (E03)	B - W-B	Heated oxygen sensor heater	Idling	Below 3.0 V
			Engine switch on (IG)	11 to 14 V
C45-114 (OX1B) - C45-115 (EX1B)	G - L	Heated oxygen sensor	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor	Pulse generation (See waveform 3)
C45-112 (OX2B) - C45-113 (EX2B)	R - W	Heated oxygen sensor	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor	Pulse generation (See waveform 3)
C45-86 (#10) - C45-43 (E01)	R-L - W-B	Fuel injector	Engine switch on (IG)	11 to 14 V
			Idling	Pulse generation (See waveform 4)
C45-109 (#20) - C45-43 (E01)	L - W-B	Fuel injector	Engine switch on (IG)	11 to 14 V
			Idling	Pulse generation (See waveform 4)

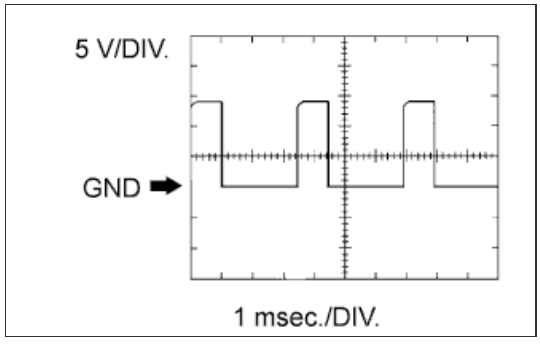
			Cranking	5.5 V or higher
C45-72 (PSP) - C45-81 (E1)	G - W-B	Power steering oil pressure sensor	Engine switch on (IG)	0.5 to 4.5 V



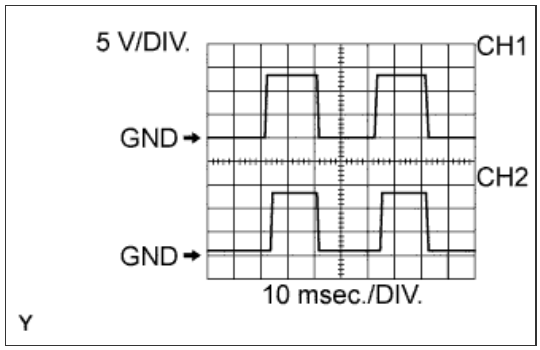
HINT:

*: The ECM terminal voltage is constant regardless of the output voltage from the sensor.

a. WAVEFORM 1:

Camshaft Oil Control Valve (OCV)

Terminal No. (Symbol)	Tool Setting	Condition
C45-58 (OC1+) - C45-57 (OC1-)	5 V/DIV., 1 msec./DIV.	Idling
C45-52 (OC2+) - C45-51 (OC2-)	5 V/DIV., 1 msec./DIV.	Idling
C45-56 (OE1+) - C45-55 (OE1-)	5 V/DIV., 1 msec./DIV.	Idling
C45-50 (OE2+) - C45-49 (OE2-)	5 V/DIV., 1 msec./DIV.	Idling

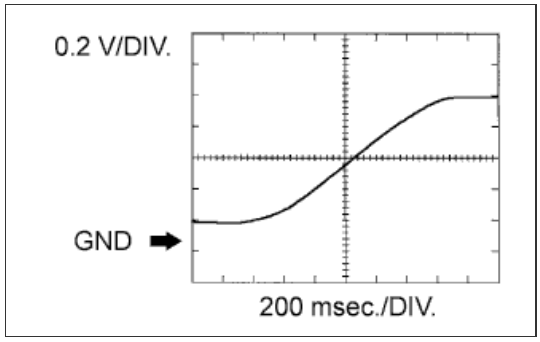


b. WAVEFORM 2:

A/F Sensor Signal

Terminal No. (Symbol)	Tool Setting	Condition
C45-22 (HA1A) - C45-23 (E04)	5 V/DIV., 10 msec./DIV.	Idling with warm engine
C45-20 (HA2A) - C45-21 (E05)	5 V/DIV., 10 msec./DIV.	Idling with warm engine

HINT:

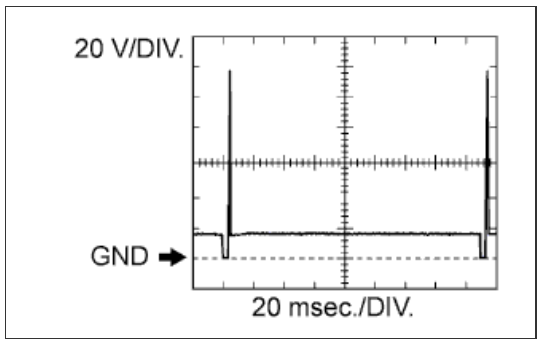


The wavelength varies in accordance with the engine operating condition.

c. WAVEFORM 3:

Heated Oxygen Sensor

Terminal No. (Symbol)	Tool Setting	Condition
C45-114 (OX1B) - C45-115 (EX1B)	0.2 V/DIV., 200 msec./DIV.	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor
C45-112 (OX2B) - C45-113 (EX2B)	0.2 V/DIV., 200 msec./DIV.	Engine speed maintained at 2500 rpm for 2 minutes after warming up sensor



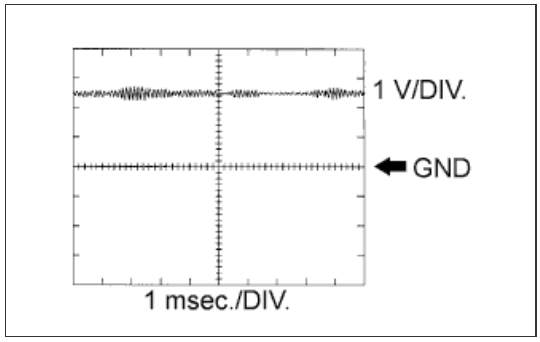
HINT:

In the Data List, item O2S B1S2 or O2S B2S2 shows the ECM input values from the heated oxygen sensor.

d. WAVEFORM 4:

Injector No. 1 (to No. 8) Injection Signal

Terminal No. (Symbol)	Tool Setting	Condition
C45-86 (#10) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C45-109 (#20) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C45-85 (#30) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C45-108 (#40) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C45-84 (#50) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C45-107 (#60) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C45-83 (#70) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling
C45-106 (#80) - C45-43 (E01)	20 V/DIV., 20 msec./DIV.	Idling



HINT:

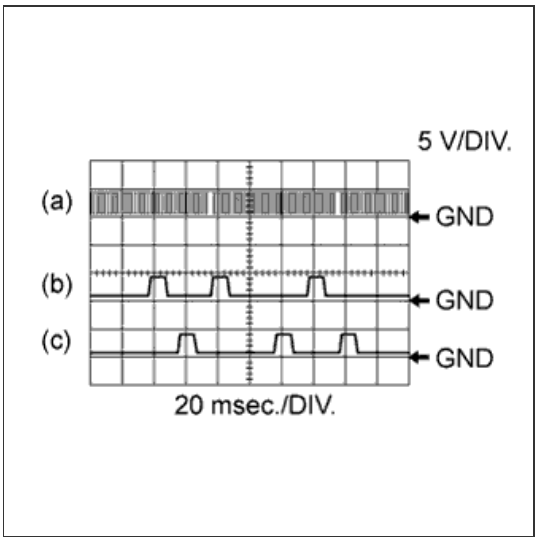
The wavelength becomes shorter as the engine speed increases.

e. WAVEFORM 5:

Knock Sensor

Terminal No. (Symbol)	Tool Setting	Condition
C45-94 (KNK1) - C45-93 (EKNK)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
C45-117 (KNK2) - C45-116 (EKN2)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine
		Engine speed maintained at

C45-96 (KNK3) - C45-95 (EKN3)	1 V/DIV., 1 msec./DIV.	4000 rpm after warming up engine
C45-119 (KNK4) - C45-118 (EKN4)	1 V/DIV., 1 msec./DIV.	Engine speed maintained at 4000 rpm after warming up engine



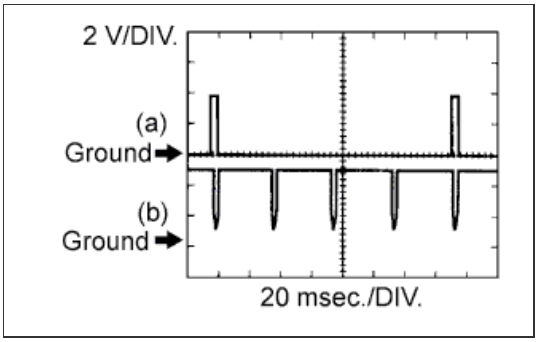
HINT:

- **The wavelength becomes shorter as the engine speed increases.**
- **The waveforms and amplitudes displayed differ slightly depending on the vehicle.**

f. WAVEFORM 6:

Crankshaft Position Sensor and VVT Sensor for Intake Side

Terminal No. (Symbol)	Tool Setting	Condition
(a) C45-110 (NE+) - C45-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(b) C45-92 (VV1+) - C45-91 (VV1-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(c) C45-87 (VV2+) - C45-88 (VV2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up



HINT:

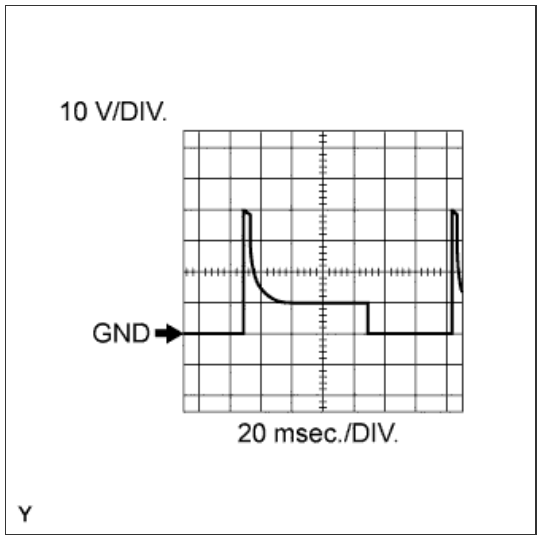
The wavelength becomes shorter as engine speed increases.

g. WAVEFORM 7:

Igniter IGT Signal (from ECM to Igniter) and Igniter IGF Signal (from Igniter to ECM)

Terminal No. (Symbol)	Tool Setting	Condition
(a) C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C45-35 (IGT5) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(a) C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(b) C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling
(b) C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling

HINT:



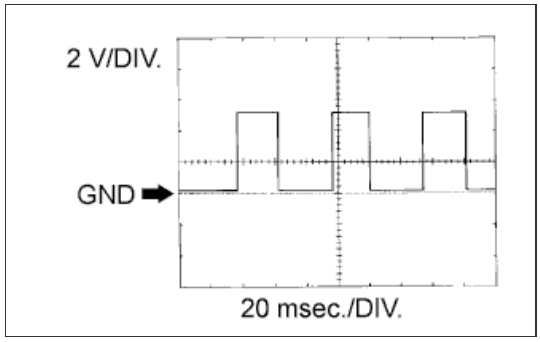
The wavelength becomes shorter as engine speed increases.

h. WAVEFORM 8:

Purge VSV

Terminal No. (Symbol)	Tool Setting	Condition

C45-63 (PRG) - C45-81 (E1)	10 V/DIV., 20 msec./DIV.	Idling



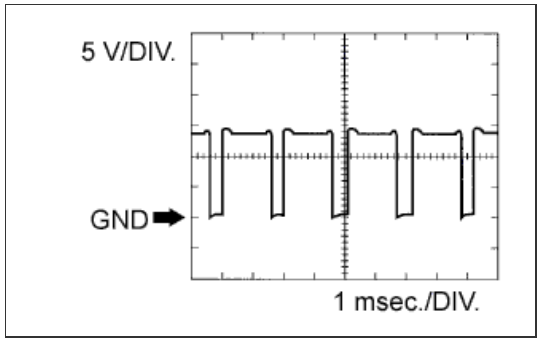
HINT:

If the waveform is not similar to the illustration, check the waveform again after idling for 10 minutes or more.

i. WAVEFORM 9:

Vehicle Speed Signal

Terminal No. (Symbol)	Tool Setting	Condition
A38-13 (SPD) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Driving at 20 km/h (12 mph)



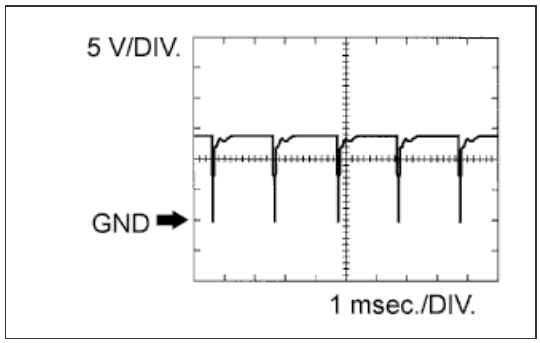
HINT:

The wavelength becomes shorter as the vehicle speed increases.

j. WAVEFORM 10:

Throttle Actuator Positive Terminal

Terminal No. (Symbol)	Tool Setting	Condition
C45-19 (M+) - C45-82 (ME01)	5 V/DIV., 1 msec./DIV.	Idling with warm engine



HINT:

The duty ratio varies depending on the throttle actuator operation.

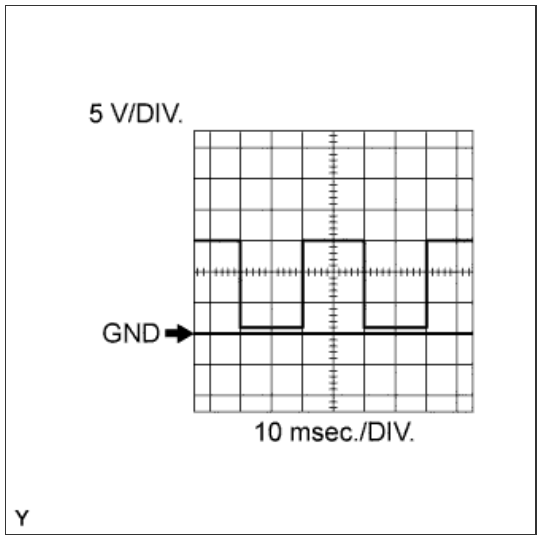
k. WAVEFORM 11:

Throttle Actuator Negative Terminal

Terminal No. (Symbol)	Tool Setting	Condition
C45-18 (M-) - C45-82 (ME01)	5 V/DIV., 1 msec./DIV.	Idling with warm engine

HINT:

The duty ratio varies depending on the throttle actuator operation.



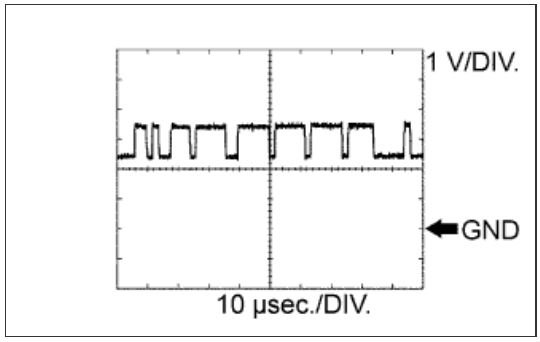
l. WAVEFORM 12:

Engine Speed Signal

Terminal No. (Symbol)	Tool Setting	Condition
A38-15 (TACH) - C45-81 (E1)	5 V/DIV., 10 msec./DIV.	Idling

HINT:

The wavelength becomes shorter as the engine speed increases.



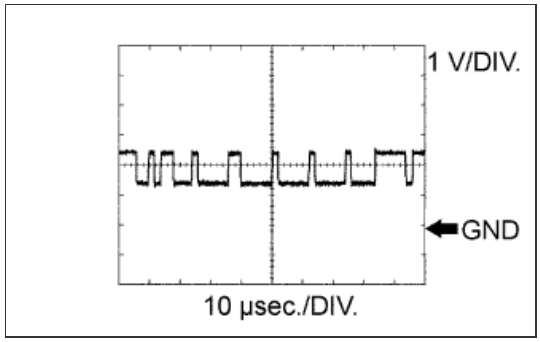
m. WAVEFORM 13:

CAN Communication Signal (Reference)

Terminal No. (Symbol)	Tool Setting	Condition
A38-10 (CANH) - C45-81 (E1)	1 V/DIV., 10 µsec./DIV.	Engine stops and engine switch on (IG)

HINT:

The waveform varies depending on the CAN communication signal.



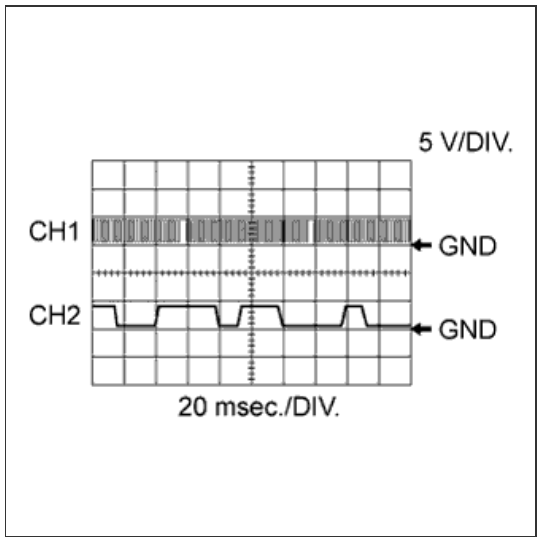
n. WAVEFORM 14:

CAN Communication Signal (Reference)

Terminal No. (Symbol)	Tool Setting	Condition
A38-11 (CANL) - C45-81 (E1)	1 V/DIV., 10 µsec./DIV.	Engine stops and engine switch on (IG)

HINT:

The waveform varies depending on the CAN communication signal.

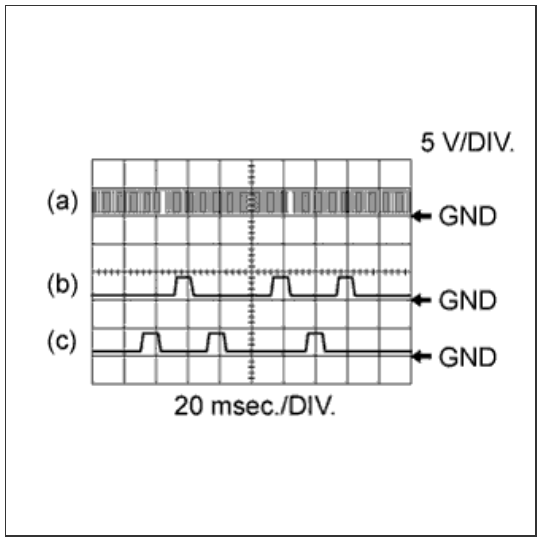


o. WAVEFORM 15:

Crankshaft Position Sensor and Camshaft Position Sensor

Terminal No. (Symbol)	Tool Setting	Condition
CH1: C45-110 (NE+) - C45-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
CH2: C45-90 (G2) - C45-89 (G2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up

HINT:



The wavelength becomes shorter as the engine speed increases.

p. WAVEFORM 16:

Crankshaft Position Sensor and VVT Sensor for Exhaust Side

Terminal No. (Symbol)	Tool Setting	Condition
(a) C45-110 (NE+) - C45-111 (NE-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(b) C45-69 (EV1+) - C45-68 (EV1-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up
(c) C45-64 (EV2+) - C45-65 (EV2-)	5 V/DIV., 20 msec./DIV.	Idle after engine warmed up

HINT:

The wavelength becomes shorter as engine speed increases.

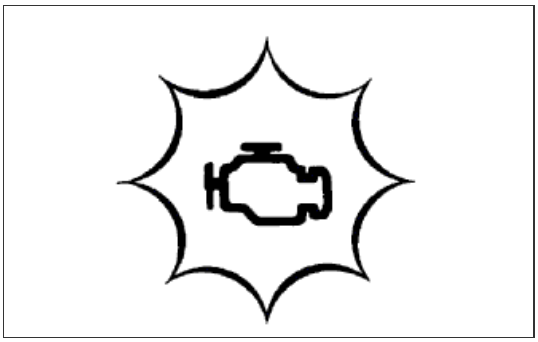
EURO-OBD (EUROPE)

When troubleshooting Europe On-Board Diagnostic (Euro-OBD) vehicles, the vehicle must be connected to an OBD scan tool (complying with ISO 15765-4). Various data output from the vehicle ECM can then be read.

Euro-OBD regulations require that the on-board computer of the vehicle illuminate the Malfunction Indicator Lamp (MIL) on the instrument panel when the computer detects a malfunction in:

1. The emission control system components
2. The powertrain control components (which affect vehicle emissions)
3. The computer itself



In addition, the applicable Diagnostic Trouble Codes (DTCs) prescribed by ISO 15765-4 are stored in the ECM memory. If the malfunction does not reoccur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain stored in the ECM memory.

To check the DTCs, connect the intelligent tester to the Data Link Connector 3 (DLC3) of the vehicle. The scan tool displays DTCs, the freeze frame data and a variety of the engine data. The DTCs and freeze frame data can be cleared with the scan tool.

M-OBD (EXCEPT EUROPEAN SPEC.)

When troubleshooting Multiplex On-Board Diagnostic (M-OBD) vehicle, the vehicle must be connected to the intelligent tester. Various data output from the ECM can then be read.
OBD regulations require that the on-board computer of the vehicle illuminate the MIL on the instrument panel when the computer detects a malfunction in:

1. The emission control system components
2. The powertrain control components (which affect vehicle emissions)
3. The computer

In addition, the applicable DTCs are stored in the ECM memory. If the malfunction does not recur in 3 consecutive trips, the MIL turns off automatically but the DTCs remain stored in the ECM memory.

NORMAL MODE AND CHECK MODE

The diagnosis system operates in normal mode during normal vehicle use. In normal mode, 2 trip detection logic is used to ensure accurate detection of malfunctions. Check mode is also available as an option for technicians. In check mode, 1 trip detection logic is used for simulating malfunction symptoms and increasing the ability of the system to detect malfunctions, including intermittent problems (intelligent tester only).

2 TRIP DETECTION LOGIC

When a malfunction is first detected, the malfunction is temporarily stored in the ECM memory (1st trip). If the same malfunction is detected during the next subsequent driving cycle, the MIL is illuminated (2nd trip).

FREEZE FRAME DATA

The ECM records vehicle and driving condition information as freeze frame data the moment a DTC is stored. When troubleshooting, freeze frame data can be helpful in determining whether the vehicle was running or stopped, whether the engine was warmed up or not, whether the air-fuel ratio was lean or rich, as well as other data recorded at the time of a malfunction.

BATTERY VOLTAGE

Standard voltage:
11 to 14 V

If voltage is below 11 V, replace or recharge the battery before proceeding.

MIL (Malfunction Indicator Lamp)

a. The MIL is illuminated when the engine switch is first turned on (IG) (the engine is not running).

b. The MIL should turn off when the engine is started. If the MIL remains illuminated, the diagnosis system has detected a malfunction or abnormality in the system.

HINT:

If the MIL is not illuminated when the engine switch is first turned on (IG), check the MIL circuit (Click here).

ALL READINESS

HINT:

- **With "All Readiness" it is possible to check whether or not the DTC judgment has been completed by using the intelligent tester.**
- **Check "All Readiness" after simulating malfunction symptoms or for validation after finishing repairs.**

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear the DTCs (Click here).

e. Perform the DTC judgment driving pattern to run the DTC judgment.

f. Enter the following menus: Powertrain / Engine and ECT / Utility / All Readiness.

g. Input the DTCs to be confirmed.

h. Check the DTC judgment result.

Result

Tester Display	Description
NORMAL	• DTC judgment completed • System normal
ABNORMAL	• DTC judgment completed • System abnormal
INCOMPLETE	• DTC judgment not completed • Perform driving pattern after confirming DTC enabling conditions
UNKNOWN	• Unable to perform DTC judgment • Number of DTCs which do not fulfill DTC preconditions has reached ECU memory limit

for Preparation Click here

NOTICE:

When the diagnosis system is changed from the normal mode to check mode or vice versa, all DTCs and freeze frame data recorded in normal mode are cleared. Before changing modes, always check and make a note of DTCs and freeze frame data.

HINT:

- **DTCs which are stored in the ECM can be output to the intelligent tester. The tester can display the current and pending output DTCs.**
- **Same DTCs are not set if the ECM does not detect the same malfunction again during a second consecutive driving cycle. However, such malfunctions, detected on only one occasion, are stored as pending DTCs.**

CHECK DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Check the DTC(s) and freeze frame data, and then write them down.

f. Check the details of the DTC(s) (Click here).

CLEAR DTC

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Enter the following menus: Powertrain / Engine and ECT / DTC.

e. Clear the DTCs.

CLEAR DTC (Without using the intelligent tester)

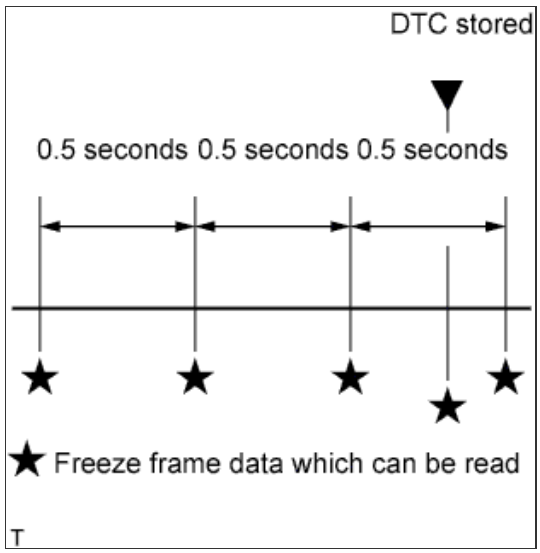
a. Perform either of the following operations:

i. Disconnect the cable from the negative (-) battery terminal for more than 1 minute.

ii. Remove the EFI MAIN fuse from the engine room relay block located inside the engine compartment for more than 1 minute.

for Preparation Click here

DESCRIPTION



Freeze frame data records the engine conditions (fuel system, calculated load, engine coolant temperature, fuel trim, engine speed, vehicle speed, etc.) when a malfunction is detected. When troubleshooting, it can help determine if the vehicle was running or stopped, the engine was warmed up or not, the air-fuel ratio was Lean or Rich, and other data from the time the malfunction occurred.

HINT:

If it is impossible to duplicate the problem even though a DTC is output, confirm the freeze frame data.

The ECM records engine conditions in the form of freeze frame data every 0.5 seconds. Using the intelligent tester, 5 separate sets of freeze frame data can be checked.

- 3 data sets before the DTC was stored.
- 1 data set when the DTC was stored.
- 1 data set after the DTC was stored.
  These data sets can be used to simulate the condition of the vehicle around the time of the occurrence of the malfunction. The data may assist in identifying the cause of the malfunction, and in judging whether it was temporary or not.

LIST OF FREEZE FRAME DATA

Tester Display	Measurement Item	Diagnostic Note
Vehicle Speed	Vehicle speed	Speed indicated on speedometer.
Engine Speed	Engine speed	-
Calculate Load	Calculated load	Calculated load by ECM.
Vehicle Load	Vehicle load	-
MAF	Mass air flow volume	If approximately 0.0 gm/s: • Mass air flow meter power source circuit open or short. • VG circuit open or short. If 160.0 gm/s or more: • E2G circuit open.
Atmosphere Pressure	Atmosphere pressure	-
Coolant Temp	Engine coolant temperature	If -40°C (-40°F), sensor circuit open. If 140°C (284°F) or more, sensor circuit shorted.
Intake Air	Intake air temperature	If -40°C (-40°F), sensor circuit open. If 140°C (284°F) or more, sensor circuit shorted.
Engine Run Time	Accumulated engine running time	-
Initial Engine Coolant Temp	Engine coolant temperature at engine start	-
Initial Intake Air Temp	Intake air temperature at engine start	-
Battery Voltage	Battery voltage	-
Accel Sens. No.1 Volt %	Absolute Accelerator Pedal Position (APP) No. 1	-
Accel Sens. No.2 Volt %	Absolute APP No. 2	-

Throttle Sensor Volt %	Throttle sensor positioning	-
Throttl Sensor #2 Volt %	Throttle sensor positioning #2	-
Throttle Sensor Position	Throttle position	-
Throttle Motor DUTY	Throttle motor	-
Injector (Port)	Injection period of No. 1 cylinder	-
Injection Volum (Cylinder 1)	Injection volume	-
Fuel Pump/Speed Status	Fuel pump/speed status	-
EVAP (Purge) VSV	EVAP purge VSV duty ratio	-
Evap Purge Flow	Ratio of evaporative purge flow to intake air volume	-
Purge Density Learn Value	Learning value of purge density	-
EVAP Purge VSV	EVAP Purge VSV	-
Target Air-Fuel Ratio	Ratio compared to stoichiometric level	-
AF Lambda B1S1	Fuel trim at A/F sensor	-
AF Lambda B2S1	Fuel trim at A/F sensor	-
AFS Voltage B1S1 AFS Voltage B2S1	A/F sensor output	Performing Control the Injection Volume or Control the Injection Volume for A/F Sensor function of Active Test enables technician to check output voltage of sensor.
AFS Current B1S1	A/F sensor current	-
AFS Current B2S1	A/F sensor current	-
O2S B1S2 O2S B2S2	Heated oxygen sensor output	Performing Control the Injection Volume or Control the Injection Volume for A/F Sensor function of Active Test enables technician to check output voltage of sensor.
Short FT #1	Short-term fuel trim	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio.
Long FT #1	Long-term fuel trim	Overall fuel compensation carried out in long-term to compensate a continual deviation of short-term fuel trim from central value.
Total FT #1	Total fuel trim	-
Short FT #2	Short-term fuel trim	Short-term fuel compensation used to maintain air-fuel ratio at stoichiometric air-fuel ratio.
Long FT #2	Long-term fuel trim	Overall fuel compensation carried out in long-term to compensate a continual deviation of short-term fuel trim from central value.
Total FT #2	Total fuel trim	-
Fuel System Status #1	Fuel system status (for Bank 1)	• OL (Open Loop): Has not yet satisfied conditions to go closed loop. • CL (Closed Loop): Using heated oxygen sensor as feedback for fuel control. • OL Drive: Open loop due to driving conditions (fuel enrichment). • OL Fault: Open loop due to detected system fault. • CL Fault: Closed loop but heated oxygen sensor, which used for fuel control, malfunctioning.
Fuel System Status #2	Fuel system status (for Bank 2)	• OL (Open Loop): Has not yet satisfied conditions to go closed loop. • CL (Closed Loop): Using heated oxygen sensor as feedback for fuel control. • OL Drive: Open loop due to driving conditions (fuel enrichment). • OL Fault: Open loop due to detected system fault. • CL Fault: Closed loop but heated oxygen sensor, which used for fuel control, malfunctioning.
IGN Advance	Ignition advance	-
Knock Feedback Value	Feedback value of knocking	-

Knock Correct Learn Value	Correction learning value of knocking	-
ACIS VSV	VSV for Acoustic Control Induction System (ACIS)	-
VVT Control Status #1	VVT control status	-
VVT Control Status #2	VVT control status	-
Catalyst Temp B1S1	Estimated catalyst temperature (for Sensor 1)	-
Catalyst Temp B2S1	Estimated catalyst temperature (for Sensor 1)	-
Catalyst Temp B1S2	Estimated catalyst temperature (for Sensor 2)	-
Catalyst Temp B2S2	Estimated catalyst temperature (for Sensor 2)	-
Starter Signal	Starter switch (STSW) signal	-
Starter Control	Starter switch status	-
Power Steering Signal	Power steering switch status	-
Starter Relay	Starter relay status	-
Power Steer. Sig. Record	Power steering signal (history)	This signal status is usually ON until the cables are disconnected from the battery terminals.
ACC Relay	ACC relay status	-
Neutral Position SW Signal	Park/Neutral position (PNP) switch signal	-
Stop Light Switch	Stop light switch	-
A/C Signal	A/C signal	-
Closed Throttle Position SW	Closed throttle position switch	-
Fuel Cut Condition	Fuel cut condition	-
Immobiliser Communication	Immobiliser communication	-
Electrical Load Signal	Electrical load signal	-
Time after DTC Cleared	Cumulative time after DTC cleared	-
Distance from DTC Cleared	Accumulated distance from DTC cleared	-
Warmup Cycle Cleared DTC	Warm-up cycle after DTC cleared	-
TC and TE1	TC and CG (TE1) terminals of DLC3	-
Ignition Trig. Count	Ignition counter	-
Cylinder #1 Misfire Count	Cylinder #1 misfire	-
Cylinder #2 Misfire Count	Cylinder #2 misfire	-
Cylinder #3 Misfire Count	Cylinder #3 misfire	-
Cylinder #4 Misfire Count	Cylinder #4 misfire	-
Cylinder #5 Misfire Count	Cylinder #5 misfire	-
Cylinder #6 Misfire Count	Cylinder #6 misfire	-
Cylinder #7 Misfire Count	Cylinder #7 misfire	-
Cylinder #8 Misfire Count	Cylinder #8 misfire	-
All Cylinders Misfire Count	All cylinders misfire	-
Multi Cylinders Misfire Count	Multiple cylinder misfire	-
Misfire RPM	Engine speed when misfire occurred	-
Misfire Load	Engine load when misfire occurred	-
Misfire Margin	Margin to detect engine misfire	-
Catalyst OT MF F/C	Catalyst over temperature misfire prevention F/C	-
Cat OT MF F/C History	Catalyst over temperature misfire prevention F/C history	-
Cat OT MF F/C Cylinder#1	Display of fuel cut operation in No. 1 cylinder (if certain level of misfire malfunction is detected)	-
Cat OT MF F/C Cylinder#2	Display of fuel cut operation in No. 2 cylinder (if certain level of misfire malfunction is detected)	-
Cat OT MF F/C Cylinder#3	Display of fuel cut operation in No. 3 cylinder (if certain level of misfire malfunction is detected)	-
Cat OT MF F/C Cylinder#4	Display of fuel cut operation in No. 4 cylinder (if certain level of misfire malfunction is detected)	-
Cat OT MF F/C Cylinder#5	Display of fuel cut operation in No. 5 cylinder (if certain level of misfire malfunction is detected)	-
Cat OT MF F/C Cylinder#6	Display of fuel cut operation in No. 6 cylinder (if certain level of misfire malfunction is detected)	-
Cat OT MF F/C Cylinder#7	Display of fuel cut operation in No. 7 cylinder (if certain level of misfire malfunction is detected)	-
Cat OT MF F/C Cylinder#8	Display of fuel cut operation in No. 8 cylinder (if	-

	certain level of misfire malfunction is detected)	
Power Steering Pressure	Power steering pressure sensor	-
ACT VSV	A/C cut status for Active Test	-
Idle Fuel Cut	Fuel cut idle	ON: when throttle valve fully closed and engine speed over 3500 rpm.
FC TAU	Fuel cut during very light load	Fuel cut being performed under very light load to prevent engine combustion from becoming incomplete.
SPD (NT)	Input shaft speed	Data is displayed in increments of 50 rpm.
SPD (SP2)	Output shaft speed	-

HINT:

Intelligent tester:

Compared to the normal mode, check mode is more sensitive to malfunctions. Therefore, check mode can detect the malfunctions that cannot be detected in normal mode.

NOTICE:

All the stored DTCs and freeze frame data are cleared if: 1) the ECM is changed from normal mode to check mode or vice versa; or 2) the engine switch is turned from on (IG) to on (ACC) or off while in check mode. Before changing modes, always check and note any DTCs and freeze frame data.

CHECK MODE PROCEDURE

a. Check and ensure the following conditions:

   i. Battery positive voltage 11 V or higher.

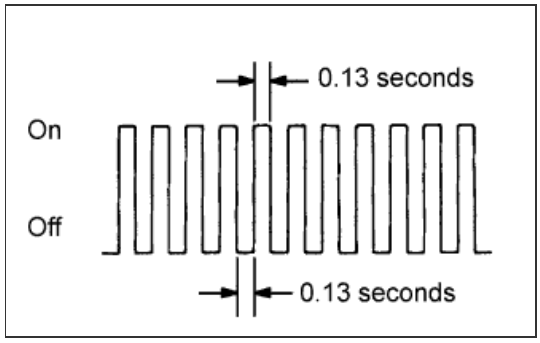
   ii. Throttle valve fully closed.

   iii. Transmission in the P or position.

   iv. A C switch off.

b. Turn the engine switch off.

c. Connect the intelligent tester to the DLC3.



d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain Engine and ECT Utility Check Mode.

g. witch the ECM from normal mode to check mode.

h. Make sure the MIL flashes as shown in the illustration.

i. tart the engine.

j. Make sure the MIL turns off.

k. imulate the conditions of the malfunction described by the customer.

l. Check the DTCs and freeze frame data using the tester.

for Preparation Click here

If any of the following DTCs are stored, the ECM enters fail-safe mode to allow the vehicle to be driven temporarily.

DTC	Component	Fail-Safe Operation	Fail-Safe Deactivation Condition
P0011, P0021, P0015 and P0025*3	Camshaft oil control valve (OCV)	lsen a misfire occ rs, f el c ts performed for catalyst overheat malf nction prevention. • ith a normal load and normal engine speed (MIL is blin ing): - F el c ts performed on the malf nctioning cylinder. • ith a high load and high engine speed driving (MIL is blin ing): - Throttle valve opening angle control is performed. - F el c ts performed on all cylinders or the malf nction cylinder.	Pass condition detected and then engine switch t rned off
P0031, P0032, P0051 and P0052	Air F el ratio (A F) Sensor eater	The ECM t rns off the A F sensor heater.	Engine switch off
P003 P0038, P005 and P0058	eated O ygen (O2) Sensor eater	The ECM t rns off the O2 sensor heater.	Engine switch off
P0102 and P0103	Mass Air Flow (MAF) Meter	The ECM calc lates ignition timing according to the engine speed and throttle valve position.	Pass condition detected
P0110, P0112 and P0113	Inta e Air Temperat re (IAT) Sensor	The ECM estimates the IAT to be 20 C (68 F).	Pass condition detected
P0115, P011 and P0118	Engine Coolant Temperat re (ECT) Sensor	The ECM estimates the ECT to be 80 C (1 F).	Pass condition detected
P0120, P0121, P0122, P0123, P0220, P0222, P0223, P0604, P0606, P060A, P060 P060D, P060E, P065 P2102, P2103, P2111, P2112, P2118, P211 and P2135	Electronic Throttle Control System (ETCS)	The ECM c st off throttle act ator c rrent and the throttle valve is ret rned to a throttle position by the ret rn spring. The ECM then ad sts the engine o t by controlling f el in ection (intermittent f el c t and ignition timing in accordance with the accelerator pedal opening angle to allow the vehicle to contin e at minimal speed*1.	Pass condition detected and then engine switch t rned off
P0300, P0301, P0302, P0303, P0304, P0305, P0306, P030 and P0308*2	• F el in ector • Electronic Throttle Control System (ETCS)	lsen a misfire occ rs, f el c ts performed for catalyst overheat malf nction prevention. • ith a normal load and normal engine speed (MIL is blin ing): - F el c ts performed on the malf nctioning cylinder. • ith a high load and high engine speed driving (MIL is blin ing): - Throttle valve opening angle control is performed. - F el c ts performed on all cylinders or the malf nction cylinder.	Pass condition detected and then engine switch t rned off
P032 P0328, P032C, P032D, P0332, P0333, P033C and P033D	Knoc Sensor	The ECM sets the ignition timing to ma im m retard.	Engine switch off

P0351 to P0358	Ignition Coil	The ECM c st f el.	Pass condition detected
P0504	Stop Light Switch	The accelerator pedal angle is fi ed.	Accelerator pedal angle is fi ed
P2120, P2121, P2122, P2123, P2125, P212 P2128 and P2138	Accelerator Pedal Position (APP) Sensor	The APP sensor has 2 sensor circ its: Main and S b. If either circ it malf nctions, the ECM controls the engine sing the other circ it. If both circ its malf nction, the ECM regards the accelerator pedal as being released. As a res lt, the throttle valve is closed and the engine idles.	Pass condition detected and then engine switch t rned off

HINT:

- ***1: The vehicle can be driven slo l hen the accelerator pedal is depressed fir l and slo l f the accelerator pedal is depressed ickl the vehicle a speed up and slo do n erraticall**
- *** : Misfire related fail-safe operations occur hen catal soverheat alfunctions occur.**
- ***3: nl for M-**

DATA LIST

HINT:

Using the intelligent tester to read the Data List allows the values or states of switches, sensors, actuators and other items to be read without removing any parts. This non-intrusive inspection can be very useful because intermittent conditions or signals may be discovered before parts or wiring is disturbed. Reading the Data List information early in troubleshooting is one way to save diagnostic time.

NOTICE:

In the table below, the values listed under "Normal Condition" are reference values. Do not depend solely on these reference values when deciding whether a part is faulty or not.

a. Warm up the engine.

b. Turn the engine switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Data List / All Data.

g. According to the display on the intelligent tester, read the Data List.

Tester Display	Measurement Item/Range	Normal Condition	Diagnostic Note
Vehicle Speed	Vehicle speed/ Min.: 0 km/h (0 mph), Max.: 255 km/h (158 mph)	Actual vehicle speed	The speed is indicated on speedometer.
Engine Speed	Engine speed/ Min.: 0 rpm, Max.: 16383 rpm	650 to 750 rpm: Idling	-
Calculate Load	Calculated load by ECM/ Min.: 0%, Max.: 100%	• 11 to 25%: Idling • 12 to 26%: Running without load (2500 rpm)	-
Vehicle Load	Vehicle load/ Min.: 0%, Max.: 25700%	Actual vehicle load	-
MAF	Air flow rate from Mass Air Flow (MAF) meter/ Min.: 0 gm/s, Max.: 655.35 gm/s	4.0 to 8.0 gm/s.: Idling	If the mass air flow volume is approximately 0.0 gm/s.: • The mass air flow meter power source circuit is open or short. • The VG circuit is open or short. If the mass air flow volume is 271.0 gm/s. or more: • The E2G circuit is open.
Atmosphere Pressure	Atmospheric pressure/ Min.: 0 kPa, Max.: 255 kPa	Equivalent to atmospheric pressure (absolute pressure)	-
Coolant Temp	Engine coolant temperature/ Min.: -40°C, Max.: 215°C	75 to 100°C (167 to 212°F): After warming up	If the value is -40°C (-40°F): the sensor circuit is open. If the value is 140°C (284°F): the sensor circuit is shorted.
Intake Air	Intake air temperature/ Min.: -40°C, Max.: 140°C	Equivalent to ambient air temperature	If the value is -40°C (-40°F): the sensor circuit is open. If the value is 140°C (284°F): the sensor circuit is shorted.
Engine Run Time	Engine run time/ Min.: 0 s, Max.: 65535 s	Time after engine start	Service data.
Initial Engine Coolant Temp	Initial engine coolant temperature/ Min.: -40°C, Max.: 119.3°C	Coolant temperature when engine started	Service data.
Initial Intake Air Temp	Initial intake air temperature/ Min.: -40°C, Max.: 119.3°C	Intake air temperature when engine started	Service data.

Battery Voltage	Battery voltage/ Min.: 0 V, Max.: 65.535 V	11 to 14 V: Idling	-
Accel Sens. No.1 Volt %	Absolute Accelerator Pedal Position (APP) No. 1/ Min.: 0%, Max.: 100%	10 to 22%: accelerator pedal released 54 to 86%: accelerator pedal fully depressed	-
Accel Sens. No.2 Volt %	Absolute APP No. 2/ Min.: 0%, Max.: 100%	12 to 42%: accelerator pedal released 66 to 98%: accelerator pedal fully depressed	-
Accel Sensor Out No.1	APP sensor No. 1 voltage/ Min.: 0 V, Max.: 4.980 V	-	ECT Service data.
Accel Sensor Out No.2	APP sensor No. 2 voltage/ Min.: 0 V, Max.: 4.980 V	-	ECT Service data.
Accel Sensor Out No.1	APP sensor No. 1 voltage/ Min.: 0 V, Max.: 4.980 V	0.5 to 1.1 V: accelerator pedal is released 2.6 to 4.5 V: accelerator pedal is fully depressed	-
Accel Sensor Out No.2	APP sensor No. 2 voltage/ Min.: 0 V, Max.: 4.980 V	1.2 to 2.0 V: accelerator pedal is released 3.4 to 5.0 V: accelerator pedal is fully depressed	-
Accelerator Idle Position	Whether or not accelerator pedal position sensor detecting idle/ ON or OFF	ON: Idling	-
Accel Fully Close #1 (AD)	Accelerator fully closed value No. 1 (AD)/ Min.: 0, Max.: 4.98 V	-	ETCS service data
Accel Fully Close Learn #1	Accelerator fully closed learning value No. 1/ Min.: 0 deg, Max.: 124.5 deg	-	ETCS service data.
Accel Fully Close Learn #2	Accelerator fully closed learning value No. 2/ Min.: 0 deg, Max.: 124.5 deg	-	ETCS service data.
Throttle Sensor Volt %	Throttle valve opening percentage according to throttle position sensor/ Min.: 0%, Max.: 100%	• 10 to 22%: Accelerator pedal released • 64 to 96%: Accelerator pedal fully depressed	Value calculated based on the voltage at terminal VTA1.
Throttl Sensor #2 Volt %	Throttle valve opening percentage according to throttle position sensor No. 2/ Min.: 0%, Max.: 100%	• 42 to 62%: Accelerator pedal released • 92 to 100%: Accelerator pedal fully depressed	Value calculated based on the voltage at terminal VTA2.
ST1	Brake pedal signal/ ON or OFF	ON: Brake pedal depressed	-
System Guard	System guard/ ON or OFF	-	ETCS service data.
Open Side Malfunction	Open side malfunction/ ON or OFF	-	ETCS service data.
Throttle Idle Position	Whether or not throttle position sensor detecting idling/ ON or OFF	• ON: Accelerator pedal released • OFF: Accelerator pedal fully depressed	-
Throttle Require Position	Required throttle position/ Min.: 0 V, Max.: 4.9 V	0.5 to 1.1 V: Idling	-
Throttle Sensor Position*1	Throttle position sensor/ Min.: 0%, Max.: 100%	• 0%: Accelerator pedal released • 50 to 80%: Accelerator pedal fully depressed	Recognition value for throttle opening angle on ECM.
Throttle Position No. 1	Throttle position sensor No. 1 output voltage/ Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
Throttle Position No. 2	Throttle position sensor No. 2 output voltage/ Min.: 0 V, Max.: 4.98 V	-	ETCS freeze data
Throttle Position	Throttle position No. 1/	• 0.5 to 1.1 V: Accelerator pedal released • 3.2 to 4.8 V:	-

No. 1	Min.: 0 V, Max.: 4.98 V	Accelerator pedal fully depressed • 0.6 to 1.4 V: Fail-safe operating	
Throttle Position No. 2	Throttle position No. 2/ Min.: 0 V, Max.: 4.98 V	• 2.1 to 3.1 V: Accelerator pedal released • 4.6 to 5.0 V: Accelerator pedal fully depressed • 2.1 to 3.1 V: Fail-safe operating	-
Throttle Position Command	Throttle position command value/ Min.: 0 V, Max.: 4.980 V	0.5 to 4.8 V	-
Throttle Sens Open Pos #1	Throttle sensor opener position No. 1/ Min.: 0 V, Max.: 4.980 V	0.6 to 1.4 V	ETCS service data.
Throttle Sens Open Pos #2	Throttle sensor opener position No. 2/ Min.: 0 V, Max.: 4.980 V	1.7 to 2.5 V	ETCS service data.
Throttle Sens Open #1(AD)	Throttle sensor opener position No. 1 (AD)/ Min.: 0 V, Max.: 4.98 V	0.5 to 4.8 V	-
Throttle Motor	Whether or not throttle actuator control permitted/ ON or OFF	• ON: Ignition switch ON • OFF: ETCS has failed	-
Throttle Motor Current	Throttle motor current/ Min.: 0 A, Max.: 19.9 A	0 to 3.0 A: Idling	ETCS service data.
Throttle Motor DUTY	Throttle actuator/ Min.: 0%, Max.: 100%	10 to 22%: Idling after engine warmed up	ETCS service data.
Throttle Motor Current	Throttle actuator current/ Min.: 0 A, Max.: 19.92 A	0 to 3.0 A: Idling	-
Throttle Motor Open Duty	Throttle actuator opening duty ratio/ Min.: 0%, Max.: 255%	0 to 40%: During idling	When accelerator pedal depressed, duty ratio increased.
Throttle Motor Close Duty	Throttle actuator closed duty ratio/ Min.: 0%, Max.: 255%	0 to 40%: During idling	When accelerator pedal released quickly, duty ratio increased.
Throttle Motor Duty (Open)	Throttle actuator duty ratio (open)/ Min.: 0%, Max.: 255%	0 to 40%: Idling	ETCS service data.
Throttle Motor Duty (Close)	Throttle actuator duty ratio (closed)/ Min.: 0%, Max.: 255%	0 to 40%: Idling	ETCS service data.
Throttle Fully Close Learn	Throttle valve fully closed (learned value)/ Min.: 0 V, Max.: 4.98 V	0.4 to 1.0 V: Accelerator pedal released	-
ETCS Actuator Power	Whether or not electric throttle control system power inputted/ ON or OFF	• ON: Ignition switch ON and system normal • OFF: ETCS has failed	-
+BM Voltage	+BM voltage/ Min.: 0 V, Max.: 79.998 V	11 to 14 V: Engine switch on (IG) and system normal	ETCS service data.
Actuator Power Supply	Actuator power supply/ ON or OFF	ON: Idling	ETCS service data.
Clutch Current	Clutch current/ Min.: 0 A, Max.: 2.49 A	-	-
Fail Safe Drive	Whether or not fail-safe function executed/ ON or OFF	• ON: ETCS has failed • OFF: ETCS normal	ETCS service data.
Fail Safe Drive (Main CPU)	Whether or not fail-safe function executed/ ON or OFF	• ON: ETCS has failed • OFF: ETCS normal	ETCS service data.
Injector (Port)	Injection period of the No. 1 cylinder/ Min.: 0 µs, Max.: 65535 µs	2000 to 4000 µs: idling	-
Injection Volum (Cylinder 1)	Injection volume (cylinder 1)/ Min.: 0 ml, Max.: 2.047 ml	0 to 0.5 ml	Quantity of fuel injection volume for 10 times.
Fuel Pump/Speed Status	Fuel pump/speed status/ ON or OFF	-	-
EVAP (Purge) VSV	Purge VSV control duty/ Min.: 0%, Max.: 100%	0 to 100%: During idling	Order signal from ECM.
Evap Purge Flow	Purge flow/	0 to 100%: Idling	-

	Min.: 0%, Max.: 399.9%		
Purge Density Learn Value	Learning value of purge density/ Min.: -200%, Max.: 199.993%	Idling: -40 to 0%	Service data.
EVAP Purge VSV	VSV status for EVAP control/ ON or OFF	-	-
Target Air-Fuel Ratio	Air fuel ratio: Min.: 0, Max.: 1.999	0.8 to 1.2: During idling	-
AF Lambda B1S1	Short-term fuel trim associated with the Bank 1 Sensor 1/ Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) = Rich • Stoichiometric air fuel ratio = 1 • Value more than 1 (1.001 to 1.999) = Lean	-
AF Lambda B2S1	Short-term fuel trim associated with the Bank 2 Sensor 1/ Min.: 0, Max.: 1.999	• Value less than 1 (0.000 to 0.999) = Rich • Stoichiometric air fuel ratio = 1 • Value more than 1 (1.001 to 1.999) = Lean	-
AFS Voltage B1S1	Air fuel ratio sensor output voltage (for Bank 1 Sensor 1)/ Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
AFS Voltage B2S1	Air fuel ratio sensor output voltage (for Bank 2 Sensor 1)/ Min.: 0 V, Max.: 7.999 V	2.8 to 3.8 V: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
AFS Current B1S1	Air fuel ratio sensor current Bank 1 Sensor 1/ Min.: -128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output current of the sensor.
AFS Current B2S1	Air fuel ratio sensor current (for Bank 2 Sensor 1)/ Min.: -128 mA, Max.: 127.99 mA	-0.5 to 0.5 mA: Idling	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the output current of the sensor.
O2S B1S2	Heated oxygen sensor output voltage (for Bank 1 Sensor 2)/ Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
O2S B2S2	Heated oxygen sensor output voltage (for Bank 2 Sensor 2)/ Min.: 0 V, Max.: 1.275 V	0.1 to 0.9 V: Driving 70 km/h (44 mph)	Performing the Control the Injection Volume or Control the Injection Volume for A/F Sensor function of the Active Test enables the technician to check the voltage output of the sensor.
Short FT #1	Short-term fuel trim of Bank 1/ Min.: -100%, Max.: 99.2%	-20 to 20%	This item refers to the short-term fuel compensation used to maintain the air fuel ratio at the stoichiometric air-fuel ratio.
Long FT #1	Long-term fuel trim of Bank 1/ Min.: -100%, Max.: 99.2%	-20 to 20%	This item refers to the overall fuel compensation carried out in the long-term to compensate for a continual deviation of the short-term fuel trim from the central value.
Short FT #2	Short-term fuel trim of Bank 2/ Min.: -100%, Max.: 99.2%	-20 to 20%	This item refers to the short-term fuel compensation used to maintain the air fuel ratio at the stoichiometric air-fuel ratio.
	Long-term fuel trim of Bank 2/		This item refers to the overall fuel compensation carried out in the long-term to compensate for a

Long FT #2	Min.: -100%, Max.: 99.2%	-20 to 20%	continual deviation of the short-term fuel trim from the central value.
Fuel System Status #1	Fuel system status (Bank 1)/ OL, CL, OLDrive, OLFault or CLFault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
Fuel System Status #2	Fuel system status (Bank 2)/ OL, CL, OLDrive, OLFault or CLFault	CL: Idling after warming up	• OL (Open Loop): Has not yet satisfied the conditions to go to closed loop. • CL (Closed Loop): Using the heated oxygen sensor as feedback for fuel control. • OLDrive: Open loop due to driving conditions (fuel enrichment). • OLFault: Open loop due to a detected system fault. • CLFault: Closed loop but the heated oxygen sensor, which is used for fuel control, is malfunctioning.
IGN Advance	Ignition timing advance for No. 1 cylinder/ Min.: -64 deg, Max.: 63.5 deg	BTDC 5 to 15 deg: Idling	-
Knock Feedback Value	Feedback value of knocking/ Min.: -1024°CA, Max.: 1023.9°CA	-22 to 0° CA: Driving, 70 km/h (44 mph)	Service data.
Knock Correct Learn Value	Correction learning value of knocking/ Min.: -1024°CA, Max.: 1023.9°CA	0 to 22° CA: Driving, 70 km/h (44 mph)	Service data.
ACIS VSV	VSV status for ACIS control/ ON or OFF	-	-
VVT Control Status #1	Variable valve timing (VVT) control status (Bank 1)/ ON or OFF	-	-
VVT Control Status #2	VVT control status (Bank 2)/ ON or OFF	-	-
VVT Aim Angle #1*2	VVT aim angle (Bank 1)/ Min.: 0%, Max.: 399.9%	0 to 80%	VVT duty signal value during intrusive operation.
VVT Change Angle #1*2	VVT change angle (Bank 1)/ Min.: 0 DegFR, Max.: 639.9 DegFR	0 to 5 DegFR: Idling	Displacement angle during intrusive operation.
VVT OCV Duty #1*2	VVT OCV operation duty (Bank 1)/ Min.: 0%, Max.: 399.9%	0 to 100%	Requested duty value for intrusive operation.
VVT Aim Angle #2*2	VVT aim angle (Bank 2)/ Min.: 0%, Max.: 399.9%	0 to 80%	VVT duty signal value during intrusive operation.
VVT Change Angle #2*2	VVT change angle (Bank 2)/ Min.: 0 DegFR, Max.: 639.9 DegFR	0 to 5 DegFR: Idling	Displacement angle during intrusive operation.
VVT OCV Duty	VVT OCV operation duty (Bank 2)/		Requested duty value for intrusive

#2*2	Min.: 0%, Max.: 399.9%	0 to 100%	operation.
VVT Ex Hold Lrn Val #1*2	VVT exhaust hold duty ratio learning value (Bank 1)/ Min.: 0%, Max.: 399.9%	0 to 80%	VVT duty signal value during intrusive operation.
VVT Ex Chg Angle #1*2	VVT exhaust change angle (Bank 1)/ Min.: 0 DegFR, Max.: 639.9 DegFR	0 to 5 DegFR: Idling	Displacement angle during intrusive operation.
VVT Ex OCV Duty #1*2	VVT exhaust OCV duty (Bank 1)/ Min.: 0%, Max.: 399.9%	0 to 100%	Requested duty value for intrusive operation.
VVT Ex Hold Lrn Val #2*2	VVT exhaust hold duty ratio learning value (Bank 2)/ Min.: 0%, Max.: 399.9%	0 to 80%	VVT duty signal value during intrusive operation.
VVT Ex Chg Angle #2*2	VVT exhaust change angle (Bank 2)/ Min.: 0 DegFR, Max.: 639.9 DegFR	0 to 5 DegFR: Idling	Displacement angle during intrusive operation.
VVT Ex OCV Duty #2*2	VVT exhaust OCV duty (Bank 2)/ Min.: 0%, Max.: 399.9%	0 to 100%	Requested duty value for intrusive operation.
Catalyst Temp B1S1	Catalyst temperature (Bank 1, Sensor 1)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp B2S1	Catalyst temperature (Bank 2, Sensor 1)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp B1S2	Catalyst temperature (Bank 1, Sensor 2)/ Min.: -40°C, Max.: 6513.5°C	-	-
Catalyst Temp B2S2	Catalyst temperature (Bank 2, Sensor 2)/ Min.: -40°C, Max.: 6513.5°C	-	-
Starter Signal	Starter signal/ Open or Close	Open: Cranking	-
Starter Control	Starter switch status/ ON or OFF	ON: Cranking	-
Power Steering Signal Record	Power steering switch signal/ ON or OFF	ON: Power steering operation	-
Starter Relay	Starter relay status/ ON or OFF	ON: Cranking	-
Power Steer. Sig. Record	Power steering signal (history)/ ON or OFF	ON: When steering wheel first turned after battery terminals connected	This signal status is usually ON until the cables are disconnected from the battery terminals.
ACC Relay	Acc relay status/ ON or OFF	ON: Cranking	-
Neutral Position SW Signal	PNP switch status/ ON or OFF	ON: Shift lever in P or N	-
Stop Light Switch	Stop light switch/ ON or OFF	ON: Brake pedal depressed	-
A/C Signal	A/C switch status/ ON or OFF	ON: A/C ON	-
Closed Throttle Position SW	Closed throttle position switch/ ON or OFF	• ON: Throttle fully closed • OFF: Throttle open	-
Fuel Cut Condition	Fuel cut condition/ ON or OFF	ON: Fuel cut operating	-
Immobiliser Communication	Immobiliser communication/ ON or OFF	ON: Normal	-
Electrical Load Signal	Electrical load signal/ ON or OFF	ON: Headlights or defogger is turned ON	-
Check Mode	Check mode/ ON or OFF	ON: Check mode ON	Refer to the Check Mode Procedure (Click here).
SPD Test Result	Check mode result for vehicle speed sensor/ Compl or Incmpl	-	-
Misfire Test Result	Check mode result for misfire monitor/ Compl or Incmpl	-	-
	Check mode result for heated		

OXS1 Test Result	oxygen sensor (Bank 1)/ Compl or Incmpl	-	-
OXS2 Test Result	Check mode result for heated oxygen sensor (Bank 2)/ Compl or Incmpl	-	-
A/F Test Results #2	Check mode result for air fuel ratio sensor (Bank 2)/ Compl or Incmpl	-	-
A/F Test Results #1	Check mode result for air fuel ratio sensor (Bank 1)/ Compl or Incmpl	-	-
Complete Parts Monitor	Comprehensive component monitor/ Not Avl or Avail	-	-
Fuel System Monitor	Fuel system monitor/ Not Avl or Avail	-	-
Misfire Monitor	Misfire monitor/ Not Avl or Avail	-	-
EGR/VVT Monitor	EGR/VVT monitor/ Not Avl or Avail	-	-
EGR/VVT Monitor	EGR/VVT monitor/ Compl or Incmpl	-	-
O2S(A/FS) Heater Monitor	O2S (A/FS) heater monitor/ Not Avl or Avail	-	-
O2S(A/FS) Heater Monitor	O2S (A/FS) heater monitor/ Compl or Incmpl	-	-
O2S(A/FS) Monitor	O2S (A/FS) monitor/ Not Avl or Avail	-	-
O2S(A/FS) Monitor	O2S (A/FS) monitor/ Compl or Incmpl	-	-
A/C Monitor	A/C Monitor/ Not Avl or Avail	-	-
A/C Monitor	A/C Monitor/ Compl or Incmpl	-	-
2nd Air Monitor	2nd air monitor/ Not Avl or Avail	-	-
2nd Air Monitor	2nd air monitor/ Compl or Incmpl	-	-
EVAP Monitor	EVAP monitor/ Not Avl or Avail	-	-
EVAP Monitor	EVAP monitor/ Compl or Incmpl	-	-
Heated Catalyst Monitor	Heated catalyst monitor/ Not Avl or Avail	-	-
Heated Catalyst Monitor	Heated catalyst monitor/ Compl or Incmpl	-	-
Catalyst Monitor	Catalyst monitor/ Not Avl or Avail	-	-
Catalyst Monitor	Catalyst monitor/ Compl or Incmpl	-	-
# Codes (Include History)	Number of codes/ Min.: 0, Max.: 255	-	Number of stored DTCs.
MIL	MIL status/ ON or OFF	ON: MIL on	-
MIL ON Run Distance	MIL on run distance/ Min.: 0 km, Max.: 65535 km	Distance after DTC stored	-
Running Time from MIL ON	Running time from MIL on/ Min.: 0 min, Max.: 65535 min	Equivalent to running time after MIL on	-
Time after DTC Cleared	Time after DTC cleared/ Min.: 0 minutes, Max.: 65535 minutes	Equivalent to time after DTCs cleared	-
Distance from DTC Cleared	Distance after DTC cleared/ Min.: 0 km, Max.: 65535 km	Equivalent to drive distance after DTCs cleared	-
Warmup Cycle Cleared DTC	Warm-up cycle after DTC cleared/ Min.: 0, Max.: 255	-	Number of warm-up cycles after the DTC is cleared.
OBD Requirements	OBD requirement	OBD2	-

Number of Emission DTC	Emission related DTCs	-	Number of emission related DTCs.
TC and TE1	TC and TE1 terminal of DLC3/ ON or OFF	-	-
Ignition Trig. Count	Ignition counter/ Min.: 0, Max.: 65535	0 to 800	-
Cylinder #1 Misfire Count to Cylinder #8 Misfire Count	Misfire count of the cylinder 1 to 8/ Min.: 0, Max.: 255	0	-
All Cylinders Misfire Count	All cylinders misfire count/ Min.: 0, Max.: 255	0 to 35	-
Multi Cylinders Misfire Count	Multiple cylinder misfire count/ Min.: 0 Max.: 65535	0 to 65535	-
Misfire RPM	Engine speed for first misfire range/ Min.: 0 rpm, Max.: 6375 rpm	0 rpm: Misfire 0	-
Misfire Load	Engine load for first misfire range/ Min.: 0 g/rev, Max.: 3.98 g/rev	0 g/rev: Misfire 0	-
Misfire Margin	Misfire monitoring/ Min.: -128%, Max.: 127%	-100 to 99.2%	Misfire detecting margin
Catalyst OT MF F/C	Catalyst over temperature misfire prevention F/C/ Not Avl or Avail	Avail: Cat OT MF F/C available Not Avl: Cat OT MF F/C not available	-
Cat OT MF F/C History	Catalyst over temperature misfire prevention F/C history/ ON or OFF	OFF: Fuel cut operation not exists	-
Cat OT MF F/C Cylinder #1	Display of fuel cut operation in No. 1 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #2	Display of fuel cut operation in No. 2 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #3	Display of fuel cut operation in No. 3 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #4	Display of fuel cut operation in No. 4 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #5	Display of fuel cut operation in No. 5 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #6	Display of fuel cut operation in No. 6 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #7	Display of fuel cut operation in No. 7 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Cat OT MF F/C Cylinder #8	Display of fuel cut operation in No. 8 cylinder (if certain level of misfire malfunction is detected)/ ON or OFF	ON: Fuel cut operating	-
Power Steering Pressure	Power steering oil pressure/ Min.: 0 MPa, Max.: 25.599 MPa	-	-
ACT VSV	A/C cut status for Active Test/ ON or OFF	-	-
Idle Fuel Cut	Fuel cut idle/ ON or OFF	ON: Fuel cut operation	Idle Fuel Cut is "ON" when the throttle valve is fully closed and the engine speed is more than 2800 rpm.
FC TAU	Fuel cut TAU: Fuel cut during very light load/	ON: Fuel cut operation	The fuel cut being performed under a very light load to prevent the

	ON or OFF		engine combustion from becoming incomplete.
Model Code	Model code	-	Identifying the model code: URJ2###.
Engine Type	Engine type	-	Identifying the engine type: 3URFE.
Cylinder Number	Number of cylinders/ Min.: 0, Max.: 255	-	Identifying the number of cylinders: 8.
Transmission Type	Transmission type	-	Identifying the transmission type: ECT 6th.
Destination	Destination	-	Identifying the destination: W.
Model Year	Model year/ Min.: 1900, Max.: 2155	-	Identifying the model year: 20##.
Engine Speed of Cyl #1	Engine speed for cylinder 1/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Engine Speed of Cyl #2	Engine speed for cylinder 2/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Engine Speed of Cyl #3	Engine speed for cylinder 3/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Engine Speed of Cyl #4	Engine speed for cylinder 4/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Engine Speed of Cyl #5	Engine speed for cylinder 5/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Engine Speed of Cyl #6	Engine speed for cylinder 6/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Engine Speed of Cyl #7	Engine speed for cylinder 7/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Engine Speed of Cyl #8	Engine speed for cylinder 8/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
Av Engine Speed of All Cyl	Engine speed for all cylinders/ Min.: 0 rpm, Max.: 51199 rpm	-	Output only when Check the Cylinder Compression is performed using Active Test.
SPD (NT)	Input shaft speed/ Min.: 0 rpm, Max.: 12750 rpm	Lock-up is • ON (after warming up engine): Input turbine speed (NT) equal to engine speed • OFF (idling with shift lever in N): Input turbine speed (NT) nearly equal to engine speed	Data is displayed in increments of 50 rpm.
SPD (SP2)	Output shaft speed/ Min.: 0 km/h (0 mph), Max.: 255 km/h (158 mph)	Vehicle stopped: 0 km/h (0 mph) (output shaft speed is equal to vehicle speed)	-

HINT:

- **Normal Condition: If no conditions are specifically stated for "idling", the shift lever is in N or P, the A/C switch is off and all accessory switches are off.**
- ***1: Excluding throttle valve opening percentage due to Idle Speed Control (ISC).**
- ***2: Data List values are only displayed when performing the following Active Tests: Control the VVT Linear (Bank 1), Control the VVT Linear (Bank 2), Control the VVT Exhaust Linear (Bank 1) and Control the VVT Exhaust Linear (Bank 2). For other Active Tests, the Data List value will be 0.**

ACTIVE TEST

HINT:

Using the intelligent tester to perform Active Tests allows relays, VSVs, actuators and other items to be operated without removing any parts. This non-intrusive functional inspection can be very useful because intermittent operation may be discovered before parts or wiring is disturbed. Performing

Active Tests early in troubleshooting is one way to save diagnostic time. Data List information can be displayed while performing Active Tests.

a. Warm up the engine.

b. Turn the engine switch off.

c. Connect the intelligent tester to the DLC3.

d. Turn the engine switch on (IG).

e. Turn the tester on.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test.

g. According to the display on the intelligent tester, perform the Active Test.

Tester Display	Test Part	Control Range	Diagnostic Note
Control the Injection Volume	Change injection volume	Between -12.5% and 24.8%	• All the injectors are tested at the same time. • Perform the test at 3000 rpm or less. • The injection volume can be changed in 0.1 or 0.2% graduations within the control range.
Control the Injection Volume for A/F Sensor	Change injection volume	Lower by 12.5% or increase 24.8%	• Perform the test at 3000 rpm or less. • Control the Injection Volume for A/F Sensor enables the checking and graphing of the A/F (Air Fuel Ratio) sensor voltage outputs. • To conduct the test, enter the following menus: Active Test / Control the Injection Volume for A/F Sensor / AFS Voltage B1S1 and O2S B1S2 or AFS Voltage B2S1 and O2S B2S1.
Activate the VSV for Intake Control	Activate VSV for intake control	ON/OFF	-
Activate the VSV for Evap Control	Activate purge VSV control	ON/OFF	-
Control the A/C Cut Signal	Control A/C cut signal	ON/OFF	Test possible when • Engine switch is on (IG). • Engine is stopped.
Control the Fuel Pump / Speed	Activate fuel pump	ON/OFF	Test possible when • Engine switch is on (IG). • Engine is stopped.
Connect the TC and TE1	Turn on and off TC and TE1 connection	ON/OFF	• ON: TC and TE1 connected. • OFF: TC and TE1 disconnected.
Control the Idle Fuel Cut Prohibit	Prohibit idling fuel cut control	ON/OFF	-
Prohibit the Catalyst OT Misfire prevent F/C	Prohibit catalyst overheat malfunction prevention fuel cut operation during misfire	ON/OFF ON: Fuel cut is prohibited	Confirm that the vehicle is stopped and the engine speed is 3000 rpm or less.
Activate the Starter Relay	Activate the starter relay	ON/OFF	Engine is stopped.
Activate the ACC Cut Relay	Activate the ACC CUT relay	ON/OFF	Engine is stopped.

Control the ETCS Open/Close Slow Speed	Throttle actuator	Close/Open Open: throttle valve opens slowly	This test is possible when the following conditions are met: • The engine switch is on (IG). • The engine does not starts. • Fully depressing the accelerator pedal (APP: 58 degrees or more).
Control the ETCS Open/Close Fast Speed	Throttle actuator	Close/Open Open: throttle valve opens fast	Same as above.
Control the VVT Linear (Bank 1)	Control Variable Valve Timing (VVT) [Bank 1]	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• Engine stalls or idles roughly when VVT actuator is operated by 100%. • Test is possible during idle.
Control the VVT System (Bank 1)	Turn on and off Oil Control Valve (OCV)	ON/OFF	• Engine stalls or idles roughly when OCV is turned on. • Engine runs or idles normally when OCV is OFF.
Control the VVT Linear (Bank 2)	Control Variable Valve Timing (VVT) [Bank 2]	-128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• Engine stalls or idles roughly when VVT actuator is operated by 100%. • Test is possible during idle.
Control the VVT System (Bank 2)	Turn on and off Oil Control Valve (OCV)	ON/OFF	• Engine stalls or idles roughly when OCV is turned on. • Engine runs or idles normally when OCV is OFF.
Control the VVT Exhaust Linear (Bank 1)	Control VVT (Bank 1)	128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• Engine stalls or idles roughly when VVT actuator is operated by 100%. • Test is possible while engine is idling.
Control the VVT Exhaust Linear (Bank 2)	Control VVT (Bank 2)	128 to 127% This valve added to present OCV control duty 100%: Maximum advance -100%: Maximum retard	• Engine stalls or idles roughly when VVT actuator is operated by 100%. • Test is possible while engine is idling.
Control the Cylinder #1 Fuel Cut	Cylinder #1 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the Cylinder #2 Fuel Cut	Cylinder #2 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the Cylinder #3 Fuel Cut	Cylinder #3 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the Cylinder #4 Fuel Cut	Cylinder #4 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the Cylinder #5 Fuel Cut	Cylinder #5 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the Cylinder #6 Fuel Cut	Cylinder #6 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the Cylinder #7 Fuel Cut	Cylinder #7 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the Cylinder #8 Fuel Cut	Cylinder #8 injector fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Control the All Cylinders Fuel Cut	All cylinder fuel cut	ON/OFF	Test is possible while vehicle is stopped and engine is idling.*1
Check the Cylinder Compression*2	Check the cylinder compression pressure	ON/OFF	Fuel injection and ignition stop in all cylinders.

NOTICE:

- ***1: If the display of the Data List Catalyst OT MF F/C item is Not Avl, perform this Active Test with the vehicle stopped and the engine idling.**
- ***1: If the display of the Data List Catalyst OT MF F/C item is Avail, perform this Active Test as described below.**
    1. **Stop the engine and turn the engine switch on (IG) to turn Control the Cylinder#1 Fuel Cut (to Control the Cylinder#8 Fuel Cut) on.**
    2. **Start the engine.**

HINT:

*2: When cranking the engine, each cylinder measures the engine speed.

In this Active Test, the fuel and ignition of all cylinders is cut. The engine must then be cranked for approximately 10 seconds. At this time, the speed of each cylinder is measured. If the speed of one cylinder is more than the other cylinders, it can be determined that the compression pressure of that cylinder is lower than the other cylinders.

1. Warm up the engine.
2. Turn the engine switch off.
3. Connect the intelligent tester to the DLC3.
4. Turn the engine switch on (IG).
5. Turn the tester on.
6. Enter the following menus: Powertrain / Engine and ECT / Active Test / Check the Cylinder Compression.

    HINT:

    To display the entire Data List, press the pull down menu button next to Primary. Then select Compression.

7. Push the snapshot button to turn the snapshot function on.

    HINT:

    Using the snapshot function, data can be recorded during the Active Test.

8. While the engine is not running, press the RIGHT or LEFT button to change Check the Cylinder Compression to ON.

    HINT:

    After performing the above procedure, Check the Cylinder Compression will start. Fuel injection for all cylinders is prohibited and each cylinder engine speed measurement enters standby mode.

9. Crank the engine for about 10 seconds.

    HINT:

    Continue to crank the engine until the values change from the default value (51199 rpm).

10. Monitor the engine speed (Engine Speed of Cyl #1 to #8) displayed on the intelligent tester.

    HINT:

    At first, the intelligent tester displays extremely high cylinder engine speed values. After approximately 10 seconds of engine cranking, each cylinder engine speed measurement will change to the actual engine speed.

    NOTICE:

    - **Do not crank the engine continuously for 20 seconds or more.**
    - **If it is necessary to crank the engine again after Check the Cylinder Compression has been changed to ON and the engine has been cranked once, press Exit to return to the Active Test menu screen. Then change Check the Cylinder Compression to ON and crank the engine.**
    - **Use a fully-charged battery.**

11. Stop cranking the engine, and then change "Check the Cylinder Compression" to OFF after the engine stops.

    NOTICE:

    If the Active Test is changed to OFF while the engine is being cranked, the engine will start.

12. Push the snapshot button to turn the snapshot function off.
13. Select "Stored Data" on the intelligent tester screen, select the recorded data and display the data as a graph.

    HINT:

    If the data is not displayed as a graph, the change of the values cannot be observed.

14. Check the change in engine speed values.

    HINT:

    As the data values of the Active Test return to their default values when cranking is stopped, the engine speed value of each cylinder cannot be observed. Therefore, it is necessary to use the data recorded with the snapshot function to check the engine speed values recorded during cranking.

for Preparation Click here

HINT:

Parameters listed in the chart may be different than your readings depending on the type of instrument and other factors.

For details of each DTC, refer to the "See page" below.

SFI System

DTC Code	Detection Item	Trouble Areas	MIL	Memory	See page
P0010	Camshaft Position "A" Actuator Circuit (Bank 1)	- Open or short in OCV for intake camshaft (for Bank 1) circuit - OCV for intake camshaft (for Bank 1) - ECM	Comes on	DTC stored	Click here
P0011	Camshaft Position "A" - Timing Over-Advanced or System Performance (Bank 1)	- Valve timing - OCV for intake camshaft - OCV filter - Intake camshaft timing gear - ECM	Comes on (Euro-OBD) Does not come on (M-OBD)	DTC stored	Click here

DTC P0010 Camshaft Position "A" Actuator Circuit (Bank 1)

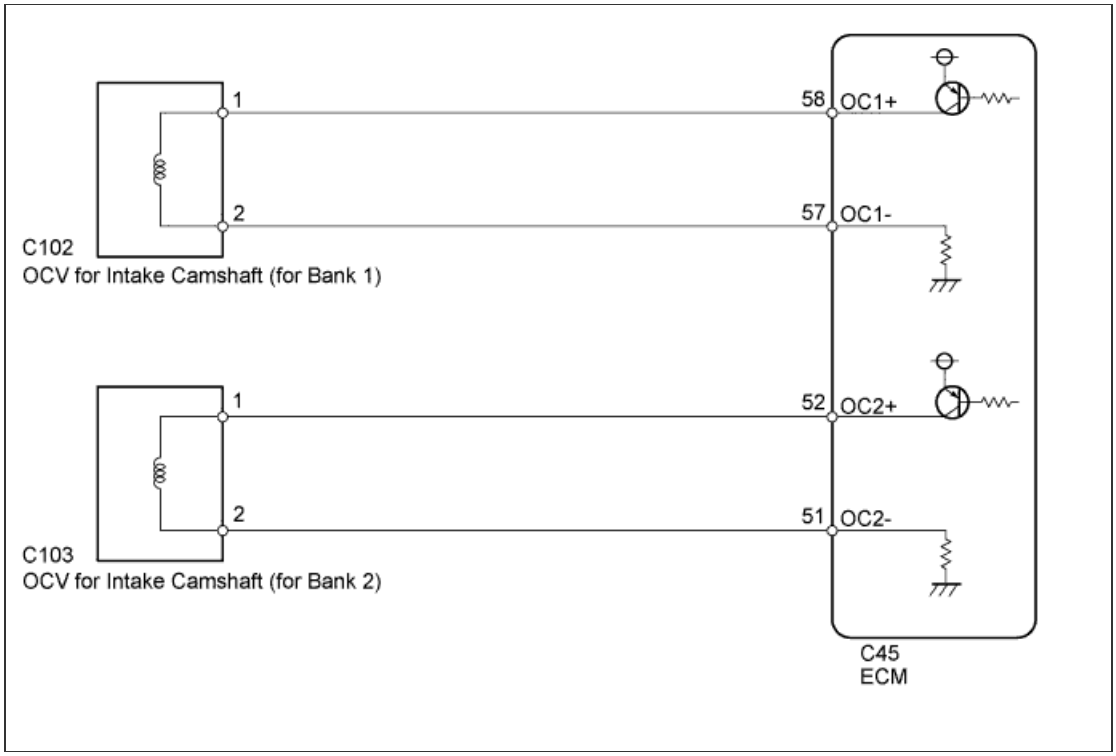
DTC P0020 Camshaft Position "A" Actuator Circuit (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 V to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.

DTC Code	DTC Detection Condition	Trouble Area
P0010	An open or short in the Camshaft Oil Control Valve (OCV) for intake side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for intake side of Bank 1) circuit • OCV (for intake side of Bank 1) • ECM
P0020	An open or short in the OCV for intake side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for intake side of Bank 2) circuit • OCV (for intake side of Bank 2) • ECM



HINT:

This DTC relates to the Camshaft Oil Control Valve (OCV).

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**

1.CHECK DTC

a. Clear DTC after recording the freeze frame data and DTC (Click here).

b. Turn the engine switch off.

c. Allow the engine to idle and check DTC.

d. Check that P0010 or P0020 is not output.

OK:
P0010 or P0020 is not output.

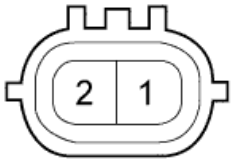
NG → Go to step 2

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Disconnect the C102 or C103 camshaft oil control valve (OCV) connector.



b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition

1 - 2	20°C (68°F)	6.9 to 7.9 Ω

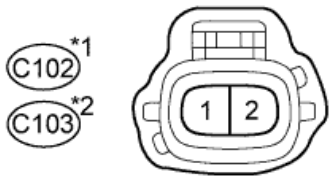
Component without harness connected:
(Oil Control Valve)

NG → REP ACE CAMSHAFT OI CONTRO A E ASSEMBLY (Click here)

OK

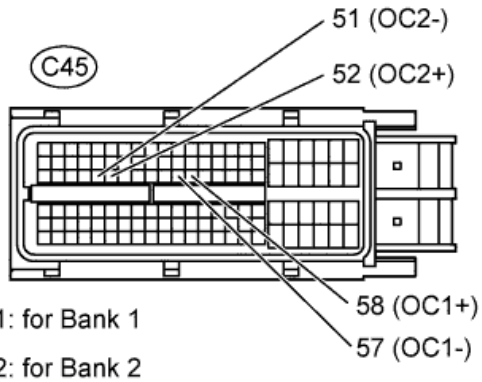
3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C102 or C103 OCV connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C102-1 - C45-58 (OC1+)	Always	Below 1 Ω
C103-1 - C45-52 (OC2+)	Always	Below 1 Ω
C102-2 - C45-57 (OC1-)	Always	Below 1 Ω
C103-2 - C45-51 (OC2-)	Always	Below 1 Ω
C102-1 or C45-58 (OC1+) - Body ground	Always	10 kΩ or higher
C103-1 or C45-52 (OC2+) - Body ground	Always	10 kΩ or higher
C102-2 or C45-57 (OC1-) - Body ground	Always	10 kΩ or higher
C103-2 or C45-51 (OC2-) - Body ground	Always	10 kΩ or higher

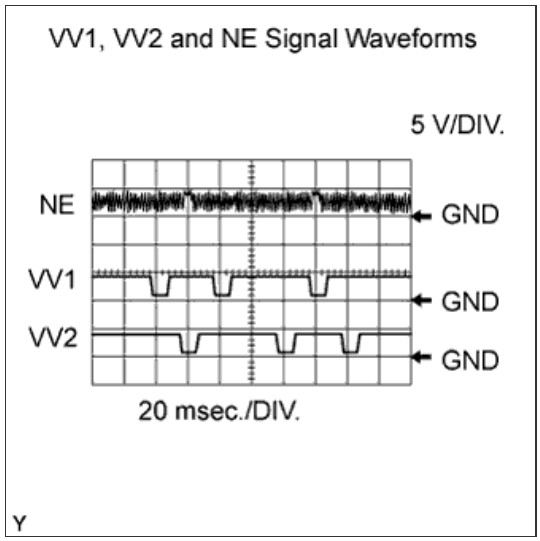
DTC P0347 Camshaft Position Sensor "A" Circuit Low Input (Bank 2)

DTC P0348 Camshaft Position Sensor "A" Circuit High Input (Bank 2)



for Preparation Click here

DESCRIPTION

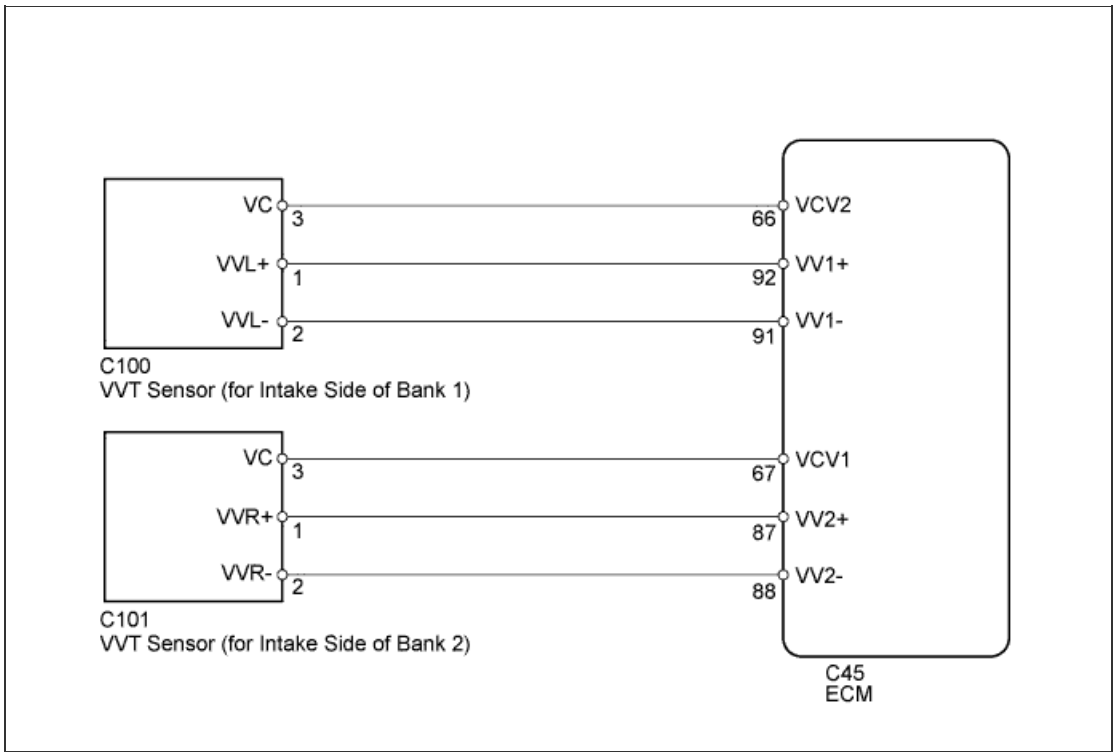
The intake camshaft Variable Valve Timing (VVT) sensor (VV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The intake camshaft has 3 teeth on its outer circumference. When the intake camshaft rotates, changes occur in the air gaps between the teeth and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the intake camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft position sensor plate has 34 teeth. The crankshaft position sensor generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor (for intake side of Bank 1, 2) signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0343 P0348	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-92 (VV1+) - C45-91 (VV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-87 (VV2+) - C45-88 (VV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown



HINT:

VV1+ and VV2+ stand for the VVT sensor (for intake side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

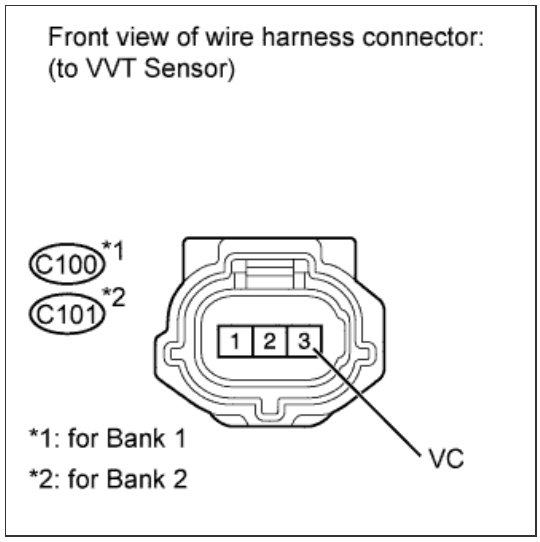
If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C100 or C101 VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

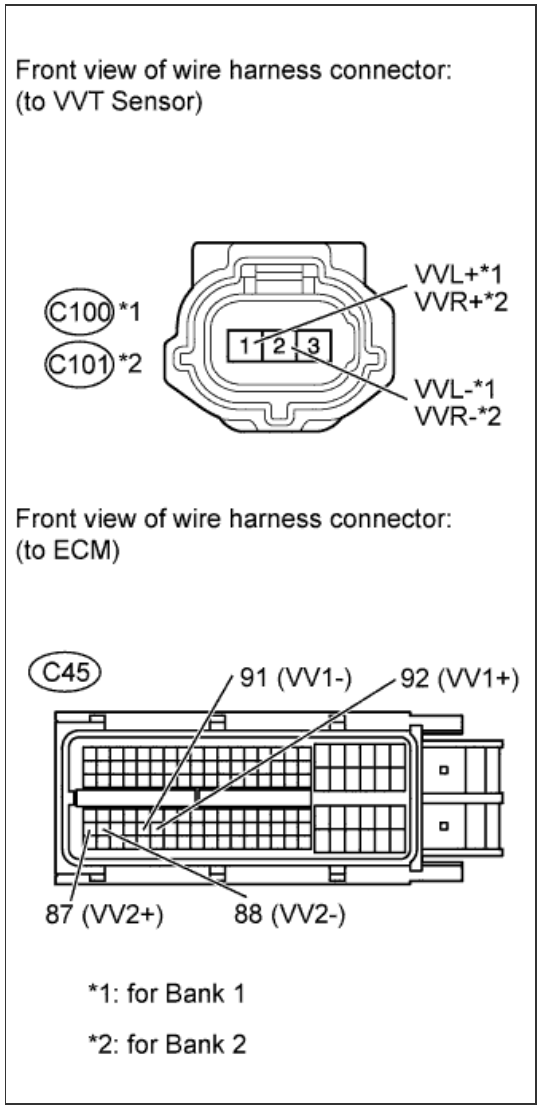
Standard Voltage:

Tester Connection	Condition	Specified Condition
C100-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C101-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR FOR INTAKE SIDE - ECM)



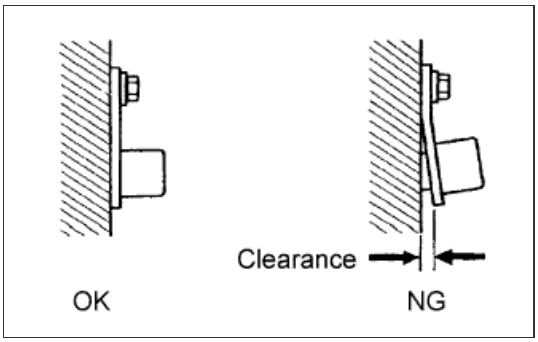
a. Disconnect the C100 or C101 VVT sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C100-1 (VVL+) - C45-92 (VV1+)	Always	Below 1 Ω
C100-2 (VVL-) - C45-91 (VV1-)	Always	Below 1 Ω
C101-1 (VVR+) - C45-87 (VV2+)	Always	Below 1 Ω
C101-2 (VVR-) - C45-88 (VV2-)	Always	Below 1 Ω
C100-1 (VVL+) or C45-92 (VV1+) - Body ground	Always	10 kΩ or higher
C100-2 (VVL-) or C45-91 (VV1-) - Body ground	Always	10 kΩ or higher
C101-1 (VVR+) or C45-87 (VV2+) - Body ground	Always	10 kΩ or higher
C101-2 (VVR-) or C45-88 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor (for intake side) installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK INTAKE CAMSHAFT (TEETH)

a. Check the teeth of the camshaft.

OK:
Teeth do not have any cracks or deformation.

NG → REPLACE INTAKE CAMSHAFT (Click here)

OK

5.REPLACE VVT SENSOR (for Intake Side)

a. Replace the VVT sensor (for Intake Side) (Click here).

NEXT

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs.

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No output	A
P0340, P0342, P0343, P0345, P0347 or P0348	B

HINT:

If the engine does not start, replace the ECM.

B → REPLACE ECM (Click here)

DESCRIPTION

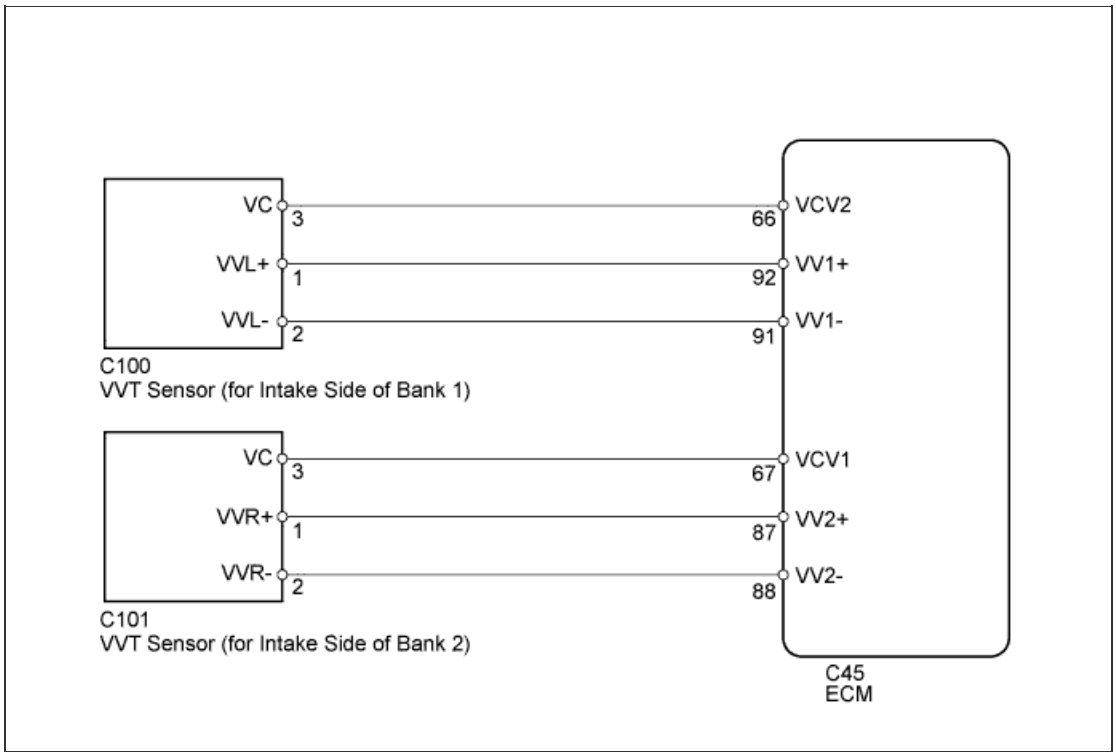
The intake camshaft Variable Valve Timing (VVT) sensor (VV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The intake camshaft has 3 teeth on its outer circumference. When the intake camshaft rotates, changes occur in the air gaps between the teeth and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the intake camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft position sensor plate has 34 teeth. The crankshaft position sensor generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor (for intake side of Bank 1, 2) signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0343 P0348	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-92 (VV1+) - C45-91 (VV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-87 (VV2+) - C45-88 (VV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown



HINT:

VV1+ and VV2+ stand for the VVT sensor (for intake side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

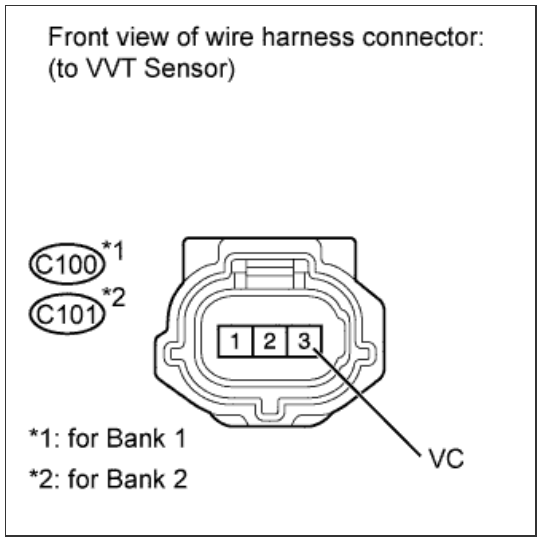
If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C100 or C101 VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

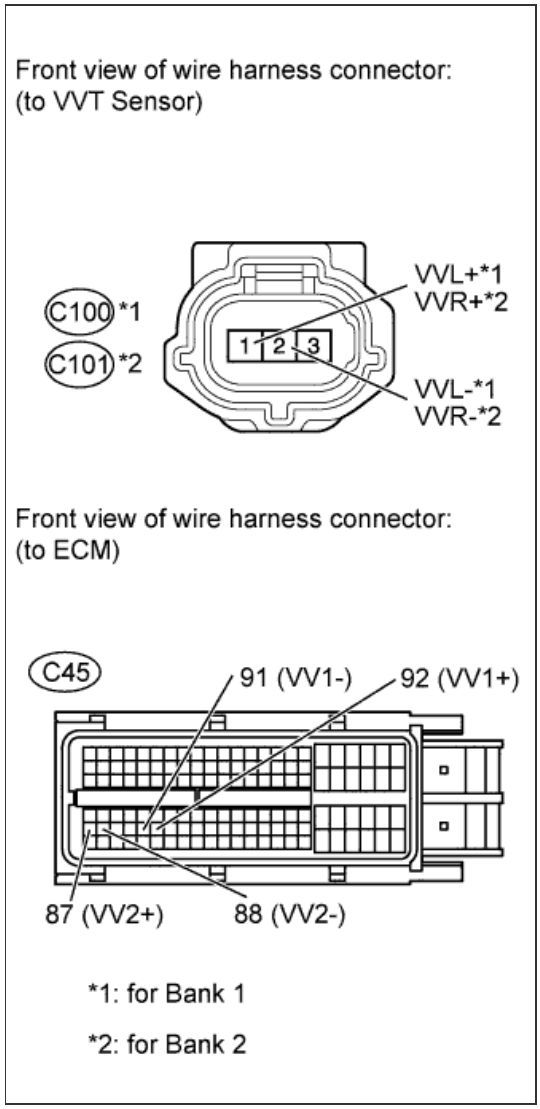
Standard Voltage:

Tester Connection	Condition	Specified Condition
C100-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C101-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

2.CHECK HARNESS AND CONNECTOR (VVT SENSOR FOR INTAKE SIDE - ECM)



a. Disconnect the C100 or C101 VVT sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C100-1 (VVL+) - C45-92 (VV1+)	Always	Below 1 Ω
C100-2 (VVL-) - C45-91 (VV1-)	Always	Below 1 Ω
C101-1 (VVR+) - C45-87 (VV2+)	Always	Below 1 Ω
C101-2 (VVR-) - C45-88 (VV2-)	Always	Below 1 Ω
C100-1 (VVL+) or C45-92 (VV1+) - Body ground	Always	10 kΩ or higher
C100-2 (VVL-) or C45-91 (VV1-) - Body ground	Always	10 kΩ or higher
C101-1 (VVR+) or C45-87 (VV2+) - Body ground	Always	10 kΩ or higher
C101-2 (VVR-) or C45-88 (VV2-) - Body ground	Always	10 kΩ or higher

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Turn the A/C on.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Linear (Bank 1) or Control the VVT Linear (Bank 2).

g. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

HINT:

Refer to "Data List / Active Test" [VVT OCV Duty #1, VVT Change Angle #1, VVT OCV Duty #2 and VVT Change Angle #2] (Click here).

NG → Go to step 4

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

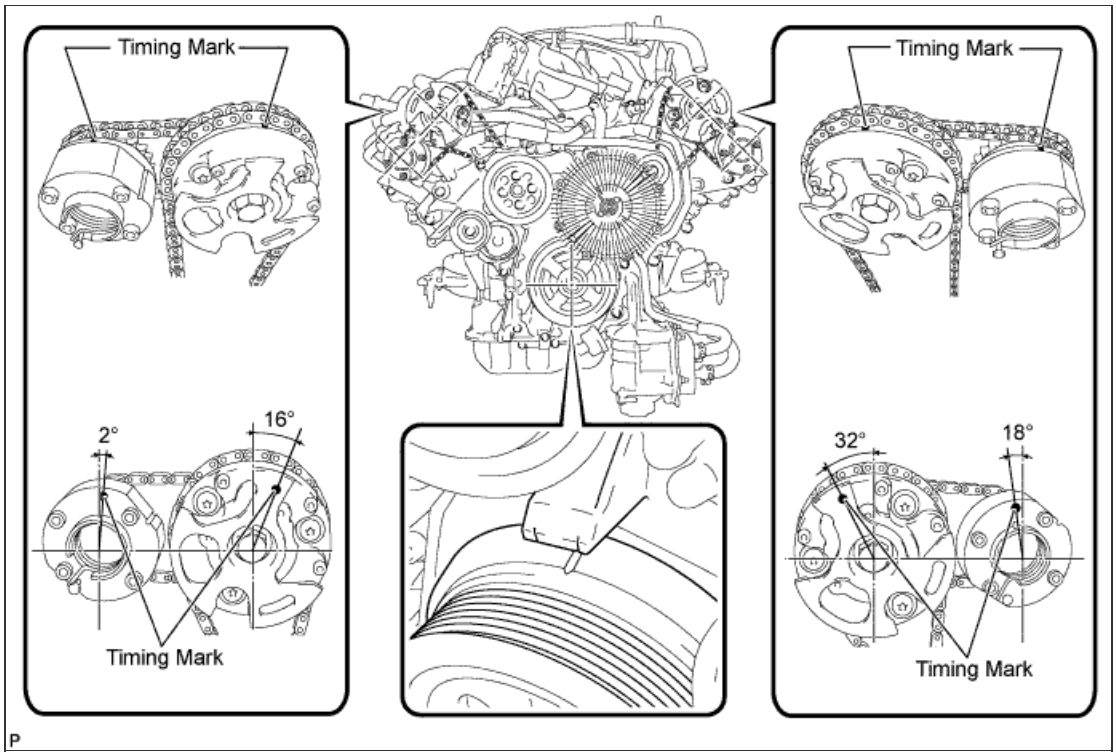
c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.



OK:
No DTC output.

NG → Go to step 4

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

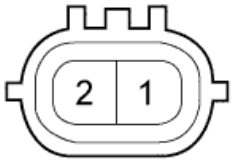
OK

5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

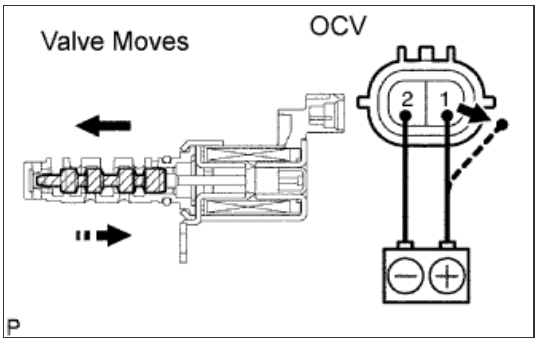
a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

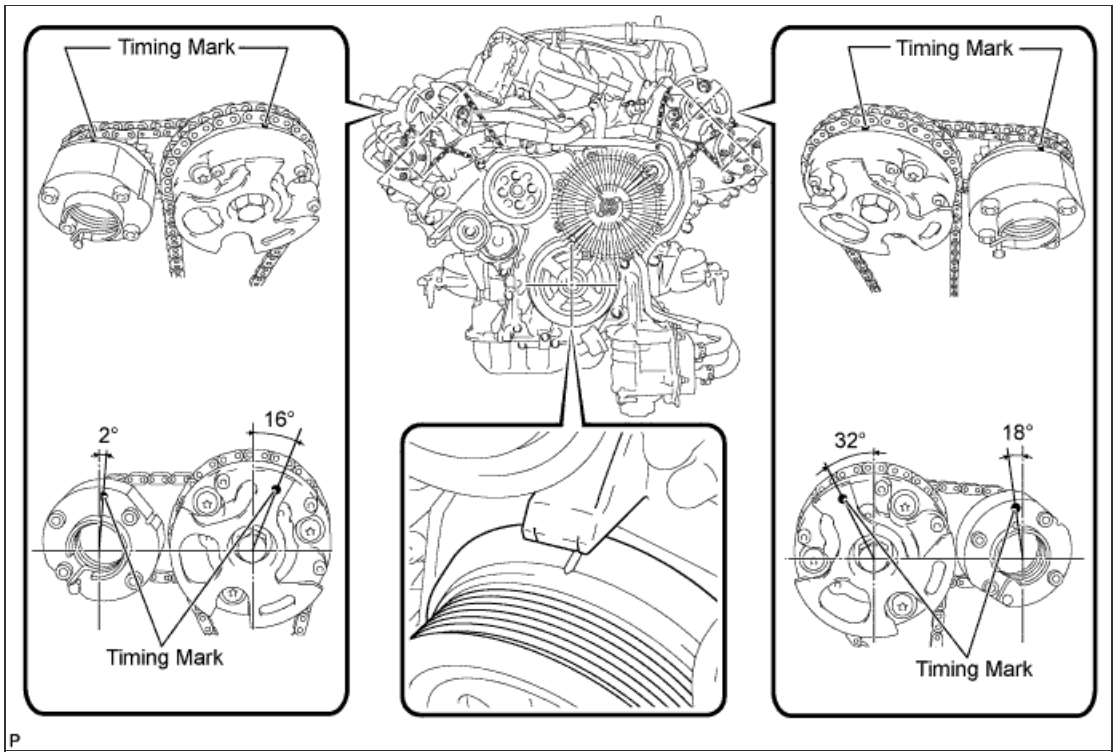
c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.



OK:
No DTC output.

NG → Go to step 4

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

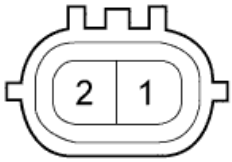
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

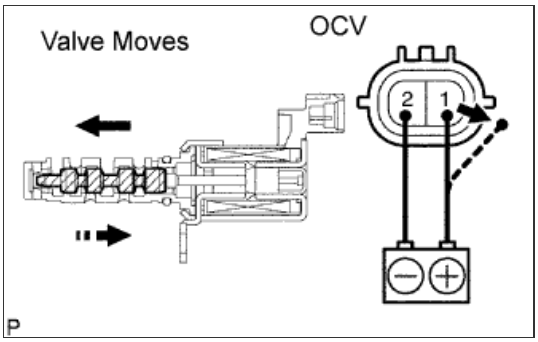
a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

DESCRIPTION

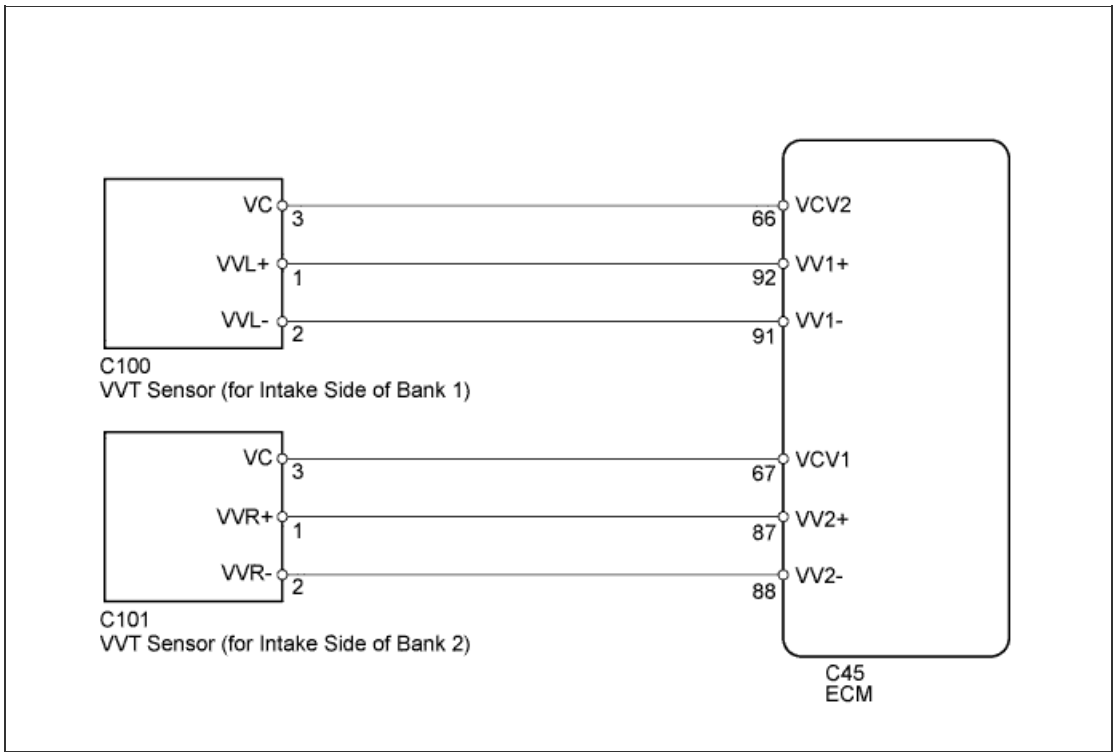
The intake camshaft Variable Valve Timing (VVT) sensor (VV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The intake camshaft has 3 teeth on its outer circumference. When the intake camshaft rotates, changes occur in the air gaps between the teeth and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the intake camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft position sensor plate has 34 teeth. The crankshaft position sensor generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor (for intake side of Bank 1, 2) signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0343 P0348	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-92 (VV1+) - C45-91 (VV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-87 (VV2+) - C45-88 (VV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown



HINT:

VV1+ and VV2+ stand for the VVT sensor (for intake side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

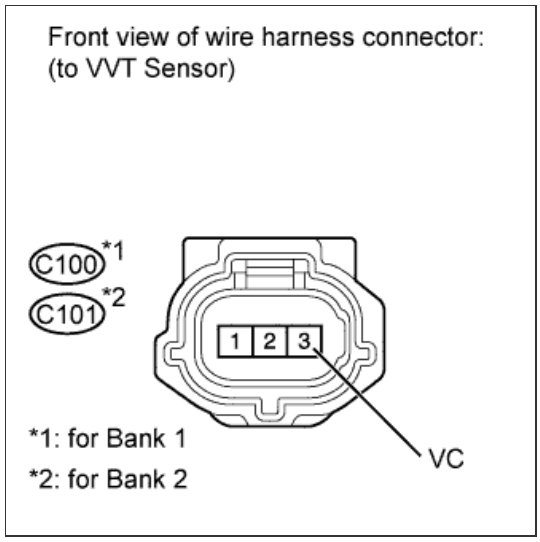
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C100 or C101 VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C100-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C101-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

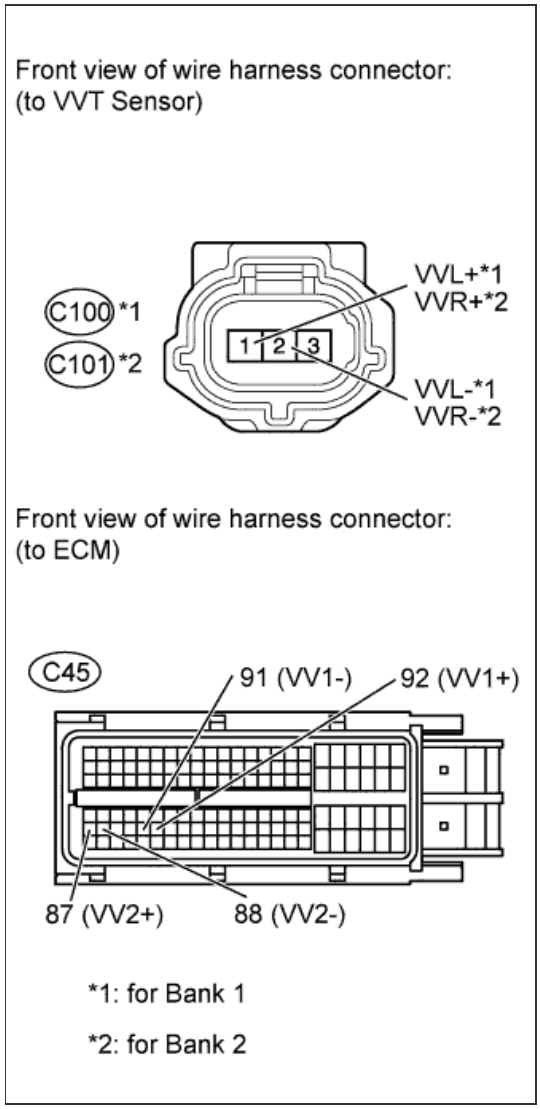
2.CHECK HARNESS AND CONNECTOR (VVT SENSOR FOR INTAKE SIDE - ECM)



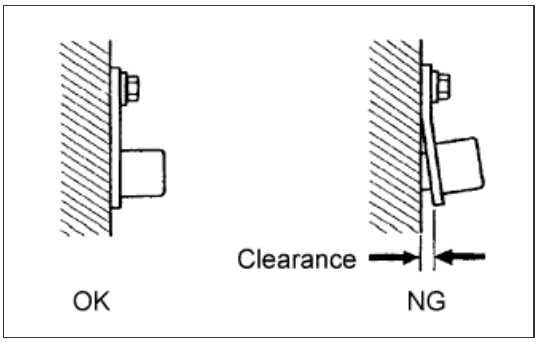
a. Disconnect the C100 or C101 VVT sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C100-1 (VVL+) - C45-92 (VV1+)	Always	Below 1 Ω
C100-2 (VVL-) - C45-91 (VV1-)	Always	Below 1 Ω
C101-1 (VVR+) - C45-87 (VV2+)	Always	Below 1 Ω
C101-2 (VVR-) - C45-88 (VV2-)	Always	Below 1 Ω
C100-1 (VVL+) or C45-92 (VV1+) - Body ground	Always	10 kΩ or higher
C100-2 (VVL-) or C45-91 (VV1-) - Body ground	Always	10 kΩ or higher
C101-1 (VVR+) or C45-87 (VV2+) - Body ground	Always	10 kΩ or higher
C101-2 (VVR-) or C45-88 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0010 (Click here).

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Turn the A/C on.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Linear (Bank 1) or Control the VVT Linear (Bank 2).

g. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

HINT:

Refer to "Data List / Active Test" [VVT OCV Duty #1, VVT Change Angle #1, VVT OCV Duty #2 and VVT Change Angle #2] (Click here).

NG → Go to step 4

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

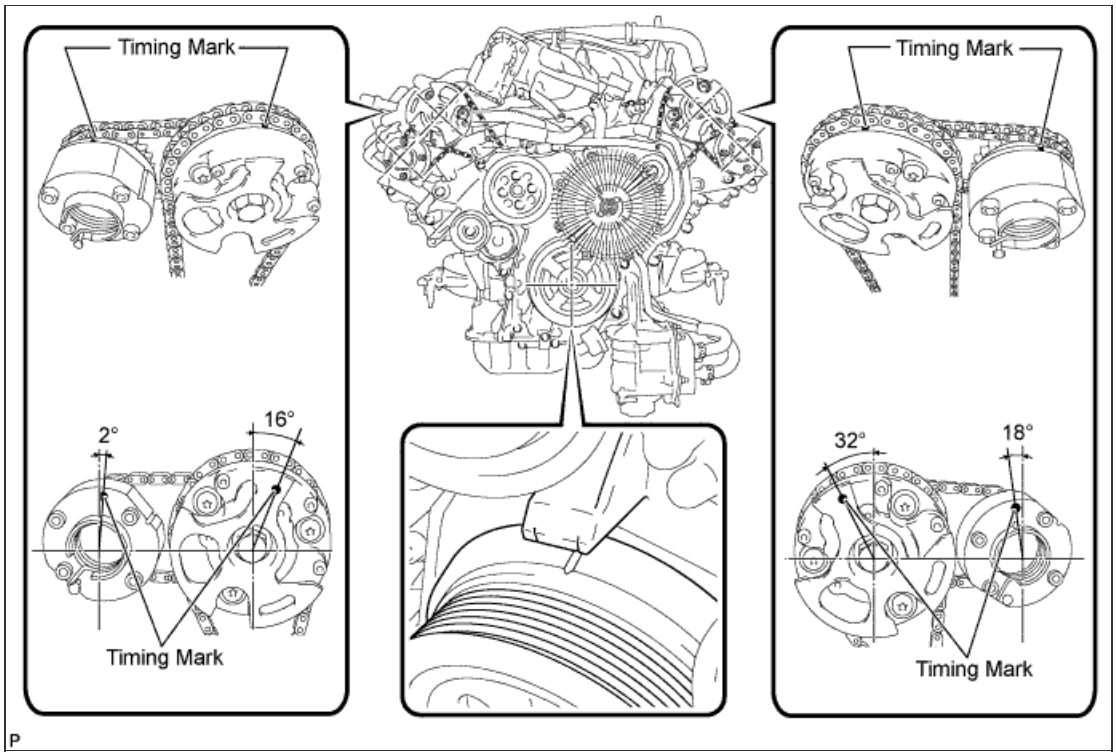
c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.



OK:
No DTC output.

NG → Go to step 4

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

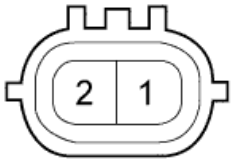
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

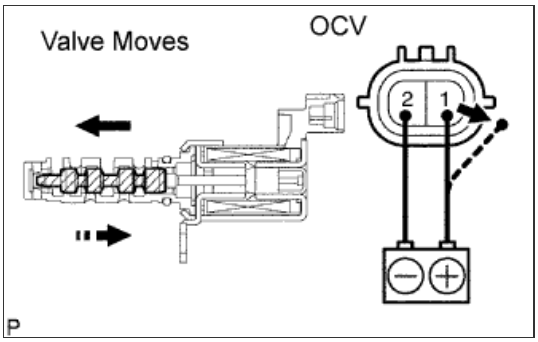
a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. DESCRIPTION

The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the intake camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual intake valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target intake valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0011 P0021	The intake valve timing is not adjusted in the valve timing advance range (1 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM
P0012 P0022	The intake valve timing is not adjusted in the valve timing retard range (2 trip detection logic).	• Valve timing • OCV (for intake side of Bank 1, 2) • OCV filter • Camshaft timing gear • ECM

MONITOR DESCRIPTION

The ECM optimizes the intake valve timing using the VVT (Variable Valve Timing) system to control the intake camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the intake camshaft.
If the difference between the target and actual intake valve timings is large, and changes in the actual intake valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).

Example:
A DTC is stored when the following conditions 1, 2 and 3 are met:

1. The difference between the target and actual intake valve timing is more than 5° CA (Crankshaft Angle) and the condition continues for more than 4.5 seconds.
2. It takes 5 seconds or more to change the valve timing by 5° CA.
3. After above conditions 1 and 2 are met, the OCV is forcibly activated during 10 seconds.

DTC P0011 and P0021 (Advanced Cam Timing) are subject to 1 trip detection logic.
DTC P0012 and P0022 (Retarded Cam Timing) are subject to 2 trip detection logic.
These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
The monitor will run if all of the following conditions are met:

- The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
- The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
- The engine has idled for 3 minutes.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

DTC P0011, P0012, P0021 or P0022 may be stored when foreign objects in the engine oil are caught in some parts of the system. The DTC will remain stored even if the system returns to normal after a short time. Foreign objects are filtered out by the oil filter.

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0011	P0012
Bank 2	P0021	P0022

- **If DTC P0011 or P0012 is output, check the left bank VVT system for intake side circuit (for Bank 1).**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0021 or P0022 is output, check the right bank VVT system for intake side circuit (for Bank 2).**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0011, P0012, P0021 or P0022 is output	A
P0011, P0012, P0021 or P0022 and other DTCs are output	B

HINT:

If any DTCs other than P0011, P0012, P0021 or P0022 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the tester on.

d. Warm up the engine.

e. Turn the A/C on.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Linear (Bank 1) or Control the VVT Linear (Bank 2).

g. Check the engine speed while operating the Camshaft Oil Control Valve (OCV) using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

HINT:

Refer to "Data List / Active Test" [VVT OCV Duty #1, VVT Change Angle #1, VVT OCV Duty #2 and VVT Change Angle #2] (Click here).

NG → Go to step 4

OK

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0011, P0012, P0021 OR P0022)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC output.

NG → Go to step 4

OK

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TOOTH OF TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → ADJUST VALVE TIMING (Click here)

OK

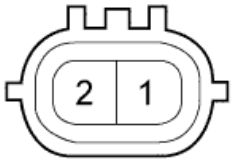
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

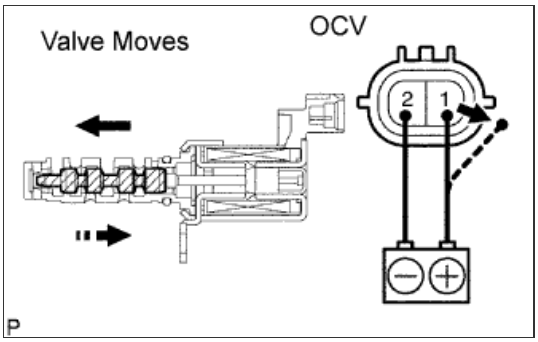
a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the OCV filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE INTAKE CAMSHAFT TIMING GEAR

a. Replace the intake camshaft timing gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTCs (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester.

f. Drive the vehicle for more than 10 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC is output.

HINT:

DTC P0011, P0012, P0021 or P0022 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

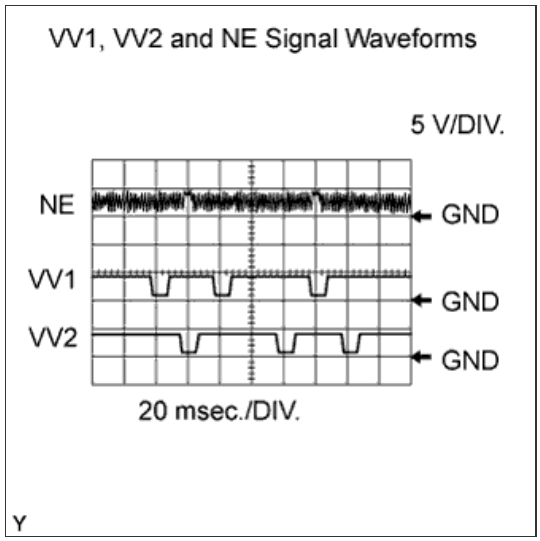
DTC P0348 Camshaft Position Sensor "A" Circuit High Input (Bank 2)



for Preparation Click here

DESCRIPTION

The intake camshaft Variable Valve Timing (VVT) sensor (VV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The intake camshaft has 3 teeth on its outer circumference. When the intake camshaft rotates, changes occur in the air gaps between the teeth and MRE, which affects the magnetic field. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the intake camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.
The crankshaft position sensor plate has 34 teeth. The crankshaft position sensor generates 34 signals for each revolution. Based on a combination of the VVT signal and NE signal, the ECM detects the crankshaft angle. Then the ECM uses this data to control fuel injection time and injection timing. Also, based on the NE signal, the ECM detects the engine speed.

DTC Code	DTC Detection Condition	Trouble Area
P0340 P0345	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor (for intake side of Bank 1, 2) signal is sent to the ECM during cranking (2 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0342 P0347	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM
P0343 P0348	The output voltage of the VVT sensor (for intake side of Bank 1, 2) is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for intake side) circuit • VVT sensor (for intake side) • Intake camshaft (for Bank 1, 2) • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-110 (NE+) - C45-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-92 (VV1+) - C45-91 (VV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-87 (VV2+) - C45-88 (VV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

VV1+ and VV2+ stand for the VVT sensor (for intake side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

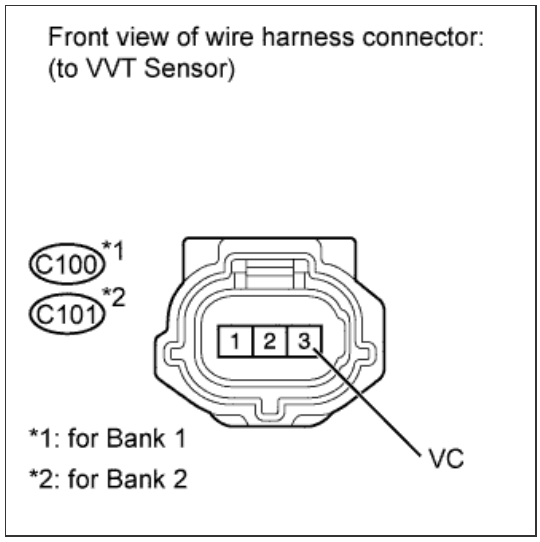
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**



1.CHECK HARNESS AND CONNECTOR (SENSOR POWER SOURCE)

a. Disconnect the C100 or C101 VVT sensor connector.

b. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Condition	Specified Condition
C100-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V
C101-3 (VC) - Body ground	Engine switch on (IG)	4.5 to 5.0 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

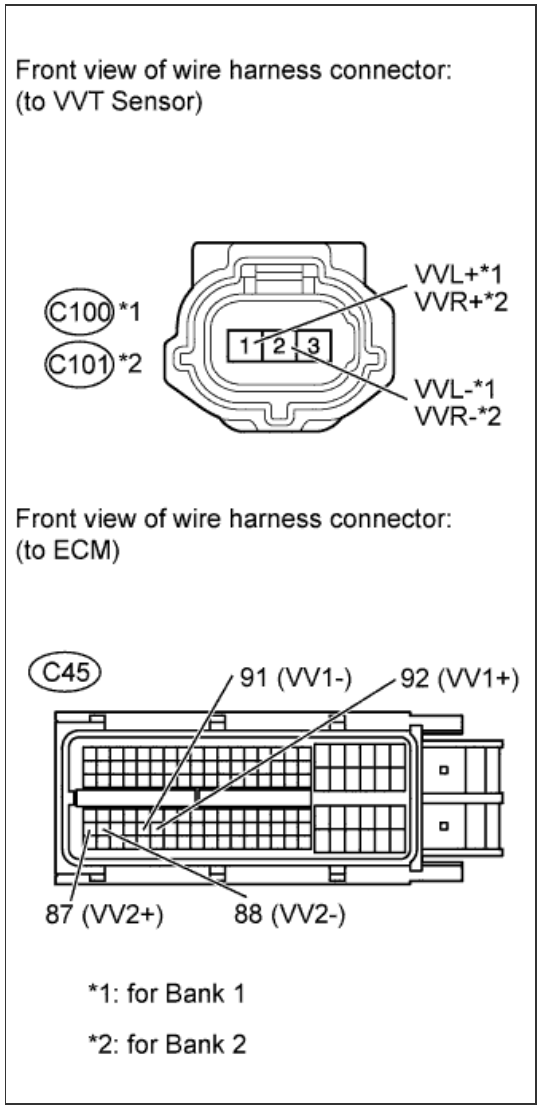
2.CHECK HARNESS AND CONNECTOR (VVT SENSOR FOR INTAKE SIDE - ECM)



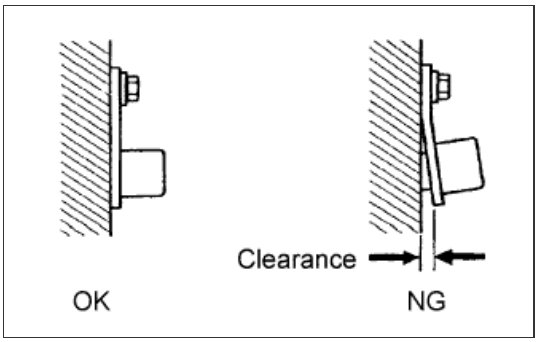
a. Disconnect the C100 or C101 VVT sensor connector.

b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C100-1 (VVL+) - C45-92 (VV1+)	Always	Below 1 Ω
C100-2 (VVL-) - C45-91 (VV1-)	Always	Below 1 Ω
C101-1 (VVR+) - C45-87 (VV2+)	Always	Below 1 Ω
C101-2 (VVR-) - C45-88 (VV2-)	Always	Below 1 Ω
C100-1 (VVL+) or C45-92 (VV1+) - Body ground	Always	10 kΩ or higher
C100-2 (VVL-) or C45-91 (VV1-) - Body ground	Always	10 kΩ or higher
C101-1 (VVR+) or C45-87 (VV2+) - Body ground	Always	10 kΩ or higher
C101-2 (VVR-) or C45-88 (VV2-) - Body ground	Always	10 kΩ or higher



NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

3.CHECK SENSOR INSTALLATION

a. Check the VVT sensor (for intake side) installation.

OK:
Sensor is installed correctly.

NG → SECURELY REINSTALL SENSOR (Click here)

OK

4.CHECK INTAKE CAMSHAFT (TEETH)

a. Check the teeth of the camshaft.

OK:
Teeth do not have any cracks or deformation.

NG → REPLACE INTAKE CAMSHAFT (Click here)

OK

5.REPLACE VVT SENSOR (for Intake Side)

a. Replace the VVT sensor (for Intake Side) (Click here).

NEXT

6.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG).

c. Turn the tester on.

d. Clear DTCs.

e. Start the engine.

f. Enter the following menus: Powertrain / Engine and ECT / DTC.

g. Read DTCs.

Result

Result	Proceed to
No output	A
P0340, P0342, P0343, P0345, P0347 or P0348	B

HINT:

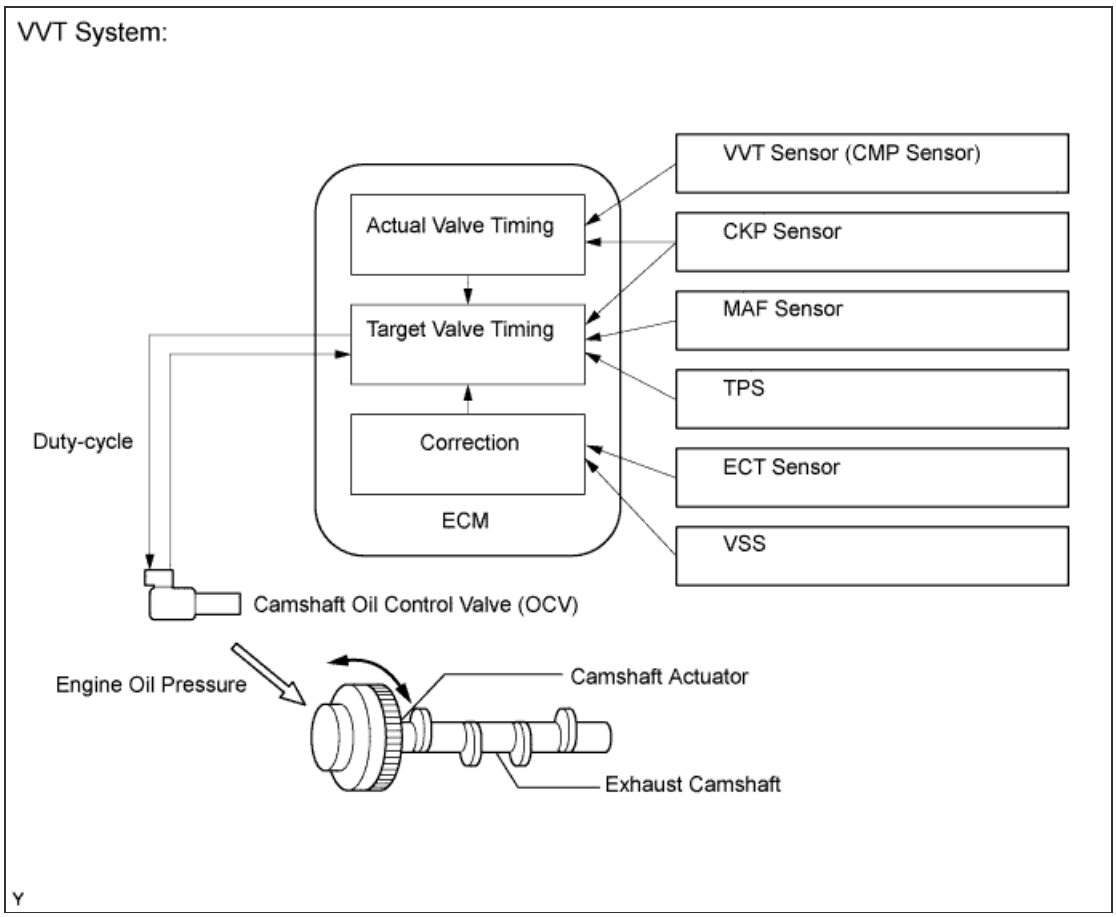
If the engine does not start, replace the ECM.

B → REPLACE ECM (Click here)

A

END



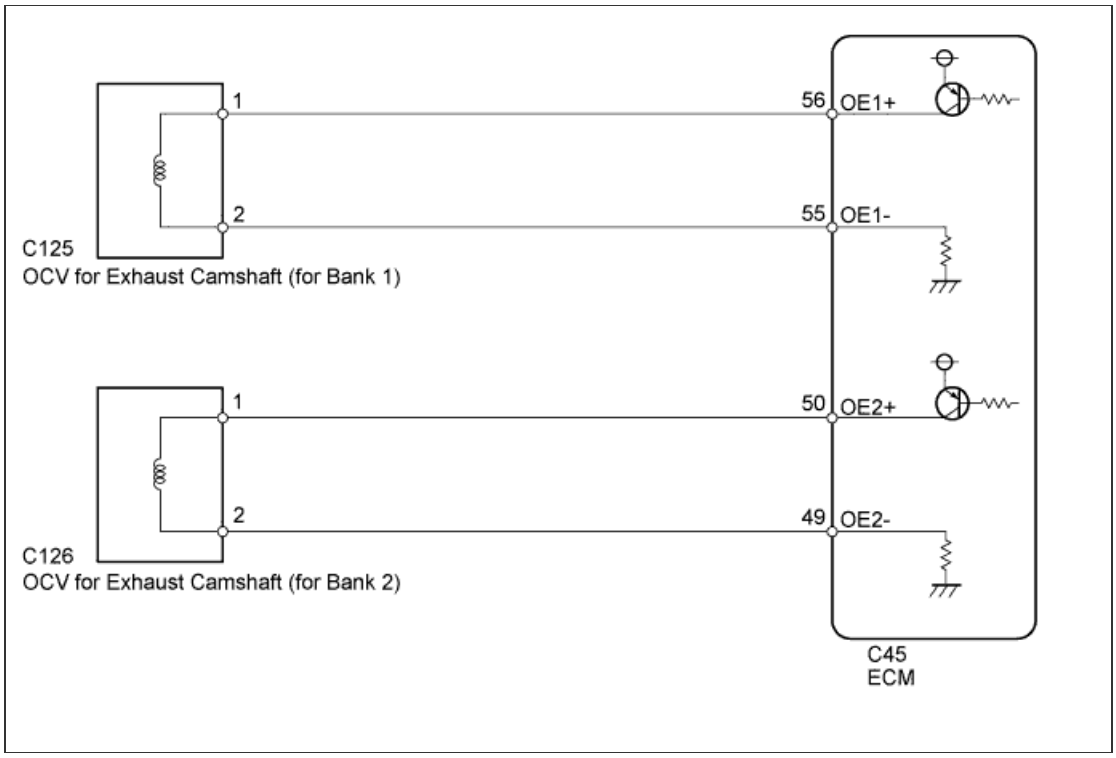
DTC P0013 Camshaft Position "B" Actuator Circuit / Open (Bank 1)

DTC P0023 Camshaft Position "B" Actuator Circuit / Open (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the Camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.



DTC Code	DTC Detection Condition	Trouble Area
P0013	An open or short in the Camshaft Oil Control Valve (OCV) for exhaust side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1) circuit • OCV (for exhaust side of Bank 1) • ECM
P0023	An open or short in the OCV for exhaust side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for exhaust side of Bank 2) circuit • OCV (for exhaust side of Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If DTC P0013 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0023 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK DTC (DTC P0013 OR P0023)

a. Connect the intelligent tester to the DLC3.

b. Clear DTC after recording the freeze frame data and DTC.

c. Turn the engine switch off.

d. Allow the engine to idle and check DTC.

e. Check that P0013 or P0023 is not output.

OK:
P0013 or P0023 is not output.

NG → **Go to step 2**

OK

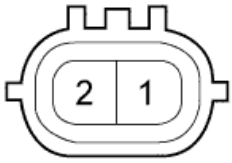
CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Disconnect the C125 or C126 OCV connector.



b. Remove the camshaft oil control valve (OCV) (Click here).

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

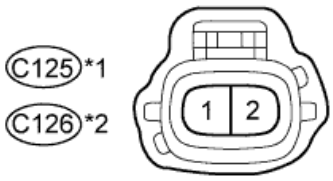
Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK →

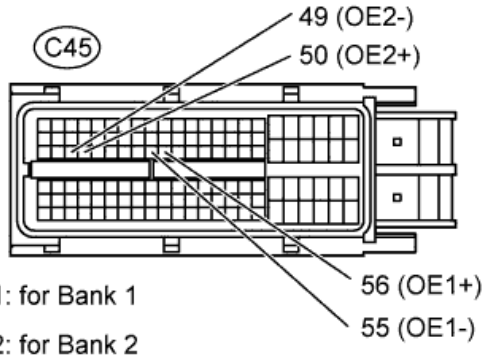
3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C125 or C126 OCV connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C125-1 - C45-56 (OE1+)	Always	Below 1 Ω
C125-2 - C45-55 (OE1-)	Always	Below 1 Ω
C126-1 - C45-50 (OE2+)	Always	Below 1 Ω
C126-2 - C45-49 (OE2-)	Always	Below 1 Ω
C125-1 or C45-56 (OE1+) - Body ground	Always	10 kΩ or higher
C125-2 or C45-55 (OE1-) - Body ground	Always	10 kΩ or higher
C126-1 or C45-50 (OE2+) - Body ground	Always	10 kΩ or higher
C126-2 or C45-49 (OE2-) - Body ground	Always	10 kΩ or higher

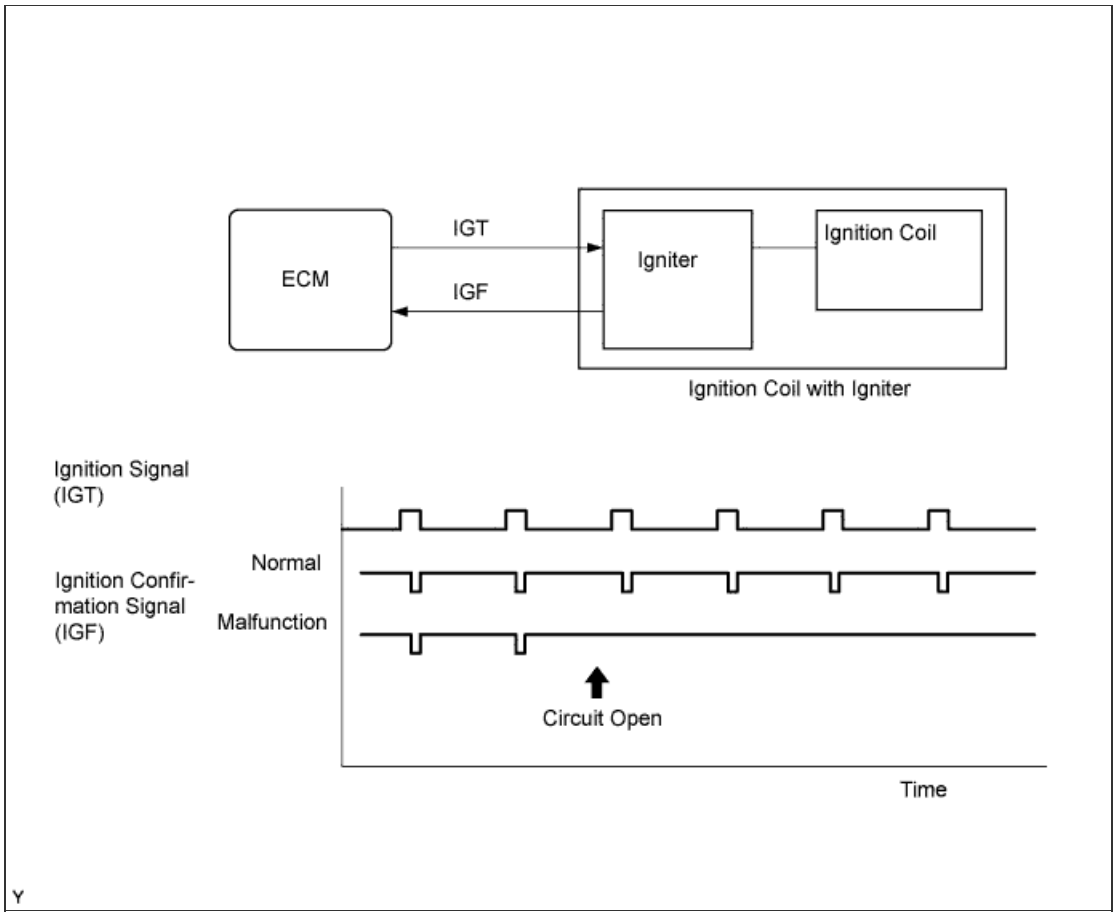
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-35 (IGT5) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

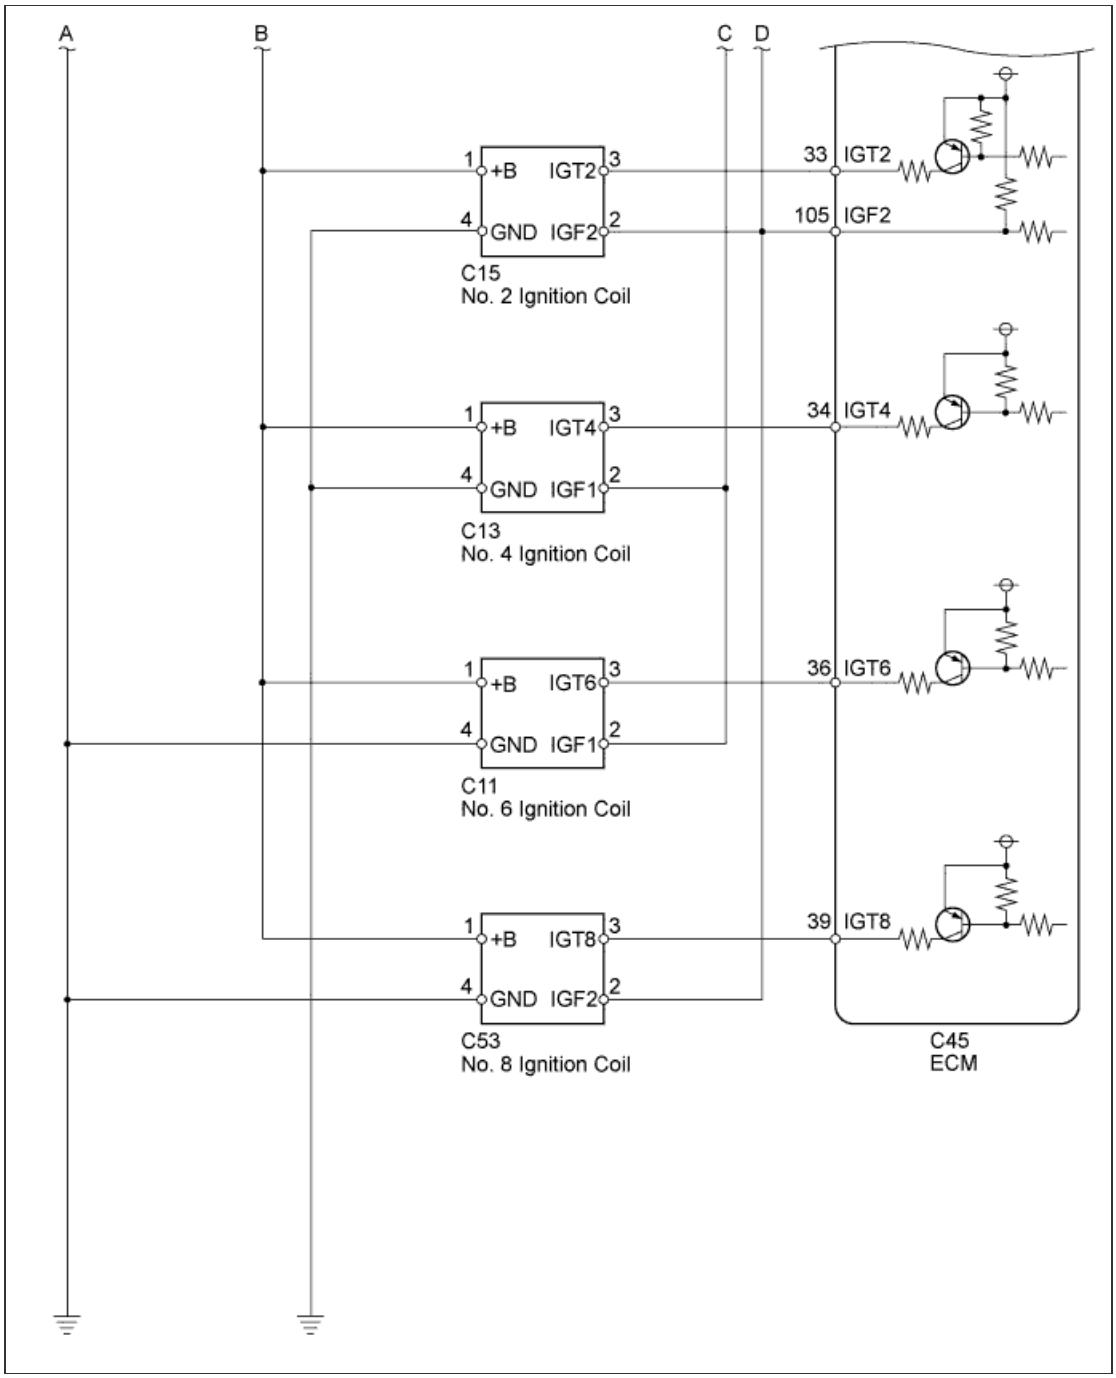
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

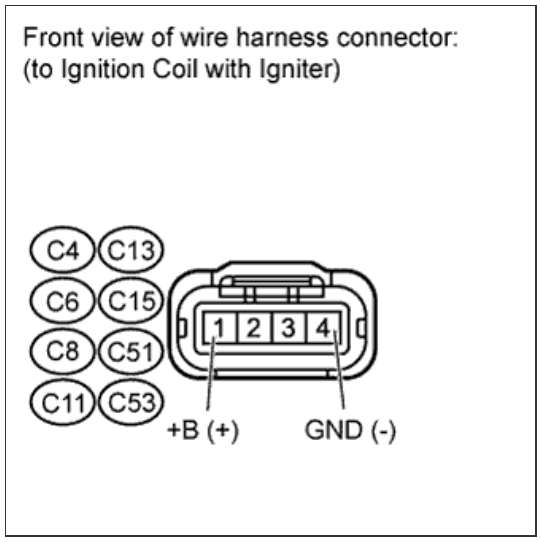
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)



a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 (+B) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 (+B) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

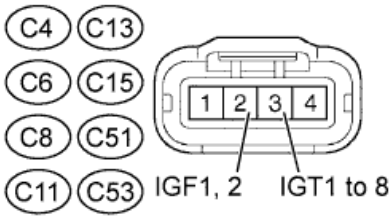
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

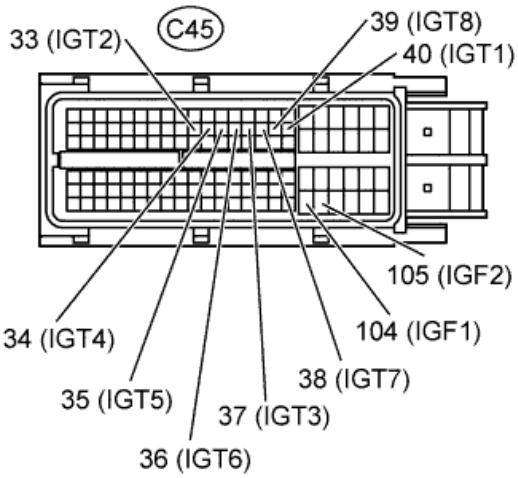
a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:



Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C51-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω

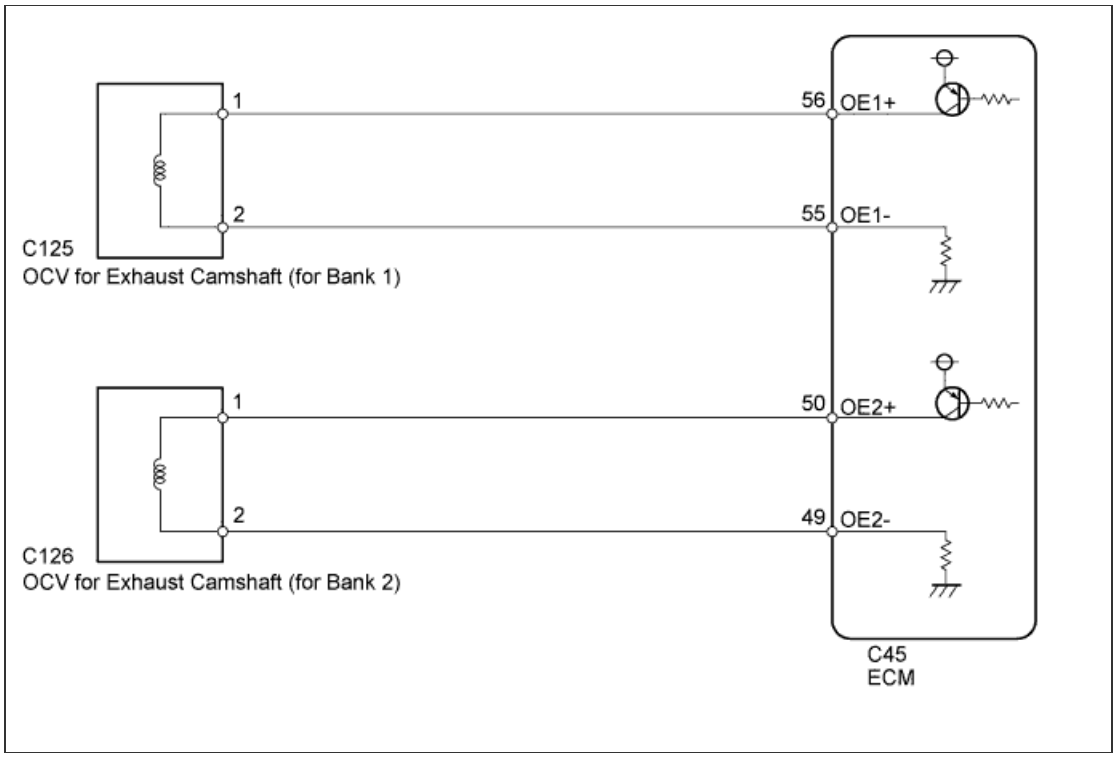
DTC P0013 Camshaft Position "B" Actuator Circuit / Open (Bank 1)

DTC P0023 Camshaft Position "B" Actuator Circuit / Open (Bank 2)

for Preparation Click here

DESCRIPTION

- This DTC is designed to detect opens or shorts in the Camshaft Oil Control Valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.
- The VVT (variable valve timing) system adjusts the intake valve timing to improve the driveability. The engine oil pressure turns the camshaft actuator to adjust the valve timing. The OCV is a solenoid valve and switches the engine oil line. The valve moves when the ECM applies 12 volts to the solenoid. The ECM changes the energizing time to the solenoid (duty-cycle) in accordance with the camshaft position, crankshaft position, throttle position, etc.



DTC Code	DTC Detection Condition	Trouble Area
P0013	An open or short in the Camshaft Oil Control Valve (OCV) for exhaust side (for Bank 1) circuit (1 trip detection logic).	• Open or short in Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1) circuit • OCV (for exhaust side of Bank 1) • ECM
P0023	An open or short in the OCV for exhaust side (for Bank 2) circuit (1 trip detection logic).	• Open or short in OCV (for exhaust side of Bank 2) circuit • OCV (for exhaust side of Bank 2) • ECM

MONITOR DESCRIPTION

This DTC is designed to detect opens or shorts in the camshaft oil control valve (OCV) circuit. If the OCV duty-cycle is excessively high or low while the engine is running, the ECM will illuminate the MIL and store the DTC.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

- **If DTC P0013 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0023 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK DTC (DTC P0013 OR P0023)

a. Connect the intelligent tester to the DLC3.

b. Clear DTC after recording the freeze frame data and DTC.

c. Turn the engine switch off.

d. Allow the engine to idle and check DTC.

e. Check that P0013 or P0023 is not output.

OK:
P0013 or P0023 is not output.

NG → **Go to step 2**

OK

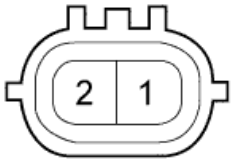
CHECK FOR INTERMITTENT PROBLEMS (Click here)

2.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY

a. Disconnect the C125 or C126 OCV connector.



b. Remove the camshaft oil control valve (OCV) (Click here).

c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
1 - 2	20°C (68°F)	6.9 to 7.9 Ω

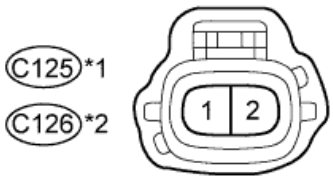
Component without harness connected:
(Oil Control Valve)

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK →

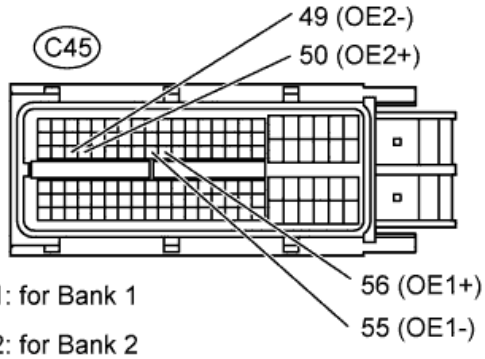
3.CHECK HARNESS AND CONNECTOR (OCV - ECM)

a. Disconnect the C125 or C126 OCV connector.



b. Disconnect the C45 ECM connector.

c. Measure the resistance according to the value(s) in the table below.



Standard Resistance:

Tester Connection	Condition	Specified Condition
C125-1 - C45-56 (OE1+)	Always	Below 1 Ω
C125-2 - C45-55 (OE1-)	Always	Below 1 Ω
C126-1 - C45-50 (OE2+)	Always	Below 1 Ω
C126-2 - C45-49 (OE2-)	Always	Below 1 Ω
C125-1 or C45-56 (OE1+) - Body ground	Always	10 kΩ or higher
C125-2 or C45-55 (OE1-) - Body ground	Always	10 kΩ or higher
C126-1 or C45-50 (OE2+) - Body ground	Always	10 kΩ or higher
C126-2 or C45-49 (OE2-) - Body ground	Always	10 kΩ or higher

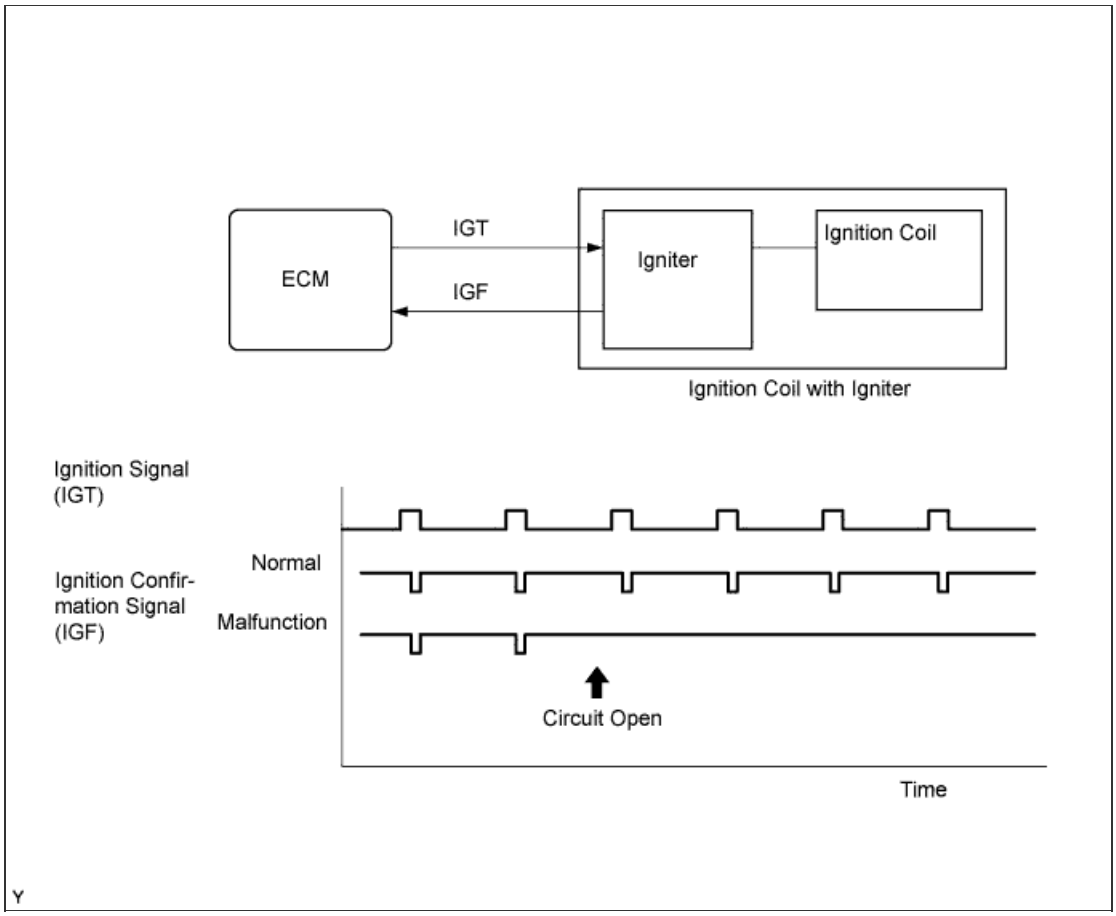
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-35 (IGT5) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

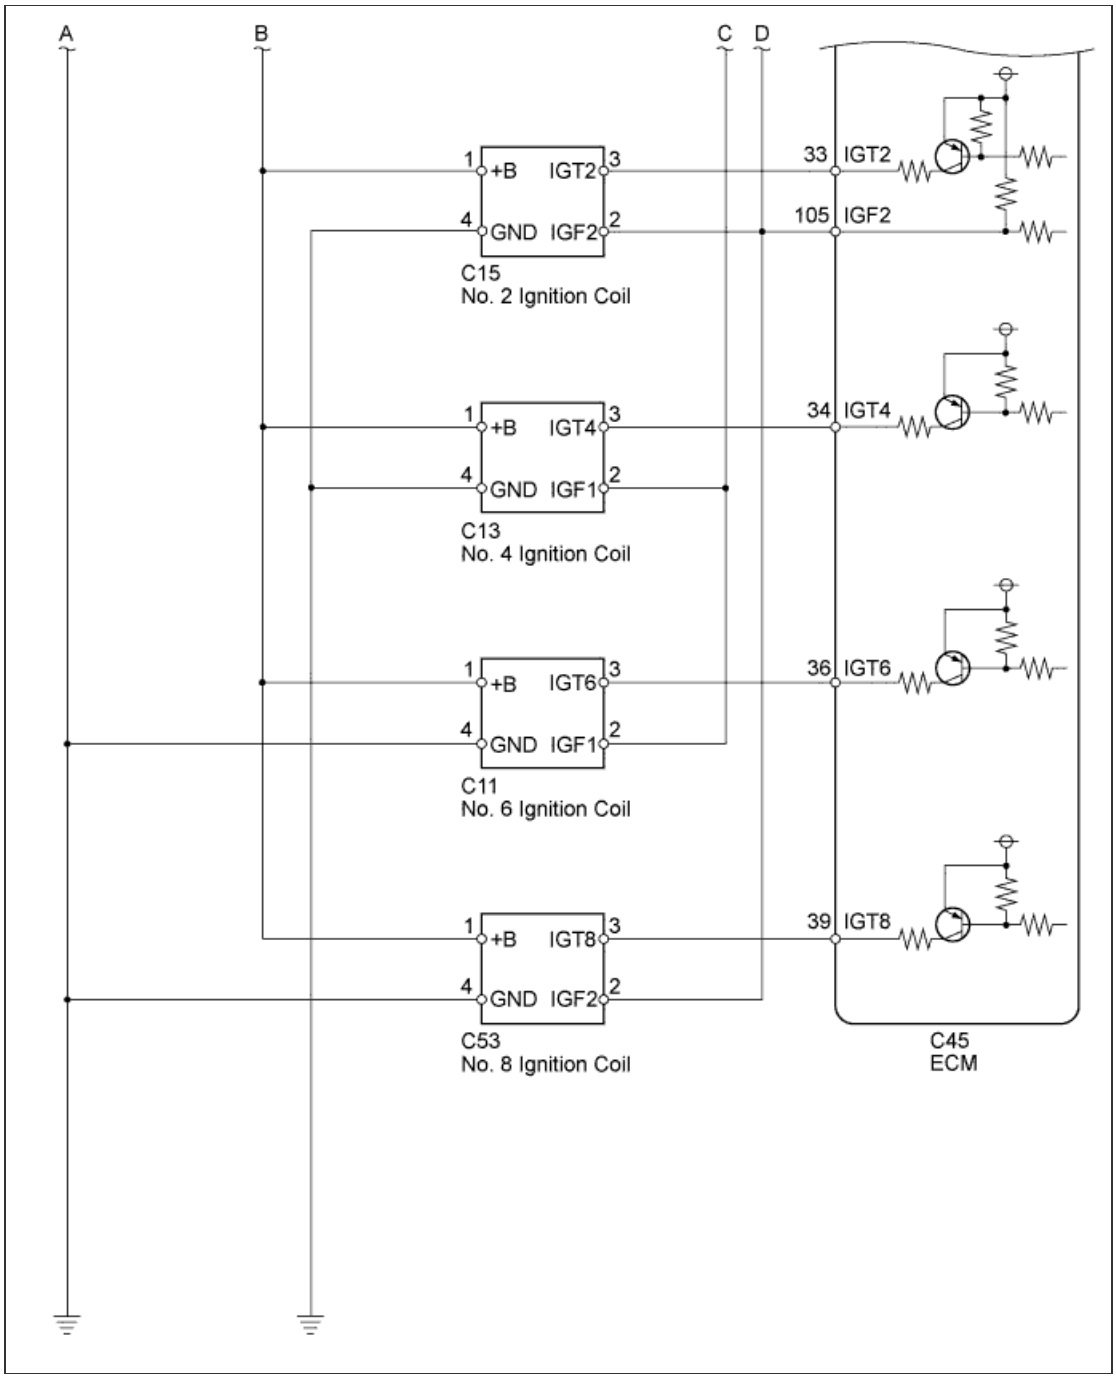
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

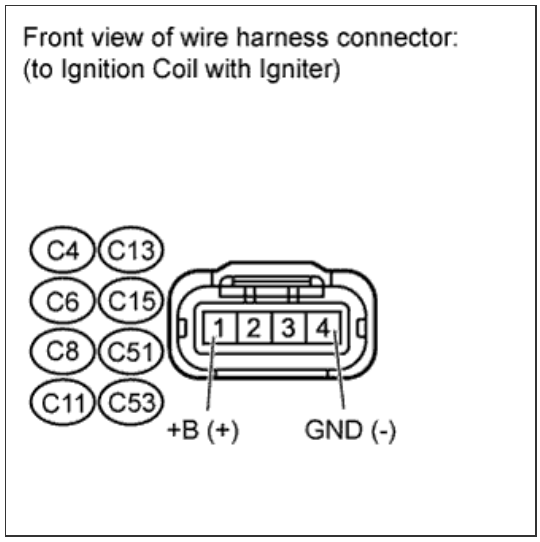
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)



a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 (+B) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 (+B) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

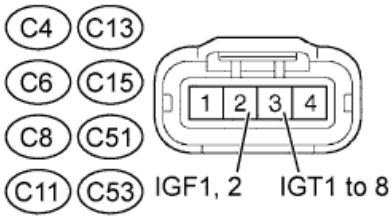
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C51-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C53-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C4-3 (IGT1) - C45-40 (IGT1)	Always	Below 1 Ω

C15-3 (IGT2) - C45-33 (IGT2)	Always	Below 1 Ω
C6-3 (IGT3) - C45-37 (IGT3)	Always	Below 1 Ω

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1 and 2 are met for 10 seconds or more:
   1. It takes 5 seconds or more to change the valve timing by 5°CA.
   2. After the above condition 1 is met, the camshaft timing oil control valve is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- **If DTC P0014 or P0015 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0024 or P0025 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Turn the A/C on.

e. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

f. Check the engine speed while operating the camshaft timing oil control valve using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

HINT:

Refer to "Data List / Active Test" [VVT Ex OCV Duty #1, VVT Ex Chg Angle #1, VVT Ex OCV Duty #2 and VVT Ex Chg Angle #2] (Click here).

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:

No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

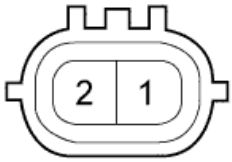
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
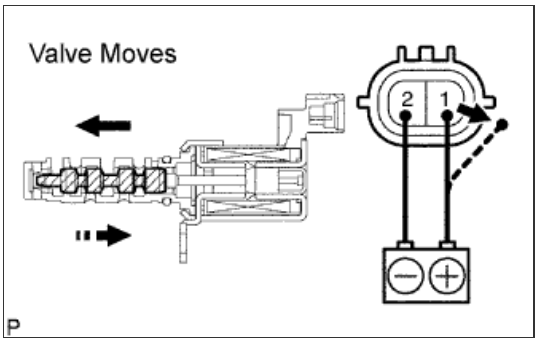
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

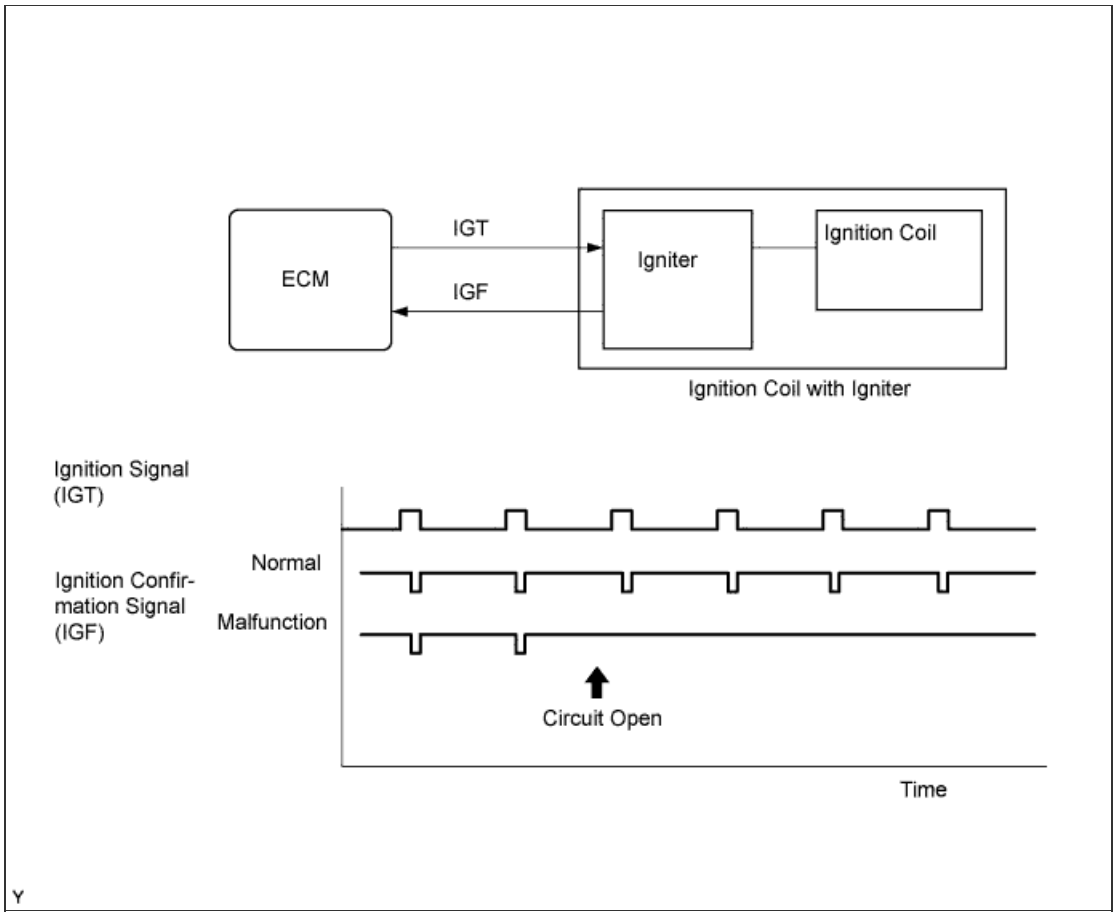
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-35 (IGT5) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

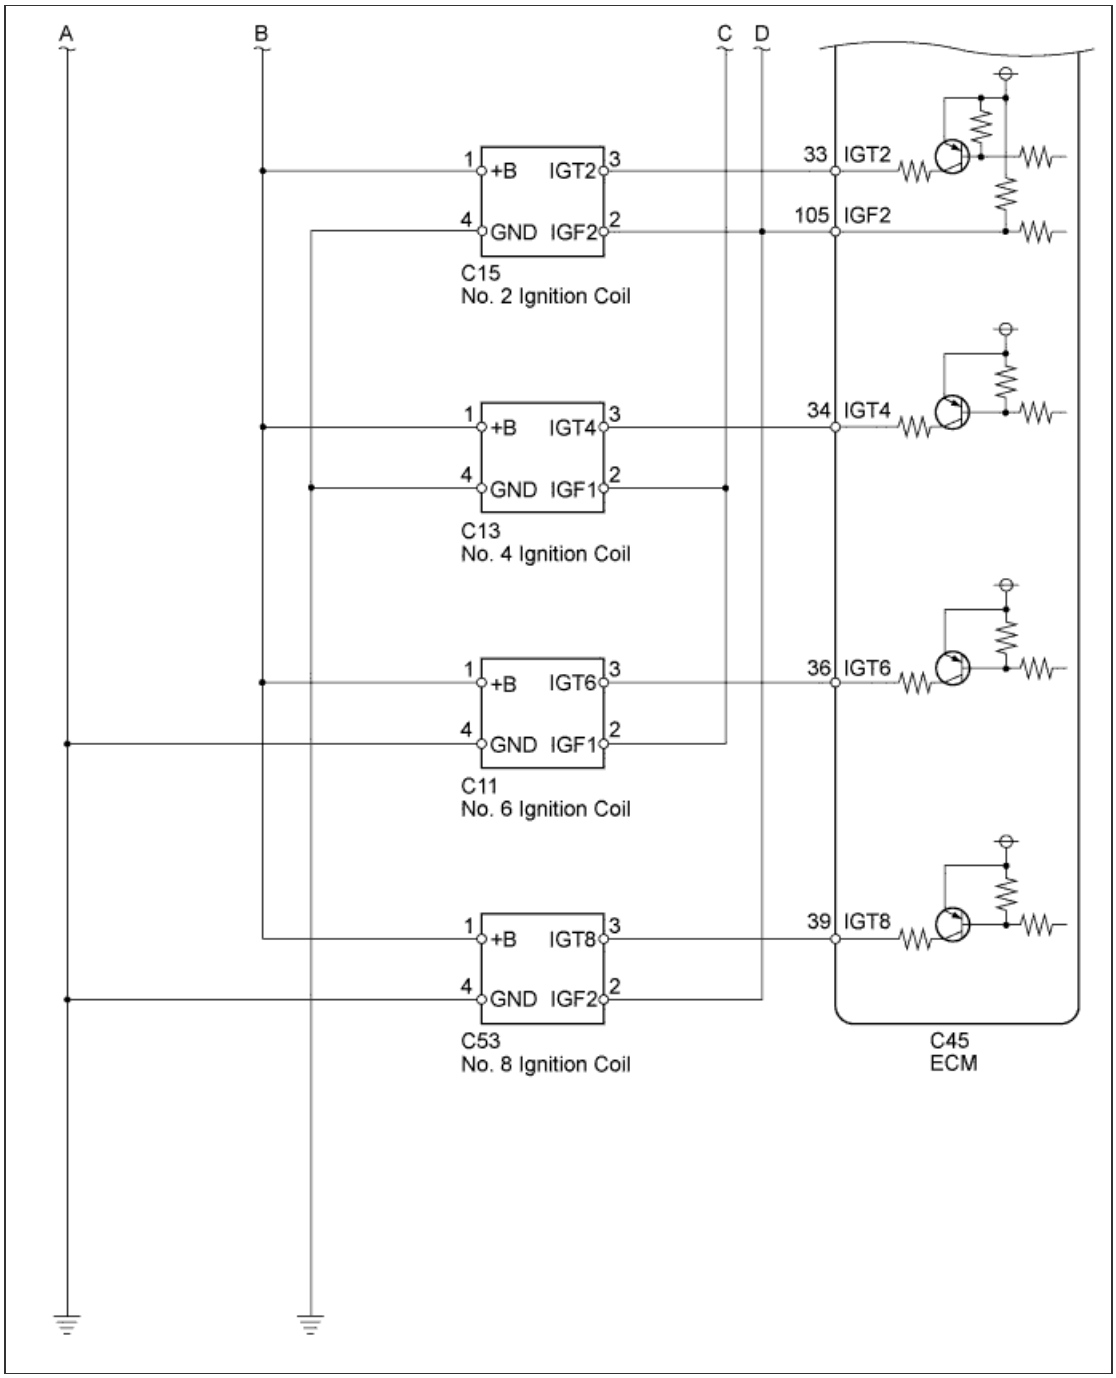
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

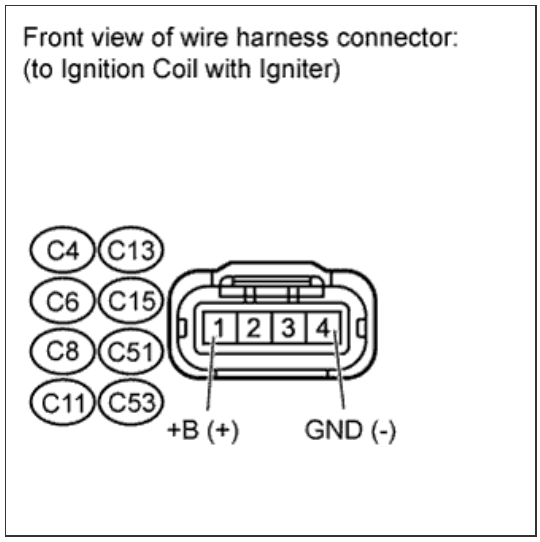
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)



a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 (+B) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 (+B) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

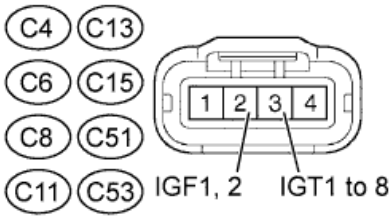
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C51-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C53-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C4-3 (IGT1) - C45-40 (IGT1)	Always	Below 1 Ω

C15-3 (IGT2) - C45-33 (IGT2)	Always	Below 1 Ω
C6-3 (IGT3) - C45-37 (IGT3)	Always	Below 1 Ω

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1 and 2 are met for 10 seconds or more:
   1. It takes 5 seconds or more to change the valve timing by 5°CA.
   2. After the above condition 1 is met, the camshaft timing oil control valve is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

INSPECTION PROCEDURE

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- **If DTC P0014 or P0015 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0024 or P0025 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Turn the A/C on.

e. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

f. Check the engine speed while operating the camshaft timing oil control valve using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

HINT:

Refer to "Data List / Active Test" [VVT Ex OCV Duty #1, VVT Ex Chg Angle #1, VVT Ex OCV Duty #2 and VVT Ex Chg Angle #2] (Click here).

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:

No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

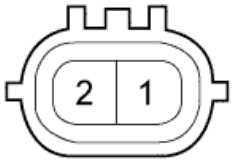
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
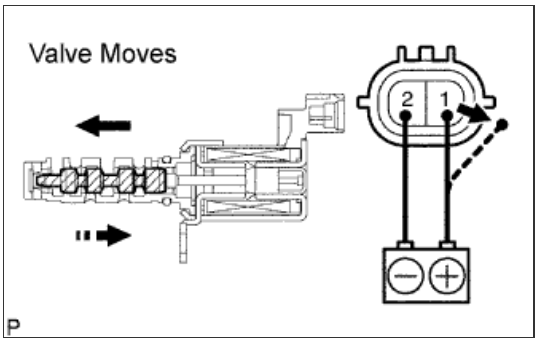
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM IS OK

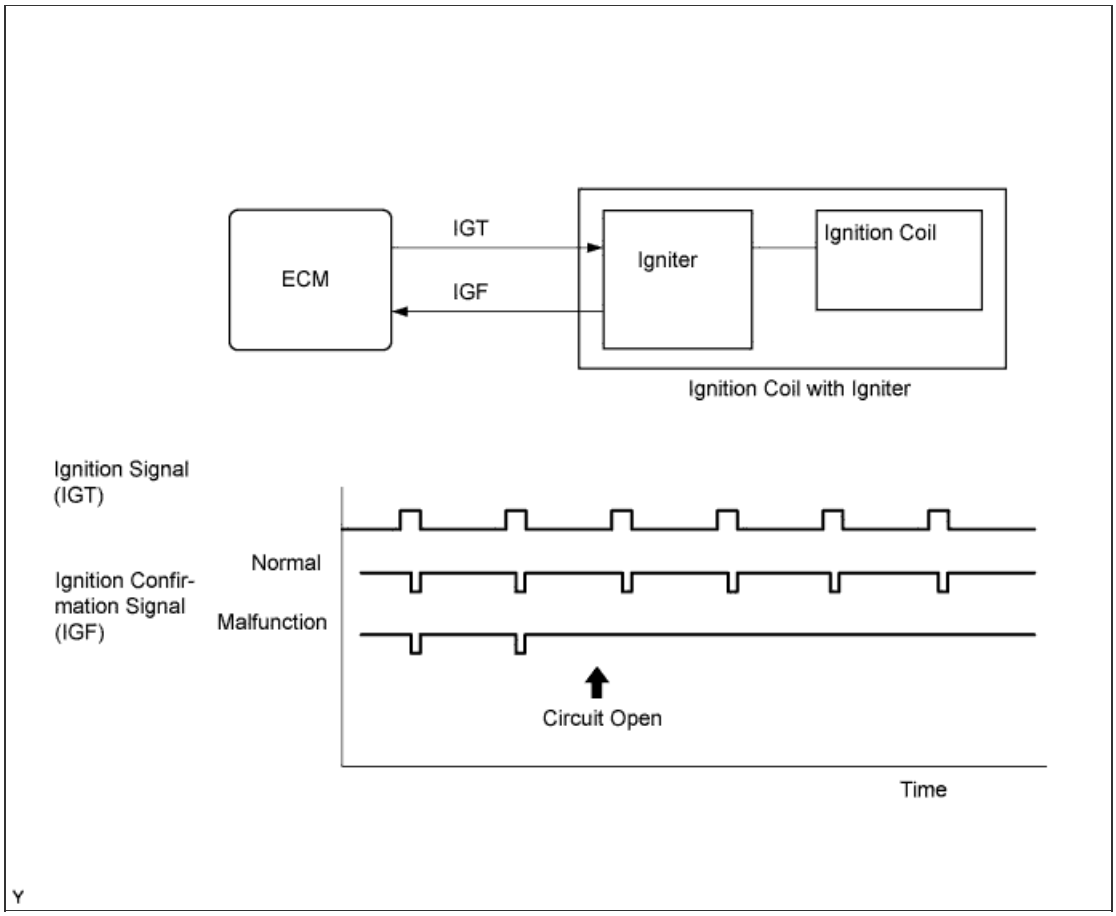
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

for Preparation Click here

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1 and 2 are met for 10 seconds or more:
   1. It takes 5 seconds or more to change the valve timing by 5°CA.
   2. After the above condition 1 is met, the camshaft timing oil control valve is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

WIRING DIAGRAM

Refer to DTC P0013 (Click here).

INSPECTION PROCEDURE

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- **If DTC P0014 or P0015 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0024 or P0025 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Turn the A/C on.

e. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

f. Check the engine speed while operating the camshaft timing oil control valve using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

HINT:

Refer to "Data List / Active Test" [VVT Ex OCV Duty #1, VVT Ex Chg Angle #1, VVT Ex OCV Duty #2 and VVT Ex Chg Angle #2] (Click here).

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:

No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

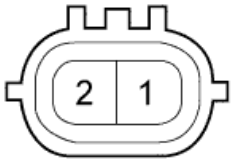
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
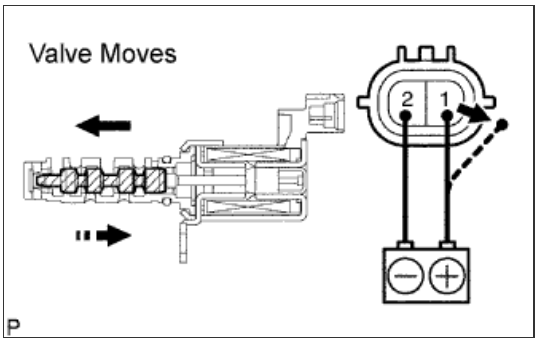
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM IS OK

DESCRIPTION

HINT:

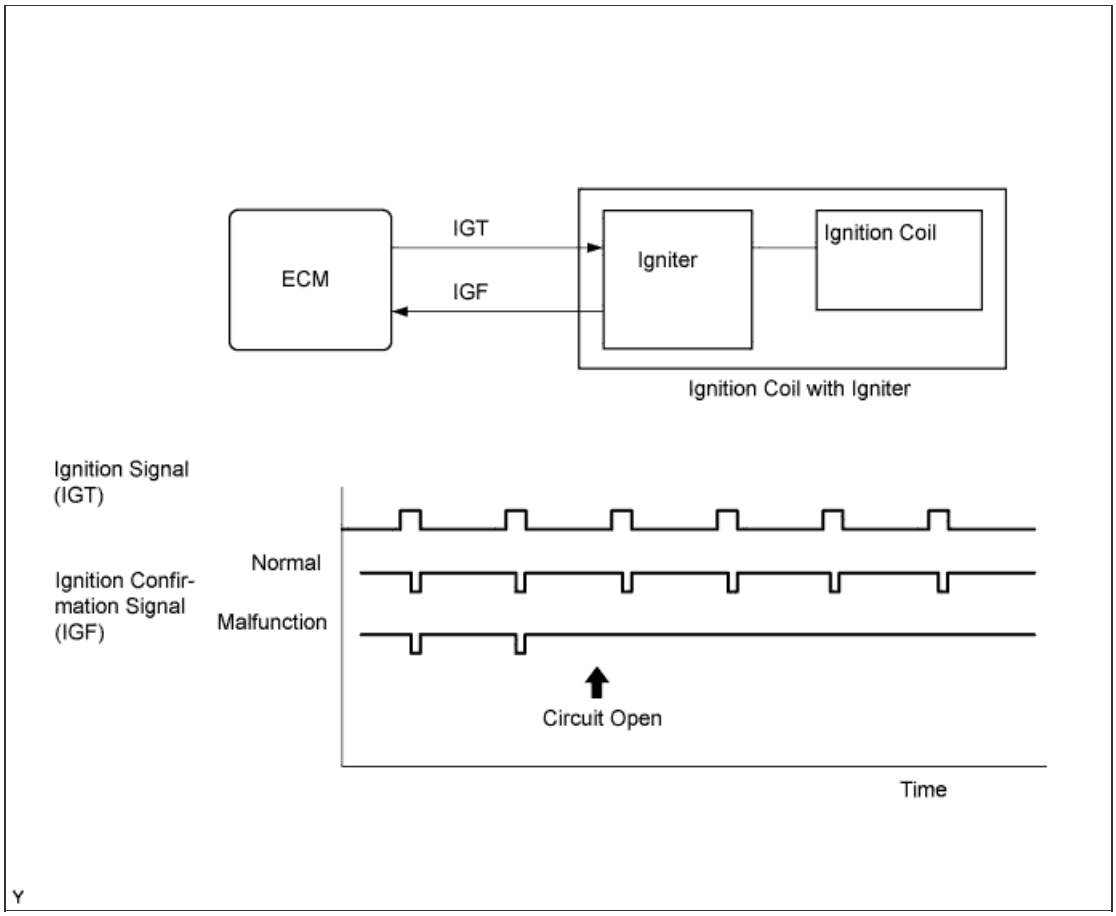
- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-35 (IGT5) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

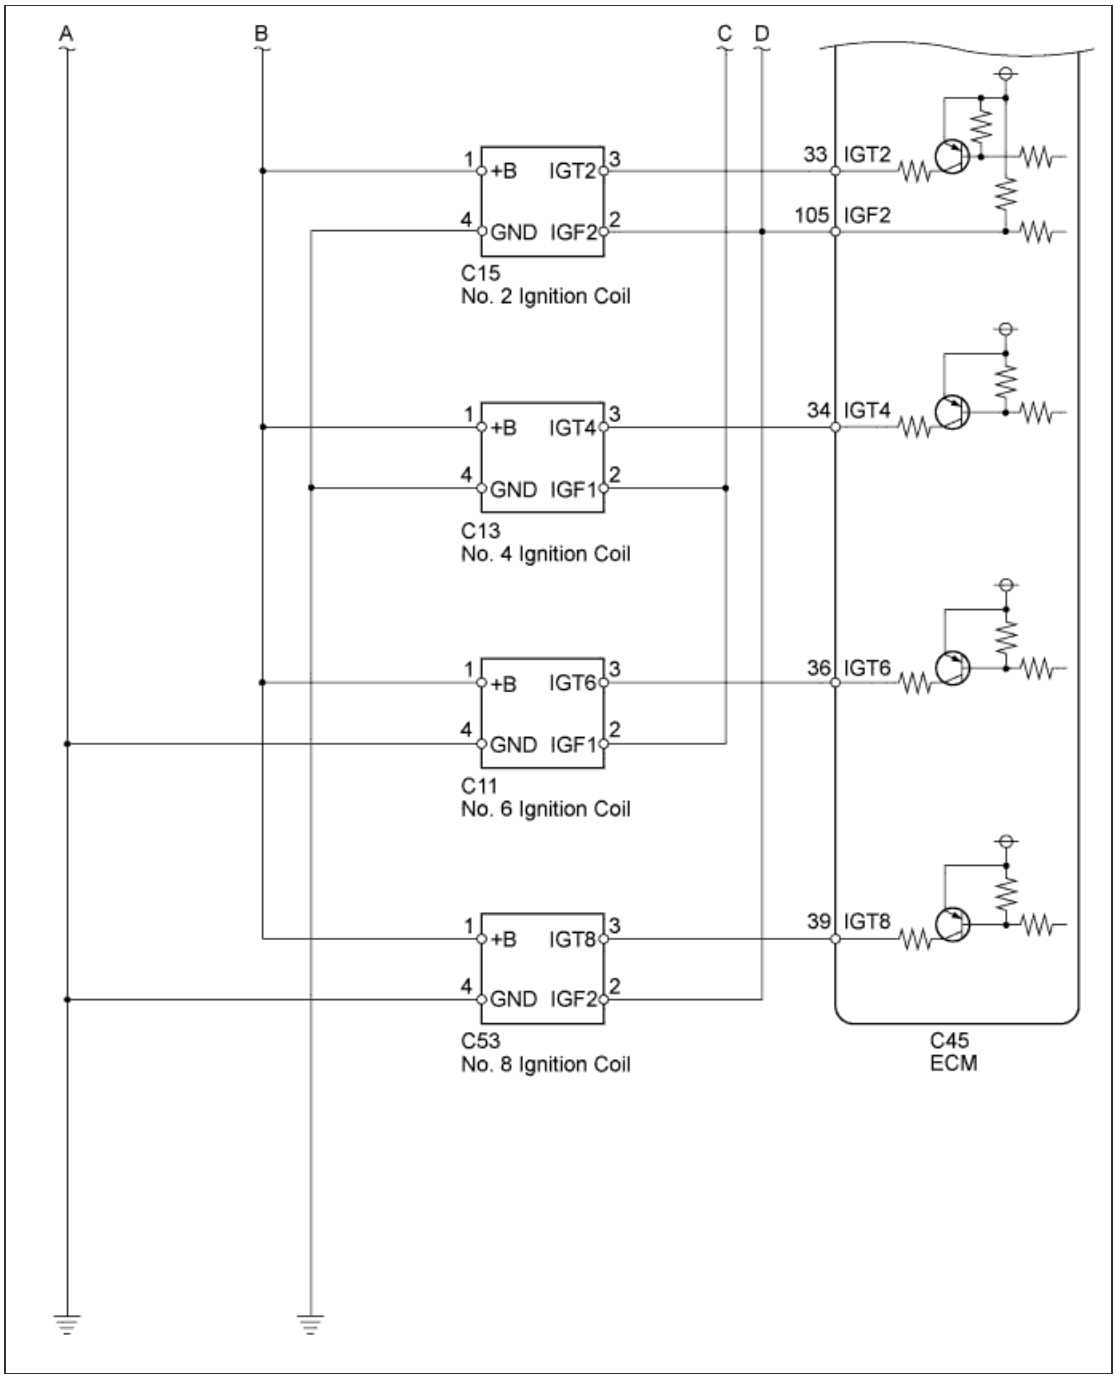
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

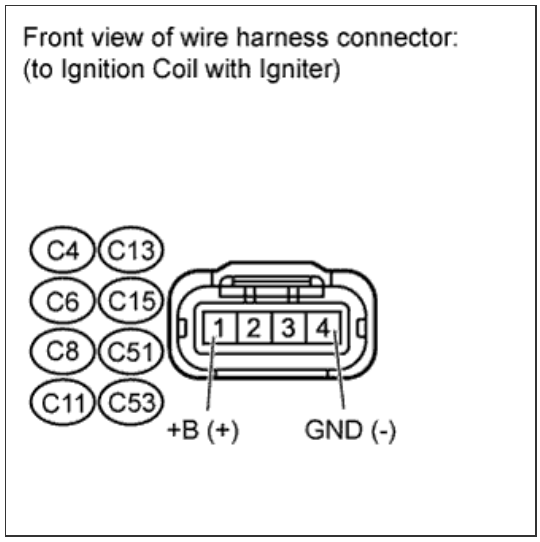
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)



a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 (+B) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 (+B) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

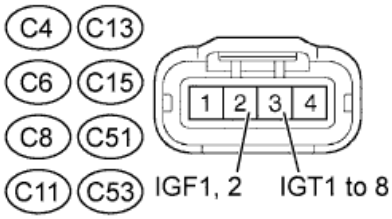
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω

DESCRIPTION

HINT:

If DTC P0014, P0015, P0024 or P0025 is output, check the VVT (Variable Valve Timing) system.

The Variable Valve Timing (VVT) system includes the ECM, OCV and VVT controller. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. Camshaft timing control is performed according to engine operating conditions such as the intake air volume, throttle valve position and engine coolant temperature. The ECM controls the OCV based on the signals transmitted by several sensors. The VVT controller regulates the exhaust camshaft angle using oil pressure through the OCV. As a result, the relative positions of the camshaft and crankshaft are optimized, the engine torque and fuel economy improve, and the exhaust emissions decrease under overall driving conditions. The ECM detects the actual exhaust valve timing using signals from the camshaft and crankshaft position sensors, and performs feedback control. This is how the target exhaust valve timing is verified by the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0014 P0024	The exhaust valve timing is not adjusted in the valve timing advance range (2 trip detection logic).	• Valve timing • Camshaft Oil Control Valve (OCV) (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM
P0015 P0025	The exhaust valve timing is not adjusted in the valve timing retard range (1 trip detection logic).	• Valve timing • OCV (for exhaust side of Bank 1, 2) • OCV filter • Camshaft timing exhaust gear • ECM

MONITOR DESCRIPTION

1. The ECM optimizes the exhaust valve timing using the VVT (Variable Valve Timing) system to control the exhaust camshaft. The VVT system includes the ECM, Camshaft Oil Control Valve (OCV) and VVT controller.
2. The ECM sends a target duty-cycle control signal to the OCV. This control signal regulates the oil pressure supplied to the VVT controller. The VVT controller can advance or retard the exhaust camshaft.
   If the difference between the target and actual exhaust valve timing is large, and changes in actual exhaust valve timing are small, the ECM interprets this as the VVT controller stuck malfunction and stores DTC(s).
   Example:
   A DTC is stored when the following conditions 1 and 2 are met for 10 seconds or more:
   1. It takes 5 seconds or more to change the valve timing by 5°CA.
   2. After the above condition 1 is met, the camshaft timing oil control valve is forcibly activated during 10 seconds.
3. DTCs P0014 and P0024 (Advanced Cam Timing) are subject to 2 trip detection logic.
4. DTCs P0015 and P0025 (Retarded Cam Timing) are subject to 1 trip detection logic.
   These DTCs indicate that the VVT controller cannot operate properly due to OCV malfunctions or the presence of foreign objects in the OCV.
5. The monitor will not run unless the following conditions are met:
   1. The engine is warm (the engine coolant temperature is 75°C [167°F] or higher).
   2. The vehicle has been driven at more than 64 km/h (40 mph) for 3 minutes.
   3. The engine has idled for 3 minutes.

WIRING DIAGRAM

INSPECTION PROCEDURE

HINT:

Abnormal Bank	Advanced Timing Over (Valve Timing is Out of Specified Range)	Retarded Timing Over (Valve Timing is Out of Specified Range)
Bank 1	P0014	P0015
Bank 2	P0024	P0025

- **If DTC P0014 or P0015 is output, check the bank 1 VVT system for exhaust side circuit.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **If DTC P0024 or P0025 is output, check the bank 2 VVT system for exhaust side circuit.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**
- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0014, P0015, P0024 or P0025	A
P0014, P0015, P0024 or P0025 and other DTCs	B

HINT:

If any DTCs other than P0014, P0015, P0024 or P0025 are output, troubleshoot those DTCs first.

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Warm up the engine.

d. Turn the A/C on.

e. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Exhaust Linear (Bank 1) or Control the VVT Exhaust Linear (Bank 2).

f. Check the engine speed while operating the camshaft timing oil control valve using the tester.

OK:

Operation	Specified Condition
0%	Normal engine speed
100%	Engine idles roughly or stalls

HINT:

Refer to "Data List / Active Test" [VVT Ex OCV Duty #1, VVT Ex Chg Angle #1, VVT Ex OCV Duty #2 and VVT Ex Chg Angle #2] (Click here).

NG → **Go to step 4**

OK ↓

3.CHECK WHETHER DTC OUTPUT RECURS (DTC P0014, P0015, P0024 OR P0025)

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read DTCs using the tester.

OK:

No DTC output.

NG → **Go to step 4**

OK ↓

CHECK FOR INTERMITTENT PROBLEMS (Click here)

4.CHECK VALVE TIMING (CHECK FOR LOOSE AND JUMPED TEETH ON TIMING CHAIN)

a. Remove the cylinder head cover LH and RH.

b. Turn the crankshaft pulley, and align its groove with the timing mark "0" of the timing chain cover.

c. Check that the timing marks of the camshaft timing gears and camshaft timing exhaust gears are at the positions shown in the illustration.

OK:

Timing marks on camshaft timing gears are aligned as shown in the illustration.

NG → **ADJUST VALVE TIMING (Click here)**

OK

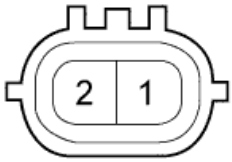
5.INSPECT CAMSHAFT OIL CONTROL VALVE ASSEMBLY (OCV FOR EXHAUST CAMSHAFT)



a. Remove the OCV (Click here).

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
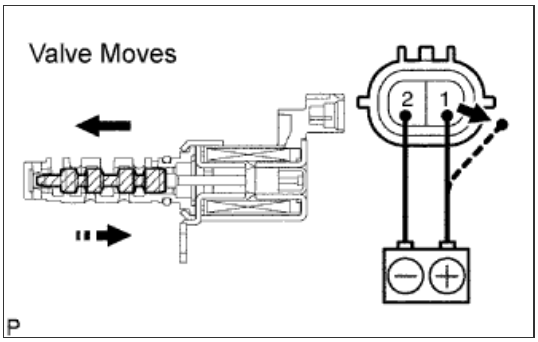
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



Component without harness connected:
(Oil Control Valve)

c. Check the valve operation.

OK:

Measurement Condition	Specified Condition
No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE ASSEMBLY (Click here)

OK

6.INSPECT OIL CONTROL VALVE FILTER

a. Remove the oil control valve filter (Click here).

b. Check that the filter is not clogged.

OK:
Filter is not clogged.

NG → CLEAN OIL CONTROL VALVE FILTER

OK

7.REPLACE CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing exhaust gear (Click here).

NEXT

8.CHECK WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the tester on.

c. Clear the DTCs (Click here).

d. Warm up the engine.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. With the engine warmed up, idle it for 1 minute. Then drive the vehicle for 5 minutes.

g. Read the output DTCs using the tester.

OK:
No DTC output.

HINT:

DTC P0014, P0015, P0024 or P0025 is output when foreign objects in the engine oil are caught in some parts of the system. These codes will stay stored even if the system returns to normal after a short time. These foreign objects are then captured by the oil filter, thus eliminating the source of the problem.

NG → REPLACE ECM (Click here)

OK

SYSTEM IS OK

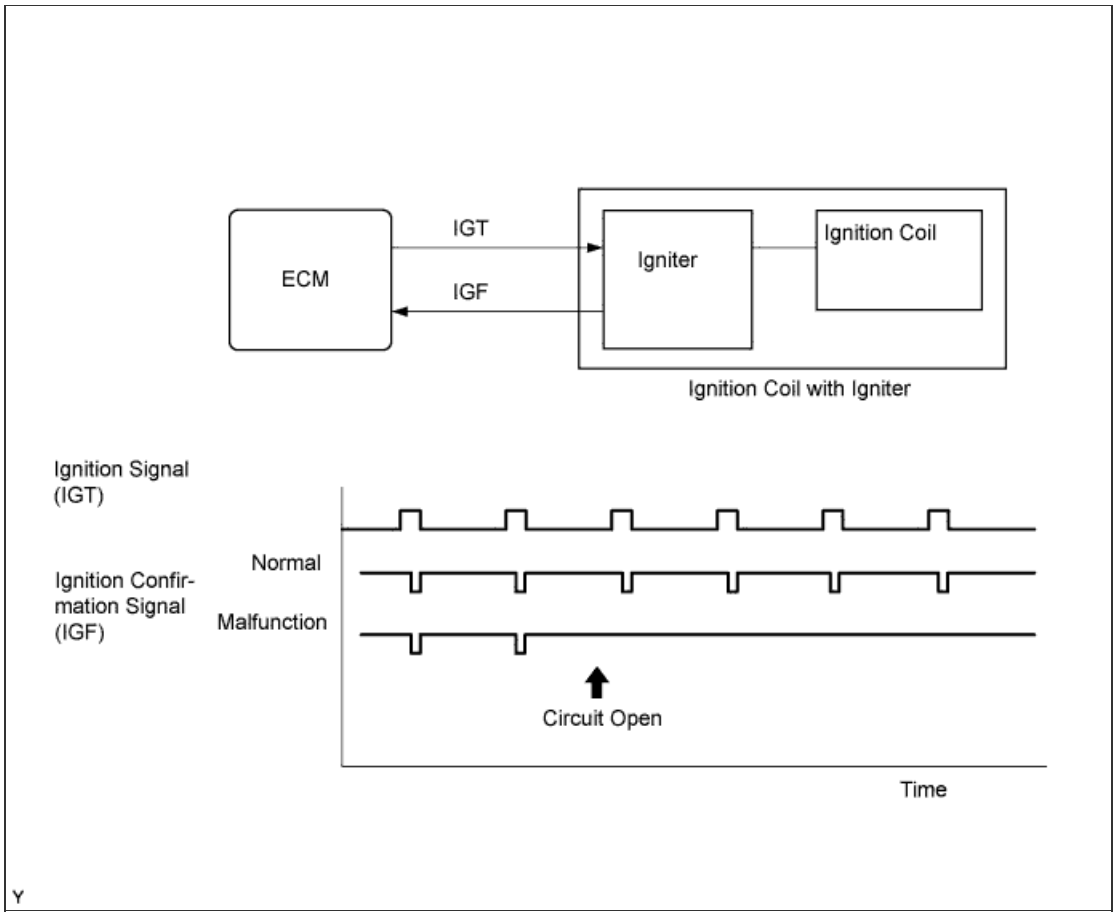
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-35 (IGT5) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

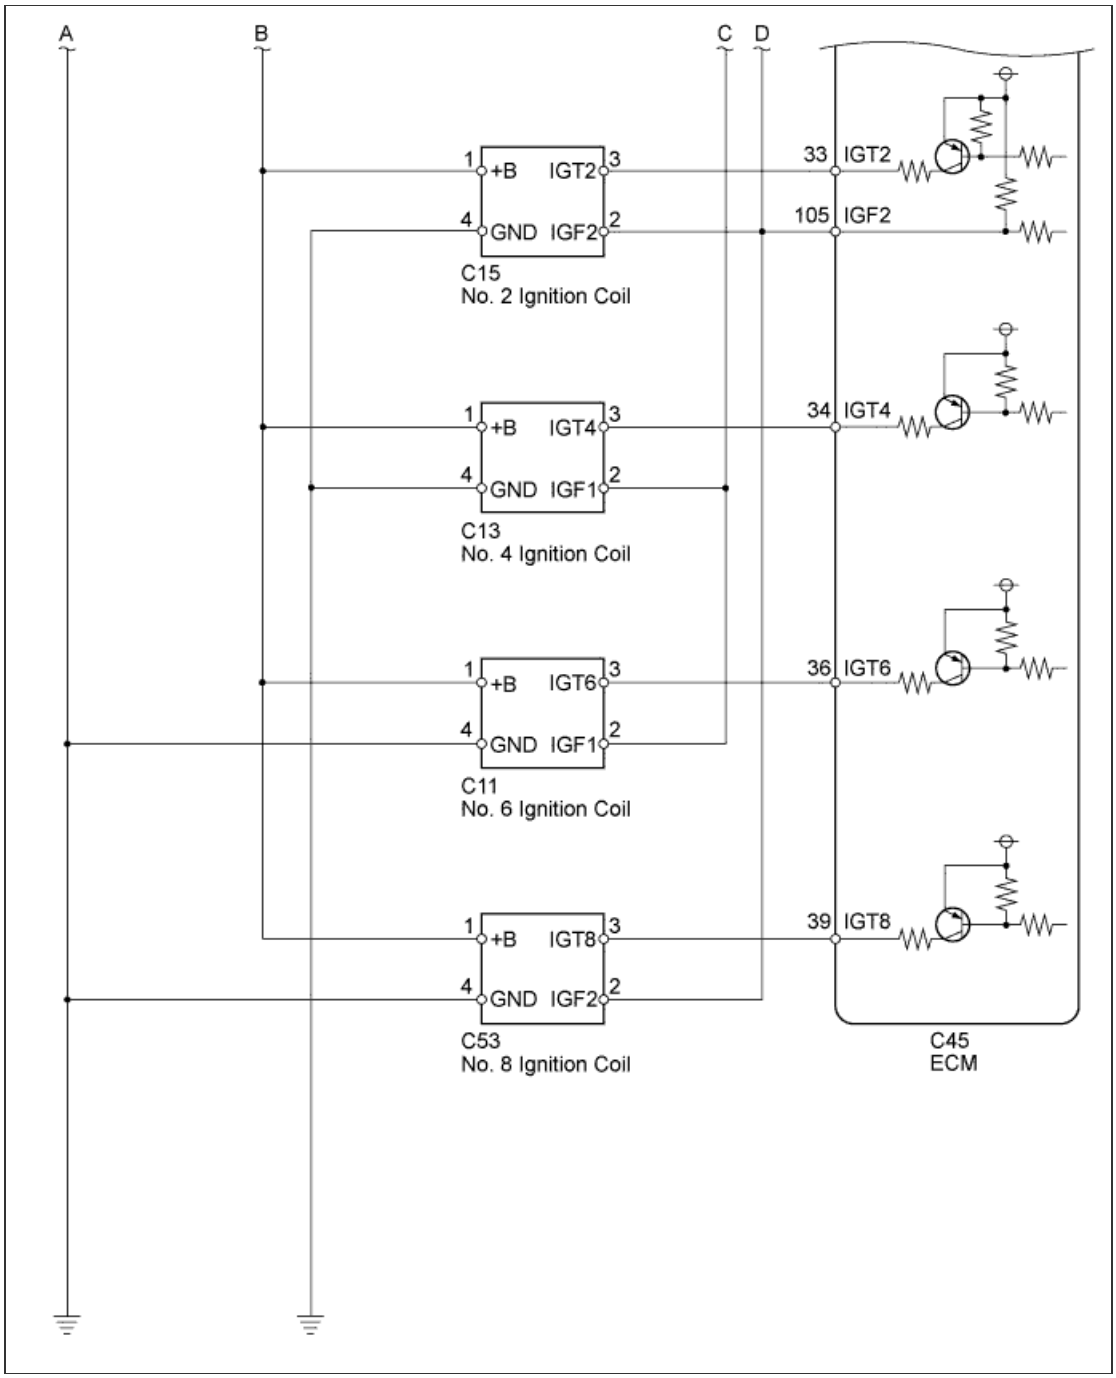
While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.



MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

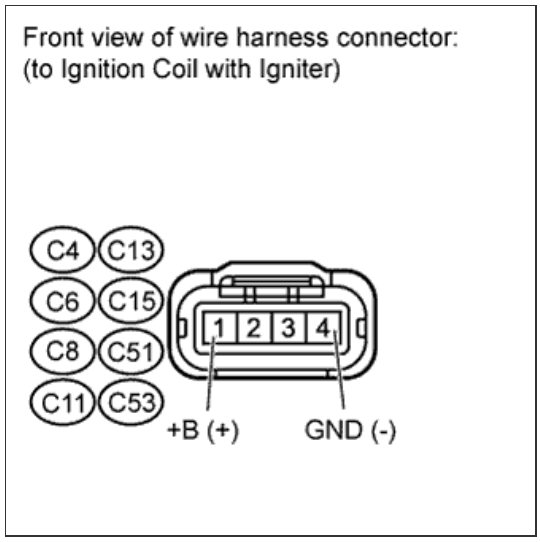
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)



a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 (+B) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 (+B) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

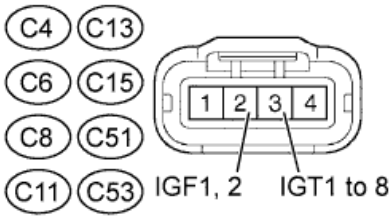
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω

DTC P0019 Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor B)

for Preparation Click here

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake and exhaust valve open and close timing is controlled by the ECM. The ECM performs intake and exhaust valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft oil control valve (OCV) (for intake side of bank 1) • Camshaft timing gear assembly • ECM
P0017	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 1) • Camshaft timing exhaust gear assembly • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for intake side of bank 2) • Camshaft timing gear assembly • ECM
P0019	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 2) • Camshaft timing exhaust gear assembly • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (Bank 1) or P0018 (Bank 2).
To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0017 (Bank 1) or P0019 (Bank 2).

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

HINT:

If the VVT system can be operated through the Active Test, it can be assumed that the VVT system is operating normally.

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the A/C on.

d. Turn the tester on

e. Warm up the engine.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Linear (Bank 1) or Control the VVT Linear (Bank 2) or Control the VVT Exhaust Linear (Bank 1) or Control the Exhaust VVT Linear (Bank 2) / All Data / VVT Change Angle #1, VVT Change Angle #2, VVT Ex Chg Angle #1, VVT Ex Chg Angle #2.

g. Perform the Active Test. Check that the displacement angle varies.

OK:

Displacement angle varies.

NG → Go to step 4

OK

3.ADJUST VALVE TIMING

a. Adjust the valve timing (Click here).

NEXT → Go to step 6

4.INSPECT CAMSHAFT OIL CONTROL VALVE (FOR INTAKE SIDE OR EXHAUST SIDE)

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
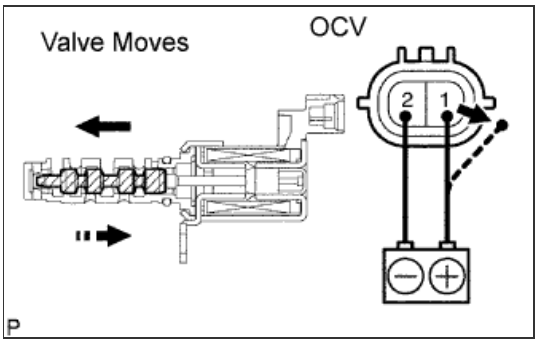
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition

No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE (Click here)

OK

5.REPLACE CAMSHAFT TIMING GEAR OR CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing gear (Click here).

b. Replace the camshaft timing exhaust gear (Click here).

NEXT

6.CONFIRM WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTC (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle in an urban area for approximately 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC is output.

NG → GO TO DTC CHART (Click here)

OK

- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.

C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

INSPECTION PROCEDURE

HINT:

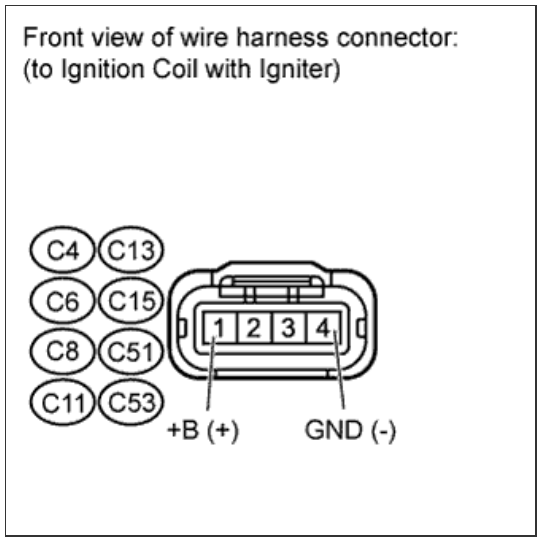
Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.

1.INSPECT IGNITION COIL ASSEMBLY (POWER SOURCE)



a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-4 (GND) - Body ground	Always	Below 1 Ω
C15-4 (GND) - Body ground	Always	Below 1 Ω
C6-4 (GND) - Body ground	Always	Below 1 Ω

C13-4 (GND) - Body ground	Always	Below 1 Ω
C8-4 (GND) - Body ground	Always	Below 1 Ω
C11-4 (GND) - Body ground	Always	Below 1 Ω
C51-4 (GND) - Body ground	Always	Below 1 Ω
C53-4 (GND) - Body ground	Always	Below 1 Ω

c. Measure the voltage according to the value(s) in the table below.

Standard Voltage:

Tester Connection	Switch Condition	Specified Condition
C4-1 (+B) - C4-4 (GND)	Engine switch on (IG)	11 to 14 V
C15-1 (+B) - C15-4 (GND)	Engine switch on (IG)	11 to 14 V
C6-1 (+B) - C6-4 (GND)	Engine switch on (IG)	11 to 14 V
C13-1 (+B) - C13-4 (GND)	Engine switch on (IG)	11 to 14 V
C8-1 (+B) - C8-4 (GND)	Engine switch on (IG)	11 to 14 V
C11-1 (+B) - C11-4 (GND)	Engine switch on (IG)	11 to 14 V
C51-1 (+B) - C51-4 (GND)	Engine switch on (IG)	11 to 14 V
C53-1 (+B) - C53-4 (GND)	Engine switch on (IG)	11 to 14 V

NG → REPAIR OR REPLACE HARNESS OR CONNECTOR

OK

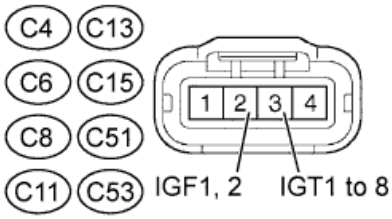
2.CHECK HARNESS AND CONNECTOR (IGNITION COIL ASSEMBLY - ECM)

a. Disconnect the C4, C6, C8, C11, C13, C15, C51 or C53 ignition coil connector.

b. Disconnect the C45 ECM connector.



c. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
C4-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C15-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C6-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C13-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C8-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C11-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C51-2 (IGF1) - C45-104 (IGF1)	Always	Below 1 Ω
C53-2 (IGF2) - C45-105 (IGF2)	Always	Below 1 Ω
C4-3 (IGT1) - C45-40 (IGT1)	Always	Below 1 Ω

C15-3 (IGT2) - C45-33 (IGT2)	Always	Below 1 Ω
C6-3 (IGT3) - C45-37 (IGT3)	Always	Below 1 Ω

DTC P0019 Crankshaft Position - Camshaft Position Correlation (Bank 2 Sensor B)

for Preparation Click here

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake and exhaust valve open and close timing is controlled by the ECM. The ECM performs intake and exhaust valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft oil control valve (OCV) (for intake side of bank 1) • Camshaft timing gear assembly • ECM
P0017	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 1) • Camshaft timing exhaust gear assembly • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for intake side of bank 2) • Camshaft timing gear assembly • ECM
P0019	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 2) • Camshaft timing exhaust gear assembly • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (Bank 1) or P0018 (Bank 2).
To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0017 (Bank 1) or P0019 (Bank 2).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0016, P0017, P0018 OR P0019)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0016, P0017, P0018 or P0019 is output	A
P0016, P0017, P0018 or P0019 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

A

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

HINT:

If the VVT system can be operated through the Active Test, it can be assumed that the VVT system is operating normally.

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the A/C on.

d. Turn the tester on

e. Warm up the engine.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Linear (Bank 1) or Control the VVT Linear (Bank 2) or Control the VVT Exhaust Linear (Bank 1) or Control the Exhaust VVT Linear (Bank 2) / All Data / VVT Change Angle #1, VVT Change Angle #2, VVT Ex Chg Angle #1, VVT Ex Chg Angle #2.

g. Perform the Active Test. Check that the displacement angle varies.

OK:

Displacement angle varies.

NG → Go to step 4

OK

3.ADJUST VALVE TIMING

a. Adjust the valve timing (Click here).

NEXT → Go to step 6

4.INSPECT CAMSHAFT OIL CONTROL VALVE (FOR INTAKE SIDE OR EXHAUST SIDE)

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
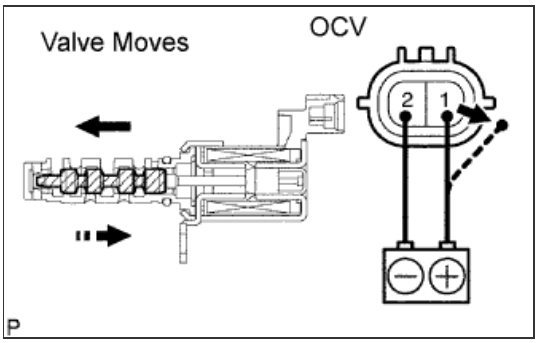
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition

No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE (Click here)

OK

5.REPLACE CAMSHAFT TIMING GEAR OR CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing gear (Click here).

b. Replace the camshaft timing exhaust gear (Click here).

NEXT

6.CONFIRM WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTC (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle in an urban area for approximately 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC is output.

NG → GO TO DTC CHART (Click here)

OK

END

DESCRIPTION

HINT:

- **These DTCs indicate malfunctions relating to the primary circuit.**
- **If DTC P0351 is output, check the No. 1 ignition coil circuit.**
- **If DTC P0352 is output, check the No. 2 ignition coil circuit.**
- **If DTC P0353 is output, check the No. 3 ignition coil circuit.**
- **If DTC P0354 is output, check the No. 4 ignition coil circuit.**
- **If DTC P0355 is output, check the No. 5 ignition coil circuit.**
- **If DTC P0356 is output, check the No. 6 ignition coil circuit.**
- **If DTC P0357 is output, check the No. 7 ignition coil circuit.**
- **If DTC P0358 is output, check the No. 8 ignition coil circuit.**

A Direct Ignition System (DIS) is used on this vehicle.
The DIS is a 1-cylinder ignition system in which each cylinder is ignited by one ignition coil and one spark plug is connected to the end of each secondary wiring. A powerful voltage, generated in the secondary wiring, is applied directly to each spark plug. The sparks of the spark plugs pass from the center electrode to the ground electrodes.
The ECM determines the ignition timing and transmits the ignition (IGT) signals to each cylinder. Using the IGT signal, the ECM turns the power transistor inside the igniter on and off. The power transistor, in turn, switches on and off the current to the primary coil. When the current to the primary coil is cut off, a powerful voltage is generated in the secondary coil. This voltage is applied to the spark plugs, causing them to spark inside the cylinders. As the ECM cuts the current to the primary coil, the igniter sends back an ignition confirmation (IGF) signal to the ECM for each cylinder ignition.

DTC Code	DTC Detection Condition	Trouble Area
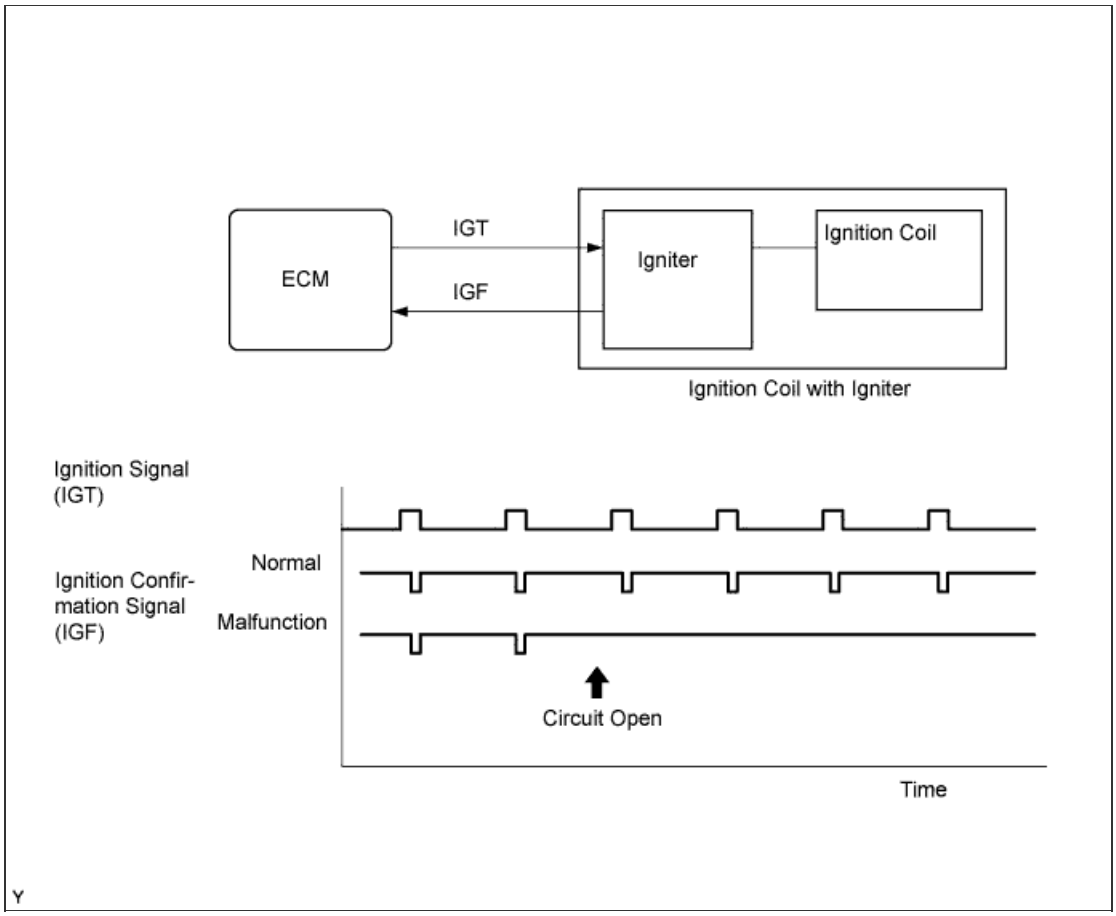
P0351 P0352 P0353 P0354 P0355 P0356 P0357 P0358	No IGF signal is sent to the ECM while the engine is running (1 trip detection logic).	• Ignition system • Open or short in IGF1 or IGT circuit (1 to 8) between ignition coil and ECM • No. 1 to No. 8 ignition coils • ECM

Reference: Inspection using an oscilloscope.



Standard:

Tester Connection	Tool Setting	Condition	Specified Condition
C45-40 (IGT1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-33 (IGT2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-37 (IGT3) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-34 (IGT4) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-35 (IGT5) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-36 (IGT6) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-38 (IGT7) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-39 (IGT8) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-104 (IGF1) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown
C45-105 (IGF2) - C45-81 (E1)	2 V/DIV., 20 msec./DIV.	Idling	The correct waveform is as shown

HINT:

While cranking or idling the engine, check the waveform between terminals IGT (1 to 8) and E1, and IGF1 or IGF2 and E1 of the ECM connector.

MONITOR DESCRIPTION

If the ECM does not receive any IGF signals despite transmitting the IGT signal, it interprets this as a fault in the igniter and stores DTC(s).
If the malfunction is not repaired successfully, a DTC is stored 1 second after the engine is next started.

DESCRIPTION

In the VVT (Variable Valve Timing) system, the appropriate intake and exhaust valve open and close timing is controlled by the ECM. The ECM performs intake and exhaust valve control by performing the following: 1) controlling the camshaft and camshaft timing oil control valve, and operating the camshaft timing gear; and 2) changing the relative positions of the camshaft and crankshaft.

DTC Code	DTC Detection Condition	Trouble Area
P0016	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • Camshaft oil control valve (OCV) (for intake side of bank 1) • Camshaft timing gear assembly • ECM
P0017	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 1) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 1) • Camshaft timing exhaust gear assembly • ECM
P0018	Deviation in the crankshaft position sensor signal and VVT sensor (for Intake side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for intake side of bank 2) • Camshaft timing gear assembly • ECM
P0019	Deviation in the crankshaft position sensor signal and VVT sensor (for Exhaust side of Bank 2) signal (2 trip detection logic).	• Mechanical system (Timing chain has jumped tooth or chain stretched) • OCV (for exhaust side of bank 2) • Camshaft timing exhaust gear assembly • ECM

MONITOR DESCRIPTION

To monitor the correlation of the intake camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The intake valve timing is set to the most retarded angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0016 (Bank 1) or P0018 (Bank 2).
To monitor the correlation of the exhaust camshaft position and crankshaft position, the ECM checks the VVT learning value while the engine is idling. The VVT learning value is calibrated based on the camshaft position and crankshaft position. The exhaust valve timing is set to the most advanced angle while the engine is idling. If the VVT learning value is out of the specified range in consecutive driving cycles, the ECM illuminates the MIL and stores DTC P0017 (Bank 1) or P0019 (Bank 2).

INSPECTION PROCEDURE

HINT:

- **Read freeze frame data using the intelligent tester. Freeze frame data records the engine condition when malfunctions are detected. When troubleshooting, freeze frame data can help determine if the vehicle was moving or stationary, if the engine was warmed up or not, if the air-fuel ratio was lean or rich, and other data from the time the malfunction occurred.**
- **Bank 1 refers to the bank that includes the No. 1 cylinder*.**
  ***: The No. 1 cylinder is the cylinder which is farthest from the transmission.**
- **Bank 2 refers to the bank that does not include the No. 1 cylinder.**

1.CHECK ANY OTHER DTCS OUTPUT (IN ADDITION TO DTC P0016, P0017, P0018 OR P0019)

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Enter the following menus: Powertrain / Engine and ECT / DTC.

d. Read DTCs.

Result

Result	Proceed to
P0016, P0017, P0018 or P0019 is output	A
P0016, P0017, P0018 or P0019 and other DTCs are output	B

B → GO TO DTC CHART (Click here)

2.PERFORM ACTIVE TEST USING INTELLIGENT TESTER (OPERATE OCV)

HINT:

If the VVT system can be operated through the Active Test, it can be assumed that the VVT system is operating normally.

a. Connect the intelligent tester to the DLC3.

b. Start the engine.

c. Turn the A/C on.

d. Turn the tester on

e. Warm up the engine.

f. Enter the following menus: Powertrain / Engine and ECT / Active Test / Control the VVT Linear (Bank 1) or Control the VVT Linear (Bank 2) or Control the VVT Exhaust Linear (Bank 1) or Control the Exhaust VVT Linear (Bank 2) / All Data / VVT Change Angle #1, VVT Change Angle #2, VVT Ex Chg Angle #1, VVT Ex Chg Angle #2.

g. Perform the Active Test. Check that the displacement angle varies.

OK:

Displacement angle varies.

NG → Go to step 4

OK

3.ADJUST VALVE TIMING

a. Adjust the valve timing (Click here).

NEXT → Go to step 6

4.INSPECT CAMSHAFT OIL CONTROL VALVE (FOR INTAKE SIDE OR EXHAUST SIDE)

a. Remove the OCV.

b. Measure the resistance according to the value(s) in the table below.

Standard Resistance:

Tester Connection	Condition	Specified Condition
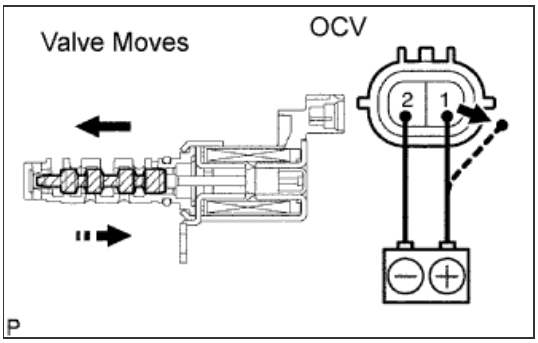
1 - 2	20°C (68°F)	6.9 to 7.9 Ω



c. Check the valve operation.

OK:

Measurement Condition	Specified Condition

No battery voltage applied to terminals 1 and 2 → Battery voltage applied to terminals 1 and 2	Valve moves quickly

NG → REPLACE CAMSHAFT OIL CONTROL VALVE (Click here)

OK

5.REPLACE CAMSHAFT TIMING GEAR OR CAMSHAFT TIMING EXHAUST GEAR

a. Replace the camshaft timing gear (Click here).

b. Replace the camshaft timing exhaust gear (Click here).

NEXT

6.CONFIRM WHETHER DTC OUTPUT RECURS

a. Connect the intelligent tester to the DLC3.

b. Turn the engine switch on (IG) and turn the tester on.

c. Clear the DTC (Click here).

d. Start the engine and warm it up.

e. Switch the ECM from normal mode to check mode using the tester (Click here).

f. Drive the vehicle in an urban area for approximately 10 minutes.

g. Read DTCs using the tester.

OK:
No DTC is output.

NG → GO TO DTC CHART (Click here)

OK

END

DESCRIPTION

The exhaust camshaft Variable Valve Timing (VVT) sensor (EV1, 2 signal) consists of a magnet and MRE (Magnetic Resistance Element).
The exhaust camshaft has a sensor plate with 3 teeth on its outer circumference. When the exhaust camshaft rotates, changes occur in the air gaps between the 3 teeth and MRE, which affects the magnet. As a result, the resistance of the MRE material fluctuates. The VVT sensor converts the exhaust camshaft rotation data into pulse signals, uses the pulse signals to determine the camshaft angle, and sends it to the ECM.

DTC Code	DTC Detection Condition	Trouble Area
P0365 P0390	When either condition below is met: • The input voltage to the ECM remains at below 0.3 V or higher than 4.7 V for more than 4 seconds when 2 or more seconds have elapsed after turning the engine switch on (IG) (1 trip detection logic). • No VVT sensor signal is sent to the ECM during cranking (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0367 P0392	The output voltage of the VVT sensor is below 0.3 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM
P0368 P0393	The output voltage of the VVT sensor is higher than 4.7 V for 4 seconds (1 trip detection logic).	• Open or short in VVT sensor (for exhaust side) circuit • VVT sensor (for exhaust side) • Exhaust camshaft • Jumped tooth of timing chain • ECM

Reference: Inspection using an oscilloscope.

Standard:

Tester Connection	Tool Setting	Condition	Specified Condition

C45 110 (NE+) - C45-111 (NE-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-69 (EV1+) - C45-68 (EV1-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown
C45-64 (EV2+) - C45-65 (EV2-)	5 V/DIV. 20 msec./DIV.	Cranking or idling	The correct waveform is as shown

HINT:

EV1+ and EV2+ stand for the VVT sensor (for exhaust side) signal, and NE+ stands for the CKP sensor signal.

MONITOR DESCRIPTION

If no signal is transmitted by the VVT sensor despite the engine revolving, or the rotations of the camshaft and the crankshaft are not synchronized, the ECM interprets this as a malfunction of the sensor.
